Versioned URL: `/api/now/v1/cmdb/instance/{className}/{sys_id}`

Default URL: `/api/now/cmdb/instance/{className}/{sys_id}`

Supported request parameters

Path parameters

Name	Description
className	CMDB class name. This is the name of the table that contains the desired CI records, such as cmdb_ci_linux_server or cmdb_ci_apache_web_server. Data type: String
sys_id	Sys_id of the CI record to update. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
attributes	Data attributes to replace in the CI record. The available attributes depend on the specified CMDB class. You can locate the available attributes in the associated CMDB table which typically begins with "cmdb_ci", such as cmdb_ci_linux_server or cmdb_ci_mfp_printer. For information about attestation, see CIs attestation. Data type: Object
source	Required. Entity that updated the information. This must be one of the choice values specified in the discovery_source field in the Configuration Item [cmdb_ci] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Response parameters

Name	Description
attributes	Data attributes currently in the CI record. The available attributes depend on the specified CMDB class. You can locate the available attributes in the associated CMDB table which typically begins with "cmdb_ci", such as cmdb_ci_linux_server or cmdb_ci_mfp_printer. Data type: Object

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response parameters (continued)

Name	Description
error	Information on any errors encountered while processing the endpoint request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Message that identifies the error. Data type: String
inbound_relations	List of objects that define the inbound relations associated with the CI. Data type: Array `"inbound_relations": [ { "sys_id": "String", "target": {Object}, "type": {Object} } ]`
inbound_relations.sys_id	Sys_id of the inbound CI relationship. Located in the CI Relationship [cmdb_rel_ci] table. Data type: String
inbound_relations.target	Information that describes the target inbound relation. Data type: Object `"target": { "display_value": "String", "link": "String", "value": "String" }`
inbound_relations.target.display_value	Name of the inbound relation to display in a user interface. Data type: String
inbound_relations.target.link	CMDB REST endpoint URL to use to retrieve the inbound relation from the Configuration Item [cmdb_ci] table.

Response parameters (continued)

Name	Description
	Data type: String
inbound_relations.target.value	Sys_id of the inbound CI. Located in the Configuration Item [cmdb_ci] table. Data type: String
inbound_relations.type	Information about the type of inbound relationship. Data type: Object `"type": { "display_value": "String", "link": "String", "value": "String" }`
inbound_relations.type.display_value	Name of the inbound type to display in a user interface. Data type: String
inbound_relations.type.link	*Table* REST endpoint URL to use to retrieve the inbound relation type from the CI Relationship Type [cmdb_rel_type] table. Data type: String
inbound_relations.type.value	Sys_id of the type of inbound relationship. Located in the CI Relationship Type [cmdb_rel_type] table. Data type: String
outbound_relations	List of objects that define the outbound relations associated with the CI. Data type: Array `"outbound_relations": [ { "sys_id": "String", "target": {Object}, "type": {Object} } ]`
outbound_relations.sys_id	Sys_id of the outbount CI relationship. Located in the CI Relationship [cmdb_rel_ci] table. Data type: String
outbound_relations.target	Required. Information about the target outbound relation. Data type: Object

Response parameters (continued)

Name	Description

	<pre>"target": {
	  "display_value": "String",
	  "link": "String",
	  "value": "String"
	}</pre>

outbound_relations.target.display_value	Name of the outbound relation to display in a user interface. Data type: String
outbound_relations.target.link	CMDB REST endpoint URL to use to retrieve the outbound relation from the Configuration Item [cmdb_ci] table. Data type: String
outbound_relations.target.value	Sys_id of the outbound CI. Located in the Configuration Item [cmdb_ci] table. Data type: String

outbound_relations.type	Information about the type of outbound relationship.
	
	Data type: Object
	<pre>"type": {
	  "display_value": "String",
	  "link": "String",
	  "value": "String"
	}</pre>

outbound_relations.type.display_value	Name of the outbound type to display in a user interface. Data type: String
outbound_relations.type.link	*Table* REST endpoint URL to use to retrieve the outbound relation from the CI Relationship Type [cmdb_rel_type] table. Data type: String
outbound_relations.type.value	Sys_id of the type of outbound relationship. Located in the CI Relationship Type [cmdb_rel_type] table. Data type: String
status	Only appears if an error is encountered. Status of the endpoint processing. Possible value: failure Data type: String

CMDB Instance - POST /now/cmdb/instance/{classname}/{sys_id}/relation

Adds an inbound and/or outbound relation to the specified configuration item (CI). The specified CI is the parent.

URL format

Versioned URL: `/api/now/v1/cmdb/instance/{className}/{sys_id}/relation`

Default URL: `/api/now/cmdb/instance/{className}/{sys_id}/relation`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
className	CMDB class name. This is the name of the table that contains the desired CI records, such as cmdb_ci_linux_server or cmdb_ci_apache_web_server. Data type: String
sys_id	Sys_id of the CI record to update. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
inbound_relations	List of objects that define the inbound relations to associate with the CI. Data type: Array `"inbound_relations": [ { "target": "String", "type": "String" } ]`
inbound_relations.target	Required if *inbound_relations* is specified. Sys_id of the target inbound relation to associate with the specified CI. Located in the Configuration Item [cmdb_ci] table. Data type: String
inbound_relations.type	Required if *inbound_relations* is specified. Sys_id of the type of inbound relationship. Located in the CI Relationship Type [cmdb_rel_type] table. Data type: String
outbound_relations	List of objects that define the outbound relations to associate with the CI. Data type: Array `"outbound_relations": [ { "target": "String", "type": "String"`

Request body parameters (XML or JSON) (continued)

Name	Description
	}]
outbound_relations.target	Required if *outbound_relations* is specified. Sys_id of the target outbound relation. Located in the Configuration Item [cmdb_ci] table. Data type: String
outbound_relations.type	Required if *outbound_relations* is specified. Sys_id of the type of outbound relationship. Located in the CI Relationship Type [cmdb_rel_type] table. Data type: String
source	Required. Entity that updated the information. This must be one of the choice values specified in the discovery_source field in the Configuration Item [cmdb_ci] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Response parameters

Name	Description
attributes	Data attributes currently in the CI record. The available attributes depend on the specified CMDB class. You can locate the available attributes in the associated CMDB table which typically begins with "cmdb_ci", such as cmdb_ci_linux_server or cmdb_ci_mfp_printer. Data type: Object

error	Information on any errors encountered while processing the endpoint request.
	
	Data type: Object
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional information about the error. Data type: String
error.message	Message that identifies the error. Data type: String

inbound_relations	List of objects that define the inbound relations associated with the CI.
	
	Data type: Array
	`"inbound_relations": [`
	`  {`
	`  "sys_id": "String",`
	`  "target": {Object},`

Response parameters (continued)

Name	Description

	<pre>"type": {Object}
	}
	]</pre>

inbound_relations.sys_id	Sys_id of the inbound CI relationship. Located in the CI Relationship [cmdb_rel_ci] table. Data type: String

inbound_relations.target	Information that describes the target inbound relation.
	
	Data type: Object
	<pre>"target": {
	"display_value": "String",
	"link": "String",
	"value": "String"
	}</pre>

inbound_relations.target.display_value	Name of the inbound relation to display in a user interface. Data type: String
inbound_relations.target.link	CMDB REST endpoint URL to use to retrieve the inbound relation from the Configuration Item [cmdb_ci] table. Data type: String
inbound_relations.target.value	Sys_id of the inbound CI. Located in the Configuration Item [cmdb_ci] table. Data type: String

inbound_relations.type	Information about the type of inbound relationship.
	
	Data type: Object
	<pre>"type": {
	"display_value": "String",
	"link": "String",
	"value": "String"
	}</pre>

inbound_relations.type.display_value	Name of the inbound type to display in a user interface. Data type: String
inbound_relations.type.link	*Table* REST endpoint URL to use to retrieve the inbound relation type from the CI Relationship Type [cmdb_rel_type] table.

Response parameters (continued)

Name	Description
	Data type: String
inbound_relations.type.value	Sys_id of the type of inbound relationship. Located in the CI Relationship Type [cmdb_rel_type] table. Data type: String
outbound_relations	List of objects that define the outbound relations associated with the CI. Data type: Array `"outbound_relations": [ { "sys_id": "String", "target": {Object}, "type": {Object} } ]`
outbound_relations.sys_id	Sys_id of the outbount CI relationship. Located in the CI Relationship [cmdb_rel_ci] table. Data type: String
outbound_relations.target	Required. Information about the target outbound relation. Data type: Object `"target": { "display_value": "String", "link": "String", "value": "String" }`
outbound_relations.target.display_value	Name of the outbound relation to display in a user interface. Data type: String
outbound_relations.target.link	CMDB REST endpoint URL to use to retrieve the outbound relation from the Configuration Item [cmdb_ci] table. Data type: String
outbound_relations.target.value	Sys_id of the outbound CI. Located in the Configuration Item [cmdb_ci] table. Data type: String
outbound_relations.type	Information about the type of outbound relationship. Data type: Object

Response parameters (continued)

Name	Description
	`"type": { "display_value": "String", "link": "String", "value": "String" }`
outbound_relations.type.display_value	Name of the outbound type to display in a user interface. Data type: String
outbound_relations.type.link	*Table* REST endpoint URL to use to retrieve the outbound relation from the CI Relationship Type [cmdb_rel_type] table. Data type: String
outbound_relations.type.value	Sys_id of the type of outbound relationship. Located in the CI Relationship Type [cmdb_rel_type] table. Data type: String
status	Only appears if an error is encountered. Status of the endpoint processing. Possible value: failure Data type: String

Example: Sample cURL request

```
curl
 "https://instance.servicenow.com/api/now/cmdb/instance/cmdb_ci_
linux_server/3a290cc60a0a0bb400000bdb386af1cf/relation" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json"\
--user "username":"password" \
--data {

CMDB Instance - PATCH /now/cmdb/instance/{classname}/{sys_id}

Replaces the attributes in the specified configuration item (CI) record with the specified name-value pairs. This endpoint does not create, update, or delete the associated relations.

URL format

Versioned URL: `/api/now/v1/cmdb/instance/{className}/{sys_id}`

Default URL: `/api/now/cmdb/instance/{className}/{sys_id}`

Supported request parameters

Path parameters

Name	Description
className	CMDB class name. This is the name of the table that contains the desired CI records, such as cmdb_ci_linux_server or cmdb_ci_apache_web_server. Data type: String
sys_id	Sys_id of the CI record to update. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
attributes	Data attributes to replace in the CI record. The available attributes depend on the specified CMDB class. You can locate the available attributes in the associated CMDB table which typically begins with "cmdb_ci", such as cmdb_ci_linux_server or cmdb_ci_mfp_printer. For information about attestation, see CIs attestation. Data type: Object
source	Required. Entity that updated the information. This must be one of the choice values specified in the discovery_source field in the Configuration Item [cmdb_ci] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Response parameters

Name	Description
attributes	Data attributes currently in the CI record. The available attributes depend on the specified CMDB class. You can locate the available attributes in the associated CMDB table which typically begins with "cmdb_ci", such as cmdb_ci_linux_server or cmdb_ci_mfp_printer. Data type: Object

error	Information on any errors encountered while processing the endpoint request.
	
	Data type: Object
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional information about the error. Data type: String
error.message	Message that identifies the error. Data type: String

inbound_relations	List of objects that define the inbound relations associated with the CI.
	
	Data type: Array
	`"inbound_relations": [`
	`  {`
	`  "sys_id": "String",`
	`  "target": {Object},`
	`  "type": {Object}`

Response parameters (continued)

Name	Description
	<pre> }]</pre>
inbound_relations.sys_id	Sys_id of the inbound CI relationship. Located in the CI Relationship [cmdb_rel_ci] table. Data type: String

inbound_relations.target	Information that describes the target inbound relation.
	
	Data type: Object
	<pre>"target": {
	  "display_value": "String",
	  "link": "String",
	  "value": "String"
	}</pre>

inbound_relations.target.display_value	Name of the inbound relation to display in a user interface. Data type: String
inbound_relations.target.link	CMDB REST endpoint URL to use to retrieve the inbound relation from the Configuration Item [cmdb_ci] table. Data type: String
inbound_relations.target.value	Sys_id of the inbound CI. Located in the Configuration Item [cmdb_ci] table. Data type: String

inbound_relations.type	Information about the type of inbound relationship.
	
	Data type: Object
	<pre>"type": {
	  "display_value": "String",
	  "link": "String",
	  "value": "String"
	}</pre>

inbound_relations.type.display_value	Name of the inbound type to display in a user interface. Data type: String
inbound_relations.type.link	*Table* REST endpoint URL to use to retrieve the inbound relation type from the CI Relationship Type [cmdb_rel_type] table.

Response parameters (continued)

Name	Description
	Data type: String
inbound_relations.type.value	Sys_id of the type of inbound relationship. Located in the CI Relationship Type [cmdb_rel_type] table. Data type: String
outbound_relations	List of objects that define the outbound relations associated with the CI. Data type: Array `"outbound_relations": [ { "sys_id": "String", "target": {Object}, "type": {Object} } ]`
outbound_relations.sys_id	Sys_id of the outbount CI relationship. Located in the CI Relationship [cmdb_rel_ci] table. Data type: String
outbound_relations.target	Required. Information about the target outbound relation. Data type: Object `"target": { "display_value": "String", "link": "String", "value": "String" }`
outbound_relations.target.display_value	Name of the outbound relation to display in a user interface. Data type: String
outbound_relations.target.link	CMDB REST endpoint URL to use to retrieve the outbound relation from the Configuration Item [cmdb_ci] table. Data type: String
outbound_relations.target.value	Sys_id of the outbound CI. Located in the Configuration Item [cmdb_ci] table. Data type: String
outbound_relations.type	Information about the type of outbound relationship. Data type: Object

Response parameters (continued)

Name	Description
	`"type": { "display_value": "String", "link": "String", "value": "String" }`
outbound_relations.type.display_value	Name of the outbound type to display in a user interface. Data type: String
outbound_relations.type.link	*Table* REST endpoint URL to use to retrieve the outbound relation from the CI Relationship Type [cmdb_rel_type] table. Data type: String
outbound_relations.type.value	Sys_id of the type of outbound relationship. Located in the CI Relationship Type [cmdb_rel_type] table. Data type: String
status	Only appears if an error is encountered. Status of the endpoint processing. Possible value: failure Data type: String

Example: Sample cURL request

```
curl
 "https://instance.servicenow.com/api/now/cmdb/instance/cmdb_cla
ss_sw/70bc4e11c0a8210d01f074cbe6bd73b4" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json"\
--user "username":"password"\
--data {
    "attributes": {
      "firewall_status": "Active",
      "name": "Linux299",

CMDB Meta API

The *CMDB Meta* API provides endpoints to obtain meta data on a Configuration Management Database (CMDB) class.

