        var response = request.execute();
        var httpResponseStatus = response.getStatusCode();

        gs.info("http response status_code: " +
 httpResponseStatus);
    }
    catch (ex) {
        var message = ex.getMessage();
        gs.info(message);
    }
})();
```

RESTMessageV2 - setRequestHeader(String name, String value)

Sets an HTTP header in the REST message to the specified value.

Parameters

Name	Type	Description
name	String	Name of the header.
value	String	Value to assign to the specified header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
sm.setRequestHeader("Accept","Application/json");
```

RESTMessageV2 - setRequestorProfile(String requestorContext, String requestorId)

Overrides the default requestor profile for the REST message in order to retrieve an OAuth access token associated with a different requestor.

This method applies only to REST messages configured to use OAuth 2.0 authentication. This method is optional and is unnecessary in most configurations.

Parameters

Name	Type	Description
requestorContext	String	
requestorId	String	

Returns

Type	Description
void	

RESTMessageV2 - setStringParameter(String name, String value)

Sets a REST message function variable with the specified name from the REST message record to the specified value.

XML reserved characters in the value are converted to the equivalent escaped characters. Use `setStringParameterNoEscape` to set a variable without escaping XML reserved characters.

Parameters

Name	Type	Description
name	String	Name of the REST message variable. This parameter must be defined in the REST message record before you can assign a value to it.
value	String	Value to assign the variable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
sm.setStringParameter("s","NOW");
```

RESTMessageV2 - setStringParameterNoEscape(String name, String value)

Sets a REST message function variable with the specified name from the REST message record to the specified value.

This method is equivalent to *setStringParameter* but does not escape XML reserved characters.

Parameters

Name	Type	Description
name	String	Name of the REST message variable. This parameter must be defined in the REST message record before you can assign a value to it.
value	String	Value to assign the variable.

Returns

Type	Description
void	

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
sm.setStringParameterNoEscape("s","NOW");
```

RESTResponseV2 - Scoped, Global

The *RESTResponseV2* API provides methods that allow you to use the data returned by an outbound REST message in JavaScript code.

A RESTResponseV2 object is returned by the *RESTMessageV2* methods *execute()* and *executeAsync()*.

You can use this API in scoped applications or within the global scope.

This API runs in the `sn_ws` namespace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RESTResponseV2 - getAllHeaders()

Returns all headers contained in the response, including any duplicate headers.

Parameters

Name	Type	Description
None		

Returns

Type	Description
List<GlideHTTPHeader>	List of headers contained in the response. Each header is represented as a GlideHTTPHeader object which contains the header *name* and *value*.

The follow code example shows how to call the REST Table API and then lists out all of the headers found in the response.

```
var request = new sn_ws.RESTMessageV2();
request.setEndpoint('http://
<SN_Instance_host>/api/now/table/incident');
request.setHttpMethod('GET');

request.setBasicAuth('username', 'password');
request.setRequestHeader("Accept", "application/json");
var res = request.execute();
if (res.getStatusCode() != 200) {
  gs.info('Bad Request');
}

var headers = res.getAllHeaders();
for(var i in headers){
  gs.info(headers[i].name + ': ' + headers[i].value);
}
```

Response headers

```

Strict-Transport-Security: max-age=63072000; includeSubDomains
```

RESTResponseV2 - getBody()

Gets the content of the REST response body.

Use this function when you want to get the request body as text content. Do not use this method when saving the response as a binary attachment. If a RESTMessageV2 object called the *`saveResponseBodyAsAttachment(...)`* function, using *`getBody()`* on the associated RESTResponseV2 object will cause an error. When saving the response as an attachment, if the outbound REST message fails, call *`getErrorMessage()`* on the response to retrieve the body content.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	REST response body.

```
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
var response = sm.execute();
var responseBody = response.getBody();
```

RESTResponseV2 - getCookies()

Returns all cookies included in the response.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Array of strings representing cookies. Iterate through the array to perform operations on each cookie.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Display individual cookies from the response.

```
var cookies = response.getCookies();
for (var i = 0; i < cookies.length; i++) {
  gs.info('cookie: ' + cookies.get(i));
}
```

Output:

```
cookie: JSESSIONID=4135AA97A5D12DA22EF614AA2B0CAFD8.node20;
 Path=/; Secure; HttpOnly
cookie: SABASESSIONID=370152970.36895.0000; path=/
```

RESTResponseV2 - getErrorCode()

Gets the numeric error code if there was an error during the REST transaction.

This error code is specific to the ServiceNow AI Platform, it is not an HTTP error code. Provide this error code if you require assistance from ServiceNow Customer Support.

Note: To retrieve the contents of the actual error message, use the getBody() method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Numeric error code, such as 1 for socket timeout.

```
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
var response = sm.execute();
var errorCode = response.getErrorCode();
```

RESTResponseV2 - getErrorMessage()

Gets the error message if there was an error during the REST transaction.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Error message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
var response = sm.execute();
var errorMsg = response.getErrorMessage();
```

RESTResponseV2 - getHeader(String name)

Gets the value for a specified header.

Parameters

Name	Type	Description
name	String	Name of the header that you want the value for, such as Set-Cookie.

Returns

Type	Description
String	Value of the specified header.

```
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
var response = sm.execute();
var headerVal = response.getHeader("Content-Type");
```

RESTResponseV2 - getHeaders()

Gets all headers returned in the REST response and the associated values.

Note: If a header is present more than once in the response, such as a Set-Cookie header, this function returns only the last of the duplicate headers. To return all headers including duplicates, use the *`getAllHeaders()`* function.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Object that maps the name of each header to the associated value.

```
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
var response = sm.execute();
var headers = response.getHeaders();
```

RESTResponseV2 - getQueryString()

Gets the fully-resolved query sent to the REST endpoint..

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This query contains the endpoint URL as well as any values assigned to variables in the REST message. Use this method only with responses to direct requests. This method is not supported for requests sent asynchronously, or requests sent using a MID server.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Fully-resolved query.

```
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
var response = sm.execute();
var queryString = response.getQueryString();
```

RESTResponseV2 - getResponseAttachmentSysid()

Gets the sys_id value of the attachment created from the response body content.

If the RESTMessageV2 object associated with this response called the *`saveResponseBodyAsAttachment(...)`* function, use *`getResponseAttachmentSysid()`* to get the sys_id of the created attachment record. Use this function when you want to perform additional operations with the new attachment record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the new attachment record.

RESTResponseV2 - getStatusCode()

Gets the numeric HTTP status code returned by the REST provider.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Numeric status code returned by the REST provider, such as 200 for a successful response.

```
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
var response = sm.execute();
var statusCode = response.getStatusCode();
```

RESTResponseV2 - haveError()

Indicates if there was an error during the REST transaction.

Parameters

Name	Type	Description
None		

Returns

Type	Description
boolean	Returns true if there was an error, false if there was no error.

```
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
var response = sm.execute();
var error = response.haveError();
```

RESTResponseV2 - waitForResponse(Number timeoutSecs)

Set the amount of time the instance waits for a response from the web service provider.

This method overrides the property glide.rest.outbound.ecc_response.timeout for this REST response.

Parameters

Name	Type	Description
timeoutSecs	Number	The amount of time, in seconds, to wait for this response.

Returns

Type	Description
void	

```
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var response = sm.executeAsync();
response.waitForResponse(60);
```

RoundingInterval - Global

The *RoundingInterval* script include provides methods that handle all the details of rounding intervals for CPU speed and RAM size.

Use in any server-side Discovery script.

RoundingInterval - RoundingInterval(String type)

Creates an instance of the RoundingInterval class.

Parameters

Name	Type	Description
type	String	Can be either CPU or RAM.

RoundingInterval - getRoundedValue(Number value)

Returns the value after applying the rounding interval.

Parameters

Name	Type	Description
value	Number	The value to round off

Returns

Type	Description
Number	The value after rounding

RTETransformer - Scoped

The *RTETransformer* API provides a method to transform and store an array of messages into a record in the associated ServiceNow instance based on a provided extract, transform, and load (ETL) definition.

For example, you can use this API when you have JSON payload(s) that contain user information and you want to transform that information into the sys_user table using the Robust Transform Engine (RTE).

Use the `sn_impex` namespace when accessing this API.

For additional information, see Define Robust Transform Engine operations.

RTETransformer - rteTransform(String transformDefinitionId, Boolean verboseLogging, String source, Number batchSize)

Instantiates an RTETransformer object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
transformDefinitionId	String	Sys_id of the extract, transform, and load (ETL) definition to use for the transform. Located in the ETL Definitions [sys_rte_eb_etl_definition] table. For information on creating an ETL, see Create Extract Transform Load (ETL) definitions.
verboseLogging	Boolean	Flag that indicates whether to enable verbose logging and the creation of import set rows for debugging. Valid values: • true: Enable logging and import set row creation. • false: Do not enable logging and import set row creation.
source	String	Name field of the import set record.
batchSize	Number	Number of messages to process at one time (batch). For example, if there are 10 messages in a payload, and this value is set to 2, the method runs five separate batch jobs to process all messages in the payload.

The following code example shows how to instantiate an RTETransformer object for the source testSourceRecord that has a batch size of 10.

```
(function(/*CTIOperationRequest*/
 request, /*CTIOperationResponse*/ response, /*Context*/ ctx) {
  // Uses an ETL definition with a target table of incident, and
 mappings for the number and short description field
  var transformer = new
 sn_impex.RTETransformer("c58f1c6377110110f5455d14cd5a998b",
 true, "testSourceRecord", 10);
  var messages =
 ["{\"number\":\"testnumber\",\"short_description\":
\"testdesc\"}"];
  var results = transformer.transform(messages);

  for (var i = 0; i < results.length; i++) {
    var dataList = results[i].data.incident;
    gs.log("source record id: " + results[i].sourceRecordSysId);
    gs.log("status: " + results[i].status);
    for (var j = 0; j < dataList.length; j++) {
      gs.log("number:" + dataList[j].number);
      gs.log("short desc:" + dataList[j].short_description);
    }
  }
})(request, response, ctx);
```

RTETransformer - transform(Array message)

Transforms and stores an array of messages into a record in the associated ServiceNow instance based on a provided extract, transform, and load (ETL) definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, if you want to transform user information into a sys_user record, you can create a message array with a single message and pass it into this transform method.

Parameters

Name	Type	Description
message	Array of Objects	Stringified JSON objects representing the records to transform based on the ETL definition. For example, if you want to transform a single user with the data active, email, first name, and last name to the sys_user table, the message would look similar to this: `[ { "active":"true", "email":"example@servicenow.com", "first_name":"Jane", "last_name":"Doe" } ]` **Note:** The field names must match the field/path of the source entity fields.

Returns

Name	Description
data	Data for the transformed records, organized by table name. The returned record data matches the mapped fields specified in the ETL definition. Data type: Object `"data": { "tableName": [] }`

data.tableName	Details of the table containing the records.
	
	Data type: Array of Objects
	
	`"tableName": [{ "sys_id": String, // Other data for a single transformed record }] }`
	
	For example:
	
	`"sys_user": [{ "sys_id":"b29e629877130110f5455d14cd5a99ad", "active": "true",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Name	Description

	<pre> "email": "example@servicenow.com",
	  "first_name": "Jane",
	  "last_name": "Doe"
	}]</pre>

data.tableName.sys_id	Sys_id of the record within the table. Data type: String
data.tableName.<other_ETL_info>	Additional fields that were specified in the passed ETL. Data type: Any
message	If an error occurs while transforming the specified record, a message that describes the error. Null if the transform is successful. Data type: String
sourceRecordSysId	Sys_id of the import set table record. The import set table name is JSON Event Sink [imp_json_event_sink]. Data type: String
status	Status of the transform, such as processed or error. Data type: String

The following code example shows how to transform and store a record in the User [sys_user] table.

```
(function(/*CTIOperationRequest*/
 request, /*CTIOperationResponse*/ response, /*Context*/ ctx) {
  // Uses an ETL definition with a target table of sys_user, and
 mappings for the active,
  //email, first name, and last name fields
  var transformer = new
 sn_impex.RTETransformer("c58f1c637711011Of5455d14cd5a998b",
 true, "testSourceRecord", 10);
  var messages = [JSON.stringify({
    "active":"true",
    "email":"example@servicenow.com",
    "first_name":"Jane",
    "last_name":"Doe"
  }),
  JSON.stringify({
    "active":"true",
    "email":"example2@servicenow.com",
    "first_name":"John",
    "last_name":"Deer"
  })];
  var results = transformer.transform(messages);

  for (var i = 0; i < results.length; i++) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    var dataList = results[i].data.sys_user;
    gs.log("source record id: " + results[i].sourceRecordSysId);
 gs.log("status: " + results[i].status);
    for (var j = 0; j < dataList.length; j++) {
      gs.log("First Name: " + dataList[j].first_name);
      gs.log("Last Name: " + dataList[j].last_name);
      gs.log("Email: " + dataList[j].email;
      gs.log("Active: " + dataList[j].active;
    }
  }
}
```

Results:

```
source record id: b29e629877130110f5455d14cd5a99ad
status: PROCESSED
First Name: Jane
Last Name: Doe
Email: example@servicenow.com
Active: true
First Name: John
Last Name: Deer
Email: example2@servicenow.com
Active: true
```

sb - Scoped, Global

The *sb* script include provides methods that enable you to perform operations on Service Exchange configuration records.

There are two types of Service Exchange configuration records that you can perform operations on using this script include:

- Remote Record Producers (RRP)
- Remote Task Definition (RTD)

You can perform any of the following Service Exchange operations on these configuration records:

- Checkout: Creates a draft version of a specified configuration record. Any published version is still available for customer use.
- Publish: Publishes the draft version of a specified configuration record and makes it available for customer use.
- Archive: Archives an inactive version of a specified configuration record and makes it unavailable to customers.
- Retire: Retires all versions of a specified configuration record and makes them unavailable to customers.
- Update virtual field: Populates virtual fields in a task table on a target instance when using Service Exchange remote tasks.

For additional information on Service Exchange configuration records, see Create configuration revisions.

To access this API, the Service Exchange for Providers application (sn_sb_pro) and the Service Exchange Base (sn_sb) plugins must be installed on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You call the methods in this API using the *sb* script include. The code for these methods, however, resides in the *PSBPublicAPIUtil* script include.

When calling these methods from global scope, use the following syntax:

```
sb.checkout(glideRecord);
sb.publish(glideRecord);
sb.archive(glideRecord);
sb.retire(glideRecord);
```

When calling them from a scoped application, use this syntax:

```
global.sb.checkout(glideRecord);
global.sb.publish(glideRecord);
global.sb.archive(glideRecord);
global.sb.retire(glideRecord);
```

sb - archive(glideRecord)

Validates that the specified GlideRecord is a valid Service Exchange configuration record and verifies that the record is in the "inactive" state. If this validation passes, archives the specified configuration record, leaving all other versions of the same configuration record untouched.

For additional information on configuration revisions and their associated states, see Create configuration revisions.

Parameters

Name	Type	Description
glideRecord	GlideRecord	Configuration record to archive. This record can be one of the following: • Remote Record Producers (RRP): Records located in the Remote record producer [sn_sb_pro_remote_record_producer] table. • Remote Task Definition (RTD): Records located in the Remote task definition [sn_sb_pro_remote_task_def] table.

Returns

Type	Description
Boolean	Flag that indicates whether the configuration record was archived. Possible values: • true: Configuration record was archived. • false: Error occurred; configuration record wasn't archived.

The following code example shows how to call this method from global scope on an FDS configuration record.

```
var grConfig = new
 GlideRecord('sn_sb_pro_remote_record_producer'); //
 Configuration table that contains the desired record
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
grConfig.get('0ed11101ff6aca10c1befe258c4fd99e'); // Sys_id of
 the configuration record to publish
var isExecuted = sb.archive(grConfig);
```

sb - checkout(glideRecord)

Validates that the specified GlideRecord is a valid Service Exchange configuration record and verifies that the record is in the "published" state. If this validation passes, creates a new version of the specified configuration record and sets the state field to "draft".

Parameters

Name	Type	Description
glideRecord	GlideRecord	Configuration record to checkout. This record can be one of the following: • Remote Record Producers (RRP): Records located in the Remote record producer [sn_sb_pro_remote_record_producer] table. • Remote Task Definition (RTD): Records located in the Remote task definition [sn_sb_pro_remote_task_def] table.

Returns

Type	Description
GlideRecord	If successful, returns the newly created configuration record with the state field set to "draft". If an error occurred, returns null.

The following code example shows how to call this method from the global scope on an RTD configuration record.

```
var grConfig = new GlideRecord('sn_sb_pro_remote_task_def'); //
 Configuration table that contains the desired record
grConfig.get('0ed11101ff6aca10c1befe258c4fd99e'); // Sys_id of
 the configuration record to checkout
var checkoutGr = sb.checkout(grConfig);
```

sb - publish(glideRecord)

Validates that the specified GlideRecord is a valid Service Exchange configuration record and verifies that the record is in the "draft" state. If this validation passes, publishes the draft version of the configuration record.

Parameters

Name	Type	Description
glideRecord	GlideRecord	Configuration record to publish. This record can be one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• Remote Record Producers (RRP): Records located in the Remote record producer [sn_sb_pro_remote_record_producer] table. • Remote Task Definition (RTD): Records located in the Remote task definition [sn_sb_pro_remote_task_def] table.

Returns

Type	Description
Boolean	Flag that indicates whether the configuration record was published. Possible values: • true: Configuration record was published. • false: Error occurred; configuration record wasn't published.

The following code example shows how to call this method from global scope on an RRP configuration record.

```
var grConfig = new
 GlideRecord('sn_sb_pro_remote_record_producer''); //
 Configuration table that contains the desired record
grConfig.get('0ed11101ff6aca10c1befe258c4fd99e'); // Sys_id of
 the configuration record to publish
var isExecuted = sb.publish(grConfig);
```

sb - retire(glideRecord)

Validates that the specified GlideRecord is a valid Service Exchange configuration record and verifies that the record is in a valid state. If this validation passes, retires the specified version of the configuration record along with all other revisions of that same configuration record.

For additional information on configuration revisions and their associated states, see Create configuration revisions.

Parameters

Name	Type	Description
glideRecord	GlideRecord	Configuration record to retire. This record can be one of the following: • Remote Record Producers (RRP): Records located in the Remote record producer [sn_sb_pro_remote_record_producer] table. • Remote Task Definition (RTD): Records located in the Remote task definition [sn_sb_pro_remote_task_def] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the configuration record was retired. Possible values: • true: Configuration record was retired. • false: Error occurred; configuration record wasn't retired.

The following code example shows how to call this method from global scope on an RTD configuration record.

```
var grConfig = new GlideRecord('sn_sb_pro_remote_task_def'); //
 Configuration table that contains the desired record
grConfig.get('0ed11101ff6aca10c1befe258c4fd99e'); // Sys_id of
 the configuration record to checkout
var isExecuted = sb.retire(grConfig);
```

sb - updateVirtualField(GlideRecord remoteTaskGr, String virtualField, String virtualValue, String virtualDisplayValue)

Populates virtual fields in a task table on a target instance when using Service Exchange remote tasks.

A virtual field is a field that exists in a target task table but doesn't exist in the source task table. You use this method to pass the values for a virtual field from the source instance to the target instance. This method stores the specified values for the virtual field as JSON in the form section of the specified remote task. This remote task is then synced to the target instance where the values are stored in the mapped field in the target task table.

Virtual fields are defined in remote task definitions. Remote task definitions contain inbound and outbound mapping tables that map fields between task tables in source and target instances. When a source table doesn't contain a field that exists on a target table, the field is configured in the remote task definition as a virtual field. The consumer can then use either Service Exchange transforms or this method to update the values of these virtual fields in the associated target task record.

The following section describes an example use case on how to implement virtual fields and then use the *`updateVirtualField()`* method to populate values in the virtual field. In this example, the two task tables that are bound together by a remote task definition are the provider Case table and the consumer Incident table. When an incident record is created or updated on the consumer instance, it's configured to sync with the provider Case table. The Affected Instances field in the Case table is a required field but doesn't exist in the Incident table. To handle this situation, the Affected Instances field must be defined as a virtual field in the inbound mapping of the associated remote task definition.

1. The provider creates a remote task definition for the provider Case table and the consumer Incident table.
2. On the **Inbound fields** tab in the **Related links** of the remote task definition, the provider maps the fields between the Incident table and the Case table.

   When defining the Affected Instances field, the provider selects the **Virtual** check box and then selects **Affected Instances** from the **Target field** on the **Target mapping** tab.

   Note: When defining a virtual field, no source field is defined as it doesn't exist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The provider then publishes the remote task definition, which is synced to the consumer instance.
4. The consumer creates a remote task for the Incident table. A JSON payload that holds all values for the mapped fields, including the information on virtual fields, is included on a form section in the remote task.
5. The consumer instance calls the *`updateVirtualField()`* method, such as in a business rule that runs when records in the Incident table are updated, to set the values of the Affected Instances field in the remote task.

   Note: Even though you can populate data in the target table at any time, required fields configured as virtual fields must be populated in the remote task before the remote task is sent to the producer instance.

6. The remote task is synced to the provider instance and creates a Case record on the provider instance.

For information on how to create a remote task definition, see Create remote task definitions in Service Exchange for Providers.

For information on how to create a Service Exchange transform, see Transform data with the Service Exchange transform framework.

Warning: You should only call this method in a before business rule as it updates the remote task that it is called on. If you call this method in an after business rule, you must include strict conditions that prevent the update of the virtual field on the remote task from triggering the business rule as this can cause an infinite loop.

Parameters

Name	Type	Description
remoteTaskGr	GlideRecord	GlideRecord object of the remote task for which to set the specified virtual field values.
virtualField	String	**Field name** of the virtual field for which to update the associate information. Defined on the **Outbound fields** related tab of the associated remote task definition.
virtualValue	String	Value to set for this field on the target instance.
virtualDisplayValue	String	Display value to set for this field on the target instance

Returns

Type	Description
None	

The following example shows how to call this method.

```
var remoteTaskGr = new GlideRecord("");
/** Remote Task table name,
** Table name vary based on which instance the script is being
 executed.
**/

remoteTaskGr.get(""); // Remote Task record sys_id
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

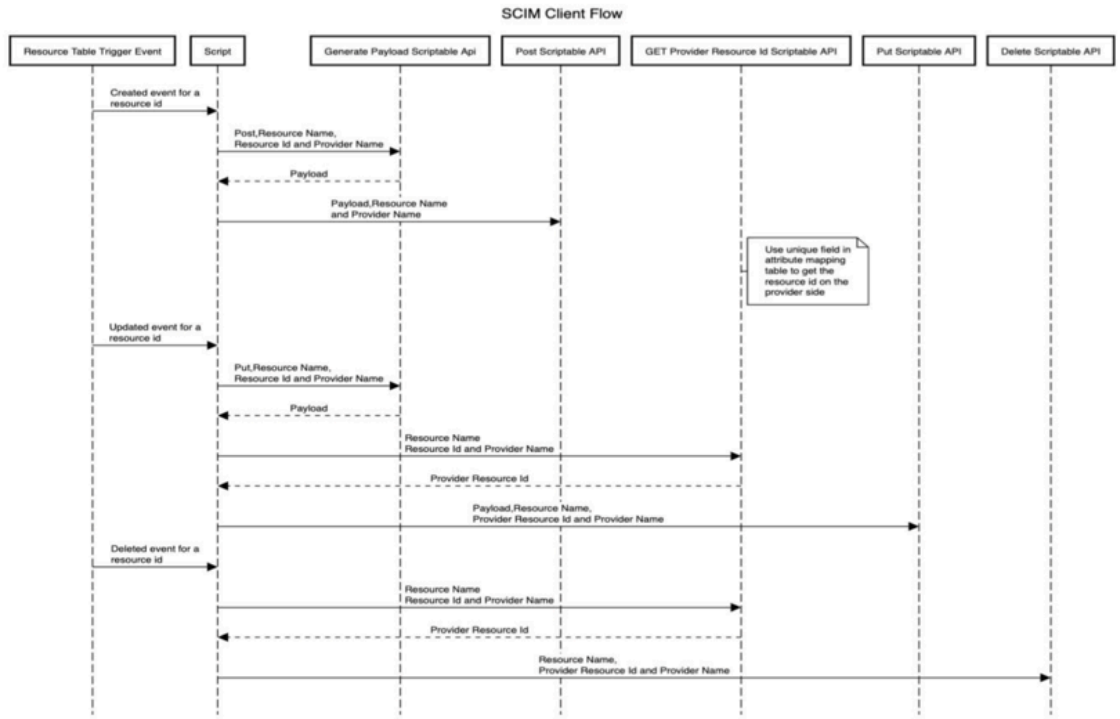
```
global.sb.updateVirtualField(remoteTaskGr,"<virtual outbound
 field name>", "<value to set on target field>", "<display value
 to set on target field>");
```

SCIM2Client - Scoped

The *SCIM2Client* API provides methods that call the System for Cross-domain Identity Management (SCIM) Provider (server role) to create, update, or delete data in a service provider (SP).

SCIM is a REST and JSON-based protocol that defines a client and server role. A client is usually an identity provider (IDP), such Okta, that contains a robust directory of user identities. An SP is typically a SaaS application, such as Box or Slack, that needs a subset of information from those identities. When changes to identities are made in the IDP, including create, update, and delete, they are automatically synchronized to the SP according to the SCIM protocol.

The following image illustrates typical API call flows for manipulating service provider data.



This API runs in the `sn_auth` namespace and requires the SCIM v2 - ServiceNow Cross-domain Identity Management Client (com.snc.integration.scim2.client) plugin to be installed to access the API.

You can locate the results of each SCIM method call in the SCIM Client Logs [sys_scim_client_logs] table.

For additional information on SCIM, see System for Cross-domain Identity Management (SCIM).

SCIM2Client - executeDelete (String provider, String resourceName, String providerResourceId)

Deletes a specified resource from an external service provider system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
provider	String	Required. Name of the configured SCIM service provider. The service provider name is defined in the name field of the SCIM Provider [sys_scim_provider] table.
resourceName	String	Required. Name of the resource type, such as User or Group. This value is located in the resource_name field in the SCIM Provider Resource Mapping [sys_scim_provider_resource_mapping] table.
providerResourceId	String	Required. Unique identifier of the associated resource on the external service provider system.

Returns

Type	Description
message	If the *status* is SUCCESS, the endpoint returns the response body as defined by the REST *SCIM* API. Data type: String
status	Status of the request. Possible values: • FAILURE • SUCCESS Data type: String

The following example shows how to delete a user resource in the SNOW Provider system.

```
var scimClient = new sn_auth.SCIM2Client();
var response = scimClient.executeDelete('SNOW
 Provider','User','f282abf03710200044e0bfc8bcbe5d12');
gs.info('response: ' + response);
```

Output:

```
// Example of a successful response
{
  "status":"SUCCESS",
  "message":null
}

// Example of a failed response
{
  "status":"FAILURE",
  "message":"{
    \"schemas\":[
      \"urn:ietf:params:scim:api:messages:2.0:Error\"
    ],
    \"status\":\"404\",
    \"detail\":\"Invalid user id
 3985e598876989103fa711f83cbb35ae1\"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }"
}
```

SCIM2Client - executeGet (String provider, String resourceName, String queryParams)

Returns all resources from a specified external provider system that match the passed criteria.

This information is used to call the corresponding SCIM service provider API.

Parameters

Name	Type	Description
provider	String	Required. Name of the configured SCIM service provider. The service provider name is defined in the name field of the SCIM Provider [sys_scim_provider] table.
resourceName	String	Required. Name of the resource type, such as User or Group. This value is located in the resource_name field in the SCIM Provider Resource Mapping [sys_scim_provider_resource_mapping] table.
queryParams	String	Required. SCIM compliant query parameters passed to the external SCIM service provider endpoint. For additional information on the available query parameters and their associated format, refer to the following sections in the Internet Engineering Task Force document: System for Cross-domain Identity Management: Protocol • https://datatracker.ietf.org/doc/html/rfc7644#section-3.4.2.2 • https://datatracker.ietf.org/doc/html/rfc7644#section-3.4.2.4 • https://datatracker.ietf.org/doc/html/rfc7644#section-3.4.2.3 • https://datatracker.ietf.org/doc/html/rfc7644#section-3.4.2.5

Returns

Type	Description
message	If the *status* is SUCCESS, the endpoint returns the response body as defined by the REST *SCIM* API. Data type: String
status	Status of the request. Possible values: • FAILURE • SUCCESS Data type: String

The following example shows how to retrieve all of the available users from the snow test service provider whose work email contains lucius.bagnoli.

```
var scimClient = new sn_auth.SCIM2Client();
var queryParams = {};
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
queryParams['filter'] = 'emails[type eq \"work\" and value co
 \"lucius.bagnoli\"]';
var response = scimClient.executeGet('SCIM Provider
 Demo','User', queryParams);
gs.info('response for get with filter: ' + response);
```

Response:

```
//Example of a successful response
{
  "status":"SUCCESS",

```

SCIM2Client - executeGetById (String provider, String resourceName, String providerResourceId, Map<String, String> queryParams)

Returns a resource from the external provider system with the specified unique resource ID.

This information is used to call the corresponding SCIM service provider API.

Parameters

Name	Type	Description
provider	String	Required. Name of the configured SCIM service provider. The service provider name is defined in the name field of the SCIM Provider [sys_scim_provider] table.
providerResourceId	String	Required. Unique identifier of the associated resource on the external service provider system.
queryParams	String	Required. SCIM compliant query parameters passed to the external SCIM service provider endpoint. For additional information on the available query parameters and their associated format, refer to the following sections in the Internet Engineering Task Force document: System for Cross-domain Identity Management: Protocol • https://datatracker.ietf.org/doc/html/rfc7644#section-3.4.2.2 • https://datatracker.ietf.org/doc/html/rfc7644#section-3.4.2.4 • https://datatracker.ietf.org/doc/html/rfc7644#section-3.4.2.3 • https://datatracker.ietf.org/doc/html/rfc7644#section-3.4.2.5

Returns

Type	Description
message	If the *status* is SUCCESS, the endpoint returns the response body as defined by the REST *SCIM* API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
status	Status of the request. Possible values: • FAILURE • SUCCESS Data type: String

This example shows how to obtain the specified resource from the external provider system "snow test".

```
var scimClient = new sn_auth.SCIM2Client();
var queryParams = {};
var response = scimClient.executeGetById('snow test','User',
 'f282abf03710200044e0bfc8bcbe5d12', queryParams);
gs.info('response for simple getById: ' + response);
```

Output:

```
// Example of a successful response
{
  "status":"SUCCESS",
  "message":"{
    \"schemas\":[

 \"urn:ietf:params:scim:schemas:extension:servicenow:2.0:User\",
      \"urn:ietf:params:scim:schemas:core:2.0:User\"

```

SCIM2Client - provision (String provider, String resourceName, String resourceId)

Creates or updates a resource in an external service provider system for a specified sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, if you create or update a user in a ServiceNow instance, you can use this method to create or update the same resource on an external service provider system. Only those fields which are mapped in the SCIM Provider Resource Mapping [sys_scim_provider_resource_mapping] table can be created or updated in the corresponding resource.

For additional information on provider resource mapping, see Create a SCIM Provider Resource Mapping.

Parameters

Name	Type	Description
provider	String	Required. Name of the configured SCIM service provider. The service provider name is defined in the name field of the SCIM Provider [sys_scim_provider] table.
resourceName	String	Required. Name of the resource type, such as User or Group. This value is located in the resource_name field in the SCIM Provider Resource Mapping [sys_scim_provider_resource_mapping] table.
resourceId	String	Required. Sys_id of the resource saved in the ServiceNow instance (the client). This value is located in the primary_table field in the SCIM Provider Resource Mapping [sys_scim_provider_resource_mapping] table.

Returns

Type	Description
message	If the *status* is SUCCESS, the endpoint returns the response body as defined by the REST *SCIM* API. Data type: String
status	Status of the request. Possible values: • FAILURE • SUCCESS Data type: String

The following example shows how to provision a user on the Snow Provider.

```
var scimClient = new sn_auth.SCIM2Client();
var response = scimClient.provision('SNOW
 Provider','User','f282abf03710200044e0bfc8bcbe5d12');
gs.info('response: ' + response);
```

Output:

```
// Example of successful response
{
  "status":"SUCCESS",
  "message":"{
    \"schemas\":[
```

 Provider and resource name: User"
}
```

SCIM2Client - provisionNew (String provider, String resourceName, String resourceId)

Creates a new resource in an external service provider system for a specified sys_id.

For example, if you create a new user in a ServiceNow instance, you can use this method to create the same resource on an external service provider system. Only those fields which are mapped in the SCIM Provider Resource Mapping [sys_scim_provider_resource_mapping] table can be created in the corresponding external service provider system. If the resource is already present in the external service provider system, an error response is returned.

For additional information on provider resource mapping, see Create a SCIM Provider Resource Mapping.

Parameters

Name	Type	Description
provider	String	Required. Name of the configured SCIM service provider. The service provider name is defined in the name field of the SCIM Provider [sys_scim_provider] table.
resourceName	String	Required. Name of the resource type, such as User or Group. This value is located in the resource_name field in the SCIM Provider Resource Mapping [sys_scim_provider_resource_mapping] table.
resourceId	String	Required. Sys_id of the resource saved in the ServiceNow instance (the client). This value is located in the primary_table field in the SCIM Provider Resource Mapping [sys_scim_provider_resource_mapping] table.

Returns

Type	Description
message	If the *status* is SUCCESS, the endpoint returns the response body as defined by the REST *SCIM* API. Data type: String
status	Status of the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Possible values: • FAILURE • SUCCESS Data type: String

The following example shows how to create a new user in the external service provider SNOW Provider.

```
var scimClient = new sn_auth.SCIM2Client();
var response = scimClient.provisionNew('SNOW
 Provider','User','f282abf03710200044e0bfc8bcbe5d12');
gs.info('response: ' + response);
```

Output:

```
// Example of successful response
{
  "status":"SUCCESS",
  "message":"{
    \"schemas\":[

 \"urn:ietf:params:scim:schemas:extension:servicenow:2.0:User\",

  No provider resource mapping id found for provider name: SNOW
 Provider and resource name: User"
}
```

SCIM2ClientUtil - Scoped

The *SCIM2ClientUtil* API provides utility methods to obtain the unique identifiers of external provider systems and then use that information when calling the *SCIM2Client* API.

This API runs in the `sn_auth` namespace and requires the SCIM v2 - ServiceNow Cross-domain Identity Management Client (com.snc.integration.scim2.client) plugin to be installed to access the API.

For additional information on SCIM, see System for Cross-domain Identity Management (SCIM).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SCIM2ClientUtil - getProviderIdByFilter(String provider, String resourceName, String filter)

Returns the unique identifier of a specified resource from a specified external provider system for a unique resource ID in a ServiceNow instance using a filter expression to describe the desired resource.

This API is useful when mapping ServiceNow fields to SCIM fields where the resource identifier in the external provider system is needed. Before calling this method, a unique field must be defined for the resource in the system attribute map, located in the SCIM Provider Resource Mapping [sys_scim_provider_resource_mapping] table.

For additional information on provider resource mapping, see Create a SCIM Provider Resource Mapping.

Parameters

Name	Type	Description
provider	String	Name of the configured SCIM service provider. Table: In the name field of the SCIM Provider [sys_scim_provider] table.
resourceName	String	Name of the resource type, such as User or Group. Table: In the resource_name field of the SCIM Provider Resource Mapping [sys_scim_provider_resource_mapping] table.
filter	String	Filter expression to apply to the return results. For additional information on the available filter parameters and their associated format, refer to the following section in the Internet Engineering Task Force document: System for Cross-domain Identity Management: Protocol https://datatracker.ietf.org/doc/html/rfc7644#section-3.4.2.2

Returns

Type	Description
String	Unique resource identifier used by the external service provider. Throws an exception if there is any problem while fetching the information.

The following example shows how to obtain the resource identifier of the user using the filter `'username eq "abel.tuter"'`.

```
var response =
 sn_auth.SCIM2ClientUtil.getProviderIdByFilter('SNOW
 Provider','User','username eq "abel.tuter"');
gs.info('response: ' + response);
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
"005d500b536073005e0addeeff7b12f4
```

The following example shows how to use a script to obtain the resource identifier of the manager using the filter `'userName eq "' + manager + '"'`.

```
(function getValue(resourceGR) {
  try {
    var manager = resourceGR.manager.user_name;
    return sn_auth.SCIM2ClientUtil.getProviderIdByFilter('SCIM
 Provider Demo', 'User', 'userName eq "' + manager + '"');
  } catch (e) {
    gs.error('Unable to get attribute value using script' + e);
    // Handle failure scenario here
  }
})(resourceGR);
```

Output:

```
"125d500b535973005e0addeeff8c12a2"
```

SCIM2ClientUtil - getProviderIdByResourceId(String provider, String resourceName, String resourceId)

Returns the unique identifier of a specified resource from a specified external provider system for a unique resource ID in a ServiceNow instance.

This API is useful when mapping ServiceNow fields to SCIM fields where the resource identifier in the external provider system is needed. Before calling this method, a unique field must be defined for the resource in the system attribute map, located in the SCIM Provider Resource Mapping [sys_scim_provider_resource_mapping] table.

For additional information on provider resource mapping, see Create a SCIM Provider Resource Mapping.

Parameters

Name	Type	Description
provider	String	Name of the configured SCIM service provider. Table: In the name field of the SCIM Provider [sys_scim_provider] table.
resourceName	String	Name of the resource type, such as User or Group. Table: In the resource_name field of the SCIM Provider Resource Mapping [sys_scim_provider_resource_mapping] table.
resourceId	String	Sys_id of the resource saved in the ServiceNow instance (the client). Table: In the primary_table field of the SCIM Provider Resource Mapping [sys_scim_provider_resource_mapping] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Unique resource identifier used by the external service provider. Throws an exception if there is any problem while fetching the information.

The following example shows how to obtain the resource identifier of the user with the sys_id f282abf03710200044e0bfc8bcbe5d12.

```
var response =
 sn_auth.SCIM2ClientUtil.getProviderIdByResourceId('SNOW
 Provider','User','f282abf03710200044e0bfc8bcbe5d12');
gs.info('response: ' + response);
```

Output:

```
  "005d500b536073005e0addeeff7b12f4"
```

ScopedCacheManager - Scoped

The *ScopedCacheManager* API provides methods for retrieving, setting, and flushing cache data for scoped applications.

This API requires the Scoped Cache (com.glide.scopedcache) plugin and runs in the `sn_scoped_cache` namespace. The plugin is installed and activated by default.

These methods require one or more scoped caches and scoped cache pairs to be defined. For more information on creating scoped caches, see the ScopedCacheManager API Developer Guide.

Using this API with scoped caches provides several advantages, including:

- Caching strings in scoped applications that live in memory across transactions.
- Caching scoped application data in memory and flushing this data based on changes in the underlying table.
- Defining and use cache data outside the transaction life cycle.
- Caching the output of expensive operations or calculations for quick access in the future.

ScopedCacheManager – flushScopedCache(String catalog, String key)

Flushes an entire cache or a single entry from a cache.

Parameters

Name	Type	Description
catalog	String	Name of the cache defined in the Scoped Caches [sys_scoped_cache] table.
key	String	Optional. Cache key. Set this parameter to flush a single entry from a cache.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to flush the "abc" key from a cache named myCache. To flush the entire cache, leave out the key parameter.

```
sn_scoped_cache.ScopedCacheManager.flushScopedCache("myCache",
 "abc");
```

ScopedCacheManager – get(String catalog, String key)

Gets a value from a cache.

Parameters

Name	Type	Description
catalog	String	Name of the cache defined in the Scoped Caches [sys_scoped_cache] table.
key	String	Cache key.

Returns

Type	Description
String	Cache entry.

The following example shows how to count the number of incident records having short descriptions with a number of characters greater than the key (50). In this case, there are 6 incident records with short descriptions longer than 50 characters. This value is stored in the cache as a reusable string, so you don't have to make a calculation each time you want to retrieve the value.

```
var cache2 = "Cache 2"; // column pair type

// Re-populate the column cache
for (var i = 0; i < 100; i+=10) {
    var inc = new GlideRecord('incident');
    inc.query();
    var counter = 0;
    while (inc.next()) {
        if (inc.getValue('short_description').length > i)
        counter++;
    }
    sn_scoped_cache.ScopedCacheManager.put(cache2, i.toString(),
 counter.toString());
}

// script to get values from column cache
gs.info(sn_scoped_cache.ScopedCacheManager.get(cache2, "50"));
```

Output:

```
scoped_app: 6
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ScopedCacheManager – getCacheEntryDetails(String catalog, String key)

Gets cache entry details including byte size, object type, and entry value.

Parameters

Name	Type	Description
catalog	String	Name of the cache defined in the Scoped Caches [sys_scoped_cache] table. The catalog name must be prefixed with the scope name and a caret character. For example, "test_cache" in the global scope is prefixed as `"global^test_cache"`.
key	String	Cache key.

Returns

Type	Description
String	String in the format `<ObjectType> (<EntrySize>): <Value.toString()>`.

The following example shows how to display cache entry details for a scoped cache named `test_cache`.

```
sn_scoped_cache.ScopedCacheManager.put("test_cache", "key1",
 "val1");
gs.info(sn_scoped_cache.ScopedCacheManager.getCacheEntryDetails(
"global^test_cache", "key1"));
```

Output:

```
java.lang.String (48):
val1
```

ScopedCacheManager – prefixFlush(String catalog, String prefix)

Flushes all cache entries that have keys beginning with a specified prefix.

Parameters

Name	Type	Description
catalog	String	Name of the cache defined in the Scoped Caches [sys_scoped_cache] table.
prefix	String	Prefix by which to search for keys when flushing the cache.

Returns

Type	Description
None	

The following example shows how to flush cache values for keys with the prefix `a`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
sn_scoped_cache.ScopedCacheManager.put("test_cache", "aKey1",
 "val1");
sn_scoped_cache.ScopedCacheManager.put("test_cache", "aKey2",
 "val2");
sn_scoped_cache.ScopedCacheManager.put("test_cache", "bKey1",
 "val3");

sn_scoped_cache.ScopedCacheManager.prefixFlush("test_cache",
 "a");

gs.info(sn_scoped_cache.ScopedCacheManager.get("test_cache",
 "aKey1"));
gs.info(sn_scoped_cache.ScopedCacheManager.get("test_cache",
 "aKey2"));
gs.info(sn_scoped_cache.ScopedCacheManager.get("test_cache",
 "bKey1"));
```

Output:

```
*** Script: null
*** Script: null
*** Script: val3
```

ScopedCacheManager – put(String catalog, String key, String value)

Puts a value in a scoped cache for caches that are **Table** or **Table Column** pair types.

Parameters

Name	Type	Description
catalog	String	Name of the cache defined in the Scoped Caches [sys_scoped_cache] table.
key	String	Cache key.
value	String	Cache entry.

Returns

Type	Description
None	

The following example shows how to define and retrieve a key called "abc" to a cache named myCache. The cache is table-paired with the Incident [incident] table. The example also shows how the cache is flushed after updating the description field of an incident record.

```
//put value in cache for key "abc"
gs.info("put key 'abc' into cache with value 'value1'");
sn_scoped_cache.ScopedCacheManager.put("myCache", "abc",
 "value1");

// retrieve value from cache for key "abc"
gs.info("value of 'abc' in cache: ");
gs.info(sn_scoped_cache.ScopedCacheManager.get("myCache",
 "abc")+"\n");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//update an incident record (add string to the description
 field)
gs.info("Updating incident record.");
var gr = new GlideRecord("incident");
gr.get("<incident_sys_id>");
gr.description= "test12345";
if (gr.update()) {
    gs.info("Record updated successfully.\n");
};

//retrieve the value from cache for key "abc"
gs.info("Retrieving 'abc' from cache. Value should be null
 because a table pair was updated.");
gs.info(sn_scoped_cache.ScopedCacheManager.get("myCache",
 "abc"));
```

Output:

```
scoped_app: put key 'abc' into cache with value 'value1'
scoped_app: value of 'abc' in cache:
scoped_app: value1

scoped_app: Updating incident record.
scoped_app: Record updated successfully.

scoped_app: Retrieving 'abc' from cache. Value should be null
 because a table pair was updated.
scoped_app: null
```

ScopedCacheManager – putMultiRow(String catalog, String key, String value, Array ids)

Puts an entry into the cache and sets all records with the specified sys_ids as a flush source for that entry. This method is intended for caches that are **Table** or **Table Column** pair types.

Parameters

Name	Type	Description
catalog	String	The catalog to be flushed. Name of the cache defined in the Scoped Caches [sys_scoped_cache] table.
key	String	Cache key for the new entry.
value	String	Value for new entry.
ids	Array	List of sys_ids of the records to be used as flush sources for the entry. These records can be from different tables.

Returns

Type	Description
None	

The following example shows how to use an incident and user record as flush points. The test_cache key INC0000060 is flushed when either of the specified records is updated.

```
// This example requires a table-row pair for the "incident" and
 "sys_user" tables assigned to a cache named test_cache
```

```
var inc1ID = "1c741bd70b2322007518478d83673af3";
var userID = "681ccaf9c0a8016400b98a06818d57c7";

// update to email should invalidate the entry
gs.info("initial put");
putCacheEntry();
gs.info("cache value for INC0060: " +
 sn_scoped_cache.ScopedCacheManager.get("test_cache",
 "INC0000060"));
var gr = new GlideRecord("sys_user");
gr.get(userID);
gr.setValue("email", "a" + gr.getValue("email"));
gr.update();
gs.info("updated user email");
gs.info("cache value: " +
 sn_scoped_cache.ScopedCacheManager.get("test_cache",
 "INC0000060"));

// update to incident number should invalidate the entry.
gs.info("second put");
putCacheEntry();
gs.info("cache value: " +
 sn_scoped_cache.ScopedCacheManager.get("test_cache",
 "INC0000060"));
var gr = new GlideRecord("incident");
gr.get(inc1ID);
gr.setValue("number", gr.getValue("number") + "1");
gr.update();
gs.info("updated incident number");
gs.info("cache value: " +
 sn_scoped_cache.ScopedCacheManager.get("test_cache",
 "INC0000060"));

function putCacheEntry() {
    var incGr = new GlideRecord("incident");
    incGr.get(inc1ID);
    var userGr = new GlideRecord("sys_user");
    userGr.get(userID);
    // the cache stores that the incident is assigned to a
 specific user. So if the incident or user record changes, we
 should flush.

 sn_scoped_cache.ScopedCacheManager.putMultiRow("test_cache",inc
Gr.getValue("number"), userGr.getValue("email"), [inc1ID,
 userID]);
}
```

Output:

```
*** Script: initial put
*** Script: cache value for INC0060: employee@example.com
*** Script: Updating Joe Employee's primary email device based
 on change to user record email address
*** Script: updated user email
*** Script: cache value: null
*** Script: second put
*** Script: cache value: aemployee@example.com
```

```
*** Script: updated incident number
*** Script: cache value: null
```

ScopedCacheManager – putRow(String catalog, String key, String value, String sysId)

Puts a value in a single row (table) of a cache. Use this method for caches that are **Table Row** or **Table Row and Column** pair types.

Parameters

Name	Type	Description
catalog	String	Name of the cache defined in the Scoped Caches [sys_scoped_cache] table.
key	String	Cache key.
value	String	Cache entry.
sysId	String	Optional. Sys_id of a row in a table, that is, the record being tracked.

Returns

Type	Description
None	

The following example uses a table row pair cache type named incident_cache. The cache adds the incident caller ID, and the cache entries associated with the changed record's sys_id are cleared.

```
// build the cache:
var number = 'INC0009009';
var inc = new GlideRecord('incident');
inc.addQuery('number', number);
inc.query();
inc.next();
var entry = inc.caller_id.getDisplayValue();
sn_scoped_cache.ScopedCacheManager.putRow("incident_cache",
 inc.getValue('number'), entry, inc.getValue('sys_id'));
gs.info(sn_scoped_cache.ScopedCacheManager.get("incident_cache",
 number));

// when the incident is altered, the cache entry will be
 flushed.
inc = new GlideRecord('incident');
inc.addQuery('number', number);
inc.query();
inc.next();
inc.setValue('short_description',
 inc.getValue('short_description') + "a");
inc.update();
gs.info(sn_scoped_cache.ScopedCacheManager.get("incident_cache",
 number));
```

Output:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
scoped_app: John Jones
scoped_app: null
```

ScriptableDataStream - Scoped, Global

The *ScriptableDataStream* API provides methods to interact with a stream of data.

This class can only be used in a server-side script after retrieving a ScriptableDataStream object using one of these APIs:

- The *executeDataStreamAction()* method in the *FlowAPI* class. See FlowAPI.
- The *getDataStream()* method in the *ScriptableFlowRunnerResult* class. See ScriptableFlowRunnerResult.

After retrieving a ScriptableDataStream object, call the methods in this specific order:

1. Use the *hasNext()* method to determine whether there are more items in the data stream.
2. Use the *next()* method to access the next item in the stream.
3. Use the *getItemIndex()*, *getItemInPageIndex()*, and *getPageIndex()* methods to get information from the stream.
4. Use the *close()* method to close the stream.

This class runs is in the `sn_fd` namespace.

Note: Always wrap data stream logic in a `try/catch` block to catch errors. Always include a `finally` statement that ends with the *close()* method from the *ScriptableDataStream* class to close the data stream and prevent performance issues.

ScriptableDataStream - close()

Closes the connection to a data stream. Always call this method after performing any desired operations on a data stream.

You can only call this method on a ScriptableDataStream object returned from the *executeDataStreamAction()* method in the FlowAPI class. See FlowAPI.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
(function() {

 try {
  // Execute Data Stream Action.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  var stream =
 sn_fd.FlowAPI.executeDataStreamAction('x_snc_my_scope.data_stre
am_name');
  // Process each item in the data stream
  while (stream.hasNext()) {
   // Get a single item from the data stream.
   var user = stream.next();

   // Only log the first item in each page
   if (stream.getItemInPageIndex() == 0) {
    gs.info('first user on page is ' + user.name);
   }
  }
 } catch (ex) {
  var message = ex.getMessage();
  gs.error(message);
 } finally {
  stream.close();
 }

})();
```

ScriptableDataStream - getItemIndex()

Returns the current index of an item in a data stream.

You can only call this method on a ScriptableDataStream object returned from the *executeDataStreamAction()* method in the FlowAPI class. See FlowAPI.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Current index of an item in a data stream using zero-based indexing.

```
(function() {

 try {

  // Execute Data Stream Action.
  var stream =
 sn_fd.FlowAPI.executeDataStreamAction('x_my_scope.data_stream_n
ame');

  // Process each item in the data stream
  while (stream.hasNext()) {

   // Get a single item from the data stream.
   var User = stream.next();

   // Use the item. Example:
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    // var now_GR = new GlideRecord(<table_name>);
    // now_GR.<field_name> = User.<field_name>;
    // now_GR.insert();

    // By default, this code snippet will terminate after 10
 items.
    // Remove or modify this limit after your code has been
 tested.
    if (stream.getItemIndex() >= 9) {
     break;
    }
   }
 } catch (ex) {
   var message = ex.getMessage();
   gs.error(message);
 } finally {
   stream.close();
 }

})();
```

ScriptableDataStream - getItemInPageIndex()

Returns the current index of an item within the current page in a data stream.

You can only call this method on a ScriptableDataStream object returned from the *executeDataStreamAction()* method in the FlowAPI class. See FlowAPI.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Current index of an item within the current page in the data stream using zero-based indexing.

```
(function() {

 try {
   // Execute Data Stream Action.
   var stream =
 sn_fd.FlowAPI.executeDataStreamAction('x_snc_my_scope.data_stre
am_name');
   // Process each item in the data stream
   while (stream.hasNext()) {
    // Get a single item from the data stream.
    var user = stream.next();

    // Only log the first item in each page
    if (stream.getItemInPageIndex() == 0) {
     gs.info('first user on page is ' + user.name);
    }
```

```
  }
 } catch (ex) {
  var message = ex.getMessage();
  gs.error(message);
 } finally {
  stream.close();
 }

})();
```

ScriptableDataStream - getPageIndex()

Returns the current index of a page in a data stream.

You can only call this method on a ScriptableDataStream object returned from the *`executeDataStreamAction()`* method in the FlowAPI class. See FlowAPI.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Current index of a page in a data stream using zero-based indexing.

```
(function() {

 try {

  // Execute Data Stream Action.
  var stream =
 sn_fd.FlowAPI.executeDataStreamAction('x_my_scope.data_stream_n
ame');

  // Process each item in the data stream
  while (stream.hasNext()) {

   // Get a single item from the data stream.
   var item = stream.next();

   // Use the item.
   var now_GR = new GlideRecord('incident');
   now_GR.setValue('number',item.id);
   now_GR.setValue('short_description',item.name);
   now_GR.insert();

   // By default, this code snippet will terminate after 5
 pages.
   // Remove or modify this limit after testing your code.
   if (stream.getPageIndex() >= 4) {
    break;
   }
  }
```

```
 } catch (ex) {
  var message = ex.getMessage();
  gs.error(message);
 } finally {
  stream.close();
 }

})();
```

ScriptableDataStream - hasNext()

Returns true if there are more items in the data stream.

You can only call this method on a ScriptableDataStream object returned from the *executeDataStreamAction()* method in the FlowAPI class. See FlowAPI.

Note: By default, the instance waits for 600 seconds to retrieve a single page of data from a MID Server. If you encounter a timeout when running a Data Stream action through a MID Server, change this default by increasing the *datastream_alternative_env_fetch_page_timeout_seconds* system property.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that determines whether there are more items in the data stream. Values include: • true: There are more items to iterate through in the data stream. • false: There are no more items in the data stream.

This example creates an incident record for each item returned in the data stream.

```
(function() {

 try {

  // Execute Data Stream Action.
  var stream =
 sn_fd.FlowAPI.executeDataStreamAction('x_my_scope.data_stream_n
ame');

  // Process each item in the data stream
  while (stream.hasNext()) {

   // Get a single item from the data stream.
   var item = stream.next();

   // Use the item.
   var now_GR = new GlideRecord('incident');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   now_GR.setValue('number',item.id);
   now_GR.setValue('short_description',item.name);
   now_GR.insert();

   // By default, this code snippet will terminate after 10
 items.
   // Remove or modify this limit after testing your code.
   if (stream.getItemIndex() >= 9) {
    break;
   }
  }
 } catch (ex) {
  var message = ex.getMessage();
  gs.error(message);
 } finally {
  stream.close();
 }

})();
```

ScriptableDataStream - next()

Returns the next item in a data stream.

You can only call this method on a ScriptableDataStream object returned from the *executeDataStreamAction()* method in the FlowAPI class. See FlowAPI.

Note: By default, the instance waits for 600 seconds to retrieve a single page of data from a MID Server. If you encounter a timeout when running a Data Stream action through a MID Server, change this default by increasing the *datastream_alternative_env_fetch_page_timeout_seconds* system property.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	The next item in the data stream. This object contains the outputs defined by the Data Stream action. To view the Data Stream action outputs, navigate to the Outputs section of the Data Stream action in the Flow Designer interface.

This example creates an incident record for each item returned in the data stream.

```
(function() {

 try {

  // Execute Data Stream Action.
  var stream =
 sn_fd.FlowAPI.executeDataStreamAction('x_my_scope.data_stream_n
ame');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  // Process each item in the data stream
  while (stream.hasNext()) {

    // Get a single item from the data stream.
    var item = stream.next();

    // Use the item.
    var now_GR = new GlideRecord('incident');
    now_GR.setValue('number',item.id);
    now_GR.setValue('short_description',item.name);
    now_GR.insert();

    // By default, this code snippet will terminate after 10
 items.
    // Remove or modify this limit after testing your code.
    if (stream.getItemIndex() >= 9) {
     break;
    }
  }
 } catch (ex) {
  var message = ex.getMessage();
  gs.error(message);
 } finally {
  stream.close();
 }

})();
```

ScriptableFlowRunner - Scoped

Creates a builder object used to define parameters for flow, subflow, and action execution. You can specify a flow to execute in a particular domain. Start the flow, subflow, or action execution directly from the builder and view the results in a ScriptableFlowRunnerResult object.

Use these methods in your server-side scripts with the `sn_fd` namespace identifier.

API call order

Build and execute flows, subflows, and actions using these APIs in the following order:

1. *`FlowAPI`*: **Creates a builder object**

   Use *`getRunner()`* to instantiate the ScriptableFlowRunner builder object.
2. *`ScriptableFlowRunner`*: **Specify Workflow Studio content to run**

   Use these methods in the following order to create the builder pattern:

   1. Use one of the methods *`action()`*, *`datastream()`*, *`flow()`*, or *`subflow()`* to specify what type of Workflow Studio object to build.
   2. Use one or more methods such as *`addInput()`*, *`inDomain()`*, or *`quick()`* to specify execution parameters.
   3. Use the *`run()`* method to run the action, flow, or subflow with the provided parameters and return a ScriptableFlowRunnerResult object.
3. *`ScriptableFlowRunnerResult`*: **Retrieve Workflow Studio execution details**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use one or more methods such as *getContextId()*, *getOutputs()*, and *getDomainId()* to view execution details.

Example

This example shows how to create a ScriptableFlowRunner builder object and uses it to execute an approval action on a specific record. A ScriptableFlowRunnerResult object captures the execution arguments and action outputs.

```
(function() {
  try {

    var inputs = {};

    inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c';  //
 Pass the record's sys_id in as input.

    var result = sn_fd.FlowAPI.getRunner()  // Create a
 ScriptableFlowRunner builder object.
      .action('global.markapproved')        // Run the global
 scope action named markapproved.
      .inForeground()
      .inDomain('TOP/ACME')                 // Run the action
 from the TOP/ACME domain.
      .withInputs(inputs)
      .run();                               // Run the action
 and return a FlowRunnerResult object.

    var contextId = result.getContextId();  // Retrieve the
 context ID from the result
    var dateRun = result.getDate();
    var domainUsed = result.getDomainId();  // Retrieve the
 Domain ID from the result.
    var flowName = result.getFlowObjectName();
    var flowObjectType = result.getFlowObjectType();

    var outputs = result.getOutputs();            // Retrieve
 any outputs from the action execution.
    var newApprovalStatus = outputs['approval'];  // Echo back
 the approval status for verification.

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

ScriptableFlowRunner - action(String scopedActionName)

Identifies the scope and name of the action to execute.

See also:

- ScriptableFlowRunner - flow(String scopedFlowName)
- ScriptableFlowRunner - subflow(String scopedSubflowName)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
scopedActionName	String	Scope and name of the action to execute. For example, `global.actionName`.

Returns

Type	Description
ScriptableFlowRunner	Builder object used to run a Workflow Studio action, flow, or subflow.

This example shows how to create a ScriptableFlowRunner builder object and uses it to execute an approval action on a specific record. A ScriptableFlowRunnerResult object captures the execution arguments and action outputs.

```
(function() {
  try {

    var inputs = {};

    inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c';  //
Pass the record's sys_id in as input.

    var result = sn_fd.FlowAPI.getRunner()  // Create a
ScriptableFlowRunner builder object.
      .action('global.markapproved')        // Run the global
scope action named markapproved.
      .inForeground()
      .inDomain('TOP/ACME')                 // Run the action
from the TOP/ACME domain.
      .withInputs(inputs)
      .run();                               // Run the action
and return a FlowRunnerResult object.

    var contextId = result.getContextId();  // Retrieve the
context ID from the result
    var dateRun = result.getDate();
    var domainUsed = result.getDomainId();  // Retrieve the
Domain ID from the result.
    var flowName = result.getFlowObjectName();
    var flowObjectType = result.getFlowObjectType();

    var outputs = result.getOutputs();            // Retrieve
any outputs from the action execution.
    var newApprovalStatus = outputs['approval'];  // Echo back
the approval status for verification.

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
})();
```

ScriptableFlowRunner - addInput(String name, Object value)

Adds a single input. If the name passed as an argument already exists as a separate input, the new value replaces the pre-existing value.

This method adds a single input. To create an object and add multiple inputs, use the *`withInputs()`* method.

Parameters

Name	Type	Description
name	String	The name of the input for the flow, subflow, or action.
value	Object	The value of the input for the flow, subflow, or action.

Returns

Type	Description
ScriptableFlowRunner	Builder object used to run a Workflow Studio action, flow, or subflow.

This example runs an action that takes a single input called `table_name`.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .action('global.test_action')
      .addInput('table_name', 'incident')
      .inForeground()
      .run();

    gs.info(result.debug());

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

Output:

```
Flow Designer: TableName
*** Script: FlowRunnerResult
Flow Object Name: global.test_action
Flow Object Type: action
Domain: null
Result Time: 2020-06-09 00:10:57
ContextId: null
Output count: 1
```

ScriptableFlowRunner - asUser()

Runs flow as the user who triggered it, not the system, for quick background executions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a flow is triggered using `quick()` along with the `asUser()` method, user who triggered the flow is retrieved and is used for the flow execution.

Parameters

Name	Type	Description
None		

Returns

Type	Description
ScriptableFlowRunner - Scoped	Builder object used to run a Workflow Studio action, flow, or subflow.

This example shows how to create a ScriptableFlowRunner builder object and uses it to execute an approval action on a specific record using `asUser()` and `quick()` methods. A ScriptableFlowRunnerResult object captures the execution arguments and action outputs.

```
(function() {
    try {

        var outputs = sn_fd.FlowAPI.getRunner() // Create a
 ScriptableFlowRunner builder object.
        .flow('global.stry53225960_flow_asuser_test')
        .inForeground()
        .quick() //Run the flow from a server-side script.
        .asUser() //Run flow with the roles specified in the
 flow.
        .run(); // Run the action and return a FlowRunnerResult
 object.

    } catch (ex) {
        var message = ex.getMessage();
        gs.error(message);
    }

})();
```

Errors

These errors may occur while using the `asUser()` method:

- Script returns an error when `asUser()` not used along with `quick()`.
- Script returns an error when `asUser()` is called in a flow that has roles defined.
- Script returns an error when `withRoles()` and `asUser()` methods are called at the same time.

ScriptableFlowRunner - datastream(String scopedDatastreamName)

Identifies the scope and name of the data stream action to execute.

To learn more about data stream actions, see Data Stream actions and pagination.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
scopedDatastreamName	String	Scope and name of the Data Stream action to execute. For example, `global.dataStreamActionName`.

Returns

Type	Description
ScriptableFlowRunner	Builder object used to run a Workflow Studio action, flow, or subflow.

This example shows how to run a Data Stream action.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .datastream('global.test_dsa')
      .inForeground()
      .run();

    gs.info(result.debug());

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

Output:

```
*** Script: FlowRunnerResult
Flow Object Name: global.test_dsa
Flow Object Type: datastream
Domain: null
Result Time: 2020-06-08 16:41:13
ContextId: null
Output count: 0
```

ScriptableFlowRunner - flow(String scopedFlowName)

Identifies the scope and name of the flow to execute.

See also:

- ScriptableFlowRunner - action(String scopedActionName)
- ScriptableFlowRunner - subflow(String scopedSubflowName)

Parameters

Name	Type	Description
scopedFlowName	String	Scope and name of the flow to execute. For example, `global.flowName`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
ScriptableFlowRunner	Builder object used to run a Workflow Studio action, flow, or subflow.

This example shows how to run a flow that logs a message.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.test_flow')
      .inForeground()
      .run();

    gs.info(result.debug());

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

Output:

```
*** Script: FlowRunnerResult
Flow Object Name: global.test_flow
Flow Object Type: flow
Domain: null
Result Time: 2020-06-08 16:41:13
ContextId: null
Output count: 0
```

ScriptableFlowRunner - inBackground()

Runs the flow, subflow, or action asynchronously. Once the flow object starts running, script execution resumes immediately.

Parameters

Name	Type	Description
None		

Returns

Type	Description
ScriptableFlowRunner	Builder object used to run a Workflow Studio action, flow, or subflow.

Note: As of the Xanadu release, running an action, flow, or subflow in the background using the quick() method returns an execution ID as the ContextId value. The execution ID is not an actual context record as no records are inserted into the Flow Context [sys_flow_context] table. Rather the execution ID is used to track the asynchronous call.

This example shows how to run a flow in the background asynchronously.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
(function() {
    try {

      var result = sn_fd.FlowAPI.getRunner()
        .flow('global.change__unauthorized__review')
        .inBackground()
        .run();

      gs.info(result.debug());

    } catch (ex) {
      var message = ex.getMessage();
      gs.error(message);
    }

  })();
```

Output:

```

```

ScriptableFlowRunner - inDomain(String domainId)

Runs the flow, subflow, or action in the specified domain. Checks to ensure the domain exists and is available.

Parameters

Name	Type	Description
domainId	String	The sys_id or name for the domain of execution for the flow.

Returns

Type	Description
ScriptableFlowRunner	Builder object used to run a Workflow Studio action, flow, or subflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example shows how to create a ScriptableFlowRunner builder object and uses it to execute an approval action on a specific record. A ScriptableFlowRunnerResult object captures the execution arguments and action outputs.

```
(function() {
  try {

    var inputs = {};

    inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c';  //
 Pass the record's sys_id in as input.

    var result = sn_fd.FlowAPI.getRunner()  // Create a
 ScriptableFlowRunner builder object.
      .action('global.markapproved')        // Run the global
 scope action named markapproved.
      .inForeground()
      .inDomain('TOP/ACME')                 // Run the action
 from the TOP/ACME domain.
      .withInputs(inputs)
      .run();                               // Run the action
 and return a FlowRunnerResult object.

    var contextId = result.getContextId();  // Retrieve the
 context ID from the result
    var dateRun = result.getDate();
    var domainUsed = result.getDomainId();  // Retrieve the
 Domain ID from the result.
    var flowName = result.getFlowObjectName();
    var flowObjectType = result.getFlowObjectType();

    var outputs = result.getOutputs();            // Retrieve
 any outputs from the action execution.
    var newApprovalStatus = outputs['approval'];  // Echo back
 the approval status for verification.

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

ScriptableFlowRunner - inForeground()

Runs the flow, subflow, or action synchronously. Script execution pauses while the flow object is running.

Note: This method does not support pausing the action to wait for conditions. Steps that pause for wait conditions such as Ask for Approval or Wait for Condition are not supported.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
ScriptableFlowRunner	Builder object used to run a Workflow Studio action, flow, or subflow.

This example shows how to create a ScriptableFlowRunner builder object and uses it to execute an approval action on a specific record. A ScriptableFlowRunnerResult object captures the execution arguments and action outputs.

```
(function() {
  try {

    var inputs = {};

    inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c';  //
 Pass the record's sys_id in as input.

    var result = sn_fd.FlowAPI.getRunner()  // Create a
 ScriptableFlowRunner builder object.
      .action('global.markapproved')        // Run the global
 scope action named markapproved.
      .inForeground()
      .inDomain('TOP/ACME')                 // Run the action
 from the TOP/ACME domain.
      .withInputs(inputs)
      .run();                               // Run the action
 and return a FlowRunnerResult object.

    var contextId = result.getContextId();  // Retrieve the
 context ID from the result
    var dateRun = result.getDate();
    var domainUsed = result.getDomainId();  // Retrieve the
 Domain ID from the result.
    var flowName = result.getFlowObjectName();
    var flowObjectType = result.getFlowObjectType();

    var outputs = result.getOutputs();            // Retrieve
 any outputs from the action execution.
    var newApprovalStatus = outputs['approval'];  // Echo back
 the approval status for verification.

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

ScriptableFlowRunner - quick()

Runs a flow, subflow, action, or Data Stream action from a server-side script synchronously or asynchronously without creating execution details or other related records. Improves performance by eliminating record-keeping overhead. Use this API to increase the speed of high-volume processing, for example multiple executions per second, in a production environment.

Reporting & records generated

This method does not create execution details and context records, regardless of Workflow Studio settings.

Wait condition support

This method does not support pausing an action or flow to wait for conditions. Actions, flow logic, and steps that pause for wait conditions such as Ask for Approval, Wait for Condition, or Wait for a duration are not supported.

MID Server support

This method does not support pausing an action or flow to run from a MID Server. This restriction includes data stream action preprocessing scripts that pause an action to run from a MID Server.

Data stream action support

This method does not support pausing a data stream action to run a preprocessing script from a MID Server.

Flow priority support

This method supports flow priority settings. The flow runs at the specified flow priority.

Parameters

Name	Type	Description
None		

Returns

Type	Description
ScriptableFlowRunner	Builder object used to run a Workflow Studio action, flow, or subflow.

Note: As of the Xanadu release, running an action, flow, or subflow in the background using the quick() method returns an execution ID as the ContextId value. The execution ID is not an actual context record as no records are inserted into the Flow Context [sys_flow_context] table. Rather the execution ID is used to track the asynchronous call.

This example shows how to run a flow without creating any related records.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.change__unauthorized__review')
      .inBackground()
      .quick()
      .run();

    gs.info(result.debug());
```

```

ScriptableFlowRunner - run()

Runs the flow, subflow, or action with the specified parameters.

Parameters

Name	Type	Description
None		

Returns

Type	Description
ScriptableFlowRunnerResultObjectScoped	Object containing the execution details of a Workflow Studio action, flow, or subflow.

This example shows how to create a ScriptableFlowRunner builder object and uses it to execute an approval action on a specific record. A ScriptableFlowRunnerResult object captures the execution arguments and action outputs.

```
(function() {
  try {

    var inputs = {};

    inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c';  //
 Pass the record's sys_id in as input.

    var result = sn_fd.FlowAPI.getRunner()  // Create a
 ScriptableFlowRunner builder object.
      .action('global.markapproved')        // Run the global
 scope action named markapproved.
```

```
      .inForeground()
      .inDomain('TOP/ACME')                  // Run the action
 from the TOP/ACME domain.
      .withInputs(inputs)
      .run();                                // Run the action
 and return a FlowRunnerResult object.

    var contextId = result.getContextId();  // Retrieve the
 context ID from the result
    var dateRun = result.getDate();
    var domainUsed = result.getDomainId();  // Retrieve the
 Domain ID from the result.
    var flowName = result.getFlowObjectName();
    var flowObjectType = result.getFlowObjectType();

    var outputs = result.getOutputs();            // Retrieve
 any outputs from the action execution.
    var newApprovalStatus = outputs['approval'];  // Echo back
 the approval status for verification.

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

ScriptableFlowRunner - subflow(String scopedSubflowName)

Identifies the scope and name of the subflow to execute.

See also:

- ScriptableFlowRunner - action(String scopedActionName)
- ScriptableFlowRunner - flow(String scopedFlowName)

Parameters

Name	Type	Description
scopedSubflowName	String	Scope and name of the subflow to execute. For example, `global.subflowName`.

Returns

Type	Description
ScriptableFlowRunner	Builder object used to run a Workflow Studio action, flow, or subflow.

This example shows how to run a subflow that logs a message.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .subflow('global.output_test')
```

```

ScriptableFlowRunner - timeout(Number timeout)

Sets a timeout for a flow, subflow, or action execution.

Parameters

Name	Type	Description
timeout	Number	Timeout in milliseconds.

Returns

Type	Description
ScriptableFlowRunner	Builder object used to run a Workflow Studio action, flow, or subflow.

This example shows how to run a flow and sets a timeout for two minutes.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.test_flow')
      .inForeground()
      .timeout(120000)
      .run();

    gs.info(result.debug());

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
```

Output count: 0
```

ScriptableFlowRunner - validateInputs(Boolean validateInputs)

Throw an error and prevent the ScriptableFlowRunner class from running when any method input has an unexpected value. This method defaults to true for any ScriptableFlowRunner call.

Parameters

Name	Type	Description
validateInputs	Boolean	Flag that indicates whether to validate ScriptableFlowRunner method inputs. There are two valid values. • true: Throw an error when inputs have unexpected values and stop running the script. • false: Allow the script to run with unexpected values. Default: True

Returns

Type	Description
None	

This example shows how to run a flow without validating the method input values.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.test_flow')
      .inForeground()
      .validateInputs(false)
      .run();

    gs.info(result.debug());

  } catch (ex) {
```

Domain: null
Result Time: 2020-06-08 16:41:13
ContextId: null
Output count: 0
```

ScriptableFlowRunner - withConnectionAliasOverride(String aliasName, String overrideName)

Overrides the Connections and Credentials alias associated with the flow, action, or subflow. You can override the default parent alias with any of its child aliases.

To learn more about overriding a Connections and Credentials alias, see Supporting multiple connections.

Parameters

Name	Type	Description
parentAliasSysID	String	The sys_id of the parent alias, the alias you want to override.
overrideAliasSysID	String	The sys_id of the child alias, the alias you want to use when running the flow, subflow, or action.

Returns

Type	Description
ScriptableFlowRunner	Builder object used to run a Workflow Studio action, flow, or subflow.

This example shows how to run a flow using a different alias than the default associated with the flow.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.test_flow')
      .withConnectionAliasOverride('sn_original_alias.spoke',
 'x_new_alias.spoke')
      .inForeground()
      .run();

    gs.info(result.debug());

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }

})();
```

ScriptableFlowRunner - withInputs(Map inputs)

Adds a collection of inputs. If a name in one of the name-value pairs already exists, the new value replaces the pre-existing value.

Parameters

Name	Type	Description
inputs	Object	Map object containing the name-value pairs that define inputs for the flow, subflow, or action.

Returns

Type	Description
ScriptableFlowRunner	Builder object used to run a Workflow Studio action, flow, or subflow.

Creates an input object and passes the value to the *withInputs()* method.

```
(function() {
  try {

    var inputs = {};

    inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c';  //
Pass the record's sys_id in as input.

    var result = sn_fd.FlowAPI.getRunner()  // Create a
ScriptableFlowRunner builder object.
      .action('global.markapproved')        // Run the global
scope action named markapproved.
      .inForeground()
      .inDomain('TOP/ACME')                 // Run the action
from the TOP/ACME domain.
      .withInputs(inputs)
      .run();                               // Run the action
and return a FlowRunnerResult object.

    var contextId = result.getContextId();  // Retrieve the
context ID from the result
    var dateRun = result.getDate();
    var domainUsed = result.getDomainId();  // Retrieve the
Domain ID from the result.
    var flowName = result.getFlowObjectName();
    var flowObjectType = result.getFlowObjectType();

    var outputs = result.getOutputs();            // Retrieve
any outputs from the action execution.
    var newApprovalStatus = outputs['approval'];  // Echo back
the approval status for verification.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

ScriptableFlowRunner - withRoles()

Runs the flow as the user who triggered the flow or executes the flow with roles that have been added in Workflow Studio.

When a flow is triggered using *`quick()`* along with the *`withRoles()`* method, roles defined in the flow properties are retrieved, passed during the flow execution, and the flow is run with the roles.

Parameters

Name	Type	Description
None		

Returns

Type	Description
ScriptableFlowRunner - Scoped	Builder object used to run a Workflow Studio action, flow, or subflow.

This example shows how to create a ScriptableFlowRunner builder object and uses it to execute an approval action on a specific record using *`withRoles()`* and *`quick()`* methods. A ScriptableFlowRunnerResult object captures the execution arguments and action outputs.

```
(function() {
    try {

        var outputs = sn_fd.FlowAPI.getRunner() // Create a
 ScriptableFlowRunner builder object.
        .flow('global.stry53225960_flow')
        .inForeground()
        .quick() //Run the flow from a server-side script.
        .withRoles() //Run the flow as the user who triggered
 the flow.
        .run(); // Run the action and return a FlowRunnerResult
 object.

    } catch (ex) {
        var message = ex.getMessage();
        gs.error(message);

    }

})();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Errors

These errors may occur while using the *withRoles()* method:

- *withRoles()* performs no operation if it is not used along with *quick()*.
- Script returns an error when *withRoles()* is called in a flow that doesn't have any roles.
- Script returns an error when *withRoles()* and *asUser()* methods are called at the same time.

ScriptableFlowRunnerResult - Scoped

Captures the result of using *ScriptableFlowRunner* to execute a flow, subflow, or action. Includes data such as the context ID, domain, and any outputs from the flow execution.

Use these methods in your server-side scripts with the `sn_fd` namespace identifier.

API call Order

Build and execute flows, subflows, and actions using these APIs in the following order:

1. *FlowAPI*: **Creates a builder object**

   Use *getRunner()* to instantiate the ScriptableFlowRunner builder object.
2. *ScriptableFlowRunner*: **Specify Workflow Studio content to run**

   Use these methods in the following order to create the builder pattern:

   1. Use one of the methods *action()*, *datastream()*, *flow()*, or *subflow()* to specify what type of Workflow Studio object to build.
   2. Use one or more methods such as *addInput()*, *inDomain()*, or *quick()* to specify execution parameters.
   3. Use the *run()* method to run the action, flow, or subflow with the provided parameters and return a ScriptableFlowRunnerResult object.
3. *ScriptableFlowRunnerResult*: **Retrieve Workflow Studio execution details**

   Use one or more methods such as *getContextId()*, *getOutputs()*, and *getDomainId()* to view execution details.

Example

This example shows how to create a ScriptableFlowRunner builder object and uses it to execute an approval action on a specific record. A ScriptableFlowRunnerResult object captures the execution arguments and action outputs.

```
(function() {
  try {

    var inputs = {};

    inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c';  //
 Pass the record's sys_id in as input.

    var result = sn_fd.FlowAPI.getRunner()  // Create a
 ScriptableFlowRunner builder object.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      .action('global.markapproved')        // Run the global
scope action named markapproved.
      .inForeground()
      .inDomain('TOP/ACME')                 // Run the action
from the TOP/ACME domain.
      .withInputs(inputs)
      .run();                               // Run the action
and return a FlowRunnerResult object.

   var contextId = result.getContextId();  // Retrieve the
context ID from the result
   var dateRun = result.getDate();
   var domainUsed = result.getDomainId();  // Retrieve the
Domain ID from the result.
   var flowName = result.getFlowObjectName();
   var flowObjectType = result.getFlowObjectType();

   var outputs = result.getOutputs();            // Retrieve
any outputs from the action execution.
   var newApprovalStatus = outputs['approval'];  // Echo back
the approval status for verification.

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

ScriptableFlowRunnerResult - debug()

Returns information about the executed flow, subflow, or action, including the context ID, domain ID, and execution outputs.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Execution details about the Workflow Studio action, flow, or subflow run. • flow object name: Name of the flow, subflow, or action. • flow object type: Flow, subflow, action, or datastream action. • domain ID: ID of the domain that the flow, subflow, or action ran in. • result time: Amount of time it took to run.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• context ID: Sys_id of the Workflow Studio execution details record for the action, flow, or subflow. • output count: Number of action or subflow outputs.

This example shows how to retrieve information about the executed flow, subflow, or action from the ScriptableFlowRunnerResult object.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.test_flow')
      .inForeground()
      .timeout(12000)
      .run();

    gs.info(result.debug());

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

Output:

```
*** Script: FlowRunnerResult
Flow Object Name: global.test_flow
Flow Object Type: flow
Domain: null
Result Time: 2020-06-08 18:28:41
ContextId: null
Output count: 0
```

ScriptableFlowRunnerResult - getContextId()

Returns the context ID of the flow, subflow, or action.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The sys_id of the Workflow Studio execution details record for the action, flow, or subflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example shows how to retrieve a context ID from a ScriptableFlowRunnerResult object.

```
var contextId = result.getContextId();
```

Output:

```
4ecead85c4da1110598d0c7d6bf73554
```

ScriptableFlowRunnerResult - getDate()

Returns the date and time when a Workflow Studio action, flow, or subflow ran as a GlideDateTime object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideDateTime	The execution date and time for the flow, subflow, or action.

This example shows how to retrieve the date and time of a flow execution from a ScriptableFlowRunnerResult object.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.test_flow')
      .inForeground()
      .timeout(12000)
      .run();

    gs.info(result.getDate());

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

Output:

```
2020-05-22 18:45:42
```

ScriptableFlowRunnerResult - getDataStream()

Returns the stream of data from a data stream action.

If the *`datastream()`* method was used in the *`ScriptableFlowRunner`* builder class, this returns the stream of data as a ScriptableDataStream object. Use the *`ScriptableDataStream`* class to iterate over items in the stream. See ScriptableDataStream.

For more information about data stream actions, see Data Stream actions and pagination.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
ScriptableDataStream	A ScriptableDataStream object you can use to iterate through items in a data stream. Use the methods in the *ScriptableDataStream* class to interact with this object. See ScriptableDataStream.

This example shows how to retrieve a data stream from a ScriptableFlowRunnerResult object.

```
var datastream = result.getDataStream();
```

ScriptableFlowRunnerResult - getDomainId()

Returns the sys_id of the domain that the Workflow Studio action, flow, or subflow ran in.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The sys_id of the domain that the Workflow Studio action, flow, or subflow ran in.

This example shows how to retrieve a domain ID from a ScriptableFlowRunnerResult object.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.test_flow')
      .inForeground()
      .inDomain('TOP/ACME')
      .timeout(12000)
      .run();

    gs.info(result.getDomainId());

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

```
4ecead85a4da1110598d0c7d6bf75554
```

ScriptableFlowRunnerResult - getFlowObjectType()

Returns the type of Workflow Studio object run.

Parameters

Name	Type	Description
None		

Returns

Type	Description
FlowObjectType	The type of Workflow Studio object run, which is either action, flow, or subflow.

This example shows how to retrieve the flow object type from the *ScriptableFlowRunnerResult* API.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.test_flow')
      .inForeground()
      .timeout(12000)
      .run();

    gs.info(result.getFlowObjectType());

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

Output:

```
flow
```

ScriptableFlowRunnerResult - getFlowObjectName()

Returns the scope and internal name of the Workflow Studio action, flow, or subflow run.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The scope and internal name of the Workflow Studio action, flow, or subflow run. For example, `global.emailflow`.

This example shows how to retrieve the name of the flow, subflow, or action name from a ScriptableFlowRunnerResult object.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.test_flow')
      .inForeground()
      .timeout(12000)
      .run();

    gs.info(result.getFlowObjectName());

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

Output:

```
global.test_flow
```

ScriptableFlowRunnerResult - getOutputs()

Returns the outputs of a completed Workflow Studio action, flow, or subflow.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Object containing the output of a completed Workflow Studio action, flow, or subflow.

This example shows how to retrieve the outputs from a Workflow Studio action, flow, or subflow run with the *`ScriptableFlowRunner`* API.

```
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .action('global.test_action')
      .inForeground()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      .timeout(12000)
      .run();

    gs.info(result.getOutputs());

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

Output:

```
Flow Designer: Warning. This is an important log message.
```

SentimentAnalyser - Scoped

The *SentimentAnalyser* script include provides methods to perform sentiment analysis on a string value.

You should use this script include in a script that is treated as an admin-executing script. For example, use the *Sentiment Analysis* script includein a script action or scheduled job.

To use this class in a scoped application, use the `sn_nlp_sentiment` namespace identifier. The Sentiment Analysis plugin (com.snc.sentiment_analysis) must be enabled to access the *SentimentAnalyser* API.

SentimentAnalyser - SentimentAnalyser()

Creates an instance of the SentimentAnalyser class with the default connector configuration that is used for sentiment analysis.

```
var sa = new sn_nlp_sentiment.SentimentAnalyser();
```

SentimentAnalyser - SentimentAnalyser(GlideRecord configGR)

Creates an instance of the SentimentAnalyser class with the specified connector configuration that is used for sentiment analysis.

Parameters

Name	Type	Description
configGR	GlideRecord	GlideRecord object of a connector configuration.

```
var sa = new sn_nlp_sentiment.SentimentAnalyser(configGR);
```

SentimentAnalyser - analyze(String inputText)

Performs sentiment analysis on the specified text.

Parameters

Name	Type	Description
inputText	String	Text on which sentiment analysis should be performed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
JSON object	Result of the sentiment analysis specifying the status, score, normalised score, sys_id of the relevant connector configuration, and error message.

```
var sa = new sn_nlp_sentiment.SentimentAnalyser();
var result = sa.analyze ("Example string");
```

Output:

```
{"status": "Success", "score": "0.7", "normalizedScore":
 "0.7", "connectorConfig": "10932aa773101300734e234ffff6a777",
 "errorMessage":""}
```

SentimentAnalyser - analyzeMultiple(Array inputTextArray)

Performs sentiment analysis on an array of strings.

Parameters

Name	Type	Description
inputTextArray	Array	Array of text (string) on which to perform sentiment analysis.

Returns

Type	Description
JSON Array	An array that gives the result of the sentiment analysis performed on multiple texts specifying the status, score, normalized score, sys_id of the relevant connector configuration, and error message.

```
var sa = new sn_nlp_sentiment.SentimentAnalyser();
var result = sa.analyzeMultiple (["Example string1","Example
 string2"]);
```

Output:

```
[{"text": "I am happy","result": {Success",
 "score": "0.7", "normalizedScore": "0.7",
 "connectorConfig": "10932aa773101300734e234ffff6a777",
 "errorMessage":""}},{"text": "I am not happy","result":
 {Success", "score": "-0.7", "normalizedScore": "-0.7",
 "connectorConfig": "10932aa773101300734e234ffff6a777",
 "errorMessage":""}}]
```

SentimentAnalyser - analyzeMultipleWithLanguage(Array inputTextArray, String language)

Performs sentiment analysis on an array of strings in the specified language.

Parameters

Name	Type	Description
inputTextArray	Array	Array of text (string) on which to perform sentiment analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
language	String	Language for the input text. This can very for different sentiment services.

Returns

Type	Description
JSON Array	An array with the result of the sentiment analysis performed on multiple texts of the mentioned language, specifying the status, score, normalized score, sys_id of the relevant connector configuration, and error message.

```
var sa = new sn_nlp_sentiment.SentimentAnalyser();
var result = sa.analyzeMultipleWithLanguage (["Example
 string1","Example string2"], "en");
```

Output:

```
[{"text": "I am happy","result": {Success",
 "score": "0.7", "normalizedScore": "0.7",
 "connectorConfig": "10932aa773101300734e234ffff6a777",
 "errorMessage":""}},{"text": "I am not happy","result":
 {Success", "score": "-0.7", "normalizedScore": "-0.7",
 "connectorConfig": "10932aa773101300734e234ffff6a777",
 "errorMessage":""}}]
```

SentimentAnalyser - analyzeWithLanguage(String inputText, String language)

Performs sentiment analysis on a specified text and language.

Parameters

Name	Type	Description
inputText	String	Text on which to perform sentiment analysis.
language	String	Language for the input text. This can vary for different sentiment services.

Returns

Type	Description
JSON object	Result of the sentiment analysis specifying the status, score, normalized score, sys_id of the relevant connector configuration, and error message.

```
var sa = new sn_nlp_sentiment.SentimentAnalyser();
var result = sa.analyze ("Example string", "en");
```

Output:

```
{"status": "Success", "score": "0.7", "normalizedScore":
 "0.7", "connectorConfig": "10932aa773101300734e234ffff6a777",
 errorMessage":""}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SentimentAnalyser - getConnectorByName(String connectorName)

Returns the GlideRecord of the specified connector configuration.

Parameters

Name	Type	Description
connectorName	String	Name of the connector configuration.

Returns

Type	Description
GlideRecord	GlideRecord of the specified connector configuration.

```
var sa = new sn_nlp_sentiment.SentimentAnalyser();
var connector = sa.getConnectorByName("xxx");
```

Output:

```
GlideRecord object of the connector configuration with name
 "xxx", null if no connector is named as "xxx".
```

SentimentAnalyser - getDefaultConnector()

Returns the GlideRecord of the default connector configuration.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideRecord	GlideRecord of the default connector configuration.

```
var sa = new sn_nlp_sentiment.SentimentAnalyser();
var defaultConnector = sa.getDefaultConnector();
```

SerialNumberManager - Global

The *SerialNumberManager* script include provides methods to manage the serial numbers for discovery devices.

You can use this script include with a discovery script where you need to manage serial numbers.

SerialNumberManager - add(Number sType, Number value)

Adds the specified serial number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sType	Number	The serial number type
value	Number	The serial number

Returns

Type	Description
void	

SerialNumberManager - getSerialNumber()

Returns the serial number.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The serial number.

SerialNumberManager - getSerialsForCIData()

Returns serial number information for CI Data, including the type, serial number, and validity.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	An array with the serial number information in the following order: serial number type, serial number, and validity flag.

SerialNumberManager - isValid(Number value)

Checks if the number is a valid serial number.

Parameters

Name	Type	Description
value	Number	The number to check

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	True if the number is valid; otherwise, false.

ServiceRegistryQuery - Global

The `ServiceRegistryQuery` script include provides methods to map Shazzam service registry query results against a port probe. Child classes provide specifics on mapping.

Use this script include during the discovery scanning phase.

ServiceRegistryQuery - ServiceRegistryQuery(Object source)

Creates an instance of the ServiceRegistryQuery class.

Parameters

Name	Type	Description
source	Object	A GlideRecord or sys_id of the registry service.

ServiceRegistryQuery - findForPortProbe(PortProbe portProbe)

Parses an array of IDs for the given port probe.

Parameters

Name	Type	Description
portProbe	PortProbe	The port probe

Returns

Type	Description
void	

ServiceRegistryQuery - get(Object source)

Retrieves a registry service by id, regardless of child class.

Parameters

Name	Type	Description
source	Object	The registry service GlideRecord or sys_id.

Returns

Type	Description
String	The registry service

ServiceRegistryQuery - getShazzamQuerierClassname()

Returns the Shazzam! querier class name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The class name

ServiceRegistryQuery - toPortProbeMap()

Retrieves the port probe XML and creates a map.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The port probe map

ServiceRegistryQuery - toPortProbeXml()

Creates XML output for Shazzam! port probes.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The XML output for the probe.

ShazzamLaunch - Global

The `ShazzamLaunch` script include provides methods to handle the details of launching a Shazzam probe for a given discovery.

Use this script include to launch a Shazzam probe during the discovery scanning phase.

ShazzamLaunch - ShazzamLaunch(DiscoveryStatus status, DiscoverySchedule schedule)

Creates an instance of the Shazzamlaunch class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
status	DiscoveryStatus	The DiscoveryStatus instance for this discovery.
schedule	DiscoverySchedule	The DiscoverySchedule instance for this discovery.

Returns

Type	Description
void	

ShazzamLaunch - addPortProbe(String midPPs, String portProbes, IPIncludeExcluIdeCollection ipiec)

Adds a single port probe to our MID services collection.

Parameters

Name	Type	Description
midPPs	String	A hashmap with two properties. • midServer: a MIDServer instance • portProbes: a hashmap (by port probe name) of DiscoveryPortProbe instances.
portProbes	String	A hashmap (byMIDServer name) that contains these properties. • range: An IPMetaCollection containing the ranges to be probed. • midserver: A MIDServer instance for the MID server to be probed. • portProbes: a hashmap (by port probe name) of DiscoveryPortProbe instances to be probed.
ipiec	IPIncludeExcludeCollection	The range to be probed.

Returns

Type	Description
void	

ShazzamLaunch - addRange(IPCollection ipc, String portProbes, Boolean samePhase)

Adds the specified range and this discovery's port probes to scan (as defined by behavior) to the collection of MID servers and port probes that need to be probed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
ipc	IPCollection	The range to be discovered
portProbes	String	A hashmap (by MID server name) of hashmaps containing these properties. • range: an IPMetaCollection containing the ranges to be probed. • midServer: a Mid server instance for the MID server to be probed. • portProbes: a hashmap (by port probe name) of DiscoveryPortProbe instances to be probed.
samePhase	Boolean	True if this should use the same phase as is currently running.

Returns

Type	Description
void	

ShazzamLaunch - fireShazzamProbe(String portProbe, String ip, String sensor)

Fires a Shazzam probe for the MID server and services in the given hash map.

Parameters

Name	Type	Description
portProbe	String	A hashmap containing these properties. • range: an IPMetaCollection containing the ranges to be probed. • midServer: a MIDServer instance for the MID server to be probed.
ip	String	A comma-separated list of IPs to fire probes for.
sensor	String	The sys_id of the sensor that launched this probe (network discovery only).

Returns

Type	Description
void	

ShazzamLaunch - launch(String ip, Boolean samePhase, String sensor)

Launches Shazzam probes as necessary, depending on the current phase of each behavior used.

Parameters

Name	Type	Description
ip	String	A comma-separated list of IPs to fire probes for.
samePhase	Boolean	True if this launch should use the same phase as is currently running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
sensor	String	The sys_id of the sensor that launched this (only in network discovery).

Returns

Type	Description
Boolean	True if any probes are launched.

ShazzamLaunch - makeProbeSpec(String portProbe)

Makes an XML port probe spec for the given port probe hashmap.

Parameters

Name	Type	Description
portProbe	String	A hashmap containing these properties. • range: an IPMetaCollection containing the ranges to be probed. • midServer: a MIDServer instance for the MID server to be probed. • portProbes: a hashmap (by port probe name) of DiscoveryPortProbe instances to be probed.

Returns

Type	Description
String	An XML port probe specification

ShazzamResult - Global

The `ShazzamResult` script include provides methods to encapsulate a Shazzam result.

Use this script include during the discovery scanning phase.

ShazzamResult - active

Property that shows if the IP address is active

Field

Name	Type	Description
active	Boolean	True if this IP address is active, which means at least one port is open.

ShazzamResult - alive

Property is true if this IP address is alive, which means no ports are open, but at least one responded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field

Name	Type	Description
alive	Boolean	True if the IP address is alive, meaning no ports are open, but at least one port responded.

ShazzamResult - domainName

The Windows domain name for the IP.

Field

Name	Type	Description
domainName	String	The Windows domain name for the IP if one was resolved by the scanner.

ShazzamResult - hostName

Host name for the IP.

Field

Name	Type	Description
hostName	String	Host name of the IP if one was resolved by the scanner.

ShazzamResult - ip

IP address of the results.

Field

Name	Type	Description
ip	String	IP address of the results

ShazzamResult - scanners

A JavaScript array of ShazzamScanner instances.

Field

Name	Type	Description
scanners	Array	Array of ShazzamScanner instances

ShazzamScanner - Global

The *ShazzamScanner* script include provides methods to encapsulate a Shazzam scanner.

Use this script include during the discovery scanning phase.

ShazzamScanner - contents

A hash map of any nodes contained within the scanner, by name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field

Name	Type	Description
contents	Hash map	A hash map of any nodes contained within the scanner, by name.

ShazzamScanner - domainName

The Windows domain name, if one was resolved by the scanner.

Field

Name	Type	Description
domainName	String	The Windows domain name, if one was resolved by the scanner.

ShazzamScanner - hostName

The IP hostname, if one was resolved by the scanner.

Field

Name	Type	Description
hostName	String	The IP hostname, if one was resolved by the scanner.

ShazzamScanner - name

The scanner name.

Field

Name	Type	Description
name	String	The scanner name

ShazzamScanner - port

The port being scanned.

Field

Name	Type	Description
port	String	The port being scanned.

ShazzamScanner - portProbe

The port probe name.

Field

Name	Type	Description
portProbe	String	The port probe name.

ShazzamScanner - protocol

The scanner protocol.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field

Name	Type	Description
protocol	String	The scanner protocol.

ShazzamScanner - result

The scanner result.

Field

Name	Type	Description
result	String	The scanner result.

ShazzamScanner - service

The scanner service name.

Field

Name	Type	Description
service	String	The scanner service name.

SimilaritySolution - Global

The *`SimilaritySolution`* API is a scriptable object used in Predictive Intelligence stores.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

The solution setup-to-training flow is as follows:

1. Use the constructor to create a similarity solution object.
2. Add the solution object to the similarity solution store using the *`SimilaritySolutionStore - add()`* method.
3. Train the solution using the *`submitTrainingJob()`* method. This creates a version of the object that you can manage using the *`SimilaritySolutionVersion`* API.
4. Get predictions using the *`SimilaritySolutionVersion - predict()`* method.

Note: This API runs with full privileges before the Vancouver Patch 7 Hotfix 2b and Washington DC Patch 7 releases. With later releases, grant access using ACLs. For more information see Query ACLs.

For usage guidelines, refer to Using ML APIs.

SimilaritySolution - SimilaritySolution(Object config)

Creates a similarity solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
config	Object	JavaScript object containing configuration properties of the solution. `{ "domainName": "String", "label": "String", "lookupDataset": {Object}, "minRowCount": "String", "processingLanguage": "String", "stopwords": [Array], "testDataset": {Object}, "trainingFrequency": "String", "updateFrequency": "String" }`
config.domainName	String	Optional. Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Default: Current domain, for example, `"global"`.
config.label	String	Identifies the prediction task.
config.lookupDataset	Object	Name of the *DatasetDefinition* to use as the lookup set.
config.minRowCount	String	Optional. Minimum number of records required in the dataset for training. Default: 10000
config.processingLanguage	String	Optional. Processing language in two-letter ISO 639-1 language code format. Default: "en"
config.stopwords	Array	Optional. Preset list of strings that the system automatically generates based on the *language* property setting. For details, see Create a custom stopwords list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: English Stopwords
config.testDataset	Object	Name of the *DatasetDefinition* to scan for similarities with *lookupDataset* results.
config.trainingFrequency	String	Optional. The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once
config.updateFrequency		The frequency at which the model for the solution definition must be rebuilt. Possible values: • do_not_update • every_1_day • every_1_hour • every_6_hours • every_12_hours • every_1_minute • every_15_minutes • every_30_minutes Default: do_not_update

The following example shows how to create an object and add it to the SimilaritySolution store.

```
var incidentData = new sn_ml.DatasetDefinition({
        'tableName' : 'incident',
        'fieldNames' : ['category', 'short_description']
    });
    var kbData = new sn_ml.DatasetDefinition({
        'tableName' : 'kb_knowledge',
        'fieldNames' : ['short_description'],
        'encodedQuery' : 'active=true'
    });
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    var mySolution = new sn_ml.SimilaritySolution({
        'label': "similarity solution",
        'lookupDataset' : kbData,
        'testDataset' : incidentData,
    });

    // add solution
    var solutionName =
 sn_ml.SimilaritySolutionStore.add(mySolution);
```

SimilaritySolution - cancelTrainingJob()

Cancels a job for a solution object that has been submitted for training.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to cancel an existing training job.

```
var mySolution =
 sn_ml.SimilaritySolutionStore.get('ml_sn_global_global_similari
ty');

mySolution.cancelTrainingJob();
```

SimilaritySolution - getActiveVersion()

Gets the active *SimilaritySolutionVersion* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Active *SimilaritySolutionVersion* object.

The following example shows how to get an active *SimilaritySolution* version from the store and return its training status.

```
var mlSolution =
 sn_ml.SimilaritySolutionStore.get('ml_x_snc_global_global_simil
arity');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getStatus()), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

SimilaritySolution - getAllVersions()

Gets all versions of a *SimilaritySolution* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	Existing versions of a solution object. See also *SimilaritySolutionVersion* API.

The following example shows how to get all *SimilaritySolution* version objects and call the *getVersionNumber()* and *getStatus()* solution version methods on them.

```
var mlSolution =
 sn_ml.SimilaritySolutionStore.get('ml_x_snc_global_global_Simil
arity');

var mlSolutionVersions = mlSolution.getAllVersions();

for (i = 0; i < mlSolutionVersions.length; i++) {
gs.print("Version " + mlSolutionVersions[i].getVersionNumber() +
 " Status: " + mlSolutionVersions[i].getStatus() +"\n");
```

Output:

```
Version 3 Status:
 {"state":"solution_complete","percentComplete":"100","hasJobEnd
ed":"true"}

Version 2 Status:
 {"state":"solution_complete","percentComplete":"100","hasJobEnd
ed":"true"}

Version 1 Status:
 {"state":"solution_cancelled","percentComplete":"0","hasJobEnde
d":"true"}
```

SimilaritySolution - getLatestVersion()

Gets the latest version of a solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	*SimilaritySolutionVersion* object corresponding to the latest version of a *SimilaritySolution*.

The following example shows how to get the latest version of a solution and return its training status.

```
var mlSolution =
 sn_ml.SimilaritySolutionStore.get('ml_x_snc_global_global_Simil
arity');

gs.print(JSON.stringify(JSON.parse(mlSolution.getLatestVersion()
.getStatus()), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

SimilaritySolution - getName()

Gets the name of the object to use for interaction with the store.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the solution object.

The following example shows how to update *SimilaritySolution* dataset information and print the name of the object.

```
// Update solution
var myIncidentData = new sn_ml.DatasetDefinition({
   'tableName' : 'incident',
   'fieldNames' : ['category', 'short_description', 'priority'],
   'encodedQuery' : 'activeANYTHING'
});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var eligibleFields =
 JSON.parse(myIncidentData.getEligibleFields('Similarity'));

var mySimilarity = new sn_ml.SimilaritySolution({
   'label': "my Similarity solution",
   'dataset' : myIncidentData,
   'inputFieldNames': eligibleFields['eligibleInputFieldNames'],
   'predictedFieldName': 'category'
});

// update solution
sn_ml.SimilaritySolutionStore.update('ml_x_snc_global_global_my_
solution_definition_4', mySimilarity);

// print solution name
gs.print('Solution Name: '+mySimilarity.getName());
```

Output:

```
Solution Name: ml_x_snc_global_global_my_solution_definition_4
```

SimilaritySolution - getProperties()

Gets solution object properties.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Contents of the Dataset and *SimilaritySolution()* object details in the *SimilaritySolutionStore*. `{ "domainName": "String", "label": "String", "lookupDatasetProperties": {Object}, "name": "String", "processingLanguage": "String", "scope": "String", "stopwords": [Array], "testDatasetProperties": {Object},`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"trainingFrequency": "String", "updateFrequency": "String"
	}</pre>

<Object>.domainName	Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String.

<Object>.label	Identifies the prediction task. <pre>{
	"label": "my first prediction"
	}</pre> Data type: String.

<Object>.lookupDatasetProperties	Details of the *DatasetDefinition()* object used as the lookup set. <pre>{
	"encodedQuery": "String", "fieldDetails": [Array], "fieldNames": [Array], "tableName": "String"
	}</pre> Data type: Object.

<Object>.lookupDatasetProperties.tableName	Name of the table for the dataset. For example, `"tableName" : "Incident"`. Data type: String.
<Object>.lookupDatasetProperties.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Data type: Array.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.lookupDatasetProperties.fieldNames.fieldDetails	List of JavaScript objects that specify field properties. `[ { "name": "String", "type": "String" } ]` Data type: Array.
<Object>.lookupDatasetProperties.fieldNames.fieldDetails.<object>.name	Name of the field defining the type of information to restrict this dataset to. Data type: String.
<Object>.lookupDatasetProperties.fieldDetails.<object>.type	Machine-learning field type. Data type: String.
<Object>.lookupDatasetProperties.fieldDetails.encodedQuery	Encoded query string in standard Glide format. See Encoded query strings. Data type: String.
<Object>.name	System-assigned name. Data type: String.
<Object>.processingLanguage	Processing language in two-letter ISO 639-1 language code format. Data type: String.
<Object>.scope	Object scope. Currently the only valid value is `global`. Data type: String
<Object>.stopwords	Optional. Preset list of strings that the system automatically generates based on the *`language`* property setting. For details, see Create a custom stopwords list. Data type: Array.
<Object>.testDatasetProperties	Details of the *`DatasetDefinition()`* object used to retrieve similarities between results searched in this

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	model and results found in the *lookupDataset*. `{ "encodedQuery": "String", "fieldDetails": [Array], "fieldNames": [Array], "tableName": "String" }` Data type: Object.
<Object>.testDatasetProperties.tableName	Name of the table for the dataset. For example, `"tableName" : "Incident"`. Data type: String.
<Object>.testDatasetProperties.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Data type: Array.
<Object>.testDatasetProperties.fieldNames.fieldDetails	List of JavaScript objects that specify field properties. `[ { "name": "String", "type": "String" } ]` Data type: Array.
<Object>.testDatasetProperties.fieldNames.fieldDetails.<object>.name	Name of the field defining the type of information to restrict this dataset to. Data type: String.
<Object>.testDatasetProperties.fieldDetails.<object>.type	Machine-learning field type. Data type: String.
<Object>.testDatasetProperties.fieldDetails.encodedQuery	Encoded query string in standard Glide format. See Encoded query strings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String.
<Object>.trainingFrequency	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once Data type: String.
<Object>.updateFrequency	The frequency at which the model for the solution definition must be rebuilt. Possible values: • do_not_update • every_1_day • every_1_hour • every_6_hours • every_12_hours • every_1_minute • every_15_minutes • every_30_minutes Default: do_not_update Datatype: String

The following example gets properties of a solution object in the store.

```
var mySolution =
 sn_ml.SimilaritySolutionStore.get('ml_sn_global_global_similari
ty_solution');

gs.print(JSON.stringify(JSON.parse(mySolution.getProperties()),
 null, 2));
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
*** Script: {
  "domainName": "global",
  "label": "similarity",
  "lookupDatasetProperties": {
    "tableName": "incident",
    "fieldNames": [
      "short_description"
    ]
  },
  "name": "ml_x_snc_global_global_similarity",
  "processingLanguage": "en",
  "scope": "global",
  "stopwords": [
    "Default English Stopwords"
  ],
  "testDatasetProperties": {
    "tableName": "incident",
    "fieldNames": [
      "short_description"
    ]
  },
  "trainingFrequency": "every_30_days",
  "updateFrequency": "do_not_update"
}
```

SimilaritySolution - getVersion(String version)

Gets a solution by provided version number.

Parameters

Name	Type	Description
version	String	Existing version number of a solution.

Returns

Type	Description
Object	Specified version of the *SimilaritySolution()* object on which you can call *SimilaritySolutionVersion* API methods.

The following example shows how to get the training status of a solution by version number.

```
var mlSolution =
 sn_ml.SimilaritySolutionStore.get('ml_x_snc_global_global_simil
arity');

gs.print(JSON.stringify(JSON.parse(mlSolution.getVersion('1').ge
tStatus()), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "hasJobEnded": "true"
}
```

SimilaritySolution - setActiveVersion(String version)

Activates a specified version of a solution in the store.

Parameters

Name	Type	Description
version	String	Name of the *SimilaritySolution()* object version to activate. Activating this version deactivates any other version.

Returns

Type	Description
None	

The following example shows how to activate a solution version in the store.

```
sn_ml.SimilaritySolution.setActiveVersion("ml_x_snc_global_simil
arity_solution");
```

SimilaritySolution - submitTrainingJob()

Submits a training job.

Note: Before running this method, you must first add a solution to the store using the *SimilaritySolutionStore - add()* method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	*SimilaritySolutionVersion* object corresponding to the *SimilaritySolution* being trained.

```
// Create a dataset
var incidentData = new sn_ml.DatasetDefinition({
    'tableName' : 'incident',
    'fieldNames' : ['category', 'short_description']
});

var kbData = new sn_ml.DatasetDefinition({
    'tableName' : 'kb_knowledge',
    'fieldNames' : ['short_description'],
    'encodedQuery' : 'active=true'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
});

// Create a solution
var encoder = sn_ml.EncoderStore.get('GloVe');
var mySolution = new sn_ml.SimilaritySolution({
    'label': "similarity solution",
    'lookupDataset' : kbData,
    'testDataset' : incidentData,
    'encoder' : encoder,
});

// Add solution
var solutionName =
 sn_ml.SimilaritySolutionStore.add(mySolution);

// Train the solution - this is a long running job
var mySimilarityVersion = mySolution.submitTrainingJob();
```

SimilaritySolutionStore - Global

Enables storing and retrieving solutions.

The *SimilaritySolutionStore* API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

SimilaritySolutionStore - add(Object mlSolution)

Adds a new solution object to the store and returns a unique name.

Note: Label values do not need to be unique. For example, if you run this method with the same label 10 times, this method adds 10 different uniquely-named objects to the store.

Parameters

Name	Type	Description
mlSolution	SimilaritySolution	*SimilaritySolution()* object to add to the store.

Returns

Type	Description
String	System-generated solution name.

The following example shows how to add a solution to the store. Use to run the training job after adding it to the store.

```
// Create a dataset
var myData = new sn_ml.DatasetDefinition({

  'tableName' : 'incident',
  'fieldNames' : ['assignment_group', 'short_description',
 'description'],
  'encodedQuery' : 'activeANYTHING'

});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Create a solution
var mySolution = new sn_ml.SimilaritySolution({

  'label': "my solution definition",
  'dataset' : myData,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames':['short_description']

});

// Add the solution to the store to later be able to retrieve
 it.
var my_unique_name =
 sn_ml.SimilaritySolutionStore.add(mySolution);
```

SimilaritySolutionStore - deleteObject(String name)

Removes a specified solution object from the store.

Parameters

Name	Type	Description
name	String	Name of the *SimilaritySolution()* object to be deleted.

Returns

Type	Description
None	

The following example shows how to delete a solution from the store.

```
sn_ml.SimilaritySolutionStore.deleteObject("ml_sn_global_global_
solution");
```

SimilaritySolutionStore - get(String name)

Gets a solution object from the store.

Parameters

Name	Type	Description
name	String	Name of a solution in the store.

Returns

Type	Description
Object	*SimilaritySolution* object. Returns an error if the object does not exist.

The following example shows how to get a solution object from the store using the *get()* method and view its training status using the SimilaritySolution - getActiveVersion() and SimilaritySolutionVersion - getStatus() methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Get status
var mlSolution =
 sn_ml.SimilaritySolutionStore.get('ml_x_snc_global_similarity_s
olution');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getStatus(), null, 2)));
```

Output:

```
{
 "state":"solution_complete",
 "percentComplete":"100",
 "hasJobEnded":"true"
}
```

SimilaritySolutionStore - getAllNames(Object options)

Gets the names of all solution definition records in the store.

Parameters

Name	Type	Description
options	Object	Options for restricting results within the specified properties. `{ "label": "String", "domainName": "String", "scope": "String" };`
options.label	String	Optional. Label of your solution object.
options.domainName	String	Optional. Name of the domain for your solution object. Refer to Domain separation and Predictive Intelligence.
options.scope	String	Optional. Name of an application scope for your solution object.

Returns

Type	Description
Array	List of strings representing solution object names in the store.

In the following example, the *getAllNames()* method returns a list of all names in the store.

```
gs.print(JSON.stringify(JSON.parse(sn_ml.SimilaritySolutionStore
.getAllNames()), null, 2));
```

Output:

```
[
  "ml_x_snc_global_global_my_solution_definition_3",
  "ml_incident_assignment",
  "ml_x_snc_global_global_my_solution_definition",
  "ml_x_snc_global_global_my_solution_definition_2",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "ml_sn_global_global_incident_service"
]
```

In the following example, the *getAllNames()* method returns only names associated with values set in the *options* parameter.

```
var options = {
  'label' : 'my solution definition',
  'domainName' : 'global',
  'scope' : 'global'
};
var solNames =
 sn_ml.SimilaritySolutionStore.getAllNames(options);
gs.print(JSON.stringify(JSON.parse(solNames), null, 2));
```

Output:

```
[
  "ml_x_snc_global_global_my_solution_definition"
]
```

SimilaritySolutionStore - update(String name, Object mlSolution)

Replaces an existing object in the store with the object passed as a parameter. The object name provided must be empty or match.

Parameters

Name	Type	Description
name	String	Name of the solution to update.
mlSolution	*SimilaritySolSimilaritySolution()* object properties to update.	

Returns

Type	Description
None	

The following example shows how to update a solution object in the store.

```
var solutionUpdate = new sn_ml.SimilaritySolution({
  'label': 'my solution definition',
  'dataset' : myData,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames': ['short_description']
});

sn_ml.SimilaritySolutionStore.update('ml_sn_global_global_incide
nt_service', solutionUpdate);
```

SimilaritySolutionVersion - Global

The *SimilaritySolutionVersion* API is a scriptable object used in Predictive Intelligence stores.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

This API is used is used for working with solution versions based on SimilaritySolution API objects in the SimilaritySolution store.

The system creates a solution version each time you train a solution definition. Most versions are created during scheduled solution training.

Methods in this API are accessible using the following *`SimilaritySolution`* methods:

- *`getActiveVersion()`*
- *`getAllVersions()`*
- *`getLatestVersion()`*
- *`getVersion()`*

SimilaritySolutionVersion - getProperties()

Gets solution object properties and version number.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Contents of the Dataset and SimilaritySolution version details. Results vary by object property setup. `{ "domainName": "String", "isActive": "String", "label": "String", "lookupDatasetProperties": {Object}, "name": "String", "predictedFieldName": "String", "processingLanguage": "String", "scope": "String", "stopwords": [Array], "testDatasetProperties": {Object}, "trainingFrequency": "String", "updateFrequency": "String", "versionNumber": "String" }`
<Object>.domainName	Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String.
<Object>.isActive	Flag that indicates whether this version is active. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: Version is active. • false: Version is not active. Data type: String
<Object>.label	Identifies the prediction task. `{ "label": "my first prediction" }` Data type: String.
<Object>.lookupDatasetDetails	Details of the *DatasetDefinition()* object used as the lookup set. `{ "encodedQuery": "String", "fieldDetails": [Array], "fieldNames": [Array], "tableName": "String" }` Data type: Object.
<Object>.lookupDatasetDetails.tableName	Name of the table for the dataset. For example, `"tableName" : "Incident"`. Data type: String.
<Object>.lookupDatasetDetails.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Data type: Array.
<Object>.lookupDatasetDetails.fieldDetails	List of JavaScript objects that specify field properties. `[ { "name": "String", "type": "String" } ]` Data type: Array.
<Object>.lookupDatasetDetails.fieldDetails.name	Name of the field. Required.
<Object>.lookupDatasetDetails.fieldDetails.type	Machine learning data type of <object_name> to restrict this dataset to. Data type: String.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String.
<Object>.lookupDatasetProperties	Encoded query string in standard Glide format. See Encoded query strings. Data type: String.
<Object>.name	System-assigned name. Data type: String.
<Object>.predictedFieldName	Identifies a field to be trained for predictability. Data type: String.
<Object>.processingLanguage	Processing language in two-letter ISO 639-1 language code format. Data type: String.
<Object>.scope	Object scope. Currently the only valid value is `global`. Data type: String
<Object>.stopwords	Optional. Preset list of strings that the system automatically generates based on the *`language`* property setting. For details, see Create a custom stopwords list. Data type: Array.
<Object>.testDatasetProperties	Details of the *`DatasetDefinition()`* object used to retrieve similarities between results searched in this model and results found in the *`lookupDataset`*. `{ "encodedQuery": "String", "fieldDetails": [Array], "fieldNames": [Array], "tableName": "String" }` Data type: Object.
<Object>.testDatasetProperties.tableName	Name of the table for the dataset. For example, `"tableName" : "Incident"`. Data type: String.
<Object>.testDatasetProperties.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Data type: Array.
<Object>.testDatasetProperties.fieldDetails	List of JavaScript objects that specify field properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>[
	  {
	  "name": "String",
	  "type": "String"
	  }
	]</pre>
	Data type: Array.

<Object>.testDatasetProperties.fields	Name of the field and its corresponding type object information Data type: String.
<Object>.testDatasetProperties.fields.type	Machine learning field type. Data type: String.
<Object>.testDatasetProperties.filterQuery	Encoded query string to restrict the dataset to. Details regarding encoded query string format. See Encoded query strings. Data type: String.
<Object>.trainingFrequency	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once Data type: String.
<Object>.updateFrequency	The frequency at which the model for the solution definition must be rebuilt. Possible values: • do_not_update • every_1_day • every_1_hour • every_6_hours • every_12_hours • every_1_minute

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• every_15_minutes • every_30_minutes Default: do_not_update Datatype: String
<Object>.versionNumber	Version number of the *SimilaritySolution* object. Data type: String.

The following example gets properties of the active object version in the store.

```
// Get properties
var mlSolution =
 sn_ml.SimilaritySolutionStore.get('ml_x_snc_global_similarity_s
olution');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getProperties()), null, 2));
```

Output:

```
*** Script: {
  "domainName": "global",
  "encoderProperties": {
    "datasetsProperties": [],
    "name": "wordCorpusA"
  },
  "isActive": "true",
  "label": "similarity",
  "lookupDatasetProperties": {
    "encodedQuery": "",
    "fieldNames": [
      "short_description"
    ],
    "tableName": "incident"
  },
  "name": "ml_x_snc_global_global_similarity",
  "processingLanguage": "en",
  "stopwords": [
    "Default English Stopwords"
  ],
  "testDatasetProperties": {
    "fieldNames": [
      "short_description"
    ],
    "tableName": "incident"
  },
  "versionNumber": "3"
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SimilaritySolutionVersion - getStatus(Boolean includeDetails)

Gets training completion status.

Parameters

Name	Type	Description
includeDetails	Boolean	Flag that indicates whether to return status *details*. Valid values: • true: Return additional details. • false: Don't return additional details. Default: False

Returns

Type	Description
Object	JavaScript object containing training status information for a SimilaritySolution object. `{ "state": "String", "percentComplete": "Number as a String", "hasJobEnded": "Boolean value as a String", "details": {Object} }`
<Object>.state	Training completion state. If the training job reaches a terminal state, the job does not leave that state. If the state is terminal, the *hasJobEnded* property is set to `true`. Possible values: • `fetching_files_for_training` • `preparing_data` • `retry` • `solution_cancelled` (terminal) • `solution_complete` (terminal) • `solution_error` (terminal) • `solution_incomplete` • `training_request_received` • `training_request_timed_out` (terminal) • `training_solution` • `uploading_solution` • `waiting_for_training` Data type: String
<Object>.hasJobEnded	Flag that indicates whether training is complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Valid values: • true: Training is complete. • false: Training is incomplete. Data type: Boolean value as a String
<Object>.percentComplete	Training percent complete. If the completion percentage is less than 100, the job might be in a terminal state. For example, if training times out. Data type: Number as a String Range: 0 thru 100
<Object>.details	Object containing a list of additional training details. Data type: Object

The following example shows a successful result with training complete.

```
// Get status
var mlSolution =
 sn_ml.SimilaritySolutionStore.get('ml_x_snc_global_similarity_s
olution');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getStatus(true), null, 2)));
```

Output:

```
{
 "state":"solution_complete",
 "percentComplete":"100",
 "hasJobEnded":"true",
 "details":{"stepLabel":"Solution Complete"} // This information
 is only returned if getStatus(true);
}
```

The following example shows an unsuccessful result with training complete.

```
// Get status
var solutionName = 'ml_x_snc_global_global_similarity_solution';
var mlSolution =
 sn_ml.SimilaritySolutionStore.get(solutionName);
var trainingStatus =
 JSON.parse(mlSolution.getLatestVersion().getStatus());

gs.print(JSON.stringify(JSON.parse(trainingStatus), null, 2));
```

Output:

```
{
 "state":"solution_error",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 "percentComplete":"100",
 "hasJobEnded":"true"
}
```

SimilaritySolutionVersion - getVersionNumber()

Gets the version number of a solution object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Version number.

The following example shows how to get a version number.

```
// Get version number
var mlSolution =
 sn_ml.SimilaritySolutionStore.get('ml_x_snc_global_similarity_s
olution');

gs.print("Version number:
 "+JSON.stringify(JSON.parse(mlSolution.getActiveVersion().getVe
rsionNumber()), null, 2));
```

Output:

```
Version number: 1
```

SimilaritySolutionVersion - predict(Object input, Object options)

Gets the input data for a prediction.

Parameters

Name	Type	Description
input	Object	*GlideRecord* or array of JSON objects containing field names and values as key-value pairs.
options	Object	Optional values for filtering prediction results. `{ "apply_threshold": Boolean, "top_n": Number }`
options.apply_threshold	Boolean	Flag that indicates whether to check the threshold value for the solution and apply it to the result set. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• true: Return results in which confidence is greater than threshold. • false: Return all results. Default: True
options.top_n	Number	If provided, returns the top results, up to the specified number of predictions.

Returns

Type	Description
Object	JSON object containing the prediction results sorted by sys_id or record_number. `{ <identifier>: [Array] }`
<Object>.<identifier>	List of objects with details for each prediction result. Data type: Array of Objects `<identifier>: [ { "confidence": Number, "predictedSysId": "String", "predictedValue": "String", "threshold": Number } ]`
<Object>.<identifier>.<object.confidence	Value of the confidence associated with the prediction. For example, 53.84. Data type: Number
<Object>.<identifier>.<object.predictedSysId	The sys_id of the predicted value. Results can be from any table on which information is being predicted. Data type: String
<Object>.<identifier>.<object.predictedValue	Value of the prediction result. Data type: String
<Object>.<identifier>.<object.threshold	Value of the configured threshold associated with the prediction. Data type: Number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to display prediction results for a *predict()* method that takes a GlideRecord by sys_id for input and includes optional parameters to restrict to top three results and exclude the threshold value.

```
var mlSolution =
 sn_ml.SimilaritySolutionStore.get('ml_x_snc_global_similarity_s
olution');

// single GlideRecord input
var input = new GlideRecord("incident");
input.get("<sys_id>");

// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;

var results = mlSolution.getVersion(1).predict(input, options);
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));
```

```
{
        "<sys_id/now_GR>": [
    {
      "confidence": 62.10782320780268,
      "threshold": 20.36,
      "predictedValue": "Clone Issues",
      "predictedSysId": ""
    },
    {
      "confidence": 6.945237375770391,
      "threshold": 16.63,
      "predictedValue": "Instance Administration",
      "predictedSysId": ""
    },
    {
      "confidence": 5.321061076300759,
      "threshold": 23.7,
      "predictedValue": "Administration",
      "predictedSysId": ""
    }
  ]
}
```

The following example shows how to display prediction results for a *predict()* method that takes an array of field names as key-value pairs for input and includes optional parameters to restrict to top three results and exclude the threshold value.

```
var mlSolution =
 sn_ml.SimilaritySolutionStore.get("ml_x_snc_global_similarity_s
olution");
// key-value pairs input
var input = [{"short_description":"my email is not working"},
 {short_description:"need help with password"}];
// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;
```

      "predictedSysId": ""
    }
  ]
}
```

SkillDeterminationUtils - Scoped

The *SkillDeterminationUtils* script include provides utility methods to get or set work item skill data.

This script include requires the Skill Determination (com.snc.skill_determination) plugin and is provided within the `sn_skill_rule` namespace.

SkillDeterminationUtils - SkillDeterminationUtils()

Constructor to create an instance of SkillDeterminationUtils.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

```
var util = new sn_skill_rule.SkillDeterminationUtils();
```

SkillDeterminationUtils - assignSkillsToWorkItem(Array skills, GlideRecord now_GR)

Assigns an array of active skill objects to a work item.

Parameters

Name	Type	Description
skills	Array	Array of active skill objects to be assigned.
skill.skillName	String	Name of the skill.
skill.skillSysId	String	Sys ID of the skill.
skill.mandatory	Boolean	True if the skill is mandatory, false otherwise.
skill.skillLevelName	String	Optional skill level name.
skill.skillLevelSysId	String	Optional skill level Sys ID.
now_GR	GlideRecord	GlideRecord of the work item on which to assign skills.

Returns

Type	Description
None	

The examples below create an Interaction record using the table name (interaction) and show how to assign skills to the interaction work item, creating a record in the Interaction Skills [interaction_m2m_skill] table.

Use case 1: Use returned results from determineWorkItemSkills() to assign skills to a work item from the Interaction table.

```
// Create an interaction record
var now_GR = new GlideRecord('interaction');
now_GR.insert();

var util = new sn_skill_rule.SkillDeterminationUtils();

// Get interaction skills interaction
// and specify if any are mandatory
var result = util.determineWorkItemSkills(now_GR);

// Assign skills determined by result and
// assign them to the interaction work item
util.assignSkillsToWorkItem(result, now_GR);
```

Use case 2: Manually insert skills array. In this case, assign IT skills to the Interaction work item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var now_GR = new GlideRecord('interaction');
now_GR.insert();

var util = new sn_skill_rule.SkillDeterminationUtils();

var skills = [{"skillSysId":"2eb1c2029f100200a3bc1471367fcfe4",
 "skillName":"IT", "mandatory":true, "skillLevelName":"",
 "skillLevelSysId":null}];

util.assignSkillsToWorkItem(skills, now_GR);
```

SkillDeterminationUtils - determineWorkItemSkills(GlideRecord now_GR)

Gets skills for a specified work item, indicates if the skills are mandatory, and lists any skill levels.

Parameters

Name	Type	Description
now_GR	GlideRecord	GlideRecord of a work item from any interaction or task table extension.

Returns

Type	Description
Array	One or more skill objects. • skillSysId: String. Sys ID of the skill from the Skills [cmn_skill] table. • skillName: String. Name of the skill. • mandatory: Boolean. True if mandatory, false otherwise. • skillLevelName: If skill exists, name of the skill level. • skillLevelSysId: If skill exists, Sys ID of the skill level from the Skill Levels [cmn_skill_level] table.

The following script creates an interaction record, gets skills for the interaction work item, and indicates if the skills are mandatory.

```
// Create an interaction record
var now_GR = new GlideRecord('interaction');
now_GR.insert();

var util = new sn_skill_rule.SkillDeterminationUtils();

var result = util.determineWorkItemSkills(now_GR);
gs.info(JSON.stringify(result));
```

Output:

```
[{"skillSysId":"6c0f025c7f672300a8b1bdc8adfa917f",
"skillName":"Premier Support Certified",
"mandatory":false,"skillLevelName":"",
"skillLevelSysId":null}]
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLARepair - Global

The *SLARepair* script include provides methods that delete the existing SLAs and then recreates them from each task's history.

SLARepair - repairByFilter(String filter, String sourceTable)

Repair the task SLAs associated with the passed-in filter and source table.

Parameters

Name	Type	Description
filter	String	Encoded query that is used to retrieve a set of records from the source table.
sourceTable	String	Name of a table that is (or extends) contract_sla, task_sla, or task.

Returns

Type	Description
void	

Repair SLAs for problems created last month with a priority of 2.

```
var now_GR = new GlideRecord("problem");
now_GR.addQuery("sys_created_on", "ON", "Last
 Month@javascript:gs.beginningOfLastMonth()@javascript:gs.endOfL
astMonth()");
now_GR.addQuery("priority", "2");
now_GR.query();

var repair = new SLARepair();
repair.repairByFilter(now_GR.getEncodedQuery(),
 now_GR.getRecordClassName());
```

SLARepair - repairByGlideRecord(GlideRecord now_GR)

Repair the task SLAs associated with the passed in GlideRecord.

Parameters

Name	Type	Description
now_GR	GlideRecord	GlideRecord for a table that is (or extends) contract_sla, task_sla, or task.

Returns

Type	Description
void	

Repair SLAs for problems created last month with a priority of 2.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var now_GR = new GlideRecord("problem");
now_GR.addQuery("sys_created_on", "ON", "Last
 Month@javascript:gs.beginningOfLastMonth()@javascript:gs.endOfL
astMonth()");
now_GR.addQuery("priority", "2");
now_GR.query();

var repair = new SLARepair();
repair.repairByGlideRecord(now_GR);
```

SLARepair - repairBySysId(String sysId, String sourceTable)

Repair the task SLAs associated with the passed in sys_id and source table.

Parameters

Name	Type	Description
sysId	string	Specify the ID of a table that is (or extends) contract_sla, task_sla, or task.
sourceTable	string	Specify the name of a table that is (or extends) contract_sla, task_sla, or task.

Returns

Type	Description
void	

Find problems created last month with a priority of 2.

```
var now_GR = new GlideRecord("problem");
now_GR.addQuery("sys_created_on", "ON", "Last
 Month@javascript:gs.beginningOfLastMonth()@javascript:gs.endOfL
astMonth()");
now_GR.addQuery("priority", "2");
now_GR.query();

var repair = new SLARepair();
repair.repairBySysId(now_GR.sys_id + "",
 now_GR.getRecordClassName());
```

SLARepair - setAuditEnabled(Boolean onOrOff)

Enables or disables auditing when running a repair.

By default, auditing is set to the value in the property *com.snc.sla.repair.audit*. You can override this by passing in true to enable or false to disable auditing.

Parameters

Name	Type	Description
onOrOff	Boolean	Flag that indicates whether to enable auditing. Valid values: • true: Enable auditing. • false: Disable auditing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
this	Self-reference to allow for method chaining.

```
var builder = new SLARepair();
  builder.setAuditEnabled(true);
```

SLARepair - setRunWorkflow(Boolean onOrOff)

Enables or disables running a workflow for each of the Task SLA records being repaired.

By default, when a Task SLA is repaired the workflow is run during the repair process. To override this, you can pass in false to disable running of the workflow.

Parameters

Name	Type	Description
onOrOff	Boolean	Flag that indicates whether to enable workflow. Valid values: • true: Enable workflow. • false: Disable workflow.

Returns

Type	Description
this	Self-reference to allow for method chaining.

```
var repair = new SLARepair();
repair.setRunWorkflow(false);
```

SLARepair - setValidateOnly(Boolean onOrOff)

Validates the repair request.

If false is passed in, the task SLAs are repaired. If true is passed in, calls to repair don't alter any task SLAs, they only validate the supplied parameters and generate a count of records to be repaired.

Parameters

Name	Type	Description
onOrOff	Boolean	Flag that indicates whether to enable validation. Valid values: • true: Enable validation. • false: Disable validation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
this	Self-reference to allow for method chaining.

```
var repair = new SLARepair();
  repair.setValidateOnly(true);
```

SLPServiceRegistryQuery - Global

The *SLPServiceRegistryQuery* script include provides methods to map Shazzam! SLP query results to port probes.

Use this script include during the discovery scanning phase.

SLPServiceRegistryQuery - getShazzamQuerierClassname()

Returns the Shazzam querier class name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The class name

SLPServiceRegistryQuery - toPortProbeMap()

Creates a scalar map for port probes to use in XML output to Shazzam!.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	The scalar map

SMSPreferenceHandlerSNC - Scoped, Global

The *SMSPreferenceHandler* script include provides methods to manage short message service (SMS) configurations.

This script include is implemented as the script include *SMSPreferenceHandlerSNC* and resides in the `sn_sms_pref` namespace. To use this API you must install the Notify plugin (com.snc.notify) which requires a separate subscription. You can activate this plugin if you have the admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SMSPreferenceHandlerSNC - SMSPreferenceHandler(String provider)

Instantiates the SMSPreferenceHandler script include object.

Parameters

Name	Type	Description
provider	String	Name of the telephony service provider.

```
var handler = new
 sn_sms_pref.SMSPreferenceHandler('TwilioDirect'); // Pass the
 provider name
var config = handler.getConfig();
```

SMSPreferenceHandlerSNC - getConfig()

Returns the preferences configuration record for the current telephony service provider.

The method queries all preference configuration records from the SMS Preference Configuration [sn_sms_pref_configuration] table for the current telephony service provider, sorts the results by the Order field (lowest to highest), and then returns the first record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideRecord	Preference configuration record for the current telephony service provider. If no record exists, then null.

```
var handler = new
 sn_sms_pref.SMSPreferenceHandler('TwilioDirect'); // Pass the
 provider name
var config = handler.getConfig();
```

SNEventSenderProvider - Global

The *SNEventSenderProvider* API provides a method to instantiate an IEventSender instance.

Use this API when writing scripts that will run on MID Servers to instantiate the object to send an event to your ServiceNow instance.

Use the *IEventSender* API to send the event to the ServiceNow instance. Use the *Event* API to add/update fields within an event.

You must activate the Event Management (com.glideapp.itom.snac) plugin before attempting to access this API. The Event Management plugin requires a separate subscription and must be activated. This plugin includes demo data and activates related plugins if they are not already active.

For additional information on event management, see Event Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

EventSender - getEventSender()

Returns an IEventSender object to use to send events from a MID Server to a ServiceNow instance.

You must call this method before calling any *IEventSender* API methods.

Parameters

Name	Type	Description
None		

Returns

Type	Description
IEventSender	IEventSender object to use to send an event to a ServiceNow instance.

```
var eventSender = SNEventSenderProvider.getEventSender();
```

SNMPGatherDocParts - Global

The *SNMPGatherDocParts* script include provides methods to handle the gathering of parts of an SNMP response document for JavaScript SNMP sensors.

Use this script include in a discovery script when you need to gather the parts of an SNMP response document.

SNMPGatherDocParts - gather(String doc, Object probe)

Returns the given XML document with any data gathered by prior SNMP probes.

Parameters

Name	Type	Description
doc	String	The XML document for this sensor
probe	Object	The probe instance

Returns

Type	Description
String	The XML document with the gathered data.

SNMPNetworkInterfaces - Global

The *SNMPNetworkInterfaces* script include provides methods to create network interfaces for JavaScript SNMP sensors.

Use this script include in discovery scripts when you need to create network interfaces for JavaScript SNMP sensors.

SNMPNetworkInterfaces - process(String cmdb_ci, String doc, Boolean isComputer, String agentName, String ecc_sys_id)

Analyzes the SNMP data and reconciles the discovered NICs to the CMDB's NICs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
cmdb_ci	String	The sys_id of the CI
doc	String	The SNMP data in XML form
isComputer	Boolean	If true, this is a computer; otherwise, false.
agentName	String	Name of the MID server
ecc_sys_id	String	The sys_id of the ECC queue record with the input.

Returns

Type	Description
void	

SNMPResponse - Global

The *SNMPResponse* script include provides methods to wrap an SNMP payload response instance with methods to safely and easily retrieve SNMP singleton fields or tables.

Use this script include to retrieve SNMP singleton fields or tables.

SNMPResponse - buildIndex(Object cur, String name, String extName)

Builds an index to all SNMP entities in the current object.

Parameters

Name	Type	Description
cur	Object	The current object
name	String	The index name
extName	String	The index extension

Returns

Type	Description
void	

SNMPResponse - buildReferences()

Builds references to actual instances for all identified indexes (in the discovery_snmp_ref table) that can be resolved.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

SNMPResponse - getAmbiguousOIDs(String refBase, String refLeaf)

Returns an array of OIDs that match the given ref_base and which have a defined, non-null ref_leaf.

The last character of ref_base may be a question mark; in that case, if the parent node is a table then all table entries are returned.

Parameters

Name	Type	Description
refBase	String	The reference base
refLeaf	String	The reference leaf

Returns

Type	Description
Array	An array of OIDs that match the given ref_base and which have a defined, non-null ref_leaf.

SNMPResponse - getOIDInt(String name)

Returns the integer contained in the OID object with the given MIB name.

Parameters

Name	Type	Description
name	String	The MIB name

Returns

Type	Description
Number	The integer contained in the OID object, or zero if the object could not be found or is empty.

SNMPResponse - getOIDObj(String name)

Retrieves the OID object with the given MIB name from the response.

This method does not work with numeric OID strings, only MIB names.

Parameters

Name	Type	Description
name	String	The MIB name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
OID object	The OID object with the given MIB name, or null if the object could not be found or if any table entries are encountered while walking down the named elements.

SNMPResponse - getOIDTable(String parentName, String entryName)

Returns a hashmap of table entries under the given parent MIB name, with the given entry MIB names.

Parameters

Name	Type	Description
parentName	String	The parent MIB name
entryName	String	The entry MIB name

Returns

Type	Description
Hashmap	A hashmap of table entries under the given parent MIB name, with the given entry MIB names, or null if the parent does not exist.

SNMPResponse - getOIDText(String name)

Returns the text contained in the OID object with the given MIB name.

Parameters

Name	Type	Description
name	String	The MIB name

Returns

Type	Description
String	The text contained in the OID object. Returns null if the object could not be found, or if it has no text.

SNMPResponse - normalize(Object cur)

Resolves SNMP tables into hashmaps and OID values into primitives.

All SNMP numeric types convert to a JavaScript number. An SNMP null type converts to a JavaScript null. An SNMP IP Address value converts to a Java IPAddressV4 instance. All other values convert to a JavaScript string.

Parameters

Name	Type	Description
cur	Object	The SNMP table or OID value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

SOAPMessageV2 - Scoped, Global

The *SOAPMessageV2* API provides methods to send an outbound SOAP message using JavaScript.

Use this API to manage the response returned by the SOAP provider.

You can use this API in scoped applications or within the global scope. This API runs in the `sn_ws` namespace.

Use the SOAPResponseV2 - Scoped, Global API to query the return parameters.

See also:

- Direct SOAPMessageV2 example
- Recordless SOAPMessageV2 example
- Asynchronous SOAPMessageV2 example
- SOAPMessageV2 MID server example

SOAPMessageV2 - SOAPMessageV2()

Instantiates an empty SOAPMessageV2 object.

When using an object instantiated this way, you must manually specify a SOAP action and endpoint.

Parameters

Name	Type	Description
None		

```
var sm = new sn_ws.SOAPMessageV2();
```

SOAPMessageV2 - SOAPMessageV2(String soapMessage, String soapFunction)

Instantiates a SOAPMessageV2 object from a SOAP message record and a function associated with that record.

Values such as the endpoint, authentication, or MID Server settings from the SOAP message record apply to this object.

Parameters

Name	Type	Description
soapMessage	String	SOAP message record you want to use as the base for this object.
soapFunction	String	SOAP function you want to execute. Available SOAP functions depend on the WSDL supplied by the web service provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
```

SOAPMessageV2 - execute()

Sends the SOAP message to the endpoint.

Parameters

Name	Type	Description
None		

Returns

Type	Description
SOAPResponseV2 - Scoped, Global	Response returned by the SOAP provider.

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
var response = sm.execute(); //Might throw exception if http
 connection timed out or some issue with sending request itself
 because of encryption/decryption of password.
```

SOAPMessageV2 - executeAsync()

Sends the SOAP message to the ECC queue.

SOAP messages in the ECC queue are processed by the SOAPClient business rule.

By default, this business rule does not run asynchronously. To configure this business rule to run asynchronously, set the **When** value to Async and add current.update() to the end of the **Script**. The instance does not wait for a response from the web service provider when sending a message through the ECC queue.

Parameters

Name	Type	Description
None		

Returns

Type	Description
SOAPResponseV2 - Scoped, Global	Response returned by the SOAP provider. **Note:** Attempting to use the SOAP response object before the response has been processed may result in a timeout error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
var response = sm.executeAsync();
```

SOAPMessageV2 - getEndpoint()

Gets the endpoint for the SOAP message.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	URL of the SOAP web service provider.

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
var endpoint = sm.getEndpoint();
```

SOAPMessageV2 - getRequestBody()

Returns the content of the SOAP message body.

Note: Before calling the *`getRequestBody()`* method, you must call the execute() method to obtain the response object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	SOAP message body.

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","StockQuoteSoap.GetQuote"); //
Might throw exception if message doesn't exist or not visible
 due to scope.
var response = sm.execute();
var requestBody = response.getRequestBody();
```

SOAPMessageV2 - getRequestHeader(String headerName)

Gets the value for an HTTP header specified by the SOAP client.

By default, this method cannot return the value for a header set automatically by the system. To grant this method access to all headers, set the property glide.http.log_debug to true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
headerName	String	Request header you want to get the value for.

Returns

Type	Description
String	Value of the specified header.

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
var header = sm.getRequestHeader("Accept");
```

SOAPMessageV2 - getRequestHeaders()

Gets HTTP headers that were set by the SOAP client and the associated values.

This method does not return headers set automatically by the system. To configure this method to return all headers, set the property glide.http.log_debug to true.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Object that maps the name of each header to the associated value.

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
var requestHeaders = sm.getRequestHeaders();
```

SOAPMessageV2 - setBasicAuth(String userName, String userPass)

Sets basic authentication headers for the SOAP message.

Setting basic authentication headers using this method overrides basic authentication values defined in the SOAP message record.

Parameters

Name	Type	Description
userName	String	Username to use when authenticating the SOAP message.
userPass	String	Password for the specified user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
sm.setBasicAuth("username","password");
```

SOAPMessageV2 - setEccCorrelator(String correlator)

Associates outbound requests and the resulting response record in the ECC queue.

This method only applies to SOAP messages sent through a MID Server. The correlator provided populates the **Agent correlator** field on the ECC queue record for the response. Provide a unique correlator for each outbound request to associate the correct results in the ECC queue with the request when designing asynchronous automation through a MID Server.

Parameters

Name	Type	Description
correlator	String	Unique identifier

Returns

Type	Description
void	

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
sm.setEccCorrelator("unique_id");
```

SOAPMessageV2 - setEccParameter(String name, String value)

Overrides a value from the database by writing to the SOAP message payload.

This method only applies to SOAP messages sent through a MID Server. Use this method when a value from the SOAP message in the database is invalid, such as when the endpoint URL is longer than the maximum **SOAP endpoint** field length.

These are valid values for the name parameter.

- *source*: The endpoint URL.
- *name*: The SOAP message function to run.

Parameters

Name	Type	Description
name	String	Name of the ECC parameter.
value	String	Value to assign to the specified ECC parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
sm.setEccParameter("source","http://very.long.endpoint");
```

SOAPMessageV2 - setEndpoint(String endpoint)

Sets the endpoint for the SOAP message.

By default, the SOAP message uses the endpoint specified in the SOAP message record. Use this method to override the default. You must call this method when using the SOAPMessageV2() constructor with no parameters.

Parameters

Name	Type	Description
endpoint	String	URL of the SOAP web service provider you want to interface with.

Returns

Type	Description
void	

```
var sm = new sn_ws.SOAPMessageV2();
sm.setEndpoint("http://web.service.endpoint");
```

SOAPMessageV2 - setHttpTimeout(Number timeoutMs)

Sets the amount of time the SOAP message waits for a response from the web service provider before the request times out.

Parameters

Name	Type	Description
timeoutMs	Number	Amount of time to wait for a response from the web service provider, in milliseconds.

Returns

Type	Description
void	

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
sm.setHttpTimeout(6000);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SOAPMessageV2 - setLogLevel(String level)

Sets the log level for this message and the corresponding response.

Setting a log level using the SOAPMessageV2 API overrides the log level configured on the SOAP message record. This log level may not apply if the endpoint domain is excluded, or if the property *glide.outbound_http_log.override* is true. To view outbound web service logs, navigate to **System Logs** > **Outbound HTTP Requests**.

Parameters

Name	Type	Description
level	String	The log level. Valid values are basic, elevated, and all.

Returns

Type	Description
void	

SOAPMessageV2 - setMIDServer(String midServerName)

Configures the SOAP message to be sent through a MID Server.

By default, the SOAP message uses the MID Server specified in the SOAP message function record. Use this method to override the default.

Parameters

Name	Type	Description
midServerName	String	Name of the MID Server you want to send the SOAP message through. Your instance must have an active MID Server with the specified name.

Returns

Type	Description
void	

SOAPMessageV2 - setMutualAuth(String profileName)

Sets the mutual authentication protocol profile for the SOAP message.

Setting a protocol profile using this method overrides the protocol profile selected for the SOAP message record.

Parameters

Name	Type	Description
profileName	String	Name of the protocol profile to use for mutual authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
sm.setMutualAuth("auth_profile_name");
```

SOAPMessageV2 - setRequestBody(String requestBody)

Sets the body content to send to the web service provider.

When you set the body content using this method, variables in the body are not substituted for parameters from the SOAP message function record. You must explicitly define all values within the SOAP message body.

Parameters

Name	Type	Description
requestBody	String	Body of the SOAP message.

Returns

Type	Description
void	

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
var body = "<SOAP message body>";
sm.setRequestBody(body);
```

SOAPMessageV2 - setRequestHeader(String headerName, String headerValue)

Sets an HTTP header in the SOAP message to the specified value.

Parameters

Name	Type	Description
headerName	String	Name of the header.
headerValue	String	Value to assign to the specified header.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
sm.setRequestHeader("Accept","Application/json");
```

SOAPMessageV2 - setSOAPAction(String soapAction)

Defines the SOAP action this SOAP message performs.

The WSDL for your web service provider lists SOAP actions you can perform. You must call this method when using the SOAPMessageV2() constructor with no parameters.

Parameters

Name	Type	Description
soapAction	String	SOAP action this SOAP message performs.

Returns

Type	Description
void	

```
var sm = new sn_ws.SOAPMessageV2();
sm.setSOAPAction("GetQuote");
//construct SOAP message by specifying endpoint and auth
sm.execute();
```

SOAPMessageV2 - setStringParameter(String name, String value)

Sets a variable with the specified name from the SOAP message record to the specified value.

XML reserved characters in the value are converted to the equivalent escaped characters.

Parameters

Name	Type	Description
name	String	Name of the SOAP message variable.
value	String	Value to assign to the specified variable.

Returns

Type	Description
void	

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
sm.setStringParameter("symbol","NOW");
```

SOAPMessageV2 - setStringParameterNoEscape(String name, String value)

Sets a variable with the specified name from the SOAP message record to the specified value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method is equivalent to setStringParameter but does not escape XML reserved characters.

Parameters

Name	Type	Description
name	String	Name of the SOAP message variable.
value	String	Value to assign to the specified variable.

Returns

Type	Description
void	

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
sm.setStringParameterNoEscape("symbol","NOW");
```

SOAPMessageV2 - setWSSecurity(String keystoreId, String keystoreAlias, String keystorePassword, String certificateId)

Sets web service security values for the SOAP message.

Setting security values using this method overwrites web service security values defined for the SOAP message record.

Parameters

Name	Type	Description
keystoreId	String	Sys_id of the Java or PKCS12 key store to use.
keystoreAlias	String	Alias that identifies the public and private keys.
keystorePassword	String	Password assigned to the key store record.
certificateId	String	Sys_id of the trusted server certificate.

Returns

Type	Description
void	

```
var sm = new
 sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw
 exception if message doesn't exist or not visible due to scope.
sm.setWSSecurity("70d65e074f3812001f6eac118110c71a","Quote
 keys","UXr82cqX75Z7MaSa+EyjGA==","ba969a074f3812001f6eac118110c
76d");
```

SOAPResponseV2 - Scoped, Global

The *SOAPResponseV2* API provides methods that use the data returned by an outbound SOAP message in JavaScript code.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A SOAPResponseV2 object is returned by the *SOAPMessageV2* methods *execute()* and *executeAsync()*.

You can use this API in scoped applications or within the global scope.

This API runs in the `sn_ws` namespace.

See also:

- Direct SOAPMessageV2 example
- Recordless SOAPMessageV2 example
- Asynchronous SOAPMessageV2 example
- SOAPMessageV2 MID server example

SOAPResponseV2 - getAllHeaders()

Returns all headers contained in the response, including any duplicate headers.

Parameters

Name	Type	Description
None		

Returns

Type	Description
List<GlideHTTPHeader>	List of headers contained in the response. Each header is represented as a GlideHTTPHeader object which contains the header *name* and *value*.

```
var r = new sn_ws.SOAPMessageV2('<A SOAP message>', 'get');
var response = r.execute();
var headers = response.getAllHeaders();
for(var i in headers){
  gs.info(headers[i].name + ': ' + headers[i].value);
}
```

SOAPResponseV2 - getBody()

Gets the content of the SOAP response body.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	SOAP response body.

```
var body = response.getBody();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SOAPResponseV2 - getCookies()

Returns all cookies included in the response.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Array of strings representing cookies. Iterate through the array to perform operations on each cookie.

Display individual cookies from the response.

```
var cookies = response.getCookies();
for (var i = 0; i < cookies.length; i++) {
  gs.info('cookie: ' + cookies.get(i));
}
```

Output:

```
cookie: JSESSIONID=4135AA97A5D12DA22EF614AA2B0CAFD8.node20;
 Path=/; Secure; HttpOnly
cookie: SABASESSIONID=370152970.36895.0000; path=/
```

SOAPResponseV2 - getErrorCode()

Gets the numeric error code if there was an error during the SOAP transaction.

This error code is specific to the ServiceNow AI Platform, it is not an HTTP error code. Provide this error code if you require assistance from Customer Service and Support.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Numeric error code, such as 1 for a socket timeout.

```
var errorCode = response.getErrorCode();
```

SOAPResponseV2 - getErrorMessage()

Gets the error message if there was an error during the SOAP transaction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Error message

```
var errorMsg = response.getErrorMessage();
```

SOAPResponseV2 - getHeader(String name)

Gets the value for a specified HTTP header.

Parameters

Name	Type	Description
name	String	Name of the header that you want the value for, such as Set-Cookie.

Returns

Type	Description
String	Value of the specified header.

```
var headerVal = response.getHeader("Accept");
```

SOAPResponseV2 - getHeaders()

Gets all HTTP headers returned in the SOAP response and the associated values.

Note: If a header is present more than once in the response, such as a Set-Cookie header, this function returns only the last of the duplicate headers. To return all headers including duplicates, use the *`getAllHeaders()`* function.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Object that maps the name of each header to the associated value.

```
var headers = response.getHeaders();
```

SOAPResponseV2 - getStatusCode()

Gets the numeric HTTP status code returned by the SOAP provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Numeric status code returned by the SOAP provider, such as 200 for a successful response.

```
var statusCode = response.getStatusCode();
```

SOAPResponseV2 - haveError()

Indicates if there was an error during the SOAP transaction.

Parameters

Name	Type	Description
None		

Returns

Type	Description
boolean	Returns true if there was an error, false if there was no error.

```
var error = response.haveError();
```

SOAPResponseV2 - waitForResponse(Number timeoutSecs)

Sets the amount of time the instance waits for a response from the web service provider.

This method overrides the property glide.soap.outbound.ecc_response.timeout for this SOAP response.

Parameters

Name	Type	Description
timeoutSecs	Number	Amount of time, in seconds, to wait for this response.

Returns

Type	Description
void	

```
response.waitForResponse(60);
```

SPScriptedFacet - Scoped

Defines facet items, filters, or mapped queries for a facets object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can only use the *SPScriptedFacet* API in a facet generation script in a Service Portal search source. The facet generation script is only visible when **Is scripted source** is selected.

There is no constructor for this class. Instead, use the *createFacet()* or *createMultiChoiceFacet()* methods of the *SPScriptedFacetService* class to generate a facets object.

SPScriptedFacet - addFacetItem(String label, Object valueObj)

Adds facet items or mapped queries to a facets object.

Before adding facet items to a facets object, create the facets object using the *createFacet()* or *createMultiChoiceFacet()* methods of the *SPScriptedFacetService* class.

Parameters

Name	Type	Description
label	String	The display label for the facet item or mapped query.
valueObj	Object	The facet item or mapped query for the facet. Can only contain types String, Number, Boolean, and Double.