This API requires that the user have the ITIL role.

CMDB Meta - GET /now/cmdb/meta/{classname}

Returns the meta data for the specified CMDB class.

URL format

Versioned URL: `/api/now/{api_version}/cmdb/meta/{className}`

Default URL: `/api/now/cmdb/meta/{className}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
className	CMDB class name. This is the name of the table that contains the desired CI records, such as cmdb_ci_linux_server or cmdb_ci_apache_web_server. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
attributes	Available fields in the specified class table. Data type: Array
children	List of classes extended from the specified class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: Array
icon	Class icon sys_id. Data type: String
icon_url	Class icon URL. Data type: String
identification_rules	Attributes associated with the configuration item identification rules for the specified class. Data type: Object
is_extendable	Flag that indicates whether the class can be extended to create other classes. Possible values: • true: Class can be extended. • false: Class cannot be extended. Data type: Boolean
label	Specified class display name. Data type: String
name	Table/class name. Data type: String
parent	Parent class. Data type: String
relationship_rules	Relationships between the specifed class and other classes in the CMDB. Data type: Array

Example: Sample cURL request

```
curl
 "https://instance.servicenow/api/now/cmdb/meta/cmdb_ci_comput
er" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

```
{

Consumer API

The *Consumer* API provides endpoints to retrieve and update Customer Service Management (CSM) consumer records.

In addition, you can generate new social media profile records when creating a consumer.

The *Consumer* API requires the Customer Service plugin (com.sn_customerservice) and is provided within the `now` namespace.

Users require the csm_ws_integration role for full API access.

Consumer - GET /now/consumer

Retrieves a specified set of Customer Service Management (CSM) consumer records.

URL format

Versioned URL: `/api/now/{api_version}/consumer`

Default URL: `/api/now/consumer`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *sysparm_offset* parameter to paginate record retrieval. In the response, the boolean parameter *hasMore* is returned. It indicates whether there are more records to return that meet the filter criteria. Data type: Number Default: 10
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset +sysparm_limit`, until you reach the end of all records. Do not pass a negative number in the *sysparm_offset* parameter.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: Number Default: 0
sysparm_query	Encoded query used to filter the result set. For example: `sysparm_query=caller_id=javascript:gs.getUserID()^active=true` The encoded query supports *order by*. To sort responses based on certain fields, use the *ORDERBY* and *ORDERBYDESC* clauses in *`sysparm_query`*. For example, `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcategory` filters all active records and orders the results in ascending order by number first, and then in descending order by category. If part of the query is invalid, such as by specifying an invalid field name, the instance ignores the invalid part. It then returns rows using only the valid portion of the query. You can control this behavior using the property *`glide.invalid_query.returns_no_rows`*. Set this property to true to return no rows on an invalid query. **Note:** The *`glide.invalid_query.returns_no_rows`* property controls the behavior of all queries across the instance, such as in lists, scripts (*`GlideRecord.query()`*), and web service APIs. Data type: String

Request body parameters (XML or JSON)

Element	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

The endpoint may return the following JSON or XML elements in the response body. In addition to the list of elements defined below (which define the elements in a base system), the endpoint also returns any custom fields added to the Consumer [csm_consumer] table. For additional information on these elements, refer to your specific table definition [**System Definition** > **Tables**].

Element	Description
active	Flag that indicates whether the consumer is active. Possible values: • true: Consumer active • false: Consumer de-activated Data type: Boolean Default: true
business_phone	Business phone number of the consumer. Data type: String Maximum length: 40
city	City in which the consumer resides. Data type: String Maximum length: 100

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
country	Country in which the consumer resides. Data type: String Maximum length: 40
date_format	Format in which to display dates. Valid values: • dd-mm-yyyy • dd/mm/yyyy • dd.mm.yyyy • mm-dd-yyyy • yyyy-mm-dd Data type: String Maximum length: 40 Default: blank (system date format)
email	Email address of the consumer. Data type: String Maximum length: 100
fax	Fax number of the consumer. Data type: String Maximum length: 40
first_name	Consumer first name. Data type: String Maximum length: 50
gender	Gender of the consumer. Data type: String Maximum length: 40
home_phone	Home phone number of the consumer. Data type: String Maximum length: 40
household	Sys_id of the record that describes the household characteristics. Located in the Household [csm_household] table. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
last_name	Consumer last name. Data type: String Maximum length: 50
middle_name	Consumer middle name. Data type: String Maximum length: 50
mobile_phone	Consumer mobile phone number. Data type: String Maximum length: 40
name	Consumer full name; first_name+middle_name+last_name. Data type: String Maximum length: 152
notes	Notes on consumer. Data type: String Maximum length: 4,000
notification	Indicates whether the consumer should receive notifications. Valid values: • 1: Disabled • 2: Enabled Data type: Integer Maximum length: 40 Default: 2
number	Unique number associated with the consumer. Data type: String Maximum length: 40
photo	Photo of the consumer. Data type: Image
preferred_language	Consumer primary language. Data type: String Maximum length: 3

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
prefix	Consumer name prefix such as, Dr., Mr., Mrs., or Ms. Data type: String Maximum length: 40
primary	Flag that indicates whether this is the primary consumer. Possible values: • true: Primary consumer • false: Not primary consumer Data type: Boolean Default: false
state	State in which the consumer resides. Data type: String Maximum length: 100
street	Consumer street address. Data type: String Maximum length: 255
suffix	Consumer name suffix such as Jr., Sr., or II. Data type: String
sys_created_by	User that created the consumer record. Data type: String Maximum length: 40
sys_created_on	Date and time the consumer record was originally created. Data type: String
sys_domain	ServiceNow domain in which the consumer information resides. Data type: String
sys_id	Unique identifier for the consumer. Data type: String
sys_mod_count	Number of times that the associated consumer information has been modified. Data type: Integer
sys_tags	System tags.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String
sys_updated_by	User that last updated the consumer information. Data type: String Maximum length: 40
sys_updated_on	Date and time when the consumer information was last updated. Data type: String
time_format	Format in which to display time. Valid values: • hh.mm.ss a: hh.mm.ss (12 hour) • hh:mm:ss a: hh:mm:ss (12 hour) • HH.mm.ss: hh.mm.ss (24 hour) • HH:mm:ss: hh:mm:ss (24 hour) Data type: String Maximum length: 40 Default: blank (system time format)
time_zone	Consumer time zone, such as Canada/Central or US/Eastern. Data type: String Maximum length: 40
title	Consumer business title such as Manager, Software Developer, or Contractor. Data type: String Maximum length: 60
user	Sys_id of the consumer user. Located in the Consumer User [csm_consumer_user] table. Data type: String
zip	Consumer zip code. Data type: String Maximum length: 40

Example: cURL request

```

Consumer - POST /now/consumer

Creates a new Customer Service Management (CSM) consumer.

In addition, you can create a social media profile for the consumer using this endpoint. To create the profile, you must specify the following parameters in the request body:

- *social_channel*
- *social_handle*
- *social_handle_url*

Warning: This endpoint does not perform parameter validation as doing so can create excessive overhead. If a request parameter is misspelled, is not valid, or is not supported by the endpoint, it is ignored without warning.

URL format

Versioned URL: `/api/now/{api_version}/consumer`

Default URL: `/api/now/consumer`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Element	Description
mobile_phone	Consumer mobile phone number. Data type: String Maximum length: 40
name	Consumer full name; first_name+middle_name+last_name. Data type: String Maximum length: 152
notes	Notes on consumer. Data type: String Maximum length: 4,000
notification	Indicates whether the consumer should receive notifications. Valid values: • 1: Disabled • 2: Enabled Data type: Integer Maximum length: 40 Default: 2
photo	Photo of the consumer. Data type: Image
preferred_language	Consumer primary language. Data type: String Maximum length: 3
prefix	Consumer name prefix such as, Dr., Mr., Mrs., or Ms. Data type: String Maximum length: 40
primary	Flag that indicates whether this is the primary consumer. Possible values: • true: Primary consumer • false: Not primary consumer Data type: Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Element	Description
	Default: false
social_channel	Social media channel to which the consumer is associated such as Twitter, Facebook, or Instagram. Data type: String
social_handle	User handle on the social media channel. Data type: String
social_handle_url	URL to the consumer's social channel handle. Data type: String
state	State in which the consumer resides. Data type: String Maximum length: 100
street	Consumer street address. Data type: String Maximum length: 255
suffix	Consumer name suffix such as Jr., Sr., or II. Data type: String
time_format	Format in which to display time. Valid values: • hh.mm.ss a: hh.mm.ss (12 hour) • hh:mm:ss a: hh:mm:ss (12 hour) • HH.mm.ss: hh.mm.ss (24 hour) • HH:mm:ss: hh:mm:ss (24 hour) Data type: String Maximum length: 40 Default: blank (system time format)
time_zone	Consumer time zone, such as Canada/Central or US/Eastern. Data type: String Maximum length: 40
title	Consumer business title such as Manager, Software Developer, or Contractor.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Element	Description
	Data type: String Maximum length: 60
user	Sys_id of the consumer user. Located in the Consumer User [csm_consumer_user] table. Data type: String
zip	Consumer zip code. Data type: String Maximum length: 40

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	New consumer record was successfully created.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Element	Description
result	Sys_id of the newly created consumer record. Data type: String

Example: cURL request

```
curl -X POST "https://instance.servicenow.com/api/now/consumer"
 \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-d " { \
  "country": "USA", \
  "notes": "Never comes in before 10am", \
  "gender": "Female", \
  "city": "San Marcos", \
  "prefix": "Ms", \
  "title": "Director", \
  "notification": "1", \
  "business_phone": "(555)555-1234", \
  "mobile_phone": "(555)555-1235", \
  "street": "123 Sesame St", \
  "state": "CA", \
  "fax": "(555)555-1236", \
  "first_name": "Jane", \
  "zip": "92001", \
  "home_phone": "(555)555-1234", \
  "last_name": "Brown", \
  "active": "true", \
  "middle_name": "Dell", \
  "time_zone": "PST", \
  "name": "Jane Brown", \
  "household": "4", \
  "user": "c3d35d82c37122005871d44d81d3ae91", \
  "primary": "false" \
}"
--user "username":"password"
```