Returns

Type	Description
void	

```
function createMultiChoiceFacetFromKB(label, variable, values,
 orderBy){
  if(!values || values.length == 0)
    return;

  var kbFacet = facetService.createMultiChoiceFacet(label,
 variable);
  var kbMap = {};
  for(var i in values) {
    var key = values[i].label;
    var value = values[i].id;
    var parent = new KBParentData().getParentCategory(value,
 key);
    key = parent.join(' > ');
    kbMap[key] = value;
  }

  var labels = Object.keys(kbMap).sort();
  for (i = 0; i < labels.length; i++) {
    var currentLabel = labels[i];
    kbFacet.addFacetItem(currentLabel, kbMap[currentLabel]);
    //adds facet search options for each kbMap entry
  }
}
```

SPScriptedFacetService - Scoped

Generates a multi-choice or single-choice facets object for an advanced search source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The *SPScriptedFacetService* API can only be used in a facet generation script in a Service Portal search source. The facet generation script is only visible when **Is scripted source** is selected.

There is no constructor for this class. Instead, use the *createFacet()* or *createMultiChoiceFacet()* methods to generate a facets object.

SPScriptedFacetService - createFacet(String label, String id)

Creates a single choice facets object.

After creating the facets object, add facet items or mapped queries to the facet using the *addFacetItem()* method of the *SPScriptedFacet* class.

Parameters

Name	Type	Description
label	String	Label for the facet.
id	String	ID for the facet.

Returns

Type	Description
Object	Single choice facets object. Returns an error when: • A duplicate label or ID is found. • A label or ID is not defined.

Can only be used in a facet generation script in a Service Portal advanced search source.

```
var stateFacet = facetService.createFacet("State", "state");
```

SPScriptedFacetService - createMultiChoiceFacet(String label, String id)

Creates a multi choice facets object.

After creating the facets object, add facet items or mapped queries to the facet using the *addFacetItem()* method of the *SPScriptedFacet* class.

Parameters

Name	Type	Description
label	String	Label for the facet.
id	String	ID for the facet.

Returns

Type	Description
Object	Multi choice facets object. Returns an error when:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• A duplicate label or ID is found. • A label or ID is not defined.

```
function createMultiChoiceFacetFromKB(label, variable, values,
 orderBy){
  if(!values || values.length == 0)
    return;

  var kbFacet = facetService.createMultiChoiceFacet(label,
 variable);
  var kbMap = {};
  for(var i in values) {
    var key = values[i].label;
    var value = values[i].id;
    var parent = new KBParentData().getParentCategory(value,
 key);
    key = parent.join(' > ');
    kbMap[key] = value;
  }

  var labels = Object.keys(kbMap).sort();
  for (i = 0; i < labels.length; i++) {
    var currentLabel = labels[i];
    kbFacet.addFacetItem(currentLabel, kbMap[currentLabel]);
    //adds facet search options for each kbMap entry
  }
}
```

SPSEOUtilsSNC - Global

The *SPSEOUtilsSNC* script include provides utility methods that return human-readable URLs for a specific page, or for the current page, based on the transaction request.

In addition, this API provides other utility methods that you can use to obtain information that is needed to call other human-readable URL methods.

SPSEOUtilsSNC - getHumanReadableUrl(GlideRecord pageGR, String queryString)

Returns the human-readable URL for a specified record in the Page [sp_page] table. Uses the passed-in query parameters to resolve any dynamic page variables required by the URL.

Parameters

Name	Type	Description
pageGR	GlideRecord	GlideRecord object of the record in the Page [sp_page] table for which to return the human-readable URL. Use the SPSEOUtilsSNC - getPageRecordWithPageRoute(GlideRecord pageId, String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		portalId, Boolean preventReRoute) method to obtain the desired sp_page GlideRecord.
queryString	String	Query string to use to resolve any parameters that may need to be passed by the URL. For example: ?id=kb_article&sys_id=471ee81eff6002009b20fffffffff34

Returns

Type	Description
String	Human-readable URL for the specified Service Portal record. The URL variables are resolved using the contents of the passed *queryString* parameter.

The following code example shows how to call this method to obtain the human-readable URL.

```
function() {
  var util = new global.SPSEOUtilsSNC();
  var portalId = util.getPortalId();
  var pageGR = util.getPageRecordWithPageRoute(
    'kb_article', portalId, false);
  var queryString =
 "?id=kb_article&sys_id=471ee81eff6002009b20fffffffff34";
  var hrUrl = util.getHumanReadableUrl(pageGR, queryString);
```

Output:

```
"getting-around-in-windows"
```

SPSEOUtilsSNC - getHumanReadableUrlForCurrentRequest()

Returns the human-readable URL for the current Service Portal record.

This method replicates the parameters in the cryptic URL of the current page, such as the *id* parameter and the query parameters, when creating this human-readable URL.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Human-readable URL for the current Service Portal record.

The following code example shows how to call this method. In this example, the current Service Portal record uses the cryptic URL of `<instance-url>/sp?id=kb_article&sys_id=471ee81eff6002009b20fffffffff34` and is configured

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to show the short description of a KB article that discusses navigation in Windows. The returned human-readable URL for this cryptic URL is "getting-around-in-windows".

```
// In a script include
function() {
  var util = new global.SPSEOUtilsSNC()
  var hrUrl = util.getHumanReadableUrlForCurrentRequest();
}
```

Output:

```
getting-around-in-windows
```

SPSEOUtilsSNC - getPageRecordWithPageRoute(GlideRecord pageId, String portalId, Boolean preventReRoute)

Returns the GlideRecord from the Pages [sp_page] table whose ID field matches the passed ID parameter (*pageId*). Call this method prior to calling the *getHumanReadableUrl()* method to obtain the desired sp_pages GlideRecord.

You can also request that the method use the page route maps information to return the GlideRecord of the final Service Portal page associated with the passed Service Portal page ID. For additional information on page route maps, see Redirect a reference to a page ID.

Parameters

Name	Type	Description
pageId	String	ID of the Pages [sp_page] record to return. Located in the *id* field of the Pages [sp_page] table.
portalId	String	Sys_id of the associated Service Portal [sp_portal] record. Required to return the appropriate login or 404 pages in case the record associated with the passed *pageId* parameter is not accessible or unavailable. Use the SPSEOUtilsSNC - getPortalId() method to obtain the desired Service Portal ID.
preventReRoute	Boolean	Flag that indicates whether to use page route maps to return the GlideRecord for the last sp_page that the passed page ID resolves to, instead of the matching sp_page record. Possible values: • true: Use the page route maps to return the last sp_page record that the passed page ID resolves to. • false: Return the sp_page record that the passed page ID matches.

Returns

Type	Description
GlideRecord	Record that matches the query request for the sp_page record.

The following code example shows how to call this method prior to calling the *getHumanReadableUrl()* method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
function() {
  var util = new global.SPSEOUtilsSNC();
  var portalId = util.getPortalId();
  var pageGR = util.getPageRecordWithPageRoute(
    'kb_article', portalId, false);
  var queryString =
 "?id=kb_article&sys_id=471ee81eff6002009b20fffffffff34";
  var hrUrl = util.getHumanReadableUrl(pageGR, queryString);
```

SPSEOUtilsSNC - getPortalId()

Returns the sys_id of the portal being loaded based on the portal suffix in the request URL. Call this method prior to calling the *getPageRecordWithPageRoute()* method to obtain the desired Service Portal sys_id.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the requested Service Portal based on the portal suffix of the request URL.

The following code example shows how to call this method for a URL such as `<instance-url>/sp?id=index`.

```
function() {
  var util = new global.SPSEOUtilsSNC();
  var portalId = util.getPortalId();
  var pageGR = util.getPageRecordWithPageRoute(
    'kb_article', portalId, false);
  var queryString =
 "?id=kb_article&sys_id=471ee81eff6002009b20fffffffff34";
  var hrUrl = util.getHumanReadableUrl(pageGR, queryString);
```

Output:

```

SPWidgetAccessControl - Global

The *SPWidgetAccessControl* script include provides methods that allow administrators to check whether a provided table is granted public access to a widget and is securely accessed by an intended audience.

For details and instructions about using the *SPWidgetAccessControl* API in your server script, see Configure widget security (Restrict which tables public widgets can access for guest users).

SPWidgetAccessControl – SPWidgetAccessControl()

Instantiates the SPWidgetAccessControl object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

The following example shows how to initialize a new SPWidgetAccessControl object.

```
new global.SPWidgetAccessControl()
```

SPWidgetAccessControl – hasPublicAccess(String tableName, Object SPScriptable, String options, Object input)

Returns information about whether a specified table has public access to a widget.

Parameters

Name	Type	Description
tableName	String	Required. Name of the table to query. For example, enter `incident` to query the Incident [Incident] table.
SPScriptable	Scriptable Object	Required. Widget's SP Scriptable. Formatted as `$sp` in the request. `SPScriptable:{ "widgetSysId":widget sys_id, "request":request object }`
options	Object	Optional. Widget/rectangle options passed in the widget. `"options":{ "table":"incident", "maximum_entries": "10" }`
input	Object	Optional. Widget/rectangle input passed during runtime. `"input":{ "table":"incident", "display_field":"name" }`

Returns

Type	Description
Boolean	Flag that indicates the widget access status of the specified table. Possible values: • true: The provided table is granted security access on the widget. • false: The provided table is not granted security access on the widget. Default: false

The following example shows confirmation that the Incident table has access to the Simple List Widget as shown in the configuration table, m2m_sp_public_widget_allow_table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
options.table = "incident";
//$sp,options,input - which are available by default in any
 widget script
new
 global.SPWidgetAccessControl().hasPublicAccess(options.table,
 $sp, options, input);
```

Output:

```
true
```

StandardCredentialsProvider - Scoped, Global

The *StandardCredentialsProvider* API provides methods to retrieve credential information.

You can use this API in scoped applications or within the global scope. In scoped scripts, use the `sn_cc` namespace identifier.

This API provides methods to retrieve credential information by sys_id and by specified credential attributes.

```
//Get a single credential

var provider = new sn_cc.StandardCredentialsProvider();
var credential =
 provider.getCredentialByID("f43c6d40a0a0b5700c77f9bf387afe3");
var userName = credential.getAttribute("user_name");
var password = credential.getAttribute("password");
//using getAttribute for new keys in extended tables, for
 example
//cloud management credential has the "user_public_key"
 attribute
var userPublicKey = credential.getAttribute("user_public_key");

//Get a list of SSH credentials

var provider = new sn_cc.StandardCredentialsProvider();
var credentials = provider.getCredentials(["ssh"]);
for (var i = 0; i < credentials.length; i++) {
  var credential = credentials[i];
  gs.info(credential.getAttribute("name"));
}
```

StandardCredentialsProvider - StandardCredentialsProvider()

Instantiates a credentials provider object.

Parameters

Name	Type	Description
None		

```
var provider = new sn_cc.StandardCredentialsProvider();
var credentials =
 provider.getCredentialByID("ef43c6d40a0a0b5700c77f9bf387afe3");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

StandardCredentialsProvider - getCredentials(String types, String tags)

Returns an array of all credentials that match the specified types and tags.

Parameters

Name	Type	Description
tags	String	Optional. Comma-separated list of tag names. For example, "ssh, jdbc". Examples of valid calls: • `var credentials = provider.getCredentials(null, null);` • `var credentials = provider.getCredentials(["ssh"], "");` • `var credentials = provider.getCredentials(new ArrayList<String>(), "ssh,admin");`
types	Array	Optional. Credential type names. For example, ["ssh", "windows"] **Note:** If *types* is null or empty, any match returns a credential. If *types* is specified, the credentials whose type matches one of the types is returned.

Returns

Type	Description
StandardCredential	Credential record object.

This code example shows how to get the provider credentials for "ssh" credential types.

```
var provider = new sn_cc.StandardCredentialsProvider();
var credentials = provider.getCredentials(["ssh"]);
```

This code example shows how to get the provider credentials for "ssh" and "windows" credential types that have tags of "admin".

```
var provider = new sn_cc.StandardCredentialsProvider();
ArrayList<String> types = new ArrayList<>();
types.add("ssh");
types.add("windows");
JSONArray jsonArray = provider.getCredentials(types, "admin");
```

StandardCredentialsProvider - getCredentialByAliasID(String sys_id)

Returns the credential record object through its credential alias (sys_alias).

This method is specifically for use with credential types. For information, see Credential aliases for Discovery.

Parameters

Name	Type	Description
sys_id	String	Sys_id of the credential alias record in the Connection & Credential Aliases [sys_alias] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
StandardCredential	Credential record object.

The following example retrieves a credential using the alias ID and displays the user name.

```
var provider = new sn_cc.StandardCredentialsProvider();
var aliasCred =
 provider.getCredentialByAliasID("752a91887740001038e286a2681061
fb");
gs.info("User name: " + aliasCred.getAttribute("user_name"));
```

Output for a credential record with a user name:

```
User name: Dara Lee
```

StandardCredentialsProvider - getCredentialByID(String sys_id)

Returns the credential record object identified by the specified sys_id.

Parameters

Name	Type	Description
sys_id	String	Sys_id of the credential record. Located in the Credentials [discovery_credentials] table.

Returns

Type	Description
StandardCredential	Credential record object.

The following example retrieves a credential and displays the user name.

```
var provider = new sn_cc.StandardCredentialsProvider();
var credentials =
 provider.getCredentialByID("ef43c6d40a0a0b5700c77f9bf387afe3");
gs.info("User name: " + credentials.getAttribute("user_name"));
```

Output for a credential record with a user name:

```
User name: Dara Lee
```

StartDiscovery - Global

The *StartDiscovery* script include provides methods to start discovery jobs.

Use this script include during the discovery scanning phase.

StartDiscovery - addAdditionalIP(String status, String ip, String sensor)

Adds an IP (or comma-separated list of IPs) to an existing discovery (used by networks discovery).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
status	String	The discovery status
ip	String	An IP address, or a comma-separated list of IP addresses.
sensor	String	The discovery sensor

Returns

Type	Description
void	

StartDiscovery - discoverFromSchedule(String ip, Boolean samePhase, String sensor)

Handles discovery of devices (whether basic or advanced) from a schedule.

Parameters

Name	Type	Description
ip	String	An IP address, or a comma-separated list of IP addresses.
samePhase	Boolean	
sensor	String	The discovery sensor

Returns

Type	Description
void	

StartDiscovery - getCancelScript()

Returns the cancel script.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The cancel script

StartDiscovery - scheduleCancelJob()

If the schedule specifies a cancel time, if necessary, schedules a job to cancel the discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

The following example shows how to use the *scheduleCancelJob()* method to cancel a current discovery job.

```
var discoveryScheduleGR = new
 GlideRecord('discovery_schedule'); // Create a discovery
 schedule Gliderecord
discoveryScheduleGR.get('name', 'Disco'); // Put the discovery
 schedule job name

var discoverySchedule = new
 DiscoverySchedule(discoveryScheduleGR);
var discoveryStatusSysId = new
 StartDiscovery().startFromIP(discoverySchedule,
 '172.167.31.231'); // Initiate discovery
gs.info(discoveryStatusSysId); // Display the sys_id of the
 discovery status record

discoveryStatusSysId.scheduleCancelJob(); // Schedule a cancel
 job, located in the sys_trigger table
```

Output:

```
Operation Table  Row Count
insert  discovery_result 1
update  discovery_status 1
insert  sys_trigger      1
insert  discovery_status 1
*** Script: Fired started event for: undefined Disco
*** Script: Scheduling Discovery DIS0010023 for cancellation at
 2022-02-13 16:42:44
*** Script: 1828b05f1b6d811070cb96c6b04bcb53
```

StartDiscovery - startFromIP(DiscoverySchedule schedule, String ip)

Starts a discovery for a single IP using the specified schedule to get information such as MID servers and behaviors.

Parameters

Name	Type	Description
schedule	DiscoverySchedule	DiscoverySchedule instance for the schedule to use.
ip	String	IP address to discover. Format: dot-formatted string

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Sys_id of the status record created.

This example uses the *startFromIP()* method to obtain the record that contains the discover information.

```
// Get a discovery schedule gliderecord
var discoveryScheduleGR = new GlideRecord('discovery_schedule');
discoveryScheduleGR.get('name', 'Discover Management Range
 172.x.x.x');

// Create a DiscoverySchedule object to get information such as
 MID servers and behaviors
var discoverySchedule = new
 DiscoverySchedule(discoveryScheduleGR);
var discoveryStatusSysId = new
 StartDiscovery().startFromIP(discoverySchedule, '172.1.1.10');

// Sys_id of the genterated status record
gs.info(discoveryStatusSysId);
```

Output:

```
9d3c1197c611228701cd1d94bc32d76d
```

StartDiscovery - startFromSchedule(GlideRecord schedule, GlideRecord job)

Invoked by the discovery script include to kick off a scheduled (or discover now) discovery.

Parameters

Name	Type	Description
schedule	GlideRecord	The instance of discovery_schedule that this discovery is based on.
job	GlideRecord	The instance of sys_trigger that triggered this discovery.

Returns

Type	Description
void	

StateManagementScriptableApi - Global

The *StateManagementScriptableApi* provides a set of methods for manipulating configuration item (CI) operational states and applying CI actions.

The *StateManagementScriptableApi* methods adhere to restrictions and allowances specified by not allowed CI actions, compatible CI actions, and not allowed operational transitions. If a method attempts to perform a restricted operation, the operation is blocked, an error is logged, and a task is created if appropriate.

The *StateManagementScriptableApi* methods are static methods. You access the methods using the SNC.StateManagementScriptableApi global object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

StateManagementScriptableApi - addBulkCIAction(String requestorId, String sysIdList, String ciActionName, String ciActionListOld, String leaseTime)

Add a CI action to a list of CIs.

Parameters

Name	Type	Description
requestorId	String	A sys_id of a workflow context, or the GUID returned from the `registerOperator()` method.
sysIdList	String	A list comma separated list of CI sys_ids.
ciActionName	String	The CI action name.
ciActionListOld	String	(Optional) A comma separated list of old CI actions that all CIs should be in.
leaseTime	String	(Optional) Time duration for which the lease is valid for specified CI Action. In the format HH:MM:SS.

Returns

Type	Description
String	A JSON formatted string with name-value pairs for • result - true if the action is set for all CIs in the list; otherwise, false. • errors - list of errors.

StateManagementScriptableApi - extendCIActionLease(String requestorId, String ciSysId, String ciActionName, String leaseTime)

Extend the CI-action-lease time for the registered user. If the previous lease has expired, the new lease time starts now.

Parameters

Name	Type	Description
requestorId	String	A sys_id of a workflow context, or the GUID returned from the `registerOperator()` method.
ciSysId	String	The CI's sys_id.
ciActionName	String	The CI action name.
leaseTime	String	Time duration for which the lease is valid for specified CI Action. In the format HH:MM:SS.

Returns

Type	Description
String	A JSON formatted string with name-value pairs for

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• result - true if the lease time has been set. • errors - list of errors.

StateManagementScriptableApi - getCIActions(String ciSysId)

Returns a list of active CI actions for the specified CI.

Parameters

Name	Type	Description
ciSysId	String	Sys_id of the CI.

Returns

Type	Description
String	A JSON formatted string with name-value pairs. Possible values: • ciActions - Comma-separated list of active CI actions for the CI, or `no_active_action`. • errors - List of errors.

The following example shows how to get active actions for a list of configuration items.

```
// Store sys_ids of configuration items for which to get data
var CIArray =
 ["a9c0c8d2c6112276018f7705562f9cb0","0c43bc4fc61122750182c13241
1702f2","46bbf419a9fe1981009802288c1eb79d","46a4381ca9fe1981005c
3e99af3cd164","0c43bcbdc61122750182c132e9b6565d"];

var output = '';

// looping above array to fetch each sys_id and passing to
 method
for(var i=0; i < CIArray.length; i++) {

  // passing sys_id of CI stored in array to method
  output =
 SNC.StateManagementScriptableApi.getCIActions(CIArray[i]);

  // print a JSON formatted string with name-value pairs
  gs.print(output);
}
```

Output:

```
{"ciActions":["no_active_action"],"result":true}
{"ciActions":["no_active_action"],"result":true}
{"ciActions":["no_active_action"],"result":true}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{"ciActions":["no_active_action"],"result":true}
{"ciActions":["no_active_action"],"result":true}
```

StateManagementScriptableApi - getOperationalState(String ciSysId)

Returns the operational state of the CI.

Parameters

Name	Type	Description
ciSysId	String	Sys_id of the CI.

Returns

Type	Description
String	A JSON formatted string with name-value pairs. Possible values: • ciActions - String choice values of the operational_status field, or UNKNOWN. • errors - List of errors.

The following example shows how to get the operational states of a list of specified configuration items.

```
// Store sys_ids of configuration items for which to get the
 operational state.
var CIArray =
 ["0c43bc4fc61122750182c132411702f2","46bbf419a9fe1981009802288c
1eb79d","46a4381ca9fe1981005c3e99af3cd164","0c43bcbdc61122750182
c132e9b6565d","a9c0c8d2c6112276018f7705562f9cb0"];

var output = '';

// Loop the array to fetch each sys_id and pass to the method.
for(var i=0;i<CIArray.length;i++) {
  // Pass sys_id of CI stored in array to the method
  output =
 SNC.StateManagementScriptableApi.getOperationalState(CIArray[i
]);

  // prints a JSON formatted string with name-value pairs
  gs.print(output);
}
```

Output:

```
*** Script: {"operationalState":"Operational","result":true}
*** Script: {"operationalState":"Operational","result":true}
*** Script: {"operationalState":"Operational","result":true}
*** Script: {"operationalState":"Operational","result":true}
ci_state_management                          : INVALID_SYS_ID:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 [a9c0c8d2c6112276018f7705562f9cb0]"}],"operationalState":"unkno
wn","result":false}
```

StateManagementScriptableApi - isCompatibleCIAction(String actionName, String otherActionName)

Determines if the two specified actions are compatible.

Parameters

Name	Type	Description
actionName	String	A CI action name
otherActionName	String	A CI action name

Returns

Type	Description
Boolean	Returns true if the two specified CI actions are compatible.

StateManagementScriptableApi - isLeaseExpired(String requestorId, String ciSysId, String ciActionName)

Determines if the lease has expired for the requestor of a specified CI Action.

Parameters

Name	Type	Description
requestorId	String	A sys_id of a workflow context, or the GUID returned from the *`registerOperator()`* method.
ciSysId	String	The CI's sys_id.
ciActionName	String	Name of the CI action.

Returns

Type	Description
String	A JSON formatted string with name-value pairs for • result - true if the user's lease has expired. • errors - list of errors.

StateManagementScriptableApi - isNotAllowedAction(String ciType, String opsLabel, String actionName)

For a type of CI, determine if a CI action is not allowed for an operational state.

Parameters

Name	Type	Description
ciType	String	The CI type

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
opsLabel	String	The operational state
actionName	String	The CI action name

Returns

Type	Description
Boolean	Returns true if the action is not allowed on the specified CI type in the specified operational state.

StateManagementScriptableApi - isNotAllowedOpsTransition(String ciType, String opsLabel, String transitionOpsLabel)

For a type of CI, determine if an operational state transition is not allowed.

Parameters

Name	Type	Description
ciType	String	The CI type
opsLabel	String	The label of the beginning operational state.
transitionOpsLabel	String	The label of the ending operational state.

Returns

Type	Description
Boolean	Returns true if specified operational state transition is not allowed on the specified CI type.

StateManagementScriptableApi - isValidRequestor(String requestorId)

Determines if the specified requestor is a valid active workflow user or a registered user.

Parameters

Name	Type	Description
requestorId	String	Sys_id of a workflow context or the GUID returned from the *`registerOperator()`* method.

Returns

Type	Description
String	JSON formatted name-value pairs. Possible values: • result - `true` if the requestorId is valid. • errors - list of errors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example show how to use the *isValidRequestor()* method to check if an operator is a registered user.

```
var output =
 SNC.StateManagementScriptableApi.registerOperator();
var jsonUtil = new JSON();
var result = jsonUtil.decode(output);
var requestorId = result.requestorId; // Fetching requestorId

output =
 SNC.StateManagementScriptableApi.isValidRequestor(requestorId);
gs.info(output);
```

Output:

```
{"result":true}
```

StateManagementScriptableApi - registerOperator()

Registers an operator for a non-workflow user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	A JSON formatted string with name-value pairs for • requestorid - Registered user GUID that is used to set CI Action/operational states. • result - true if successfully registered. • errors - list of errors.

```
var output =
 SNC.StateManagementScriptableApi.registerOperator();
var jsonUntil = new JSON();
var result = jsonUntil.decode(output);
var requestorId = result.requestorId;
```

StateManagementScriptableApi - removeBulkCIAction(String requestorId, String sysIdList, String ciActionName)

Removes a CI action for a list of CIs.

Parameters

Name	Type	Description
requestorId	String	A sys_id of a workflow context, or the GUID returned from the *registerOperator()* method.
sysIdList	String	A comma separated list of CI sys_ids

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
ciActionName	String	The CI action name

Returns

Type	Description
String	A JSON formatted string with name-value pairs for • result - true if the action is removed for all CIs in the list; otherwise, false. • errors - list of errors.

StateManagementScriptableApi - setBulkCIOperationalState(String requestorId, String sysIdList, String opsLabel, String opsStateListOld)

Set the operational state for list of CIs.

Parameters

Name	Type	Description
requestorId	String	A sys_id of a workflow context, or the GUID returned from the *`registerOperator()`* method.
sysIdList	String	A comma separated list of CI sys_ids.
opsLabel	String	This is the string label of an operational_status choice.
opsStateListOld	String	(Optional) A comma separated list of old CI states that all CIs should be in.

Returns

Type	Description
String	A JSON formatted string with name-value pairs for • result - true if the state is set for all CIs in the list; otherwise, false. • errors - list of errors.

```
var output =
 SNC.StateManagementScriptableApi.registerOperator();
var jsonUntil = new JSON();
var result = jsonUtil.decode(output);
var requestorId = result.requestorId;

// list of sys_ids to update
var sys_ids;

// Set list of sys_ids's Operational State to 'Repair in
 Progress'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
output =
 SNC.StateManagementScriptableApi.setBulkCIOperationalState(requ
estorId, sys_ids,'Repair in Progress');
gs.print(output);
```

StateManagementScriptableApi - unregisterOperator(String requestorId)

Unregisters an operator for non-workflow users.

Parameters

Name	Type	Description
requestorId	String	Sys_id of a workflow context or the GUID returned from the *`registerOperator()`* method.

Returns

Type	Description
String	JSON formatted name-value pairs. Possible values: • result - `true` if successfully unregistered • errors - list of errors.

This example show how to use the *`unregisterOperator()`* method to unregister a registered user.

```
var output =
 SNC.StateManagementScriptableApi.registerOperator();
var jsonUtil = new JSON();
var result = jsonUtil.decode(output);
var requestorId = result.requestorId; // Fetching requestorId

output =
 SNC.StateManagementScriptableApi.unregisterOperator(requestorI
d);
gs.info(output);
```

Output:

```
{"result":true}
```

Style - Scoped, Global

Creates a style for defining properties such font size, border, and alignment. You can apply the same style to multiple objects simultaneously.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the `sn_pdfgeneratorutils` namespace. The plugin is activated by default.

This API is a component used with the Document API to generate a PDF.

You can apply custom styles to the following API elements:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Cell
- Paragraph
- Table

Style - Style()

Instantiates a new *Style* object.

Parameters

Name	Type	Description
None		

The following examples shows how to create a *Style* object that you can add to a Cell, Paragraph or Table element.

```
var style = new sn_pdfgeneratorutils.Style();
```

Style – setBackgroundColor(Color color)

Specifies a background color of an element.

Parameters

Name	Type	Description
color	Color	Background color.

Returns

Type	Description
None	

The following example shows how to set element background color. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var color = new sn_pdfgeneratorutils.Color([1, 0.9, 0.9]); //
 provided as array of RGB float values

style.setBackGroundColor(color);
```

Style – setBold()

Sets a style to bold font.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to set a style to bold font.

```
var style = new sn_pdfgeneratorutils.Style();
style.setBold();
```

Style – setBorder(Number width)

Sets the style border on all four sides of an element.

Parameters

Name	Type	Description
width	Number	Style border width in points.

Returns

Type	Description
None	

The following example shows how to set a style border. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var width = 2;

style.setBorder(width);
```

Style – setBorderBottom(Number width)

Sets the style border to the bottom of an element.

Parameters

Name	Type	Description
width	Number	Style border width in points.

Returns

Type	Description
None	

The following example shows how to set a style border to the bottom of an element. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var width = 2;
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
style.setBorderBottom(width);
```

Style – setBorderLeft(Number width)

Sets the style border on the left side of an element.

Parameters

Name	Type	Description
width	Number	Style border width in points.

Returns

Type	Description
None	

The following example shows how to set a style border on the left side of an element. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var width = 2;

style.setBorderLeft(width);
```

Style – setBorderRight(Number width)

Sets the style border on the right side of an element.

Parameters

Name	Type	Description
width	Number	Style border width in points.

Returns

Type	Description
None	

The following example shows how to set a style border on the right side of an element. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var width = 2;

style.setBorderRight(width);
```

Style – setBorderTop(Number width)

Sets the style border to the top of an element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
width	Number	Style border width in points.

Returns

Type	Description
None	

The following example shows how to set a style border to the top of an element. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var width = 2;

style.setBorderTop(width);
```

Style – setColoredBorder(Number width, Color color)

Sets style border with color on all four sides of an element.

Parameters

Name	Type	Description
width	Number	Style border width in points.
color	Color	Style border color.

Returns

Type	Description
None	

The following example shows how to set a style border with color. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var width = 1.0;
var borderColor = new sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);

style.setColoredBorder(width, borderColor);
```

Style – setColoredBorderBottom(Number width, Color color)

Sets style border with color to the bottom side of an element.

Parameters

Name	Type	Description
width	Number	Style border width in points.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
color	Color	Style border color.

Returns

Type	Description
None	

The following example shows how to set a style border to the bottom of an element.For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var width = 1.0;
var borderColor = new sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);

style.setColoredBorderBottom(width, borderColor);
```

Style – setColoredBorderLeft(Number width, Color color)

Sets style border with color on the left side of an element.

Parameters

Name	Type	Description
width	Number	Style border width in points.
color	Color	Style border color.

Returns

Type	Description
None	

The following example shows how to set a style border. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var width = 1.0;
var borderColor = new sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);

style.setColoredBorderLeft(width, borderColor);
```

Style – setColoredBorderRight(Number width, Color color)

Sets style border with color on the right side of an element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
width	Number	Style border width in points.
color	Color	Style border color.

Returns

Type	Description
None	

The following example shows how to set a style border with color. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var width = 1.0;
var borderColor = new sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);

style.setColoredBorderRight(width, borderColor);
```

Style – setColoredBorderTop(Number width, Color color)

Sets style border with color to the top side of an element.

Parameters

Name	Type	Description
width	Number	Style border width in points.
color	Color	Style border color.

Returns

Type	Description
None	

The following example shows how to set a style border. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var width = 1.0;
var borderColor = new sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);

style.setColoredBorderTop(width, borderColor);
```

Style – setFontColor(Color color)

Sets a font color.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
color	Color	Font color.

Returns

Type	Description
None	

The following example shows how to set a font color. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var fontColor = new sn_pdfgeneratorutils.Color([1,0.5,0.5]);

style.setFontColor(fontColor);
```

Style – setFontSize(Number fontSize)

Sets a style font size.

Parameters

Name	Type	Description
fontSize	Number	Font size in points.

Returns

Type	Description
None	

The following example shows how to set a font size.

```
var style = new sn_pdfgeneratorutils.Style();

style.setFontSize(12);
```

Style – setHorizontalAlignment(String alignment)

Sets the horizontal alignment for a style.

Parameters

Name	Type	Description
alignment	String	Horizontal alignment setting. Valid values: • center: Align contents to the center. • left: Align contents to the left. • right: Align contents to the right.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to set horizontal alignment on an element. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var alignment = "Center";

style.setHorizontalAlignment(alignment);
```

Style – setItalic()

Sets a style to italic font.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to set an element style to an italic font.

```
var style = new sn_pdfgeneratorutils.Style();
style.setItalic();
```

Style – setPadding(Number padding)

Sets the padding of all four sides of an element to the same width.

See also:

- setPaddingBottom()
- setPaddingLeft()
- setPaddingRight()
- setPaddingTop()

Parameters

Name	Type	Description
padding	Number	Padding width in points as a decimal value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to set bottom style to 2.5 points. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var padding = 2.5;

style.setPadding(padding);
```

Style – setPaddingBottom(Number padding)

Sets the value of the bottom padding width of an element.

See also:

- setPadding()
- setPaddingLeft()
- setPaddingRight()
- setPaddingTop()

Parameters

Name	Type	Description
padding	Number	Padding width in points as a decimal value.

Returns

Type	Description
None	

The following example shows how to set bottom element padding to 2.5 points. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var padding = 2.5;

style.setPaddingBottom(padding);
```

Style – setPaddingLeft(Number padding)

Sets the value of the left padding width of an element.

See also:

- setPadding()
- setPaddingBottom()
- setPaddingRight()
- setPaddingTop()

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
padding	Number	Padding width in points as a decimal value.

Returns

Type	Description
None	

The following example shows how to set left element padding to 2.5 points. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var padding = 2.5;

style.setPaddingLeft(padding);
```

Style – setPaddingRight(Number padding)

Sets the value of the right padding width of a style.

See also:

- setPadding()
- setPaddingBottom()
- setPaddingLeft()
- setPaddingTop()

Parameters

Name	Type	Description
padding	Number	Padding width in points as a decimal value.

Returns

Type	Description
None	

The following example shows how to set right element padding to 2.5 points. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var padding = 2.5;

style.setPaddingRight(padding);
```

Style – setPaddingTop(Number padding)

Sets the value of the top padding width of an element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

See also:

- setPadding()
- setPaddingBottom()
- setPaddingLeft()
- setPaddingRight()

Parameters

Name	Type	Description
padding	Number	Padding width in points as a decimal value.

Returns

Type	Description
None	

The following example shows how to set top element padding to 2.5 points. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var padding = 2.5;

style.setPaddingTop(padding);
```

Style – setTextAlignment(String alignment)

Sets the text alignment for a style.

Parameters

Name	Type	Description
alignment	String	Text alignment position. Valid values: • text-center: Aligns text to the center. • text-justified: Modifies the space between characters to completely fill text between the left and right sides. The final line is left-aligned. • text-justified-all: Justifies text alignment including the final line. • text-left: Align text to the left. • text-right: Align text to the right.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to set the element text to center alignment.

```
var style = new sn_pdfgeneratorutils.Style();

String alignment = "text-center";

style.setTextAlignment(alignment);
```

Style – setVerticalAlignment(String alignment)

Sets the vertical alignment for this element.

Parameters

Name	Type	Description
alignment	String	Vertical alignment setting. Valid values: • bottom: Aligns contents to the bottom. • mid: Aligns contents to the center. • top: Aligns contents to the top.

Returns

Type	Description
None	

The following example shows how to set vertical alignment on an element. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();

var alignment = "Mid";

style.setVerticalAlignment(alignment);
```

Stream - Scoped, Global

The *Stream* API provides methods to interact with a stream of items such as records. For example, you can use the *forEach()* method to update the state of each record in a stream returned by the *GlideQuery* API.

You can get a Stream object in these ways:

- Instantiate a Stream object using the constructor.
- Return a Stream object from the *GlideQuery.select()* method. For more information, see *GlideQuery*.

This method is static and does not require an instance of the class: *fromArray()*.

Use the *Stream* API in scoped or global server-side scripts. This API requires the GlideQuery [com.sn_glidequery] plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Implementation

This API can work with the *GlideQuery* and *Optional* APIs in a builder pattern where the method calls chain together, each method building on the returned result of the previous method. Use methods to define the attributes of the query. The methods do not execute until you call a terminal method, a method that returns a query result, allowing you to define the requirements of the query before executing it.

If the query returns a single record, the system wraps the result in an Optional object. If the query returns a stream of records, the system wraps the result in a Stream object. These objects let you manage the result using a set of methods in each API.

For example, this script performs a query on the Task table, groups the records by priority, and returns each priority that has total reassignments greater than four.

```
var query = new global.GlideQuery('task')
    .where('active', true) //Returns new GlideQuery object with
 a "where" clause.
    .groupBy('priority') //Returns new GlideQuery object with a
 "group by" clause.
    .aggregate('sum', 'reassignment_count') //Returns new
 GlideQuery object with a "sum(reassignment_count)" clause.
    .having('sum', 'reassignment_count', '>', 4) //Returns
 new GlideQuery object with a "having reassignment_count > 4"
 clause.
    .select() //Returns a stream of records wrapped in a Stream
 object.
    .forEach(function (priority){ //Terminal method in the
 Stream class that executes the query and returns the result.
      gs.info("Priority " + priority.group.priority + ": " +
 priority.sum.reassignment_count + " reassignments");
    });
```

Output:

```
Priority 1: 11 reassignments
Priority 3: 6 reassignments
Priority 5: 5 reassignments
```

Terminal methods

For performance reasons, a query only fetches data when you call a terminal method. These are the terminal methods from the *Stream* class:

- *every()*
- *find()*
- *forEach()*
- *reduce()*
- *some()*
- *toArray()*

Stream - Stream(Function nextFn)

Instantiates a Stream object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instead of using this constructor, you can return a Stream object based on a query using the *GlideQuery* API.

Parameters

Name	Type	Description
nextFn	Function	A function that retrieves the next item in the stream.

This example shows you how to create a Stream object based on a random number generator. Make sure to include the *limit()* method to avoid creating an infinite loop.

```
new Stream(Math.random)
   .map(Math.round)
   .map(function (num) {
      return num === 1 ? 'heads' : 'tails';
   })
   .limit(10)
   .forEach(gs.info)
```

Output:

```
*** Script: tails
*** Script: heads
*** Script: tails
*** Script: heads
*** Script: tails
*** Script: heads
*** Script: tails
*** Script: tails
*** Script: tails
*** Script: tails
```

Stream - chunk(Number count)

Returns results in batches of arrays, each containing the number of records passed to the method.

Parameters

Name	Type	Description
count	Number	Number of records in each array returned from the stream.

Returns

Type	Description
Stream	Object used to interact with a stream of items such as records.

This example shows how to query a table and chunk the result into batches of arrays.

```
var chunkResult = new GlideQuery('cmdb_ci_hardware')
    .select('asset', 'purchase_date')
    .limit(10)
    .chunk(5) //Returns arrays of 5 sys_ids at a time
    .forEach(function (chunk){
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        gs.info(JSON.stringify(chunk, null, 2));
    });
```

Output:

```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }
]
```

This example shows how to create a child query using batches of IDs. When you call the *flatMap()* method after using the *chunk()* method, the system iterates over the batch of records instead of each individual record.

```
var chunkResult = new global.GlideQuery('cmdb_ci_hardware')
    .select('sys_id')
    .map(function (device) { return device.sys_id; })
    .chunk(5) //Returns arrays of 5 sys_ids at a time
    .flatMap(function (deviceIds) {
        return new GlideQuery('cmdb_sam_sw_install')
            .where('installed_on', 'IN', deviceIds)
            .select('software_model', 'installed_on');
    })

gs.info(JSON.stringify(chunkResult));
```

Stream - every(Function predicate)

Applies a predicate function to every item in the Stream object. If the predicate returns true for every item in the stream, the method returns true. If the predicate returns false for any item in the stream, the method returns false.

Parameters

Name	Type	Description
predicate	Function	Predicate function to apply to every record or item inside the Stream object. The function must take each item in the stream as input and return a boolean.

Returns

Type	Description
Boolean	Flag that indicates whether the predicate function returns true for every item in the stream. Valid values: • true: The predicate function returns true for every item in the stream. • false: The predicate function does not return true for every item in the stream.

This example shows how to apply a predicate function to every item in a stream.

```
var hasOnlyShortDescriptions = new global.GlideQuery('task')
   .whereNotNull('description')
   .select('description')
   .every(function (t) {
       return t.description.length < 10;
       });

gs.info(hasOnlyShortDescriptions);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
false
```

Stream - filter(Function predicate)

Applies a predicate function to each item in the Stream object. If the predicate returns true, the method returns the stream. If the predicate returns false, it returns an empty Stream object.

For better performance, use the *`where()`*, *`whereNotNull()`*, and *`whereNull()`* methods in the *`GlideQuery`* class instead of this method where possible. See GlideQuery.

Parameters

Name	Type	Description
predicate	Function	Predicate function to apply to every record or item inside the Stream object. The function must take each item in the stream as input and return a boolean.

Returns

Type	Description
Stream	Object used to interact with a stream of items such as records.

This example shows how to check all records in the Task table against a defined filter. If the records match the filter, the system returns the stream of records. Otherwise, it returns an empty Stream object.

```
var shoutingTasks = new global.GlideQuery('task')
   .whereNotNull('description')
   .select('description')
   .filter(function (task) {
      return task.description.toUpperCase() ===
 task.description;
   })
```

Stream - find(Function predicate)

Returns the first record or item in the Stream object that matches the predicate function. If no predicate function is provided, then the method returns the first record or item in the Stream.

Parameters

Name	Type	Description
predicate	Function	Optional. Predicate function to apply to the items inside the Stream object. The function must take each item in the stream as input and return a boolean.

Returns

Type	Description
Optional	Object containing the returned record.

This example shows how to return the first record from the stream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var UserOptional = new global.GlideQuery('sys_user')
   .where('active', true)
   .where('company.name', 'ServiceNow')
   .select()
   .find()
   .map(function (user) {
      return JSON.stringify(user);
   })

gs.info(UserOptional);
```

Output:

```
Optional<{"sys_id":"babb4639b76233004fbc2089ee11a97f"}>
```

Stream - flatMap(function fn)

Applies a function to every item in a stream. Returns another stream that you can iterate over.

Use this method instead of *map()* if the function returns a second stream of records.

Parameters

Name	Type	Description
fn	Function	Function to apply to the result of the query that returns a Stream object.

Returns

Type	Description
Stream	Object containing the stream of records updated after applying the function.

This example shows you how to query the User table and then create a child query from the result. This example executes an N+1 query, which can cause performance issues. Avoid this use case in a production environment.

```
var records = new global.GlideQuery('sys_user')
   .where('last_login', '>', '2015-12-31')
   .select('first_name', 'last_name')
   .flatMap(function (u) {
      return new global.GlideQuery('task')
           .where('closed_by', u.sys_id)
           .select('closed_at', 'description')
           .map(function (t) {
                return {
                    first_name: u.first_name,
                    last_name: u.last_name,
                    description: t.description,
                    closed_at: t.closed_at
                 };
           });
      })
   .limit(5)
   .toArray(100);
```

   }
]
```

Stream - forEach(Function fn)

Applies the specified function to each record or item in the stream.

Parameters

Name	Type	Description
fn	Function	Function to apply to each item in the stream.

Returns

Type	Description
None	

This example shows you how to print the result of each item in the stream.

```
var firstNames = new global.GlideQuery('sys_user')
   .select('first_name')
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   .forEach(function (u) {
      gs.debug(u.first_name);
   });
```

Output:

```
*** Script: [DEBUG] survey
*** Script: [DEBUG] Lucius
*** Script: [DEBUG] Jimmie
*** Script: [DEBUG] Melinda
*** Script: [DEBUG] Jewel
*** Script: [DEBUG] Sean
*** Script: [DEBUG] Jacinto
*** Script: [DEBUG] Krystle
*** Script: [DEBUG] Billie
*** Script: [DEBUG] Christian
*** Script: [DEBUG] Naomi
...
```

Stream - fromArray(Object arr)

Returns a Stream object that contains the values from the provided array.

Note: This method is static. You do not need an instance of the class to use this method.

Parameters

Name	Type	Description
arr	Array	Array of values to create the stream from.

Returns

Type	Description
Stream	Object used to interact with a stream of items such as records.

This example shows how to create a Stream object containing an array of values.

```
var nameStream = Stream.fromArray(['Bob', 'Sue', 'Sam'])
   .map(function (name) {
      return name.toUpperCase();
   })
   .toArray(3);

gs.info(JSON.stringify(nameStream));
```

Output:

```
["BOB","SUE","SAM"]
```

Stream - limit(Number count)

Limits the number of results returned by the stream.

For better performance, use the *`limit()`* method in the *`GlideQuery`* class where possible. See GlideQuery. You may need to use this method to limit results with the *`Stream.flatMap()`* method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
count	Number	Number of records to return.

Returns

Type	Description
Stream	Object used to interact with a stream of items such as records.

This example shows you how to limit the results returned from the *`Stream.flatMap()`* method.

```
var records = new global.GlideQuery('sys_user')
   .where('last_login', '>', '2015-12-31')
   .select('first_name', 'last_name')
   .flatMap(function (u) {
      return new GlideQuery('task')
           .where('closed_by', u.sys_id)
           .select('closed_at', 'description')
           .map(function (t) {
                return {
                    first_name: u.first_name,
                    last_name: u.last_name,
                    description: t.description,
                    closed_at: t.closed_at
                 };
           });
      })
   .limit(5)
   .forEach(function (task){
      gs.info(JSON.stringify(task, null, 2));
   });
```

Output:

```
*** Script: {
  "first_name": "System",
  "last_name": "Administrator",
  "description": null,
  "closed_at": "2021-10-04 13:40:16"
}
*** Script: {
  "first_name": "System",
  "last_name": "Administrator",
  "description": null,
  "closed_at": "2021-10-04 13:40:22"
}
*** Script: {
  "first_name": "System",
  "last_name": "Administrator",

```

Stream - map(Function fn)

Applies a function to each item in a stream and returns the updated Stream object.

Parameters

Name	Type	Description
fn	Function	Function to apply to the result of the query that takes the each item in the stream as input.

Returns

Type	Description
Stream	Object containing the stream of records updated after applying the function.

This example shows you how to apply a function to every item in the stream.

```
var users = new global.GlideQuery('sys_user')
   .whereNotNull('first_name')
   .select('first_name')
   .map(function (u) {
      return u.first_name.toUpperCase();
   })
   .toArray(100);

gs.info(JSON.stringify(users));
```

Output:

```
[
   "SURVEY",
   "LUCIUS",
   "JIMMIE",
   "MELINDA",
   "JEWEL",
   "SEAN",
   "JACINTO",
   "KRYSTLE",
   "BILLIE",
   "CHRISTIAN",
   ...
]
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stream - reduce(function reducerFn, Any initialValue)

Executes a reducer function on each item in the stream, resulting in single output value.

This method is similar to the native JavaScript *`reduce()`* method. For more information, see w3schools documentation.

Parameters

Name	Type	Description
reducerFn	Function	Function to apply to each item in the stream that reduces the stream to a single value. This function must take two arguments: • `acc`: Accumulator that accumulates all values returned by the function. • `cur`: Current item being accumulated in the array.
initialValue	Any	Value passed to the function as the initial value.

Returns

Type	Description
Any	Accumulated total of all items returned by the reducer function.

This example shows you how to return the record with the longest name from the User table.

```
var longestName = new global.GlideQuery('sys_user')
   .whereNotNull('first_name')
   .select('first_name')
   .reduce(function (acc, cur) {
       return cur.first_name.length > acc.length
           ? cur.first_name
           : acc;
       }, '');

gs.info(JSON.stringify(longestName));
```

Output:

```
"ATF_TestItilUser1"
```

Stream - some(Function predicate)

Applies a predicate function, a function that takes a single value and returns true or false, to each item in the stream. If the predicate returns true for any item in the stream, the method returns true.

Parameters

Name	Type	Description
predicate	Function	Predicate function to apply to the items inside the Stream object. Must return a Boolean value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the predicate function returned true for an item in the stream. Valid values: • true: The predicate function returned true for an item in the stream. • false: The predicate function did not return true for an item in the stream.

This example shows how to check whether any descriptions in the Task table are over 1,000 characters long.

```
var hasLongDescriptions = new global.GlideQuery('task')
   .whereNotNull('description')
   .select('description')
   .some(function (t) {
      return t.description.length > 1000;
   });

gs.info(hasLongDescriptions);
```

Output:

```
false
```

Stream - toArray(Number count)

Returns an array containing the given number of items from the stream.

Parameters

Name	Type	Description
count	Number	The maximum number of items from the stream to return in the array.

Returns

Type	Description
Array	Array containing the given number of items from the stream.

This example shows you how to transform a stream of records into a JavaScript array.

```
var users = new global.GlideQuery('sys_user')
    .limit(10)
    .select('first_name', 'last_name')
    .toArray(50);

gs.info(JSON.stringify(users));
```

Output:

```

Subflow - Scoped (deprecated)

The *Subflow* API provides methods to run published Workflow Studio subflows.

This API is deprecated and replaced by the FlowAPI - Scoped, Global.

The *Subflow* API can only be used in server scripts.

Use the `sn_fd` namespace to access the *Subflow* API.

Before interacting with a subflow using the *Subflow* API, you must first create and publish the subflow in the Workflow Studio interface. Because the *Subflow* API only interacts with pre-built subflows, there is no constructor for the class.

Note: To optimize instance performance, avoid calling these methods from an asynchronous business rule script. Instead, create a scheduled job record within the Workflow Studio UI.

Subflow - startAsync(String scopeName.subflowName, Map inputs)

Runs a published subflow asynchronously.

Asynchronous calls are non-blocking, allowing the client to execute other code in the script without having to wait for the subflow to complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
scopeName.subflowName	String	The application scope for the subflow and the internal name of the subflow to run. If scopeName is not included, the scope of the user currently logged in is used. Retrieve the internal name of the subflow using the **Internal name** column on the Workflow Studio landing page.
inputs	Map	Name-value pairs that define subflow inputs. If a subflow includes mandatory inputs, they must be included. For inputs of Reference or Document ID field types, use a GlideRecord object as the value.

Returns

Type	Description
Object	PlanResponse object containing the following properties: • contextId: Sys_id of the execution details record for the executed subflow. Access the execution details by navigating to the Flow Executions tab in Workflow Studio and filtering by sys_id. An exception occurs when the subflow: • Does not exist within the specified application scope, or the subflow or scope name has been misspelled. • Is not published. • Is passed an input object that does not match the subflow inputs. • Exceeds the recursion limit set by the *com.glide.hub.flow_engine.indirect_recursion_limit* system property. The default value is three.

```
//Run a subflow that takes two inputs: user, a sys_user record,
 and laptop_welcome_message, a string.
(function startSubflowAsync() {

  try {
    var userToProvisionFor = new GlideRecord('sys_user');
    userToProvisionFor.get('62826bf03710200044e0bfc8bcbe5df1');

    var inputs = {};
    inputs['user'] = userToProvisionFor;
    inputs['laptop_welcome_message'] = 'Welcome Onboard!!';

    var result =
 sn_fd.Subflow.startAsync('sn_devstudio.provisionlaptop',
 inputs);

    //The Sys ID of a flow execution (contextId)
    var contextId = result.contextId;

  } catch (ex) {
    var message = ex.getMessage();
```

```
    gs.error(message);
  }

})();
```

SummaryTableWriter - Global

The *SummaryTableWriter* script include enables the creation of summary sets for reports that can be generated with standard queries and trending.

This script include provides methods that enable you to customize the output of the summary sets for reports, such as adding a title, defining a query on which to base the report data, and specifying the stack column and X axis.

SummaryTableWriter - SummaryTableWriter(String tableName, String columnName)

Produces a summary set for the COUNT of all incidents grouped by category.

The custom chart definition table contains a field named **Table** that is hidden by default. If the field is set, which it is in some of the base custom charts, then, no matter what is defined within the custom chart scripts, clicking on the chart points you to this table.

For example, if you create a custom chart against the `[task]` table through a script, but you copied the custom chart from a custom chart that contains Table = incident, then clicking on any bar in the custom script will go to incident.do rather than to task.do.

To check the value of the **Table** field, click the additional actions icon and select **Configure** > **Form Layout** and move the **Table** field from **Available** to **Selected**. Open the custom chart definition and set the **Table** field to **none**.

Parameters

Name	Type	Description
tableName	String	Table used in the query to generate the data.
columnName	String	Field that is used to determine the X axis values.

```
var summarySet = new SummaryTableWriter('incident', 'category');
summarySet.generate();
```

SummaryTableWriter - generate()

Creates the summary set of records for reports.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var opened = new SummaryTableWriter('incident', '');
opened.generate();
```

SummaryTableWriter - setQuery(String query)

Defines the query to use to load the data for the summary record set.

Parameters

Name	Type	Description
query	String	Query to use to load the summary data.

Returns

Type	Description
void	

```
var summarySet = new SummaryTableWriter('incident', 'category');
summarySet.setQuery("active=true");
summarySet.generate();
```

SummaryTableWriter - setStackOn(String column)

Defines the column on which to stack the incident records.

Parameters

Name	Type	Description
column	String	Column that is used to stack the incident records.

Returns

Type	Description
void	

```
var summarySet = new SummaryTableWriter('incident', 'category');
summarySet.setQuery("active=true");
summarySet.setStackOn('priority');
summarySet.generate();
```

SummaryTableWriter - setTitle(String title)

Sets the title of the summary set, which is also the chart title.

Parameters

Name	Type	Description
title	String	Title given to the summary set that is used as the chart title. Also used as the key field for chart generators to determine whether the data was generated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var opened = new SummaryTableWriter('incident', '');
opened.setTitle("Trend of Open Incidents");
opened.setTrend('opened_at', 'month');
opened.generate();
```

SummaryTableWriter - setTrend(String field, String interval)

Sets the time field used for the X axis or stacking field; can also set the time interval used to calculate the trend.

Parameters

Name	Type	Description
field	String	Time field that is used for X axis values if grouping is not used. If grouping is used, then this is the stacking field.
interval	String	Time interval that is used to calculate the trend.

Returns

Type	Description
void	

```
var opened = new SummaryTableWriter('incident', '');
opened.setTitle("Trend of Open Incidents");
opened.setTrend('opened_at', 'month');
opened.generate();
```

SVGToPDFConversionAPI - Scoped, Global

The *SVGToPDFConversionAPI* provides methods that enable the adding of an SVG to a PDF and converting an SVG to PDF.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the `sn_pdfgeneratorutils` namespace. The plugin is activated by default.

See also PDFGenerationAPI.

SVGToPDFConversionAPI - SVGToPDFConversionAPI()

Instantiates a new *SVGToPDFConversionAPI* object.

Parameters

Name	Type	Description
None		

The following examples shows how to create a *SVGToPDFConversionAPI* object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var v = new sn_pdfgeneratorutils.SVGToPDFConversionAPI();
```

SVGToPDFConversionAPI - addSVGToPDF(String svg, String inputPdfSysId, String targetTable, String targetSysId, String nameForPdf, Number pageNo, Number x, Number y, Number svgImgWidth, Number svgImgHeight)

Adds an SVG image to a PDF on a specified page with image size and location coordinates.

Parameters

Name	Type	Description
svg	String	SVG to convert to a PDF document.
inputPdfSysId	String	Sys_id of the target PDF in which to create a copy of with an SVG. The target PDF is in the Attachments [sys_attachment] table.
targetTable	String	Name of the table containing the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.
targetTableSysId	String	Sys_id of the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.
targetTable	String	Name of the table on which to attach the converted PDF.
targetTableSysId	String	Sys_id of the record on which to attach the converted PDF.
pdfName	String	Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.
pageNo	Number	Page number in the attached PDF on which to place the SVG.
x	Number	Horizontal position of the SVG in the page. Value is in points.
y	Number	Vertical position of the SVG in the page. Value is in points.
svgImgWidth	Number	Width of the SVG image in pixels.
svgImgHeight	Number	Height of the SVG image in pixels.

Returns

Type	Description
Object	Object containing sys_id of a new PDF attachment with inserted SVG if successful, error message otherwise. `{ "attachment_id": "String", "message": "String", "status": "String" }`
<Object>. attachment_id	If SVG conversion is successful, sys_id of the attached PDF. The file is listed in the Attachments [sys_attachment] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.message	Message confirming success or error. Possible values: • Adding SVG content to PDF failed. • Adding SVG to PDF and creating new PDF is successful. • Given target record [<tableName> - <targetTableSysId>] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record. • Input PDF attachment sys id to add the SVG content is null • Input SVG content is empty or null • PdfReader is not opened with owner password • The target table name to attach the modified PDF : <targetTable> is empty or null • The target table name to attach the modified PDF : <targetTable> is not valid Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

The following example shows how get SVG from the description field of an incident record and add it to page 5 of a PDF attachment. The new PDF with SVG is located in the Attachments [sys_attachment] table.

```
var gr = new GlideRecord("incident");

var svg;

if (gr.get("<tableSysId>")) {
 svg = gr.description.toString();
}

var result = new
 sn_pdfgeneratorutils.SVGToPDFConversionAPI().addSVGToPDF(svg,
 "<inputPdfSysId>", "incident", "<tableSysId>", "AddSVGToPDF",
 5, 30, 30, 300, 100);
gs.info(JSON.stringify(result));
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{"attachment_id":"<sys_id>","message":"Adding SVG to PDF and
 creating new PDF is successful.","status":"success"}
```

SVGToPDFConversionAPI - convertSVGToPDF(String svg, String pdfName, String targetTable, String targetTableSysId)

Converts an SVG provided as string to PDF.

Parameters

Name	Type	Description
svg	String	SVG to convert to a PDF document.
pdfName	String	Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.
targetTable	String	Name of the table on which to attach the converted PDF.
targetTableSysId	String	Sys_id of the record on which to attach the converted PDF.

Returns

Type	Description
Object	Object containing sys_id of the PDF attachment converted from SVG if successful, error message otherwise. `{ "attachment_id": "String", "message": "String", "status": "String" }`
<Object>. attachment_id	If SVG conversion is successful, sys_id of the attached PDF. The file is listed in the Attachments [sys_attachment] table. Data type: String
<Object>.message	Message confirming success or error. Possible values: • Converting SVG image to PDF document failed. • Exception while reading Source document contents. • Given target record [<tableName> - <targetTableSysId>] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record. • SVG to PDF conversion is successful. • The Target table name - <tableName> to attach the converted SVG is not valid • The Target table name - <tableName> to attach the converted SVG is empty or null

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

The following example shows how get SVG from the description field of an incident record, to convert the SVG to PDF and attach it to a record.

```
var gr = new GlideRecord("incident");

var svg;

if (gr.get("<tableSysId>")) {
 svg = gr.description.toString();
}

var v = new sn_pdfgeneratorutils.SVGToPDFConversionAPI();

var result = v.convertSVGToPDF(svg, "ConvertSVGToPDF",
 "incident", "<targetTableSysId>");
gs.info(JSON.stringify(result));
```

Output:

```
{"attachment_id":"<pdf_attachment_sys_id>","message":"SVG to PDF
 conversion is successful.","status":"success"}
```

SVGToPDFConversionAPI - convertSVGToPDFWithSize(String svg, String nameForPDF, String targetTable, String targetTableSysId, Number svgImgWidth, Number svgImgHeight)

Converts an SVG provided as string to PDF with image width and height values.

Parameters

Name	Type	Description
svg	String	SVG to convert to a PDF document.
pdfName	String	Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.
targetTable	String	Name of the table on which to attach the converted PDF.
targetTableSysId	String	Sys_id of the record on which to attach the converted PDF.
svgImgWidth	Number	Width of the SVG image in pixels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
svgImgHeight	Number	Height of the SVG image in pixels.

Returns

Type	Description
Object	Object containing sys_id of the PDF attachment converted from SVG if successful, error message otherwise. `{ "attachment_id": "String", "message": "String", "status": "String" }`
<Object>. attachment_id	If SVG conversion is successful, sys_id of the attached PDF. The file is listed in the Attachments [sys_attachment] table. Data type: String
<Object>.message	Message confirming success or error. Possible values: • Converting SVG image to PDF document failed. • Exception while reading Source document contents. • Given target record [<tableName> - <targetTableSysId>] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record. • The Target table name - <tableName> to attach the converted SVG is not valid • The Target table name - <tableName> to attach the converted SVG is empty or null • SVG to PDF conversion is successful. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

The following example shows how get SVG from the description field of an incident record, to convert the SVG to PDF, and attach it to a record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gr = new GlideRecord("incident");

var svg;

if (gr.get("<tableSysId>")) {
 svg = gr.description.toString();
}

var v = new sn_pdfgeneratorutils.SVGToPDFConversionAPI();

var result = v.convertSVGToPDFWithSize(svg, "ConvertSVGToPDF",
 "incident", "<targetTableSysId>", 600, 150);
gs.info(JSON.stringify(result));
```

Output:

```
{"attachment_id":"<pdf_attachment_sys_id>","message":"SVG to PDF
 conversion is successful.","status":"success"}
```

SystemDocument - Scoped, Global

The *SystemDocument* API provides methods for setting fields of a record in the Documents [ds_document] table.

This API requires the Document Management plugin (com.snc.platform_document_management) and is provided within the `sn_doc_services` namespace. For information, see Document Services.

To create a document, use the DocumentService API.

SystemDocument - SystemDocument(String docName)

Instantiates a *SystemDocument* object.

Parameters

Name	Type	Description
docName	String	Name of the document.

Returns

Type	Description
None	

The following example shows how to instantiate a *SystemDocument* object and set several fields for a document record. See also DocumentService API.

```
var d = new sn_doc_services.SystemDocument('My document');

// Define the document fields
var reviewers =
 '62826bf03710200044e0bfc8bcbe5df1,a8f98bb0eb32010045e1a5115206f
e3a';
d.description('description');
d.classification('restricted');
d.state('review');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
d.department('93b25282c0a8000b0b55c8ab34e2f1e6');
d.template(false);
d.type('policy');
d.reviewers(reviewers);
d.audience('external');

var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId :
 10404202245034l0f877a6fed1c2b031 is successful.",
  "request_id": "10404202245034l0f877a6fed1c2b031",
  "status": "success"
}
```

SystemDocument - audience(String audience)

Sets the Audience field of a document record to specify external or internal availability. Represents the Audience field in a Document Management form.

Parameters

Name	Type	Description
audience	String	String representing the intended audience of the document. Possible values: • external • internal Default: internal

Returns

Type	Description
None	

The following example shows how to set the Audience field in a new document record. See also DocumentService - Scoped, Global.

```
var d = new sn_doc_services.SystemDocument('My document');
var s = new sn_doc_services.DocumentService();

d.audience('external');

gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId :
 1193fd4624103410f877a6fed1c2b016 is successful.",
  "request_id": "1193fd4624103410f877a6fed1c2b016",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "status": "success"
}
```

SystemDocument - classification(String classification)

Sets the Classification field of a document record to identify the level of information sensitivity. Represents the Classification field in a Document Management form.

Parameters

Name	Type	Description
classification	String	Classification of the document. Possible values: • confidential • public • restricted Default: public

Returns

Type	Description
String	The value of the classification property of a *SystemDocument* object.

The following example shows how to set the classification field in a new document record. See also DocumentService API.

```
var d = new sn_doc_services.SystemDocument('My restricted
 document');
var s = new sn_doc_services.DocumentService();

d.classification('restricted');

gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId :
 d80435c624103410f877a6fed1c2b0d0 is successful.",
  "request_id": "d80435c624103410f877a6fed1c2b0d0",
  "status": "success"
}
```

SystemDocument - createdFromTemplate(String docTemplate)

Sets the template from which to generate a document. When the document is generated, the specified template is listed in the Created From Template field in the Documents [ds_document_list] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
docTemplate	String	Sys_id of a document listed in the Documents [ds_document_list] table. The document must have the Template checkbox selected (true). See also DocumentVersionService API.

Returns

Type	Description
None	

The following example shows how to create a new document record from an existing template. See also DocumentService API.

```
var d = new sn_doc_services.SystemDocument('New doc from
 template');
var s = new sn_doc_services.DocumentService();

d.createdFromTemplate('<doc_template_sys_id>');

gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId :
 deaef1ce24103410f877a6fed1c2b085 is successful.",
  "request_id": "deaef1ce24103410f877a6fed1c2b085",
  "status": "success"
}
```

SystemDocument - department(String docDept)

Sets the Department field of a document record.

Parameters

Name	Type	Description
docDept	String	Sys_id of a department listed in the Departments [cmn_department] table.

Returns

Type	Description
None	

The following example shows how to set the department field in a new document record. See also DocumentService API.

```
var d = new sn_doc_services.SystemDocument('My document');

// Assign the doc to the human resources department
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
d.department('<dept_sys_id>');

var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId :
 491efbee24187410f877a6fed1c2b0a9 is successful.",
  "request_id": "491efbee24187410f877a6fed1c2b0a9",
  "status": "success"
}
```

SystemDocument - description(String description)

Sets the Description field of a document record.

Parameters

Name	Type	Description
description	String	Description of the document.

Returns

Type	Description
None	

The following example shows how to set the description field in a document record. See also: DocumentService API.

```
var d = new sn_doc_services.SystemDocument('My document');

d.description('Information describing the doc.');

var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId :
 9acd7fea24587410f877a6fed1c2b060 is successful.",
  "request_id": "9acd7fea24587410f877a6fed1c2b060",
  "status": "success"
}
```

SystemDocument - name(String docName)

Sets the Name field of a document record.

Note: You can also set the name as a parameter in the *SystemDocument()* constructor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
docName	String	Name of the document.

Returns

Type	Description
None	

The following example shows how to set the Name field in a new document record. See also DocumentService API.

```
var d = new sn_doc_services.SystemDocument();

d.name('Document named using method instead of constructor');

var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId :
 c19d7f2624587410f877a6fed1c2b0eb is successful.",
  "request_id": "c19d7f2624587410f877a6fed1c2b0eb",
  "status": "success"
}
```

SystemDocument - owner(String owner)

Sets the Owner field of a document record.

Parameters

Name	Type	Description
owner	String	Sys_id of a user listed in the Users [sys_user] table. Role required: admin Default: Current user

Returns

Type	Description
None	

The following example shows how to set the owner field in a new document record. See also DocumentService API.

```
var d = new sn_doc_services.SystemDocument('My document');
var s = new sn_doc_services.DocumentService();

d.owner('aa826bf03710200044e0bfc8bcbe5dd6');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId :
 4235318a24103410f877a6fed1c2b0ff is successful.",
  "request_id": "4235318a24103410f877a6fed1c2b0ff",
  "status": "success"
}
```

SystemDocument - reviewers(String reviewers)

Sets the Reviewers field of a document record.

Parameters

Name	Type	Description
reviewers	String	List of one or more document reviewers by sys_id. The reviewer must be a user listed in the Users [sys_user] table.

Returns

Type	Description
None	

The following example shows how to set the reviewers field in a new document record. See also DocumentService API.

```
var d = new sn_doc_services.SystemDocument('My document');

var reviewers =
 '62826bf03710200044e0bfc8bcbe5df1,a8f98bb0eb32010045e1a5115206f
e3a';
d.reviewers(reviewers);

var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId :
 8d19f9ca24103410f877a6fed1c2b0aa is successful.",
  "request_id": "8d19f9ca24103410f877a6fed1c2b0aa",
  "status": "success"
}
```

SystemDocument - state(String state)

Sets the State field of a document record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
state	String	State of the document representing where the document is in the workflow. Valid values: • draft • submit • review • complete Default: draft

Returns

Type	Description
None	

The following example shows how to set the state field in a new document record. See also DocumentService API.

```
var d = new sn_doc_services.SystemDocument('My document');
var s = new sn_doc_services.DocumentService();

d.state('submit');

gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId :
 19aab54e24103410f877a6fed1c2b03d is successful.",
  "request_id": "19aab54e24103410f877a6fed1c2b03d",
  "status": "success"
}
```

SystemDocument - template(Boolean template)

Specifies whether a document record is a template.

Parameters

Name	Type	Description
template	Boolean	Flag that specifies whether a document record is a template. Valid values: • true: The default version of this document is a template. • false: This document is not a template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: false

Returns

Type	Description
None	

The following example shows how to indicate that a document record is a template. See also DocumentService API.

```
var d = new sn_doc_services.SystemDocument('My document');

d.template(true);

var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId :
 f7f006ce24103410f877a6fed1c2b053 is successful.",
  "request_id": "f7f006ce24103410f877a6fed1c2b053",
  "status": "success"
}
```

SystemDocument - type(String docType)

Sets the Type field of a document record.

Parameters

Name	Type	Description
docType	String	Type of document. Valid values: • contract • guideline • policy • procedure Default: None

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to set the type field in a new document record. See also DocumentService API.

```
var d = new sn_doc_services.SystemDocument('How to use the
 document mgmt API');
var s = new sn_doc_services.DocumentService();

d.type('guideline');

gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId :
 8adfb10224503410f877a6fed1c2b0e4 is successful.",
  "request_id": "8adfb10224503410f877a6fed1c2b0e4",
  "status": "success"
}
```

SystemDocumentList - Scoped, Global

The *SystemDocumentList* API provides methods for setting the record fields in the Document Lists [ds_document_lists] table.

This API requires the Document Management plugin (com.snc.platform_document_management) and is provided within the `sn_doc_services` namespace. For information, see Document Services.

To create or manage a document list, use the DocumentListService API.

SystemDocumentList - SystemDocumentList(String docListName)

Instantiates a *SystemDocumentList* object.

Parameters

Name	Type	Description
docListName	String	Name of the document list.

Returns

Type	Description
None	

The following example shows how to instantiate a *SystemDocumentList* object.

```
var docList = new sn_doc_services.SystemDocumentList();
```

SystemDocumentList - description(String description)

Sets the Description field of a new document list record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
description	String	Description of the document list.

Returns

Type	Description
None	

The following example shows how to add a description to the document list. See also DocumentListService API.

```
var dL = new sn_doc_services.SystemDocumentList('My document
 list');

// Define the document list field
dL.description('description');

var docList = new sn_doc_services.DocumentListService();
gs.info(JSON.stringify(docList.createDocumentList(dL), null,
 2));
```

Output:

```
{
  "message": "Create List for the given name : My document list,
 List sysId : b2c021a924683c10f877a6fed1c2b0b1 is successful.",
  "request_id": "b2c021a924683c10f877a6fed1c2b0b1",
  "status": "success"
}
```

SystemDocumentList - name(String docListName)

Sets the Name field of a document list record.

Note: You can also set the name as a parameter in the *SystemDocumentList()* constructor.

Parameters

Name	Type	Description
docListName	String	Name of the document list.

Returns

Type	Description
None	

The following example shows how to rename an existing document list. See also DocumentListService.

```
var docListID = 'b2c021a924683c10f877a6fed1c2b0b1';
var docListUpdate = new sn_doc_services.SystemDocumentList();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
docListUpdate.name('name change');

var docListSvc = new sn_doc_services.DocumentListService();
gs.info(JSON.stringify(docListSvc.updateDocumentList(docListID ,
 docListUpdate), null, 2));
```

Output:

```
{
  "message": "Update List for the given sysId :
 b2c021a924683c10f877a6fed1c2b0b1 is successful.",
  "request_id": "b2c021a924683c10f877a6fed1c2b0b1",
  "status": "success"
}
```

SystemDocumentListEntry - Scoped, Global

The *SystemDocumentListEntry* API provides methods for setting the record fields in the Document List Entries [ds_document_list_entry] table.

This API requires the Document Management plugin (com.snc.platform_document_management) and is provided within the `sn_doc_services` namespace. For information, see Document Services.

Before using the methods in this API, you must add a document with its versions, and create a document list.

- SystemDocument – Define a document object.
- DocumentService – Add, update, or delete a document.
- SystemDocumentVersion – Define a document version.
- DocumentVersionService – Add, update, or delete a document version.
- SystemDocumentList – Define a document list.
- DocumentListService – Add, update, or delete a document list.

SystemDocumentListEntry - SystemDocumentListEntry(String listID)

Instantiates a *SystemDocumentListEntry* object.

Parameters

Name	Type	Description
listSysId	String	Sys_id of a document list record in the Document Lists [ds_document_lists] table.

Returns

Type	Description
None	

The following example shows how to instantiate a *SystemDocumentListEntry* object.

```
var docList = new
 sn_doc_services.SystemDocumentListEntry("<docListSysId>");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SystemDocumentListEntry - description(String description)

Sets the Description field of a document list entry record.

Parameters

Name	Type	Description
description	String	Description of the document list entry.

Returns

Type	Description
None	

The following example shows how to add a description to the document list entry provided using the constructor. See also DocumentListEntryService API.

```
var docListEntry = new
 sn_doc_services.SystemDocumentListEntry('21afddea2460fc10f877a6
fed1c2b0dd');

docListEntry.description('birth');

var dlEntrySvc = new sn_doc_services.DocumentListEntryService();
gs.info(JSON.stringify(dlEntrySvc.createDocumentListEntry(docLis
tEntry), null, 2));
```

Output:

```
{
  "message": "Create List Entry , List Entry sysId :
 d3f0b13624e8fc10f877a6fed1c2b0d9is successful.",
  "request_id": "d3f0b13624e8fc10f877a6fed1c2b0d9",
  "status": "success"
}
```

SystemDocumentListEntry - document(String docSysId)

Specifies the document template to add to a document list.

To define a document as a template:

- Define the document object setting the SystemDocument – template() method to true. Create or update the document record with the methods in the DocumentService API.
- Select the Template check box of a document in the Documents [ds_document] table.

The document record specified must have a version. Use the following APIs to define and add a document version:

- SystemDocumentVersion – Define a document version.
- DocumentVersionService – Add, update, or delete a document version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
docSysId	String	Sys_id of a document record in the Documents [ds_document] table. The document specified must be a template and have a version.

Returns

Type	Description
None	

The following example shows how to add a document template as a document list entry. See also DocumentListEntryService API.

```
var docListEntry = new
 sn_doc_services.SystemDocumentListEntry('21afddea2460fc10f877a6
fed1c2b0dd');
docListEntry.document("9acd7fea24587410f877a6fed1c2b060");
docListEntry.description('birth certificate');

var dlEntrySvc = new sn_doc_services.DocumentListEntryService();
gs.info(JSON.stringify(dlEntrySvc.createDocumentListEntry(docLis
tEntry), null, 2));
```

Output:

```
{
  "message": "Create List Entry , List Entry sysId :
 d3f0b13624e8fc10f877a6fed1c2b0d9is successful.",
  "request_id": "d3f0b13624e8fc10f877a6fed1c2b0d9",
  "status": "success"
}
```

SystemDocumentListEntry - documentList(String listSysId)

Specifies the document list in which to add a document.

Note: You can alternatively set the document list as a parameter in the *SystemDocumentListEntry()* constructor.

Use the following APIs to define and create a document list:

- SystemDocumentList – Define a document list.
- DocumentListService – Add, update, or delete a document list.

Parameters

Name	Type	Description
listSysId	String	Sys_id of a document list record in the Document Lists [ds_document_lists] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to set the document list in which to add a document. See also DocumentListEntryService API.

```
var docListEntry = new
 sn_doc_services.SystemDocumentListEntry();

docListEntry.documentList('21afddea2460fc10f877a6fed1c2b0dd');
docListEntry.document('deaef1ce24103410f877a6fed1c2b085');
docListEntry.description('passport');

var dlEntrySvc = new sn_doc_services.DocumentListEntryService();
gs.info(JSON.stringify(dlEntrySvc.createDocumentListEntry(docLis
tEntry), null, 2));
```

Output:

```
{
  "message": "Create List Entry , List Entry sysId :
 c4ccaa8b24283050f877a6fed1c2b003is successful.",
  "request_id": "c4ccaa8b24283050f877a6fed1c2b003",
  "status": "success"
}
```

SystemDocumentVersion - Scoped, Global

The *SystemDocumentVersion* API provides methods for setting the values of a document's source version in the Versions [ds_document_version] table.

This API requires the Document Management plugin (com.snc.platform_document_management) and is provided within the `sn_doc_services` namespace. For information, see Document Services.

To create a document version, use the DocumentVersionService API.

SystemDocumentVersion - SystemDocumentVersion(String docSysId)

Instantiates a *SystemDocumentVersion* object.

Parameters

Name	Type	Description
docSysId	String	Sys_id of a document record in the Documents [ds_document] table.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to instantiate a *SystemDocumentVersion* object and create a document version. See also DocumentVersionService.

```
var versionDefinition = new
 sn_doc_services.SystemDocumentVersion('491efbee24187410f877a6fe
d1c2b0a9');

versionDefinition.type('url');
versionDefinition.url('http://one/1.0');

var versionSvc = new sn_doc_services.DocumentVersionService();
gs.info(JSON.stringify(versionSvc.createDocumentVersion(versionD
efinition), null, 2));
```

Output:

```
{
  "message": "Adding an entry to DocumentVersion for the
 given docId : 491efbee24187410f877a6fed1c2b0a9, sysId :
 d5a340d9242cf810f877a6fed1c2b069 is successful.",
  "request_id": "d5a340d9242cf810f877a6fed1c2b069",
  "status": "success"
}
```

SystemDocumentVersion - document(String docSysId)

Specifies the document record for this version.

Note: You can alternatively set the name as a parameter in the *SystemDocumentVersion()* constructor.

Parameters

Name	Type	Description
docSysId	String	Sys_id of a document record in the Documents [ds_document] table.

Returns

Type	Description
None	

The following example shows how to set the name field of a document version. See also *DocumentVersionService* – createDocumentVersion().

```
var versionDefinition = new
 sn_doc_services.SystemDocumentVersion();

versionDefinition.document('491efbee24187410f877a6fed1c2b0a9');

var versionSvc = new sn_doc_services.DocumentVersionService();
gs.info(JSON.stringify(versionSvc.createDocumentVersion(versionD
efinition), null, 2));
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "message": "Adding an entry to DocumentVersion for the
 given docId : 491efbee24187410f877a6fed1c2b0a9, sysId :
 1c504c91242cf810f877a6fed1c2b08b is successful.",
  "request_id": "1c504c91242cf810f877a6fed1c2b08b",
  "status": "success"
}
```

SystemDocumentVersion - type(String docType)

Sets the Type field of a document version.

Parameters

Name	Type	Description
docType	String	Document source type. Valid values: • url • attachment Default: attachment **Note:** An attachment can currently only be added in the Document Versions [ds_document_version] table UI and not with the API.

Returns

Type	Description
None	

The following example shows how to set the type field and create a document version. See also DocumentVersionService.

```
var versionDefinition = new
 sn_doc_services.SystemDocumentVersion('491efbee24187410f877a6fe
d1c2b0a9');

versionDefinition.type('url');
versionDefinition.url('http://one/1.0');

var versionSvc = new sn_doc_services.DocumentVersionService();
gs.info(JSON.stringify(versionSvc.createDocumentVersion(versionD
efinition), null, 2));
```

```
{
  "message": "Adding an entry to DocumentVersion for the
 given docId : 491efbee24187410f877a6fed1c2b0a9, sysId :
 d5a340d9242cf810f877a6fed1c2b069 is successful.",
  "request_id": "d5a340d9242cf810f877a6fed1c2b069",
  "status": "success"
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SystemDocumentVersion - url(String url)

Sets the URL of a document version.

Parameters

Name	Type	Description
url	String	URL of the source document for this version.

Returns

Type	Description
None	

The following example shows how to set the URL field as the source of a document version. See also DocumentVersionService.

```
var versionDefinition = new
 sn_doc_services.SystemDocumentVersion('491efbee24187410f877a6fe
d1c2b0a9');

versionDefinition.type('url');
versionDefinition.url('http://one/1.0');

var versionSvc = new sn_doc_services.DocumentVersionService();
gs.info(JSON.stringify(versionSvc.createDocumentVersion(versionD
efinition), null, 2));
```

```
{
  "message": "Adding an entry to DocumentVersion for the
 given docId : 491efbee24187410f877a6fed1c2b0a9, sysId :
 d5a340d9242cf810f877a6fed1c2b069 is successful.",
  "request_id": "d5a340d9242cf810f877a6fed1c2b069",
  "status": "success"
}
```

SystemDocumentVersion - versionNumber(Number versionNumber)

Sets the number of a document version.

Parameters

Name	Type	Description
versionNumber	Number	Version number for this document.

Returns

Type	Description
None	

The following example shows how to set the version number and create a document version. See also DocumentVersionService.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var versionDefinition = new
 sn_doc_services.SystemDocumentVersion('491efbee2418741Of877a6fe
d1c2b0a9');

versionDefinition.type('url');
versionDefinition.url('http://one/1.0');
versionDefinition.versionNumber(5);

var versionSvc = new sn_doc_services.DocumentVersionService();
gs.info(JSON.stringify(versionSvc.createDocumentVersion(versionD
efinition), null, 2));
```

Output:

```
{
  "message": "Adding an entry to DocumentVersion for the
 given docId : 491efbee2418741Of877a6fed1c2b0a9, sysId :
 ff47449d242cf810f877a6fed1c2b06c is successful.",
  "request_id": "ff47449d242cf810f877a6fed1c2b06c",
  "status": "success"
}
```

Table - Scoped, Global

Creates a Table object to add to a PDF document. Defines the data to use in each cell and sets styles, margins, and alignment.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the `sn_pdfgeneratorutils` namespace. The plugin is activated by default.

This API is a component used with the Document API to generate a PDF.

Build a Table object using the methods in this class. You can use these additional classes to add cells, paragraphs, and styles to your table:

`Cell API`

Create a cell using the *`Cell`* API. Then, add the cell to your table using one of these methods:

- *`Table.addCell()`*
- *`Table.addCellWithStyle()`*
- *`Table.addHeaderCell()`*
- *`Table.addImageCell()`*
- *`Table.addParagraphCell()`*
- *`Table.addTextCell()`*

`Paragraph API`

Create a paragraph using the *`Paragraph`* API. Add the paragraph to a cell in the table using *`Cell.addParagraph()`*.

`Style API`

Set styles, colors, and borders using the *`Style`* API. Add the styles to the table using one of these methods:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `Table.setDefaultStyle()`
- `Table.setHeaderStyle()`

You can then apply the Table object to a PDF document using the following class and method.

`Document API`

Use the `Document.addTable()` method to add your table to a PDF document. You can use the `Document.saveAsAttachment()` method to attach the document to a record.

Table - Table(Boolean ltr, Array columnWidths, Boolean largeTable)

Instantiates a new Table object with text direction, column width, and layout settings.

Parameters

Name	Type	Description
ltr	Boolean	Flag that indicates text direction of the language in the table. For information, see W3C: Script direction and languages. Valid values: • true: Text direction is left-to-right. • false: Text direction is right-to-left.
columnWidths	Array	Numbers specifying the width of each column in a table. Sizes are based proportionally. For example, `var columnWidths = [2, 1, 1];` is a three-column table with a first column twice as large as the other two. Default: Each column is equal width.
largeTable	Boolean	Flag that indicates whether 100% width and fixed layout are set implicitly. Valid values: • true: Table uses 100% width with a fixed layout. If true, use the `complete()` method when all content has been added to indicate that the table is complete. • false: Automatic table size. Default: false

The following example shows how to create a 2-column Table object.

```
var table = new sn_pdfgeneratorutils.Table(true, [70,200],
 false);
```

Table – addCell(Cell cell)

Adds a cell element to the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
cell	Cell	Cell element to add to the table.

Returns

Type	Description
None	

This example shows how to create a Table object from the incident table and add a Number and a Short Description cell to each row.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var whiteColor =  sn_pdfgeneratorutils.Color([1,1,1]);
var greyColor =  sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
var headerBgColor = new
 sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

// Query Incident
var gr = new GlideRecord("incident");
gr.query();

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [70,200],
 false);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);

table.setHeaderStyle(headerStyle);

var nParagraph = new sn_pdfgeneratorutils.Paragraph("Number");
var sParagraph = new sn_pdfgeneratorutils.Paragraph("Short
 Description");

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;

hdrCell1.addParagraph(nParagraph);
hdrCell2.addParagraph(sParagraph);

table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);

var row = 0;

while(gr.next()) {
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   var numCell = new sn_pdfgeneratorutils.Cell;
   var sdCell = new sn_pdfgeneratorutils.Cell;

   var numberParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.number);
   var sdParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.short_description);

   numCell.addParagraph(numberParagraph);
   sdCell.addParagraph(sdParagraph);

   if (row % 2 == 1) {
      table.setDefaultbackGroundColor(greyColor);
   } else {
      table.setDefaultbackGroundColor(whiteColor);
   }

   table.addCell(numCell);
   table.addCell(sdCell);

   row = row + 1;

}

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – addCellWithStyle(Cell cell, Style style)

Adds a cell element with an applied style to the table.

Parameters

Name	Type	Description
cell	Cell	Cell object to add to the table.
style	Style	Style to apply to the cell.

Returns

Type	Description
None	

This example shows how to apply a style to a specified Cell object and save the document as an attachment to a record.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var whiteColor =  sn_pdfgeneratorutils.Color([1,1,1]);
var greyColor =  sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
var cellBgColor = new sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

// Query Incident
```

```
var gr = new GlideRecord("incident");
gr.query();

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [70,200],
 false);

var cellStyle = new sn_pdfgeneratorutils.Style;
cellStyle.setBackgroundColor(cellBgColor);
cellStyle.setTextAlignment("text-center");
cellStyle.setBold();
cellStyle.setFontColor(whiteColor);

var nParagraph = new sn_pdfgeneratorutils.Paragraph("Number");
var sParagraph = new sn_pdfgeneratorutils.Paragraph("Short
 Description");

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;

hdrCell1.addParagraph(nParagraph);
hdrCell2.addParagraph(sParagraph);

table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);

var row = 0;

while(gr.next()) {
   var numCell = new sn_pdfgeneratorutils.Cell;
   var sdCell = new sn_pdfgeneratorutils.Cell;

   var numberParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.number);
   var sdParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.short_description);

   numCell.addParagraph(numberParagraph);
   sdCell.addParagraph(sdParagraph);

   if (row % 2 == 1) {
      table.setDefaultbackGroundColor(greyColor);
   } else {
      table.setDefaultbackGroundColor(whiteColor);
   }

   table.addCellWithStyle(numCell, cellStyle);
   table.addCell(sdCell);

   row = row + 1;

}

document.addTable(table);
document.saveAsAttachment("incident", "sys_id", "filename.pdf");
```

Table – addHeaderCell(Cell cell)

Adds a header Cell object to the table.

Parameters

Name	Type	Description
cell	Cell	Header cell to add to the table.

Returns

Type	Description
None	

This example shows how to add a header cell to a table that contains a Paragraph object. For more information on Paragraph objects, see the *Paragraph API*.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var whiteColor =  sn_pdfgeneratorutils.Color([1,1,1]);
var greyColor =  sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
var headerBgColor = new
 sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

// Query Incident
var gr = new GlideRecord("incident");
gr.query();

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [70,200],
 false);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);

table.setHeaderStyle(headerStyle);

var nParagraph = new sn_pdfgeneratorutils.Paragraph("Number");
var sParagraph = new sn_pdfgeneratorutils.Paragraph("Short
 Description");

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;

hdrCell1.addParagraph(nParagraph);
hdrCell2.addParagraph(sParagraph);

table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);
```

```
var row = 0;

while(gr.next()) {
   var numCell = new sn_pdfgeneratorutils.Cell;
   var sdCell = new sn_pdfgeneratorutils.Cell;

   var numberParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.number);
   var sdParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.short_description);

   numCell.addParagraph(numberParagraph);
   sdCell.addParagraph(sdParagraph);

   if (row % 2 == 1) {
      table.setDefaultbackGroundColor(greyColor);
   } else {
      table.setDefaultbackGroundColor(whiteColor);
   }

   table.addCell(numCell);
   table.addCell(sdCell);

   row = row + 1;

}

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – addImageCell(Image image)

Adds a cell that contains an image to the table.

Parameters

Name	Type	Description
image	Image	Image object to add to the cell.

Returns

Type	Description
None	

This example shows how to create a table with two image cells and attach the document to a record.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large
 table
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var table = new sn_pdfgeneratorutils.Table(true, [70,200],
 false);

var icon = new sn_pdfgeneratorutils.Image("<sys_id>");
var picture = new sn_pdfgeneratorutils.Image("<sys_id>");

table.addImageCell(icon);
table.addImageCell(picture);

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – addParagraphCell(Paragraph p)

Adds a cell that contains a paragraph to the table.

Parameters

Name	Type	Description
p	Paragraph	Paragraph object to add to the cell.

Returns

Type	Description
None	

This example shows how to create a table with a single cell containing paragraph content.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

var paragraph = new sn_pdfgeneratorutils.Paragraph("Content to
 add to the cell");

table.addParagraphCell(paragraph);

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – addTextCell(String text)

Adds a cell that contains a string to the table.

Parameters

Name	Type	Description
text	String	Text to add to the cell.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

This example shows how to create a table with a single cell containing a string.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");

document.addTable(table);
document.saveAsAttachment("incident", "record_sys_id",
 "filename.pdf");
```

Table – complete()

Indicates that all the intended content has been added to a large table.

Use with the *`Table.flush()`* method to add additional content to a table already added to a document. This method only applies when the *`largeTable`* parameter in the constructor is set to true.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

This example shows how to indicate adding content to a table already added to a document is complete.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var whiteColor =  sn_pdfgeneratorutils.Color([1,1,1]);
var greyColor =  sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
var headerBgColor = new
 sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

// Query Incident
var gr = new GlideRecord("incident");
gr.query();
```

```
// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [1,2,1,1],
 true);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);

table.setHeaderStyle(headerStyle);

var numberParagraph = new
 sn_pdfgeneratorutils.Paragraph("Number");
var descParagraph = new sn_pdfgeneratorutils.Paragraph("Short
 Description");
var stateParagraph = new
 sn_pdfgeneratorutils.Paragraph("State");
var assignedParagraph = new
 sn_pdfgeneratorutils.Paragraph("Assigned to");

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;
var hdrCell3 = new sn_pdfgeneratorutils.Cell;
var hdrCell4 = new sn_pdfgeneratorutils.Cell;

hdrCell1.addParagraph(numberParagraph);
hdrCell2.addParagraph(descParagraph);
hdrCell3.addParagraph(stateParagraph);
hdrCell4.addParagraph(assignedParagraph);

table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);
table.addHeaderCell(hdrCell3);
table.addHeaderCell(hdrCell4);

var row = 0;

while(gr.next()) {
   var numCell = new sn_pdfgeneratorutils.Cell;
   var sdCell = new sn_pdfgeneratorutils.Cell;

```
   sdCell.addParagraph(sdParagraph);
   stateCell.addParagraph(stateParagraph);
   assignedCell.addParagraph(assignedParagraph);

   if (row % 2 == 1) {
      table.setDefaultbackGroundColor(greyColor);
   } else {
      table.setDefaultbackGroundColor(whiteColor);
   }

   table.addCell(numCell);
   table.addCell(sdCell);
   table.addCell(stateCell);
   table.addCell(assignedCell);

   row = row + 1;

}

document.addTable(table);
table.addTextCell("A cell added later");
table.flush();
table.complete();
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – donotSplitRowOnPageBreak(Boolean value)

Prevents splitting a row across two pages, when possible.

Parameters

Name	Type	Description
value	Boolean	Flag that indicates whether to split a row across two pages, or move the entire row onto the second page. However, this property does not apply when the row spans more than a single page. Valid values: • true: If the remaining part of a page is not large enough for the row, adds the entire row to a new page. • false: If the remaining part of a page is not large enough for the row, splits the row across two pages. Default: false

Returns

Type	Description
None	

This example shows how to prevent splitting a row across two pages.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true,
 [25,25,25,75,400], false);

table.addTextCell("Text to add to the cell");
table.addTextCell("More text to add to the cell");
table.addTextCell("Even more text to add to the cell");
table.addTextCell("Even more text to add to the cell");
table.addTextCell("Even more text to add to the cell");

table.donotSplitRowOnPageBreak(true);

document.addTable(table);
document.saveAsAttachment("incident", "record_sys_id",
 "filename.pdf");
```

Table – flush()

Adds additional content to a table that is already added to a document.

Use with the *`Table.complete()`* method to indicate that you have added all additional content to the table. This method only applies when the *`largeTable`* parameter in the constructor is set to true.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

This example shows how to add a text cell to a table that is already added to a document.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var whiteColor =  sn_pdfgeneratorutils.Color([1,1,1]);
var greyColor =  sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
var headerBgColor = new
 sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

// Query Incident
var gr = new GlideRecord("incident");
gr.query();
```

```
// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [1,2,1,1],
 true);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);

table.setHeaderStyle(headerStyle);

var numberParagraph = new
 sn_pdfgeneratorutils.Paragraph("Number");
var descParagraph = new sn_pdfgeneratorutils.Paragraph("Short
 Description");
var stateParagraph = new
 sn_pdfgeneratorutils.Paragraph("State");
var assignedParagraph = new
 sn_pdfgeneratorutils.Paragraph("Assigned to");

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;
var hdrCell3 = new sn_pdfgeneratorutils.Cell;
var hdrCell4 = new sn_pdfgeneratorutils.Cell;

hdrCell1.addParagraph(numberParagraph);
hdrCell2.addParagraph(descParagraph);
hdrCell3.addParagraph(stateParagraph);
hdrCell4.addParagraph(assignedParagraph);

table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);
table.addHeaderCell(hdrCell3);
table.addHeaderCell(hdrCell4);

var row = 0;

while(gr.next()) {
   var numCell = new sn_pdfgeneratorutils.Cell;
   var sdCell = new sn_pdfgeneratorutils.Cell;
   var stateCell = new sn_pdfgeneratorutils.Cell;
   var assignedCell = new sn_pdfgeneratorutils.Cell;

   var numberParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.number);
   var sdParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.short_description);
   var stateParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.state);
   var assignedParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.assigned_to);

   numCell.addParagraph(numberParagraph);
```

```
   sdCell.addParagraph(sdParagraph);
   stateCell.addParagraph(stateParagraph);
   assignedCell.addParagraph(assignedParagraph);

   if (row % 2 == 1) {
      table.setDefaultbackGroundColor(greyColor);
   } else {
      table.setDefaultbackGroundColor(whiteColor);
   }

   table.addCell(numCell);
   table.addCell(sdCell);
   table.addCell(stateCell);
   table.addCell(assignedCell);

   row = row + 1;

}

document.addTable(table);
table.addTextCell("A cell added later");
table.flush();
table.complete();
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – getDefaultStyle()

Returns the default style.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Style	Default style.

This example shows how to set and then return the default style.

```
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

var style = new sn_pdfgeneratorutils.Style();

style.setItalic();

table.setDefaultStyle(style);

table.addTextCell("Text to add to the cell");

var defaultStyle = table.getDefaultStyle();
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info(defaultStyle);
```

Table – getHeaderStyle()

Returns the style applied to the table's header.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Style	Style applied to the table's header.

This example shows how to set and return the table's header style.

```
var table = new sn_pdfgeneratorutils.Table(true, [1,1], false);

var whiteColor =  sn_pdfgeneratorutils.Color([1,1,1]);
var headerBgColor = new
 sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);

table.setHeaderStyle(headerStyle);

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;

table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);

var styleObject = table.getHeaderStyle();

gs.info(styleObject);
```

Table – setBorder(Number width)

Sets a border of designated width around the outer edges of the table.

Parameters

Name	Type	Description
width	Number	Width of the border. Unit: Points

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

This example shows how to create a table with two-pixel border and attach the table to a record.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.setBorder(2);

document.addTable(table);
"document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – setDefaultbackGroundColor(Color color)

Sets the table's default background color.

Parameters

Name	Type	Description
color	Color	Color object used as the default background color for the table.

Returns

Type	Description
None	

This example shows how to set the default background color for the table.

```
// declare table by providing width array with automatic table
 size
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

var color = new sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);

table.setDefaultbackGroundColor(color);

table.addTextCell("Text to add to the cell");
```

Table – setDefaultStyle(Style defaultStyle)

Sets the default style to apply to the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
defaultStyle	Style	Default style to apply to the table.

Returns

Type	Description
None	

This example shows how to apply a default style to a table.

```
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

var style = new sn_pdfgeneratorutils.Style();

style.setItalic();

table.setDefaultStyle(style);

table.addTextCell("Text to add to the cell");

var defaultStyle = table.getDefaultStyle();

gs.info(defaultStyle);
```

Table – setFixedPosition(Number pageNumber, Number left, Number bottom, Number width)

Sets the table to a fixed position on the page.

Parameters

Name	Type	Description
pageNumber	Number	Number of the page to add the table to.
left	Number	Number of pixels from the left margin to add the table. Unit: Points
bottom	Number	Number of pixels from the bottom margin to add the table. Unit: Points
width	Number	Width of the table. Unit: Points

Returns

Type	Description
None	

This example shows how to reposition the table into the bottom left corner of the page.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.setFixedPosition(1,36,36,500);

document.addTable(table);
"document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – setHeaderStyle(Style headerStyle)

Sets the Style object to apply to the table's header.

Parameters

Name	Type	Description
headerStyle	Style	Style object to apply to the table's header.

Returns

Type	Description
None	

This example shows how to set and return the table's header style.

```
var table = new sn_pdfgeneratorutils.Table(true, [1,1], false);

var whiteColor =  sn_pdfgeneratorutils.Color([1,1,1]);
var headerBgColor = new
 sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);

table.setHeaderStyle(headerStyle);

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;

table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);

var styleObject = table.getHeaderStyle();

gs.info(styleObject);
```

Table – setHorizontalAlignment(String alignment)

Sets the horizontal alignment of the table.

Parameters

Name	Type	Description
alignment	String	Alignment for the table. Valid values: • center: Align contents to the center. • left: Align contents to the left. • right: Align contents to the right.

Returns

Type	Description
None	

This example shows how to create a small table aligned in the center of the page.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.setWidth(90);
table.setHorizontalAlignment("center");

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – setMargin(Number margin)

Sets all margins around the table to the same width.

Parameters

Name	Type	Description
margin	Number	Value of the top, right, bottom, and left margins in points.

Returns

Type	Description
None	

This example shows how to set a margin for the entire table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.setMargin(3);

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – setMarginBottom(Number margin)

Sets the margin at the bottom of the page.

Parameters

Name	Type	Description
margin	Number	Height of the bottom margin in points.

Returns

Type	Description
None	

This example shows how to set a margin for the bottom of the page to three points.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var whiteColor =  sn_pdfgeneratorutils.Color([1,1,1]);
var greyColor =  sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
var headerBgColor = new
 sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

// Query Incident
var gr = new GlideRecord("incident");
gr.query();

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [70,200],
 false);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);
```

```
table.setHeaderStyle(headerStyle);

var nParagraph = new sn_pdfgeneratorutils.Paragraph("Number");
var sParagraph = new sn_pdfgeneratorutils.Paragraph("Short
 Description");

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;

hdrCell1.addParagraph(nParagraph);
hdrCell2.addParagraph(sParagraph);

table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);

// set the bottom margin to three points
table.setBottomMargin(3);

var row = 0;

while(gr.next()) {
   var numCell = new sn_pdfgeneratorutils.Cell;
   var sdCell = new sn_pdfgeneratorutils.Cell;

   var numberParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.number);
   var sdParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.short_description);

   numCell.addParagraph(numberParagraph);
   sdCell.addParagraph(sdParagraph);

   if (row % 2 == 1) {
      table.setDefaultbackGroundColor(greyColor);
   } else {
      table.setDefaultbackGroundColor(whiteColor);
   }

   table.addCell(numCell);
   table.addCell(sdCell);

   row = row + 1;

}

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – setMarginLeft(Number margin)

Sets the margin at the left side of the page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
margin	Number	Width of the left margin in points.

Returns

Type	Description
None	

This example shows how to set a margin for the left side of the page.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.setMarginLeft(100);

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – setMarginRight(Number margin)

Sets the margin at the right side of the page.

Parameters

Name	Type	Description
margin	Number	Width of the right margin in points.

Returns

Type	Description
None	

This example shows how to set a margin for the left side of the page.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.setMarginRight(100);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
document.addTable(table);
"document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – setMarginTop(Number margin)

Sets a margin at the top of the page.

Parameters

Name	Type	Description
margin	Number	Height of the top margin in points.

Returns

Type	Description
None	

This example shows how to set a margin at the top of the page.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.setMarginTop(100);

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – setWidth(Number width)

Sets the table's total width.

Parameters

Name	Type	Description
width	Number	Width of the table. Unit: Points

Returns

Type	Description
None	

This example shows how to create a table 90 points wide and attach the document to a record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.setWidth(90);
table.setHorizontalAlignment("center");

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Table – useAllAvailableWidth()

Expands the table to use the entire width available on the page.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

This example shows how to create a table that expands to the available width on the page.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.useAllAvailableWidth();

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

TableUtils - Global

The *TableUtils* script include provides shortcuts for accessing table related information.

This class is available to server-side scripts.

TableUtils - TableUtils(String tableName)

Creates an instance of a TableUtils class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
tableName	String	The table name

```
var tu = new TableUtils("incident");
```

TableUtils - drop(String tableName)

Drops a database table.

Note: Use with extreme caution. Dropping a table permanently deletes the table and all its data. If the table is extended, use *dropTableAndExtensions*.

Parameters

Name	Type	Description
tableName	String	Name of the table to drop

Returns

Type	Description
void	

```
var tu = new TableUtils();
tu.drop("table_that_will_be_lost_forever");
```

Output:

```
dropping table table_that_will_be_lost_forever
Starting cache flush
Cache flush complete
TABLE DROP: admin dropped table table_that_will_be_lost_forever
```

TableUtils - dropAndClean(String tableName)

Drops a database table and cleans up references to the table.

Note: Use with extreme caution. Dropping a database table permanently deletes the table and all its data. If the table is extended, use *dropTableAndExtensions*.

Parameters

Name	Type	Description
tableName	String	Name of the table to drop

Returns

Type	Description
void

 table_that_will_be_lost_forever
*** Script: removing dictionary entries for
 table_that_will_be_lost_forever
Background message, type:info, message: Table deleted
```

TableUtils - dropTableAndExtensions(String tableName)

Drops a database table, all of it's extended tables, and cleans up references to the tables.

Note: Use with extreme caution. Dropping a database table permanently deletes the table and all of its data.

Parameters

Name	Type	Description
tableName	String	The table to drop

Returns

Type	Description
void	

```
var tu = new TableUtils();
tu.dropTableAndExtensions("table_that_will_be_lost_forever");
```

Output:

```
dropping table parent_table_that_will_be_lost_forever
Starting cache flush
Cache flush complete
TABLE DROP: admin dropped table
 ext_table_that_will_be_lost_forever
removing gauges for ext_table_that_will_be_lost_forever
removing forms for ext_table_that_will_be_lost_forever
removing styles for ext_table_that_will_be_lost_forever
removing forms sections for ext_table_that_will_be_lost_forever
removing lists for ext_table_that_will_be_lost_forever
removing related lists for ext_table_that_will_be_lost_forever
```

```

TableUtils - getAbsoluteBase()

Returns the base table name from which the table was extended.

Note: For any table under the cmdb_ci hierarchy, this method returns cmdb_ci and not cmdb, which is the actual base table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Base table name

```
var table = new TableUtils("cmdb_ci_server");
gs.print(table.getAbsoluteBase());
```

Output: cmdb_ci

TableUtils - getAllExtensions()

Returns the list of tables that extend a table, includes the base table.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
ArrayList	A list of tables that extend the table, includes the base table.

```
var table = new TableUtils("task");
gs.print(table.getAllExtensions());
```

Output:

```
[task, incident, issue, kb_submission, sysapproval_group,
 change_request, change_request_imac, sc_task,
problem, sc_req_item, ticket, ast_transfer_order, planned_task,
 change_task, change_phase, sc_request]
```

TableUtils - getHierarchy()

Returns a list of all classes participating in the hierarchy of the specified table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
ArrayList	A list of all classes in the specified table's hierarchy.

```
var table = new TableUtils("cmdb_ci_server");
gs.print(table.getHierarchy());
```

Output: [cmdb_ci_server, cmdb_ci_computer, cmdb_ci_hardware, cmdb_ci, cmdb_ci_mainframe, cmdb_ci_linux_server, cmdb_ci_mainframe_lpar, cmdb_ci_esx_server, cmdb_ci_unix_server, cmdb_ci_solaris_server, cmdb_ci_hpux_server, cmdb_ci_aix_server, cmdb_ci_osx_server, cmdb_ci_netware_server, cmdb_ci_win_server]

TableUtils - getTables()

Returns the table hierarchy.

Parameters

Name	Type	Description
None		

Returns

Type	Description
ArrayList	A list of table names in the parent hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Get the hierarchy of tables
var table = new TableUtils("cmdb_ci_computer");
var tableArrayList = table.getTables();

// Use the j2js method to convert the Java ArrayList to
 JavaScript
gs.include("j2js");
var tableArray = j2js(tableArrayList);

// Write the value of each element in the JavaScript array
var i = 0;
while ( i < tableArray.length ) {
gs.print("Table with index " + i + ": " + tableArray[i]);
i++;
}
```

Output:

```
Table with index 0: cmdb_ci_computer
Table with index 1: cmdb_ci_hardware
Table with index 2: cmdb_ci
Table with index 3: cmdb
```

TableUtils - getTableExtensions()

Returns a list of tables that extend a table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
ArrayList	A list of table names that extend the table.

This example shows that 58 tables in this instance extend the Computer [cmdb_ci_computer] table. (Output condensed below.)

```
// Get the tables that extend the table
var table = new TableUtils("cmdb_ci_computer");
var tableArrayList = table.getTableExtensions();

// Use the j2js method to convert the Java ArrayList to
 JavaScript
gs.include("j2js");
var tableArray = j2js(tableArrayList);

// Write the value of each element in the JavaScript array
var i = 0;
while ( i < tableArray.length ) {
  gs.print("Table with index " + i + ": " + tableArray[i]);
  i++;
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
Table with index 0: cmdb_ci_mainframe_hardware
Table with index 1: cmdb_ci_handheld_computing
Table with index 2: cmdb_ci_ucs_blade
Table with index 3: cmdb_ci_storage_switch
Table with index 4: cmdb_ci_server
Table with index 5: cmdb_ci_hmc_server
...
Table with index 56: cmdb_ci_pc_hardware
Table with index 57: cmdb_ci_ucs_rack_unit
```

TableUtils - hasExtensions()

Determines if a table has been extended.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the table has extensions.

```
var table = new TableUtils("cmdb_ci_server");
gs.print(table.hasExtensions());
```

Output:

```
true
```

TableUtils - isBaseClass()

Determines if a table is a base class, meaning it has no parents and has extensions.

For example, Task is a base class since it is not extended from another table and has tables extended from it. Sys_user is not a base class because it has no parents, but does not have extensions.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether a table is a base class table meaning it has no parents but has extensions. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: Table is a base class. • false: Table is not a base class.

```
var table = new TableUtils("task");
gs.print("Task is base class: " + table.isBaseClass());

var table = new TableUtils("sys_user");
gs.print("User is base class: " + table.isBaseClass());
```

Output:

```
 Task is base class: true
User is base class: false
```

TableUtils - isSoloClass()

Determines if the table has no parents and no extensions.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the table has no parent and no table is extended from it.

```
var table = new TableUtils("task");
gs.print("task is solo class: " + table.isSoloClass());

var table = new TableUtils("cmdb_ci_win_server");
gs.print("cmdb_ci_win_server is solo class: " +
 table.isSoloClass());

var table = new TableUtils("sys_user");
gs.print("sys_user is solo class: " + table.isSoloClass());
```

Output:

```
task is solo class: false
cmdb_ci_win_server is solo class: false
sys_user is solo class: true
```

TableUtils - tableExists()

Checks to see if a table exists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the table exists.

```
var table = new TableUtils("my_table");
gs.print("Does 'my_table' exist? " + table.tableExists());
```

Output: Does 'my_table' exist? false

TaskStateUtil - Global

The `TaskStateUtil` script include provides methods for working with task-type table state attributes.

This script include is primarily used by the Task Active State Management business rule to set the active field based on state changes. Configurations are defined in the task.state dictionary element, usually using dictionary overrides since state values vary by table.

You can call the `TaskStateUtil` script include in any server script to determine inactive states, default work, or default close states for a table.

The required attributes are defined on the planned_task table so all planned task types are supported. We will eventually add the attributes to other task types and eventually the base task table. You are free to do this if you want to leverage this feature now.

These attributes can be defined on the task.state dictionary element or a dictionary override for extended task tables.

Related Attributes

Attribute	Definition
close_states	Semicolon delimited list of state values that are inactive, used to identify whether the task should be set to active or inactive.
default_close_state	Optional. Attribute to define the state value of the default close state if you want to define business rules that automatically close a task. Default: 3, typically Closed Complete if attribute is not defined.
default_work_state	Optional. Attribute to define the state value of the default working state if you want to define business rules that automatically set a task for working.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related Attributes (continued)

Attribute	Definition
	Default: 2, typically Work in Progress if the attribute is not defined.

TaskStateUtil - TaskStateUtil(GlideRecord task)

Creates a TaskStateUtil object.

Parameters

Name	Type	Description
task	GlideRecord	This must be a GlideRecord from a task table.

```
var stateUtil = new TaskStateUtil(current);
```

TaskStateUtil - ATTR_DEFAULT_WORK

The name of the attribute that identifies default work state.

Field

Name	Type	Description
ATTR_DEFAULT_WORK	String	Identifies default work state. Value: default_work_state

TaskStateUtil - ATTR_DEFAULT_CLOSE

The name of the attribute that identifies the default close state.

Field

Name	Type	Description
ATTR_DEFAULT_CLOSE	String	Identifies the default close state. Value: default_close_state

TaskStateUtil - ATTR_INACTIVE_STATES

The name of the attribute that identifies inactive states.

Field

Name	Type	Description
ATTR_INACTIVE_STATES	String	Identifies inactive states. Value: close_states

TaskStateUtil - SYSTEM_DEFAULT_CLOSE

The value of the default close state is Closed Complete on the Task table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field

Name	Type	Description
SYSTEM_DEFAULT_CLOSE	Integer	Value of the default close state is Closed Complete on the Task table. Value: 3

TaskStateUtil - SYSTEM_DEFAULT_WORK

The value of the default work state is Work in progress on the Task table.

Field

Name	Type	Description
SYSTEM_DEFAULT_WORK	Integer	Value of the default work state is Work in progress on the Task table. Value: 2

TaskStateUtil - SYSTEM_INACTIVE_STATES

The values of the default inactive states: Closed Complete, Closed Incomplete, Closed Skipped on the Task table.

Field

Name	Type	Description
SYSTEM_INACTIVE_STATES	Integer array	Values of the default inactive states: Closed Complete, Closed Incomplete, Closed Skipped on the Task table. Value: 3, 4, 7

TaskStateUtil - getDefaultCloseState

Returns the value for the default closed state.

The default closed state value is 3 if the default_close_state attribute has not been specified.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	State value representing the closed state.

```
var stateUtil = new TaskStateUtil(current);
//get the close state
var defaultCloseState =  stateUtil.getDefaultCloseState();
current.state = defaultCloseState;
```

TaskStateUtil - getDefaultWorkState()

Returns the value for the default work state.

The default work state value is 2 if the default_work_state attribute has not been specified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The state value representing the working state.

```
var stateUtil = new TaskStateUtil(current);
//get the work state
var defaultWorkState =  stateUtil.getDefaultWorkState();
current.state = defaultWorkState;
```

TaskStateUtil - getInactiveStates

Returns a list of the inactive state values.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	Array of state values that are inactive.

```
var stateUtil = new TaskStateUtil(current);
//get the inactive state values
var inactiveStates = stateUtil.getInactiveStates();
```

TaskStateUtil - isStateInactive(String state)

Returns the active status of the specified state.

Parameters

Name	Type	Description
state	String	The state value to check.

Returns

Type	Description
Boolean	True if the state is inactive.

```
var stateUtil = new TaskStateUtil(current);
var previousStateInactive =
 stateUtil.isStateInactive(previous.state);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var currentStateInactive =
 stateUtil.isStateInactive(current.state);
```

TaskStateUtil - runMarkClosed

Decides whether the *mark closed* business rule should be run or not.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Whether the business rule should be allowed to run or not.

TaskStateUtil - runTaskCloser

Decides whether the *task closer* business rule should be run or not.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Determines whether the business rule should be allowed to run or not.

TaskStateUtil - runTaskReopener

Decides whether the *task reopener* business rule should be run or not.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Whether the business rule should be allowed to run or not.

TaskStateUtil - setDefaultWorkState(String defaultWorkState)

Enables the user to specify their own default work state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
defaultWorkState	String	The value to use for the default work state.

Returns

Type	Description
TaskStateUtil	A self-reference to allow for method chaining.

TemplatePrinter - Scoped

The *TemplatePrinter* API provides methods to handle printing from a mail script to the email message.

There is no constructor for this API. The methods are called in mail scripts using the *template* global variable.

TemplatePrinter - print(String string)

Prints the string to the email body.

Parameters

Name	Type	Description
string	String	String to print.

Returns

Type	Description
void	

```
template.print("Incident number - " + current.number + "\n");
```

TemplatePrinter - space(Number spaces)

Adds non-breaking spaces to the email body.

Parameters

Name	Type	Description
spaces	Number	Number of non-breaking spaces to output to the email body.

Returns

Type	Description
void	

```
template.space(4);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

TimelineSpan - Global

The *TimelineSpan* API provides methods to define a set of properties that describe the characteristics and interactive behavior of an element rendered within a time line item.

Since it is extremely important for all of a time line item's collection of spans to be unique, the creation of a new instance should be performed using the *createTimelineItem()* method of an existing time line Item instance.

TimelineSpan - addPredecessor(Object Array objArray)

Adds multiple relationships between the current instance and other TimelineSpan objects by enumerating through the array of JavaScript objects.

Each object should have an internal property *relationship_sys_id* and *predecessor_sys_id* specified.

Parameters

Name	Type	Description
objArray	Object Array	JavaScript object array that contains two internal properties: *relationship_sys_id* and *predecessor_sys_id*.

Returns

Type	Description
void	

TimelineSpan - addPredecessor(String strPredecessorSysId, String strRelationshipSysId, String strTableName)

Adds the specified relationship between the current instance and another *TimelineSpan* and allows the relationship to open a *GlideWindow* to display information about the relationship.

Parameters

Name	Type	Description
strPredecessorSysId	String	Sys_id of the planned task record that is the predecessor of the relationship.
strRelationshipSysId	String	Sys_id of the relationship record of the relationship.
strTableName	String	Name of the table for the relationship.

Returns

Type	Description
void	

TimelineSpan - addPredecessor(String strPredecessorSysId, String strRelationshipSysId)

Adds the specified relationship between the current instance and another time line span with sys_id *strPredecessorSysId*.

The drawn line will not have any double click handlers associated with it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
strPredecessorSysId	String	Sys_id of the planned task record that is the predecessor of the relationship.
strRelationshipSysId	String	Sys_id of the relationship record of the relationship.

Returns

Type	Description
void	

TimelineSpan - getAllowXDragLeft()

Returns the boolean value of the *AllowXDragLeft* property.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the object's start time can be adjusted. Valid values: • true: Object start time can be adjusted. • false: Object start time can't be adjusted.

TimelineSpan - getAllowXDragRight()

Returns the boolean value of the *AllowXDragRight* property.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the object's end time can be adjusted. Valid values: • true: Object end time can be adjusted. • false: Object end time can't be adjusted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

TimelineSpan - getAllowXMove()

Returns the boolean value of the *AllowXMove* property.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the object can be moved horizontally. Valid values: • true: Object can be moved horizontally. • false: Object can't be moved horizontally.

TimelineSpan - getAllowYMove()

Returns the boolean value of the *AllowYMove* property.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the object can be moved vertically. Valid values: • true: Object can be moved vertically. • false: Object can't be moved vertically.

TimelineSpan - getAllowYMovePredecessor()

Returns the boolean value of the *AllowYMovePredecessor* property.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the a dashed relationship line can be drawn from the current object to a new successor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Valid values: • true: Dashed relationship line can be drawn from the current object to a new successor. • false: Dashed relationship line can't be drawn from the current object to a new successor.

TimelineSpan - getInnerSegmentClass()

Returns the name of the current inner segment class for the time line span.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the class for the current inner segment style.

TimelineSpan - getInnerSegmentEndTimeMs()

Returns the time in milliseconds of the end time of the inner segment portion of the timeline span.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	End time of the timeline span inner segment portion. Unit: Milliseconds

TimelineSpan - getInnerSegmentStartTimeMs()

Returns the time in milliseconds of the start time of the inner segment portion of the timeline span.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Start time of the timeline span inner segment portion. Unit: Milliseconds

TimelineSpan - getIsChanged()

Returns a boolean that specifies whether or not the current timeline item has been modified after initialization.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the current span has been marked as changed. Valid values: • true: Marked as changed. • false: Not marked as changed.

TimelineSpan - getPointIconClass()

Returns a string that specifies the name of the icon class to use for displaying the element on the timeline if the current instance has zero duration.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the icon class to use for displaying the current timeline span if the duration is zero.

TimelineSpan - getPredecessors()

Returns an array of all the predecessor objects associated with the current instance. Each array object is a HashMap that contains a `predecessor_sys_id` and `relationship_sys_id` property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object Array	List of HashMaps that contain two internal properties: `predecessor_sys_id` and `relationship_sys_id`.

TimelineSpan - getSpanColor()

Returns the string name of the background color specified for displaying this span.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	HTML color name to use as the background color for the element.

TimelineSpan - getSpanText()

Returns the string that specifies the text to display adjacent to the time element.

Note: This text only displays if the GlideTimeline object has enabled timeline text defined using the `glideTimeline.showTimelineText(true)` method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Text displayed adjacent to the element.

TimelineSpan - getStartTimeMs()

Returns the start time in milliseconds of the current TimelineSpan object.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Start time of the element. Unit: Milliseconds

TimelineSpan - getSysId()

Returns the sys_id of the current object.

This method is useful for returning the sys_id when the current object instance was created without a specific sys_id to obtain the dynamically generated GUID.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Unique sys_id of the current element.

TimelineSpan - getTable()

Returns the name of the table where the sys_id is referenced.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Table name.

TimelineSpan - getTooltip()

Returns the text/html to display in the tooltip when the TimelineSpan element is being hovered over.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Tooltip text.

TimelineSpan - setAllowXDragLeft(Boolean bFlag)

Sets a flag that determines whether the element's start date can be dragged left or right therefore adjusting the duration of the task.

The effect of this behavior is controlled by the script include that handles the appropriate event. The default value for this property is false.

Parameters

Name	Type	Description
bFlag	Boolean	Flag that indicates whether the element's start date can be adjusted. Valid values: • true: Start date can be adjusted. • false: Start date can't be adjusted.

Returns

Type	Description
void	

TimelineSpan - setAllowXDragRight(Boolean bFlag)

Sets a flag that determines whether the element's end date can be dragged left or right therefore adjusting the duration of the task.

The effect of this behavior is controlled by the script include that handles the appropriate event. The default value for this property is false.

Parameters

Name	Type	Description
bFlag	Boolean	Flag that indicates whether the element's end date can be adjusted. Valid values: • true: End date can be adjusted. • false: End date can't be adjusted.

Returns

Type	Description
void	

TimelineSpan - setAllowXMove(Boolean bFlag)

Sets a flag that determines whether the element can be moved to start at a different time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The effect of this behavior is controlled by the script include that handles the appropriate event. The default value for this property is false.

Parameters

Name	Type	Description
bFlag	Boolean	Flag that indicates whether the element can be moved horizontally. Valid values: • true: Element can be moved horizontally. • false: Element can't be moved horizontally.

Returns

Type	Description
void	

TimelineSpan - setAllowYMove(Boolean bFlag)

Sets a flag that determines whether the element can be dragged vertically on the timeline.

The effect of this behavior is controlled by the script include that handles the appropriate event. The default value for this property is false.

Parameters

Name	Type	Description
bFlag	Boolean	Flag that indicates whether the element can be moved vertically. Valid values: • true: Element can be moved vertically. • false: Element can't be moved vertically.

Returns

Type	Description
void	

TimelineSpan - setAllowYMovePredecessor(Boolean bFlag)

Sets a flag that determines whether a dashed relationship line can be drawn from this element interactively on the timeline.

The effect of this behavior is controlled by the script include that handles the appropriate event. The default value for this property is false.

Parameters

Name	Type	Description
bFlag	Boolean	Flag that indicates whether the a dashed relationship line can be drawn from the current object to a new successor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • true: Dashed relationship line can be drawn from the current object to a new successor. • false: Dashed relationship line can't be drawn from the current object to a new successor.

Returns

Type	Description
void	

TimelineSpan - setInnerSegmentClass(String styleClass)

Sets the name of the class to use for stylizing the inner segment if it exists.

Parameters

Name	Type	Description
styleClass	String	Name of the color class to use to stylize the inner segment. Valid values: • blue • green • silver Default: green

Returns

Type	Description
void	

TimelineSpan - setInnerSegmentTimeSpan(Number startTimeMs, Number endTimeMs)

Creates an inner segment to show within the current timespan defined by the specified range.

Parameters

Name	Type	Description
startTimeMs	Number	Start time. Unit: Milliseconds
endTimeMs	Number	End time. Unit: Milliseconds

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

TimelineSpan - setPointIconClass(String iconClassName)

Sets the icon class to use for displaying the current element on the timeline if the current instance has zero duration.

Note: This only affects the current *TimelineSpan* object and will take precedence over the *defaultPointIconClass* specified by the *GlideTimeline*.

Parameters

Name	Type	Description
iconClassName	String	Icon class to use to display the current element on the timeline if the current instance has zero duration. Valid values: • black_circle • black_square • blue_circle • blue_square • green_circle • green_square • milestone • red_circle • red_square • sepia_circle • sepia_square

Returns

Type	Description
void	

TimelineSpan - setSpanColor(String strColor)

Sets the color for displaying this span.

Parameters

Name	Type	Description
strColor	String	HTML name for the color of this span.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

TimelineSpan - setSpanText(String strSpanText)

Sets the text to display adjacent to the time element.

Note: This text only displays if the GlideTimeline object has enabled timeline text set using the `glideTimeline.showTimelineText(true)` method.

Parameters

Name	Type	Description
strSpanText	String	Text to display next to the time element.

Returns

Type	Description
void	

TimelineSpan - setTimeSpan(Number nStartTime, Number nEndTimeMs)

Sets the start and end dates for the current span.

Parameters

Name	Type	Description
nStartTime	Number	Start time. Unit: Milliseconds
nEndTimeMs	Number	End time. Unit: Milliseconds

Returns

Type	Description
void	

TimelineSpan - setTimeSpan(String strStartTime, String strEndTimeMs)

Sets the start and end times for the current span.

Parameters

Name	Type	Description
strStartTime	String	Start time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Unit: Milliseconds
strEndTimeMs	String	End time. Unit: Milliseconds

Returns

Type	Description
void	

TimelineSpan - setTooltip(String strTooltipText)

Sets the text to display in the tooltip when the TimelineSpan element is being hovered over.

Parameters

Name	Type	Description
strTooltipText	String	Text to display in the tooltip. **Note:** You can specify valid HTML in this string.

Returns

Type	Description
void	

TMFTopicEventAPIUtilOOB - Scoped

The `TMFTopicEventAPIUtilOOB` script include contains functions to handle *`Event Notification Management Open`* API requests that are triggered by external trigger definitions to create, update, and delete events in the Event [em_event] table.

This script include contains the default implementation for the *`Event Notification Management Open`* API. If you want to change the default functionality of this API, you need to override the functions contained in this script include in the `TMFTopicEventAPIUtil` script include.

This script include runs in the `sn_ind_tmf642` namespace and requires the Telecommunications Alarm Management Open API (app-ind-tmfapi-alarm) plugin to be activated.

For additional information on how to override these functions, see the Event Notification Management Open API Developer Guide.

For additional information on the *`Event Notification Management Open`* API, see Event Notification Management Open API.

TMFTopicEventAPIUtilOOB - getAlarmChangeEventSchema()

Returns the payload schema used when processing an alarm change event (ALARM_CHANGE_EVENT_SCHEMA).

This function is called as part of the `AlarmChangeEvent` flow action call process. You can change the functionality of this function by overriding the default functionality in the `TMFTopicEventAPIUtil` script include and the schema in the `TMFAlarmAPIConstants` script include.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Schema defined in `TMFAlarmAPIConstants.ALARM_CHANGE_EVENT_SCHEMA`.

```
// Schema validation
var schema = this.getAlarmChangeEventSchema();
var validationResults =
 this.schemaValidator.validateJSON(changeAlarmPayload, schema);
if (validationResults.length > 0) {
  this.responseObject.status =
 TMFAlarmAPIConstants.EVENT_TRANSFORMATION_ERROR;
  this.responseObject.responseError.errorMessage =
 TMFAlarmAPIConstants.MESSAGES.CHANGE_ERROR;
  this.responseObject.responseError.errorReason =
 TMFAlarmAPIConstants.MESSAGES.CHANGE_ERROR_PAYLOAD;
  var messageDetails = [];
  for (var i = 0; i < validationResults.length; i++)

 messageDetails.push(this.createErrorObject(validationResults[i]
.message, validationResults[i].dataPath));
  this.responseObject.responseError.details = messageDetails;
  return this.responseObject;
```

TMFTopicEventAPIUtilOOB - getAlarmCreateEventSchema()

Returns the payload schema used when processing an alarm create event (ALARM_CREATE_EVENT_SCHEMA).

This function is called as part of the `AlarmCreateEvent` flow action call process. You can change the functionality of this function by overriding the default functionality in the `TMFTopicEventAPIUtil` script include and the schema in the `TMFAlarmAPIConstants` script include.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Schema defined in `TMFAlarmAPIConstants.ALARM_CREATE_EVENT_SCHEMA`

```
// Schema validation
var schema = this.getAlarmCreateEventSchema();
var validationResults =
 this.schemaValidator.validateJSON(eventAlarmObject, schema);
if (validationResults.length > 0) {
  this.responseObject.status =
 TMFAlarmAPIConstants.EVENT_TRANSFORMATION_ERROR;
  this.responseObject.responseError.errorMessage =
 TMFAlarmAPIConstants.MESSAGES.CREATE_ERROR;
  this.responseObject.responseError.errorReason =
 TMFAlarmAPIConstants.MESSAGES.CREATE_ERROR_PAYLOAD;
  var messageDetails = [];
  for (var i = 0; i < validationResults.length; i++)

 messageDetails.push(this.createErrorObject(validationResults[i]
.message, validationResults[i].dataPath));
  this.responseObject.responseError.details = messageDetails;
  return this.responseObject;
}
```

TMFTopicEventAPIUtilOOB - getAlarmDeleteEventSchema()

Returns the payload schema used when processing an alarm delete event (ALARM_DELETE_EVENT_SCHEMA).

This function is called as part of the `AlarmDeleteEvent` flow action call process. You can change the functionality of this function by overriding the default functionality in the `TMFTopicEventAPIUtil` script include and the schema in the `TMFAlarmAPIConstants` script include.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Schema defined in `TMFAlarmAPIConstants.ALARM_DELETE_EVENT_SCHEMA`.

```
// Schema validation
var schema = this.getAlarmDeleteEventSchema();
var validationResults =
 this.schemaValidator.validateJSON(deleteAlarmPayload, schema);
if (validationResults.length > 0) {
  this.responseObject.status =
 TMFAlarmAPIConstants.EVENT_TRANSFORMATION_ERROR;
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  this.responseObject.responseError.errorMessage =
 TMFAlarmAPIConstants.MESSAGES.CLEAR_ERROR;
  this.responseObject.responseError.errorReason =
 TMFAlarmAPIConstants.MESSAGES.CLEAR_ERROR_PAYLOAD;
  var messageDetails = [];
  for (var i = 0; i < validationResults.length; i++)

 messageDetails.push(this.createErrorObject(validationResults[i]
.message, validationResults[i].dataPath));
  this.responseObject.responseError.details = messageDetails;
  return this.responseObject;
}
```

TMFTopicEventAPIUtilOOB - mapAlarmChangeObjectToEvent(alarmObject, GlideRecord newEventGr)

Maps the parameters in the passed change request payload to fields in the specified record in the Event [em_event] table.

You can customize field mappings to add data to the Event [em_event] table or change the default field mappings. To modify mappings, create functions with identical names and parameters in the `TMFTopicEventAPIUtil` script include to override the mappings in the `TMFTopicEventAPIUtilOOB` script include. If you add fields to the mappings, these fields must also be added to the associated schema (`TMFAlarmAPIConstants.ALARM_CHANGE_EVENT_SCHEMA`).

This function is called as part of the *`transformAndPersistChangeEvent()`* function.

Parameters

Name	Type	Description
alarmObject	Object	Payload should match what is defined in the schema defined in `TMFAlarmAPIConstants.ALARM_CHANGE_EVENT_SCHEMA`.
newEventGr	GlideRecord	GlideRecord of the record to updated in the Event [em_event] table.

Returns

Type	Description
None	

```
this.mapAlarmChangeObjectToEvent(additionalInfoObj, newEventGr);

var id = newEventGr.insert();
return gs.nil(id) ? id : newEventGr.message_key;
```

TMFTopicEventAPIUtilOOB - mapCreateAlarmObjectToEvent(Object alarmObject, GlideRecord eventGr)

Maps the parameters in the passed create request payload to fields in the specified record in the Event [em_event] table.

You can customize field mappings to add data to the Event [em_event] table or change the default field mappings. To modify mappings, create functions with identical

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

names and parameters in the TMFTopicEventAPIUtil script include to override the mappings in the TMFTopicEventAPIUtilOOB script include. If you add fields to the mappings, these fields must also be added to the associated schema (TMFAlarmAPIConstants.ALARM_CREATE_EVENT_SCHEMA).

This function is called as part of the *transformAndPersistAlarmCreateEvent()* function.

Parameters

Name	Type	Description
alarmObject	Object	Payload should match what is defined in the schema defined in TMFAlarmAPIConstants.ALARM_CREATE_EVENT_SCHEMA.
eventGr	GlideRecord	GlideRecord of the record in the Event [em_event] table.

Returns

Type	Description
None	

```
this.mapCreateAlarmObjectToEvent(eventAlarmObject, eventGr);
var id = eventGr.insert();
return gs.nil(id) ? id : msgKey;
```

TMFTopicEventAPIUtilOOB - mapDeleteAlarmObjectToEvent(Object additionalInfoObj, GlideRecord newEventGr)

Maps the parameters in the passed delete request payload to fields in the specified record in the Event [em_event] table.

You can customize field mappings to add data to the Event [em_event] table or change the default field mappings. To modify mappings, create functions with identical names and parameters in the TMFTopicEventAPIUtil script include to override the mappings in the TMFTopicEventAPIUtilOOB script include. If you add fields to the mappings, these fields must also be added to the associated schema (TMFAlarmAPIConstants.ALARM_DELETE_EVENT_SCHEMA).

This function is called as part of the *transformAndPersistDeleteEvent()* function.

Parameters

Name	Type	Description
alarmObject	Object	Payload should match what is defined in the schema defined in TMFAlarmAPIConstants.ALARM_DELETE_EVENT_SCHEMA.
newEventGr	GlideRecord	GlideRecord of the record to use to map the fields in the payload to those in the Event [em_event] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
this.mapDeleteAlarmObjectToEvent(additionalInfoObj, newEventGr);
var id = newEventGr.insert();
return gs.nil(id) ? id : newEventGr.message_key;
```

TMFTopicEventAPIUtilOOB - prepareEventAlarmRecordResponse(String msgKey Object alarmObject, Object responseObject)

Generates the response object after event creation or update, including the clearing of an event.

This function is called by the *processAlarmCreateEvent()*, *processChangeAlarm()*, and *processDeleteAlarmEvent()* functions. You can change the functionality of this function by overriding the default functionality in the TMFTopicEventAPIUtil script include.

Parameters

Name	Type	Description
msgKey	String	Message key. This key is generated when an event is created. Located in the Message key field in the Events [em_event] table.
alarmObject	Object	Event payload to process. The format of this payload should correlate to the event type that is being processed. The schemas for these payloads are defined in the TMFAlarmAPIConstants script include.
responseObject	Object	Empty response object. Use this object to record any issues with the verification of the payload schema. Data type: Object `"responseObject": { "responseError": {Object}, "status": "String", "successResponse": {Object} }`
responseObject.responseError	Object	Details about any error that occurred during validation. `"responseError": { "details": [Array], "errorMessage": "String", "errorReason": "String" }`
responseObject.responseError.details	Array	Any additional information to pass back to the calling routine. For example: `var messageDetails = []; for (var i = 0; i < validationResults.length; i++) messageDetails.push(this.createErrorObje`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`ct(validationResults[i].message, validationResults[i].dataPath)); this.responseObject.responseError.details = messageDetails; return this.responseObject`
responseObject.responseError.errorMessage	String	Error message that describes the error that occurred. The available error messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.responseError.errorReason	String	Reason why the endpoint failed. The available error reasons are defined in the `TMFAlarmAPIConstants` script include.
responseObject.status	String	Status of the function call. The available status messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.successResponse	Object	Successful response from the function call. For example, you could store the payload object in this value.

Returns

Type	Description
responseObject	Details about the status of the function call. `"responseObject": { "responseError": {Object}, "status": "String", "successResponse": {Object} }`
responseObject.status	Status of the function call. The available status messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.successResponse	Successful response from the function call. For example, you could store the payload object in this value.
responseObject.responseError	Details about any error that occurred during validation. `"responseError": { "details": [Array], "errorMessage": "String", "errorReason": "String" }`
responseObject.responseError.details	Any additional information to pass back to the calling routine. For example: `var messageDetails = []; for (var i = 0; i < validationResults.length; i++) messageDetails.push(this.createErrorObject(vali`

Returns (continued)

Type	Description
	`dationResults[i].message, validationResults[i].dataPath)); this.responseObject.responseError.details = messageDetails; return this.responseObject`
responseObject.responseError.errorMessage	Error message that describes the error that occurred. The available error messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.responseError.errorReason	Reason why the endpoint failed. The available error reasons are defined in the `TMFAlarmAPIConstants` script include.

```
processDeleteAlarm: function(additionalInfoObj, gr,
 deleteAlarmPayload, responseObject) {
var msgKey =
 this.transformAndPersistDeleteEvent(additionalInfoObj, gr);
var responsePayload =
 this.prepareEventAlarmRecordResponse(msgKey,
 deleteAlarmPayload, responseObject);
this._logger.logDebug("processDeleteAlarmEvent");
return responsePayload;
},
```

TMFTopicEventAPIUtilOOB - processAlarmChangeEvent(Object changeAlarmPayload)

Starts the process of updating a record in the Event [em_event] table when the *eventType* is set to `AlarmChangeNotification`.

This function is called by the `AlarmChangeEvent` flow action. You can change the functionality of this function by overriding the default functionality in the `TMFTopicEventAPIUtil` script include.

Parameters

Name	Type	Description
changeAlarmPayload	Object	Event change payload to process. The payload should match the schema defined in `TMFAlarmAPIConstants.ALARM_CHANGE_EVENT_SCHEMA`.

Returns

Type	Description
responseObject	Details about the status of the function call. `"responseObject": { "responseError": {Object}, "status": "String", "successResponse": {Object} }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
responseObject.responseError	Details about any error that occurred during validation. `"responseError": { "details": [Array], "errorMessage": "String", "errorReason": "String" }`
responseObject.responseError.details	Any additional information to pass back to the calling routine. For example: `var messageDetails = []; for (var i = 0; i < validationResults.length; i++) messageDetails.push(this.createErrorObject(validationResults[i].message, validationResults[i].dataPath)); this.responseObject.responseError.details = messageDetails; return this.responseObject`
responseObject.responseError.errorMessage	Error message that describes the error that occurred. The available error messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.responseError.errorReason	Reason why the endpoint failed. The available error reasons are defined in the `TMFAlarmAPIConstants` script include.
responseObject.status	Status of the function call. The available status messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.successResponse	Successful response from the function call. For example, you could store the payload object in this value.

`Called by the AlarmChangeEvent flow action`

TMFTopicEventAPIUtilOOB - processAlarmCreateEvent(Object eventAlarmObject)

Starts the process of creating a record in the Event [em_event] table when the *eventType* is set to `AlarmCreateNotification`.

This function is called by the `AlarmCreateEvent` flow action. You can change the functionality of this function by overriding the default functionality in the `TMFTopicEventAPIUtil` script include.

Parameters

Name	Type	Description
eventAlarmObject	Object	Event create payload to process. The payload should match the schema defined in `TMFAlarmAPIConstants.ALARM_CREATE_EVENT_SCHEMA`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
responseObject	Details about the status of the function call. `"responseObject": { "responseError": {Object}, "status": "String", "successResponse": {Object} }`
responseObject. responseError	Details about any error that occurred during validation. `"responseError": { "details": [Array], "errorMessage": "String", "errorReason": "String" }`
responseObject. responseError.details	Any additional information to pass back to the calling routine. For example: `var messageDetails = []; for (var i = 0; i < validationResults.length; i++) messageDetails.push(this.createErrorObject(validationResults[i].message, validationResults[i].dataPath)); this.responseObject.responseError.details = messageDetails; return this.responseObject`
responseObject. responseError. errorMessage	Error message that describes the error that occurred. The available error messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject. responseError. errorReason	Reason why the endpoint failed. The available error reasons are defined in the `TMFAlarmAPIConstants` script include.
responseObject. status	Status of the function call. The available status messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject. successResponse	Successful response from the function call. For example, you could store the payload object in this value.

```
Called by AlarmCreateEvent flow action.
```

TMFTopicEventAPIUtilOOB - processDeleteAlarmEvent(Object deleteAlarmPayload)

Starts the process of clearing the alarm event in the Event [em_event] table when the *eventType* is set to `AlarmDeleteNotification`.

This function clears the state field and closes the event alarm. It also updates any parameters in the passed payload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This function is called by the `AlarmDeleteEvent` flow action. You can change the functionality of this function by overriding the default functionality in the `TMFTopicEventAPIUtil` script include.

Parameters

Name	Type	Description
deleteAlarm Payload	Object	Event delete payload to process. The payload should match the schema defined in `TMFAlarmAPIConstants.ALARM_DELETE_EVENT_SCHEMA`.

Returns

Type	Description
responseObject	Details about the status of the function call. `"responseObject": { "responseError": {Object}, "status": "String", "successResponse": {Object} }`
responseObject. responseError	Details about any error that occurred during validation. `"responseError": { "details": [Array], "errorMessage": "String", "errorReason": "String" }`
responseObject. responseError.details	Any additional information to pass back to the calling routine. For example: `var messageDetails = []; for (var i = 0; i < validationResults.length; i++) messageDetails.push(this.createErrorObject(validationResults[i].message, validationResults[i].dataPath)); this.responseObject.responseError.details = messageDetails; return this.responseObject`
responseObject. responseError. errorMessage	Error message that describes the error that occurred. The available error messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject. responseError. errorReason	Reason why the endpoint failed. The available error reasons are defined in the `TMFAlarmAPIConstants` script include.
responseObject. status	Status of the function call. The available status messages are defined in the `TMFAlarmAPIConstants` script include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
responseObject.successResponse	Successful response from the function call. For example, you could store the payload object in this value.

```
Called by AlarmDeleteEvent flow action.
```

TMFTopicEventAPIUtilOOB - transformAndPersistAlarmCreateEvent(Object alarmObject)

Transforms the passed in create event payload using the associated create event mapping values and stores the information in Event [em_event] table.

This function is called by the processAlarmCreateEvent() function as part of the flow action. You can change the functionality of this function by overriding the default functionality in the `TMFTopicEventAPIUtil` script include.

Parameters

Name	Type	Description
alarmObject	Object	Payload to use to create a record in the Event [em_event] table. The payload should match the schema defined in `TMFAlarmAPIConstants.ALARM_CREATE_EVENT_SCHEMA`.

Returns

Type	Description
String	Unique ID (Message key) of the event.

This function is only called by the `AlarmCreateEvent` flow action, so no code example is provided.

TMFTopicEventAPIUtilOOB - transformAndPersistChangeEvent(Object additionalInfoObj, GlideRecord existingGr)

Transforms the passed in change event payload using the associated change event mapping values and stores the updated information in the passed GlideRecord within the Event [em_event] table.

This function is called by the processAlarmChangeEvent() function as part of the flow action. You can change the functionality of this function by overriding the default functionality in the `TMFTopicEventAPIUtil` script include.

Parameters

Name	Type	Description
additionalInfoObj	Object	Payload to use to update the fields in the record specified in the *`existingGr`* parameter. The payload should match the schema defined in `TMFAlarmAPIConstants.ALARM_CHANGE_EVENT_SCHEMA`.
existingGr	GlideRecord	GlideRecord of the event record in the Event [em_event] table to update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Unique ID (Message key) of the event.

This function is only called by the `AlarmChangeEvent` flow action, so no code example is provided.

TMFTopicEventAPIUtilOOB - transformAndPersistDeleteEvent(Object additionalInfoObj GlideRecord existingGr)

Transforms the passed in delete (clear) event payload using the associated delete event mapping values and stores the updated information in the passed GlideRecord within the Event [em_event] table.

This function is called by the >processAlarmDeleteEvent() function as part of the flow action. You can change the functionality of this function by overriding the default functionality in the `TMFTopicEventAPIUtil` script include.

Parameters

Name	Type	Description
additional InfoObj	Object	Payload to use to update the clear event fields in the record specified in the *`existingGr`* parameter. The payload should match the schema defined in `TMFAlarmAPIConstants.ALARM_DELETE_EVENT_SCHEMA`.
existingGr	GlideRecord	GlideRecord of the event record in the Event [em_event] table for which to clear the alarm.

Returns

Type	Description
String	Unique ID (Message key) of the event.

This function is only called by the `AlarmDeleteEvent` flow action, so no code example is provided.

TMFTopicEventAPIUtilOOB - validateSubscription(Object eventAlarmObject, Object responseObject)

Performs validation on the subscription.

This validation includes checking if the callback URL used to make the event notification and the *`eventType`* in the payload are registered.

This function is called by the *`processAlarmCreateEvent()`*, *`processChangeAlarm()`*, and *`processDeleteAlarmEvent()`* functions. You can change the functionality of this function by overriding the default functionality in the `TMFTopicEventAPIUtil` script include.

Parameters

Name	Type	Description
eventAlarm Object	Object	Event payload to validate. The format of this payload should correlate to the event type that is being processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		The schemas for these payloads are defined in the `TMFAlarmAPIConstants` script include.
responseObject	Object	Empty response object. Use this object to record any issues with the verification of the payload schema. Data type: Object `"responseObject": { "responseError": {Object}, "status": "String", "successResponse": {Object} }`
responseObject.status	String	Status of the function call. The available status messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.successResponse	Object	Successful response from the function call. For example, you could store the payload object in this value.
responseObject.responseError	Object	Details about any error that occurred during validation. `"responseError": { "details": [Array], "errorMessage": "String", "errorReason": "String" }`
responseObject.responseError.details	Array	Any additional information to pass back to the calling routine. For example: `var messageDetails = []; for (var i = 0; i < validationResults.length; i++) messageDetails.push(this.createErrorObject(validationResults[i].message, validationResults[i].dataPath)); this.responseObject.responseError.details = messageDetails; return this.responseObject`
responseObject.responseError.errorMessage	String	Error message that describes the error that occurred. The available error messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.responseError.errorReason	String	Reason why the endpoint failed. The available error reasons are defined in the `TMFAlarmAPIConstants` script include.

Returns

Type	Description
responseObject	Details about the status of the function call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	`"responseObject": { "responseError": {Object}, "status": "String", "successResponse": {Object} }`
responseObject. responseError	Details about any error that occurred during validation. `"responseError": { "details": [Array], "errorMessage": "String", "errorReason": "String" }`
responseObject. responseError.details	Any additional information to pass back to the calling routine. For example: `var messageDetails = []; for (var i = 0; i < validationResults.length; i++) messageDetails.push(this.createErrorObject(validationResults[i].message, validationResults[i].dataPath)); this.responseObject.responseError.details = messageDetails; return this.responseObject`
responseObject. responseError. errorMessage	Error message that describes the error that occurred. The available error messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject. responseError. errorReason	Reason why the endpoint failed. The available error reasons are defined in the `TMFAlarmAPIConstants` script include.
responseObject. status	Status of the function call. The available status messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject. successResponse	Successful response from the function call. For example, you could store the payload object in this value.

This function is only called by the `AlarmCHANGEEvent` flow action, so no code example is provided.

TMFTopicEventAPIUtilOOB - verifyAlarmChangeEventPayload(Object changeAlarmPayload, Object responseObject)

Provides the ability to define additional verification of the passed in change event payload.

This function is called by the processAlarmChangeEvent() function as part of the flow action. Currently there is no additional payload verification provided for the change payload. You can add functionality for this function by overriding the default functionality in the `TMFTopicEventAPIUtil` script include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
changeAlarmPayload	Object	Payload to verify. Payload should match the schema defined in `TMFAlarmAPIConstants.ALARM_CHANGE_EVENT_SCHEMA`.
responseObject	Object	Empty response object. Use this object to record any issues with the verification of the payload schema. Data type: Object `"responseObject": { "responseError": {Object}, "status": "String", "successResponse": {Object} }`
responseObject.responseError	Object	Details about any error that occurred during validation. `"responseError": { "details": [Array], "errorMessage": "String", "errorReason": "String" }`
responseObject.responseError.details	Array	Any additional information to pass back to the calling routine. For example: `var messageDetails = []; for (var i = 0; i < validationResults.length; i++) messageDetails.push(this.createErrorObject(validationResults[i].message, validationResults[i].dataPath)); this.responseObject.responseError.details = messageDetails; return this.responseObject`
responseObject.responseError.errorMessage	String	Error message that describes the error that occurred. The available error messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.responseError.errorReason	String	Reason why the endpoint failed. The available error reasons are defined in the `TMFAlarmAPIConstants` script include.
responseObject.status	String	Status of the function call. The available status messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.successResponse	Object	Successful response from the function call. For example, you could store the payload object in this value.

Returns

Type	Description
responseObject	Details about the status of the function call.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	`"responseObject": { "responseError": {Object}, "status": "String", "successResponse": {Object} }`
responseObject. responseError	Details about any error that occurred during validation. `"responseError": { "details": [Array], "errorMessage": "String", "errorReason": "String" }`
responseObject. responseError.details	Any additional information to pass back to the calling routine. For example: `var messageDetails = []; for (var i = 0; i < validationResults.length; i++) messageDetails.push(this.createErrorObject(validationResults[i].message, validationResults[i].dataPath)); this.responseObject.responseError.details = messageDetails; return this.responseObject`
responseObject. responseError. errorMessage	Error message that describes the error that occurred. The available error messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject. responseError. errorReason	Reason why the endpoint failed. The available error reasons are defined in the `TMFAlarmAPIConstants` script include.
responseObject. status	Status of the function call. The available status messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject. successResponse	Successful response from the function call. For example, you could store the payload object in this value.

```
 // Apply customized validations if applicable, defaults to no
 error
var changePayloadResponse =
 this.verifyAlarmChangeEventPayload(changeAlarmPayload,
 this.responseObject);
if (!gs.nil(changePayloadResponse.responseError.errorMessage))
  return changePayloadResponse;
```

TMFTopicEventAPIUtilOOB - verifyAlarmCreateEventPayload(Object alarmObject, Object responseObject)

Provides the ability to define additional verification of the passed in create event payload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This function is called by the processAlarmCreateEvent() function as part of the flow action. Currently there is no additional payload verification provided for the create payload. You can add functionality for this function by overriding the default functionality in the `TMFTopicEventAPIUtil` script include.

Parameters

Name	Type	Description
alarmPayload	Object	Payload to verify. Payload should match the schema defined in `TMFAlarmAPIConstants.ALARM_CREATE_EVENT_SCHEMA`.
responseObject	Object	Empty response object. Use this object to record any issues with the verification of the payload schema. Data type: Object `"responseObject": { "responseError": {Object}, "status": "String", "successResponse": {Object} }`
responseObject.status	String	Status of the function call. The available status messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.successResponse	Object	Successful response from the function call. For example, you could store the payload object in this value.
responseObject.responseError	Object	Details about any error that occurred during validation. `"responseError": { "details": [Array], "errorMessage": "String", "errorReason": "String" }`
responseObject.responseError.details	Array	Any additional information to pass back to the calling routine. For example: `var messageDetails = []; for (var i = 0; i < validationResults.length; i++) messageDetails.push(this.createErrorObject(validationResults[i].message, validationResults[i].dataPath)); this.responseObject.responseError.details = messageDetails; return this.responseObject`
responseObject.responseError.errorMessage	String	Error message that describes the error that occurred. The available error messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.responseError.errorReason	String	Reason why the endpoint failed. The available error reasons are defined in the `TMFAlarmAPIConstants` script include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
responseObject	Details about the status of the function call. `"responseObject": { "responseError": {Object}, "status": "String", "successResponse": {Object} }`
responseObject. responseError	Details about any error that occurred during validation. `"responseError": { "details": [Array], "errorMessage": "String", "errorReason": "String" }`
responseObject. responseError.details	Any additional information to pass back to the calling routine. For example: `var messageDetails = []; for (var i = 0; i < validationResults.length; i++) messageDetails.push(this.createErrorObject(validationResults[i].message, validationResults[i].dataPath)); this.responseObject.responseError.details = messageDetails; return this.responseObject`
responseObject. responseError. errorMessage	Error message that describes the error that occurred. The available error messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject. responseError. errorReason	Reason why the endpoint failed. The available error reasons are defined in the `TMFAlarmAPIConstants` script include.
responseObject. status	Status of the function call. The available status messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject. successResponse	Successful response from the function call. For example, you could store the payload object in this value.