```
{
    "result": "0f5c13addb93230057c3fd441d9619b8"
}
```

Contact API

The *Contact* API provides endpoints that enable you to retrieve and update Customer Service Management (CSM) contact records.

In addition, you can generate new social media profile records when creating a contact.

The *Contact* API requires the Customer Service plugin (com.sn_customerservice) and is provided within the now namespace.

Users need the csm_ws_integration role for full API access.

Contact - GET /now/contact

Retrieves a specified set of Customer Service Management (CSM) contacts.

URL format

Versioned URL: `/api/now/{api_version}/contact`

Default URL: `/api/now/contact`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. In the response, the boolean parameter *`hasMore`* is returned. It indicates whether there are more records to return that meet the filter criteria. Data type: Number Default: 10
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset +sysparm_limit`, until you reach the end of all records. Do not pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0
sysparm_query	Encoded query used to filter the result set. For example: `sysparm_query=caller_id=javascript:gs.getUserID()^active=true` The encoded query supports *order by*. To sort responses based on certain fields, use the *ORDERBY* and *ORDERBYDESC* clauses in *`sysparm_query`*. For example, `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcategory` filters all active records and orders the results in ascending order by number first, and then in descending order by category.

Query parameters (continued)

Name	Description
	If part of the query is invalid, such as by specifying an invalid field name, the instance ignores the invalid part. It then returns rows using only the valid portion of the query. You can control this behavior using the property *glide.invalid_query.returns_no_rows*. Set this property to true to return no rows on an invalid query. **Note:** The *glide.invalid_query.returns_no_rows* property controls the behavior of all queries across the instance, such as in lists, scripts (*GlideRecord.query()*), and web service APIs. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

The endpoint may return the following JSON or XML elements in the response body. In addition to the list of elements defined below (which define the elements in a base system), the endpoint also returns any custom fields added to the Contact [customer_contact] table. For additional information on these elements, refer to your specific table definition [**System Definition** > **Tables**].

Element	Description
account	Sys_id of the account record to which the contact is associated; Account [customer_account] table. Data type: String
active	Flag that indicates whether the contact is active within the system. Possible values: • true: Contact is active • false: Contact is inactive Data type: Boolean Default: true
agent_status	Status of the agent. Possible values: • Off work • On break • On route • On site Data type: String Maximum length: 40
building	Sys_id of the record that describes the building in which the contact resides; Building [cmn_building] table. Data type: String
calendar_integration	Calendar application that the contact uses.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	1: Outlook Data type: Number (Integer) Default: 1
city	City in which the contact resides. Data type: String Maximum length: 40
company	Sys_id of the company record to which the contact is associated; Company [core_company] table. Data type: String
cost_center	Sys_id of the cost center associated with the contact; Cost Center [cmn_cost_center] table. Data type: String
country	Country code of the country in which the contact resides. Data type: String Maximum length: 3
date_format	Format in which to display dates to contacts. Valid values: • dd/mm/yyyy • dd-mm-yyyy • dd.mm.yyyy • mm-dd-yyyy • yyyy-mm-dd Data type: String Maximum length: 40 Default: blank (system date format)
default_perspective	Sys_id of the default perspective for the contact. Located in the Menu List [sys_perspective] table. Data type: String
department	Sys_id of the department associated with the contact. Located in the Department [cmn_department] table. Data type: String
edu_status	Education status of the associated contact.

Element	Description
	Data type: String Maximum length: 40 Default: faculty
email	Contact email address. Data type: String
employee_number	Contact employee number. Data type: String
enable_multifactor_authn	Flag that indicates whether multifactor authorization is required for the contact to log in to the service portal. Possible values: • true: Multifactor authorization enabled • false: Multifactor authorization disabled Data type: Boolean Default: false
failed_attempts	Number of failed log in attempts. Data type: Number (Integer)
first_name	Contact first name. Data type: String Maximum length: 50
gender	Contact gender. Data type: String Maximum length: 40
geolocation_tracked	Flag that indicates whether the contact location is obtained through geotracking. Possible values: • true: Contact location obtained through geotracking • false: Contact location not obtained through geotracking Data type: Boolean Default value: false
home_phone	Contact home phone number. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Maximum length: 40
internal_integration_user	Flag that indicates whether the contact is an internal integration user. Possible values: • true: Internal integration user • false: Other type of user Data type: Boolean Default: false
introduction	Introduction Data type: String Maximum length: 40
last_login	Date on which the contact last logged into the system. Data type: String (Date)
last_login_device	Device the consumer used the last time they logged in to the system. Data type: String Maximum length: 40
last_login_time	Date and time the contact logged in to the system. Data type: String (Date/time)
last_name	Contact last name. Data type: String Maximum length: 50
last_position_update	Date and time the last position was updated. Data type: String (Date/time)
latitude	Latitude coordinate of the contact. Data type: Number (Floating point) Maximum length: 40
ldap_server	Sys_id of the LDAP server used by the contact to last log in to the system; LDAP Server [ldap_server_config] table. Data type: String
location	Sys_id of the record that describes the location of the contact; Location [cmn_location] table.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String
locked_out	Flag that indicates if the contact is locked-out. Possible values: • true: Contact locked-out • false: Contact not locked-out Data type: Boolean Default: false
longitude	Longitude coordinate of the contact. Data type: Number (Floating point) Maximum length: 40
manager	Sys_id of the record that describes the direct supervisor of the contact; User [sys_user] table. Data type: String
middle_name	Contact middle name. Data type: Number (Floating point) Maximum length: 50
mobile_phone	Contact mobile phone number. Data type: String Maximum length: 40
name	Contact full name. Data type: String Maximum length: 151
notification	Indicates whether the contact should receive notifications. Valid values: • 1: Disabled • 2: Enabled Data type: Number (Integer) Default: 2
on_schedule	Indicates the timeliness of dispatched service personnel. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	• Ahead: Ahead of schedule. • behind_less30: Behind schedule, but less than 30 minutes. • behind_30to60: Behind schedule between 30 and 60 minutes. • behind_more60: Behind schedule more than 60 minutes. • on_time: On schedule. Data type: String Maximum length: 40
phone	Contact business phone number. Data type: String Maximum length: 40
photo	Photo image of the contact. Data type: Image
preferred_language	Country code of the contact primary language. Data type: String Maximum length: 3
roles	List of user roles associated with the contact. Data type: String Maximum length: 40
schedule	Sys_id of the record that describes the work schedule for the associated contact; Schedule [cmn_schedule] table. Data type: String
source	Source of the contact. Data type: String Maximum length: 255
state	State in which the contact resides. Data type: String Maximum length: 40
street	Contact street address. Data type: String Maximum length: 255
sys_class_name	Table that contains the contact record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String Maximum length: 80
sys_created_by	User that originally created the associated contact record. Data type: String Maximum length: 40
sys_created_on	Data and time the associated contact was originally created. Data type: String (Date/time)
sys_domain	ServiceNow instance domain of the associated contact record. Data type: String
sys_domain_path	Contact record domain path. Data type: String Maximum length: 255 Default: / (global)
sys_id	Unique identifier for the associated contact record. Data type: String
sys_mod_count	Number of times that the associated contact record has been modified. Data type: Number (Integer)
sys_tags	System tags. Data type: String
sys_updated_by	User that last updated the associated contact information. Data type: String Maximum length: 40
sys_updated_on	Data and time the associated contact information was updated. Data type: String (Date/time)
time_format	Format in which to display time. Valid values: • hh.mm.ss a: hh.mm.ss (12 hour) • hh:mm:ss a: hh:mm:ss (12 hour)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Element	Description
	• HH.mm.ss: hh.mm.ss (24 hour) • HH:mm:ss: hh:mm:ss (24 hour) Data type: String Maximum length: 40 Default: Blank (system time format)
time_sheet_policy	Sys_id of the record that contains the time sheet policy for the associated contact; Time Sheet Policy [time_sheet_policy] table. Data type: String
time_zone	Time zone in which the contact resides, such as Canada/Central or US/Eastern. Data type: String Maximum length: 40
title	Contact business title such as Manager, Software Developer, or Contractor. Data type: String Maximum length: 60
user_name	Contact user ID. Data type: String Maximum length: 40
vip	Flag that indicates whether the associated contact has VIP status. Possible values: • true: VIP • false: Not VIP Data type: Boolean Default: false
web_service_access_only	Flag that indicates whether the contact can only access services through the web. Possible values: • true: Web access only • false: Access through all available methods Data type: Boolean Default: false

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the contact to retrieve. Located in the Contact [customer_contact] table.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Indicates that the request is invalid. Could be due to one of the following reasons: • Requested case does not exist. • User does not have access to the case.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

The endpoint may return the following JSON or XML elements in the response body. In addition to the list of elements defined below (which define the elements in a base system), the endpoint also returns any custom fields added to the Contact [customer_contact] table. For additional information on these elements, refer to your specific table definition [**System Definition** > **Tables**].

Element	Description
account	Sys_id of the account record to which the contact is associated; Account [customer_account] table. Data type: String
active	Flag that indicates whether the contact is active within the system. Possible values: • true: Contact is active • false: Contact is inactive Data type: Boolean Default: true
agent_status	Status of the agent. Possible values: • Off work • On break • On route • On site Data type: String Maximum length: 40

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
building	Sys_id of the record that describes the building in which the contact resides; Building [cmn_building] table. Data type: String
calendar_integration	Calendar application that the contact uses. 1: Outlook Data type: Number (Integer) Default: 1
city	City in which the contact resides. Data type: String Maximum length: 40
company	Sys_id of the company record to which the contact is associated; Company [core_company] table. Data type: String
cost_center	Sys_id of the cost center associated with the contact; Cost Center [cmn_cost_center] table. Data type: String
country	Country code of the country in which the contact resides. Data type: String Maximum length: 3
date_format	Format in which to display dates to contacts. Valid values: • dd/mm/yyyy • dd-mm-yyyy • dd.mm.yyyy • mm-dd-yyyy • yyyy-mm-dd Data type: String Maximum length: 40 Default: blank (system date format)
default_perspective	Sys_id of the default perspective for the contact. Located in the Menu List [sys_perspective] table. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
department	Sys_id of the department associated with the contact. Located in the Department [cmn_department] table. Data type: String
edu_status	Education status of the associated contact. Data type: String Maximum length: 40 Default: faculty
email	Contact email address. Data type: String
employee_number	Contact employee number. Data type: String
enable_multifactor_authn	Flag that indicates whether multifactor authorization is required for the contact to log in to the service portal. Possible values: • true: Multifactor authorization enabled • false: Multifactor authorization disabled Data type: Boolean Default: false
failed_attempts	Number of failed log in attempts. Data type: Number (Integer)
first_name	Contact first name. Data type: String Maximum length: 50
gender	Contact gender. Data type: String Maximum length: 40
geolocation_tracked	Flag that indicates whether the contact location is obtained through geotracking. Possible values: • true: Contact location obtained through geotracking • false: Contact location not obtained through geotracking

Element	Description
	Data type: Boolean Default value: false
home_phone	Contact home phone number. Data type: String Maximum length: 40
internal_integration_user	Flag that indicates whether the contact is an internal integration user. Possible values: • true: Internal integration user • false: Other type of user Data type: Boolean Default: false
introduction	Introduction Data type: String Maximum length: 40
last_login	Date on which the contact last logged into the system. Data type: String (Date)
last_login_device	Device the consumer used the last time they logged in to the system. Data type: String Maximum length: 40
last_login_time	Date and time the contact logged in to the system. Data type: String (Date/time)
last_name	Contact last name. Data type: String Maximum length: 50
last_position_update	Date and time the last position was updated. Data type: String (Date/time)
latitude	Latitude coordinate of the contact. Data type: Number (Floating point) Maximum length: 40

Element	Description
ldap_server	Sys_id of the LDAP server used by the contact to last log in to the system; LDAP Server [ldap_server_config] table. Data type: String
location	Sys_id of the record that describes the location of the contact; Location [cmn_location] table. Data type: String
locked_out	Flag that indicates if the contact is locked-out. Possible values: • true: Contact locked-out • false: Contact not locked-out Data type: Boolean Default: false
longitude	Longitude coordinate of the contact. Data type: Number (Floating point) Maximum length: 40
manager	Sys_id of the record that describes the direct supervisor of the contact; User [sys_user] table. Data type: String
middle_name	Contact middle name. Data type: Number (Floating point) Maximum length: 50
mobile_phone	Contact mobile phone number. Data type: String Maximum length: 40
name	Contact full name. Data type: String Maximum length: 151
notification	Indicates whether the contact should receive notifications. Valid values: • 1: Disabled • 2: Enabled Data type: Number (Integer)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Default: 2
on_schedule	Indicates the timeliness of dispatched service personnel. Valid values: • Ahead: Ahead of schedule. • behind_less30: Behind schedule, but less than 30 minutes. • behind_30to60: Behind schedule between 30 and 60 minutes. • behind_more60: Behind schedule more than 60 minutes. • on_time: On schedule. Data type: String Maximum length: 40
phone	Contact business phone number. Data type: String Maximum length: 40
photo	Photo image of the contact. Data type: Image
preferred_language	Country code of the contact primary language. Data type: String Maximum length: 3
roles	List of user roles associated with the contact. Data type: String Maximum length: 40
schedule	Sys_id of the record that describes the work schedule for the associated contact; Schedule [cmn_schedule] table. Data type: String
source	Source of the contact. Data type: String Maximum length: 255
state	State in which the contact resides. Data type: String Maximum length: 40
street	Contact street address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String Maximum length: 255
sys_class_name	Table that contains the contact record. Data type: String Maximum length: 80
sys_created_by	User that originally created the associated contact record. Data type: String Maximum length: 40
sys_created_on	Data and time the associated contact was originally created. Data type: String (Date/time)
sys_domain	ServiceNow instance domain of the associated contact record. Data type: String
sys_domain_path	Contact record domain path. Data type: String Maximum length: 255 Default: / (global)
sys_id	Unique identifier for the associated contact record. Data type: String
sys_mod_count	Number of times that the associated contact record has been modified. Data type: Number (Integer)
sys_updated_by	User that last updated the associated contact information. Data type: String Maximum length: 40
sys_updated_on	Data and time the associated contact information was updated. Data type: String (Date/time)
time_format	Format in which to display time. Valid values: • hh.mm.ss a: hh.mm.ss (12 hour) • hh:mm:ss a: hh:mm:ss (12 hour)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Element	Description
	• HH.mm.ss: hh.mm.ss (24 hour) • HH:mm:ss: hh:mm:ss (24 hour) Data type: String Maximum length: 40 Default: Blank (system time format)
time_sheet_policy	Sys_id of the record that contains the time sheet policy for the associated contact; Time Sheet Policy [time_sheet_policy] table. Data type: String
time_zone	Time zone in which the contact resides, such as Canada/Central or US/Eastern. Data type: String Maximum length: 40
title	Contact business title such as Manager, Software Developer, or Contractor. Data type: String Maximum length: 60
user_name	Contact user ID. Data type: String Maximum length: 40
vip	Flag that indicates whether the associated contact has VIP status. Possible values: • true: VIP • false: Not VIP Data type: Boolean Default: false
web_service_access_only	Flag that indicates whether the contact can only access services through the web. Possible values: • true: Web access only • false: Access through all available methods Data type: Boolean Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
zip	Contact zip code. Data type: String Maximum length: 40

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/now/contact/ddce70866f9331
003b3c498f5d3ee417 \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Contact - POST /now/contact

Creates a new Customer Service Management (CSM) contact.

In addition, you can create a social media profile for the contact using this endpoint. To create the profile, you must specify the following parameters in the request body:

- *social_channel*
- *social_handle*
- *social_handle_url*

Warning: This endpoint does not perform parameter validation as doing so can create excessive overhead. If a request parameter is misspelled, is not valid, or is not supported by the endpoint, it is ignored without warning.

URL format

Versioned URL: `/api/now/{api_version}/contact`

Default URL: `/api/now/contact`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Element	Description
account	Sys_id of the account record to which the contact is associated; Account [customer_account] table. Data type: String
active	Flag that indicates whether the contact is active within the system. Possible values: • true: Contact is active • false: Contact is inactive Data type: Boolean Default: true
agent_status	Status of the agent. Possible values: • Off work • On break • On route • On site Data type: String Maximum length: 40
building	Sys_id of the record that describes the building in which the contact resides; Building [cmn_building] table. Data type: String
calendar_integration	Calendar application that the contact uses.

vip	Flag that indicates whether the associated contact has VIP status. Possible values: • true: VIP • false: Not VIP Data type: Boolean Default: false
web_service_access_only	Flag that indicates whether the contact can only access services through the web. Possible values: • true: Web access only • false: Access through all available methods Data type: Boolean Default: false
zip	Contact zip code. Data type: String Maximum length: 40

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	New contact record was successfully created.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Element	Description
result	Sys_id of the newly created contact record. Data type: String

Example: cURL request

```
curl -X POST "https://instance.servicenow.com/api/now/contact" \
-H 'Accept: application/json' \
-H 'Content-Type: application/json' \
-d '{ \

Continuous Integration/Continuous Delivery (CICD) API

The *CICD* API provides endpoints that enable integration with common DevOps tools for building pipelines. These tools include Jenkins, Azure Pipelines, GitLab, GitHub Actions, Atlassian Bamboo/Pipelines, and more.

It provides integrators with the ability to build CICD pipelines for ServiceNow AI Platform applications driven by pull/merge request workflows typical in source-driven development. It leverages the Source Control, Application Repository, and Automated Test Framework features.

The *CI/CD* API provides the following product and feature areas:

- Source control

  Apply remote changes for an application linked to a remote Git repository through the Source Control feature in Studio, on a specific instance.

  Imports an application using the specified repository URL and branch name.

- Application repository: Available for scoped applications, global application, application customizations for scoped applications on the ServiceNow Store, and through plugins.
  - Publish an application from an instance to the connected application repository.
  - Install an application onto an instance from the connected application repository.
  - Rollback an application that was installed through rollback context.
- Batch

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

  - Define a JSON manifest file to batch install multiple applications together.
  - Rollback the entire batch install through rollback context.
  - Returns the results of a batch install based on a specified result identifier.
- Plugins
  - Activate a plugin.
  - Rollback a plugin through rollback context.
- Automated Test Framework (ATF)
  - Start an ATF test suite.
  - Obtain the pass/fail result of an ATF test suite.
- Instance scan
  - Start an instance scan (full, point scan on table, point scan on record, scoped application, update set, combination of these items.)
  - Obtain the pass/fail result of an instance scan run.
- Progress

  Obtain the percentage completion on an instance for processes initiated by other endpoint calls. You can use this feature to poll until progress completion before proceeding with the next step.

This API uses an asynchronous response model. When you call an endpoint, such as to run a test suite `/sn_cicd/testsuite/run`, the endpoint kicks off the associated function, such as starting the execution of the test suite. The endpoint then returns a response message that contains the execution status of the requested function, typically `Pending`, along with a unique identifier and link. Use this information to obtain additional information about the progress, source, results, and/or findings of the request. Depending on the function request, you can use one of the following means to obtain additional information about a request:

- Call the `/sn_cicd/progress/{progress_id}` endpoint using the `links.progress.id` parameter returned by the initiating endpoint.
- Call the `/sn_cicd/testsuite/results/{result_id}` endpoint using the `links.result.id` parameter returned by the initiating endpoint.
- Call the `/sn_cicd/instance_scan/result/{progress_id}` endpoint using the `links.progress.id` parameter returned by the initiating endpoint.
- Call the `/sn_cicd/sc/apply_stash/{stash_id}` endpoint using the `links.stash.id` parameter returned by the `/sn_cicd/progress/{progress_id}` endpoint.
- Link out to the `links.<progress/result/source/findings>.url` parameter returned by the initiating endpoint.

Note: To install an application from a repository, the application must first be published to the repository using the `/sn_cicd/app_repo/publish` endpoint. Once published, any instance connected to that repository can then install and rollback the application. If the application is not first published, the installation request fails.

The sn_cicd.sys_ci_automation or admin role is required to use this API.

Beginning in Tokyo, the CICD API endpoints that need to obtain the **instance wide lock / mutex** to perform their requested operation will use a queue, rather than rejecting requests while the **instance wide lock / mutex** is occupied. Multiple CICD pipelines simultaneously make requests

© 2026 ServiceNow, Inc. All rights reserved.

without detecting the rejection and retrying, and instead, can simply monitor the progress as they would for successful requests previously. This behavior is on by default.

The current queue can be inspected by a user with the admin role by navigating to the **System Diagnostic ->Application Operation Queue**. From here the queue can be paused and resumed by the admin to allow for other manual operations that may require the **instance wide lock / mutex**.

Note: When paused, any in progress operation will run to completion but no new operation will be started. The API will continue to accept and queue new requests. A pending operation can also be cancelled before it begins running by updating the listed execution tracker to a cancelled state. If for whatever reason, an operation cannot proceed after the time out specified in com.glide.update_operation.job_cancel_timeout_minutes (default: 48 hours), it will be cancelled.

When an upgrade is scheduled, the queue will go into an upgrade paused state two hours prior to the upgrade unless overridden by the property com.glide.update_operation.queue_upgrade_window. This allows for any in progress operation to complete before the upgrade commences.

Note: The queue automatically resumes when the upgrade is completed.

CI/CD - GET /sn_cicd/app/batch/results/{result_id}

Returns the results of a batch install based on a specified result identifier.

Call this method after calling the `/sn_cicd/app/batch/install` endpoint to obtain the results of the batch install. Use the value returned in the `links.results.id` parameter of the return results of `/sn_cicd/app/batch/install` endpoint as the `result_id` for this endpoint. You can also call the `/api/sn_cicd/progress/{progress_id}` endpoint to obtain information on the progress of the installation if it has not yet completed.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/app/batch/results/{result_id}`

Default URL: `/api/sn_cicd/app/batch/results/{result_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String
result_id	Sys_id of the batch installation for which to return results information. This value is returned in the *links.results.id* parameter of the */sn_cicd/app/batch/install* endpoint. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is inactive.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
error	Error message. Data type: String
batch_items	JSON array, where each object provides details of a package installation. Data type: Array `"batch_items" [{ "customization_version": "String", "id": "String", "install_date": "String", "name": "String", "notes": "String", "state": "String", "status_message": "String", "type": "String", "url": "String", "version": "String" }]`
batch_items.customization_version	Only applicable when the *batch_items.type* parameter is set to *application* or *plugin* and the *requested_customization_version* parameter is passed in the batch install request. Version of the store application or scoped ServiceNow plugin customization package to install, such as 1.0.2 or 2.3. Data type: String
batch_items.id	Sys_id of the application or identifier of the plugin to install. Same as the *packages.id* parameter in the initiating */sn_cicd/app/batch/install* endpoint call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
batch_items.install_date	Date and time that the package was installed. Empty if the request is still in progress. Data type: String
batch_items.name	Name of the package. Data type: String
batch_items.notes	User specified notes about the package. Same as the *packages.notes* parameter in the initiating */sn_cicd/app/batch/install* endpoint call. Data type: String
batch_items.state	Current state of the associated package installation. Possible values: • Failed • In progress • Installed • Invalid • Ready • Rolled Back Data type: String
batch_items.status_message	Describes any errors that occurred during the installation of the package and/or customizations. Data type: String
batch_items.type	Type of application. Same as the *packages.type* parameter in the initiating */sn_cicd/app/batch/install* endpoint call. Valid values: • application • plugin Data type: String
batch_items.url	URL of the associated package installation record on your ServiceNow instance. Data type: String
batch_items.version	Version of the package to install, such as 1.0.2 or 2.3. Same as the *packages.requested_version* parameter in the initiating */sn_cicd/app/batch/install* endpoint call.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
batch_plan	Describes the installation batch plan. Data type: Object `"batch_plan": { "id": "String", "name": "String", "notes": "String", "state": "String", "url": "String" }`
batch_plan.id	Sys_id of the return results information. Same value as what was passed in the *result_id* request parameter. Data type: String
batch_plan.name	User specified descriptive name for this batch request. Same as the *name* parameter in the initiating */sn_cicd/app/batch/install* endpoint call. Data type: String
batch_plan.notes	Notes that were passed in when the batch install was invoked. Same as the *notes* parameter in the initiating */sn_cicd/app/batch/install* endpoint call. Data type: String
batch_plan.state	Current state of the overall batch installation. Possible values: • Failed • In progress • Installed • Invalid • Partial Install • Ready • Rolled Back Data type: String
batch_plan.url	URL of the batch installation plan record on your ServiceNow instance. Data type: String

Example: cURL request

This example checks the status of a batch installation plan called Release 2.0 IT Operations.

403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
500	Internal server error. An unexpected error occurred while processing the request.

Request body

The API accepts these JSON or XML elements in the request body.

Elements accepted in the request body

Element	Description
None	

Response body

The API returns these JSON or XML elements in the response body.

Elements returned in the response body

Element	Description
error	Error message. Data type: String

links	All links and sys_ids associated with the response.
	
	Data type: Object
	`"links": {`
	`  "progress": {Object}`
	`}`

links.findings	Object that contains information about the instance scan findings.
links.findings.label	Additional information about the instance scan findings.
links.findings.url	URL to use to retrieve a list of records that violated the checks.

links.progress	Describes the progress link information.
	
	Data type: Object
	`"progress": {`
	`  "id": "String",`
	`  "url": "String"`
	`}`

links.progress.id	Unique identifier of the progress detail.

Elements returned in the response body (continued)

Element	Description
links.progress.url	URL to use to retrieve the progress details. Data type: String
links.results	Results information. Data type: Object `"results": { "id": "String", "url": "String" }`
links.results.id	Sys_id of the instance scan results record.
links.results.url	URL to use to obtain the results of the instance scan.
status	Numeric execution state. Used with *status_label*. Values: • 0 (Pending) • 1 (Running) • 2 (Successful) • 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with *status*. Values: • Canceled • Failed • Pending • Running • Successful Data type: String
status_message	Additional information on why the operation failed. Empty if the operation is successful. Data type: String

CI/CD - GET /sn_cicd/progress/{progress_id}

Returns the current progress and status of the Continuous Integration and Continuous Delivery (CICD) function associated with a specified progress ID.

Call this method after calling one of the asynchronous CICD endpoints such as `/sn_cicd/app_repo/publish`, `/sn_cicd/app_repo/install`, `/sn_cicd/testsuite/run`, or `/sn_cicd/sc/apply_stash`.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/progress/{progress_id}`

Default URL: `/api/sn_cicd/progress/{progress_id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
progress_id	Unique identifier of the function for which to return progress information. This value is returned in the *`links.progress.id`* parameter of the endpoint that initiated the action, such as */sn_cicd/app_repo/publish*, */sn_cicd/app_repo/install*, */sn_cicd/testsuite/run*, or */sn_cicd/sc/apply_stash*. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is inactive.
409	Conflict. The requested item isn't unique.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
error	Error message. Data type: String

links	All links and sys_ids associated with the response.
	
	Data type: Object
	`"links": {`
	`  "progress": {Object}`
	`}`

links.progress	Describes the progress link information.
	