```
// Apply customized validations if applicable, defaults to no
 error
var creatPayloadResponse =
 this.verifyAlarmCreateEventPayload(eventAlarmObject,
 this.responseObject);
if (!gs.nil(creatPayloadResponse.responseError.errorMessage))
  return creatPayloadResponse;
```

TMFTopicEventAPIUtilOOB - verifyDeleteEventPayload(Object deleteAlarmPayload, Object responseObject)

Provides the ability to define additional verification of the passed in delete event payload.

This function is called by the processDeleteAlarmEvent() function as part of the flow action. Currently there is no additional payload verification provided for the delete payload. You can add functionality for this function by overriding the default functionality in the `TMFTopicEventAPIUtil` script include.

Parameters

Name	Type	Description
deleteAlarm Payload	Object	Payload to verify. Payload should match the schema defined in `TMFAlarmAPIConstants.ALARM_DELETE_EVENT_SCHEMA`.
responseObject	Object	Empty response object. Use this object to record any issues with the verification of the payload schema. Data type: Object `"responseObject": { "responseError": {Object}, "status": "String", "successResponse": {Object} }`
responseObject status	String	Status of the function call. The available status messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject successResponse	Object	Successful response from the function call. For example, you could store the payload object in this value.
responseObject responseError	Object	Details about any error that occurred during validation. `"responseError": { "details": [Array], "errorMessage": "String", "errorReason": "String" }`
responseObject responseError. details	Array	Any additional information to pass back to the calling routine. For example: `var messageDetails = []; for (var i = 0; i < validationResults.length; i++) messageDetails.push(this.createErrorObject(validationResults[i].message, validationResults[i].dataPath)); this.responseObject.responseError.details = messageDetails; return this.responseObject`
responseObject responseError. errorMessage	String	Error message that describes the error that occurred. The available error messages are defined in the `TMFAlarmAPIConstants` script include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
responseObject.responseError.errorReason	String	Reason why the endpoint failed. The available error reasons are defined in the `TMFAlarmAPIConstants` script include.

Returns

Type	Description
responseObject	Details about the status of the function call. `"responseObject": { "responseError": {Object}, "status": "String", "successResponse": {Object} }`
responseObject.responseError	Details about any error that occurred during validation. `"responseError": { "details": [Array], "errorMessage": "String", "errorReason": "String" }`
responseObject.responseError.details	Any additional information to pass back to the calling routine. For example: `var messageDetails = []; for (var i = 0; i < validationResults.length; i++) messageDetails.push(this.createErrorObject(validationResults[i].message, validationResults[i].dataPath)); this.responseObject.responseError.details = messageDetails; return this.responseObject`
responseObject.responseError.errorMessage	Error message that describes the error that occurred. The available error messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.responseError.errorReason	Reason why the endpoint failed. The available error reasons are defined in the `TMFAlarmAPIConstants` script include.
responseObject.status	Status of the function call. The available status messages are defined in the `TMFAlarmAPIConstants` script include.
responseObject.successResponse	Successful response from the function call. For example, you could store the payload object in this value.

```
// Apply customized validations if applicable, defaults to no
 error
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var deletePayloadResponse =
 this.verifyDeleteEventPayload(deleteAlarmPayload,
 this.responseObject);
if (!gs.nil(deletePayloadResponse.responseError.errorMessage))
  return deletePayloadResponse;
```

TopicAPIUtilsOOB - Scoped

The *TopicAPIUtilsOOB* script include provides methods that are used when processing the *Event Management Topic Open API* endpoint.

If you want to change the default functionality of *Event Management Topic Open API*, you need to override the functions contained in this script include in the TopicAPIUtils script include.

This script include runs in the sn_api_notif_mgmt namespace and requires the sn_api_notif_mgmt.event_mgmt_integration role.

TopicAPIUtilsOOB - createTopicHelper(Object topicObject, Array warnings)

Inserts the information passed in the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint into the Topic [sn_api_notif_mgmt_topic] table.

If you want to modify this insertion process, you need to override this method in the *TopicAPIUtils* script include.

Parameters

Name	Type	Description
topicObject	Object	Topic payload object passed into the Event Management Topic Open API endpoint. For example: `{ "name": "HighPriorityTroubleTicket", "headerQuery": "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttributeChangeEvent", "contentQuery": "troubleTicket.ticketType=incident&troubleTicket.severity=1", "externalId": "ext001", "namespace": "telecomEvents" }` The schema of this object must match what is defined in *Constants.SCHEMA.CREATE_TOPIC_SCHEMA* located in the sn_api_notif_mgmt.Constants script include.
warnings	Array	Warning messages to return in the Event Management Topic Open API endpoint response if the method encounters an issue at the level of "warning". This parameter allows you to add custom warning messages to your implementation of this endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		If there are no additional warning messages, you must pass an empty array.

Returns

Type	Description
Object	Response object. `{ "contentQuery": "String", "eventType": "String", "externalId": "String", "headerQuery": "String", "id": "String", "name": "String" }` For details on these parameters, see the return results for Event Management Topic Open - POST /sn_api_notif_mgmt/topic.

The following code example shows how to call this method.

```
processTopicCreation: function(topicObject) {
  try {
    var warnings = [];

    var schema = this.getCreateTopicSchema();
    if (!this.isValidCreateTopicPayload(topicObject, schema,
 warnings)) {
      this._logger.logDebug("Create Topic : validation failed");
      return this.response;
    }
    this.createTopicHelper(topicObject, warnings);
    this._logger.logDebug("Create Topic: Topic created
 succesfully");
  } catch (ex) {
    this._logger.logErr("Create Topic : Process aborted, error
 is: " + ex);
    var errorObj =
 this.apiCoreUtil.getErrorObj(sn_tmt_core.Constants.ERROR_CODES.
INTERNAL_ERROR, Constants.MESSAGES.TOPIC_CREATE_ERROR,
 Constants.MESSAGES.TOPIC_CREATE_ERROR);
    var details = [];
    details.push(this.apiCoreUtil.getErrorDetailsObj(ex.message
 + '', ''));
    errorObj.details = details;
    this.response.details = errorObj;
  }

  return this.response;
},
```

TopicAPIUtilsOOB - getCreateTopicSchema()

Returns the defined schema for the payload used by the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint to validate the topic payload.

If you want to customize the schema for the topic payload, you need to override the default payload schema, *Constants.SCHEMA*, located in the `sn_api_notif_mgmt.Constants` script include. This default value of this schema is:

```
CREATE_TOPIC_SCHEMA: "{
  \"title\":\"Topic\",
  \"type\":\"object\",
  \"properties\":{
    \"name\":{
      \"type\":\"string\"
    },
    \"contentQuery\":{
      \"type\":\"string\"
    },
    \"headerQuery\":{
      \"type\":\"string\"
    },
    \"namespace\":{
      \"type\":\"string\"
    }
  },
  \"required\":[\"name\"]
}"
```

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Schema for the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint payload. Use this schema to validate the schema passed into the endpoint using the TopicAPIUtilsOOB - isValidCreateTopicPayload(Object topicObject, String schema, Array warnings) method.

The following code example shows how to call this method.

```
processTopicCreation: function(topicObject) {
  try {
    var warnings = [];

    var schema = this.getCreateTopicSchema();
    if (!this.isValidCreateTopicPayload(topicObject, schema,
 warnings)) {
      this._logger.logDebug("Create Topic : validation failed");
      return this.response;
    }
    this.createTopicHelper(topicObject, warnings);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    this._logger.logDebug("Create Topic: Topic created
 succesfully");
  } catch (ex) {
    this._logger.logErr("Create Topic : Process aborted, error
 is: " + ex);
    var errorObj =
 this.apiCoreUtil.getErrorObj(sn_tmt_core.Constants.ERROR_CODES.
INTERNAL_ERROR, Constants.MESSAGES.TOPIC_CREATE_ERROR,
 Constants.MESSAGES.TOPIC_CREATE_ERROR);
    var details = [];
    details.push(this.apiCoreUtil.getErrorDetailsObj(ex.message
 + '', ''));
    errorObj.details = details;
    this.response.details = errorObj;
  }

  return this.response;
},
```

TopicAPIUtilsOOB - isValidCreateTopicPayload(Object topicObject, String schema, Array warnings)

Validates the payload passed into the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint. This validation is performed on the request body and the schema.

If you want to modify the validation process for the payload, you need to override this method in the *TopicAPIUtils* script include.

Parameters

Name	Type	Description
topicObject	Object	Topic payload object passed into the Event Management Topic Open API endpoint. For example: `{ "name": "HighPriorityTroubleTicket", "headerQuery": "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttributeChangeEvent", "contentQuery": "troubleTicket.ticketType=incident&troubleTicket.severity=1", "externalId": "ext001", "namespace": "telecomEvents" }` The schema of this object must match what is defined in *Constants.SCHEMA.CREATE_TOPIC_SCHEMA* located in the `sn_api_notif_mgmt.Constants` script include.
schema	String	Schema to use to validate the topic payload. Use the TopicAPIUtilsOOB - getCreateTopicSchema() method to obtain this schema.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
warnings	Array	Warning messages to return in the Event Management Topic Open API endpoint response if the method encounters an issue at the level of "warning". This parameter allows you to add custom warning messages to your implementation of this endpoint. If there are no additional warning messages, you must pass an empty array.

Returns

Type	Description
Boolean	Flag that indicates whether the payload passed in the *topicObject* parameter passed the schema and request body validations. Valid values: • true: Payload is valid. • false: Payload is invalid.

The following code example shows how to call this method.

```
processTopicCreation: function(topicObject) {
  try {
    var warnings = [];

    var schema = this.getCreateTopicSchema();
    if (!this.isValidCreateTopicPayload(topicObject, schema,
 warnings)) {
      this._logger.logDebug("Create Topic : validation failed");
      return this.response;
    }
    this.createTopicHelper(topicObject, warnings);
    this._logger.logDebug("Create Topic: Topic created
 succesfully");
  } catch (ex) {
    this._logger.logErr("Create Topic : Process aborted, error
 is: " + ex);
    var errorObj =
 this.apiCoreUtil.getErrorObj(sn_tmt_core.Constants.ERROR_CODES.
INTERNAL_ERROR, Constants.MESSAGES.TOPIC_CREATE_ERROR,
 Constants.MESSAGES.TOPIC_CREATE_ERROR);
    var details = [];
    details.push(this.apiCoreUtil.getErrorDetailsObj(ex.message
 + '', ''));
    errorObj.details = details;
    this.response.details = errorObj;
  }

  return this.response;
},
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

TopicAPIUtilsOOB - prepareCreateTopicResponse(Object topicObject, String topicSysId, Array warnings)

Generates and returns the response to a *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint call.

If you want to customize the response object returned by the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint, you need to override this method in the *TopicAPIUtils* script include.

Parameters

Name	Type	Description
topicObject	Object	Topic payload object passed into the Event Management Topic Open API endpoint. For example: `{ "name": "HighPriorityTroubleTicket", "headerQuery": "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttributeChangeEvent", "contentQuery": "troubleTicket.ticketType=incident&troubleTicket.severity=1", "externalId": "ext001", "namespace": "telecomEvents" }` The schema of this object must match what is defined in *Constants.SCHEMA.CREATE_TOPIC_SCHEMA* located in the `sn_api_notif_mgmt.Constants` script include.
topicSysId	String	Sys_id of the topic created as part of the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* call. Located in the Topic [sn_api_notif_mgmt_topic] table.
warnings	Array	Warning messages to return in the Event Management Topic Open API endpoint response if the method encounters an issue at the level of "warning". This parameter allows you to add custom warning messages to your implementation of this endpoint. If there are no additional warning messages, you must pass an empty array.

Returns

Type	Description
Object	Endpoint response object. For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	{
	"externalId": "ext001",
	"name": "HighPriorityTroubleTicket",
	"headerQuery":
	"eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttributeChangeEvent",
	"contentQuery":
	"troubleTicket.ticketType=incident&troubleTicket.severity=1",
	"namespace": "telecomEvents",
	"id": "7ee9850443c3f550461f99612bb8f223"
	}

The following code example shows how to call this method.

```
createTopicHelper: function(topicObject, warnings) {
 var topicObj = new sn_tmt_core.BaseObject();
 topicObj.setValue('topic_name', topicObject.name);
 if (!gs.nil(topicObject.headerQuery))
   topicObj.setValue('header_query', topicObject.headerQuery);
 if (!gs.nil(topicObject.contentQuery))
   topicObj.setValue('content_query',
topicObject.contentQuery);
 if (!gs.nil(topicObject.namespace))
   topicObj.setValue('namespace', topicObject.namespace);
 if (!gs.nil(topicObject.externalId))
   topicObj.setValue('topic_id', topicObject.externalId);
 topicObj.setValue('type', "egress");
 topicObj.setValue('user_created', false);

 new TopicUtil().createTopic(topicObj);

 // If topic external id is passed by external system, add it
in topic id field. This will act as an external id for us.

 var topicGr =
TopicDAO.getTopicByNameHeaderContentNamespace(topicObject.name,
topicObject.headerQuery, topicObject.contentQuery,
topicObject.namespace, '');

 if (topicGr && topicGr.next())
   var newTopicSysId = topicGr.getValue('sys_id');

   this.prepareCreateTopicResponse(topicObject, newTopicSysId,
warnings);
   return this.response;

},
```

TopicAPIUtilsOOB - processTopicCreation(Object topicObject)

Processes the request made by the *Event Management Topic Open API* endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method invokes the helper methods needed for data insertion, schema validation, request body validation, and response-orchestration. Override this method if you need to customize the fundamental processing of the Event Management Topic Open - POST /sn_api_notif_mgmt/topic request. Otherwise, override the individual helper methods.

Parameters

Name	Type	Description
topicObject	Object	Topic payload object passed into the Event Management Topic Open API endpoint. For example: `{ "name": "HighPriorityTroubleTicket", "headerQuery": "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttributeChangeEvent", "contentQuery": "troubleTicket.ticketType=incident&troubleTicket.severity=1", "externalId": "ext001", "namespace": "telecomEvents" }` The schema of this object must match what is defined in *Constants.SCHEMA.CREATE_TOPIC_SCHEMA* located in the `sn_api_notif_mgmt.Constants` script include.

Returns

Type	Description
Object	Endpoint response object. For example: `{ "externalId": "ext001", "name": "HighPriorityTroubleTicket", "headerQuery": "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttributeChangeEvent", "contentQuery": "troubleTicket.ticketType=incident&troubleTicket.severity=1", "namespace": "telecomEvents", "id": "7ee9850443c3f550461f99612bb8f223" }`

The following code example shows how to call this method.

```
try {
  var topicAPIUtils = new TopicAPIUtils();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  var apiResponse =
 topicAPIUtils.processTopicCreation(request.body.data);
  response.setStatus(apiResponse.status);
  return tsmOpenAPIUtil.responseBuilder(response,
 apiResponse.details);
}
```

TopicAPIUtilsOOB - transformCreateTopicResponse(Object topicObject, String topicSysId)

Provides the ability to add custom data to the response object returned to the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint.

To customize this response object, override this method in the *TopicAPIUtils* script include.

Parameters

Name	Type	Description
topicObject	Object	Topic payload object passed into the Event Management Topic Open API endpoint. For example: `{ "name": "HighPriorityTroubleTicket", "headerQuery": "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttributeChangeEvent", "contentQuery": "troubleTicket.ticketType=incident&troubleTicket.severity=1", "externalId": "ext001", "namespace": "telecomEvents" }` The schema of this object must match what is defined in *Constants.SCHEMA.CREATE_TOPIC_SCHEMA* located in the `sn_api_notif_mgmt.Constants` script include.
topicSysId	String	Sys_id of the topic created as part of the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* call. Located in the Topic [sn_api_notif_mgmt_topic] table. You can add information from this record to the topic response object.

Returns

Type	Description
Object	Transformed endpoint response object. This object should be TMF688 compliant. For example: `{ "externalId": "ext001", "name": "HighPriorityTroubleTicket",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	"headerQuery": "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttributeChangeEvent", "contentQuery": "troubleTicket.ticketType=incident&troubleTicket.severity=1", "namespace": "telecomEvents", "id": "7ee9850443c3f550461f99612bb8f223" }

The following code example shows how to call this method.

```
prepareCreateTopicResponse: function(topicObject, topicSysId,
 warnings) {
  if (!gs.nil(topicSysId)) {
    topicObject.id = topicSysId;
    this.response.status =
 sn_tmt_core.Constants.STATUS_CODES.CREATED;
    topicObject = this.transformCreateTopicResponse(topicObject,
 topicSysId); // Customize response payload as per requirement.
    this.response.details = topicObject;
    if (!gs.nil(warnings) && warnings.length > 0) {
      this.response.details.warnings = warnings;
    }
  } else {
    var errorObj =
 this.apiCoreUtil.getErrorObj(sn_tmt_core.Constants.ERROR_CODES.
INTERNAL_ERROR, Constants.MESSAGES.CREATE_TOPIC_ERROR,
 Constants.MESSAGES.CREATE_TOPIC_ERROR);
    var details = [];

 details.push(this.apiCoreUtil.getErrorDetailsObj(Constants.MESS
AGES.CREATE_TOPIC_ERROR, ''));
    errorObj.details = details;
    this.response.details = errorObj;
  }
},
```

The following code example shows code for overriding the default functionality of this method.

```
transformCreateTopicResponse: function(topicObject, topicSysId)
 {
  new sn_tmt_core.BaseAPIUtil().removeNulls(topicObject);

  // Add custom attributes to the topicObject
  topicObject.origin = “ServiceNow”,
  topicObject.ServiceId= “service001”,
  return topicObject;
},
```

TopicAPIUtilsOOB - validateTopicAttributes(Object topicObject, Array details)

Validates whether the topic name, header-query, content-query, and namespace combination passed in the *Event Management Topic Open API* endpoint payload is unique.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The endpoint uses this attribute combinations to determine whether the topic currently exists in the Topic [sn_api_notif_mgmt_topic] table.

If you want to modify the validation process you need to override this method in the *TopicAPIUtils* script include.

Parameters

Name	Type	Description
topicObject	Object	Topic payload object passed into the Event Management Topic Open API endpoint. For example: `{ "name": "HighPriorityTroubleTicket", "headerQuery": "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttributeChangeEvent", "contentQuery": "troubleTicket.ticketType=incident&troubleTicket.severity=1", "externalId": "ext001", "namespace": "telecomEvents" }` The schema of this object must match what is defined in *Constants.SCHEMA.CREATE_TOPIC_SCHEMA* located in the `sn_api_notif_mgmt.Constants` script include.
details	Array	Warning messages to return in the Event Management Topic Open API endpoint response if the method encounters an issue at the level of "warning". This parameter allows you to add custom warning messages to your implementation of this endpoint. If there are no additional warning messages, you must pass an empty array.

Returns

Type	Description
Boolean	Flag that indicates whether the topic name, header-query, content-query, and namespace combination passed in the *topicObject* parameter is unique. Valid values: • true: Parameter combination is unique. • false: Parameter combination isn't unique.

The following code example shows how to call this method.

```
isValidCreateTopicPayload: function(topicObject, schema,
 warnings) {
```

```

TopicAPIUtilsOOB - validateTopicExternalId(Object topicObject, Array details)

Validates the topic external ID passed in the request body of the *Event Management Topic Open API* endpoint.

In the base implementation this only validates that the external ID is not empty. If you want to modify the validation process for the topic external ID, you need to override this method in the *TopicAPIUtils* script include. The passed external ID is mapped to the topic_id field in the Topic [sn_api_notif_mgmt_topic] table.

Parameters

Name	Type	Description
topicObject	Object	Topic payload object passed into the Event Management Topic Open API endpoint. For example: `{ "name": "HighPriorityTroubleTicket", "headerQuery": "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttributeChangeEvent", "contentQuery": "troubleTicket.ticketType=incident&troubleTicket.severity=1", "externalId": "ext001", "namespace": "telecomEvents" }` The schema of this object must match what is defined in *Constants.SCHEMA.CREATE_TOPIC_SCHEMA* located in the `sn_api_notif_mgmt.Constants` script include.
details	Array	Error/detail messages to return in the Event Management Topic Open API endpoint response if the method encounters an issue at the level of "error". This parameter allows you to add custom error messages to your implementation of this endpoint. If there are no additional error messages, you must pass an empty array.

Returns

Type	Description
Boolean	Flag that indicates whether the external ID passed in the *topicObject* parameter is valid. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: External ID is valid. • false: External ID is invalid.

The following code example shows how to call this method.

```
isValidCreateTopicPayload: function(topicObject, schema,
 warnings) {
  var isValidPayload = true;
  var details = [];
  var validationResults =
 this.jsonSchemaValidation.validateJSON(topicObject, schema,
 ''); // Schema validation
  var errorObj =
 this.apiCoreUtil.getErrorObj(sn_tmt_core.Constants.ERROR_CODES.
MISSING_BODY_FIELD,
 sn_tmt_core.Constants.MESSAGES.MISSING_BODY_FIELD,
 sn_tmt_core.Constants.MESSAGES.MISSING_BODY_FIELD);

  if (validationResults.length > 0) {
    if (validationResults[0].message ==
 Constants.PAYLOAD_MISSING) {
      this._logger.logDebug("isValidCreateTopicPayload: Missing
 request body, invalid payload");
      errorObj =
 this.apiCoreUtil.getErrorObj(sn_tmt_core.Constants.ERROR_CODES.
MISSING_BODY, sn_tmt_core.Constants.MESSAGES.MISSING_BODY,
 sn_tmt_core.Constants.MESSAGES.MISSING_BODY);

 details.push(this.apiCoreUtil.getErrorDetailsObj(sn_tmt_core.Co
nstants.MESSAGES.MISSING_BODY, ''));
      errorObj.details = details;
      this.response.details = errorObj;
      return false;
    } else {
      for (var i = 0; i < validationResults.length; i++) {
        var missingFieldMsg =
 sn_tmt_core.Constants.MESSAGES.MISSING_FIELD_KEY;
        var message = validationResults[i].message;
        var errorMessage = '';
        if (message.indexOf('missing') != -1) {
          var newMessage =
 this.apiCoreUtil.constructErrorMsg(message,
 validationResults[i].dataPath);
          errorMessage = missingFieldMsg.replace(/\$key/g,
 newMessage);
        } else {
          errorMessage = message;
        }

 details.push(this.apiCoreUtil.getErrorDetailsObj(errorMessage,
 validationResults[i].dataPath));
      }
```

    if (!isValidPayload) {
      errorObj.details = details;
      this.response.details = errorObj;
    }
    return isValidPayload;
  },
```

TopicSubscriptionUtilOOB - Scoped

The *TopicSubscriptionUtilOOB* script include provides methods to query and manipulate records in the Topic subscription [sn_api_notif_mgmt_topic_subscription] table. This class operates at the service layer and interacts with the Data Access Object (DAO) class.

These functions are called when the **Register** button is selected on the Topic Subscription form. If you want to change the default functionality of this script include, you need to override the functions contained in this script include in the `TopicSubscriptionUtil` script include.

Both script includes run in the `sn_api_notif_mgmt` namespace.

For additional information on topic subscriptions, see Handling the external events using Telecommunications API notification.

TopicSubscriptionUtilOOB - executeRegistrationSubflow(String topicSubID)

Triggers a spoke subflow to register the passed topic subscription on an external system.

Before triggering the registration flow, the function checks whether the passed topic subscription record contains a callback URL and whether the topic is already registered. If these checks pass, it triggers a demo subflow. This demo subflow is defined as an adapter in the spoke selector and performs a "mock" outbound registration call.

This function is called when a user selects the **Register** button in the Topic subscriptions form. The name of the demo subflow is defined in `Constants.INITIATE_REGISTRATION_PROCESS = "sn_ind_tmf642.initiate_registration_process";`

You need to override this function in the `TopicSubscriptionUtil` script include to define your own custom subflow to register topic subscriptions.

Within this registration subflow you must create a REST step, connection alias, or other implementation to call a registration endpoint on the external system to register a topic. This endpoint should pass the topic name and callback URL to register. In return, the external system endpoint should return the subscription ID, whether the registration was successful, and the registration information to store in the Topic subscription table. This information typically includes the registration status, registration message, and subscription ID fields. Your registration subflow should then call the updateRegistrationResponse() method to store the response payload in the Topic subscription table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
topicSubID	String	Sys_id of the topic subscription record to register.

Returns

Type	Description
None	

The following code example shows how to override this function.

```
var TopicSubscriptionUtil= Class.create();

TopicSubscriptionUtil.prototype =
 Object.extendsObject(TopicSubscriptionUtilOOB, {

  // Define overriding functions here. Pass the topicSubID of
 the record to be registered for subscription
  executeRegistrationSubflow: function(topicSubID){
    var topicSubGr = new
 TopicSubscriptionUtil(topicSubID).topicSubscriptionDAO.getGlide
Record();

    // Customer extensible function to call their defined
 subflows. Here one can call their own subflow that
    // will perform registration by giving an endpoint of the
 external env and parsing and updating the topic Sub
    // record with Registered information.
    var registrationFlow = ''; // Pass the subflow name that you
 want to override here.
    var inputs = {};
    inputs['topic_subscription_rec'] = topicSubGr;
    try {
      var flowOp =
 sn_fd.FlowAPI.getRunner().subflow(registrationFlow).inBackgroun
d().withInputs(inputs).run();

    } catch (ex) {
      gs.addErrorMessage(gs.getMessage(ex + ' Please check the
 subflow and inputs defined.'));

    }
  }
  type: TopicSubscriptionUtil
});
```

TopicSubscriptionUtilOOB - getSubFlowName()

Returns the subflow to use for the spoke selector subflow trigger to register topic subscriptions.

Typically this function is called from the executeRegistrationSubflow() function. This subflow is responsible for contacting an external system and registering a topic subscription. The name of the subflow to use is defined in `Constants.INITIATE_REGISTRATION_PROCESS`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can change this functionality to include the name of your own subflow by overriding the name of the subflow to execute in the `sn_api_notif_mgmt.Constants` script include.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the subflow to use. For the demo implementation, this subflow is defined as `Constants.INITIATE_REGISTRATION_PROCESS = "sn_ind_tmf642.initiate_registration_process";`.

The following code example shows how to override this function.

```
var TopicSubscriptionUtil= Class.create();
TopicSubscriptionUtil.prototype =
  Object.extendsObject(TopicSubscriptionUtilOOB, {

  // Define overriding functions here. Define a constants and
 return.
  // That is your subflow that has the registration process. In
 current OOB implementation
  // it's a spoke selector implementation.
  getSubFlowName: function(){
    var subflowName = '' // Pass your subflow name here
    return subflowName;
  }

 type: TopicSubscriptionUtil

});
```

TopicSubscriptionUtilOOB - getTopicName(topicSubRefID)

Returns the name of the topic associated with the passed sys_id of a record in the Topic Subscription [sn_api_notif_mgmt_topic_subscription] table.

Parameters

Name	Type	Description
topicSubRefID	String	Sys_id of the topic subscription record whose topic name to return. Located in the Topic Subscription [sn_api_notif_mgmt_topic_subscription] table.

Returns

Type	Description
String	Topic name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to override this function.

```
var TopicSubscriptionUtil = Class.create();
TopicSubscriptionUtil.prototype =
  Object.extendsObject(TopicSubscriptionUtilOOB, {

  // Define overriding functions here. Pass topicSubId or
 topicId and get topicname from there.
  getTopicName: function(topicSubRefID){
    var topicSubGr = new
 TopicSubscriptionUtil(topicSubRefID).topicSubscriptionDAO.getGl
ideRecord();
    var topicRefID = topicSubGr.getValue('topic');
    var topicGr = new
 TopicUtil(topicRefID).topicDAO.getGlideRecord();
    return topicGr.getValue('topic_name');
  }
type: TopicSubscriptionUtil
});
```

TopicSubscriptionUtilOOB - getUnregisteredTopicIds()

Returns the sys_ids of any unregistered topics. Unregistered topics are those topics that are in the Topic [sn_api_notif_mgmt_topic] table, but not in the Topic Subscription [sn_api_notif_mgmt_topic_subscription] table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	List of sys_ids of the topic records that have not yet been registered.

The following code example shows update this function.

```
 var TopicSubscriptionUtil= Class.create();
TopicSubscriptionUtil.prototype =
  Object.extendsObject(TopicSubscriptionUtilOOB, {

  // Define overriding functions here. This method is returning
 all topic IDs
  // that are not in the Topic Subscription table. Modify
 queries here to
  // return other topics in Topic Subscription table to return
 either 'Error' or
  // 'UnRegistered' status topics.

  getUnregisteredTopicIds: function(){
    var topicIds = [];
    var topicSubscriptionGr =
 TopicSubscriptionDAO.getInSubscriptionTopic();
    if (!gs.nil(topicSubscriptionGr)) {
      while (topicSubscriptionGr.next()) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        topicIds.push(topicSubscriptionGr.getValue('topic'));
      }
    }

    var unregisteredTopicGr =
 TopicDAO.getUnregisteredTopic(topicIds);
    if (!gs.nil(unregisteredTopicGr)) {
      var unregisterTopicIds = [];
      while (unregisteredTopicGr.next()) {

 unregisterTopicIds.push(unregisteredTopicGr.getValue('sys_id'
));
      }
    }

    return unregisterTopicIds;
  }

  type: TopicSubscriptionUtil
});
```

TopicSubscriptionUtilOOB - updateRegistrationResponse(Object registrationDetails)

Updates the topic subscription record in the Topic subscription [sn_api_notif_mgmt_topic_subscription] table with the values from the mock registration response of an outbound topic registration endpoint call.

You can override this function in the `TopicSubscriptionUtil` script include to modify the information that is stored in the associated topic subscription record. For more information on executing the subflow that returns the registration details, see executeRegistrationSubflow().

Parameters

Name	Type	Description
registration Details	Object	For the demo implementation, this is a mock response returned by the demo registration API call. If you override this function, the response payload should at least contain the following topic subscription fields: • registration_status • registration_message • subscription_id

Returns

Type	Description
Error	If the call is successful, nothing is returned. If an error occurred, it returns:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• status_reason: Returned from a spoke call clarifying the reason for failure when `status_code = 0`. • errormessage: Error message that describes the failure when status_code is not 0 or 1, such as: `'Spoke Request Type output not set, please check request adapter flow'`.

The following code example shows how to update this function.

```
var TopicSubscriptionUtil= Class.create();
TopicSubscriptionUtil.prototype =
  Object.extendsObject(TopicSubscriptionUtilOOB, {

// Define overriding functions here. Modify this method to parse
 the registration details
// output from a spoke selector flow. You can pass different
 parameters from the registration response
// and map them to the fields in the Topic Subscription table.

  updateRegistrationResponse: function(registrationDetails){
    var reqTypeId = Constants.TOPIC_SUB_REQUEST_TYPE;
    var outputMap = new
 sn_appss.IntegrationRequestConfigAPI().outputJSONToMap(reqType
Id, registrationDetails.result);
    var updateTopicSubObj = new sn_tmt_core.BaseObject();
    if
 (Constants.REGISTRATION_RESPONSE_SUCCESS_CODES.indexOf(response
Code) != -1) {
      updateTopicSubObj.setValue('registration_status',
 Constants.REGISTRATION_STATUS.REGISTERED);
      updateTopicSubObj.setValue('registration_message',
 outputMap.response_body.message);
      updateTopicSubObj.setValue('subscription_id',
 outputMap.response_body.result.id);
    }
  }
  type: TopicSubscriptionUtil

});
```

TopicSubscriptionUtilOOB - updateTopicSubscriptionRec(Object topicSubObj)

Stores the current topic subscription record in the Topic subscription [sn_api_notif_mgmt_topic_subscription] table using DAO insert.

Typically you will call this function within the updateRegistrationResponse() function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
topicSubObj	Object	Fields to update in the associated topic subscription record. This is the payload returned by the registration subflow. For example: `"topicSubObj": { "registration_message": "String", "registration_status": "String", "subscription_id": "String" }` For more information, see executeRegistrationSubflow().

Returns

Type	Description
String	Sys_id of the topic subscription record that was updated.

The following code example shows how to update this function.

```
var TopicSubscriptionUtil= Class.create();
TopicSubscriptionUtil.prototype =
  Object.extendsObject(TopicSubscriptionUtilOOB, {

// Define overriding functions here. Pass a topic subscription
 record object that contains
// the values to update in a record.

  updateTopicSubRec: function(topicSubObj){
    return
 this.topicSubscriptionDAO.updateTopicSubscription(topicSubObj);
  }

type: TopicSubscriptionUtil

});
```

The following code example shows how to call this function.

```
if (!gs.nil(outputMap) && outputMap.status_code == '1') {
  var responseCode = outputMap.response_body.code;
  var topicSubID = registrationDetails.topicSubID;
  var topicSubGr = new
 TopicSubscriptionUtil(topicSubID).topicSubscriptionDAO.getGlide
Record();
  var updateTopicSubObj = new sn_tmt_core.BaseObject();
  if
 (Constants.REGISTRATION_RESPONSE_SUCCESS_CODES.indexOf(response
Code) != -1) {
    updateTopicSubObj.setValue('registration_status',
 Constants.REGISTRATION_STATUS.REGISTERED);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    updateTopicSubObj.setValue('registration_message',
 outputMap.response_body.message);
    updateTopicSubObj.setValue('subscription_id',
 outputMap.response_body.result.id);
  } else {
    updateTopicSubObj.setValue('registration_status',
 Constants.REGISTRATION_STATUS.ERROR);
    updateTopicSubObj.setValue('registration_message',
 outputMap.response_body.message);
  }
    new
 TopicSubscriptionUtil(topicSubGr).updateTopicSubscriptionRec(up
dateTopicSubObj);
    return '';
} else if (!gs.nil(outputMap) && outputMap.status_code == '0') {
  return outputMap.status_reason;
} else {
  var errorMsg = 'Spoke Request Type output not set, please
 check request adapter flow';
  return errorMsg;
}
```

TopicUtilOOB - Scoped

The `TopicUtilOOB` script include contains functions that enable you to query and manipulate records in the Topic [sn_api_notif_mgmt_topic] table. This class operates at the service layer that interacts with the Data Access Object (DAO) class.

These functions are called when the **Get Topics** button is selected on the Topics form. If you want to change the default functionality of this script include, you must override the functions contained in this script include in the `TopicUtil` script include.

Both script includes run in the `sn_api_notif_mgmt` namespace.

For additional information on topics, see Handling the external events using Telecommunications API notification.

TopicUtilOOB - createTopic(Object topicObj)

Creates a record in the Topic [sn_api_notif_mgmt_topic] table using DAO insert.

Typically you will call this function within the validateAndInsertTopic function that also performs various validations on the content.

Parameters

Name	Type	Description

topicObj	Object	Object that contains the fields to store in the topic record. For the base implementation the object has the following format. If you modify or extend the Topics table, this object should reflect that structure. Ensure that you include any required fields.
		`"topicObj": {`
		`"content_query": "String";`
		`"description": "String";`
		`"header_query": "String";`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>"namespace": "String";
		"topic_id": "String";
		"topic_name": "String";
		"type": "String";
		}</pre>

Returns

Type	Description
String	Sys_id of the created topic record.

The following code example shows how to call this function.

```
validateAndInsertTopics: function(topicsResponse) {
  if (!gs.nil(topicsResponse)) {
    var topicsArr = topicsResponse.response;
    for (var i = 0; i < topicsArr.length; i++) {
      var name = topicsArr[i].name;
      var headerQuery = topicsArr[i].headerQuery;
      var contentQuery = topicsArr[i].contentQuery;
      var namespace = topicsArr[i].namespace;
      var id = topicsArr[i].id;
      var description = topicsArr[i].description;
      var topicGr =
 TopicDAO.getTopicByNameHeaderContentNamespace(name,
 headerQuery, contentQuery, namespace,'');
      if (topicGr && !topicGr.hasNext()) {
        var topicObj = new sn_tmt_core.BaseObject();
        topicObj.setValue('topic_name', name);
        topicObj.setValue('header_query', headerQuery);
        topicObj.setValue('content_query', contentQuery);
        topicObj.setValue('namespace', namespace);
        topicObj.setValue('description', description);
        topicObj.setValue('topic_id', id);
        topicObj.setValue('type', Constants.TYPE_INGRESS);
        this.createTopic(topicObj);
      }
    }
  }
}
```

The following code example shows how to override this function.

```
var TopicUtil = Class.create();
TopicUtil.prototype =
  Object.extendsObject(TopicUtilOOB, {

  // Define overriding functions here. Pass a topic record
 object with
  // values for a single Topic table record.

  createTopic: function(topicObj){
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    return this.topicDAO.create(topicObj);
  }

  type: TopicUtil

});
```

TopicUtilOOB - getSubFlowName()

Returns the name of the subflow to call to obtain topics from an external system.

Typically this function is called from the triggerSubflow() function. This subflow is responsible for contacting an external system and obtaining any topic records that need to be inserted in the Topics [sn_api_notif_mgmt_topic] table.

The name of the subflow is defined in `Constants.GET_TOPICS_SUBFLOW`. For the demo implementation this subflow is `sn_ind_tmf642.event_alarm_notifications_api` and generates a "mock" response (doesn't call an external system) to show the end-to-end processing.

You can change this functionality to include the name of your own subflow by overriding the name of the subflow to execute in the `sn_api_notif_mgmt.Constants` script include.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the subflow to use to obtain topics from an external system.

The following code example shows how to override this function.

```
var TopicUtil= Class.create();
TopicUtil.prototype =
  Object.extendsObject(TopicUtilOOB, {

  // Define overriding function here. In TopicUtilOOB it returns
 the flow name of a GET outbound API call that mocks the GET
 call.
  // Override this function to return a flow that returns topics
 from an external system.

  getSubflowName: function(){
    return <flow_name>; // Return the name here
  }

  type: TopicUtil

});
```

TopicUtilOOB - triggerSubflow()

Triggers the subflow that is responsible for obtaining topic records from an external system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This function is called when the user selects the **Get Topics** button on the Topics form.

The name of the subflow that gets triggered is defined in `Constants.GET_TOPICS_SUBFLOW`. For the demo implementation this subflow is `sn_ind_tmf642.event_alarm_notifications_api` and generates a "mock" response (doesn't call an external system) to show the end-to-end processing.

You need to change this functional to include the name of your own subflow by overriding the name of the subflow to execute in the `sn_api_notif_mgmt.Constants` script include.

Within the subflow you must create a REST step, connection alias, or other implementation to provide an endpoint URL that retrieves topics from your external network. When the topics are returned by that subflow, you call the validateAndInsertTopics function to verify the passed back topic payload and insert/update the records in the Topic table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to override this function.

```
var TopicUtil = Class.create();
TopicUtil.prototype =
  Object.extendsObject(TopicUtilOOB, {

  // Define overriding functions here. Override this function to
 call your own GET API outbound call subflow.
  triggerSubflow: function(){
    var result =''; // Pass the subflow here

    try {
      var flowOp =
 sn_fd.FlowAPI.getRunner().subflow(result).inBackground().withIn
puts().run();
      if (flowOp) {
        gs.addInfoMessage(gs.getMessage('Please refresh the list
 to see new Topics.'));
      }
    } catch (ex) {
      gs.addInfoMessage(gs.getMessage(ex + ' Please check if the
 trigger is defined and passed correctly'));
    }
  }

  type: TopicUtil

});
```

TopicUtilOOB - validateAndInsertTopics(Array topicsResponse)

Validates the passed in topic record payload and inserts records in the Topic [sn_api_notif_mgmt_topic} table containing this data.

The passed topics payload is obtained from the "GET API endpoint" used to retrieve topics from an external system. For more information on triggering this GET API, see triggerSubflow().

You can change this functionality to include your own validation rules and topic record fields by overriding this function in the `TopicUtil` script include.

Parameters

Name	Type	Description
topicsResponse	Array of objects	Topic record payload returned by the external system through the GET API endpoint within the subflow. This payload should match the structure of the Topics [sn_api_notif_mgmt_topic] table. Each object within the array is a separate topic. For example, in the demo implementation this is: `"topicResponse": [ { "name": "String"; "header_query": "String"; "content_query": "String"; "namespace": "String"; "id": "String"; "description": "String" }, { "name": "String"; "header_query": "String"; "content_query": "String"; "namespace": "String"; "id": "String"; "description": "String" } ]`

Returns

Type	Description
None	

The following code example shows how to override this function.

```
var TopicUtil= Class.create();
TopicUtil.prototype =
  Object.extendsObject(TopicUtilOOB, {

  // Define overriding functions here. Override this function to
 include custom
  // validations on topic payload parameters and insert the
 record into the Topics table.

  validateInsertTopics: function(topicsResponse){
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    // Provide validation on the passed payload.
    this.createTopic(topicObj);
  }

type: TopicUtil

});
```

TopicUtilOOB - verifyTopics(String topicname, String headerQuery, String contentQuery, String namespace, String previousSysId)

Determines whether any other topic record in the Topic [sn_api_notif_mgmt_topic] table contains the specified combination of fields as its composite key, indicating a duplicate topic.

Parameters

Name	Type	Description
topicname	String	Name of the topic.
headerQuery	String	Filter to apply to the content of the event header properties. This query defines the type of events to listen to for the associated topic. You can pass this parameter as a nested query. For example: `"headerQuery": "eventType=AlarmCreateNotification&domain=Paris",` For additional information, refer to the TMF688 Event Management API User Guide.
contentQuery	String	Filter to apply to the content of the event. This query is a deeper event filter that is used to find information such as event severity or probable cause. You can pass this parameter as a nested query. For example: `"contentQuery": "event.alarm.perceivedSeverity=CRITICAL",` For additional information, refer to the TMF688 Event Management API User Guide.
namespace	String	Namespace in which the associated topic resides. Topics can't be duplicated within a domain, but can be contained in multiple domains.
previousSysId	String	Optional. Sys_id of the topic to update. Only pass this value when updating an existing topic.

Returns

Type	Description
Boolean	Flag that indicates whether another record in the Topic table contains the specified combination of fields. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: Another record in the Topic table contains the combination of fields. • false: No other record in the Topic table contains the combination of fields.

The following code example shows how to override this function.

```
var TopicUtil= Class.create();
TopicUtil.prototype =
  Object.extendsObject(TopicUtilOOB, {

  // Define overriding functions here. Override this function to
 provide custom validations on
  // the passed parameters and to verify whether an insert is
 possible or not.

  verifyTopics: function(topicname, headerQuery, contentQuery,
 namespace, previousSysId) {

    // Write modified code here to get any combination of
 records present in the current Topic table.
    // In the current implementation, the function checks if
 there is a duplicate topic record that contains the
    // passed parameters.

  },

type: TopicUtil

});
```

Transformer - Scoped, Global

The *Transformer* API provides methods to parse and transform structured JSON or XML source content into structured key-value pair output, using a defined set of rules.

This API works along with the *TransformerDefinition* and *TransformerRuleList* APIs. Together, these APIs transform XML nodes or any entity in a structured JSON document into an output of name-value pairs. Supported JSON entities including objects and elements within an array, such as strings, numbers, and other arrays.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The *TransformerRuleList* API enables you to create transformation rule lists that define what data in the source document to include in the output and how to transform the source data.

- The *TransformerDefinition* API associates a transformation rule list with a JSON/XML record path to define reusable transform definition objects. You can use a transform definition object to transform one or more source documents.

- The *Transformer* API performs the actual data transformation, one data entity at a time, using the specified transformation rule list to create the desired output data.

You can use the *Transformer* class in both scoped and global server scripts. When using this class, use the `sn_tfrm` namespace identifier. Before this API is available in an instance, you must activate the Transformation Service plugin (com.glide.transform).

The following example illustrates how to use the *TransformerRuleList* API to define the transformation rules, the *TransformerDefinition* API to define the transformation criteria, and the *Transformer* API to actually perform the transformation.

This code example retrieves an external JSON-based stock details document, creates rules for transforming that data into a tabular table, and then transforms the source document, one row at a time. The following is a snippet of the JSON source document being transformed:

```
{
  "NOW": {
    "quote": {
      "symbol": "NOW",
      "companyName": "ServiceNow Inc.",
      "primaryExchange": "New York Stock Exchange",
      "sector": "Technology",
      "open": 166.78,
      "openTime": 1522935000556,
      "close": 165.77,
      "changePercent": 0.00656,
       ...
     },
 ...}
```

```
var stockAPI = new sn_ws.RESTMessageV2('Stock Details', 'Default
 GET');
var response = stockAPI.execute();
var responseBody = response.getBody(); // obtain the source JSON
 document

/* Define the list of rules to use to transform the acquired
 JSON stock detail
information into a tabular table */

var transformerRuleList = new sn_tfrm.TransformerRuleList() //
 instantiate the rule list object
  .fromJSON() // indicate that the source document is JSON
  .addRule('ticker', '$.quote.symbol') // add a rule to copy
 the value in the "symbol" field of the source document to the
 ticker field in the output document (no changes)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .addRule('change_percentage', '$.quote.changePercent') //
 copy the "changePercent" field from source into the
 change_percentage field of output document
  .thenMultiply('100') // multiply the change_percentage value
 by 100
  .thenRoundDown('0') // addthen round it down to a whole number
  .addRule('close_price', '$.quote.close') // copy the "close"
 field to the close_price field in the 21=-[';output
  .thenAdaptCurrency('USD', false) // attach the US dollar code
 to the close_price field, but do not display the symbol
  .addRule('summary') // add a blank "summary" field to the
 output (no corresponding source field)
  .thenConcat('Shares of ') // in the summary field concatenate
 the string "Shares of "
  .thenConcatSymbol('ticker') // then concatenate the "ticker"
 field from the source document
  .thenConcat(' closed at ') // then concatenate the string "
 closed at "
  .thenConcatSymbol('close_price'); // then concatenate the
 "close_price" field from the source document

// Create a transformer definition that associates the rule list
 to use and the record path of the set of records in the source
 document to transform.
var path = '$.*';
var transformerDefinition = new
 sn_tfrm.TransformerDefinition(transformerRuleList, path);

// Instantiate the transformer object.
var transformer = new sn_tfrm.Transformer(transformerDefinition,
 responseBody);

// Transform the source data, one row at a time, until all rows
 are processed.
var results = [];
while (transformer.transform()) {
  results.push(transformer.getRow());
}
```

Output:

```
 {ticker: "Now", change_percentage: "0", close_price: "165.77
 USD", summary: "Shares of Now closed at 165.77" }
```

Transformer - Transformer(Object transformerDefinition, String document)

Instantiates a Transformer object (constructor).

Parameters

Name	Type	Description
transformerDefinition	Object	Object that describes the content transformation; includes rule list and JSONPath/XPath record path. Use the *TransformerRuleList()* and *TransformerDefinition()* APIs to generate this object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
document	String	Source document to translate.

```
var stockAPI = new sn_ws.RESTMessageV2('Stock Details', 'Default
 GET');
var response = stockAPI.execute();
var responseBody = response.getBody();

var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .addRule('ticker', 'quote.symbol')
  .addRule('change_percentage', 'quote.change')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', 'quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('summary')
  .thenConcat('Shares of ')
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')
  .thenConcatSymbol('close')

var path = '$.*';
var transformerDefinition = new
 sn_tfrm.TransformerDefinition(transformerRuleList, path);
var transformer = new sn_tfrm.Transformer(transformerDefinition,
 responseBody);

var results = [];
while (transformer.transform()) {
  results.push(transformer.getRow());
}
```

Transformer - getRow()

Returns the row resulting from the last transformation (or null if no row exists).

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Object containing one transformed row/node of data.

```
var results = [];
while (transformer.transform()) {
  results.push(transformer.getRow());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
{ticker: "Now", change_percentage: "0", close_price: "165.77
USD", summary: "Shares of Now closed at 165.77" }
```

Transformer - transform()

Transforms the next available row/node in the source document.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether there is a valid next row to transform. • true: Valid next row • false: No additional rows

```
var results = [];
while (transformer.transform()) {
  results.push(transformer.getRow());
```

Output:

```
{ticker: "Now", change_percentage: "0", close_price: "165.77
USD", summary: "Shares of Now closed at 165.77" }
```

Transformer - Scoped, Global

The *Transformer* API manipulates time-series data to prepare the data for evaluation and analysis.

You can call this API in scoped and global server scripts. When using the *Transformer* class, use the `sn_clotho` namespace identifier.

The general use case is to determine the period to be evaluated, select the records from the table with the metric field, define the type of transform to run, and then execute the transform.

```
// create the start and end time
       var start = new GlideDateTime();
 start.addSeconds(-1 * 60 * 60);
 var end = new GlideDateTime();

 //mb_demo_drone is a table with metric fields.
 var drones = new GlideRecord("mb_demo_drone");
 drones.addQuery("model", "Kingfisher Phantom");
 drones.query();

 //build a transform that returns a simple average
 var builder = new sn_clotho.Transformer(drones);
 builder.metric("mb_demo_mt_rem_battery").avg().label("Original
");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//execute transform and return result for visualization
var result = builder.execute(start,end);
```

This class is part of the MetricBase application.

Transformer - Transformer(GlideRecord sourceRecords)

Create a Transformer object.

Parameters

Name	Type	Description
sourceRecords	GlideRecord	Contains the records for which metrics are to be evaluated. Can be one record or many.

```
//where drones is a GlideRecord created from a table with a
 metric field
var builder = new sn_clotho.Transformer(drones);
```

Transformer - execute(GlideDateTime start, GlideDateTime end)

Run the transform.

Use the *metric()* and *groupBy()* methods before calling *execute()*. The *execute()* method can only be called once for each Transformer object.

Actions performed as part of the transform do not change the data in the MetricBase database.

Parameters

Name	Type	Description
start	GlideDateTime	The beginning of the period to be evaluated.
end	GlideDateTime	The end of the period to be evaluated.

Returns

Type	Description
TransformResult	The transformed data.

```
var minutesAgoStart = 60;
var end = new GlideDateTime();
var start = new GlideDateTime(end);
start.addSeconds(-1 * 60 * minutesAgoStart);

// query subject records
var grDrone = new GlideRecord('mb_demo_drone');
grDrone.query();

// building transform; get the average transforms of a metric,
grouping by model
var transformer = new sn_clotho.Transformer(grDrone);
transformer.groupBy("fleet").metric("mb_demo_mt_altitude").avg(
).label('avg - %g:fleet:');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// execute and return result for visualization
var tfrmResult = transformer.execute(start, end);
```

Transformer - groupBy(String field)

Specifies the field to use to group the data.

If you are going to use the *groupBy()* method, you must call it must before calling the *execute()* method.

Parameters

Name	Type	Description
field	String	The field in the table to use to group the transform results.

Returns

Type	Description
TransformPart	A TransformPart object that you can use to specify the transform characteristics.

```
var transformer = new sn_clotho.Transformer(grDrone);
var trnsfrm = transformer.groupBy("fleet");
```

Transformer - metric(String metricName)

Specify the metric field to be used in the transform.

You can specify multiple metrics to be used in the transform. The *metric()* method cannot be called after the *execute()* method is called.

Parameters

Name	Type	Description
metricName	String	Name of the metric field.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify the transform characteristics.

```
var transformer = new sn_clotho.Transformer(grDrone);
var trnsfrm = transformer.metric("mb_demo_mt_altitude");
```

TransformerDefinition - Scoped, Global

The *TransformerDefinition* API provides methods to instantiate and manage the TransformerDefinition object, which associates a transformation rules list and a record path.

This API works along with the *Transformer* and *TransformerRuleList* APIs. Together, these APIs transform XML nodes or any entity in a structured JSON document into an output of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

name-value pairs. Supported JSON entities including objects and elements within an array, such as strings, numbers, and other arrays.

- The *TransformerRuleList* API enables you to create transformation rule lists that define what data in the source document to include in the output and how to transform the source data.

- The *TransformerDefinition* API associates a transformation rule list with a JSON/XML record path to define reusable transform definition objects. You can use a transform definition object to transform one or more source documents.

In addition, this object provides methods that enable you to obtain the record path of the TransformerDefinition object. It can also validate whether the definition has a valid TransformerRuleList associated with it.

The *Transformer* API performs the actual data transformation, one data entity at a time, using the specified transformation rule list to create the desired output data.

You can use the *TransformerDefinition* class in both scoped and global server scripts. When using this class, use the `sn_tfrm` namespace identifier. Also, before this API is available in an instance, you must activate the Transformation Service plugin (com.glide.transform).

TransformerDefinition - TransformerDefinition(Object transformerRuleList, String recordPath)

Instantiates a TransformerDefinition object.

Parameters

Name	Type	Description
transformerRuleList	Object	TransformerRuleList to associate with this transformer definition.
recordPath	String	Optional. The path (JSONPath for JSON, XPath for XML) that identifies the container (parent) of nodes to parse as records in the source document. For JSON documents, these nodes can be any object, array, or JSON primitive (string, number, boolean). For XML documents, these nodes are the child elements of the container. If *recordPath* is unspecified, the entire document is inferred as a single record. For JSON documents, if the top node is an array and *recordPath* is unspecified, then the top array is the record's container, and each of its entries is a record.

```
var stockAPI = new sn_ws.RESTMessageV2('Stock Details', 'Default
 GET');
var response = stockAPI.execute();
var responseBody = response.getBody();

var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .addSymbol('ticker', 'quote.symbol')
  .addSymbol('change_percentage', 'quote.change_change')
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .thenMultiply('100')
  .thenRoundDown('0')
  .addSymbol('close_price', 'quote.close')
  .thenAdaptCurrency('USD', false)
  .addSymbol('summary')
  .thenConcat('Shares of ')
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')
  .thenConcatSymbol('close');

var path = '$.*'; // Transform all objects in the JSON document
var transformerDefinition = new
 sn_tfrm.TransformerDefinition(transformerRuleList, recordPath);
var transformer = new sn_tfrm.Transformer(transformerDefinition,
 responseBody);

var results = [];
while (transformer.transform()) {
  results.push(transformer.getRow());
}
```

TransformerDefinition - TransformerDefinition(String transformerDefinitionSysId)

Instantiates a TransformerDefinition object using an existing transformer definition.

Parameters

Name	Type	Description
transformerDefinitionSysId	String	Sys_id of a transformer definition. Located in the Record Transformer [sys_record_transformer] table.

This example instantiates a TransformerDefinition object based on the provided sys_id.

```
var transformerDefinition = new
 sn_tfrm.TransformerDefinition("7208b59743542110d4dc2c78c9b8f2e2
");
```

TransformerDefinition - recordPath()

If set when the TransformerDefinition object was instantiated, returns the record path for the source data file associated with the TransformerDefinition object.

A record path (JSONPath for JSON, XPath for XML) identifies the container (parent) of nodes to parse as records in the source document.

For JSON documents, these nodes can be any object, array, or JSON primitive (string, number, boolean). For XML documents, these nodes are the child elements of the container.

If *recordPath* is unspecified, the entire document is inferred as a single record. For JSON documents, if the top node is an array and *recordPath* is unspecified, then the top array is the record's container, and each of its entries is a record.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	If set, the record path associated with the transformer definition. If not set, returns null.

```
var path = '$.records';
var transformerDefinition = new
 sn_tfrm.TransformerDefinition(transformerRuleList, recordPath);
var transformer = new sn_tfrm.Transformer(transformerDefinition,
 responseBody);
.
.
.

var recordPath = transformerDefinition.recordfPath();

var results = [];
while (transformer.transform()) {
  results.push(transformer.getRow());
}
```

TransformerDefinition - validate()

Validates whether a valid TransformerRuleList is associated with the TransformerDefintion object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether a valid TransformerRuleList is associated with the specified TransformerDefintion object. Valid values: • true: Valid TransformerRuleList associated • false: Invalid or no TransformerRulList associated

```
var transformerDefinition = new
 sn_tfrm.TransformerDefinition(transformerRuleList, recordPath);
var transformer = new sn_tfrm.Transformer(transformerDefinition,
 responseBody);
.
.
.

if (transformerDefinition.validate()) {

  var results = [];
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  while (transformer.transform()) {
    results.push(transformer.getRow());
  }
}
```

TransformerRuleList - Scoped, Global

The *TransformerRuleList* API enables you to create a list of rules for transforming various types of JSON and XML data into name-value pair output.

This API works along with the *Transformer* and *TransformerDefinition* APIs. Together, these APIs transform XML nodes or any entity in a structured JSON document into an output of name-value pairs. Supported JSON entities including objects and elements within an array, such as strings, numbers, and other arrays.

- The *TransformerRuleList* API enables you to create transformation rule lists that define what data in the source document to include in the output and how to transform the source data.
- The *TransformerDefinition* API associates a transformation rule list with a JSON/XML record path to define reusable transform definition objects. You can use a transform definition object to transform one or more source documents.
- The *Transformer* API performs the actual data transformation, one data entity at a time, using the specified transformation rule list to create the desired output data.

When you instantiate the TransformRuleList object, you must define whether it describes a JSON or XML source document using the *.fromJSON()* or *.fromXML()* methods. For example:

`var trl = sn_tfrm.TransformerRuleList().fromJSON();` or `var trl = sn_tfrm.TransformerRuleList().fromXML();`

Then use the *addRule()* method to define a transformation rule for each element in the source document that you want to include as a name-value pair in the output.

Use "adapter methods", such as *setName()* or *thenAdd()*, to define how to manipulate data elements when the transformation is performed. Adapter methods work along with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns. You can apply one or more adapter methods to each data transformation. Adapter methods enable you to do things such as:

- Concatenate text.
- Perform mathematical functions, such as add, subtract, divide, and multiply.
- Round values up or down (round up/down, ceiling/floor).
- Define whether to use the minimum or maximum value when comparing a source data element to a specified value.
- Apply a currency code.
- Convert between different units of measure.
- Format data elements.
- Apply patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Replace specified data elements with a specified value.
- Split and rearrange strings.

You can use the *TransformerRuleList* class in both scoped and global server scripts. When using this class in a scoped application, use the `sn_tfrm` namespace identifier. Also, before this API is available in an instance, you must activate the Transformation Service plugin (com.glide.transform).

TransformerRuleList - addRule(String rule, String path)

Creates an entry in the associated transformation rules list which defines a field to create in the output.

You can create rules for any element in a source document. For example, `.addRule('ticker', '$.quote.symbol')` creates the field "ticker" in the output and copies over the value in quote.symbol of the source.

Once you define a rule using *addRule()*, you then use adaptor methods, such as *thenAdd()*, *thenReplace()*, and *thenFloor()* to manipulate the rule's output data. You can define as many adaptor methods as needed for a single rule. All adapter methods directly after an *addRule()* call, until the next *addRule()* call, apply to that rule. Adapter methods are cumulative with the result of all adapter methods being the final value saved in the output field.

For example, in the following code snippet, *thenMultiply()* and *thenRoundDown()* apply to *addRule('change_percentage', '$.quote.changePercent')*; *addRule('close_price', '$.quote.close')* starts a new rule. If the value in *$.quote.changePercent* is .011, then the final output value is "1" (.011 * 100 rounded down to the ones position).

```
.addRule('change_percentage', '$.quote.changePercent')
.thenMultiply('100')
.thenRoundDown('0')
.addRule('close_price', '$.quote.close')
```

The *addRule()* method also supports the parameter *summary*; `.addRule('summary')`. This implementation creates the name field "summary:" in the output, but does not correlate it to any field in the source. You can then use the adaptor methods *thenConcat()* and *thenConcatSymbol()* to modify the contents of the summary field.

Parameters

Name	Type	Description
rule	String	Name of the element in the destination output.
path	String	Optional. JSONPath or XPath to the data element in the source document. The adapter methods *thenConcat()* and *thenConcatSymbol()* do not require you to define this parameter if no other adapter methods are defined for the rule. All other adapter methods require this parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('summary')
  .thenConcat('Shares of ')
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')
  .thenConcatSymbol('close_price');
```

TransformerRuleList - setName(String name)

Defines a name for the associated TransformerRuleList object for logging purposes.

Parameters

Name	Type	Description
name	String	Name to use to identify the associated TransformerRuleList object. Although the API does not force this name to be unique, it is helpful if they are unique within an instance.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('summary')
  .thenConcat('Shares of ')
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')
  .thenConcatSymbol('close_price');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

TransformerRuleList - thenAdaptCurrency(String currencyCode, Boolean outputNumericCurrencyValue)

Adds an adapter to the current rule that ties the specified currency code to the output field defined in the associated *addRule()* call.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
currencyCode	String	Currency code to tie to the destination data element, such as USD, EUR, and GBP.
outputNumericCurrencyValue	Boolean	Optional. Flag that indicates whether to display the currency code. Valid values: • true: do not display the country code; numeric value only • false: display the country code Default: false

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('summary')
  .thenConcat('Shares of ')
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')
  .thenConcatSymbol('close_price');
```

TransformerRuleList - thenAdaptDuration(String inputDuration, String outputDuration)

Adds an adapter to the current rule that converts the source field from one unit of measure to another, such as from minutes to seconds or weeks to days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
inputDuration	String	Current unit of measure of the source field. Valid values: • NANOSECOND • MICROSECOND • MILLISECOND • SECOND • MINUTE • HOUR • DAY • WEEK
outputDuration	String	Unit of measure to convert the source field to in the output. Valid values: • NANOSECOND • MICROSECOND • MILLISECOND • SECOND • MINUTE • HOUR • DAY • WEEK

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .thenAdaptCurrency('USD', false)
  .addRule('daily', '$.quote.weekly')
  .thenAdaptDuration('WEEK', 'DAY');
```

TransformerRuleList - thenAdd(Number operand)

Adds an adapter to the current rule that adds the passed in value to the source field.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
operand	Number	Value to add to the source field.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new
 sn_tfrm.TransformerRuleList.fromJSON()
  .setName('Stock Report 05182019 JSON')
  .addSymbol('ticker', '$.symbol')
  .addSymbol('change_percentage', '$.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addSymbol('trade_price', '$.current_price')
  .thenAdaptCurrency('USD', false)
  .addMultiply('$.trade_quantity')
  .thenAdd('4.5');
```

TransformerRuleList - thenApplyMap(Object map)

Adds an adapter to the current rule that searches the associated source field for a list of strings and replaces them in the output with the specified replacement values.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
map	Object	Name/value pairs. • name: text to locate in the source data element • value: text to replace it with in the output

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Current TransformerRuleList object.

In this example, the *thenApplyMap()* call searches the source text in the company_info field for Inc. and St. and replaces them with Incorporated and Street in the company_info field in the output.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('company_info', '$.quote.company_info')
  .thenApplyMap({'Inc.': 'Incorporated', 'St.': 'Street'});
```

TransformerRuleList - thenApplyPattern(String matchPattern, String outputPattern

Adds an adapter to the current rule that matches a specified regex pattern to content in the source field and then replaces/reformats that content with a second regex pattern and stores that value in the output.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
matchPattern	String	Regex pattern to use to locate the text to replace/reformat.
outputPattern	String	Regex pattern to use to update the located text.

Returns

Type	Description
Object	Current TransformerRuleList object.

In this example, any company name that ends with "Inc." is transformed to "Incorporated", such as Company Inc. to Company Incorporated.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .thenAdaptCurrency('USD', false)
  .addRule('company', '$.quote.company')
  .thenApplyPattern('(.+)(\\w{3}\\.)', '$1Incorporated');
```

TransformerRuleList - thenCeiling(Number operand)

Adds an action to the current rule to round the source field up at the decimal position specified by the passed in value.

Unlike straight rounding where the number is rounded based on the value of the digit in the specified decimal position (0-4 round down, 5-9 round up), ceiling always rounds up. For example, the ceiling value for 2.156 and 2.152 is always 2.16 for the passed in decimal position of 2; whereas for straight rounding the values would be 2.16 and 2.15 respectively. For negative numbers, the ceiling operation makes the number more positive, as in the ceiling value of -2.156 is -2.15; whereas the same number rounded up makes the value more negative, -2.16.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
operand	Number	Decimal position to the right of the decimal point at which to round the number up (apply ceiling). For example, if this value is 2 and the source data element is 6.421, the resulting value is 6.43.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Mortgage Rates 05022019 JSON')
  .addRule('interest_rate', '$.quote.interest_rate')
  .thenCeiling('2') // Always round the interest rate up to the
 hundredths place
  .addRule('monthly_payment', '$.quote.total_loan_amount')
  .thenDivideBy('180');
```

TransformerRuleList - thenConcat(String value)

Adds an adapter to the current rule that concatenates the passed in string to the output field.

Unlike other adapter methods, this method does not have to be applied to a source field. You can use this method to create completely new data strings in the output.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
value	String	Text to concatenate to the end of the current data element.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('summary')
  .thenConcat('Shares of ')
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')
  .thenConcatSymbol('close_price');
```

TransformerRuleList - thenConcatSymbol(String symbol)

Adds an adapter to the current rule that concatenates the value of a field previously defined in the rules list to the current output field.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
symbol	String	Name of the rules list element to append to the output field.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('summary')
  .thenConcat('Shares of ')
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')
  .thenConcatSymbol('close_price');
```

TransformerRuleList - thenDivideBy(Number operand)

Adds an adapter to the current rule that divides the source field by the passed in value.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
operand	Number	Value by which to divide the source field.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('dividend_per_share', '$.quote.total_dividend')
  .thenDivideBy('$.quote.total_shares');
```

TransformerRuleList - thenDivideInto(Number operand)

Adds an adapter to the current rule that divides the passed in value by the source field.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
operand	Number	Value into which to divide the source field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('dividend_per_share', '$.quote.total_shares')
  .thenDivideInto('$.quote.total_dividends');
```

TransformerRuleList - thenFloor(Number operand)

Adds an adapter to the current rule that rounds the source field down at the decimal position specified by the passed in value and stores it in the output.

Unlike straight rounding where the number is rounded based on the value of the digit in the specified decimal position (0-4 round down, 5-9 round up), floor always rounds down. For example, the floor value for 2.156 and 2.152 is always 2.15 for the passed in decimal position of 2; whereas for straight rounding the values would be 2.16 and 2.15 respectively. For negative numbers, the floor operation makes the number more negative, as in the floor value of -2.156 is -2.16; whereas the same number rounded down makes the value more positive, -2.15.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
operand	Number	Decimal position to the right of the decimal point at which to round the number down (apply floor). For example, if this value is 2 and the source data element is 6.427, the resulting value is 6.42.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Mortgage Rates 05022019 JSON')
  .addRule('interest_rate', '$.quote.interest_rate')
  .thenFloor('2') // Always round the interest rate down to the
 hundreths place
  .addRule('monthly_payment', '$.quote.total_loan_amount')
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .thenDivideBy('180');
```

TransformerRuleList - thenFormat(String matchPattern, String outputPattern)

Adds an adapter to the current rule that reformats the content in the source field that matches the specified match pattern, with the specified output pattern.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
matchPattern	String	Pattern to match against the source field. Valid values: • @: any character • #: decimal digit • \: literal escape (\@ for the @ symbol)
outputPattern	String	Pattern to replace the content with in the output. Valid values: • @: any character • #: decimal digit • \: literal escape (\@ for the @ symbol)

Returns

Type	Description
Object	Current TransformerRuleList object.

This example reformats the quote date from YYYY/MM/DD to YYYY MM-DD.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('date', '$.quote.date')
  .thenFormat('####/##/##', '#### ##-##');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

TransformerRuleList - thenMax(Number operand)

Adds an adapter to the current rule that compares the passed in value against the source field and copies the greater of the two values to the output field.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
operand	Number	Value to compare to the source field.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Mortgage Rates 05022019 JSON')
  .addRule('lowest_interest_rate', '$.quote.interest_rate')
  .thenMax('3.5') // Interest rate cannot be less than 3.5%
  .addRule('dividend_per_share', '$.quote.total_shares')
  .thenDivideInto('$.quote.total_dividends');
```

TransformerRuleList - thenMin(Number operand)

Adds an adapter to the current rule that compares the passed in value against the source field and copies the lower of the two values to the output field.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
operand	Number	Value to compare to the source field.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addSymbol('broker_fee_percentage', '$.quote.broker_fee')
  .thenMin('10') // Maximum of 10% broker fee
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .addSymbol('dividend_per_share', '$.quote.total_shares')
  .thenDivideInto('$.quote.total_dividends');
```

TransformerRuleList - thenMultiply(Number operand)

Adds an adapter to the current rule that multiplies the source field by the passed in value.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
operand	Number	Value by which to multiply the source field.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('summary')
  .thenConcat('Shares of ')
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')
  .thenConcatSymbol('close_price');
```

TransformerRuleList - thenReplace(String matchString, String replaceString)

Adds an adapter to the current rule that finds all text within the source field that matches a specified string and replaces it with an updated string.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
matchString	String	String to match against the source field to identify the text to replace.
replaceString	String	String with which to replace the matching text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Current TransformerRuleList object.

In this example, any company name that ends with "Inc." is transformed to "Incorporated", such as Company Inc. to Company Incorporated.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('company', '$.quote.company')
  .thenReplace('Inc.', 'Incorporated');
```

TransformerRuleList - thenRoundDown(Number operand)

Adds an adapter to the current rule that rounds the source field down at the decimal position specified by the passed in value.

For negative numbers, the *thenRoundDown()* method makes the number more positive; the round down value of -2.156 is -2.15. The *thenFloor()* method makes the same number more negative, -2.16.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
operand	Number	Decimal position to the right of the decimal point at which to round the number down. For example, if this value is 2 and the source data element is 6.427, the resulting value is 6.42.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList90
  .fromJSON()
  .setName('Mortgage Rates 05022019 JSON')
  .addRule('interest_rate', '$.quote.interest_rate')
  .thenRoundDown('2') // Always round the interest rate down to
 the hundredths place
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .addRule('monthly_payment', '$.quote.total_loan_amount')
  .thenDivideBy('180');
```

TransformerRuleList - thenRoundUp(Number operand)

Adds an adapter to the current rule that rounds the source data element up at the decimal position specified by the passed in value.

For negative numbers, the *thenRoundUp()* method makes the number more negative; the round up value of -2.156 is -2.16. The *thenCeiling()* method makes the same number more positive, -2.15.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
operand	Number	Decimal position to the right of the decimal point at which to round the number up. For example, if this value is 2 and the source data element is 6.422, the resulting value is 6.43.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Mortgage Rates 05022019 JSON')
  .addRule('interest_rate', '$.quote.interest_rate')
  .thenRoundUp('2') // Always round the interest rate up to the
 hundredths place
  .addRule('monthly_payment', '$.quote.total_loan_amount')
  .thenDivideBy('180');
```

TransformerRuleList - thenSplit(String splitPattern, String replaceString)

Adds an adapter to the current rule that splits, reorganizes, and replaces strings within the source field and saves them in the output field.

The *splitPattern* parameter denotes how to divide the source text string into segments. This parameter can be a typical word separator such as a space (' '), comma (','), or semicolon (';'), and can also be any string, such as 'name'. For example, if the source text is "Smith John Michael" and the *splitPattern* is a space, then the available segments are "Smith", "John", and "Michael". To reference a segment, use $#, where # is the number of the order of the segment in the source text string. For example, if the method call is `thenSplit(' ', '$2 $3 $1')`, then the output is "John Michael Smith". In addition, you can add constants within the output pattern, such as `thenSplit(' ', 'First name: $2 Middle name: $3 Last name: $1')`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
splitPattern	String	String that denotes how to split the text into segments.
replaceString	String	String that defines the output string, including segment references and constants. Not all segments need to be referenced. Reference the segments defined by the *splitPattern* using $#, where # is the number of the order of the segment in the source data element. Reference the entire source data element using $0.

Returns

Type	Description
Object	Current TransformerRuleList object.

In this example, the CEO name is last name, first name in the source data and in the output it will be transformed to first name last name.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('CEO', '$.quote.CEO')
  .thenSplit(',', '$2 $1');
```

TransformerRuleList - thenSubtract(Number operand)

Adds an adapter to the current rule that subtracts the passed in value from the source field and stores it in the output field.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the *addRule()* method. They define adaptations to apply to the output field defined by the *addRule()* method such as formatting, rounding, and applying patterns.

Parameters

Name	Type	Description
operand	Number	Value to subtract from the source data element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Current TransformerRuleList object.

```
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock 05182019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('trade_price', '$.quote.current_price')
  .addMultiply('$.quote.trade_quantity')
  .thenSubtract('$.quote.discount_dollars');
```

TransformPart - Scoped, Global

The *TransformPart* API provides methods to specify details of the transform to be done.

You can call this class in scoped and global server scripts. When using the *TransformPart* class, use the `sn_clotho` namespace identifier.

There is no constructor for this class. TransformPart objects are returned by many *Transformer* and *TransformPart* methods.

The methods of this class define the transforms to be done. The actual transformation is done when the *execute()* method is called on the Transformer object.

The order the *TransformPart* methods are called is important.

- You must call the *metric()* method before calling a transform method.
- You cannot use the *metric()* or *groupBy()* methods after calling a transform method.
- Intermediate transforms are not returned in a result unless the *collect()* method is called for the intermediate result you want.

```
// where tp is a TransformPart object
// example 1
tp.avg().add(2);
var tr = tp.execute();
// tr contains avg+2, but not avg

// example 2
tp.avg().add(2);
tp.avg();
var tr = tp.execute();
// tr contains both avg and avg + 2

// example 3
tp.avg().collect().add(2);
var tr = tp.execute();
// tr contains both avg and avg + 2
```

This class is part of the MetricBase application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

TransformPart - add(Number constant)

Add the specified number to the value in each time stamp.

Parameters

Name	Type	Description
constant	Number	The number to add to the value in each time stamp.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - avg()

Aggregate the selected metric series into one series containing the average value for each time stamp.

Parameters

Name	Type	Description
None		

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - bottom(Number count)

Create a result set that for each time stamp returns specified number of bottom values. This method results in 'count' number of series. Each value retains the label of its source series.

Parameters

Name	Type	Description
count	Number	The number of series to return. The series are labeled 0 to count - 1.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - ceil(Number ceiling)

Replace the value in any time stamp that is greater than the specified value with the specified value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
ceiling	Number	The maximum allowed value for any time stamp.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - collect()

Mark this transform for collection.

Transforms that are part of a chain, but not the last transform, are by default not collected. A collected transform is returned as part of the transform result.

Parameters

Name	Type	Description
None		

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - count()

Aggregate the selected metric series into one series containing the number of values for each time stamp.

Parameters

Name	Type	Description
None		

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - div(Number constant)

Divide the value in each time stamp by the specified number.

Parameters

Name	Type	Description
constant	Number	The number by which to divide the value of each time stamp.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - filter(Object aggregator, Object duration)

Create a series using the specified aggregator for the specified time.

Parameters

Name	Type	Description
aggregator	Object	Can be: • AVG • CHISQUARE • LAST • MAX • MEDIAN • MIN • STDDEV For definitions of these options, see MetricBase transforms.
duration	Object	Time period for the series.

Returns

Type	Description
TransformPart	TransformPart object that you can use to specify transform characteristics.

TransformPart - floor(Number floor)

Replace the value in any time stamp that is less than the specified value with the specified value.

Parameters

Name	Type	Description
floor	Number	The minimum value for any time stamp.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - fractiles(Array fractions)

Create series made up of the value that the specified percentage of values is below. Returns a series for each fraction in the specified array.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The value in a time stamp in a returned series is the value at which the specified fraction of the samples for that time stamp is below. For example, if the fraction is 0.5, then the value in the time stamp is the value where half the values in the input series are below (median).

Parameters

Name	Type	Description
fractions	Array of numbers	The fractions to use on the input series.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics. Contains one series for each fraction specified.

```
// returns a single series containing the median for each time
 stamp, which
// means that half a time stamp's values are below the returned
 value
fractiles([.5])
// returns four series, one series for each of the 25%, 50%,
 75%, and 100% quartiles
fractiles([.25, .5, .75, 1])
// returns the median, 95% percentile, the max value
fractiles([.50, .95, 1])
```

TransformPart - getResult()

Return the part of the result relevant to this transform.

The `collect()` method must be called before the `execute()` method, and the `execute()` method must be called before calling the `getResult()` method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
TransformResult	Contains the transform results associated with this part of the transform.

```
var t = new sn_clotho.Transformer(drones);
t.metric("mb_demo_mt_altitude");
var avgTform = t.avg();
t.execute();
var avgTformResult = avgTform.getResult();
```

TransformPart - groupBy(String field)

Specify a field by which to group data. To specify multiple fields, run successive calls individually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The *groupBy()* method cannot be called after a transform has been run.

Parameters

Name	Type	Description
field	String	Name of a field in the table by which to group the transform results.

Returns

Type	Description
TransformPart	A *TransformPart* object that can be used to specify transform characteristics.

The following example shows how to group altitude average metrics by fleet and model fields.

```
transformer.groupBy("fleet,model").metric("mb_demo_mt_altitude")
.avg().label('%g:fleet: - %g:model:');

var transformPart = transformer.groupBy("fleet,model")

transformPart.metric("mb_demo_mt_altitude").avg().label('%g:fle
et: - %g:model:');
```

TransformPart - interpolate(Object count)

Create a data value for a NaN data item by interpolating from adjacent data values.

Parameters

Name	Type	Description
count	Object	Specifies the number of data samples in each direction to check for a non NaN value. If if a non NaN value is not found, NaN is used.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - iqr()

Perform an Interquartile range transform.

Creates a result set of four series.

- IQR, the median of all entries
- IQR range, below Q1-1.5IQR, or above Q3+1.5IQR
- Q1, the median of the smallest half of entries
- Q3, the median of the largest half of entries

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - label(String label)

Add a label for the resulting series.

Parameters

Name	Type	Description
label	String	The label for the transform results.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - limit(Object count)

Returns at most the specified number of values, starting at the most recent non-NaN value.

Parameters

Name	Type	Description
count	Object	A number of time stamps.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - log(Number base)

Run a logarithm on the value in each time stamp where the result is the log of the specified base for the time stamp value.

Parameters

Name	Type	Description
base	Number	The base for the logarithm calculation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - max()

Returns a series with the maximum value for each time stamp.

Parameters

Name	Type	Description
None		

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - median()

Create a series containing the median of values for each time stamp across a set of series.

If there are n series in the TranformPart object, then if n is odd, the (n / 2 + 1) value for a time stamp is the median. If n is even, the average of the (n / 2) and (n / 2 + 1) values for a time stamp is the median.

Parameters

Name	Type	Description
None		

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - metric(String metric)

Specify the metric field to be used in the transform.

You can specify multiple metrics to be used in the transform. The `metric()` method cannot be called after the transform has been run.

Parameters

Name	Type	Description
metric	String	Name of the metric field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - min()

Returns a series with the minimum value for each time stamp.

Parameters

Name	Type	Description
None		

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - mul(Number constant)

Multiply the value in each time stamp by the specified number.

Parameters

Name	Type	Description
constant	Number	The number by which to multiply the value of each time stamp.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - partition(String aggregator, GlideDateTime duration, GlideDateTime base)

Partition the series into intervals of the same duration.

Parameters

Name	Type	Description
aggregator	String	The aggregator to use. Can be min, max, avg, or last.
duration	GlideDateTime or an ISO 8601 formatted string	The interval length.
base	GlideDateTime or an ISO 8601	The zero offset for partitioning. For example, if you partition by day (24h), then set the base to Monday at midnight in your time zone. If you partition by 30 days, then set the base to 1st day of the most recent month.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
	formatted string	

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - resample(Number count)

Specify the number of data points to include in the result.

Aligns a series with a fixed number of data points in the given range. If the original series has more data points than specified, multiple values are averaged. If the original series has fewer data points than specified, data points are added by interpolating data points between existing data points.

You can use the `resample()` method to reduce the number of samples in the result to more closely match the number of samples you are going to display.

Parameters

Name	Type	Description
count	Number	The number of samples to include in the result.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - resample(Number min, Number max)

Specify the minimum and maximum number of samples to include in the result.

This method is useful when you are showing series with different time periods (granularities).

This method determines the average number of points per series and if that fits between the specified minimum and maximum, each series is resampled to that average number of points. If the calculated average is greater than the maximum specified or smaller than the minimum specified, the specified maximum or minimum is used.

Parameters

Name	Type	Description
min	Number	The minimum number of samples to include in the result. If not enough samples are available, interpolation is used to create samples.
max	Number	The maximum number of samples to include in the result.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - resample(String aggregator, Number numValues)

Specify an aggregator to use to create a result set of the specified size. The aggregator can be LAST, AVG, MIN, or MAX.

You can use the *`resample()`* method to reduce the number of samples in the result to more closely match the number of samples you are going to display.

Parameters

Name	Type	Description
aggregator	String	Can be LAST, AVG, MIN, or MAX.
numValues	Number	The number of samples to include in the result set. When the number of values requested is greater than the number of values in the data for the requested time period, *`interpolate()`* is used to add values between existing points to reach the requested number of values.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - resample(String aggregator, GlideDuration duration)

Specify an aggregator to use to create a result set over the specified duration. The aggregator can be LAST, AVG, MIN, or MAX.

Resamples the underlying data to the requested period.

- When the time series is stored at a 1 minute interval and `resample(AVG, new GlideDuration("1:00"))` is called, the result will have one data point at every hour reflecting the average of the previous 60 values.
- When the period requested is smaller than the period of the data, interpolation is used to calculate the intervening data points.

You can use the *`resample()`* method to reduce the number of samples in the result to more closely match the number of samples you are going to display.

Parameters

Name	Type	Description
aggregator	String	Can be LAST, AVG, MIN, or MAX.
duration	GlideDuration	The time period for the result set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - round(Number precision)

Round the value in each time stamp to the specified precision.

Performs this calculation on each value.

```
(v / precision) * precision
```

Parameters

Name	Type	Description
precision	Number	The value to be used in the rounding calculation.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - stddev()

Create a series containing the standard deviation of values for each time stamp across a set of series.

Parameters

Name	Type	Description
None		

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - sub(Object constant)

Subtract the specified number from the value in each time stamp.

Parameters

Name	Type	Description
constant	Object	The number to subtract from the value in each time stamp.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

TransformPart - sum()

Aggregate the selected metric series into one series containing the sum of all values for each time stamp.

Parameters

Name	Type	Description
None		

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformPart - top(Number count)

Create a result set that for each time stamp returns the specified number of top values. This method results in 'count' number of series. Each value retains the label of its source series.

Parameters

Name	Type	Description
count	Number	The number of series to return. The series are labeled 0 to count - 1.

Returns

Type	Description
TransformPart	A TransformPart object that can be used to specify transform characteristics.

TransformResult - Scoped, Global

The *`TransformResult`* API provides methods that return the result of a transformation run on time-series data.

You can use this API in both scoped and global server scripts. When using the *`Transformer`* class in a scoped application, use the `sn_clotho` namespace identifier.

There is no constructor for this class. TransformResult objects are returned by many *`TransformPart`* methods.

This class is part of the MetricBase application.

TransformResult - byGroup()

Returns an array of Data objects. Returns an error if no group was specified for the transform.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Array	An array of Data objects, with each object corresponding to a group.

TransformResult - getByLabel(String label)

Returns the transformed data with the specified label.

Parameters

Name	Type	Description
label	String	The label that identifies the data to be retrieved.

Returns

Type	Description
Data	The Data object with the transform results.

TransformResult - getData()

Returns a single Data object, or null if the result is empty.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Data	The Data object with the transform results.

TransformResult - toArray()

Returns the transformed data as an array. This method turns a Data object into an array.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	The Data object formatted as an array.

TroubleTicketNotificationUtilOOB - Scoped

The `TroubleTicketNotificationUtilOOB` script include provides methods used to define and generate the TMF-compliant payloads for trouble ticket notification events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Override the methods in this script include to:

- Add/remove attributes to an existing trouble ticket event type.
- Define attributes for a new trouble ticket event type.

For additional information, see Configure trouble ticket notifications using the Producer Event Notification Framework.

This script include runs within the `sn_ind_tsm_sdwan` namespace.

The calling user must have the ticket_integrator role.

TroubleTicketNotificationUtilOOB - addAdditionalEventAttributes(Object tmfEventPayload)

Adds custom event header attributes to the passed TMF trouble ticket event payload. The attributes added by this method are added to the event-level header for all trouble ticket events.

Parameters

Name	Type	Description
tmfEventPayload	Object	TMF-compliant trouble ticket event payload. For details on the format of this event payload, see the TMF621 Trouble Ticket Management API REST Specification v5.0.0 and the TMF688 Event Management API User Guide v4.0.0.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
constructTMFEvent: function(eventId) {
  var troubleTicketEvent = {};
  if (gs.nil(eventId)) {
    troubleTicketEvent.eventId = gs.generateGUID();
  } else {
    troubleTicketEvent.eventId = eventId;
  }
  troubleTicketEvent['@type'] =
 Constants.EVENT_TYPE_TROUBLE_TICKET;
  this.addAdditionalEventAttributes(troubleTicketEvent);
  return troubleTicketEvent;
},
```

TroubleTicketNotificationUtilOOB - constructTMFEvent(String eventId)

Generates the TMF688-compliant header attributes in the event section of the payload. These attributes are consistent across all event payloads.

In the default implementation, this method adds the *`eventId`* and the *`@type`* header attributes.

This method calls the helper method *`addAdditionalEventAttributes()`*. In this method you can add other header attributes to the event payload. For details, see Modify a trouble ticket event payload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
eventId	String	Unique identifier of the associated event. This can be any unique value. In the default implementation, if you don't pass the event ID, the value is set to a system generated GUID.

Returns

Type	Description
Object	TMF payload with the event-level attributes set. For details on the format of this event payload, see theTMF688 Event Management API User Guide v4.0.0 .

The following code example shows how to call this method to construct the event header attributes when generating a trouble ticket attribute change payload.

```
generateTroubleTicketAttributeChangePayload:
 function(incidentGr, eventType, eventId) {
  var tmfEventPayload = this.constructTMFEvent(eventId);
  tmfEventPayload.eventType = eventType;
  tmfEventPayload.event =
 this.addAttributeChangeTroubleTicketAttributes(incidentGr);

  return tmfEventPayload;
},
```

TroubleTicketNotificationUtilOOB - generateCreateTroubleTicketEventPaylaod(Object incidentGr, String eventType, String eventId)

Constructs the TMF-compliant payload for the associated create trouble ticket for incident event type.

This method is executed when the associated event type is `TROUBLE_TICKET_CREATE: "TroubleTicketCreateEvent"`. This method calls two helper methods:

- *`constructTMFEvent()`*: Adds the event header attributes (TMF688) to the payload.
- *`addCreateTroubleTicketAttributes()`*: Override this method to add trouble ticket attributes (TMF621), both mandatory and optional, to the payload. This method is just a stub in the default implementation.

You can override these helper methods in the `TroubleTicketNotificationUtil` script include to configure both event header and trouble ticket attributes in the TMF-compliant payload.

Parameters

Name	Type	Description
incidentGr	Object	JSON formatted glide record that caused the trouble ticket event to be generated. Use the information in this glide record to construct the TMF621-compliant trouble ticket event payload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
eventType	String	Unique identifier of the associated trouble ticket event type. For the default implementation of this method, this should always be `"TroubleTicketCreateEvent"`. For a list of all base trouble ticket event types, refer to *`Constants.EVENT_TYPES`* in the `sn_api_notif_mgmt.Constants` script include file.
eventId	String	Unique identifier of the associated event.

Returns

Type	Description
Object	TMF-compliant trouble ticket event payload. For details on the format of this event payload, see the TMF621 Trouble Ticket Management API REST Specification v5.0.0 and the TMF688 Event Management API User Guide v4.0.0.

The following code example shows how to call this method.

```
fetchEventHandlerAndCreateTMFEvent: function(eventSnapshot,
 eventType, eventId) {
  var eventPayload;
  switch (eventType) {
    case Constants.EVENT_TYPES.TROUBLE_TICKET_STATUS_CHANGE:
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateTroubl
eTicketStatusChangePayload(eventSnapshot, eventType, eventId);
      break;

    case Constants.EVENT_TYPES.TROUBLE_TICKET_CREATE:
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateCreate
TroubleTicketEventPaylaod(eventSnapshot, eventType, eventId);
      break;

    case Constants.EVENT_TYPES.TROUBLE_TICKET_ATTRIBUTE_CHANGE:
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateTroubl
eTicketAttributeChangePayload(eventSnapshot, eventType,
 eventId);
      break;

    case Constants.EVENT_TYPES.TROUBLE_TICKET_CREATE_FOR_CASE:
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateCreate
TroubleTicketEventPaylaodForCase(eventSnapshot, eventType,
 eventId);
      break;

    default:
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      this._logger.debug("Event with id " + eventId + " could
 not find the matching payload generator");
      eventPayload = null;
  }
return eventPayload;
},
```

TroubleTicketNotificationUtilOOB - generateCreateTroubleTicketEventPaylaodForCase(Object incidentGr, String eventType, String eventId)

Constructs the TMF-compliant payload for the associated create trouble ticket for case event type.

This method is executed when the associated event type is `TROUBLE_TICKET_CREATE_FOR_CASE: "TroubleTicketCreateEventForCase"`. This method calls two helper methods:

- *`constructTMFEvent()`*: Adds the event attributes (TMF688) to the payload.
- *`addCreateTroubleTicketAttributesForCase()`*: Override this method to add trouble ticket attributes (TMF621), both mandatory and optional, to the payload. This method is just a stub in the default implementation.

You can override these helper methods in the `TroubleTicketNotificationUtil` script include to configure both event header and trouble ticket attributes in the TMF-compliant payload.

Parameters

Name	Type	Description
incidentGr	Object	JSON formatted glide record that caused the trouble ticket event to be generated. Use the information in this glide record to construct the TMF621-compliant trouble ticket event payload.
eventType	String	Unique identifier of the associated trouble ticket event type. For the default implementation of this method, this should always be `"TroubleTicketCreateEvent"`. For a list of all base trouble ticket event types, refer to *`Constants.EVENT_TYPES`* in the `sn_api_notif_mgmt.Constants` script include file.
eventId	String	Unique identifier of the associated event.

Returns

Type	Description
Object	TMF-compliant trouble ticket event payload. For details on the format of this event payload, see the TMF621 Trouble Ticket Management API REST Specification v5.0.0 and the TMF688 Event Management API User Guide v4.0.0.

The following code example shows how to call this method.

eTicketAttributeChangePayload(eventSnapshot, eventType,
 eventId);
      break;

    case Constants.EVENT_TYPES.TROUBLE_TICKET_CREATE_FOR_CASE:
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateCreate
TroubleTicketEventPaylaodForCase(eventSnapshot, eventType,
 eventId);
      break;

    default:
      this._logger.debug("Event with id " + eventId + " could
 not find the matching payload generator");
      eventPayload = null;
  }
return eventPayload;
},
```

TroubleTicketNotificationUtilOOB - generateTroubleTicketAttributeChangePayload(Object incidentGr, String eventType, String eventId)

Constructs the TMF-compliant payload for the trouble ticket attribute change event for incident event type.

This method is executed when the associated event type is `TROUBLE_TICKET_ATTRIBUTE_CHANGE: "TroubleTicketAttributeChangeEvent"`. This method calls two helper methods:

- *`constructTMFEvent()`*: Adds the event attributes (TMF688) to the payload.
- *`addAttributeChangeTroubleTicketAttributes()`*: Override this method to add trouble ticket attributes (TMF621), both mandatory and optional, to the payload. This method is just a stub in the default implementation.

You can override these helper methods in the `TroubleTicketNotificationUtil` script include to configure both event header and trouble ticket attributes in the TMF-compliant payload.

TroubleTicketEventPaylaodForCase(eventSnapshot, eventType,
 eventId);
      break;

    default:
      this._logger.debug("Event with id " + eventId + " could
 not find the matching payload generator");
      eventPayload = null;
  }
return eventPayload;
},
```

TroubleTicketNotificationUtilOOB - generateTroubleTicketStatusChangePayload(Object incidentGr, String eventType, String eventId)

Constructs the TMF-compliant payload for the associated trouble ticket status change event for incident event type.

This method is executed when the associated event type is `TROUBLE_TICKET_STATUS_CHANGE: "TroubleTicketStatusChangeEvent"`. This method calls two helper methods:

- *`constructTMFEvent()`*: Adds the event attributes (TMF688) to the payload.
- *`addStatusChangeTroubleTicketAttributes()`*: Override this method to add trouble ticket attributes (TMF621), both mandatory and optional, to the payload. This method is just a stub in the default implementation.

You can override these helper methods in the `TroubleTicketNotificationUtil` script include to configure both event header and trouble ticket attributes in the TMF-compliant payload.

Parameters

Name	Type	Description
incidentGr	Object	JSON formatted glide record that caused the trouble ticket event to be generated. Use the information in this glide record to construct the TMF621-compliant trouble ticket event payload.
eventType	String	Unique identifier of the associated trouble ticket event type. For the default implementation of this method, this should always be `"TroubleTicketCreateEvent"`. For a list of all base trouble ticket event types, refer to *`Constants.EVENT_TYPES`* in the `sn_api_notif_mgmt.Constants` script include file.
eventId	String	Unique identifier of the associated event.

Returns

Type	Description
Object	TMF-compliant trouble ticket event payload. For details on the format of this event payload, see the TMF621 Trouble Ticket Management API

TroubleTicketEventPaylaodForCase(eventSnapshot, eventType,
 eventId);
      break;

    default:
      this._logger.debug("Event with id " + eventId + " could
 not find the matching payload generator");
      eventPayload = null;
  }
return eventPayload;
},
```

UniversalRequestUtilsSNC - Scoped

The *UniversalRequestUtilsSNC* API enables handling universal request life cycles. Provided as a script include record.

This API requires the Universal Request (com.snc.universal_request) plugin and is provided within the `sn_uni_req` namespace.

For information, refer to Universal Request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UniversalRequestUtilsSNC - createUniversalRequest(Object copyFields)

Creates a universal request and returns the sys_id of the newly created universal request record.

This method is called using the *`UniversalRequestUtils`* prototype in the `sn_uni_req` namespace. For example, `sn_uni_req.UniversalRequestUtils().createUniversalRequest(<copyFields>)`.

Parameters

Name	Type	Description
copyFields	Object	JSON object containing field names and values to set on a new record in the Universal Requests [universal_request] table. Provide details by field name and field value in the format `{ '<field_name>': '<field_value>' }`. The following fields are considered the most useful details to assign to a primary ticket. `{ 'assignment_group': 'String', 'assigned_to': 'String', 'contact_type': 'String', 'description': 'String', 'opened_by': 'String', 'opened_for': 'String', 'priority': 'String', 'restricted': Boolean, 'short_description': 'String' };` Other fields not listed might be eligible for your use case. For a list of table fields and related fields in the system, view the Data dictionary tables. **Note:** Do not include the primary_ticket or sys_id fields in the copyFields JSON object.
copyFields.assignment_group	String	Optional. Sys_id of the group assigned to the resource. Located in the Group [sys_user_group] table. Default: Default assignment group is set per assignment rules.
copyFields.contact_type	String	Optional. Method by which the resource was initially reported. Possible values: • chat • email • phone • social • web

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Maximum length: 40
copyFields.description	String	Optional. Detailed description of the problem associated with the resource. Maximum length: 4,000
copyFields.opened_by	String	Optional. Sys_id of the person that initially opened the resource. Located in the User [sys_user] table.
copyFields.opened_for	String	Optional. Required for HR Service Delivery cases. The sys_id of the user for whom the resource was opened.
copyFields.priority	String	Optional. Priority of the resource. Specified as a number. Possible values: • 1: Critical • 2: High • 3: Moderate • 4: Low Default: 3
copyFields.restricted	Boolean	Optional. Flag that indicates if the universal request has restricted access. Refer to Universal Request roles and groups. Valid values: • true: Universal request is only accessible to users with the `sn_uni_req.sensitiveinfo_agent` role. Users with this role have permissions to view sensitive information, such as payroll details. • false: Universal request access is unrestricted. Default: false
copyFields.short_description	String	Concise description of the resource. Maximum length: 160

Returns

Type	Description
String	Sys_id of the newly created universal request record.

The following example shows how to set fields on a new universal request. In this use case, this code is added to the beginning of the Inbound Email Actions [sysevent_in_email_action] scoped **Create HR Case** script. If the case doesn't apply to HR, agents can transfer the case to the appropriate department.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var copiedFields = {
  'opened_for': "<user_sys_id>",
  'short_description': email.subject,
  'restricted': false,
  'priority': '1'
};

// createUniversalRequest() must be called to create the
 universal request prior to creating the child case

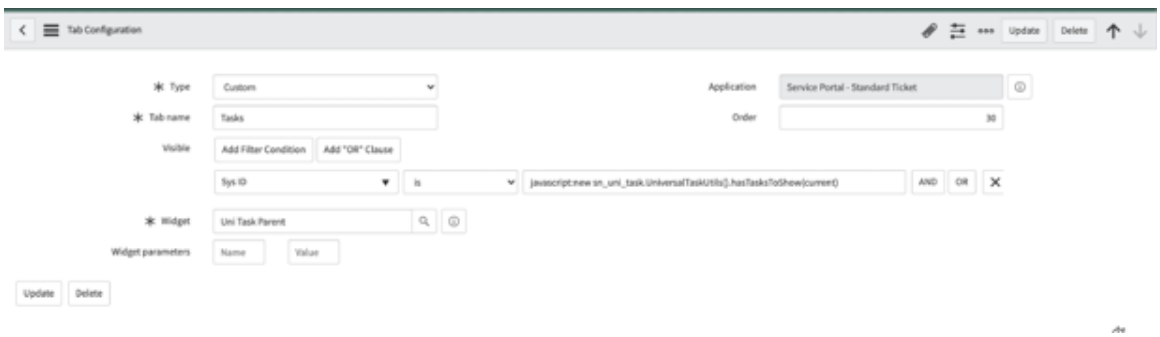
var ur = new
 sn_uni_req.UniversalRequestUtils().createUniversalRequest(copie
dFields);
current.universal_request = ur;
```

UniversalTaskUtils - Scoped, Global

The *UniversalTaskUtils* script include provides methods for managing universal tasks.

With the ServiceNow Universal Task application, agents can create tasks for employees. For example, agents can ask for additional information or request an action to resolve a parent ticket or request. Universal tasks are available for any ticket type that extends the Task [task] table.

Using this script include you can change the state of active universal tasks to "Complete" or "Cancelled", obtain all active universal tasks for a specified parent task, check whether a parent universal task has any children, and apply templates to a universal task record. You can use these methods in scripts and in the Visable condition builders on the **Tab configuration** form to manage the data that appears on the **Universal Task** tab. For additional information, see Add a Task tab on the Standard Ticket page.



You can use this script include in both scoped and global applications. The Universal Task application (sn_uni_task) must be installed on the associated instance to have access to this script include. You must always specify the `sn_uni_task` namespace when calling methods in this API.

For additional information on the Universal Task application, see Universal Task.

UniversalTaskUtils - applyTemplate(String templateSysId, GlideRecord uniTaskGr)

Applies the specified universal task template to the specified universal task record.

Before you can use this method, there must be universal task templates configured in your instance. For details, see Universal Task templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
templateSysId	String	Sys_id of universal task template to apply to the specified universal task record. Located in the Universal Task Template [sn_uni_task_template] table.
uniTaskGr	GlideRecord	GlideRecord of the universal task record to which to apply the template.

Returns

Type	Description
None	Any errors are written to the system log.

This code example shows a function that acquires, and then applies, the Feedback Template.

```
(function executeRule(current, previous /*null when async*/) {
  var templateGr = new GlideRecord('sn_uni_task_template');
  templateGr.get('name','Feedback Template');
  var templateSysId = templateGr.getValue('sys_id');
  new sn_uni_task.UniversalTaskUtils().applyTemplate
 (templateSysId,current);
})(current, previous);
```

UniversalTaskUtils - getActiveChildTasks(String parentSysId)

Returns the active child task records, in the form of a GlideRecord, for the specified parent ticket.

You can then use the *GlideRecord* API, scoped or global depending on the calling application's scope, to access the returned data, such as using the *getRowCount()* method to count active tasks.

Parameters

Name	Type	Description
parentSysId	String	Sys_id of the parent ticket whose active child tickets to return.

Returns

Type	Description
GlideRecord	GlideRecord that contains all active child task records for the specified parent task.

The following example shows a function that obtains all active child tasks for the current sys_id and then uses *getRowCount()* to obtain the number of active child tasks.

```
(function executeRule(current, previous /*null when async*/) {
  var gr_ActiveTasks = new
 sn_uni_task.UniversalTaskUtils().getActiveChildTasks(current.sy
s_id);
  var count = gr_ActiveTasks.getRowCount();
})(current, previous);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UniversalTaskUtils - hasTasksToShow(GlideRecord current)

Checks whether the specified parent ticket has any universal tasks that are in the work-in progress or complete state.

You can use this method to determine whether to show the Universal Task tab to a requester in a standard ticket configuration only if there are tasks that are work-in progress or complete.

Parameters

Name	Type	Description
current	GlideRecord	GlideRecord of the parent ticket to check.

Returns

Type	Description
sys_id	If universal tasks are associated with the parent ticket, the sys_id of the parent ticket; otherwise null. Data type: String

The following example shows a function that calls this method to check for universal tasks.

```
(function executeRule(current, previous /*null when async*/) {
  var sysId = new
 sn_uni_task.UniversalTaskUtils().hasTasksToShow(current);
})(current, previous);
```

UniversalTaskUtils - markActiveChildTasksCancelled(String parentSysId)

Changes the state of all active universal tasks under the specified parent ticket to "Cancelled".

Parameters

Name	Type	Description
parentSysId	String	Sys_id of the parent ticket whose active child universal tasks' state should be changed to "Cancelled".

Returns

Type	Description
None	

This code example shows how to use this method to update the states of all universal tasks associated with the specified parent task to cancelled.

```
(function executeRule(current, previous /*null when async*/) {
  new
 sn_uni_task.UniversalTaskUtils().markActiveChildTasksCancelled(
current.sys_id);
})(current, previous);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UniversalTaskUtils - markActiveChildTasksCompleted(String parentSysId)

Changes the state of all active child universal tasks associated with the specified parent ticket to "Complete".

Parameters

Name	Type	Description
parentSysId	String	Sys_id of the parent ticket whose active child universal tasks' state should be changed to "Complete".

Returns

Type	Description
None	

This code example shows how to use this method to update the states of all universal tasks associated with the specified parent task to completed.

```
(function executeRule(current, previous /*null when async*/) {
  new
 sn_uni_task.UniversalTaskUtils().markActiveChildTasksCompleted(
current.sys_id);
})(current, previous);
```

UPSHandler - Global

The *UPSHandler* script include provides methods to handle SNMP classification and identification for uninterruptible power supplies (UPSs).

Use this script include for SNMP-related discovery.

UPSHandler - classifyAndIdentify()

Classifies and identifies the UPSs.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

UserCriteria - Scoped

The *UserCriteria* API provides methods to create, modify, and delete user criteria records using scripts.

To use this class in a scoped application, use the `sn_uc` namespace identifier. The User Criteria Scoped API plugin (ID: com.glideapp.user_criteria.scoped.api) must be enabled to access this API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UserCriteria - UserCriteria()

Creates an instance of the UserCriteria class.

```
var uc = new sn_uc.UserCriteria();
```

UserCriteria - UserCriteria(String sys_id)

Creates an instance of the UserCriteria class with the specified sys_id.

Parameters

Name	Type	Description
sys_id	String	sys_id of the user criteria.

```
var uc = new
 sn_uc.UserCriteria("31bea3d53790200044e0bfc8bcbe5dec");
```

UserCriteria - create(Object columnValues, Boolean standardUpdate)

Creates a user criteria with specified values in the user_criteria table. Values specified in columnValues override the values provided via setters.

Parameters

Name	Type	Description
columnValues	Object	Key and value pairs for a column and its value.
standardUpdate	Boolean	Set to true to enable the running of engines and workflow.

Returns

Type	Description
String	sys_id of the created user criteria.

```
var uc = new sn_uc.UserCriteria();
uc.setCompanies("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc61122
75000025157c651c89");
uc.setActive(true);
uc.setUsers("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc611227500
0025157c651c89");
var UserCriteriaId = uc.create();
gs.info(UserCriteriaId);
```

Output:

```
41bea3d53790200044e0bfc8bcbe5dec
```

UserCriteria - deleteRecord()

Deletes the current user criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	If true, the user criteria is deleted. If false, no user criteria is found to delete.

```
var uc = new
 sn_uc.UserCriteria("31bea3d53790200044e0bfc8bcbe5dec");
uc.deleteRecord();
```

Output:

```
true
```

UserCriteria - read(String columns)

Displays the mapping for the attribute and value pairs of the catalog item.

Parameters

Name	Type	Description
columns	String	Array of catalog item attributes.

Returns

Type	Description
Object	Mapping for the attribute and value pairs of the catalog item.

```
var uc = new
 sn_uc.UserCriteria("7b8a6927ef732100438236caa5c0fb89");
var obj = uc.read(["company","name"]);
gs.info(JSON.stringify(obj));
```

Output:

```
Script: {"name":"All ACME Corporation
 employees","company":"e7c1f3d53790200044e0bfc8bcbe5deb,227cdfb0

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UserCriteria - setActive(Boolean active)

Specifies if the user criteria is active.

Parameters

Name	Type	Description
active	Boolean	If true, the user criteria is active. If false, the user criteria is inactive.

Returns

Type	Description
void	

```
var uc = new sn_uc.UserCriteria();
uc.setActive(true);
```

UserCriteria - setAdvanced(boolean advanced)

Specifies if the user criteria has an advanced script.

Parameters

Name	Type	Description
advanced	Boolean	If true, the user criteria has an advanced script. If false, the user criteria does not have an advanced script.

Returns

Type	Description
void	

```
var uc = new sn_uc.UserCriteria();
uc.setAdvanced(true);
```

UserCriteria - setCompanies(String companies)

Sets the company property for the user criteria.

Parameters

Name	Type	Description
companies	String	Comma-separated list of the company sys_ids to be set for the user criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var uc = new sn_uc.UserCriteria();
uc.setCompanies("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc6112275000025157c651c89");
```

UserCriteria - setDepartments(String departments)

Sets the department property for the user criteria.

Parameters

Name	Type	Description
departments	String	Comma-separated list of the department sys_ids to be set for the user criteria.

Returns

Type	Description
void	

```
var uc = new sn_uc.UserCriteria();
uc.setDepartments("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc6112275000025157c651c89");
```

UserCriteria - setGroups(String groups)

Sets the group property for the user criteria.

Parameters

Name	Type	Description
groups	String	Comma-separated list of the group sys_ids to be set for the user criteria.

Returns

Type	Description
void	

```
var uc = new sn_uc.UserCriteria();
uc.setGroups("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc6112275000025157c651c89");
```

UserCriteria - setLocations(String locations)

Sets the location property for the user criteria.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
locations	String	Comma-separated list of the location sys_ids to be set for the user criteria.

Returns

Type	Description
void	

```
var uc = new sn_uc.UserCriteria();
uc.setLocations("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc6112275000025157c651c89");
```

UserCriteria - setMatchAll(Boolean match_all)

Sets the match_all property for the user criteria.

Parameters

Name	Type	Description
None	match_all	If true, all conditions set as properties for the user criteria should be fulfilled. If false, at least one condition set as a property for the user criteria should be fulfilled.

Returns

Type	Description
void	

```
var uc = new sn_uc.UserCriteria();
uc.setMatchAll(true);
```

UserCriteria - setName(String name)

Sets the name property for the user criteria.

Parameters

Name	Type	Description
name	String	Name of the user criteria.

Returns

Type	Description
void	

```
var uc = new sn_uc.UserCriteria();
uc.setName("Property1");
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UserCriteria - setRoles(String roles)

Sets the role property for the user criteria.

Parameters

Name	Type	Description
roles	String	Comma-separated list of the role sys_ids to be set for the user criteria.

Returns

Type	Description
void	

```
var uc = new sn_uc.UserCriteria();
uc.setRoles("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc611227500
0025157c651c89");
```

UserCriteria - setScript(String script)

Sets the script for the user criteria.

Parameters

Name	Type	Description
script	String	Script to be set for the advanced user criteria.

Returns

Type	Description
void	

```
var uc = new sn_uc.UserCriteria();
uc.setScript("function scriptTest() {
  var retVal;
  if (gs.getUser().getRecord().getDisplayValue('department') ==
 'Product Management') {
      retVal = true;
  } else {
      retVal = false;
  }
  return retVal;
}");
```

UserCriteria - setUsers(String users)

Sets the user property for the user criteria.

Parameters

Name	Type	Description
users	String	Comma-separated list of the user sys_ids to be set for the user criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var uc = new sn_uc.UserCriteria();
uc.setUsers("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc611227500
0025157c651c89");
```

UserCriteria - update(Object columnValues, String reason)

Updates the current catalog item with the specified values.

Parameters

Name	Type	Description
columnValues	Object	Mapping for the column name and the value pairs.
reason	String	Reason for updating the catalog item.

Returns

Type	Description
String	Returns the sys_id of the created user criteria.

```
var uc = new sn_uc.UserCriteria();
uc.update("name": "Updated name", "The existing name is not
 relevant. Setting a relevant name");
```

Output:

```
31bea3d53790200044e0bfc8bcbe5dec
```

UserSkillAnalyzer - Global

The *UserSkillAnalyzer* API provides methods to analyze user skills against skills required to complete work items.

This API requires the Skills Management plugin (com.snc.skills_management), which you can activate if you have the admin role.

See Qualify and rank users based on skills and skill levels.

UserSkillAnalyzer - UserSkillAnalyzer()

Instantiates a new UserSkillAnalyzer object.

Parameters

Name	Type	Description
None		

```
var userSkillAnalyzer = new SNC.UserSkillAnalyzer();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UserSkillAnalyzer - analyzeUserByID(String requiredSkillsJson, String userID, Boolean isSkillLevelEnforced)

Analyzes user skills against the required skills and sets the number of matching skills, skill level gap, and qualification that can be collected from an instance.

Analyzes whether an agent is qualified to work on a task by verifying if the agent has the skills and skill levels required to complete the task. If an agent is qualified to work on a task, the API analyzes the level gap between required skills and user's skill level which can be further used by the application to choose the best agent based on level gap. It also analyzes the total number of skills with and without skill levels the agent has to execute that task.

Parameters

Name	Type	Description
requiredSkillsJson	String	List of required skills to compare with user. Each skill is listed as a JSON entry in the following format: • sys_id: String. Sys ID of skill from the Skills [cmn_skill] tab • is_mandatory: Boolean. Flag that indicates whether the sk mandatory. • level: String. Sys ID from the Skill Levels [cmn_skill_level]
userID	String	Sys ID from the User [sys_user] table.
isSkillLevelEnforced	Boolean	True if user must have a minimum skill level for all required n skills, false otherwise. Default: false.

Returns

Type	Description
String	JSON that contains all the required information about the user based on the anal map as follows: • sys_id: String. Sys ID from the User [sys_user] table. • is_qualified: Boolean. Flag that indicates whether the user is qualified for the re skills. ○ True if user has all the mandatory skills and skill level is enforced. ○ False if user does not have all mandatory skills or does not meet level require • num_skills: Number. Skills matched against the required skills. • num_skills_matching_level: Number. User skills matching the required skill leve • total_skill_level_gap: Number. Skill level gap helps ranking algorithm find optim meeting minimum skill level requirements. Calculated based on overall gap bet skill level and user skill level. User must have required skill level for mandatory s • optional_skill_level_gap: Number. Provides skill level gap for optional skills only the end points in distinguishing between total skill level and optional skill level Error if inaccurate parameters or malformed JSON provided.

var userSysID = "a8f98bb0eb32010045e1a5115206fe3a";
var userSkillAnalyzer = new SNC.UserSkillAnalyzer();
var result =
 userSkillAnalyzer.analyzeUserById(JSON.stringify(skills),
 userSysID, true);
gs.info('Results: ' + result);
```

Output:

```
Calling user analyzer
*** Script: Results:
 {"sys_id":"a8f98bb0eb32010045e1a5115206fe3a","is_qualified":fal
se,"num_skills":0,"num_skills_matching_level":0,"total_skill_lev
el_gap":0,"optional_skill_level_gap":0}
```

UserSkillAnalyzer - analyzeUserBySkills(String requiredSkillsJson, String userSkillsJson, Boolean isSkillLevelEnforced)

Analyzes user skills against the required skills and sets the number of matching skills, skill-level gap, and qualification that can be collected from an instance.

Parameters

Name	Type	Description
requiredSkillsJson	String	List of required skills to qualify the users against. Each skill is listed as a JSON entry in the following format: • sys_id: String. Sys ID of skill from the Skills [cmn_skill] tab • is_mandatory: Boolean. Flag that indicates whether the sk mandatory. • level: String. Sys ID from the Skill Levels [cmn_skill_level]
userSkillsJson	String	List of user skills to determine qualification for required skills Each skill is listed as a JSON entry in the following format: • sys_id: String. Sys ID of skill from the Skills [cmn_skill] tab • is_mandatory: Boolean. Flag that indicates whether the sk mandatory. • level: String. Sys ID from the Skill Levels [cmn_skill_level]
isSkillLevelEnforced	Boolean	True if user must have minimum skill level for all required ma skills, false otherwise. Default: false.

Returns

Type	Description
String	JSON that contains all the required information about the user based on the anal map as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• sys_id: String. Sys ID from the User [sys_user] table.
	• is_qualified: Boolean. Flag that indicates whether the user is qualified for the re skills.
	  ○ True if user has all the mandatory skills and skill level is enforced.
	  ○ False if user does not have all mandatory skills or does not meet level require
	• num_skills: Number. Skills matched against the required skills.
	• num_skills_matching_level: Number. User skills matching the required skill leve
	• total_skill_level_gap: Number. Skill level gap helps ranking algorithm find optim meeting minimum skill level requirements. Calculated based on overall gap bet skill level and user skill level. User must have required skill level for mandatory
	• optional_skill_level_gap: Number. Provides skill level gap for optional skills only the end points in distinguishing between total skill level and optional skill level
	
	Error if inaccurate parameters or malformed JSON provided.

```
var skills = [{"sys_id":"48c9f873c0a8018b65c3814608b201e6",
 "is_mandatory": true,
 "level":"4e0ac4d6b3332300290ea943c6a8dc4e"},
    {"sys_id":"48c9fdddc0a8018b04bd8d7914c82c9d",
 "is_mandatory": false,
 "level":"4e0ac4d6b3332300290ea943c6a8dc4e"}];
var userSkills = [{"sys_id":"48c9f873c0a8018b65c3814608b201e6",
 "is_mandatory": true,
 "level":"4e0ac4d6b3332300290ea943c6a8dc4e"},
     {"sys_id":"k, th", "is_mandatory": false,
 "level":"4e0ac4d6b3332300290ea943c6a8dc4e"}];
var userSkillAnalyzer = new SNC.UserSkillAnalyzer();
var result =
 userSkillAnalyzer.analyzeUserBySkills(JSON.stringify(skills),
 JSON.stringify(userSkills));
gs.info('Results: ' + result);
```

UserSkillRanking - Global

The *UserSkillRanking* API provides methods to configure options for choosing the right user and getting a sorted list of qualified users based on number of matching skills and skill-level gap.

This API requires the Skills Management plugin (com.snc.skills_management), which you can activate if you have the admin role.

See Qualify and rank users based on skills and skill levels.

UserSkillRanking - UserSkillRanking()

Instantiates a UserSkillRanking object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

UserSkillRanking - getQualifiedRankedUsers(String requiredSkillsJson, String usersJson, String rankType, Boolean isSkillLevelEnforced)

Provides a list of qualified users based on matching mandatory skills and levels if the `isSkillLevelEnforced` parameter is true).

Parameters

Name	Type	Description
requiredSkillsJson	String	List of required skills to qualify users. Each skill is listed as a JSON entry in the following format: • sys_id: String. Sys ID of skill from the Skills [cmn_skill] tab • is_mandatory: Boolean. Flag that indicates whether the sk mandatory. • level: String. Sys ID from the Skill Levels [cmn_skill_level]
usersJson	String	List of user Sys IDs from sys_user table (in JSON format) rep users to be qualified against required skills.
rankType	String	Enables sorting qualified users based on ranking type. Poss are comparators to provide sorted list of qualified users bas number of matching skills and skill level gap: • NO_RANKING (default) – Used if empty value provided. • NUM_SKILLS – Number of skills matched against required • NUM_SKILL_ MATCHING_LEVEL – Number of user skills m the required skill level. • LEAST_SKILL_ LEVEL_GAP – Finds user skill that most clo minimum skill level requirements. • MOST_SKILL_ LEVEL_GAP – Finds user that least meets r skill level requirements. • BEST_OPTIMUM_ USER – Finds optimum user for all skill
isSkillLevelEnforced	Boolean	True if user must have minimum skill level for all required ma skills, false otherwise. Default: false.

Returns

Type	Description
String	List of qualified users as JSON. Error if inaccurate parameters or malformed JSON provided.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var skills = [{"sys_id":"48c9f873c0a8018b65c3814608b201e6",
 "is_mandatory": true,
 "level":"4e0ac4d6b3332300290ea943c6a8dc4e"},
    {"sys_id":"48c9fdddc0a8018b04bd8d7914c82c9d",
 "is_mandatory": false,
 "level":"4e0ac4d6b3332300290ea943c6a8dc4eS"}];
var users = ["a8f98bb0eb32010045e1a5115206fe3a",
 "62826bf03710200044e0bfc8bcbe5df1"];
var userSkillRanking = new SNC.UserSkillRanking();
var qualifiedUsers =
 userSkillRanking.getQualifiedRankedUsers(JSON.stringify(skill
s), JSON.stringify(users), "BEST_OPTIMUM_USER", true);
```

v_query – Scoped, Global

The *v_query* API provides methods to obtain information about a scriptable object that represents a query running against a remote table.

This API requires the Remote Tables plugin (com.glide.script.vtable) to be activated. For additional information, see Retrieving external data using remote tables and scripts.

Remote table rows are created using the *v_table* API.

v_query - getCondition(String field)

Gets an encoded query string for the specified field.

See also *v_table* API.

Parameters

Name	Type	Description
field	String	Name of the field.

Returns

Type	Description
String	Returns an encoded query string for the given field.

The following example shows results for a field with an encoded query of `number=INC0001^active=true`.

```
var result = v_query.getCondition("number");
gs.info(result);
```

Output:

```
number=INC0001
```

v_query - getEncodedQuery()

Returns the query against a remote table as an encoded query string

For details, see Encoded query strings.

See also *v_table* API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The encoded query as a string.

The following example is a snippet from Retrieving specific records from a third-party source.

```
gs.info(v_query.getEncodedQuery());
```

Output:

```
active=true^priority=1
```

v_query - getParameter(String field)

Gets the value of a field in an equality query condition.

See also:

- Retrieving specific records from a third-party source
- *v_table* API

Parameters

Name	Type	Description
field	String	Name of the field to be queried.

Returns

Type	Description
String	Value of the field in the query condition. For example, if `name=John` is the encoded query, then *`getParameter("name")`* returns `"John"`.

The following example shows how to get the value of a caller ID field.

```
v_query.getParameter("caller_id");
```

Output:

```
12345123451234512345123451234501
```

v_query - getSysId()

Returns the sys_id value in a get query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id value in the get query, for example, if `sys_id=123`, this method returns `123`.

The following example is a snippet from Retrieving specific records from a third-party source.

```
v_query.getSysId();
```

Output:

```
a3a7ffb6dba41010db2051735e4619b7
```

v_query - getTextSearch()

Gets a text search query parameter.

See also:

- Encoded query strings
- Querying tables in script
- *v_table* API

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Text search query parameter, for example `email`.

In the following example, the method returns true if the query contains a text query parameter, such as `GOTO123TEXTQUERY321=email`.

```
// for query value GOTO123TEXTQUERY321=email
v_query.getTextSearch();
```

Output:

```
email
```

v_query - isGet()

Determines if the query is a get query, that is, a query that retrieves a record by sys_id.

See also:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Retrieving specific records from a third-party source
- *v_table* API

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag indicates that query for a specific record has `sys_id=` as the query format. Valid values: • true: Query contains equality query condition on the sys_id field. • false: Query does not include equality query condition on the sys_id field.

In the following example, if the encoded query is `sys_id=d1954c744662010bd7e061e67a6776e`, the *v_query.isGet()* method returns true. If the encoded query is anything else, such as `Number=INC0000001`, the *v_query.isGet()* method returns false.

```
// Virtual table to query
var row = {
 sys_id: "d1954c744662010bd7e061e67a6776e",
 number: "INC0000001",
 short_description: "New laptop request",
 u_balance: 1200.23
};

v_table.addRow(row);

v_query.isGet();
```

v_query - isTextSearch()

Indicates if the query contains a text query parameter.

See also:

- Encoded query strings
- Querying tables in script
- *v_table* API

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the query contains a text query parameter. Valid values: • true: Query contains a text query parameter. • false: Query does not contain a text query parameter.

In the following example, the method returns true if the query contains a text query parameter, such as `GOTO123TEXTQUERY321=email`.

```
v_query.isTextSearch();
```

v_query - setLastErrorMessage(String message)

Sets the last error message in the GlideRecord.

See also:

- Scoped GlideRecord - getLastErrorMessage()
- Retrieving specific records from a third-party source
- *v_table* API

Parameters

Name	Type	Description
message	String	Error message.

Returns

Type	Description
None	

The following example shows the basic structure used to set an error message.

```
(function executeQuery (v_table, v_query) {
 try {

 // Add code to test for errors during execution
 } catch(ex) {

  v_query.setLastErrorMessage(ex.message);

 }

}) (v_table, v_query);
```

The following example shows how to set the last error message in a REST API.

```
(function executeQuery (v_table, v_query) {
 try {

 // call a REST API
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 } catch(ex) {

  v_query.setLastErrorMessage("Error obtaining results from
 remote service");

 }

}) (v_table, v_query);
```

v_table – Scoped, Global

The *v_table* API provides methods to add rows to a remote table through a scriptable object.

This API requires the Remote Tables plugin (com.glide.script.vtable) to be activated. For additional information, see Retrieving external data using remote tables and scripts.

Use the *v_query* scriptable object to query remote tables.

v_table - addRow(Object row)

Adds rows to the remote table.

See also:

- Create a script definition for a remote table
- Lookup remote information in the system of record
- Retrieving specific records from a third-party source
- v_query API

Parameters

Name	Type	Description
row	Object	JavaScript object containing field name and value map in which the key is the field name, for example, `{number: "INC0001", sys_id: "a34"}`. `{ "<field name>": "value" }`
row.<field value>	String	Represents the value of the selected field. Although no fields are mandatory, provide the sys_id at a minimum. Example listing only sys_id field and value: `{ "sys_id": "<uniqueID>" }`

Returns

Type	Description
Boolean	Flag that indicates whether the row was added to the remote table. Valid values: • true: Success. • false: Row was not added.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to use the RESTMessageV2 API to create and execute the REST call to an external bank application. The script shows how to use the *addRow()* method to store return results in a remote table.

```
(function executeQuery (v_table, v_query) {
  // Parameters needed in the request body of the REST endpoint
  var requestBody = {

 'financial_account':v_query.getParameter('financial_account')
  };

  // Instantiate the RESTMessageV2 object
  var request = new sn_ws.RESTMessageV2();
  // Set the HTTP method as "GET"
  request.setHttpMethod('get');
  // URL of the endpoint on the bank application

 request.setEndpoint('https://
<yourbankapphost>/api/getTransactionDetails');
  // Request body as a string
  request.setRequestBody(JSON.stringify(requestBody));
  // Call the REST endpoint
  var response = request.execute();
  // Get the response body
  var responseBody = response.getBody();
  // Parse the response body into an object
  var responseObj = JSON.parse(responseBody);

  // Store the response body into a virtual table
  v_table.addRow({
    sys_id: gs.generateGUID(),
    amount: responseObj.amount,
    description: responseObj.description,
    posting_date: responseObj.posting_date,
    transaction_date: responseObj.transaction_date
  });

}) (v_table, v_query);
```

VMUtils - Global

The *VMUtils* script include provides methods for discovery and provisioning of virtual machines.

This script include is available in server-side scripts to convert between UUID and Correlation ID formats.

VMUtils - turnCorrelationIdToUuid(String correlationId)

Converts a correlation ID into a UUID for a virtual machine in the ServiceNow system.

Parameters

Name	Type	Description
correlationId	String	The correlation ID to convert

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The UUID, or an empty string if invalid.

```
gs.info(VMUtils.turnCorrelationIdToUuid('42 10 82 82 62 35 ca
 68-b5 1c 1e f8 5c 0a 0d 5b'));
```

Output:

```
42108282-6235-ca68-b51c-1ef85c0a0d5b
```

VMUtils - turnUuidToCorrelationId(String uuid)

Converts a WMware universal unique identifier (UUID) to a format that matches the original format in the ServiceNow system.

vCenter works with UUIDs where the ESXi Linux console worked with this format.

Parameters

Name	Type	Description
uuid	String	The UUID to convert.

Returns

Type	Description
String	The identifier converted to the ServiceNow format.

```
gs.info(VMUtils.turnUuidToCorrelationId('13eb78d0-d504-11e1-9b23
-0800200c9a66'));
```

Output:

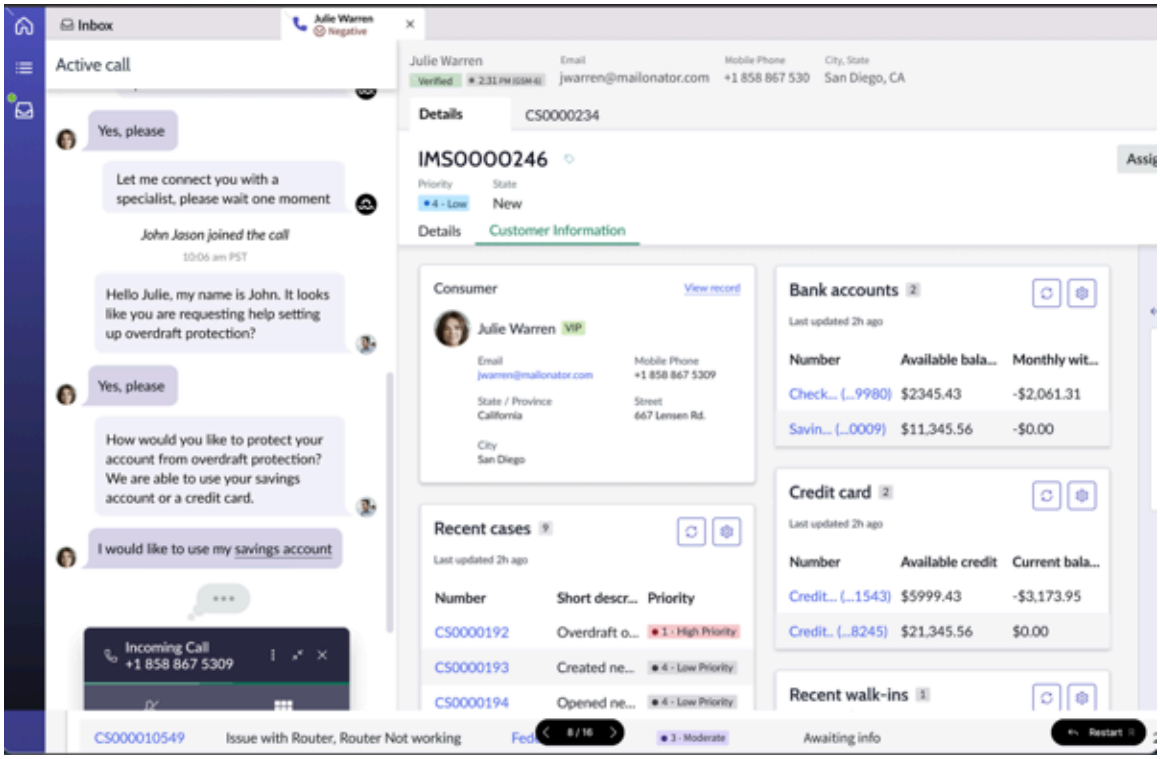
```
13 eb 78 d0 d5 04 11 e1-9b 23 08 00 20 0c 9a 66
```

VoiceTranscriptObject - Scoped

The *VoiceTranscriptObject* scriptable API provides methods to save third-party voice conversation transcript data to a table within a ServiceNow instance.

When calling the `VoiceTranscriptObject` class, use the `sn_cs` namespace identifier.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Availability

This API is available in the base ServiceNow system. Access is restricted by the ACLs imposed on the Interaction [interaction] and Conversation [sys_cs_conversation] tables.

VoiceTranscriptObject - addVoiceInteractionMessage(String interactionId, String Json)

Adds the specified messages to the specified voice transaction record.

You can call this endpoint multiple times during real-time transcribing of the call or pass all messages in a single call if you are transcribing the call for historical purposes. If you are processing a real-time conversation, you should call this endpoint frequently, so that the messages appear in Agent Workspace in a timely manner. Messages are ordered based on their start and end times in relation to the start of the call.

Parameters

Name	Type	Description
interactionId	String	Sys_id of the interaction record to add the specified messages to. This value is returned by the VoiceTranscriptObject - startVoiceInteraction(String Json) method and stored in the Interaction [interaction] table.
<json_string>	String (Array of Objects)	List of messages to attach to the specified voice interaction. `"<json_string>":[ { "attributes": [Array], "beginOffsetMillis": Long, "content": "String" "endOffsetMillis": Long, "id": "String", "isEvent": Boolean, "isInternalMessage": Boolean,`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>"loudnessScore": "Number",
		"participantId": "String",
		"sentiment": "String"
		}
		]</pre>

<json_string>.attributes	Array of Objects	Key-value pairs to associate to the voice interaction. These can be any type of data object, from simple objects to complex compound objects. They are used as unique identifiers when invoking Amazon Web Services APIs. Default: None
<json_string>.beginOffsetMillis	Long	Required. Time offset between the start of the voice interaction and the start of the associated message. For example: "beginOffsetMillis": 2650. Unit: Milliseconds
<json_string>.content	String	Required. Text of the message to add to the voice interaction.
<json_string>.endOffsetMillis	Long	Required. Time offset between the start of the voice interaction and the end of the message. For example: "endOffsetMillis": 9380. Unit: Milliseconds
<json_string>.id	String	Message UUID of the source of this voice conversation, such as for AmazonConnect. Sets the source message ID column value. Default: None
<json_string>.isEvent	Boolean	Set by Amazon Connect but not currently used by the method. Flag that indicates whether the associated message is an event. Valid values: • true: Message is an event. • false: Message is not an event. Default: false
<json_string>.isInternalMessage	Boolean	Flag that indicates whether this is an internal message and should not be shown to the caller. Transcriptions are typically considered internal messages and only appear for the agent and not to the caller. In addition, Agent Whisper is used when a silent third-party is chatting with or is brought into a phone conversation without the caller knowing and offers advice to an agent. The caller does not hear or see these messages, but the agent does.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • true: Internal message, do not display to the caller. • false: Not an internal message, display to caller. Default: false
<json_string>.loudness	Number	Measurement as to how loudly a customer or agent is speaking during a call. Contact Lens displays an analysis of the conversation that shows where they may be talking loudly and have a negative sentiment. Default: Null
<json_string>.participantId	String	Required. Participant associated with the message. Valid values: • CUSTOMER • AGENT
<json_string>.sentiment	String	Sentiment of the message. This value is generated by a third-party provider. Based on the ServiceNow instance configuration settings, this value is then translated to be either positive, negative, or neutral and is stored in the conversation and interaction record. Valid values: • NEGATIVE • NEUTRAL • POSITIVE Default: Null

Returns

Type	Description
String	Message that describes the results of the call.
String	If successful, sys_id of the voice interaction message record that was created. Located in the Voice Transcript Conversation Message [sys_cs_message_voice_transcript] table. If an error occurred, an error message describing the reason for the failure.

The following example shows how to add messages to an existing voice interaction record.

```
var request = [
  {
    "isEvent":"False",
    "isInternalMessage":"False",
    "beginOffsetMillis":100000,
    "content":"This is John. How can I help you?",
    "endOffsetMillis":150000,
    "id":"954c4edc-31a8-48b0-8f6e-7fa0c4ca00a8",
    "participantId":"AGENT",
    "sentiment":"NEUTRAL"
  },
  {
    "isEvent":"False",
    "isInternalMessage":"False",
    "beginOffsetMillis":200000,
    "content":"Uh, yes, John. Um, I'm a little very frustrated
 right now.",
    "endOffsetMillis":25000,
    "id":"18bcf19c-4a9b-4af1-9bd7-7bfb5ba53b9f",
    "participantId":"CUSTOMER",
    "sentiment":"NEGATIVE"
  }
];

gs.log(sn_cs.VoiceTranscriptObject.addVoiceInteractionMessage("1
f4ed6fdb7471110b6e8bc15ae11a971", JSON.stringify(request)));
```

Output:

```
// Success
Voice conversation transcript has been successfully saved.
 Conversation id: ea01113cb7f71110b6e8bc15ae11a94d

// Error
Exception occurred while adding the message: <error message>
```

VoiceTranscriptObject - createConversation(String interactionId, String Json)

Creates a conversation record within the Conversation [sys_cs_conversation] table for the specified interaction.

Parameters

Name	Type	Description
interactionId	String	Sys_id of the interaction record for which to create a conversation record. This value is returned by the VoiceTranscriptObject - startVoiceInteraction(String Json) method and stored in the Interaction [interaction] table.
<json_string>	String	JSON string of the input parameters. `"<json_string>": { "agentId": "String", "callerPhoneNumber": "String", "clientSessionId": "String", "inboundId": "String", "userId": "String"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
<json_string>.agentId	String	Unique identifier of the agent to assign the voice interaction to. Located in the User ID field in the User [sys_user] table. Default: None. Assigned to the next available agent.
<json_string>.callbackPhoneNumber	String	Caller's callback phone number. This is the number the agent uses to reach the caller in case the call drops. Format: E.164 standard compliant Default: None
<json_string>.clientSessionId	String	Unique identifier of a record in an external system used to track this phone call. This information links the records between the two systems. Default: None
<json_string>.inboundId	String	Unique identifier of the application provider for the voice service. Located in the Inbound ID field in the Provider Channel Application [sys_cs_provider_application] table. Default: Pull from chat
<json_string>.userId	String	Required. Phone number of the caller who made the call associated with the voice transaction. Format: Defined by the software that created the voice conversation script. Typically E.164 standard compliant.

Returns

Type	Description
String	If successful, returns the sys_id of the newly created conversation record. Located in the Conversation [sys_cs_conversation] table. If an error occurs, returns a detailed error message.

The following code example shows how to create a new conversation record using this method.

```
var request = {
  "userId": "+14089178877"
};

var response =
 sn_cs.VoiceTranscriptObject.createConversation("e0fc03d7b7a2111
0b6e8bc15ae11a96c", JSON.stringify(request));
gs.log("Conversation id: " + JSON.stringify(response));
```

Output:

```
// Success
{"conversationId":"28435dbcb7f71110b6e8bc15ae11a972","status":"S
UCCESS"}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Error
{"error":"Exception occurred while creating a conversation:
 <error message>","status":"FAILED"}
```

VoiceTranscriptObject - endVoiceInteraction(String interactionId, String Json)

Terminates the specified voice interaction. Once called, no additional voice messages are translated and stored for the phone conversation.

Parameters

Name	Type	Description
interactionId	String	Sys_id of the interaction record whose voice interaction to terminate. Located in the Interaction [interaction] table.

<json_string>	JSON String	Optional. Parameters that contain additional information about the voice interactions.
		`"<json_string>": {`
		`  "recordingURL": "String"`
		`}`

<json_string>.recordingURL	String	Optional. URL where the original voice recording is located. If configured to do so, this URL appears in Agent Workspace. Default: None

Returns

Type	Description
String	If successful, returns `Success`. If an error occurs, returns a detailed error message.

The following code example shows how to end an active voice interaction and pass in the original voice recording URL.

```
var request = {
  "recordingURL":
 "https://servicenow.zoom.us/rec/QbF7XmPFHPlX1LG"
};

gs.log(sn_cs.VoiceTranscriptObject.endVoiceInteraction("1f4ed6fd
b7471110b6e8bc15ae11a971", JSON.stringify(request)));
```

Output:

```
// Success
Success

// Error
Exception occurred while ending the interaction: <error message>
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VoiceTranscriptObject - saveVoiceConversationTranscript(String voiceConversationJson)

Saves third-party voice conversation transcript data to tables within a ServiceNow instance that is then accessible through Customer Service Management (CSM).

These voice conversations are typically generated using third-party vendor software. This method parses the passed JSON and saves the data into the Conversation [sys_cs_conversation], Conversation Message [sys_cs_message], and Voice Transcript Conversation Message [sys_cs_message_voice_transcript] tables within the ServiceNow instance. CSM accesses the information in these tables to display the voice conversation transcripts.

Parameters

Name	Type	Description

voiceConversationJson	String	JSON that represents the voice conversation to store. This JSON is sent by another ServiceNow plugin, such as OpenFrame. Third-party vendors, such as Amazon, send the JSON to the plugin. The associated plugin parses out the voice conversation and sends the JSON in the required format to Virtual Agent.
		
		For example, the following is an example of an Amazon Connect conversation:
		
		`{`
		
		`"interactionId":"bgr09b5a-7308-47b2-jy97-737de9f45d19",`
		`"source":"AmazonConnect",`
		`"conversationStarted":"2021-08-06 15:07:51",`
		`"transcript":[`
		`{`
		`"isEvent":"False",`
		`"isInternalMessage":"False",`
		`"beginOffsetMillis":2650,`
		`"content":"This is John. How can I help you? Yeah,",`
		`"endOffsetMillis":9380,`
		
		`"id":"954c4edc-31a8-48b0-8f6e-7fa0c4ca00a8",`
		`"participantId":"AGENT",`
		`"Sentiment":"NEUTRAL",`
		`"loudnessScore":"null,null",`
		`"attributes": [{`
		`"key":"key1",`
		`"value":"value1"`
		`},{`
		`"key":"key2",`
		`"value":"value2"`
		`}]`
		`},`
		`{`
		`"isEvent":"False",`
		`"isInternalMessage":"False",`

Parameters (continued)

Name	Type	Description

		"beginOffsetMillis":9120,
		"content":"Uh, yes, John. I'm a little very frustrated right now.",
		"endOffsetMillis":22900,
		"id":"18bcf19c-4a9b-4af1-9bd7-7bfb5ba53b9f",
		"participantId":"CUSTOMER",
		"sentiment":"NEGATIVE",
		"loudnessScore":"null,null",
		"attributes": [{
		"key":"key1",
		"value":"value1"
		},{
		"key":"key2",
		"value":"value2"
		}]
		},
		{
		"isEvent":"True",
		"isInternalMessage":"True",
		"beginOffsetMillis":23590,
		"content":"Agent asked for help in chat",
		"endOffsetMillis":30610,
		"id":"ab09b3b6-23fd-4e41-be05-6b2b53c19059",
		"participantId":"CUSTOMER",
		"sentiment":"NEUTRAL",
		"loudnessScore":"null,null,null,null",
		"attributes": []
		}
		]
		}

Returns

Type	Description
String	Results of the method call. Possible return results: • Voice conversation transcript has been successfully saved. Conversation id: `<transcript_record_sys_id>` • Voice conversation transcript could not be saved. Detail error: `<error details>`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• ERROR: InteractionId is missing in the request. • ERROR: Interaction specified in the request has already been processed.

This example shows how to call the *saveVoiceConversationTranscript()* method to save an Amazon Connect transcript.

```
var voiceConversationJson = "{\n" +

```
var result =
 sn_cs.VoiceTranscriptObject.saveVoiceConversationTranscript(voi
ceConversationJson);
gs.log(result);
```

Output:

```
Voice conversation transcript has been successfully saved.
 Conversation id: 9c573169c611228700193229fff72400
```

VoiceTranscriptObject - startVoiceInteraction(String Json)

Creates a voice interaction record within the Interaction [interaction] table.

You must create this record before trying to save any transcribed voice messages. You can also use this method to assign a call to a specific agent by passing in their specific user ID.

Parameters

Name	Type	Description
<json_string>	String	JSON string of the input parameters. `"<json_string>": { "agentId": "String", "callerPhoneNumber": "String", "clientSessionId": "String", "inboundId": "String", "userId": "String"`
<json_string>.agentId	String	Unique identifier of the agent to assign the voice interaction to. Located in the User ID field in the User [sys_user] table. Default: None. Assigned to the next available agent.
<json_string>.callerPhoneNumber	String	Caller's callback phone number. This is the number the agent uses to reach the caller in case the call drops. Format: E.164 standard compliant Default: None
<json_string>.clientSessionId	String	Unique identifier of a record in an external system used to track this phone call. This information links the records between the two systems. Default: None
<json_string>.inboundId	String	Unique identifier of the application provider for the voice service. Located in the Inbound ID field in the Provider Channel Application [sys_cs_provider_application] table. Default: Pull from chat
<json_string>.userId	String	Required. Phone number of the caller who made the call associated with the voice transaction. Format: Defined by the software that created the voice conversation script. Typically E.164 standard compliant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Results of the method call. Possible return results: • Success: {"interactionId":"<interaction_sys_id>","status":"SUCCESS"} • Error: {"error":"<error message>","status":"FAILED"}

The following code example shows how to create a voice interaction record.

```
var request = {
  "userId": "+14089178877",
  "callerPhoneNumber": "+14089178878",
  "clientSessionId": "f8453abb-a33d-45b7-bf01-52b7a821e99z"
};
var response =
 sn_cs.VoiceTranscriptObject.startVoiceInteraction(JSON.stringif
y(request));
gs.log(JSON.stringify(response));
```

Output:

```
// Success
{"interactionId":"ea01113cb7f71110b6e8bc15ae11a950","status":"SU
CCESS"}

// Error
{"error":"Exception occurred while starting the interaction:
 <error message>","status":"FAILED"}
```

WalkWorkflow - Global

The *`WalkWorkflow`* script include provides methods to walk a workflow and return a list of successors for each activity along with a shortest path order that indicates the activity depth in the workflow.

Walkworkflow - Walkworkflow(GlideRecord workflowVersion)

Constructor for **Walkworkflow** class.

Parameters

Name	Type	Description
workflowVersion	GlideRecord	*`GlideRecord`* on table wf_workflow_version of the workflow version to analyze.

Returns

Type	Description
Workflow	Workflow object just created.

Walkworkflow - computeFullSequences()

Computes the full sequence for every path.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Does not combine paths at Join activities. After calling this method, call `getSequences()` to yield the computed sequences.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

Walkworkflow - computeSequences()

Computes the sequences of activities.

All sequences leading up to a join end at the join and then a single sequence from the join is computed. This ensures that all sequences can be walked up to a join, and then the sequence can be walked from the join. After calling this method a call to `getSequences()` will yield the computed sequences.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

Walkworkflow - dump()

Outputs the internal state of this class to `gs.print()`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

Walkworkflow - dumpSequences()

Outputs the sequences internal to this class to `gs.print()`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

Walkworkflow - dumpShortestPathOrders(description)

Outputs the shortest path orders internal to this object to `gs.print()`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

Walkworkflow - getActivitiesAtOrder(Number order)

Returns all the activities at the specified shortest path order.

Parameters

Name	Type	Description
order	Number	The order number the client is interested in.

Returns

Type	Description
String Array	An array of activity sys_ids at the specified order. If an empty array is returned, there are no more activities.

Walkworkflow - getSequences( )

Returns the activity sequences.

The `walk()` method must have been called prior to calling this method.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	A string of |-delimited sequences. Each sequence is a comma-delimited list of activity ids (table wf_workflow_activity).

Walkworkflow - walk(Boolean fullSequences)

Walks the workflow and sets up the activity shortest path ordering.

After calling this method the client would call the various accessor methods to obtain relevant data about the workflow.

Parameters

Name	Type	Description
fullSequences	Boolean	(Optional) If **true**, computes the full sequences. Default is false.

Returns

Type	Description
void	

WFActivityHandler - Global

The `WFActivityHandler` script include is the base class for all workflow activities.

As the base class for all workflow activities, this code always executes as part of an activity.

When developing your own workflow activities, create your script object by deriving from this class and overriding methods as necessary to get the functionality you want. Client code must override method `onExecute()` to perform meaningful activity processing.

WFActivityHandler - debug(String msg, String args)

Logs a debug message.

Parameters

Name	Type	Description
msg	String	Message to send to the log.
args	String	String to send to the log

Returns

Type	Description
void	

WFActivityHandler - debug(String msg, Array args)

Logs a debug message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
msg	String	Message to send to the log.
args	Array	Array of values to send to the log

Returns

Type	Description
void	

WFActivityHandler - generate(String activityId, String order, GlideDateTime startAtDspValue, Boolean noCreateFlag)

Generates approvals and tasks before the activity runs for a preview of upcoming work.

Enables generating objects at the start of a workflow in a **pending** state. For related information, see Generate workflow activity.

Parameters

Name	Type	Description
activityId	String	Sys_id of this running activity. Located in the Workflow Activities [wf_activity] table.
order	String	The order number associated with the task or approval.
startAtDspValue	String	The starting time for the task or approval in GlideDateTime format.
noCreateFlag	Boolean	Flag that indicates whether to skip creating an approval record. Valid values: • true: Do not create an approval record. • false: Create an approval record. Default: True

Returns

Type	Description
Object	Pre-generation object saved in the workflow scratchpad. For example, the object might be an array of approval IDs. When the activity runs the `onExecute` function, it can request the pre-generation object to determine one of the following conditions: • Approvals have already been created in a pending state. • The activity must create the approvals using the `onExecute` function.

WFActivityHandler - info(String msg, String args)

Logs an information message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
msg	String	Message to send to the log.
args	String	String to send to the log.

Returns

Type	Description
void	

WFActivityHandler - info(String msg, Array args)

Logs an information message.

Parameters

Name	Type	Description
msg	String	Message to send to the log.
args	Array	Array of values to send to the log

Returns

Type	Description
void	

WFActivityHandler - js(String str)

Evaluates activity variables in the script.

Used to evaluate strings that contain el such as `${some script}` or strings starting with `javascript:`. See almost any existing activity for example usage.

Parameters

Name	Type	Description
str	String	String that possibly contains embeded el.

Returns

Type	Description
String	The evaluated string.

WFActivityHandler - onCancel( )

Event handler for *`cancel`* event.

The base class for the activity script sets this activity to be cancelled. Derived classes (activities) can override this method if additional processing is required to cancel this activity. Activity *`Manual Approvals`* is an example of overriding this method to perform additional processing to cancel this activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

WFActivityHandler - onExecute( )

Virtual method. Activity subclasses must override this method to perform work appropriate to the activity.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

WFActivityHandler - runScript(String script)

Enables activities to run a script contained in an activity variable of type script.

Example activities that use this method include If, *`Wait for condition`*, and *`Approval - User`*.

Parameters

Name	Type	Description
script	String	String containing valid Javascript.

Returns

Type	Description
variable	If the script set the workflow variable *`answer`* then this value is returned. If not, then the result of the script execution is returned.

WFActivityHandler - setActivityOutput( )

Sets the activity output property.

See activity *`SOAP Message`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

WFActivityHandler - setResultFailed(String reason)

Sets the activity result as failed with an optional reason string.

See Activity *SOAP Message*.

Parameters

Name	Type	Description
reason	String	(Optional) Description of the reason this activity failed.

Returns

Type	Description
void	

WFActivityHandler - setResultSucceeded( )

Sets the result of this activity as successful.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

WFActivityHandler - warn(String msg, String args)

Logs a warning message.

Parameters

Name	Type	Description
msg	String	Message to send to the log.
args	String	String to send to the log

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

WFActivityHandler - warn(String msg, Array args)

Logs a warning message.

Parameters

Name	Type	Description
msg	String	Message to send to the log.
args	Array	Array of values to send to the log

Returns

Type	Description
void	

WindowsOSNameHelper - Global

The *`WindowsOSNameHelper`* script include provides methods to handle the formatting of Windows OS names.

Use in any server-side discovery scripts where you need to format OS names.

WindowsOSNameHelper - formatWindowsOSName(String name)

Formats the given Windows OS name.

Parameters

Name	Type	Description
name	String	The name to format

Returns

Type	Description
String	The formatted name

WindowsOSNameHelper - makeOSChoiceValid(String value)

Ensures that the OS choice is valid.

Note: Deprecated. Use *`OSChoice.reconcile()`*

Parameters

Name	Type	Description
value	String	The value to validate

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

WindowsOSNameHelper - osCleanupName(String name)

Cleans up the specified Windows OS name by stripping out incorrect characters, incorrect capitalization, extra spaces, or trailing spaces.

Parameters

Name	Type	Description
name	String	The name to clean up.

Returns

Type	Description
String	The cleaned up name

Workflow - Global

The `Workflow` script include provides methods that interface with the Workflow engine.

Use these methods to manipulate workflows.

Workflow - broadcastEvent(String contextId, String eventName)

Sends the specified event (message) into the workflow context to pass along to the executing activities.

Typical use of this method is to enable activities that wait for some action to occur before proceeding. For additional information on using `broadcastEvent`, refer to Workflow event-specific functions.

For a list of the available OOB events, refer to Workflow events in the base system.

Parameters

Name	Type	Description
contextId	String	The context ID.
eventName	String	The name of the event.

Returns

Type	Description
void	

```
//where current is a task record with a workflow context
      var wf = new Workflow().getRunningFlows(current);
      while(wf.next()) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            new Workflow().broadcastEvent(wf.sys_id, 'resume');
        }
```

Workflow - cancel(GlideRecord record)

Cancels all running workflows on this record by broadcasting the *cancel* event to activities in all running workflows on this record.

Parameters

Name	Type	Description
record	GlideRecord	*GlideRecord* on any table. All workflows running on this record will be cancelled.

Returns

Type	Description
void	

```
//get workflow helper
      var workflow = new Workflow();
      //cancel all the workflows, where current is a task record
 with a workflow context
      workflow.cancel(current);
      gs.addInfoMessage(gs.getMessage("Workflows for {0} have
 been cancelled", current.getDisplayValue()));
```

Workflow - cancelContext(GlideRecord context)

Cancels this running context by broadcasting a *cancel* event to activities in this workflow context.

Parameters

Name	Type	Description
context	GlideRecord	*GlideRecord* of the running context to cancel.

Returns

Type	Description
void	

```
// If a workflow has started for this item, cancel it, where
 current is a task record with a workflow context
      if ((current.stage == 'Request Cancelled') &&
 current.context
          && !current.context.nil()) {
      var w = new Workflow();
      var now_GR = new GlideRecord('wf_context');

      if (now_GR.get(current.context))
          w.cancelContext(now_GR);
      }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow - deleteWorkflow(GlideRecord current)

Deletes all the workflows on the record.

Parameters

Name	Type	Description
current	GlideRecord	*GlideRecord* for which the caller wants to delete all workflows. This can be any record on any table.

Returns

Type	Description
void	

```
//where current is a task record with a workflow context
      var wkfw = new Workflow();
      wkfw.deleteWorkflow(current);
```

Workflow - fireEvent(GlideRecord eventRecord, String eventName, Object eventParms)

Fires the named event of a running workflow on the input record.

Used in Activities **Approval Coordinator**, **Timer**, **Lock**, and some others.

Parameters

Name	Type	Description
eventRecord	GlideRecord	Event record listed in the Workflow Executing Activites [wf_executing] table.
eventName	String	The name of the event to send to the executing workflow.
eventParms	Object	Optional. Parameters in JSON format used by the event.