	Data type: Object
	`"progress": {`
	`  "id": "String",`
	`  "url": "String"`
	`}`

links.progress.id	Unique identifier to use to obtain the progress details for the operation. Use this value when calling the endpoint `/sn_cicd/progress/{progress_id}`. Data type: String
links.progress.url	URL to use to retrieve the progress details. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
links.results	Results information. Data type: Object `"results": { "id": "String", "url": "String" }`
links.results.id	Unique identifier of the results information. Use this value when calling the associated results endpoint. Data type: String
links.results.url	URL to use to obtain the results of the endpoint execution, such as results. Data type: String
links.source	Source information. Data type: Object `"source": { "id": "String", "url": "String" }`
links.source.id	Unique identifier of the source record in the Execution Tracker [sys_execution_tracker] table. Data type: String
links.source.url	URL to use to obtain the source information in the Execution Tracker [sys_execution_tracker] table. Data type: String
links.stash	If a was created during an apply_changes operation, this object contains information about the stash. This object is not returned if a stash wasn't created. Data type: Object `"stash": { "id": "String", "url": "String" }`
links.stash.id	Unique identifier of the created stash. Use this value when calling the CI/CD - POST /sn_cicd/sc/apply_stash/{stash_id} endpoint to apply the stash. Data type: String
links.stash.url	URL of the associated stash. Data type: String

Name	Description
percent_complete	Percentage of the request that is complete. Data type: Number
status	Numeric execution state. Used with *status_label*. Values: • 0 (Pending) • 1 (Running) • 2 (Successful) • 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with *status*. Values: • Canceled • Failed • Pending • Running • Successful Data type: String
status_message	Description of the current state. Data type: String

Example: Obtain the progress of a test suite run

```
curl
 'instance.servicenow.com/api/sn_cicd/progress/a4fae8911bdc00103
d374087bc4bcbbd' \
--request GET \
--header 'Accept: application/json' \
--user 'username':'password'
```

Progress of the apply changes call.

```
{
    "result": {
        "links": {
            "progress": {
                "id": "a4fae8911bdc00103d374087bc4bcbbd",
```

  }
}
```

CI/CD - GET /sn_cicd/testsuite/results/{result_id}

Returns the results of a test suite run based on a specified results identifier.

Call this endpoint after calling *`/sn_cicd/progress/{progress_id}`* to obtain the result of the executed test suite.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/testsuite/results/{result_id}`

Default URL: `/api/sn_cicd/testsuite/results/{result_id}`

© 2026 ServiceNow, Inc. All rights reserved.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
result_id	Unique identifier of the test suite results to retrieve. The corresponding `/sn_cicd/progress/{progress_id}` endpoint call returns this information. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is inactive.
409	Conflict. The requested item isn't unique.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
child_suite_results	Results of nested test suites. The format of this content is the same as the parent test.
error	Error message. Data type: String
links	Object that contains all links and sys_ids associated with the response. Data type: Object
links.results	Object that contains the results information. Data type: Object
links.results.id	Unique identifier of the results information. Use this value when calling the endpoint `/sn_cicd/testsuite/results/{result_id}`. Data type: String
links.results.url	URL to use to obtain the results of the endpoint execution, such as results. Data type: String
percent_complete	Percentage of the request that is complete.
rolledup_test_error_count	Number of tests with errors. Data type: Number
rolledup_test_failure_count	Number of tests that failed. Data type: Number

Name	Description
rolledup_test_skip_count	Number of tests that were skipped. Data type: Number
rolledup_test_success_count	Number of tests that ran successfully. Data type: Number
status	Numeric execution state. Used with *status_label*, such as 0: Pending. Values: • 0 (Pending) • 1 (Running) • 2 (Successful) • 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with *status*, such as 0: Pending. Values: • Pending • Running • Successful • Failed • Canceled Data type: String
status_message	Description of the current state. Data type: String
test_suite_duration	Amount of time that it took to execute the test suite. Unit: Seconds Data type: String
test_suite_name	Name of the test suite. Data type: String
test_suite_status	State of the test suite.

   "child_suite_results": []
 }
}
```

CI/CD - POST /sn_cicd/app/batch/install

Installs two or more packages in a single specified batch.

A batch can contain any combination of the following types:

- Application:
  - Scoped applications in the ServiceNow Store that are not owned by your company
  - Scoped or global applications in the application repository that are owned by your company
  - Your application customizations for Store applications in the application repository
- ServiceNow plugin:

  Application customizations for scoped applications that were packaged in a plugin and were published to the application repository.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This endpoint uses an asynchronous response model. When you call an endpoint, it kicks off the associated function, such as starting the execution of the batch install plan. The endpoint then returns a response message that contains the execution status of the requested function, typically Pending, along with a unique identifier and link. Use this information to obtain additional information about the progress or results of the request.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/app/batch/install`

Default URL: `/api/sn_cicd/app/batch/install`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
name	Required. User specified descriptive name for this batch request. Data type: String
notes	User specified additional notes about the batch install plan. Data type: String Default: Null
packages	Required. JSON array, where each object specifies details of a package to install. Data type: Array `"packages": [{ "id": "String", "load_demo_data": Boolean, "notes": "String", "requested_customization_versio n": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	<pre>"requested_version": "String",
	"type": "String"
	}]</pre>

packages.id	Required. Sys_id of the application or identifier of the plugin to install. Data type: String
packages.load_demo_data	Flag that indicates whether demo data is loaded when installing the package. Valid values: • true: Demo data should be loaded. • false: Demo data should not be loaded. Data type: Boolean Default: false
packages.notes	User specified notes about the package. Data type: String Default: Null
packages.requested_customization_version	Version of the application customization to the store application or to the scoped ServiceNow plugin to install, such as 1.0.2 or 2.3. Data type: String Default: None. If this parameter is not set, then the system does not look for customizations for the application.
packages.requested_version	Required if *packages.type* is set to *application*; ignored if set to *plugin*. Version of the package to install, such as 1.0.2 or 2.3. Data type: String
packages.type	Required. Type of package. Valid values: • application • plugin Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
405	Invalid method. The functionality is disabled.

Response body parameters (JSON or XML)

Name	Description
error	Error message. Data type: String

links	All links and sys_ids associated with the response.
	
	Data type: Object
	
	`"links": {`
	`  "progress": {Object},`
	`  "results": {Object},`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

	<pre>"rollback": {Object}
	}</pre>

links.progress	Describes the progress link information.
	
	Data type: Object
	<pre>"progress": {
	"id": "String",
	"url": "String"
	}</pre>

links.progress.id	Unique identifier to use to obtain the progress details for the operation. Use this value when calling the endpoint */sn_cicd/progress/{progress_id}*. Data type: String
links.progress.url	URL to use to retrieve the progress details. Data type: String

links.results	Describes the results link information.
	
	Data type: Object
	<pre>"results": {
	"id": "String",
	"url": "String"
	}</pre>

links.results.id	Sys_id of the results of the batch endpoint call. Use this value when calling the endpoint specified in *links.results.url* to query the batch install results. Data type: String
links.results.url	URL to use to retrieve the results of the batch install. Data type: String

links.rollback	Describes the batch install rollback information.
	
	Data type: Object
	<pre>"rollback": {
	"id": "String"
	}</pre>

links.rollback.id	Sys_id of the rollback details for the installed packages. Use this parameter to rollback the installation of the specified packages to their previous versions using the */sn_cicd/app/batch/rollback/{rollback_id}* endpoint. **Note:** The rollback capability is only available after the installation is complete.

Name	Description
	Data type: String
percent_complete	Percentage of the request that is complete. Data type: Number
status	Numeric execution state. Used with *status_label*. Values: • 0 (Pending) • 1 (Running) • 2 (Successful) • 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with *status*. Values: • Canceled • Failed • Pending • Running • Successful Data type: String
status_message	Description of the current state. Data type: String

Example: cURL request

This example initiates a batch installation called Release 2.2 Deployment that contains three packages (one of each type) to install.

```
curl 'instance.servicenow.com/api/sn_cicd/app/batch/install \
--request POST \
--header 'Accept: application/json' \
--user 'username':'password' \
--data { "name": "Release 2.2 Deployment",
 "packages": [
   {
     "id": "syd_id_abcefghi",
     "type": "application",
     "load_demo_data": false,
```

}
```

CI/CD - POST /sn_cicd/app/batch/rollback/{rollback_id}

Rolls back all of the packages associated with a specific batch installation to their previous versions.

This endpoint works in conjunction with the `/sn_cicd/app/batch/install` endpoint. The *rollback_id* is provided in the return results of this endpoint. When this endpoint is called, it rolls back all packages specified in the associated install; you cannot rollback individual packages. If there is no previous version, the endpoint uninstalls the associated package.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This endpoint uses an asynchronous response model. When you call an endpoint, it kicks off the associated function, such as starting the execution of the batch install plan. The endpoint then returns a response message that contains the execution status of the requested function, typically Pending, along with a unique identifier and link. Use this information to obtain additional information about the progress or results of the request.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/app/batch/rollback/{rollback_id}`

Default URL: `/api/sn_cicd/app/batch/rollback/{rollback_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
rollback_id	Sys_id of the batch installation plan for which to rollback the installed packages to their previous versions. This value is returned in the *`links.rollback.id`* parameter of the *`/sn_cicd/app/batch/install`* endpoint. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is inactive.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
error	Error message. Data type: String

links	All links and sys_ids associated with the response.
	
	Data type: Object
	`"links": {`
	`  "progress": {Object}`
	`}`

links.progress	Describes the progress link information.
	
	Data type: Object
	`"progress": {`
	`  "id": "String",`
	`  "url": "String"`
	`}`

links.progress.id	Unique identifier to use to obtain the progress details for the operation. Use this value when calling the endpoint */sn_cicd/progress/{progress_id}*.

Name	Description
	Data type: String
links.progress.url	URL to use to retrieve the progress details. Data type: String
percent_complete	Percentage of the request that is complete. Data type: Number
status	Numeric execution state. Used with *status_label*. Values: • 0 (Pending) • 1 (Running) • 2 (Successful) • 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with *status*. Values: • Canceled • Failed • Pending • Running • Successful Data type: String
status_message	Description of the current state. Data type: String

Example: cURL request

This example rolls back all the packages within the specified installation batch plan to their previous version.

```
curl
 'instance.servicenow.com/api/sn_cicd/app/batch/rollback/a329f82
e871da64c724ba21c82a764f2 \
--request POST \
--header 'Accept: application/json' \
--user 'username':'password'

```

CI/CD - POST /sn_cicd/app_repo/install

Installs the specified application from the application repository onto the instance making the endpoint call.

Using this endpoint you are able to install both unaltered and customized ServiceNow base system and ServiceNow Store applications, customized ServiceNow plugins, and your own ServiceNow applications.

The following outlines the parameters that you need to pass to implement specific use cases. All parameters that are not specified are not passed in and use the associated defaults.

- To only install the base application and not the corresponding application customizations.
  - sys_id: Sys_id of the base application that has been customized.
  - base_app_version: Version of the base application to install.
- To install a specified version of application customizations and automatically install the recommended base application version. The recommended base application version is the version of the base application that was installed on the instance at the time that the customizations were last published. Every version of application customizations has a corresponding recommended base application version.
  - sys_id: Sys_id of the application that has been customized.
  - auto_upgrade_base_app: true
  - version: Version of the application customizations to install.
- To install the latest version of the application customizations and its corresponding recommended base application version.
  - sys_id: Sys_id of the application that has been customized.
  - auto_upgrade_base_app: true
- To install the latest version of the application customizations, but not upgrade the base application to the application customizations recommended base application version.
  - sys_id: Sys_id of the application that has been customized.
  - auto_upgrade_base_app: false
- To install application customizations along with the scoped ServiceNow plugin of the current release.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- scope: Scope of the plugin that has been customized OR
- sys_id: Sys_id of the application that has been customized. This is not the ID of the plugin.
- version: Version of the application customizations to install.

- To install application customizations for an already installed and activated scoped plugin.
  - sys_id: Sys_id of the application that has been customized. This is not the ID of the plugin.
  - auto_upgrade_base_app: false
  - version: Version of the application customizations to install.

Since base plugins can have only one version per family release, the *auto_upgrade_base_app* and *base_app_version* parameters do not apply to application customization installs for plugins. To activate a plugin for the first time on an instance, use the */sn_cicd/plugin/{plugin_id}/activate* endpoint instead.

Note: This endpoint uses an asynchronous response model. When you call an endpoint, it kicks off the associated function, such as starting the execution of the batch install plan. The endpoint then returns a response message that contains the execution status of the requested function, typically Pending, along with a unique identifier and link. Use this information to obtain additional information about the progress or results of the request.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/app_repo/install`

Default URL: `/api/sn_cicd/app_repo/install`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
auto_upgrade_base_app	Only applicable if you intend to install application customizations and the base application was built on a version that is later than the currently installed version. Flag that indicates whether the associated base application should be automatically upgraded to a later version. Valid values: • true: Automatically upgrade the associated base application. • false: Leave the base application as the version currently installed on the instance. Data type: Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: false
base_app_version	Version of the base application to install. A base application is any third-party application that is available in theServiceNow Store. If the application has no application customizations, or if the application has application customizations and you are only updating the base application, then enter the updated version of the application in this parameter. If you are updating application customizations, don't pass this parameter, but rather pass the *version* parameter. Data type: String Default: Null
scope	Required if *sys_id* is not specified. Scope name of the application, such as x_aah_custom_app. You can locate this value in the *scope* field in the Custom Application [sys_app] table or Store Application [sys_store_app] table. Data type: String
sys_id	Required if *scope* is not specified. Sys_id of the application to install. You can locate this value in the *Sys ID* field in the Custom Application [sys_app] table or Store Application [sys_store_app] table. Data type: String
version	Version of the application to install. Data type: String Default: If the *base_app_version* parameter is empty and the *auto_upgrade_base_app* parameter is set to true, installs the latest application customizations and its recommended base application version (as long as it doesn't downgrade the base application.) If the *auto_upgrade_base_app* parameter is false, installs the application customizations, but the base application is not upgraded. If the *base_app_version* parameter is defined, only installs the base application.

Request body parameters (XML or JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is inactive.
409	Conflict. The requested item isn't unique.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
error	Error message. Data type: String
links	All links and sys_ids associated with the response. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"links": {
	  "progress": {Object}
	}</pre>

links.progress	Describes the progress link information.
	
	Data type: Object
	<pre>"progress": {
	  "id": "String",
	  "url": "String"
	}</pre>

links.progress.id	Unique identifier to use to obtain the progress details for the operation. Use this value when calling the endpoint `/sn_cicd/progress/{progress_id}`. Data type: String
links.progress.url	URL to use to retrieve the progress details. Data type: String
percent_complete	Percentage of the request that is complete. Data type: Number
rollback_version	If available, the previously installed version. If not available, null. Data type: String
status	Numeric execution state. Used with `status_label`. Values: • 0 (Pending) • 1 (Running) • 2 (Successful) • 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with `status`. Values: • Canceled • Failed • Pending

        "url":
 "https://instance.servicenow.com/api/sn_cicd/progress/c159b1e9d
b1c0010b5e3f6c5ae961903"
      }
   },
   "status": "0",
   "status_label": "Pending",
   "status_message": "",
   "status_detail": "",
   "error": "",
   "percent_complete": 0,
   "rollback_version": "1.1.0"
  }
}
```

CI/CD - POST /sn_cicd/app_repo/publish

Publishes the specified application and all of its artifacts to the application repository.

Note: If there are uncommitted changes to tracked files when you call this endpoint, it returns a 400 Bad Request status code. You can either commit the changes manually in Studio or call the CI/CD - POST /sn_cicd/sc/apply_changes endpoint to stash the changes. Changes that aren't tracked in the Customer Updates [sys_update_xml] table are committed automatically after publishing to the application repository. For information about the layout of the changes in the Customer Updates table and a description of the changes that aren't represented in this table, see Customer Updates table.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/app_repo/publish`

Default URL: `/api/sn_cicd/app_repo/publish`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
dev_notes	Developer notes to store with the application. Data type: String
scope	Required if *`sys_id`* isn't specified. The scope of the application. You can locate this value in the *`scope`* field in the Custom Application [sys_app] table. Data type: String
sys_id	Required if *`scope`* isn't specified. The sys_id of the application to store in the repository. You can locate this value in the *`Sys ID`* field in the Custom Application [sys_app] table. Data type: String
version	Version under which to store the application. If the version number is passed, the publish process uses that version and updates the local application version if different. If the version number isn't passed, the publish process uses the current version of the local application and fails if that version exists in the application repository. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Request failed. Possible issues: • The application version isn't correct or is a downgrade. • The application is connected to source control and contains uncommitted changes that must be resolved. Consult the returned error message for additional information.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is inactive.
409	Conflict. The requested item isn't unique.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
error	Error message. Data type: String

The following example shows how to publish the application with the specified sys_id and all of its artifacts to the application repository.

```
curl
 'instance.servicenow.com/api/sn_cicd/app_repo/publish?sys_id=4d
d9686d1b9800103d374087bc4bcb3d' \
--request POST \
--header 'Accept: application/json' \
--user 'username':'password'
```

```
{
"result": {
   "links": {
       "progress": {
           "id": "d174f8e11bd800103d374087bc4bcbd9",
           "url":
 "https://instance.service-now.com/api/sn_cicd/progress/d174f8e1
1bd800103d374087bc4bcbd9"
        }
    },
    "status": "0",
    "status_label": "Pending",
    "status_message": "",
    "status_detail": "",
    "error": "",
    "percent_complete": 0
  }
}
```

CI/CD - POST /sn_cicd/app_repo/rollback

Initiates a rollback of a specified application to a specified version.

Note: The rollback functionality is only available after the installation is complete.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/app_repo/rollback`

Default URL: `/api/sn_cicd/app_repo/rollback`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
scope	Required if *`sys_id`* is not specified. The scope name of the application to rollback.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String
sys_id	Required if *scope* is not specified. The sys_id of the application to rollback. Data type: String
version	Required. Version of the application that is expected after the rollback operation. If the request is to rollback an App Customization install, then set this field to the version of the base application that the system is expected to have after the rollback operation. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
405	Invalid method. The functionality is inactive.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
error	Error message. Data type: String

links	All links and sys_ids associated with the response.
	
	Data type: Object
	`"links": {`
	`  "progress": {Object}`
	`}`

links.progress	Describes the progress link information.
	
	Data type: Object
	`"progress": {`
	`  "id": "String",`
	`  "url": "String"`
	`}`

links.progress.id	Unique identifier to use to obtain the progress details for the operation. Use this value when calling the endpoint `/sn_cicd/progress/{progress_id}`. Data type: String
links.progress.url	URL to use to retrieve the progress details. Data type: String
percent_complete	Percentage of the request that is complete. Data type: Number
status	Numeric execution state. Used with `status_label`. Values: • 0 (Pending) • 1 (Running) • 2 (Successful)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with *status*. Values: • Canceled • Failed • Pending • Running • Successful Data type: String
status_message	Description of the current state. Data type: String

Example: cURL request

```
curl
 'instance.servicenow.com/api/sn_cicd/app_repo/rollback?sys_id=2
d146921dbd80010caf55268dc9619d8&version=1.1.0' \
--request POST \
--header 'Accept: application/json' \
--user 'username':'password'
```

```
{

CI/CD - POST /sn_cicd/instance_scan/full_scan

Runs all active checks present in your instance.

You can run checks that are provided with Instance Scan or you can create your own checks. For more information, see Instance Scan.

Note: This endpoint is part of the *CICD Instance Scan Execution Service* API and is used under the sn_cicd namespace.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/instance_scan/full_scan`

Default URL: `/api/sn_cicd/instance_scan/full_scan`

Supported request parameters

Parameters

Parameter	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
500	Internal server error. An unexpected error occurred while processing the request.

Request body

The API accepts these JSON or XML elements in the request body.

Elements accepted in the request body

Element	Description
None	

Response body

The API returns these JSON or XML elements in the response body.

Elements returned in the response body

Element	Description
error	Error message. Data type: String

links	All links and sys_ids associated with the response.
	
	Data type: Object
	`"links": {`
	`  "progress": {Object}`
	`}`

links.progress	Describes the progress link information.
	
	Data type: Object
	`"progress": {`
	`  "id": "String",`
	`  "url": "String"`
	`}`

links.progress.id	Unique identifier of the progress detail. Use this value when calling the endpoint */sn_cicd/instance_scan/result/{progress_id}*.
links.progress.url	URL to use to retrieve the progress details. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

```
    },
    "status": "0",
    "status_label": "Pending",
    "status_message": "",
    "status_detail": "",
    "error": ""
  }
}
```

CI/CD - POST /sn_cicd/instance_scan/point_scan

Executes all applicable checks against a specified record.

For example, if you execute a point scan against a Catalog Item, only the checks applicable to the Catalog Item table run, and only the specified record is scanned.

You can run checks that are provided with Instance Scan or you can create your own checks. For more information, see Instance Scan.

Note: This endpoint is part of the *CICD Instance Scan Execution Service* API and is used under the sn_cicd namespace.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/instance_scan/point_scan`

Default URL: `/api/sn_cicd/instance_scan/point_scan`

Supported request parameters

Parameters

Parameter	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
target_table	Required. Name of the table in which the record to scan resides, such as "Incident." Data type: String
target_sys_id	Required. The sys_id of the record within the specified table to scan. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Invalid or empty query parameters.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
500	Internal server error. An unexpected error occurred while processing the request.

Request body

The API accepts these JSON or XML elements in the request body.

Elements accepted in the request body

Element	Description
None	

Response body

The API returns these JSON or XML elements in the response body.

Elements returned in the response body

Element	Description
error	Error message.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Elements returned in the response body (continued)

Element	Description
	Data type: String
links	All links and sys_ids associated with the response. Data type: Object `"links": { "progress": {Object} }`
links.progress	Describes the progress link information. Data type: Object `"progress": { "id": "String", "url": "String" }`
links.progress.id	Unique identifier of the progress detail. Use this value when calling the endpoint */sn_cicd/instance_scan/result/{progress_id}*.
links.progress.url	URL to use to retrieve the progress details. Data type: String
status	Numeric execution state. Used with *status_label*. Values: • 0 (Pending) • 1 (Running) • 2 (Successful) • 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with *status*. Values: • Canceled • Failed • Pending • Running • Successful

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Elements returned in the response body (continued)

Element	Description
	Data type: String
status_message	Additional information on why the operation failed. Empty if the operation is successful. Data type: String

Example: Sample cURL request

```
curl
 'instance.service-now.com/api/sn_cicd/instance_scan/point_sc
an?target_table=incident&target_sys_id=2d146921dbd80010caf55268d
c9619d8' \
--request POST \
--header 'Accept: application/json' \
--user 'username':'password'
```

```
{
"result": {
   "links": {
       "progress": {
           "id": "a4fae8911bdc00103d374087bc4bcbbd",
           "url":
 "https://instance.service-now/api/sn_cicd/progress/a4fae8911bdc
00103d374087bc4bcbbd"
       }
    },
    "status": "0",
    "status_label": "Pending",
    "status_message": "",
    "status_detail": "",
    "error": ""
  }
}
```

CI/CD - POST /sn_cicd/instance_scan/suite_scan/combo/{combo_sys_id}

Runs a scan using a suite and target (scoped apps or update sets) that have already run previously.

Before calling this endpoint, you must call the */sn_cicd/instance_scan/suite_scan/{suite_sys_id}/scoped_apps* or */sn_cicd/instance_scan/suite_scan/{suite_sys_id}/update_sets* endpoints, or execute a suite scan in the UI.

Note: This endpoint is part of the *CICD Instance Scan Execution Service* API and is used under the sn_cicd namespace.

URL format

Versioned URL: /api/sn_cicd/{api_version}/instance_scan/suite_scan/combo/{combo_sys_id}

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/sn_cicd/instance_scan/suite_scan/combo/{combo_sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
combo_sys_id	The sys_id of the scan to run. The scan must be an existing scan that you want to re-run. Located in the Combo [scan_combo] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Element	Description
error	Error message. Data type: String

links	All links and sys_ids associated with the response.
	
	Data type: Object
	`"links": {`
	`  "progress": {Object}`
	`}`

links.progress	Describes the progress link information.
	
	Data type: Object
	`"progress": {`
	`  "id": "String",`
	`  "url": "String"`
	`}`

links.progress.id	Unique identifier of the progress detail. Use this value when calling the endpoint `/sn_cicd/instance_scan/result/{progress_id}`.
links.progress.url	URL to use to retrieve the progress details. Data type: String
status	Numeric execution state. Used with `status_label`. Values: • 0 (Pending) • 1 (Running) • 2 (Successful)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	• 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with *status*. Values: • Canceled • Failed • Pending • Running • Successful Data type: String
status_message	Additional information on why the operation failed. Empty if the operation is successful. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_cicd/instance_scan/suit
e_scan/combo/245d29cc1bd32010178aed72604bcb4b" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

Response body - success.

```
{
  "result": {
    "links": {
      "progress": {
        "id": "c08be5c71b1b2010178aed72604bcb6e",
        "url":
 "https://instance.servicenow.com/api/sn_cicd/progress/c08be5c71
b1b2010178aed72604bcb6e"
      }
    },
    "status": "0",
    "status_label": "Pending",
    "status_message": "",
    "status_detail": "",
    "error": ""
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
}
```

CI/CD - POST /sn_cicd/instance_scan/suite_scan/{suite_sys_id}/scoped_apps

Runs all active checks inside a suite against a list of scoped apps.

Note: This endpoint is part of the *CICD Instance Scan Execution Service* API and is used under the sn_cicd namespace.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/instance_scan/suite_scan/{suite_sys_id}/scoped_apps`

Default URL: `/api/sn_cicd/instance_scan/suite_scan/{suite_sys_id}/scoped_apps`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
suite_sys_id	The sys_id of the suite to run. Located in the Suite [scan_check_suite] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
app_scope_sys_ids	Required. A list of sys_ids of the scoped applications to scan. Located in the Application [sys_scope] table. The array can't be an empty array. Data type: Array `app_scope_sys_ids: ["String", "String", "String"]`

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Element	Description
error	Error message. Data type: String

links	All links and sys_ids associated with the response.
	
	Data type: Object
	`"links": {`
	`  "progress": {Object}`
	`}`

links.progress	Describes the progress link information.
	
	Data type: Object
	`"progress": {`
	`  "id": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description

	<pre>{
	  "url": "String"
	}</pre>

links.progress.id	Unique identifier of the progress detail. Use this value when calling the endpoint `/sn_cicd/instance_scan/result/{progress_id}`.
links.progress.url	URL to use to retrieve the progress details. Data type: String
status	Numeric execution state. Used with `status_label`. Values: • 0 (Pending) • 1 (Running) • 2 (Successful) • 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with `status`. Values: • Canceled • Failed • Pending • Running • Successful Data type: String
status_message	Additional information on why the operation failed. Empty if the operation is successful. Data type: String

Example: cURL request

This example runs all active checks inside a suite against one scoped application.

```
curl
 "https://instance.servicenow.com/api/sn_cicd/instance_scan/suit
e_scan/833655cc1b94101046e87733cd4bcb4e/scoped_apps" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
```

      }
    },
    "status": "0",
    "status_label": "Pending",
    "status_message": "",
    "status_detail": "",
    "error": ""
  }
}
```

CI/CD - POST /sn_cicd/instance_scan/suite_scan/{suite_sys_id}/update_sets

Runs all active checks inside a suite against a list of update sets.