Returns

Type	Description
void	

```
// where current is a task record with a workflow context
  var w = new Workflow();
  w.fireEvent(current, 'execute');
```

Workflow - fireEventById(String eventRecordId, String eventName)

Fires the named event on the record specified by record ID.

Used in Activities **Approval Coordinator**, **Timer**, **Lock**, and some others.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
eventRecordId	String	The sys_id of the glide record.
eventName	String	The name of the event to send to the executing workflow.

Returns

Type	Description
void	

```
var wkfw = new Workflow();

 wkfw.fireEventById('f2400ec10b0a3c1c00ca5bb5c6fae427','Timer');
```

Workflow - getContexts(GlideRecord record)

Returns all workflow contexts for a specified record.

Parameters

Name	Type	Description
record	GlideRecord	*GlideRecord* for which the caller wants a list of all workflow contexts. This can be any record on any table for which the caller wants the running workflow contexts.

Returns

Type	Description
GlideRecord	GlideRecord in the Workflow context [wf_context] table filtered for all workflow contexts for the specified record (in any state, such as running, cancelled, finished).

```
//where current is a task record with a workflow context
var wkfw = new Workflow();
var context = wkfw.getContexts(current);
while (context.next())
  gs.print(context.started);
```

Workflow - getEstimatedDeliveryTime(String workflowId)

Gets the estimated time for a workflow to complete.

Parameters

Name	Type	Description
workflowId	String	Sys_id of the workflow (table wf_workflow) to get the estimated run time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Display value from a GlideDuration (e.g., 3 days), or blank if unknown.

```
var wkfw = new Workflow();

 gs.print(wkfw.getEstimatedDeliveryTime('b99a866a4a3623120074c03
3e005418f'));
```

2 Days

Workflow - getEstimatedDeliveryTimeFromWFVersion(GlideRecord wfVersion)

Get the estimated elapsed execution time for the workflow version.

Parameters

Name	Type	Description
wfVersion	GlideRecord	*GlideRecord* on table wf_workflow_version of a specific workflow version for which the caller wants the estimated during of executing.

Returns

Type	Description
String	Display value from a GlideDuration (e.g., 3 days), or blank if unknown.

```
//where current is a task record with a workflow context
      var wkfw = new Workflow();
      var context = wkfw.getContexts(current);

 gs.print(wkfw.getEstimatedDeliveryTimeFromWFVersion(context.wf_
version));
```

Workflow - getReturnValue(String workflowID, Number amount, Boolean result)

Gets the appropriate workflow return value for the input workflow ID. This is either the workflow checked out by the current user or the published workflow with the most recent date.

This is either the workflow checked out by the current user or the published workflow with the most recent date. This method is available starting with the Fuji release.

Parameters

Name	Type	Description
workflowID	String	The sys_id of the workflow (table wf_workflow)
amount	Number	amount
result	Boolean	**True**, if true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
???	The return value of the workflow as specified by the Return Value activity. Workflows without a Return Value activity return a null value.

```
var wkfw = new Workflow();
      wkfw.getReturnValue('context');
```

Output:

```
*** Script: b99a866a4a3623120074c033e005418f
```

Workflow - getRunningFlows(GlideRecord record)

Gets all the currently running workflow contexts for the input record.

The input record is any record on any table for which the caller wants the running workflow contexts.

Parameters

Name	Type	Description
record	GlideRecord	*GlideRecord* of the record for which the caller wants a list of all running workflows.

Returns

Type	Description
GlideRecord	GlideRecord on table wf_context and filtered for all executing workflow contexts.

```
//where current is a task record with a workflow context
      var wf = new Workflow().getRunningFlows(current);
      while(wf.next()) {
          new Workflow().broadcastEvent(wf.sys_id, 'pause');
      }
```

Workflow - getVersion(String workflowID)

Gets the appropriate workflow version for the input workflow ID. This is either the workflow checked out by the current user or the published workflow with the most recent date.

This is either the workflow checked out by the current user or the published workflow with the most recent date.

Parameters

Name	Type	Description
workflowID	String	The sys_id of the workflow (table wf_workflow)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
none	

```
var wkfw = new Workflow();
      wkfw.getVersion('b99a866a4a3623120074c033e005418f');
```

Workflow - getVersionFromName(String workflowName)

Returns the appropriate workflow version for the input workflow name.

See *`getVersion()`* for more information.

Parameters

Name	Type	Description
workflowName	String	Name of the workflow (table wf_workflow)

Returns

Type	Description
void	

```
var wkfw = new Workflow();
      wkfw.getVersionFromName('Emergency Change');
```

Workflow - getWorkflowFromName(String workflowName)

Returns the sys_id of the workflow associated with the specified workflow name.

Parameters

Name	Type	Description
workflowName	String	Name of the workflow.

Returns

Type	Description
String	The sys_id of the workflow associated with the passed in name.

```
var wflw = new Workflow();
      gs.print(wflw.getWorkflowFromName('Emergency Change'));
```

Workflow - hasWorkflow(GlideRecord record)

Determines if a specified record has any workflow contexts associated to it.

This includes running and completed workflow contexts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
record	GlideRecord	*GlideRecord* under scrutiny. This *GlideRecord* can be from any table.

Returns

Type	Description
Boolean	True, if record has associated workflow; otherwise, returns False.

```
var wkfw = new Workflow();

 gs.print(wkfw.hasWorkflow('f2400ec10b0a3c1c00ca5bb5c6fae427'));
```

false

Workflow - restartWorkflow(GlideRecord current, Boolean maintainStateFlag)

Recalculates the approvals and tasks for a workflow by adding new approvals and tasks, while not resetting current approvals and tasks.

You can use this method to perform such tasks as adding a company to a change request, without resetting the current approvals for companies already in the workflow.

Parameters

Name	Type	Description
current	GlideRecord	*GlideRecord* of the record this workflow is executing. This can by any record on any table.
maintainStateFlag	Boolean	Flag that indicates whether to maintain all approvals and tasks in their current state. Valid values: • true: Maintain all approvals and tasks in their current state. • false: Update all approval and task states.

Returns

Type	Description
void	

This example shows the workflow being restarted with the approval file changing from Rejected to Requested.

```
(function(){
  var comment = 'Workflow Restarted - the Approval Field
 changing from Rejected to Requested';
  var gLock = new GlideRecordLock(current);
    gLock.setSpinWait(50);
  if (gLock.get()) {
    new Workflow().restartWorkflow(current, false);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    current.setDisplayValue('approval_history', comment);
  }
})
```

Workflow - runFlows(GlideRecord record, String operation)

Runs all workflows for a given record in a given table and its descendant tables.

Sample usage can be seen in the Script Includes "SNC - Run parent workflows", and "SNC - Run parent workflows (Approval)".

Parameters

Name	Type	Description
record	GlideRecord	GlideRecord to run workflows against.
operation	String	Database operation. Valid values: • insert • update • delete

Returns

Type	Description
void	

```
var now_GR = new GlideRecord('wf_test');
now_GR.addQuery('parent', current.parent);
now_GR.addQuery('sys_id','!=',current.sys_id);
now_GR.query();
while(now_GR.next()) {
    new Workflow().runFlows(now_GR, 'update');
}
```

Workflow - startFlow(String workflowId, GlideRecord current, String operation, Array vars)

Starts a specified workflow.

See script include WorkflowScheduler and Business Rule "Start Workflow" on table sc_req_item for examples of use.

Parameters

Name	Type	Description
workflowId	String	The sys_id of the workflow to start. This sys_id refers to table wf_workflow.
current	GlideRecord	The record to use as current in this workflow. This is normally from the *Table* field of the workflow properties for this workflow.
operation	String	The operation to perform on *current*. Possible values: **insert**, **update**, **delete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
vars	Array	Collection of variables to add to the workflow

```
////where current is a task record with a workflow context
      var w = new Workflow();
      var context = w.startFlow(id, current,
 current.operation(), getVars());
```

Workflow - startFlowFromContextInsert(GlideRecord context, String operation)

Helper method for business rule *Auto start on context*.

Parameters

Name	Type	Description
context	GlideRecord	GlideRecord on table wf_context of a new record (the "current" record in the business rule).
operation	String	Database operation being performed. One of *insert*, *update*, *delete*.

Returns

Type	Description
void	

```
//where current is a task record with a workflow context
      current.name = current.workflow_version.name;
      current.started_by.setValue(gs.userID());

      if (gs.nil(current.id)) {
        var now_GR = new GlideRecord('wf_workflow_execution');
        now_GR.name = current.name;
        now_GR.insert();

        current.table = 'wf_workflow_execution';
        current.id = now_GR.sys_id;
      }

      var wf = new Workflow();
      wf.startFlowFromContextInsert(current,
 current.operation())
```

Workflow - startFlowRetroactive(String workflowId, Number retroactiveMSecs, GlideRecord current, String operation, Array, ???)

Used by business rule *Start Workflow* on table task_sla. This starts a workflow and the extra arguments to this method are used by activity "Timer" to pause the execution of the workflow for some duration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
workflowID	String	The sys_id of the workflow to start. This sys_id refers to table wf_workflow.
retroactiveMSecs	Number	Delay in milliseconds used by Activity **Timer**.
current	GlideRecord	GlideRecord of the record to use as current in this workflow. This is normally from the *Table* field of the workflow properties for this workflow
operation	String	Database operation being performed.One of *insert*, *update*, *delete*.
vars	Array	Collection of variables to add to the workflow.
withSchedule	???	Schedule used by Activity **Timer**

Returns

Type	Description
GlideRecord	A GlideRecord on table wf_context on the inserted record for this newly created workflow context.

```
// is this a retroactive start?
     ////where current is a task record with a workflow context
     var msecs = new GlideDateTime().getNumericValue() -
 current.start_time.getGlideObject().getNumericValue();

     // treat this as a retroactive workflow start if the SLA
 started more than 5 seconds ago
     var w = new Workflow();
     if (msecs <= 5000)
       w.startFlow(id, current, current.operation());
     else
       w.startFlowRetroactive(id, msecs, current,
 current.operation());

     // update the record in case the workflow changed some
 values
     current.update();
```

Workflow - Workflow()

Constructor for *Workflow* class.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var w = new Workflow();
```

Workflow - Scoped

The scoped *Workflow* API provides methods that can be used in an activity definition script.

There are no constructors for creating an instance of a scoped workflow object. Instead, use the global workflow object available in activity scripts. This workflow object is available in any script location inside a workflow.

Scoped Workflow - debug(String message, Object args)

Adds a debug message to the log.

Parameters

Name	Type	Description
message	String	The message to add to the log.
args	Object	Arguments to add to the message.

Returns

Type	Description
String	The message added to the log.

```
var loggedMessage = workflow.debug("All is well");
```

Scoped Workflow - error(String message, Object args)

Adds an error message to the log.

Parameters

Name	Type	Description
message	String	The message to add to the log.
args	Object	Arguments to add to the message.

Returns

Type	Description
String	The logged message

```
var loggedMessage = workflow.error("An error has occurred. ");
```

Scoped Workflow - getVariable(String name)

Returns the specified variable's value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	The variable name

Returns

Type	Description
Object	The variable's value

```
var value = workflow.getVariable("task");
```

Scoped Workflow - info(String message, Object args)

Adds an informational message to the log.

Parameters

Name	Type	Description
message	String	The message to add to the log.
args	Object	Arguments to add to the message.

Returns

Type	Description
String	The message that is logged.

```
var loggedMessage = workflow.info("All is well");
```

Scoped Workflow - inputs

Object that contains the workflow variables.

This is not a method, but rather a way to reference the variables in a workflow object, such as the user. Workflow variables are defined in the properties of the workflow or by scripted activities.

Field

Name	Type	Description
inputs	Object	Workflow variables as name value pairs. The variables of a workflow object are custom to an integrator's implementation.

```
var user = workflow.inputs.u_user;
```

Scoped Workflow - name()

Returns the workflow name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The workflow name

```
var name = workflow.name();
```

Scoped Workflow - removeVariable(String name)

Removes the specified variable from the workflow.

Parameters

Name	Type	Description
name	String	The variable name

Returns

Type	Description
void	

```
var value = workflow.removeVariable("task");
```

Scoped Workflow - result

Element of the workflow object that contains the workflow results.

This is not a method, but rather the element in the workflow object that contains the results of a workflow.

Field

Name	Type	Description
result	String	Workflow results.

```
var wfResult = workflow.result;
```

Scoped Workflow - scratchpad()

Returns the workflow's scratchpad object.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	The scratchpad object.

```
var scratchpad = workflow.scratchpad();
```

Scoped Workflow - setResult(String result)

Sets the workflow's result.

Parameters

Name	Type	Description
result	String	The workflow's result

Returns

Type	Description
void	

```
workflow.setResult("Success");
```

Scoped Workflow - setVariable(String name, Object value)

Sets the specified variable to the specified value.

Parameters

Name	Type	Description
name	String	The variable name
value	Object	The value to be assigned to the variable.

Returns

Type	Description
void	

```
workflow.setVariable("task", "terrible");
```

Scoped Workflow - warn(String message, Object args)

Adds a warning message to the log.

Parameters

Name	Type	Description
message	String	The message to add to the log.
args	Object	Arguments to add to the message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The logged message

```
var loggedMessage = workflow.warn("Check your permissions.");
```

WorkflowDuration - Global

The *WorkflowDuration* script include provides methods to calculates the duration (in seconds) based on the variables of a workflow activity. It is an interface between *Workflow Timer()* and *DurationCalculator()*.

WorkflowDuration - addSeconds(GlideRecord record, Number amount)

Adds the number of seconds to the specified start date/time.

Parameters

Name	Type	Description
record	GlideRecord	description
amount	Number	amount

Returns

Type	Description
Boolean	True, if object was successfully created.

WorkflowDuration - calculate(GlideRecord record)

Calculates the number of seconds and the due date.

Parameters

Name	Type	Description
record	GlideRecord	The record that contains the fields with the schedule, timezone, and date/time information. This is almost always *activity.vars.__var_record__*.

Returns

Type	Description
void	

WorkflowDuration - calculateTimeLeft(GlideRecord record)

Calculates the number of seconds remaining to the specified end date/time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
record	GlideRecord	The record that contains the fields with the schedule, timezone, and date/time information. This is almost always `activity.vars.__var_record__`.

Returns

Type	Description
void	

WorkflowDuration - getEndDateTime( )

Returns the end date/time set by a call to `calculate(record)`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideDateTime	The end date/time.

WorkflowDuration - getSeconds( )

Returns the seconds value that was set by a call to `calculate(record)`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of seconds set by a call to calculate(record).

WorkflowDuration - getTotalSeconds( )

Returns the totalSeconds value that was set by a call to calculate(record).

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	The total number of seconds set by a call to calculate(record).

WorkflowDuration - setEndDateTime(String dt)

Sets the end date/time to use when calculating the remaining time.

To convert the value into the GlideDateTime internal format, use `GlideDateTime.getValue()`.

Parameters

Name	Type	Description
dt	String	The end date/time to use.

Returns

Type	Description
void	

WorkflowDuration - setEndDateTime(GlideDateTime dt)

Sets the end date/time to use when calculating the remaining time.

To convert the value into the GlideDateTime internal format, use **GlideDateTime.getValue()**.

Parameters

Name	Type	Description
dt	GlideDateTime	The end date/time to use.

Returns

Type	Description
void	

WorkflowDuration - setStartDateTime(String dt)

Sets the start date/time to use in the calculations.

Parameters

Name	Type	Description
dt	String	The start date/time to use, in GMT.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WorkflowDuration - setStartDateTime(GlideDateTime dt)

Sets the start date/time to use in the calculations.

To convert the value into the GlideDateTime internal format, use `GlideDateTime.getValue()`.

Parameters

Name	Type	Description
dt	GlideDateTime	The start date/time to use.

Returns

Type	Description
void	

WorkflowDuration - setUsedSecs(Number secs)

Sets the *used seconds* compensation, where the number of seconds is the number of seconds inside of any schedule.

Can be a -ve number, which extends the duration.

Parameters

Name	Type	Description
secs	Number	The number of used seconds to set.

Returns

Type	Description
void	

WorkflowDuration - setWorkflow(Object schedule, Object timezone)

Sets the workflow schedule/timezone. Used for *schedule_type* **workflow_schedule** and *timezone_type* **workflow_timezone**).

Parameters

Name	Type	Description
schedule	Object	The schedule to use. Usually from the workflow *context.schedule*.
timezone	Object	The timezone to use. Usually from the workflow *context.timezone*.

Returns

Type	Description
void

WorkflowModelManager - Global

The *WorkflowModelManager* script include provides methods to query the workflow model, to step backwards and forwards between specified workflow history items, and to query the history for activity and transition-specific information.

The interaction with the *WorkflowModelManager* script include is through the *ActivityHistoryRecord* data object. The *ActivityHistoryRecord* object is an inner class and is only used while interacting with *WorkflowModelManager*.

To acquire the executed history of the workflow activities:

```
var model = new WorkflowModelManager('myContextId');
var activities = model.getExecutedHistory();
```

To output the playback of the workflow:

```
var model = new WorkflowModelManager('myContextId');
model.getExecutedHistory();
model.playBack();
```

At this time, the playBack is required to load the executed transitions. This will also play a role in walking backwards on a model to rollback to a specific activity.

To see the details of the cached model:

```
var model = new WorkflowModelManager('myContextId');
 model.getExecutedHistory();
 model.dump();
```

Related topics

WFActivityHandler - Global

WorkflowModelManager - WorkflowModelManager(String contextId)

Creates a new WorkflowModelManager object (constructor) within the specified context.

Parameters

Name	Type	Description
contextId	String	The ID for the context in which you want the WorkflowModelManager created.

Returns

Type	Description
ActivityHistoryRecord	The ActivityHistoryRecord JavaScript object requested.

```
var model = new WorkflowModelManager('MyContextId');
```

WorkflowModelManager - getActivityHistoryRecordById(String haRecordSysId)

Retrieves the history activity that is cached by the *wf_history.sys_id* provided in the argument.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
haRecordSysId	String	Sys_id of the desired Activity History [wf_history] record.

Returns

Type	Description
ActivityHistoryRecord	Requested ActivityHistoryRecord JavaScript object.

This example shows how to use the method to obtain the specified history activity record.

```
var model = new
 WorkflowModelManager('a71efa6345550110a86630cf9552f3af');  //
 The sys_id of the wf_context
model.getExecutedHistory();
var current_hist_obj =
 model.getActivityHistoryRecordById('2b1efa6345550110a86630cf955
2f3bc'); // The sys_id of the desired record
gs.info(JSON.stringify(current_hist_obj));
```

Output:

```
{
   "sys_id":"2b1efa6345550110a86630cf9552f3bc",
   "index":"3",
   "startTime":1643795456000,

```

WorkflowModelManager - getAllTransitionedIntoActivity(Object description)

Retrieves the history activities that executed and transitioned into the one represented by the *sys_id* in the argument.

The **next** status is based on the *wf_activity.sys_id* associated with the activity represented in the haRecord existing as a TO in a transition associated with any ActivityHistoryRecords that executed in the workflow's history. (This differs from *getPreviousByTransition*, which only returns TO transitions that come before the haRecord in the execution sequence (by time).) The return value is a collection of ActivityHistoryRecords that identify the argument haRecord.wfaId as their TO activity. The return values are based on all transitions in the executed history collection that transition To get the activity that executed prior to this activity in time use *getPreviousByExecutedOrder*.

Parameters

Name	Type	Description
description	Object	ActivityHistoryRecord JavaScript object.

Returns

Type	Description
Object Array	Array of ActivityHistoryRecord JavaScript objects.

WorkflowModelManager - getAllTransitionedIntoActivityId(String haRecordSysId)

Retrieves the history activities that executed and transitioned into the one represented by the *sys_id* in the argument. The *next* status is based on the *wf_activity.sys_id* associated with the activity represented in the haRecord existing as a TO in a transition associated with any ActivityHistoryRecords that executed in the workflow's history. (This differs from *getPreviousByTransition*, which returns only TO transitions that come before the haRecord in the execution sequence (by time).) The return value is a collection of ActivityHistoryRecords that identify the argument haRecord.wfaId as their TO activity.

The *next* status is based on the *wf_activity.sys_id* associated with the activity represented in the haRecord existing as a TO in a transition associated with any ActivityHistoryRecords that executed in the workflow's history. (This differs from *getPreviousByTransition*, which returns only TO transitions that come before the haRecord in the execution sequence (by time).) The return value is a collection of ActivityHistoryRecords that identify the argument haRecord.wfaId as their TO activity.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
haRecordSysId	String	The sys_id of the activity history (table wf_history).

Returns

Type	Description
Object Array	Array of ActivityHistoryRecord JavaScript objects requested.

```
var model = new
 WorkflowModelManager('a143585c3b001000dada82c09ccf3d44');
      model.getExecutedHistory();
      var activity = model.begin;
      gs.print('activity: ' + activity.wfaName + ', transitions:
 ' + activity.transitions.length);
      while( activity != null){
          gs.print('activity: ' + activity.wfaName + ',
 transitions: ' + activity.transitions.length);
          var parents =
 model.getAllTransitionedIntoActivity(activity);
          for( var i = 0; i < parents.length; i++ ){
              gs.print(' ---------------  parent activity: ' +
 parents[i].wfaName );
            }
           activity = model.getNextByExecutedOrder( activity );
      }
```

WorkflowModelManager - getExecutedHistory( )

This is the worker method that must be called to initialize the *WorkflowModelManager* object. In the process of initializing the WorkflowModelManager object, *getExecutedHistory()* creates and populates the *activityHistoryRecord* data object array (which is a member of the *WorkflowModelManager* class). Most *WorkflowModelManager* methods return a subset of the *activityHistoryRecord* array. Your script can then call one or more of the *activityHistoryRecord* methods to accomplish further work.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String Array	An ordered array of sys_ids from table wf_history. It is unlikely client code would use the return value; it is kept internally to this object for use by subsequent method calls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var model = new WorkflowModelManager('myContextId');
var activities = model.getExecutedHistory();
var current =
 model.getActivityHistoryRecordById('d6681d573b130000dada82c09cc
f3d10');
```

WorkflowModelManager - getFinalExecutedActivityList( )

Queries the wf_history table by context and retrieves all the activities executed in the workflow given by the context set in the construction of this object.

This function produces a list of executed activities in the exact order each activity passed through the server side ActivityManager.java using the new activity_index to force the order coming out of the database. On its this call will not give the full picture; it needs to load and map the transitions.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object Array	Array of ActivityHistoryRecord javascript objects.

WorkflowModelManager - getFinalExecutedActivityIdList( )

Gets the list of *wf_history.sys_ids* of all activities that successfully executed and were not rolled back or skipped up to the moment the function was called.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String Array	Array of wf_history.sys_id values for executed activities.

```
var model = new
 WorkflowModelManager('ee3e0a053b101000dada82c09ccf3d7c');
      model.getExecutedHistory();
      var finals = model.getFinalExecutedActivityIdList();
      gs.print(' EXECUTION PATH IDs --------------- : '  +
 finals.length);

      for ( var x = 0; x < finals.length; x++ ) {
          gs.print(finals[x] );
      }
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WorkflowModelManager - getNextByExecutedOrder(Object haRecord)

Retrieves the history activity that executed just after the one provided in the argument.

The *next* status is based on the activity index reflecting the nearest prior activity in time, and not necessarily the nearest next wf_activity that the provided activity transitioned to. To get the nearest next activity that transitioned to this haRecord passed in, use `getNextByTransitionOrder(haRecord).`

Note: In the process of assembling the execution order array, blanks are left in the array where history objects have been deleted. This is done to ensure the index in the array and the activity_index of the object remain in synch. For that reason, all objects coming out of the execution order array should be tested for nil() and not assumed to be the previous record based on activity_index or array index value alone.

Parameters

Name	Type	Description
haRecord	Object	ActivityHistoryRecord JavaScript object.

Returns

Type	Description
Object	The requested ActivityHistoryRecord JavaScript object.

The following example shows how to use the `getNextByExecutedOrder()` method to retrieve the history activity that executed after the specified activity.

```
var model = new
 WorkflowModelManager('34451ec2cb200200d71cb9c0c24c9c66'); //
 Sys_id of the workflow context
model.getExecutedHistory();
var current_hist_obj =
 model.getActivityHistoryRecordById('0199483adba52200a6a2b31be0b
8f562');// Sys_id of the current activity from wf_history table
var next_hist_obj =
 model.getNextByExecutedOrder(current_hist_obj);
gs.info(JSON.stringify(next_hist_obj));
```

Output:

```
{
   "sys_id":"b2c5a06e07e0011094b4fe4f7c1ed049",
   "index":"3",
   "startTime":1640265864000,
   "endTime":1640265864000,
   "wfaId":"64d4e4aa07e0011094b4fe4f7c1ed060",
   "wfaIsParent":{

   },
   "parent":"",
   "wfaName":{

   },
   "adId":"1ca8d7cf0a0a0b265e9a000c2c08248c",
   "adName":{
```

}
```

WorkflowModelManager - getNextByExecutedOrderId(String haRecordSysId)

Retrieves the history activity that is cached by the *wf_history.sys_id* provided in the argument and then calls into *getNextByExecutedOrder()* with the retrieved JavaScript object.

Parameters

Name	Type	Description
haRecordSysId	String	The sys_id of the activity history (table wf_history).

Returns

Type	Description
Object	The ActivityHistoryRecord JavaScript object requested.

```
var model = new
 WorkflowModelManager('7b3e01573b130000dada82c09ccf3dcf');
      model.getExecutedHistory();
      var current =
 model.getActivityHistoryRecordById('d6681d573b130000dada82c09cc
f3d10');
      current.debugDump();

      var results =
 model.getNextByExecutedOrderId(current.sys_id);
      results.debugDump();
```

WorkflowModelManager - getNextByTransitionId(String haRecordSysId)

Retrieves the history activity that executed just after the one identified by the sys_id provided in the argument.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This function retreives the cached history record associated with the provided *wf_history.sys_id* and then calls *getNextByTransition*. The return values are based on which transitions came before the *haRecord* submitted and not necessarily the activities that executed just prior to the *haRecord* in time. To get the activity that executed prior to this activity in time, use *getNextByExecutedOrder*.

Parameters

Name	Type	Description
haRecordSysId	String	Sys_id of the desired Activity History [wf_history] record.

Returns

Type	Description
Object Array	Array of ActivityHistoryRecord JavaScript objects.

```
var model = new
 WorkflowModelManager('7b3e01573b130000dada82c09ccf3dcf');
model.getExecutedHistory();
model.playBack();

var current =
 model.getActivityHistoryRecordById('d6681d573b130000dada82c09cc
f3d10');
current.debugDump();
var results = model.getNextByTransitionId(current.sys_id);
gs.print('COMPLETED NEXT' + results.length );
for(var i = 0; i < results.length; i++){
  results[i].debugDump();
}
```

WorkflowModelManager - getPreviousByExecutedOrder(Object haRecord)

Retrieves the history activity that executed just previous to the one provided in the argument.

The **previous** status is based on the activity index reflecting the nearest prior activity in time and not necessarily the nearest prior activity with a valid transition to this activity. To get the nearest prior activity that transitioned to this haRecord passed in use *getPreviousByTransition(haRecord)*.

Note: In the process of assembling the execution order array, blanks are left in the array where history objects have been deleted. This ensures that the index in the array and the activity_index of the object remain in sync. For that reason, all objects coming out of the execution order array should be tested for nil() and not assumed to be the previous record based on activity_index or array index value.

Parameters

Name	Type	Description
haRecord	Object	ActivityHistoryRecord JavaScript object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	The ActivityHistoryRecord JavaScript object requested.

WorkflowModelManager - getPreviousByExecutedOrderId(String haRecordSysId)

Retrieves the history activity cached by the *wf_history.sys_id* provided in the argument, then calls *getPreviousByExecutedOrder()* with the retrieved JavaScript object.

Parameters

Name	Type	Description
haRecordSysId	String	Workflow history system ID (wf_history.sys_id)

Returns

Type	Description
ActivityHistoryRecord	The ActivityHistoryRecord JavaScript object requested.

```
var model = new WorkflowModelManager('contextId');
      model.getExecutedHistory();
      var current =
 model.getActivityHistoryRecordById('wf_history.sys_id');
      current.debugDump();

      var results =
 model.getPreviousByExecutedOrderId(current.sys_id);
      results.debugDump();
```

WorkflowModelManager - getPreviousByTransition(Object haRecord)

Retrieves the history activities that executed just prior to the one provided in the argument.

The **next** status is based on the wf_activity.sys_id associated with the activity represented in the haRecord existing as a TO in a transition associated with any ActivityHistoryRecords that come before the haRecord in the execution sequence. (This differs from *getAllTransitionedIntoActivity*, which returns all TO transitions up to the given haRecord in the execution sequence .) The return value is a collection of ActivityHistoryRecords that identify the argument haRecord.wfaId as their TO activity. The return values are based on which transitions came before the haRecord submitted and not necessarily the activities that executed just prior to the haRecord in time. To get the activity that executed prior to this activity in time, use *getPreviousByExecutedOrder*.

Parameters

Name	Type	Description
haRecord	Object	ActivityHistoryRecord JavaScript object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object Array	Array of ActivityHistoryRecord JavaScript objects requested.

WorkflowModelManager - getPreviousByTransitionId(String haRecordSysId)

Retrieves the history activities that executed just prior to the one provided in the argument.

The *next* status is based on the *wf_activity.sys_id* associated with the activity represented in the haRecord existing as a TO in a transition associated with any ActivityHistoryRecords that come before the haRecord in the execution sequence. The return value is a collection of ActivityHistoryRecords that identify the argument haRecord.wfaId as their TO activity. The return values are based on which transitions came before the haRecord sumbitted and not necessarily the activities that executed just prior to the haRecord in time. To get the activity that executed prior to this activity in time use *getPreviousByExecutedOrder()*.

Parameters

Name	Type	Description
haRecordSysId	String	Sys_id of the activity history. Located in the wf_history table.

Returns

Type	Description
Object	Array of ActivityHistoryRecord JavaScript objects requested.

The following example shows how to use the *getPreviousByTransitionId()* method to obtain ActivityHistoryRecord objects.

```
var w_history = new GlideRecord('wf_history');
w_history.addQuery('context.id',
 '089ebdad1b420110c97a40c6cc4bcbf7'); // Pass sys_id of record
 -> Requested Item / Change Request / Request, etc....
w_history.query();
if (w_history.next()) {
    var model = new WorkflowModelManager(w_history.context); //
 Call sys_id of the workflow context
    model.getExecutedHistory();
    var previousObje_hist_obj =
 model.getPreviousByTransitionId(w_history.sys_id); // Sys_id of
 wf_history table
    gs.info(JSON.stringify(previousObje_hist_obj));
}
```

Output:

```
[
  {
    "sys_id": "a40a92950721011094b4fe4f7c1ed05e",
    "index": "1",
    "startTime": 1644255752000,
    "endTime": 1644255758000,
    "wfaId": "28200e2a77873300b473455caa1061cd",
```

WorkflowModelManagerAjax - Global

The *WorkflowModelManagerAjax* script include provides an AjaxProcessor wrapper for the *WorkflowModelManager* script include. This class derives from *AbstractAjaxProcessor*.

Use this class in the Workflow Debug context menus.

WorkflowModelManagerAjax - getExecutedHistory( )

Puts the execution history into the return parameter based on the query string.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

WorkflowModelManagerAjax - getFinalExecutedActivityIdList( )

Returns the final execution activity list based on a query string.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

This example shows how to obtain the sys_ids of an executed activity list.

```
var model = new WorkflowModelManagerAjax(); // Initiate the
 class

  model.getParameter = function(paramName) {
    return {
       sysparm_key_id: "0213a4a607e0011094b4fe4f7c1ed0e2", //
 sys_id of workflow context
       sysparm_key_table: 'wf_context'
    }[paramName];
  } // Override the parameters while calling from server side

  model.getExecutedHistory();
  var finals = model.getFinalExecutedActivityIdList(); // Get
 the list of IDs
  finals = JSON.parse(finals);
  var finalarrofID = finals.ids;
    for ( var x = 0; x < finalarrofID .length; x++ ) {
      gs.print(JSON.stringify(finalarrofID[x]) ); // Print the
 sys_ids of workflow history records
    }
```

Output:

```
WorkflowModelManagerAjax: creating new WorkflowModelManager for
 context=0213a4a607e0011094b4fe4f7c1ed0e2
WorkflowModelManagerAjax: returning 4 ActivityHistoryRecords
WorkflowModelManagerAjax: returning 4 activities  in execution
 path for 0213a4a607e0011094b4fe4f7c1ed0e2
*** Script: "0a13a4a607e0011094b4fe4f7c1ed0e3"
*** Script: "d61368a607e0011094b4fe4f7c1ed027"
*** Script: "de1368a607e0011094b4fe4f7c1ed02b"
*** Script: "961368a607e0011094b4fe4f7c1ed02f"
```

WorkflowModelManagerAjax - getRolledBackActivityIdList( )

Puts the rollback activity list into the return parameter based on the query string.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WorkflowScheduler - Global

The *WorkflowScheduler* script include provides a method to start a workflow.

This code is executed in the business rule "Set workflow scheduler script" on the Workflow Schedule [wf_workflow_schedule] table.

WorkflowScheduler - run( )

Starts the workflow specified in current, which is a record in the Workflow Schedule [wf_workflow_schedule] table.

This method is called from the Business Rule Set "workflow scheduler script" on the wf_workflow_schedule table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

WorkflowTimeline - Global

The *WorkflowTimeline* script include provides methods to generate a view that shows a workflow context on the timeline.

WorkflowTimeline-getItems()

Generates the Ajax response for the timeline.

This method is called by the Prototype JavaScript Framework. See the *AbstractTimelineSchedulePage* script include for more details.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

XMLDocument2 - Scoped, Global

The *XMLDocument2* API is a JavaScript object wrapper for parsing and extracting XML data from an XML string.

Use this JavaScript class to create an object from an XML string, usually a return value from a web-service invocation, or the XML payload of ECC Queue. Using the XMLDocument2 object in a JavaScript business rule lets you query values from the XML elements and attributes directly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An XML string has a tree structure, and the parts of the structure are called nodes. An XMLDocument2 object deals with two node types, element, and document element. An element node is a node with a name and possibly attributes and child nodes. A document-element node is the root node of the XML tree. It is the only node without a parent node.

Note: This API works for scoped or global applications.

Scoped XMLDocument2 - XMLDocument2()

Creates an XMLDocument2 object.

Parameters

Name	Type	Description
None		

Scoped XMLDocument2 - XMLDocument2(GlideScriptableInputStream inputStream)

Creates an XMLDocument2 object from an attachment stream.

Parameters

Name	Type	Description
inputStream	GlideScriptableInputStream	The input stream the XMLDocument2 object encapsulates.

Scoped XMLDocument2 - createElement(String name)

Creates and adds an element node to the current node. The element name is the string passed in as a parameter. The new element has no text child nodes.

Parameters

Name	Type	Description
name	String	The new element's name.

Returns

Type	Description
XMLNode	Current XML node.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
xmlDoc.createElement("new2");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info(xmlDoc);
```

Output:

```
?xml version="1.0" encoding="UTF-8"?>
<test>
    <one>
        <two att="xxx">abcd1234</two>
            <three att="yyy" boo="yah">1234abcd</three>
        <two>another</two>
    </one>
    <number>1234</number>
    <new2></new2>
</test>
```

Scoped XMLDocument2 - createElementWithTextValue(String name, String value)

Creates and adds an element node with a text child node to the current node.

Parameters

Name	Type	Description
name	String	Name of the element to add.
value	String	Element's text value.

Returns

Type	Description
XMLNode	Current XML node.

```
var xmlString = "<test>" +
    "  <one>" +
    "    <two att=\"xxx\">abcd1234</two>" +
    "    <three boo=\"yah\" att=\"yyy\">1234abcd</three>" +
    "    <two>another</two>" +
    "  </one>" +
    "  <number>1234</number>" +
    "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
xmlDoc.createElementWithTextValue("new", "test");
gs.info(xmlDoc);
```

Output:

```
<?xml version="1.0" encoding="UTF-8"?>
    <test>
        <one>
            <two att="xxx">abcd1234</two>
            <three att="yyy" boo="yah">1234abcd</three>
            <two>another</two>
        </one>
        <number>1234</number>
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        <new>test</new>
    </test>
```

Scoped XMLDocument2 - getDocumentElement()

Gets the document element node of the XMLdocument2 object. The document element node is the root node.

Parameters

Name	Type	Description
None		

Returns

Type	Description
XMLNode	The document element.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
//returns the root node of the document tree.
var rootNode = xmlDoc.getDocumentElement();
gs.info(rootNode.getTextContent());
```

Output:

```
abcd1234    1234abcd    another    1234
```

Scoped XMLDocument2 - getFirstNode(String xPath)

Gets the first node in the specified xPath.

This method only supports a subset of predicate xPath expressions. For example, assume the following document:

```
<store>
    <resources company="ABC Inc">
        <resources type="servers" />
    </resources>
    <resources company="XYZ Inc">
        <resource type="bookstore">
            <book>
                <title>Windows</title>
                <price>10</price>
            </book>
            <book year="2009">
                <title>Harry Potter</title>
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                <price>50</price>
            </book>
            <book year="1999">
                <title>Learning XML</title>
                <price>120</price>
            </book>
            <book year="2019">
                <title>Learning Java</title>
                <price>99</price>
            </book>
        </resource>
    </resources>
</store>
```

This method supports the following xPath expressions with predicates:

```
"/store/resources/resource[@type='bookstore']/book[@year='1999'
]",
"/store/resources/resource[@type='bookstore']/book[@year]",
"/store/resources/resource[@type='bookstore']/book[price >
 100]"
```

However, it does not support the following xPath expressions with predicates:

```
"/store/resources/resource[@type='bookstore']/book[2]",
"/store/resources/resource[@type='bookstore']/book[last()]",
"/store/resources/resource[@type='bookstore']/book[position()>
2]"
```

To work around this, use xPath without predicates, such as `"/store/resources/resource[@type='bookstore']/book")` and then filter the nodes in the script using the *`getFirstNode()`* and *`getNextNode()`* methods.

Parameters

Name	Type	Description
xPath	String	The xPath to obtain the node from.

Returns

Type	Description
XMLNode	The first node.

```
var xmlString = "<test>" +
  "  <one>" +
  "    <two att=\"xxx\">abcd1234</two>" +
  "    <three boo=\"yah\" att=\"yyy\">1234abcd</three>" +
  "    <two>another</two>" +
  "  </one>" +
  "  <number>1234</number>" +
  "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
var foo = xmlDoc.getFirstNode('/test/one/two');
gs.info(foo.getTextContent());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
abcd1234
```

Scoped XMLDocument2 - getNextNode(Object current)

Gets the node after the specified node.

Parameters

Name	Type	Description
current	Object	The current node.

Returns

Type	Description
XMLNode	The next node.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
var foo = xmlDoc. getFirstNode('/test/one/two');
var foo2 = xmlDoc.getNextNode(foo);
gs.info(foo.getTextContent());
gs.info(foo2.getTextContent());
```

Output:

```
abcd1234

another
```

Scoped XMLDocument2 - getNode(String xPath)

Gets the node specified in the xPath.

Note: This method is intended for use with small documents since it parses the entire document to match the xPath expression. If the document is too large, an out of memory error may occur. For large documents, use the *getFirstNode(String xPath)* and *getNextNode(Object current)* methods, which are designed to stream through the document without parsing the entire document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
xPath	String	xPath of the node to obtain.

Returns

Type	Description
XMLNode	Current XML node.

```
/*
 * Checks if given node indeed of given tag.
 * Params:
 *  tag - String, name of tag to check
 *  node - XMLNode, node in which to check for the tag
 * Returns:
 *  true, if tag is present
 *  false, otherwise
 */
function isNodeOfTag (node, tag) {
  try {
    if (tag == node.getNodeName()) {
      gs.info("Given node belongs to tag " + tag);
      return true;
    }
  } catch (error) {
    gs.error("Given node might not belong to tag " + tag + ".
 Error while checking: " + error);
    return false;
  }
}

var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";

var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);

var node = xmlDoc.getNode("/test/one/two"); // tag 'two' is
 present in this XML.
isNodeOfTag(node, "two");

var node = xmlDoc.getNode("/test/one/four"); // tag 'four' is
 not present in this XML.
isNodeOfTag(node, "four");
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Given node belongs to tag two
Given node might not belong to tag four. Error while checking:
 java.lang.NullPointerException
```

Scoped XMLDocument2 - getNodeText(String xPath)

Gets all the text child nodes from the node referenced in the specified XPath.

Parameters

Name	Type	Description
xPath	String	XPath of the text to obtain.

Returns

Type	Description
String	Text children in the XPath.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
gs.info(xmlDoc.getNodeText("//two"));
```

Output:

```
abcd1234
```

Scoped XMLDocument2 - parseXML(String xmlDoc)

Parses the XML string and loads it into the XMLDocument2 object.

Parameters

Name	Type	Description
xmlDoc	String	The document to parse.

Returns

Type	Description
Boolean	Flag that indicates whether the content was parsed.

This example parses the xmlString and loads it into the xmlDocument2 object.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
var rootNode = xmlDoc.getDocumentElement();
```

Scoped XMLDocument2 - setCurrentElement(XMLNode element)

Makes the node passed in as a parameter the current node.

Parameters

Name	Type	Description
element	XMLNode	The element node to set as the current node.

Returns

Type	Description
void	

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
//returns the root node of the document tree.
var rootNode = xmlDoc.getDocumentElement(); //returns
 org.w3c.dom.Element
// sets the root node as the current element
xmlDoc.setCurrentElement(rootNode);
```

Scoped XMLDocument2 - setEnableCDATAReporting(Boolean enable)

Sets whether nodes are treated as CDATA or regular text after parsing. CDATA reporting is deactivated by default.

This method must be called with Scoped XMLDocument2 - parseXML(String xmlDoc).

See also: Scoped XMLNode - isCDATANode().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
enable	Boolean	Flag that indicates whether to handle CDATA nodes as CDATA or regular text nodes. Valid values: • true: Enable CDATA reporting. • false: Handle CDATA nodes as regular text nodes after parsing and concatenate it with the adjacent text. Default: False

Returns

Type	Description
None	

The following example shows how CDATA is parsed in an element with CDATA reporting activated. The result of *`content.getFirstChild()`* is an element that holds the text value `another`. This element internally contains the information identifying it as a CDATA type. The result of *`content.getLastChild()`* is an element that holds the text value `element`. This element internally contains the information as a text type.

```
var xmlString = "<test>" +
  "  <one>" +
  "    <three boo=\"yah\" att=\"yyy\">1234abcd</three>" +
  "    <two><![CDATA[another]]>element</two>" +
  "  </one>" +
  "  <number>1234</number>"
  "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.setEnableCDATAReporting(true); // Enable CDATA reporting
xmlDoc.parseXML(xmlString);
var content = xmlDoc.getFirstNode('/test/one/two');
gs.info(content.getFirstChild().getTextContent()); // prints
 "another"
gs.info(content.getLastChild().getTextContent()); // prints
 "element"
```

Output:

```
another
element
```

Note: Without CDATA reporting activated in the example, the entire child concatenates the CDATA as text with the rest of the text (`element`) in each line as follows:

```
anotherelement
anotherelement
```

Scoped XMLDocument2 - setNamespaceAware(Boolean aware)

When set to true, the XMLDocument2 object processes the document with XML namespaces.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you don't set this, an XML document with namespaces won't be enumerated correctly, and an XPath search would fail.

Parameters

Name	Type	Description
aware	Boolean	When true, the XMLDocument2 object processes the document with XML namespaces.

Returns

Type	Description
void	

Scoped XMLDocument2 - toString()

Returns a string containing the XML.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	A string containing the XML.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
gs.info(xmlDoc.toString());
```

Output - Line breaks were added to the output for readability.

```
<?xml version="1.0" encoding="UTF-8"?>
<test>
<one>
<two att="xxx">abcd1234</two>
<three att="yyy" boo="yah">1234abcd</three>
<two>another</two>
</one>
<number>1234</number>
</test>
```

XMLNode - Scoped, Global

The *XMLNode* API provides methods to query values from XML nodes. XMLNodes are extracted from XMLDocument2 objects, which contain XML strings.

There are no constructors for creating a stand alone instance of an XMLNode object. Instead, use the *createElement()* method of XMLDocument2, which adds a node to an existing document.

Scoped XMLNode - getAttribute(String attribute)

Gets the value of the attribute.

Parameters

Name	Type	Description
attribute	String	Name of the attribute.

Returns

Type	Description
String	The attribute's value.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
var node = xmlDoc.getNode('//two');
gs.info(node.getAttribute('att'));
```

Output:

```
xxx
```

Scoped XMLNode - getAttributes()

Returns an object containing the node's attributes as properties with values.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Contains name-value pairs where the name is the attribute and the value is the attribute's value.

Scoped XMLNode - getChildNodeIterator()

Gets a XMLNodeIterator object that can be used to walk through the list of child nodes.

Parameters

Name	Type	Description
None		

Returns

Type	Description
XMLNodeIterator	The node iterator object.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
var node = xmlDoc.getNode('//one');
var iter= node.getChildNodeIterator();
gs.info(iter.hasNext());
```

Scoped XMLNode - getFirstChild()

Gets the node's first child node.

Parameters

Name	Type	Description
None		

Returns

Type	Description
XMLNode	The node's first child node.

```
var xmlString = "<test>" +
                "<one>" +
                "<two att=\"xxx\">abcd1234</two>" +
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                "<three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "<two>another</two>" +
                "</one>" +
                "<number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
var node = xmlDoc.getNode('//one');
gs.info(node.getFirstChild());
```

Output:

```
<two att="xxx">abcd1234</two>
```

Scoped XMLNode - getLastChild()

Gets the node's last child node.

Parameters

Name	Type	Description
None		

Returns

Type	Description
XMLNode	The node's last child.

```
var xmlString = "<test>" +
                "<one>" +
                "<two att=\"xxx\">abcd1234</two>" +
                "<three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "<two>another</two>" +
                "</one>" +
                "<number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
var node = xmlDoc.getNode('//one');

gs.info(node.getLastChild());
```

Output:

```
<two>another</two>
```

Scoped XMLNode - getNodeName()

Gets the node's name. A node's name is determined by the node type. A document-element node's name is #document. A text node's name is #text. An element node's name is the element's name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The node's name.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
var node = xmlDoc.getNode('//two');
gs.info(node.getNodeName());
```

Output:

```
two
```

Scoped XMLNode - getNodeValue()

Gets the node's value. A node's value is determined by the node type. Element and document-element nodes return null.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The node's value.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
xmlDoc.parseXML(xmlString);
var node = xmlDoc.getNode('//two');
gs.info(node.getNodeValue());
```

Output:

```
null
```

Scoped XMLNode - getTextContent()

Gets the text content of the current node. The text content of a node consists of all the node's child text nodes

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The text content of the current node.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmldoc = new XMLDocument2();
xmldoc.parseXML(xmlString);
var node = xmldoc.getNode('//one/two');
gs.info(node.getTextContent());
```

Output:

```
abcd1234
```

Scoped XMLNode - hasAttribute(String attribute)

Determines if the node has the specified attribute.

Parameters

Name	Type	Description
attribute	String	The name of the attribute to check.

Returns

Type	Description
Boolean	True if the node has the attribute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
var node = xmlDoc.getNode('//two');
gs.info(node.hasAttribute('att'));
```

Output:

```
true
```

Scoped XMLNode - isCDATANode()

Indicates whether the CDATA node is preserved as a separate node.

Use the Scoped XMLDocument2 - setEnableCDATAReporting(Boolean enable) method to ensure that CDATA nodes are preserved and not handled as text.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether a queried node is CDATA or plain text. Valid values: • true: The node queried is CDATA. • false: The node queried is plain text.

The following example shows how to parse an XML string with CDATA reporting enabled using Scoped XMLDocument2 - setEnableCDATAReporting(Boolean enable). The code uses *`isCDATANode()`* to show that the first node queried in the XML string is a CDATA node.

```
var xmlString = "<test>" +
  "  <one>" +
  "    <two att=\"xxx\">abcd1234</two>" +
  "    <three boo=\"yah\" att=\"yyy\">1234abcd</three>"+
  "    <four><![CDATA[another]]>element</four>" +
  "  </one>" +
  "  <number>1234</number>" +
  "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.setEnableCDATAReporting(true); // Enables CDATA reporting
xmlDoc.parseXML(xmlString);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var content = xmlDoc.getFirstNode('/test/one/four');
gs.info(content.getFirstChild().isCDATANode());
```

Output:

```
true
```

Scoped XMLNode - toString()

Returns the string value of the current node.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The string value of the current node.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
var node = xmlDoc.getNode('//one');
gs.info(node.toString());
```

Output: Line breaks were added to the output.

```
<one>
<two att="xxx">abcd1234</two>
<three att="yyy" boo="yah">1234abcd</three>
<two>another</two>
</one>
```

XMLNodeIterator - Scoped

The *XMLNodeIterator* API provides methods to iterate through a node of a XML document.

There are no constructors for creating a stand alone instance of a XMLNodeIterator object. To create a XMLNodeIterator object use the *getChildNodeIterator()* method of the XMLNode object.

XMLNodeIterator - hasNext()

Returns true if the iteration has more elements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the iteration has more elements.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
var node = xmlDoc.getNode('//one');
var iter= node.getChildNodeIterator();
gs.info(iter.hasNext());
```

XMLNodeIterator - next()

Gets the next element in the iteration. The returned element may be a #text node for the spaces/tabs if XML is "pretty formatted".

Parameters

Name	Type	Description
None		

Returns

Type	Description
XMLNode	The next element in the iteration.

```
var xmlString = "<test>" +
                "  <one>" +
                "    <two att=\"xxx\">abcd1234</two>" +
                "    <three boo=\"yah\"
 att=\"yyy\">1234abcd</three>" +
                "    <two>another</two>" +
                "  </one>" +
                "  <number>1234</number>" +
                "</test>";
var xmlDoc = new XMLDocument2();
xmlDoc.parseXML(xmlString);
var node = xmlDoc.getNode('//one');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var iter= node.getChildNodeIterator();
while(iter.hasNext()) {
   var n = iter.next();
   gs.info('Node name: ' +  n.getNodeName());
   gs.info('Node value: ' +  n.getNodeValue());
}
```

Output:

```
Node name: #text
Node value:
Node name: two
Node value: null
Node name: #text
Node value:
Node name: three
Node value: null
Node name: #text
Node value:
Node name: two
Node value: null
Node name: #text
Node value:
```

XMLStreamingAPI - Scoped

Builds a large streaming XML payload for use in a REST or SOAP request to send bulk data to a third-party API. You can also create the payload as an XML string for a non-streaming option.

Use these methods in a Workflow Studio Script step with the `sn_ih` namespace identifier. For example, you can use this API to create an XML payload in the Workflow Studio Script step and pass the returned value to the REST step to send the request to a third-party service. For more information, see the Workflow Studio Script step.

Note: You can only use this API within the Workflow Studio environment.

There is no constructor for this class. Instead, you must call the *`build()`* method in the XMLStreamingBuilder class to return an XMLStreamingAPI object.

API call order

Generate XML payloads by first instantiating a builder object with *`XMLStreamingBuilder`* and then calling the methods in the *`XMLStreamingAPI`* class:

1. *`XMLStreamingBuilder`*: **Creates a builder object**

   Use these method in the following order to create a builder object:

   1. *`XMLStreamingBuilder()`*: Instantiates the XMLStreamingBuilder object.
   2. *`withAttachment()`*: Optional. Creates an XML document as an attachment and stores it in the Streaming Attachments [streaming_attachment] table. If you don't call this method, the API builds the payload as an XML string.
   3. *`expiresAt()`*: Optional. Sets a time when the attachment expires. False is the default. Must also call the *`withAttachment()`* method.
   4. *`build()`*: Returns an XMLStreamingAPI object.

2. *`XMLStreamingAPI`*: **Builds the XML payload**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use these methods in the following order to create the XML payload:

1. `startDocument()`: Creates the top-level parent element in the XML document.
2. Methods to generate child elements in the XML document, such as `writeTextElement()`, `startElement()`, and `writeArray()`.
3. Methods to generate attributes for an element, such as `writeAttribute()`, `writeNamespace()`, and `writeDtd()`.
4. `endElement()`: Closes an XML element.
5. `endDocument`: Closes the top-level parent element.
6. `getXMLString()` or `getAttachmentId()`: Returns the XML string or attachment ID that you created.
7. `close()`: Closes the XMLStreamingAPI object.

Size limits

Payloads generated through this API cannot exceed these size limits:

- Attachments: 200 MB
- Strings: 5 MB

The following example shows how to create an XML document and store it in the Streaming Attachments [streaming_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.XMLStreamingBuilder()
    .withAttachment() // Creates the XML document in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the XMLStreamingAPI object.

  builder.startDocument("Employee") // Begins generating the XML
 document.
    .writeTextElement("firstName","John") // Writes a
 "firstName" element and value.
    .writeTextElement("lastName","Smith")
    .writeTextElement("age","25")
    .startElement("address") // Adds an "address" parent
 element.
      .writeTextElement("streetAddress", "21 2nd Street") //
 Writes a child element and value.
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement() // Adds a closing tag for the "address"
 element.
    .startElement("phoneNumber")
      .writeTextElement("type","home")
      .writeTextElement("number","212 555-1234")
      .writeTextElement("type","fax")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      .writeTextElement("number","646 555-4567")
    .endElement()
  .endDocument() // Stops generating the XML document.

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
} catch (err) {
  gs.log(err);
} finally {
  builder.close();
}
```

Alternatively, this example shows how to use the API in the Script step and create the payload as an XML string. You can use this option to create payloads under 5 MB.

```
(function execute(inputs, outputs) {

  var builder = new sn_ih.XMLStreamingBuilder().build();

  builder.startDocument("Employee")
    .enablePrettyPrint()
    .writeTextElement("firstName","John")
    .writeTextElement("lastName","Smith")
    .writeTextElement("age","25")
    .startElement("address")
      .writeTextElement("streetAddress", "21 2nd Street")
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement()
    .startElement("phoneNumber")
      .writeTextElement("type","home")
      .writeTextElement("number","212 555-1234")
      .writeTextElement("type","fax")
      .writeTextElement("number","646 555-4567")
    .endElement()
  .endDocument()

  outputs.payload = builder.getXMLString();

})(inputs, outputs);
```

Output:

```
<?xml version="1.0" encoding="UTF-8"?>
<firstName>John</firstName>
<lastName>Smith</lastName>
<age>25</age>
<address>
  <streetAddress>21 2nd Street</streetAddress>
  <city>Santa Clara</city>
  <state>CA</state>
  <postalCode>11111</postalCode>
</address>
<phoneNumber>
  <type>home</type>
  <number>212 555-1234</number>
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  <type>fax</type>
  <number>646 555-4567</number>
</phoneNumber>
```

XMLStreamingAPI - close()

Closes the XMLStreamingAPI object. You must call this method to close the stream after building your XML document.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

Example

The following example shows how to create an XML document and store it in the Streaming Attachments [streaming_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.XMLStreamingBuilder()
    .withAttachment() // Creates the XML document in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the XMLStreamingAPI object.

  builder.startDocument("Employee") // Begins generating the XML
 document.
    .writeTextElement("firstName","John") // Writes a
 "firstName" element and value.
    .writeTextElement("lastName","Smith")
    .writeTextElement("age","25")
    .startElement("address") // Adds an "address" parent
 element.
      .writeTextElement("streetAddress", "21 2nd Street") //
 Writes a child element and value.
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement() // Adds a closing tag for the "address"
 element.
    .startElement("phoneNumber")
      .writeTextElement("type","home")
      .writeTextElement("number","212 555-1234")
      .writeTextElement("type","fax")
      .writeTextElement("number","646 555-4567")
    .endElement()
```

```
  .endDocument() // Stops generating the XML document.

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
} catch (err) {
  gs.log(err);
} finally {
  builder.close();
}
```

XMLStreamingAPI - disablePrettyPrint()

Ends pretty print XML formatting.

Before calling this method, you must first call *`enablePrettyPrint()`* to add XML formatting to a section.

Parameters

Name	Type	Description
None		

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

The following example shows how to add pretty print formatting to the `address` element.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.XMLStreamingBuilder()
    .withAttachment()
    .expiresAt(ttl)
    .build();

  builder.startDocument("Employee")
    .writeTextElement("firstName","John")
    .writeTextElement("lastName","Smith")
    .writeTextElement("age","25")
    .enablePrettyPrint()
    .startElement("address")
      .writeTextElement("streetAddress", "21 2nd Street")
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement()
    .disablePrettyPrint()
    .startElement("phoneNumber")
      .writeTextElement("type","home")
      .writeTextElement("number","212 555-1234")
      .writeTextElement("type","fax")
      .writeTextElement("number","646 555-4567")
    .endElement()
  .endDocument()
```

```
  gs.log(builder.getAttachmentId());
} catch (err) {
  gs.log(err);
} finally {
  builder.close();
}
```

XMLStreamingAPI - enablePrettyPrint()

Adds pretty print formatting to an XML element or tree of elements.

Use the *`disablePrettyPrint()`* method to end the formatting.

Parameters

Name	Type	Description
None		

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

The following example shows how to add pretty print formatting to the `address` element.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.XMLStreamingBuilder()
    .withAttachment()
    .expiresAt(ttl)
    .build();

  builder.startDocument("Employee")
    .writeTextElement("firstName","John")
    .writeTextElement("lastName","Smith")
    .writeTextElement("age","25")
    .enablePrettyPrint()
    .startElement("address")
      .writeTextElement("streetAddress", "21 2nd Street")
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement()
    .disablePrettyPrint()
    .startElement("phoneNumber")
      .writeTextElement("type","home")
      .writeTextElement("number","212 555-1234")
      .writeTextElement("type","fax")
      .writeTextElement("number","646 555-4567")
    .endElement()
  .endDocument()

  gs.log(builder.getAttachmentId());
} catch (err) {
  gs.log(err);
} finally {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  builder.close();
}
```

XMLStreamingAPI - endDocument()

Ends the structure of your XML document.

After calling the *startDocument()* method and organizing your streaming XML document, call the *endDocument()* method at the end of your document's structure. You must use these two methods together to successfully build your streaming XML document's structure.

Parameters

Name	Type	Description
None		

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

The following example shows how to create an XML document containing elements about a user.

```
try {
    var ttl = new GlideDateTime('2011-01-01 12:00:00');
    var builder = new
 sn_ih.XMLStreamingBuilder().withAttachment().expiresAt(ttl);
    var streamingDocument = builder.build();

    streamingDocument.startDocument('Employee')
        .writeTextElement('firstName', 'John')
        .writeTextElement('lastName', 'Smith')
        .writeTextElement('age', '25')
        .endDocument();
    gs.log(streamingDocument.getAttachmentId());
} catch (err) {
    gs.log(err);
} finally {
    streamingDocument.close();
}
```

XMLStreamingAPI - endElement()

Adds a closing tag to an XML element.

Use the following methods in this sequence to create a valid XML element:

1. Use the *startElement()* method to add a starting tag.
2. Use the *endElement()* method to add the closing tag.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

The following example shows how to build a parent element named `address` and then write four child elements.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.XMLStreamingBuilder()
    .withAttachment()
    .expiresAt(ttl)
    .build();

  builder.startDocument("Employee")
      .startElement("address")
      .writeTextElement("streetAddress", "21 2nd Street")
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement()
  .endDocument()

  gs.log(builder.getAttachmentId());
} catch (err) {
  gs.log(err);
} finally {
  builder.close();
}
```

XMLStreamingAPI - getXMLString()

Returns the XML document as a string.

To return the XML document as a string, don't call the *`getAttachementId()`* method in the *`XMLStreamingBuilder`* class. For more information, see XMLStreamingBuilder - Scoped.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	XML document created using the *`XMLStreamingAPI`* methods, as a string.

The following example shows how to create an XML document and then return it as a string.

```
(function execute(inputs, outputs) {

  var builder = new sn_ih.XMLStreamingBuilder().build();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  builder.startDocument("Employee")
    .enablePrettyPrint()
    .writeTextElement("firstName","John")
    .writeTextElement("lastName","Smith")
    .writeTextElement("age","25")
    .startElement("address")
      .writeTextElement("streetAddress", "21 2nd Street")
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement()
    .startElement("phoneNumber")
      .writeTextElement("type","home")
      .writeTextElement("number","212 555-1234")
      .writeTextElement("type","fax")
      .writeTextElement("number","646 555-4567")
    .endElement()
  .endDocument()

  outputs.payload = builder.getXMLString();

})(inputs, outputs);
```

Output:

```
<?xml version="1.0" encoding="UTF-8"?>
<firstName>John</firstName>
<lastName>Smith</lastName>
<age>25</age>
<address>
  <streetAddress>21 2nd Street</streetAddress>
  <city>Santa Clara</city>
  <state>CA</state>
  <postalCode>11111</postalCode>
</address>
<phoneNumber>
  <type>home</type>
  <number>212 555-1234</number>
  <type>fax</type>
  <number>646 555-4567</number>
</phoneNumber>
```

XMLStreamingAPI - startDocument(String rootElement, Object namespaceDefinitionMap)

Begins building an XML document.

After calling the *`build()`* method, call the *`startDocument()`* method to start organizing your XML document. You must also call the *`endDocument`* method at the end of your document's structure.

Parameters

Name	Type	Description
rootElement	String	Optional. Root element, or top-level parent element, for your XML document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
namespaceDefinitionMap	Object	Optional. Map of keys and values for the namespaces and their associated values in a subsequent list of elements. For example: `{ 'namespaceOne':'namespaceValue', 'namespaceTwo':'namespaceValue' }`

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

The following example shows how to create an XML document containing elements with information about an employee.

```
try {
    var ttl = new GlideDateTime('2011-01-01 12:00:00');
    var builder = new
 sn_ih.XMLStreamingBuilder().withAttachment().expiresAt(ttl);
    var streamingDocument = builder.build();

    streamingDocument.startDocument('Employee')
        .writeTextElement('firstName', 'John')
        .writeTextElement('lastName', 'Smith')
        .writeTextElement('age', '25')
        .endDocument();
    gs.log(streamingDocument.getAttachmentId());
} catch (err) {
    gs.log(err);
} finally {
    streamingDocument.close();
}
```

XMLStreamingAPI - startElement(String name, Object namespaceMap, Object attributeMap, String prefix)

Adds a starting tag for an XML element.

Use the following methods in this sequence to create a valid XML element:

1. Use the *`startElement()`* method to add a starting tag.
2. Use the *`endElement()`* method to add the closing tag.

Parameters

Name	Type	Description
name	String	Name of the XML element.
namespaceMap	Object	Optional. Map of keys and values for the namespaces and their associated values in a subsequent list of elements. For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`{ 'namespaceOne':'namespaceValue', 'namespaceTwo':'namespaceValue' }`
attributeMap	Object	Optional. Map of keys and values for the attributes and their associated values in a subsequent list of elements.
prefix	String	Optional. Prefix for the XML element.

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

The following example shows how to build a parent element named *address* and then write four child elements.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.XMLStreamingBuilder()
    .withAttachment()
    .expiresAt(ttl)
    .build();

  builder.startDocument("Employee")
      .startElement("address")
      .writeTextElement("streetAddress", "21 2nd Street")
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement()
  .endDocument()

  gs.log(builder.getAttachmentId());
} catch (err) {
  gs.log(err);
} finally {
  builder.close();
}
```

XMLStreamingAPI - writeArray(String elementName, Array data, String wrappingElement)

Adds a list of nested elements with predefined text to your streaming XML document.

After calling the *startDocument()* method, you can call the *writeArray()* method to add a block of nested elements to your streaming XML document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
elementName	String	Name of the XML element associated with each string listed in the *data* array.
data	Array	List of values to assign to each element nested inside *wrappingElement*.
wrappingElement	String	Parent element containing each *elementName*.

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

The following example shows how to build a parent element named `officeLocations`, and then nest an array of five `city` elements.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.XMLStreamingBuilder()
    .withAttachment()
    .expiresAt(ttl)
    .build();

  builder.startDocument("Employee")
      .writeArray('city', ['Santa Clara','San
 Diego','Chicago','Sydney','London'], 'officeLocations')
  .endDocument()

  gs.log(builder.getAttachmentId());
} catch (err) {
  gs.log(err);
} finally {
  builder.close();
}
```

XMLStreamingAPI - writeAttribute(String name, String value)

Adds an attribute to an element in your XML document.

After calling the *startDocument()*, *startElement()*, or *writeTextElement()* method, you can call the *writeAttribute()* method to add an attribute to the associated XML element.

Parameters

Name	Type	Description
name	String	Name of the XML element's attribute.
value	String	Value for the XML element's attribute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

This example adds an attribute named *idNumber* to the *employee* element.

```
try {
    var ttl = new GlideDateTime('2011-01-01 12:00:00');
    var builder = new
 sn_ih.XMLStreamingBuilder().withAttachment().expiresAt(ttl);
    var streamingDocument = builder.build();

    streamingDocument.startDocument('Employee')
    .writeAttribute('idNumber','12345')
        .writeTextElement('firstName', 'John')
        .writeTextElement('lastName', 'Smith')
        .writeTextElement('age', '25')
    .endDocument();
    gs.log(streamingDocument.getAttachmentId());
} catch (err) {
    gs.log(err);
} finally {
    streamingDocument.close();
}
```

XMLStreamingAPI - writeAttributes(Object attributeMap)

Adds attributes to an element in your XML document.

After calling the *startDocument()*, *startElement()*, or *writeTextElement()* method, you can call the *writeAttributes()* method to add attributes to the associated XML element.

Parameters

Name	Type	Description
attributeMap	Object	Map of keys and values containing attribute names and values to associate with the XML element. For example: `{ 'attributeOne':'attributeValue', 'attributeTwo':'attributeValue' }`

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

This example adds attributes named *idNumber*, *officeLocation*, and *department* to the *employee* element.

```
try {
    var ttl = new GlideDateTime('2011-01-01 12:00:00');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    var builder = new
 sn_ih.XMLStreamingBuilder().withAttachment().expiresAt(ttl);
    var streamingDocument = builder.build();

    streamingDocument.startDocument('Employee')
    .writeAttributes({'idNumber':'12345', 'officeLocation':'San
 Diego', 'department':'Sales'})
        .writeTextElement('firstName', 'John')
        .writeTextElement('lastName', 'Smith')
        .writeTextElement('age', '25')
    .endDocument();
    gs.log(streamingDocument.getAttachmentId());
} catch (err) {
    gs.log(err);
} finally {
    streamingDocument.close();
}
```

XMLStreamingAPI - writeCData(String data)

Adds CDATA to your XML document.

After calling the *writeCDataElement()* method, you can call the *writeCData()* method to add CDATA within the element.

Parameters

Name	Type	Description
data	String	Value to include after the CDATA keyword in your CDATA element.

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

This example adds CDATA to the CDATA element `timeWorked`.

```
try {
    var ttl = new GlideDateTime('2011-01-01 12:00:00');
    var builder = new
 sn_ih.XMLStreamingBuilder().withAttachment().expiresAt(ttl);
    var streamingDocument = builder.build();

    streamingDocument.startDocument('Employee')
        .writeTextElement('firstName', 'John')
        .writeTextElement('lastName', 'Smith')
        .writeTextElement('age', '25')
        .writeCDataElement('timeWorked')
        .writeCData('< 2 years')
    .endDocument();
    gs.log(streamingDocument.getAttachmentId());
} catch (err) {
    gs.log(err);
} finally {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    streamingDocument.close();
}
```

XMLStreamingAPI - writeCDataElement(String name, String data, Object prefix)

Adds a CDATA element to your XML document.

After calling the *`startDocument()`* method, you can call the *`writeCDataElement()`* method to add a CDATA element to your XML document.

Parameters

Name	Type	Description
name	String	Name of the CDATA element.
data	String	Optional. Type of data to parse the CDATA element as.
prefix	Object	Optional. Map of child elements and values that the CDATA element includes. For example: `{ 'prefixOne':'prefixValue', 'prefixTwo':'prefixValue' }` You must associate an XML element's prefix with a namespace using writeNamespace().

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

This example uses a document type definition named `address` to define an internal document type definition for the XML document.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.XMLStreamingBuilder()
    .withAttachment()
    .expiresAt(ttl)
    .build();

  builder.startDocument("Employee")
  .writeDtd('address')
  .writeCDataElement('home', '#PCDATA', {'streetAddress',
 'city', 'state', 'postalCode'})
      .writeTextElement("streetAddress", "21 2nd Street")
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
  .endDocument()

  gs.log(builder.getAttachmentId());
} catch (err) {
  gs.log(err);
} finally {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  builder.close();
}
```

XMLStreamingAPI - writeCharacters(String text)

Adds text to your XML document.

Use the *writeCharacters()* method to insert string data to a section in your XML document.

Parameters

Name	Type	Description
text	String	Text to add to a section of your XML document.

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

The following example shows how to add text values to elements in your XML document.

```
try {
    var ttl = new GlideDateTime('2011-01-01 12:00:00');
    var builder = new
 sn_ih.XMLStreamingBuilder().withAttachment().expiresAt(ttl);
    var streamingDocument = builder.build();

    streamingDocument.startDocument('Employee')
        .startElement('firstName')
        .writeCharacters('John')
        .EndElement()
        .startElement('lastName')
        .writeCharacters('Smith')
        .endElement()
    .endDocument();
    gs.log(streamingDocument.getAttachmentId());
} catch (err) {
    gs.log(err);
} finally {
    streamingDocument.close();
}
```

XMLStreamingAPI - writeComment(String comment)

Adds a comment to your XML document.

After calling the *startDocument()* method, you can call the *writeComment()* method to add a comment to your XML document.

Parameters

Name	Type	Description
comment	String	Comment text to include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

The following example shows how to add a comment to an XML document.

```
try {
    var ttl = new GlideDateTime('2011-01-01 12:00:00');
    var builder = new
 sn_ih.XMLStreamingBuilder().withAttachment().expiresAt(ttl);
    var streamingDocument = builder.build();

    streamingDocument.startDocument('Employee')
        .writeComment('Element for information related to active
 employees.')
        .writeTextElement('firstName', 'John')
        .writeTextElement('lastName', 'Smith')
        .writeTextElement('age', '25')
    .endDocument();
    gs.log(streamingDocument.getAttachmentId());
} catch (err) {
    gs.log(err);
} finally {
    streamingDocument.close();
}
```

XMLStreamingAPI - writeDtd(String dtd)

Adds a document type definition to your XML document.

After calling the `startDocument()` method, you can call the `writeDtd()` method to add a valid XML document type definition to your XML document.

Parameters

Name	Type	Description
dtd	String	Name of a valid XML document type definition.

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

This example uses a document type definition named `address` to define an internal document type definition for the XML document.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.XMLStreamingBuilder()
    .withAttachment()
    .expiresAt(ttl)
    .build();

  builder.startDocument("Employee")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .writeDtd('address')
  .writeCDataElement('home', '#PCDATA', {'streetAddress',
 'city', 'state', 'postalCode'})
      .writeTextElement("streetAddress", "21 2nd Street")
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
  .endDocument()

  gs.log(builder.getAttachmentId());
} catch (err) {
  gs.log(err);
} finally {
  builder.close();
}
```

XMLStreamingAPI - writeNamespace(String prefix, String namespaceURI)

Adds a namespace to an element in your XML document.

After calling the *`startDocument()`*, *`startElement()`*, or *`writeTextElement()`* method, you can call the *`writeNamespace()`* method to add a namespace to the associated XML element.

Parameters

Name	Type	Description
prefix	String	Prefix for the XML namespace.
namespaceURI	String	Optional. URI for the namespace.

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

The following example shows how to add a namespace and URI to the `company` root element, and then assign the prefix to the nested `companyName` element.

```
try {
    var ttl = new GlideDateTime('2011-01-01 12:00:00');
    var builder = new
 sn_ih.XMLStreamingBuilder().withAttachment().expiresAt(ttl);
    var streamingDocument = builder.build();

    streamingDocument.startDocument('company')
    .writeNamespace('x','https://www.servicenow.com')
        .writeTextElement('companyName', 'ServiceNow')
        .writeNamespace('x')
    .endDocument();
    gs.log(streamingDocument.getAttachmentId());
} catch (err) {
    gs.log(err);
} finally {
    streamingDocument.close();
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

XMLStreamingAPI - writeNamespaces(Object namespaceMap)

Adds namespaces to the root element in your XML document.

After calling the `startDocument()` or `startElement()` method, you can call the `writeNamespaces()` method to declare namespaces for the associated XML element.

Parameters

Name	Type	Description
namespaceMap	Object	Map of keys and values containing namespace prefixes and URIs to associate with the root element of the XML document. For example: `{ 'namespaceOne':'namespaceValue', 'namespaceTwo':'namespaceValue' }`

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

This example adds two namespaces and URIs to the `company` root element, and then assigns the appropriate prefixes to the nested elements.

```
try {
    var ttl = new GlideDateTime('2011-01-01 12:00:00');
    var builder = new
 sn_ih.XMLStreamingBuilder().withAttachment().expiresAt(ttl);
    var streamingDocument = builder.build();

    streamingDocument.startDocument('company')
    .writeNamespaces({'x':'https://www.servicenow.com',
 'y':'https://www.developer.servicenow.com'})
        .writeTextElement('companyName', 'ServiceNow')
        .writeNamespace('x')
        .writeTextElement('devFramework', 'UI Framework')
        .writeNamespace('y')
    .endDocument();
    gs.log(streamingDocument.getAttachmentId());
} catch (err) {
    gs.log(err);
} finally {
    streamingDocument.close();
}
```

XMLStreamingAPI - writeTextElement(String name, String text, Object prefix)

Adds a single XML element to your XML document.

After calling the `startDocument()` method, you can call the `writeTextElement()` method to add a single XML element to your XML document's structure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Name of the XML element.
text	String	Value for the XML element.
prefix	Object	Optional. Map of prefixes and values associated with the XML element. For example: `{ 'prefixOne':'prefixValue', 'prefixTwo':'prefixValue' }` You must associate an XML element's prefix with a namespace using writeNamespace().

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

The following example shows how to create an XML document containing three elements with information about an employee.

```
try {
    var ttl = new GlideDateTime('2011-01-01 12:00:00');
    var builder = new
 sn_ih.XMLStreamingBuilder().withAttachment().expiresAt(ttl);
    var streamingDocument = builder.build();

    streamingDocument.startDocument('Employee')
        .writeTextElement('firstName', 'John')
        .writeTextElement('lastName', 'Smith')
        .writeTextElement('age', '25')
    .endDocument();
    gs.log(streamingDocument.getAttachmentId());
} catch (err) {
    gs.log(err);
} finally {
    streamingDocument.close();
}
```

XMLStreamingBuilder - Scoped

Creates a builder object to build a large XML payload for use in a REST or SOAP request to send bulk data to a third-party API. You can also create the payload as an XML string for a non-streaming option.

Use these methods in a Workflow Studio Script step with the `sn_ih` namespace identifier. For example, you can use this API to create an XML payload in the Workflow Studio Script step and pass the returned value to the REST step to send the request to a third-party service. For more information, see the Workflow Studio Script step.

Note: You can only use this API within the Workflow Studio environment.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API call order

Generate XML payloads by first instantiating a builder object with *XMLStreamingBuilder* and then calling the methods in the *XMLStreamingAPI* class:

1. *XMLStreamingBuilder*: **Creates a builder object**

   Use these method in the following order to create a builder object:

   1. *XMLStreamingBuilder()*: Instantiates the XMLStreamingBuilder object.
   2. *withAttachment()*: Optional. Creates an XML document as an attachment and stores it in the Streaming Attachments [streaming_attachment] table. If you don't call this method, the API builds the payload as an XML string.
   3. *expiresAt()*: Optional. Sets a time when the attachment expires. False is the default. Must also call the *withAttachment()* method.
   4. *build()*: Returns an XMLStreamingAPI object.

2. *XMLStreamingAPI*: **Builds the XML payload**

   Use these methods in the following order to create the XML payload:

   1. *startDocument()*: Creates the top-level parent element in the XML document.
   2. Methods to generate child elements in the XML document, such as *writeTextElement()*, *startElement()*, and *writeArray()*.
   3. Methods to generate attributes for an element, such as *writeAttribute()*, *writeNamespace()*, and *writeDtd()*.
   4. *endElement()*: Closes an XML element.
   5. *endDocument*: Closes the top-level parent element.
   6. *getXMLString()* or *getAttachmentId()*: Returns the XML string or attachment ID that you created.
   7. *close()*: Closes the XMLStreamingAPI object.

Size limits

Payloads generated through this API cannot exceed these size limits:

- Attachments: 200 MB
- Strings: 5 MB

The following example shows how to create an XML document and store it in the Streaming Attachments [streaming_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.XMLStreamingBuilder()
    .withAttachment() // Creates the XML document in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the XMLStreamingAPI object.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  builder.startDocument("Employee") // Begins generating the XML
 document.
    .writeTextElement("firstName","John") // Writes a
 "firstName" element and value.
    .writeTextElement("lastName","Smith")
    .writeTextElement("age","25")
    .startElement("address") // Adds an "address" parent
 element.
      .writeTextElement("streetAddress", "21 2nd Street") //
 Writes a child element and value.
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement() // Adds a closing tag for the "address"
 element.
    .startElement("phoneNumber")
      .writeTextElement("type","home")
      .writeTextElement("number","212 555-1234")
      .writeTextElement("type","fax")
      .writeTextElement("number","646 555-4567")
    .endElement()
  .endDocument() // Stops generating the XML document.

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
} catch (err) {
  gs.log(err);
} finally {
  builder.close();
}
```

Alternatively, this example shows how to use the API in the Script step and create the payload as an XML string. You can use this option to create payloads under 5 MB.

```
(function execute(inputs, outputs) {

  var builder = new sn_ih.XMLStreamingBuilder().build();

  builder.startDocument("Employee")
    .enablePrettyPrint()
    .writeTextElement("firstName","John")
    .writeTextElement("lastName","Smith")
    .writeTextElement("age","25")
    .startElement("address")
      .writeTextElement("streetAddress", "21 2nd Street")
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement()
    .startElement("phoneNumber")
      .writeTextElement("type","home")
      .writeTextElement("number","212 555-1234")
      .writeTextElement("type","fax")
      .writeTextElement("number","646 555-4567")
    .endElement()
  .endDocument()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  outputs.payload = builder.getXMLString();

})(inputs, outputs);
```

Output:

```
<?xml version="1.0" encoding="UTF-8"?>
<firstName>John</firstName>
<lastName>Smith</lastName>
<age>25</age>
<address>
  <streetAddress>21 2nd Street</streetAddress>
  <city>Santa Clara</city>
  <state>CA</state>
  <postalCode>11111</postalCode>
</address>
<phoneNumber>
  <type>home</type>
  <number>212 555-1234</number>
  <type>fax</type>
  <number>646 555-4567</number>
</phoneNumber>
```

XMLStreamingBuilder - XMLStreamingBuilder()

Instantiates the XMLStreamingBuilder object.

Parameters

Name	Type	Description
None		

This example shows how to instantiate a `builder` object.

```
var builder = new sn_ih.XMLStreamingBuilder()
```

XMLStreamingBuilder - build()

Returns an XMLStreamingAPI object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
XMLStreamingAPI	Streaming XML object for constructing the payload.

The following example shows how to create an XML document and store it in the Streaming Attachments [streaming_attachment] table with a defined expiration date.

```
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.XMLStreamingBuilder()
    .withAttachment() // Creates the XML document in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the XMLStreamingAPI object.

  builder.startDocument("Employee") // Begins generating the XML
 document.
    .writeTextElement("firstName","John") // Writes a
 "firstName" element and value.
    .writeTextElement("lastName","Smith")
    .writeTextElement("age","25")
    .startElement("address") // Adds an "address" parent
 element.
      .writeTextElement("streetAddress", "21 2nd Street") //
 Writes a child element and value.
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement() // Adds a closing tag for the "address"
 element.
    .startElement("phoneNumber")
      .writeTextElement("type","home")
      .writeTextElement("number","212 555-1234")
      .writeTextElement("type","fax")
      .writeTextElement("number","646 555-4567")
    .endElement()
  .endDocument() // Stops generating the XML document.

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
} catch (err) {
  gs.log(err);
} finally {
  builder.close();
}
```

XMLStreamingBuilder - expiresAt(Object expiresAt)

Sets a time when the attachment expires. Must also call the *`withAttachment()`* method.

Parameters

Name	Type	Description
expiresAt	GlideDateTime	Object that is set when the attachment expires. • Minimum value: 7200 seconds, or two hours, from the time the attachment is created. This is the default value if you don't call the *`expiresAt()`* method. • Maximum value: 172800 seconds, or 48 hours, from the time the attachment is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
XMLStreamingBuilder	Builder object used to initiate the XML payload.

The following example shows how to create an XML document and store it in the Streaming Attachments [streaming_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.XMLStreamingBuilder()
    .withAttachment() // Creates the XML document in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the XMLStreamingAPI object.

  builder.startDocument("Employee") // Begins generating the XML
 document.
    .writeTextElement("firstName","John") // Writes a
 "firstName" element and value.
    .writeTextElement("lastName","Smith")
    .writeTextElement("age","25")
    .startElement("address") // Adds an "address" parent
 element.
      .writeTextElement("streetAddress", "21 2nd Street") //
 Writes a child element and value.
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement() // Adds a closing tag for the "address"
 element.
    .startElement("phoneNumber")
      .writeTextElement("type","home")
      .writeTextElement("number","212 555-1234")
      .writeTextElement("type","fax")
      .writeTextElement("number","646 555-4567")
    .endElement()
  .endDocument() // Stops generating the XML document.

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
} catch (err) {
  gs.log(err);
} finally {
  builder.close();
}
```

XMLStreamingBuilder - withAttachment()

Creates an XML document as an attachment and stores it in the Streaming Attachments [streaming_attachment] table. If you don't call this method, the API creates the XML document as a string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
XMLStreamingBuilder	Builder object used to initiate the XML payload.

The following example shows how to create an XML document and store it in the Streaming Attachments [streaming_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.XMLStreamingBuilder()
    .withAttachment() // Creates the XML document in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the XMLStreamingAPI object.

  builder.startDocument("Employee") // Begins generating the XML
 document.
    .writeTextElement("firstName","John") // Writes a
 "firstName" element and value.
    .writeTextElement("lastName","Smith")
    .writeTextElement("age","25")
    .startElement("address") // Adds an "address" parent
 element.
      .writeTextElement("streetAddress", "21 2nd Street") //
 Writes a child element and value.
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement() // Adds a closing tag for the "address"
 element.
    .startElement("phoneNumber")
      .writeTextElement("type","home")
      .writeTextElement("number","212 555-1234")
      .writeTextElement("type","fax")
      .writeTextElement("number","646 555-4567")
    .endElement()
  .endDocument() // Stops generating the XML document.

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
} catch (err) {
  gs.log(err);
} finally {
  builder.close();
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example shows how to build the XML payload and save it as a string.

```
(function execute(inputs, outputs) {

  var builder = new sn_ih.XMLStreamingBuilder().build();

  builder.startDocument("Employee")
    .enablePrettyPrint()
    .writeTextElement("firstName","John")
    .writeTextElement("lastName","Smith")
    .writeTextElement("age","25")
    .startElement("address")
      .writeTextElement("streetAddress", "21 2nd Street")
      .writeTextElement("city", "Santa Clara")
      .writeTextElement("state", "CA")
      .writeTextElement("postalCode", "11111")
    .endElement()
    .startElement("phoneNumber")
      .writeTextElement("type","home")
      .writeTextElement("number","212 555-1234")
      .writeTextElement("type","fax")
      .writeTextElement("number","646 555-4567")
    .endElement()
  .endDocument()

  outputs.payload = builder.getXMLString();

})(inputs, outputs);
```

Output:

```
<?xml version="1.0" encoding="UTF-8"?>
<firstName>John</firstName>
<lastName>Smith</lastName>
<age>25</age>
<address>
  <streetAddress>21 2nd Street</streetAddress>
  <city>Santa Clara</city>
  <state>CA</state>
  <postalCode>11111</postalCode>
</address>
<phoneNumber>
  <type>home</type>
  <number>212 555-1234</number>
  <type>fax</type>
  <number>646 555-4567</number>
</phoneNumber>
```

XMLUtilJS - Global

The *XMLUtilJS* script include provides XML utility methods for JavaScript to be used with Discovery scripts.

This script include is provided with the Discovery plugin. Use this script include in any server-side Discovery script in which you need XML utilities.

Access these methods using the static variable *XMLUtilJS*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

XMLUtilJS - escapeForXMLText(String text)

Provides escape text for a given string.

Parameters

Name	Type	Description
text	String	The text to format.

Returns

Type	Description
String	The formatted text.

The following example shows how to list escaped XML data in a document. See also *stringToValue()*.

```
// Create an XML document to work with
var doc = new XMLDocument2();

// Add an element called catalog
var catalog = doc.createElement('catalog');

// Set current element to the one previously made to add more
 elements
doc.setCurrentElement(catalog);

// Add an element called catalog
var bookAttribute = doc.createElement('book');

// Add an attribute to the element created
bookAttribute.setAttribute('id', 'bk101');

// Create multiple elements with a defined value
doc.createElementWithTextValue('author', 'Gambardella,
 Matthew');
doc.createElementWithTextValue('title', 'XML Developer');
doc.createElementWithTextValue('genre', 'Computer');
doc.createElementWithTextValue('price', '44.95');

// Pass the created XML document as a string to the XMLUtilJS
 API function
var escapedXML = XMLUtilJS.escapeForXMLText(doc.toString());

// Print the escapedXML. If an invalid XML is created, the
 original value will be returned
gs.print(escapedXML);
```

Output:

```
&lt;?xml version="1.0"
 encoding="UTF-8"?&gt;&lt;catalog&gt;&lt;book
 id="bk101"/&gt;&lt;author&gt;Gambardella,
 Matthew&lt;/author&gt;&lt;title&gt;XML
 Developer&lt;/title&gt;&lt;genre&gt;Computer&lt;/genre&gt;&lt;p
rice&gt;44.95&lt;/price&gt;&lt;/catalog&gt;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

XMLUtilJS - stringToValue(String str)

Converts a string to an XML value.

Parameters

Name	Type	Description
str	String	The string to convert.

Returns

Type	Description
String	The specified string converted to XML.

The following example shows how to transform a string of escaped XML to tagged XML output. See also *escapeForXMLText()*.

```
//Example of an escaped XML string, previously generated by
 XMLUtilJS.escapeForXMLText()
var escapedXML = '&lt;catalog&gt;&lt;book
 id="bk101"&gt;&lt;author&gt;Gambardella,
 Matthew&lt;/author&gt;&lt;title&gt;XML Developer\'s
 Guide&lt;/title&gt;&lt;genre&gt;Computer&lt;/genre&gt;&lt;price
&gt;44.95&lt;/price&gt;&lt;publish_date&gt;2000-10-01&lt;/publis
h_date&gt;&lt;description&gt;An in-depth look at creating
 applications with
 XML.&lt;/description&gt;&lt;/book&gt;&lt;/catalog&gt;';

//Pass in escaped XML text and store output in a variable
var output = XMLUtilJS.stringToValue(escapedXML);

// If the input value is a string value of NULL, the output will
 be null, otherwise an unescaped XML string value.
gs.print(output);
```

Output:

```
<catalog><book id="bk101"><author>Gambardella,
 Matthew</author><title>XML Developer's
 Guide</title><genre>Computer</genre><price>44.95</price><publis
h_date>2000-10-01</publish_date><description>An in-depth look at
 creating applications with XML.</description></book></catalog>
```

XMLUtilJS - unescapeForXMLText(String text)

Provides un-escaped XML for a given string.

Parameters

Name	Type	Description
text	String	The XML text to clean up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The cleaned up XML string.

The following example shows how to convert an escaped XML string to tagged XML output. See also *escapeForXMLText()*.

```
//Example of an escaped XML string, previously generated by
 XMLUtilJS.escapeForXMLText()
var escapedXML = '&lt;catalog&gt;&lt;book
 id="bk101"&gt;&lt;author&gt;Gambardella,
 Matthew&lt;/author&gt;&lt;title&gt;XML Developer\'s
 Guide&lt;/title&gt;&lt;genre&gt;Computer&lt;/genre&gt;&lt;price
&gt;44.95&lt;/price&gt;&lt;publish_date&gt;2000-10-01&lt;/publis
h_date&gt;&lt;description&gt;An in-depth look at creating
 applications with
 XML.&lt;/description&gt;&lt;/book&gt;&lt;/catalog&gt;';

//Pass in escaped XML text and store output in a variable
var output = XMLUtilJS.unescapeForXMLText(escapedXML);

//Print the escapedXML. If the XML is invalid, the original
 value will be returned
gs.print(output);
```

Output:

```
<catalog><book id="bk101"><author>Gambardella,
 Matthew</author><title>XML Developer's
 Guide</title><genre>Computer</genre><price>44.95</price><publis
h_date>2000-10-01</publish_date><description>An in-depth look at
 creating applications with XML.</description></book></catalog>
```

XMLUtilJS - valueToString(String XMLvalue)

Converts an XML value to a string.

Parameters

Name	Type	Description
XMLvalue	String	The XML to convert

Returns

Type	Description
String	The XML value converted to a string.

The following example shows how to convert an XML document to a string.

```
//Create an XML document to work with
var doc = new XMLDocument2();

//Add an element called catalog
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var catalog = doc.createElement("catalog");

//Set our current element to the one previously made to add
 further elements
doc.setCurrentElement(catalog);

//Add an element called catalog
var bookAttribute = doc.createElement("book");

//Add an attribute to the element created
bookAttribute.setAttribute("id" , "bk101");

//create multiple elements with a defined value
doc.createElementWithTextValue("author" , "Gambardella,
 Matthew");
doc.createElementWithTextValue("title" , "XML Developer");
doc.createElementWithTextValue("genre" , "Computer");
doc.createElementWithTextValue("price" , "44.95");

//Pass the created XML document as a string to the XMLUtilJS API
 function.
var escapedXML = XMLUtilJS.valueToString(doc.toString());

// Print the results
// Returns NULL if XML is invalid
gs.print(escapedXML);
```

Output:

```
&lt;?xml version="1.0"
 encoding="UTF-8"?&gt;&lt;catalog&gt;&lt;book
 id="bk101"/&gt;&lt;author&gt;Gambardella,
 Matthew&lt;/author&gt;&lt;title&gt;XML
 Developer&lt;/title&gt;&lt;genre&gt;Computer&lt;/genre&gt;&lt;p
rice&gt;44.95&lt;/price&gt;&lt;/catalog&gt;
```

Client API reference

Use client-side JavaScript APIs to control aspects of how ServiceNow AI Platform is displayed and functions within the web browser. This reference lists available classes and methods along with parameters, descriptions, and examples to help control the end-user experience.

StandaloneClientMethods

Standalone client methods are methods that you can use within your client JavaScripts, such as reflistOpen, but aren't a part of any class or API.

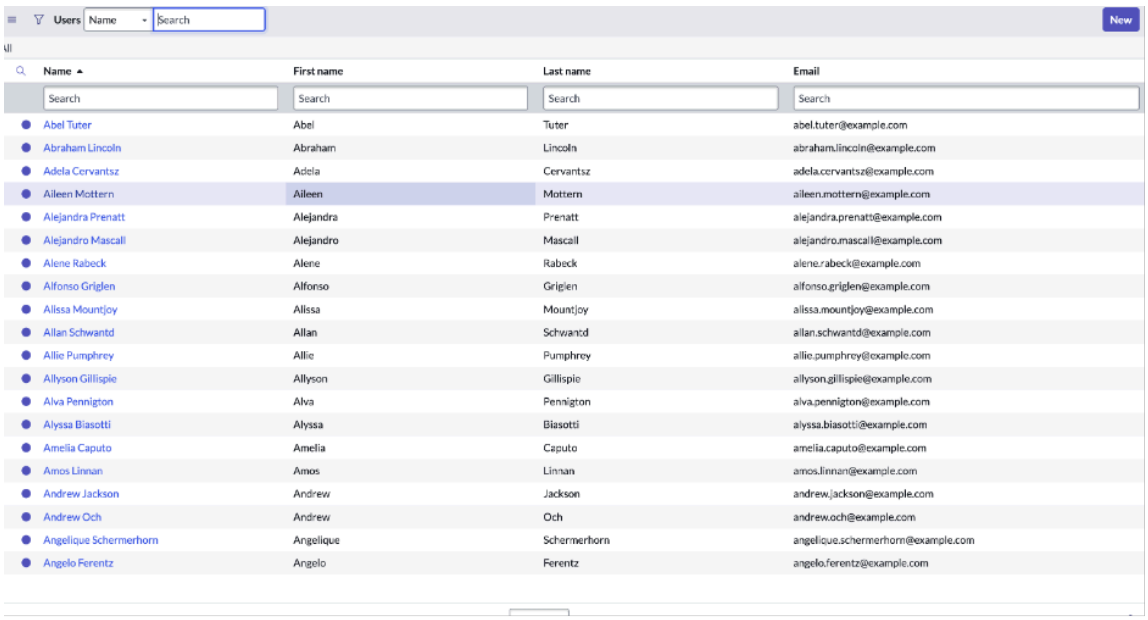
You can directly access these methods within a client script without any constructor or other type of instantiation before use.

Standalone - reflistOpen (String target, String elementName, String refTableName, String dependent, String useQBE, String refQualElements, String additionalQual, String parentID, String forceReference, String ignoreTargetValue)

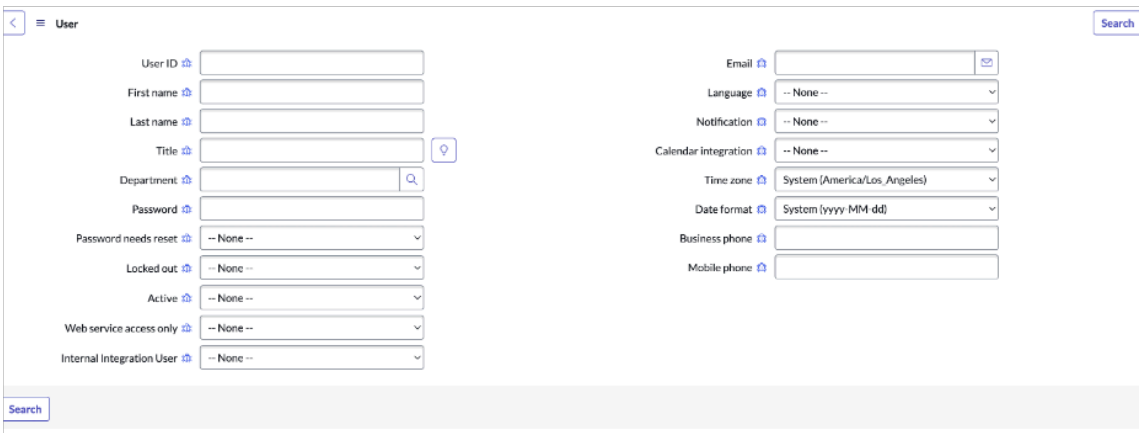
Shows the reference field data in a standard pop-up window. This method is commonly used when selecting a magnifying glass icon, beside any reference field, in UI 16 forms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, using this method you can display reference field data for a specific set of query criteria:



Similarly, you can use this method to display a search form that enables the user to enter their own set of query criteria for selecting the reference field data to display.



When opening the URL in the standard pop-up, if the URL length is greater than TinyURL length, 1024 by default, the URL is converted to TinyURL, such as:

`"sys_user_list.do?sysparm_tiny=7ea02c4ff8a8b510f877c74d78b60460"`.

Note:

`reflistOpen()` isn't supported in Workspace Client Script. Use the *`g_modal.showFrame()`* method instead.

Parameters

Name	Type	Description
target	String	Form target reference field ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For example, the `caller_id` parameter's target reference field ID is `incident.caller_id`.
elementName	String	Form reference field element name. For example: `caller_id`
refTableName	String	Reference table to map to the form reference field. For example, for the reference field `caller_id`, sys_user is the reference table. In this case, you would pass the value `sys_user`.
dependent	String	Configured dependent field for the specified *`target`* element. For additional information, see Make a field dependent.
useQBE	String	Flag that indicates the type of information to return in the pop-up window. Valid values: • true: Display a query form with a search button. • false: Display the query results. Default: false
refQualElements	String	Configured reference qualifier for the specified *`target`* element. The function appends the specified reference qualifiers to the URL and only displays the filtered results in the pop-up window. If you don't want to include a reference qualifier, pass an empty string. For additional information on reference qualifiers, see Reference qualifiers.
additionalQual	String	Optional. Additional qualifier query to use to filter the results that display in the pop-up window. For example, for a `caller_id` reference field in an incident, you could pass the user's sys_id `sys_id=62826bf03710200044e0bfc8bcbe5df1`. The function filters the User [sys_user] table and shows the filtered results in the pop-up window.
parentID	String	Optional. Currently only an internal parameter, no need to pass a value.
forceReference	String	Optional. Currently only an internal parameter, no need to pass a value.
ignoreTargetValue	String	Optional. Currently only an internal parameter, no need to pass a value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Pop-up window	Displays the returned reference field data in a standard pop-up window.

The following example shows how to invoke this method to show the caller field data in the pop-up window for the incident table (first image above).

```
function onChange(control, oldValue, newValue, isLoading,
 isTemplate) {
   if (isLoading || newValue === '') {
      return;
   }

   reflistOpen('incident.caller_id', 'caller_id',
 'sys_user','company', 'false', '');
}
```

The following example shows how to invoke this same client script, but with `useQBE = true`, which displays a search button and associated search criteria within the pop-up window (second image above).

```
function onChange(control, oldValue, newValue, isLoading,
 isTemplate) {
   if (isLoading || newValue === '') {
      return;
   }

   //  Type appropriate comment here, and begin script below
   reflistOpen('incident.caller_id', 'caller_id',
 'sys_user','company', 'true', '');
}
```

DynamicTranslation - Client

The *`DynamicTranslation`* API provides methods that translate text, in real time, into multiple languages using translation service providers. This API is available for both standard clients and Angular-based Service Portal clients.

In addition, you can use this API to detect the language of a specific string and check whether the *`DynamicTranslation`* methods are enabled for a translation service. Use this API to create a seamless localization experience for your user interface, enabling one interface to service multiple countries.

Currently this API supports two translation service providers: Microsoft Azure Translator Service and Google Cloud Translator Service. You can also configure other translation services within your instance and then use the *`DynamicTranslation`* API to translate your text.

To use this API you must activate the Dynamic Translation plugin. For information on this plugin and additional information on Dynamic Translation, refer to Dynamic translation overview. Also, to use this API in a Service Portal widget, you must inject the dynamicTranslation service into the widget client script function.

Note: The name of the class to use in Service Portal clients is *`dynamicTranslation`*, while the name of the class to use in standard clients is *`DynamicTranslation`*.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DynamicTranslation - getDetectedLanguage(String text, Object parms)

Detects the language of the passed in text.

If you pass in a translator, the method uses that translation service to detect the source language. Otherwise, the detection is performed by the default translation service. Ensure that the text strings that you provide contain enough verbiage to enable proper language detection.

In addition to the detected language, the response contains a confidence level of the detection, along with other possible language alternatives. If a translator is not passed in, the method also returns the default translation service used to detect the language.

Parameters

Name	Type	Description
text	String	Text to use to detect the language.

parms	Object	Optional. JSON object that contains additional translation parameters.
		`"parms": {`
		`  "translator": "String"`
		`}`

parms.translator	String	Translation service to use to detect the language of a string. Translation services are configured under the **Translator Configuration** menu and located in the Translator Configuration [sn_dt_translator_configuration] table. Possible values - not case-sensitive: • Google • Microsoft • IBM • <custom> **Note:** To use custom translation services you must first configure the translation service in your instance. For details, see Integrate with a translation service provider. Default: Translation service configured in the Translator Configuration [sn_dt_translator_configuration] table.

Returns

Type	Description

alternatives	Array of objects that describe other languages that might also be a match.
	Data type: Array
	`"alternatives": [`
	`  {`
	`  "code": "String",`
	`  "confidence": "String",`

Returns (continued)

Type	Description

	<pre>"name": "String"
	}
	]</pre>

alternatives.code	Language code of the alternative language. Data type: String
alternatives.confidence	Float value indicating the confidence level of the alternative language. Value is between zero and one. The lower the value, the lower the confidence level. Data type: String
alternatives.name	Language code of the alternative language. Data type: String

detectedLanguage	Description of the detected language.
	
	Data type: Object
	<pre>"detectedLanguage": {
	"code": "String",
	"confidence": "String",
	"name": "String"
	}</pre>

detectedLanguage.code	Language code of the detected language. Data type: String
detectedLanguage.confidence	Float value indicating the confidence level of the alternative language. Value is between zero and one. The lower the value, the lower the confidence level. Data type: String
detectedLanguage.name	Language code of the detected language. Data type: String
translator	Translation service used to detect the language. Data type: String
Error messages	The following are error messages that the method may return and indications as to the error's root cause. • Text ("text" field) is missing or invalid. (40000): The text to detect the language is either missing or not a string. • Dynamic Translation plugin is not installed. (40001): The *`Dynamic Translation`* API was invoked without activating the com.glide.dynamic_translation plugin.

Returns (continued)

Type	Description
	For information on activating this plugin, see Dynamic translation overview. • Translator ("translator" field) is invalid. (40003): The passed in *translator* parameter is not a string. • <translator> translator is not configured. (40004): The specified translation service is not configured in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • <translator> translator is inactive. (40005): The specified translation service is not set to **Active** in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • Additional parameters are invalid. (40006): The additional parameters that were passed are not an object. • Maximum time limit has been exceeded. (40009): The operation took longer than the defined timeout value specified in the Translation Configuration. Default: 40 seconds • Default translator is not configured for detection. (40011): The default translation service has not been specified for language detection in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • <translator> translator is not configured for detection. (40013): The specified translation service is not configured for language detection in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • Unknown error occurred. (40051): Default error thrown when the error doesn't fall in to any other category. • Text ("text" field) has exceeded its maximum length. (40052): The text that was passed in for language detections exceeds the maximum length supported by the corresponding translation service. • Request is not authorized because credentials are missing or invalid (40055): The credentials configured for the translation service in Connections & Credentials are not valid. For information on connections and credentials, see Dynamic translation overview.

This example shows code that detects a string in English using IBM's translation service in a standard client script.

```
var detectedResponse =
 DynamicTranslation.getDetectedLanguage('Please detect the
```

```
 language of this text',
 {"translator":'IBM'}).then(function(res) {console.log(res); },
 function(res) {console.log(res); } );
```

Output:

```
detectedResponse {
  detectedLanguage:
    { "code": "en", "confidence": "1", "name": "en" }
  alternatives:
    [
      { "code": "vi", "confidence": "0.86", "name": "vi" },
      { "code": "id", "confidence": "0.86", "name": "id" }
    ]
 }
```

This example shows a client script that throws an error when an invalid translation service is passed in.

```
var detectedResponse =
 DynamicTranslation.getDetectedLanguage('Please detect the
 language of this text', {"translator":123}).then(function(res)
 {console.log(res); }, function(res) {console.log(res); } );
```

Output:

```
{"code":"40003","message":"Translator (\"translator\" field) is
 invalid"}
```

This example shows code that detects a string in English using IBM's translation service in a Service Portal widget client script. Note that the name of the class is `dynamicTranslation` not `DynamicTranslation`.

```
var detectedResponse =
 dynamicTranslation.getDetectedLanguage('Please detect the
 language of this text',
 {"translator":'IBM'}).then(function(res) {console.log(res); },
 function(res) {console.log(res); } );
```

Output:

```
detectedResponse {
  detectedLanguage:
    { "code": "en", "confidence": "1", "name": "en" }
  alternatives:
    [
      { "code": "vi", "confidence": "0.86", "name": "vi" },
      { "code": "id", "confidence": "0.86", "name": "id" }
    ]
 }
```

This example shows a Service Portal widget client script that throws an error when an invalid translation service is passed in.

```
var detectedResponse =
 dynamicTranslation.getDetectedLanguage('Please detect the
 language of this text', {"translator":123}).then(function(res)
 {console.log(res); }, function(res) {console.log(res); } );
```

Output:

 invalid"}
```

DynamicTranslation - getDetectedLanguages(Array texts, Object parms)

Detects the languages of the passed in text strings.

If you pass in a translator, the method uses that translation service to detect the source language. Otherwise, the detection is performed by the default translation service. Ensure that the text strings that you provide contain enough verbiage to enable proper language detection.

In addition to the detected language, the response contains a confidence level of the detection, along with other possible language alternatives. If a translator is not passed in, the method also returns the default translation service used to detect the language.

When calling this method from a portal client script, use the class name `dynamicTranslation`; such as `dynamicTranslation.getTranslations()`. When calling it from a platform client script, use the class name `DynamicTranslation`; such as `DynamicTranslation.getTranslations()`.

Parameters

Name	Type	Description

parms	Object	Optional. JSON object that contains additional translation parameters.
		`"parms": {`
		`  "translator": "String"`
		`}`

parms.translator	String	Translation service to use to detect the language of a string. Translation services are configured under the **Translator Configuration** menu and located in the Translator Configuration [sn_dt_translator_configuration] table. Possible values - not case-sensitive: • Google • Microsoft • IBM • <custom> **Note:** To use custom translation services you must first configure the translation service in your instance. For details, see Integrate with a translation service provider. Default: Translation service configured in the Translator Configuration [sn_dt_translator_configuration] table.
texts	Array	List of text strings to use to detect the language(s).

Returns

Type	Description
detections	Language detection of text strings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Object `"detections": { "alternatives": [Array], "detectedLanguage": {Object}, "isError": Boolean ]`
detections.alternatives	Array of objects that describe other languages that might also be a match. Data type: Array `"alternatives": [ { "code": "String", "confidence": "String", "name": "String" } ]`
detections.alternatives.code	Language code of the alternative language. Data type: String
detections.alternatives.confidence	Float value indicating the confidence level of the alternative language. Value is between zero and one. The lower the value, the lower the confidence level. Data type: String
detections.alternatives.name	Language code of the alternative language. Data type: String
detections.detectedLanguage	Description of the detected language. Data type: Object `"detectedLanguage": { "code": "String", "confidence": "String", "name": "String" }`
detections.detectedLanguage.code	Language code of the detected language. Data type: String
detections.detectedLanguage.confidence	Float value indicating the confidence level of the alternative language. Value is between zero and one. The lower the value, the lower the confidence level. Data type: String

Returns (continued)

Type	Description
detections.detectedLanguage	language code of the detected language. Data type: String
detections.isError	Flag that indicates whether the detection of language for the text resulted in an error. Valid values: • true: Error encountered. • false: Language detection was successful. Data type: Boolean
status	Status of the response to the method call. Possible values: • Error • Partial • Success Data type: String
translator	Translation service used to detect the language. Data type: String
Error messages	The following are error messages that the method may return and indications as to the error's root cause. • Text ("text" field) is missing or invalid. (40000): The text to detect the language is either missing or not a string. • Dynamic Translation plugin is not installed. (40001): The *`Dynamic Translation`* API was invoked without activating the com.glide.dynamic_translation plugin. For information on activating this plugin, see Dynamic translation overview. • Translator ("translator" field) is invalid. (40003): The passed in *`translator`* parameter is not a string. • <translator> translator is not configured. (40004): The specified translation service is not configured in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • <translator> translator is inactive. (40005): The specified translation service is not set to **Active** in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • Additional parameters are invalid. (40006): The additional parameters that were passed are not an object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• Maximum time limit has been exceeded. (40009): The operation took longer than the defined timeout value specified in the Translation Configuration. Default: 40 seconds • Request failed with multiple errors. (40010): Multiple errors occurred in the language detection call. For more information, refer to the response for each individual text string. • Default translator is not configured for detection. (40011): The default translation service has not been specified for language detection in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • <translator> translator is not configured for detection. (40013): The specified translation service is not configured for language detection in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • Translator configuration version is invalid. Migrate to v3. (40014): The associated version of the Translator Configuration for the specified translation service does not support the specified text translation method. For more information, see Migrate to version v3 of a translator configuration. • Unknown error occurred. (40051): Default error thrown when the error doesn't fall in to any other category. • Text ("text" field) has exceeded its maximum length. (40052): The text that was passed in for language detections exceeds the maximum length supported by the corresponding translation service. • Request is not authorized because credentials are missing or invalid (40055): The credentials configured for the translation service in Connections & Credentials are not valid. For information on connections and credentials, see Dynamic translation overview.

This example shows code from a portal client script that detects English as the language of the passed-in strings using the Microsoft translation service.

```
var detectedResponse =
 dynamicTranslation.getDetectedLanguages(["First text
 string language to detect", "Second text string language to
 detect"], {"translator": "Microsoft"}).then(function(res)
 {console.log(res);}, function(res) {console.log(res);});
gs.info(JSON.stringify(detectedResponse));
```

Output

```
{
  "translator":"Microsoft",
  "status":"Success",
  "detections":[
    {
      "isError":false,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "detectedLanguage":{"name":"en", "code":"en",
 "confidence":"1"},
      "alternatives":[
        {"name":"id", "code":"id", "confidence":"0.83"},
        {"name":"ms", "code":"ms", "confidence":"0.83"}
      ]
    },
    {
      "isError":false,
      "detectedLanguage":{"name":"en", "code":"en",
 "confidence":"1"},
      "alternatives":[
        {"name":"fr", "code":"fr", "confidence":"0.83"},
        {"name":"id", "code":"id", "confidence":"0.83"}
      ]
    }
  ]
}
```

This example shows code in a portal client script that returns a Partial status when two text strings are passed in and one of them is invalid. To use this code example in a platform client script, change `dynamicTranslation.getDetectedLanguages` to `DynamicTranslation.getDetectedLanguages`.

```
var detectedResponse =
 dynamicTranslation.getDetectedLanguages(["First
 text string language to detect", ""], {"translator":
 "Microsoft"}).then(function(res) {console.log(res); },
 function(res) {console.log(res); } );
gs.info(JSON.stringify(detectedResponse));
```

Output

```
{
  "translator":"Microsoft",
  "status":"Partial",
  "detections":[
    {
      "isError":false,
      "detectedLanguage":{"name":"en", "code":"en",
 "confidence":"1"},
      "alternatives":[
        {"name":"id", "code":"id", "confidence":"0.83"},
        {"name":"ms", "code":"ms", "confidence":"0.83"}
      ]
    },
    {
      "isError":true,
      "code":"40000",
      "message":"Text is missing or invalid"
    }
  ]
}
```

This example shows code from a portal client script that throws an error when an invalid translation service is passed in. To use this code example for a platform client script, change `dynamicTranslation.getDetectedLanguages` to `DynamicTranslation.getDetectedLanguages`.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var detectedResponse =
 dynamicTranslation.getDetectedLanguages(["First text string
 language to detect", "Second text string language to detect"],
 {"translator": "123"}).then(function(res) {console.log(res); },
 function(res) {console.log(res); } );
gs.info(JSON.stringify(detectedResponse));
```

Output

```
{"code":"40003","message":"Translator (\"translator\" field) is
 invalid","status":"Error"}
```

DynamicTranslation - getTranslation(String textToTranslate, Object parms)

Translates the passed in text to one or more languages.

The method uses translation services, such as Microsoft Azure Translator Service and Google Cloud Translator Service, to perform the translation. If you do not pass in translation parameters, the method uses the system default.

Parameters

Name	Type	Description
textToTranslate	String	Text to translate.
parms	Object	Optional. JSON object that contains additional translation parameters. `"parms": { "additionalParameters": {Object}, "sourceLanguage": "String", "targetLanguages": [Array], "translator": "String" }`
parms.additionalParameters	Object	Optional. Array of JSON objects. Each object contains key-value pairs that provide additional information for performing the translation. `"additionalParameters": { "parameterName": "String", "parameterValue": "String" }`
parms.additionalParameters.parameterName	String	Optional. Key name. Valid values: textype: Type of text to translate. For Microsoft Azure Translator Service only.
parms.additionalParameters.parameterValue	String	Optional. Value of the associated key.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • plain: Standard text string • html: HTML text string Default: plain
parms.sourceLanguage	String	Optional. Language code of the source text. Default: Translation service detects the source language.
parms.targetLanguages	Array	Optional. List of language codes to use to translate the text. The method returns translated text for each language code. Default: User preferred language.
parms.translator	String	Optional. Translation service to use to translate the text (not case-sensitive). Valid values: • Google • Microsoft • IBM • <custom> **Note:** To use custom translation services you must first configure the translation service in your instance. For details, see Integrate with a translation service provider. Default: Translation service configured in the Translator Configuration [sn_dt_translator_configuration] table.

Returns

Type	Description
detectedLanguage	Description of the detected language. Data type: Object `"detectedLanguage": { "code": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Type	Description
	information on connections and credentials, see Dynamic translation overview. • Text cannot be translated to target languages. (40056): The specified translation service is not able to translate the passed in text into the specified target languages.

This example shows the translation of plain text content from English (detected) into French and Italian using Microsoft's translation service in a standard client script.

```
DynamicTranslation.getTranslation("Translate this text using
 platform from client", {
  "targetLanguages": ["fr", "it"],
  "additionalParameters": [{
    "parameterName": "texttype",
    "parameterValue": "plain"
  }],
  "translator": "Microsoft"
 }).then(function(res){console.log(res);},
 function(res){console.log(res);});
```

Response:

```
{"translations":[
    {
      "targetLanguage":"it",
      "translatedText":"Tradurre questo testo utilizzando la
 piattaforma dal client"
    },
    {
      "targetLanguage":"fr",
      "translatedText":"Traduire ce texte en utilisant la
 plate-forme du client"
    }
  ],
  "translator":"Microsoft",
  "detectedLanguage":{"code":"en","name":"en"}
}
```

This example shows a client script that throws an error when an invalid target language is passed in.

```
DynamicTranslation.getTranslation("Translate this text using
 platform from client", {
  "targetLanguages": ["123"],
  "additionalParameters": [{
    "parameterName": "texttype",
    "parameterValue": "plain"
  }],
  "translator": "Microsoft"
 }).then(function(res){console.log(res);},
 function(res){console.log(res);});
```

Response:

```
{"code":"40054","message":"Target language is invalid"}
```

This example shows the translation of plain text content from English (detected) into French and Italian using Microsoft's translation service in a Service Portal widget client script. Note that the name of the class is `dynamicTranslation` not `DynamicTranslation`.

```
dynamicTranslation.getTranslation("Translate this text using
 platform from client", {
  "targetLanguages": ["fr", "it"],
  "additionalParameters": [{
    "parameterName": "texttype",
    "parameterValue": "plain"
  }],
  "translator": "Microsoft"
 }).then(function(res){console.log(res);},
 function(res){console.log(res);});
```

Response:

```
{"translations":[
    {
      "targetLanguage":"it",
      "translatedText":"Tradurre questo testo utilizzando la
 piattaforma dal client"
    },
    {
      "targetLanguage":"fr",
      "translatedText":"Traduire ce texte en utilisant la
 plate-forme du client"
    }
  ],
  "translator":"Microsoft",
  "detectedLanguage":{"code":"en","name":"en"}
}
```

This example shows a Service Portal widget client script that throws an error when an invalid target language is passed in

```
dynamicTranslation.getTranslation("Translate this text using
 platform from client", {
  "targetLanguages": [123],
  "additionalParameters": [{
    "parameterName": "texttype",
    "parameterValue": "plain"
  }],
  "translator": "Microsoft"
 }).then(function(res){console.log(res);},
 function(res){console.log(res);});
```

Response:

```
{"code":"40054","message":"Target language is invalid"}
```

DynamicTranslation - getTranslations(Array texts, Object parms)

Translates the passed in text strings to one or more languages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The method uses translation services, such as Microsoft Azure Translator Service and Google Cloud Translator Service, to perform the translation. If you do not pass in translation parameters, the method uses the system default.

When calling this method from a portal client script, use the class name *dynamicTranslation*; such as *dynamicTranslation.getTranslations()*. When calling it from a platform client script, use the class name *DynamicTranslation*; such as *DynamicTranslation.getTranslations()*.

Parameters

Name	Type	Description
texts	Array	List of text stings to translate.
parms	Object	Optional. JSON object that contains additional translation parameters. `"parms": { "additionalParameters": {Object}, "sourceLanguage": "String", "targetLanguages": [Array], "translator": "String" }`
parms.additionalParameters	Object	Optional. Array of JSON objects. Each object contains key-value pairs that provide additional information for performing the translation. `"additionalParameters": { "parameterName": "String", "parameterValue": "String" }`
parms.additionalParameters.parameterName	String	Optional. Key name. Valid values: textype: Type of text to translate. For Microsoft Azure Translator Service only.
parms.additionalParameters.parameterValue	String	Optional. Value of the associated key. Valid values: • plain: Standard text string • html: HTML text string Default: plain
parms.sourceLanguage	String	Optional. Language code of the source text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: Translation service detects the source language.
parms.targetLanguages	Array	Optional. List of language codes to use to translate the text. The method returns translated text for each language code. Default: User preferred language.
parms.translator	String	Optional. Translation service to use to translate the text (not case-sensitive). Valid values: • Google • Microsoft • IBM • <custom> **Note:** To use custom translation services you must first configure the translation service in your instance. For details, see Integrate with a translation service provider. Default: Translation service configured in the Translator Configuration [sn_dt_translator_configuration] table.

Returns

Type	Description
status	Status of the response to the method call. Possible values: • Error • Partial • Success Data type: String
translations	Array of objects that describe the language translations. Data type: Array `translations": [ { "isError": Boolean;`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"detectedLanguage": {Object},
	"textTranslations": [Array]
	}
	]</pre>

translations.isError	Flag that indicates whether the translation of the text resulted in an error. Valid values: • true: Error encountered. • false: Text translation was successful. Data type: Boolean

translations.detectedLanguage	Description of the detected language.
	
	Data type: Object
	<pre>"detectedLanguage": {
	"code": "String",
	"name": "String"
	}</pre>

translations.detectedLanguage.code	Language code of the detected language. Data type: String
translations.detectedLanguage.name	Language code of the detected language. Data type: String

textTranlations	Array of objects. Description of the language used to translate the text string.
	<pre>"textTranslation": {
	"targetLanguage": "String",
	"translatedText": "String"
	}</pre>

textTranslations.targetLanguage	Language code to which the source text was translated. Data type: String
textTranslations.translatedText	Translated text. Data type: String
translator	Translation service used to translate the text. Data type: String
Error messages	The following are error messages that the method may return and indications as to their root cause.

© 2026 ServiceNow, Inc. All rights reserved.

Returns (continued)

Type	Description

	• Text ("text" field) is missing or invalid. (40000): The text to translate is either missing or not a string.
	• Dynamic Translation plugin is not installed. (40001): The *`Dynamic Translation`* API was invoked without activating the com.glide.dynamic_translation plugin. For information on activating this plugin, see Dynamic translation overview.
	• Default translator is not configured for translation. (40002): No translation service is selected as the default translation service in the Translator Configurations. For information on creating/modifying a translator configuration, see Create a translator configuration.
	• Translator ("translator" field) is invalid. (40003): The passed in *`translator`* parameter is not a string.
	• <translator> translator is not configured. (40004): The specified translation service is not configured in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration.
	• <translator> translator is inactive. (40005): The specified translation service is not set to **Active** in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration.
	• Additional parameters are invalid. (40006): The additional parameters that were passed are not an object.
	• Target languages ("targetLanguages" field) are invalid. (40007): The *`targetLanguages`* parameter is passed in the call but is not valid for one of the following reasons:
	  ○ Value is not an array
	  ○ Array is empty
	  ○ One or multiple of the entries is not a string
	• Source language ("sourceLanguage" field) is invalid. (40008): The *`sourceLanguage`* parameter is passed in the call but the value is not a String.
	• Maximum time limit has been exceeded. (40009): The operation took longer than the defined timeout value specified in the Translation Configuration. Default: 40 seconds
	• Request failed with multiple errors. (40010): Multiple errors occurred in the language detection call. For

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	more information, refer to the response for each individual text string. • <translator> translator is not configured for translation. (40012): The specified translation service is not configured for text translation in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • Translator configuration version is invalid. Migrate to v3. (40014): The associated version of the Translator Configuration for the specified translation service does not support the specified text translation method. For more information, see Migrate to version v3 of a translator configuration. • Unknown error occurred. (40051): Default error thrown when the error doesn't fall in to any other category. • Text ("text" field) has exceeded its maximum length. (40052): The text that was passed in to translate exceeds the maximum length supported by the corresponding translation service. • Source language is invalid. (40053): The passed in *sourceLanguage* parameter contains a language code that is not supported by the corresponding translation service. • Target language is invalid. (40054): One or more of the language codes passed in the *targetLanguages* parameter is not supported by the corresponding translation service. • Request is not authorized because credentials are missing or invalid (40055): The credentials configured for the translation service in Connections & Credentials are not valid. For information on connections and credentials, see Dynamic translation overview. • Text cannot be translated to target languages. (40056): The specified translation service is not able to translate the passed in text into the specified target languages.

This example shows code in a portal client script that translates a list of text strings into French and Italian using the Microsoft translation service.

```
dynamicTranslation.getTranslations(["Translate first text using
 portal from client", "Translate second text using portal from
 client"], {
  "targetLanguages": ["fr", "it"],
  "additionalParameters": [{
    "parameterName": "texttype",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "parameterValue": "plain"
  }],
  "translator": "Microsoft"
 }).then(function(res){console.log(res);},
 function(res){console.log(res);});
```

Response:

```
{
  "translations":[
    {
      "isError":false,
      "textTranslations":[
        {
          "targetLanguage":"it",
          "translatedText":"Tradurre il primo testo utilizzando
 il portale dal client"
        },
        {
          "targetLanguage":"fr",
          "translatedText":"Traduire le premier texte à l'aide
 du portail à partir du client"
        }
      ],
      "detectedLanguage": {"name":"en", "code":"en"}
    },
    {
      "isError":false,
      "textTranslations":[
        {
          "targetLanguage":"it",
          "translatedText":"Traduci il secondo testo utilizzando
 il portale dal client"
        },
        {
          "targetLanguage":"fr",
          "translatedText":"Traduire le deuxième texte à l'aide
 du portail à partir du client"
        }
      ],
      "detectedLanguage": {"name":"en", "code":"en"}
    }
  ],
  "translator":"Microsoft",
  "status":"Success"
}
```

This example shows a portal client script that returns a Partial status when one of the two passed in text strings is invalid. To use this code example for a platform client script, change `dynamicTranslation.getTranslations` to `DynamicTranslation.getTranslations`.

```
dynamicTranslation.getTranslations(["Translate first text using
 portal from client", ""], {
  "targetLanguages": ["fr", "it"],
  "additionalParameters": [{
    "parameterName": "texttype",
    "parameterValue": "plain"
```

```
  }],
  "translator": "Microsoft"
 }).then(function(res){console.log(res);},
 function(res){console.log(res);});
```

Response:

```
{
  "translations":[
    {
      "isError":false,
      "textTranslations":[
        {
          "targetLanguage":"it",
          "translatedText":"Tradurre il primo testo utilizzando
 il portale dal client"
        },
        {
          "targetLanguage":"fr",
          "translatedText":"Traduire le premier texte à l'aide
 du portail à partir du client"
        }
      ],
      "detectedLanguage":{"name":"en", "code":"en"}
    },
    {
      "isError":true,
      "code":"40000",
      "message":"Text is missing or invalid"
    }
  ],
 "translator":"Microsoft",
 "status":"Partial"
}
```

This example shows a portal client script that throws an error when an invalid translation service is passed in. To use this code example for a platform client script, change `dynamicTranslation.getTranslations` to `DynamicTranslation.getTranslations`.

```
dynamicTranslation.getTranslations(["Translate first text using
 portal from client", "Translate second text using portal from
 client"], {
  "targetLanguages": ["fr", "it"],
  "additionalParameters": [{
    "parameterName": "texttype",
    "parameterValue": "plain"
  }],
  "translator": 123
 }).then(function(res){console.log(res);},
 function(res){console.log(res);});
```

Response:

```
{"code":"40003","message":"Translator (\"translator\" field) is
 invalid","status":"Error"}
```

DynamicTranslation - isEnabled(String translator)

Determines whether the various methods in the `DynamicTranslation` API are enabled for a translation service.

If you pass in a specific translation service, the method checks the method activation for that translation service; otherwise the method checks the default translation service.

When calling this method from a portal client script, use the class name `dynamicTranslation`; such as `dynamicTranslation.isEnabled()`. When calling it from a platform client script, use the class name `DynamicTranslation`; such as `DynamicTranslation.isEnabled()`.

Parameters

Name	Type	Description
translator	String	Optional. Translation service to use to verify whether the methods are active. Translation services are configured under the Translator Configuration menu. Possible values - not case-sensitive: • Google • Microsoft • IBM • <custom> **Note:** To use custom translation services you must first configure the translation service in your instance. For details, see Integrate with a translation service provider. Default: Default translation service.

Returns

Type	Description
batchDetection	Flag that indicates whether the `getDetectedLanguages()` method is enabled. Possible values: • true: Enabled • false: Disabled Data type: Boolean
batchTranslation	Flag that indicates whether the `getTranslations()` method is enabled. Possible values: • true: Enabled • false: Disabled Data type: Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
detection	Flag that indicates whether the *getDetectedLanguage()* method is enabled. Possible values: • true: Enabled • false: Disabled Data type: Boolean
translation	Flag that indicates whether the *getTranslation()* method is enabled. Possible values: • true: Enabled • false: Disabled Data type: Boolean
Error messages	The following are error messages that the API may return and indications as to their root cause. • Translator ("translator" field) is invalid. (40003): The passed in *translator* parameter is not a string.

This example shows a client script that checks whether the *DynamicTranslation* methods are enabled for the Microsoft translation service. To use this code example for a platform client script, change `DynamicTranslation.getTranslations` to `dynamicTranslation.getTranslations`.

```
DynamicTranslation.isEnabled('Microsoft').then(function(res){con
sole.log(res);}, function(res){console.log(res);});
```

Output:

```
{"detection":true,"batchTranslation":true,"batchDetection":true,
"translation":true}
```

This example shows a client script that throws an error when an invalid translation service is passed in. To use this code example for a platform client script, change `DynamicTranslation.getTranslations` to `dynamicTranslation.getTranslations`.

```
DynamicTranslation.isEnabled(123).then(function(res){console.log
(res);}, function(res){console.log(res);});
```

Output:

```
{"code":"40003","message":"Translator (\"translator\" field) is
 invalid"}
```

g_modal - Client

The *g_modal* API enables you to display a modal window to enhance application functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use this API to display modals in workspaces.

Using this API you can:

- Display input type fields in a modal window.
- Show something in a frame such as a UI page or external link.
- Perform an action on user confirmation.
- Load a component.
- Use HTML to populate the contents of a modal.

g_modal - alert(String title, String message, Function callback, style Object)

Displays an alert message relating to a UI action.

Parameters

Name	Type	Description
title	String	Optional. Title to display in the header of the modal. Default: Alert
message	String	Message to display in the modal body. **Note:** If you only pass one parameter, the method treats it as the *`message`* parameter.

callback	Function	Optional. Function to call after the form has been submitted and processed on the server.
		
		The callback function has the form `callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where:
		• *`action_verb`*: Name of the UI action executed. Examples:
		  ○ sysverb_cancel (Cancel button)
		  ○ sysverb_insert (Submit button)
		  ○ sysverb_save (Save button)
		• *`sys_id`*: Sys_id of the affected record.
		• *`table`*: Name of the table containing the record.
		• *`displayValue`*: Value that appears on the form.
		
		Default: No additional processing

style	Object	Optional. Style of the confirmation button to display in the modal. `"style": { "buttonTitle": "String", "buttonType": "String" }`
style.buttonTitle	String	Optional. Text to display on the confirmation button.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: OK
style.buttonType	String	Optional. Type of confirmation button to display. Default: default

Returns

Type	Description
Promise	If a *callback* parameter is passed, returns promise if successful, error otherwise. If a *callback* parameter isn't passed, the method always returns success.

The following code example shows how to call this method to display an alert message 'Only the assigned to can end this action.'.

```
function onClick(g_form) {

  if (g_user.userID != g_form.getValue('assigned_to')) {
    g_modal.alert('Only the assigned to can end this action.');
    return;
  }

  var msg = getMessage("Are you sure you want to take this
 action?");
  g_modal.confirm(getMessage("Confirmation"), msg, function
 (confirmed) {
    if (confirmed) {
      g_form.setValue('state', 'closed_complete');
      g_form.save();
    }
  });

  return false;
}
```

g_modal - confirm(String title, String message, Function callback, style Object)

Displays a confirm message relating to a UI action.

Parameters

Name	Type	Description
title	String	Optional. Title to display in the header of the modal. Default: Confirm
message	String	Message to display in the modal body.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Note: If you only pass one parameter, the method treats it as the *message* parameter.

callback	Function	Optional. Function to call after the form has been submitted and processed on the server.
		
		The callback function has the form `callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where:
		• *action_verb*: Name of the UI action executed. Examples:
		  ○ sysverb_cancel (Cancel button)
		  ○ sysverb_insert (Submit button)
		  ○ sysverb_save (Save button)
		• *sys_id*: Sys_id of the affected record.
		• *table*: Name of the table containing the record.
		• *displayValue*: Value that appears on the form.
		
		Default: No additional processing

style	Object	Optional. Style of the confirm and cancel buttons to display in the modal. `"style": { "cancelTitle": "String", "cancelType": "String", "confirmTitle": "String", "confirmType": "String" }`
style.cancelTitle	String	Optional. Text to display on the cancel button. Default: Cancel
style.cancelType	String	Optional. Type of cancel button to display. Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: confirm
style.confirmTitle	String	Optional. Text to display on the confirm button. Default: OK
style.confirmType	String	Optional. Type of confirm button to display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: default

Returns

Type	Description
Promise	If a *callback* parameter is passed, returns promise if successful, error otherwise. If a *callback* parameter isn't passed, the method always returns success.

The following code example shows how to call this method to display the confirmation message "Are you sure you want to take this action?"

```
function onClick(g_form) {

  if (g_user.userID != g_form.getValue('assigned_to')) {
    g_modal.alert('Only the assigned to can end this action.');
    return;
  }

  var msg = getMessage("Are you sure you want to take this
 action?");
  g_modal.confirm(getMessage("Confirmation"), msg, function
 (confirmed) {
    if (confirmed) {
      g_form.setValue('state', 'closed_complete');
      g_form.save();
    }
  });

  return false;
}
```

Output:

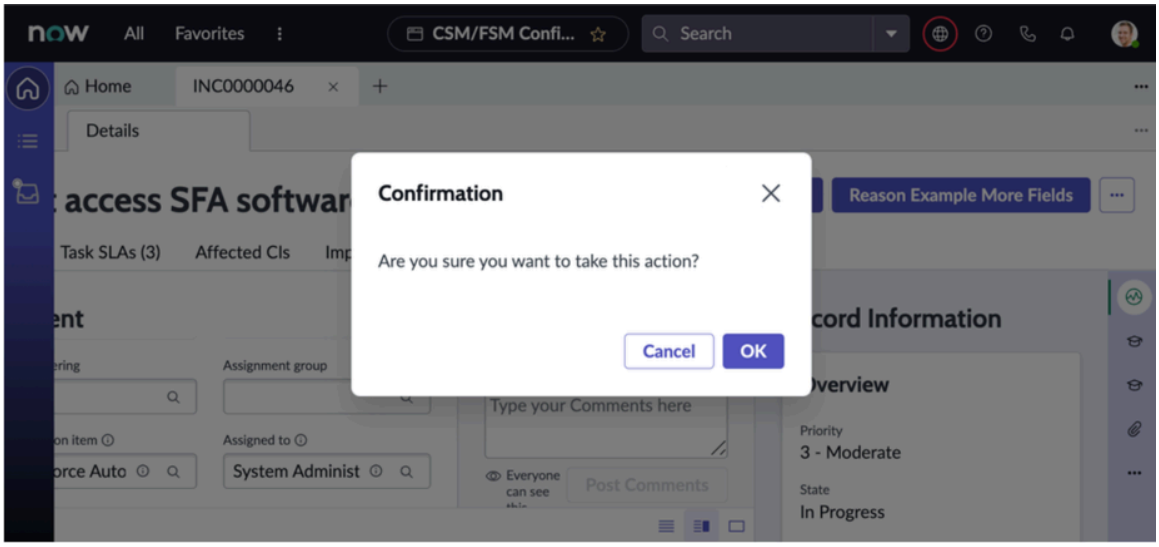
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



g_modal - confirmDestroy(String title, String message, Function callback, style Object)

Displays a confirm message related to a UI action, with the confirm button displaying a destructive style.

Parameters

Name	Type	Description
title	String	Optional. Title to display in the header of the modal. Default: Confirm
message	String	Message to display in the modal body. **Note:** If you only pass one parameter, the method treats it as the *`message`* parameter.

callback	Function	Optional. Function to call after the form has been submitted and processed on the server.
		
		The callback function has the form `callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where:
		• *`action_verb`*: Name of the UI action executed. Examples:
		  ○ sysverb_cancel (Cancel button)
		  ○ sysverb_insert (Submit button)
		  ○ sysverb_save (Save button)
		• *`sys_id`*: Sys_id of the affected record.
		• *`table`*: Name of the table containing the record.
		• *`displayValue`*: Value that appears on the form.
		
		Default: No additional processing

style	Object	Optional. Style of the confirm and cancel buttons to display in the modal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`"style": { "cancelTitle": "String", "cancelType": "String", "confirmTitle": "String", "confirmType": "String" }`
style.cancelTitle	String	Optional. Text to display on the cancel button. Default: Cancel
style.cancelType	String	Optional. Type of cancel button to display. Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: confirm
style.confirmTitle	String	Optional. Text to display on the confirm button. Default: OK
style.confirmType	String	Optional. Type of confirm button to display. Default: destructive

Returns

Type	Description
Promise	If a *`callback`* parameter is passed, returns promise if successful, error otherwise. If a *`callback`* parameter isn't passed, the method always returns success.

This code example shows how to call the *`confirmDestroy()`* method to display a confirmation modal with a red **OK** button.

```
function callback(value){
  value ? console.log("confirm destroy callback") :
 console.log('cancel callback');
}

function onClick(g_form) {
  g_modal.confirmDestroy("Confirm Destroy Title", "Confirm
 Destroy Message", callback, {
    cancelTitle: "Cancel",
    confirmTitle: "Confirm",
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

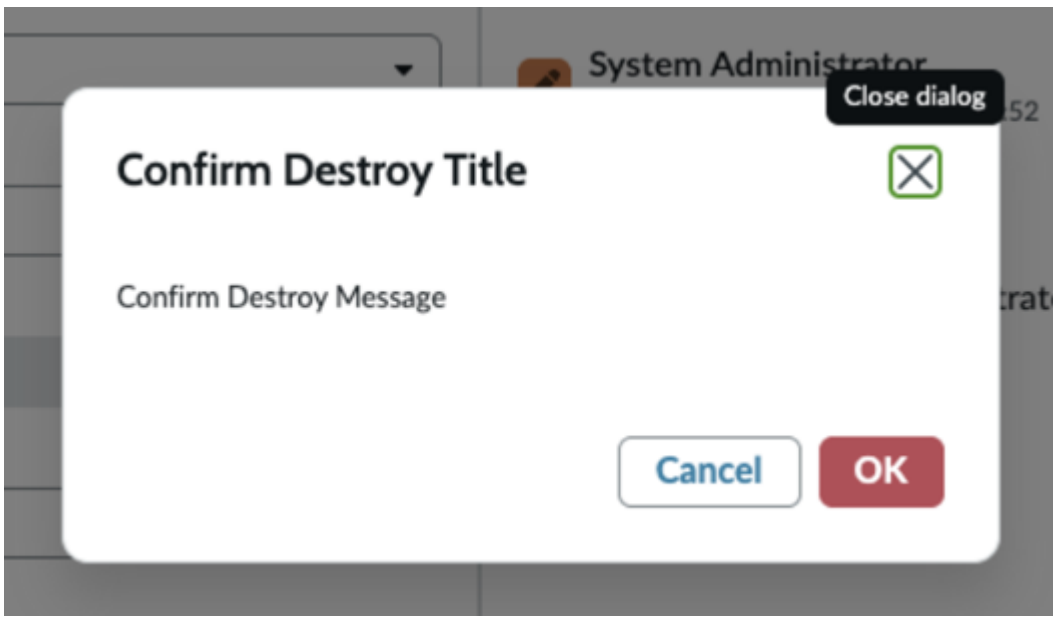
```
    cancelType: "destructive",
    confirmType: "confirm"
  })

  .then(

    function test() {
      g_form.setValue("state', '7");
    },

    function fail() {
      g_form.setValue("state", 2)
    }
  )
}
```

Output:



g_modal - richText(String title, String richText, Function callback, String size, String cancelTitle, String confirmTitle, String cancelType, String confirmType)

Displays a modal that uses passed HTML to generate the content within the modal.

Parameters

Name	Type	Description
title	String	Optional. Title to display in the header of the modal. Default: blank
richText	String	HTML content to display in the modal. **Note:** This method removes `<script>` tags, inline JavaScript, and other elements that might pose security exploits.
callback	Function	Optional. Function to call after the form has been submitted and processed on the server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		The callback function has the form `callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where:
		• *`action_verb`*: Name of the UI action executed. Examples:
		  ○ sysverb_cancel (Cancel button)
		  ○ sysverb_insert (Submit button)
		  ○ sysverb_save (Save button)
		• *`sys_id`*: Sys_id of the affected record.
		• *`table`*: Name of the table containing the record.
		• *`displayValue`*: Value that appears on the form.
		Default: No additional processing

cancelTitle	String	Optional. Text to display on the cancel button. Default: Cancel
confirmTitle	String	Optional. Text to display on the confirm button. Default: OK
cancelType	String	Optional. Type of cancel button to display. Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: confirm
confirmType	String	Optional. Type of confirm button to display. Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: default

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Promise	If a *callback* parameter is passed, returns promise if successful, error otherwise. If a *callback* parameter isn't passed, the method always returns success.

The following code example shows how to display the text "This is rich text" in bold in the associated modal.

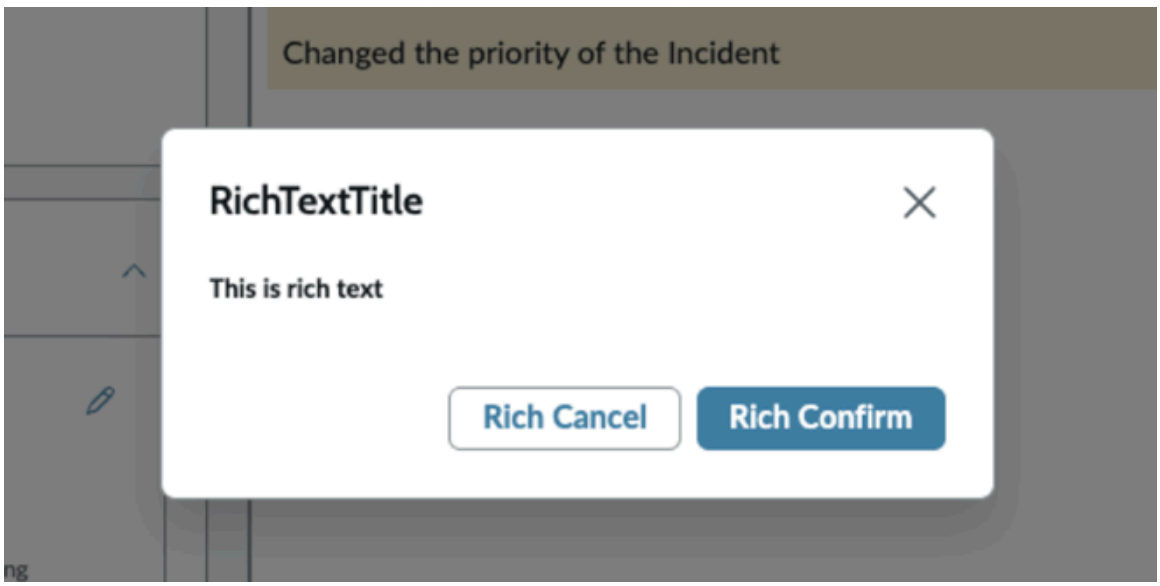
```
function callback(value){
  value ? console.log("confirm richtext callback") :
 console.log('cancel rich text callback');
}

function onClick(g_form) {
  g_modal.richText("RichTextTitle", "<b>This is rich text</b>",
 callback, {
    cancelTitle: "Rich Cancel",
    confirmTitle: "Rich Confirm"
  })

  .then(
    function test() {
      g_form.setValue("state', '7");
    },

    function fail() {
      g_form.setValue("state", 2)
    }
  )
}
```

Output:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g_modal - showFields(String title, Array fields, Function callback, String size, String cancelTitle, String confirmTitle, String cancelType, String confirmType, String instruction)

Displays a modal window that contains the specified fields and an **OK** and **Cancel** buttons by default.

Parameters

Name	Type	Description
title	String	Optional. Title to display in the header of the modal. Default: " "
fields	Array of Objects	List of fields to display in the modal. Each field is defined in a separate object. The *`fields`* parameters that you pass are dependent on the type of field (*`fields.type`*) specified. The fields display in the modal in the same order as they appear in the array. `fields: [ { autoFocus: Boolean, choices: "Array", display_value_list: "String", enableMentions: Boolean, label: "String", mandatory: Boolean, name: "String", referringTable: "String", referringRecordId: "String", type: "String", value: "String" } ]`
fields.autoFocus	Boolean	Optional. Flag that indicates whether the field should default to auto focus when the modal loads. Only one field should have this value set to true. Valid values: • true: Auto focus. • false: Don't auto focus. Default: false
fields.choices	Array of Objects	Required if the *`fields.type`* parameter is set to `choice`. List of options to display in the associated list field. Each entry in the choice list must be specified as a separate object in the `choices` array. For example: `choices: [ { displayValue: "String", value: "String`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		}]
fields.choices.displayValue	String	Optional. Value to display in the list field. Default: Blank
fields.choices.value	String	Optional. Internal value of the value displayed in the list field. Default: Null
fields.display_value_list	Array of Strings	Optional. List of strings to display. For example, `['item1', 'item2', 'item3']`.
fields.enableMentions	Boolean	Required if *`fields.type`* is `html`. Flag that indicates whether you can mention a user in the modal. Valid values: • true: Users can be mentioned in the modal. • false: Users can't be mentioned in the modal. Default: false
fields.label	String	Optional. Text to display as the label for this field in the modal. Default: Blank
fields.mandatory	Boolean	Optional. Flag that indicates whether the field is mandatory. Valid values: • true: Field is mandatory. • false: Field is optional. Default: false
fields.name	String	Internal name of the field. If the *`fields.type`* parameter is set to `reference` or `glide_list`, it is the reference field on the current record being used to search.
fields.referringTable	String	Required if the *`fields.type`* parameter is set to `reference` or `glide_list`. Name of the table that you are referencing from. For example: `incident`
fields.referringRecordId	String	Required if the *`fields.type`* parameter is set to `reference`. Sys_id of the record that you're calling in the UI action form.
fields.type	String	Type of field to display in the modal. Each field type has a set of *`fields.<>`* elements that can be passed. The values in brackets [ ] below are the *`fields`* elements supported by the associated *`fields`* type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • boolean [autofocus, label, mandatory, name, value] • choice [autofocus, choices, label, mandatory, name, value] • domain_id [label, referringRecordId, referringTable, value] • glide_list [autofocus, display_value_list, label, name, mandatory, referringRecordId, referringTable, value] • html [autofocus, enableMentions, label, mandatory, name, referringRecordId, referringTable, value] • reference [autofocus, label, mandatory, name, reference, referringRecordId, referringTable, value] • string [autofocus, label, mandatory, name, value] • textarea [autofocus, label, mandatory, name, value]

fields.value	String	Optional. Value to display in the field.
		For example, for a choice field you might display a user prompt:
		`value: getMessage(' -- Select -- ')`
		Or for a reference field you might display the value of a field on the associated form:
		`g_form.getValue('caller_id')`
		Default: Blank

callback	Function	Optional. Function to call after the form has been submitted and processed on the server.
		The callback function has the form `callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where:
		• *`action_verb`*: Name of the UI action executed. Examples:
		  ○ sysverb_cancel (Cancel button)
		  ○ sysverb_insert (Submit button)
		  ○ sysverb_save (Save button)
		• *`sys_id`*: Sys_id of the affected record.
		• *`table`*: Name of the table containing the record.
		• *`displayValue`*: Value that appears on the form.
		Default: No additional processing

size	String	Optional. Size of the modal.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • fw: Full-width • sm: 420px by 315px • md: 600px by 450px • lg: 800px by 600px **Note:** If a pixel value is specified, the modal takes up the whole browser. For example, passing "1px" makes the modal full-width. Default: sm
cancelTitle	String	Optional. Text to display on the cancel button. Default: Cancel
confirmTitle	String	Optional. Text to display on the confirm button. Default: OK
cancelType	String	Optional. Type of cancel button to display. Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: confirm
confirmType	String	Optional. Type of confirm button to display. Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: default
instruction	String	Optional. Instructions to display in the modal. This content appears below the modal title and above the first field in the modal. Default: No instructions displayed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

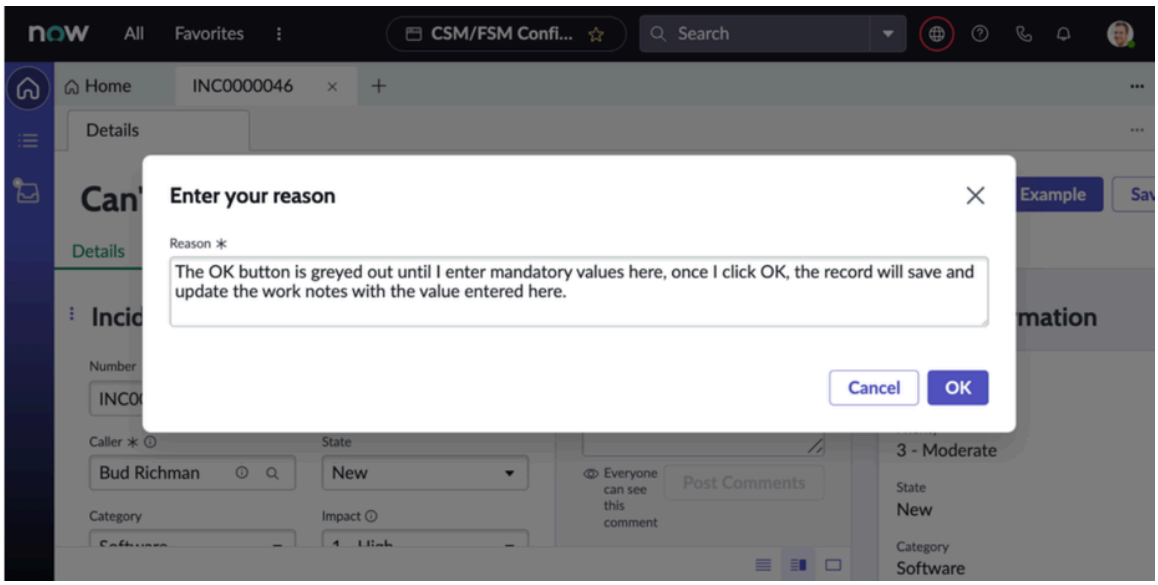
Returns

Type	Description
Promise	Returns promise if successful, error otherwise.

The following example shows prompting a user for a reason using a modal window, and then passing it back to the work notes field on the record. The *then()* method returns a promise, which returns what the modal returns; *fieldValues* in this case. The work notes field on the client-side, with the field value, are in the *updatedFields* array. Since only one field is returned, the example assumes an index position of *0*.

```
function onClick(g_form) {
    g_modal.showFields({
        title: "Enter your reason",
        fields: [{
            type: 'textarea',
            name: 'work_notes',
            label: getMessage('Reason'),
            mandatory: true
        }],
        size: 'lg'
    }).then(function(fieldValues) {
        g_form.setValue('work_notes',
 fieldValues.updatedFields[0].value);
        g_form.save();
    });
}
```

Output:



The following example expands on the example above, adding choice and a reference fields.

```
function onClick(g_form) {

    var fields = [{
        type: 'textarea',
        name: 'work_notes',
        label: getMessage('Reason'),
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        mandatory: true
    },
    {
        type: 'choice',
        name: 'reason_code',
        label: getMessage('Reason code'),
        value: getMessage(' -- Select -- '),
        choices: [
          {
            displayValue: 'Duplicate',
            value: 'duplicate'
          },
          {
            displayValue: 'Canceled',
            value: 'canceled'
          }
        ],
        mandatory: true
    },
    {
        type: 'reference',
        name: 'caller_id',
        label: getMessage('What is your name?'),
        mandatory: true,
        reference: 'sys_user',
        referringTable: 'incident',
        referringRecordId: g_form.getUniqueValue(),
  value: g_form.getValue('caller_id'),
  displayValue: g_form.getDisplayValue('caller_id')
    }
  ];

  g_modal.showFields({
    title: "Enter your reason",
    fields: fields,
    size: 'lg'
  }).then(function(fieldValues) {
        g_form.setValue('work_notes',
 fieldValues.updatedFields[0].value);
        g_form.setValue('caller_id',
 fieldValues.updatedFields[2].value);
        g_form.save();
  });
}
```

The following example shows how to use this method to display a modal that contains textarea, choices, reference, glide_list, and domain_id field types.

```
function onClick(g_form) {
  var fields = [
    {
      type: 'textarea',
      name: 'work_notes',
      label: getMessage('Reason'),
      mandatory: true
    },
    {
      type: 'choice',
      name: 'reason_code',
      label: getMessage('Reason code'),
      value: getMessage(' -- Select -- '),
      choices: [
        {
          displayValue: 'Duplicate',
          value: 'duplicate'
        },
        {
          displayValue: 'Canceled',
          value: 'canceled'
        }
      ],
      mandatory: true
    },
    {
      type: 'reference',
      name: 'caller_id',
      label: getMessage('What is your name?'),
      mandatory: true,
      referringTable: 'incident',
      referringRecordId: g_form.getUniqueValue(),
        value: g_form.getValue('caller_id')
    },
     {
      type: 'glide_list',
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g_modal - showFrame(String title, String url, Function callback, String size, String height, String modalHeight, String modalWidth, Boolean showClose, String autoCloseOn, Boolean hasLoadingMessage, Boolean closeOnEscape, Boolean hideOverlay)

Displays a modal that uses a link to an external URL or UI page for its content.