Note: This endpoint is part of the *CICD Instance Scan Execution Service* API and is used under the sn_cicd namespace.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/instance_scan/suite_scan/{suite_sys_id}/update_sets`

Default URL: `/api/sn_cicd/instance_scan/suite_scan/{suite_sys_id}/update_sets`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
suite_sys_id	The sys_id of the suite to run. Located in the Suite [scan_check_suite] table. Data type: String

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Element	Description
error	Error message. Data type: String

links	All links and sys_ids associated with the response.
	
	Data type: Object
	
	`"links": {`
	`  "progress": {Object}`
	`}`

links.progress	Describes the progress link information.
	
	Data type: Object
	
	`"progress": {`
	`  "id": "String",`
	`  "url": "String"`
	`}`

links.progress.id	Unique identifier of the progress detail. Use this value when calling the endpoint `/sn_cicd/instance_scan/result/{progress_id}`.
links.progress.url	URL to use to retrieve the progress details. Data type: String
status	Numeric execution state. Used with `status_label`. Values: • 0 (Pending) • 1 (Running) • 2 (Successful) • 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with `status`.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is inactive.
409	Conflict. The requested item isn't unique.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
error	Error message. Data type: String

links	All links and sys_ids associated with the response.
	
	Data type: Object
	`"links": {`
	`  "progress": {Object}`
	`}`

links.progress	Describes the progress link information.
	
	Data type: Object
	`"progress": {`
	`  "id": "String",`
	`  "url": "String"`
	`}`

links.progress.id	Unique identifier to use to obtain the progress details for the operation. Use this value when calling the endpoint `/sn_cicd/progress/{progress_id}`. Data type: String
links.progress.url	URL to use to retrieve the progress details. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

links.progress.url	URL to use to retrieve the progress details. Data type: String
percent_complete	Percentage of the request that is complete. Data type: Number
status	Numeric execution state. Used with `status_label`. Values: • 0 (Pending) • 1 (Running) • 2 (Successful) • 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with `status`.

    "status_detail": "",
    "error": "",
    "percent_complete": 0
  }
}
```

CI/CD - POST /sn_cicd/sc/apply_changes

Starts applying changes from a remote source control to a specified local application or application-customization.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/sc/apply_changes`

Default URL: `/api/sn_cicd/sc/apply_changes`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
auto_upgrade_base_app	Only applicable when changes are applied for app-customization and the latest commit on the Git repository is built on a version that is later than that of the base application that is currently installed on the local instance. Flag that indicates whether the system should auto upgrade the base application to a later version. Data type: Boolean Default: true
branch_name	Name of the branch in the source control system from which to acquire the application. Data type: String Default: Default branch specified on the source control system.
scope	Required if *sys_id* is not specified. The scope name of the application for which to apply the changes, such as x_aah_custom_app. You can locate this value in the *scope* field in the Custom Application [sys_app] table or Store Application [sys_store_app] table for the app-customization. Data type: String
sys_id	Required if *scope* is not specified. The sys_id of the application for which to apply the changes. You can locate this value in the *Sys ID* field in the Custom Application [sys_app] table or Store Application [sys_store_app] table for the app-customization. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is inactive.
409	Conflict. The requested item isn't unique.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
error	Error message. Data type: String
links	All links and sys_ids associated with the response. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"links": {
	  "progress": {Object}
	}</pre>

links.progress	Describes the progress link information.
	
	Data type: Object
	<pre>"progress": {
	  "id": "String",
	  "url": "String"
	}</pre>

links.progress.id	Unique identifier to use to obtain the progress details for the operation. Use this value when calling the endpoint `/sn_cicd/progress/{progress_id}`. Data type: String
links.progress.url	URL to use to retrieve the progress details. Data type: String
percent_complete	Percentage of the request that is complete. Data type: Number
status	Numeric execution state. Used with *status_label*. Values: • 0 (Pending) • 1 (Running) • 2 (Successful) • 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with *status*. Values: • Canceled • Failed • Pending • Running • Successful

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
status_message	Additional information on why the operation failed. Empty if the operation is successful. Data type: String

Example: cURL request

```
curl
 'https://instance.servicenow.com/api/sn_cicd/sc/apply_changes?a
pp_sys_id=043db024db737300a9a754e4dc961915' \
--request POST \
--header 'Accept: application/json' \
--user 'username':'password'
```

```
{
"result": {
   "links": {
       "progress": {
           "id": "a4fae8911bdc00103d374087bc4bcbbd",
           "url":
 "https://instance.service-now/api/sn_cicd/progress/a4fae8911bdc
00103d374087bc4bcbbd"
       }
    },
    "status": "0",
    "status_label": "Pending",
    "status_message": "",
    "status_detail": "",
    "error": "",
    "percent_complete": 0
  }
}
```

CI/CD - POST /sn_cicd/sc/apply_stash/{stash_id}

Starts applying a previously generated "stash" of changes from a remote source control to a specified local application or application-customization.

This endpoint works in conjunction with the POST/api/sn_cicd/sc/apply_changes and CI/CD - GET /sn_cicd/progress/{progress_id} endpoints. When the *POST /api/sn_cicd/sc/apply_changes* endpoint is called, any unsaved or uncommitted changes in App Engine Studio on the associated instance are saved into the database as a stash.

The way to determine whether a stash was created when the changes were initially applied is to call the *GET /sn_cicd/progress/{progress_id}* endpoint. If a stash was created, the sys_id (*stash_id*) and URL of the stash are returned. To apply the stashed changes to the associated application, call this *apply_stash* endpoint using the *stash_id* returned by the *progress* endpoint.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/sc/apply_stash/{stash_id}`

Default URL: `/api/sn_cicd/sc/apply_stash/{stash_id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
stash_id	Unique identifier of the stash to apply. This value is returned in the *`links.stash.id`* parameter in the corresponding CI/CD - GET /sn_cicd/progress/{progress_id} endpoint call. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is inactive.
409	Conflict. The requested item isn't unique.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
error	Error message. Data type: String

links	All links and sys_ids associated with the response.
	
	Data type: Object
	`"links": {`
	`  "progress": {Object}`
	`}`

links.progress	Describes the progress link information.
	
	Data type: Object
	`"progress": {`
	`  "id": "String",`
	`  "url": "String"`
	`}`

links.progress.id	Unique identifier to use to obtain the progress details for the operation. Use this value when calling the endpoint `/sn_cicd/progress/{progress_id}`. Data type: String
links.progress.url	URL to use to retrieve the progress details. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
percent_complete	Percentage of the request that is complete. Data type: Number
status	Numeric execution state. Used with *status_label*. Values: • 0 (Pending) • 1 (Running) • 2 (Successful) • 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with *status*. Values: • Canceled • Failed • Pending • Running • Successful Data type: String
status_message	Description of the current state. Data type: String

Example: cURL request

The following code example shows how to call the *apply_stash* endpoint for *stash_id* fc2224e4e0429110f8771827f8fd3634.

```
curl
 "https://instance.servicenow.com/api/sn_cicd/sc/apply_stash/fc2
224e4e0429110f8771827f8fd3634"\
--request POST \
--header "Accept:application/json" \
--header "Content_Type:application/json" \
--user 'username':'password'
```

The stash is pending, so not yet applied.

```
{
  "result": {
    "links": {
```

```
      "progress": {
        "id": "6b04ec28e0429110f8771827f8fd36a4",
        "url":
 "https://instance.servicenow.com/api/sn_cicd/progress/6b04ec28e
0429110f8771827f8fd36a4"
      }
    },
    "status": "0",
    "status_label": "Pending",
    "status_message": "",
    "status_detail": "",
    "error": "",
    "percent_complete": 0
  }
}
```

CI/CD - POST /sn_cicd/sc/import

Imports an application using the specified repository URL and branch name.

Use this endpoint to import an application from source control in the calling instance so you can then use Continuous Integration and Continuous Delivery (CICD) endpoints, such as /sn_cicd/sc/apply_changes, to deploy the application to upper environments.

Note: Before using this endpoint, a Git repository that has been setup by another instance using **Link to source control** must be available.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/sc/import`

Default URL: `/api/sn_cicd/sc/import`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
auto_upgrade_base_app	Only applicable when the application being imported is an app-customization and the latest commit on the Git repository is built on a version that is later than that of the base application that is currently installed on the local instance. Flag that indicates whether the system should auto-upgrade the base application to a later version. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• true: Auto-upgrade the base application. • false: Do not auto-upgrade the base application. Data type: Boolean Default: True
branch_name	Required. Name of the branch in the source control system to import the application from. Data type: String
credential_sys_id	Sys_id of the credentials that have access to the Git repository. Data type: String Default: Sys_id set in the system properties glide.source_control.default_basic_auth_credential_sys_id or glide.source_control.default_ssh_private_key_credential_sys_id, depending on whether the *repo_url* parameter is an https or ssh repository. By default, this property is empty.
mid_server_sys_id	Sys_id of the MID server to use for source control operations for this application. Data type: String Default: Empty string/NULL
repo_url	Required. URL of the Git repository to import the application from. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*.

Name	Description
	<pre> "url": "String" }</pre>
links.progress.id	Unique identifier to use to obtain the progress details for the operation. Use this value when calling the endpoint `/sn_cicd/progress/{progress_id}`. Data type: String
links.progress.url	URL to use to retrieve the progress details. Data type: String
percent_complete	Percentage of the request that is complete. Data type: Number
status	Numeric execution state. Used with `status_label`. Values: • 0 (Pending) • 1 (Running) • 2 (Successful) • 3 (Failed) • 4 (Canceled) Data type: String
status_detail	Additional information about the current state. Data type: String
status_label	Execution state description. Used with `status`. Values: • Canceled • Failed • Pending • Running • Successful Data type: String
status_message	Description of the current state. Data type: String

Example: cURL request

The following example shows how to import the application located at `https://code.devsnc.com/some-user/ncRegrApp1.git` in the `main_branch`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "https://instance.servicenow.com/api/sn_cicd/sc/import?repo_url
=https%3A%2F
%2Fcode.devsnc.com%2Fsome-user%2FncRegrApp1.git&branch_name=main
_branch&credential_sys_id=af9b6d6180feb010f8779c30d4dd6b6b" \
--request POST \
--header "Accept:application/json" \
--user 'admin':'admin'
```

Returns the progress of the import.

```
{
  "result": {
    "links": {
      "progress": {
        "id": "a18c06ea64f23010f87769cd983d4574",
        "url":
 "https://instance.servicenow.com/api/sn_cicd/progress/a18c06ea6
4f23010f87769cd983d4574"
      }
    },
    "status": "0",
    "status_label": "Pending",
    "status_message": "",
    "status_detail": "",
    "error": "",
    "percent_complete": 0
  }
}
```

CI/CD - POST /sn_cicd/testsuite/run

Starts a specified automated test suite. The test suite runs on the instance from which the endpoint was called.

Note: If the suite you are running contains UI tests, you must have either a scheduled Client Test Runner open, or be able to configure headless Test Runner execution. To learn more see Headless browser for Automated Test Framework.

URL format

Versioned URL: `/api/sn_cicd/{api_version}/testsuite/run`

Default URL: `/api/sn_cicd/testsuite/run`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
browser_name	Name of the browser to use to run the client test. This value must match what is specified in the scheduled client test runner. For additional information on scheduled client test runners, see Scheduled Client Test Runners. Data type: String Valid values: (must be all lower-case) • any • chrome • firefox • edge • ie • safari Default: any
browser_version	Starting value of the version of the browser specified in *browser_name* to use to run the test. For example, if you enter "9", that would enable all 9.x.x.x versions. This value must match what is specified in the scheduled client test runner. Data type: String
is_performance_run	Optional. Flag that indicates whether to execute the test suite as a performance test (Performance Run). Valid values: • true: Runs the test suite as a performance test. • false: Runs the test suite with the default behavior of a standard, functional test of the instance. Default: false
os_name	Name of the operating system under which to run the test suite. This value must match what is specified in the scheduled client test runner. Data type: String
os_version	Starting value of the version of the operating system under which to run the test suite. For example, if you enter "8", that would enable all 8.x.x.x versions. This value must match what is specified in the scheduled client test runner. Data type: String
run_in_cloud	Optional. Flag that indicates whether to execute the test suite in Cloud Runner or manually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Valid values: • true: Runs the test suite using the Cloud Runner. • false: Runs the test suite using the manual test runner. Default: false
test_suite_sys_id	Required if *test_suite_name* is not specified. The sys_id of the test suite to run. This value is located in the Test [sys_atf_test_suite] table. Data type: String
test_suite_name	Required if *test_suite_sys_id* is not specified. The name of the test suite to run. This value is located in the Test [sys_atf_test_suite] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user credentials are incorrect.
403	Forbidden. The user isn't an admin or doesn't have the sn_cicd.sys_ci_automation role.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is inactive.
409	Conflict. The requested item isn't unique.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
error	Error message. Data type: String

links	All links and sys_ids associated with the response.
	
	Data type: Object
	`"links": {`
	`  "progress": {Object}`
	`}`

links.progress	Describes the progress link information.
	
	Data type: Object
	`"progress": {`
	`  "id": "String",`
	`  "url": "String"`
	`}`

links.progress.id	Unique identifier to use to obtain the progress details for the operation. Use this value when calling the endpoint `/sn_cicd/progress/{progress_id}`. Data type: String
links.progress.url	URL to use to retrieve the progress details. Data type: String
links.results	Results information. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.