Parameters

Name	Type	Description
title	String	Optional. Title to display in the header of the modal. Default: blank
url	String	URL of the information to load in the IFrame. **Note:** If only one argument is passed, it is treated as the *`url`* parameter.

callback	Function	Optional. Function to call after the form has been submitted and processed on the server.
		
		The callback function has the form `callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where:
		• *`action_verb`*: Name of the UI action executed. Examples:
		  ○ sysverb_cancel (Cancel button)
		  ○ sysverb_insert (Submit button)
		  ○ sysverb_save (Save button)
		• *`sys_id`*: Sys_id of the affected record.
		• *`table`*: Name of the table containing the record.
		• *`displayValue`*: Value that appears on the form.
		
		Default: No additional processing

size	String	Optional. Size of the modal. Valid values: • fw: Full-width • sm: 420px by 253.25px • md: 600px by 253.25px • lg: 800px x 254px Default: lg
height	String	Optional. Height of the content section in the modal. This value is in the format of "<number><unit>", such as "80%" or "300px". If you only pass a number, the method assumes the unit of measure is pixels. Valid units of measure:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• % • em • px • vh Default: 100% or 153.75px
modalHeight	String	Optional. Height of the modal. This value is in the format of "<number><unit>", such as "80%" or "300px". If you only pass a number, the method assumes the unit of measure is pixels. Valid units of measure: • % • em • px • vh Default: 254px
modalWidth	String	Optional. Width of the modal. This value is in the format of "<number><unit>", such as "80%" or "300px". If you only pass a number, the method assumes the unit of measure is pixels. Valid units of measure: • % • em • px • vh Default: 800px
showClose	Boolean	Optional. Flag that indicates whether the close icon (X) appears in the upper-right corner of the modal. Valid values: • true: Display the close icon. • false: Don't display the close icon. Default: true
autoCloseOn	String	Optional. Condition on which to automatically close the modal. Valid values: • EMPTY_BODY • URL_CHANGED

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: Don't automatically close modal.
hasLoadingMessage	Boolean	Optional. Flag that indicates whether to display the **Loading...** message in the content slot of the modal before loading the modal content. Valid values: • true: Display loading message. • false: Don't display the loading message. The content slot of the modal is empty before content is loaded. **Note:** You can't customize the "Loading..." message; only configure whether it displays or not. Default: false
closeOnEscape	Boolean	Optional. Flag that indicates whether the user can close the modal by pressing the escape key. Valid values: • true: Modal closes when the user presses the escape key. • false: Modal doesn't close when the user presses the escape key. Default: false
hideOverlay	Boolean	Optional. Flag that indicates whether to display the transparent gray overlay over the record page. Valid values: • true: Hide the transparent gray overlay over the record page. • false: Display the transparent gray overlay over the record page. Default: false

Returns

Type	Description
Promise	Returns promise if successful, error otherwise. This promise is resolved when the IFrame modal is closed.

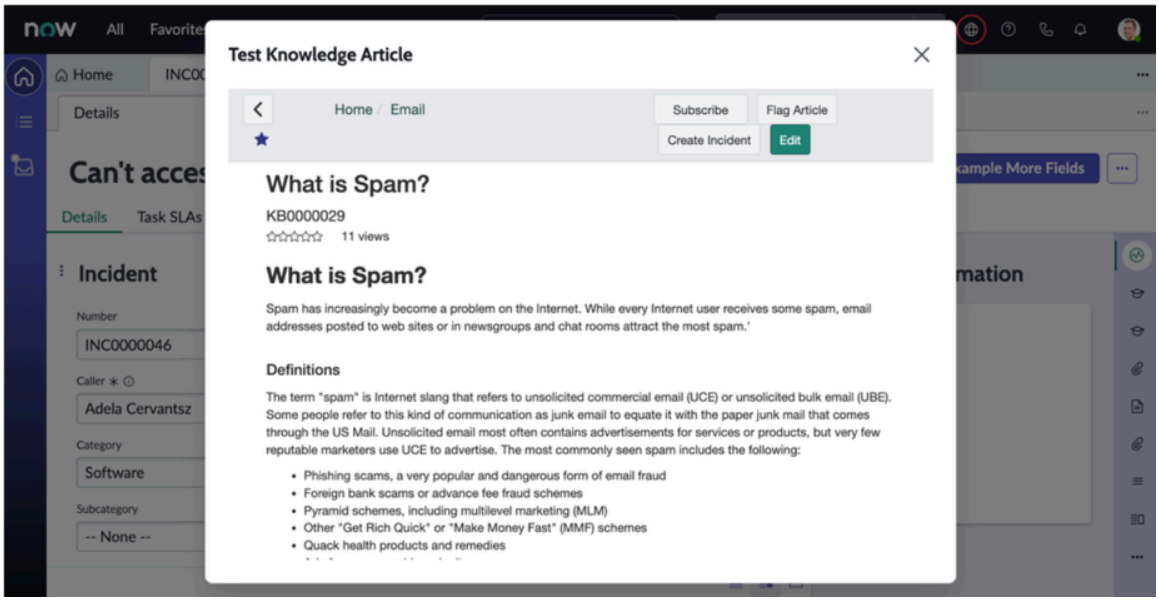
The following example shows how to display a KB article in a model using the sys_id of the KB article record and a base URL.

```
function onClick(g_form) {
  var kbId = '24d9243187032100deddb882a2e3ec33'; //sysId of KB
 article
  g_modal.showFrame({
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    url: '/kb_view.do?sys_kb_id=' + kbId,
    title: 'Test Knowledge Article',
    size: 'lg',
    height: 500px
  });
}
```

Output:



This example shows how to use an embedded UI page when creating a modal. It uses *`window.parent.postMessage()`* in the UI page to pass data from the iFrame back to the workspace since the *`g_form`* API is not accessible in a UI page when it is in the iFrame.

```
function onClick(g_form) {
  function proposeMIC(data) {
    var workNotes = data.msg + "\n" + data.workNotes;
    var notes = g_form.getValue('work_notes') + ' ' + workNotes;
    var bi = g_form.getValue('business_impact') + ' ' +
 data.businessImpact;
    g_form.setValue('work_notes', notes.trim());
    g_form.setValue('business_impact', bi.trim());
    g_form.submit('sysverb_mim_propose');
  }

  function openPopup() {
    if(!g_form.getControl('work_notes')) {
      getMessage('Cannot propose major incident as "Worknotes"
 is not visible', function(msg) {
  g_form.addErrorMessage(msg);
      });
      return false;
    }

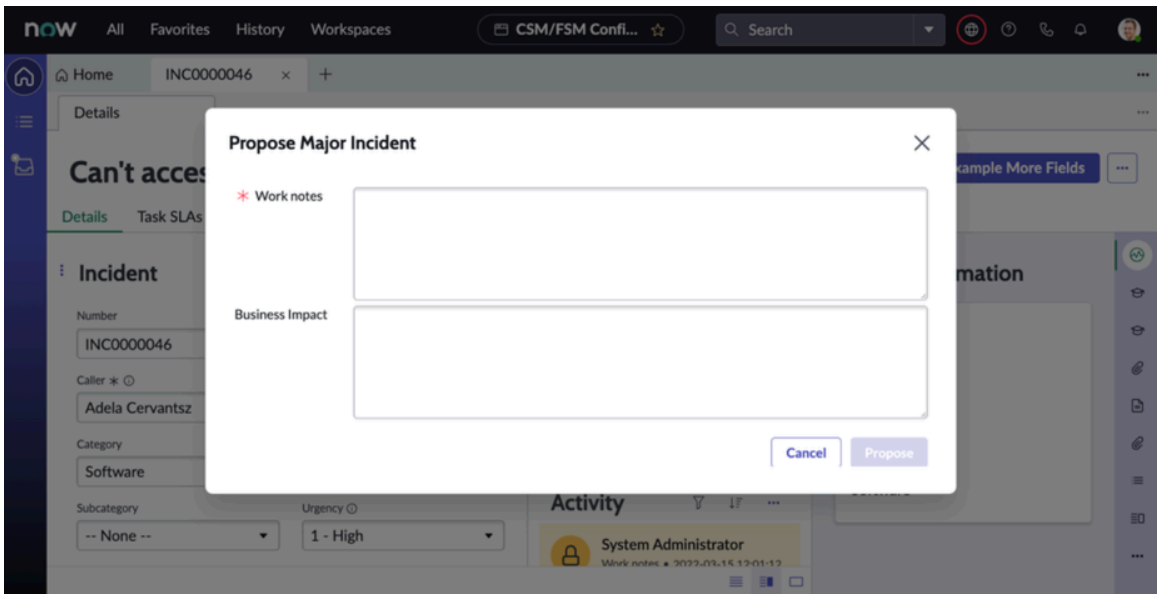
    var url =
 "/sn_major_inc_mgmt_mim_propose.do?sysparm_stack=no&sysparm_wor
kspace=" + true;
    g_modal.showFrame({
      title: getMessage("Propose Major Incident"),
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      url: url,
      size: 'lg',
      autoCloseOn: 'URL_CHANGED',
      callback: function (ret, data) {
        if (ret)
          proposeMIC(data);
      }
    });
  }

  openPopup();
}
```

Output:



g_service_catalog - Client

The *g_service_catalog* API provides methods to access data in a multi-row variable set (MRVS) when a model is open.

This API is available in all environments, such as, Service Portal, ServiceNow AI Platform, Workspace, and Now® Mobile.

g_service_catalog - getValue(String variableName)

Returns the value of the specified field on the catalog item form when used in a client script on multi-row variable sets (MRVS).

Use this method when an MRVS modal is open for editing or creating and you want to modify data within the MRVS based on the value of a field on the parent catalog item form. For example, when you need to modify the contents of the cells within an MRVS based on a check box on the parent form. You can also use this method to access the data of other MRVS elements within the same parent form.

Note: This method can only be called from the parent object, such as *g_service_catalog.parent.getValue()*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
variableName	String	Name of the variable in the catalog item form to return.

Returns

Type	Description
String	Value contained in the specified variable of the catalog item form.

In this example, a catalog item for blocking multiple IP addresses on a firewall has a variable *address_type* with two choices - **IPV4** and **IPV6**. The MRVS has two variables (*ipv4_address* and *ipv6_address*) for the respective address types. If the **Address type** field on the parent form is set to **IPV4**, the field **IPV6 address** is hidden on the MRVS.

```
function onLoad() {
  if (g_service_catalog.parent.getValue("address_type") ==
 "ipv4") {
    g_form.setValue("ipv4_address", "XX.XX.XX.XX");
    g_form.setVisible("ipv6_address", "false");
  }
}
```

GlideAgentWorkspace (g_aw) - Client

The *g_aw* API provides methods that enable a UI action or client script to open a specified record in an Agent Workspace tab.

There is no constructor for this class. Access *GlideAgentWorkspace* methods using the g_aw global object.

GlideAgentWorkspace - closeRecord()

Closes the currently open record, such as a form, in a subtab within Agent Workspace.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example saves the content of the tab and then closes it.

```
function onClick(g_form) {
```

```
function onClick(g_form) {
  g_form.save().then(function(){
    g_aw.closeRecord();
  });
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideAgentWorkspace - openRecord(String table, String sysId, Object params)

Opens a specified record, such as a form, in a subtab within Agent Workspace.

Note: This method is only available in the Agent Workspace client scripting environment or in a UI action on the workspace client script field.

Parameters

Name	Type	Description
table	String	Name of the table that contains the record to open.
sysId	String	Sys ID of the record to open.
params	Object	Optional. Name/value pairs of the parameters to pass to the record. `"params": { "readOnlyForm": Boolean; "defaultTab": "String"; "hideDetails": Boolean }`
params.readOnlyForm	Boolean	Flag that indicates whether all fields on the opened record are read-only; regardless of the UI policy and ACLs. • true: All fields are read only. • false: Fields adhere to the associated UI policy and ACLs. Default: false
params.defaultTab	String	Name of the initial tab to display in the workspace. You can only specify related items or related lists. If not specified, the details tab appears unless *`hideDetails`* is set to true. For more information on the method to use to obtain a related list name, see getRelatedListNames().
params.hideDetails	Boolean	Flag that indicates whether to hide the details tab and the UI actions. • true: Only the form header, all other tabs, and the first available tab appear on the form. • false: Details tab and UI actions appear on the form. Default: false

Returns

Type	Description
None	

Open a sys_user record in a subtab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
g_aw.openRecord('sys_user',
 '62826bf03710200044e0bfc8bcbe5df1');
```

Open a record in a subtab where all fields are read-only.

```
g_aw.openRecord('sys_user', '62826bf03710200044e0bfc8bcbe5df1',
 {readOnlyForm: true});
```

Open a record in a subtab and go directly to the "Groups" related list.

```
g_aw.openRecord('sys_user', '62826bf03710200044e0bfc8bcbe5df1',
 {defaultTab: "sys_user_grmember.user"});
```

Open a record in a subtab but only show the form header and other tabs.

```
g_aw.openRecord('sys_user', '62826bf03710200044e0bfc8bcbe5df1',
 {hideDetails: true});
```

GlideAjax - Client

The *GlideAjax* class enables a client script to call server-side code in a script include.

To use *GlideAjax* in a client script, follow these general steps.

1. Create a *GlideAjax* instance by calling the *GlideAjax* constructor. As the argument to the constructor, specify the name of the script include class that contains the method you want to call.
2. Call the *addParam* method with the *sysparm_name* parameter and the name of the script-include method you want to call.
3. Optional. Call the *addParam* method one or more times to provide the script-include code with other parameters it needs.
4. Execute the server-side code by calling *getXML()*.

> **Note:** *getXML()* is the preferred method for executing the code, because it is asynchronous and does not hold up the execution of other client code. Another method, *getXMLWait()*, is also available but is not recommended. Using *getXMLWait()* ensures the order of execution, but can cause the application to seem unresponsive, significantly degrading the user experience of any application that uses it. *getXMLWait()* is not available to scoped applications.

```
var ga = new GlideAjax('HelloWorld'); // HelloWorld is the
 script include class
ga.addParam('sysparm_name','helloWorld'); // helloWorld is the
 script include method
ga.addParam('sysparm_user_name',"Bob"); // Set parameter
 sysparm_user_name to 'Bob'
ga.getXML(HelloWorldParse);  /* Call HelloWorld.helloWorld()
 with the parameter sysparm_user_name set to 'Bob'
      and use the callback function HelloWorldParse() to return
 the result when ready */

// the callback function for returning the result from the
 server-side code
function HelloWorldParse(response) {
   var answer =
 response.responseXML.documentElement.getAttribute("answer");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    alert(answer);
}
```

GlideAjax - GlideAjax(String class_name)

Constructor for *`GlideAjax`*.

Parameters

Name	Type	Description
class_name	String	The name of the server-side class that contains the method you want to execute.

In this example, a client script sets the user to Fred Luddy and then calls a script include to get their manager.

```
// client script - contains onLoad function and a callback
 function

function onLoad() {
   var ga = new GlideAjax('GetUserInfo'); // GetUserInfo is the
 script include name
   ga.addParam('sysparm_name','managerName'); // managerName is
 the function in the script include that we're calling
   ga.addParam('sysparm_user_name','fred.luddy'); // set user to
 Fred Luddy

   /* Call GetUserInfo.managerName() with user set to Fred Luddy
 and use the callback function ManagerParse() to return the
 result when ready */
   ga.getXMLAnswer(ManagerParse);
}

// callback function for returning the result from the script
 include
function ManagerParse(response) {
   alert(response);
}

// GetUserInfo script include

var GetUserInfo = Class.create();
GetUserInfo.prototype =
 Object.extendsObject(global.AbstractAjaxProcessor, {

    managerName: function() {
        var userName = this.getParameter("sysparm_user_name");
        var grUser = new GlideRecord('sys_user');
        grUser.get("user_name", userName);

        // Build the payload. You can return additional data if
 needed.
        var result = {
           "manager": grUser.getDisplayValue('manager')
        };
        return JSON.stringify(result);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    },
    type: 'GetUserInfo'
});
```

GlideAjax - addParam(String parm_name, String parm_value)

Specifies a parameter name and value to be passed to the server-side function associated with this *GlideAjax* object.

You can execute *addParam* multiple times with different parameters and values.

Note: The first call to *addParam* should be with the parameter *sysparm_name* and the name of the server-side method you want to call. The server-side code does not execute until the client script calls *getXML()* or *getXMLAnswer()*.

Parameters

Name	Type	Description
parm_name	String	The name of the parameter to pass. (The name must begin with the `sysparm_`.)
parm_value	String	The value to assign to *parm_name*.

Returns

Type	Description
void	

In this example, a client script sets the user to Fred Luddy and then calls a script include to get their manager.

```
// client script - contains onLoad function and a callback
 function

function onLoad() {
   var ga = new GlideAjax('GetUserInfo'); // GetUserInfo is the
 script include name
   ga.addParam('sysparm_name','managerName'); // managerName is
 the function in the script include that we're calling
   ga.addParam('sysparm_user_name','fred.luddy'); // set user to
 Fred Luddy

   /* Call GetUserInfo.managerName() with user set to Fred Luddy
 and use the callback function ManagerParse() to return the
 result when ready */
   ga.getXMLAnswer(ManagerParse);
}

// callback function for returning the result from the script
 include
function ManagerParse(response) {
   alert(response);
}

// GetUserInfo script include
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var GetUserInfo = Class.create();
GetUserInfo.prototype =
 Object.extendsObject(global.AbstractAjaxProcessor, {

    managerName: function() {
        var userName = this.getParameter("sysparm_user_name");
        var grUser = new GlideRecord('sys_user');
        grUser.get("user_name", userName);

        // Build the payload. You can return additional data if
 needed.
        var result = {
           "manager": grUser.getDisplayValue('manager')
        };
        return JSON.stringify(result);
    },
    type: 'GetUserInfo'
});
```

GlideAjax - getAnswer()

Retrieves the results from a server-side method called from the client via *`getXMLWait()`*.

Parameters

Name	Type	Description
none		

Returns

Type	Description
void	The result returned by the server-side method previously called with *`getXMLWait()`*.

GlideAjax - getXMLAnswer(Function callback, Object additionalParam, Object responseParam)

Calls the processor asynchronously and gets the answer element of the response in XML format.

Parameters

Name	Type	Description
callback	Function	Callback function. The function receives the answer element of the response in XML format as an argument.
additionalParam	Object	Optional. Name-value pair of additional parameters.
responseParam	Object	Optional. Second argument for the callback function.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example retrieves the number of attachments for a given sysid using GlideAjax and updates the UI with the count. It also passes an additional parameter (for example, a timestamp) to the callback function, which can be used for debugging or tracking when the request was made.

```
function updateAttachmentCount(sysid) {
  var ga = new GlideAjax('AttachmentAjax');
  ga.addParam('sysparm_type', 'attachmentCount');
  ga.addParam('sysparm_value', sysid);

  // Adding an additional parameter object
  var additionalParam = { timestamp: new Date().toISOString() };

  ga.getXMLAnswer(numberOfAttachments, additionalParam, sysid);
}

function numberOfAttachments(answer, additionalParam, sysid) {
  var number = parseInt(answer);

  console.log('Additional Param:', additionalParam); //
 Debugging
  console.log('Timestamp:', additionalParam?.timestamp); //
 Example usage

  var buttons = $$('.attachmentNumber_' + sysid);
  if (buttons[0] == undefined)
    $('header_attachment_list_label').down().innerHTML = number;
  else {
    for (var i = 0; i < buttons.length; i++) {
      buttons[i].innerHTML = number;
    }
  }
}
```

GlideAjax - getXML(Function callback)

Sends the server a request to execute the method and parameters associated with this *GlideAjax* object.

The server processes the request asynchronously and -- when ready -- returns the results via the function specified as the *callback_function*.

Parameters

Name	Type	Description
callback	Function	The name of the callback function to process the results returned by the server.

Returns

Type	Description
void	

```
var comments = gel("dialog_comments").value;
var ga = new GlideAjax('validateComments'); //Call script
 include to escape text
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
ga.addParam('sysparm_name', 'validateComments');
ga.addParam('sysparm_comments', comments);
ga.getXML(callback);

return false;

function callback(response) {
  var comments =
 response.responseXML.documentElement.getAttribute("answer");
  comments = trim(comments);
  if (comments == "") {
     //If comments are empty, alert the user and stop submission
     alert("Please enter your comments before submitting.");
  } else {
    //If there are comments, close the dialog window and submit
 them
    GlideDialogWindow.get().destroy(); //Close the dialog window
    g_form.setValue("comments", comments); //Set the "Comments"
 field with comments in the dialog
  }
```

GlideAjax - getXMLWait()

Sends the server a request to execute the method and parameters associated with this *GlideAjax* object.

The server processes the request synchronously and will not process further requests from the client until finished. To retrieve the results, the client must call *getAnswer()*. Using *getXMLWait()* ensures the order of execution, but can cause the application to seem unresponsive, significantly degrading the user experience of any application that uses it. We recommend using *getXML()* instead.

Note: *getXMLWait()* is not available to scoped applications.

Parameters

Name	Type	Description
none		

Returns

Type	Description
void	

```
var ga = new GlideAjax('HelloWorld');
      ga.addParam('sysparm_name','helloWorld');
      ga.addParam('sysparm_user_name',"Bob");
      ga.getXMLWait();
      alert(ga.getAnswer());
```

GlideDialogWindow - Client (deprecated)

The *GlideDialogWindow* API provides methods for displaying a dialog in the current window and frame.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use these methods in scripts anywhere that you can use a client-side JavaScript. These methods are most often called from a UI action with the **Client** check box selected.

Note: This API has been deprecated, use the *GlideModal* API instead.

GlideDialogWindow - GlideDialogWindow(String id, Boolean readOnly, Number width, Number height)

Provides methods for displaying a dialog in the current window and frame.

Use these methods in scripts anywhere that you can use a client-side JavaScript. These methods are most often called from a UI Action with the **Client** check box selected.

Parameters

Name	Type	Description
id	String	Name of the UI page to load into the dialog window.
readOnly	Boolean	Optional. Flag that indicates whether the dialog window is read only (true) or read/write (false). Default: false
width	Number	Optional. Size (in pixels) to set the width of the dialog window.
height	Number	Optional. Size (in pixels) to set the height of the dialog window.

Returns

Type	Description
void	

```
// Creates a dialog window
var gdw = new GlideDialogWindow('show_list');

// Creates a read-only dialog window
var gdw = new GlideDialogWindow('show_list', true);

// Creates a dialog window that is 400 pixels wide
var gdw = new GlideDialogWindow('show_list', false, 400);

// Creates a dialog window that is 400 pixels wide and 200
 pixels tall
var gdw = new GlideDialogWindow('show_list', false, 400, 200);
```

GlideDialogWindow - adjustBodySize()

Adjusts the body height of a dialog window to be the window height minus the header height.

You typically call this method after calling *GlideDialogWindow - setSize()*.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var gdw = new GlideDialogWindow('show_list');
      gdw.setTitle('Test');
      gdw.setSize(750,300);
      gdw.adjustBodySize();
      gdw.render();
```

GlideDialogWindow - destroy()

Closes the dialog window.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
//Destroy the current dialog window.
      GlideDialogWindow.get().destroy();
```

GlideDialogWindow - render()

Renders the dialog window.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var gdw = new GlideDialogWindow('show_list');
      gdw.setTitle('Test');
      gdw.setSize(750,300);
      gdw.setPreference('table', 'u_test_list');
      gdw.setPreference('title', 'A New Title');
      gdw.render();
```

GlideDialogWindow - setPreference(String name, String value)

Sets a given window property to a specified value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Any window property can be set using this method.

Parameters

Name	Type	Description
name	String	The window property to set.
value	String	The value for the window property.

Returns

Type	Description
void	

```
var gdw = new GlideDialogWindow('show_list');
      gdw.setTitle('Test');
      gdw.setSize(750,300);
      gdw.setPreference('table', 'u_test_list');
      gdw.setPreference('title', 'A New Title');
```

GlideDialogWindow - setSize(Number width, Number height)

Sets the size of the dialog window.

If you do not pass width and height parameters, a default size is used.

Parameters

Name	Type	Description
width	Number	The width of the dialog window.
height	Number	The height of the dialog window.

Returns

Type	Description
void	

```
var gdw = new GlideDialogWindow('show_list');
      gdw.setSize(750,300);
```

GlideDialogWindow - setTitle(String title)

Sets the title of the dialog window.

Parameters

Name	Type	Description
title	String	The title for the current window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
//var gdw = new GlideDialogWindow('show_list');
      gdw.setTitle('test');
```

GlideDocument - Client

The *GlideDocument* API provides methods to search a Document Object Model (DOM) element, a document, or a JQuery element.

You can use this API in client-side scripts using *ListV2* and *ListV3* APIs. The *GlideDocument* APIs are accessed using the `g_document` global object.

GlideDocument - getElement(String selector, Element context)

Returns a node found in the specified DOM based context or created from the HTML context.

Parameters

Name	Type	Description
selector	String or Object	Selector expression
context	String or Object	Optional. DOM Element, document, or JQuery object to search.

Returns

Type	Description
node	Node that matches the selector.

This example shows how to get the list view name value from a UI page.

```
//HTML entry
<input type="hidden" id="list_view" name="list_view"
 value="${sysparm_list_view}" />

// Client script
var listView = g_document.getElement('#list_view').value;
```

GlideDocument - getElements(String selector, Element context)

Returns a node list found in the specified DOM based context or created if an HTML context is specified.

Parameters

Name	Type	Description
selector	String or Object	The selector expression
context	String or Object	(Optional) A DOM Element, document, or JQuery object to be searched.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
node list	A list of nodes that matches the selector.

GlideFlow - Client

The *GlideFlow* API provides methods for client-side interactions with actions, flows, and subflows.

You can use this API with classic ServiceNow AI Platform UI experiences that accept client scripts. The action, flow, or subflow must be set as client callable, and have a valid ACL using the Manage Security feature in Workflow Studio.

Note: This APi is incompatible with the Workspace Experience UI.

Some of the methods within the *GlideFlow* API return `promise` objects. A `promise` represents the eventual result of an asynchronous operation. For more information on promises, see Promise - Javascript MDN or AngularJS documentation.

Using this API, you can:

- Start actions, flows, or subflows via a script.
- Get an existing execution.
- Get the status and any available outputs.
- Wait for the completion of an action, flow, or subflow.

There is no constructor for the *GlideFlow* API. Access *GlideFlow* methods using the `GlideFlow` global object.

GlideFlow - execution.awaitCompletion()

Returns a completion object for the execution.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	An object that contains completion details for a flow or action execution.

In this example, an action is executed using startAction(), which returns an execution object. The code then uses awaitCompletion() on this execution object, which returns a completion object. The code uses this completion object to log the status and outputs within the execution.

```
(function() {
 var inputs = {};

 inputs['input1'] = 'string input'; // String
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 GlideFlow.startAction('global.action_name', inputs)
  .then(function(execution) {
   return execution.awaitCompletion();
  }, errorResolver)
  .then(function(completion) {
   var status = completion.status;
   console.log(status);

   // Available Outputs:
   var outputs = completion.outputs;
   console.log(outputs);
  }, errorResolver());

 function errorResolver(error) {
  // Handle errors in error resolver
  console.error(error);
 }
})();
```

GlideFlow - execution.getExecutionStatus()

Returns a string containing the execution status of the current execution.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	A string containing the execution status.

In this example, the code obtains an execution object using the getExecution method. The getExecution method requires an ID, which is returned by the method used to start the execution. The code then uses getExecutionStatus() to determine whether the execution has been completed before continuing.

```
// Get an existing action, getStatus, and getOutputs if complete
(function() {
   GlideFlow.getExecution('mamIN4Q35vmEFe744EwJV5GHrSz8fmJG')
      .then(function(execution) {
         execution.getExecutionStatus().then(
            function(status) {
               if (status === 'COMPLETE')
                  execution.getOutputs().then(
                     function(outputs) {
                        console.log(outputs);
                     },
                     errorResolver
                  );
            },
            errorResolver
         );
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      }, errorResolver);

   function errorResolver(error) {
      // Handle errors in error resolver
      console.error(error);
   }
})();
```

GlideFlow - execution.getOutputs()

Returns an outputs object for the execution.

Use this method to access output generated by the execution of an action, flow, or subflow.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	An object containing outputs for an action, flow, or subflow.

In this example, the code obtains an execution object using the getExecution method. After the execution is complete, the code uses getOutputs() to return an outputs object, which it then logs using the console.log method.

```
// Get an existing action, getStatus, and getOutputs if complete
(function() {
   GlideFlow.getExecution('mamIN4Q35vmEFe744EwJV5GHrSz8fmJG')
      .then(function(execution) {
         execution.getExecutionStatus().then(
            function(status) {
               if (status === 'COMPLETE')
                  execution.getOutputs().then(
                     function(outputs) {
                        console.log(outputs);
                     },
                     errorResolver
                  );
            },
            errorResolver
         );
      }, errorResolver);

   function errorResolver(error) {
      // Handle errors in error resolver
      console.error(error);
   }
})();
```

GlideFlow - getExecution(String executionId)

Get an existing execution instance by ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
executionId	String	The ID of the execution to be retrieved.

Returns

Type	Description
Object	A promise of an execution object.

In this example, the code gets an execution, then waits for it to be completed before logging the executions completion status and outputs using console.log.

```
// Get an existing action and await completion
(function() {
 GlideFlow.getExecution('79cd437e0b202300a150a95e93673ae3')
  .then(function(execution) {
   return execution.awaitCompletion();
  }, errorResolver)
  .then(function(completion) {

   var status = completion.status;
   console.log(status);

   // Available Outputs:
   var outputs = completion.outputs;
   console.log(outputs);
  }, errorResolver());

 function errorResolver(error) {
  // Handle errors in error resolver
  console.error(error);
 }
})();
```

GlideFlow - startAction(String scopedName.actionName, Map inputs)

Start an action.

Parameters

Name	Type	Description
scopedName	String	The scoped name of the flow to be executed.
inputs	Object	An object containing inputs defined for the action.

Returns

Type	Description
Object	An object containing details on the action execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this example, the code starts the global action_name action using arguments in the inputs input object variable. Upon completion, the example uses console.log or console.error to report on the success or failure of the flow.

```
// Start an action and await completion.
(function() {
 var inputs = {};

 inputs['input1'] = 'string input'; // String

 GlideFlow.startAction('global.action_name', inputs)
  .then(function(execution) {
   return execution.awaitCompletion();
  }, errorResolver)
  .then(function(completion) {
   var status = completion.status;
   console.log(status);

   // Available Outputs:
   var outputs = completion.outputs;
   console.log(outputs);
  }, errorResolver());

 function errorResolver(error) {
  // Handle errors in error resolver
  console.error(error);
 }
})();
```

GlideFlow - startFlow(String scopedName.flowName, Map inputs)

Start a flow.

Parameters

Name	Type	Description
scopedName	String	The scoped name of the flow to be executed.
inputs	Object	An object containing inputs defined for the flow.

Returns

Type	Description
Object	An object containing details on the flow execution.

This example flow is normally triggered when a record on the incident table is updated. Because you are activating the flow from Client script, you must provide this information. The code creates an inputs variable that contains the current record and the table for the record

```
// Start a Flow
(function() {
      var inputs = {};
      inputs['current'] = { // GlideRecord
        table : 'incident',
```

```
        sys_id : '79cd437e0b202300a150a95e93673ae3'
    };
        inputs['table_name'] = 'incident';
         GlideFlow.startFlow('global.flow_name', inputs)
  .then(
   function(execution) {
    console.log('Started flow_name with execution id :' +
 execution.getExecutionId());
   },
   function(error) {
    console.log('Unable to start flow: ' + error);
   }
  );
})();
```

GlideFlow - startSubflow(String scopedName.subflowName, Map inputs)

Start a subflow.

Parameters

Name	Type	Description
scopedName	String	The scoped name of the flow to be executed.
inputs	Object	An object containing inputs used for the subflow.

Returns

Type	Description
Object	An object containing details on the subflow execution.

In this example, the code starts the global subflow_name subflow using arguments in the inputs array variable. Upon completion, the example uses console.log or console.error to report on the success or failure of the flow.

```
// Start an action and await completion.
(function() {
 var inputs = {};

 inputs['input1'] = 'string input'; // String

 GlideFlow.startSubflow('global.subflow_name', inputs)
  .then(function(execution) {
   return execution.awaitCompletion();
  }, errorResolver)
  .then(function(completion) {
   var status = completion.status;
   console.log(status);

   // Available Outputs:
   var outputs = completion.outputs;
   console.log(outputs);
  }, errorResolver());

 function errorResolver(error) {
```

```
  // Handle errors in error resolver
  console.error(error);
 }
})();
```

GlideForm (g_form) - Client

The *GlideForm* API provides methods to customize forms.

Only use *GlideForm* methods on the client. You can use these methods to make custom changes to the form view of records. All validation of examples was done using client scripts.

You can also use some of these methods in other client scripts (such as Catalog Client Scripts or Wizard Client Scripts), but you must first test this to determine whether they will work as expected.

Note: The methods *getControl()*, *getHelpTextControl()*, *getElement()*, and *getFormElement()* are deprecated for mobile devices. For information on using *GlideForm* for mobile, see Mobile Client GlideForm (g_form) Scripting and Migration.

There is no constructor for the *GlideForm* class. Access *GlideForm* methods using the `g_form` global object.

GlideForm - addDecoration(String fieldName, String icon, String title)

Adds an icon on a field's label.

Adding the same item twice is prevented; however, you can add the same icon with a different title.

Note: This method is not supported by Service Catalog.

Parameters

Name	Type	Description
fieldName	String	The field name.
icon	String	The font icon to show next to the field. Supported icons - icon-user, icon-user-group, icon-lightbulb, icon-home, icon-mobile, icon-comment, icon-mail, icon-locked, icon-database, icon-book, icon-drawer, icon-folder, icon-catalog, icon-tab, icon-cards, icon-tree-right, icon-tree, icon-book-open, icon-paperclip, icon-edit, icon-trash, icon-image, icon-search, icon-power, icon-cog, icon-star, icon-star-empty, icon-new-ticket, icon-dashboard, icon-cart-full, icon-view, icon-label, icon-filter, icon-calendar, icon-script, icon-add, icon-delete, icon-help, icon-info, icon-check-circle, icon-alert, icon-sort-ascending, icon-console, icon-list, icon-form, and icon-livefeed.
title	String	The text title for the icon.

Returns

Type	Description
void	

```
g_form.addDecoration('caller_id', 'icon-star', 'preferred
 member');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideForm - addDecoration(String fieldName, String icon, String title, String color)

Adds an icon on a field's label.

Adding the same item twice is prevented; however, you can add the same icon with a different title.

Note: This method is not supported by Service Catalog.

Parameters

Name	Type	Description
fieldName	String	The field name.
icon	String	The font icon to show next to the field. Supported icons - icon-user, icon-user-group, icon-lightbulb, icon-home, icon-mobile, icon-comment, icon-mail, icon-locked, icon-database, icon-book, icon-drawer, icon-folder, icon-catalog, icon-tab, icon-cards, icon-tree-right, icon-tree, icon-book-open, icon-paperclip, icon-edit, icon-trash, icon-image, icon-search, icon-power, icon-cog, icon-star, icon-star-empty, icon-new-ticket, icon-dashboard, icon-cart-full, icon-view, icon-label, icon-filter, icon-calendar, icon-script, icon-add, icon-delete, icon-help, icon-info, icon-check-circle, icon-alert, icon-sort-ascending, icon-console, icon-list, icon-form, and icon-livefeed.
title	String	The text title for the icon.
color	String	A CSS color.

Returns

Type	Description
void	

```
g_form.addDecoration('caller_id', 'icon-star', 'Mark as
 Favorite', 'color-green');
```

GlideForm - addErrorMessage(String message)

Displays the specified error message at the top of the form.

This message appears for approximately four seconds and then disappears. This timeout is not configurable at this time.

Parameters

Name	Type	Description
message	String	Message to display.

Returns

Type	Description
void	

```
g_form.addErrorMessage('This is an error');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideForm - addFormMessage(String message, String type, Object options)

Displays a floating form message at the top of the form detail section. The message does not cover UI actions.

See also:

- clearAllFormMessages()
- clearFormMessages()

Parameters

Name	Type	Description
message	String	Message to display.
type	String	The type of message. Valid values: • error • info • warning
options	Object	Optional. Object containing buttons to add to the form message and any metadata needed to handle a button click. `{ buttons: [Array], meta: {Object} }`
options.buttons	Array	Array of buttons to add to the form message. `buttons: [ { label: "String", actionName: "String" } ]`
options.buttons.label	String	Text to display on the button.
options.buttons.actionName	String	Name used by FORM_MESSAGE_BUTTON_CLICKED event handlers to determine the button that was clicked. For example, if you add a button with the actionName `assign_to_me`, you must create an event handler in UIB on the FORM_MESSAGE_BUTTON_CLICKED event that only executes when the actionName is `assigned_to_me`.
options.meta	Object	Map of any metadata needed to handle the button click formatted as key-value pairs. `meta: { 'key': 'value' }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For example, for an **Assign to me** button the event handler needs the sys_id of the user to assign the record to.

Returns

Type	Description
None	

The following example shows how to add form messages of each type.

```
g_form.addFormMessage('info message','info');
g_form.addFormMessage('warning message','warning');
g_form.addFormMessage('error message','error');
g_form.addFormMessage('info2 message','info');
g_form.addFormMessage('warning2 message','warning');
g_form.addFormMessage('error2 message','error');
g_form.addFormMessage('Would you like to reassign this
 to yourself?', 'info', {buttons: [{label: "Assign to
 me", actionName: "assign_to_me"}], meta: {'userId':
 '46d44a23a9fe19810012d100cca80666'}});
```

GlideForm - addInfoMessage(String message)

Adds the specified informational message to the top of the form.

This message appears for approximately four seconds and then disappears. This timeout is not configurable at this time.

Parameters

Name	Type	Description
message	String	Message to display.

Returns

Type	Description
void	

```
g_form.addInfoMessage('The top five fields in this form are
 mandatory');
```

GlideForm - addOption(String fieldName, String choiceValue, String choiceLabel)

Adds a choice to the end of a choice list field.

Parameters

Name	Type	Description
fieldName	String	The name of the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
choiceValue	String	The value to be stored in the database.
choiceLabel	String	The value displayed.

Returns

Type	Description
void	

```
g_form.addOption('priority', '6', '6 - Really Low');
```

GlideForm - addOption(String fieldName, String choiceValue, String choiceLabel, Number choiceIndex)

Adds a choice to the list field at the position specified.

Note: Duplicate list labels are not supported in Service Portal. For example, items with label text matching another label are ignored and not added to the list.

Parameters

Name	Type	Description
fieldName	String	The field name.
choiceValue	String	The value stored in the database.
choiceLabel	String	The value displayed.
choiceIndex	Number	Order of the choice in the list. The index is into a zero based array.

Returns

Type	Description
void	

```
g_form.addOption('priority', '2.5', '2.5 - Moderately High', 3);
```

GlideForm - clearMessages()

Removes all informational and error messages from the top of the form.

Removes informational and error messages added with *g_form.addInfoMessage()* and *g_form.addErrorMessage()*.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
g_form.clearMessages();
```

GlideForm - clearAllFormMessages()

Removes all form messages of any type.

See also:

- addFormMessage()
- clearFormMessages()

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to clear all messages from the form.

```
g_form.clearAllFormMessages();
```

GlideForm - clearFormMessages(String type)

Removes all form messages of a given type.

See also:

- addFormMessage()
- clearAllFormMessages()

Parameters

Name	Type	Description
type	String	The type of message. Valid values: • error • info • warning

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to clear all error messages from the form.

```
g_form.clearFormMessages('error');
```

GlideForm - clearOptions(String fieldName)

Removes all options from the choice list.

Parameters

Name	Type	Description
fieldName	String	Name of the field.

Returns

Type	Description
void	

GlideForm - clearValue(String fieldName)

Removes any value(s) from the field.

Parameters

Name	Type	Description
fieldName	String	Name of the field.

Returns

Type	Description
void	

GlideForm - disableAttachments()

Prevents file attachments from being added.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

GlideForm - enableAttachments()

Allows file attachments to be added. Shows the paper clip icon.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GlideForm - flash(String fieldName, String color, Number count)

Used to draw attention to a particular field. Flashes the specified color for a specified duration of time in the specified field.

This method is not supported by Service Catalog.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
fieldName	String	Specifies the field to highlight in the following format: `"<table-name>.<field-name>"`.
color	String	RGB color or acceptable CSS color.
count	Number	Specifies how long the label will flash. Options include: • 2: Flashes for 1 second • 0: Flashes for 2 seconds • -2: Flashes for 3 seconds • -4: Flashes for 4 seconds

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
g_form.flash("incident.number", "#FFFACD", 0);
```

GlideForm - getActionName()

Returns the most recent action name, or, for a client script, the sys_id of the UI action clicked.

Note: Not available in Wizard client scripts.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The current action name.

```
function onSubmit() {
   var action = g_form.getActionName();
   alert('You pressed ' + action);
}
```

GlideForm - getBooleanValue(String fieldName)

Returns a Boolean value for the specified field.

Parameters

Name	Type	Description
fieldName	String	Name of the field.

Returns

Type	Description
Boolean	Returns false if the field value is false or undefined; otherwise returns true.

GlideForm - getControl(String fieldName)

Returns the HTML element for the specified field.

Compound fields may contain several HTML elements. This method is generally not necessary as there are built-in methods that use the fields on a form.

If the field is a reference field and the control is a choice list, *`getControl()`* may not return a control as expected. In this case, use `sys_select.<table name>.<field name>`.

This method is not available in mobile scripts or Service Portal scripts.

Parameters

Name	Type	Description
fieldName	String	Name of the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
HTMLElement	The field's HTML element.

GlideForm - getDecimalValue(String fieldName)

Returns the decimal value of the specified field.

Parameters

Name	Type	Description
fieldName	String	The name of the field.

Returns

Type	Description
String	The decimal value of the specified field.

```
function onChange(control, oldValue, newValue, isLoading) {
   alert(g_form.getDecimalValue('percent_complete'));
}
```

GlideForm - getDisplayBox(String fieldName)

Gets the display value from a form in the core UI.

Note: To get a display value from a form in Service Portal, use the getDisplayValue() method.

See also:

- getValue()
- Get the display value of a reference variable

Parameters

Name	Type	Description
fieldName	String	Name of the field from which you want to retrieve a value in the form.

Returns

Type	Description
None	

```
var caller = g_form.getDisplayBox('caller_id').value;

var assignee = g_form.getDisplayBox('assigned_to').value;

if (caller == assignee)
{
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   alert('in');
}
```

GlideForm - getDisplayValue(String fieldName)

Gets the display value from a form in Service Portal.

Note: To get a display value from a form in the core UI, use the getDisplayBox() method.

See also:

- getValue()
- Get the display value of a reference variable

Note: In the core UI, calling this method as `g_form.getDisplayValue()` without an argument returns the record display value rather than the display value of an individual field.

Parameters

Name	Type	Description
fieldName	String	Name of the field from which you want to retrieve a value in the form.

Returns

Type	Description
None	

The following example shows how to get the display value of a reference variable in the core UI or Service Portal. The use case for this example is on the community site.

```
function onChange(control, oldValue, newValue, isLoading) {
     if (isLoading || newValue == '') {
          return;
     }
     if(window == null){
          var valuePortal = g_form.getDisplayValue('requester');
          alert('Portal->' + valuePortal);
     }
     else{
          var valueNative =
 g_form.getDisplayBox('requester').value;
          alert('CoreUI->' + valueCoreUI);
     }
     //Type appropriate comment here, and begin script below
}
```

GlideForm - getElement(String id)

Returns the HTML element specified by the parameter.

Compound fields may contain several HTML elements. This method is generally not necessary as there are built-in methods that use the fields on a form.

This method is not available in mobile scripts or Service Portal scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
id	String	The field id.

Returns

Type	Description
HTMLElement	The field's HTML element.

GlideForm - getFormElement()

Returns the HTML element for the form.

This method is not available in mobile scripts or Service Portal scripts.

Parameters

Name	Type	Description
None		

Returns

Type	Description
HTMLFormElement	The HTML element for the form.

GlideForm - getHelpTextControl(String fieldName)

Returns the HTML element of the help text for the specified field.

This method is applicable to service catalog variables only.

Parameters

Name	Type	Description
fieldName	String	Name of the field.

Returns

Type	Description
HTMLElement	Help text field's HTML element.

GlideForm - getIntValue(String fieldName)

Returns the integer value of the field.

Parameters

Name	Type	Description
fieldName	String	The field name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Integer value of the field.

GlideForm - getLabelOf(String fieldName)

Returns the plain text value of the field label.

Parameters

Name	Type	Description
fieldName	String	The field name

Returns

Type	Description
String	The label text.

```
if (g_user.hasRole('itil')) {
    var oldLabel = g_form.getLabelOf('comments');
    g_form.setLabelOf('comments', oldLabel + ' (Customer
 visible)');
}
```

GlideForm - getOption(String fieldName, String choiceValue)

Returns the option element for a selected box named *fieldName* where *choiceValue* matches the option value.

Note: This method does not work on read-only fields.

Parameters

Name	Type	Description
fieldName	String	Name of the field.
choiceValue	String	Value of the option.

Returns

Type	Description
HTMLElement	The HTMLElement for the option. Returns null if the field or option is not found.

The following example shows how to get the label for a choice list value.

```
// Get the label for a choice list value
// fieldName is 'category'

function onChange(control, oldValue, newValue, isLoading) {
var choiceValue = g_form.getValue('category');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var choiceLabel = g_form.getOption('category',
 choiceValue).text;
}
```

GlideForm - getReference(String fieldName, Function callBack)

Returns the GlideRecord for a specified field.

If a callback function is present, this routine runs asynchronously. The browser (and script) processing continues normally until the server returns the reference value, at which time, the callback function is invoked. If a callback function is not present, this routine runs synchronously and processing halts (causing the browser to appear to hang) while waiting on a server response.

Important: It is strongly recommended that you use a callback function.

Callback function support for ServiceCatalogForm.getReference is available.

Note: Using this method requires a call to the server which requires additional time and may introduce latency to your page. Use this method with caution. For additional information, see Client script design and processing.

Parameters

Name	Type	Description
fieldName	String	Name of the field.
callBack	Function	Name of the call back function.

Returns

Type	Description
GlideRecord	GlideRecord object for the specified field. If the specified reference cannot be found, it returns an initialized GlideRecord object where currentRow = -1 and rows.length = 0.

```
function onChange(control, oldValue, newValue, isLoading) {
    g_form.getReference('caller_id', doAlert); // doAlert is our
 callback function
}

function doAlert(caller) { // reference is passed into callback
 as first arguments
   if (caller.getValue('vip') == 'true') {
      alert('Caller is a VIP!');
   }
}
```

GlideForm - getRelatedListNames()

Returns an array of related list names from the current form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	String array of related list names from the current form. The related list names are listed in the order in which they appear on the form.

```
var listNames = g_form.getRelatedListNames();

for (var i = 0; i < listNames.length; i++) {
  this.showRelatedList(listNames[i]);
 }
```

GlideForm - getSectionNames()

Returns all section names, whether visible or not.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array of strings	The section names.

GlideForm - getSections()

Returns an array of the form's sections.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array of HTML elements	The form's sections.

```
function onChange(control, oldValue, newValue, isLoading) {
   //this example was run on a form divided into sections
 (Change form)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   // and hid a section when the "state" field was changed
   var sections = g_form.getSections();
   if (newValue == '2') {
      g_form.setSectionDisplay(sections[1], false);
   } else {
      g_form.setSectionDisplay(sections[1], true);
   }
}
```

GlideForm - getTableName()

Returns the name of the table to which this record belongs.

On the server side, the table for the current record can be retrieved with *current.sys_class_name* or *current.getTableName()*.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the table.

```
function onLoad() {
    if (g_form.isNewRecord()) {
        var tableName = g_form.getTableName(); //Get the table
 name
    }
}
```

GlideForm - getUniqueValue()

Returns the sys_id of the record displayed in the form.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The record's sys_id.

```
function onLoad() {
   var incSysid = g_form.getUniqueValue();
   alert(incSysid);
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideForm - getValue(String fieldName)

Returns the value of the specified form field.

This method also supports getting values from a multi-row variable set (MRVS). To obtain data from fields within an MRVS, you must first use `JSON.parse(getValue('<mrvs_field_name>') || '[]')` to obtain the MRVS array, and then use indexing to access the fields within the row objects. For more details, see the code example below.

Parameters

Name	Type	Description
fieldName	String	Name of the field whose value to return.

Returns

Type	Description
String	Value of the specified field.

The following example shows how to get the short description from the current form.

```
function onChange(control, oldValue, newValue, isLoading) {
   alert(g_form.getValue('short_description'));
}
```

The following example shows how to get values from an MRVS. In this example, salaries are being managed through the Service Catalog. The client script searches all rows within the MRVS for the value entered in the **Job title** and then updates the matching entries within the MRVS with what is entered in the **Salary** field. The MRVS is named "variable_set_1" and contains the following fields within each row object: Employee name [employee_name], Job title [employee_job_title], and Salary [employee_salary]. In addition, the Catalog Item contains: Job title [job_title] and Salary [salary].

```
function onChange(control, oldValue, newValue, isLoading) {
if (isLoading || newValue == '') {
return;
}

// Get the MRVS
var vs1 = g_form.getValue('variable_set_1') || '[]';
var multiRowVariableSet = JSON.parse(vs1);

for (var i = 0; i < multiRowVariableSet.length; i++) {
// Check if the entered job title matches the title in the
 current MRVS row
  if (multiRowVariableSet[i].employee_job_title ==
 g_form.getValue("job_title")){
    // Update the value of a matching field with the new salary
    multiRowVariableSet[i].employee_salary = newValue;
  }
}

// Update the MRVS
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
g_form.setValue('variable_set_1',
 JSON.stringify(multiRowVariableSet));
}
```

GlideForm - hideAllFieldMsgs()

Hides all field messages.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GlideForm - hideAllFieldMsgs(String type)

Hides all field messages of the specified type.

Parameters

Name	Type	Description
type	String	The type of message. Valid values: • error • info

Returns

Type	Description
void	

GlideForm - hideErrorBox(String fieldName)

Hides the error message placed by *showErrorBox()*.

Whenever possible, use *hideFieldMsg()* rather than this method whenever possible.

Parameters

Name	Type	Description
fieldName	String	The name of the field or control.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideForm - hideFieldMsg(String fieldName, Boolean clearAll)

Hides the first message that appears in the specified field on the current form.

Use the GlideForm - showFieldMsg(String field, String message, String type) or GlideForm - showFieldMsg(String field, String message, String type, Boolean scrollForm) methods to display messages on a form.

For example, the following code snippet shows how to display two messages on the `work_notes` field of a form and then hide the first message:

```
g_form.showFieldMsg('work_notes', 'First message', "error");
g_form.showFieldMsg('work_notes', 'Second message', "error");
g_form.hideFieldMsg('work_notes', false); // This call hides the
 'First message'
```

Parameters

Name	Type	Description
fieldName	String	Name of the field on which to hide the message.
clearAll	Boolean	Optional. Flag that indicates whether to hide all messages for the specified field. Valid values: • true: Hide all messages. • false: Only hide the first message being displayed. Default: false

Returns

Type	Description
void	

The following example shows how to clear all messages for a specified form field and then display an encryption error message.

```
function submitEncryptedInputs() {
  return processEncryptedInputs(function(inputName, fieldName) {
    if (!checkEncryptedFieldValue(fieldName)) {
      g_form.hideFieldMsg(fieldName, true); // Hide all messages
 for the specified field
      g_form.showFieldMsg(fieldName, "Your activity requires an
 encrypted input.", "error");
      return false;
    }
    return true;
  });
}
```

GlideForm - hideRelatedList(String listTableName)

Hides the specified related list on the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
listTableName	String	Name of the related list. Use the sys_id to hide a list through a relationship.

Returns

Type	Description
void	

GlideForm - hideRelatedLists()

Hides all related lists on the form.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GlideForm - isLiveUpdating()

Returns true while a live update is being done on the record the form is showing.

This can be used in an *onChange()* client script to determine if a change to the record is because of a live update from another session. The client script can then decide what action to take, or not to take. This applies to systems using Core UI with live forms enabled.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if a live update is happening on the record displayed by the form.

GlideForm - isMandatory(String fieldName)

Returns true if the field is mandatory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mandatory fields are visually distinguished by an asterisk next to the field label. The asterisk is red if the field is empty, and black if the field is not empty. The system displays a validation message if a user attempts to save or submit the form without completing those fields. For more information, see Form fields.

Parameters

Name	Type	Description
fieldName	String	Name of the field.

Returns

Type	Description
Boolean	True if the field is required, false otherwise.

GlideForm - isNewRecord()

Returns true if the record has never been saved.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if the record has not been saved; otherwise false.

```
function onLoad() {
   if(g_form.isNewRecord()){
      alert('New Record!');
   }
}
```

GlideForm - isSectionVisible(String sectionName)

Returns true if the section is visible.

Important: The isSectionVisible() function is not supported in Workspace.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true when the section is visible; otherwise, false is returned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideForm - isVisible(String fieldName)

Determines whether the field associated with the passed-in field name is visible on the current form.

Parameters

Name	Type	Description
fieldName	String	Name of the field to check whether it is visible on the current form.

Returns

Type	Description
Boolean	Flag that indicates whether the specified field is visible on the current form. Valid values: • true: Field is visible on the form. • false: Field isn't visible on the form.

The following code example shows how to check if the `user_address` field is visible on the current form.

```
if(g_form.isVisible('user_address')) {
    alert('is visible');
}
else {
    alert('is hidden');
}
```

GlideForm - onUserChangeValue(Function fn)

Registers a custom event listener that detects when any field in the current form is modified by a user.

When a form field is modified, the event listener calls the function that is passed in when the listener is initially registered. This listener is only triggered when a user makes a change to a field on the form. Changes from client scripts, UI policies, or any other non-user interactions, do not trigger the listener.

Note: This method does not work for journal fields or Service Catalog items in the classic environment.

Parameters

Name	Type	Description
fn	Function	Function to call when a user changes the value of a field within the current form. This is actually the function code, not just the function name. This function must accept the following three arguments:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• field name • original field value • updated field value

Returns

Type	Description
Function	Function to call to unregister the onUserChangeValue event listener.

```
var handler = function(fieldname, originalValue, newValue) {
  console.log('The field ('+ fieldname + ') has a new value of:
 ' + newValue); // function code
}

var unregister = g_form.onUserChangeValue(handler);

// To unregister the event listener
unregister();
```

GlideForm - refreshSlushbucket(String fieldName)

You can update a list collector variable.

Parameters

Name	Type	Description
fieldName	String	Name of the slush bucket.

Returns

Type	Description
void	

```
g_form.refreshSlushbucket('bucket');
```

GlideForm - removeDecoration(String fieldname, String icon, String title)

Removes the icon from the specified field that matches the icon and title.

Note: This method is not supported by Service Catalog.

Parameters

Name	Type	Description
fieldName	String	Field name.
icon	String	Name of the icon to remove.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
title	String	The icon's text title (name).

Returns

Type	Description
void	

```
function onChange(control, oldValue, newValue, isLoading) {
 // if the caller_id field is not present, then we can't add an
 icon anywhere
 if (!g_form.hasField('caller_id'))
  return;

 if (!newValue)
  return;

 g_form.getReference('caller_id', function(ref) {
  g_form.removeDecoration('caller_id', 'icon-star', 'VIP');

  if (ref.getValue('vip') == 'true')
   g_form.addDecoration('caller_id', 'icon-star', 'VIP');
 });
}
```

GlideForm - removeDecoration(String fieldname, String icon, String title, String color)

Removes the icon from the specified field that matches the icon, title, and color.

Note: This method is not supported by Service Catalog.

Parameters

Name	Type	Description
fieldName	String	Field name.
icon	String	Name of the icon to remove.
title	String	The icon's text title (name).
color	String	A CSS color

Returns

Type	Description
void	

```
g_form.removeDecoration('caller_id', 'icon-star', 'VIP',
 'blue');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideForm - removeOption(String fieldName, String choiceValue)

Removes the specified option from the choice list.

Parameters

Name	Type	Description
fieldName	String	Name of the field.
choiceValue	String	The value stored in the database. This is not the label.

Returns

Type	Description
void	

```
g_form.removeOption('priority', '1');
```

GlideForm - save()

Saves the record without navigating away (update and stay).

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GlideForm - setMandatory(String fieldName, Boolean mandatory)

Makes the specified field mandatory.

Mandatory fields are visually distinguished by an asterisk next to the field label. The asterisk is red if the field is empty, and black if the field is not empty. The system displays a validation message if a user attempts to save or submit the form without completing those fields. For more information, see Form fields.

Note: Whenever possible, use a UI policy rather than this method.

Parameters

Name	Type	Description
fieldName	String	Name of the field.
mandatory	Boolean	When true makes the field mandatory. When false makes the field optional.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

GlideForm - setSectionDisplay(String sectionName, Boolean display)

Shows or hides a section.

Parameters

Name	Type	Description
sectionName	String	The section name is lower case with an underscore replacing the first space in the name, and with the remaining spaces being removed, for example "Section Four is Here" becomes "section_fourishere". Other non-alphanumeric characters, such as ampersand (&), are removed. Section names can be found by using the `getSectionNames()` method.
display	Boolean	When true shows the section. When false hides the section.

Returns

Type	Description
Boolean	Returns true when successful.

GlideForm - setValue(String fieldName, String value, String displayValue)

Sets the value of a specified form field to the value of a specified display value in a reference record.

To improve performance by preventing a round trip when setting the value for a reference field, use this method, not `setValue(fieldName, value)`. When setting multiple reference values for a list collector field, pass arrays in the `value` and `displayValue` parameters.

Note: The method `setValue()` can cause a stack overflow when used in an OnChange client script. This is because every time the value is set, it will register as a change, which may re-trigger the OnChange client script. To prevent this, perform a check that will validate that the new value will be different from the old value. For example, before performing `setValue(shortDesc, newValue.toUpperCase());`, validate that the short description is not already uppercase. This will prevent the client script from applying the `toUpperCase()` more than once.

Parameters

Name	Type	Description
fieldName	String	Name of the form field to update.
value	String or Array	Sys_id of the reference record to use to update the field. If the specified field is a GlideList, this parameter can contain an array of sys_ids. In this case, the method performs a lookup of all records specified in the array and those values are used to update the contents of the specified field (related list).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Note: When defining a value in a choice list, be sure to use number value rather than the label.
displayValue	String or Array	Field within the specified reference record to use to update the specified field. For example, in the User [sys_user] table it might be userName. If the specified field is a GlideList, this parameter can contain an array of display value names. For additional information on display values, see Display value.

Returns

Type	Description
void	

This example shows passing the sys_id of the reference record that contains the userName field to use to update the **assigned_to** form field.

```
g_form.setValue('assigned_to', userSysID, userName);
```

This example shows passing an array of reference record sys_ids and an array of corresponding display value names to use to update the form fields in the GlideList **glide-list_field_name**.

```
g_form.setValue('glide-list_field_name', sysIDArray,
 displayNameArray);
```

GlideForm - showErrorBox(String name, String message, Boolean scrollForm)

Displays an error message under the specified form field (either a control object or the name of the field). If the control or field is currently off the screen and the scrollForm parameter is true, the form scrolls to the control or field.

A global property (glide.ui.scroll_to_message_field) is available that controls automatic message scrolling when the form field is off screen (scrolls the form to the control or field). The *`showFieldMsg()`* method is a similar method that requires a type parameter.

Parameters

Name	Type	Description
name	String	Name of the field or control.
message	String	Message to display.
scrollForm	Boolean	When true scrolls the form to the field. When false the form does not scroll to the field.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideForm - showFieldMsg(String field, String message, String type)

Displays either an informational or error message under the specified form field (either a control object or the name of the field). If the control or field is off the screen, the form is scrolled to the field.

A global property (glide.ui.scroll_to_message_field) is available that controls automatic message scrolling when the form field is off screen (scrolls the form to the control or field).

The *showErrorBox()* method is a shorthand method that does not require the type parameter.

Note: This method does not work with the *journal_field* type field in Core UI.

Parameters

Name	Type	Description
field	String	Name of the field or control.
message	String	Message to display.
type	String	"error","info", or "warning".

Returns

Type	Description
void	

```
g_form.showFieldMsg('impact','Low impact response time can be
 one week','info');
```

GlideForm - showFieldMsg(String field, String message, String type, Boolean scrollForm)

Displays either an informational or error message under the specified form field (either a control object or the name of the field). If the control or field is currently off the screen and scrollForm is true, the form is scrolled to the field.

A global property (glide.ui.scroll_to_message_field) is available that controls automatic message scrolling when the form field is off screen (scrolls the form to the control or field).

The *showErrorBox()* method is a shorthand method that does not require the type parameter.

Note: This method does not work with the *journal_field* type field in Core UI.

Parameters

Name	Type	Description
field	String	Name of the field or control.
message	String	Message to display.
type	String	"error","info", or "warning".
scrollForm	Boolean	When true, the form scrolls to the field if it is off screen. When false, the form does not scroll.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
g_form.showFieldMsg('impact','Low impact not allowed with High
 priority','error',false);
```

GlideForm - setDisabled(String fieldName, Boolean disable)

Makes the specified field available or unavailable.

Parameters

Name	Type	Description
fieldName	String	Name of the field.
disable	Boolean	When true disables the field. When false enables the field.

Returns

Type	Description
void	

GlideForm - setDisplay(String fieldName, Boolean display)

Displays or hides a field.

This method cannot hide a mandatory field with no value. If the field is hidden, the space is used to display other items. Whenever possible, use a UI policy instead of this method.

Parameters

Name	Type	Description
fieldname	String	Name of the field.
display	Boolean	When true displays the field, when false hides the field.

Returns

Type	Description
void	

```
function onChange(control, oldValue, newValue, isLoading,
 isTemplate) {
   //If the page isn't loading
   if (!isLoading) {
      //If the new value isn't blank
      if (newValue != '') {
         g_form.setDisplay('priority', false);
      }
      else
         g_form.setDisplay('priority', true);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        }
    }
```

GlideForm - setLabelOf(String fieldName, String label)

Sets the plain text value of the field label.

Note: This method is not supported by Service Catalog.

Parameters

Name	Type	Description
fieldName	String	The field name.
label	String	The field text label.

Returns

Type	Description
void	

```
if (g_user.hasRole('itil')) {
    var oldLabel = g_form.getLabelOf('comments');
    g_form.setLabelOf('comments', oldLabel + ' (Customer
 visible)');
}
```

GlideForm - setReadOnly(String fieldName, Boolean readOnly)

Makes the specified field read-only or editable.

Whenever possible, use a UI policy instead of this method.

To make a mandatory field read-only, you must first remove the mandatory requirement for that field by using the *`setMandatory()`* method.

Once you set a field to read-only, you cannot use the setValue() method to update the value of that field. If you need to set the value in this way, you must set the readOnly value to false.

Parameters

Name	Type	Description
fieldName	String	Name of the field.
readOnly	Boolean	Flag that determines whether the associate field is editable or read-only. Possible values: • true: Set field to read-only • false: Set field to be editable

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how set the Variable Editor to read only. To do this in Service Catalog tables, use *setVariablesReadOnly()*.

```
// Create a Client Script on a table (e.g., incident) and paste
 this script
// Uncheck (set to false) the "isolate script" checkbox (not
 available by default)
// To add the isolate script checkbox to the form, configure
 form layout to add the checkbox
function onLoad() {

 $("variable_map").querySelectorAll("item").forEach(function(it
em){
    var variable = item.getAttribute("qname");
    g_form.setReadOnly("variables."+ variable, true);
  });
}
```

GlideForm - setValue(String fieldName, String value)

Sets the value of a specified form field to the passed in value.

This method also supports setting values in a multi-row variable set (MRVS). You must first use `JSON.parse(getValue('<mrvs_field_name>'))` to obtain the MRVS array and then use indexing to update the fields within the row objects. Once all values are updated in the MRVS, use the *setValue()* method to save the updated MRVS array. For more details, see the code example below.

Note: The method *setValue()* can cause a stack overflow when used in an OnChange client script. This is because every time the value is set, it will register as a change, which may re-trigger the OnChange client script. To prevent this, perform a check that will validate that the new value will be different from the old value. For example, before performing `setValue(shortDesc, newValue.toUpperCase());`, validate that the short description is not already uppercase. This will prevent the client script from applying the *toUpperCase()* more than once.

Note: When defining a value in a choice list, be sure to use the number value rather than the label.

Parameters

Name	Type	Description
fieldName	String	Name of the form field to update.
value	String	String value to set in the specified field.

Returns

Type	Description
void	

The following example shows how to set the short description in the current form.

```
g_form.setValue('short_description', 'replace this with
 appropriate text');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to set values in an MRVS. In this example, salaries are being managed through the Service Catalog. The client script searches all rows within the MRVS for the value entered in the **Job title** and then updates the matching entries within the MRVS with what is entered in the **Salary** field. The MRVS is named "variable_set_1" and contains the following fields within each row object: Employee name [employee_name], Job title [employee_job_title], and Salary [employee_salary]. In addition, the Catalog Item contains: Job title [job_title] and Salary [salary].

```
function onChange(control, oldValue, newValue, isLoading) {
if (isLoading || newValue == '') {
return;
}

// Get the MRVS
var multiRowVariableSet =
 JSON.parse(g_form.getValue('variable_set_1'));

for (var i = 0; i < multiRowVariableSet.length; i++) {
// Check if the entered job title matches the title in the
 current MRVS row
  if (multiRowVariableSet[i].employee_job_title ==
 g_form.getValue("job_title")){
    // Update the value of a matching field with the new salary
    multiRowVariableSet[i].employee_salary = newValue;
  }
}

// Update the MRVS
g_form.setValue('variable_set_1',
 JSON.stringify(multiRowVariableSet));
}
```

GlideForm - setVariablesReadOnly(Boolean isReadOnly)

Makes a Service Catalog variable editor read only.

Note: This method is only applicable to Service Catalog variable editors in the core UI. This method is not supported in the Service Catalog form.

The method must be placed in the client script of the table in which the variable editor is added, such as Requested Item [sc_req_item], Incident [incident], and so on. To set variables to read only in other tables, use the setReadOnly() method.

See also: Service Catalog variable editors

Parameters

Name	Type	Description
isReadOnly	Boolean	Flag that determines whether the variable editor is read only. Possible values: • true: Sets the variable editor as read-only. • false: Sets the variable editor as editable. Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

Adding the following line to a client script sets the variable editor to read only.

```
g_form.setVariablesReadOnly(true);
```

GlideForm - setVisible(String fieldName, Boolean display)

Displays or hides the field.

On desktop UI, the space is left blank when hidden. On Mobile or Service Portal UI, the space is filled in my other fields when hidden. This method cannot hide mandatory fields with no value.

Use UI Policy rather than this method whenever possible.

Parameters

Name	Type	Description
fieldName	String	The field name.
display	Boolean	When true displays the field. When false hides the field.

Returns

Type	Description
void	

```
function onChange(control, oldValue, newValue, isLoading,
 isTemplate) {
   //If the page isn't loading
   if (!isLoading) {
      //If the new value isn't blank
      if(newValue != '') {
         g_form.setVisible('priority', false);
      }
      else
         g_form.setVisible('priority', true);
      }
   }
```

GlideForm - showErrorBox(String name, String message)

Displays an error message under the specified form field (either a control object or the name of the field). If the control or field is currently off the screen, the form scrolls to the control or field.

A global property (glide.ui.scroll_to_message_field) is available that controls automatic message scrolling when the form field is off screen (scrolls the form to the control or field). The *`showFieldMsg()`* method is a similar method that requires a type parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	The name of the control or field.
message	String	The message to be displayed.

Returns

Type	Description
void	

GlideForm - showRelatedList(String listTableName)

Displays the specified related list on the form.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
listTableName	String	Name of the related list.

Returns

Type	Description
void	

GlideForm - showRelatedLists()

Displays all the form's related lists.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GlideForm - submit()

Saves the record.

The user is taken away from the form, returning them to where they were.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GlideForm - submit(String verb)

Performs the UI action specified by the parameter.

Parameters

Name	Type	Description
verb	String	An action_name from a sys_ui_action record. The action name must be for a visible form button.

Returns

Type	Description
void	

Mobile GlideForm (g_form) - Client

The `Mobile GlideForm (g_form)` API provides methods to work with forms on the mobile platform.

Use these methods in any script that targets a mobile device.

MobileGlideForm (g_form) - addDecoration(String fieldName, String icon, String text)

Adds a decorative icon next to a field.

Parameters

Name	Type	Description
fieldName	String	The field name.
icon	String	The font icon to show next to the field.
text	String	The text title for the icon (used for screen readers).

Returns

Type	Description
void	

This example adds a VIP icon next to the caller.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
function onChange(control, oldValue, newValue, isLoading) {
      // if the caller_id field is not present, then we can't
 add an icon anywhere
      if (!g_form.hasField('caller_id'))
          return;

      if (!newValue)
         return;

      g_form.getReference('caller_id', function(ref) {
      g_form.removeDecoration('caller_id', 'icon-star', 'VIP');

      if (ref.getValue('vip') == 'true')
           g_form.addDecoration('caller_id', 'icon-star',
 'VIP');
      });
      }
```

MobileGlideForm (g_form) - getLabel(String fieldName)

Gets the form label text.

Parameters

Name	Type	Description
fieldName	String	The field name.

Returns

Type	Description
String	The label text.

```
if (g_user.hasRole('itil')) {
      var oldLabel = g_form.getLabel('comments');
      g_form.setLabel('comments', oldLabel + ' (Customer
 visible)');
      }
```

MobileGlideForm (g_form) - hasField(String fieldName)

Determines if a field is present on the form.

Present means that it can be shown, not that it is visible.

Parameters

Name	Type	Description
fieldName	String	The field to look for.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	True if the field is present on the form; false, if it is not. On the form means that the field is part of g_form. It could still be hidden, read-only, mandatory, or invalid.

This example makes the assigned_to field mandatory if the assignment_group field is on the form.

```
if (g_form.hasField('assignment_group'))
      g_form.setMandatory('assigned_to', true);
```

MobileGlideForm (g_form) - removeDecoration(String fieldName, String icon, String text)

Removes a decorative icon from next to a field.

Parameters

Name	Type	Description
fieldName	String	The field name.
icon	String	The icon to remove.
text	String	The text title for the icon.

Returns

Type	Description
void	

```
function onChange(control, oldValue, newValue, isLoading) {
      // if the caller_id field is not present, then we can't
 add an icon anywhere
      if (!g_form.hasField('caller_id'))
           return;

      if (!newValue)
           return;

      g_form.getReference('caller_id', function(ref) {
           g_form.removeDecoration('caller_id', 'icon-star',
 'VIP');

           if (ref.getValue('vip') == 'true')
                g_form.addDecoration('caller_id', 'icon-star',
 'VIP');
      });
      }
```

MobileGlideForm (g_form) - setLabel(String fieldName, String label)

Sets the form label text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
fieldName	String	The field name.
label	String	The field label text.

Returns

Type	Description
void	

This example changes the comments label.

```
if (g_user.hasRole('itil')) {
      var oldLabel = g_form.getLabel('comments');
      g_form.setLabel('comments', oldLabel + ' (Customer
 visible)');
      }
```

GlideGuid - Client

The *GlideGuid* API provides methods to create a globally unique identifier.

You access the GlideGuidV3 methods using the `g_guid` global object.

GlideGuid - generate(Number stringLength)

Creates a globally unique identifier 32 characters long, or as specified with the optional length argument.

Parameters

Name	Type	Description
stringLength	Number	The desired string length, must be between 1 and 32 inclusive. This parameter is optional. If not specified, the returned string will be 32 characters long.

Returns

Type	Description
String	The globally unique identifier.

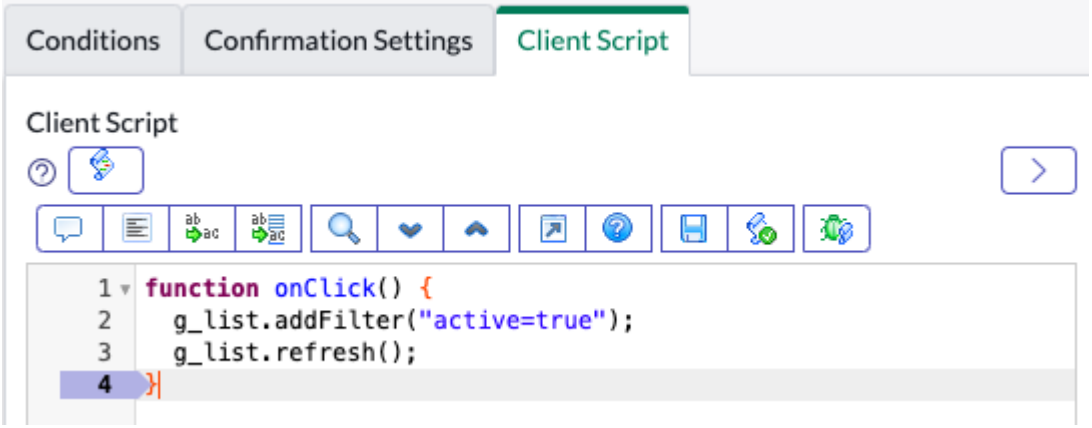
GlideList (Next Experience) - Client

The *GlideList* API provides methods to customize lists in the Next Experience UI Framework.

This API enables adding GlideList functionality to a button in the Workspace Experience UI. Use the `g_list` variable to call each method.

To add a button, create a list action and add *GlideList* method calls into the **Client Script** field `onClick{}` method. For instructions, see Use the client GlideList API in the Workspace Experience UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: Each method must be used with the `refresh()` method, with the exceptions of `sort()` and `sortDescending()` methods.

The methods in this API are based on `GlideList2`. The following `GlideList2` methods are not supported in the Next Experience framework and cause an error in the console log:

- `isUserList()`
- `setFirstRow()`
- `showHideGroups()`
- `showHideList()`
- `toggleList()`
- `toggleListNoPref()`

GlideList (Next Experience) - addFilter(String filter)

Adds a single term to the list query filter.

See also setFilter().

Parameters

Name	Type	Description
filter	String	Encoded query string in standard Glide format. See Encoded query strings.

Returns

Type	Description
None	

The following example shows how to retrieve a list of active records and refresh the page.

```
g_list.addFilter("active=true");
g_list.refresh();
```

GlideList (Next Experience) - getChecked()

Returns a comma-separated list of the sys_ids for the items that are checked in the associated list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Comma-separated list of the sys_ids for the items that are checked in the list. Does not check to determine that the items returned are allowed to be executed.

The following example shows how to get the sys_ids of each record selected in a list.

```
var myChecked = g_list.getChecked();
alert(myChecked);
g_list.refresh();
```

Output in an alert box (empty if no records are selected):

```
079893e6b733330059128ac7ee11a967,
 4fca6d45b7131010f03e9b7ade11a9d3,
 5c460fbf1bd0011079e52131604bcbd9
```

GlideList (Next Experience) - getFixedQuery()

Returns the fixed query.

A fixed query is the part of the query that cannot be removed from the breadcrumb (i.e., it is fixed for the user).

Apply this method under **Related List Actions** in the Workspace Experience UI. For instructions, see Use the client GlideList API in the Workspace Experience UI.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The fixed query string for the list.

The following example shows how to display a fixed query with a debug message in the browser console log.

```
console.log(g_list.getFixedQuery() + " debug message");
```

The output after clicking the button on the Child Incidents tab in an Incident record.

```
parent_incident=46f1784ba9fe19810018aa27fbb23482 debug message
```

GlideList (Next Experience) - getGroupBy()

Returns the field or comma-separated list of fields that are used to group the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

See also:

- getQuery()
- setGroupBy()

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The field or comma-separated list of fields that are used to group the list.

The following example shows how to get field groupBy values of the current list view.

```
var grpdBy = g_list.getGroupBy();
alert("The list is grouped by " + grpdBy);
g_list.refresh();
```

Output in an alert box for a list grouped by priority:

```
The list is grouped by ^GROUPBYpriority
```

GlideList (Next Experience) - getListName()

Returns the name of the list, which is usually the table name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The list name (usually the table name).

The following example shows how to call the method.

```
g_list.getListName();
```

GlideList (Next Experience) - getOrderBy()

Returns the first field used to order the list.

See also:

- getQuery()
- setOrderBy()

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The field by which to order the list. Empty if the list is not ordered.

The following example shows how to get field orderBy values of the current list view.

```
var orderBy = g_list.getOrderBy();

alert("The list is ordered by " + orderBy);
g_list.refresh();
```

Output in an alert box for a list ordered by priority:

```
The list is ordered by ^ORDERBYDESCpriority
```

GlideList (Next Experience) - getParentTable()

Returns the name of the parent table for a related list (the table associated with the form).

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The parent table name.

The following example shows how to call the method.

```
g_list.getParentTable();
g_list.refresh();
```

GlideList (Next Experience) - getQuery(Object)

Returns the encoded query string for the list.

See also:

- getFixedQuery()
- getGroupBy()
- getOrderBy()
- setGroupBy()
- setOrderBy()

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
<object>	Object	Optional. By default, this method includes orderBy, groupBy, and fixed query in the results. You can set object properties to restrict results to one or more of the three available options.
<object>.orderBy	Boolean	Optional. Flag that indicates whether to include orderBy in results. Valid values: • true: Include orderBy in results. • false: Do not include orderBy in results. Default: false
<object>.groupBy	Boolean	Optional. Flag that indicates whether to include groupBy in results. Valid values: • true: Include groupBy in results. • false: Do not include groupBy in results. Default: false
<object>.fixed	Boolean	Optional. Flag that indicates whether to include fixed query in results. Valid values: • true: Include fixed query in results. • false: Do not include fixed query in results. Default: false

Returns

Type	Description
String	Encoded query string for the list.

The following example shows how to display the list encoded query with a debug message in the browser console log.

```
var myQuery = g_list.getQuery();
console.log(myQuery + " message");
```

Output:

```
active=false^EQ message
```

GlideList (Next Experience) - getRelated()

Returns the related list field that associates the related list to the parent form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Field that connects the list to the parent form.

The following example shows how to call the method.

```
g_list.getRelated();
```

GlideList (Next Experience) - getTableName()

Returns the table name for the list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Returns the table name for the list.

The following example shows how to display the list name for the current view.

```
var listName = g_list.getListName();
alert("The current list name is " + listName);
g_list.refresh();
```

Output in an alert box:

```
The current list name is incident
```

GlideList (Next Experience) - getTitle()

Returns the list title.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The list title.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to call the method.

```
g_list.getTitle();
```

GlideList (Next Experience) - getView()

Returns the view used to display the list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The name of the view.

The following example shows how to call the method.

```
g_list.getView();
```

GlideList (Next Experience) - refresh(Number firstRow)

Refreshes the list. The *orderBy* part of the list filter is ignored so that the list uses its natural ordering when it is refreshed.

Parameters

Name	Type	Description
firstRow	Number	The first row to appear in the list. Default: First row of the current view.

Returns

Type	Description
None	

The following example shows how to call the method.

```
g_list.addFilter("active=true");
g_list.refresh();
```

GlideList (Next Experience) - refreshWithOrderBy(Number firstRow)

Refreshes the list. The *orderBy* part of the list filter is included if it is specified for the list.

Parameters

Name	Type	Description
firstRow	Number	The first row to appear in the list. Default: First row of the current view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to call the method.

```
g_list.refreshWithOrderBy();
```

GlideList (Next Experience) - setFilter(String filter)

Sets the encoded query string for the list, ignoring the *orderBy* and *groupBy* parts of the query string.

See also addFilter().

Parameters

Name	Type	Description
filter	String	Encoded query string in standard Glide format. See Encoded query strings.

Returns

Type	Description
None	

The following example shows how to restrict list results to active records.

```
g_list.setFilter("active=true");
g_list.refresh();
```

GlideList (Next Experience) - setGroupBy(String groupBy)

Sets the list *groupBy* criteria for a single field.

See also:

- getGroupBy()
- getQuery()

Parameters

Name	Type	Description
groupBy	String	The *groupBy* criteria for the list.

Returns

Type	Description
None	

The following example shows how to group listed records by Caller ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
g_list.setGroupBy("caller_id");
g_list.refresh();
```

GlideList (Next Experience) - setOrderBy(String orderBy)

Sets the *orderBy* criteria for the list.

For a single order by field, use *orderBy* field or *orderByDesc* field. For multiple fields, use `orderByField1^orderByField2^orderByField3`. *orderBy* specifies ascending order and orderByDesc specifies descending. These prefix strings are optional. If not specified, *orderBy* is the default order.

See also:

- getOrderBy()
- getQuery()
- sort()
- sortDescending()

Parameters

Name	Type	Description
orderBy	String	Single or multiple orderBy fields.

Returns

Type	Description
None	

The following example shows how to order the list by the value of the Priority field.

```
g_list.setOrderBy("priority");
g_list.refresh();
```

GlideList (Next Experience) - setRowsPerPage(Number rows)

Sets the number of rows per page to display.

Parameters

Name	Type	Description
rows	Number	The number of rows to display.

Returns

Type	Description
None	

The following example shows how to limit results to 50 rows per page.

```
g_list.setRowsPerPage(50);
refresh();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideList (Next Experience) - sort(String field)

Sorts the list in ascending order and sets the field as an *orderBy* column.

See also:

- getOrderBy()
- getQuery()
- setOrderBy()
- sortDescending()

Note: This method does not require the *refresh()* method.

Parameters

Name	Type	Description
field	String	Field to use to sort the list.

Returns

Type	Description
None	

The following example shows how to sort results by the **Number** field.

```
g_list.sort("number");
```

GlideList (Next Experience) - sortDescending(String field, Number amount)

Sorts a single field in the list in descending order and sets the field as an *orderByDescField* column.

See also:

- getOrderBy()
- getQuery()
- setOrderBy()
- sortDescending()

Note: This method does not require the *refresh()* method.

Parameters

Name	Type	Description
field	String	Field to use to sort the list.

Returns

Type	Description
None	

The following example shows how to sort results by the Number field in descending order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
g_list.sortDescending("number");
```

GlideList2 (g_list) - Client

The *GlideList2* API provides methods to customize (v2) lists.

The variable `g_list` is used to access a specified list object. The `g_list` variable is not available to the related lists form link UI action. It is available to the lists form link UI action.

These methods are used in UI context menus and UI actions.

Several of these methods are available in Next Experience UI Framework. For details, see GlideList (Next Experience UI Framework).

GlideList2 - addFilter(String filter)

Adds a single term to the list query filter.

Parameters

Name	Type	Description
filter	String	Encoded query string in standard Glide format. See Encoded query strings.

Returns

Type	Description
void	

```
g_list.addFilter("active=true");
```

GlideList2 - get(Object DOMelement)

Returns the *GlideList2* object for the list that contains the specified item.

Parameters

Name	Type	Description
DOMelement	Object	The DOM element ID for the list for which you want the *GlideList2* object.

Returns

Type	Description
Object	The GlideList2 object or null if not found.

GlideList2 - get(String ListID)

Returns the *GlideList2* object for the list specified.

Parameters

Name	Type	Description
ListID	String	The list ID for which you want the *GlideList2* object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	The GlideList2 object or null if not found.

```
function assignLabelActionViaLookupModal(tableName, listId) {
 var list = GlideList2.get(listId);
 if (!list)
  return;

 assignLabelViaLookup(tableName, sysIds, list.getView());
}
```

GlideList2 - getChecked()

Returns a comma-separated list of the sys_ids for the items that are checked in the associated list.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	Comma-separated list of the sys_ids for the items that are checked in the list. Does not check to determine that the items returned are allowed to be executed.

```
function removeLabelActionViaLookupModal(tableName, listId) {
  var list = GlideList2.get(listId);
  if (!list)
    return;

  var sysIds = list.getChecked();
  if (!sysIds)
    return;

  removeLabelViaLookup(tableName, sysIds);
}
```

GlideList2 - getFixedQuery()

Returns the fixed query.

A fixed query is the part of the query that cannot be removed from the breadcrumb (i.e., it is fixed for the user). It is specified by including a *sysparm_fixed_query* parameter for the application module.

Parameters

Name	Type	Description
none		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The fixed query string for the list.

```
var list = GlideList2.get(container.readAttribute('list_id'));
var filter = this._getFilter(element);
var fixedQuery = list.getFixedQuery();
if (fixedQuery)
  filter = fixedQuery + "^" + filter;
```

GlideList2 - getGroupBy()

Returns the field or comma-separated list of fields that are used to group the list.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The field or comma-separated list of fields that are used to group the list.

```
function runFilterV2Lists(name, filter) {
  var list = GlideList2.get(name);
    if (list) {
      var groupBy = list.getGroupBy();
      if (groupBy)
        filter += "^" + groupBy;

        list.setFilterAndRefresh(filter);
    }
}
```

GlideList2 - getListName()

Returns the name of the list, which is usually the table name.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The list name (usually the table name).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var list = GlideList2.get(name);
var listName = list.getListName();
```

GlideList2 - getOrderBy()

Returns the first field used to order the list.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The field by which to order the list. Empty if the list is not ordered.

```
var list = GlideList2.get(listId);
if (!list)
  return;
var orderBy = list.getOrderBy();
```

GlideList2 - getParentTable()

Returns the name of the parent table for a related list (the table associated with the form).

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The parent table name.

```
for (var id in GlideLists2) {
  var list = GlideLists2[id];
  if (list.getTableName() == listTableName &&
 list.getParentTable() == tableName)
    return list.getContainer();
}
```

GlideList2 - getQuery(Boolean orderBy, Boolean groupBy, Boolean fixed, Boolean all)

Returns the encoded query string for the list.

Parameters

Name	Type	Description
orderBy	Boolean	Optional. Flag that indicates whether to include orderBy in results. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• true: Include orderBy in results. • false: Do not include orderBy in results. Default: false
groupBy	Boolean	Optional. Flag that indicates whether to include groupBy in results. Valid values: • true: Include groupBy in results. • false: Do not include groupBy in results. Default: false
fixed	Boolean	Optional. Flag that indicates whether to include fixed query in results. Valid values: • true: Include fixed query in results. • false: Do not include fixed query in results. Default: false
all	Boolean	Default. Flag that indicates whether to include orderBy, groupBy, and fixed query in results. Valid values: • true: Include orderBy, groupBy, and fixed query in results. • false: Do not include all three options in results. Default: true

Returns

Type	Description
String	Encoded query string for the list.

```
var list = GlideList2.get(this.listID);
var ajax = new GlideAjax("AJAXJellyRunner",
 "AJAXJellyRunner.do");
  ajax.addParam("sysparm_query_encoded", list.getQuery({groupby:
 true, orderby: true}));
  ajax.addParam("sysparm_table", list.getTableName());
  ajax.addParam("sysparm_view", list.getView());
```

GlideList2 - getRelated()

Returns the related list field that associates the related list to the parent form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	Field that connects the list to the parent form.

```
var list = GlideList2.get(name);
var related = list.getRelated();
if (related)
  ajax.addParam("sysparm_is_related_list", "true");
```

GlideList2 - getTableName()

Returns the table name for the list.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	Returns the table name for the list.

```
GlideList2.getListsForTable = function(table) {
    var lists = [];
    for (var id in GlideLists2) {
        var list = GlideLists2[id];
        if (list.getTableName() == table)
            lists.push(list);
    }
    return lists;
}
```

GlideList2 - getView()

Returns the view used to display the list.

Parameters

Name	Type	Description
none		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The name of the view.

```
function assignLabelActionViaLookupModal(tableName, listId) {
 var list = GlideList2.get(listId);
 if (!list)
  return;

 assignLabelViaLookup(tableName, sysIds, list.getView());
}
```

GlideList2 - getTitle()

Returns the list title.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The list title.

```
var list = GlideList2.get(name);
var listTitle = list.getTitle();
```

GlideList2 - isUserList()

Returns **true** if the list has been personalized by the user by choosing the list mechanic and changing the list layout.

Parameters

Name	Type	Description
none		

Returns

Type	Description
Boolean	True if the list layout has been changed.

```
var list = GlideList2.get(listId);
if (!list)
  return;
if (list.isUserList())
  var tableName = list.getTableName();
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideList2 - refresh(Number firstRow, String additionalParms)

Refreshes the list. The *orderBy* part of the list filter is ignored so that the list uses its natural ordering when it is refreshed.

Parameters

Name	Type	Description
firstRow	Number	The first row to appear in the list. Default: First row of the current view.
additionalParms	String	Optional name-value pairs that are submitted with the list refresh request.

Returns

Type	Description
void	

```
$timeout(function() {
  if (GlideList.lists) {
    var list = GlideList.get(name);
    if (list) {
       if (sortBy) {
         if (sortDirection == 'ASC')
            list.sort(sortBy);
         else
            list.sortDescending(sortBy);
         }
       list.refresh();
     }
   }
}
```

GlideList2 - refreshWithOrderBy(Number firstRow, String description)

Refreshes the list. The *orderBy* part of the list filter is included if it is specified for the list.

Parameters

Name	Type	Description
firstRow	Number	The first row to appear in the list. Default: First row of the current view.
description	String	Optional name-value pairs that are submitted with the list refresh request.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
ga.getXML(function(serverResponse) {
  var response =
 serverResponse.responseXML.getElementsByTagName("response")[0];
  if (response) {
    var list = GlideList2.getByName("backlog_stories");
    list.refreshWithOrderBy();
    var status = response.getAttribute('status');
    $j('html, body').animate({scrollTop:
 $j("#"+data.record.sys_id).offset().top},500);
    if (status == 'failure') {
      alert('${gs.getMessage("Story cannot be created. Team is
 not associated with any project.")}');
    }
  }
}
```

GlideList2 - setFilter(String filter)

Sets the encoded query string for the list, ignoring the *orderBy* and *groupBy* parts of the query string.

Parameters

Name	Type	Description
filter	String	Encoded query string in standard Glide format. See Encoded query strings.

Returns

Type	Description
void	

```
list =
 GlideList2.get($(side+"ContentDivRelease").select(".list_div")[
0].getAttribute("id"));
if (list) {
  list.setFilter("active=true");
  list.refresh(1);
 }
```

GlideList2 - setFilterAndRefresh(String filter)

Sets the encoded query string for the list, including the *orderBy* and *groupBy* if specified, and then refreshes the list using the new filter.

Parameters

Name	Type	Description
filter	String	Encoded query string.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
function updateListFilter(projectID) {
  var list = GlideList2.getByName("backlog_stories");
  var fixedQuery = $('hdn_additional_filters').value;
  if(!projectID) {
      list.setFilterAndRefresh(fixedQuery +
 "^ORDERBYteam_index");
      list.setOrderBy("team_index");
  }
}
```

GlideList2 - setFirstRow(Number rowNum)

Sets the first row that appears in the list when the list is refreshed.

Parameters

Name	Type	Description
rowNum	Number	Row number of the first row to display.

Returns

Type	Description
void	

```
var nextRow = 0;
var rowsPerPage = 20;
var list = GlideList2.get(listId);
if (!list)
  return;
list.setFirstRow(nextRow);
nextRow = nextRow + rowsPerPage;
```

GlideList2 - setGroupBy(String groupBy)

Sets the list *groupBy* criteria for a single field.

Parameters

Name	Type	Description
groupBy	String	The *groupBy* criteria for the list.

Returns

Type	Description
void	

```
function runContextAction(listId) {
  var g_list = GlideList2.get(listId);
  g_list.setGroupBy('');
  g_list.refresh(1);
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideList2 - setOrderBy(String orderBy)

Sets the *orderBy* criteria for the list.

For a single order by field, use *orderBy* field or *orderByDesc* field. For multiple fields, use `orderByField1^orderByField2^orderByField3`. *orderBy* specifies ascending order and orderByDesc specifies descending. These prefix strings are optional. If not specified, *orderBy* is the default order.

Parameters

Name	Type	Description
orderBy	String	Single or multiple orderBy fields.

Returns

Type	Description
void	

```
            updateOrderBy: function(orderBy){
  var list = GlideList2.get(this.listID);
  if (list)
    list.setOrderBy(orderBy);
};
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideList2 - setRowsPerPage(Number rows)

Sets the number of rows per page to display.

Parameters

Name	Type	Description
rows	Number	The number of rows to display.

Returns

Type	Description
void	

```
link: function(scope) {
  var list = GlideList2.get(scope.listId);
  list.setRowsPerPage(scope.maxRows);
  list.setFilterAndRefresh(scope.tableQuery);
}
```

GlideList2 - showHideGroups(Boolean showFlag)

Shows or hides all the groups within the list and saves the current collapsed/expanded state of the groups as a user preference.

Parameters

Name	Type	Description
showFlag	Boolean	If **true**, shows the groups within the list.

Returns

Type	Description
void	

```
function showHideAllGroups(showFlag) {
  var list = GlideList2.get(listId);
  if (!list)
    return;
  list.showHideGroups(showFlag);
}
```

GlideList2 - showHideList(Boolean showFlag)

Displays or hides the list and saves the current collapsed/expanded state of the list as a user preference.

Parameters

Name	Type	Description
showFlag	Boolean	If **true**, displays the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
GlideList2.toggleAll = function(expandFlag) {
for (var id in GlideLists2) {
  var list = GlideLists2[id];
list.showHideList(expandFlag);
}
```

GlideList2 - sort(String field)

Sorts the list in ascending order and sets the field as an *orderBy* column.

Parameters

Name	Type	Description
field	String	Field to use to sort the list.

Returns

Type	Description
void	

```
$timeout(function() {
  if (GlideList.lists) {
    var list = GlideList.get(name);
    if (list) {
       if (sortBy) {
         if (sortDirection == 'ASC')
            list.sort(sortBy);
         else
            list.sortDescending(sortBy);
         }
       list.refresh();
     }
   }
}
```

GlideList2 - sortDescending(String field, Number amount)

Sorts a single field in the list in descending order and sets the field as an *orderByDescField* column.

Parameters

Name	Type	Description
field	String	Field to use to sort the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
$timeout(function() {
  if (GlideList.lists) {
    var list = GlideList.get(name);
    if (list) {
       if (sortBy) {
         if (sortDirection == 'ASC')
            list.sort(sortBy);
         else
            list.sortDescending(sortBy);
         }
       list.refresh();
     }
   }
}
```

GlideList2 - toggleList()

Toggles the display of the list and saves the current collapsed/expanded state of the list as a user preference.

Parameters

Name	Type	Description
none		

Returns

Type	Description
void	

```
var list = GlideList2.get(listId);
if (!list)
  return;
list.toggleList();
```

GlideList2 - toggleListNoPref()

Toggles the display of the list but does not save the current collapsed/expanded state of the list as a user preference.

Parameters

Name	Type	Description
none		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var list = GlideList2.get(listId);
if (!list)
  return;
list.toggleListNoPref();
```

GlideListV3 (g_list) - Client (deprecated)

The *GlideListV3* API provides methods to manipulate lists.

You access the *GlideListV3* methods by using the `g_list` global object. These methods are used in UI context menus and UI actions. The g_list object is not available for related lists on the form link UI action.

Note:

This API is no longer supported. Consider using the GlideList2() API instead.

GlideListV3 - addFilter(String filter)

Adds a single term to the list query filter.

Parameters

Name	Type	Description
filter	String	Query string condition to add.

Returns

Type	Description
void	

GlideListV3 - get(String listId)

Returns the GlideList object for specified list.

Parameters

Name	Type	Description
listId	String	The list name.

Returns

Type	Description
Object	The GlideList object for the specified list, or null if not found.

GlideListV3 - get(Object DomElement)

Returns the GlideList object for the specified DOM element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
DomElement	Object	The DOM element ID for which you want the GlideList object.

Returns

Type	Description
Object	The GlideList object for the specified DOM element. Returns null if the DOM element is not found.

GlideListV3 - getChecked()

Returns a comma-separated list of sys_ids for checked items in the list. Does not return items that are not allowed to be executed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Comma-separated list of the sys_ids for checked items in the list. Does not return items that are not allowed to be executed.

GlideListV3 - getFixedQuery()

Returns the sysparm_fixed query.

The fixed query is the part of the query that cannot be removed from the breadcrumb (i.e., it is fixed for the user). It is specified by including a *`sysparm_fixed_query`* parameter for the application module.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The fixed query string for the list.

GlideListV3 - getFormTarget()

Returns the form's target attribute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The form's target attribute.

GlideListV3 - getGroupBy()

Returns the field or comma-separated list of fields that are used to group the list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The field or comma-separated list of fields used to group the list.

GlideListV3 - getListName()

Returns the name of the list, which is usually the table name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The list name.

GlideListV3 - getOrderBy()

Returns the first field used to order the list.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The field used to order the list, or an empty string if the list is not sorted.

GlideListV3 - getParentTable()

Returns the name of the parent table (the table associated with the form).

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The parent table name.

GlideListV3 - getQuery(Object options)

Returns the encoded query string for the list.

Parameters

Name	Type	Description
options	Object	The options can be one or more of the following. • orderby - include ORDERBY in the query • groupby - include GROUPBY in the query • fixed - include sysparm_fixed_query in the query • all - include all the options in the query

Returns

Type	Description
String	Encoded query string for the list.

GlideListV3 - getReferringUrl()

Returns the referring URL.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Returns the parent form's URL, or '*' if there is no parent form.

GlideListV3 - getRelated()

Returns the related list field that associates the related list to the parent form.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Field that connects the list to the parent form.

GlideListV3 - getRelatedListType()

Returns the related list type.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The relationship table type.

GlideListV3 - getRelationshipId()

Returns the relationship record id, if this is type REL related list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The sys_id of the relationship record.

GlideListV3 - getRowCount()

Returns the number of rows returned by the query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of rows returned by the query.

GlideListV3 - getRowsPerPage()

Returns the number of rows to be displayed on a page.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of rows to be displayed on a page.

GlideListV3 - getTableName()

Returns the table name of the list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The list's table name.

GlideListV3 - getTitle()

Returns the list title.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The list title.

GlideListV3 - getView()

Returns the view used to display the list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The name of the view

GlideListV3 - isUserList()

Returns true if the list has been personalized by the user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the list layout has changed.

GlideListV3 - refresh(Number firstRow, Object additionalParams)

Refreshes the list. The orderBy part of the list filter is ignored so that the list's natural ordering is used.

Parameters

Name	Type	Description
firstRow	Number	(Optional) The first row to display in the list. If not specified, the list's current first row is used.
additionalParams	Object	(Optional) Name- value pairs that are submitted with the list refresh request.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideListV3 - refreshWithOrderBy(Number firstRow, Object additionalParams)

Refreshes the list using the orderBy fields.

Parameters

Name	Type	Description
firstRow	Number	(Optional) The first row to display in the list. If not specified, the list's current first row is used.
additionalParams	Object	(Optional) Name- value pairs that are submitted with the list refresh request.

Returns

Type	Description
void	

GlideListV3 - setFilter(String filter, Boolean saveOrderBy, Boolean saveGroupBy)

Sets the encoded query string for the list ignoring the orderBy and groupBy parts of the query string.

Parameters

Name	Type	Description
filter	String	An encoded query string.
saveOrderBy	Boolean	The default is false. When true uses the orderBy part of the query.
saveGroupBy	Boolean	The default is false. When true uses the groupBy part of the query.

Returns

Type	Description
void	

GlideListV3 - setFilterAndRefresh(String filter)

Sets the encoded query string for the list, and then refreshes the list using the new filter.

This preserves the groupby and orderby parameters.

Parameters

Name	Type	Description
filter	String	Encoded query string.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideListV3 - setFirstRow(Number firstRow)

Sets the first row to be displayed when the list is refreshed.

Parameters

Name	Type	Description
firstRow	Number	The row number in the list.

Returns

Type	Description
void	

GlideListV3 - setFormTarget(String target)

Specifies where to display the response from the form.

Parameters

Name	Type	Description
target	String	The form.target attribute value to use.

Returns

Type	Description
void	

GlideListV3 - setGroupBy(String groupBy)

Sets the *groupBy* criteria for the list, for a single field or multiple fields.

For a single field, use field or groupByField. The groupBy prefix is optional. For multiple fields use `field1^field2^field3` or `groupByField1^groupByField2^groupByField3`.

Parameters

Name	Type	Description
String	groupBy	The group by criteria for the list.

Returns

Type	Description
void	

GlideListV3 - setOrderBy(String orderBy)

Sets the *orderBy* criteria for the list.

For a single order by field use *orderBy* field or *orderByDescField*. For multiple fields, use `orderByField1^orderByField2^orderByField3`. *orderBy* specifies ascending order and orderByDesc specifies descending. These prefix strings are optional. If not specified *orderBy* is assumed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
orderBy	String	Single or multiple order by fields.

Returns

Type	Description
void	

GlideListV3 - setReferringUrl(String url)

Sets the parent form referring url.

Parameters

Name	Type	Description
url	String	The parent form's URL

Returns

Type	Description
void	

GlideListV3 - setRowsPerPage(Number numRows)

Set the number of rows to display on a page.

Parameters

Name	Type	Description
numRows	Number	The number of rows to display on a page.

Returns

Type	Description
void	

GlideListV3 - showHideGroups(Boolean showFlag)

Displays or hides all of the groups within the list and saves the current collapsed/expanded state of the groups as a user preference.

Parameters

Name	Type	Description
showFlag	Boolean	When true, displays the groups within the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

GlideListV3 - showHideList(Boolean showFlag)

Displays or hides the list and saves the current collapsed/expanded state of the list as a user preference.

Parameters

Name	Type	Description
showFlag	Boolean	When true, displays the list.

Returns

Type	Description
void	

GlideListV3 - sort(String field)

Sort the list in ascending order.

Parameters

Name	Type	Description
field	String	The field to be used to sort the list.

Returns

Type	Description
void	

GlideListV3 - sortDescending(String field)

Sorts the list in descending order.

Parameters

Name	Type	Description
field	String	The field used to sort the list.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideListV3 - toggleList()

Toggles the list display between collapsed and expanded, and saves the state as a user preference.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GlideListV3 - toggleListNoPref()

Toggles the list display between collapsed and expanded, but does not save the state as a user preference.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GlideMenu (g_menu and g_item) - Client

The *GlideMenu* API provides methods that can be used in UI context menus and in onShow scripts to customize UI context menu items.

There is no constructor for the *GlideMenu* class. Access *GlideMenu* methods using the g_menu global object.

- g_menu is the UI context menu that is about to be shown. The onShow script can make changes to the appearance of the menu before it is displayed using these methods.
- g_item is the current UI context menu item that is about to be shown. It is used in several of the *g_menu* methods to specify an item.

GlideMenu - clearImage(GlideMenuItem item)

Clears the image for an item.

Parameters

Name	Type	Description
item	GlideMenuItem	Specifies the item to have its image removed from display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
g_menu.clearImage(g_item);
```

GlideMenu - clearSelected()

Clears any selection images from items in the menu.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GlideMenu - getItem(String itemID)

Returns a menu item by item ID.

It can be necessary to find an item in a menu so that it can be changed before being displayed. Each menu item may be assigned a unique ID when the menu item is created (either from a UI Context Menu entry or from the `addAction()` method in the Dynamic Script Action).

Parameters

Name	Type	Description
itemID	String	Specifies the item to be returned.

Returns

Type	Description
GlideMenuItem	The menu item

GlideMenu - setDisabled(GlideMenuItem item)

Disables a menu item so that it cannot be selected. The disabled menu item is displayed in a lighter color (grayed out) to indicate it is disabled.

Parameters

Name	Type	Description
item	GlideMenuItem	The item to be disabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
g_menu.setDisabled(g_item);
```

GlideMenu - setEnabled(GlideMenuItem item)

Enables the specified menu item.

Parameters

Name	Type	Description
item	GlideMenuItem	The item to be enabled.

Returns

Type	Description
void	

```
g_menu.setEnabled(g_item);
```

GlideMenu - setHidden(GlideMenuItem item)

Hides the specified menu item.

When hiding menu items, the separator bars are not adjusted, so it is possible to end up with the menu showing two separators in a row.

Parameters

Name	Type	Description
item	GlideMenuItem	The item to be hidden.

Returns

Type	Description
void	

```
g_menu.setHidden(g_item);
```

GlideMenu - setImage(GlideMenuItem item, String imgSrc)

Sets an image for an item.

Parameters

Name	Type	Description
item	GlideMenuItem	the item to have the image displayed.
imgSrc	String	the image to attach to the menu item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
g_menu.setImage(g_item, 'images/checked.gifx');
```

GlideMenu - setLabel(GlideMenuItem item, String label)

Sets the display label for a menu item. The label may contain HTML.

Parameters

Name	Type	Description
item	GlideMenuItem	the item to be labeled.
label	String	the label to be displayed. The string may contain HTML.

Returns

Type	Description
void	

```
g_menu.setLabel(g_item, "This is a new label");
```

GlideMenu - setVisible(GlideMenuItem item)

Displays the specified item.

Parameters

Name	Type	Description
item	GlideMenuItem	The item to be displayed.

Returns

Type	Description
void	

```
g_menu.setVisible(g_item);
```

GlideModalForm - Client

The *GlideModalForm* API provides methods to display a form in a GlideModal.

General usage of the *GlideModalForm* class involves creating the object, setting any preferences, and then rendering the GlideModalForm.

```
var dialog = new GlideModalForm('dialog title',
 'table_name_or_form_name', [callback on completion of submit])
  dialog.setPreference('name', 'value');
  dialog.render();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Specify the query parameters that are passed to the form using the *setPreference()* method. Any name/value pair that you specify with *setPreference()* is sent along with the form POST request to display the form.

The GlideModalForm is set to fill the height of the document window.

GlideModalForm - GlideModalForm(String title, String tableName, Function onCompletionCallback, Boolean readOnly)

Creates an instance of the GlideModalForm class.

Parameters

Name	Type	Description
title	String	Modal form title.
tableName	String	Table being shown.
onCompletionCallback	Function	Function to call after the form has been submitted and processed on the server. The callback function has the form`callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where: • *action_verb*: Name of the UI action executed. Examples are sysverb_insert (Submit button), sysverb_cancel, sysverb_save (Save button). • *sys_id*: Sys_id of the affected record. • *table*: Name of the table containing the record. • *displayValue*: Value that appears on the form.
readOnly	Boolean	Optional. Flag that indicates whether the modal form should be set to read only. Valid values: • true: Set form to read only. • false: Set for to read/write. Default: false

This example shows how to instantiate a GlideModalForm object.

```
function openDevice(deviceSysID, deviceName) {
  var uName = gel('hidden_user_name').value + "'s ";
  deviceName = new String(deviceName).escapeHTML();
  var gp = new GlideModalForm(uName + deviceName,
 "cmn_notif_device", refreshNotifPage);
  gp.addParm('sys_id', deviceSysID);
  gp.render();
}
```

GlideModalForm - addParm(String name, String value)

Sets the specified form field to the specified value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Form field name. If the specified name is not a field in the associated modal form, it is ignored.
value	String	Value to set the specified form field to.

Returns

Type	Description
void	

This example shows how to call *addParm()* to set the value of the sys_id field the modal form.

```
function openDevice(deviceSysID, deviceName) {
  var uName = gel('hidden_user_name').value + "'s ";
  deviceName = new String(deviceName).escapeHTML();
  var gp = new GlideModalForm(uName + deviceName,
 "cmn_notif_device", refreshNotifPage);
  gp.addParm('sys_id', deviceSysID);
  gp.render();
}
```

GlideModalForm - setSysID(String sys_id)

Sets the object's sys_id preference.

Parameters

Name	Type	Description
sys_id	String	The id preference. One of the query parameters passed to the form.

Returns

Type	Description
void	

This example shows how to use the *setSysID()* method to initialize the value of the sys_id.

```
function(startDate, endDate) {
  var dialog = new GlideModalForm("Add Schedule Item",
 "cmn_schedule_span");
  dialog.setSysID("-1");
  dialog.addParm("sysparm_collection", "cmn_schedule");
  dialog.addParm("sysparm_collectionID", this.sysId);
  dialog.addParm("sysparm_collection_key", "schedule");

  var q = "schedule=" + this.sysId + "^start_date_time="
   + startDate.serializeInUserFormat() + "^end_date_time="
   + endDate.serializeInUserFormat() + "^";

  if (startDate.isAllDay(endDate))
    q += "^all_day=true^";
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  dialog.addParm("sysparm_query", q);
  dialog.render();
}
```

GlideModalForm - setCompletionCallback(Function callbackFunction)

Sets the function to be called when the form has been successfully submitted and processed by the server.

Parameters

Name	Type	Description
callbackFunction	Function	Callback function to call when the form has been successfully processed. The callback function has the form `callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where: • *`action_verb`*: action_name from a sys_ui_action record • *`sys_id`*: Sys_id of the affected record • *`table`*: Name of the table containing the record • *`displayValue`*: Value that appears on the form

Returns

Type	Description
void	

This example shows how to set the onload callback function of the associated modal.

```
function handleCreateOrEdit(targetFieldName, sourceFieldName,
 adapterRuleId, transformerSysId){
  dialog = new GlideModalForm('Edit Adapter Rule',
 "sys_adapter_rule");
  dialog.setSysID(adapterRuleId); //Pass in sys_id to edit
 existing record
  dialog.addParm('sysparm_form_only', 'true'); //Add or remove
 related lists
  dialog.setOnloadCallback(hideModalForm);
  dialog.setCompletionCallback(handleAdapterCreatedOrUpdated);
  dialog.render(); //Open the dialog
}
function handleAdapterCreatedOrUpdated(action_verb, sys_id,
 table, displayValue) {
  var draftRecordTransformer =
 g_form.getValue("draft_record_transformer");
  if(draftRecordTransformer == null ||
 draftRecordTransformer.length == 0) {
    //sync Sticky Replications if it is enabled.
    var ajax = new GlideAjax('ReplicationPoolUtil');
    ajax.addParam('sysparm_name', 'syncStickyReplicationSet');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    ajax.addParam('sysparm_entry_set',
 g_form.getValue("entry_set"));
    ajax.getXMLWait();
  }
}
```

GlideModalForm - setOnloadCallback(Function callbackFunction)

Sets the function to be called after the form has been loaded.

Parameters

Name	Type	Description
callbackFunction	Function	Function to call after the form has been loaded. The callback function has the form `callBackFunction(GlideModalForm obj)`

Returns

Type	Description
void	

This example shows how to set the on load callback function of the associated modal.

```
function handleCreateOrEdit(targetFieldName, sourceFieldName,
 adapterRuleId, transformerSysId){
  dialog = new GlideModalForm('Edit Adapter Rule',
 "sys_adapter_rule");
  dialog.setSysID(adapterRuleId); //Pass in sys_id to edit
 existing record
  dialog.addParm('sysparm_form_only', 'true'); //Add or remove
 related lists
  dialog.setOnloadCallback(hideModalForm);
  dialog.setCompletionCallback(handleAdapterCreatedOrUpdated);
  dialog.render(); //Open the dialog
}
```

GlideModalForm - render()

Shows the modal form.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example shows how to call *`render()`* to display the modal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
function openDevice(deviceSysID, deviceName) {
  var uName = gel('hidden_user_name').value + "'s ";
  deviceName = new String(deviceName).escapeHTML();
  var gp = new GlideModalForm(uName + deviceName,
 "cmn_notif_device", refreshNotifPage);
  gp.addParm('sys_id', deviceSysID);
  gp.render();
}
```

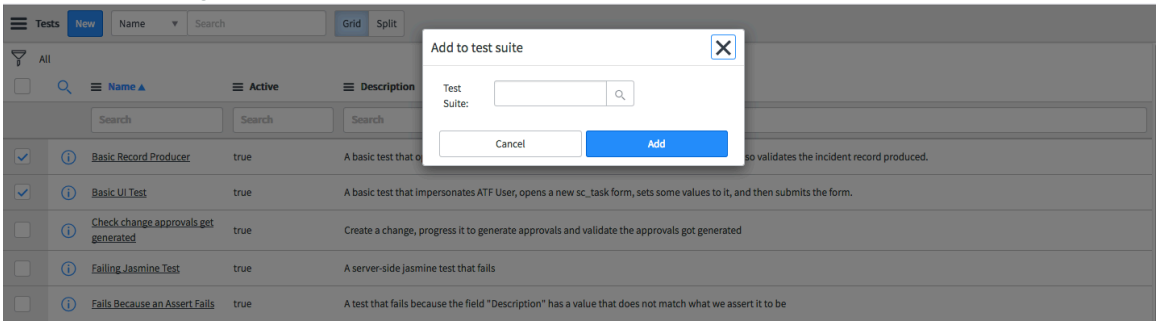
GlideModal - Client

The *GlideModal* API provides methods for displaying a content overlay.

Use these methods in scripts anywhere that you can use client-side JavaScript. These methods are most often called from a UI action with the **Client** check box selected.

This is a fully-featured replacement for the *GlideWindow* and *GlideDialogWindow* APIs.

Example overlay



GlideModal - GlideModal(String id, Boolean readOnly, Number width)

Creates an instance of the GlideModalV3 class.

Parameters

Name	Type	Description
id	String	UI page to load into the modal.
readOnly	Boolean	Flag that indicates whether to hide the close button in the modal. Valid values: • true: Don't display the close button in the modal. • false: Display the close button in the modal. Default: false
width	Number	Width of modal in pixels. Default: Maximum width: 900 pixels **Note:** You can also set the modal width using the GlideModal - setWidth(Number width) method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideModal - get(String id)

Get a GlideModal object by ID.

Parameters

Name	Type	Description
id	String	The element id of the GlideModal object.

Returns

Type	Description
GlideModal	The object.

GlideModal - getPreference(String name)

Returns the value of the specified preference (property).

Invoking actions that create the modal typically also create the necessary preferences for the modal using the GlideModal - setPreference(String name, String value) method. The UI page client script then consumes these preferences using this method.

Parameters

Name	Type	Description
name	String	Name of the preference value to retrieve. This value must have previously been set on the modal using the GlideModal - setPreference(String name, String value) method.

Returns

Type	Description
String	Specified preference's value.

This example shows a simple case of setting a preference and then retrieving that preference from a specified modal.

```
var gm = new GlideModal('UI_dialog_name');
//Sets the dialog title
gm.setTitle('Show title');

//sets the value of the preference table
gm.setPreference('table', 'incident');

//gets the value of the preference table
var title = gm.getPreference('table');
```

GlideModal - render()

Renders the UI page in the modal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var gm = new GlideModal("UI_dialog_name");

//Sets the dialog title
gm.setTitle('Show title');
gm.setWidth(550);

//Opens the dialog
gm.render();
```

GlideModal - renderWithContent(String html)

Display a modal with the specified HTML content.

The *`renderWithContent()`* method replaces the *`render()`* method, and does not request a UI page to render.

Parameters

Name	Type	Description
html	String	The HTML content to be shown in the modal.

Returns

Type	Description
void	

GlideModal - setPreference(String name, String value)

Sets the specified field on the current form to the specified value.

Parameters

Name	Type	Description
name	String	Name of the form field to update. If this field does not exist on the current form, the request is ignored.
value	String	Value to store in the specified form field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var gm = new GlideModal('UI_dialog_name');
//Sets the dialog title
gm.setTitle('Show title');
gm.setPreference('table', 'task');
gm.setPreference('name', 'value');

//Opens the dialog
gm.render();
```

GlideModal - setPreferenceAndReload(Array properties)

Set the properties and reload the modal.

Parameters

Name	Type	Description
properties	Array	An array of name-value pairs to be set.

Returns

Type	Description
void	

GlideModal - setTitle(String title)

Sets the title of the modal.

Parameters

Name	Type	Description
title	String	Title to be displayed

Returns

Type	Description
void	

```
var dialog = new GlideModal('UI_dialog_name');

//Sets the dialog title
dialog.setTitle('Show title');
dialog.setPreference('name', 'value');

//Opens the dialogdialog.render();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideModal - setWidth(Number width)

Sets the width of the modal in pixels.

You can also set the width of a modal when you first instantiate it using the GlideModal - GlideModal(String id, Boolean readOnly, Number width) method.

Parameters

Name	Type	Description
width	Number	Number of pixels to set as the width of the modal. Maximum: 900 pixels

Returns

Type	Description
void	

```
var dialog = new GlideModal('UI_dialog_name');

//Sets the dialog title
dialog.setTitle('Show title');
dialog.setPreference('name', 'value');
dialog.setWidth(550);

//Opens the dialog
dialog.render();
```

GlideModal - switchView(String newView)

Change the view and reload the modal.

Parameters

Name	Type	Description
newView	String	The view to use.

Returns

Type	Description
void	

GlideNavigation - Client

The *GlideNavigation* API provides methods to control and refresh the navigator and main frame.

These methods are accessed using the `g_navigation` global object.

GlideNavigation - open(String url, String target)

Redirects to a new URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
url	String	The URL to load. It can be any URL supported by the browser.
target	String	Optional. The frame in which to load the content specified by the URL. Default: Current frame

Returns

Type	Description
void	

This example shows how to open the list of active incidents within an instance and display the content in the current frame.

```
g_navigation.open('incident_list.do?sysparm_query=active=true');
```

GlideNavigation - openPopup(String url, String name, String features, Boolean noStack)

Opens the specified URL in a popup window.

The *features* parameter is part of the DOM specification and is passed through. For more information on the available feature list, refer to the Mozilla Developer Network.

Parameters

Name	Type	Description
url	String	URL to open.
name	String	Window name.
features	String	Comma separated list of features for the popup window.
noStack	Boolean	Flag that indicates whether to append `sysparm_stack=no` to the URL. This parameter helps prevent unexpected behavior when using the form back button. Valid values: • true: Append `sysparm_stack=no` to the URL. • false: Do not append `sysparm_stack=no` to the URL.

Returns

Type	Description
Window	Instance of the new window.

This example shows how to open the list of active incidents within a popup window called "Active Incidents", and enable the resizable, scrollbars, and status features on the window.

```
g_navigation.openPopup('incident_list.do?sysparm_query=active=tr
ue', 'Active Incidents', 'resizable,scrollbars,status', true);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideNavigation - openRecord(String tableName, String sys_id)

Redirects to a record. The record displays in the navigator frame.

Parameters

Name	Type	Description
tableName	String	Name of the table containing the record to display.
sys_id	String	Sys_id of the record to display.

Returns

Type	Description
void	

This example shows how to open a specified incident record in the navigator frame.

```
g_navigation.openRecord('incident',
 '4e49c0e81bf198101363ff37dc4bcb8a');
```

GlideNavigation - refreshNavigator()

Refreshes content in the navigator frame.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example shows how to refresh the content in the navigator frame.

```
g_navigation.refreshNavigator();
```

GlideNavigation - reloadWindow()

Reloads the current frame.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example shows how to refresh the content in the current frame.

```
g_navigation.reloadWindow();
```

GlideNotification - Client

The *GlideNotification* API provides methods that display messages over the page content.

Access this API using the g_notification global object. List V3 must be activated for the g_notification object to be available.

GlideNotification - show(String type, String message, Number duration)

Displays the specified string over the page content as the specified type of message. When the duration timer expires, the message is removed.

Note: When using this method in a scoped application, you must specify the associated namespace nowapi. For example, nowapi.g_notification.show("info", "The record has been updated", 10000);

Parameters

Name	Type	Description
type	String	Type of message to display. Valid values: • error • info • warning
message	String	Message to display.
duration	Number	Optional. Amount of time to display the message. Unit: Milliseconds Default: 5,000

Returns

Type	Description
void	

```
// Displays an info message at the top of the screen
g_notification.show("info", "The record has been updated",
 10000);

// Displays an error message at the top of the screen in a
 scoped app
nowapi.g_notification.show("error", "You need to provide
 notes!");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideRecord - Client

The *GlideRecord* API provides methods that perform database operations. This API enables the use of some GlideRecord functionality in client-side scripts, such as client scripts and UI policy scripts.

A GlideRecord contains both records and fields. Queries made with client-side *GlideRecord* methods are executed on the server. Therefore, a request is made from the client browser to obtain the record data.

The client-side *GlideRecord* API is not supported in scoped applications. Instead, create a script include and use the *GlideAJAX* API, or use the REST APIs. In addition, this API applies access control lists (ACLs) based on the credentials of the user executing the script. To execute the code on the server without ACLs, use the *GlideAjax* API.

Client side GlideRecord - GlideRecord(String tableName)

Creates an instance of the GlideRecord class for the specified table.

Parameters

Name	Type	Description
tableName	String	The table to be used.

```
var now_GR = new GlideRecord('incident');
```

Client side GlideRecord - addOrderBy(String column)

Adds a column to order by in the query.

Parameters

Name	Type	Description
column	String	The column by which to order the result set.

Returns

Type	Description
void	

Client side GlideRecord - addQuery(String name, Object value)

Adds a query to return records where the specified field name is equal to a specified value (or is in a list of values).

If you are familiar with SQL, this method is similar to the "where" clause. You can create one or more queries for a single filter by calling this method multiple times; for this method the queries are AND'ed. Once you define all of the desired queries, call the Client side GlideRecord - query(String name, Function responseFunction, String value) to execute the specified query clause (filter).

To perform an operation other than AND, use either the addQuery(String name, Object operator, Object value) method or the setEncodedQuery() method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Name of the field to check.
value	Object	The value or list of values on which to query.

Returns

Type	Description
void	

Example showing multiple queries.

```
var now_GR = new GlideRecord('incident');
now_GR.addQuery('priority', 4); // Priority is 4 - Low and,
now_GR.addQuery('state', 3); // State is On Hold
now_GR.query(response);

function response(result) {
    while(result.next()) {
       // Print all INC with priority 4 - Low AND state is On
 Hold
        console.log(result.getValue('number'));
    }
}
```

Example showing how to pass a string object.

```
var now_GR = new GlideRecord('incident');
now_GR.addQuery('short_description', new String('USB device not
 working')); // string object
now_GR.addQuery('priority', 4); //number
now_GR.query(response);

function response(result) {
    while(result.next()) {
       // Print all INC with priority 4 - Low AND short
 description contains 'USB device not working'
        console.log(result.getValue('number'));
    }
}
```

Client side GlideRecord - addQuery(String name, Object operator, Object value)

Adds a filter to return records where the field meets the specified condition (field, operator, value).

If you are familiar with SQL, this method is similar to the "where" clause. You can create one or more queries for a single filter by calling this method multiple times. Once you define all of the desired queries, call the Client side GlideRecord - query(String name, Function responseFunction, String value) to execute the specified query clause (filter).

To create more complex queries, use the setEncodedQuery() method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Name of the field to check.
operator	Object	Query operator. The available values are dependent on the data type of the *value* parameter. Numbers: • = • != • > • >= • < • <= Strings (must be in upper case): • = • != • IN • NOT IN • STARTSWITH • ENDSWITH • CONTAINS • DOES NOT CONTAIN • INSTANCEOF **Note:** Don't use the LIKE operator. Use CONTAINS instead.
value	Object	Value on which to query (not case-sensitive).

Returns

Type	Description
void	

Example showing how to add multiple queries to a filter.

```
var now_GR = new GlideRecord('incident');
now_GR.addQuery('priority', '<=', 2); // Priority is 2 or higher
 and,
now_GR.addQuery('short_description', 'CONTAINS', 'crash'); //
 Short description contains the word crash
now_GR.query(response);

function response(result) {
    while(result.next()) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
       // Print all INC with priority of 2 or higher AND short
 description contains "crash"
        console.log(result.getValue('number'));
    }
}
```

Example showing how to pass in an array to verify multiple conditions in a single query.

```
var priorities = [4,2];
var now_GR = new GlideRecord('incident');
now_GR.addQuery('priority', 'IN', priorities);
now_GR.query(response);

function response(result) {
  while(result.next()) {
    console.log(result.getValue('number'));
  }
}
```

Client side GlideRecord - deleteRecord(Function responseFunction)

Deletes the current record and calls the specified response function when complete.

Parameters

Name	Type	Description
responseFunction	Function	Response function for the callback.

Returns

Type	Description
None	

This example deletes a record and then calls the response function *response* to log an alert message.

```
var recordGR = new GlideRecord('incident');
if (recordGR.get('99ebb4156fa831005be8883e6b3ee4b9')) {
  recordGR.deleteRecord(response);
}

function response(result) {
  alert('Deleted record sys_id: ' + result.getValue('sys_id'));
}
```

Output:

```
Deleted record sys_id: 99ebb4156fa831005be8883e6b3ee4b9
```

Client side GlideRecord - get(String sys_id)

Executes a GlideRecord query for a record with the specified sys_id. This method is expected to be used to query for single records, so a next operation is performed before returning.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sys_id	String	The sys_id of the record to be found.

Returns

Type	Description
Boolean	True if one or more matching records was found. False if no records were found.

Client side GlideRecord - getEncodedQuery()

Retrieves the query condition of the current result set as an encoded query string.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	An encoded query string containing all conditions that have been added to the query.

Client side GlideRecord - getLimit()

Returns the limit for records to be returned by the GlideRecord query.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The limit for records to be returned by the GlideRecord query.

Client side GlideRecord - getTableName()

Retrieves the name of the table associated with this GlideRecord.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The table name

```
var item = new GlideRecord('sc_request');
item.addQuery('sys_id', current.request);
item.query(itemResponse);

function itemResponse(item) {
   alert('The table is ' + item.getTableName());
}
```

Client side GlideRecord - hasNext()

Determines if there are any more records in the GlideRecord.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if there are more records in the query set.

Client side GlideRecord - insert(Function responseFunction)

Inserts a new record using the field values that have been set for the current record.

Parameters

Name	Type	Description
responseFunction	Function	Function to execute once the record is inserted.

Returns

Type	Description
String	Sys_id of the inserted record, or null if the record was not inserted.

```
var now_GR = new GlideRecord('incident');
now_GR.short_description = 'Learn about GlideRecord';
var recResponse = now_GR.insert(handleResponse);

function handleResponse(recResponse, answer) {
// Answer will be the sys_id of the created record or null
alert('Newly created sys_id is - ' + answer + ' exists');
}
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client side GlideRecord - next()

Moves to the next record in the GlideRecord.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	False if there are no more records in the query set.

```
var rec = new GlideRecord('incident');
rec.query(recResponse);

function recResponse(rec) {
  while (rec.next()) {
    alert(rec.number + ' exists');
  }
}
```

Client side GlideRecord - orderBy(String column)

Specifies an orderBy column. May be called more than once to order by multiple columns.

Parameters

Name	Type	Description
column	String	The column name to be used to order the result set.

Returns

Type	Description
void	

```
function UpdateProjectWBS(project) {
  var count = 0;
  var child = new GlideRecord('pm_project_task');
  child.addQuery('parent', project.sys_id);
  child.orderBy('order');
  child.orderBy('number');
  child.query(childResponse);
  g_form.addInfoMessage(count + ' Project Tasks updated');
}

function childResponse(child) {
  var len = child.getRowCount().toString().length;
  var seq = 0;
  while (child.next()) {
    count += UpdateProjectTaskWBS(child, 1, ++seq, len, '');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }
}
```

Client side GlideRecord - query(String name, Function responseFunction, String value)

Runs the query to the server against the table based on the addQuery() filter. This method queries the GlideRecord table as well as any references of the table.

Do not make synchronous query calls. Performing a query without a response function makes the call synchronous, which means that the display will wait for the query response before continuing.

Parameters

Name	Type	Description
name	String	Optional. The name of a field to query.
responseFunction	Function	The function called when the query results are available.
value	String	Optional. The field value to query for. Any pair of literals is considered a query pair (field : value).

Returns

Type	Description
void	

The following is a basic example with a response function.

```
var rec = new GlideRecord('incident');
rec.query(recResponse);

function recResponse(rec) {
  while (rec.next()) {
   alert(rec.number + ' exists');
  }
}
```

The following example shows the difference between synchronus and asynchronous syntax, with an asynchronous example.

```
// synchronous call syntax (no response function): DO NOT USE
       query();

       // asynchronous call syntax
       // performs query with current conditions, calls
 responseFunction when done
       query(responseFunction)

       // synchronous call syntax (no response function): DO
 NOT USE
       // adds "category=hardware" to current query conditions
 and performs query
       query('category', 'hardware')

       // asynchronous call syntax
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        // adds "category=hardware" to current query conditions,
performs query, and calls responseFunction when done
        query('category', 'hardware', responseFunction)

        // asynchronous call example
        // adds "user_name=abel.tuter" to current query
conditions, performs query, and calls defined response function
when done
        function onLoad() {
        var now_GR = new GlideRecord("sys_user");
        now_GR.query("user_name", "abel.tuter", function(now_GR)
{
        if (now_GR.next()) {
        alert("You can access fields by name from the client
API, just like in the server API:\n now_GR.name = " +
now_GR.name);
        alert("You can also access fields using getValue():\n
now_GR.getValue(\"email\") = " + now_GR.getValue("email"));
        if (now_GR.getDisplayValue) {
        alert("In Service Portal, Mobile, and
Agent Workspace, you can access a field's display
value:\n now_GR.getDisplayValue(\"company\") = " +
now_GR.getDisplayValue("company"));
        } else {
        alert("On the desktop, you cannot access a field's
display value, but can get its sys_id:\n now_GR.company = " +
now_GR.company);
        }
        alert("You cannot dot-walk in the client API:\n
now_GR.company.name = " + now_GR.company.name);
        }
        });
        }
```

Client side GlideRecord - setEncodedQuery(String encodedQuery)

Adds a specified encoded query string to the current query clause.

This method enables you to specify complex filters (encoded query strings) in a single query call, unlike other client-side *addQuery()* methods. Once you define all of the desired queries, call the Client side GlideRecord - query(String name, Function responseFunction, String value) to execute the specified query clause (filter). For additional information on encoded query strings, refer to Encoded query strings.

If you call this method multiple times before calling the query() method, the queries are AND'ed together.

Parameters

Name	Type	Description
encodedQuery	String	Encoded query string to add to the current query clause.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var now_GR = new GlideRecord('incident');
now_GR.setEncodedQuery('priority=4^ORstate=3');
now_GR.query(response);

function response(result) {
    while(result.next()) {
        console.log(result.getValue('number'));
    }
}
```

Client side GlideRecord - setLimit(Number maxQuery)

Sets the limit for how many records are in the GlideRecord.

Parameters

Name	Type	Description
maxQuery	Number	The limit for the number of records to retrieve.

Returns

Type	Description
void	

GlideURLV3 - Client

The `GlideURLV3` API provides methods for manipulating a URI.

You can only use this API in client-side scripts using `ListV2` and `ListV3` APIs.

Note: This API is not supported by Service Portal, Now Mobile, or Agent Workspace.

GlideURLV3 - GlideURL(String contextPath)

Creates an instance of the GlideURL class.

Parameters

Name	Type	Description
contextPath	String	A relative path for the URL.

GlideURLV3 - addParam(String name, String value)

Adds a query string name-value pair to the URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Name of the query string parameter.
value	String	Query string value.

Returns

Type	Description
String	The GlideURL

```
var gu = new GlideURL('incident.do');
var url = gu.addParam('sys_id', '-1');
```

GlideURLV3 - getURL(Object additionalParams)

Get the entire context path and query string parameters as a single URI.

Parameters

Name	Type	Description
additionalParams	Object	A name-value pair object that contains parameters that are added to this URL request only. These additional parameters are not saved to the GlideURL object.

Returns

Type	Description
String	The GlideURL with the specified additional parameters added to the end.

GlideUser - Client

The *GlideUser* API provides methods that access information about the current user and current user roles. Using this API avoids the need to use the slower GlideRecord queries to get user information.

GlideUser methods and properties are accessed through a global object (`g_user`) that is only available in client scripts.

This API:

- contains name and role information about the current user.
- is typically used in client scripts and UI policies but is also found in UI actions that run on the client.
- cannot be used in business rules or UI actions that run on the server.

Session information about the current user and current user roles is contained in the client (web browser). All *GlideUser* methods except *getClientData()* access the session information that is available by default. The *getClientData()* method requires setup on the server and use of the *putClientData()* method to make session information available.

For information on using client-side scripts, see Introduction to Client-side Scripting.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideUser - firstName

The current user's first name.

Field

Name	Type	Description
firstName	String	Current user's first name.

```
alert('first name = ' + g_user.firstName);
```

GlideUser - getClientData(String key)

Returns a client value set using *setClientData()* or *GlideSession -- putClientData()*.

Session client data is a set of named strings that may be setup on the server using *GlideSession -- putClientData()*. You can use *getClientData()* during form load time to get information that the client script needs to make decisions about the form. For example, to identify which fields should be visible.

See also *GlideForm*.

Parameters

Name	Type	Description
key	String	Name of the client data to retrieve.

Returns

Type	Description
String	Value of the client data.

```
var loginLanguage = g_user.getClientData("loginlanguage");
```

GlideUser - getFullName()

Returns the first and last name of the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The current user's full name.

```
var formalName = g_user.getFullName();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideUser - hasRole(String role, Boolean includeDefaults)

Returns true if the current user has the specified role or the admin role.

Parameters

Name	Type	Description
role	String	Role to check.
includeDefaults	Boolean	Optional. Flag that indicates whether to include default roles, such as snc_internal and snc_external, in the request. For additional information on roles, see Exploring user administration. Default: false

Returns

Type	Description
Boolean	Returns true if the current user has the specified role or the admin role; otherwise returns false.

```
var isInternal = g_user.hasRole('snc_internal', true);
```

```
var isItil = g_user.hasRole('itil');
```

GlideUser - hasRoleExactly(String role, Boolean includeDefaults)

Determines whether the current user has the specified role.

Parameters

Name	Type	Description
includeDefaults	Boolean	Optional. Flag that indicates whether to include default roles, such as snc_internal and snc_external, in the request. For additional information on roles, see Explicit roles. Default: false
role	String	Role to check.

Returns

Type	Description
Boolean	Returns true if the current user has the specified role.

```
var isInternal = g_user.hasRoleExactly('snc_internal', true);
```

```
var isItil = g_user.hasRoleExactly('itil');
```

GlideUser - hasRoleFromList(String roles, Boolean includeDefaults)

Returns true if the current user has at least one of the specified roles or has the admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
roles	String	Comma-separated list of roles to check
includeDefaults	Boolean	Optional. Flag that indicates whether to include default roles, such as snc_internal and snc_external, in the request. For additional information on roles, see Exploring user administration. Default: false

Returns

Type	Description
Boolean	Returns true if the current user has a role in the list or the admin role.

```
var isOK = g_user.hasRoleFromList("itil, maint");
```

```
var isOK = g_user.hasRoleFromList("itil, maint, snc_internal",
 true);
```

GlideUser - hasRoles(Boolean includeDefaults)

Returns true if the current user has any role.

Parameters

Name	Type	Description
includeDefaults	Boolean	Optional. Flag that indicates whether to include default roles, such as snc_internal and snc_external, in the request. For additional information on roles, see Exploring user administration. Default: false

Returns

Type	Description
Boolean	Returns true if the current user has at least one role.

```
var yesRole = g_user.hasRoles();
```

```
var yesRole = g_user.hasRoles(true);
```

GlideUser - lastName

The current user's last name.

Field

Name	Type	Description
lastName	String	Current user's last name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
alert('last name = ' + g_user.lastName);
```

GlideUser - setClientData(String key, String value)

Sets a client value that you can retrieve using *getClientData()*.

See also *GlideForm*.

Parameters

Name	Type	Description
key	String	Name of the client data to store as a key.
value	Number	Value to assign to the key.

Returns

Type	Description
None	

```
function onSubmit() {

 if (!g_user.getClientData('keyName')) {
  var now_GR = new GlideRecord('incident');
  now_GR.addActiveQuery();
  now_GR.setLimit(1);
  now_GR.query(cb);
  return false;
 }
 return true;
}

function cb(now_GR) {
 // <insert glide operation >
 g_user.setClientData('keyName', now_GR.getValue('<number>'));
 g_form.submit();
}
```

GlideUser - userName

The current user's username, for example gsmith02. It is not the user's name, for example George Smith.

Field

Name	Type	Description
userName	String	Current user's username.

```
var userName = g_user.userName;
   alert('Current user = ' + userName);
```

GlideUser - userID

Returns the sys_id of the current user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field

Name	Type	Description
userID	String	Sys_id of the current user.

```
var userID = g_user.userID;
   alert('Current user ID = ' + userID);
```

GlideUIScripts - Client

The *GlideUIScripts* API provides methods to access UI scripts from within client-side code.

There is no constructor for this class. Access methods using the `g_ui_scripts` global object in any client-side code, such as client or validation scripts.

This API is only supported in Workspaces and Service Portal. It is not supported in the Core UI (UI16).

To use this API, the **UI Type** field must be set to **Mobile / Service Portal** or **All** on both the client script and the UI script. It cannot be set to **Desktop**.

GlideUIScripts - getUIScript(String scriptName)

Calls a UI script from a client script or other client-side code. Returns a promise.

Use the `then()` function to perform an asynchronous action after the call resolves.

Note: This method is not supported in Internet Explorer 11 when called outside of the Angular application environment. If calling a UI script outside of an Angular context using IE11, call the script directly using the `g_ui_scripts['nameOfScript'];` syntax.

Parameters

Name	Type	Description
scriptName	String	API name of the UI script to run.

Returns

Type	Description
Promise	The result of the asynchronous call.

In this example, a client script calls a UI script to show an alert when the page loads.

```
// Client script
function onLoad() {
    g_ui_scripts.getUIScript('myUIScript').then(function(script)
 {
        script.myUIScriptMethod();
    }, function() {
        console.log('The script did not load');
    });
}
```

```
// UI script - myUIScript
(function() {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    return {
        myUIScriptMethod: function() {
            alert("This is an alert.");
        }
    };
})();
```

Guided Tours - Client

The *Guided Tours* API provides methods for launching and stopping guided tours.

This API includes methods used in Guided Tour Designer.

Guided Tours - applyListFilter(Function filter_func)

Sets a function to retrieve filtered tour results when the `getAllTours()` method is called.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

Parameters

Name	Type	Description
filter_func	Function	Filter function that takes a single `tour` object from the `tours[]` array returne `getAllTours()` method.

Returns

Type	Description
None	

The following example shows basic API usage.

```
//create a filter function
var filtFunction = function(tour) {
   //only return those tours whose name starts with 'my'
   return tour.name.indexOf('my') === 0);
}

//apply the filter
top.NOW.guided_tours.api.applyListFilter (filtFunction);

//call the getAllTours method to observe the filtered tours
top.NOW.guided_tours.api.getAllTours (function(er, tours) {
  if(!er) {
    console.log('The filtered tours are: ');
    console.log(tours);
  }
});
```

The following example shows how to use the `options` field on the tour object to add JSON with custom tour identifiers for reading and filtering tours inside the `filter_func()` function.

```
top.NOW.guided_tours.api.applyListFilter(function(tour) {
       var options = (tour.options)? JSON.parse(tour.options):
 null;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      return (options && options.my_param) ? (options.my_param
 == my_value) : false;
});
```

Guided Tours - endTour()

Stops a currently playing tour. This method silently exits if no tours are playing.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Null	

```
//create a callback function to end the tour if it starts
 correctly
var cbFunction = function(err) {
 if (err) {
   console.log('Error Occurred');
}
 else {
    // tour has started so we can call endTour
    top.NOW.guided_tours.api.endTour();
}
}

//calling the startTour method so that we can end the tour as
 soon as it starts
top.NOW.guided_tours.api.startTour('a297e04b732313007077edcc5ef6
a780', 2, cbFunction);
```

Guided Tours - events.off(String event_name, Function listener_function)

Removes an existing event listener.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

Parameters

Name	Type	Description
event_name	String	Event name to be removed from the listener. Valid event names: • tourStarted • tourEnded • tourCompleted • tourFailed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• tourAbandoned • tourDismissed • stepStarted
listener_function	Function	Optional. If provided, specified listener function is removed from remaining eve listeners attached with that event. If not provided, all listener functions attache that event are removed.

Returns

Type	Description
None	

```
//create a callback function to handle the result of the api
 call
var eventListenerTourStarted = function() {
   console.log('The tour has started');
}
var eventListenerTourEnded = function() {
   console.log('The tour has ended');
}

//attaching event listeners for tourStarted and tourEnded Events
top.NOW.guided_tours.events.on('tourStarted',eventListenerTourSt
arted);
top.NOW.guided_tours.events.on('tourEnded',
 eventListenerTourEnded);

…
//start a tour
top.NOW.guided_tours.api.startTour
 ('a297e04b732313007077edcc5ef6a780', 2, cbFunction);
//As soon as the tour starts the eventListenerTourStarted gets
 fired
…
top.NOW.guided_tours.api.endTour();
// eventListenerTourEnded gets fired

….

//removing the event listeners
 top.NOW.guided_tours.events.off('tourStarted',eventListenerTour
Started);
top.NOW.guided_tours.events.off('tourEnded',
 eventListenerTourEnded);
```

Guided Tours - events.on(String event_name, Function listener_function)

Attaches an event listener to a guided tour event.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
event_name	String	Event name to be attached to the listener. Valid event names: • stepStarted • tourStarted • tourEnded • tourCompleted • tourFailed • tourAbandoned • tourDismissed
listener_function	Function	Listener to be added. **Note:** Clear any event listener after it solves its purpose.

listener_function.obj	Object	Passed to `listener_function()` by each event in the following format:
		• For stepStarted events:
		`{tour: '<tour_sys_id>', step: step_num}`
		• For all other events:
		`{tour: '<tour_sys_id>'}`
		JSON parameters:
		• tour_sys_id: String. Guided tour ID from the Guided Tours [sys_embedded_tour_guide] table
		• step_num: Number. Value between 0 (first step) and n (final step)

The following example shows basic API usage.

```
//create a callback function to handle the result of the api
 call
var eventListenerTourStarted = function() {
   console.log('The tour has started');
}
var eventListenerTourEnded = function() {
   console.log('The tour has ended');
}

//attaching event listeners for tourStarted and tourEnded Events
top.NOW.guided_tours.events.on('tourStarted',eventListenerTourSt
arted);
top.NOW.guided_tours.events.on('tourEnded',
 eventListenerTourEnded);

...
//start a tour
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
top.NOW.guided_tours.api.startTour
 ('a297e04b732313007077edcc5ef6a780', 2, cbFunction);
//As soon as the tour starts the eventListenerTourStarted gets
 fired
…
top.NOW.guided_tours.api.endTour();
// eventListenerTourEnded gets fired

….

//removing the event listeners
 top.NOW.guided_tours.events.off('tourStarted',eventListenerTour
Started);
top.NOW.guided_tours.events.off('tourEnded',
 eventListenerTourEnded);
```

The following example shows how to use the `listener_function` parameter with `obj` as an argument.

```
top.NOW.guided_tours.events.on("tourStarted", function
 (obj){console.log(obj);});
```

Guided Tours - getAllTours(Function cb_function)

Gets a list of tours on the current page from which this method is called. Because this method is asynchronous, a callback function must be passed to determine operation success and get a list of tours.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

Parameters

Name	Type	Description
cb_function	Function	Callback function called by `getAllTours()` after attempt to fetch all tours fo current page from which `getAllTours()` method is called.
cb_function.err	Object	Points to the error object if any occurred during the operation: `err = { success: false, message: 'string containing th error object' }` Null otherwise.
cb_function.tours	Array	List of available tours for the page. If no tours are present on the page, `cb_function.tours` returns undefined `if(!tours) console.log('No tour present')`

Returns

Type	Description
None	

```
//create a callback function to handle the result of the API
 call
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var cbFunction = function(err, tours) {
 if (err) {
   console.log('Error Occurred');
}
 else {
     if(!tours) console.log('No tour present')
   else {
      tours.forEach(function(t) {
               console.log(t);
            });
         }
}
}
//calling the getTours method
top.NOW.guided_tours.api.getAllTours(cbFunction);
```

Guided Tours - loadPlayer()

Loads the guided tours player on a page in which guided tours player is not present by default.

Complete signature:

```
NOW.guided_tours.api.loadPlayer()
```

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

Guided Tours - startTour(String tour_id, Number step_number, Function cb_function)

Starts a tour. Because this method is asynchronous, you must pass a callback function to determine operation success.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

Parameters

Name	Type	Description
tour_id	String	Sys ID of the tour from the Guided Tours [sys_embedded_tour_guide] table.
step_number	Number	Optional. Step at which to start the tour. If not provided (or step number is 0), to starts from the beginning.
cb_function	Function	Optional. Callback function called by `startTour()` method after attempt to the tour.
cb_function.err	Object	Points to the error object if any occurred during the operation: `err = { success: false, message: 'string containing t error object' }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Null otherwise.

Returns

Type	Description
None	

```
//create a callback function to handle the result of the API
 call
var cbFunction = function(err) {
 if (err) {
   console.log('Error Occurred');
}
 else {
   console.log('The tour with tourid=%s was successfully
 launched', tourId);
}
}

//calling the startTour method
top.NOW.guided_tours.api.startTour('a297e04b732313007077edcc5ef6
a780', 2, cbFunction);
```

i18N - Client

The *i18N* API provides methods to get and format translated messages.

The *i18N* methods are accessed using the `g_i18n` global object.

i18N - format(String message, Object map)

Formats a string containing named tokens with values from a map.

Parameters

Name	Type	Description
message	String	The message to have the tokens added.
map	Object	The map of name/value pairs to replace in the message.

Returns

Type	Description
String	The formatted string

```
// Returns: "The rich young ruler was very very rich"
nowapi.g_i18n.format("The {p1} {p2} {p3} was very very
 {p1}",{p1: "rich", p2: "young", p3: "ruler"});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i18N - getMessage(String msgKey, Function callback)

Retrieves a translated message.

If the specified string exists in the database for the current language, then the translated message is returned. If the specified string does not exist for the current language, then the English version of the string is returned. If the string does not exist at all in the database, then the ID itself is returned.

Parameters

Name	Type	Description
msgKey	String	The message to be retrieved.
callback	Function	The function to be called when the message has been retrieved. The callback function has one argument, a string that is the translated message.

Returns

Type	Description
void	

i18N - getMessages(Array msgKeys, Function callback)

Retrieves a set of messages.

If the specified string exists in the database for the current language, then the translated message is returned. If the specified string does not exist for the current language, then the English version of the string is returned. If the string does not exist at all in the database, then the ID itself is returned.

Parameters

Name	Type	Description
msgKeys	Array	An array of keys specifying the messages to be retrieved.
callback	Function	The function to be called when the messages have been retrieved. The callback function has one argument, an object containing key-value pairs, where key is the requested message key, and the value is the translated string.

Returns

Type	Description
void	

openFrameAPI - Client

The *openFrameAPI* provides methods that interact with OpenFrame. OpenFrame is an omni-present frame that communication partners can use to integrate their systems into the ServiceNow platform.

One of the core requirements is the ability to connect and serve code from different domains that can connect seamlessly with partner subsystems. This cross domain connection is required

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to keep connections and callbacks registered into communication systems without any cross domain issues.

OpenFrame has two significant parts: one that lives in the ServiceNow application (referred to as TopFrame) and this API that is sourced from the partner application. This API has the necessary methods to communicate with TopFrame and control the visual features of the OpenFrame.

Note: To stay current with reference to the OpenFrame library, use the following resource URI: `https://[servicenow instance]/scripts/openframe/latest/openFrameAPI.min.js`.

openFrameAPI - getAWAAgentPresence(String success, String failure)

Returns the logged in agent's current presence state.

Parameters

Name	Type	Description
success	String	If the method is successful, name of the callback function to invoke.
failure	String	If the method fails, name of the callback function to invoke.

Returns

Type	Description

presence	Results passed to the success callback function by the openFrame infrastructure.
	
	Data type: Object
	
	`"presence": {`
	`  "available": Boolean,`
	`  "channels": [Array],`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

presence.available	Flag that indicates whether the associated agent is available. Valid values: • true: Agent is available. • false: Agent isn't available. Data type: Boolean

presence.channels	List of available channels of communication with the agent.
	
	Data type: Array of Objects
	
	`"channels": [`
	`  {`
	`  "available": Boolean,`
	`  "name": "String",`
	`  "restrict_update": Boolean,`
	`  "service_channel_type": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"sys_id": "String"
	}
	]</pre>

presence.channels.available	Flag that indicates whether the channel is available. Valid values: • true: Channel is available. • false: Channel isn't available. Data type Boolean
presence.channels.name	Name of the channel, such as Chat or Phone. Data type: String
presence.channels.restrictUpdate	Flag that indicates whether the user can restrict updates to the channel. Valid values: • true: User can restrict updates to the channel. • false: User can't restrict updates to the channel. Data type Boolean
presence.channels.service_channel_type	Type of the service channel. Data type: String
presence.channels.sys_id	Sys_id of the channel record. Located in the Service Channels [awa_service_channel] table. Data type: String
presence.name	Name of the agent's presence state. Data type: String
presence.sys_id	Sys_id of the presence state record. Located in the Presence States [awa_presence_state] table. Data type: String

The following code exapmle shows how to call this method.

```
function failure(data)
{
  console.log("failure: " + JSON.stringify(data));
}

function success(data)
{
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  console.log("success: " + JSON.stringify(data));
}

openFrameAPI.getAWAAgentPresence(success, failure)
```

Response to success callback function:

```
success: {
  "presence": {
    "name": "Available",
    "sys_id": "0b10223c57a313005baaaa65ef94f970",
    "available": true,
    "channels": [
      {
        "name": "Chat",
        "available": true,
        "sys_id": "27f675e3739713004a905ee515f6a7c3",
        "restrict_update": false,
        "service_channel_type": "chat"
      }
    ]
  }
}
```

openFrameAPI - hide()

Hides the OpenFrame in the TopFrame.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
openFrameAPI.hide()
```

openFrameAPI - init(Object config, function successCallback, function failureCallback)

Initializes OpenFrame. This must be the first method that you call.

This method initializes communication to TopFrame and initializes any visual elements passed in the *config* parameter.

Parameters

Name	Type	Description
config	Object	Name-value pairs to use during the initialization process. Possible keys:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• height • subTitle • title • titleIcon • width All keys are optional. Pass an empty object if you don't want to set these key-value pairs.
successCallback	function	Name of the callback function to use if the *init* method succeeds. The OpenFrame configuration stored in the system is passed as a parameter to the callback function.
failureCallback	function	Name of the callback function to use if the *init* method fails.

Returns

Type	Description
void	

```
var config = {
height: 300,
width: 200
}
function handleCommunicationEvent(context) {
console.log("Communication from Topframe", context);
}
function initSuccess(snConfig) {
console.log("openframe configuration", snConfig);
//register for communication event from TopFrame
openFrameAPI.subscribe(openFrameAPI.EVENTS.COMMUNICATION_EVENT,
handleCommunicationEvent);
}
function initFailure(error) {
console.log("OpenFrame init failed...", error);
}
openFrameAPI.init(config, initSuccess, initFailure);
```

openFrameAPI - isVisible(function callback)

Checks to see if the OpenFrame is visible in the TopFrame.

Parameters

Name	Type	Description
callback	function	The callback function receives a parameter with a value of true or false. True if OpenFrame is visible and false if not visible.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
function callback(isVisible) {
console.log(isVisible)
}
openFrameAPI.isVisible(callback)
```

openFrameAPI - openCustomURL(String details)

Opens a custom URL in the UI16 interface.

Parameters

Name	Type	Description
Url	String	Text of the custom URL. Maximum size: 2083 characters

Returns

Type	Description
void	

```
openFrameAPI.openCustomURL('10_cool_things.do');
```

openFrameAPI - openServiceNowForm(Object details)

Opens a form URL.

When an agent receives an incoming call, the OpenFrame window displays information such as the account, contact, or consumer. Clicking a link in the OpenFrame window displays the corresponding record.

- In the platform interface, this API opens a form URL in TopFrame.
- For Agent Workspace, this API supports interaction tab management. In Agent Workspace, an interaction record opens in a parent tab and the specified entity record opens in a child tab under the interaction tab.

Parameters

Name	Type	Description

details	Object	Key-value pairs that identify the form URL to open.
		
		`"details": {`
		`  "entity": "String";`
		`  "interaction_sys_id": "String";`
		`  "query": "String"`
		`}`

details.entity	String	Table or entity name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
details.interaction_sys_id	String	Optional. Sys_id of the interaction record to open as parent tab in Agent Workspace. **Note:** In the platform interface the *interaction_sys_id* is ignored.
details.query	String	Query to identify the record to open, such as: `query:'sys_id=<record_sys_id>'`.

Returns

Type	Description
void	

The following example shows basic usage in platform:

```
openFrameAPI.openServiceNowForm({entity:'customer_account',
query:'sys_id=447832786f0331003b3c498f5d3ee452',
 'interaction_sys_id':'3be092313b711300758ce9b534efc4dd'});
```

The following example shows how to use the *query* parameter to create a new record with data provided in the form by using sysparm_query and an encoded query to populate the first and last name fields in Workspace:

```
openFrameAPI.openServiceNowForm({ entity: 'sys_user',
query:
 'sys_id=-1&sysparm_query=first_name=Ivan^last_name=Greggor' });
```

openFrameAPI - openServiceNowFormwithChildTab()

Opens a ServiceNow form with a child tab if invoked in a workspace or opens an entity if invoked in the UI16 interface.

Parameters

Name	Type	Description
openServiceNowFormwithChildTab	Object	Defines if the API opens a ServiceNow form with a child tab if invoked in a workspace or opens an entity if invoked in the UI16 interface. `openFrameAPI.openServiceNowFormwithChildTab({ entity: "String", sys_id: String", parent_entity: "String", parent_entity_sys_id: "String" })`
openServiceNowFormwithChildTab.entity	String	The name of the table that contains the record to open.
openServiceNowFormwithChildTab.sys_id	String	The sys_id of the record to open.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
openServiceNowFormwithChildTab	String	Name of the table to open as a parent tab.
openServiceNowFormwithChildTab	String	Sys_id of the parent record to open.

Returns

Type	Description
None	

The following example opens the parent entity as a parent tab on a configured workspace, or opens just the entity if invoked in UI16.

```
openFrameAPI.openServiceNowFormwithChildTab({
  entity: "customer_account",
  sys_id: "447832786f0331003b3c498f5d3ee452",
  parent_entity: "interaction",
  parent_entity_sys_id: "3be092313b711300758ce9b534efc4dd"
});
```

openFrameAPI - openServiceNowList(Object details)

Opens a list URL in the UI16 interface.

Parameters

Name	Type	Description
details	Object	Key value pairs that describe the content to use when opening the list URL. Valid values: • entity: Table name • query: Encoded query string

Returns

Type	Description
void	

```
openFrameAPI.openServiceNowList({entity:'case',
 query:'active=true'});
```

openFrameAPI - setFrameMode(mode)

Sets the OpenFrame mode.

The mode passed in this API:

- Sets the appropriate icon in the header: collapse or expand
- Raises the relevant event for CTI:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- openFrameAPI.EVENTS.COLLAPSE
- openFrameAPI.EVENTS.EXPAND

Parameters

Name	Type	Description
Mode	String	Set OpenFrame Mode. Enumerated options: **1.** openFrameAPI.FRAME_MODE.COLLAPSE **2.** openFrameAPI.FRAME_MODE.EXPAND

Returns

Type	Description
void	

```
openFrameAPI.setFrameMode(openFrameAPI.FRAME_MODE.COLLAPSE);
```

openFrameAPI - setHeight(height)

Sets the OpenFrame height.

Parameters

Name	Type	Description
Height	Number	Height in pixels

Returns

Type	Description
void	

```
openFrameAPI.setHeight(100);
```

openFrameAPI - setIcons(Array icons)

Defines icons in the OpenFrame header that are placed next to the close icon.

Parameters

Name	Type	Description
icons	Array of objects	A list of icon configurations, where each icon configuration is an object with key values *`imageURL`*, *`imageTitle`*, and any other needed context. Maximum size: Icons can be a maximum of 16x16 pixels. Larger images are automatically adjusted to this maximum.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
openFrameAPI.setIcons([{imageURL:'https://
mydomian.com/image/mute.png',
imageTitle:'mute', id:101},
 {imageURL:'https://mydomian.com/image/hold.png',
imageTitle:'hold', id:102}]);
```

openFrameAPI - setPresenceIndicator(presence)

Sets the presence indicator to display agent availability in a workspace.

For more information on configuring OpenFrame, refer to Create an OpenFrame configuration

Parameters

Name	Type	Description
state	String	Presence state of the agent. Default states: • Available • Away • Offline You can also specify custom states.
color	String	Presence indicator color on workspace. Supported colors: • red • orange • grey • green

Returns

Type	Description
void	

```
openframeAPI.setPresenceIndicator('Available', 'green');
```

openFrameAPI - setSize(Number width, Number height)

Sets the OpenFrame size.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
width	Number	Should be greater than zero.
height	Number	Should be greater than zero.

Returns

Type	Description
void	

```
openFrameAPI.setSize(300, 370);
```

openFrameAPI - setSubtitle(String subTitle)

Sets the OpenFrame subtitle.

Parameters

Name	Type	Description
subTitle	String	A string of 256 or fewer characters.

Returns

Type	Description
void	

```
openFrameAPI.setSubtitle('+18888888888');
```

openFrameAPI - setTitle(String title)

Sets the OpenFrame title.

Parameters

Name	Type	Description
title	String	A string of 256 or fewer characters.

Returns

Type	Description
void	

```
openFrameAPI.setTitle('Incoming Call');
```

openFrameAPI - setTitleIcon(Object icon)

Sets the OpenFrame's title icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
icon	Object	Object of key value pairs. Keys include *imageURL*, *imageTitle*, and any other context needed. Maximum size: Icons can be a maximum of 16x16 pixels. Larger images are automatically adjusted to this maximum.

Returns

Type	Description
void	

```
openFrameAPI.setTitleIcon({imageURL:'/my/image/path.png',
 imageTitle:'mute', id:101});
```

```
openFrameAPI.setTitleIcon({imageURL:'https://
mydomian.com/image/path.png',
imageTitle:'mute', id:101});
```

openFrameAPI - setWidth(width)

Sets the OpenFrame width.

Parameters

Name	Type	Description
Width	Number	Width in pixels

Returns

Type	Description
void	

```
openFrameAPI.setWidth(100);
```

openFrameAPI - show()

Makes the OpenFrame visible in the TopFrame.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
openFrameAPI.show()
```

openFrameAPI - subscribe(openFrameAPIEVENT event, function eventCallback)

Subscribes to a specified event.

Parameters

Name	Type	Description
event	openFrameAPIEVENT	The event to subscribe to: • openframe_agent_off_interaction: Indicates the presence of an agent on chat as off or available. • openframe_awa_agent_presence: In Advanced Work Assignment (AWA), this event occurs when there's any change in the agent presence state. Computer Telephony Integration (CTI) developers can subscribe to this event to receive presence state changes. • openframe_awa_workitem_accepted: Occurs when a work item is accepted by an agent. • openframe_awa_workitem_offered: Occurs when a work item is offered to an agent. • openframe_awa_workitem_rejected: Occurs when a work item is rejected by an agent. • openframe_before_destroy: Occurs before the TopFrame is unloaded. • openframe_collapse: Occurs when the collapse icon is selected on the OpenFrame header. • openframe_communication: Application-specific and can be customized. • openframe_communication_failure: Occurs when communication to TopFrame fails. • openframe_expand: Occurs when the expand icon is selected on the OpenFrame header. • openframe_header_icon_clicked: Deprecated. Use openframe_icon_clicked or openframe_title_icon_clicked instead. • openframe_hidden: Occurs when the OpenFrame is hidden. • openframe_icon_clicked: Occurs when any icon other than the close icon is selected on the OpenFrame footer. The callback receives the icon object as a parameter. • openframe_shown: Occurs when the OpenFrame is shown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• openframe_title_icon_clicked: Occurs when the title icon is selected on the OpenFrame. The callback receives the titleIcon object as a parameter.
eventCallback	function	Function to call when the specified event occurs.

Returns

Type	Description
results	Most event subscriptions have no return values. The event subscriptions that do return values are described in the following table entries.
openframe_awa_agent_presence	In AWA, the *openframe_awa_agent_presence* event returns the `presence` object: `"presence":{ "available": Boolean, "channels":[ { "available": Boolean, "name": "String", "restrict_update": Boolean, "sys_id": "String" } ], "name": "String", "sys_id": "String" }` *presence*: Information about an agent's current presence state and channel. • *presence.available*: Flag that indicates whether the agent is available. • *presence.channels*: List of objects that describe the available channels of communication with the agent. ◦ *presence.channels.available*: Flag that indicates whether the channel is available. ◦ *presence.channels.name*: Channel name, such as Chat or Phone. ◦ *presence.channels.restrict_update*: Flag that indicates whether the user can restrict updates. ◦ *presence.channels.sys_id*: Channel sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• *presence.name*: Name of the agent's presence state. • *presence.sys_id*: Presence state sys_id.

openframe_awa_workitem_accepted and openframe_awa_workitem_offered	In AWA, the *openframe_awa_workitem_accepted* and *openframe_awa_workitem_offered* events return the `workItem` object:
	`"workItem": { "document": { "sys_id": "String", "table": "String" }, "isAutoAccepted": Boolean, "isQueueTransferred": Boolean, "previousWorkItem": "String", "serviceChannel": { "name": "String", "sys_id": "String" }, "size": Number, "sys_id": "String" }`
	workItem: Information about the work item that is associated with the event.
	• *workItem.document*: List of documents associated with the work item task.
	  ○ *workItem.document.sys_id*: Sys_id of the document assigned to the work item task.
	  ○ *workItem.document.table*: Name of the document table assigned to the task.
	• *workItem.isAutoAccepted*: Flag that indicates whether the work item was automatically accepted by the system. Set to true if the work item was auto-accepted.
	• *workItem.isQueueTransferred*: Flag that indicates whether the work item is queue transferred. Set to true if the work item is queue transferred, false if it isn't. For more information on queue transfers, see Transfer a chat to another queue.
	• *workItem.previousWorkItem*: Sys_id of the previous work item for the same document ID. For the non-transfer work items this value is empty.
	• *workItem.serviceChannel*: List of service channels associated with the work item task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ *workItem.serviceChannel.name*: Name of the service channel, such as Chat or Phone. ○ *workItem.serviceChannel.sys_id*: Sys_id of the service channel. • *workItem.size*: Agent's capacity used when this work item is assigned to the agent. • *workItem.sys_id*: Sys_id of the work item that was accepted or offered.
openframe_awa_workitem_rejected	In AWA, the *openframe_awa_workitem_rejected* event returns the `workItem` object: `"workItem": { "document": { "sys_id": "String", "table": "String" }, "isQueueTransferred": Boolean, "previousWorkItem": "String", "rejection": { "reason": "String", "sys_id": "String" }, "serviceChannel": { "name": "String", "sys_id": "String" }, "size": Number, "sys_id": "String" }` *workItem*: Information about the work item that is associated with the event. • *workItem.document*: List of documents associated with the work item task. ○ *workItem.document.sys_id*: Sys_id of the document assigned to the work item task. ○ *workItem.document.table*: Name of the document table assigned to the task. • *workItem.isQueueTransferred*: Flag that indicates whether the work item is queue transferred. Set to true if the work item is queue transferred, false if it isn't. For more information on queue transfers, see Transfer a chat to another queue. • *workItem.previousWorkItem*: Sys_id of the previous work item for the same document ID. For the non-transfer work items this value is empty.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• *workItem.rejection*: List of reasons for the rejection of the work item.
	  ○ *workItem.rejection.reason*: Name of the reason for rejecting the work items.
	  ○ *workItem.rejection.sys_id*: Sys_id of the rejection reason.
	  Table: Reject Reasons [awa_reject_reason]
	• *workItem.serviceChannel*: List of service channels associated with the work item task.
	  ○ *workItem.serviceChannel.name*: Name of the service channel, such as Chat or Phone.
	  ○ *workItem.serviceChannel.sys_id*: Sys_id of the service channel.
	• *workItem.size*: Agent's capacity used when this work item is assigned to the agent.
	• *workItem.sys_id*: Sys_id of the work item that was accepted or offered.

The following code example shows how to call this method for an `openframe_awa_agent_presence` event.

```
function handleIconClick(context) {
console.log("Icon was clicked", context);
}
openFrameAPI.subscribe(openFrameAPI.events.openframe_awa_agent_presence, handleIconClick);
```

Output:

```
// Sample presence object output
// openframe_awa_agent_presence event only

{
  "result":{
    "presence":{
      "name":"Available",
      "sys_id":"27f675e3739713004a905ee515f6a7c3",
      "available":true,
      "channels":[
        {
          "name":"Chat",
          "available":true,
          "sys_id":"36f675e4239713124a905fe515f6a832",
          "restrict_update":false
        },
        {
          "name":"Phone",
          "available":true,
          "sys_id":"9378a530a1820610f809018efd9bc01e",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
          "restrict_update":false
        }
      ]
    }
  }
}
```

The following code example shows how to call this method for an `openframe_awa_workitem_accepted` event.

```
function handleIconClick(context) {
console.log("Icon was clicked", context);
}
openFrameAPI.subscribe(openFrameAPI.events.openframe_awa_workite
m_accepted, handleIconClick);
```

Output:

```
// Sample workItem object output
// openframe_awa_workitem_accepted event only
{
  "result": {
    "workItem": {
      "sys_id": "14c86c40a1650610f87701807d9bc0be",
      "size": 1,
      "serviceChannel": {
        "name": "Chat",
        "sys_id": "27f675e3739713004a905ee515f6a7c3"
      },
      "document": {
        "sys_id": "aa582040a1650610f87701807d9bc076",
        "table": "interaction"
      },
      "previousWorkItem": "7c78a440a1650610f87701807d9bc02b",
      "isQueueTransferred": true,
      "isAutoAccepted": true
    }
  }
}
```

The following code example shows how to call this method for an `openframe_awa_workitem_rejected` event.

```
function handleIconClick(context) {
console.log("Icon was clicked", context);
}
openFrameAPI.subscribe(openFrameAPI.events.openframe_awa_workite
m_rejected, handleIconClick);
```

Output:

```
// Sample workItem object output
// openframe_awa_workitem_rejected event only
{
  "payload": {
    "workItem": {
      "sys_id": "2c3bdc4824250610f8775e73b116f8de",
      "size": "1",
```

      "isQueueTransferred": true
    }
  }
}
```

openFrameAPI - version()

Returns the OpenFrame API version.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The OpenFrame API version

```
var version = openFrameAPI.version();

console.log("API version " + version);
```

NotifyClient - Client

The `NotifyClient` API provides methods that enable you to use Notify telephony functionality, such as making and receiving calls from a web browser.

Several `NotifyClient` methods take a callback function as a parameter. Because `NotifyClient` method calls are made asynchronously, these methods can't return a value directly. Use the callback function to parse the returned data, such as by assigning variables or making other API calls.

NotifyClient - Client(Object notifyConfig, Boolean initializeVendorClientLazily)

Instantiates a new Notify WebRTC Client object.

Parameters

Name	Type	Description
initializeVendorClientLazily	Boolean	Flag that indicates whether to use the autoSelectVendorCallback function passed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		in the `setCallerId()` method to automatically set the caller's associated vendor (`notifyConfig.vendor` does not need to be defined in the constructor). • false: Default. Do not use the autoSelectVendorCallback function to set the caller's vendor. The vendor must be set in the constructor. • true: Use the autoSelectVendorCallback function to define the vendor when the caller ID is set.
notifyConfig	Object	JSON object that contains the configuration settings for the Notify WebRTC Client.
notifyConfig.autoLoadScriptResources	Boolean	Flag that indicates how to load the core JS library needed by the vendor client. • false: Default. Use vendor specific codes to load the required vendor JS library (enables backwards compatibility). • true: Use notifyClient.js to load the core JS library.
notifyConfig.callerId	Number	Registered Notify number to use. Do not directly set this value. Use the method `notifyClient.setCallerID()` to set this value.
notifyConfig.forceRefreshToken	Boolean	Flag that indicates whether to auto-renew expired client tokens. • false: Do not automatically renew client tokens when they expire. • true: Default. Automatically renew client tokens when they expire.
notifyConfig.skipParentId	Boolean	Flag that indicates whether to immediately invoke the onIncoming caller for incoming calls. • false: Default. Do not immediately invoke the onIncoming event handler. • true: Immediately invoke the onIncoming event handler. By setting this flag, if there is another call, where the `<Dial><Client>` Twiml caused the incoming call, then setting this

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		flag causes the system to auto poll the backend. This auto poll obtains the parent notify_call reference.
notifyConfig.vendor	Constant	Vendor to which the caller belongs. • SNC.Notify.Vendor.TWILIO_DIRECT • SNC.Notify.Vendor.TWILIO (older, deprecated Twilio driver)

The following example shows how to create the NotifyClient constructor, register various event listeners, and initialize the client driver.

```
jQuery(function () {

  var notifyConfig = {
    autoLoadScriptResources: true // This will take care of auto
 loading the JS resources needed by the client (if any)
  };
  var client = new SNC.Notify.Client(notifyConfig, true); // The
 second argument ensures that the proper vendor for the given
 number is auto determined
  client.setCallerId('valid_notify_long_number', function () {
    // This is called after the vendor has been determined.

    if (!notifyConfig.vendor) // Means this number has no
 compatible vendor
      return;

    client.addEventListener(SNC.Notify.STD_EVENTS.ONLINE,
 function () {
      // Ability to call is available
    });
    client.addEventListener(SNC.Notify.STD_EVENTS.OFFLINE,
 function () {
      // Ability to call is _not_ available right now
    });
    client.addEventListener(SNC.Notify.STD_EVENTS.ERROR,
 function (msg, code) {
      // Some error happened
    });
      //... register other event handlers here
      //Show UI elements which can be used to invoke
 client.call() and other APIs
    client.init(); // This is important to call this.
    });
});
```

NotifyClient - addEventListener(String event, Function fn)

Registers an event handler to listen for changes in a Notify client.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using this method you can register multiple listeners. Each listener must be a separate method call.

Parameters

Name	Type	Description

event	String	Name of the event to listen for.
		
		Instead of passing strings, use the constants defined in `SNC.Notify.STD_EVENTS`.
		
		• CALL_START: call has started and is in progress.
		• CALL_CANCEL: caller canceled the call.
		• CALL_INIT: WebRTC connected to a call (incoming or outgoing).
		• CALL_DISCONNECT: current call has been disconnected.
		• ERROR: Error occurred. Parameters: `message(string), errCode(string)`
		  ◦ `message`: error message to display.
		  ◦ `errCode`: Optional. Associated error code.
		• INCOMING_CALL: Call is coming in. Parameters: `from(string), to(string), callId(string), parentId(string), sysId(string), isFromClient(boolean)`
		  ◦ `from`: caller's phone number.
		  ◦ `to`: called phone number.
		  ◦ `callId`: SID of the call.
		  ◦ `parentId`: parent notify_call reference. If skipParentId is set to true, this parameter should not be passed.
		  ◦ `sysId`: WebRTC-to-WebRTC calls only. Unique identifier (sys_id) of the caller.
		  ◦ `isFromClient`: WebRTC-to-WebRTC calls only. Flag that indicates whether the call is from another WebRTC client.
		• CALL_MUTE: client is muted.
		• CALL_UNMUTE: client is unmuted.
		• OFFLINE: WebRTC session is not active.
		• ONLINE: WebRTC session is ready. Must be set after calling the init() method.

Returns

Type	Description
Function	Function to use to de-register a listener.

This example shows how to register multiple listeners.

```
jQuery(function () {

  var notifyConfig = {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    autoLoadScriptResources: true // This will take care of auto
 loading the JS resources needed by the client (if any)
  };
  var client = new SNC.Notify.Client(notifyConfig, true); // The
 second argument ensures that the proper client for the given
 number is auto determined
  client.setCallerId('valid_notify_long_number', function () {
    // This is called after the client has been determined.

    if (!notifyConfig.vendor) // Means this number has no
 compatible client
      return;

    client.addEventListener(SNC.Notify.STD_EVENTS.ONLINE,
 function () {
      // Ability to call is available
    });
    client.addEventListener(SNC.Notify.STD_EVENTS.OFFLINE,
 function () {
      // Ability to call is _not_ available right now
    });
    client.addEventListener(SNC.Notify.STD_EVENTS.ERROR,
 function (msg, code) {
      // Some error happened
    });
      //... register other event handlers here

    client.init(); // This is important to call this.
    });
});
```

This example shows how to de-register a listener.

```
var dereg =
 notifyClient.addEventListener(SNC.Notify.STD_EVENTS.ONLINE,
 function () {
 ...
 });
 dereg();
  // The event listener function is no longer triggered.
```

NotifyClient - call(Object identifier)

Calls the specified phone number or the phone number associated with a specified user.

Note: When checking the status of a call/connection, always compare against the constants provided by `SNC.Notify.Status`.

Parameters

Name	Type	Description
identifier	Object	JSON object that contains either a phone number to call or the sys_id of a WebRTC user. Passing a user sys_id causes the call to be made through browser-to-browser communication. You can obtain the user sys_id from the Notify WebRTC Session table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Note: If you provide both a phone number and user sys_id, the method only uses the phone number.

Returns

Type	Description
void	

This example demonstrates passing a phone number as the function parameter.

```
notifyClient.call({
    phoneNumber: "+18001112223"
});
```

This example demonstrates passing a user record sys_id as the function parameter.

```
notifyClient.call({
    userId: "6816f79cc0a8016401c5a33be04be441"
});
```

This example shows a button click handler.

```
$j("#pickupCallBtn").on("click", function() {
 notifyClient.hangupCall();
});
```

This example shows an event handler.

```
onConnect: function(status) {
  // webRTC receives a call connection event (incoming or
 outgoing).
  if (status == SNC.Notify.Status.OPEN) {
    setStatus(getTimeStamp() + " -- Successfully established
 call");
    showHangupButton();
  }
},
```

NotifyClient - destroy()

Kills the current Notify client, rendering it unusable.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

NotifyClient - forwardCall(Object argument)

Forwards an ongoing incoming or outgoing phone call to either a different phone number or a different WebRTC client.

Parameters

Name	Type	Description
argument	Object	JSON object that contains the necessary information for forwarding the call to either a phone number or a WebRTC client (user sys_id). You can obtain this sys_id from the Notify WebRTC Session table.

Returns

Type	Description
void	

This example demonstrates forwarding a call to a different phone number. The dtmf attribute allows you to send DTMF dial tones to the receiving number.

```
var arg = {
    type: "number",
    id: "+17012345678",
    dtmf: "1234"
}
client.forwardCall(arg);
```

This example demonstrates forwarding a call to a different Notify client.

```
var arg = {
    type: "userId",
    id: "6816f79cc0a8016401c5a33be04be441"
}
client.forwardCall(arg);
```

NotifyClient - getAvailableClients(Function callback)

Returns a list of clients available to accept calls.

This method excludes the current client from the list. The equivalent Notify-getAvailableClients() method does not filter any user.

Parameters

Name	Type	Description
callback	Function	Function to use to parse the list of clients. This function accepts a single parameter, an array of JSON objects with the following format: `[{ sys_id: "...", // user's sys_id`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		<pre> name: "..." // user's name }]</pre>

Returns

Type	Description
void	

NotifyClient - getParentId(String callId, Function callback)

Returns the parent call identifier for a specified call identifier, if one exists.

Depending on the telephony provider, there may be a delay before the parent call identifier is returned; therefore you must provide a callback function.

Parameters

Name	Type	Description
callId	String	Unique identifier of the call for which to return the parent call identifier.
callback	Function	Function that obtains the JSON object that contains either the parent call identifier or an error message if the identifier could not be obtained after several tries.

Returns

Type	Description
String	Parent call identifier.

This example shows how to use this method to obtain the parent call identifier.

```
notifyClient.getParentId( callId, function(jsonObj) {} );
```

This example shows the contents of the jsonObj parameter.

```
{
 parentId: "xyz",
 error: "msg"
}
```

NotifyClient - getStatus()

Returns the normalized status of the current call.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Current status of the call. The values returned by the telephony provider API are normalized by replacing the returned driver value with its equivalent value as defined in SNC.Notify.Status.

This example shows how to obtain the status of the current Notify client.

```
clientStatus = notifyClient.getStatus();
```

NotifyClient - hangupCall()

End the current call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example how to hang up a call.

```
$j("#pickupCallBtn").on("click", function() {
    notifyClient.hangupCall();
});
```

NotifyClient - init()

Initializes the client driver.

For example, when using the Twilio client, it invokes the method *`Twilio.Device.setup()`*. Call this method after the user has interacted with the page. This initialization process is asynchronous, therefore, you must provide an ONLINE event handler. This handler is called when the setup process is complete and the system is ready to take or make calls.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example shows how to initialize the Notify client.

```
$j(function() {
  notifyClient = new SNC.Notify.Client( notifyConfig );
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  notifyClient.setCallerId( '+31858889170' );
  notifyClient.init();
});
```

NotifyClient - mute(Boolean muted)

Mute or unmute the current client.

Parameters

Name	Type	Description
muted	Boolean	Mutes or unmutes the current call. • false: (or any non-true value) unmutes the current call. • true: mutes the current call.

Returns

Type	Description
void	

This example shows how to send mute the current call.

```
notifyClient.mute( "true" );
```

NotifyClient - pickupCall()

Answers and connects to an incoming call from a WebRTC client.

Call this method when there is a notification of an incoming call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example shows how to pickup a call.

```
$j("#pickupCallBtn").on("click", function() {
    notifyClient.pickupCall();
});
```

NotifyClient - sendDtmf(String digits)

Send one or more DTMF-valid digits over the current call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
digits	String	One or more DTMF-valid digits.

Returns

Type	Description
void	

This example shows how to send DTMF signals to the current call.

```
notifyClient.SendDtmf( "1246AF" ) {} );
```

NotifyClient - setCallerId(String value, Function autoSelectVendorCallback)

Sets the caller ID for the current client session.

You can change or update the caller ID at any time however, the caller ID must belong to the same vendor.

Parameters

Name	Type	Description
value	String	Phone number to use to make and receive calls.
autoSelectVendorCallback	Function	**Optional.** *`initializeVendorClientLazily`* must be set to "true" in the constructor to use this function, otherwise an error is thrown. Name of the callback function to call once the vendor is automatically set for the specified phone number. With this option, the vendor does not need to be specified in the constructor (*`notifyConfig.vendor`*). Auto vendor selection is an asynchronous operation. Therefore, this callback is required to indicate when it is safe to call *`notifyConfig.init()`*, as this method requires that the vendor be set before it is called. In addition, you must also check if *`notifyConfig.vendor`* has been set in the callback to ensure that a vendor has been specified.

Returns

Type	Description
void	

This example shows how to set the caller ID. This example assumes that the vendor is set in the constructor.

```
$j(function() {
  notifyClient = new SNC.Notify.Client( notifyConfig );
  notifyClient.setCallerId( '+31858889170' );
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  notifyClient.init();
});
```

NotifyClient - setClientAvailable(Boolean available)

Sets the availability of an active WebRTC client agent.

This type of availability is different than an agent being in a call. In this case, an active WebRTC client may be connected and not on a call, but may not want to receive calls.

Calling this method updates the **Available** field value on the Notify Client Connected Session [notify_client_session] record associated with this client session. You can get a list of available clients using the *`getAvailableClients()`* method.

Parameters

Name	Type	Description
available	boolean	Flag that indicates whether an active WebRTC client wants to receive calls. • false: client does not want to receive calls. • true: client does want to receive calls.

Returns

Type	Description
void	

NotifyOnTaskClient - Client

The *`NotifyOnTaskClient`* API provides methods for sending SMS messages or starting/managing a conference call for various telephony service providers, such as Zoom and Webex.

Any UI can consume the *`NotifyOnTaskClient`* API by explicitly including the NotifyOnTaskClient UI script.

Using the *`NotifyOnTaskClient`* API you can:

- Start a conference call
- End a conference call
- Add participants
- Perform actions that are available through the telephony driver such as:
  - mute/unmute participants
  - remove participants from a conference call
  - add participants to a conference call
  - start a conference call
  - end a conference call

The Notify (com.snc.notify) plugin requires a separate subscription. For additional information on activating the Notify plugin, see Activate Notify.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyOnTaskClient - addParticipants(Object data)

Adds the specified participants to a specified conference call.

Parameters

Name	Type	Description
data	Object	Object that describes the conference call.
data.addToWorkNotes	Boolean	Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record. For this functionality to work, you must also specify values in the *data.table* and *data.sysId* parameters. These parameters identify the record in which to add the work notes. Default: false
data.confId	String	Required. Sys ID of the conference call. The conference Sys ID is located in the Notify Conference Call [notify_conference_call] table.
data.items	Array	Required. Information for each participant to include in the conference call. Valid array values: • *id*: User Sys ID; located in the User [sys_User] table. • *notifyParticipantId*: Participant Sys ID; located in the Notify Participant [notify_participant] table. • *phoneNumber*: Phone number of the participant. If this value is passed in conjunction with either the *id* or *notifyParticipantId*, this value supersedes the phone numbers in the user/participant record and is used to place the call. • *email*: email address of the participant.
data.message	String	Message that is read aloud when a user answers the call, such as, "P1 incident has been created please login to instance."
data.serviceProvider	String	Required. Name of conference service provider, such as Zoom or Webex.
data.sysId	String	Sys ID of the source record to associate with the conference call. For example, if a conference call is held to discuss a specific incident or problem, put the Sys ID of the incident or problem record in this value. This Sys ID is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		This parameter is used in conjunction with the *data.Table*, *data.addToWorkNotes*, and *allowMulticonference* parameters. You should configure this value when the conference call is initially created through a "start" action. If required, you can also set this value through this method.
data.table	String	Table that contains the source record to associate with the conference call. A source record can be any record, such as an "incident" or "problem", that is the topic of discussion in the conference call. This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked. This parameter is used in conjunction with the *data.sysId*, *data.addToWorkNotes*, and *allowMulticonference* parameters. You should configure this value when the conference call is initially created through a "start" action. If required, you can also set this value through this method.

Returns

Type	Description

Object	Results of the conference action.
	
	`<action>.status`: Status of the conference action.
	
	• Data type: Boolean
	• Valid values:
	  ○ true: Conference action succeeded
	  ○ false: Conference action failed
	
	`<action>.successMessages`: If *status* is true, success message(s), else empty.
	
	• Data type: Array of Strings
	
	`<action>.warnMessages`: If *status* is false, any warning messages thrown during processing.
	
	• Data type: Array of Strings
	
	`<action>.errorMessages`: If *status* is false, any error messages thrown during processing.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• Data type: Array of Strings

```
function addToConferenceCall() {
    var data = NotifyOnTaskClient.getNotifyActionTemplate();
    data.serviceProvider = 'Telephony'; // e.g 'Zoom', 'WebEx'
    data.confId = 'Active conference sysId';
    data.items.push({ id: 'userSysId' });
    data.items.push({ phoneNumber: '+917799555331' });
    data.items.push({ email: 'yln99518@gmail.com' });

    NotifyOnTaskClient.addParticipants(data).then(function
 (result) {
        var joinActionResult = result[0];
        if(joinActionResult.status) {

 joinActionResult.successMessages.forEach(function(msg) {
                console.log(msg);
            });
            return;
        }

        joinActionResult.warnMessages.forEach(function(msg) {
            console.warn(msg);
        });
        joinActionResult.errorMessages.forEach(function(msg) {
            console.error(msg);
        });
    }, function (errMsg) {
        console.log(errMsg);
    });
}
```

NotifyOnTaskClient - doConferenceAction(String action, Object data)

Performs the specified conference call action, such as starting/ending a conference call or joining, removing, muting, or unmuting participants from a conference call.

You can start a new conference call and add participants within a single call to this method or call the method multiple times to start the call and then manage participants separately. In addition, through the passed in data object, you can configure the method to:

- Save pointers in the conference call record to the specific record (source record), such as an incident or problem, that is the topic of discussion for the conference call.
- Allow/disallow multiple conference calls for a source record.
- Automatically log the participants that were in the conference call in the **Work notes** field of the source record.
- Have a message read aloud when a participant answers an outgoing call from the conference.

Parameters

Name	Type	Description
action	String	Defines the conference call action to perform. The following are the available conference call actions: • start: Starts the conference call identified in *data.confId* • end: Terminates the conference call identified in *data.confId* • join: Adds the participant specified in the *data.items* array to the conference call identified in *data.confId* • multiJoin: Adds the participants specified in the *data.items* array to the conference call identified in *data.confId* • selfJoin: Adds the currently logged in user to the conference call (no entry in *data.items* required.) • kick: Removes the participant specified in the *data.items* array from the conference call identified in *data.confId* • multiKick: Removes the participants specified in the *data.items* array from the conference call identified in *data.confId* • mute: Mutes the participant specified in the *data.items* array on the conference call identified in *data.confId* • multiMute: Mutes the participants specified in the *data.items* array on the conference call identified in *data.confId* • unmute: Unmutes the participant specified in the *data.items* array from the conference call identified in *data.confId* • multiUnmute: Unmutes the participants specified in the *data.items* array from the conference call identified in *data.confId*
data	Object	Object that describes the conference call.
data.addToWorkNotes	Boolean	Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record. For this functionality to work, you must also specify values in the *data.table* and *data.sysId* parameters. These parameters identify the record in which to add the work notes. Default: false Actions for which this parameter is valid:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• start • join • multiJoin • selfJoin
data.allowMulticonference	Boolean	Flag that indicates whether to allow multiple conference calls for a specific record at one time. For this functionality to work, you must also specify values in the *`data.table`* and *`data.sysId`* parameters. These parameters identify the record that is allowed to have multiple conference calls. Default: false Actions for which this parameter is valid: • start
data.confId	String	Sys ID of the conference call. The conference Sys ID is located in the Notify Conference Call [notify_conference_call] table. Actions for which this parameter is required: • end • join • multiJoin • selfJoin **Note:** Participant actions such as mute, unmute, and kick do not require this parameter to be set as the method obtains this information from the Notify Conference Call Participant [notify_participant] table.
data.fromNumber	String	Service provider number to call into for the conference call. Locate this value in the Number or Phone number column of the Notify Phone Number [notify_number] table. Actions for which this parameter is required: • start
data.isNewConference	Boolean	Flag that indicates whether this is a new or an existing conference call.

Parameters (continued)

Name	Type	Description
		Valid values: • true: New conference call • false: Existing conference call Default: false Actions for which this parameter is valid: • start
data.message	String	Message that is read aloud when a user answers the call, such as, "P1 incident has been created please login to instance." Actions for which this parameter is valid: • start • join • multiJoin
data.items	Array	Information for each participant to include in the conference call. Valid array values: • id: Sys ID of user; located in the User [sys_User] table. Valid actions: join, multiJoin, start • notifyParticipantId: Sys ID of the Notify participant; located in the Notify Participant [notify_participant] table. Valid actions: join, kick, multiJoin, mute, start, unmute • phoneNumber: Phone number of the participant. If this value is passed in conjunction with either the *id* or *notifyParticipantId*, this value supersedes the phone numbers in the user/participant record and is used to place the call. Valid actions: join, multiJoin, start • email: Email address of the participant. Valid actions: join, multiJoin, start
data.serviceProvider	String	Required. Name of conference service provider, such as Zoom or Webex. Actions for which this parameter is required:

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• all
data.sysId	String	Sys ID of the source record to associate with the conference call. For example, if a conference call is held to discuss a specific incident or problem, put the Sys ID of the incident or problem record in this value. This Sys ID is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked. This parameter is used in conjunction with the *`data.Table`*, *`data.addToWorkNotes`*, and *`allowMulticonference`* parameters. Actions for which this parameter is valid: • start
data.table	String	Table that contains the source record to associate with the conference call. A source record can be any record, such as an "incident" or "problem", that is the topic of discussion in the conference call. This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked. This parameter is used in conjunction with the *`data.sysId`*, *`data.addToWorkNotes`*, and *`allowMulticonference`* parameters. Actions for which this parameter is valid: • start

Returns

Type	Description

Object	Results of the conference action.
	
	`<action>.status`: Status of the conference action.
	
	• Data type: Boolean
	• Valid values:
	  ○ true: Conference action succeeded
	  ○ false: Conference action failed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	`<action>.successMessages`: If *`status`* is true, success message(s), else empty. • Data type: Array of Strings `<action>.warnMessages`: If *`status`* is false, any warning messages thrown during processing. • Data type: Array of Strings `<action>.errorMessages`: If *`status`* is false, any error messages thrown during processing. • Data type: Array of Strings

The following example shows how to create a function to call doConferenceAction() to manipulate the participants in a conference call by passing in the action and the participants.

```
/**
 *
 * @param {string} action - action to perform on the conference
 object or participant object
 * @param {Array} participants;
 */
function doConferenceAction(action, participants) {
    var data = NotifyOnTaskClient.getNotifyActionTemplate();
    data.serviceProvider = 'Telephony'; // e.g 'Zoom', 'WebEx'
    data.confId = 'Active conference sysId';
    data.items = participants;

    NotifyOnTaskClient.doConferenceAction(action,
 data).then(function (result) {
        var kickActionResult = result[0];
        if (kickActionResult.status)
            console.log(action + ' succeeded');
        else {
            kickActionResult.warnMessages.forEach(function (msg)
 {
                console.warn(msg);
            });
            kickActionResult.errorMessages.forEach(function
 (msg) {
                console.error(msg);
            });
        }
    }, function (errMsg) {
            console.log(errMsg)
    });
}

// kick participants
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
doConferenceAction('kick', [{notifyParticipantId:
 'notifyParticipantSysId'}]);

// kick multiple participants

doConferenceAction('multiKick',
    [{notifyParticipantId: 'notifyParticipantSysId'},
    {notifyParticipantId: 'notifyParticipantSysId'}]);

// Mute participants
doConferenceAction('mute', [{notifyParticipantId:
 'notifyParticipantSysId'}]);
doConferenceAction('mute', [{notifyParticipantId:
 'notifyParticipantSysId'}]);

doConferenceAction('multiMute',
    [{notifyParticipantId: 'notifyParticipantSysId'},
    {notifyParticipantId: 'notifyParticipantSysId'}]);

// self join to any confernece.
doConferenceAction('selfJoin', [{id: 'logged in userId'}]);
```

NotifyOnTaskClient - endConference(Object data)

Terminates the specified conference call.

Parameters

Name	Type	Description
data	Object	Object that describes the conference call.
data.confId	String	Sys ID of the conference call.
data.serviceProvider	String	Required. Name of conference service provider, such as Zoom or Webex.

Returns

Type	Description

Object	Results of the conference action.
	
	`<action>.status`: Status of the conference action.
	
	• Data type: Boolean
	• Valid values:
	  ○ true: Conference action succeeded
	  ○ false: Conference action failed
	
	`<action>.successMessages`: If *`status`* is true, success message(s), else empty.
	
	• Data type: Array of Strings

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	`<action>.warnMessages`: If *`status`* is false, any warning messages thrown during processing. • Data type: Array of Strings `<action>.errorMessages`: If *`status`* is false, any error messages thrown during processing. • Data type: Array of Strings

```
function endConferenceCall() {
    var data = NotifyOnTaskClient.getNotifyActionTemplate();
    data.serviceProvider = 'Telephony'; // e.g 'Zoom', 'WebEx'
    data.confId = 'Active conference sysId';

    NotifyOnTaskClient.endConference(data).then(function
 (result) {
        var endActionResult = result[0];
        if (endActionResult.status)
            console.log('Conference has been ended');
        else {
            endActionResult.warnMessages.forEach(function (msg)
 {
                console.warn(msg);
            });
            endActionResult.errorMessages.forEach(function (msg)
 {
                console.error(msg);
            });
        }
    }, function (errMsg) {
        console.log(errMsg);
    });
}
```

NotifyOnTaskClient - getNotifyActionTemplate()

Returns a JSON data template to use with the *`doConferenceAction()`* method. Using this template automatically structures the data object so that you don't have to manually create it.

Call this method prior to calling the *`doConferenceAction()`* method. For the desired conference call action, set the desired parameters within the template, and then pass the template in the *`doConferenceAction()`* call. For additional information on the valid parameters for each action, see doConferenceAction().

Note: This is a helper method. You can also manually construct this object and pass it into the *`doConferenceAction()`* method and have the same outcome.

Parameters

Name	Type	Description
None		

Returns

Type	Description
data	Object that describes the conference call.
data.addToWorkNotes	Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record. For this functionality to work, you must also specify values in the *data.table* and *data.sysId* parameters. These parameters identify the record in which to add the work notes. Default: false Actions for which this parameter is valid: • start • join • multiJoin • selfJoin
data.allowMultconference	Flag that indicates whether to allow multiple conference calls for a specific record at one time. For this functionality to work, you must also specify values in the *data.table* and *data.sysId* parameters. These parameters identify the record that is allowed to have multiple conference calls. Default: false Actions for which this parameter is valid: • start
data.confId	Sys ID of the conference call. The conference Sys ID is located in the Notify Conference Call [notify_conference_call] table. Actions for which this parameter is required: • end • join • multiJoin • selfJoin

Returns (continued)

Type	Description
	Note: Participant actions such as mute, unmute, and kick do not require this parameter to be set as the method obtains this information from the Notify Conference Call Participant [notify_participant] table.
data.fromNumber	Service provider number to call into for the conference call. Locate this value in the Number or Phone number column of the Notify Phone Number [notify_number] table. Actions for which this parameter is required: • start
data.isNewConference	Flag that indicates whether this is a new or an existing conference call. Valid values: • true: New conference call • false: Existing conference call Default: false Actions for which this parameter is valid: • start
data.items	Information for each participant to include in the conference call. Valid array values: • id: Sys ID of user; located in the User [sys_User] table. Valid actions: join, multiJoin, start • notifyParticipantId: Sys ID of the Notify participant; located in the Notify Participant [notify_participant] table. Valid actions: join, kick, multiJoin, mute, start, unmute • phoneNumber: Phone number of the participant. If this value is passed in conjunction with either the *id* or *notifyParticipantId*, this value supersedes the phone numbers in the user/participant record and is used to place the call. Valid actions: join, multiJoin, start • email: Email address of the participant. Valid actions: join, multiJoin, start

Returns (continued)

Type	Description
data.message	Message that is read aloud when a user answers the call, such as, "P1 incident has been created please login to instance." Actions for which this parameter is valid: • start • join • multiJoin
data.serviceProvider	Required. Name of conference service provider, such as Zoom or Webex. Actions for which this parameter is required: • all
data.sysId	Sys ID of the source record to associate with the conference call. For example, if a conference call is held to discuss a specific incident or problem, put the Sys ID of the incident or problem record in this value. This Sys ID is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked. This parameter is used in conjunction with the *`data.Table`*, *`data.addToWorkNotes`*, and *`allowMulticonference`* parameters. Actions for which this parameter is valid: • start
data.table	Table that contains the source record to associate with the conference call. A source record can be any record, such as an "incident" or "problem", that is the topic of discussion in the conference call. This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked. This parameter is used in conjunction with the *`data.sysId`*, *`data.addToWorkNotes`*, and *`allowMulticonference`* parameters. Actions for which this parameter is valid: • start

The following example shows how to call getNotifyActionTemplate() to obtain the data template necessary to define the actions for doConferenceAction().

NotifyOnTaskClient - start(Object data)

Starts a new conference call.

Parameters

Name	Type	Description
data	Object	Object that describes the conference call.
data.addToWorkNotes	Boolean	Optional.Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record. For this functionality to work, you must also specify values for the *data.table* and *data.sysId* parameters to identify the record in which to add the work notes. Default: false
data.allowMulticonference	Boolean	Optional. Flag that indicates whether to allow multiple conference calls for a specific record at one time. For this functionality to work, you must also specify values in the *data.table* and *data.sysId* parameters. These parameters identify the record that is allowed to have multiple conference calls. Default: false
data.fromNumber	String	Required. Service provider number to call into for the conference call. Locate this value in the Number or Phone number column of the Notify Phone Number [notify_number] table.
data.items	Array	Optional. Information for each participant to include in the conference call. Valid array values: • *id*: User Sys ID; located in the User [sys_User] table. • *notifyParticipantId*: Participant Sys ID; located in the Notify Participant [notify_participant] table. • *phoneNumber*: Phone number of the participant. If this value is passed in conjunction with either the *id* or *notifyParticipantId*, this value supersedes the phone numbers in the user/participant record and is used to place the call. • *email*: Email address of the participant.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
data.message	String	Optional. Message that is read aloud when a user answers the call, such as, "P1 incident has been created please login to instance."
data.serviceProvider	String	Required. Name of conference service provider, such as Zoom or Webex.
data.sysId	String	Optional. Sys ID of the source record to associate with the conference call. For example, if a conference call is held to discuss a specific incident or problem, put the Sys ID of the incident or problem record in this value. This Sys ID is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked. This parameter is used in conjunction with the *`data.Table`*, *`data.addToWorkNotes`*, and *`allowMulticonference`* parameters.
data.table	String	Optional. Table that contains the source record to associate with the conference call. A source record can be any record, such as an "incident" or "problem", that is the topic of discussion in the conference call. This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked. This parameter is used in conjunction with the *`data.sysId`*, *`data.addToWorkNotes`*, and *`allowMulticonference`* parameters.

Returns

Type	Description

Object	Results of the conference action.
	
	`<action>.status`: Status of the conference action.
	
	• Data type: Boolean
	• Valid values:
	  ○ true: Conference action succeeded
	  ○ false: Conference action failed
	
	`<action>.successMessages`: If *`status`* is true, success message(s), else empty.
	
	• Data type: Array of Strings
	
	`<action>.warnMessages`: If *`status`* is false, any warning messages thrown during processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• Data type: Array of Strings `<action>.errorMessages`: If *`status`* is false, any error messages thrown during processing. • Data type: Array of Strings

```
function startConferenceCall() {
    var data = NotifyOnTaskClient.getNotifyActionTemplate();
    data.table = 'incident';
    data.sysId = '1234';
    data.serviceProvider = serviceProvider;
    data.addToWorkNotes = true;
    data.fromNumber = 'Telephony Number';
    data.items.push({ id: 'userSysId' });
    data.items.push({ phoneNumber: '+917799555332' });
    data.items.push({ email: 'yln99517@gmail.com' });

    NotifyOnTaskClient.start(data).then(function (result) {
        var startActionResult = result[0];
        if(startActionResult.status) {

 startActionResult.successMessages.forEach(function(msg) {
                console.log(msg);
            });
            return;
        }

        startActionResult.warnMessages.forEach(function(msg) {
            console.warn(msg);
        });
        startActionResult.errorMessages.forEach(function(msg) {
            console.error(msg);
        });
    }, function (errMsg) {
        console.log(errMsg);
    });
}
```

ScopedSessionDomain - Client

The *`ScopedSessionDomain`* script include that contains client-side methods that provide functionality related to the current session domain.

This API is only available if the Domain Support - Domain Extensions Installer plugin (com.glide.domain.msp_extensions) plugin has been activated in the instance. In addition, the caller must have the admin role to access this API.

ScopedSessionDomain - getCurrentDomainID()

Returns the sys_id of the current domain for the logged-in user session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The identifier that is returned depends on the domain type and the instantiation of that domain.

- If the user is configured in the global domain, and does not use the domain picker to switch domains, the method returns null.
- If the user uses the domain picker to switch to the global domain, the method returns the string "global".
- For all other domains, the method returns the sys_id of that domain.

To access this method from a client-side script, you must use GlideAjax() to invoke it. To invoke this method from a server-side script, use something similar to the following to instantiate the object and access the method.

```
var ssg = new global.ScopedSessionDomain();
domainID = ssg.getCurrentDomainID();
```

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the session domain of the current logged-in user. This is the same information that appears in the domain picker.

This example shows how to call the *getCurrentDomainID()* method from a client-side script.

```
// This example is calling the script include in a client
 script.
// This particular record is within the "Service Portal -
 Standard Ticket" scope.
// To reproduce this example:
//  1. Change application scope to "Service Portal - Standard
 Ticket"
//  2. Navigate to Client Script table and open a new form and
 name it anything
//  3. Set table=ticket_configuration (this table is within the
 same scope)
//  4. Set UI type=Desktop and Type=onLoad
//  5. Populate the script field with the script above
//  6. Navigate to the ticket_configuration table and open any
 form.
//
// This will trigger the client script, invoke the API, and pop
 up a browser alert containing the sys_id of the user's current
 domain

function onLoad() {
  var ga = new GlideAjax("global.ScopedSessionDomain"); // Set
 the script include
  ga.addParam("sysparm_name", "getCurrentDomainID"); // Set the
 getCurrentDomainID method
  ga.getXML(getResponse);
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  function getResponse(response) {
     var answer =
 response.responseXML.documentElement.getAttribute('answer');
     alert(answer); // Pops up the sys_id of the domain record
  }
}
```

ScriptLoader - Client

The *ScriptLoader* API provides methods to load scripts asynchronously.

You can use this API in client-side scripts for a platform/desktop UI using *ListV2* and *ListV3* APIs. It isn't available for Service Portal, Mobile, or Agent Workspace.

You access *ScriptLoader* methods by using the global object `ScriptLoader`.

ScriptLoader - getScripts(Array scripts, Function callback)

Loads scripts asynchronously.

Parameters

Name	Type	Description
scripts	Array	Array of scripts to load.
callback	Function	Function to call when the scripts have been loaded. The callback function must not have any arguments.

Returns

Type	Description
void	

```
var scriptFiles=[
'scripts/classes/providers/ProviderUI.js',
'scripts/classes/providers/wf_provider_client_script.js'
];

ScriptLoader.getScripts(scriptFiles, function() {
  ProviderUI.setFields(['input_transform']);
  ProviderUI.apply();

 ProviderUI.removeDisabledAttribute("sys_readonly.wf_element_act
ivity.access");
}
```

ScriptLoader - getScripts(String filePath, Function callback)

Gets scripts asynchronously.

Parameters

Name	Type	Description
filePath	String	Path, including the file name, that contains one or more scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
callback	Function	Function to call after the scripts have been loaded. This callback function should not have arguments.

Returns

Type	Description
void	

This example shows how load a utility script and then run the *getDepartment()* function.

```
// Client script to load a utility script and run the
 getDepartment callback function
ScriptLoader.getScripts('sn_ui_script_util.Utilities.jsdbx',
 getDepartment);

function getDepartment() {
  var req = sn_ui_script_util.Utilities.rest('json');
  req.addParam("sysparm_query", "sys_id=" + newValue);
  req.addParam("sysparm_fields", "department");
  req.addParam("sysparm_display_value", true);
  req.success(updateNotes);
  req.get("/api/now/table/sys_user");
}

function updateNotes(data) {
  g_form.setValue("work_notes",
 data.result[0].department.display_value);
}
```

SNAnalytics - Client

The *SNAnalytics* API provides methods to push custom analytics data (events, pages, and user properties) to the User Experience Analytics for Service Portal dashboard.

User Experience Analytics for Service Portal provides dashboard views for monitoring the key performance indicators (KPIs) of web applications built on Service Portal. You can use these insights to optimize your portal. For example, User Experience Analytics tracks when a user orders a catalog item or views a knowledge article. You can use this data to infer which items or articles are the most popular among users.

To access this API, the Service Portal Analytics (com.glide.service-portal.analytics) plugin must be activated on the instance. In addition, within your application, you must import the snAnalytics Angular service, such as:

```
<client_script><![CDATA[function($rootScope, $scope, $window,
 $timeout, spUtil, $sce, spModal, $uibModal, $location,
 cabrillo, snAnalytics)
```

For additional information, see User Experience Analytics for Service Portal.

SNAnalytics - addEvent(Object payload)

Stores the specified event information in the analytics data store.

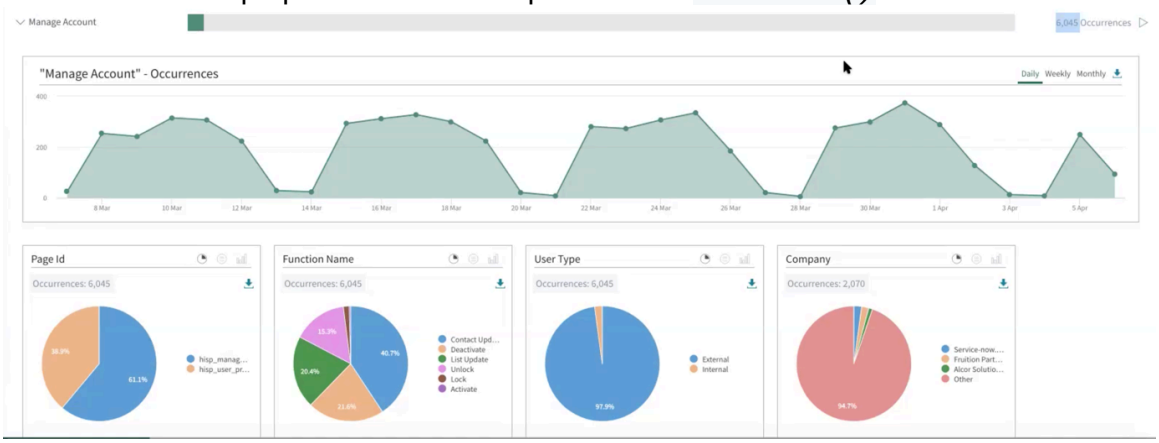
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Events are actions performed by a user, such as clicking a button or submitting a form. Call this method within your web-page widget whenever you want to capture a user action. These events then automatically appear on the associated user session timeline and User Experience Analytics dashboard.

The following is an example of a payload passed in an *addEvent()* call:

```
var payload= {};
payload.name = "Manage Account";
payload.data = {};
payload.data["Function Name"] = c.data.function_name;
payload.data["User Type"] = c.data.user_type;
payload.data["Company"] = c.data.company_name;
snAnalytics.addEvent(payload);
```

The screen capture below shows the information that appears on the analytics dashboard for the event "Manage Account." The timeline at the top represents the number of times that the event occurred. The pie charts below the timeline reflect the properties that were captured in the *addEvent()* call.



If you want to capture when users access a web page, use the SNAnalytics - startPage(String name, String description) method instead of this method.

Parameters

Name	Type	Description
payload	Object	Event to store in the analytics data store. Data type: Object `"payload": { "data": [Array], "name": String }`
payload.data	Array Each element can be a string (case-sensitive), boolean, number, or date.	Optional. Name-value pairs of custom event properties. These properties can be any values that you want to track and see on the analytics dashboard. They appear under the associated event timeline on the analytics dashboard. The **Page Id** property always appears first on the dashboard for all base system events, and all other properties are sorted alphabetically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		If no properties are required for an event, only an event timeline appears on the analytics dashboard. Properties can be added at a later time. The following values are automatically converted by this method: • String value of "yes": Boolean value of "true" • String value of "no": Boolean value of "false Default value: Null
payload.name	String	Descriptive name of the event. Special characters are not allowed. Maximum length: The length of the event name and value cannot exceed 300 bytes.

Returns

Type	Description
None	

The following example shows how to call the *addEvent()* method during initialization of a widget.

```
function initialize() {
  c.options.glyph = c.options.glyph || 'search';
  c.options.title = c.options.title || c.data.searchMsg;
  c.options.color = c.options.color || "default";
  c.searchTerm = c.data.q;
  c.searchQuery = "";
  c.pageID = $scope.page && $scope.page.id;
  c.showSuggestions =  c.data.searchTypeBehavior ===
 "suggestions" && c.data.isSuggestionsEnabled === "true";
  c.suggestionsLimit = c.options.limit || "";
  c.latitude = null;
  c.longitude = null;
  c.isLocationTrackerDisabled = c.data.isLocationTrackerDisabled
 === "true";
  c.isTypeAheadEnabled = c.data.isTypeAheadEnabled === "true";

  c.sendAnalytics = function(type){
    var payload= {};
    payload.name = "Initiate Search";
    payload.data = {};
    payload.data["Keyword"] = (type == 'User Entered' ?
 c.searchTerm : c.searchQuery);
    payload.data["Type"] = type;
    snAnalytics.addEvent(payload);
  };
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SNAnalytics - appendToUserProperty(String name, String value)

Appends the specified string to the specified user string property in the analytics data store.

Parameters

Name	Type	Description
name	String or String[]	Name of the property to append the specified string to. Special characters are not allowed. **Note:** The associated property must be a string or string[]. Maximum length: The length of the property name and property value cannot exceed 300 bytes.
value	String	Value to append to the string property. The following values are automatically converted by this method: • String value of "yes": Boolean value of "true" • String value of "no": Boolean value of "false

Returns

Type	Description
None	

This example shows how to add `television` to the `tags` property.

```
snAnalytics.setUserProperties({
  level: 7,
  lastPurchase: new Date(),
  lastPurchaseId: '41563cd2-1666-4855-8c0d-b9ca778aed23',
  isPremium: true,
  tags: ['chair', 'table'],
});

// Append television to the tags property (now 'tags' will have
 'chair', 'table', and 'television')
snAnalytics.appendToUserProperty('tags', 'television');
```

SNAnalytics - incUserProperty(String name, Number value)

Increments or decrements the specified user property value with the specified number value in the analytics data store.

Parameters

Name	Type	Description
name	String	Name of the property to increment. Value is case-sensitive. **Note:** The associated property must be a number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
value	Number	Amount to increment the property by. If you enter a negative number, the value is decremented.

Returns

Type	Description
None	

The following example shows how to increment the property `Grace days` by 5.

```
snAnalytics.incUserProperty('Grace days', 5)
```

SNAnalytics - removeUserProperty(String name)

Removes the specified property for the current user from the analytics data store.

In addition, the property no longer appears on the analytics dashboard.

Parameters

Name	Type	Description
name	String	Name of the property to remove. Value is case-sensitive.

Returns

Type	Description
None	

The following example shows how to remove the IsAdmin property.

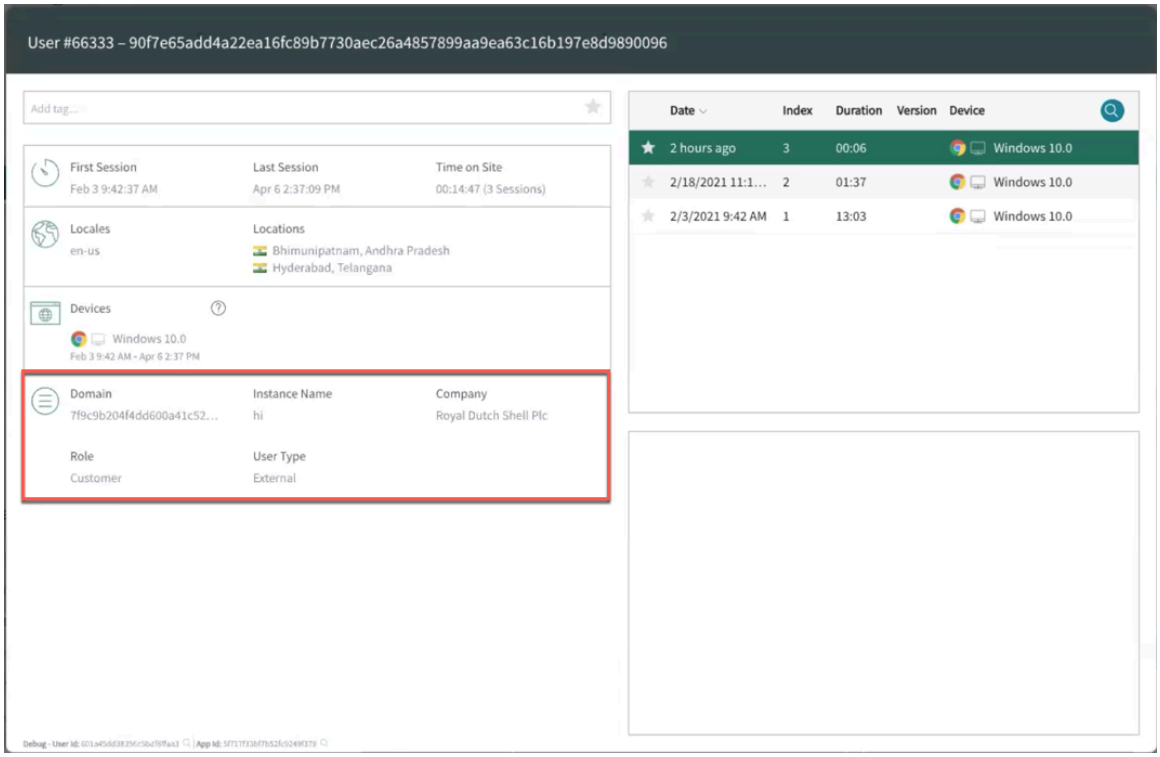
```
snAnalytics.removeUserProperty('IsAdmin');
```

SNAnalytics - setUserProperties(Object properties)

Sets the specified properties with the specified values for the current user in the analytics data store.

These properties are saved in the analytics data store and appear on the user session details page as illustrated below. If a property already exists in the analytics data store, the current value is overwritten with the new value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Parameters

Name	Type	Description
properties	Object Each element in this object can be a string, boolean, number, date, string[], or null.	Object that contains the name-value pairs of the user properties to set, such as: `{ level: 7, lastPurchase: new Date(), lastPurchaseId: '41563cd2-1666-4855-8c0d-b9ca778aed23', isPremium: true, tags: ['chair', 'table'], }` The following values are automatically converted by this method: • String value of "yes": Boolean value of "true" • String value of "no": Boolean value of "false

Returns

Type	Description
None	

The following example shows how to set multiple properties for the current user.

```
snAnalytics.setUserProperties({
  level: 7,
  lastPurchase: new Date(),
```

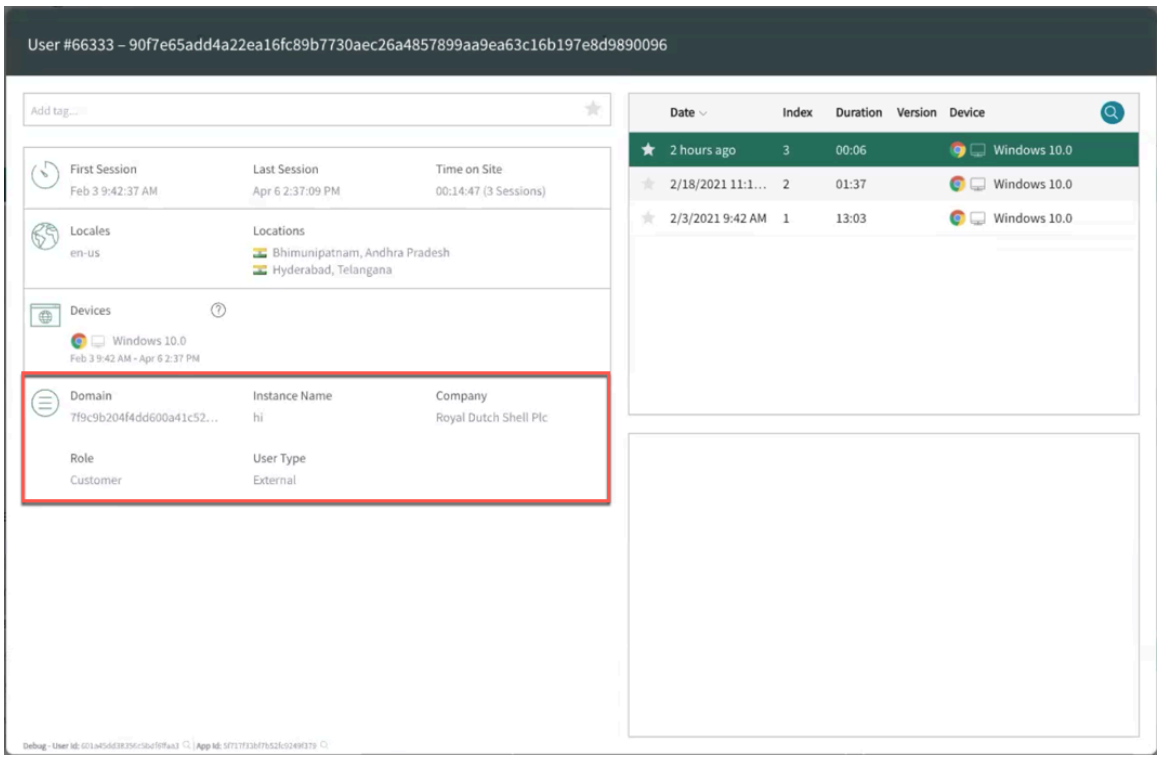
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  lastPurchaseId: '41563cd2-1666-4855-8c0d-b9ca778aed23',
  isPremium: true,
  tags: ['chair', 'table'],
});
```

SNAnalytics - setUserProperty(String name, UserProperty value)

Sets the specified property with the specified value for the current user in the analytics data store.

These properties are saved in the analytics data store and appear on the user session details page as illustrated below. If a property already exists in the analytics data store, the current value is overwritten with the new value.



Parameters

Name	Type	Description
name	String	Name of the property to update. This name appears as the label for the property. For example, in the prior screenshot, Domain, Instance Name, Company, Role, and User Type are all name parameters. Special characters are not allowed. Maximum length: The length of the property name and property value cannot exceed 300 bytes.
value	UserProperty This value can be a string, boolean, number, date, string[], or null.	Value to set in the specified property. The following values are automatically converted by this method: • String value of "yes": Boolean value of "true" • String value of "no": Boolean value of "false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to set the property `Company`.

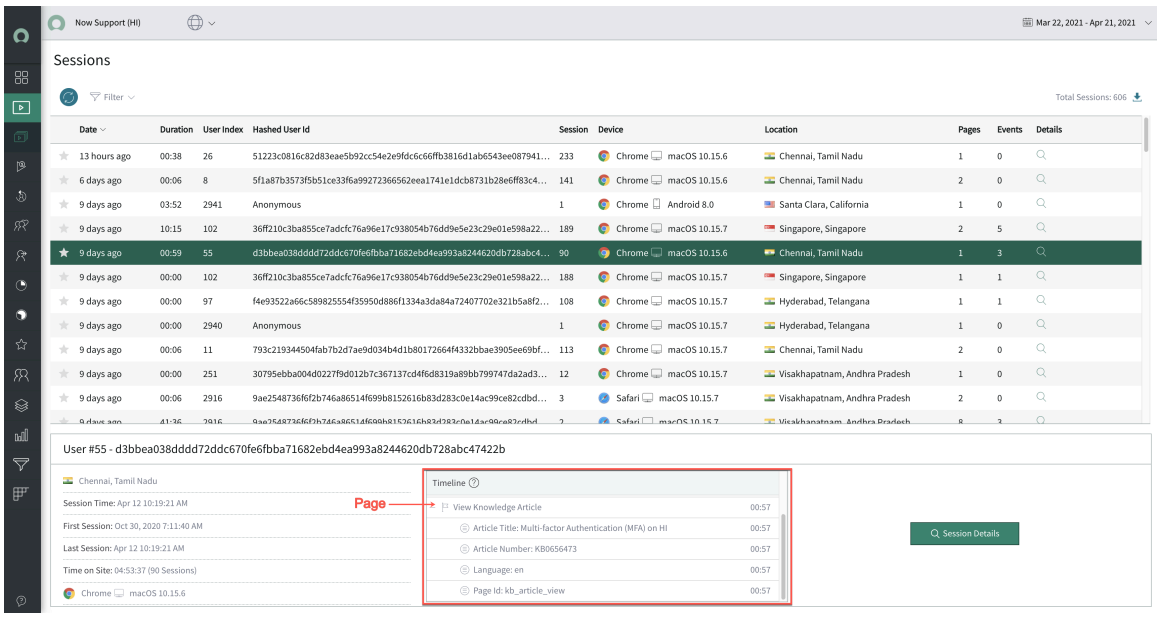
```
snAnalytics.setUserProperty('Company', "ABC Company")
```

SNAnalytics - startPage(String name, String description)

Saves the name and description of a page in the analytics data store.

This information appears in the user session timeline and on the analytics dashboard. Call this method within your custom widgets to track the pages visited by a user. You can also use this method to track user navigation within an individual page. For more information, see Use User Experience Analytics.

Note: In general, portal pages are automatically tagged with this tracking capability. Use this method for custom scenarios, such as a single page custom widget in a wizard scenario.



Parameters

Name	Type	Description
name	String	Descriptive name of the page or page section. Special characters are not allowed.
description	String	Optional. Description of the page to appear in the timeline and analytics dashboard. Default: *name* parameter value

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to call the *startPage()* method.

```
snAnalytics.startPage('login_view', 'Login');
```

spAriaUtil - Client

The *spAriaUtil* API provides methods to show messages on a screen reader.

This API is an angular service that you can use in Service Portal widget client scripts.

spAriaUtil - sendLiveMessage(String message)

Announce a message to a screen reader.

The *sendLiveMessage()* method injects text into an aria-live region on the page. The default setting for an aria-live region is `assertive`, which means that messages are announced immediately. This can annoy and confuse users if used too frequently.

Parameters

Name	Type	Description
message	String	The message to be shown.

Returns

Type	Description
void	

```
function(spAriaUtil) {
  /* widget controller */

  spAriaUtil.sendLiveMessage('Hello world!');
}
```

spContextManager - Client

Makes data from a Service Portal widget available to other applications and services in a Service Portal page. For example, pass widget data to Agent Chat when it opens in a Service Portal page.

The *spContextManager* API is an AngularJS service that you can use in Service Portal widget client scripts.

Keys passed to this API are unique per page. For example, if the `'agent-chat'` key is already initialized by another widget on the page through the *addContext()* method, you must use the *updateContextForKey()* method to update the key's data. Available keys include: agent-chat: Sends widget data to Agent Chat.

For more information about passing data to Agent Chat, see Configure Agent Chat in Service Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

spContextManager - addContext(String key, Object context)

Initializes a key and adds widget data as the value. For example, add data to the 'agent-chat' key to make it available to Agent Chat.

Use this method the first time data is added to a specific key on a Service Portal page. If the key is already used by another widget on the page, use the *`updateContextForKey()`* method instead.

Parameters

Name	Type	Description
key	String	Name of the key to send the data. Available keys include**agent-chat**: Sends widget data to Agent Chat when it opens in a Service Portal page.
context	Object	Widget data in JSON format to send to the application or service specified in the key parameter. For example, `{'approval_count': 5}`.

Returns

Type	Description
void	

Pass `approval_count` to Agent Chat. When a user initiates an Agent Chat conversation from the Service Portal homepage, the system appends `&sysparm_approval_count=5` to the Agent Chat `iframe` URL.

```
function ($scope, spContextManager) {
    spContextManager.addContext('agent-chat', {
        'approval_count': 5
    });
};
```

spContextManager - getContext()

Returns each key and associated data object defined by any widget on the page.

Using this method may affect performance. Use this method to understand which keys are initialized on the page and to get their current values. If you know which key you need to access, use the *`getContextForKey()`* method instead.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Each key and associated data object defined on the page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
function ($scope, spContextManager) {
  spContextManager.getContext();
}
```

spContextManager - getContextForKey(String key, Boolean returnPromise)

Returns the widget data associated with a key.

Parameters

Name	Type	Description
key	String	Name of the key to get context from. Available keys include: agent-chat: Sends widget data to Agent Chat.
returnPromise	Boolean	Flag that determines whether to return the data associated with a key as a promise or an object. Values include: • True: return the data as a promise. Use this option if another widget on the page uses the *addContext()* method to initialize the same key. Returning a promise prevents returning an undefined object when the key is not yet initialized. • False: returns an object containing the data associated with the key.

Returns

Type	Description
Promise	If returnPromise is true, returns a promise that is fulfilled when another widget on the page initializes the key.
Object	If returnPromise is false, returns an object containing the data associated with the key. For example, `{approval_count: 5}`.

Pass `approval_count` to Agent Chat. When a user initiates an Agent Chat conversation from the Service Portal homepage, the system appends `&sysparm_approval_count=5` to the Agent Chat `iframe` URL.

```
function ($scope, spContextManager) {
  spContextManager.getContextForKey('agent-chat',
 true).then(function(context) {
    context = context || {};
    context.approval_count = 5;
    spContextManager.updateContextForKey('agent-chat', context);
  });
}
```

spContextManager - updateContextForKey(String key, Object context)

Sends data to an existing key. For example, if another widget on the page uses the 'agent-chat' key to pass data to the Agent Chat configuration, you must update the context of the key rather than using the *addContext()* method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
key	String	Name of the key to send the data. Available keys include**agent-chat**: Sends widget data to Agent Chat when it opens in a Service Portal page.
context	Object	Widget data in JSON format to send to the application or service specified in the key parameter. For example, `{'approval_count': 5}`.

Returns

Type	Description
void	

Pass `approval_count` to Agent Chat. When a user initiates an Agent Chat conversation from the Service Portal homepage, the system appends `&sysparm_approval_count=5` to the Agent Chat `iframe` URL.

```
function ($scope, spContextManager) {
  spContextManager.getContextForKey('agent-chat',
 true).then(function(context) {
    context = context || {};
    context.approval_count = 5;
    spContextManager.updateContextForKey('agent-chat', context);
  });
}
```

spModal - Client

Shows alerts, prompts, and confirmation dialogs in Service Portal widgets. The *`spModal`* class is available in Service Portal client scripts.

The *`spModal`* class is a lightweight wrapper for Angular UI bootstrap's $uibModal. You can use the *`spModal.open()`* method to display a widget in a modal dialog.

spModal - alert(String message).then(fn)

Displays an alert.

Parameters

Name	Type	Description
message	String	The message to display.

Returns

Type	Description
Boolean	The promise contains a single argument that contains true or false.

```
// HTML template
<button ng-click="c.onAlert()" class="btn btn-default">
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    Alert
  </button>

// Client script
function(spModal) {
    var c = this;
  c.onAlert = function () {
        spModal.alert('How do you feel today?').then(function
 (answer) {
            c.simple = answer;
        });
    }
 }
```

spModal - confirm(String message).then(fn)

Displays a confirmation message.

Parameters

Name	Type	Description
message	String	The message to display.

Returns

Type	Description
Boolean	The promise contains a single argument that contains true or false.

```
// HTML template
 <button ng-click="c.onConfirm()" class="btn btn-default">
 Confirm </button>
<span>{{c.confirmed}}</span>

// Client script
function(spModal) {
  var c = this;
  c.onConfirm = function() {
        c.confirmed = "asking";
        spModal.confirm("Can you confirm or deny
 this?").then(function(confirmed) {
            c.confirmed = confirmed; // true or false
        })
    }
 }
```

Confirm with HTML message:

```
//HTML template
<button ng-click="c.onConfirmEx()" class="btn btn-default">
    Confirm - HTML message
  </button>
  <span>{{c.confirmed}}</span>

// Client script
function(spModal) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  var c = this;
  // more control, passing options
    c.onConfirmEx = function() {
        c.confirmed = "asking";
        var warn = '<i class="fa fa-warning"
 aria-hidden="true"></i>';
        spModal.open({
            title: 'Delete this Thing?',
            message: warn + ' Are you <b>sure</b> you want to do
 that?'
        }).then(function(confirmed) {
            c.confirmed = confirmed;
        })
    }
}
```

spModal - open(Object options).then(fn)

Opens a modal window using the specified options.

Parameters

Name	Type	Description
options	Object	An object that may have these properties. • backdrop: Boolean|String. Controls the presence of a backdrop. Valid values: ○ true: Displays backdrop. ○ false: No backdrop. ○ static: Disables modal closing by selecting the backdrop. Default: true • buttons: Array. Buttons to show on the dialog. The default is Cancel and OK. • input: Boolean. When true, shows an input field on the dialog. Default: false • keyboard: Boolean. When true, indicates that the dialog is closable using the ESC key. Default: true • message: String. HTML that goes in the header. Default: empty • noDismiss: Boolean. When true,indicates that the header section that contains the close icon is present. Default: false • shared: Client-side object. Shares data with the embedded widget client script. • size: String. Size of the window. Valid values: 'sm' or 'lg'.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: empty • title: String. HTML that goes in the header. Default: empty • value: String. Value of the input field. Default: empty • widget: String. Widget ID or sys_id to embed in the dialog. Default: empty • widgetInput: Object. Sent to the embedded widget as input. Default: null

Returns

Type	Description
void	

The following code example shows how to create a prompt with a label.

```
//HTML template
<button ng-click="c.onOpen()" class="btn btn-default">
    Prompt with label
  </button>
  <div ng-show="c.name">
    You answered <span>{{c.name}}</span>
  </div>

//Client code
function(spModal) {
  var c = this;
  c.onOpen = function() {
        //ask the user for a string
        spModal.open({
            title: 'Give me a name',
            message: 'What would you like to name it?',
            input: true,
            value: c.name
        }).then(function(name) {
            c.name = name;
        })
    }
}
```

The following code example shows how to use the custom buttons option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//HTML template
<button ng-click="c.onAgree()" class="btn btn-default">
    Agree
  </button>
  <div ng-show="c.agree">
    You answered {{c.agree}}
  </div>

//Client script
function(spModal) {
  var c = this;
  c.onAgree = function() {
        // ask the user for a string
        // note embedded html in message
        var h = '<h4>Apple likes people to agree to lots of
 stuff</h4>'
        // Line feeds added to the following lines for
 presentation formatting.
        var m = 'Your use of Apple software or hardware products
 is based
on the software license and other terms and conditions in effect
 for the
product at the time of purchase. Your agreement to these terms
 is required
to install or use the product. '
        spModal.open({
            title: 'Do you agree?',
            message: h + m,
            buttons: [
                {label:'✘ ${No}', cancel: true},
                {label:'✔ ${Yes}', primary: true}
            ]
        }).then(function() {
            c.agree = 'yes';
        }, function() {
            c.agree = 'no';
        })
    }
}
```

The following code example shows how to use the embedded widget option.

```
//HTML template
<button ng-click="c.onWidget('widget-cool-clock')" class="btn
 btn-default">
    Cool Clock
  </button>

//Client script
function(spModal) {
  var c = this;
  c.onWidget = function(widgetId, widgetInput) {
        spModal.open({
            title: 'Displaying widget ' + widgetId,
            widget: widgetId,
            widgetInput: widgetInput || {}
        }).then(function(){
```

```
            console.log('widget dismissed');
        })
    }
}
```

spModal - prompt(String message, String default).then(fn)

Displays a prompt for user input.

Parameters

Name	Type	Description
message	String	The message to display.
default (optional)	String	A default value to use if the user does not provide a response.

Returns

Type	Description
String	The promise contains the user's response, or the default value if the user does not enter a response.

```
//HTML template
 <button ng-click="c.onPrompt()" class="btn btn-default">
    Prompt
  </button>
  <div ng-show="c.name">
    You answered <span>{{c.name}}</span>
  </div>

// Client script
function(spModal) {
  var c = this;
  c.onPrompt = function() {
        spModal.prompt("Your name please",
 c.name).then(function(name) {
            c.name = name;
        })
    }
}
```

spUtil - Client

The *spUtil* API provides utility methods to perform common functions in a Service Portal widget client script.

These functions include:

- Display a notification error message. spUtil - addErrorMessage(String message)
- Display a notification info message. spUtil - addInfoMessage(String message)
- Display a trivial notification message. spUtil - addTrivialMessage(String message)
- Create a unique identifier. spUtil - createUid()
- Format a string with variables. spUtil - format(String template, Object data)
- Embed a widget model in a widget client script. spUtil - get(String widgetId Object data)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Retrieve all headers to use for API calls. spUtil - getHeaders()
- Return the complete host domain. spUtil - getHost()
- Execute the callback with User Preference response by passing the preference name. spUtil - getPreference(String preference, Function callback)
- Return the current service portal URL information. spUtil - getURL()
- Check if the current client is a mobile device. spUtil - isMobile()
- Parse the comma-separated attributes within a specified string. spUtil - parseAttributes(String attributes)
- Watch for updates to a table or filter and returns the value from the callback function. spUtil - recordWatch(Object $scope, String table, String filter, Function callback)
- Call the server and replaces the current **options** and **data** with the server response. spUtil - refresh(Object $scope)
- Scroll to the element with the specified selector, over a specified period of time. spUtil - scrollTo(String selector, Number time)
- Update the header breadcrumbs. spUtil - setBreadCrumb(Object $scope, Array breadcrumbs)
- Set a user preference. spUtil - setPreference(String pref, String value)
- Update the search page. spUtil - setSearchPage(String searchPage)
- Update the data object on the server within a given scope. spUtil - update(Object $scope)

For additional information on widgets, see Service Portal widgets.

spUtil - addErrorMessage(String message)

Displays a notification error message.

Parameters

Name	Type	Description
message	String	Error message to display.

Returns

Type	Description
void	

```
spUtil.addErrorMessage("There has been an error processing your
 request")
```

spUtil - addInfoMessage(String message)

Displays a notification info message.

Parameters

Name	Type	Description
message	String	Message to display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
spUtil.addInfoMessage("Your order has been placed")
```

spUtil - addTrivialMessage(String message)

Displays a trivial notification message.

Trivial messages disappear after a short period of time.

Parameters

Name	Type	Description
message	String	Message to display.

Returns

Type	Description
void	

```
spUtil.addTrivialMessage("Thanks for your order")
```

spUtil - createUid()

Create a unique identifier.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	A unique 32 character ID.

spUtil - get(String widgetId Object data)

Embeds a widget model in a widget client script.

The callback function returns the full widget model. For additional information on widgets, see Service Portal widgets.

Parameters

Name	Type	Description
widgetId	String	Widget ID or sys_id of the widget to embed.
data	Object	Optional. Name/value pairs of parameters to pass to the widget model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Model of the embedded widget.

Without data passed.

```
spUtil.get("widget-cool-clock").then(function(response) {
  c.coolClock = response;
});
```

With data passed.

```
spUtil.get('pps-list-modal', {title: c.data.editAllocations,
  table: 'resource_allocation',
  queryString: 'GROUPBYuser^resource_plan=' + c.data.sysId,
  view: 'resource_portal_allocations' }).then(function(response)
 {
    var formModal = response;
    c.allocationListModal = response;
  });
```

spUtil - getHeaders()

Retrieves all headers to use for API calls.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	All headers to use for API calls.

spUtil - getHost()

Returns the complete host domain.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The complete host domain, for example `hi.servicenow.com`

spUtil - getPreference(String preference, Function callback)

Executes the callback with User Preference response by passing the preference name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
preference	String	Name of the preference.
callback	Function	Define the callback function.

Returns

Type	Description
void	

spUtil - getURL()

Returns the current service portal URL information.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Current service portal URL.

spUtil - format(String template, Object data)

Formats a string that contains variables.

Use this method as an alternative to string concatenation.

Parameters

Name	Type	Description
template	String	String template that contains values for variable substitution.
data	Object	Object containing the values for the variables defined in the template string.

Returns

Type	Description
String	String containing the variable values instead of the variable nomenclature.

```
spUtil.format('An error ocurred: {error} when loading {widget}',
 {error: '404', widget: 'sp-widget'})
```

Output:

```
'An error occurred: 404 when loading sp-widget'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

spUtil - isMobile()

Checks if the current client is a mobile device.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the current client is a mobile device. Valid values: • true: Current client is a mobile device. • false: Current client is not a mobile device.

spUtil - parseAttributes(String attributes)

Parses the comma-separated attributes within a specified string.

Parameters

Name	Type	Description
attributes	String	String containing comma separated attributes, such as the Attributes field of a dictionary record.

Returns

Type	Description
Array	Array of objects containing the parsed attributes.

```
function getRefQualElements() {
  var refQualElements = [];
  if (field && field.attributes &&
 field.attributes.indexOf('ref_qual_elements') > -1) {
    var attributes = spUtil.parseAttributes(field.attributes);
    refQualElements =
 attributes['ref_qual_elements'].split(';');
  }
  return refQualElements;
}
```

spUtil - recordWatch(Object $scope, String table, String filter, Function callback)

Watches for updates to a table or filter and returns the value from the callback function.

Allows a widget developer to respond to table updates in real-time. For instance, by using *`recordWatch()`*, the Simple List widget can listen for changes to its data table. If records are added, removed, or updated, the widget updates automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When passing the `$scope` argument into the *`recordWatch()`* function, inject `$scope` into the parameters of your client script function.

Parameters

Name	Type	Description
$scope	Object	Scope of the data object updated by the callback function.
table	String	Watched table.
filter	String	Filter for fields to watch.
callback	Function	Optional. Parameter to define the callback function.

Returns

Type	Description
Promise	Return value of the callback function.

```
//A simple recordWatch function.
spUtil.recordWatch($scope, "live_profile", "sys_id=" +
 liveProfileId);

//In a widget client script
function(spUtil, $scope) {
  /* widget controller */
  var c =this;

  // Registers a listener on the incident table with the filter
 active=true,
  // meaning that whenever something changes on that table with
 that filter,
  // the callback function is executed.
  // The callback function takes a single parameter 'response',
 which contains
  // the property 'data'. The 'data' property contains
 information about the changed record.
  spUtil.recordWatch($scope, "incident", "active=true",
 function(response) {

    // Returns the data inserted or updated on the table
    console.log(response.data);

    });
}
```

spUtil - refresh(Object $scope)

Calls the server and replaces the current **options** and **data** with the server response.

Calling `spUtil.refresh()` is similar to calling `server.refresh()`. However, when you call `spUtil.refresh()`, you can define the $scope object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
$scope	Object	Scope defined for the update.

Returns

Type	Description
Object	Updated options and data objects.

spUtil - scrollTo(String selector, Number time)

Scrolls to the element with the specified selector, over a specified period of time.

Parameters

Name	Type	Description
selector	String	Selector to scroll to.
time	Number	Time taken to scroll to the specified selector. Unit: Milliseconds

Returns

Type	Description
void	

spUtil - setBreadCrumb(Object $scope, Array breadcrumbs)

Updates the header breadcrumbs.

Parameters

Name	Type	Description
$scope	Object	Scope defined for the table.
breadcrumbs	Array	Conditions used to create the breadcrumb filter.

Returns

Type	Description
void	

spUtil - setPreference(String pref, String value)

Sets a user preference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
pref	String	Preference name
value	String	Preference value

Returns

Type	Description
void	

spUtil - setSearchPage(String searchPage)

Updates the search page.

Parameters

Name	Type	Description
searchPage	String	Name of the search page.

Returns

Type	Description
void	

spUtil - update(Object $scope)

Updates the data object on the server within a given scope.

This method is similar to `server.update()`, but includes a $scope parameter that defines the scope to pass over.

Parameters

Name	Type	Description
$scope	Object	Scope defined for the update.

Returns

Type	Description
Object	Updated data object.

The following example includes a P1 widget that watches for changes to the state field and uses a filter to watch all active P1s and let the callback function determine whether to refresh the data. The *data.changes* property contains an array of any updated fields. If the state of any fields have changed, the data is updated in the widget.

```
var q = "priority=1^active=true^EQ";
spUtil.recordWatch($scope, "incident", q, function(event, data)
 {
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   if (data.changes.includes("state")) { // only update if state
 was updated.
      spUtil.update($scope);
   }
});
```

StopWatch - Client

The *StopWatch* API provides methods to measure the duration of operations.

You can use this API in client-side scripts using *ListV2* and *ListV3* APIs.

StopWatch - StopWatch()

Creates an instance of the StopWatch class.

Uses the current time as the start time.

Parameters

Name	Type	Description
None		

```
var sw = new StopWatch();

// some slow code here
for(var i=0,j=1;i<100000000;i++) {
    j=Math.sqrt(i*i*j);
}

if (sw.getTime() > 500)
    console.log("Long running script. Execution time: [" +
 sw.toString() + "]");

sw.restart();

// some faster code
for(i=0,j;i<100000;i++) {
    j= i + Math.random() * i;
}

console.log("Finished in: " + sw.getTime() + "ms");
sw.stop();
```

StopWatch - StopWatch(Date initialDate)

Creates an instance of the StopWatch class using the specified date as the initial value.

Parameters

Name	Type	Description
initialDate	Date	The initial date for the object.

StopWatch - getTime()

Returns the number of milliseconds since the timer started.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Time since the timer started. Unit: Milliseconds

```
var sw = new StopWatch();

// some slow code here
for(var i=0,j=1;i<100000000;i++) {
    j=Math.sqrt(i*i*j);
}

if (sw.getTime() > 500)
    console.log("Long running script. Execution time: [" +
 sw.toString() + "]");

sw.restart();

// some faster code
for(i=0,j;i<100000;i++) {
    j= i + Math.random() * i;
}

console.log("Finished in: " + sw.getTime() + "ms");
sw.stop();
```

StopWatch - restart()

Resets the timer start to the current time.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var sw = new StopWatch();

// some slow code here
for(var i=0,j=1;i<100000000;i++) {
    j=Math.sqrt(i*i*j);
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
}

if (sw.getTime() > 500)
    console.log("Long running script. Execution time: [" +
 sw.toString() + "]");

sw.restart();

// some faster code
for(i=0,j;i<100000;i++) {
    j= i + Math.random() * i;
}

console.log("Finished in: " + sw.getTime() + "ms");
sw.stop();
```

StopWatch - toString()

Returns the elapsed time.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Elapsed time. Format: HH:MM:SS.SSS

```
var sw = new StopWatch();

// some slow code here
for(var i=0,j=1;i<100000000;i++) {
    j=Math.sqrt(i*i*j);
}

if (sw.getTime() > 500)
    console.log("Long running script. Execution time: [" +
 sw.toString() + "]");

sw.restart();

// some faster code
for(i=0,j;i<100000;i++) {
    j= i + Math.random() * i;
}

console.log("Finished in: " + sw.getTime() + "ms");
sw.stop();
```

UIB API reference

Use UI Builder (UIB) APIs in UIB client applications.

api - UI Builder

The `api` API provides methods that you can use when developing client scripts in the UI Builder.

This API is exposed to client scripts, also known as page scripts. Client scripts are executed in response to something happening on a page, such as:

- User interaction events/actions, such as a button click.
- Lifecycle events, such as a data broker execution started.

These scripts do not have to return anything to the framework and can be written as an asynchronous function.

This API is also exposed to scripted property values. These scripts are executed whenever the framework-runtime needs to calculate a value, such as:

- Passing to a component property.
- Determining component visibility.
- Emitting an event with a payload.

These scripts cannot be written as an asynchronous function. They also cannot invoke side-effect methods on the api object, such as, `api.emit()`, `api.setState()`, and `api.data.<data_resource_id>.*()`.

The api object contains both configuration dependent and configuration independent properties that you can access within the context of the associated page or component. You cannot directly modify the properties within this object. Modification can only be made through the available methods.

api - api.context.props.<page_property_name>

Page properties can be configured within UI Builder. The configuration values depend on the context in which the page is used.

Field

Name	Type	Description

<page_property_name>	Any	Available values are dependant on the client script implementation.
		
		To access these properties, use the following: `api.context.props.<page_property_name>`.
		
		For example:
		`// A record page with property table could be accessed with`
		`function isActivityStreamVisible({api}) {`
		`  return api.context.props.table === 'incident';`
		`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field (continued)

Name	Type	Description
		Note: These property values are read-only. Mutating nested object values from scripts is not supported.

api - api.context.session.<session_property>

Context session properties associated with the current user.

Available session properties

Name	Type	Description
isLoggedIn	Boolean	Flag that indicates whether the current user is logged in to the system. Possible values: • true: Current user is logged in to • false: Current user is not logged in.
properties.awaEnabled	String	The system property glide.awa.enabled that indicates whether the auto assignment for work items for Advanced Work Assignment (AWA) is enabled for the current user. Possible values: • true: AWA is enabled for the user. • false: AWA is not enabled for the user. For additional information, see Components installed with Advanced Work Assignment.
properties.forgetMe.value	String	The property glide.ui.forgetme that indicates whether to remove the **Remember Me** check box from the login page to prevent login information from being cached. Possible values: • true: Remove the **Remember Me** check box. • false: Display the **Remember Me** check box. For additional information, see Remove remember me.
properties.sessionTimeLeft.value	String Number coerced to string	The system property glide.ui.session_timeleft that determines the mount of time left before the current session times out. Use this property to prompt the user to extent the current session before it times out. Unit: Minutes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available session properties (continued)

Name	Type	Description
properties.sessionTimeout.value	String Number coerced to string	The system property glide.ui.session_timeout that determines the initial session time out value. Unit: Minutes - Values greater than 1440 minutes are treated as one day. For additional information, see Session activity timeout
properties.trackingEnabled.value	String	The system property glide.uxbuilder.tracking.enabled that indicates whether to enable/disable web analytics library loading and instantiation for UI Builder based applications. Possible values: • true: Enabled for the user. • false: Disabled for the user.
user.avatar	String	URL of the current user's avatar.
user.dateFormat	String	Default date format.
user.domain	String	Domain path for the current user.
user.firstName	String	First name of the current user.
user.fullName	String	First and last name of the current user.
user.initials	String	Initials of the current user.
user.language	String	Primary language spoken by the current user.
user.preferences	Array of objects	Name-value pairs that describe the user preferences. These user preferences are stored as records in the User Preference [sys_user_preference] table, and are updated each time the user changes their settings. For additional information, see Exploring user administration.
user.roles	Array	Comma-separated list of roles assigned to the current user. **Note:** If the user has no roles assigned, this context session property returns null rather than an empty array.
user.sys_id	String	Sys_id of the user in the User [sys_user] table.
user.timeFormat	String	Default time format to use for the user.
user.timeZone	String	Time zone of the current user.
user.timeZoneOffset	String	Time zone offset of the current user.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

api - api.data.<data_resource_id>.lifecycle.lastFetchSucceeded

Boolean flag that indicates whether the last fetch attempt for the specified data resource instance finished successfully.

If the value is true, the last fetch attempt for the data resource instance finished successfully; otherwise, false.

Field

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

api - api.data.<data_resource_id>.addErrorMessage(Object payload)

Displays the specified error message at the top of the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the error message to display.
		`"payload": {`
		`  "message": "String"`
		`}`

payload.message	String	Error message to display.

Returns

Type	Description
None	

```
api.data.gform.addErrorMessage({message: 'Error message'});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

api -api.data.<data_resource_id>.addInfoMessage(Object payload)

Displays the specified informational message at the top of the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the informational message to display. `"payload": { "message": "String" }`
payload.message	String	Informational message to display.

Returns

Type	Description
None	

```
api.data.gform.addInfoMessage({message: 'Test message'});
```

api - api.data.<data_resource_id>.addOption(Object payload)

Adds an option to the specified choice type field.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the field value to update. `"payload": { "choiceIndex": "String", "choiceLabel": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>{
		  "choiceValue": "String",
		  "fieldName": "String"
		}</pre>

payload.choiceIndex	String	Optional. Index into the choice list at which to insert the option. Default: End of the choice list.
payload.choiceLabel	String	Label of the option to add to the specified field.
payload.choiceValue	String	Value of the option to add to the specified field.
payload.fieldName	String	Name of the choice type form field to add the specified option to.

Returns

Type	Description
None	

```
api.data.gform.addOption({fieldName: 'priority', choiceLabel:
 'Extremely High', choiceValue: '10'});
```

api - api.data.<data_resource_id>.addWarningMessage(Object payload)

Displays the specified warning message at the top of the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the warning message to display.
		<pre>"payload": {
		  "message": "String"
		}</pre>

payload.message	String	Warning message to display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
api.data.gform.addWarningMessage({message: 'Test message'});
```

api - api.data.<data_resource_id>.clearMessage()

Removes all informational and error messages from the top of the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

Returns

Type	Description
None	

```
api.data.gform.clearMessage();
```

api - api.data.<data_resource_id>.clearOptions(Object payload)

Clears all options from the specified choice type field.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the choice type field whose options are to be cleared.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`"payload": { "fieldName": "String" }`
payload.fieldName	String	Name of the choice type field whose options are to be cleared.

Returns

Type	Description
None	

```
api.data.gform.clearOptions({fieldName: 'priority'});
```

api - api.data.<data_resource_id>.executeUiAction(Object payload)

Executes the specified UI action.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the UI action to execute. `"payload": { "actionSysId": "String" }`
payload.actionSysId	String	Sys_id of the UI action to execute. Located in the UI Action [sys_ui_action] table.

Returns

Type	Description
None	

```
api.data.gform.executeUiAction({actionSysId:
 '60615ff90f730010ac7de6f8c4767e9a'});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

api - api.data.<data_resource_id>.execute(Object inputValues)

Triggers an execute operation on the specified data resource.

This method is only available if the data resource is one of the following types:

- Composite
- GraphQL
- REST
- Scriptlet
- Transform

Note: This method is only exposed if the *mutates_server_data* field is set to `true` on the corresponding data resource (sys_ux_data_broker_* table) record. It is accessible under *api.data.<data_resource_Id>.refresh()*.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
inputValues	Object	Object to pass to the specified data resource. This object must conform to the data resource's input parameters.

Returns

Type	Description
None	

This code example shows a page script that is invoked when the **Submit** button on the page is clicked. The page is configured wit a Server Data Resource tat creates a new record.

```
function handler({api}) {
  if (api.state.movieYear === 2020) {
    // The data resource used in this case specifies two input
 parameters: name and year
    api.data.create_movie_record.execute({
      name: api.state.movieName,
      year: api.state.movieYear
    });
  }
}
```

api - api.data.<data_resource_id>.hideFieldMessage(Object payload)

Hides the oldest message next to the specified field or clears all messages associated with the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the field message to hide. `"payload": { "clearAll": Boolean, "fieldName": "String" }`
payload.clearAll	Boolean	Optional. Flag that indicates whether to clear all messages associated with the specified form field. Valid values: • true: Clear all messages associated with the specified field. • false: Do not clear all messages associated with the specified field. Default: false
payload.fieldName	String	Name of the form field for which to hide the oldest message or clear all associated messages.

Returns

Type	Description
None	

```
api.data.gform.hideFieldMessage({fieldName:
 'short_description'});
```

api - api.data.<data_resource_id>.hideRelatedList(Object payload)

Hides the specified related list on the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the related list to hide. `"payload": { "listTableName ": "String" }`
payload.listTableName	String	Name of the related list to hide. Located in the Related List [sys_ui_related_list] table. If the list to hide is through a relationship, provide the sys_id of the list instead of the name.

Returns

Type	Description
None	

```
api.data.gform.hideRelatedList({listTableName:'incident.parent_incident'});
```

api - api.data.<data_resource_id>.hideRelatedLists()

Hides all related lists on the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

Returns

Type	Description
None	

```
api.data.gform.hideRelatedLists();
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

api - api.data.<data_resource_id>.refresh()

Triggers a refresh operation for the specified non-mutating data resource instance.

Call this method if the underlying data being fetched by the data resource changes. A data resource is considered non-mutating if the *mutates_server_data* field on the record is set to false.

This method is asynchronous and emits an internal event to trigger the refresh of the specified data resource instance. The UI Builder allows you to trigger client scripts in response to data resource lifecycle events, such as DATA_FETCH_SUCCEEDED and DATA_FETCH_FAILED. For additional information on these events, see Event mapping.

This method is only available if the data resource is one of the following types:

- Composite
- GraphQL
- REST
- Scriptlet
- Transform

Note: This method is only exposed if the *mutates_server_data* field is set to `false` on the corresponding data resource (sys_ux_data_broker_* table) record.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

Returns

Type	Description
None	

This code example shows a page script that is invoked when a dropdown item is selected in a page. The page is configured with two Server Data Resources that query problem and incident tables.

```
function handler({api, event}) {
  const value = event.payload.value[0];
  if (value === 'problem')
    api.data.problem_list_1.refresh();
  else if(value === 'incident')
    api.data.incident_list_1.refresh();
}
```

api - api.data.<data_resource_id>.reload()

Reloads the current form using the same table and sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

Returns

Type	Description
None	

```
api.data.gform.reload();
```

api - api.data.<data_resource_id>.removeOption(Object payload)

Removes an option from the specified choice type field.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the choice type field to update.
		
		`"payload": {`
		`  "choiceValue": "String",`
		`  "fieldName": "String"`
		`}`

payload.choiceValue	String	Value of the option to remove from the specified choice type field.
payload.fieldName	String	Name of the choice type form field from which to remove the specified value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
api.data.gform.removeOption({fieldName: 'priority', choiceValue:
 '1'});
```

api - api.data.<data_resource_id>.save()

Triggers form submission using the *Save* UI action.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

Returns

Type	Description
None	

```
api.data.gform.save();
```

api - api.data.<data_resource_id>.setMandatory(Object payload)

Sets whether the specified form field is mandatory.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the field whose mandatory information to update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`"payload": { "fieldName": "String", "mandatory": Boolean }`
payload.fieldName	String	Name of the form field whose mandatory value is to be set.
payload.mandatory	Boolean	Flag that indicates the specified form field is mandatory, meaning the form cannot be saved without this field containing a valid value. Valid values: • true: Field is mandatory. • false: Field is optional.

Returns

Type	Description
None	

```
api.data.gform.setMandatory({fieldName: 'short_description',
 mandatory: false});
```

api - api.data.<data_resource_id>.setReadOnly(Object payload)

Sets the read/write capabilities of the specified form field.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the field whose readability information to update. `"payload": { "fieldName": "String", "readonly": Boolean }`
payload.fieldName	String	Name of the form field whose readability is to be set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
payload.readonly	Boolean	Flag that indicates the read/write capabilities of the specified form field. Valid values: • true: Field is read only. • false: Field is read/write.

Returns

Type	Description
None	

```
api.data.gform.setReadOnly({fieldName: 'short_description',
 readonly: false});
```

api -api.data.<data_resource_id>.setValue(Object payload)

Updates a specified GlideForm field with the specified value. Optionally, you can also update the display value with the same specified value.

Only the value on the form is updated. The value is not saved in the database.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the field whose value to update.
		
		`"payload": {`
		`  "displayValue": "String",`
		`  "fieldName": "String",`
		`  "value": "String"`
		`}`

payload.displayValue	String	Optional. Name of the display value to update. If left blank, the display value is not modified.
payload.fieldName	String	Name of the form field to update.
payload.value	String	Value to update the field with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
api.data.gform.setValue({fieldName: 'short_description', value:
 'short description'});
```

api - api.data.<data_resource_id>.setVisible(Object payload)

Sets the visibility of the specified form field.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the field on which to set visibility.
		
		`"payload": {`
		`  "fieldName": "String",`
		`  "visibility": Boolean`
		`}`

payload.fieldName	String	Name of the form field whose visibility is to be set.
payload.visibility	Boolean	Flag that indicates whether the associated field is visible on the current form. Valid values: • true: Field will display on the form. • false: Field will not display on the form.

Returns

Type	Description
None	

```
api.data.gform.setVisible({fieldName: 'short_description',
 visibility: false});
```

api - api.data.<data_resource_id>.showFieldMessage(Object payload)

Displays the specified message next to the specified field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the field message to display. `"payload": { "fieldName": "String", "message": "String", "type": "String"`
payload.fieldName	String	Name of the field next to which the message should appear.
payload.message	String	Message to display.
payload.type	String	Optional. Type of message to display. Valid values: • error • info • warning Default: info

Returns

Type	Description
None	

```
api.data.gform.showFieldMessage({fieldName: 'short_description',
 message: 'Error message', type: 'error'});
```

api - api.data.<data_resource_id>.showRelatedList(Object payload)

Displays the specified related list on the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the related list to display. `"payload": { "listTableName ": "String" }`
payload.listTableName	String	Name of the related list to display. Located in the Related List [sys_ui_related_list] table. If the list to display is through a relationship, provide the sys_id of the list instead of the name.

Returns

Type	Description
None	

```
api.data.gform.showRelatedList({listTableName:'incident.parent_incident'});
```

api - api.data.<data_resource_id>.showRelatedLists()

Displays all related lists associated with the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

Returns

Type	Description
None	

```
api.data.gform.showRelatedLists();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

api - api.data.<data_resource_id>.submit()

Triggers form submission using the specified UI action.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the UI action to use to submit the current form. `"payload": { "submitActionName": "String" }`
payload.submitActionName	String	Name of the UI action to execute to submit the current form.

Returns

Type	Description
None	

```
api.data.gform.submit({submitActionName:'sysverb_ws_save'});
```

api - api.emit(String eventName, Object payload)

Emits an event with the specified name and payload.

The event name being emitted must be part of the associated page definition's dispatched events list, which is stored in the UX Macroponent Definition [sys_ux_macroponent] table. Any *`api.emit`* call that dispatches events not declared in this table are ignored.

For additional information on events, see Work with events.

Parameters

Name	Type	Description
eventName	String	Name of the event to emit. This name should follow the UI Framework action naming guidelines: • Should be upper snake case, such as ITEM_CHANGED. All letters in upper case and all spaces replaced with underscores. • Should be past tense, such as BUTTON_CLICKED or USER_SELECTED.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For additional information on these action naming guidelines, see https://developer.servicenow.com/dev.do#!/reference/now-experience/sandiego/ui-framework/main-concepts/dispatching-actions.
payload	Object	Optional. Object that contains the data to send with the emitted event. This object is free-form and can contain whatever data is necessary by the entity receiving the data. **Note:** Payloads of primitive type work, but could result in inconsistent behavior.

Returns

Type	Description
None	

The following code example shows emitting an event called *NOW_UXF_PAGE#ADD_NOTIFICATIONS* with an associated *items* payload.

```
function handler({api}) {
  api.emit('NOW_UXF_PAGE#ADD_NOTIFICATIONS', {
    items: [
      {
        id: 'alert1',
        status: 'positive',
        icon: 'check-circle-outline',
        content: 'Here is some information!',
        textLinkProps: {
          label: 'More info',
          href: 'https://www.servicenow.com'
        },
      action: {type: 'acknowledge'}
      }
    ]
  });
}
```

api - setState(String stateParam, Any value)

Sets the value of the specified client state parameter.

Use client state parameters to maintain a shared state on a page. The shared state can then be passed as values to properties of components used on the page. You can also access and update client states in multiple page scripts. A common use case is to keep track of values input by users in multiple form controls on a page. When the form is submitted, a client script could then use all of the values stored in client state parameters to create a new record with a data broker. A page can have one or more client state parameters, which you can declare for a page through the UI Builder. You can then bind a client state parameter to one or more components to share or act on the client state parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

api.setState() calls are executed asynchronously and do not necessarily update the UI immediately. If the value to set depends on the *currentValue* of the client state parameter, or any of the properties provided in the api object, you should use this variant of the *api.setState()* method to avoid using outdated values.

Parameters

Name	Type	Description
stateParm	String	Name of the client state parameter to update. This name must be declared in the client state parameters of the associated page. For additional information on declaring client state parameters, see Work with client state parameters.
value	Any - Must be the same as the client state parameter declaration.	Value to set the specified client state parameter to.

Returns

Type	Description
None	

This example shows a script that could be executed to update the email client state parameter when an input value is set on a now-input component.

```
function handler({api, event}) {
    api.setState('email', event.payload.value);
}
```

api - setState(String stateParam, Function callbackFn)

Sets the value of the specified client state parameter to the value returned by the specified callback function.

The callback function is invoked with an object that has two properties: *currentValue* and *api*. The function should never mutate the *currentValue* property or the *api* object directly.

Use client state parameters to maintain a shared state on a page. The shared state can then be passed as values to properties of components used on the page. You can also access and update client states in multiple page scripts. A common use case is to keep track of values input by users in multiple form controls on a page. When the form is submitted, a client script could then use all of the values stored in client state parameters to create a new record with a data broker. A page can have one or more client state parameters, which you can declare for a page through the UI Builder. You can then bind a client state parameter to one or more components to share or act on the client state parameter.

api.setState() calls are executed asynchronously and do not necessarily update the UI immediately. If the value to set depends on the *currentValue* of the client state parameter, or any of the properties provided in the api object, you should use this variant of the *api.setState()* method to avoid using outdated values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
stateParm	String	Name of the client state parameter to update. This name must be declared in the client state parameters of the associated page. For additional information on declaring client state parameters, see Work with client state parameters.
callbackFn	Function	Callback function to execute to obtain the value.

Returns

Type	Description
None	

This example shows how to use `api.setState` to log users into a page.

```
function handler({api, event}) {
  const {name, value} = event.payload;
  if (name === 'username' || name === 'password') {
    // Update the loginParameters state object with the
 username/password value
    api.setState('loginParameters', ({currentValue}) => {
      return {
        ...currentValue,
        [name]: value
      };
    });
  }
}
```

api - api.state.<client_state_parameter_name>

Current value of the specified client state parameter.

Field

Name	Type	Description

<client_state_parameter_name>	Any. The available client state parameters are dependent on the page configuration.	Name of the client state parameter. Available client states are dependant on the client script implementation.
		
		To access the available client states, use the following: `api.state.<client_state_name>`.
		
		For example:
		`function showRelatedLists({api}) {`
		`return !`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field (continued)

Name	Type	Description

		`api.state.isCustomListSelected;`
		`}`
		
		Note: These property values are read-only. To update a client state parameter, use api.setState(). Mutating nested object values from scripts is not supported.

helpers - UI Builder

The *helpers* API provides general functionality that is common across page scripts, eliminating the need to write scripts for simple functionality such as opening and closing a modal.

This API is only available to page scripts, it is not available in any other UI Builder scripts including:

- component property value scripts
- component visibility scripts
- event payload scripts
- UX client script includes

helpers - helpers.modal.close(String modalId)

Closes the specified modal on the current page.

Parameters

Name	Type	Description
modalId	String	Modal component ID of the modal to close. Component IDs are auto generated when a component is dragged and dropped on the UI Builder stage. You can locate the ID on the property page.

Returns

Type	Description
None	

This example shows closing a modal with a component ID that ends with `alert-modal`.

```
function handler({api, event, imports, helpers}) {
  helpers.modal.close("[component-id$='alert_modal']")
}
```

helpers - helpers.modal.open(String modalId, Object options)

Opens the specified modal on the current page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can only display one modal at a time within a page. If a modal is currently open, and you call this method, the existing modal is hidden and the new modal appears.

Parameters

Name	Type	Description
modalId	String	Component ID of the modal to open. Component IDs are auto generated when a component is dragged and dropped on the UI Builder stage. You can locate the ID on the property page.
options	Object	Optional. `"options": { "content": "String", "contentFullWidth": Boolean, "headerLabel": "String", "size": "String" }`
options.content	String	Text content for the modal.
options.contentFullWidth	Boolean	Flag that indicates whether to remove the horizontal padding around the body of the modal in order to fit wider content. Valid values: • true: Remove the padding. • false: Do not remove the padding. Default: false
options.headerLabel	String	Text content for the modal header.
options.size	String	Size of the modal container. Most sizes automatically expand to fill the viewport when the screen size is small. Valid values: • sm • md • lg • fullscreen Default: sm

Returns

Type	Description
None	

This example shows opening a modal with ca omponent ID that ends with `alert-modal`.

```
function handler({api, event, imports, helpers}) {
  helpers.modal.open("[component-id$='alert_modal']")
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

helpers - helpers.navigate.setRouteParams(Object params)

Passes the specified parameters down to other components on the same page.

Use this method in any page component that wants to add a parameter in a URL. You may want to add a parameter to a URL when another component needs to know the current value of that parameter when it changes, so it can react to it. For example, use this method to pass the `selectedIndex` of a tab component so it reflected in the URL to give focus to that tab.

Parameters

Name	Type	Description
params	Object	Key-value pairs of optional parameters to pass to other components. This must be a plain, flat object with only primitive values. Array or object references are ignored and not added to the URL. All specified keys must be part of the optional parameters in the route configuration or they are also ignored. For additional information on optional parameters, see Create a page in UI Builder.

Returns

Type	Description
None	

This code example shows how to append the URL `params/selected-tab-index/2`. Note that the parameter in the actual URL is changed from camel case to snake case, so `selectedTabIndex` becomes `selected-tab-index`.

```
function handler({api, event, helpers, imports}) {
  helpers.navigate.setRouteParams({'params':
 {'selectedTabIndex':  2}});
}
```

helpers - helpers.navigate.to(String route, Object fields, Object params, Boolean redirect, Boolean passiveNavigation, String targetRoute)

Navigates from one screen to another based on the specified route and field information. URL changes and the respective screen loads are observed.

Parameters

Name	Type	Description
route	String	Name of the route. Must be a valid entry from UX App Routes (sys_ux_app_route.list). This value is reflected in the URL, and the URL is created based on the *route*, *fields*, and *optionalParams* column values: `/<route>/<field1Value>/{<field2Value>/params/<optionalParamKey1>/<optionalParamValue1>/<optionalParamKey2>/<optionalParamValue2>`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For example: `/record/incident/12345/params/selectedTabIndex/4`
fields	Object	Optional. Key-value pairs of required parameters. For example: `'fields' : {'table': 'incident', 'sysId': '12345'}`.
params	Object	Optional. Key-value pairs of optional parameters. For example: `'params' : {'selectedTabIndex': 4}`.
redirect	Boolean	Flag that indicates whether to remove the latest history entry from the browser history. For example, if you navigate to sites A, B and then C. If *`redirect`* is set to `true` while navigating to C, the history entry for B is removed. The browser history only shows only A and C. Valid values: • true: Removes the latest history entry, and redirects to the latest URL. • false: Does not remove any history entries. Default: false
passiveNavigation	Boolean	Flag that indicates whether to perform background navigation. Background navigation is when a page is opened but it is not active or shown. For example, opening an inactive tab for the page, but it is not visible but loaded in the background. Valid values: • true: Perform background navigation. • false: Do not perform background navigation. Default: false
targetRoute	String or Object	Sub navigation to a drill-down, deep-link, or sub-tab. If set to `current`, the current route does a sub-navigation under the current URL. For example, if `/record/incident/123` is the current URL, and the following call is made: `helper.navigate.to('record', {'table': 'problem', 'sysId': '567'}, {}, false, false, 'current');` The following URL is generated: `/record/incident/123/sub/record/problem/567` **Note:** *`targetRoute`* can be either a string such as `'current'` or an object, such as `navigation NAV_ITEM_SELECTED payload`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

This example shows how to navigate to a page passing just the *route* parameter.

```
function handler({api, event, imports, helpers}) {
  helpers.navigate.to('test');
}
```

This example shows how to navigate to a page passing the *route* and *fields* parameters.

```
function handler({api, event, imports, helpers}) {
  helpers.navigate.to('test', {'key': 'value'});
}
```

This example shows how to navigate to a page passing the *route*, *fields*, and *params* parameters.

```
function handler({api, event, helpers, imports}) {
  helpers.navigate.to('test', {'key': 'value'}, {'first':
 'FirstName', 'last': 'Last Name'});
}
```

helpers - helpers.screen.updateStatus(Object statusObj)

Enables pages to report their status updates, such as title, icon, dirty state, message, and error changes.

Status updates are reported to WorkspaceChrome or AppShell, whichever the outer layer is, and acting as the host.

Parameters

Name	Type	Description
statusObj	Object	Payload to send to the current page to report that the content has been updated. Valid values: • *dirtyModalId*: (String) ID of the modal that has changed. • *hasError*: (Boolean) Flag that indicates that there are errors on the page. • *hasUpdate*: (Boolean) Flag that indicates that there were updates to the page. • *icon*: (String) Name of the updated or new icon. • *isDirty*: (Boolean) Flag that indicates whether the page is dirty (values have changed). • *message*: (String) Updated/new message. • *screenKey*: (String) ID of the screen on which the change occurred. Every screen has a *screenKey* as a property on the screen macroponent inside sn-canvas-screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• *status*: (String) Status operation for this action. This value must be one of the following: inserted, deleted, saved, or closed. • *title*: (String) Updated/new display title. • *tooltipPreview*: (JSON) Updated or new tool tip. For example, `tooltipPreview : { primaryTitle, secondaryContent: {} }`

Returns

Type	Description
None	

```
screen.updateStatus({'dirtyModalId': 'customModalId', 'isDirty':
 true});
```

helpers - helpers.snHttp(String url, Object options)

Makes an HTTP request to the ServiceNow instance and returns a promise with the results.

Note: There is a known issue where objects named *options* are omitted from the HTTP response.

```
{
  options: {},
  otherFields: {}
}

becomes

{
  otherFields: {}
}
```

Parameters

Name	Type	Description
url	String	HTTP endpoint relative to the instance URL. For example, `/api/now/table/incident` or `/api/now/table/incident/a83820b58f723300e7e16c7827bdeed`.
options	Object	Describes the contents of the HTTP request. `"options": { "batch": Boolean, "body": {Object}, "headers": {Object}, "method": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
options.batch	Boolean	Optional. Flag that indicates whether this HTTP request should be batched with other HTTP requests made to the instance. Valid values: • true: Make request as part of a batch request. • false: Make dedicated request. Default: true
options.body	Object	Optional. Data to send as the request body. Only applicable for request methods PUT, POST, and PATCH. Elements in the object depend on the type of HTTP method. For details, refer to the code examples below. Default: `{}`

options.headers	Object	Optional. Additional HTTP request headers.
		
		For example:
		`headers: {`
		`  "Content-Type": "application/json",`
		`  "Accept": "application/xml"`
		`}`

options.method	String	Optional. HTTP method. Valid values: • DELETE • GET • PATCH • POST • PUT Default: GET

Returns

Type	Description

error	Object that describes any error returned by the REST API.
	
	Data type: Object
	`"error": {`
	`  "data": "String",`
	`  "message": "String",`
	`  "options": {Object},`
	`  "status": Number,`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"statusText": "String"
	}</pre>

error.data	Response returned from the HTTP API. Data type: Defined by REST API
error.message	Message describing the error encountered when trying to process the HTTP request. **Note:** This parameter is not always returned. Data type: String

error.options	Describes the original HTTP request.
	
	Data type: Object
	<pre>"options": {
	"headers": {Object},
	"responseHeader": {Object}
	}</pre>

error.options.headers	Object containing a list of all of the request headers sent in the request. Data type: Object
error.options.responseHeaders	Object containing a list of all of the response headers sent in the request. Data type: Object
error.status	Returned HTTP error status code, such as 400, 405, or 500. Data type: Number
error.statusText	Returned HTTP status message, such as `Bad Request`. Data type: String
response	Returned when HTTP request is successful. The response to the HTTP request. Data type: Any

The following example show how to call *`snHttp()`* which returns a promise.

```
function handler({api, event, helpers, imports}) {
  helpers.snHttp('/api/now/table/u_movie', {method: 'GET'})
    .then(({response}) => {
      // do something with the table data
    })
    .catch(({error}) => {
      const message = `Error: ${error.data.error.message}`;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      console.error(message);
      api.emit('NOW_UXF_PAGE#ADD_NOTIFICATIONS', {
        id: 'alert5',
        status: 'high',
        icon: 'info-circle-outline',
        content: message,
        action: { type: 'dismiss' }
    });
  });
}
```

The following example show how to call *snHttp()* using *async* and *await*.

```
async function handler({helpers}) {
  try {
    const result = await
 helpers.snHttp('/api/now/table/u_movie', {method: 'GET'});
  } catch ({error}) {
      const message = `Error: ${error.data.error.message}`;
      console.error(message);
      api.emit('NOW_UXF_PAGE#ADD_NOTIFICATIONS', {
        id: 'alert5',
        status: 'high',
        icon: 'info-circle-outline',
        content: message,
        action: { type: 'dismiss' }
      });
  }
}
```

The following example show how to set up a POST request.

```
function handler({api, helpers, event, imports}) {
  helpers
    .snHttp("/api/now/table/incident", {
      method: "POST",
      body: {
        description: "Sample description",
        close_notes: "Sample close notes",
        order: "-1"
      }
    })
    .then(({ response }) => {
      // handle POST request response
    })
    .catch(({ error }) => {
      // handle POST request errors
    });
}
```

The following example show how to set up a PUT request.

```
function handler({api, helpers, event, imports}) {
  helpers

 .snHttp("/api/now/table/incident/a83820b58f723300e7e16c7827bdee
d2", {
      method: "PUT",
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      body: {
        activity_due: "1970-04-02 18:26:17"
      },
      headers: {
        "Content-Type": "application/json",
        "Accept": "application/xml"
      }
    })
    .then(({ response }) => {
      // handle PUT request response
    })
    .catch(({ error }) => {
      // handle PUT request errors
    });
}
```

helpers - helpers.timing.clearInterval(Number timeoutId)

Cancels the execution of the function that was scheduled through a prior `setInterval()` call.

Parameters

Name	Type	Description
timeoutId	Number	Unique identifier of the scheduled function to clear. This value is returned by the corresponding `setInterval()` call.

Returns

Type	Description
None	

This example shows using `clearInterval()` to cancel a timing operation that was previously set using the `setInterval()` method. This function could be invoked by a user clicking a **Disable Auto-refresh** button on a page.

```
function handler({api, helpers}) {
  api.setState('intervalId', ({currentValue}) => {
    if (currentValue > -1) {
      helpers.timing.clearInterval(currentValue);
    }
    return -1;
  });
}
```

helpers - helpers.timing.clearTimeout(Number timeoutId)

Cancels the execution of the function that was scheduled through a prior `setTimeout()` call.

Parameters

Name	Type	Description
timeoutId	Number	Unique identifier of the scheduled function to clear. This value is returned by the corresponding `setTimeout()` call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

This code example shows how to terminate a timer with the specified *timeoutId*.

```
function handler({api, helpers}) {
  api.setState('timeoutId', ({currentValue}) => {
    if (currentValue > -1) {
      helpers.timing.clearTimeout(currentValue);
    }
    return -1;
  });
}
```

helpers - helpers.timing.setInterval(Function fn, Number delay)

Repeatedly executes the specified function, using the specified delay value as the interval between function calls.

Unlike the native JavaScript *setInterval()* method, this method does not support passing a code string to evaluate as the first argument. Any additional arguments are passed to the function itself.

Parameters

Name	Type	Description
fn	Function	Function to repeatedly execute.
delay	Number	Length of the time-interval between each function execution. Unit: Milliseconds

Returns

Type	Description
Number	Unique identifier of the function execution operation. Use this value in the helpers - helpers.timing.clearInterval(Number timeoutId) method if you need to cancel this operation.

This code example shows how to refresh the timestamp on a page every second. This function could be invoked by a user clicking an **Enable Auto-refresh** button on a page.

```
function handler({api, helpers}) {
  // Every one second, refresh the value of current timestamp
 client state parameter
  const intervalId = helpers.timing.setInterval(() => {
    api.setState('currentTimestamp', new Date().toString())
  }, 1000);

  // The interval ID is kept in state to use when calling the
 helpers.timing.clearInterval() method at a later point
  api.setState('intervalId', intervalId);
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

helpers - helpers.timing.setTimeout(Function fn, Number delay)

Executes the specified function, after the specified delay.

Unlike the native JavaScript `setTimeout()` method, this method does not support passing a code string to evaluate as the first argument. Any additional arguments are passed to the function itself.

Parameters

Name	Type	Description
fn	Function	Function to execute.
delay	Number	Length of the time to wait before calling the specified function. Unit: Milliseconds

Returns

Type	Description
Number	Unique identifier of the function execution operation. Use this value in the helpers - helpers.timing.clearTimeout(Number timeoutId) method if you need to cancel this operation.

This code example shows how to set a 20 minute timer. You could associate this function with a button **Remind me in 20 minutes**.

```
function handler({api, helpers}) {
  const timeoutId = helpers.timing.setTimeout(() => {
    api.emit('NOW_UXF_PAGE#ADD_NOTIFICATIONS', {
      id: 'alert5',
      status: 'high',
      icon: 'info-circle-outline',
      content: 'Try to look away at something that is 20 feet
 away from you for a total of 20 minutes.',
      action: { type: 'dismiss' }
    });
  }, 20 * 60 * 1000);

  // The timeout ID is kept in state to use when calling the
 helpers.timing.clearTimeout() method at a later point
  api.setState('timeoutId', timeoutId);
}
```

helpers - helpers.translate(String message, String tokens)

Asynchronously retrieves and translates the specified message based on the current user's session language.

You can use this method with the api - setState(String stateParam, Any value) to bind the translated value to other fields on the page.

Note: You can call this method using a promise or `async` and `await`. The code examples below show both implementations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
message	String	Message to translate.
tokens	String	Optional. Comma-separated list of parameters to use for replacing string variables. For example: `helpers.translate('Text {0} {1}', 'to', 'translate');`

Returns

Type	Description
String	Translated text string.

The following example shows how to pass in table field references to embed in the corresponding variables in a string, using a promise.

```
function handler ({api, helpers}) {
  helpers.translate('Welcome {0} {1}!', user.firstName,
 user.lastName)
    .then((translatedText) => {
      api.setState('greeting', translatedText);
    });
}
```

The following example shows how to use `async` and `await` in your function instead of a promise.

```
async function handler ({api, helpers}) {
  const translatedText = await helpers.translate('Welcome to
 {0}', 'ServiceNow');
    api.setState('greeting', translatedText);
}
```

Client mobile API reference

Use Cabrillo JS to build custom mobile experiences inside of ServiceNow AI Platform native mobile apps.

Cabrillo JS constants

These are the constants used by Cabrillo JS.

Cabrillo JS constants - button styles

Constants to use when setting the style of a button.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties

Name	Type	Description
cabrillo.viewLayout.MORE_MENU_BUTTON_STYLE	String	Indicates that the button appears in the navigation bar's overflow button menu.
cabrillo.viewLayout.REPLACE_BACK_BUTTON_STYLE	String	Replaces the native back button with a Cabrillo button. **Note:** Use this style with caution. If the webpage does not restore the native back button after using the Cabrillo replacement, the user may not be able to navigate back.

Cabrillo JS constants - close button styles

Constants to use when setting the close button style of modal interfaces.

Properties

Name	Type	Description
cabrillo.modal.CLOSE_BUTTON_STYLE_CANCEL	String	The modal has a localized cancel button to close the modal.
cabrillo.modal.CLOSE_BUTTON_STYLE_CLOSE	String	The modal has a localized close button to close the modal.
cabrillo.modal.CLOSE_BUTTON_STYLE_DONE	String	The modal has a localized done button to close the modal.

Cabrillo JS constants - message styles

Constants to use when setting the style of a message.

The appearance of each message style can be customized using theme colors. For more information, see Next Experience theming for mobile.

Properties

Name	Type	Description
cabrillo.message.ERROR_MESSAGE_STYLE	String	The message is styled to indicate an error.
cabrillo.message.INFO_MESSAGE_STYLE	String	The message is styled to indicate non-critical information.
cabrillo.message.SUCCESS_MESSAGE_STYLE	String	The message is styled to indicate a success.
cabrillo.message.WARNING_MESSAGE_STYLE	String	The message is styled to indicate a warning.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cabrillo JS constants - modal presentation styles

Constants to use when setting the presentation style of modal interfaces.

Properties

Name	Type	Description
cabrillo.modal.MODAL_PRESENTATION_STYLE_FULL_SCREEN	String	The modal is presented full screen.
cabrillo.modal.MODAL_PRESENTATION_STYLE_FORM_SHEET	String	The modal is presented as a form sheet, but may adapt to full screen on small devices.

Cabrillo JS data types

These are common data types used by Cabrillo JS APIs.

Cabrillo.Attachment

Defines an attachment.

Properties

Name	Type	Description
content_type	String	The attachment content type.
ext	String	The attachment file extension.
file_name	String	The full file name of the attachment including the extension.
sys_created_by	String	The user name of the user that created the attachment.
sys_id	String	The attachment record sys_id.
sys_updated_on	String	The date the attachment record was updated.
table_name	String	Name of the table containing the record to which the attachment is attached.
table_sys_id	String	The sys_id of the record that to which the attachment is attached.
thumbnail	String	The URL for the image thumbnail of the attachment. Only applies to image attachments.

Cabrillo.AttachmentOptions

Defines attachment options.

Properties

Name	Type	Description
isSingleSelection	Boolean	Optional. Flag that indicates whether the document picker for uploading files allows multi-selection. Valid values: • true: Only one file to upload can be selected at a time. • false: Multiple files to upload can be selected at a time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
		Default: False

Cabrillo.Button

Defines a button. Different interface contexts may support a subset of a button's properties.

Properties

Name	Type	Description
backgroundColor	String	Background color of the button or badge. A string containing hex, RGB, HSL, or an x11-named color. **Note:** The color can't be set for buttons in the navigation bar. The color can be set for bottom buttons.
badgeCount	Number	Number value to display on the button's badge.
buttonId	String	Required. Unique id for the button. This value is returned in the button action payload to indicate which button the user tapped.
buttonStyle	String	Used to customize the style of the button.
enabled	Boolean	Indicates whether the button is enabled.
imageName	String	Specifies an image. Possible values are: • add: Displays an add button. • back: Displays a back arrow image to navigate back. • cart: Displays a shopping cart. • close: Displays an X image to navigate back. • edit: Displays an edit button. • filter: Displays a filter button. • menu: Displays a menu button. • search: Displays a search button.
textColor	String	The text color of the badge or button. A string containing hex, RGB, HSL, or an x11-named color. **Note:** The color can't be set for buttons in the navigation bar. The color can be set for bottom buttons.
title	String	Title of the button. The string should be localized.

Cabrillo.ModalResponse

Contains the result passed from a modal window that was dismissed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties

Name	Type	Description
results	Object	The result from the dismissed modal window.

Cabrillo.NavigationRequest

Specifies a request to navigate to a list or record.

Properties

Name	Type	Description
table	String	The table to navigate to. Required for both list and record navigation.
sysId	String	The sys_id of the record to navigate to. Required for record navigation.
query	String	An encoded query for the requested list. Can be used to seed values for record navigation requests.
view	String	The list or record view.

Cabrillo.Rect

Contains the location and dimensions of a rectangle.

Properties

Name	Type	Description
x	Number	The x origin of the rectangle.
y	Number	The y origin of the rectangle.
width	Number	The width in points.
height	Number	The height in points.

Cabrillo.Spinner

Defines a spinner.

Properties

Name	Type	Description
mask	Boolean	Optional. Determines whether to display a mask behind the spinner. Valid values: • true: Displays a mask behind the spinner. • false: Does not display a mask behind the spinner.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
		Default: false
maskColor	String	Color of the mask, if enabled.

cabrillo - Client

Cabrillo JS is a client side JavaScript API for accessing capabilities inside ServiceNow native mobile applications.

Use Cabrillo JS to build a custom mobile experience in ServiceNow native mobile applications. Cabrillo JS provides APIs to use native device capabilities, native mobile UI, and other ServiceNow mobile functionality.

Cabrillo JS is available in AngularJS as an injectable parameter. For example, you can inject Cabrillo JS in a Service Portal widget client script.

```
function(cabrillo) {
    var c = this;

    // Used to determine if Cabrillo is executing in
 ServiceNow's native mobile apps.
    c.isNative = cabrillo.isNative();
}
```

Cabrillo JS APIs are only supported when executing in ServiceNow native mobile applications. Use the *`cabrillo.isNative()`* API to determine if the script is executing in a native context.

Note: Cabrillo JS APIs are unavailable in GlideForm client scripts.

cabrillo - isNative()

Boolean value indicating if Cabrillo JS is executing a ServiceNow native mobile application.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if Cabrillo JS is running in a native context; otherwise, false.

```
var isNative = cabrillo.isNative();
```

cabrillo.attachments - Client

The name space for Cabrillo JS attachment functions. This enables adding and viewing attachments.

cabrillo.attachments - addFile(String tableName, String sysId, Object params, String options)

Presents a document picker and uploads the selected file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: This method is deprecated. Use the addFiles() method instead.

Parameters

Name	Type	Description
tableName	String	Table name of the record to which to attach the attachment.
sysID	String	The sys_id of the record to which to attach the attachment.
params	Object	Unused. Set to null.
options	String	Unused. Set to null.

Returns

Type	Description
promise	If successful a Cabrillo.Attachment object. If the operation fails, an error.

```
var table = 'incident';
var sysID = 'a9e30c7dc61122760116894de7bcc7bd';

cabrillo.attachments.addFile(table,
    sysID,
    null,
    null
).then(function(attachment) {
    if (attachment) {
        console.log('Added a new file.', attachment);
    } else {
        console.log('User cancelled adding an attachment.');
    }
}, function(error) {
    console.log('Failed to attach new file.', error);
});
```

cabrillo.attachments - addFiles(String tableName, String sysId, Object params, Object options)

Presents a document picker to select and upload files.

Parameters

Name	Type	Description
tableName	String	Name of the table that contains the record to attach the file to.
sysID	String	Sys_id of the record to attach the file to.
params	Object	Optional. Reserved for future use. Set to null.
options	Object	Optional. Additional settings for uploading files. `{ "isSingleSelection": Boolean }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
options.isSingleSelection	Boolean	Optional. Flag that indicates whether the document picker for uploading files allows multi-selection. Valid values: • true: Only one file to upload can be selected at a time. • false: Multiple files to upload can be selected at a time. Default: False

Returns

Type	Description
Promise	Contains any successfully created attachments and any errors. If multiple files were selected, a Cabrillo.Attachment is created for each successfully uploaded file while an error message is generated for each unsuccessful upload. Data type: Object `{ "attachments": [Array], "errors": [Array] }`
Promise.attachments	Contains any successfully created attachments. Data type: Array `"attachments": [Cabrillo.Attachment]`
Promise.errors	Contains any errors. Data type: Array `"errors": ["String"]`

This example creates a button for adding multiple attachments to an incident record and checks for any upload errors.

```
this.attachMultipleFilesButton = function() {
   c.log("Attempting to add multiple attachments to
 INC0010453");
   var table = 'incident';
   var sysID = 'fc74aefa1bfb2c10181499f1b24bcb3c';

   cabrillo.attachments.addFiles(table,
 sysID).then(function(result) {
      if (result) {
         handleMultipleResult(result)
      } else {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
         c.log('User cancelled adding an attachment.');
      }
   }, function(error) {
      c.log('Failed to attach new files.', error);
   });
}

// A helper function to handle addFiles results
function handleMultipleResult(result) {
   c.log('Added multiple attachments.', result);
   if (result.attachments) {
      c.log('Number of new attachments',
 result.attachments.length);
   }
   if (result.errors) {
      c.log('Number of errors during upload',
 result.errors.length);
   }
}
```

cabrillo.attachments -viewFile(Cabrillo.Attachment attachment, Cabrillo.Rect sourceRect, String sourceBase64Image)

Presents a document picker and uploads the selected file.

Note: Scaling using a sourceRect parameter with a sourceBase64 image is only supported on iOS. Android ignores these parameters and opens the image without a scaling animation.

Parameters

Name	Type	Description
attachment	Cabrillo.Attachment	Describes the attachment to view.
sourceRect	Cabrillo.Rect	Optional. Describes the source rectangle of the image to scale up.
sourceBase64Image	String	Optional. A base64 representation of the source image to scale up.

Returns

Type	Description
promise	If successful, an unresolved object, otherwise an error.

```
// A Cabrillo.Attachment dictionary to view
var attachment = {
    sys_id: '8e99daa3ff133100ba13fffffffff2d',
    content_type: 'image/jpeg',
    path: '8e99daa3ff133100ba13fffffffff2d.iix'
};

cabrillo.attachments.viewFile(attachment,
    null,
    null
).then(function() {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    // It worked. Nothing to do here.
}, function(error) {
    console.log('Failed to view file.', error);
});
```

To scale an image that was tapped into a native image viewer, the *viewFile()* method accepts optional arguments for the image's rectangle on the page as well as a base64 encoded thumbnail of the image. The thumbnail is scaled into the full size image with an animation.

```
// Grab image metadata from an image that was tapped
var imageMetadata = imageMetadataFromEvent(event);

// Optional rect of image on page
var imageRect = imageMetadata.rect;

// Optional base64 encoded image to scale up into native viewer
var base64EncodedImage = imageMetadata.base64;

// A Cabrillo.Attachment dictionary to view
var attachment = {
    sys_id: '8e99daa3ff133100ba13fffffffff2d',
    content_type: 'image/jpeg',
    path: '8e99daa3ff133100ba13fffffffff2d.iix'
}

cabrillo.attachments.viewFile(attachment,
    imageRect,
    base64EncodedImage
).then(function() {
    // It worked. Nothing to do here.
}, function(error) {
    console.log('Failed to view file.', error);
});
```

cabrillo.camera - Client

Cabrillo JS camera functions to provide camera access for bar code scanning.

cabrillo.camera - getBarcode()

Provides a standard interface for scanning bar codes. Use this to present a bar code scanner and capture scanned result.

Supported bar code types.

- 1D bar codes: EAN-13, EAN-8, UPC-A, UPC-E, Code-39, Code-93, Code-128, ITF
- 2D bar codes: QR Code, Data Matrix, PDF-417, AZTEC

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
promise	Resolves to a bar code string, or if the operation fails, an error.

```
cabrillo.camera.getBarcode().then(function(barcode) {
    if (barcode) {
        console.log('Scanned barcode.', barcode);
    } else {
        console.log('User cancelled scanning barcode.');
    }
}, function(error) {
    console.log('Failed to scan barcode.', error);
});
```

cabrillo.flowControl - Client

Cabrillo JS functions for managing the flow of a web view.

cabrillo.flowControl - flowEnded(String flowName)

Indicates to the client that the web flow is complete.

The mobile client can then take appropriate action, which typically is to close the web view.

Parameters

Name	Type	Description
flowName	String	Optional. The name of the web flow to close.

Returns

Type	Description
None	

```
var flowName = 'Open Incident Flow';
cabrillo.flowControl.flowEnded(flowName);
```

cabrillo.flowControl - flowEndedWithUpdate(String flowName, boolean clientRefreshNeeded)

Indicates to the client that the web flow is complete and the client should update the native screens.

The mobile client can then take appropriate action, which typically is to close the web view.

Parameters

Name	Type	Description
flowName	String	Optional. The name of the web flow to close.
clientRefreshNeeded	Boolean	Optional. Flag that indicates whether the client needs to refresh the displayed data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • true: The client needs to refresh the displayed data. • false: The client doesn't need to refresh the displayed data. Default: false

Returns

Type	Description
None	

```
var flowName = 'Open Incident Flow';
var clientRefreshNeeded = true;
cabrillo.flowControl.flowEnded(flowName, clientRefreshNeeded);
```

cabrillo.message - Client

Cabrillo JS functions to display messages in the native UI.

cabrillo.message - showMessage(String style, String title)

Displays a message in the native UI.

Parameters

Name	Type	Description
style	String	Style of the banner. Possible values: • cabrillo.message.ERROR_MESSAGE_STYLE • cabrillo.message.INFO_MESSAGE_STYLE • cabrillo.message.SUCCESS_MESSAGE_STYLE • cabrillo.message.WARNING_MESSAGE_STYLE For more information, see Cabrillo JS constants - message styles.
title	String	Text to display in the banner.

Returns

Type	Description
promise	If successful, an unresolved object, otherwise an error.

```
var style = cabrillo.message.SUCCESS_MESSAGE_STYLE;
var title = "You did it!";
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
cabrillo.message.showMessage(
   style,
   title
).then(function(response) {
   console.log('success');
}, function(error) {
   console.log(error);
});
```

cabrillo.modal - Client

Cabrillo JS functions for presenting web content inside of native modals.

cabrillo.modal - dismissModal(Object data)

Use to dismiss a modal that has been presented with the *`presentModal()`* function.

A presented modal is responsible for dismissing itself and passing any results back to the presenting context. The *`dismissModal()`* function must be called from the presented context not from the presenting context.

Parameters

Name	Type	Description
data	Object	Optional. An object to pass back to the presenting context when the presented context dismisses itself.

Returns

Type	Description
promise	If successful, an unresolved object, otherwise an error.

```
// Any object can be passed back to the presenting context when
 the presented context dismisses itself.
var results = {
    team: 'Mobile'
    company: 'ServiceNow'
}

cabrillo.modal.dismissModal(results).then(function() {
    console.log('Modal was dismissed and results were passed to
 presenting context.');
}, function(error) {
    console.log(error);
});
```

cabrillo.modal - presentModal(String title, String url, String closeButtonStyle, String modalPresentationStyle)

Presents content in a native modal interface.

Parameters

Name	Type	Description
title	String	Title of the modal interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
url	String	The URL to open the modal. This must be an internal instance URL (fully qualified or relative; a relative URL is preferred).
closeButtonStyle	String	Close button style of the modal interface. Possible values: • cabrillo.modal.CLOSE_BUTTON_STYLE_CANCEL • cabrillo.modal.CLOSE_BUTTON_STYLE_CLOSE • cabrillo.modal.CLOSE_BUTTON_STYLE_DONE For more information, see Cabrillo JS constants - close button styles.
modalPresentationStyle	String	Presentation style of the modal interface. Possible values: • cabrillo.modal.MODAL_PRESENTATION_STYLE_FULL_SCREEN • cabrillo.modal.MODAL_PRESENTATION_STYLE_FORM_SHEET For more information, see Cabrillo JS constants - modal presentation styles. **Note:** This parameter is only supported on Apple iOS.

Returns

Type	Description
promise	If successful, a Cabrillo.ModalResponse object, otherwise an error.

Present a native modal that loads a custom URL. This presents a custom Service Portal page in a form sheet style modal. The promise is fulfilled when the modal is dismissed. See the *dismissModal()* function for custom dismissal capabilities.

```
cabrillo.modal.presentModal('Portal Page',
    '/$sp.do?id=my_modal_page',
    cabrillo.modal.CLOSE_BUTTON_STYLE_CLOSE,
    cabrillo.modal.MODAL_PRESENTATION_STYLE_FORM_SHEET
).then(function(response) {
    // The results from the modal are in a results key on the
 response object.
    var results = response && response.results ?
 response.results : null;

    if (results) {
        console.log('Modal dismissed with results.', results);
    } else {
        console.log('Modal dismissed without results.');
    }
}, function(error) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    console.log(error);
});
```

cabrillo.navigation - Client

Cabrillo JS functions for forward and backward navigation.

cabrillo.navigation - goBack()

Enables backward navigation.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if Cabrillo JS will navigate backward; otherwise false.

```
cabrillo.navigation.goBack();
```

cabrillo.navigation - goto(String url, Cabrillo.NavigationRequest request)

Enables forward navigation.

Use the request parameter not the url parameter for list or record navigation.

Parameters

Name	Type	Description
url	String	An URL to navigate to. This should be used for custom URL navigation. Optional.
request	Cabrillo.NavigationRequest	Describes the list or record to navigate to. Optional.

Returns

Type	Description
Boolean	Returns true if Cabrillo JS will navigate; otherwise returns false.

Navigate to a URL.

```
cabrillo.navigation["goto"]('/$sp.do?id=my_custom_page');
```

Navigate to a list. The request parameter is preferred over the url parameter for list navigation.

```
// A Cabrillo.NavigationRequest dictionary that specifies a list
 of active incidents.
var request = {
    table: 'incident',
    query: 'active=true',
};
cabrillo.navigation["goto"](null, request);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigate to a record. The request parameter is preferred over the url parameter for record navigation.

```
// A Cabrillo.NavigationRequest dictionary that specifies an
 incident record.
var request = {
    table: 'incident',
    sysId: 'a9e30c7dc61122760116894de7bcc7bd'
};
cabrillo.navigation["goto"](null, request);
```

Navigate to a new record.

```
// A Cabrillo.NavigationRequest dictionary that specifies a new
 incident record.
// The new record will be seeded with the encoded query.
var request = {
    table: 'incident',
    sysId: '-1',
    query: 'short_description=This is a new incident.'
};
cabrillo.navigation["goto"](null, request);
```

cabrillo.nowapp - Client

The name space for Cabrillo Now App functions. This enables you to interact with screens inside of ServiceNow AI Platform® native mobile apps.

cabrillo.nowapp - openLauncherScreen(String launcherScreenId)

Opens a mobile launcher native screen.

Parameters

Name	Type	Description
launcherScreenId	String	Sys_id of the launcher screen from the Applet launcher [sys_sg_applet_launcher] table.

Returns

Type	Description
Boolean	Flag that indicates whether the method is available on the native side. Valid values: • true: the method is available on the native side • false: the method is not available on the native side.

```
const launcherScreenId = 'a9e30c7dc61122760116894de7bcc7bd';
const result =
 cabrillo.nowapp.openLauncherScreen(launcherScreenId);
If (result === false) {
    console.log("method is not available")
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
true
```

cabrillo.nowapp - openScreen(String screenId)

Opens a mobile native screen.

Parameters

Name	Type	Description
screenId	String	The sys_id of the screen record to open from the Screen [sys_sg_screen] table.

Returns

Type	Description
Boolean	Flag that indicates whether the method is available on the native side. Valid values: • true: the method is available on the native side • false: the method is not available on the native side.

```
const screenId = 'a9e30c7dc61122760116894de7bcc7bd';
cabrillo.nowapp.openScreen(screenId);
If (result === false) {
    console.log("method is not available")
}
```

Output:

```
true
```

cabrillo.nowapp - openScreenWithRecordContext(String screenId, String table, String recordId)

Opens a mobile native screen with a record context.

Parameters

Name	Type	Description
ScreenId	string	Sys_id of the screen record to open from the Screen [sys_sg_screen] table.
table	string	The record table.
record	string	The record sys_id.

Returns

Type	Description
Boolean	Flag that indicates whether the method is available on the native side.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Valid values: • true: the method is available on the native side • false: the method is not available on the native side.

```
const screenId = 'a9e30c7dc61122760116894de7bcc7bd';
const recordId= '8e99daa3ff133100ba13757574847f2d';
const table= 'sys_users';
const result =
 cabrillo.nowapp.openScreenWithRecordContext(screenId, table,
 recordId);
If (result === false) {
    console.log("method is not available")
}
```

Output:

```
true
```

cabrillo.nowapp - performFunction(String functionId, String table, String recordId)

Executes a native mobile function.

Note: Only Action functions are supported for the Vancouver release. For more information, see Action functions.

Parameters

Name	Type	Description
functionId	string	Sys_id of the target function from the Button [sys_sg_button] table.
table	string	The record table. Optional for Global Action items. For more information about mobile function, see Action functions. **Note:** Differences between Global and Record actions: • Record: Applies an action at the record level. For example, use this option to create a button that changes the state of a record. You can set the context to Record for actions on a particular field, a particular record, or swipe actions. If the action function includes a UI parameter with the Input source field set to Auto fill, you must specify the table in the Table field. • Global: Applies an action at the global, or list level. For example, use this option to add a button that creates a record. Do not use the Global setting for actions that are in the context of a record, or actions that include a UI parameter with the Input source field set to Auto fill.
recordId	string	The record sys_id. Optional for Global Action Items. For more information about mobile function, see Action functions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Note: Differences between Global and Record action items: • Record: Applies an action at the record level. For example, use this option to create a button that changes the state of a record. You can set the context to Record for actions on a particular field, a particular record, or swipe actions. If the action function includes a UI parameter with the Input source field set to Auto fill, you must specify the table in the Table field. • Global: Applies an action at the global, or list level. For example, use this option to add a button that creates a record. Do not use the Global setting for actions that are in the context of a record, or actions that include a UI parameter with the Input source field set to Auto fill.

Returns

Type	Description
Boolean	Flag that indicates whether the method is available on the native side. Valid values: • true: the method is available on the native side • false: the method is not available on the native side.

```
const functionId= 'a9e30c7dc61122760116894de7bcc7bd';
const recordId= '8e99daa3ff133100ba13757574847f2d';
const table= 'sys_users';
const result = cabrillo.nowapp.performFunction(functionId,
 table, recordId);
If (result === false) {
    console.log("method is not available")
}
```

Output:

```
true
```

cabrillo.nowapp - refresh()

Refresh the UI stack in the event a table update is made in the web view that may affect a previous screen.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the method is available on the native side. Valid values: • true: the method is available on the native side • false: the method is not available on the native side.

```
const result = cabrillo.nowapp.refresh();
If (result === false) {
    console.log("method is not available")
```

Output:

```
true
```

cabrillo.viewLayout - Client

Cabrillo JS functions to provide access to native UI elements like buttons and spinners.

cabrillo.viewLayout - getTitle()

Gets the current native view's title.

Parameters

Name	Type	Description
None		

Returns

Type	Description
promise	If successful, resolves to the title text, otherwise an error.

```
cabrillo.viewLayout.getTitle()
.then(function(title) {
   console.log(title);
}, function(error) {
   console.log(error);
});
```

cabrillo.viewLayout - hideBackButton()

Hides the back button on the client interface.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
cabrillo.viewLayout.hideBackButton();
```

cabrillo.viewLayout - hideSpinner()

Hides a native spinner in the current interface.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
cabrillo.viewLayout.hideSpinner();
```

cabrillo.viewLayout - setBottomButtons(Array buttons, Function execute)

Set buttons at the bottom of the current interface.

Images and badges are not supported in bottom buttons.

Parameters

Name	Type	Description
buttons	Array of Cabrillo.Button objects	Describes the buttons to set. A maximum of one button is currently supported.
execute	Function	The function to call when a button is tapped. The function has no return value and takes the selected button index as its only parameter. The function must have a single parameter that is a Number.

Returns

Type	Description
promise	If successful, an unresolved object, otherwise an error.

Set bottom buttons.

```
var buttons = [
    {
        title: 'Add to Cart',
        buttonId: 'btnAddCart',
        enabled: true,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        backgroundColor: '#3091F9',
        textColor: '#FFFFFF'
    }
];

cabrillo.viewLayout.setBottomButtons(buttons, (buttonIndex) => {
    console.log('Success. Received an event from the button.');
}).catch((err) => {
    console.log('Failed to register buttons.');
    console.error(err);
});
```

Clear bottom buttons.

```
cabrillo.viewLayout.setBottomButtons();
```

cabrillo.viewLayout - setNavigationBarButtons(Array buttons, Function execute)

Set buttons in the navigation bar of the current interface.

Images and badges for buttons that appear in the overflow button menu are omitted. For this reason, it's best to provide a title and an image name when setting an image button in the navigation bar.

Parameters

Name	Type	Description
buttons	Array of Cabrillo.Button objects.	Describes the buttons to set. Buttons may overflow into an additional menu as needed.
execute	Function	The function to call when a button is tapped. The function has no return value and takes the selected button index as its only parameter. The function must have a single parameter that is a Number.

Returns

Type	Description
promise	If successful, an unresolved object, otherwise an error.

Set navigation bar buttons.

```
var buttons = [
   {
      title: "Save",
      enabled: true,
      buttonId: "btnSave",
   },
];

cabrillo.viewLayout
   .setBottomButtons(buttons, (buttonIndex) => {
      console.log("Success. Received an event from the
 button.");
   })
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   .catch((err) => {
      console.log("Failed to register buttons.");
      console.error(err);
   });
```

Handle multiple buttons.

```
var buttons = [
   {
      title: "Save",
      enabled: true,
      buttonId: "btnSave",
   },
   {
      title: "Delete",
      enabled: true,
      buttonId: "btnDelete",
   },
];

cabrillo.viewLayout
   .setNavigationBarButtons(buttons, (buttonIndex) => {
      switch (buttonIndex) {
         case 0:
            console.log("Received an event from the Save
 button.");
            break;
         case 1:
            console.log("Received an event from the Delete
 button.");
            break;
      }
   })
   .catch((err) => {
      console.log("Failed to register buttons.");
      console.error(err);
   });
```

Buttons placed in the navigation bar can be represented by an image.

```
var buttons = [
   {
      title: "Compose",
      buttonId: "btnCompose",
      imageName: "compose",
      enabled: true,
   },
];

cabrillo.viewLayout
   .setNavigationBarButtons(buttons, (buttonIndex) => {
      console.log("Success. Received an event from the
 button.");
   })
   .catch((err) => {
      console.log("Failed to register buttons.");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      console.error(err);
   });
```

A native back button is shown in the native app by default, but you can replace the back button with a Cabrillo button by setting a button's `buttonStyle` property.

```
var buttons = [
   {
      title: "Cancel",
      buttonId: "btnCancel",
      imageName: "close",
      buttonStyle:
 cabrillo.viewLayout.REPLACE_BACK_BUTTON_STYLE,
      enabled: true,
   },
   {
      title: "Done",
      enabled: true,
   },
];

cabrillo.viewLayout
   .setNavigationBarButtons(buttons, (buttonIndex) => {
      switch (buttonIndex) {
         case 0:
            c.log("Cancel button was clicked.");
            break;
         case 1:
            c.log("Done button was clicked.");
            break;
      }
   })
   .catch((err) => {
      c.log("Failed to register buttons.");
      c.error(err);
   });
```

Buttons are placed in the overflow button menu as needed. To force a button into the overflow button menu, set the button's buttonStyle property.

```
var buttons = [
   {
      title: "Save",
      buttonId: "btnSave",
      buttonStyle: cabrillo.viewLayout.MORE_MENU_BUTTON_STYLE,
      enabled: true,
   },
];

cabrillo.viewLayout
   .setNavigationBarButtons(buttons, (buttonIndex) => {
      console.log("Success. Received an event from the
 button.");
   })
   .catch((err) => {
      console.log("Failed to register buttons.");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      console.error(err);
   });
```

Buttons may have a badge when placed in the navigation bar. This example sets a button with a shopping cart icon and a badge count of 3. The badge has a blue background with white text.

```
var buttons = [
   {
      title: "Cart",
      buttonId: "btnCart",
      imageName: "cart",
      badgeCount: 3,
      backgroundColor: "#3091F9",
      textColor: "#FFFFFF",
      enabled: true,
   },
];

cabrillo.viewLayout
   .setNavigationBarButtons(buttons, (buttonIndex) => {
      console.log("Success. Received an event from the
 button.");
   })
   .catch((err) => {
      console.log("Failed to register buttons.");
      console.error(err);
   });
```

Clear navigation bar buttons.

```
cabrillo.viewLayout.setNavigationBarButtons();
```

cabrillo.viewLayout - setTitle(String title)

Sets the current native view's title.

Parameters

Name	Type	Description
title	String	The title of the interface.

Returns

Type	Description
void	

```
cabrillo.viewLayout.setTitle('My Title');
```

cabrillo.viewLayout - showBackButton()

Shows the back button on the client interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

```
cabrillo.viewLayout.showBackButton();
```

cabrillo.viewLayout - showSpinner(Object options)

Shows a native spinner in the current interface.

Parameters

Name	Type	Description
options	Object	Optional. Additional settings to modify the appearance of the spinner. `{ "mask": Boolean, "maskColor": "String" }`
options.mask	Boolean	Optional. Determines whether to display a mask behind the spinner. Valid values: • true: Displays a mask behind the spinner. • false: Does not display a mask behind the spinner. Default: false
options.maskColor	String	Color of the mask, if enabled.

Returns

Type	Description
None	

```
var options = { mask: true, maskColor: '#ffffff' };
cabrillo.viewLayout.showSpinner(options);
```

m_form - Client

Provides methods to get and set input values on input form screens, as well as display messages.

This API supports the following input types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Boolean
- Choice
- Date/time
- Number
- Reference
- String

This API can be used with the MobileScriptIncludeCaller - Client API to auto-fill inputs on input form screens. For more information about input form screens, see Input form screen.

Use this API in the **Client script** field of a Mobile UI Rule Action. For instructions on configuring a Mobile UI Rule Action with the correct settings for this API, see Configure auto-fill inputs on input form screens.

m_form - addErrorMessage(String message)

Displays an error message at the top of the input form screen.

Parameters

Name	Type	Description
message	String	The message to display.

Returns

Type	Description
None	

In this example, an informational or error message is displayed on the form depending on the value entered for the priority.

```
// Client script in a Mobile UI Rule Action
function onChange(inputName, newValue) {
   var priority = newValue;
   if (priority > 0 && priority < 3) {
      getMessage("This incident should be handled ASAP",
 function(response){
         m_form.addInfoMessage(response);
      });
   } else {
      getMessage("The selected priority is invalid",
 function(response){
         m_form.addErrorMessage(response);
      });
   }
}
```

m_form - addInfoMessage(String message)

Displays an informational message at the top of the input form screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
message	String	The message to display.

Returns

Type	Description
None	

In this example, an informational or error message is displayed on the form depending on the value entered for the priority.

```
// Client script in a Mobile UI Rule Action
function onChange(inputName, newValue) {
   var priority = newValue;
   if (priority > 0 && priority < 3) {
      getMessage("This incident should be handled ASAP",
 function(response){
         m_form.addInfoMessage(response);
      });
   } else {
      getMessage("The selected priority is invalid",
 function(response){
         m_form.addErrorMessage(response);
      });
   }
}
```

m_form - getValue(String inputName)

Returns the value of a specified input on an input form screen.

Parameters

Name	Type	Description
inputName	String	Name of the input to return the value of.

Returns

Type	Description
String	The value of the specified input. **Note:** If the input is a choice list with multi-select, the return type is an array of strings containing the selected values.

This client script passes the employee_id input value to the script include, which uses the ID to look up the employee's title. The title is provided to the callback function, which it uses to auto-fill the business_title input on the input form screen.

```
// Client script in a Mobile UI Rule Action
function onChange(inputName, newValue) {
   var employeeId = m_form.getValue("employee_id");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   var caller = new MobileScriptIncludeCaller("UserUtilsTest",
 "getBusinessTitle");
   caller.addParam("employeeId", employeeId);
   caller.call(function(response) {
      m_form.setValue("business_title", response);
   });
}
```

Script include.

```
// Mobile callable script include
var UserUtilsTest = Class.create();
UserUtilsTest.prototype =
 Object.extendsObject(global.AbstractMobileCallableInclude, {
   getBusinessTitle: function() {
      var employeeId = this.getParameter("employeeId");
      var gr = new GlideRecord("sys_user");
      gr.get(employeeId);
      return gr.getValue("title");
   },
   type: 'UserUtilsTest'
});
```

m_form - setAffectedInputs(Array inputNames)

Adds a shimmering effect to specified inputs indicating that the value is being set by a script.

The shimmering effect ends once the value for the input is set.

Parameters

Name	Type	Description
inputNames	Array	Array of strings containing the names of inputs to apply the shimmer effect to.

Returns

Type	Description
None	

This client script adds a shimmer effect to the caller input to indicate that it's auto-filled.

```
// Client script in a Mobile UI Rule Action
function onChange(inputName, newValue) {
   var affectedInputs = [];
   affectedInputs.push("Caller");
   m_form.setAffectedInputs(affectedInputs);
   m_form.setValue("Caller",
 ["800b174138d089c868d09de320f9833b",
 "46d44a23a9fe19810012d100cca80666"]);
   var result = m_form.getValue("Caller");
   console.log(`Ref test: ${result[0]}`);
}
```

m_form - setValue(String inputName, Object value, String displayValue)

Sets the value of a specified input on an input form screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
inputName	String	Name of the input to set the value of.
value	Object	Value to set the input to. The data type of the value varies based on the input being set.
displayValue	String	Optional. Use this parameter when setting the value of Reference type inputs.

Returns

Type	Description
None	

This example sets an integer value for the order input.

```
m_form.setValue("order", 5);
```

This example sets a string value for the description input.

```
m_form.setValue("description", "This is the description
 content");
```

This example uses an object containing the value and display value to set a reference type input.

```
m_form.setValue("Caller",
 [{"value":"800b174138d089c868d09de320f9833b",
 "displayValue":"Abel Tuter"}]);
```

MobileScriptIncludeCaller - Client

Provides methods to call script includes from Mobile UI Rule Actions.

This API can be used with the m_form - Client API to auto-fill inputs on input form screens. For more information about input form screens, see Input form screen.

Use this API in the **Client script** field of a Mobile UI Rule Action. For instructions on configuring a Mobile UI Rule Action with the correct settings for this API, see Configure auto-fill inputs on input form screens.

The script include must have the **Mobile callable** field selected to be called by this API.

MobileScriptIncludeCaller - MobileScriptIncludeCaller(String scriptName, String functionName)

Creates an instance of the *`MobileScriptIncludeCaller`* class with the script include and function to call.

Parameters

Name	Type	Description
scriptName	String	Name of the mobile-callable script include to call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		If the script include supports cross-scope access and it's in a different scope than the client script, the name of the script include must be prefixed with the scope.
functionName	String	The public function to call in the script include.

This example shows how to create an instance of the *MobileScriptIncludeCaller* class that can be used to call the `getBusinessTitle()` function in the UserUtilsTest script include.

```
var caller = new MobileScriptIncludeCaller("UserUtilsTest",
 "getBusinessTitle");
```

MobileScriptIncludeCaller - addParam(String key, Object value)

Adds a parameter to pass when calling the script include.

This method enables you to pass values from the input form to the script include.

Parameters

Name	Type	Description
key	String	Key to use for the parameter.
value	Object	Value of the parameter.

Returns

Type	Description
None	

This example shows how to add the value of the employee_id input from the input form to the *MobileScriptIncludeCaller* object.

```
var employeeId = m_form.getValue("employee_id");
var caller = new MobileScriptIncludeCaller("UserUtilsTest",
 "getBusinessTitle");
caller.addParam("employeeId", employeeId);
```

MobileScriptIncludeCaller - call(Function successCallback, Function errorCallback)

Calls the script include specified by the constructor.

The server call executes asynchronously and the script include's response is passed to the callback function. If the response from the server fails, for example if the script include isn't found, the response argument passed to the callback is empty or null.

The script include must have the **Mobile callable** field selected to be called by this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
successCallback	Function	Optional. The name of the callback function to process the results returned by the server. If a callback function isn't provided, this method returns a promise, which can be consumed using the Promise API.
errorCallback	Function	Optional. The name of the callback function to call if an error occurs.

Returns

Type	Description
None	

This client script passes the employee_id input value to the script include, which uses the ID to look up the employee's title. The title is provided to the callback function, which it uses to auto-fill the business_title input on the input form screen.

```
// Client script in a Mobile UI Rule Action
function onChange(inputName, newValue) {
   var employeeId = m_form.getValue("employee_id");
   var caller = new MobileScriptIncludeCaller("UserUtilsTest",
 "getBusinessTitle");
   caller.addParam("employeeId", employeeId);
   caller.call(function(response) {
      m_form.setValue("business_title", response);
   });
}
```

Script include.

```
// Mobile callable script include
var UserUtilsTest = Class.create();
UserUtilsTest.prototype =
 Object.extendsObject(global.AbstractMobileCallableInclude, {
   getBusinessTitle: function() {
      var employeeId = this.getParameter("employeeId");
      var gr = new GlideRecord("sys_user");
      gr.get(employeeId);
      return gr.getValue("title");
   },
   type: 'UserUtilsTest'
});
```

Mobile SDK API reference

Use the ServiceNow Mobile SDK to leverage the functionality and resources of the ServiceNow platform within your standalone mobile Android and iOS applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mobile SDK API reference - Android

The Mobile SDK for Android provides the classes necessary to interface Android devices with the ServiceNow platform.

It provides classes that enable you to create feature services such as chat, REST API interface, GraphQL, and web access, that allow you to create interactive applications on any Android device.

For additional information on how to implement specific use cases using this API, see the Mobile SDK Developer Guide - Android.

AuthorizationToken class - Android

The `AuthorizationToken` class provides the authorization token provided by the host application. Used by the NowSDK to authorize access to a specified ServiceNow instance for the currently logged in user.

Properties

Name	Type	Description
token	String	Value of the authorization token.
type	String	Type of authorization token. Valid values (case-sensitive): • JWT • OAuthAccess • OAuthRefresh

AuthorizatonToken - AuthorizationToken(type: AuthorizationTokenType, token: String)

Returns the authorization token provided by the host application.

Parameters

Name	Type	Description
type	String	Type of authorization token. Valid values (case-sensitive): • JWT • OAuthAccess • OAuthRefresh
token	String	Value of the authorization token.

Returns

Type	Description
None	

```
class SDKManager @Inject constructor(
  private val settings: Provider<NowSDKSettings>,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  private val jwtService: JWTService
) : NowSDKAuthorizationProviding,
  DevicePermissionDelegate {

  override fun requestAuthorization(
    instanceURL: URL,
    callback: Consumer<List<AuthorizationToken>?>
  ) {
      GlobalScope.launch(Dispatchers.IO) {
        try {
          val token = jwtService.getJWT(settings.get().user,
 settings.get().clientId).token
          callback.accept(
            listOf(
              AuthorizationToken(
                AuthorizationTokenType.JWT,
                token
              )
            )
          )
        } catch (ex : Exception) {
           Log.e("JWT", "Failed to get jwt", ex)
           return@launch callback.accept(null)
        }
      }
    }
```

Call interface - Android

The `Call` interface represents a request that is prepared for processing.

Possible processing options include:

- cancel
- enqueue
- execute
- map

A call object cannot be processed twice.

Properties

Name	Type	Description
request	Request	Original request that initiated this call.

Call - cancel()

Cancels the associated call, if possible (best effort.)

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
private var inFlightDataRequestCall: Call<*>? = null
fun cancelTransfer() = inFlightDataRequestCall?.cancel()
```

Call - enqueue(onSuccess: Consumer<Response<T>>, onError: Consumer<NowDataError>)

Schedules the request to be executed as soon as the system\thread is available to execute this request.

Parameters

Name	Type	Description
onSuccess	Consumer <Response<T>>	Callback to execute if the call is successful. HTTP response with the body parsed to the data type specified by the *T* parameter. **Note:** Consumer is a OOB Java type for asynchronous consumption of an object. In this case, the call uses generic to return a type `Response<T>` where `T` is the object type.
onError	Consumer <NowDataError>	Callback to execute if the call fails. NowDataError

Returns

Type	Description
None	

The following code example shows how to call this function.

```
fun makeGraphQLRequest(query: String) {
  val call = graphQLService.graphQLRequest(query)
  call.enqueue(
    { response -> handleResponse(response) },
    { nowDataError -> handleError(nowDataError) }
  )
}
```

Call - execute()

Invokes the request immediately. Blocks until the response is processed or is in error.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Response<T>	Response data in the format defined in the *T* parameter.

The following code example shows how to call this function.

```
val response = apiService.data(NowAPIService.Endpoint(
  relativePath = CASES_API,
  requestMethod = HttpMethod.GET,
  requireAuth = true)
).execute()
```

FetchConfiguration class - Android

The *FetchConfiguration* class provides the ability to define the configuration for fetching records from the associatedServiceNow table.

This class only contains a single function (constructor), FetchConfiguration().

Properties

Name	Type	Description
filter	Filter	Query to use to filter the return results.
limit	Integer	Number of records per page/response to return.
queryParams	QueryParams	Iterable structure that contains name-value pairs of request query parameters.
readConfiguration	FieldReadConfiguration	Configuration for the fields to return in the response.

FetchConfiguration - FetchConfiguration(filter: Filter? = null, limit: Int? = null, readConfiguration: FieldReadConfiguration? = null)

Enables you to define the records and fields to return from the associated ServiceNow table.

Parameters

Name	Type	Description
filter	Filter	Optional. Query to use to filter the records that are returned from the table. For example: `active=true^short_descriptionLIKEbroken` Default: null - Return all records.
limit	Integer	Optional. Number of records to return per page/ response. Default: null - Return the maximum allowed by the ServiceNow REST API.
readConfiguration	FieldReadConfiguration	Optional. Configuration of the fields returned in the response. Default: null - Return all fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call this function.

```
nowTableService.records("incident", FetchConfiguration(
  filter = Filter("active=true"),
  limit = 10,
  readConfiguration = FieldReadConfiguration(
    includeFields = listOf("sys_id", "short_description")
  )
))
```

FieldReadConfiguration class - Android

The *FieldReadConfiguration* class provides the ability to define what fields to return or not return in a response record.

Properties

Name	Type	Description
includeFields	Collection <String>	Fields to return in the response.
queryItems	Map <String, String>	Read-only. Collection of query items representing the read configuration.
queryParams	QueryParams	Iterable structure that contains name-value pairs of request query parameters. Use these parameters to build a request.

FieldReadConfiguration - FieldReadConfiguration(includeFields: Collection<String> = listOf(), vararg options: FieldReadConfiguration.Options)

Defines the fields to include in the return response from the associated ServiceNow table.

Parameters

Name	Type	Description
includeFields	Collection<String>	List of comma-separated fields to return in the response. If the list is empty, all fields are returned.
vararg options	FieldReadConfiguration.Options	Optional. Array of zero or more options that define the type of field information to return. Possible values: • ACTUAL_VALUES: Include the field's actual value in the response. • DISPLAY_VALUES: Include the field's display value in the response. • EXCLUDE_REFERENCE_LINK: Exclude the *Table* API links for the reference fields.

The following code example shows how to call this function.

```
val readConfiguration = FieldReadConfiguration(
  includeFields = listOf("sys_id", "sys_created_on",
 "short_description"),
  options =
 arrayOf(FieldReadConfiguration.Options.DISPLAY_VALUES)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
)
val fetchConfiguration = FetchConfiguration(
  filter = Filter("active=true"),
  readConfiguration = readConfiguration
)
val response = nowTableService.records("incident",
 fetchConfiguration).execute()
handleResponse(response)
```

FieldWriteOptions structure - Android

The *`FieldWriteOptions`* class provides functions that set the options for updating or creating fields in a record on a ServiceNow instance.

Properties

Name	Type	Description
queryItems	Map <String, String>	Collection of request query items that represent the write options.

FieldWriteOptions - FieldWriteOptions(vararg options: FieldWriteOptions.Options)

Sets the options for writing or creating fields in a record on your ServiceNow instance.

Parameters

Name	Type	Description
vararg options	FieldWriteOptions.Options	Options to set when creating or writing to fields. Valid values: • TREAT_INPUT_VALUES_AS_DISPLAY_VALUES: Specified field values should be saved as the display values. If this value isn't set to `true`, the passed values are assumed to be the actual field values. • SUPPRESS_AUTO_SYS_FIELD: Suppress auto-generation of system fields.

The following code example shows how to call this function.

```
// Update assigned_to field using actual value (syd_id of user)
val response = runCatching {
    getNowTableService()?.updateRecord("sys_id_of_record",
 "sn_customerservice_case", mapOf("assigned_to" to
 "<sys_id_of_user>"))?.execute()
}

// Update assigned_to field using display value
val fieldWriteOptions =
 FieldWriteOptions(FieldWriteOptions.Options.TREAT_INPUT_VALUES_
AS_DISPLAY_VALUES)
val response = runCatching {
    getNowTableService()?.updateRecord("sys_id_of_user",
 "sn_customerservice_case", mapOf("assigned_to" to "John
 Doe"))?.execute()
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter API - Android

The `Filter` class provides the ability to configure filters that define the data to return in the return results of a REST endpoint query.

Properties

Name	Type	Description
queryItems	Map<String, String>	Collection of query items representing the filter.

Filter - Filter(conditions: List<Condition>, keywords: String? = null, sortBy: List<Sort>? = null)

Creates a filter based on specific keywords and conditions that can be OR'd or AND'd together.

Parameters

Name	Type	Description
conditions	List<Condition>	Simple or compound conditions to add to the query. Possible conditions: • BooleanSimpleCondition: Conditions available for boolean record fields. • DateSimpleTimeCondition: Conditions available for date-time record fields. • EmailSimpleCondition: Conditions available for email fields. • IntegerChoiceSimpleCondition: Conditions available for integer choice fields. • NumericSimpleCondition: Conditions available for various numeric fields. • ReferenceSimpleCondition: Condition operators available for reference record fields. • StringChoiceSimpleCondition: Condition operators available for choice record fields containing strings. • StringSimpleCondition: Condition operators available for string record fields. • CompoundCondition: Allows you to group SimpleConditions into a compound condition using ConditionUtils.CompoundOperator connectors.
keywords	String	Optional. Any specific word or phrase to search for. Default: nil - No specific word search.
sortBy	List<Sort>	Optional. List of record field names and the associated sort order constant to sort the returned records by. For example: `val sortBy = listOf("zipcode", ORDER_DESC)` If you include multiple sort fields, each subsequent field is a further sort of the prior field(s). Valid sort values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• ORDER_ASC: Sort ascending • ORDER_DESC: Sort descending Default: ORDER_ASC

Returns

Type	Description
None	

```
// Where the record is active

val condition1 = BooleanSimpleCondition.conditionIs("active",
 true)

// AND the date value of the SLA due field is on "today" or any
 date after today.

val condition2 = DateSimpleTimeCondition.atOrAfter("sla_due", 0,
 ConditionUtils.DateTimeValueOperator.daysAgoStart)

val filter = Filter(conditions = listOf(condition1, condition2))
```

Filter - Filter(criteriaList: List<Criteria>, sortBy: List<Sort>? = null)

Creates a filter based on one or more filter criteria that are OR'd together.

Parameters

Name	Type	Description
criteriaList	List<Criteria>	Top level criteria conditions to group with `OR` connectors.
sortBy	List<Sort>	Optional. List of record field names and the associated sort order constant to sort the returned records by. For example: `val sortBy = listOf("zipcode", ORDER_DESC)` If you include multiple sort fields, each subsequent field is a further sort of the prior field(s). Valid sort values: • ORDER_ASC: Sort ascending • ORDER_DESC: Sort descending Default: ORDER_ASC

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
val activeIncidents =
 BooleanSimpleCondition.conditionIs("active", true)
val assignedToEmpty =
 StringSimpleCondition.isEmpty("assigned_to")
val assignedToAbel =
 StringSimpleCondition.conditionIs("assigned_to", "Abel Tuter")
val assignedToAbelOrEmpty =
 CompoundCondition(ConditionUtils.CompoundOperator.OR,
 listOf(assignedToEmpty, assignedToAbel))
val needToReassign =
 Criteria().addConditions(listOf(activeIncidents,
 assignedToAbelOrEmpty))
val highEscelations =
 StringSimpleCondition.conditionIs("escalation", "2")
val overdueEscelations =
 StringSimpleCondition.conditionIs("escalation", "3")
val highOrOverdueEscelations =
 CompoundCondition(ConditionUtils.CompoundOperator.OR,
 listOf(highEscelations, overdueEscelations))
val needToHandleEscalation =
 Criteria().addCondition(highOrOverdueEscelations)
val myPrioritiesForTodayFilter = Filter(listOf(needToReassign,
 needToHandleEscalation))
```

NotSupportedPushError class - Android

A function from the *`NotSupportedPushError`* class is thrown when the NowPushSDK cannot process the push notification request. When this type of error is thrown, you must parse and handle the push notification outside of the MobileSDK framework.

Properties

Name	Type	Description
cause	Throwable	Cause of the error.
message	String	Message that contains the error details to display to the user.

NowAnalyticsSDK interface - Android

The *`NowAnalyticsSDK`* interface provides functions that enable you to configure analytics properties, user settings, and events for managing a collection of user analytics data.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration to associate with the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowAnalyticsSDK - addEvent(eventName: String)

Adds an application event, such as a user reaching a specific level or screen. These events appear on the dashboard in the order that they occurred.

Parameters

Name	Type	Description
named eventName	String	Name of the event to add.

Returns

Type	Description
None	

The following code example shows how to call this function to add an application event.

```
// Add event
NowAnalyticsSDK.getAnalyticsService().addEvent("Successful
 Login")
```

NowAnalyticsSDK - addEvent(eventName: String, props: MutableMap<String, Any>)

Adds an application event, such as a user reaching a specific level or screen, and enables the setting of custom properties on the event. These events appear on the dashboard in the order that they occurred.

Parameters

Name	Type	Description
eventName	String	Name of the event to add.
props	MutableMap	Custom property key-value pairs for the event. The total size of the event name, property key and value cannot exceed 300 bytes per property. Properties that exceed this limit are ignored. Property keys may not contain dot ('.') or dollar ('$') signs, if they do, they are trimmed. Strings are UTF-8 encoded. Supported value types: • Integer • Double • Float • String • Url • Boolean • Date

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this function to add an application event that includes custom properties for the event.

```
// Add event with properties
NowAnalyticsSDK.getAnalyticsService().addEvent("Open Case",
  mutableMapOf(
    "Screen Name" to "Case",
    "Case Number" to 123,
    "Case Priority" to 5
  )
)
```

NowAnalyticsSDK - addScreenAction(actionName: String)

Adds a custom action. These actions appear in the user dashboard as part of the session data and describes a screen change in an application.

Parameters

Name	Type	Description
actionName	String	Name of the action to add to the screen, such as `MyButtonClick`.

Returns

Type	Description
None	

The following code example shows how to call this function to add a custom action to the current screen.

```
// Add a custom action to the current screen
NowAnalyticsSDK.getAnalyticsService().addScreenAction("MyButtonC
lick")
```

NowAnalyticsSDK - appendToUserProperty(propertyName: String, item: String)

Appends the specified item to the specified user property list.

Parameters

Name	Type	Description
propertyName	String	Name of the user property to append the list item to.
item	String	List item to append to the property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this function to append a case to the specified list.

```
// Append handled case to list
NowAnalyticsSDK.getAnalyticsService().appendToUserProperty("Case
 Identifiers", "TASK-1")
```

NowAnalyticsSDK - configure(instanceURL: URL, configureCallbacks: ConfigureCallbacks?)

Configures the specified ServiceNow instance URL and callbacks to NowAnalytics.

Once this method is called, the actual configuration is fetched from the associated ServiceNow instance and synced automatically.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance to associate with the NowAnalyticfs service.
configureCallbacks	ConfigureCallbacks	Optional. Callback to execute whenever there is an error communicating to the ServiceNow instance. This callback can be called at any point in time and can be called multiple times for multiple reasons.

Returns

Type	Description
None	

The following code example shows how to call this function to configure the specified instance.

```
// Init NowAnalytics after NowSDK is initialized
NowAnalyticsSDK.getAnalyticsService().configure(URL("https://
my.instance.service-now.com"),
  // Optional - pass callback
  object: ConfigureCallbacks {
    override fun onFail(e: Exception) {
      // configuration failed
    }

    override fun onSuccess() {
      // configuration succeeded
    }
  }
)
```

NowAnalyticsSDK - deleteCurrentUserData()

Deletes all local and remote data for the current user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method also unsets the current active user and opts this device out of future analytics tracking.

Note: This method performs a synchronous call to the SNAnalytics servers. It is therefore recommended that you perform this on a side thread.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the deletion was successful. Possible values: • true: Deletion was successful. • false: Deletion failed. Failure may occur if the SNAnalytics servers cannot be reached, such as when there is no connectivity. The method should be retried.

The following code example shows how to call this function to delete the current user's data.

```
// Delete user data
NowAnalyticsSDK.getAnalyticsService().deleteCurrentUserData()
```

NowAnalyticsSDK - getTrackingConsent()

Returns the current user's consent response to analytics tracking.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the current user consented to having their data collected. Possible values: • true: User agreed to having their data collected. • false: User opted out of having their data collected.

The following code example shows how to call this function to request the current user's consent response to analytics tracking.

```
// Get the current user tracking consent value
val curUserConsent =
 NowAnalytics.sharedAnalyticsService.getTrackingConsent()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowAnalyticsSDK - incUserProperty(propertyName: String, value: Double)

Increments or decrements the value of the specified numeric property by the specified value.

Parameters

Name	Type	Description
propertyName	String	Name of the user property to increment.
value	Double	Value to increment the property by. Enter a negative value to decrement the value.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
// Increment numeric_property_name by one
NowAnalyticsSDK.getAnalyticsService().incUserProperty("numeric_p
roperty_name", 1.0)

// Decrement numeric_property_name by one
NowAnalyticsSDK.getAnalyticsService().incUserProperty("numeric_p
roperty_name", -1.0)
```

NowAnalyticsSDK - installJavascriptInterface(webView: WebView)

Enables the calling of javaScript.SNMobileAnalytics methods from within a {@link android.webkit.WebView}, using JavaScript.

Parameters

Name	Type	Description
webView	WKWebView	The {@link android.webkit.WebView} to attach to.

Returns

Type	Description
None	

The following code example shows how to call this function to enable the calling of javaScript.SNMobileAnalytics methods.

```
// Register JS object inside the web page
// This creates an object called 'SNMobileAnalytics' on JS that
 has the following methods:
// SNMobileAnalytics.setUserId(userId)
//   example: SNMobileAnalytics.setUserId("John Doe")
// SNMobileAnalytics.startScreen(screenName)
//   example: SNMobileAnalytics.startScreen("WelcomeScreen")
// SNMobileAnalytics.addScreenAction(actionName)
//   example: SNMobileAnalytics.addScreenAction("MyButtonClick")
// SNMobileAnalytics.addEvent(eventName, properties)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//   example: SNMobileAnalytics.addEvent("Successful Login")
//
SNMobileAnalytics.addEvent("Successful Login",
 JSON.stringify({"Screen Name": "Case", "Case Number": "123",
 "Case Priority": 5}))
NowAnalyticsSDK.getAnalyticsService().installJavascriptInterface
(webView)
```

NowAnalyticsSDK - removeUserProperty(propertyName: String)

Deletes the specified property for the current user.

Parameters

Name	Type	Description
propertyName	String	Name of the user property to delete.

Returns

Type	Description
None	

The following code example shows how to call this function to remove the "Temp Cases" property.

```
// Remove unnecessary property
NowAnalyticsSDK.getAnalyticsService().removeUserProperty("Temp
 Cases")
```

NowAnalyticsSDK - setListener(nowAnalyticsListener: NowAnalyticsListener?)

Sets a listener on the NowAnalytics' events such as session changes and automatic screen detections.

Note: Every time you call this method, the listener is overridden.

Parameters

Name	Type	Description
nowAnalytics Listener	NowAnalytics Listener	The interface that NowAnalytics notifies for session events. • onNowAnalyticsScreenDetected: Called when NowAnalytics automatically detects a screen. • onNowAnalyticsSessionEnded: Called after a session ends. • onNowAnalyticsSessionEnding: Called just before a session is about to finish, allowing you to prevent the session from ending. • onNowAnalyticsSessionStarted: Called when a session has started. • onNowAnalyticsSessionStarting: Called just before a session is about to start, allowing you to prevent the session from being started.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this function to set the *NowAnalyticsListener()*.

```
// From anywhere in the code you can register the delegate
NowAnalyticsSDK.getAnalyticsService().setListener(NowAnalyticsLi
stener())
```

NowAnalyticsSDK - setTrackingConsent(consentGiven: Boolean)

Sets the current user's consent response to analytics tracking.

Parameters

Name	Type	Description
consentGiven	Boolean	Flag that indicates the current user's consent for analytics tracking. Valid values: • true: User consented to having their data tracked. • false: User opted out of having their data tracked.

Returns

Type	Description
None	

The following code example shows how to call this function to set the current user's consent response to analytics tracking.

```
// Enable tracking consent
NowAnalyticsSDK.getAnalyticsService().setTrackingConsent(true)
```

NowAnalyticsSDK - setUserId(userId: String)

Sets the application-specific user identifier. Pass nil to log the current user out.

Parameters

Name	Type	Description
userId	String	Unique application-specific user identifier. This identifier is used to aggregate reports for that user in the dashboard.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call this function to set the application-specific user identifier to "John Doe".

```
// Set User Id for proper identification
NowAnalyticsSDK.getAnalyticsService().setUserId("John Doe")
```

NowAnalyticsSDK - setUserProperties(userProperties: MutableMap<String, Any>)

Sets multiple properties with the specified values for the current user. Properties can be anything that you want to track on the dashboard for a user.

To set the current user, call the NowAnalyticsSDK - setUserId(userId: String) function.

Parameters

Name	Type	Description
userProperties	MutableMap	Key-value pairs of the user properties to set. Supported value types: • Number • Strings • Date • URL • Null

Returns

Type	Description
None	

The following code example shows how to call this function to set multiple properties for the current user.

```
// Add several properties at once
NowAnalyticsSDK.getAnalyticsService().setUserProperties(
  mutableMapOf(
    "Cases Handled" to 100,
    "Last Login" to Date(),
    "Is Remote" to true,
    "Profile URL" to URL("https://www.servicenow.com")
  )
)
```

NowAnalyticsSDK - setUserProperty(propertyName: String, propertyValue: Any)

Sets the specified property with the specified value for the current user. Properties can be anything that you want to track on the dashboard for a user.

To set the current user, call the NowAnalyticsSDK - setUserId(userId: String) function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
propertyName	String	Name of the user property to set.
value	Any	Value to set the user property to. Supported value types: • Number • Strings • Date • URL • Null

Returns

Type	Description
None	

The following code example shows how to call this function to set the property "Role" to "Admin" for the current user.

```
// Set the "Role" property of the user to "Admin"
NowAnalyticsSDK.getAnalyticsService().setUserProperty("Role",
 "Admin")
```

NowAnalyticsSDK - startScreen(screenName: String)

Logs the time when the associated screen first appears in the UI.

You typically call this method from the activity's *`onResume()`* method.

Parameters

Name	Type	Description
named screenName	String	Name of the screen to log the start time for, such as `WelcomeScreen`. This can be anything that you want to define as a screen and display/aggregate on an analytics dashboard.

Returns

Type	Description
None	

The following code example shows how to call this function to set the start time of the display of the "WelcomeScreen".

```
// Mark the appearance starting time of a screen
// This method should be usually called from the onResume()
 method
NowAnalyticsSDK.getAnalyticsService().startScreen("WelcomeScree
n")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowAPIService interface - Android

The *NowAPIService* interface provides the ability to perform requests on a specified ServiceNow REST API.

Note: Guest users only work for the *NowAPIService* interface if the REST API being accessed is configured for guest users.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Service configuration to associate with the protocol.

NowAPIService - data(endpoint: NowAPIService.Endpoint, queryParams: QueryParams, headers: Headers, body: String)

Calls the specified REST API on the specified ServiceNow instance.

Parameters

Name	Type	Description
endpoint	NowAPIService.Endpoint	REST endpoint to call.
queryParams	QueryParams	Optional. Query parameter object that contains the query parameters to pass in the REST call. Default: null
headers	Headers	Optional. Headers object that contains the headers to pass in the REST call. Default: null
body	String	Optional. Object that contains the request body and content type to pass into the REST call. Default: null

Returns

Type	Description
Call<ByteArray>	Return results from the called REST endpoint.

```
suspend fun loadCases(): List<CaseItem> =
 withContext(Dispatchers.IO) {
  val apiService = nowServiceManager.getNowAPIService()

  val result = runCatching {
    val response = apiService.data(NowAPIService.Endpoint(
      relativePath = CASES_API,
      requestMethod = HttpMethod.GET,
      requireAuth = true)
    ).execute()
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    val byteArray = response.body ?: throw Exception("Null
 Result")
    val buffer = Buffer()
    val reader = JsonReader.of(buffer.write(byteArray))
    val listType = Types.newParameterizedType(
      List::class.java,
      CaseItem::class.java
    )

    val resultType = Types.newParameterizedType(
      ResultResponse::class.java,
      listType
    )
    val adapter =
 moshi.adapter<ResultResponse<List<CaseItem>>>(resultType)
    adapter.fromJson(reader)
  }

  if (result.isSuccess) {
      result.getOrNull()?.result ?: throw Exception("Cases not
 in response")
  } else {
      throw result.exceptionOrNull() ?: Exception("Error Cases")
  }
}
```

NowAttachment class - Android

The *NowAttachment* class provides an object that contains an attachment and its associated metadata.

Properties

Name	Type	Description
data	Data	Attachment data/file.
metadata	NowAttachmentMetadata	Metadata associated with the attachment.

NowAttachmentMetadata class - Android

The *NowAttachmentMetadata* class provides functions that enable you to encode and manage attachment metadata.

NowAttachmentMetadata Properties

Name	Type	Description
averageImageColor	String	Most dominant color in the associated image.
chunkSizeInBytes	Integer	If the attachment is too large to be transferred in a single packet, the maximum of bytes (chunk) of the attachment file to send in an individual packet. Unit: Bytes
compressedSize InBytes	Integer	Compressed size of the attachment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowAttachmentMetadata Properties (continued)

Name	Type	Description
		Unit: Bytes
created	Date	Date on which the attachment was created.
createdBy	String	Entity that created the attachment.
download	URL	Full download URL of the attachment associated with the metadata.
fileName	String	Name of the attachment file.
hash	String	Expected SHA256 digest for the attachment. A downloaded attachment is validated by comparing its computed digest to this SHA256 digest.
imageHeight	Integer	Height of image. Unit: Pixels
imageWidth	Integer	Width of image. Unit: Pixels
isCompressed	Boolean	Flag that indicates whether the attachment file is compressed. Possible values: • true: Attachment is compressed. • false: Attachment in not compressed.
mimeType	String	Attachment MIME type.
modificationCount	Integer	Number of times that the attachment was modified.
sizeInBytes	Integer	Size of the attachment. Unit: Bytes
sourceSysId	String	Sys_id of the attachment record to which the metadata is associated.
sourceTableName	String	Name of the source table in which the attachment resides.
state		Availability state. Valid values: • AVAILABLE • CONDITIONALLY • PENDING • UNAVAILABLE
sysId	String	Unique 32-character Globally Unique ID (GUID), that identifies each record in a ServiceNow instance.
tags	String	List of tags associated with the attachment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowAttachmentMetadata Properties (continued)

Name	Type	Description
updated	Date	Date on which the attachment was last modified.
updatedBy	String	Entity that updated the attachment.

NowAttachmentMetadata - NowAttachmentMetadata(sysId: String, fileName: String, mimeType: String, _isCompressed: String, _sizeInBytes: String, _compressedSizeInBytes: String, _chunkSizeInBytes: String, _modificationCount: String, created: Date, createdBy: String, updated: Date, updatedBy: String, download: String?, hash: String, state: NowAttachmentMetadata.State, averageImageColor: String, _imageWidth: String, _imageHeight: String, sourceTableName: String, sourceSysId: String, tags: String)

Class returned by `NowAttachement` class. This object is Parcelable.

Parameters

Name	Type	Description
sysId	String	Unique 32-character Globally Unique ID (GUID), that identifies each record in a ServiceNow instance.
fileName	String	Name of the attachment file.
mimeType	String	Attachment MIME type.
isCompressed	Boolean	Flag that indicates whether the attachment file is compressed. Possible values: • true: Attachment is compressed. • false: Attachment in not compressed.
sizeInBytes	Integer	Size of the attachment. Unit: Bytes
compressedSizeInBytes	Integer	Compressed size of the attachment. Unit: Bytes
chunkSizeInBytes	Integer	If the attachment is too large to be transferred in a single packet, the maximum of bytes (chunk) of the attachment file to send in an individual packet. Unit: Bytes
modificationCount	Integer	Number of times that the attachment was modified.
created	Date	Date on which the attachment was created.
createdBy	String	Entity that created the attachment.
updated	Date	Date on which the attachment was last modified.
updatedBy	String	Entity that updated the attachment.
download	URL	Full download URL of the attachment associated with the metadata.
hash	String	Expected SHA256 digest for the attachment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		A downloaded attachment is validated by comparing its computed digest to this SHA256 digest.
state		Availability state. Valid values: • AVAILABLE • CONDITIONALLY • PENDING • UNAVAILABLE
averageImageColor	String	Most dominant color in the associated image.
imageWidth	Integer	Width of image. Unit: Pixels
imageHeight	Integer	Height of image. Unit: Pixels
sourceTableName	String	Name of the source table in which the attachment resides.
sourceSysId	String	Sys_id of the attachment record to which the metadata is associated.
tags	String	List of tags associated with the attachment.

Returns

Type	Description
sysId (SysIdentifiable)	Unique 32-character GUID of the associated metadata record.

NowAttachmentService interface - Android

The `NowAttachmentService` interface provides functions that enable the manipulation of file attachments and their associated metadata.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration to associate with the service.

NowAttachmentService - attachment(sysId: String, validateAttachment: Boolean = true)

Retrieves the attachment with the specified sys_id and optionally validates the attachment by comparing the computed hash of the attachment to the expected hash.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sysId	String	Sys_id of the attachment to retrieve. This is the sys_id for the attachment on your ServiceNow instance.
validateAttachment	Boolean	Flag that indicates whether to validate the attachment. Valid values: • true: Validate the attachment. • false: Do not validate the attachment. Default: true

Returns

Type	Description
Call<NowAttachment>	NowAttachment object that contains the requested attachment.

```
fun getAttachment(sysId: String, isValidateAttachment: Boolean)
 {
  val call = attachmentService.attachment(sysId,
 isValidateAttachment)
  call.enqueue(
    { response ->
      val attachment: NowAttachment? = response.body
    },
      { nowDataError -> handleError(nowDataError) }
  )
}
```

NowAttachmentService - attachmentMetadata(sysId: String)

Retrieves the metadata for the attachment associated with the specified sys_id.

Parameters

Name	Type	Description
sysId	String	Sys_id of the attachment whose metadata you want to retrieve.

Returns

Type	Description
Call<NowAttachmentMetadata>	Object that contains the metadata for the specified attachment.

```
fun fetchMetadata(sysId: String) {
  val call = attachmentService.attachmentMetadata(sysId)
  call.enqueue(
    { response ->
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      val metadata: NowAttachmentMetadata? = response.body
    },
    { nowDataError -> handleError(nowDataError) }
  )
}
```

NowAttachmentService - attachmentMetadata(filter: Filter? = null, limit: Int? = null)

Retrieves the metadata for all the attachments that meet the specified criteria.

Parameters

Name	Type	Description
filter	Filter	Optional. Query string to use to filter the attachments whose metadata to return. Default: null - Returns metadata for all available attachments. Takes into consideration the *limit* parameter.
limit	Integer	Optional. Maximum number of attachment file's metadata to return. Default: null - Returns all metadata that meets the *filter* parameter specifications.

Returns

Type	Description
Call<List <NowAttachmentMetadata>>	List of objects that contain the metadata for the matching attachments.

```
fun fetchMultipleMetadata(filterQuery: String, limit: Int) {
  val call =
 attachmentService.attachmentMetadata(Filter(filterQuery),
 limit)
  call.enqueue(
    { response ->
      val metadataList: List<NowAttachmentMetadata>? =
 response.body
    },
    { nowDataError -> handleError(nowDataError) }
  )
}
```

NowAttachmentService - attachmentMetadataPaginator(filter: Filter? = null, limit: Int? = null)

Retrieves the metadata for all the attachments that meet the specified criteria and creates a paginator for iterating through the pages of the returned metadata.

You can use this paginator to navigate through the returned metadata, performing navigation operations such as fetching the first, last, previous, or next page, or checking whether there is next or previous page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
filter	Filter	Optional. Query string to use to filter the attachments whose metadata to return. Default: null - Returns metadata for all available attachments. Takes into consideration the *limit* parameter.
limit	Integer	Optional. Maximum number of attachment file's metadata to return. Default: null - Returns all metadata that meets the *filter* parameter specifications.

Returns

Type	Description
Paginator <NowAttachmentMetadata>	Success: Paginator object along with the specified pages of metadata. Failure: NowDataError object.

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val filterQuery: String = "content_type=text/plain"
  val filter = filterQuery.let(::Filter)
  val limit = 10
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(filter, limit)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")
}
```

NowAttachmentService - delete(sysId: String)

Deletes the attachment with the specified sys_id.

Parameters

Name	Type	Description
sysId	String	Sys_id of the attachment to delete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Call<ByteArray>	Success: Nothing is returned. Failure: NowDataError returned.

```
fun deleteAttachment(sysId: String) {
  val call = attachmentService.delete(sysId)
  call.enqueue(
    { response -> handleResponse(response) },
    { nowDataError -> handleError(nowDataError) }
  )
}
```

NowAttachmentService - upload(data: ByteArray, configuration: NowAttachmentUploadConfiguration)

Retrieves the metadata for all the attachments that meet the specified criteria and creates a paginator for iterating through pages of the returned metadata.

Parameters

Name	Type	Description
data	ByteArray	Metadata to upload and associate with the attachment specified in the configuration object.
configuration	NowAttachmentUploadConfiguration	Upload configuration parameters.

Returns

Type	Description
NowAttachmentMetadata	Uploaded metadata.

```
fun uploadAttachment(tableName: String, recordSysId: String,
 fileName: String) {
  val bitmap = BitmapFactory.decodeResource(resources,
 R.drawable.test_image)
  val data = bitmap.compress(ImageType.JPEG)
  val contentType = "image/jpg"
  val config = NowAttachmentUploadConfiguration(tableName,
 recordSysId, fileName, contentType)
  val call = attachmentService.upload(data, config)

  call.enqueue(
    { response ->
      val uploadedAttachmentMetadata: NowAttachmentMetadata? =
 response.body
    },
    { nowDataError -> handleError(nowDataError) }
  )
}
```

NowChatConfiguration - Android

The *NowChatConfiguration* class enables you to configure options on a chat session, such as showing a prompt before closing a chat window, disabling features while using chat, applying different conversation options when using chat, and configuring UI components in NowChat.

NowChatConfiguration - AttachmentUploadButton(isVisible: Boolean = true)

Defines the UI configurations to apply to the upload attachment button that appears next to the text input while talking with a live agent.

AttachmentUploadButton is a subclass of the *NowChatConfiguration* class.

Parameters

Name	Type	Description
isVisible	Boolean	Flag that indicates the visibility of the upload attachment button. Valid values: • true: Upload attachment button is visible. • false: Upload attachment button is hidden. Default: true

Returns

Type	Description
Object	UI configuration object.

The following code example shows how to hide the AttachmentUploadButton.

```
suspend fun launchChat() {
  val chatService = getNowChatService()

  val chatConfiguration = NowChatConfiguration(
    uiConfiguration = NowChatConfiguration.UIConfiguration(
      attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible = false)
    )
  )

  chatService?.start(activity, chatConfiguration)
}
```

NowChatConfiguration - CloseButton(icon: Drawable?)

Defines the configuration of the close button used for back navigation on the NowChat toolbar. You then pass this object into the *NowChatConfiguration()* method to configure the close button to use within the chat session.

CloseButton() is a subclass of the *NowChatConfiguration* class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
icon	Drawable?	Drawable object to use for the close (back) button. You can use the *ContextCompat.getDrawable()* method to obtain this drawable object. For example: `val myDrawable = ContextCompat.getDrawable(activity, R.drawable.my_drawable)` To use the default drawable, pass null. Default: NowChat back button

Returns

Type	Description
Object	Close button configuration object.

The following code example shows how to set a custom icon for the close button on the NowChat toolbar.

```
suspend fun launchChat() {
  val chatService = getNowChatService()

  //Drawable to use instead of the default NowChat back button.
  val myDrawable = ContextCompat.getDrawable(activity,
 R.drawable.my_drawable)

  val chatConfiguration = NowChatConfiguration(
    uiConfiguration = NowChatConfiguration.UIConfiguration(
      closeButton = NowChatConfiguration.CloseButton(
        icon = myDrawable
      )
    )
  )

  chatService?.start(activity, chatConfiguration)
}
```

NowChatConfiguration - UIConfiguration(closeButton: CloseButton? = null, attachmentUploadButton: AttachmentUploadButton? = null)

Creates and returns a UIConfiguration object based on the passed parameters. You then pass this object into the *NowChatConfiguration()* constructor to configure UI components in NowChat.

UIConfiguration is a subclass of the *NowChatConfiguration* class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
closeButton	CloseButton?	Configuration for the `CloseButton` that appears on the NowChat toolbar and is used for back navigation. Call the NowChatConfiguration - CloseButton(icon: Drawable?) subclass to define the value of this parameter. For example: `val chatConfiguration = NowChatConfiguration( uiConfiguration = NowChatConfiguration.UIConfiguration( closeButton = NowChatConfiguration.CloseButton( icon = myDrawable ) )`
attachmentUploadButton	AttachmentUploadButton?	Configuration for the `AttachmentUploadButton` that is shown next to the text input while talking with a live agent. Call the NowChatConfiguration - AttachmentUploadButton(isVisible: Boolean = true) subclass to define the value of this parameter. For example: `val chatConfiguration = NowChatConfiguration( uiConfiguration = NowChatConfiguration.UIConfiguration( attachmentUploadButton = NowChatConfiguration.AttachmentUploadButton(isVisible = false) ) )`

Returns

Type	Description
Object	UI configuration object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call the *UIConfiguration* subclass to set the icon for the closeButton and to hide the attachment upload button.

```
suspend fun launchChat() {
  val chatService = getNowChatService()

  //Drawable to use instead of the default NowChat back button.
  val myDrawable = ContextCompat.getDrawable(activity,
 R.drawable.my_drawable)

  val chatConfiguration = NowChatConfiguration(
    uiConfiguration = NowChatConfiguration.UIConfiguration(
      closeButton = NowChatConfiguration.CloseButton(
        icon = myDrawable
      ),
      attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible = false)
    )
  )

  chatService?.start(activity, chatConfiguration)
}
```

NowChatConfiguration - NowChatConfiguration(closePrompt: ClosePrompt? = null, disabledFeatures: List<Feature>? = null, conversationOptions: List<ConversationOption>? = null, uiConfiguration: UIConfiguration? = null)

Configures options for the current chat session. This method enables you to show a prompt before closing a chat window, disable features while using chat, apply different conversation options when using chat, and configure UI components in NowChat.

Parameters

Name	Type	Description
closePrompt	ClosePrompt object	Prompt to display before closing the associated chat window. Call the *NowChatConfiguration.ClosePrompt()* subclass to define the value of this parameter. For example: `closePrompt = NowChatConfiguration.ClosePrompt( header = null, message = "Are you sure you want to leave?", acceptButtonTitle = "Yes", declineButtonTitle = "No" )` If you don't want to display a close prompt, pass null.
disabledFeatures	List<NowChatConfiguration.Feature>	List of chat features to disable within the current chat session. Valid value:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		START_NEW_CONVERSATION: Hide/disable the **StartNew Conversation** button that appears in a chat window. The available chat features are defined in the *NowChatConfiguration.Feature* enum class. For example: `disabledFeatures = listOf(NowChatConfiguration.Feature.START_NEW_CONVERSATION)` If you don't want to disable any features, pass null.
conversationOptions	List<ConversationOption>?	List of conversation options to apply to NowChat. Valid values: • END_CONVERSATION_ON_EXIT: Ongoing conversation is terminated when exiting the NowChat window. • FORCE_NEW_CONVERSATION: Forces a new chat conversation when NowChat starts. The available conversation options are defined in the *NowChatConfiguration.ConversationOption* enum class. For example: `conversationOptions = listOf(NowChatConfiguration.ConversationOption.FORCE_NEW_CONVERSATION),` If you don't want to apply any options, pass null.
uiConfiguration	UIConfiguration?	UIConfiguration values to use to configure UI components in NowChat. Valid values: • *attachmentUploadButton*: Configuration for the `AttachmentUploadButton` that is shown next to the text input while talking with a live agent. • *closeButton*: Configuration for the `CloseButton` used for back navigation on the NowChat toolbar. For example: `uiConfiguration = NowChatConfiguration.UIConfiguration( closeButton = NowChatConfiguration.CloseButton(`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>icon = myDrawable
		),
		attachmentUploadButton =
		NowChatConfiguration.AttachmentUploadButton(isVisible = false)
		)</pre> To use the default configuration, pass null.

Returns

Type	Description
NowChatConfiguration	Returns a NowChatConfiguration object that you can pass when calling the NowChatService - start(activity: Activity, themeColors: NowChatTheme = object: NowChatTheme{}, contextData: Map<String, Any> = mapOf(), chatConfiguration: NowChatConfiguration? = null) method.

The following code example shows how to call this method.

```
suspend fun launchChat() {
  val chatService = getNowChatService()

  //Drawable to use instead of the default NowChat back button.
  val myDrawable = ContextCompat.getDrawable(activity,
 R.drawable.my_drawable)

  val chatConfiguration = NowChatConfiguration(
    closePrompt = NowChatConfiguration.ClosePrompt(
      header = null,
      message = "Are you sure you want to leave?",
      acceptButtonTitle = "Yes",
      declineButtonTitle = "No"
    ),
    disabledFeatures =
 listOf(NowChatConfiguration.Feature.START_NEW_CONVERSATION),
    conversationOptions =
 listOf(NowChatConfiguration.ConversationOption.FORCE_NEW_CONVERSATION),
    uiConfiguration = NowChatConfiguration.UIConfiguration(
      closeButton = NowChatConfiguration.CloseButton(
        icon = myDrawable
      ),
      attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible = false)
    )
  )

  chatService?.start(activity, chatConfiguration)
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowChatConfiguration - ClosePrompt(header: String, message: String, acceptButtonTitle: String, declineButtonTitle: String)

Creates and returns a ClosePrompt object based on the passed parameters. You then pass this object into the *NowChatConfiguration()* method to configure the close prompt options within the chat session.

Parameters

Name	Type	Description
header	String	Text to display on the prompt's header. If you don't want to display a prompt header, pass null.
message	String	Text to display as the prompt's main text.
acceptButtonTitle	String	Text to display on the prompt's primary button for closing the chat window.
declineButtonTitle	String	Text to display on the prompt's secondary button that dismisses the prompt. If you don't want to display a secondary button, pass null.

Returns

Type	Description
Object	Prompt to display before closing the associated chat window.

The following code example shows how to call this method to configure the close prompt.

```
suspend fun launchChat() {
  val chatService = getNowChatService()

  val chatConfiguration = NowChatConfiguration(
    closePrompt = NowChatConfiguration.ClosePrompt(
      header = null,
      message = "Are you sure you want to leave?",
      acceptButtonTitle = "Yes",
      declineButtonTitle = "No"
    )
  )
  chatService?.start(activity, chatConfiguration)
}
```

NowChatSDK class - Android

The *NowChatService* class provides the function necessary to create a NowChatService that interacts with NowChat. NowChat provides the ability to embed Live Agent and Virtual Agent within your application.

For additional information on Live Agent and Virtual Agent, see Virtual Agent.

NowChatSDK - makeChatService(instanceURL: URL, nowChatSdkCallbacks)

Creates a NowChat service. This is a suspend function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance that the NowChatService should interact with.
nowChatSdkCallbacks	NowChatSdkCallbacks	Callbacks for the host application to use to configure the NowChatService.

Returns

Type	Description
None	

```
@Inject lateinit var sdkSettingsProvider:
 Provider<NowSDKSettings>
@Inject lateinit var chatCallbacks: SampleAppNowChatSDKCallbacks

private fun launchChat() {
  binding.progressBar.visibility = View.VISIBLE

  NowChatSDK.makeChatService(
    URL(sdkSettingsProvider.get().instanceBaseURL),
    chatCallbacks
  ) .onSuccess {
    it.start(this, chatCallbacks.nowChatThemeColors) }
  } .onFailure {
     Log.e("NowChat", "Unable to launch chat: $it")
  }
}
```

NowChatSdkCallbacks interface - Android

The *NowChatSdkCallbacks* interface provides functions that enable callbacks for host applications to configure or handle actions from the NowChatSDK.

Properties

Name	Type	Description
isFileCollectionBlocked	Boolean	Flag that indicates whether the host application should prevent NowChat from opening the file picker. Valid values: • true: Prevent the file picker from opening. • false: Allow the file picker to open.
isGalleryCollectionBlocked	Boolean	Flag that indicates whether the host application should prevent NowChat from opening the photo gallery. Valid values: • true: Prevent the photo gallery from opening. • false: Allow the photo gallery to open.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
isLocationCollectionBlocked	Boolean	Flag that indicates whether the host application should prevent NowChat from accessing geolocation positioning. Valid values: • true: Prevent access to geolocation positioning. • false: Do not prevent access to geolocation positioning.
isPhotoCollection Blocked	Boolean	Flag that indicates whether the host application should prevent NowChat from accessing the camera. Valid values: • true: Prevent access to the camera. • false: Do not prevent access to the camera.

NowChatSdkCallbacks - didEndSessionWithId(sessionId: String)

Called when the chat screen is closed and the chat session ends.

Note: You must define the desired functionality for this callback by overriding the function as the default implementation simply writes the message "Chat session $sessionId ended." in the log.

Parameters

Name	Type	Description
sessionId	String	Sys_id of the session that ended. Table: Conversation Session [sys_cs_session]

Returns

Type	Description
None	

The following code example shows where to place your code to override the default functionality.

```
class SampleNowChatSDKCallbacks : NowChatSdkCallbacks {
  override fun didEndSessionWithId(sessionId: String) {
    Log.i("NowChat", "Chat session $sessionId ended.")
  }

//override other methods

}
```

NowChatSdkCallbacks - loadUri(uri: Uri, context: Context)

Handles the specified URI, such as to open it in a webview, custom tab, or external browser.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
uri	Uri	URI to open.
context	Context	Application context.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
class SampleNowChatSDKCallbacks : NowChatSdkCallbacks {
  override fun loadUri(uri: Uri, context: Context) {

    // Open the uri in a webview
    val webview = WebView(context)
    webview.loadUrl(uri.toString())
  }

  // Override other methods
}
```

NowChatSdkCallbacks - onExit(exitCode: NowChatExitCode)

Sets the result code to return when NowChat is exited.

This callback gets called when that full screen chat is closed and the user is returned back to the host application.

Parameters

Name	Type	Description
exitCode	NowChatExitCode	Reason for exiting NowChat. Valid values: • ChatPluginNotInstalledError: Chat plugin not installed on instance. • SessionInitializationError: Unable to initialize session with instance. • UserExit: User exited using the up button or back button • Unknown: Any unknown reason.

Returns

Type	Description
None	

The following code example shows how to call this function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
class SampleNowChatSDKCallbacks : NowChatSdkCallbacks {

  override fun onExit(exitCode: NowChatExitCode) {
    when (exitCode) {
      NowChatExitCode.UserExit -> Log.i("NowChat", "User exited
 using the up button or back button")
      NowChatExitCode.SessionInitializationError ->
 Log.i("NowChat", "Unable to initialize session with instance")
      NowChatExitCode.ChatPluginNotInstalledError ->
 Log.i("NowChat", " Chat plugin not installed on instance.")
      NowChatExitCode.Unknown -> Log.i("NowChat", "User exited
 for Unknown reason")
    }
  }

  // Override other methods
}
```

NowChatSdkCallbacks - provideProgressView(context: Context)

Returns the view to display when the NowChat UI data is loading; typically a configured indeterminate progress bar.

Parameters

Name	Type	Description
context	Context	Application context to use to create the view.

Returns

Type	Description
View	View that the NowChat service uses when loading.

The following code example shows how to call this function.

```
class SampleNowChatSDKCallbacks : NowChatSdkCallbacks {
  override fun provideProgressView(context: Context): View? {
    return ProgressBar(context).apply {
      indeterminateTintList = ColorStateList.valueOf(
        MaterialColors.getColor(
          context,
          android.R.attr.colorPrimary,
          Color.BLACK)
      )
    }

    // Override other methods
  }
}
```

NowChatService class - Android

The *NowChatService* class provides functions that enable you to launch the NowChat activity and set error configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowChatService - launchIntent(context:Context, nowChatTheme:NowChatTheme):Intent

Launches the intent used to open the NowChat activity. Typically used for creating a `[android.app.PendingIntent]`.

Parameters

Name	Type	Description
context	Context	Context used to build the intent.
nowChatTheme	NowChatTheme	Optional. Theme object to use in the NowChat UI. Default: Default colors

Returns

Type	Description
Intent	Intent and theme colors used to launch the associated NowChat activity.

This example shows how to call the *`launchIntent()`* method and process the return activity.

```
val intent = nowChatService.launchIntent(this)
val pendingIntent = PendingIntent.getActivity(
    this,
    REQUEST_CODE,
    intent,
    PendingIntent.FLAG_IMMUTABLE
)

val notification = createNotification(title, message,
 pendingIntent)
notificationManager.notify(push.notificationId, notification)
```

NowChatService - start(activity: Activity, themeColors: NowChatTheme = object: NowChatTheme{}, contextData: Map<String, Any> = mapOf(), chatConfiguration: NowChatConfiguration? = null)

Launches the specified NowChat activity.

Parameters

Name	Type	Description
activity	Activity	Activity context to use to launch the NowChat activity and to receive the `NowChatExitCode` as a resultCode through the *`onActivityResult`*.
nowChatTheme	NowChatTheme	Optional. Theme object to use in the NowChat UI. Default: Default colors
contextData	Map<String, Any>	Optional. Additional chat context variables to pass into the chat session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For additional information on chat context variables, see Live agent chat context variables.
chatConfiguration	NowChatConfiguration	Optional. ChatConfiguration to apply while using NowChat.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun launchChat() {
    val chatService = getNowChatService()

    val chatTheme = object : NowChatTheme {
        override val brand: Int
            get() = Color.BLUE

        override val textPrimary: Int
            get() = Color.BLACK

        // Override remaining theme colors

    }
    val contextData = mapOf("sys_id" to "123456789", "table" to
 "wm_task")

    //drawable to be used instead of the default NowChat back
 button.
    val myDrawable = ContextCompat.getDrawable(activity,
 R.drawable.my_drawable)

    val chatConfiguration = NowChatConfiguration(
        closePrompt = NowChatConfiguration.ClosePrompt(
            header = null,
            message = "Are you sure you want to leave?",
            acceptButtonTitle = "Yes",
            declineButtonTitle = "No"
        ),
        disabledFeatures =
 listOf(NowChatConfiguration.Feature.START_NEW_CONVERSATION),
        conversationOptions =
 listOf(NowChatConfiguration.ConversationOption.FORCE_NEW_CONVER
SATION),
        uiConfiguration = NowChatConfiguration.UIConfiguration(
            closeButton = NowChatConfiguration.CloseButton(
                icon = myDrawable
            ),
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible = false)
        )
    )

    chatService?.start(activity, chatTheme, contextData,
 chatConfiguration)
}
```

NowChatService - subscribeToUnreadMessageCount(pollingInterval: Long, listener: NowChatUnreadMessagesCountListener)

Subscribes to the unread chat message count listener.

Parameters

Name	Type	Description
pollingInterval	Long	Frequency at which to poll the web service for the unread chat message count. Unit: Milliseconds
listener	NowChatUnreadMessagesCountListener	Listener that you implement to obtain the number of unread chat messages. You must also unsubscribe to this listener when you no longer want to obtain the unread message count using the NowChatService - unsubscribeFromUnreadMessageCount(listener: NowChatUnreadMessagesCountListener) method.

Returns

Type	Description
None	

The following example shows how to subscribe to and unsubscribe from a chat unread message count listener.

```
private val unreadMessageCountListener = object:
 NowChatUnreadMessagesCountListener {
  override fun unreadMessagesCountDidChange(unreadMessageCount:
 Int) {
  }
}

fun setup() {

 nowChatService.subscribeToUnreadMessageCount(pollingInterval:10
00, unreadMessageCountListener)
}

fun teardown() {

 nowChatService.unsubscribeFromUnreadMessageCount(unreadMessageC
ountListener)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
}
```

NowChatService - unsubscribeFromUnreadMessageCount(listener: NowChatUnreadMessagesCountListener)

Unsubscribes from receiving the unread message count.

Parameters

Name	Type	Description
listener	NowChatUnreadMessagesCountListener	Listener that you implement to unsubscribe from the chat unread message count listener.

Returns

Type	Description
None	

The following example shows how to subscribe to and unsubscribe from a chat unread message count listener.

```
private val unreadMessageCountListener = object:
 NowChatUnreadMessagesCountListener {
  override fun unreadMessagesCountDidChange(unreadMessageCount:
 Int) {
  }
}

fun setup() {

 nowChatService.subscribeToUnreadMessageCount(pollingInterval:10
00, unreadMessageCountListener)
}

fun teardown() {

 nowChatService.unsubscribeFromUnreadMessageCount(unreadMessageC
ountListener)
}
```

NowChatService – updateTheme(nowChatTheme: NowChatTheme)

Updates the NowChat UI theme with the specified UI theme. Use this function to update the chat UI theme after it has been initially set using the *`start()`* function, such as when changing the theme from light to dark.

Parameters

Name	Type	Description
nowChatTheme	NowChatTheme	Theme object to use in the NowChat UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to update a light UI theme implemented using the *`start()`* function to the dark UI theme using the *`updateTheme()`* function.

```
val chatService = serviceManager.getNowChatService()

val chatThemeLight = object : NowChatTheme {
    override val backgroundPrimary: Int
        get() = Color.WHITE

    override val textPrimary: Int
        get() = Color.BLACK

    // Override remaining theme colors
}

val chatThemeDark = object : NowChatTheme {
    override val backgroundPrimary: Int
        get() = Color.BLACK

    override val textPrimary: Int
        get() = Color.WHITE

    // Override remaining theme colors
}

//start NowChat with light theme
chatService?.start(activity, chatThemeLight)

//update NowChat theme to dark theme
chatService?.updateTheme(chatThemeDark)
```

NowChatTheme interface - Android

The *`NowChatTheme`* interface defines default colors for the elements in the Live Agent and Virtual Agent chat UI.

The *`NowChatTheme`* interface extends the *`NowUITheme`* interface and inherits the property *`nowUIColoring`*.

```
val nowUIColoring: NowUIColoring?
```

You can modify these default colors and create your own themes for your specific chat implementation.

Properties

Name	Description
alertCritical0	Alert text background. Default value: #F8C8CD

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
alertCritical3	Alert text icon and bar. Default value: #B61C2D
alertCritical4	New message divider. Default value: #891522
alertInfoZero	Highlighting conversation items. Default value: #BDDCF2
alertInfoTwo	Highlighting conversation items. Default value: #0079CC
alertModerate3	Alert and search result icons. Default value: #5D46B6
backgroundPrimary	Neutral background, choice picker, input background, and card background. Default value: #FFFFFF
backgroundPrimaryActionable	Pagination selected, popup background. Default value: #151920
backgroundSecondary	Bottom bar, columns in cards, search background in choice picker. Default value: #F6F6F8
backgroundSecondaryActionable	Clickable input such as search background (15%) or date and time background (100%). Default value: #2C323F
backgroundTertiary	Agent and bot bubble background. Default value: #E4E6EA
backgroundTertiaryActionable	Offline banner background. Default value: #454D5B
boarderTertiary	Chat input boarders Default value: #D3D6DC
brand	Headers Default value: #302F4B
brandBackground	User bubble background.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
	Default value: #D1D2EE
destructive	Destructive action on buttons. Default value: #B61C2D
highlightBlue	Inline citation items. Default value: #D9F4F9
highlightGray	Inline citation item background. Default value: #E8EAEA
linkPrimary	Link on neutral background. For disabled links use 25% opacity with same color. Default value: #3C59E7
linkSecondary	Links on non-neutral (not #FFFFFF) background. Default value: #293D9E
mandatory	Mandatory input field indicator. Default value: #E42338
navigation	Navigation icon background. Default value: #454D58
notification	New message indicator. Default value: #B61C2D
primary	Actionable text and button background. Default value: #4F52BD
screenHeaderText	Text and icon elements with fixed color that appear on top of brand color (screen header). Default value: #FFFFFF
secondary	User's swiping motion. Default value: #1C1D42
separatorSecondary	Divider lines Default value: #B0B5BF
separatorTertiary	Divider lines

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
	Default value: #D3D6DC
shadow	Card shadow (15%) Default value: #151920
textActionable	Text on buttons or highlighted background. Default value: #FFFFFF
textPrimary	Chat bubble text, card header. Default value: #151920
textSecondary	Card content, search bar icon, and text. Default value: #2C323F
textTertiary	Weekday for calendar, placeholder. Default value: #454D5B

NowDataSDK class - Android

The *NowDataSDK* class provides functions that enable the creation and initialization of various features services such as NowGraphQLService, NowAttachmentService, NowTableService, and NowAPIService.

NowDataSDK - makeGraphQLService(instanceURL: URL)

Creates and initializes an instance of the NowGraphQLService feature. This service enables access to the *GraphQL* API on your ServiceNow instance.

For additional information on the ServiceNow GraphQL API, see Query record data using the GraphQL API framework.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance to access. For example, `"https://instance.servicenow.com"`

Returns

Type	Description
Result<NowGraphQLService>	NowGraphQLService object wrapped in a Kotlin Result object.

The following code example shows how to call this function.

```
private var nowGraphQLService: NowGraphQLService? = null
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
/**
  * Create the NowGraphQLService once in the lifetime of the
 application, inside the Application class
  * or another manager class that will be injected into other
 classes via dagger/hilt.
  * NowGraphQLService should be created after initializing the
 NowSDK.
  */
suspend fun getNowGraphQLService(): NowGraphQLService? {
  if (nowGraphQLService != null) return nowGraphQLService

  return
 NowDataSDK.makeGraphQLService(URL("https://
instance-name.service-now.com")).getOrThrow()
    .also { this.nowGraphQLService = it }
}
```

NowDataSDK - makeNowAPIService(instanceURL: URL)

Creates and initializes an instance of the NowAPIService service. This service allows you to access the public REST APIs exposed by your ServiceNow instance.

In addition, you can develop custom scripted REST APIs within your ServiceNow instance and access them within your Android application using the NowAPIService API. For additional information on ServiceNow REST APIs, see Scripted REST APIs.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance to access. For example, `"https://instance.servicenow.com"`

Returns

Type	Description
Result<NowAPIService>	NowAPIService wrapped in a Kotlin Result object.

The following code example shows how to call this function.

```
private var nowApiService: NowAPIService? = null

/**
  * Create the NowAPIService once in the lifetime of the
 application inside the Application class
  * or another manager class that will be injected into other
 classes via dagger/hilt.
  * NowAPIService should be created after initializing the
 NowSDK
  */
suspend fun getNowApiService(): NowAPIService? {
  if (nowApiService != null) return nowApiService

  return
 NowDataSDK.makeAPIService(URL("https://
instance-name.service-now.com")).getOrThrow()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    .also { this.nowApiService = it }
}
```

NowDataSDK - makeNowAttachmentService(instanceURL: URL)

Creates and initializes an instance of the NowAttachmentService feature.

This service enables you to upload, download, and delete attachment files from your ServiceNow instance. After you upload an attachment to your instance, it generates metadata for the attachment that you can then download into your Android application.

For additional information on ServiceNow attachments, see Attachment API.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance to access. For example, `"https://instance.servicenow.com"`

Returns

Type	Description
Result<NowAttachmentService>	NowAttachmentService object wrapped in a Kotlin Result object.

The following code example shows how to call this method.

```
private var nowAttachmentService: NowAttachmentService? = null

/**
  * Create the NowAttachmentService once in the lifetime of the
 application inside the Application
  * class or another manager class that will be injected into
 other classes via dagger/hilt.
  * NowAttachmentService should be created after initializing
 the NowSDK.
  */
suspend fun getNowAttachmentService(): NowAttachmentService? {
  if (nowAttachmentService != null) return nowAttachmentService

  return
 NowDataSDK.makeAttachmentService(URL("https://
instance-name.service-now.com"))
    .getOrThrow()
    .also { this.nowAttachmentService = it }
}
```

NowDataSDK - makeTableService(instanceURL: URL)

Creates and initializes an instance of the NowTableService feature.

This service enables you to access to the REST *Table* API on a ServiceNow instance. For additional information on the REST *Table* API, see Table API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance to access. For example, `"https://instance.servicenow.com"`

Returns

Type	Description
Result<NowTableService>	NowTableService object wrapped in a Kotlin Result object.

The following code example shows how to call this function.

```
private var nowTableService: NowTableService? = null

/**
  * Create the NowTableService once in the lifetime of the
 application inside the Application
  * class or another manager class that will be injected into
 other classes via dagger/hilt.
  * NowTableService should be created after initializing the
 NowSDK.
  */
suspend fun getNowTableService(): NowTableService? {
  if (nowTableService != null) return nowTableService

  return
 NowDataSDK.makeTableService(URL("https://
instance-name.service-now.com")).getOrThrow()
    .also { this.nowTableService = it }
}
```

NowGraphQLService interface - Android

The *NowGraphQLService* interface provides functions that allow you to make GraphQL requests to your ServiceNow through its *GraphQL* API.

Note: The *GraphQL* API works for guest users in the base ServiceNow system.

For more details on the ServiceNow *GraphQL* API, see Query record data using the GraphQL API framework.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration to associate with the service.

NowGraphQLService - graphQLRequest(String query)

Passes the specified GraphQL query to the associated ServiceNow instance and returns the query results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
query	String	GraphQL query to pass.

Returns

Type	Description
Call<Byte Array>	Query response.

```
fun makeGraphQLRequest(query: String) {
  val call = graphQLService.graphQLRequest(query)
  call.enqueue(
    { response -> handleResponse(response) },
    { nowDataError -> handleError(nowDataError) }
  )
}
```

NowPushPayload interface

The *NowPushPayload* interface defines the push notification payload that the NowSDK implements.

NowPushPayload structure

Name	Description
instanceId	ServiceNow instance identifier as provided by the push notification system. Data type: String
instanceName	ServiceNow instance name. Data type: String
message	Body of the push notification. Data type: String
notificationId	Unique identifier for this push notification. Data type: Integer
threadId	ID to use to group notifications. User the same ID in different payloads to indicate a group. Data type: String
title	Title of the push notification. Data type: String

NowPushSDK class - Android

The *NowPushSDK* class provides the function necessary to create a `NowPushService` that enables the sending of unsolicited (push) notifications to Android devices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowPushSDK - makePushService(instanceURL: URL)

Creates a NowPush service.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance that the NowPushService should interact with.

Returns

Type	Description
Result<NowPushService>	NowPushService object wrapped in a Kotlin Result object.

This example shows how to setup to *makePushService()* method to create the Push Service.

```
private var nowPushService: NowPushService? = null

/**
  * Create the NowPushService once in the lifetime of the
 application inside the Application
  * class or another manager class that will be injected into
 other classes via dagger/hilt.
  * NowPushService should be created after initializing the
 NowSDK.
  */
suspend fun getNowPushService(): NowPushService? {
  if (nowPushService != null) return nowPushService

  return
 NowPushSDK.makePushService(URL("https://
instance-name.service-now.com")).getOrThrow()
    .also { this.nowPushService = it }
}
```

NowPushService class - Android

The *NowPushService* class provides functions that enable interaction with the Push Notification service.

Properties

Name	Description
configuration	Service configuration to associate with the service. Data type: NowServiceConfiguration

NowPushService - handlePush(remoteMessage: RemoteMessage, successCallback: Consumer<NowPushPayload>, errorCallback: Consumer<Throwable>)

Processes a push notification request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Currently the only implemented push notification type is `NowPushVirtualAgent`. Any other passed push notification type returns a NotSupportedPushError object.

Parameters

Name	Type	Description
remote Message	Remote Message	Notification as received by `com.google.firebase.messaging.FirebaseMessagingService.o` For additional information, see Receive messages in an Android app.
success Callback	Consumer <NowPushPayload>	Callback to return the processed *NowPushPayload* to.
error Callback	Consumer <Throwable>	Callback to return the thrown error to. If the error NotSupportedPushError is thrown not supported by the mobile SDK, and must be processed outside of the mobile SI

Returns

Type	Description
None	

This example shows how to override *onMessageReceived()* and pass the *RemoteMessage* through to the `NowPushService`. If the `NowPushService` recognizes the notification type, it processes the request and returns the notification object for the application to handle. Otherwise it throws the NotSupportedPushError.

```
override fun onMessageReceived(remodeeMessage: RemoteMessage){
  pushService.handlePush(remoteMessage, { push ->
    when (push) {
      is NowPushVirtualAgent → handleVirtualAgentPush(push)
    }, { error ->
        Log.e(TAG, "Unknown push", error)
        handleAppPushNotification(remoteMessage)
    })
}
```

NowPushService - registerPushToken(pushToken: String, pushApp: String, successCallback: Runnable, errorCallback: Consumer<Throwable>)

Registers a unique Firebase token with the ServiceNow instance used to identify the push notifications for the current Android device and specified application.

In order for the ServiceNow instance to generate notifications Android device to receive notifications from the application, this token must be registered.

Parameters

Name	Type	Description
pushToken	String	Firebase token retrieved by either *com.google.firebase.messaging.FirebaseMessaging.getToken* *com.google.firebase.messaging.FirebaseMessagingService.onl*
pushApp	String	Name of the push application as specified in the Push Application table on the assoc ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
success Callback	Runnable	Callback executed when the token registration is successful.
errorCallback	Consumer <Throwable>	Callback executed when the token registration fails.

Returns

Type	Description
None	

This example registers a push token for the current Android device and the application "PushAppName".

```
FirebaseMessaging.getInstance().token.addOnCompleteListener
 { task ->
  val token = task.result

  if (!task.isSuccessful || token == null) {
    throw Exception("Unable to fetch token"))
  }

  pushService.registerPushToken(token, "PushAppName", {
    Log.v(TAG, "Successfully registered push token")
  }, { e ->
    Log.e(TAG, "Error registering push", e)
  })
}
```

NowPushService - unregisterPushToken(pushToken: String, pushApp: String, successCallback: Runnable, errorCallback: Consumer<Throwable>)

Unregisters the specified Firebase push token with the associated ServiceNow instance.

Parameters

Name	Type	Description
pushToken	String	Firebase token to unregister. Retrieved by either *com.google.firebase.messaging.FirebaseMessaging.getToken* o *com.google.firebase.messaging.FirebaseMessagingService.onNe*
pushApp	String	Name of the push application associated with the token to unregister. This information i in the Push Application table on the associated ServiceNow instance.
success Callback	Runnable	Callback executed when the token unregistration is successful.
erro rCallback	Consumer <Throwable>	Callback executed when the token unregistration fails.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

This code example shows how to unregister a push token such as when the user logs out of the application.

```
pushService.unregisterPushtoken(token, "PushAppName", {
  Log.v(TAG, "Successfully unregistered push token")
},  { e ->
  Log.e(TAG, "Error unregistering push", e)
})
```

NowSDK - Android

The *NowSDK* class is a singleton that provides the public API for the NowSDK. This class is the gateway to all Android SDK feature services.

Before initializing a feature service, you must initialize the SDK itself by calling NowSDK.configure(). For additional information on getting started with the Android NowSDK, refer to the ServiceNow Mobile SDK Developers Guide - Android.

NowSDK - configure(application: Application, configuration: NowSDKConfiguration)

Configures the NowSDK for use.

You must call this function before attempting to use any of the feature services provided by the SDK.

Parameters

Name	Type	Description
application	Application	Reference to the hosting application object.
configuration	NowServiceConfiguration	Object containing the information necessary to initialize the NowSDK.

Returns

Type	Description
None	NowSDKError is thrown if the provided configuration is invalid.

The following code example shows how to call this function.

```
class SampleApplication : Application(),
 NowSDKAuthorizationProviding, DevicePermissionDelegate {

    private val nowSdkSettings = NowSDKSettings(
        instanceBaseURL =
 "https://instance-name.service-now.com",
        clientId = "client_id",
        user = "user"
    )

    private val coroutineScope = CoroutineScope(Dispatchers.IO)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    private val nowSDKConfiguration = NowSDKConfiguration(this,
 this, NowLogLevel.Debug)
    override fun onCreate() {
        super.onCreate()

        NowSDK.configure(this, nowSDKConfiguration)
    }

    override fun requestAuthorization(
        instanceURL: URL,
        callback: Consumer<List<AuthorizationToken>?>
    ) {
        coroutineScope.launch {
            when {
                nowSdkSettings.user.isNullOrBlank().not() ->
 authorizeWithJWT(
                    callback = callback,
                    user = nowSdkSettings.user,
                    clientId = nowSdkSettings.clientId
                )

                else -> authorizeWithGuest(callback = callback)
            }
        }
    }

    override fun canRequestPermission(permission:
 DevicePermission): Boolean {
        return true
    }
}
```

NowSDK - logout()

Clears all user sessions persisted in memory.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
class SampleApplication : Application() {

    private val nowSDKConfiguration =
 NowSDKConfiguration(authorizationProvider, permissionDelegate,
 NowLogLevel.Debug)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    override fun onCreate() {
        super.onCreate()
        NowSDK.configure(this, nowSDKConfiguration)
    }

    fun logout() {
        // Clear all user session when an application resets the
 user session
        NowSDK.logout()
    }
}
```

NowSDKAuthorizationProviding interface - Android

The *NowSDKAuthorizationProviding* interface provides a function that configures the link to the ServiceNow instance for which authorization is needed and any associated callbacks.

NowSDKAuthorizationProviding - requestAuthorization(instanceURL: URL, callback: Consumer<List<AuthorizationToken>?>)

Authorizes the currently logged-in user on the specified ServiceNow instance using the specified AuthorizationToken objects.

Parameters

Name	Type	Description
instanceURL	URL	ServiceNow instance for which the authorization is being requested.
callback	Consumer <List <AuthorizationToken>?>	Array of logged-in user specific Authorization Token objects.

Returns

Type	Description
None	

```
class NowSDKAuthorizationManager: NowSDKAuthorizationProviding {
  override fun requestAuthorization(
    instanceURL: URL,
    callback: Consumer<List<AuthorizationToken>?>
  ){
    val token = JWTService.fetchJwt()
    val authorizationToken =
 AuthorizationToken(AuthorizationTokenType.JWT, token)
    val result = listOf(authorizationToken)
    callback.accept(result)
  }
}
```

NowSDKConfiguration class - Android

The *NowSDKConfiguration* class contains configuration information needed to initialize the NowSDK.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties

Name	Type	Description
authorizationProvider	NowSDKAuthorizationProviding	Delegate object that is responsible for providing authorization tokens to the NowSDK upon request.
logLevel	NowLogLevel	Level of log messages for the associated logger to store. Valid values (case-sensitive): • Debug • Error • Fatal • Info • None
permissionDelegate	DevicePermissionDelegate	Delegate object called by the NowSDK to request permission from the host application to show system dialog for requesting the indicated device permission. For example: `override fun canRequestPermission(permission: DevicePermission): Boolean = when (permission) { DevicePermission.Camera -> true DevicePermission.Microphone -> false } }`

NowSDKConfiguration - NowSDKConfiguration(authorizationProvider: NowSDKAuthorizationProviding, permissionDelegate: DevicePermissionDelegate, logLevel: NowLogLevel)

Creates a new NowSDKConfiguration object.

Parameters

Name	Type	Description
authorizationProvider	NowSDKAuthorizationProviding	Delegate object that is responsible for providing authorization tokens to the NowSDK upon request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
permissionDelegate	DevicePermissionDelegate	Delegate object called by the NowSDK to request permission from the host application to show system dialog for requesting the indicated device permission. For example: `override fun canRequestPermission(permission: DevicePermission): Boolean = when (permission) { DevicePermission.Camera -> true DevicePermission.Microphone -> false } }`
logLevel	NowLogLevel	Level of log messages for the associated logger to store. Valid values (case-sensitive): • Debug • Error • Fatal • Info • None

Returns

Type	Description
None	

The following code example shows how to call this function.

```
class SampleApplication : Application(),
 NowSDKAuthorizationProviding, DevicePermissionDelegate {

    private val nowSdkSettings = NowSDKSettings(
        instanceBaseURL =
 "https://instance-name.service-now.com",
        clientId = "client_id",
        user = "user"
    )
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    private val coroutineScope = CoroutineScope(Dispatchers.IO)

    private val nowSDKConfiguration = NowSDKConfiguration(this,
 this, NowLogLevel.Debug)
    override fun onCreate() {
        super.onCreate()

        NowSDK.configure(this, nowSDKConfiguration)
    }

    override fun requestAuthorization(
        instanceURL: URL,
        callback: Consumer<List<AuthorizationToken>?>
    ) {
        coroutineScope.launch {
            when {
                nowSdkSettings.user.isNullOrBlank().not() ->
 authorizeWithJWT(
                    callback = callback,
                    user = nowSdkSettings.user,
                    clientId = nowSdkSettings.clientId
                )

                else -> authorizeWithGuest(callback = callback)
            }
        }
    }

    override fun canRequestPermission(permission:
 DevicePermission): Boolean {
        return true
    }
}
```

NowServiceConfiguration class - Android

The *`NowServiceConfiguration`* class enables you to configure the ServiceNow instance URL and package name for a feature service.

Properties

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance that the feature service will leverage. For example: https://my_domain.hr_instance.com
packageName	String	Name of the package to associate with the feature service.

NowServiceError class - Android

The *`NowServiceError`* sealed class that returns NowSDK errors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties

Name	Type	Description
cause	Throwable	Cause of the error.
message	String	Message that contains the error details to display to the user.

Errors returned by the NowSDK feature services

Type	Description
SDKNotConfigured	The NowSDK was not configured. Most likely the `NowSDK.configure()` method was not called.
ServiceConfigurationInvalid	The NowSDK was configured with invalid setting. Verify that all settings in the configuration are correct.
ServiceDisabled	The associated service is disabled.
ServiceSettingsInvalid	Unable to process the service settings.
ServiceSettingsRetrievalFailed	Unable to retrieve the NowSDK service settings from the ServiceNow instance.

NowTableService interface - Android

The `NowTableService` interface provides functions that enable you to create, read, delete, and update records within a table on a ServiceNow instance.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration to associate with the service.

NowTableService - createRecord(tableName: String, fields: Map<String, String>, writeOptions: FieldWriteOptions?, configuration: FieldReadConfiguration?)

Inserts the specified record in the specified table.

Parameters

Name	Type	Description
tableName	String	Name of the table in which to save the record.
fields	Map<String, String>	Key-value pairs for all fields to create in the record. **Note:** All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.
writeOptions	FieldWriteOptions	Optional. Write options to set on the fields, such as whether the value should be stored as display values

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		or whether to suppress auto generation of system fields. Default: null - No options selected
configuration	FieldReadConfiguration	Optional. Configuration that specifies which fields to return for the created record and what to include in the fields.

Returns

Type	Description
Call<ByteArray>	Success: ByteArray that contains the created record. You can convert this information into any data model that you need. Failure: NowDataError

```
fun createTableRecord( tableName: String, fields: KeyValues,
 includeFields: String,
  readOptions: ReadOptions?, writeOptions: WriteOptions?){

  val readOptionsArray = readOptions?.asArray() ?: arrayOf()
  val readConfig =
 FieldReadConfiguration(includeFields.split(","),
 *readOptionsArray)

  var body:ByteArray?

  val call = tableService.createRecord(tableName,
 fields.toMap(),
    writeOptions?.asFieldWriteOptions(),
    readConfig)
  call.enqueue({ body = it.body },{ Log.d("Records", "failed to
 create record") })
}
```

NowTableService - deleteRecord(sysId: String, tableName: String)

Deletes the specified record in the specified table.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to delete.
tableName	String	Name of the table in which the specified record is located, such as *incident* or *asset*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Call<ByteArray>	Success: Nothing is returned. Failure: NowDataError

```
fun deleteTableRecord( recordSysId: String, tableName: String,
 callType: CallTestType){
  val tableService = serviceProvider.tableService()
  var body:ByteArray?
  val call = tableService.deleteRecord(recordSysId, tableName)
  call.enqueue({ body = it.body },{ Log.d("Records", "failed to
 create record") })
}
```

NowTableService - paginator(tableName: String, configuration: FetchConfiguration)

Creates a paginator that allows iteration of pages of records within a table.

You can use this paginator to navigate through the returned records, performing navigation operations such as fetching the first, last, previous, or next page, or checking whether there is next or previous page.

Parameters

Name	Type	Description
tableName	String	Name of the table for which to create the paginator.
configuration	FetchConfiguration	Configuration that specified the filters to use, pagination page size limit, which fields to retrieve, and what to include in the fields.

Returns

Type	Description
Paginator<ByteArray>	Success: Paginator with ByteArray output of the requested records. You can use the functions within the Paginator object to navigate the returned records. Failure: NowDataError

```
private fun initTablePaginator() {
  paginator = service?.paginator(tableName,
 FetchConfiguration(null, 3))
    ?.observe(object: PaginatorCallBack<ByteArray> {
      override fun onSuccess(response:
 Response<List<ByteArray>>) {
      }
      override fun onFailure(e: NowDataError) {
        Log.e("NowDataError", "", e)
      }
    })
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowTableService - record(sysId: String, tableName: String, configuration: FieldReadConfiguration?)

Retrieves the specified record from the specified table.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to retrieve.
tableName	String	Name of the table in which the specified record is located, such as *incident* or *asset*.
configuration	FieldReadConfiguration	Optional. Configuration that specifies which fields to retrieve and what to include in the fields.

Returns

Type	Description
Call <ByteArray>	Success: ByteArray that contains the retrieved record. You can convert this information into any data model that you need. Failure: NowDataError

```
fun fetchTableRecord( sysId: String, tableName: String,
 includeFields: String,
  readOptions: ReadOptions?){

  val readOptionsArray = readOptions?.asArray() ?: arrayOf()
  val readConfig =
 FieldReadConfiguration(includeFields.split(","),
 *readOptionsArray)

  var body:ByteArray?

  val call = tableService.record(sysId, tableName, readConfig)
  call.enqueue({ body = it.body },{ Log.d("Record", "failed
 fetching record") })
}
```

NowTableService - records(tableName: String, configuration: FieldReadConfiguration?)

Retrieves sll records record from the specified table.

Parameters

Name	Type	Description
tableName	String	Name of the table from which to retrieve the records, such as *incident* or *asset*.
configuration	FieldReadConfiguration	Optional. Configuration that specifies which fields to retrieve and what to include in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Call <ByteArray>	Success: ByteArray that contains the retrieved records. You can convert this information into any data model that you need. Failure: NowDataError

```
fun fetchTableRecords( tableName: String, filterQuery: String,
 includeFields: String,
  readOptions: ReadOptions?, limit: Int?){

  val readOptionsArray = readOptions?.asArray() ?: arrayOf()
  val readConfig =
 FieldReadConfiguration(includeFields.split(","),
 *readOptionsArray)
  val config = FetchConfiguration(Filter(filterQuery), limit,
 readConfig)

  var body:ByteArray?

  val call = tableService.records(tableName, config)
  call.enqueue({ body = it.body },{ Log.d("Records", "failed
 fetching records") })
}
```

NowTableService - updateRecord(sysId: String, tableName: String, fields: Map<String, String>, writeOptions: FieldWriteOptions?, configuration: FieldReadConfiguration?)

Updates the specified record in the specified table with the specified fields.

Parameters

Name	Type	Description
tableName	String	Name of the table in which to update the record.
fields	Map<String, String>	Key-value pairs for all fields to update in the record. **Note:** All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.
writeOptions	FieldWriteOptions	Optional. Write options to set on the fields, such as whether the value should be stored as display values or whether to suppress auto generation of system fields. Default: null - No options selected
configuration	FieldReadConfiguration	Optional. Configuration that specifies which fields to update and what to include in the fields.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: null

Returns

Type	Description
Call <ByteArray>	Success: ByteArray that contains the updated record. You can convert this information into any data model that you need. Failure: NowDataError

```
fun updateTableRecord( sysId: String, tableName: String, fields:
 KeyValues, includeFields: String,
   readOptions: ReadOptions?, writeOptions: WriteOptions?){

   val readOptionsArray = readOptions?.asArray() ?: arrayOf()
   val readConfig =
 FieldReadConfiguration(includeFields.split(","),
 *readOptionsArray)

   var body:ByteArray?

   val call = tableService.updateRecord(recordSysId, tableName,
 fields.toMap(),
     writeOptions?.asFieldWriteOptions(),
     readConfig)
   call.enqueue({ body = it.body },{ Log.d("Records", "failed to
 update record") })
}
```

NowWebTheme interface - Android

The *NowWebTheme* interface provides properties that enable you to override the colors used within web pages hosted on your ServiceNow instance in a native web view.

The *NowWebTheme* interface extends the *NowUITheme* interface and inherits the property *nowUIColoring*.

```
val nowUIColoring: NowUIColoring?
```

This property is used to reference color variables that *NowWebTheme* can use. For additional information on how to theme the UI, see Use NowUIColoring to theme NowWebTheme and NowChatTheme in the Mobile SDK Developer Guide - Android.

Properties

Name	Description
alertCritical0	Use for: • error messages • snackbar background

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
	Default value: #F8C8CD
alertCritical3	Use for: • error messages • snackbar border Default value: #B61C2D
alertPositive0	Use for: • success messages • snackbar background Default value: #CADFC0
alertPositive3	Use for: • success messages • snackbar border Default value: #266108
alertWarning0	Use for: • warning messages • snackbar background Default value: #FBF7BF
alertWarning3	Use for: • warning messages • snackbar border Default value: #B6AA00
backgroundPrimary	Use for: • card background • choice picker • input background • neutral background Default value: #FFFFFF
backgroundSecondary	Use for overflow menu background. Default value: #F6F6F8
backgroundTertiaryActionable	Use for the background color for the topic dialog search and edit text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
	Default value: #454D5B
brand	Use for the header background in the toolbar and tables. Default value: #302F4B
notification	Use for new message indicator. Default value: #B61C2D
primary	Use for: • actionable text • button backgrounds Default value: #4F52BD
screenHeaderText	Use for text and icon elements with a fixed color that appear on top of the brand color (screen header/toolbar). Default value: #FFFFFF
textActionable	Use for: • highlighted background • text on action buttons Default value: #FFFFFF
textPrimary	Use for: • alert dialog messages • card header text • chat bubble text • picture title and description • topic text Default value: #151920
webPageThemeId	Sys_id of the theme to apply to the ServiceNow web pages loaded by *NowWeb*. Default value: Configured default theme Table: UX Theme [sys_ux_theme] table.
webPageThemeVariantId	Sys_id of the theme variant to apply to the ServiceNow web pages loaded by *NowWeb*. Default value: Configured default theme variant Table: UX Style [sys_ux_style] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowWebSDK class - Android

The *NowWebSDK* class provides a single function that enables you to load web pages hosted on your ServiceNow instance in a native web view and Cabrillo. It automatically handles user authentication and session management instead of forcing users to log into the instance through a login web page.

NowWebSDK - makeWebService(instanceURL: URL, nowWebSdkCallbacks: NowWebViewServiceDelegate? = null)

Creates a NowWeb service.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance to access. For example, `"https://instance.servicenow.com"`
nowWebSdkCallbacks	NowWebViewServiceDelegate	Callbacks for the host application to configure *NowWebService*.

Returns

Type	Description
Result<NowWebService>	NowWebService object wrapped in a Kotlin Result object.

The following code example shows how to call this function.

```
 private var nowWebService: NowWebService? = null

/**
  * Create the NowWebService once in the lifetime of the
 application, inside the Application
  * class or another manager class that will be injected into
 other classes via dagger/hilt.
  * NowWebService should be created after initializing the
 NowSDK.
  */
suspend fun getNowWebService(): NowWebService? {
  if (nowWebService != null) return nowWebService

  return
 NowWebSDK.makeWebService(URL("https://
instance-name.service-now.com"), object :
    NowWebViewServiceDelegate {
    override fun flowEnded(activity: Activity, flowName:
 String?) {
      Log.i("NowWebSdk", "flow ended")
    }

    override fun requestedDismissal(activity: Activity) {
      Log.i("NebWebSdk", "screen should be dismissed")
    }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    override fun navigationFailed(activity: Activity, error:
 String) {
      Log.i("NebWebSdk", "navigation failed")
    }

    override fun unsupportedUrl(activity: Activity, uri: Uri) {
      Log.i("NebWebSdk", "URL is unsupported")
    }
  }).getOrThrow()
      .also { this.nowWebService = it }
}
```

NowWebService class - Android

The *NowWebService* API provides a function that launches a *NowWebActivity* that hosts a web view.

Properties

Name	Type	Description
configuration	NowServiceConfiguration class - Android	Configuration information for the associated service, such as the ServiceNow instance URL and the name of the package.

NowWebService - launch(context: Context, url: URL, nowWebTheme: NowWebTheme)

Creates a NowWebActivity that hosts the web view.

Parameters

Name	Type	Description
context	Context	Context to use for launching the associated activity.
url	URL	URL of the web page to load. This web page must be on the target ServiceNow instance that the service was initialized with.
nowWebTheme	NowWebTheme	Optional. *NowWebTheme* object to apply to the UI elements of the view controller. Default: Default theme

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun launchNowWeb() {
    val webService = getNowWebService()

    val webTheme = object : NowWebTheme {
        override val brand: Int
            get() = Color.BLUE
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        override val textPrimary: Int
            get() = Color.BLACK

        //Override remaining theme colors
    }
    webService?.launch(activity,
 URL("https://instance-name.service-now.com"), webTheme)
}
```

NowWebService – preloadWebCache(preloadUris: List<URI>)

Preloads a list of specified java.net.URIs in a headless webview to pre-populate the webview cache with cacheable resources on the page.

Note: Completion of this function call is based on *`onPageFinished()`* being called in the webview, which does not take into account redirections or resources on the page. Because of this, preload may not be fully complete when this method returns.

Parameters

Name	Type	Description
preloadUris	List	List of java.net.URIs to pre-load. All java.net.URIs must be relative or match the current host configured in the NowSDK.

Returns

Type	Description
None	

The following example shows how to use the *`webService.preloadWebCache()`* function to pre-load the `mesp` page.

```
suspend fun preloadNowWeb() {
  val webService = serviceProvider.webService()
  webService.preloadWebCache(
    listOf(
      URI("mesp")
    )
  )
}
```

NowWebService – updateTheme(nowWebTheme: NowWebTheme)

Updates the NowWeb UI theme with the specified UI theme. Use this function to update the web UI theme after it has been initially set using the *`launch()`* function, such as when changing the theme from light to dark.

Parameters

Name	Type	Description
nowWebTheme	NowWebTheme	*`NowWebTheme`* object to apply to the UI elements of the view controller.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to update a light UI theme implemented using the *launch()* function to the dark UI theme using the *updateTheme()* function.

```
val webService = getNowWebService()

val lightTheme = object : NowWebTheme {
    override val brand: Int
        get() = Color.BLUE

    override val textPrimary: Int
        get() = Color.BLACK

    override val backgroundPrimary: Int
        get() = Color.WHITE

    // Override remaining theme colors
}

val darkTheme = object : NowWebTheme {
    override val brand: Int
        get() = Color.BLUE

    override val textPrimary: Int
        get() = Color.WHITE

    override val backgroundPrimary: Int
        get() = Color.BLACK

    // Override remaining theme colors
}

//launch NowWeb with light theme
webService?.launch(activity,
 URL("https://instance-name.service-now.com"), lightTheme)

//update NowWeb with dark theme
webService?.updateTheme(darkTheme)
```

NowWebViewServiceDelegate interface - Android

The *NowWebViewServiceDelegate* API provides callbacks for notification of issues within the *NowWebService* processing such as when a flow ends or a navigation fails.

NowWebViewServiceDelegate - flowEnded(flowName: String?)

Callback that notifies the host application that the specified flow has ended.

Parameters

Name	Type	Description
flowName	String	Name of the flow that ended.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun getNowWebService(): NowWebService {
  return
 NowWebSDK.makeWebService(URL("https://
instance-name.service-now.com"), object :
 NowWebViewServiceDelegate {
    override fun flowEnded(activity: Activity, flowName:
 String?) {
      Log.i("NowWebSdk", "flow ended")
    }
  }).getOrThrow()
}
```

NowWebViewServiceDelegate - navigationFailed(error : String)

Callback that notifies the host application that navigation has failed with the specified error reason.

Parameters

Name	Type	Description
error	String	Error that describes why the navigation failed.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun getNowWebService(): NowWebService {
  return
 NowWebSDK.makeWebService(URL("https://
instance-name.service-now.com"), object :
 NowWebViewServiceDelegate {
    override fun navigationFailed(activity: Activity, error:
 String) {
      Log.i("NebWebSdk", "navigation failed")
    }
  }).getOrThrow()
}
```

NowWebViewServiceDelegate - requestedDismissal()

Callback that notifies the host application that the screen should be dismissed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun getNowWebService(): NowWebService {
  return
 NowWebSDK.makeWebService(URL("https://
instance-name.service-now.com"), object :
 NowWebViewServiceDelegate {
    override fun requestedDismissal(activity: Activity) {
      Log.i("NebWebSdk", "screen should be dismissed")
    }
  }).getOrThrow()
}
```

NowWebViewServiceDelegate - unsupportedUrl(uri: Uri)

Callback that notifies the host application that the provided URL is unsupported.

Parameters

Name	Type	Description
uri	Uri	URL that is unsupported.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun getNowWebService(): NowWebService {
  return
 NowWebSDK.makeWebService(URL("https://
instance-name.service-now.com"), object :
 NowWebViewServiceDelegate {
    override fun unsupportedUrl(activity: Activity, uri: Uri) {
      Log.i("NebWebSdk", "URL is unsupported")
    }
  }).getOrThrow()
}
```

Paginator class - Android

The *Paginator* class provides functions for paging through the return results passed back by a REST endpoint call, such as those returned by the *NowTableService* class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You must first call the NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) or NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function to retrieve paginate return results.

Paginator - first()

Fetches the first page of the return results.

The method throws a `PaginationError` if it cannot fetch the first page.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  paginator.first()
}
```

Paginator - hasNext()

Checks whether there is a next page in the return results.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether there's a next page in the return results. Possible values: • true: Next page available. • false: No next page available.

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  if (paginator.hasNext() && !paginator.isBusy()) {
    paginator.next()
  }
}
```

Paginator - hasPrevious()

Checks whether there in a previous page in the return results.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether there is a previous page in the return results. Possible values: • true: Previous page available. • false: No previous page available.

The following code example shows how to call this function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  if (paginator.hasPrevious() && !paginator.isBusy()) {
    paginator.previous()
  }
}
```

Paginator - isBusy()

Checks whether the Paginator is busy fetching data.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	Flag that indicates whether the Paginator is busy fetching data. Possible values: • true: Busy fetching data. • false: Not busy.

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  if (paginator.hasNext() && !paginator.isBusy()) {
    paginator.next()
  }
}
```

Paginator - last()

Fetches the last page of the return results.

The method throws a `PaginationError` if it cannot fetch the last page.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  if !paginator.isBusy()) {
    paginator.last()
  }
}
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Paginator - next()

Fetches the next page of the return results.

The method throws a `PaginationError` if there are no more pages to fetch.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  if (paginator.hasNext() && !paginator.isBusy()) {
    paginator.next()
  }
}
```

Paginator - observe(callback: PaginatorCallBack<T>)

Sets the Paginator object's callbacks. You must call this method before calling any other Paginator functions.

Parameters

Name	Type	Description
callback	PaginatorCallBack	Callbacks to call based on the success or failure of the Paginator creation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• Success: `abstract fun onSuccess(response: Response<List<T>>)` • Failure: `abstract fun onFailure(e: NowDataError)`

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginationCallBack = object :
 PaginatorCallBack<NowAttachmentMetadata> {
    override fun onFailure(e: NowDataError) {
      handleError(e)
    }

    override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
      handleResponse(response)
    }

  }

  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(paginationCallBack)
    ?: throw Exception("Response is null")
}
```

Paginator - previous()

Fetches the previous page of the return results.

The method throws a `PaginationError` if it cannot fetch the previous page.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  if (paginator.hasPrevious() && !paginator.isBusy()) {
    paginator.previous()
  }
}
```

Paginator - reset()

Resets the Paginator back to the first page but doesn't return the first page of the return results.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }
```

```
    })
    ?: throw Exception("Response is null")

  paginator.reset()
}
```

Mobile SDK API reference - iOS

The Mobile SDK for iOS provides the classes necessary to interface iOS-based devices with the ServiceNow platform.

It provides classes that enable you to create feature services such as chat, REST API interface, GraphQL, and web access, that allow you to create interactive applications on any iOS device.

For additional information on how to implement specific use cases using this API, see the Mobile SDK Developer Guide - iOS.

Enumeration cases

Type	Description
NowAttachmentMetadata.State	Attachment metadata state. Possible values: • available • conditionally • none • pending • unavailable
NowSDKError	Errors that can be thrown from the NowSDK module. Values • configurationError • missingAuthorizationProvider • missingPermissionDelegate

FetchConfiguration structure - iOS

The `FetchConfiguration` structure provides the ability to define the configuration for fetching records from your ServiceNow instance.

Properties

Name	Type	Description
filter	Filter	Optional. Query to apply to the return results. For example, to return only active records with a short description that contains the word "broken", pass the following query: `active=true^short_descriptionLIKEbroken` Default: nil - No filter applied, all records returned (any system or table limits are honored.)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
limit	Integer	Optional. Number of records to return per page/ response. Default: nil - All records returned (any system or table limits are honored.)
readConfiguration	FieldReadConfiguration	Optional. Configuration of the fields returned in the response. Default: nil - All fields are returned.

FetchConfiguration - init(filter: Filter? = nil, limit: Int? = nil, readConfiguration: FieldReadConfiguration? = nil)

Defines the criteria for what records, and associated fields within those records, to return when fetching data from a ServiceNow instance through a REST endpoint.

Parameters

Name	Type	Description
filter	Filter	Optional. Query to apply to the return results. For example, to return only active records with a short description that contains the word "broken", pass the following query: `active=true^short_descriptionLIKEbroken` Default: nil - No filter applied, all records returned (any system or table limits are honored.)
limit	Integer	Optional. Number of records to return per page/ response. Default: nil - All records returned (any system or table limits are honored.)
readConfiguration	FieldReadConfiguration	Optional. Configuration of the fields returned in the response. Default: nil - All fields are returned.

Returns

Type	Description
None	

Shows how to configure the data to fetch from the Table API.

```
/// The configuration for what to fetch from the Table API.
lazy var fetchConfiguration: FetchConfiguration = {
  let includeFields = [
    // Case details
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "number",
    "short_description",
    "priority",
    "state",
    "opened_at",

    // Account details
    "account.name",
    "account.number",
    "contact.name",
    "contact.email",
    "contact_type",

    // Assignment
    "assignment_group.name",
    "assigned_to.name"
  ]
  let readConfiguration = FieldReadConfiguration(includeFields:
 includeFields, options: .actualValues)
  let filter = Filter(criteria: [], sortBy: [.desc("number")],
 queryCategory: nil)
  return FetchConfiguration(filter: filter, limit: 10,
 readConfiguration: readConfiguration)
}()
```

FieldReadConfiguration structure - iOS

The *FieldReadConfiguration* structure enables you to configure which fields to fetch from a ServiceNow instance table and in which format.

Properties

Name	Type	Description
includeFields	Array	List of fields to pass back in the return results.
options	Array	List of the types of fields to return. Possible values: • actualValues: Returns the values actually stored in each of the fields, including the sys_ids for referenced records. Use this setting if dates need to be decoded in Codable models using Date. • description: Returns the description of the parameter. • displayValues: Returns the display values, if available, for the selected fields. For example, user names typically contain a reference link (sys_id) to the user record. If you request the display value, the person's name is returned instead of the sys_id that is stored in the associated field. **Note:** Display values returned by a ServiceNow instance are formatted and internationalized based on the user profile configuration of the authenticated user. This may differ from the device language and locale settings on the device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
		• excludeReferenceLink: Does not return any data that is defined as reference links within the table. • rawValue: Returns the raw value of the parameter.

FieldReadConfiguration init(includeFields: [FieldName] = [], options: Options = [])

Configures the fields within a record in a ServiceNow table to pass back in the return results of a REST endpoint call.

Parameters

Name	Type	Description
includeFields	Array	List of fields to pass back in the return results.
options	Array	List of the types of fields to return. Possible values: • actualValues: Returns the values actually stored in each of the fields, including the sys_ids for referenced records. Use this setting if dates need to be decoded in Codable models using Date. • description: Returns the description of the parameter. • displayValues: Returns the display values, if available, for the selected fields. For example, user names typically contain a reference link (sys_id) to the user record. If you request the display value, the person's name is returned instead of the sys_id that is stored in the associated field. **Note:** Display values returned by a ServiceNow instance are formatted and internationalized based on the user profile configuration of the authenticated user. This may differ from the device language and locale settings on the device. • excludeReferenceLink: Does not return any data that is defined as reference links within the table. • rawValue: Returns the raw value of the parameter.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
/// The configuration for what to fetch from the Table API.
lazy var fetchConfiguration: FetchConfiguration = {
  let includeFields = [
    // Case details
    "number",
    "short_description",
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "priority",
    "state",
    "opened_at",

    // Account details
    "account.name",
    "account.number",
    "contact.name",
    "contact.email",
    "contact_type",

    // Assignment
    "assignment_group.name",
    "assigned_to.name"
  ]
  let readConfiguration = FieldReadConfiguration(includeFields:
 includeFields, options: .actualValues)
  let filter = Filter(criteria: [], sortBy:
 [.desc("opened_at")], queryCategory: nil)
  return FetchConfiguration(filter: filter, limit: 10,
 readConfiguration: readConfiguration)
}()
```

FieldWriteOptions class - iOS

The *`FieldWriteOptions`* class provides functions that set the options for updating or creating fields in a record on a ServiceNow instance.

Properties

Name	Type	Description
rawValue	Integer	Result of the bitwise operation of the `suppressAutoSysField` and the `treatInputValuesAsDisplayValues` properties.
suppressAutoSysField	Boolean	Flag that indicates whether to suppress the automatic generation of system fields. Possible values: • true: Suppress automatic generation of system fields. • false: Allow automatic generation of system fields. Default: false
treatInputValuesAsDisplayValues	Boolean	Flag that indicates whether to set field values using their display value rather than the actual value. Possible values: • true: Use display value. • false: Use actual value.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
		Default: false

Filter structure - iOS

The `Filter` structure provides the ability to configure filters that define the data to return in the return results of a REST endpoint query.

Filter - init(criteria criteriaList: [Criteria], sortBy: [Sort]? = nil, queryCategory: String? = nil)

Creates a filter based on one or more filter criteria that are OR'd together.

Parameters

Name	Type	Description
criteria	Array	Top level criteria conditions to group with OR connectors.
sortBy	String	Optional. Sort order of the return results. Possible values: • asc: Ascending • desc: Desending Default: asc
queryCategory	String	Optional. Name of the query category. Default: None

Returns

Type	Description
None	

The following example shows creating three separate criteria and when passed in, if any of those criteria are met, the record is passed back in the return results.

```
// All of criteria1 conditions must be met
let criteria1 = Criteria(conditions: …)

// OR all of criteria2 conditions must be met
let criteria2 = Criteria(conditions: …)

// OR all of criteria3 conditions must be met
let criteria3 = Criteria(conditions: …)

let filter = Filter(criterias: [criteria1, criteria2,
 criteria3])
```

Filter - init(conditions: [QueryProviding], sorts: [Sort]? = nil)

Creates a filter based on all specified conditions (AND'd together)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
conditions	QueryProviding	Conditions to group with an AND connector. Possible values: • boolean • dateTime • email • integerChoice • numeric • reference • string • stringChoice
sorts	String	Optional. Sort order of the return results. Possible values: • asc: Ascending • desc: Desending Default: asc

Returns

Type	Description
None	

The following code example shows how to call this function.

```
// Where the record is active
let condition1 = Condition.boolean(field: "active", .is(true))

// AND the date value of the SLA due field is on "today" or any
 date after today.
let condition2 = Condition.dateTime(field:
 "sla_due", .atOrAfter(0, .daysAgoStart))

let filter = Filter(conditions: [condition1, condition2])
```

Filter - init(query: String, queryCategory: String? = nil)

Creates a filter using a specified encoded query.

Parameters

Name	Type	Description
query	String	Encoded query Encoded query to use to filter the records to return from the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
queryCategory	String	Optional. Name of the query category to use for the query.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let query = "active=true^short_descriptionLIKEbroken"
let filter = Filter(query: query)
```

Filter - init(keywords: String? = nil, conditions: [Condition], sortBy: [Sort]? = nil)

Creates a filter based on specific keywords and conditions that are AND'd together.

Parameters

Name	Type	Description
keywords	String	Optional. Any specific word or phrase to search for. Default: nil - No specific word search.
conditions	String	Conditions to group with an `AND` connector. Possible values: • boolean • dateTime • email • integerChoice • numeric • reference • string • stringChoice
sortBy	String	Optional. Sort order of the return results. Possible values: • asc: Ascending • desc: Desending Default: asc

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
// Keyword that must be found in the record
let searchTerm = "…"

// AND the specified condition must be met
let condition1 = Condition.email(field:
 "state", .changesFrom("4"))

let filter = Filter(keywords: searchTerm, condition: condition1)
```

NowAnalyticsService protocol - iOS

The *`NowAnalyticsService`* protocol provides functions that enable you to configure analytics properties, user settings, and events for managing the collection of user analytics data.

An object conforming to this protocol is returned by `sharedAnalyticsService`. Use it in your application to perform API calls.

Requirements

Name	Type	Description
trackingConsent	Boolean	Flag that indicates whether the user has consented to analytics tracking for the associated device. By default, devices are opted-out. Explicitly setting this value to `false` will immediately finish any ongoing session and delete the locally recorded data. Valid values: • true: User consented to anlaytics data being tracked on this device. • false: User denied data tracking.

NowAnalyticsService - addEvent(named eventName: String, with properties: [String: Any]?)

Adds an application event, such as a user reaching a specific level or screen, and enables the setting of custom properties on the event. These events appear on the dashboard in the order that they occurred.

These events appear in your analytics dashboard.

Parameters

Name	Type	Description
named eventName	String	Name of the event to add.
with properties	Array	Optional. Custom property key-value pairs for the event. Property keys may not contain the dot ('.') or dollar ('$') signs. They will be trimmed. Supported value types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• Date • NSNull • NSNumber • Strings • URL **Note:** The total size of the *eventName*, properties key and value should not exceed 300 bytes (per event). Strings are UTF-8 encoded. Events that exceed this limit are ignored.

Returns

Type	Description
None	

The following example shows how to add a "Successful Login" event and an "Open Case" event with properties.

```
// Add event with properties
NowAnalytics.sharedAnalyticsService.addEvent(
  named: "Open Case", with: ["Screen Name": "Case",
                             "Case Number": "123",
                             "Case Priority": 5
])
```

NowAnalyticsService - addScreenAction(named actionName: String)

Adds a custom action to the current screen. These actions appear in the user dashboard as part of the session data and describes a screen change in an application.

Parameters

Name	Type	Description
named actionName	String	Name of the action to add to the screen, such as `MyButtonClick`. Maximum length: 256 UTF-8 bytes

Returns

Type	Description
None	

```
// Add event
NowAnalytics.sharedAnalyticsService.addEvent(named: "Successful
 Login")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowAnalyticsService - appendToUserProperty(named propertyName: String, listItem: String)

Appends the specified item to the specified user property list.

Parameters

Name	Type	Description
named propertyName	String	Name of the user property list to append the *listItem* to.
listItem	String	List item to append to the property.

Returns

Type	Description
None	

```
// Append handled case to list
NowAnalytics.sharedAnalyticsService.appendToUserProperty(named:
 "Case Identifiers", listItem: "TASK-1")
```

NowAnalyticsService - deleteCurrentUserData(completion: @escaping ((_ success: Bool) -> Void))

Deletes all analytics data associated with the current user. This method also unsets the current active user and opts this device out of future tracking.

To set the current user, use the setUserId() method.

Parameters

Name	Type	Description
completion	@escaping ((_ success: Bool) -> Void)	Completion handler to execute after the analytics data is deleted. Return values for the completion handler: • Success: Returns a Boolean value of true. • Failure: Void - Failure may occur if the Appsee servers cannot be reached, as when there is no connectivity. If failure occurs, retry the method.

Returns

Type	Description
None	

```
// Delete user data
NowAnalytics.sharedAnalyticsService.deleteCurrentUserData(comple
tion: { (success) -> Void in
  if success {
    // deletion succeeded
  } else {
    // deletion failed
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }
})
```

NowAnalyticsService - incUserProperty(named propertyName: String, by value: Int)

Increments or decrements the value of the specified numeric property by the specified value.

Parameters

Name	Type	Description
named propertyName	String	Name of the user property to increment.
by value	Integer	Value to increment the property by. Enter a negative value to decrement the value.

Returns

Type	Description
None	

```
// Increment the "Cases Handled" count
NowAnalytics.sharedAnalyticsService.incUserProperty(named:
 "Cases Handled", by: 2)
```

NowAnalyticsService - installJavascriptInterface(into webView: WKWebView)

Enables the calling of the methods in the *`SNAnalytics()`* API from within a WebView using JavaScript.

This method returns an SNMobileAnalytics object that is available in JavaScript, which exposes the native methods.

Parameters

Name	Type	Description
webView	WKWebView	Web view object in which to inject the JavaScript interface.

Returns

Type	Description
Object	SNMobileAnalytics

```
// Register JS object inside the web page
// This will create an object named 'SNMobileAnalytics' on JS
 that will have the following methods:
// SNMobileAnalytics.setUserId(userId)                    example:
 SNMobileAnalytics.setUserId("John Doe")
// SNMobileAnalytics.startScreen(screenName)              example:
 SNMobileAnalytics.startScreen("WelcomeScreen")
// SNMobileAnalytics.addScreenAction(actionName)          example:
 SNMobileAnalytics.addScreenAction("MyButtonClick")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// SNMobileAnalytics.addEvent(eventName, properties)    example:
 SNMobileAnalytics.addEvent("Successful Login")
//
          SNMobileAnalytics.addEvent("Successful Login",
 JSON.stringify({"Screen Name": "Case", "Case Number": "123",
 "Case Priority": 5}))
NowAnalytics.sharedAnalyticsService.installJavascriptInterface(i
nto: webView)
```

NowAnalyticsService - removeUserProperty(named propertyName: String)

Deletes the specified property for the current user.

To set the current user, use the setUserId() method.

Parameters

Name	Type	Description
named propertyName	String	Name of the user property to delete.

Returns

Type	Description
None	

```
// Remove unnecessary property
NowAnalytics.sharedAnalyticsService.removeUserProperty(named:
 "Temp Cases")
```

NowAnalyticsService - setDelegate(_ delegate: NowAnalyticsServiceDelegate?)

Sets a weak reference for a delegate to receive notifications.

Parameters

Name	Type	Description

delegate	NowAnalyticsServiceDelegate	Optional. Object that contains the reference to the delegate class.
		`// Register delegate`
		`private var analyticsDelegate =`
		`NowAnalyticsDelegate()  // Keep`
		`ref of delegate`
		`NowAnalytics.sharedAnalyticsServic`
		`e.setDelegate(analyticsDelegate)`

Returns

Type	Description
None	

This example shows how to define a delegate class for *`NowAnalyticsServiceDelegate`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Define a delegate class for NowAnalyticsServiceDelegate
class NowAnalyticsDelegate:
 NowAnalytics.NowAnalyticsServiceDelegate {
  func nowAnalyticsSessionShouldStart() -> Bool {
    // Session is about to start, return true to allow session
 to start
    return true
  }

  func nowAnalyticsSessionDidStart(_ sessionId: String) {
    // Session was started
  }

  func nowAnalyticsSessionShouldEnd(_ sessionId: String) -> Bool
 {
    // Session is about to end, return true to allow session to
 end
    return true
  }

  func nowAnalyticsSessionDidEnd(_ sessionId: String) {
    // Session was ended
  }

  func nowAnalyticsDidDetectScreen(_ screenName: String) ->
 String? {
    // Example of skipping specific screen detection
    if (screenName == "LoginViewController") {
      return nil
    }

    // Example of appending a prefix for every screen detected
    return "MyApp_" + screenName
  }
}

// Register delegate
private var analyticsDelegate = NowAnalyticsDelegate()  // Keep
 ref of delegate
NowAnalytics.sharedAnalyticsService.setDelegate(analyticsDelega
te)
```

NowAnalyticsService - setUserId(_ userId: String?)

Sets the application's user ID for the current user. Pass nil to log out the current user.

Parameters

Name	Type	Description
userId	String	Optional. Application-specific user identifier. To log the current user out, pass `nil`. The user ID must not contain HTML tags or any personal data such as name, email, or phone number.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Maximum length: 256 UTF-8 bytes

Returns

Type	Description
None	

```
// Add several properties at once
NowAnalytics.sharedAnalyticsService.setUserProperties([
  "Cases Handled": 100,
  "Last Login": Date(),
  "Is Remote": true,
  "Profile URL": URL(string: "https://www.servicenow.com")!
])
```

NowAnalyticsService - setUserProperties(_ userProperties: [String: Any])

Sets multiple properties with the specified values for the current user. Properties can be anything that you want to track on the dashboard for a user.

You must call the setUserId() function before calling this function.

Parameters

Name	Type	Description
userProperties	Array	Key-value pairs of the user properties to set. Supported value types: • NSNumber • Strings • Date • URL • NSNull Key may not contain dots ('.') or dollar ('$') signs. Maximum length: • key: 256 characters • value: 1,000 characters

Returns

Type	Description
None

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
import NowAnalytics

// Initialize the Analytics SDK
NowAnalytics.configure(for: URL(string:
 "https://my.instance.service-now.com")!)

// Enable tracking consent
NowAnalytics.sharedAnalyticsService.trackingConsent = true

// Set User Id for proper identification
NowAnalytics.sharedAnalyticsService.setUserId("John Doe")

// Set the "Role" property of the user to "Admin"
NowAnalytics.sharedAnalyticsService.setUserProperty(named:
 "Role", with: "Admin")

// Add several properties at once
NowAnalytics.sharedAnalyticsService.setUserProperties([
    "Cases Handled": 100,
    "Last Login": Date(),
    "Is Remote": true,
    "Profile URL": URL(string: "https://www.servicenow.com")!
])
```

NowAnalyticsService - setUserProperty(named propertyName: String, with value: Any?)

Sets the specified property with the specified value for the current user. You can define any property that makes sense for your application.

You must call the setUserId() function before calling this function.

Parameters

Name	Type	Description
named propertyName	String	Name of the user property to set. May not contain dots ('.') or dollar ('$') signs. Maximum length: 256 characters
with value	Any	Value to set the user property to. Supported value types: • Date • NSNull • NSNumber • Strings • URL Maximum length: 1,000 characters

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
// Set the "Role" property of the user to "Admin"
NowAnalytics.sharedAnalyticsService.setUserProperty(named:
 "Role", with: "Admin")
```

NowAnalyticsService - startScreen(named screenName: String)

Logs the time when the associated screen first appears in the UI.

Call this method after the *`viewDidAppear(_:)`* method.

Parameters

Name	Type	Description
named screenName	String	Name of the screen to log the start time for, such as `WelcomeScreen`. This can be anything that you want to define as a screen and display/aggregate on an analytics dashboard. Maximum length: 256 UTF-8 bytes

Returns

Type	Description
None	

```
// Mark the appearance starting time of a screen
// This method should be usually called from the viewDidAppear
NowAnalytics.sharedAnalyticsService.startScreen(named:
 "WelcomeScreen")
```

NowAnalyticsServiceDelegate protocol - iOS

The *`NowAnalyticsServiceDelegate`* protocol provides callback functions that provide information about the starting and ending of a user session and screen change detection.

NowAnalyticsServiceDelegate - nowAnalyticsDidDetectScreen(_ sessionId: String)

Notifies when a screen change is detected. The screen name is detected from the navigation bar. If that is not possible, it is the viewController subclass name.

Parameters

Name	Type	Description
screenName	String	Name of the screen to detect whether there is any change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Custom name to use to override the passed screenName.

This example shows how to define a delegate class for *`NowAnalyticsServiceDelegate`*.

```
import NowAnalytics

// Initialize the Analytics SDK
NowAnalytics.configure(for: URL(string:
 "https://my.instance.service-now.com")!)

// Define a delegate class for NowAnalyticsServiceDelegate
class NowAnalyticsDelegate:
 NowAnalytics.NowAnalyticsServiceDelegate {
  func nowAnalyticsSessionShouldStart() -> Bool {
    // Session is about to start, return true to allow session
 to start
    return true
  }

  func nowAnalyticsSessionDidStart(_ sessionId: String) {
    // Session was started
  }

  func nowAnalyticsSessionShouldEnd(_ sessionId: String) -> Bool
 {
    // Session is about to end, return true to allow session to
 end
    return true
  }

  func nowAnalyticsSessionDidEnd(_ sessionId: String) {
    // Session was ended
  }

  func nowAnalyticsDidDetectScreen(_ screenName: String) ->
 String? {
    // Example of skipping specific screen detection
    if (screenName == "LoginViewController") {
      return nil
    }

    // Example of appending a prefix for every screen detected
    return "MyApp_" + screenName
  }
}

// Register delegate
private var analyticsDelegate = NowAnalyticsDelegate()  // Keep
 ref of delegate
NowAnalytics.sharedAnalyticsService.setDelegate(analyticsDelega
te)
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowAnalyticsServiceDelegate - nowAnalyticsSessionDidEnd(_ sessionId: String)

Notifies when the specified session has ended.

This is a callback function that gets called when the specified session actually ends.

Parameters

Name	Type	Description
sessionId	String	Unique identifier of the session to check.

Returns

Type	Description
None	

This example shows how to define a delegate class for *NowAnalyticsServiceDelegate*.

```
import NowAnalytics

// Initialize the Analytics SDK
NowAnalytics.configure(for: URL(string:
 "https://my.instance.service-now.com")!)

// Define a delegate class for NowAnalyticsServiceDelegate
class NowAnalyticsDelegate:
 NowAnalytics.NowAnalyticsServiceDelegate {
  func nowAnalyticsSessionShouldStart() -> Bool {
    // Session is about to start, return true to allow session
 to start
    return true
  }

  func nowAnalyticsSessionDidStart(_ sessionId: String) {
    // Session was started
  }

  func nowAnalyticsSessionShouldEnd(_ sessionId: String) -> Bool
 {
    // Session is about to end, return true to allow session to
 end
    return true
  }

  func nowAnalyticsSessionDidEnd(_ sessionId: String) {
    // Session was ended
  }

  func nowAnalyticsDidDetectScreen(_ screenName: String) ->
 String? {
    // Example of skipping specific screen detection
    if (screenName == "LoginViewController") {
      return nil
    }

    // Example of appending a prefix for every screen detected
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    return "MyApp_" + screenName
  }
}

// Register delegate
private var analyticsDelegate = NowAnalyticsDelegate()  // Keep
 ref of delegate
NowAnalytics.sharedAnalyticsService.setDelegate(analyticsDelega
te)
```

NowAnalyticsServiceDelegate - nowAnalyticsSessionDidStart(_ sessionId: String)

Notifies when the specified session has started.

This is a callback function that gets called when the specified session actually starts.

Parameters

Name	Type	Description
sessionId	String	Unique identifier of the session to check.

Returns

Type	Description
Boolean	Flag that indicates that the session is starting. Valid values: • true: Session is starting • false: Session is not starting

This example shows how to define a delegate class for *`NowAnalyticsServiceDelegate`*.

```
import NowAnalytics

// Initialize the Analytics SDK
NowAnalytics.configure(for: URL(string:
 "https://my.instance.service-now.com")!)

// Define a delegate class for NowAnalyticsServiceDelegate
class NowAnalyticsDelegate:
 NowAnalytics.NowAnalyticsServiceDelegate {
  func nowAnalyticsSessionShouldStart() -> Bool {
    // Session is about to start, return true to allow session
 to start
    return true
  }

  func nowAnalyticsSessionDidStart(_ sessionId: String) {
    // Session was started
  }

  func nowAnalyticsSessionShouldEnd(_ sessionId: String) -> Bool
 {
    // Session is about to end, return true to allow session to
 end
```

```
    return true
  }

  func nowAnalyticsSessionDidEnd(_ sessionId: String) {
    // Session was ended
  }

  func nowAnalyticsDidDetectScreen(_ screenName: String) ->
 String? {
    // Example of skipping specific screen detection
    if (screenName == "LoginViewController") {
      return nil
    }

    // Example of appending a prefix for every screen detected
    return "MyApp_" + screenName
  }
}

// Register delegate
private var analyticsDelegate = NowAnalyticsDelegate()  // Keep
 ref of delegate
NowAnalytics.sharedAnalyticsService.setDelegate(analyticsDelega
te)
```

NowAnalyticsServiceDelegate - nowAnalyticsSessionShouldEnd(_ sessionId: String)

Notifies when the specified session is about to end.

This is a callback function that gets called when the specified session is about to end.

Parameters

Name	Type	Description
sessionId	String	Unique identifier of the session to check.

Returns

Type	Description
Boolean	Flag that indicates that the session is ending. Valid values: • true: Session is ending • false: Session is not ending

This example shows how to define a delegate class for *`NowAnalyticsServiceDelegate`*.

```
import NowAnalytics

// Initialize the Analytics SDK
NowAnalytics.configure(for: URL(string:

NowAPIEndpoint protocol - iOS

The *NowAPIEndpoint* protocol provides an interface for accessing any publicly exposed ServiceNow REST APIs.

Requirements

Name	Type	Description
httpMethod	String	HTTP method that the associate endpoint implements, such as get, delete, post, put, and patch.
relativePath	String	Path of the associated endpoint relative to the `/api` path. For example: `/api/now/account`
requiresAuthentication	Boolean	Flag that indicates whether the endpoint requires authentication. Default: true

NowAPIService class - iOS

The *NowAPIService* class provides functions that enable you to perform requests to a specified ServiceNow REST API.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Service configuration to associate with the protocol.

NowAPIService - data(for endpoint: NowAPIEndpoint, queryItems: [String: String], httpHeaders: [String: String], body: Data, completion: @escaping (Result<DataResponse, NowDataError>)

Requests data from the specified ServiceNow REST API and then executes the completion handler.

Parameters

Name	Type	Description
for endpoint	NowAPIEndpoint	Object containing the ServiceNow REST API endpoint to access, including the HTTP method, relative path to the endpoint, path parameters, and whether authentication is required.
queryItems	Array	Optional. Query parameters for the endpoint as key/value pairs. Default: nil
httpHeaders	Array	Optional. Request HTTP headers required by the endpoint as key/value pairs. Default: nil
body	String	Optional. Request body parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: nil
completion	@escaping (Result<DataResponse, NowDataError>)	Completion handler to execute after the REST API call completes. Return values for the completion handler: • Success: DataResponse that contains the returned data from the REST API call. • Failure: NowDataError ○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response ○ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. ○ `cannotDecodeProperty(type: Any, from: String)` ▪ *`type`*: Wrapped type to decode from a string. ▪ *`from`*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. ○ `cannotEncodeModel(EncodingError)` ▪ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		○ `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. ○ `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. ○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
struct Endpoint: NowAPIEndpoint {
  let httpMethod: HTTPMethod
  let relativePath: String
  let requiresAuthentication: Bool
}

/// HTTP request method
public enum HTTPMethod: CaseIterable {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    case options, get, head, post, put, patch, delete, trace,
 connect
}
let relativePath = "/api/now/account"
let endPoint = Endpoint(httpMethod: HTTPMethod.get,
 relativePath: relativePath, requiresAuthentication: true)

apiService.data(for: endPoint, queryItems: ["name": "abel"],
 httpHeaders: httpHeaders, body: body.data(using: .utf8))
 { [weak self] (result) in
  switch result {
    case .success(let response):
    // Data request successful
    case .failure(let error):
    // Data request failed, return NowDataError
    // .failure(error)
  }
}
```

NowAPIService - data(for endpoint: NowAPIEndpoint, queryItems: [String: String], httpHeaders: [String: String], body: Data) async throws

Requests data from the specified ServiceNow REST API.

Parameters

Name	Type	Description
for endpoint	NowAPIEndpoint	Object containing the ServiceNow REST API endpoint to access, including the HTTP method, relative path to the endpoint, path parameters, and whether authentication is required.
queryItems	Array	Optional. Query parameters for the endpoint as key/value pairs. Default: nil
httpHeaders	Array	Optional. Request HTTP headers required by the endpoint as key/value pairs. Default: nil
body	String	Optional. Request body parameters. Default: nil

Returns

Type	Description
DataResponse	Returned when the method is successful. Data from the REST API call.
NowDataError	Thrown when the method fails.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	  Thrown when there is an error in the access token.
	• `attachmentValidation`
	  Thrown when an attachment fails validation.
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	  Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	  Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	  Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	  Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	  Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	  Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	  Thrown when an expected service configuration is missing.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
do {
    let dataResponse = try await apiService.data(for: endpoint,
 queryItems: queryItems, httpHeaders: httpHeaders, body: body)
    // Data request successful
} catch {
    // Data request failed, NowDataError thrown
}
```

NowAPIService - data(for endpoint: NowAPIEndpoint, queryItems: [String: String]? = nil, httpHeaders: [String: String]? = nil, body: Data? = nil)

Requests data from the specified ServiceNow REST API.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for endpoint	NowAPIEndpoint	Object containing the ServiceNow REST API endpoint to access, including the HTTP method, relative path to the endpoint, path parameters, and whether authentication is required.
queryItems	Array	Optional. Query parameters for the endpoint as key/value pairs. Default: nil
httpHeaders	Array	Optional. Request HTTP headers required by the endpoint as key/value pairs. Default: nil
body	Data	Optional. Request body parameters.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: nil

Returns

Type	Description

AnyPublisher<DataResponse, NowDataError>	Success: Data returned by the REST API.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`

Returns (continued)

Type	Description
	Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this function.

```
struct Endpoint: NowAPIEndpoint {
    let httpMethod: HTTPMethod
    let relativePath: String
    let requiresAuthentication: Bool
}

/// HTTP request method
public enum HTTPMethod: CaseIterable {
    case options, get, head, post, put, patch, delete, trace,
 connect
}
let relativePath = "/api/now/account"
let endPoint = Endpoint(httpMethod: HTTPMethod.get,
 relativePath: relativePath, requiresAuthentication: true)

// Using Combine
apiService.data(for: Endpoint(httpMethod: httpMethod,
 relativePath: endpointPath, requiresAuthentication:
 requiresAuthentication), queryItems: queryItems, httpHeaders:
 httpHeaders, body: body.data(using: .utf8))
```

```
  .receive(on: DispatchQueue.main)
  .sink { [weak self] (comp) in
    if case let .failure(error) = comp {
      // Data request failed, return NowDataError
    }
  } receiveValue: { [weak self] (response) in
    // Data request successful
    self?.publish(data: response.data)
  }
  .store(in: &self.subscriptions)
}
```

NowAttachment structure - iOS

The *NowAttachment* structure provides functions that enable you to validate attachments by comparing their computed hash.

Properties

Name	Type	Description
data	Data	Attachment data.
hash	String	Computed digest for the attachment data. This computed digest is used to validate the attachment by comparing it to the known digest stored in the attachment metadata. Calculating the computed digest is expensive; avoid using it in the UI. Instead, consider using the hash property in the NowAttachmentMetadata class. If you must use the computed hash, use it sparingly, and consider caching it.
metadata	NowAttachmentMetadata	Metadata associated with the attachment.

NowAttachment - validate()

Validates the attachment by comparing the computed hash for the attachment data to the digest stored in the attachment metadata.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the attachment is valid. Possible values: • true: Attachment is valid. • false: Attachment is invalid.

The following code example shows how to call this function.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
guard
  let metadataHeader =
 response.httpResponse?.value(forHTTPHeaderField:
 NowAttachment.attachmentMetadataHeaderKey),
  let metadataHeaderData = metadataHeader.data(using: .utf8)
 else {
    throw NowDataError.missingAttachmentMetadata
  }

let metadata = try coder.decode(NowAttachmentMetadata.self,
 from: metadataHeaderData)
let attachment = NowAttachment(metadata: metadata, data:
 response.data)

if !attachment.validate() {
  throw NowDataError.attachmentValidation
}
// Attachment is valid
return attachment
```

NowAttachmentMetadata structure - iOS

The *NowAttachmentMetadata* structure provides functions that enable you to encode and manage attachment metadata.

Properties

Name	Type	Description
averageImageColor	String	Most dominant color in the associated image.
chunkSizeInBytes	Integer	Size of the chunk. Unit: Bytes
compressedSize InBytes	Integer	Compressed size of the attachment. Unit: Bytes
created	Date	Date on which the attachment was created.
createdBy	String	Entity that created the attachment.
download	URL	URL of the attachment on the ServiceNow instance.
fileName	String	Name of the attachment file.
hash	String	Expected SHA256 digest for the attachment. A downloaded attachment is validated by comparing its computed digest to this SHA256 digest.
imageHeight	Integer	Height of image. Unit: Pixels
imageWidth	Integer	Width of image. Unit: Pixels

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
isCompressed	Boolean	Flag that indicates whether the attachment file is compressed. Possible values: • true: Attachment is compressed. • false: Attachment in not compressed.
mimeType	String	Attachment MIME type.
modificationCount	Integer	Number of times that the attachment was modified.
sizeInBytes	Integer	Size of the attachment. Unit: Bytes
sourceSysId	String	Sys_id of the attachment file.
sourceTableName	String	Name of the source table in which the attachment resides.
state		Availability state, such as conditionally, unavailable, available, and pending.
sysId	String	Unique 32-character Globally Unique ID (GUID), that identifies each record in a ServiceNow instance.
tags	String	List of tags associated with the attachment.
updated	Date	Date on which the attachment was last modified.
updatedBy	String	Entity that updated the attachment.

NowAttachmentMetadata - encode(to encoder: Encoder)

Encodes the current object value into data using the specified encoder.

If the object fails to be encoded into data, the encoder encodes an empty keyed container in its place. This function also throws an error if any values are invalid for the specified encoder's format.

Parameters

Name	Type	Description
to encoder	Encoder	Encoder that defines the structure of the encoded output.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let query = "active=true^short_descriptionLIKEbroken"
let filter = Filter(query: query)
metadataPublisher(filter: filter, limit: 1)
private func metadataPublisher(filter: Filter?, limit: Int?) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  let publisher = attachmentService.attachmentMetadata(filter:
 filter, limit: limit)
  publisher
  .receive(on: DispatchQueue.main)
  .encode(encoder: JSONEncoder())
  .sink { [weak self] completion in
    if case let .failure(error) = completion {
      // attachment published failed, return NowDataError
    }
  } receiveValue: { [weak self] (data) in
    // Attachment published successful, return data
  }
  .store(in: &subscriptions)
}
```

NowAttachmentMetadata - init(from decoder: Decoder)

Creates a new NowAttachmentMetadata instance by decoding data into an object from the specified decoder.

This method throws an error if reading from the decoder fails or if the data read is corrupt or otherwise invalid.

Parameters

Name	Type	Description
decoder	Decoder	Decoder to read data from.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
guard
  let metadataHeader =
 response.httpResponse?.value(forHTTPHeaderField:
 NowAttachment.attachmentMetadataHeaderKey),
  let metadataHeaderData = metadataHeader.data(using: .utf8)
 else {
    throw NowDataError.missingAttachmentMetadata
  }

let metadata = try coder.decode(NowAttachmentMetadata.self,
 from: metadataHeaderData)
let attachment = NowAttachment(metadata: metadata, data:
 response.data)
```

NowAttachmentService class - iOS

The *NowAttachmentService* class provides functions that enable you to upload and query attachments that are associated with records within a table on a ServiceNow instance.

You can upload or retrieve a single file with each request. *NowAttachmentService* respects any system limitations on uploaded files, such as maximum file size and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

allowed attachment types. You can control these settings using the instance properties com.glide.attachment.max_size, 1024MB by default, and glide.attachment.extensions.

Note: `NowAttachmentService` accepts all Content-Type values (/). Specify the file content type when uploading an attachment. The content type is stored with the file metadata, enabling other tools to correctly identify and parse the file.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration settings provided when the service was initialized.

NowAttachmentService - attachment(for sysId: String, validateAttachment: Boolean) async throws

Retrieves the attachment with the specified sys_id and validates the attachment by comparing the computed hash of the attachment to the expected SHA256 checksum.

Note: Validation of an attachment can cause a performance impact. You can skip the validation step by setting the `validateAttachment` parameter to `false`. You can validate the attachment at a later stage if needed by calling the `Attachment.validate()` function.

Parameters

Name	Type	Description
for sysId	String	Sys_id of the attachment to retrieve.
validateAttachment	Boolean	Flag that indicates whether to validate the attachment. Valid values: • true: Validate the attachment. • false: Do not validate the attachment. Default: true

Returns

Type	Description
NowAttachment	Returned when the method is successful. Specified attachment.
NowDataError	Thrown when the method fails. • `accessToken(AccessTokenProviderError)` ○ *AccessTokenProviderError*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `attachmentValidation` Thrown when an attachment fails validation. • `badResponse(statusCode: HTTPStatusCode)` ○ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response • `cannotDecodeModel(DecodingError)` ○ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. • `cannotDecodeProperty(type: Any, from: String)` ○ *`type`*: Wrapped type to decode from a string. ○ *`from`*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. • `cannotEncodeModel(EncodingError)` ○ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
func downloadAttachment(sysId: String) async throws ->
 NowAttachment {
    do {
        let nowAttachment = try await
 attachmentService.attachment(for: sysId, validateAttachment:
 false)
        return nowAttachment
    } catch {
        // Handle NowDataError
        throw error
    }
}
```

NowAttachmentService - attachment(for sysId: String, validateAttachment: Boolean, completion: @escaping (Result<NowAttachment, NowDataError>))

Retrieves the attachment with the specified sys_id and validates the attachment by comparing the computed hash of the attachment to the expected SHA256 checksum. Once finished, it executes the passed completion handler.

Note: Validation of an attachment can cause a performance impact. You can skip the validation step by setting the *`validateAttachment`* parameter to `false`. You can validate the attachment at a later stage if needed by calling the *`Attachment.validate()`* function.

Parameters

Name	Type	Description
for sysId	String	Sys_id of the attachment to retrieve.
validateAttachment	Boolean	Flag that indicates whether to validate the attachment. Valid values: • true: Validate the attachment. • false: Do not validate the attachment. Default: true
completion	@escaping (Result <NowAttachment, NowDataError>)	Completion handler to execute after the attachment is retrieved. Return values for the completion handler: • Success: NowAttachment - Requested attachment • Failure: NowDataError

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response ○ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. ○ `cannotDecodeProperty(type: Any, from: String)` ▪ *`type`*: Wrapped type to decode from a string. ▪ *`from`*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. ○ `cannotEncodeModel(EncodingError)` ▪ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. ○ `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. ○ `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let sysId = UUID().uuidString  // UUID for the attachment
private func downloadAttachment(sysId: String) {
  attachmentService.attachment(for: sysId, validateAttachment:
 false) { (result) in
    switch result {
      case .success(let attachment):
        // Attachment retrieved successful, return attachment
      case .failure(let error):
        // Attachment retrieved failed, return NowDataError
    }
  }
}
```

NowAttachmentService - attachment(for sysId: String, validateAttachment: Boolean)

Retrieves the attachment with the specified sys_id and validates the attachment by comparing the computed hash of the attachment to the expected hash.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Validation of an attachment can cause a performance impact. You can skip the validation step by setting the *`validateAttachment`* parameter to `false`. If needed, you can validate the attachment at a later stage by calling the *`Attachment.validate()`* function.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for sysId	String	Sys_id of the attachment to retrieve.
validateAttachment	Boolean	Flag that indicates whether to validate the attachment. Valid values: • true: Validate the attachment. • false: Don't validate the attachment. Default: true

Returns

Type	Description
AnyPublisher <NowAttachment, NowDataError>	Success: NowAttachment - Contains the specified attachment. Failure: NowDataError • `accessToken(AccessTokenProviderError)` ○ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. • `attachmentValidation` Thrown when an attachment fails validation. • `badResponse(statusCode: HTTPStatusCode)` ○ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response • `cannotDecodeModel(DecodingError)` ○ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. • `cannotDecodeProperty(type: Any, from: String)`

Returns (continued)

Type	Description
	○ *type*: Wrapped type to decode from a string. ○ *from*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. • `cannotEncodeModel(EncodingError)` ○ *EncodingError*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this function.

```
let sysId = UUID().uuidString  // UUID for the attachment
private func downloadAttachment(sysId: String) {
  let publisher = self.attachmentService.attachment(for: sysId,
 validateAttachment: false)
  publisher
    .receive(on: DispatchQueue.main)
    .sink { [weak self] completion in
      if case let .failure(error) = completion {
```

```
        // Attachment retrieved failed, return NowDataError
      }
    } receiveValue: { [weak self] (attachment) in
      // Attachment retrieved successful, return attachment
    }
    .store(in: &subscriptions)
}
```

NowAttachmentService - attachmentMetadata(filter: Filter, limit: Int) async throws

Retrieves the metadata for all the attachments that meet the specified criteria.

Parameters

Name	Type	Description
filter	Filter	Optional. Query string to use to filter the attachments whose metadata to return. Default: nil - Returns metadata for all available attachments. Takes into consideration the *`limit`* parameter.
limit	Integer	Optional. Maximum number of attachment file's metadata to return. Default: nil - Returns all metadata that meets the *`filter`* parameter specifications.

Returns

Type	Description
[NowAttachmentMetadata]	Returned when the method is successful. Array that contains the metadata for the matching attachments.
NowDataError	Thrown when the method fails. • `accessToken(AccessTokenProviderError)` ◦ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. • `attachmentValidation` Thrown when an attachment fails validation. • `badResponse(statusCode: HTTPStatusCode)` ◦ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response • `cannotDecodeModel(DecodingError)` ◦ *`DecodingError`*: Decoding error detected.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	Thrown when an expected service configuration is missing.
	• `missingSysID`
	Thrown when an expected sys_id parameter is missing.
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
let filter = Filter(criteria: [], sortBy: [.desc("created")],
            queryCategory: nil)
do {
```

```
    let metadata = try await
 attachmentService.attachmentMetadata(filter: filter, limit: 10)
    // Metadata retrieval successful
} catch {
    // Metadata retrieval failed, NowDataError thrown
}
```

NowAttachmentService - attachmentMetadata(filter: Filter, limit: Int, completion: @escaping (Result<[NowAttachmentMetadata], NowDataError>))

Retrieves the metadata for all the attachments that meet the specified criteria.

Parameters

Name	Type	Description
filter	Filter	Optional. Query string to use to filter the attachments whose metadata to return. Default: nil - Returns metadata for all available attachments. Takes into consideration the *`limit`* parameter.
limit	Integer	Optional. Maximum number of attachment file's metadata to return. Default: nil - Returns all metadata that meets the *`filter`* parameter specifications.
completion	@escaping (Result <[NowAttachmentMetadata], NowDataError>)	Completion handler to execute after the metadata is retrieved. Return values for the completion handler: • Success: NowAttachmentMetadata - Objects containing the requested metadata. • Error: NowDataError ◦ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ◦ `attachmentValidation` Thrown when an attachment fails validation. ◦ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response

Parameters (continued)

Name	Type	Description
		▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let query = "active=true^short_descriptionLIKEbroken"
let filter = Filter(query: query)
attachmentService.attachmentMetadata(filter: filter, limit:
 limit) { (result) in
  DispatchQueue.main.async { [weak self] in
    switch result {
    case .success(let response):
      do {
        let data = try JSONEncoder().encode(response)
        // Retrieve metadata successfully, return data
      } catch {
        // Retrieve metadata failed, return error
      }
    case .failure(let error):
      // Retrieve metadata failed, return NowDataError
    }
  }
}
```

NowAttachmentService - attachmentMetadata(filter: Filter, limit: Int)

Retrieves the metadata for all the attachments that meet the specified criteria.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
filter	Filter	Optional. Query string to use to filter the attachments whose metadata to return. Default: nil - Returns metadata for all available attachments. Takes into consideration the *`limit`* parameter.
limit	Integer	Optional. Maximum number of attachment file's metadata to return. Default: nil - Returns all metadata that meets the *`filter`* parameter specifications.

Returns (continued)

Type	Description
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this function.

```
let query = "active=true^short_descriptionLIKEbroken"
let filter = Filter(query: query)
let publisher =
 self.attachmentService.attachmentMetadata(filter: filter)
publisher
  .receive(on: DispatchQueue.main)
  .encode(encoder: JSONEncoder())
  .sink { [weak self] completion in
    if case let .failure(error) = completion {
      // Retrieve metadata failed, return NowDataError
  } receiveValue: { [weak self] (data) in
     // Retrieve metadata successfully, return data
  }
.store(in: &subscriptions
```

NowAttachmentService - attachmentMetadata(for sysId: String) async throws

Retrieves the metadata for the attachment associated with the specified sys_id.

Parameters

Name	Type	Description
for sysId	String	Sys_id of the attachment whose metadata to retrieve.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
NowAttachmentMetadata	Returned when the method is successful. Metadata for the requested attachment.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`
	
	Thrown when a response from the instance cannot be parsed into its expected format.
	
	• `invalidURL`
	
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	
	• `missingAttachmentMetadata`

Returns (continued)

Type	Description
	Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
do {
    let metadata = try await
 attachmentService.attachmentMetadata(for: sysId)
    // Metadata retrieval successful
} catch {
    // Metadata retrieval failed, NowDataError thrown
}
```

NowAttachmentService - attachmentMetadata(for sysId: String, completion: @escaping (Result<NowAttachmentMetadata, NowDataError>))

Retrieves the metadata for the attachment associated with the specified sys_id and then executes the completion handler after the metadata is retrieved.

Parameters

Name	Type	Description
for sysId	String	Sys_id of the attachment whose metadata to retrieve.
completion	@escaping (Result <NowAttachmentMetadata, NowDataError>)	Completion handler to execute after the metadata is retrieved. Return values for the completion handler: • Success: NowAttachmentMetadata - Requested metadata • Failure: NowDataError

Parameters (continued)

Name	Type	Description
		○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response ○ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. ○ `cannotDecodeProperty(type: Any, from: String)` ▪ *`type`*: Wrapped type to decode from a string. ▪ *`from`*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. ○ `cannotEncodeModel(EncodingError)` ▪ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. ○ `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. ○ `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.

Parameters (continued)

Name	Type	Description
		○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let sysId = UUID().uuidString  // UUID for the attachment
attachmentService.attachmentMetadata(for: sysId) { (result) in
  DispatchQueue.main.async { [weak self] in
    switch result {
      case .success(let response):
        do {
          let data = try JSONEncoder().encode(response)
          // Retrieve metadata successfully, return data
        } catch {
          // Retrieve metadata failed, return error
        }
      case .failure(let error):
        // Retrieve metadata failed, return NowDataError
    }
  }
}
```

NowAttachmentService - attachmentMetadata(for sysId: String)

Retrieves the metadata for the attachment associated with the specified sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for sysId	String	Sys_id of the attachment whose metadata to retrieve.

Returns

Type	Description

AnyPublisher <[NowAttachmentMetadata], NowDataError>	Success: NowAttachmentMetadata - Object that contains the metadata for the requested attachment.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	Thrown when a Codable model cannot be encoded to JSON.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• `cannotParseResponse`
	
	Thrown when a response from the instance cannot be parsed into its expected format.
	
	• `invalidURL`
	
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	
	• `missingAttachmentMetadata`
	
	Thrown when the attachment metadata header is missing.
	
	• `missingServiceConfiguration`
	
	Thrown when an expected service configuration is missing.
	
	• `missingSysID`
	
	Thrown when an expected sys_id parameter is missing.
	
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	
	Thrown when a network service encountered an error.

The following code example shows how to call this function.

```
let sysId = UUID().uuidString  // UUID for the attachment
let publisher = self.attachmentService.attachmentMetadata(for:
 sysId)
publisher
  .receive(on: DispatchQueue.main)
  .encode(encoder: JSONEncoder())
  .sink { [weak self] completion in
    if case let .failure(error) = completion {
      // Retrieve metadata failed, return NowDataError
    }
  } receiveValue: { [weak self] (data) in
     // Retrieve metadata successfully, return data
  }
.store(in: &subscriptions)
```

NowAttachmentService - attachmentMetadataPaginator(filter: Filter, limit: Int)

Retrieves the metadata for all the attachments that meet the specified criteria and returns a Paginator object for iterating through the pages of the returned metadata.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
filter	Filter	Optional. Query string to use to filter the attachments whose metadata to return. Default: nil - Returns metadata for all available attachments. Takes into consideration the *`limit`* parameter.
limit	Integer	Optional. Maximum number of attachment file's metadata to return. Default: nil - Returns all metadata that meets the *`filter`* parameter specifications.

Returns

Type	Description

Paginator <[NowAttachmentMetadata]>	Success: Array of NowAttachmentMetadata objects.
	Failure: NowDataError object.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ *EncodingError*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this function.

```
let paginator: Paginator<T> = makePaginator(query: query,
 fetchLimit: 1)

func makePaginator(query: String, fetchLimit: Int?) ->
 Paginator<[NowAttachmentMetadata]> {
  attachmentsService.attachmentMetadataPaginator(filter:
 Filter(query: query), limit: fetchLimit)
}
```

NowAttachmentService - delete(sysId: String) async throws

Deletes the attachment with the specified sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sysId	String	Sys_id of the attachment to delete.

Returns

Type	Description
None	Nothing is returned if the method was successful.

NowDataError	Thrown when the method fails.
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	  Thrown when there is an error in the access token.
	• `attachmentValidation`
	  Thrown when an attachment fails validation.
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	  Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	  Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	  Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	  Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
do {
    try await attachmentService.delete(sysId: sysId)
    // Deletion successful
} catch {
    // Deletion failed, NowDataError thrown
}
```

NowAttachmentService - delete(sysId: String, completion: @escaping (Result<Void, NowDataError>))

Deletes the attachment with the specified sys_id and then executes the passed completion handler after the attachment is deleted.

Parameters

Name	Type	Description
sysId	String	Sys_id of the attachment to delete.
completion	@escaping (Result<Void, NowDataError>)	Completion handler to execute after the attachment is deleted. Return values for the completion handler: • Success: Void • Error: NowDataError

© 2026 ServiceNow, Inc. All rights reserved.

Parameters (continued)

Name	Type	Description
		Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let sysId = UUID().uuidString  // UUID for the attachment
attachmentService.delete(sysId: sysId) { (result) in
  DispatchQueue.main.async { [weak self] in
    switch result {
      case .success:
        // Attachment with sysId is deleted
      case .failure(let error):
        // Failed to delete, with NowDataError
    }
  }
}
```

NowAttachmentService - delete(sysId: String)

Deletes the attachment with the specified sys_id.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
sysId	String	Sys_id of the attachment to delete.

Returns

Type	Description

AnyPublisher<Void, NowDataError>	Success: Nothing returned
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`
	
	Thrown when a response from the instance cannot be parsed into its expected format.
	
	• `invalidURL`

Returns (continued)

Type	Description
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this function.

```
let publisher = attachmentService.delete(sysId: sysId)
publisher
  .receive(on: DispatchQueue.main)
  .sink { [weak self] completion in
    switch completion {
      case .finished:
        // Attachment with sysId is deleted
      case .failure(let error):
       // Failed to delete, with NowDataError
   }
 } receiveValue: {
 }
 .store(in: &subscriptions)
```

NowAttachmentService - init(configuration: NowServiceConfiguration, coreServiceProvider: NowCoreServiceProviding)

Initializes a new NowAttachmentService instance.

Parameters

Name	Type	Description
configuration	NowServiceConfiguration	Configuration information needed to properly initialize the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
coreServiceProvider	NowCoreServiceProviding	Optional. Object implementing the NowCoreServiceProviding protocol. Default: nil

The following code example shows how to call this function.

```
guard let coreService = NowSDK.core() else {
  // Error with NowServiceError.sdkNotConfigured
  return
}
guard
  let instanceUrl = URL(string:
 "http://sample.service-now.com"),
  let serviceConfig = NowSDK.makeServiceConfiguration(for:
 instanceUrl) else {
    // Could not create service -
    // NowServiceError.serviceConfigurationInvalid
    return
}
let attachmentService = NowAttachmentService(configuration:
 serviceConfig, coreServiceProvider: coreService)
```

NowAttachmentService - upload(data: Data, configuration: NowAttachmentUploadConfiguration, progressUpdate: @escaping ProgressUpdate) async throws

Uploads the attachment data and attaches it to a record in a table as specified in the upload configuration.

The *`ProgressUpdate`* callback provides upload progress information that you can then use to provide UI feedback.

Parameters

Name	Type	Description
data	Data	Attachment to upload.
configuration	NowAttachmentUpload Configuration	Configuration information that defines the upload parameters for the attachment, such as: • Table and record to attach the file to • Attachment file name • Type of attachment • Whether the file is encrypted
progressUpdate	@escaping ProgressUpdate	Completion handler to execute after the attachment is retrieved. This is called multiple times until the upload process is complete. Return values for the completion handler:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		ProgressUpdate - Returns the current progress of the upload. `ProgressUpdate = (_bytesWritten: Int64, _totalBytesWritten: Int64, _totalBytesExpectedToWrite: Int64) -> Void`

Returns

Type	Description
NowAttachmentMetadata	Returned when the method is successful. Object that contains the uploaded metadata.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	Thrown when a Codable model cannot be encoded to JSON.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ◦ genericError(String) ◦ operationCanceled ◦ serviceDisabled ◦ serverError(Error) ◦ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
func uploadFile(for tableName: String, sysId: String, mimeType:
 String, encryptionContext: String?, data: Data, filename:
 String) async throws -> NowAttachmentMetadata {

    let mimeType = MediaUtilities.mimeType(forFileName:
 filename)
    let uploadConfig =
 NowAttachmentUploadConfiguration(tableName: tableName,

 recordSysId: sysId,

 fileName: filename,

 contentType: mimeType,

 encryptionContext: encryptionContext)

    do {
```

```
        let attachmentMetadata = try await
 attachmentService.upload(data: data, configuration:
 uploadConfig) { (_, _, _) in }
        return attachmentMetadata
    } catch {
        // Handle NowDataError
        throw error
    }
}
```

NowAttachmentService - upload(data: Data, configuration: NowAttachmentUploadConfiguration, progressUpdate: @escaping ProgressUpdate, completion: @escaping (Result<NowAttachmentMetadata, NowDataError>))

Uploads the attachment data and attaches it to a record in a table as specified in the upload configuration.

The `ProgressUpdate` callback provides upload progress information that you can then use to provide UI feedback.

Parameters

Name	Type	Description
data	Data	Attachment to upload.
configuration	NowAttachmentUpload Configuration	Configuration information that defines the upload parameters for the attachment, such as: • Table and record to attach the file to • Attachment file name • Type of attachment • Whether the file is encrypted
progressUpdate	@escaping ProgressUpdate	Completion handler to execute after the attachment is retrieved. This is called multiple times until the upload process is complete. Return values for the completion handler: ProgressUpdate - Returns the current progress of the upload. `ProgressUpdate = (_bytesWritten: Int64, _totalBytesWritten: Int64, _totalBytesExpectedToWrite: Int64) -> Void`
completion	@escaping (Result<NowAttachmentMetadata, NowDataError>)	Completion handler to execute after the metadata is uploaded. Return values for the completion handler: • Success: NowAttachmentMetadata - Object containing the metadata for the uploaded attachment. • Error: NowDataError

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response ○ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. ○ `cannotDecodeProperty(type: Any, from: String)` ▪ *`type`*: Wrapped type to decode from a string. ▪ *`from`*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. ○ `cannotEncodeModel(EncodingError)` ▪ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. ○ `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. ○ `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
typealias ProgressUpdate = (_ bytesWritten: Int64, _
 totalBytesWritten: Int64, _ totalBytesExpectedToWrite: Int64)
 -> Void

let image = UIImage(named: "photo.png")
let data = image.pngData()
let recordSysId = "" // Sys_id of the record on the SN instance

let config = NowAttachmentUploadConfiguration(
  tableName: "tableName",
  recordSysId: recordSysId,
  fileName: "photo.png",
  contentType: "image/png",
  encryptionContext: nil)

private func uploadFile(
  data: Data,
  config: NowAttachmentUploadConfiguration,
  progress: @escaping ProgressUpdate) {
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    attachmentService.upload(data: data, configuration: config,
progressUpdate: progress) { (result) in
      DispatchQueue.main.async { [weak self] in
        switch result {
          case .success(let response)
            do {
              let data = try JSONEncoder().encode(response)
                // Upload file successfully, return data
            } catch
                // Upload file decode failed, return error
            }
          case .failure(let error):
                // Upload file failed, return NowDataError
      }
    }
  }
```

NowAttachmentService - upload(data: Data, configuration: NowAttachmentUploadConfiguration, progressUpdate: @escaping ProgressUpdate)

Uploads the attachment data and attaches it to a record in a table as specified in the upload configuration.

The `ProgressUpdate` callback provides upload progress information that you can then use to provide UI feedback.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
data	Data	Attachment to upload. The data size and type of attachment that you can upload are controlled by your ServiceNow instance.
configuration	NowAttachmentUploadConfiguration	Configuration information that defines the upload parameters for the attachment, such as: • Table and record to attach the file to • Attachment file name • Type of attachment • Whether the file is encrypted
progressUpdate	@escaping ProgressUpdate	Completion handler to execute after the attachment is retrieved. Return values for the completion handler: ProgressUpdate - Returns the current progress of the upload. This is called multiple times until the upload process is complete.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`ProgressUpdate = (_bytesWritten: Int64, _totalBytesWritten: Int64, _totalBytesExpectedToWrite: Int64) -> Void`

Returns

Type	Description

AnyPublisher <NowAttachmentMetadata, NowDataError>	Success: NowAttachmentMetadata - Object that contains the metadata for the requested attachment.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	Thrown when a Codable model cannot be encoded to JSON.

```
    let publisher = attachmentService.upload(data: data,
configuration: config, progressUpdate: progress)

    publisher
      .receive(on: DispatchQueue.main)
      .encode(encoder: JSONEncoder())
      .sink { [weak self] completion in
        if case let .failure(error) = completion {
          // Upload file failed, return NowDataError
        }
      } receiveValue: { [weak self] (data) in
        // Upload file successfully, return data
      }
      .store(in: &subscriptions)
  }
```

NowAttachmentUploadConfiguration structure - iOS

The *NowAttachmentUploadConfiguration* structure enables you to define the configuration information for an attachment that you are uploading to your ServiceNow instance.

Properties

Name	Type	Description
contentType	String	HTTP data content type.
encryptionContext	String	Optional. Sys_id of an encryption context record. Specify this parameter to allow only users with the specified encryption context to access the attachment. Default: Attached file is not encrypted with any encryption context.
fileName	String	Name of the attachment file.
recordSysId	String	Sys_id of the record on the ServiceNow instance to associate the attachment with.
tableName	String	Name of the table on the ServiceNow instance that contains the record specified in the *recordSysid* parameter.

NowAttachmentUploadConfiguration init(tableName: String, recordSysId: SysID, fileName: String, contentType: String, encryptionContext: String?)

Sets the upload configuration values for the specified attachment.

Parameters

Name	Type	Description
tableName	String	Name of the table on the ServiceNow instance that contains the record specified in the *recordSysid* parameter.
recordSysId	String	Sys_id of the record on the ServiceNow instance to associate the attachment with.
fileName	String	Name of the attachment file.
contentType	String	HTTP data content type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
encryptionContext	String	Optional. Sys_id of an encryption context record. Specify this parameter to allow only users with the specified encryption context to access the attachment. Default: Attached file is not encrypted with any encryption context.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let recordSysId = "" // Sys_id of the record on the SN instance

let config = NowAttachmentUploadConfiguration(
  tableName: "tableName",
  recordSysId: recordSysId,
  fileName: "photo.png",
  contentType: "image/png",
  encryptionContext: nil)
```

NowChat API - iOS

The *NowChat* API is a top-level global API that enables users to instantiate a NowChat service instance.

NowChat - makeChatService(instanceUrl: URL, delegate: NowChatServiceDelegate?)

Creates an instance of NowChatService with the specified configuration.

Note: You must initialize the SDK prior to calling this function or the completion block is called with a `sdkNotConfigured` error. To initialize the SDK, call the `NowSDK.configure()` method with the desired configuration.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance providing chat services.
delegate	NowChatServiceDelegate	Optional. Delegate object that implements the NowChatServiceDelegate protocol.

Returns

Type	Description
AnyPublisher<NowChatService, NowServiceError>	If successful, returns an initialized NowChatService object. If it fails, returns a NowServiceError object.

The following code example shows how to call this function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
….
guard
  let jwtUrl = URL(string: "http://xx.xx.xx.xxx:8080"),
  let instanceUrl = URL(string:
 "https://instance.service-now.com") else {
    return
  }
// AuthorizationProvider - struct conforming to
 NowSDKAuthorizationProviding protocol
let authorizationProvider = AuthorizationProvider(userEmail:
 "sdk@servicenow.com", jwtProviderUrl: jwtUrl, clientId:
 "deb8756b452d201039231ca568f26511")

// PermissionProvider - class conforming to
 DevicePermissionDelegate protocol
let permissionProvider = PermissionProvider()
let config = NowSDKConfiguration(authorizationProvider:
 authorizationProvider, permissionDelegate: permissionProvider,
 logLevel: .debug)

do {
  try NowSDK.configure(with: config)
  let chat = setup(with: instanceUrl)
} catch {
  // Return ConfigurationError.sdkError(error)
}
…..

func initializeChatService(with instanceURL: URL) ->
 AnyPublisher<NowService, ConfigurationError> {
  NowChat.makeChatService(instanceUrl: instanceURL, delegate:
 nil)
  .mapError { .sdkError($0) }
  .map { $0 as NowService }
  .eraseToAnyPublisher()
}
```

NowChat - makeChatService(instanceUrl: URL, delegate: NowChatServiceDelegate?, completion: @escaping ((Result<NowChatService, NowServiceError>) -> Void))

Creates an instance of `NowChatService` with the specified configuration, and once complete, calls the specified completion handler.

Note: You must initialize the SDK prior to calling this function or the completion block is called with a `sdkNotConfigured` error. To initialize the SDK, call the `NowSDK.configure()` method with the desired configuration.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance providing chat services.
delegate	NowChatServiceDelegate	Optional. Delegate object that implements the NowChatServiceDelegate protocol.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
completion	@escaping ((Result<NowChatService, NowServiceError>) -> Void)	Completion handler that is called containing either an initialized `NowChatService` instance or a `NowServiceError` indicating why the initialization failed.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
func initializeChatService() {
  NowChat.makeChatService(instanceUrl: instanceUrl, delegate:
 self) { [weak self] result in
    guard let self = self else { return }

    switch result {
    case .success(let service):
      self.chatService = service
    case .failure(let error):
      debugPrint("Creating the chat service failed with error:
 \(error)")
    }
    self.viewState = self.makeViewState()
  }
}
```

NowChatColoring protocol - iOS

The *`NowChatColoring`* protocol defines default colors for the elements in the Live Agent and Virtual Agent chat UI.

You can modify these default colors and create your own themes for your specific chat implementation.

Properties

Name	Description
alertCritical0	Color applied to the alert pop-up background. Default dark color: #7B1E28 Default light color: #F8C8CD
alertCritical3	Color applied to the alert pop-up icon and bar. Default dark color: #E46876 Default light color: #B61C2D

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
backgroundPrimary	Background color applied to the chat view background, choice picker, input background, and the card background. Default dark color: #07080B Default light color: #FFFFFF
backgroundPrimaryActionable	Background color applied to the pagination selected and pop-up backgrounds. Default dark color: #FFFFFF Default light color: #151920
backgroundSecondary	Background color applied to the bottom bar, columns in cards, and the search background in a choice picker. Default dark color: #151920 Default light color: #F6F6F8
backgroundSecondaryActionable	Background color applied to selectable inputs such as the search background and the date/time background. Default dark color: #C1C5CD Default light color: #2C323F
backgroundTertiary	Background color applied to the agent and bot chat bubbles. Default dark color: #252A35 Default light color: #E4E6EA
borderTertiary	Color applied to chat input borders. Default dark color: #454D5B Default light color: #D3D6DC
brand	Color applied to the activity indicator shown while loading pages. Default dark color: #302F4B Default light color: #302F4B
brandBackground	Background color applied to the user bubble background. Default dark color: #28284D Default light color: #D1D2EE
destructive	Color applied to UI elements that trigger destructive actions (e.g.: Delete)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
	Default light color: #D3D6DC
shadow	Color applied to card shadow. Default dark color: #151920 Default light color: #151920
textActionable	Color applied to button text or highlighted backgrounds. Default dark color: #07080B Default light color: #FFFFFF
textSecondary	Color applied to card content and search bar icon and text. Default dark color: #C1C5CD Default light color: #2C323F
textTertiary	Color applied to weekdays in a calendar and as a placeholder. Default dark color: ##8F95A1 Default light color: #454D5B

The following shows the default colors used for *NowChatColoring*. You can override any or all of these colors.

```
public extension NowChatColoring {
    var brand: UIColor {  nowUIColor.brand }
    var primary: UIColor {  nowUIColor.primary }
    var textActionable: UIColor { nowUIColor.textActionable }
    var screenHeaderText: UIColor
 { nowUIColor.screenHeaderText }
    var backgroundPrimary: UIColor
 { nowUIColor.backgroundPrimary }
    var backgroundSecondary: UIColor {
        nowUIColor.backgroundSecondary }
    var backgroundTertiary: UIColor {
        nowUIColor.backgroundTertiary }
    var backgroundPrimaryActionable: UIColor
 { nowUIColor.backgroundPrimaryActionable }
    var backgroundSecondaryActionable: UIColor
 { nowUIColor.backgroundSecondaryActionable }
    var brandBackground: UIColor { nowUIColor.brandBackground }
    var separatorPrimary: UIColor
 { nowUIColor.separatorPrimary }
    var separatorTertiary: UIColor
 { nowUIColor.separatorTertiary }
    var borderTertiary: UIColor { nowUIColor.borderTertiary }
    var shadow: UIColor { nowUIColor.shadow }
    var linkSecondary: UIColor { nowUIColor.linkSecondary }
```

```
    var notification: UIColor { nowUIColor.notification }
    var alertCritical0: UIColor { nowUIColor.alertCritical0 }
    var alertCritical3: UIColor { nowUIColor.alertCritical3 }
}
```

NowChatOptions - iOS

The *NowChatOptions* class enables you to configure options, such as showing a prompt before closing a chat window or disable features while using chat, on a chat session.

NowChatOptions - ClosePrompt(header: String?, message: String, acceptButtonTitle: String, declineButtonTitle: String)

Creates and returns a ClosePrompt object based on the passed parameters. You then pass this object into the *NowChatOptions()* method to configure the close prompt options within a chat session.

Parameters

Name	Type	Description
header	String	Text to display on the prompt's header. If you don't want to display a prompt header, pass "nil".
message	String	Text to display as the prompt's main text.
acceptButtonTitle	String	Text to display on the prompt's primary button for closing the chat window.
declineButtonTitle	String	Text to display on the prompt's secondary button that dismisses the prompt.

The following code example shows how to call this function.

```
func makeChatScreen() -> UIViewController? {
  guard let chatService = chatService else { return nil }
  let closePrompt = NowChatOptions.ClosePrompt(
    header: "Close Window",
    message: "Are you sure you want to close the chat window?",
    acceptButtonTitle: "Yes",
    declineButtonTitle: "No")

  let disabledFeatures = [.startNewConversation]

  let chatOptions = NowChatOptions(closePrompt: closePrompt,
    disabledFeatures: disabledFeatures,
    forceNewConversation: true)

  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(chatColors: ChatColors()), chatOptions:
 chatOptions)

  switch result {
  case .success(let chatViewController):
    return chatViewController
  case .failure(let error):
    return nil
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
}
```

NowChatOptions - NowChatOptions(closePrompt: ClosePrompt?, disabledFeatures: [Feature]?, forceNewConversation: Bool)

Configures options for the current chat session. This method enables you to show a prompt before closing a chat window, disable features while using chat, and force a new chat conversation when the chat service starts.

Parameters

Name	Type	Description
closePrompt	ClosePrompt object	Prompt to display before closing the associated chat window. If you don't want to display a close prompt, pass "nil".
disabledFeatures	[Feature]	List of chat features to disable within the current chat session. Valid value: • startNewConversation: Hide/disable the **StartNew Conversation** button that appears in a chat window. The available chat features are defined in the *`NowChatOptions.Feature`* enum class. If you don't want to disable any features, pass "nil".
forceNewConversation	Boolean	Flag that indicates whether to force a new chat conversation when the chat session starts. Any current conversations are closed. Valid values: • true: Start a new chat conversation; a new chat window opens. • false: Don't start a new chat conversation; use the existing chat window. Default: false

Returns

Type	Description
chatOptions	Returns a chatOptions object that you can pass in the NowChatService - makeChatUI(theme: NowChatThemeable, chatOptions: NowChatOptions? = nil) -> Result<UIViewController, NowChatServiceError>) method.

The following code example shows how to call this function.

```
func makeChatScreen() -> UIViewController? {
  guard let chatService = chatService else { return nil }
  let closePrompt = NowChatOptions.ClosePrompt(
    header: "Close Window",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    message: "Are you sure you want to close the chat window?",
    acceptButtonTitle: "Yes",
    declineButtonTitle: "No")

  let disabledFeatures = [.startNewConversation]

  let chatOptions = NowChatOptions(closePrompt: closePrompt,
    disabledFeatures: disabledFeatures,
    forceNewConversation: true)

  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(chatColors: ChatColors()), chatOptions:
 chatOptions)

  switch result {
  case .success(let chatViewController):
    return chatViewController
  case .failure(let error):
    return nil
  }
}
```

NowChatService class - iOS

The *NowChatService* class provides Virtual and Live Agent chat capabilities.

Using this class you can start and stop chat services, start chat sessions, create a chat user interface, and subscribe/unsubscribe to unread messages.

Properties

Name	Description
configuration	Configuration settings provided when the service was initialized. Data type: NowServiceConfiguration
instanceVersion	Version of the associated ServiceNow instance, such as utah or quebec. Data type: String
networkService	Network service associated with this chat service. Data type: NetworkService
sessionType	Type of session. Possible values: • authenticated • guest • impersonated • unknown Data type: SessionType

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowChatService - init(configuration: NowServiceConfiguration, delegate: NowChatServiceDelegate?, coreServiceProvider: NowCoreServiceProviding? = nil)

Initializes a new NowChatService instance.

Parameters

Name	Type	Description
configuration	NowServiceConfiguration	Configuration information needed to properly initialize the service.
delegate	NowChatServiceDelegate	Optional. NowChat callback delegate object implementing the NowChatServiceDelegate protocol. Default: nil
coreServiceProvider	NowCoreServiceProviding	Optional. Object implementing the NowCoreServiceProviding protocol. Provides access to NowChat services. Default: nil

The following code example shows how to call this function.

```
guard let coreService = NowSDK.core() else {
  // Error with NowServiceError.sdkNotConfigured
  return
}

guard
  let instanceUrl = URL(string:
 "http://sample.service-now.com"),
  let serviceConfig = NowSDK.makeServiceConfiguration(for:
 instanceUrl) else {
    // Could not create service -
    // NowServiceError.serviceConfigurationInvalid
    return
  }

let chatService = NowChatService(configuration: serviceConfig,
 delegate: delegate, coreServiceProvider: coreService)
```

NowChatService - makeChatUI(theme: NowChatThemeable, chatOptions: NowChatOptions? = nil) -> Result<UIViewController, NowChatServiceError>)

Creates a `UIViewController` that hosts the chat user interface.

Although this function creates the chat UI, you must still initiate the chat session by calling the *`startChat()`* function. You should make this call as the chat UI becomes visible. For more details, see the associated sample application and the Mobile SDK Developer Guide - iOS.

Parameters

Name	Type	Description
theme	NowChatThemeable Object	Theme information for the chat UI to create.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
chatOptions	NowChatOptions?	Optional. Options to apply to the chat session.

Returns

Type	Description
Object	Success: UIViewController object that contains the UI view controller configuration information. Failure: NowChatServiceError object. Possible errors: • chatServiceInvalid • coreServiceInvalid • guestUserNotAllowed • invalidCredentials • noSession • unknown • unsupportedServer

The following code example shows how to call this function.

```
func makeChatScreen() -> UIViewController? {
  guard let chatService = chatService else { return nil }
  let closePrompt = NowChatOptions.ClosePrompt(
    header: "Close Window",
    message: "Are you sure you want to close the chat window?",
    acceptButtonTitle: "Yes",
    declineButtonTitle: "No")

  let disabledFeatures = [.startNewConversation]

  let chatOptions = NowChatOptions(closePrompt: closePrompt,
    disabledFeatures: disabledFeatures,
    forceNewConversation: true)

  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(chatColors: ChatColors()), chatOptions:
 chatOptions)

  switch result {
  case .success(let chatViewController):
    return chatViewController
  case .failure(let error):
    return nil
  }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowChatService - shutdown()

Shuts down the chat service, including any active chat sessions.

After calling this function, the associated `NowChatService` is inactive and cannot be reused. To establish another chat session, create a new `NowChatService` instance by calling the *`NowChat.makeChatService()`* function.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
private func resetChat() {
  chatService?.shutdown()
  chatService = nil
  initializeChatService()
  viewState = makeViewState()
}

func initializeChatService() {
  NowChat.makeChatService(instanceUrl: instanceUrl, delegate:
 self) { [weak self] result in
    guard let self = self else { return }

    switch result {
    case .success(let service):
      self.chatService = service
    case .failure(let error):
      debugPrint("Creating the chat service failed with error:
 \(error)")
    }
    self.viewState = self.makeViewState()
}

func makeViewState() -> ViewState {
  ViewState(chatEnabled: chatService != nil,
    menuItems: menuItems)
}
```

NowChatService - startChat(contextData: [String: Any]?)

Starts a chat session.

Note: If you want to execute a completion task after the chat session is started, use the NowChatService - startChat(contextData: [String: Any]? = nil, _ completion: @escaping (Result<Void, NowChatServiceError>)) function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
contextData	[String: Any]?	Optional. Dictionary containing chat context variables that are passed into the chat session. For additional information on chat context variables, see Live agent chat context variables.

Returns

Type	Description
void or String	Success: void Error: NowChatServiceError Possible errors: • chatServiceInvalid • coreServiceInvalid • guestUserNotAllowed • invalidCredentials • noSession • unknown • unsupportedServer

The following code example shows how to call this function without passing context variables.

```
chatService.startChat { [weak self] result in
  if case .failure(let error) = result {
    debugPrint("Chat session initialization failed with error:
 \(error)")
    self?.resetChat()
  }
}
```

The following code example shows how to call this function with passing context variables.

```
chatService.startChat { [weak self] result in
  let contextData = ["sys_id": "123456789", "table_name":
 "wm_task", "active": true] as [String: Any]
  chatService.startChat(contextData: contextData) { [weak self]
 result in
    if case .failure(let error) = result {
      debugPrint("Chat session initialization failed with error:
 \(error)")
      self?.resetChat()
    }
  }
}
```

NowChatService - startChat(contextData: [String: Any]? = nil, _ completion: @escaping (Result<Void, NowChatServiceError>))

Starts a chat session and executes a completion block after chat session has started.

Parameters

Name	Type	Description
contextData	[String: Any]?	Optional. Dictionary containing chat context variables that are passed into the chat session. For additional information on chat context variables, see Live agent chat context variables.
completion	Object	Completion block to execute after the chat session has started.

Returns

Type	Description
void or String	Return values for the completion block: • Success: void • Error: NowChatServiceError Possible errors: • chatServiceInvalid • coreServiceInvalid • guestUserNotAllowed • invalidCredentials • noSession • unknown • unsupportedServer

The following code example shows how to call this function without context data.

```
func startChat() {
  guard let chatService = chatService else {
    debugPrint("Chat service is invalid")
    viewState = makeViewState()
    return
  }
  chatService.startChat { [weak self] result in
    if case .failure(let error) = result {
      debugPrint("Chat session initialization failed with error:
 \(error)")
      self?.resetChat()
    }
  }
}

func makeViewState() -> ViewState {
  ViewState(chatEnabled: chatService != nil,
```

```
    menuItems: menuItems)
}
```

The following code example shows how to call this function with context data.

```
func startChat() {
  guard let chatService = chatService else {
    debugPrint("Chat service is invalid")
    viewState = makeViewState()
    return
  }

  let contextData = ["sys_id": "123456789", "table_name":
 "wm_task", "active": true] as [String: Any]
  chatService.startChat(contextData: contextData) { [weak self]
 result in
    if case .failure(let error) = result {
      debugPrint("Chat session initialization failed with error:
 \(error)")
      self?.resetChat()
    }
  }
}

func makeViewState() -> ViewState {
  ViewState(chatEnabled: chatService != nil,
    menuItems: menuItems)
}
```

NowChatService - subscribeToUnreadMessageCount(pollingInterval: TimeInterval, completion: @escaping (Int) -> Void)

Subscribes to the unread message count listener.

Parameters

Name	Type	Description
pollingInterval	TimeInterval	Frequency at which to poll the web service for the unread chat message count. Unit: Seconds
completion	@escaping (Int) -> Void)	Completion handler to call to report the unread chat message count. *Int*: Number of unread chat messages.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
...
if viewModel.isPolling {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  viewModel.unsubscribeFromUnreadMessageCount()
  viewState.pollingInterval = ""
} else {
  viewModel.subscribeToUnreadMessageCount(pollingInterval:
 timeInterval)
}
…

func subscribeToUnreadMessageCount(pollingInterval:
 TimeInterval) {
  chatService.subscribeToUnreadMessageCount(pollingInterval:
 pollingInterval) { [weak self] count in
    self?.unreadMessageCount = count
  }
  isPolling = true
}
```

NowChatService - unsubscribeFromUnreadMessageCount()

Unsubscribes from receiving the unread message count listener.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
…
if viewModel.isPolling {
  viewModel.unsubscribeFromUnreadMessageCount()
  viewState.pollingInterval = ""
} else {
  viewModel.subscribeToUnreadMessageCount(pollingInterval:
 timeInterval)
}
…
func unsubscribeFromUnreadMessageCount() {
  chatService.unsubscribeFromUnreadMessageCount()
  isPolling = false
  unreadMessageCount = 0
}
```

NowChatService - updateTheme(theme: NowChatThemeable)

Updates the NowChat UI theme with the specified UI theme. Use this function to update the chat UI theme after it has been initially set using the *`makeChatUI()`* function such as when changing the theme from light to dark.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
theme	NowChatThemeable	Theme to update the chat UI with.

Returns

Type	Description
None	

The following code example shows how to update a light UI theme to the dark UI theme using the *updateTheme()* function.

```
struct LightNowChatColoring: NowChatColoring {
  let nowUIColor: NowUIColoring = LightNowUIColor()
  let brand = UIColor.now_color(withHexString: "#032D42")
  let primary = UIColor.now_color(withHexString: "#00566E")
  let secondary = UIColor.now_color(withHexString: "#002832")
  let destructive = UIColor.now_color(withHexString: "#E52239")
  let textPrimary = UIColor.now_color(withHexString: "#10171A")
  let textSecondary = UIColor.now_color(withHexString:
 "#232E33")
  let textTertiary = UIColor.now_color(withHexString: "#37444A")
  let textActionable = UIColor.now_color(withHexString:
 "#ffffff")
  let screenHeaderText = UIColor.now_color(withHexString:
 "#ffffff")
  let backgroundPrimary = UIColor.now_color(withHexString:
 "#ffffff")
  let backgroundSecondary = UIColor.now_color(withHexString:
 "#F5F6F7")
  let backgroundTertiary = UIColor.now_color(withHexString:
 "#E2E5E7")
  let backgroundPrimaryActionable =
 UIColor.now_color(withHexString: "#10171A")
  let backgroundSecondaryActionable =
 UIColor.now_color(withHexString: "#232E33")
  let brandBackground = UIColor.now_color(withHexString:
 "#BDDEE7")
  let borderTertiary = UIColor.now_color(withHexString:
 "#d3d6dc")
  let separatorPrimary = UIColor.now_color(withHexString:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
struct DarkNowChatTheme: NowChatThemeable {
  let color: NowChatColoring = DarkNowChatColoring()
}

func chatService(_ chatService: NowChat.NowChatService,
 systemThemeDidChange traitCollection: UITraitCollection) {
  // The systemThemeDidChange delegate method can be used to
 call updateTheme() to apply theme changes when the system theme
 changes.
  debugPrint("System Theme did change")
  chatService.updateTheme(theme:
 traitCollection.userInterfaceStyle == .dark ?
 DarkNowChatTheme() : LightNowChatTheme())
}
```

NowChatServiceDelegate protocol - iOS

The *`NowChatServiceDelegate`* protocol provides callbacks for notification of actions within the *`NowChatService`* such as a request to open a URL or dismiss the chat view controller.

NowChatServiceDelegate - chatService(_chatService: NowChatService, didRequestOpenUrlurl: URL)

Callback that notifies the host application that the specified chat service received a request to open a URL. This callback is usually triggered by a user tapping on a link in the chat UI. It is the host application's responsibility to handle opening the URL or ignore the request.

Parameters

Name	Type	Description
chatService	NowChatService	NowChatService object making the request.
didRequestOpenUrl url	URL	URL that the service has requested to open.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
func chatService(_ chatService: NowChatService,
 didRequestOpenUrl url: URL) {
  var updatedViewState = makeViewState()
  updatedViewState.urlToOpen = url
  viewState = updatedViewState
}
```

NowChatServiceDelegate - chatService(_chatService: NowChatService, systemThemeDidChange traitCollection: UITraitCollection)

Callback that notifies the host application that the system chat theme changed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
chatService	NowChatService	NowChatService object making the request.
traitCollection	UITraitCollection	UITraitCollection that contains the new theme.

Returns

Type	Description
None	

The following code example shows how to override the *systemThemeDidChange()* delegate function to call the *updateTheme()* function to apply theme changes when the system theme changes.

```
func chatService(_ chatService: any
 SnowChat.ChatServiceProvider, systemThemeDidChange
 traitCollection: UITraitCollection) {

  /// The corresponding updateTheme() method can be called here
 to change the UI theme based on System Theme
  chatService.updateTheme(theme:
 traitCollection.userInterfaceStyle == .dark ?
 DarkNowChatTheme() : LightNowChatTheme())
  print("System Theme Did Change)
}
```

NowChatServiceDelegate - chatServiceViewControllerWasDismissed(_chatService: NowChatService)

Callback that notifies the host application that the chat view controller was dismissed.

Parameters

Name	Type	Description
chatService	NowChatService	NowChatService object whose view controller was dismissed.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
func chatServiceViewControllerWasDismissed(_ chatService:
 NowChatService) {
  resetChat()
}
```

NowChatServiceDelegate - didEndSessionWithId(sessionId: String)

Called when the chat screen is closed and the chat session ends.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You must define the desired functionality for this callback by overriding the function as the default implementation simply prints the message "Chat Session ended with ID: \(sessionId)".

Parameters

Name	Type	Description
sessionId	String	Sys_id of the session that ended. Table: Conversation Session [sys_cs_session]

Returns

Type	Description
None	

The following code example shows where to place your code to override the default functionality.

```
func chatService(_ chatService: NowChatService,
 didEndSessionWithId sessionId: String) {
  print("Chat Session ended with ID: \(sessionId)")
}
```

NowChatThemeable protocol - iOS

The *NowChatThemeable* protocol provides properties that enable you to override the colors used within chat pages hosted on your ServiceNow instance.

```
public protocol NowChatThemeable {
    var color: NowChatColoring { get }
}
```

The NowChatColoring protocol contains *NowUIColoring*. This property is used to reference default color variables that *NowWebThemeable* can use.

For additional information on how to theme the UI, see Use NowUIColoring to theme NowWebTheme and NowChatTheme in the Mobile SDK Developer Guide - iOS.

Define ChatColors using default colors

```
/// Sample structure for using default colors that comes with
 Mobile SDK.
struct ChatColors: NowUIColoring {
}
```

Define ChatColors using custom colors

```
/// Use Custom Colors with light theme
struct ChatColors: NowUIColoring {
    private var defaultTheme: NowChatDefaultTheme {
        NowChatDefaultTheme(nowUITheme: NowUIDefaultTheme())
    }

    var brand: UIColor {
        lightBrand
```

```
    }
    var primary: UIColor {
        lightPrimary
    }
    var secondary: UIColor {
        lightSecondary
    }
    var textTertiary: UIColor {
        lightTextTertiary
    }
    var destructive: UIColor {
        lightDestructive
    }
    var textPrimary: UIColor {
        lightTextPrimary
    }
    var textSecondary: UIColor {
        lightTextSecondary
    }
    var textActionable: UIColor {
        lightTextActionable
    }
    var screenHeaderText: UIColor {
        lightScreenHeaderText
    }
    var backgroundPrimary: UIColor {
        lightBackgroundPrimary
    }
    var backgroundSecondary: UIColor {
        lightBackgroundSecondary
    }
    var backgroundTertiary: UIColor {
        lightBackgroundTertiary
    }
    var backgroundPrimaryActionable: UIColor {
        lightBackgroundPrimaryActionable
    }
    var backgroundSecondaryActionable: UIColor {
        lightBackgroundSecondaryActionable
    }
    var brandBackground: UIColor {
        lightBrandBackground
    }
    var linkPrimaryText: UIColor {
        lightLinkPrimary
    }
    var linkSecondary: UIColor {
        lightLinkSecondary
    }
    var separatorPrimary: UIColor {
        lightSeparatorPrimary
    }
    var separatorTertiary: UIColor {
        lightSeparatorTertiary
    }
    var borderTertiary: UIColor {
        lightBorderTertiary
```

```
    }
    var shadow: UIColor {
        lightShadow
    }
    var notification: UIColor {
        lightNotification
    }
    var alertCritical0: UIColor {
        lightAlertCritical0
    }
    var alertCritical3: UIColor {
        lightAlertCritical3
    }

    // Light Colors
    var lightBrand: UIColor
{ defaultTheme.color.nowUIColor.brand }
    var lightPrimary: UIColor
{ defaultTheme.color.nowUIColor.primary }
    var lightSecondary: UIColor
{ defaultTheme.color.nowUIColor.secondary }
    var lightDestructive: UIColor
{ defaultTheme.color.nowUIColor.destructive }
    var lightTextPrimary: UIColor
{ defaultTheme.color.nowUIColor.textPrimary }
    var lightTextSecondary: UIColor
{ defaultTheme.color.nowUIColor.textSecondary }
    var lightTextTertiary: UIColor
{ defaultTheme.color.nowUIColor.textTertiary }
    var lightTextActionable: UIColor
{ defaultTheme.color.nowUIColor.textActionable }
    var lightScreenHeaderText: UIColor
{ defaultTheme.color.nowUIColor.screenHeaderText }
    var lightBackgroundPrimary: UIColor
{ defaultTheme.color.nowUIColor.backgroundPrimary }
    var lightBackgroundSecondary: UIColor
{ defaultTheme.color.nowUIColor.backgroundSecondary }
    var lightBackgroundTertiary: UIColor
{ defaultTheme.color.nowUIColor.backgroundTertiary }
    var lightBackgroundPrimaryActionable: UIColor
{ defaultTheme.color.nowUIColor.backgroundPrimaryActionable
    }
    var lightBackgroundSecondaryActionable: UIColor
{ defaultTheme.color.nowUIColor.backgroundSecondaryActionable
    }
    var lightBrandBackground: UIColor
{ defaultTheme.color.nowUIColor.brandBackground }
    var lightLinkPrimary: UIColor
{ defaultTheme.color.nowUIColor.linkPrimaryText }
    var lightLinkSecondary: UIColor
{ defaultTheme.color.nowUIColor.linkSecondary }
    var lightSeparatorPrimary: UIColor
{ defaultTheme.color.nowUIColor.separatorPrimary }
    var lightSeparatorTertiary: UIColor
{ defaultTheme.color.nowUIColor.separatorTertiary }
    var lightBorderTertiary: UIColor
{ defaultTheme.color.nowUIColor.borderTertiary }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    var lightShadow: UIColor
 { defaultTheme.color.nowUIColor.shadow }
    var lightNotification: UIColor
 { defaultTheme.color.nowUIColor.notification }
    var lightAlertCritical0: UIColor
 { defaultTheme.color.nowUIColor.alertCritical0 }
    var lightAlertCritical3: UIColor
 { defaultTheme.color.nowUIColor.alertCritical3 }
}
```

Define ChatTheme structure with NowChatThemeable protocol

```
struct CarrascoChatTheme: NowChatThemeable {
    var color: NowChatColoring

    struct Color: NowChatColoring {
        var nowUIColor: NowUIColoring

        var backgroundPrimary: UIColor
        var backgroundSecondary: UIColor
        var backgroundPrimaryActionable: UIColor
        var backgroundSecondaryActionable: UIColor
        var brandBackground: UIColor
        var backgroundTertiary: UIColor
        var separatorPrimary: UIColor
        var separatorTertiary: UIColor
        var borderTertiary: UIColor
        var shadow: UIColor
        var linkSecondary: UIColor

        init(inputs: ChatColors) {
            nowUIColor = ThemeColor(inputs)

            backgroundPrimary = inputs.backgroundPrimary
            backgroundSecondary = inputs.backgroundSecondary
            backgroundTertiary = inputs.backgroundTertiary
            backgroundPrimaryActionable =
 inputs.backgroundPrimaryActionable
            backgroundSecondaryActionable =
 inputs.backgroundSecondaryActionable
            brandBackground = inputs.brandBackground
            separatorPrimary = inputs.separatorPrimary
            separatorTertiary = inputs.separatorTertiary
            borderTertiary = inputs.borderTertiary
            shadow = inputs.shadow
            linkSecondary = inputs.linkSecondary
        }
    }

    init(chatColors: ChatColors) {
        color = Color(inputs: chatColors)
    }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instantiate ChatTheme object by passing ChatColor as input

```
let chatTheme = CarrascoChatTheme(chatColors: ChatColors())
```

Pass ChatTheme object to NowChatService.makeChatUI ()

```
func makeChatScreen() -> UIViewController? {
  guard let chatService = chatService else { return nil }
  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(chatColors: ChatColors()))

  switch result {
  case .success(let chatViewController):
    return chatViewController
  case .failure(let error):
    debugPrint("Chat screen creation failed with error:
 \(error)")
    return nil
  }
}
```

NowCoreService class - iOS

The *NowCoreService* class provides fundamental services to the various SDK feature services. This class should only be instantiated by NowSDK.

Feature services, such as Now Analytics and NowChat, can access a shared core instance through the NowSDK.core property.

NowCoreService - accessTokenDidFail(for service: NowService)

Notifies the SDK core that the access token used to authorize the API requests to the ServiceNow instance for the specified service is no longer valid.

The SDK core returns a valid access token if it is able to generate one or returns an error.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for service	NowService	Feature service requesting the access token.

Returns

Type	Description
AnyPublisher<NowSDK.AccessToken, AccessTokenProviderError>	Success: Valid access token. Failure: AccessTokenProviderError Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• userSessionError • accessTokenRetrievalFailed • hostReturnedNoTokens - Indicates a guest user

```
NowSDK.core()?.accessTokenDidFail(for: someService)
  .mapError { YourCustomError.accessTokenFailed($0) }

.flatMap(self.handleFailedAccessToken())
  .eraseToAnyPublisher()
```

NowCoreService - accessTokenDidFail(for service: NowService) async throws

Notifies the SDK core that the access token used to authorize the API requests to the ServiceNow instance for the specified service is no longer valid.

The SDK core returns a valid access token if it is able to generate one or returns an error.

Parameters

Name	Type	Description
for service	NowService	Feature service requesting the access token.

Returns

Type	Description
NowSDK.AccessToken	Returned when the method is successful. Valid access token.
AccessTokenProviderError	Thrown when the method fails. Indicates an error retrieving an access token. Possible values: • userSessionError • accessTokenRetrievalFailed • hostReturnedNoTokens - Indicates a guest user

The following code examples shows how to call this method.

```
do {
    let accessToken = try await
 NowSDK.core()?.accessTokenDidFail(for: someService)
} catch {
    self.handleFailedAccessToken(error)
}
```

NowCoreService - canRequestPermission(_ permission: DevicePermission)

Queries the host application as to whether the service is allowed to request the device permission.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This function does not request the permission, only whether it is allowed to query the device permission. Feature services should call this function to determine if they are allowed to request a desired device permission.

Parameters

Name	Type	Description
permission	DevicePermission	Device for which the request is being made. Possible values (case-sensitive): • camera • location • microphone • photoLibrary • speachRecognition

Returns

Type	Description
Boolean	Flag that indicates whether the host application allows the SDK to request the specified device permission. Possible values: • true: Device permission can be requested. • false: Device permission cannot be requested.

```
extension AppDelegate: DevicePermissionDelegate {
  func canRequestPermission(_ permission: DevicePermission) ->
 Bool {
    return true
  }
}
```

NowCoreService - isGuestUser(for service: NowService) async

Checks whether the current user is a guest user.

Parameters

Name	Type	Description
for service	NowService	Feature service for which to perform the guest user check.

Returns

Type	Description
Boolean	Flag that indicates whether the current user is a guest user. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: Current user of the specified service is a guest user. • false: Current user of the specified service is not a guest user.

The following code example shows how to call this method.

```
let isGuestUser = await NowSDK.core()?.isGuestUser(for:
 someService)
```

NowCoreService - refreshAllSettings()

Refreshes all SDK settings for all services by re-fetching them from the active servers.

To receive updated SDK settings values whenever they're refreshed, subscribe to the publisher provided by the NowCoreService - settingsPublisher(for service: NowService) function.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

```
NowSDK.core()?.refreshAllSettings()
```

NowCoreService - refreshSettings(for service: NowService)

Refreshes the SDK settings for the specified service by re-fetching them from the server.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for service	NowService	Feature service, such as NowChat or NowAnalytics, requesting the settings refresh.

Returns

Type	Description
AnyPublisher<Settings, SettingsError>	Success: Dictionary of refreshed SDK settings. Feature services need to examine the returned data for the settings relevant to their specific features. Failure: SettingsError - Type and description of error encountered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Possible values: • fetchError • fetchFailed • invalidJSON • invalidProvider • notAuthorized • sdkNotLicensed • settingNotFound • unknown

```
var subscriptions = Set<AnyCancellable>()
NowSDK.core?.refreshSettings(for: someService)
  .sink(receiveCompletion: { completion in
    if case .failure(let error) = completion {
      print("Refresh failed with error:\ (error)")
    }
  }, receiveValue: { settings in
    print("Received refreshed settings:\ (settings)")
  })
  .store(in: &subscriptions)
```

NowCoreService - refreshSettings(for service: NowService) async throws

Refreshes the SDK settings for the specified service by re-fetching them from the server.

Parameters

Name	Type	Description
for service	NowService	Feature service, such as NowChat or NowAnalytics, requesting the settings refresh.

Returns

Type	Description
Settings	Returned when the method is successful. Dictionary of refreshed SDK settings. Feature services need to examine the returned data for the settings relevant to their specific features.
SettingsError	Thrown when the method fails. Possible values: • fetchError • fetchFailed • invalidJSON • invalidProvider

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• notAuthorized • sdkNotLicensed • settingNotFound • unknown

The following code examples shows how to call this method.

```
do {
    let settings = try await NowSDK.core()?.refreshSettings(for:
 someService)
    print("Received refreshed settings: \(settings)")
} catch {
    print("Refresh failed with Settings error: \(error)")
}
```

NowCoreService - requestAccessToken(for service: NowService)

Acquires an access token for the specified service.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for service	NowService	Feature service requesting the access token.

Returns

Type	Description
AnyPublisher<NowSDK.AccessToken, AccessTokenProviderError>	Success: NowSDK.AccessToken - Access token to use to authorize API requests made to a ServiceNow instance. Failure: AccessTokenProviderError - Type and description of error encountered. Possible values: • `accessTokenRetrievalFailed` • `hostReturnedNoTokens` - Indicates a guest user • `userSessionError`

```
NowSDK.core()?.requestAccessToken(for: someService)
```

NowCoreService - requestAccessToken(for service: NowService) async throws

Acquires an access token for the specified service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
for service	NowService	Feature service requesting the access token.

Returns

Type	Description
NowSDK.AccessToken	Returned when the method is successful. Access token to use to authorize API requests made to a ServiceNow instance.
AccessTokenProviderError	Thrown when the method fails. Indicates an error retrieving an access token. Possible values: • `accessTokenRetrievalFailed` • `hostReturnedNoTokens` - Indicates a guest user • `userSessionError`

The following code examples shows how to call this method.

```
do {
    let accessToken = try await
 NowSDK.core()?.requestAccessToken(for: someService)
} catch {
    self.handleFailedAccessToken(error)
}
```

NowCoreService - requestNetworkService(for service: NowService)

Returns a reference to a shared network service that you can use to make API requests.

Note: This is a shared service. Altering settings or ending the session can cause issues for other feature services that share this session.

Parameters

Name	Type	Description
for service	NowService	Feature service requesting the network service.

Returns

Type	Description
NetworkService	Shared network service that you can use to make API calls.

The following code example shows how to call this function.

```
NowSDK.core()?.settingsPublisher(for: chatService)
.sink(receiveCompletion: { completion in
  if case .failure(let error) = completion {
    // Setting publisher failed with error
  }
}, receiveValue: { updatedSettings in
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  // Receive array of SDK settings for chatService
})
.store(in: &subscriptions)
```

NowCoreService - requestSettings(forservice: NowService)

Returns the SDK settings for the specified feature service.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
forservice	NowService	Feature service requesting the settings.

Returns

Type	Description
AnyPublisher<Settings, SettingsError>	Success: Settings - Array of SDK settings for the specified feature service. Failure: SettingsError - Type and description of associated error. Possible values: • fetchError • fetchFailed • invalidJSON • invalidProvider • notAuthorized • sdkNotLicensed • settingNotFound • unknown

```
NowSDK.core()?.requestSettings(for: someService)
```

NowCoreService - requestSettings(for service: NowService) async throws

Returns the SDK settings for the specified feature service.

Parameters

Name	Type	Description
for service	NowService	Feature service requesting the settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Settings	Returned when the method is successful. Array of SDK settings for the specified feature service.
SettingsError	Thrown when the method fails. Type and description of associated error. Possible values: • fetchError • fetchFailed • invalidJSON • invalidProvider • notAuthorized • sdkNotLicensed • settingNotFound • unknown

The following code examples shows how to call this method.

```
do {
    let settings = try await NowSDK.core()?.requestSettings(for:
 someService)
    print("Received settings: \(settings)")
} catch {
    print("Refresh saved with Settings error: \(error)")
}
```

NowCoreService - settingsPublisher(for service: NowService)

Retrieves the settings for the publisher of the specified service.

Parameters

Name	Type	Description
for service	NowService protocol - iOS	Feature service requesting the publisher subscription.

Returns

Type	Description
AnyPublisher<Settings, Never>	Success: Settings - Array of SDK settings for the specified feature service.

The following code example shows how to call this function.

```
NowSDK.core()?.settingsPublisher(for: chatService)
.sink(receiveCompletion: { completion in
  if case .failure(let error) = completion {
    // Setting publisher failed with error
  }
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
}, receiveValue: { updatedSettings in
  // Receive array of SDK settings for chatService
})
.store(in: &subscriptions)
```

NowData framework - iOS

The *NowData* framework contains methods that enable the instantiation of NowData services, such as *NowGraphQLService*, *NowTableService*, *NowAPIService* (for custom APIs), and *NowAttachmentService*.

NowData - makeApiService(instanceUrl: URL, path: String, completion: @escaping ((Result<NowApiService, NowServiceError>) -> Void))

Creates an instance of NowApiService, and once complete, calls the specified completion handler.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance whose REST APIs are to be accessed by the service.
path	String	API path. For example, if the API call is `https://xxx.service-now.com/api/now/sg/incident`, the path is `/api/now/sg/incident`.
completion	@escaping ((Result <NowApiService, NowService Error>) -> Void)	Completion handler that is called with a `Result<NowApiService, NowServiceError>` containing either an initialized `NowApiService` instance or a `NowServiceError` indicating why the initialization failed.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let path = "api/now/sg"
let apiPublisher = apiService(for: path)

func apiService(for path: String) -> AnyPublisher<NowAPIService,
 ConfigurationError> {
  guard let instanceURL else {
    return Fail(error: ConfigurationError.invalidInstanceURL)
    .eraseToAnyPublisher()
  }
  return Future { promise in
    NowData.makeApiService(instanceUrl: instanceURL, path: path)
 { (result) in
      promise(result.mapError { .sdkError($0) })
    }
  }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .eraseToAnyPublisher()
}
```

NowData - makeAttachmentService(instanceUrl: URL, completion: @escaping ((Result<NowAttachmentService, NowServiceError>) -> Void))

Creates an instance of NowAttachmentService, and after completion, calls the specified completion handler.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance whose attachments are to be accessed by the service.
completion	@escaping ((Result <NowAttachmentService, NowServiceError>) -> Void)	Completion handler that is called with a `Result<NowAttachmentService, NowServiceError>` containing either an initialized `NowAttachmentService` instance or a `NowServiceError` indicating why the initialization failed.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
….
guard
  let jwtUrl = URL(string: "http://13.57.38.237:8080"),
  let instanceUrl = URL(string:
 "https://mobilecoresdk.service-now.com") else {
    return
  }

// AuthorizationProvider - struct conforming to
 NowSDKAuthorizationProviding protocol
let authorizationProvider = AuthorizationProvider(userEmail:
 "sdk@servicenow.com", jwtProviderUrl: jwtUrl, clientId:
 "deb8756b452d201039231ca568f26511")

// PermissionProvider - class conforming to
 DevicePermissionDelegate protocol
let permissionProvider = PermissionProvider()
let config = NowSDKConfiguration(authorizationProvider:
 authorizationProvider, permissionDelegate: permissionProvider,
 logLevel: .debug)

do {
  try NowSDK.configure(with: config)
  initializeAttachmentService (with: instanceURL)
} catch {
  // Return ConfigurationError.sdkError(error)
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
…. .

func initializeAttachmentService(instanceUrl: instanceURL)
 { result in
  switch result {
    case .success(let service)
      self?.attachmentService = service
    case .failure(let error)
      debug.print(“Creating Attachment service failed with
 error: \(error.localizedDescription)”)
      self?.attachmentService = nil
  }
}
```

NowData - makeGraphQLService(instanceUrl: URL, completion: @escaping ((Result<NowGraphQLService, NowServiceError>) -> Void))

Creates an instance of NowGraphQLService, and once complete, calls the specified completion handler.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance providing GraphQL services.
completion	@escaping ((Result <NowGraphQLService, NowServiceError>) -> Void)	Completion handler that is called with a `Result<NowGraphQLService, NowServiceError>` containing either an initialized `NowGraphQLService` instance or a `NowServiceError` indicating why the initialization failed.

Returns

Type	Description
None	

```
func initializeGraphQLService(instanceUrl: URL) {
  makeGraphQLService(instanceUrl: instanceUrl) { [weak self]
 result in
    switch result {
    case .success(let service):
      self?.graphQLService = service
    case .failure(let error):
      debugPrint("Creating GraphQL service failed with error:
 \(error.localizedDescription)")
      self?.graphQLService = nil
    }
  }
}
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowData - makeTableService(instanceUrl: URL, completion: @escaping ((Result<NowTableService, NowServiceError>) -> Void))

Creates an instance of NowTableService, and after it completes, calls the specified completion handler.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance whose tables are to be accessed by the service.
completion	@escaping ((Result <NowTableService, NowService Error>) -> Void)	Completion handler that is called with a `Result<NowTableService, NowServiceError>` containing either an initialized `NowTableService` instance or a `NowServiceError` indicating why the initialization failed.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
func initializeTableService(for instanceUrl: URL) {
  makeTableService(instanceUrl: instanceUrl) { [weak self]
 result in
    guard let self = self else { return }

    switch result {
      case .success(let tableService):
        self.tableService = tableService
        // Create a Paginator that will iterate over pages of
 customer support cases. The Paginator's response type will be
        // inferred from the Paginator's type definition (e.g.
 `Paginator<[CustomerServiceCase]>`).
        self.paginator = tableService.paginator(from:
 Self.tableName, configuration: self.fetchConfiguration)
        // Subscribe to the Paginator's publisher so we will be
 able to receive paged results.
        self.subscribeToPaginatorPublisher()
        // As we are now ready to start fetching data, inform
 the view controller.
        self.onReady(self)
      case .failure(let error):
        debugPrint("Creating table service failed with error:
 \(error.localizedDescription)")
        self.tableService = nil
        self.paginator = nil
    }
  }
}
```

NowGraphQLService class - iOS

The *NowGraphQLService* class provides functions that enable you to make requests using GraphQL queries against data on your ServiceNow instance through its *GraphQL* REST API.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration settings provided when the service was initialized.

NowGraphQLService - execute(query: GraphQLQuery) async throws

Executes the specified GraphQL query.

Parameters

Name	Type	Description
query	String	GraphQL query to execute.

Returns

Type	Description
Data	Returned when the method is successful. Query data generated from the specified query.

NowDataError	Thrown when the method fails.
	• `accessToken(AccessTokenProviderError)`
	  ○ *AccessTokenProviderError*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	  Thrown when there is an error in the access token.
	• `attachmentValidation`
	  Thrown when an attachment fails validation.
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *HTTPStatusCode*: Status code received from the instance.
	  Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *DecodingError*: Decoding error detected.
	  Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *type*: Wrapped type to decode from a string.
	  ○ *from*: String to decode to the specified type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	Thrown when an expected service configuration is missing.
	• `missingSysID`
	Thrown when an expected sys_id parameter is missing.
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	Thrown when a network service encountered an error.

The following code example shows how to call this method.

```
private func fetchArticles() async throws -> [Article] {
    guard let graphQLService = graphQLService else {
        throw ArticleListError.invalidGraphQLService
    }

    do {
        let data = try await
 graphQLService.execute(GraphQLQuery(query:
 recentlyPublishedQuery))
        let articles = try dataToArticleList(data)
    } catch let error as NowDataError {
        throw ArticleListError.fetchError(error)
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    } catch {
        throw error
    }
}
private let recentlyPublishedQuery =
"""

{
  GlideRecord_Query {
    kb_knowledge(queryConditions:
 "active=true^ORDERBYpublishedDESC" pagination: { limit: 10,
 offset: 0 }) {
      _results {
        sys_id {
          value
        },
        number {
          displayValue
        },
        short_description {
          displayValue
        },
        author {
          displayValue
        }
        published {
          displayValue
        }
      }
    }
  }
}
"""
```

NowGraphQLService - execute(query: GraphQLQuery, completion: @escaping (Result<Data, NowDataError>))

Executes the specified GraphQL query.

Parameters

Name	Type	Description
query	String	GraphQL query to execute.
completion	@escaping (Result<Data, NowDataError>)	Completion handler to execute after the query is complete. Return values: • Success: Returns query data. • Error: NowDataError

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
gqlService.execute(GraphQLQuery(query: myQuery)) { result in
  switch result {
  case .success(let data):
    // use data
  case .failure(let error):
    // handle error
  }
}
```

NowGraphQLService - init(configuration: NowServiceConfiguration, coreServiceProvider: NowCoreServiceProviding)

Creates a NowGraphQLService based on the specified parameters.

Parameters

Name	Type	Description
configuration	NowServiceConfiguration	Configuration parameters to use when initializing the service, such as the bundle ID of the application integrating with the service and the URL of the ServiceNow instance that the NowGraphQLService wants to access.
coreServiceProvider	NowCoreServiceProviding	Optional. Core service provider. **Note:** Currently this parameter is required even though it is shown as optional. Default: nil

NowGraphQLService - publisher(for query: GraphQLQuery)

Creates a publisher to request GraphQL data.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for query	GraphQLQuery	GraphQL query string to execute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
AnyPublisher<Data, NowDataError>	Success: GraphQL data set. Failure: NowDataError

The following code example shows how to call this function.

```
private func fetchArticles() -> AnyPublisher<[Article],
 ArticleListError> {
  guard let graphQLService = graphQLService else {
    return
 Fail(error: .invalidGraphQLService).eraseToAnyPublisher()
  }

  return graphQLService.publisher(for: GraphQLQuery(query:
 recentlyPublishedQuery))
    .mapError({ dataError -> ArticleListError in
      .fetchError(dataError)
    })
    .flatMap(dataToArticleList)
    .eraseToAnyPublisher()
}
```

NowLoggingService class - iOS

The *`NowLoggingService`* class provides functions that provide logging capabilities to feature services with the NowSDK.

Properties

Name	Type	Description
logLevel	NowLogLevel	Level of log messages for the associated logger to store. Valid values: • debug • error • fatal • log • info • none

NowLoggingService - logger(for category: NowLogCategory)

Returns a logger for the specified feature service.

Parameters

Name	Type	Description
for category	NowLogCategory	Feature service whose logger you want returned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • analytics • chat • coresdk • data • sdk • web

Returns

Type	Description
NowLogging	Logger to use to save all log messages for the associated service.

The following code example shows how to call this function.

```
let logging = NowLoggingService.logger(for: .chat)
…
logger.error(message: "Could not create service - service
 configuration invalid")
…
logger.debug(message: "Verifying settings…")
```

NowLoggingService - setLogLevel(_ logLevel: NowLogLevel)

Sets the desired logging level.

Note: Incoming log messages with types that don't meet the set log level threshold are discarded.

Parameters

Name	Type	Description
logLevel	NowLogLevel	Level of log messages for the associated logger to store. Valid values: • debug • error • fatal • info • none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
NowLoggingService.setLogLevel(.info)
```

NowPush API - iOS

The *NowPush* API is a top-level global API that enables users to instantiate a NowPush service instance.

NowPush - makePushService(instanceUrl: URL)

Creates an instance of `NowChatService` with the specified configuration.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance providing push notification services.

Returns

Type	Description
AnyPublisher<NowPush Service, NowServiceError>	If successful, returns an initialized NowPushService object. If it fails, returns a NowServiceError object.

This example shows how to create an instance of `NowChatService`.

```
func setup(with instanceURL: URL) -> AnyPublisher<NowService,
 ConfigurationError> {
  NowPush.makePushService(instanceUrl: instanceURL)
    .mapError { .sdkError($0) }
    .map { $0 as NowService }
    .eraseToAnyPublisher()
}
```

NowPush - makePushService(instanceUrl: URL, completion: @escaping ((Result<NowPushService, NowServiceError>) -> Void))

Creates an instance of `NowPushService` with the specified configuration, and once complete, calls the specified completion handler.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance providing push notification services.
completion	@escaping ((Result<NowPush Service, NowService Error>) -> Void)	Completion handler that is called containing either an initialized `NowPushService` instance or a `NowServiceError` indicating why the initialization failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

This example shows how to create an instance of `NowPushService`.

```
static func setup(with instanceURL: URL,completion: @escaping
  (Result<NowPushService, NowServiceError>) -> Void) {
    NowPush.makePushService(instanceUrl: instanceURL} {result in
      switch result {
      case .success(letpushService):
        completion(.success(pushService))
      case .failure(let error):
        completion(.failure(eror))
      }
    }
  }
```

NowPushPayload protocol

`NowPushPayload` is a generic protocol you can use to define a push notification protocol within the NowSDK framework.

Requirements

Name	Type	Description
message	String	Message displayed to the user in the push notification, located in the *body* field of the push notification.
type	`NowPushType: String, Codable`	Type of push notification. Possible values: • launchVirtualAgent

NowPushService class - iOS

The *`NowPushService`* class provides functions that enable interaction with the Push Notification service.

Properties

Name	Description
configuration	Configuration settings provided when the service was initialized. Data type: NowServiceConfiguration

NowPushService - registerPushToken(_token: Data, pushAppName: String, environment: NowPushEnvironment, completion: @escaping (Result<Data, NowPushError>) -> Void)

Registers a unique token with the ServiceNow instance used to identify the push notifications for the current iOS device and specified application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
_token	Data	Data object of the push token to register. This is the token obtained from the Apple Developer site. For more information, see the Mobile SDK Developer Guide - iOS.
pushAppName	String	Name of the push application for which this token is being registered.
environment	NowPushEnvironment	Environment for which the token is being registered. Valid values: • production • sandbox
completion	@escaping (Result<Data, NowPushError>) → Void	Completion handler to execute after the token has been attempted to be registered. • Success: iOS push notification certificate. • Error: NowPushError - Information about the error that occurred when trying to register the token. Possible values: ○ decoding: Decoding error occurred. ○ httpRequestFailure: Generic error that is returned whenever the http call is not a success (2xx). ○ notAuthorized: Requestor is not authorized to perform the specified push notification operation. ○ unsupportedData: Push payload is invalid.

Returns

Type	Description
None	

This example shows how to register a push notification token for the TestPushApp application.

```
func registerForPushNotifications(deviceToken: Data) {
  pushService.registerPushToken(deviceToken,
      pushAppName: "TestPushApp",
      environment: environment) { [weak self] result in
    guard let self = self else { return }
    switch result {
      case .success:
        UserDefaults.standard.set(true, forKey:
 "pushNotificationsRegistered")
        self.pushRegistrationState = .registrationSuccess
      case .failure:
        UserDefaults.standard.set(false, forKey:
 "pushNotificationsRegistered")
        self.pushRegistrationState = .registrationFailed
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
  }
}
```

NowPushService - unregisterPushToken(_token: Data, pushAppName: String, environment: NowPushEnvironment, completion: @escaping (Result<Data, NowPushError>) -> Void)

Unregisters a previously registered push token.

Parameters

Name	Type	Description
_token	Data	Data object of the push token to unregister.
pushAppName	String	Name of the push application for which this token is being unregistered.
environment	NowPushEnvironment	Environment for which the token is being registered. Valid values: • production • sandbox
completion	@escaping (Result <Data, NowPushError>) → Void	Completion handler to execute after the token has been attempted to be unregistered. • Success: API response data. • Error: `NowPushError` - Information about the error that occurred when trying to unregister the token. Possible values: ○ decoding: Decoding error occurred. ○ httpRequestFailure: Generic error that is returned whenever the http call is not a success (2xx). ○ notAuthorized: Requestor is not authorized to perform the specified push notification operation. ○ unsupportedData: Push payload is invalid.

Returns

Type	Description
None	

This example shows how to unregister the push notification token associated with the TestPushApp application.

```
func unregisterFromPushNotifications(deviceToken: Data) {
  pushService.unregisterPushToken(deviceToken, pushAppName:
 "TestPushApp", environment: environment) { [weak self] result
 in
    guard let self = self else { return }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    switch result {
      case .success:
        UserDefaults.standard.set(false, forKey:
 "pushNotificationsRegistered")
        self.pushRegistrationState = .unregisterSuccess
      case .failure:
        self.pushRegistrationState = .unregisterFailed
    }
  }
}
```

NowPushService - payloadFromUserInfo(_userInfo: [AnyHashable: Any])

Parses the `userInfo` key-value pairs into a `NowPushPayload` object.

Parameters

Name	Type	Description
_userInfo	[AnyHashable: Any]	Push payload content received as part of the push notification.

Returns

Type	Description
Result<NowPushPayload, NowPushError>	Returns the results of the payload parsing. • Success: Parsed `NowPushPayload` object. • Failure: `NowPushError` - Information about the error that was encountered while parsing the specified user payload. Possible values: ○ decoding: Decoding error occurred. ○ httpRequestFailure: Generic error that is returned whenever the http call is not a success (2xx). ○ notAuthorized: Requestor is not authorized to perform the specified push notification operation. ○ unsupportedData: Push payload is invalid.

This example shows how to parser a user payload.

```
func userNotificationCenter(_ center: UNUserNotificationCenter,
    didReceive response: UNNotificationResponse,
    withCompletionHandler completionHandler: @escaping () ->
 Void) {
  guard let pushService = pushService else {
    completionHandler()
    return
  }
  let userInfo = response.notification.request.content.userInfo
  _ = pushService.payloadFromUserInfo(userInfo)
    .flatMap(handleNowPushPayload)
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
func handleNowPushPayload(_ payload: NowPushPayload) ->
 Result<Void, NowPushError> {
  guard payload is NowPushVirtualAgent else {
    return .failure(NowPushError.unsupportedData)
  }
  launchVirtualAgent()
  return .success(())
}
```

NowRecord class - iOS

The *NowRecord* class defines a model that represents a record in a table on a ServiceNow instance.

Properties

Name	Type	Description
sysId	String	Unique 32-character Globally Unique ID (GUID) that identifies each record in a ServiceNow instance.
fields	Set	Fields within the associated record.
id	String	Sys_id of the record.

NowSDK framework - iOS

The *NowSDK* framework contains methods that enable the instantiation of various feature services.

NowSDK - configure(with configuration: NowSDKConfiguration) throws

Configures *NowSDK* for use. You must call this function before calling any of the feature services within the Mobile SDK.

Note: If the configuration that you pass is invalid, a `NowSDKError` is thrown.

Parameters

Name	Type	Description
with configuration	NowSDKConfiguration	NowSDKConfiguration that contains the information necessary to initialize the service.

Returns

Type	Description
None, NowSDKError	NowSDKError is thrown if the configuration that you pass is invalid.

The following code example shows how to call this function.

```
guard
  let jwtUrl = URL(string: "http://13.57.38.237:8080"),
  let instanceUrl = URL(string:
 "https://mobilecoresdk.service-now.com") else {
    return
  }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// AuthorizationProvider - struct conforming to
 NowSDKAuthorizationProviding protocol
let authorizationProvider = AuthorizationProvider(userEmail:
 "sdk@servicenow.com", jwtProviderUrl: jwtUrl, clientId:
 "deb8756b452d201039231ca568f26511")

// PermissionProvider - class conforming to
 DevicePermissionDelegate protocol
let permissionProvider = PermissionProvider()
let config = NowSDKConfiguration(authorizationProvider:
 authorizationProvider, permissionDelegate: permissionProvider,
 logLevel: .debug)

do {
  try NowSDK.configure(with: config)
            …
} catch {
   print("error is \(error.localizedDescription)")
}
```

NowSDK - core()

Returns a reference to the SDK core service.

Note: Host applications don't need to call this function.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Object conforming to the *NowCoreServiceProviding* protocol is returned if the SDK has been initialized by calling the NowSDK - configure(with configuration: NowSDKConfiguration) throws method; otherwise `nil`.

The following code example shows how to call this function.

```
guard let coreService = NowSDK.core() else {
  // Error with NowServiceError.sdkNotConfigured
  return
}
```

NowSDK - makeServiceConfiguration(for instanceUrl: URL)

Convenience function that feature services can use to construct n NowServiceConfiguration object.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance that the service will access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
NowServiceConfiguration	If the specified URL passes basic validity checks, and the service configuration can be properly constructed, returns the NowServiceConfiguration object; otherwise `nil`.

The following code example shows how to call this function.

```
guard
  let instanceUrl = URL(string:
 "https://mobilecoresdk.service-now.com"),
  let serviceConfig = NowSDK.makeServiceConfiguration(for:
 instanceUrl) else {
    logger.error(message: "Could not create service - service
 configuration invalid")
    return
  }
```

NowSDKConfiguration class - iOS

The *`NowSDKConfiguration`* class contains configuration information needed to initialize the NowSDK.

Properties

Name	Type	Description
authorizationProvider	NowSDKAuthorizationProviding	Delegate object that is responsible for providing authorization tokens to the NowSDK upon request.
logLevel	NowLogLevel	Level of log messages for the associated logger to store. Valid values: • debug • error • fatal • info • none
permisionDelegate	DevicePermissionDelegate	Delegate object called by the NowSDK to request permission from the host application to show system dialog requesting the indicated device permission.

NowSDKConfiguration - init(authorizationProvider: NowSDKAuthorizationProviding, permissionDelegate: DevicePermissionDelegate, logLevel: NowLogLevel)

Creates a NowSDKConfiguration object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
authorizationProvider	NowSDKAuthorizationProviding	Delegate object that is responsible for providing authorization tokens to the NowSDK on request.
permissionDelegate	DevicePermissionDelegate	Delegate object called by the NowSDK to request permission from the host application to show the system dialog for requesting the indicated device permission. For example: `class PermissionProvider: DevicePermissionDelegate { func canRequestPermission(_ permission: DevicePermission) -> Bool { return true } }`
logLevel	NowLogLevel	Level of log messages for the associated logger to store. This sets the logging level for the core services logger. You can also use the *NowLoggingService* API to set service log levels. Valid values: • debug • error • fatal • info • none

Returns

Type	Description
None	

The following code example shows how to call this function.

```
guard
  let instanceUrl = URL(string:
 "https://sn-instance.service-now.com") else {
  return
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
NowServiceConfiguration(instanceUrl: instanceUrl, appBundleId:
 "com.servicenow.appBundle")
```

NowService protocol - iOS

The *NowService* protocol provides a single interface to the NowSDK for all feature services. It defines the configuration parameters needed to access your ServiceNow instance.

All SDK feature services must implement this protocol.

Requirements

Name	Type	Description
configuration	NowServiceConfiguration	Service configuration to associate with the protocol.

NowServiceConfiguration structure - iOS

The *NowServiceConfiguration* structure defines configuration information for a feature service.

Properties

Name	Type	Description
appBundleId	String	Bundle ID of the application integrating with the NowSDK.
instanceUrl	String	URL of the ServiceNow instance that the feature service will access. For example: `https://instance.servicenow.com`.

NowServiceConfiguration - init(instanceUrl: URL, appBundleId: String)

Configures the calling feature service with the specified configuration information.

Parameters

Name	Type	Description
instanceUrl	String	URL of the ServiceNow instance that the feature service will access. For example: `https://instance.servicenow.com`.
appBundleId	String	Bundle ID of the application integrating with the NowSDK.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
guard
  let instanceUrl = URL(string:
 "https://instance.service-now.com") else {
    return
  }

NowServiceConfiguration(instanceUrl: instanceUrl, appBundleId:
 "com.servicenow.appBundle")
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowTableService class - iOS

The *NowTableService* class provides functions that enable you to perform create, read, update, and delete operations on records of existing ServiceNow tables.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration settings provided when the service was initialized.

NowTableService - create<Model: SysIdentifiableModel>(_ model: Model, in tableName: String, coder: Coder, writeOptions: FieldWriteOptions, configuration: FetchConfiguration) async throws

Inserts the specified Codable model into the specified table.

In order to create a new record by model, the model must conform to the `SysIdentifiableModel` protocol. Each table will typically have its own model.

The model's *sys_Id* parameter is ignored during creation as the *sysId* is generated by the ServiceNow platform. The ServiceNow platform generated *sys_Id* is returned in the *completion* handler's `Result` model.

Parameters

Name	Type	Description
model	SysIdentifiableModel	Model definition of the fields to insert into the table.
in tableName	String	Name of the table in which to write the records, such as *incident*.

coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance.
		
		Possible values:
		• default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`.
		• custom(JSONEncoder, JSONDecoder):
		
		Use `custom` coders to have more fine-grained control on JSON decoding/encoding.
		
		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder`
		`= .custom(myEncoder, myDecoder)`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: .default
writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Model	Returned when the method is successful. Codable model that was inserted in the specified table, including the sys_Id. Use this sys_id to reference this record in future method calls.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	Thrown when a string-wrapped value cannot be decoded from JSON.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	  Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	  Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	  Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	  Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	  Thrown when an expected service configuration is missing.
	• `missingSysID`
	  Thrown when an expected sys_id parameter is missing.
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	  Thrown when a network service encountered an error.

The following code example shows how to call this method.

```
struct User: SysIdentifiableModel {
    var sysId: String = ""
    var name: String
}

let service: NowTableService = ...
let user = User(name: "Ash Williams")
do {
    let result = try await service.create(user, in: “sys_user”)
} catch {
    ...
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowTableService - create<Model: SysIdentifiableModel>(_ model: Model, in tableName: String, coder: Coder, writeOptions: FieldWriteOptions, configuration: FetchConfiguration, completion: @escaping (Result<Model, NowDataError>))

Inserts the specified Codable model into the specified table and then executes the *completion* handler.

In order to create a new record by model, the model must conform to the `SysIdentifiableModel` protocol. Each table will typically have its own model. For example:

```
struct User: SysIdentifiableModel {
  var sysId: String = ""
  var name: String
}

let service: NowTableService = ...
let user = User(name: "Ash Williams")
service.create(Incident(fields: fields), in: tableName,
 writeOptions: writeOptions, configuration: fetchConfiguration)
 { [weak self] result in
  switch result {
  case .success(let newUser):
    /// 'newUser' contains the platform assigned 'sys_id', use
 in subsequent 'update' or 'delete' calls.
  case .failure(let error):
      ...
  }
}
```

The model's *sys_Id* parameter is ignored during creation as the *sysId* is generated by the ServiceNow platform. The ServiceNow platform generated *sys_Id* is returned in the *completion* handler's `Result` model.

Parameters

Name	Type	Description
model	SysIdentifiableModel	Model definition of the fields to insert into the table.
in tableName	String	Name of the table in which to write the records, such as *incident*.
coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance. Possible values: • default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`. • custom(JSONEncoder, JSONDecoder): Use `custom` coders to have more fine-grained control on JSON decoding/encoding. Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		```let myEncoder = JSONEncoder() myEncoder.dateFormat = … let myDecoder = JSONDecoder() myDecoder.dateFormat = … let coder: Coder = .custom(myEncoder, myDecoder)``` Default: .default
writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.
completion	@escaping (Result<Model, NowDataError>)	Completion handler to execute after creating the specified decodable model(s). Return values for the completion handler: • Success: Model - Data for the created model type. • Failure: NowDataError ○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response ○ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Thrown when a Codable model cannot be decoded from JSON. ◦ `cannotDecodeProperty(type: Any, from: String)` ▪ *type*: Wrapped type to decode from a string. ▪ *from*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. ◦ `cannotEncodeModel(EncodingError)` ▪ *EncodingError*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. ◦ `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. ◦ `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. ◦ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ◦ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ◦ `missingSysID` Thrown when an expected sys_id parameter is missing. ◦ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
struct User: SysIdentifiableModel {
  var sysId: String = ""
  var name: String
}

let service: NowTableService = ...
let user = User(name: "Ash Williams")
service.create(Incident(fields: fields), in: tableName,
 writeOptions: writeOptions, configuration: fetchConfiguration)
 { [weak self] result in
  switch result {
  case .success(let newUser):
    /// 'newUser' contains the platform assigned 'sys_id' to use
 in subsequent update or delete calls.
  case .failure(let error):
   ...
  }
}
```

NowTableService - create<Model: SysIdentifiableModel>(model: Model, in tableName: String, path: String = Constants.resultPath, coder: Coder = .default, writeOptions: FieldWriteOptions? = nil, configuration: FetchConfiguration = nil)

Inserts one Codable model into the specified table.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

In order to create a new record by model, the model must conform to the `SysIdentifiableModel` protocol. Each table will typically have its own model. For example:

```
struct User: SysIdentifiableModel {
  var sysId: String = ""
  var name: String
}

let service: NowTableService = ...
let user = User(name: "Ash Williams")
service.create(Incident(fields: fields), in: tableName,
 writeOptions: writeOptions, configuration: fetchConfiguration)
 { [weak self] result in
  switch result {
  case .success(let newUser):
    /// 'newUser' contains the platform assigned 'sys_id', use
 in subsequent 'update' or 'delete' calls.
  case .failure(let error):
      ...
  }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The model's *sys_Id* parameter is ignored during creation. The *sysId* is assigned by the ServiceNow platform. The ServiceNow platform generated *sys_Id* is returned in the publisher's `receiveValue` callback model.

Parameters

Name	Type	Description
model	SysIdentifiableModel	`SysIdentifiableModel` model to insert into the table.
in tableName	String	Name of the table in which to write the records, such as *incident*.
path	String	Optional. Dot separated path for the nested type. For example, `result` or `foo.bar.baz` for deeper nesting. Default: `Constants.resultPath`

coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance.
		
		Possible values:
		• default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`.
		• custom(JSONEncoder, JSONDecoder):
		
		Use `custom` coders to have more fine-grained control on JSON decoding/encoding.
		
		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder`
		`= .custom(myEncoder, myDecoder)`
		
		Default: .default

writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
AnyPublisher<Model,NowDataError>	Success: Codable model that was inserted in the specified table, including *sys_Id*. Use this sys_id to reference this record in future method calls. Failure: NowDataError @escaping (Result<Model, NowDataError>)

Shows how to insert a single record into the User [sys_user] table.

```
struct User: SysIdentifiableModel {
  var sysId: String = ""
  var name: String
}

let service: NowTableService = ...
let user = User(name: "Ash Williams")
let publisher: AnyPublisher<User, NowDataError> =
 service.create(user, in: "sys_user")
publisher
  .subscribe(on: DispatchQueue.global())
  .receive(on: DispatchQueue.main)
  .sink { [weak self] completion in
    ...
  } receiveValue: { [weak self] newUser in
     /// 'newUser' contains the ServiceNow platform assigned
 'sys_id' to use in subsequent update and delete calls.
    ...
  }
  .store(in: &subscriptions)
```

NowTableService - createRecord(with fields: [FieldName: FieldValue], in tableName: String, writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil) async throws

Inserts a record in the specified table that contains the specified fields.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function *convertToRecords()* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

Note: All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
with fields	[FieldName: FieldValue]	Name-value pairs of the fields to include in the record.
in tableName	String	Name of the table in which to write the records, such as *incident*.
writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Data	Returned when the method is successful. Data object containing the new record.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ *type*: Wrapped type to decode from a string. ○ *from*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. • `cannotEncodeModel(EncodingError)` ○ *EncodingError*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
do {
    let dataResult: Data = try await
 tableService.createRecord(with: fields, in: tableName,
 writeOptions: writeOptions, configuration: configuration)
    let recordResult: NowRecord = dataResult.convertToRecord()
} catch {
    print("Record creation failed with NowDataError: \(error)")
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowTableService - createRecord(with fields: [FieldName: FieldValue], in tableName: String, writeOptions: FieldWriteOptions, configuration: FieldReadConfiguration, completion: @escaping (Result<Data, NowDataError>)

Inserts the specified record in the specified table and then executes the *`completion`* handler after the record is saved.

If needed, you can decode the return results into a custom Codable model or you can use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function instead. Alternatively, you can use the convenience function *`convertToRecords()`* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myResult.convertToRecords()
```

Note: All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.

Parameters

Name	Type	Description
with fields	[FieldName: FieldValue]	Name-value pairs of the fields to include in the record.
in tableName	String	Name of the table in which to write the records, such as *incident*.
writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FieldReadConfiguration	Optional. Configuration options that specify which fields to return and what to include in the fields. Default: nil
completion	@escaping (Result<Data, NowDataError>)	Completion handler to execute after the records are retrieved. Return values: • Success: Data - Requested records • Error: NowDataError ○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token.

Parameters (continued)

Name	Type	Description
		○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response ○ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. ○ `cannotDecodeProperty(type: Any, from: String)` ▪ *`type`*: Wrapped type to decode from a string. ▪ *`from`*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. ○ `cannotEncodeModel(EncodingError)` ▪ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. ○ `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. ○ `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. ○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let fields = ["short_description" : "test description"]
let writeOptions: FieldWriteOptions =
 [.suppressAutoSysField, .treatInputValuesAsDisplayValues]
let readConfiguration = FieldReadConfiguration(includeFields:
 ["number", "short_description"])

tableService.createRecord(with: fields, in: tableName,
 writeOptions: writeOptions, configuration: readConfiguration)
 { [weak self] result in
  switch result {
    case .success(let dataResult):
      let recordResult: NowRecord = dataResult.convertToRecord()
    case .failure(let error):
       print("Record creation failed with NowDataError:
 \(error)")
  }
}
```

NowTableService - createRecord(with fields: [FieldName: FieldValue], in tableName: String, writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil)

Inserts a record in the specified table that contains the specified fields.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternatively, you can use the convenience function *convertToRecords()* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

Note: All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.

Parameters

Name	Type	Description
with fields	[FieldName: FieldValue]	Name-value pairs of the fields to include in the record.
in tableName	String	Name of the table in which to write the records, such as *incident*.
writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
AnyPublisher<Data, NowDataError>	Success: Data object containing the updated record. Failure: NowDataError • `accessToken(AccessTokenProviderError)` ◦ *AccessTokenProviderError*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. • `attachmentValidation` Thrown when an attachment fails validation. • `badResponse(statusCode: HTTPStatusCode)` ◦ *HTTPStatusCode*: Status code received from the instance.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	Thrown when an expected service configuration is missing.
	• `missingSysID`
	Thrown when an expected sys_id parameter is missing.
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	Thrown when a network service encountered an error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example shows how to create a function that inserts a record in the specified table, with the specified fields. The output of the call is a ByteArray which allows you to convert the data into any model that you want.

```
tableService.createRecord(with: fields, in: tableName,
 writeOptions: writeOptions, configuration: readConfiguration)
    .subscribe(on: DispatchQueue.global())
    .receive(on: DispatchQueue.main)
    .convertToRecord()
    .sink { completion in
        if case let .failure(error) = completion {
            print("Record creation failed with NowDataError:
 \(error)")
        }
    } receiveValue: { record in
        print("Created NowRecord: \(record)")
    }
    .store(in: &subscriptions)
```

NowTableService - delete(_ model: Model, from tableName: String) async throws

Deletes the specified Codable model from the specified table.

Parameters

Name	Type	Description
model	Model	`SysIdentifiableModel` to delete from the table. It should contain the sys_id of the record to delete.
from tableName	String	Name of the table from which to delete the information, such as *incident*.

Returns

Type	Description
None	Nothing returned when the method is successful.
NowDataError	Thrown when the method fails. • `accessToken(AccessTokenProviderError)` ◦ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. • `attachmentValidation` Thrown when an attachment fails validation. • `badResponse(statusCode: HTTPStatusCode)` ◦ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response

Returns (continued)

Type	Description

	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	  Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	  Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	  Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	  Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	  Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	  Thrown when an expected service configuration is missing.
	• `missingSysID`
	  Thrown when an expected sys_id parameter is missing.
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	  Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
do {
    try await tableService.delete(model, from: tableName)
```

```
    print("Deletion successful.")
} catch {
    print("Deletion failed with NowDataError: \(error)")
}
```

NowTableService - delete(_ model: Model, from tableName: String, completion: @escaping (Result<Void, NowDataError>))

Deletes the specified Codable model from the specified table and then executes the appropriate *`completion`* handler.

Parameters

Name	Type	Description
model	Model	`SysIdentifiableModel` to delete from the table. It should contain the sys_id of the record to delete.
from tableName	String	Name of the table from which to delete the information, such as *incident*.
completion	@escaping (Result<Void, NowDataError>)	Completion handler to execute after deleting the specified codable model(s). Return values: • Success: Nothing returned • Failure: NowDataError ○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response ○ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. ○ `cannotDecodeProperty(type: Any, from: String)`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		▪ *type*: Wrapped type to decode from a string. ▪ *from*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. ○ `cannotEncodeModel(EncodingError)` ▪ *EncodingError*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. ○ `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. ○ `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. ○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call this function.

```
tableService.delete(Incident(sysId: sysId), from: tableName)
 { [weak self] result in
  switch result {
    case .success:
      // Delete successfully
    case .failure(let error):
      // Failed to delete with NowDataError
  }
}
```

NowTableService - delete(_ model: Model, from tableName: String)

Deletes the specified Codable model from the specified table.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
model	Model	`SysIdentifiableModel` to delete from the table. It should contain the sys_id of the record to delete.
from tableName	String	Name of the table from which to delete the information, such as *incident*.

Returns

Type	Description

AnyPublisher<Void, NowDataError>	Success: Nothing returned
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.

```
      case .finished:
        // Delete successfully
      case .failure(let error):
        // Failed to delete with NowDataError
    }
  } receiveValue: { _ in
  }
  .store(in: &subscriptions)
```

NowTableService - deleteRecord(sysId: SysID, from tableName: String) async throws

Deletes the specified record from the specified table.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to delete.
from tableName	String	Name of the table from which to delete the information, such as *incident*.

Returns

Type	Description
None	Nothing returned when the method is successful.

NowDataError	Thrown when the method fails.
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	  Thrown when there is an error in the access token.
	• `attachmentValidation`
	  Thrown when an attachment fails validation.
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	  Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	  Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.

NowTableService - deleteRecord(sysId: SysID, from tableName: String, completion: @escaping (Result<Void, NowDataError>))

Deletes the specified record from the specified table and then executes the *`completion`* object after the record is deleted.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to delete.
from tableName	String	Name of the table from which to delete the information, such as *incident*.

completion	@escaping (Result<Void, NowDataError>)	Success: Nothing is returned.
		
		Failure: NowDataError
		
		• `accessToken(AccessTokenProviderError)`
		  ◦ *`AccessTokenProviderError`*: The access token provider's error code or message.
		  ▪ accessTokenRetrievalFailed
		  ▪ userSessionError(_ error: Error)
		
		Thrown when there is an error in the access token.
		
		• `attachmentValidation`
		
		Thrown when an attachment fails validation.
		
		• `badResponse(statusCode: HTTPStatusCode)`
		  ◦ *`HTTPStatusCode`*: Status code received from the instance.
		
		Thrown when a request returns an unexpected response
		
		• `cannotDecodeModel(DecodingError)`
		  ◦ *`DecodingError`*: Decoding error detected.
		
		Thrown when a Codable model cannot be decoded from JSON.
		
		• `cannotDecodeProperty(type: Any, from: String)`
		  ◦ *`type`*: Wrapped type to decode from a string.
		  ◦ *`from`*: String to decode to the specified type.
		
		Thrown when a string-wrapped value cannot be decoded from JSON.
		
		• `cannotEncodeModel(EncodingError)`
		  ◦ *`EncodingError`*: Encoding error detected.
		
		Thrown when a Codable model cannot be encoded to JSON.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ◦ genericError(String) ◦ operationCanceled ◦ serviceDisabled ◦ serverError(Error) ◦ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
tableService.deleteRecord(sysId: sysId, from: tableName) { [weak
 self] result in
  switch result {
    case .success:
      // Delete successfully
    case .failure(let error):
      // Failed to delete with NowDataError
  }
}
```

NowTableService - deleteRecord(sysId: SysID, from tableName: String)

Deletes the specified record from the specified table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to delete.
from tableName	String	Name of the table from which to delete the information, such as *incident*.

Returns

Type	Description

AnyPublisher<Void, NowDataError>	Success: Nothing returned
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

This example shows how to create a function that deletes a record in a specified table.

```
tableService.deleteRecord(sysId: sysId, from: tableName)
    .subscribe(on: DispatchQueue.global())
    .receive(on: DispatchQueue.main)
    .sink { completion in
        switch completion {
        case .finished:
            print("Record deleted.")
        case .failure(let error):
            print("Deletion failed with NowDataError: \(error)")
        }
    } receiveValue: { _ in }
    .store(in: &subscriptions)
```

NowServiceTable - init(configuration: NowServiceConfiguration, coreServiceProvider: NowCoreServiceProviding? = nil)

Creates a NowTableService object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
configuration	NowServiceConfiguration	Configuration parameters to use when creating the service.
coreServiceProvider	NowCoreServiceProviding	Optional. Service provider to associate with the NowTableService. Default: nil

The following code example shows how to call this function.

```
guard let coreService = NowSDK.core() else {
  // Error with NowServiceError.sdkNotConfigured
  return
}

guard
  let instanceUrl = URL(string:
 "http://sample.service-now.com") ,
  let serviceConfig = NowSDK.makeServiceConfiguration(for:
 instanceUrl) else {
    // Could not create service -
    // NowServiceError.serviceConfigurationInvalid
    return
  }
let tableService = NowTableService (configuration:
 serviceConfig, coreServiceProvider: coreService)
```

NowTableService - model<Model: Decodable>(with sysId: SysID? = nil, from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) async throws

Enables the retrieval of decodable model(s) from a specified table.

Table API responses are nested inside a *result* parameter similar to the following:

```
{
  "result": [
    { "name": "Ash Williams" },
    { "name": "Lionel Cosgrove" },
    { "name": "Laurie Strode" }
  ]
}
```

For large result sets, use one of the paginator functions, NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) or NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) to fetch paginated models.

Parameters

Name	Type	Description
with sysId	SysID	Optional. Sys_id of the record to return. Provide the sys_id if you want to retrieve a specific record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: nil
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
path	String	Dot separated path for the nested type. For example, `result` or `foo.bar.baz` for deeper nesting. Default: `result`

coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance.
		
		Possible values:
		• default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`.
		• custom(JSONEncoder, JSONDecoder):
		
		Use `custom` coders to have more fine-grained control on JSON decoding/encoding.
		
		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder = .custom(myEncoder, myDecoder)`
		
		Default: .default

configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Model	Returned when the method is successful. Decodable model(s).
NowDataError	Thrown when the method fails.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	  Thrown when there is an error in the access token.
	• `attachmentValidation`
	  Thrown when an attachment fails validation.
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	  Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	  Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	  Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	  Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	  Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	  Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	  Thrown when an expected service configuration is missing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this method.

```
struct User: Codable {
    var name: String
}

let service: NowTableService = ...
do {
    let result = try await service.model([User].self, from:
 "sys_user", path: "result")
    print("Fetched \(users.count) users")
} catch {
    dump(error)
}
```

The following code example shows how to fetch a single Decodable model by sys_id. Use a single model type, such as `User.self`, rather than `[User].self`.

```
let result = try await service.model(User.self, with:
 "5137153cc611227c000bbd1bd8cd2005", from: "sys_user", path:
 "result")
```

NowTableService - model<Model: Decodable>(_ type: Model.Type, with sysId: SysID? = nil, from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil, completion: @escaping (Result<Model, NowDataError>))

Retrieves decodable model(s) from a specified table.

`Table` API responses are nested inside a *`result`* parameter similar to the following:

```
{
  "result": [
    { "name": "Ash Williams" },
    { "name": "Lionel Cosgrove" },
    { "name": "Laurie Strode" }
  ]
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use this function to obtain decodable models instead of nested output.

Parameters

Name	Type	Description
type	Model.Type	Type of value to decode.
with sysId	String	Optional. Sys_id of the record to return. Default: All records returned per the *`configuration`* settings.
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
path	String	Optional. Dot separated path for the nested type. For example, `result` or `foo.bar.baz` for deeper nesting. Default: `Constants.resultPath`
coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance. Default: `.default`
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.
completion	@escaping (Result<Model, NowDataError>)	Completion handler to execute after retrieving the specified decodable model(s). Return values for the completion handler: • Success: Data for the requested model type. • Failure: NowDataError ◦ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ◦ `attachmentValidation` Thrown when an attachment fails validation. ◦ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Thrown when a request returns an unexpected response ◦ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. ◦ `cannotDecodeProperty(type: Any, from: String)` ▪ *`type`*: Wrapped type to decode from a string. ▪ *`from`*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. ◦ `cannotEncodeModel(EncodingError)` ▪ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. ◦ `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. ◦ `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. ◦ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ◦ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ◦ `missingSysID` Thrown when an expected sys_id parameter is missing. ◦ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

To retrieve a collection of decoded *User* models.

```
struct User: SysIdentifiableModel {
    var sysId: String = ""
    var name: String
}
let service: NowTableService = ...
let user = User(name: "Ash Williams")
service.create(Incident(fields: fields), in: tableName,
 writeOptions: writeOptions, configuration: fetchConfiguration)
 { [weak self] result in
  switch result {
  case .success(let newUser):
    /// 'newUser' contains the platform assigned 'sys_id', use
 in subsequent 'update' or 'delete' calls.
  case .failure(let error):
   ...
 }
}
```

To fetch a single decodable model by sys_id, use a single model type, such as `User.self`, rather than `[User].self`.

```
service.model(User.self, with:
 "5137153cc611227c000bbd1bd8cd2005", from: "sys_user", path:
 "result") { resultin ... }
```

NowTableService - model<Model: Decodable>(with sysId: SysID? = nil, from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil)

Creates a publisher that enables the retrieval of decodable model(s) from a specified table.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Table API responses are nested inside a *result* parameter similar to the following:

```
{
  "result": [
    { "name": "Ash Williams" },
    { "name": "Lionel Cosgrove" },
    { "name": "Laurie Strode" }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    ]
}
```

For large result sets, use one of the paginator functions, NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) or NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) to fetch paginated models.

Parameters

Name	Type	Description
with sysId	SysID	Optional. Sys_id of the record to return. Provide the sys_id if you want to retrieve a specific record. Default: nil
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
path	String	Dot separated path for the nested type. For example, `result` or `foo.bar.baz` for deeper nesting. Default: `result`

coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance.
		
		Possible values:
		• default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`.
		• custom(JSONEncoder, JSONDecoder):
		
		Use `custom` coders to have more fine-grained control on JSON decoding/encoding.
		
		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder = .custom(myEncoder, myDecoder)`
		
		Default: .default

configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description

AnyPublisher<Model, NowDataError>	Success: Publisher returning a decodable model(s).
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ◦ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ◦ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ◦ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ◦ *`type`*: Wrapped type to decode from a string.
	  ◦ *`from`*: String to decode to the specified type.
	
	Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ◦ *`EncodingError`*: Encoding error detected.
	
	Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`
	
	Thrown when a response from the instance cannot be parsed into its expected format.
	
	• `invalidURL`
	
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	
	• `missingAttachmentMetadata`
	
	Thrown when the attachment metadata header is missing.
	
	• `missingServiceConfiguration`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

To obtain a publisher that provides decoded User models by type, such as `[Users].self`, fetch the models by specifying a dot-separated path.

```
struct User: Codable {
  varname: String
}

let service: NowTableService = ...
let publisher: AnyPublisher<[User], NowDataError>
 = service.model(from: "sys_user", path:
 "user.photos.gps_location")
```

To fetch a single decodable model by sys_id, use a single `User.self` model type, rather than `[User].self`.

```
let publisher: AnyPublisher<User, NowDataError> =
 service.model(with: "5137153cc611227c000bbd1bd8cd2005", from:
 "sys_user", path: "result")
```

NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil)

Creates a paginator that enables iterating through pages of records.

The paginator's publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function *`convertToRecords()`* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Unless overridden in the *configuration* parameter, a paginator returns 20 items per page. Depending on ACL evaluation, the actual number of fetched items for a page might be less than the default or configured value.

Parameters

Name	Type	Description
tableName	String	Name of the table from which to retrieve the records, such as *incident*.
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description

Paginator<Data>	Success: Paginator object containing the specified records.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *AccessTokenProviderError*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *HTTPStatusCode*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *DecodingError*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *type*: Wrapped type to decode from a string.
	  ○ *from*: String to decode to the specified type.
	
	Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ *EncodingError*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

```
private var tableService: NowTableService?
// Paginator creation uses type inference to determine the
 response type.
private var paginator: Paginator<[CustomerServiceCase]>?

func initializeTableService(for instanceUrl: URL) {
  makeTableService(instanceUrl: instanceUrl) { [weak self]
 result in
    guard let self = self else { return }

    switch result {
    case .success(let tableService):
      self.tableService = tableService
      // Create a paginator that iterates over pages of customer
 support cases. The paginator's response type is
      // inferred from the paginator's type definition (e.g.
 `Paginator<[CustomerServiceCase]>`).
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      self.paginator = tableService.paginator(from:
 Self.tableName, configuration: self.fetchConfiguration)
      // Subscribe to the paginator's publisher so you are able
 to receive paged results.
      self.subscribeToPaginatorPublisher()
      // Ready to start fetching data, inform the view
 controller.
      self.onReady(self)
    case .failure(let error):
      debugPrint("Creating table service failed with error:
 \(error.localizedDescription)")
      self.tableService = nil
      self.paginator = nil
    }
  }
}
```

NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil)

Creates a paginator that enables the iteration of pages of decoded model(s) that handle nesting.

The ServiceNow REST *Table* API responses are nested inside a result property similar to the following:

```
{
  "result": [
    { "name": "Ash Williams" },
    { "name": "Lionel Cosgrove" },
    { "name": "Laurie Strode" }
  ]
}
```

To obtain a paginator that provides decoded User models, fetch the paginator by specifying a dot-separated path; in this case, *result*.

```
struct User: Codable {
  varname: String
}

let service: NowTableService = ...
let paginator: Paginator<[User]> = service.paginator(from:
 "sys_user", path: "result")
```

Note: Unless overridden in the *configuration* parameter, a paginator returns 20 items per page. Depending on the ACL evaluations, the actual number of fetched items for a page might be less than the default or configured value.

After obtaining a Paginator object, subscribe to its Combine Publisher to start receiving data:

```
paginator.publisher
  .subscribe(on: DispatchQueue.global())
  .receive(on: DispatchQueue.main)
  .sink { … }
  .store(in: &subscriptions)
```

Note: As with all Combine subscriptions, ensure that you retain the subscription to avoid unexpected results.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
path	String	Dot separated path for the nested type. For example, `result` or `result.user.photos` for deeper nesting. Specifying a custom path allows fetching or iterating over nested data. Default: `result`

coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance.
		
		Possible values:
		• default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`.
		• custom(JSONEncoder, JSONDecoder):
		
		Use `custom` coders to have more fine-grained control on JSON decoding/encoding.
		
		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder = .custom(myEncoder, myDecoder)`
		
		Default: .default

configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Paginator<Data>	Success: Paginator object containing paged `Decodable` model(s). Failure: NowDataError

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	  Thrown when there is an error in the access token.
	• `attachmentValidation`
	  Thrown when an attachment fails validation.
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	  Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	  Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	  Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	  Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	  Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	  Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	  Thrown when an expected service configuration is missing.
	• `missingSysID`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

This example shows how to obtain a Paginator object that provides decoded User models. You can fetch the desired Paginator object by hinting the compiler to return a collection of User models ([User]) and informing the Paginator object that the users are nested beneath the result path.

```
struct User: Codable {
  var name: String
}

let service: NowTableService = ...
let paginator: Paginator<[User]> = service.paginator(from:
 "sys_user", path: "result")
```

Note: The *`Table`* API always returns results nested beneath a result path, so you can safely eliminate the *`path`* parameter.

NowTableService - record(with sysId: SysID, from tableName: String, configuration: FieldReadConfiguration? = nil) async throws

Retrieves a specified record from the specified table on a ServiceNow instance.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function *`convertToRecords()`* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to return from the ServiceNow instance.
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Data	Returned when the method is successful. Data object containing the specified record.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
func fetchTableRecord(sysId: String, tableName: String,
 includeFields: [FieldName] = [FieldName](), readOptions:
 FieldReadConfiguration.Options = []) async throws -> NowRecord
 {
    let readConfig = FieldReadConfiguration(includeFields:
 includeFields, options: readOptions)
    do {
        let dataResult: Data = try await
 tableService.record(with: sysId, from: tableName,
 configuration: configuration)
        let recordResult: NowRecord =
 dataResult.convertToRecord()
        return recordResult
    } catch {
        print("Fetch failed with NowDataError: \(error)")
        throw error
    }
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowTableService - record(with sysId: SysID, from tableName: String, configuration: FieldReadConfiguration, completion: @escaping (Result<Data, NowDataError>)

Retrieves the specified record from the specified table and then executes a completion handler after the record is retrieved.

If needed, you can decode the return results into a custom Codable model or you can use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function instead. Alternatively, you can use the convenience function `convertToRecords()` to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myResult.convertToRecords()
```

For large result sets, use the NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) function to fetch paginated results.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to return from the ServiceNow instance.
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.
completion	@escaping (Result<Data, NowDataError>)	Completion handler to execute after the records are retrieved. Return values: • Success: Data - Requested records • Error: NowDataError ○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
func fetchTableRecords( tableName: String, filterQuery: String,
 includeFields: [FieldName] = [FieldName](), readOptions:
 FieldReadConfiguration.Options = [], limit: Int?) {
  let readConfig = FieldReadConfiguration(includeFields:
 includeFields, options: readOptions)
  let config = FetchConfiguration(Filter(query: filterQuery),
 limit, readConfig)
  tableService.records (from: tableName, configuration:
 fetchConfiguration) { [weak self] result in
    switch result {
      case .success(let dataResult):
        let recordResult: [NowRecord] =
 dataResult.convertToRecords()
        // Return recordResult

      case .failure(let error):
        // Failed to fetch record with NowDataError
    }
  }
}
```

NowTableService - record(with sysId: SysID, from tableName: String, configuration: FieldReadConfiguration? = nil)

Creates a publisher to retrieve a specified record from the specified table on a ServiceNow instance.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function `convertToRecords()` to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to return from the ServiceNow instance.
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description

AnyPublisher<Data, NowDataError>	Success: Data object containing the specified records.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	Thrown when an expected service configuration is missing.
	• `missingSysID`
	Thrown when an expected sys_id parameter is missing.
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	Thrown when a network service encountered an error.

This example shows how to create a function that retrieves the specified record from the specified table, with the specified fields. The output of the call is a ByteArray which allows you to convert the data into any model that you want.

```
tableService.record(with: sysId, from: tableName, configuration:
 fetchConfiguration)
    .subscribe(on: DispatchQueue.global())
    .receive(on: DispatchQueue.main)
    .convertToRecord()
    .sink { completion in
        if case let .failure(error) = completion {
            print("Record retrieval failed with NowDataError:
 \(error)")
        }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    } receiveValue: { record in
        print("Successfully retrieved record: \(record)")
    }
    .store(in: &subscriptions)
```

NowTableService - records(from tableName: String, configuration: FetchConfiguration? = nil) async throws

Retrieves records from the specified table.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function *`convertToRecords()`* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

For large result sets, use the NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) function to fetch paginated results.

Parameters

Name	Type	Description
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Data	Returned when the method is successful. Data object containing the specified records.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.

Returns (continued)

Type	Description

	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	  Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	  Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	  Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	  Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	  Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	  Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	  Thrown when an expected service configuration is missing.
	• `missingSysID`
	  Thrown when an expected sys_id parameter is missing.
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	  Thrown when a network service encountered an error.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call this method.

```
func fetchTableRecords( tableName: String, filterQuery: String,
 includeFields: [FieldName] = [FieldName](), readOptions:
 FieldReadConfiguration.Options = [], limit: Int?) {
    let readConfig = FieldReadConfiguration(includeFields:
 includeFields, options: readOptions)
    let config = FetchConfiguration(Filter(query: filterQuery),
 limit, readConfig)
    do {
      let dataResult: Data = try await
 tableService.records(from: tableName, configuration: config)
      let recordResult: [NowRecord] =
 dataResult.convertToRecords()
      // return recordResult
    } catch {
      print("Fetch failed with NowDataError: \(error)")
      throw error
  }
}
```

NowTableService - records(from tableName: String, configuration: FetchConfiguration? = nil, completion: @escaping (Result<Data, NowDataError>))

Retrieves records from a specified table and then executes the *completion* handler after the records are retrieved.

If needed, you can decode the return results into a custom Codable model or you can use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function instead. Alternatively, you can use the convenience function *convertToRecords()* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myResult.convertToRecords()
```

For large result sets, use the NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) function to fetch paginated results.

Parameters

Name	Type	Description
in tableName	String	Name of the table in which to write the records, such as *incident*.
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.
completion	@escaping (Result<Data, NowDataError>)	Completion handler to execute after the records are retrieved. Return values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. ○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
func fetchTableRecords( tableName: String, filterQuery: String,
 includeFields: [FieldName] = [FieldName](), readOptions:
 FieldReadConfiguration.Options = [], limit: Int?) {
  let readConfig = FieldReadConfiguration(includeFields:
 includeFields, options: readOptions)
  let config = FetchConfiguration(Filter(query: filterQuery),
 limit, readConfig)
  tableService.records (from: tableName, configuration:
 fetchConfiguration) { [weak self] result in
    switch result {
      case .success(let dataResult):
        let recordResult: [NowRecord] =
 dataResult.convertToRecords()
        // return recordResult

      case .failure(let error):
```

```
        // Failed to fetch record with NowDataError
    }
  }
}
```

NowTableService - records(from tableName: String, configuration: FetchConfiguration? = nil)

Creates a publisher that enable you to retrieve records from the specified table.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function *`convertToRecords()`* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

For large result sets, use the NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) function to fetch paginated results.

Parameters

Name	Type	Description
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description

AnyPublisher<Data, NowDataError>	Success: Data object containing the specified records.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	Thrown when an attachment fails validation.
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	Thrown when an expected service configuration is missing.
	• `missingSysID`
	Thrown when an expected sys_id parameter is missing.
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

This example shows how to create a function that fetches multiple records from a specified table. It creates an object which will schedule the request to be executed at some point in the future and return a ByteArray response.

```
tableService.records(from: tableName, configuration:
 fetchConfiguration)
    .subscribe(on: DispatchQueue.global())
    .receive(on: DispatchQueue.main)
    .convertToRecords()
    .sink { completion in
        if case let .failure(error) = completion {
            print("Record retrieval failed with NowDataError:
 \(error)")
        }
    } receiveValue: { records in
        print("Successfully retrieved records: \(records)")
    }
    .store(in: &subscriptions)
```

NowTableService - update<Model: SysIdentifiableModel>(_ model: Model, in tableName: String, coder: Coder = .default, writeOptions: FieldWriteOptions? = nil, configuration: FetchConfiguration? = nil) async throws

Updates the specified Codable model in the specified table.

Parameters

Name	Type	Description
model	Model	`SysIdentifiableModel` model to update in the table.
in tableName	String	Name of the table in which to write the records, such as *incident*.
coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance. Possible values: • default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`. • custom(JSONEncoder, JSONDecoder): Use `custom` coders to have more fine-grained control on JSON decoding/encoding.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder = .custom(myEncoder, myDecoder)`
		Default: .default

writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Model	Returned when the method is successful. Decodable model that was updated in the specified table.
NowDataError	Thrown when the method fails. • `accessToken(AccessTokenProviderError)` ○ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. • `attachmentValidation` Thrown when an attachment fails validation. • `badResponse(statusCode: HTTPStatusCode)` ○ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response

Returns (continued)

Type	Description

	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	  Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	  Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	  Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	  Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	  Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	  Thrown when an expected service configuration is missing.
	• `missingSysID`
	  Thrown when an expected sys_id parameter is missing.
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	  Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
struct User: SysIdentifiableModel {
    var sysId: String = ""
```

© 2026 ServiceNow, Inc. All rights reserved.

```
    var name: String}

func updateUser(user: User) async throws -> User {
    do {
        let result = try await tableService.update(user, in:
 “sys_user”)
        return result
    } catch {
        print("Update failed with NowDataError: \(error)")
        throw error
    }
}
```

NowTableService - update<Model: SysIdentifiableModel>(_ model: Model, in tableName: String, coder: Coder = .default, writeOptions: FieldWriteOptions? = nil, configuration: FetchConfiguration? = nil, completion: @escaping (Result<Model, NowDataError>))

Updates the specified Codable model in the specified table and then executes the *`completion`* handler.

Parameters

Name	Type	Description
model	Model	`SysIdentifiableModel` model to update in the table.
in tableName	String	Name of the table in which to write the records, such as *incident*.

coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance.
		
		Possible values:
		• default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`.
		• custom(JSONEncoder, JSONDecoder):
		
		Use `custom` coders to have more fine-grained control on JSON decoding/encoding.
		
		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder = .custom(myEncoder, myDecoder)`
		
		Default: .default

writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record.

```
  .subscribe(on: DispatchQueue.global())
  .receive(on: DispatchQueue.main)
  .sink { [weak self] completion in
    if case let .failure(error) = completion {
      // Failed to update with NowDataError
      self?.publish(result: .failure(error))
    }
  } receiveValue: { [weak self] updatedModel in
    do {
      let data = try coder.jsonEncoder.encode(updatedModel)
      self?.publish(data: data)
    } catch {
      // Failed to update with NowDataError
      self?.publish(result: .failure(error))
    }
  }
  .store(in: &subscriptions)
```

NowTableService - updateRecord(sysId: SysID, in tableName: String, withfields: [FieldName: FieldValue], writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil) async throws

Updates the specified record with the specified fields.

You can decode the data into a custom Codable model, or you can use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function `convertToRecords()` to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

Note: All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to return from the ServiceNow instance.
with fields	[FieldName: FieldValue]	Name-value pairs of the fields to include in the record.
in tableName	String	Name of the table in which to write the records, such as *incident*.
writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Data	Returned when the method is successful. Data object containing the updated record.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`
	
	Thrown when a response from the instance cannot be parsed into its expected format.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
do {
    let dataResult: Data = try await
 tableService.updateRecord(with: fields, in: tableName,
 writeOptions: writeOptions, configuration: configuration)
    let recordResult: NowRecord = dataResult.convertToRecord()
} catch {
    print("Record update failed with NowDataError: \(error)")
}
```

NowTableService - updateRecord(sysId: SysID, in tableName: String, with fields: [FieldName: FieldValue], writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil, completion: @escaping (Result<Data, NowDataError>)

Updates the specified record with the specified fields then executes the *`completion`* handler once the record is saved.

If needed, you can decode the return results into a custom Codable model or you can use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function instead. Alternatively, you can use the convenience function *`convertToRecords()`* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

Parameters (continued)

Name	Type	Description
		▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
tableService.updateRecord(sysId: sysId, in: tableName,
 with: fields, writeOptions: writeOptions, configuration:
 readConfiguration) { [weak self] result in
  switch result {
    case .success(let data):
      self?.publish(data: data)
    case .failure(let error):
       // Failed to update with NowDataError
  }
}
```

NowTableService - updateRecord(sysId: SysID, in tableName: String, withfields: [FieldName: FieldValue], writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil)

Updates the specified record with the specified fields.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function `convertToRecords()` to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

Note: All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to return from the ServiceNow instance.
with fields	[FieldName: FieldValue]	Name-value pairs of the fields to include in the record.
in tableName	String	Name of the table in which to write the records, such as *incident*.
writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description

AnyPublisher<Data, NowDataError>	Success: Data object containing the updated record.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ *type*: Wrapped type to decode from a string. ○ *from*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. • `cannotEncodeModel(EncodingError)` ○ *EncodingError*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

This example shows how to create a function that updates a record in the specified table, with the specified fields. The output of the call is a ByteArray which allows you to convert the data into any model that you want.

```
tableService.updateRecord(sysId: sysId, in: tableName,
 with: fields, writeOptions: writeOptions, configuration:
 readConfiguration)
    .subscribe(on: DispatchQueue.global())
    .receive(on: DispatchQueue.main)
    .convertToRecord()
    .sink { completion in
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        if case let .failure(error) = completion {
            print("Update failed with NowDataError: \(error)")
        }
    } receiveValue: { record in
        print("Record updated: \(record)")
    }
    .store(in: &subscriptions)
```

NowWeb API - iOS

The *NowWeb* API is a top-level global API that enables uses to instantiate a NowWeb service instance.

NowWeb - makeWebService(instanceUrl: URL) async throws

Creates an instance of NowWebService using the previously specified configuration.

You must initialize the SDK prior to calling this function or the completion block is called with a `sdkNotConfigured` error. To initialize the SDK, call *NowSDK.configure()* with the desired configuration.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance whose web services are to be accessed by the service.

Returns

Type	Description
NowWebService	If successful, returns an initialized NowWebService object.
NowServiceError	Throws one of the following errors if the method fails. Possible values: • sdkNotConfigured • serviceConfigurationInvalid • serviceDisabled • serviceSettingsInvalid • serviceSettingsNotFound • serviceSettingsRetrievalFailed

The following code example shows how to call this method.

```
do {
    let service = try await NowWeb.makeWebService(instanceUrl:
 instanceUrl)
    self.webService = service
} catch {
    debugPrint("Web Service creation failed with error:
 \(error.localizedDescription)")
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowWeb - makeWebService(instanceUrl: URL, completion: @escaping ((Result<NowWebService, NowServiceError>) -> Void))

Creates an instance of NowWebService using the previously specified configuration. When finished, calls the specified completion handler.

You must initialize the SDK prior to calling this function or the completion block is called with a `sdkNotConfigured` error. To initialize the SDK, call *`NowSDK.configure()`* with the desired configuration.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance whose web services are to be accessed by the service.
completion	@escaping ((Result<NowWebS NowService Error>) -> Void)	Completion handler that is called with a `Result<NowWebService, NowServiceError>` containing either an initialized `NowWebService` instance or a `NowServiceError` indicating why the initialization failed.

Returns

Type	Description
None	

```
func initializeNowSDK(userEmail: String) {
  currentUser = userEmail
  let sdkConfig = NowSDKConfiguration(authorizationProvider:
 self, permissionDelegate: self, logLevel: .debug)

  do {
      try NowSDK.configure(with: sdkConfig)
      configureAnalytics()
  } catch {
      debugPrint("Could not initialize NowSDK. Error:
 \(error.localizedDescription)")
  }
}
```

NowWeb - makeWebService(instanceUrl: URL)

Creates an instance of NowWebService using the previously specified configuration.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

You must initialize the SDK prior to calling this function or the completion block is called with a `sdkNotConfigured` error. To initialize the SDK, call *`NowSDK.configure()`* with the desired configuration.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance whose web services are to be accessed by the service.

Returns

Type	Description
AnyPublisher<NowWebService, NowServiceError>	If successful, returns an initialized NowWebService object. If it fails, returns a NowServiceError object.

```
func initializeWebService() {
  NowWeb.makeWebService(instanceUrl: instanceUrl)
    .sink { completion in
      if case .failure(let error) = completion {
        debugPrint("Web Service creation failed with error:
 \(error.localizedDescription)")
      }
    } receiveValue: { [weak self] service in
        self?.webService = service
    }
    .store(in: &subscriptions)
  }
```

NowWebColoring protocol - iOS

The *NowWebColoring* protocol provides default values for the colors used within web pages hosted on your ServiceNow instance in a native web view.

The colors specified in the table below define the default web interface colors.

Properties

Name	Description
alertCritical0	Background color applied to the error banner. Default dark color: #7B1E28 Default light color: #F8C8CD
alertCritical3	Text color applied to the error text banner. Default dark color: #E46876 Default light color: #B61C2D
alertLow0	Background color applied to the info banner. Default dark color: #DBDBDE Default light color: #DBDBDE
alertPositive0	Background color of the banner that displays success messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
	Default dark color: #CADFC0 Default light color: #CADFC0
alertPositive3	Text color of the banner that displays success messages. Default dark color: #3B7F00 Default light color: #3B7F00
alertWarning0	Background color applied to the warning banner. Default dark color: #FBF7BF Default light color: #FBF7BF
backgroundPrimary	Background color applied to the view containing the web view. Default dark color: #07080B Default light color: #FFFFFF
brand	Color applied to the activity indicator shown while loading pages. Default dark color: #302F4B Default light color: #302F4B
primary	Tint color applied to action sheet on the web screen. Default dark color: #8486FF Default light color: #4F52BD
screenHeaderBackground	Text color applied to button badges. This color is also applied to a thin border around the badge. Default dark color: #CADFC0 Default light color: #CADFC0
screenHeaderText	• Text color applied to button badges • Tint color applied to disabled navigation bar buttons, banner text, and banner icon tint on the web screen. Default dark color: #FFFFFF Default light color: #FFFFFF
textActionble	Text color for action button. Default dark color: #07080B Default light color: #FFFFFF

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
textPrimary	Text color applied to font. Default dark color: #FFFFFF Default light color: #151920
webPageThemeId	Sys_id of the theme to apply to the ServiceNow web pages loaded by *NowWeb*. Default: Configured default theme Table: Located in the UX Theme [sys_ux_theme] table.
webPageThemeVariantId	Sys_id of the theme variant to apply to the ServiceNow web pages loaded by *NowWeb*. Default: Configured default theme variant Table: Located in the UX Style [sys_ux_style] table.

The following shows the default colors used for *NowWebColoring*. You can override any or all of these colors.

```
public extension NowWebColoring {
    var brand: UIColor { nowUIColor.brand }
    var primary: UIColor { nowUIColor.primary }
    var textPrimary: UIColor {
        nowUIColor.textPrimary.withAlphaComponent(0.25)
    }
    var screenHeaderText: UIColor
 { nowUIColor.screenHeaderText }
    var screenHeaderBackground: UIColor
 { nowUIColor.screenHeaderBackground }
    var textActionble: UIColor {
        nowUIColor.textActionable
    }
    var alertCritical0: UIColor { nowUIColor.alertCritical0 }
    var alertCritical3: UIColor { nowUIColor.alertCritical3 }
    var alertPositive0: UIColor { nowUIColor.alertPositive0 }
    var alertPositive3: UIColor { nowUIColor.alertPositive3 }
    var alertLow0: UIColor { nowUIColor.alertLow0 }
    var alertWarning0: UIColor { nowUIColor.alertWarning0 }
    var backgroundPrimary: UIColor
 { nowUIColor.backgroundPrimary }
}
```

NowWebService class - iOS

The *NowWebService* class provides functions that enable the browsing of web pages on a ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration parameters to use when initializing the NowWebService instance.

NowWebService - init(configuration: NowServiceConfiguration, coreServiceProvider: NowCoreServiceProviding? = nil)

Initializes a NowWebService instance.

Parameters

Name	Type	Description
configuration	NowServiceConfiguration	Configuration parameters to use when initializing the NowWebService instance.
coreServiceProvider	NowCoreServiceProviding	Optional. Service provider to associate with the NowWebService instance. Default: nil

The following code example shows how to call this method.

```
guard let coreService = NowSDK.core() else {
  // Error with NowServiceError.sdkNotConfigured
  return
}
guard
  let instanceUrl = URL(string:
 "http://sample.service-now.com") ,
  let serviceConfig = NowSDK.makeServiceConfiguration(for:
 instanceUrl) else {
    // Could not create service -
    // NowServiceError.serviceConfigurationInvalid
    return
}

let webService = NowWebService(configuration: serviceConfig,
 coreServiceProvider: coreService)
```

NowWebService - makeWebViewController(for url: URL, delegate: NowWebViewControllerDelegate, theme: NowWebThemeable)

Creates a UIViewController object that hosts the web view.

Parameters

Name	Type	Description
for url	URL	URL of the web page to load. This web page must be on the target ServiceNow instance that the service was initialized with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
delegate	NowWebViewControllerDelegate	Optional. Object that receives callback events from the WebViewController into the native application.
theme	NowWebThemeable	Optional. NowUIThemeable protocol to apply to the UI elements of the view controller, such as color. Default: NowWebDefaultTheme(nowUITheme: NowUIDefaultTheme())

Returns

Type	Description
Result<NowWebViewController, NowWebServiceError>	Success: NowWebViewController object Failure: NowWebServiceError object

```
private func webViewController(for url: URL) ->
 NowWebViewController? {
  guard let webService = webService else {
    debugPrint("Web service not initialized")
    return nil
  }

  let result = webService.makeWebViewController(for:
 url, delegate: self, theme: CarrascoWebTheme(nowUITheme:
 CarrascoTheme()))
  switch result {
    case .success(let viewController):
      return viewController
    case .failure(let error):
      debugPrint("Web view creation failed with error:
 \(error.localizedDescription)")
  }
  return nil
}
```

NowWebService - preloadWebCache(urls: [URL], completion: PreloadWebCacheCompletion? = nil) throws

Preloads a list of specified pages with cacheable resources in the background (by NowWeb) to improve initial load times.

Parameters

Name	Type	Description
urls	Array of URL objects	URLs of the pages to preload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
completion	PreloadWebCacheCompletion	Optional closure to inform the caller that the web pages have completed loading.

Returns

Type	Description
None	

The following example shows how to use the *webService.preloadWebCache()* function to pre-load specified pages.

```
private func preloadURLs(urls: [URL]) {
  guard let webService = webService else {
    debugPrint("Web service not initialized")
    return
  }
  do {
       try webService.preloadWebCache(urls: urls) {
         debugPrint("URLs did complete preloading")
       }

  } catch {
      debugPrint(error.localizedDescription)
  }
}
```

NowWebThemeable protocol - iOS

The *NowWebThemeable* protocol provides properties that enable you to override the colors used within web pages hosted on your ServiceNow instance in a native web view.

```
public protocol NowWebThemeable {
    var color: NowWebColoring { get }
}
```

The NowWebColoring protocol contains *NowUIColoring*. This property is used to reference default color variables that *NowWebThemeable* can use.

For additional information on how to theme the UI, see Use NowUIColoring to theme NowWebTheme and NowChatTheme in the Mobile SDK Developer Guide - iOS.

Define WebColors using default colors

```
/// Sample structure for using default colors that come with
 Mobile SDK.
struct WebColors: NowUIColoring {
}
```

Define WebColors using custom colors

```
/// Use custom colors with light theme
struct WebColors: NowUIColoring {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    private var defaultTheme: NowWebDefaultTheme
 { NowWebDefaultTheme(nowUITheme: NowUIDefaultTheme())
    }

    var brand: UIColor { lightBrand }
    var primary: UIColor { lightPrimary }
    var textPrimary: UIColor { lightTextPrimary }
    var screenHeaderText: UIColor { lightScreenHeaderText }
    var screenHeaderBackground: UIColor
 { lightScreenHeaderBackground }
    var textActionable: UIColor { lightTextActionable }
    var alertCritical0: UIColor { lightAlertCritical0 }
    var alertCritical3: UIColor { lightAlertCritical3 }
    var alertPositive0: UIColor { lightAlertPositive0 }
    var alertPositive3: UIColor { lightAlertPositive3 }
    var alertLow0: UIColor { lightAlertLow0 }
    var alertWarning0: UIColor { lightAlertWarning0 }
    var backgroundPrimary: UIColor { lightBackgroundPrimary }

    // Light Colors
    var lightBrand: UIColor { defaultTheme.color.brand }
    var lightPrimary: UIColor { defaultTheme.color.primary }
    var lightTextPrimary: UIColor
 { defaultTheme.color.textPrimary }
    var lightScreenHeaderText: UIColor
 { defaultTheme.color.screenHeaderText }
    var lightScreenHeaderBackground: UIColor
 { defaultTheme.color.screenHeaderBackground }
    var lightTextActionable: UIColor
 { defaultTheme.color.textActionble }
    var lightAlertCritical0: UIColor
 { defaultTheme.color.alertCritical0 }
    var lightAlertCritical3: UIColor
 { defaultTheme.color.alertCritical3 }
    var lightAlertPositive0: UIColor
 { defaultTheme.color.alertPositive0 }
    var lightAlertPositive3: UIColor
 { defaultTheme.color.alertPositive3 }
    var lightAlertLow0: UIColor { defaultTheme.color.alertLow0 }
    var lightAlertWarning0: UIColor
 { defaultTheme.color.alertWarning0 }
    var lightBackgroundPrimary: UIColor
 { defaultTheme.color.backgroundPrimary }
}
```

Define WebTheme structure with NowWebThemeable protocol

```
struct CarrascoWebTheme: NowWebThemeable {
    var color: NowWebColoring

    struct Color: NowWebColoring {
        var nowUIColor: NowUIColoring

        var alertPositive0: UIColor
        var alertPositive3: UIColor
        var alertLow0: UIColor
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        var alertWarning0: UIColor
        var backgroundPrimary: UIColor

        init(inputs: WebColors) {
            nowUIColor = ThemeColor(inputs)

            alertPositive0 = inputs.alertPositive0
            alertPositive3 = inputs.alertPositive3
            alertLow0 = inputs.alertLow0
            alertWarning0 = inputs.alertWarning0
            backgroundPrimary = inputs.backgroundPrimary
        }
    }

    public init(webColors: WebColors) {
        color = Color(inputs: webColors)
    }
}
```

Instantiate a WebTheme object by passing WebColor as input

```
let webTheme = CarrascoWebTheme(webColors: WebColors())
```

Pass a WebTheme object to NowWebService.makeWebViewController

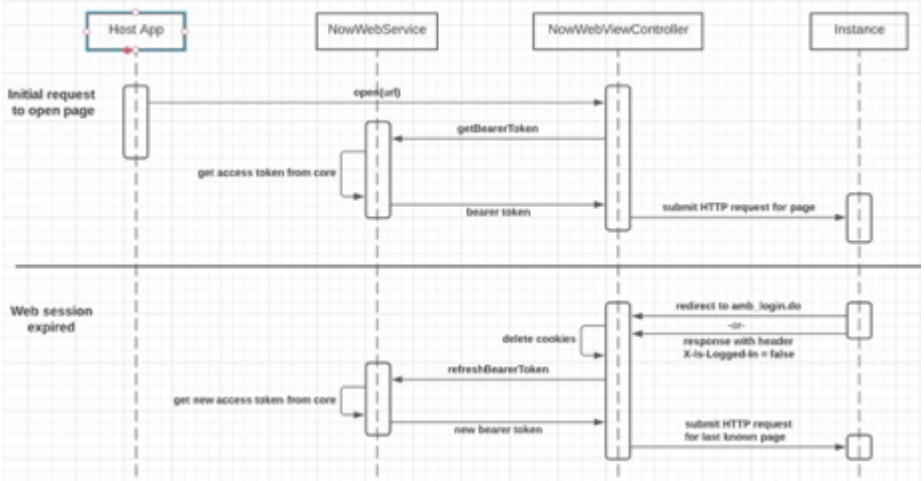
```
func webViewController(for url: URL, delegate:
 NowWebViewControllerDelegate) -> NowWebViewController? {
  guard let webService = webService else {
    debugPrint("Web service not initialized")
    return nil
  }
  let result = webService.makeWebViewController(for: url,
 delegate: delegate, theme: CarrascoWebTheme(webColors:
 WebColors()) )

  switch result {
  case .success(let viewController):
    return viewController
  case .failure(let error):
    debugPrint("Web view creation failed with error:
 \(error.localizedDescription)")
  }
  return nil
}
```

NowWebViewController class - iOS

The *NowWebViewController* class provides functions that enable you to manage a web viewer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



NowWebViewController - loadPage()

If the request is authenticated, starts loading the initial URL provided during instantiation using the *`makeWebViewController()`* method.

If the request fails authentication, the method *`nowWebViewController(_:didFailNavigationWith:)`* is called on the delegate that was passed when instantiating the object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
private func openScreen(_ screen: ArticleListViewModel.Screen) {
  switch screen {
  case .articleDetail(let sysId):
    guard let url = URL(string:
 "/mesp?id=me_kb_view&sys_kb_id=\(sysId)"), let
 webViewController = webViewController(for: url) else {
      debugPrint("Could not create web view")
      return
    }
    webViewController.loadPage()
    navigationController?.pushViewController(webViewController,
 animated: true)
  }
}
```

NowWebViewController - updateTheme(themeColors: NowWebThemeable)

Updates the NowWebView theme with the specified UI theme. Use this function to update the web UI theme after it has been initially set using the *`makeWebViewController()`* function, such as when changing the theme from light to dark.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
themeColors	NowWebTheme	Theme to update the web UI with.

Returns

Type	Description
None	

The following code example shows how to update a light UI theme implemented using the *makeWebViewController()* function to the dark UI theme using the *updateTheme()* function.

```
func nowWebViewController(_ nowWebViewController:
 NowWebViewController, systemThemeDidChange traitCollection:
 UITraitCollection) {
  // The systemThemeDidChange delegate method can be used to
 call updateTheme() to apply theme changes when the system theme
 changes.
  nowWebViewController.updateTheme(themeColors:
 traitCollection.userInterfaceStyle == .dark ?
 DarkNowWebTheme() : LightNowWebTheme())
}
```

NowWebViewControllerDelegate protocol - iOS

The *NowWebViewControllerDelegate* protocol provides callbacks for notification of issues within the *NowWebViewController* processing such as when a flow ends or a navigation fails.

NowWebViewControllerDelegate - nowWebViewController(_ nowWebViewController: NowWebViewController, didReceive unsupportedUrl: URL)

Callback that notifies the host application that the web view attempted to load an unsupported URL.

An unsupported URL could be one for a different ServiceNow instance or an absolute URL with an invalid scheme.

Note: Valid schemes are http and https.

Parameters

Name	Type	Description
nowWebViewController	NowWebViewController	Instance of NowWebViewController used when attempting to load the unsupported URL.
didReceive unsupportedUrl	URL	Invalid URL trying to be loaded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
func nowWebViewController(_ nowWebViewController:
 NowWebViewController, didReceive unsupportedUrl: URL) {
  debugPrint("nowWebViewController:receivedUnsupportedUrl:
 \(unsupportedUrl.absoluteString)")
}
```

NowWebViewControllerDelegate - nowWebViewController(_ nowWebViewController: NowWebViewController, didEndFlow flowName: String)

Callback that notifies the host application that the specified Cabrillo (mobile web) flow has ended.

Parameters

Name	Type	Description
nowWebViewController	NowWebViewController	Instance of NowWebViewController where the flow ended.
didEndFlow flowName	String	Name of the Cabrillo flow that ended

Returns

Type	Description
None	

The following code example shows how to call this method.

```
func nowWebViewController(_ nowWebViewController:
 NowWebViewController, didEndFlow flowName: String) {
  debugPrint("ended flow named: \(flowName)")
}
```

NowWebViewControllerDelegate - nowWebViewController(_ nowWebViewController: NowWebViewController, didFailNavigationWith error: Swift.Error)

Callback that notifies the host application that the web view navigation has failed.

Parameters

Name	Type	Description
nowWebViewController	NowWebViewController	Instance of NowWebViewController in which the navigation failed.
didFailNavigationWith error	Swift.Error	Error raised from the navigation failure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
func nowWebViewController(_ nowWebViewController:
 NowWebViewController, didFailNavigationWith error: Error) {
  debugPrint("NowWebViewController encountered a navigation
 error: \(error.localizedDescription)")
}
```

NowWebViewControllerDelegate - nowWebViewController(_ nowWebViewController: NowWebViewController, systemThemeDidChange traitCollection: UITraitCollection)

Callback that notifies the host application that the system web UI theme changed.

Parameters

Name	Type	Description
nowWebViewController	NowWebViewController	Instance of NowWebViewController in which the web UI theme changed.
traitCollection	UITraitCollection	UITraitCollection object that contains the new theme.

Returns

Type	Description
None	

The following code example shows how to override the *systemThemeDidChange()* delegate function to call the *updateTheme()* function to apply theme changes when the system theme changes.

```
func nowWebViewController(_ nowWebViewController:
 NowWebViewController, systemThemeDidChange traitCollection:
 UITraitCollection) {

  /// Called when the system changes between dark and light mode

    /// You can call the corresponding updateTheme() method here
 to change the UI theme based on System Theme
    nowWebViewController.updateTheme(themeColors:
 traitCollection.userInterfaceStyle == .dark ?
 DarkNowWebTheme() : LightNowWebTheme())
      print(“System Theme Did Change)
}
```

NowWebViewControllerDelegate - nowWebViewControllerDidRequestDismissal(_ nowWebViewController: NowWebViewController)

Callback that notifies the host application that during a back navigation attempt, the stack was exhausted. The host application can then decide whether to dismiss the NowWebViewController instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
nowWebViewController	NowWebViewController	Instance of NowWebViewController in which the back navigation was attempted.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
func nowWebViewControllerDidRequestDismissal(_
 nowWebViewController: NowWebViewController) {
  navigationController?.popViewController(animated: true)
}
```

Paginator API - iOS

The *`Paginator`* class provides methods for iterating through a record set returned by a call to the ServiceNow *`Table`* API through the NowTableService. It is the object that is returned by the NowTableService *`paginator()`* methods. Do not call this method outside of that environment.

Properties

Name	Type	Description
hasNext	Boolean	Flag that indicates whether there is a next page to fetch. Valid values: • true: Next page is available. • false: Next page is not available.
hasPrevious	Boolean	Flag that indicates whether there is a previous page to fetch. Valid values: • true: Previous page is available. • false: Previous page is not available.
isBusy	Boolean	Flag that indicates whether the Paginator object is busy fetching data. Valid values: • true: Publisher is busy. • false: Publisher is not busy.
isFinished	Boolean	Flag that indicates whether the Paginator object is finished. When the paginator is configured to finish, the Paginator object's publisher finishes when the last page has been fetched. A Paginator object cannot fetch any pages after it finishes. For additional information, see the description of the *`publisherShouldFinish`* parameter. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
		• true: Publisher is finished. • false: Publisher is not finished.
itemsPerPage	Integer	Number of items to fetch per page. Default: 20
numberOfPages	Integer	Total number of pages within the record set. When the Paginator object has not yet fetched any pages, this parameter is set to `Int.max`. After an initial request has been made to the ServiceNow instance, the number of pages is updated to the actual number of pages received from the ServiceNow instance.
page	Integer	Current page within the paginated record set.
publisher	String	Publisher that supplies the stream of paginated data to the subscribers. **Note:** By default, the publisher does not finish. To change this behaviour, set the *`publisherShouldFinish`* property to `true`.
publisherShouldFinish	Boolean	Flag that indicates whether to stop the Paginator object's publisher when the last page has been fetched. A Paginator object cannot fetch any pages after it finishes. Valid values: • true: Once the last page is fetched, the publisher is released from providing additional data. The *`reset()`* method is no longer functional. • false: The publisher is never finished and all methods are fully operational regardless of navigation. Default: false

Paginator - first() throws

Fetches the first page of the return results.

If this method can't fetch the first page, it throws a `PaginationError`.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
class PaginatorTestViewModel<T: JSONRepresentable>:
 ObservableObject {
  @Published var result: Result<String, Error>?
  private let paginator: Paginator<T>
  private var subscriptions = Set<AnyCancellable>()

  init(paginator: Paginator<T>) {
    self.paginator = paginator
    subscribeToPaginator()
  }

  private func subscribeToPaginator() {
    paginator.publisher
      .receive(on: DispatchQueue.main)
      .sink { [weak self] comp in
        if case .failure(let error) = comp {
          self?.result = .failure(error)
        }
      } receiveValue: { [weak self] jsonRepresentable in
        self?.result
 = .success(jsonRepresentable.jsonDescription)
      }
      .store(in: &subscriptions)
  }

  func first() {
    result = nil
    do {
      try paginator.first()
    } catch {
      self.result = .failure(error)
    }
  }
}
```

Paginator - last() throws

Fetches the last page of the return results.

If this method can't fetch the last page, it throws a `PaginationError`.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
…
func last() {
  result = nil
  do {
    try paginator.last()
  } catch {
    self.result = .failure(error)
  }
}
…
```

Paginator - next() throws

Fetches the next page of the return results.

If there are no more pages to fetch, the method throws a `PaginationError`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this method.

```
…
func next() {
  result = nil
  do {
    try paginator.next()
  } catch {
    self.result = .failure(error)
  }
}
…
```

Paginator - previous() throws

Fetches the previous page of the return results.

If the method can't fetch the previous page, it throws a `PaginationError`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this method.

```
…
func previous() {
  result = nil
  do {
    try paginator.previous()
  } catch {
    self.result = .failure(error)
  }
}
…
```

Paginator - reset()

Resets the Paginator back to the first page but doesn't return the first page of the return results.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this method.

```
…
func reset() {
  result = nil
  paginator.reset()
}
…
```

SNMobileAnalytics API

The `SNMobileAnalytics` API provides methods that you can call within a WebView using JavaScript. These methods enable you to push custom analytics data (events, pages, and user properties) to the User Experience Analytics for Service Portal dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To use these methods within your mobile application, you must first call the *installJavascriptInterface()* method, which exposes these JavaScript methods to the associated WebView.

Refer to NowAnalyticsService - installJavascriptInterface(into webView: WKWebView) for the iOS implementation.

Refer to NowAnalyticsSDK - installJavascriptInterface(webView: WebView) for the Android implementation.

SNMobileAnalytics - addEvent(String eventName, Object properties)

Adds a new web-triggered event with its associated properties to the current mobile session timeline.

Parameters

Name	Type	Description
eventName	String	Name of the event to add.
properties	Object	Optional. List of custom property key-value pairs for the event. Supported value types: • Boolean • Date • Number • String **Note:** The total size of the *eventName*, properties key and value should not exceed 300 bytes (per event).

Returns

Type	Description
None	

```
SNMobileAnalytics.addEvent('MyEvent', JSON.stringify({'Type':
 'Show', 'Amount': 16}))
```

SNMobileAnalytics - addScreenAction(String actionName)

Adds a new screen UI action tag to the current mobile session time line.

Parameters

Name	Type	Description
actionName	String	Name of the triggered web action.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
SNMobileAnalytics.addScreenAction('Custom UI Action')
```

SNMobileAnalytics - setUserId(String userId)

Sets the ID of the current active user for the current mobile session.

Parameters

Name	Type	Description
userID	String	ID to set for the current user.

Returns

Type	Description
None	

```
SNMobileAnalytics.setUserId('user123')
```

SNMobileAnalytics - startScreen(String screenName)

Adds a new web-triggered page to the current mobile session time line.

Parameters

Name	Type	Description
screenName	String	Name of the screen to log the start time for, such as `WelcomeScreen`.

Returns

Type	Description
None	

```
SNMobileAnalytics.startScreen('My Web Page')
```

REST API reference

Use REST interfaces to access data on your instance.

Account API

The `Account` API provides endpoints to retrieve Customer Service Management (CSM) account records.

This API requires the Customer Service plugin (com.sn_customerservice) and is provided within the `now` namespace.

Users require the csm_ws_integration role for full API access.

Account - GET /now/account

Retrieves a specified set of Customer Service Management (CSM) accounts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/now/{api_version}/account`

Default URL: `/api/now/account`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. In the response, the boolean parameter *`hasMore`* is returned. It indicates whether there are more records to return that meet the filter criteria. Data type: Number Default: 10
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset +sysparm_limit`, until you reach the end of all records. Do not pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0
sysparm_query	Encoded query used to filter the result set. For example: `sysparm_query=caller_id=javascript:gs.getUserID()^active=true` The encoded query supports *order by*. To sort responses based on certain fields, use the *ORDERBY* and *ORDERBYDESC* clauses in *`sysparm_query`*. For example, `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcategory` filters all active records and orders the results in ascending order by number first, and then in descending order by category. If part of the query is invalid, such as by specifying an invalid field name, the instance ignores the invalid part. It then returns rows using only the

Query parameters (continued)

Name	Description
	valid portion of the query. You can control this behavior using the property *glide.invalid_query.returns_no_rows*. Set this property to true to return no rows on an invalid query. **Note:** The *glide.invalid_query.returns_no_rows* property controls the behavior of all queries across the instance, such as in lists, scripts (*GlideRecord.query()*), and web service APIs. Data type: String

Request body parameters (XML or JSON)

Element	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Parameter	Description
account_code	Unique combination of values that an application uses to identify budget forecasts and budget plans. Data type: String Maximum length: 255
account_parent	Sys_id of the parent account of this account. Located in the Account [customer_account] table. Data type: String
account_path	Path from the parent to the child accounts in the account hierarchy. Data type: String Maximum length: 255
active_escalation	Sys_id of the active escalation associated with the account. Located in the Escalation [sn_customerservice_escalation] table. Data type: String
apple_icon	Icon for iPhone home page bookmarks. Data type: Image
banner_image	Banner image that appears on the customer portal. Data type: Image
banner_image_light	Small banner image. Data type: Image
banner_text	Banner text that appears on the customer portal. Data type: String Maximum length: 4,000
city	City in which the company that is associated with this account resides. Data type: String Maximum length: 50

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
contact	Sys_id of a contact record associated with this account. Located in the User [sys_user] table. Data type: String
country	Country in which the company that is associated with this account resides. Data type: String Maximum length: 40 Default: USA
customer	Flag that indicates whether the account is a customer account, as opposed to a partner account. Possible values: • true: Customer account • false: Partner account Data type: Boolean Default: false
discount	Discount given to the account on purchases. Data type: Number Maximum length: 15
fax_phone	Primary fax phone number for the company associated with this account. Data type: String Maximum length: 40
fiscal_year	Fiscal year for the company associated with the account. Data type: String
lat_long_error	Difference in the actual location as compared to latitude and longitude information. Data type: String Maximum length: 1,000
latitude	Latitude of the company associated with this account. Data type: Number (floating point number)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Maximum length: 40
longitude	Longitude of the company associated with this account. Data type: Number (floating point number) Maximum length: 40
manufacturer	Flag that indicates whether the company associated with this account manufactures goods. Possible values: • true: Manufactures goods • false: Does not manufacture goods Data type: Boolean Default: false
market_cap	Market value of the associated company's publicly traded stock shares. Data type: Number (currency) Maximum length: 20
name	Name of the company associated with this account. Data type: String Maximum length: 80
notes	Additional information about the company. Data type: String Maximum length: 4,000
num_employees	Number of people employed by the company. Data type: Number (Integer) Maximum length: 40
number	Number that identifies this account. Data type: String Maximum length: 40
parent	Sys_id of the parent account of this account. Located in the Company [core_company] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Data type: String
partner	Flag that indicates whether the account is a partner account or a customer account. Possible values: • true: Partner account • false: Customer account Data type: Boolean Default: false
phone	Primary phone number for the company. Data type: String
primary	Flag that indicates whether this is a primary account. Possible values: • true: Primary account • false: Secondary account Data type: Boolean Default: false
primary_contact	Sys_id of the primary contact for the account. Located in the Contact [customer_contact] table. Data type: String
profits	Profit information entered for this account. Data type: Number (Currency) Maximum length: 40
publicly_traded	Flag that indicates whether the company associated with this account is publicly traded on the stock exchange. Possible values: • true: Publicly traded • false: Private company Data type: Boolean
rank_tier	Type of account.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Possible values: • blacklist • strategic • tactical • valued • other Data type: String Maximum length: 40
registration_code	Unique code that customers use when requesting a login on the customer portal. This code provides a method for validating the customer on the company before granting access. Data type: String Maximum length: 40
revenue_per_year	Revenue produced by the company associated with this account. Data type: Number (Currency) Maximum length: 20
state	State in which the company resides. Data type: String Maximum length: 40
stock_price	Price of the company stock. Data type: String Maximum length: 40
stock_symbol	Stock symbol of the company. Data type: String Maximum length: 40
street	Street address of the company. Data type: String Maximum length: 255
sys_class_name	Table that contains the associated account record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Data type: String
sys_created_by	User that originally created the account. Data type: String Maximum length: 40
sys_created_on	Date and time that the account was originally created. Data type: String
sys_id	Sys_id for the account record. Data type: String
sys_mod_count	Number of times the account information has been updated. Data type: Number (Integer)
sys_updated_by	User that last modified the account information. Data type: String Maximum length: 40
sys_updated_on	Date and time the account information was last updated. Data type: String
theme	Sys_id of the customer portal theme used by this account. Located in the Theme [sys_ui_theme] table. Data type: String
vendor	Flag that indicates whether the company associated with this account is a vendor. Possible values: • true: Vendor • false: Not a vendor Data type: Boolean Default: false
vendor_manager	List of sys_ids of the vendor managers for the account. Located in the User [sys_user] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
vendor_type	List of sys_ids of the type of vendor such as, applications, hardware, services, or software. Located in the Vendor Type [vendor_type] table. Data type: String
website	URL of the website for the company. Data type: String Maximum length: 1,024
zip	Zip code of the company. Data type: String Maximum length: 40

Example: cURL request

```