  }
}
```

CSM Attachment API

The *CSM Attachment* API provides endpoints that allow both internal and external users to upload, download, and remove attachments associated with a table and to retrieve attachment metadata.

Only attachments associated with tables specified in the *glide.rest.attachment_csm_api.allowed_tables* system property are valid in any of the associated endpoint calls. Any logged in user, both snc_internal and snc_external, can access this API. Guests and public users do not have access rights.

This API respects any system limitations on uploaded files, such as maximum file size and allowed attachment types. You can control these settings using the *com.glide.attachment.max_size* and *glide.attachment.extensions* properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, this API has a rate limit of 500 per hour for unauthenticated and snc_external users. For more information about rate limiting, see Inbound REST API rate limiting.

CSM Attachment - DELETE /now/attachment_csm/{sys_id}

Deletes the specified attachment.

URL format

Versioned URL: `/api/now/{api_version}/attachment_csm/{sys_id}`

Default URL: `/api/now/v1/attachment_csm/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the attachment to delete. This attachment must belong to one of the tables listed within the *`glide.rest.attachment_csm_api.allowed_tables`* property in the System Properties [sys_properties] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
204	Successful. Indicates the request completed successfully.
400	Bad Request. Indicates that the attachment from this table might not be accessible. Verify that the associated table is included in the *glide.rest.attachment_csm_api.allowed_tables* system property.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
None	

Example: Sample cURL request

```
curl
 "https://instance.servicenow.com/api/now/v1/attachment_csm/615e
a769c0a80166001cf5f2367302f5" \
--request DELETE \
--user 'username':'password'
```

```
None
```

CSM Attachment - GET /now/attachment_csm

Returns the metadata for multiple attachments.

Note: You can reference all sysparm query parameters using either their full name or their shortened name (without the *sysparm_* prefix). For example, for *sysparm_limit* you can also use *limit*.

URL format

Versioned URL: `/api/now/{api_version}/attachment_csm`

Default URL: `/api/now/v1/attachment_csm`

© 2026 ServiceNow, Inc. All rights reserved.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have acce record order so records you have access to return first. **Note:** Unusually large *`sysparm_limit`* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record ret functionality enables the retrieval of all records, regardless of the number of records, in small m For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply pa available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you records. Don't pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0
sysparm_query	Required. Encoded query to use to search for attachments. This parameter must at least contain `sysparm_query=table_name=<table>` where *<t* those tables specified in the *`glide.rest.attachment_csm_api.allowed_tables`* System Properties [sys_properties] table. For example: `sysparm_query=file_name=kb_` Syntax: `sysparm_query=<col_name><operator><value>`. • <col_name>: Name of the table column to filter against. • <operator>: Supports the following values: ○ =: Exactly matches <value>. ○ !=: Does not match <value>. ○ ^: Logically AND multiple query statements. ○ ^OR: Logically OR multiple query statements. ○ LIKE: <col_name> contains the specified string. Only works for <col_name> fields whose da

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. For example, use `image/jpeg` or `image/png` to accept JPEG or PNG image files exclusively. To allow all image types, specify `image/*`; to allow any file type, specify `*/*`. Default: */*

Response headers

Header	Description
X-Attachment-Metadata	Metadata about the returned file, such as size, name, and file type.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Indicates that the attachment from this table might not be accessible. Verify that the associated table is included in the *glide.rest.attachment_csm_api.allowed_tables* system property.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
	Contents of the attachment.

Example: Sample cURL request

```
curl
 "https://instance.servicenow.com/api/now/v1/attachment_csm/<att
achment_sys_id>/file" \

```

CSM Attachment - POST /now/attachment_csm/file

Uploads a specified binary file as an attachment to a specified record.

The endpoint also returns the metadata for the saved attachment.

URL format

Versioned URL: `/api/now/{api_version}/attachment_csm/file`

Default URL: `/api/now/v1/attachment_csm/file`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
encryption_context	Sys_id of an encryption context record. Specify this parameter to allow only users with the specified encryption context to access the attachment. For additional information on encryption context records, see Column Level Encryption. Data type: String Default: Attached file is not encrypted with any encryption context.
file_name	Required. Name to give the attachment. **Note:** The file to attach must be specified after the last parameter in the passed-in query parameter list. Data type: String
table_name	Required. Name of the table to which you want to attach the file. This table must be listed within the *glide.rest.attachment_csm_api.allowed_tables* system property in the System Properties [sys_properties] table. Data type: String
table_sys_id	Required. Sys_id of the record on the specified table to which you want to attach the file. Data type: String

Request body parameters (XML or JSON)

Name	Description
<String>	Path to the binary file to attach to the specified record. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
Content-Type	Required. Data format of the file to post. For example, use `image/jpeg` or `image/png` to post JPEG or PNG image files exclusively. To allow all image types, specify `image/*`; to allow any file type, specify `*/*`.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Indicates that the attachment from this table might not be accessible. Verify that the associated table is included in the *glide.rest.attachment_csm_api.allowed_tables* system property.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. Indicates the record specified by the *table_name* and *table_sys_id* parameters does not exist or is not accessible by the current user.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
result	Metadata of the requested attachment. Data type: Object `"result": { "average_image_color": "String", "compressed": "String", "content_type": "String", "created_by_name": "String", "download_link": "String", "file_name": "String", "image_height": "String", "image_width": "String", "size_bytes": "String", "size_compressed": "String", "sys_created_by": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	"sys_created_on": "String", "sys_id": "String", "sys_mod_count": "String", "sys_tags": "String", "sys_updated_by": "String", "sys_updated_on": "String", "table_name": "String", "table_sys_id": "String", "updated_by_name": "String" }
result.average_image_color	If the attachment is an image, the sum of all colors. Data type: String Unit: RGB or number of pixels.
result.compressed	Flag that indicates whether the attachment file has been compressed. Valid values: • true: File has been compressed. • false: File has not been compressed. Data type: String
result.content_type	Content-type of the associated attachment file, such as image or jpeg or application/x-shockwave-flash. Data type: String
result.created_by_name	Full name of entity that originally created the attachment file. Data type: String
result.download_link	Download URL of the attachment on the ServiceNow instance. Data type: String
result.file_name	File name of the attachment. Data type: String
result.image_height	If an image file, the height of the image. Data type: String Unit: Pixels
result.image_width	If an image file, the width of the image. Data type: String Unit: Pixels
result.size_bytes	Size of the attachment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String Unit: Bytes
result.size_compressed	Size of the compressed attachment file. If the file is not compressed, empty. Data type: String Unit: Bytes
result.sys_created_by	Entity that originally created the attachment file. Data type: String
result.sys_created_on	Date and time that the attachment file was initially saved to the instance. Data type: String
result.sys_id	Sys_id of the attachment file. Data type: String
result.sys_mod_count	Number of times the attachment file has been modified (uploaded to the instance). Data type: String
result.sys_tags	Any system tags associated with the attachment file. Data type: String
result.sys_updated_by	Entity that last updated the attachment file. Data type: String
result.sys_updated_on	Date and time that the attachment file was last updated. Data type: String
result.table_name	Name of the table to which the attachment is associated. Data type: String
result.table_sys_id	Sys_id of the table associated with the attachment. Data type: String
result.updated_by_name	Full name of entity that last updated the attachment file. Data type: String

Example: Sample cURL request

Shows how to upload the .jpg file `Issue_screenshot.jpg` in the `/images` directory.

    "created_by_name": "John Smith",
    "updated_by_name": "John Smith"
  }
}
```

CSM Attachment - POST /now/attachment_csm/upload

Uploads a multipart file attachment.

The multipart POST method does not accept any parameters. You must specify the table name and record sys_id values within the form body. See the cURL example below for a sample of a multipart/form-data request.

Note: When using multipart POST, ensure the file content is contained in the final part of the message only. Earlier parts should contain only metadata such as table name and record sys_id.

When sending a multipart/form-data POST request to upload a file attachment, include attachment data in the form body, not in the URL parameters or request body.

Mandatory values

Value	Description
Content-Type	Content-Type of the file, included in the message body for multipart uploads.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mandatory values (continued)

Value	Description
	Note: You must define the Content-Type within the file portion of the POST message, not within the form data. Data type: String
table_name	Name of the table to which you want to attach the file. This table must be specified in the *glide.rest.attachment_csm_api.allowed_tables* property in the System Properties [sys_properties] table. Data type: String
table_sys_id	Sys_id of the record on the specified table to which you want to attach the file. Data type: String

URL format

Versioned URL: `/api/now/{api_version}/attachment_csm/upload`

Default URL: `/api/now/v1/attachment_csm/upload`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Content-Type	Data format of the request body. Set this value to `multipart/form-data` when using the multipart POST method.

Response headers

Header	Description
Location	URL of the new attachment in the ServiceNow platform instance.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. Indicates the request completed successfully.
400	Bad Request. Indicates that the attachment from this table might not be accessible. Verify that the associated table is included in the *glide.rest.attachment_csm_api.allowed_tables* system property.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item was not found.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Element	Description
result	Metadata of the requested attachment. Data type: Object `"result": { "average_image_color": "String", "compressed": "String", "content_type": "String", "created_by_name": "String", "download_link": "String", "file_name": "String", "image_height": "String", "image_width": "String", "size_bytes": "String", "size_compressed": "String", "sys_created_by": "String", "sys_created_on": "String", "sys_id": "String", "sys_mod_count": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	"sys_tags": "String", "sys_updated_by": "String", "sys_updated_on": "String", "table_name": "String", "table_sys_id": "String", "updated_by_name": "String" }
result.average_image_color	If the attachment is an image, the sum of all colors. Data type: String Unit: RGB or number of pixels.
result.compressed	Flag that indicates whether the attachment file has been compressed. Valid values: • true: File has been compressed. • false: File has not been compressed. Data type: String
result.content_type	Content-type of the associated attachment file, such as image or jpeg or application/x-shockwave-flash. Data type: String
result.created_by_name	Full name of entity that originally created the attachment file. Data type: String
result.download_link	Download URL of the attachment on the ServiceNow instance. Data type: String
result.file_name	File name of the attachment. Data type: String
result.image_height	If an image file, the height of the image. Data type: String Unit: Pixels
result.image_width	If an image file, the width of the image. Data type: String Unit: Pixels
result.size_bytes	Size of the attachment. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Unit: Bytes
result.size_compressed	Size of the compressed attachment file. If the file is not compressed, empty. Data type: String Unit: Bytes
result.sys_created_by	Entity that originally created the attachment file. Data type: String
result.sys_created_on	Date and time that the attachment file was initially saved to the instance. Data type: String
result.sys_id	Sys_id of the attachment file. Data type: String
result.sys_mod_count	Number of times the attachment file has been modified (uploaded to the instance). Data type: String
result.sys_tags	Any system tags associated with the attachment file. Data type: String
result.sys_updated_by	Entity that last updated the attachment file. Data type: String
result.sys_updated_on	Date and time that the attachment file was last updated. Data type: String
result.table_name	Name of the table to which the attachment is associated. Data type: String
result.table_sys_id	Sys_id of the table associated with the attachment. Data type: String
result.updated_by_name	Full name of entity that last updated the attachment file. Data type: String

Example: Sample cURL request

```
curl
 "https://instance.service-now.com/api/now/v1/attachment_csm/upl
oad" \
--request POST \
--header "Accept:application/json" \

    "updated_by_name": "John Smith"
  }
}
```

CTI API

The *CTI* API provides endpoints that enable Computer Telephony Integration (CTI) providers to interact with the Cloud Call Center framework.

Using this API, integrators are able to:

- Invoke CTI operations using custom operation handlers within the Cloud Call Center framework.
- Pass events from a CCP provider to a ServiceNow instance.
- Render transcripts and recordings for a specified agent call.

This API runs in the *sn_cti_core* namespace. Before you are able to access this API, you must install the Cloud Call Center Core (sn_cti_core) application. For information on this installation, see Install Cloud Call Center applications.

For additional information on the Cloud Call Center, see Cloud Call Center.

CTI_API - GET /sn_cti_core/cti_api/call_analysis/{interaction_sys_id}

Renders transcripts and recordings for a specified agent call.

Components use this endpoint in Agent and Manager workspaces to render associated agent call transcripts and recordings. To access this endpoint, the user credentials that you pass in the call must have the workspace_user, interaction_agent, or admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This endpoint has a corresponding extension point, sn_cti_core.CTICallAnalysisExtractor, that is responsible for rendering the call data. The base system provides an implementation for Amazon Connect. If your implementation is different, you should customize this extension point before utilizing this endpoint. Also, the response parameters returned by this endpoint correspond to the implementation of this extension point. For additional information on implementing extension points, see Using extension points to extend application functionality and Extension points in Cloud Call Center.

URL format

Default URL: `/api/sn_cti_core/cti_api/call_analysis/{interaction_sys_id}`

Supported request parameters

Path parameters

Name	Description
interaction_sys_id	Sys_id of the agent call for which to render to transcript and recording. Located in the Interaction [interaction] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
Various	Depends on the implementation in the sn_cti_core.CTICallAnalysisExtractor extension point.

Response body parameters (JSON or XML)

Name	Description
Depends on the implementation in the sn_cti_core.CTICallAnalysisExtractor extension point.	

Example: cURL request

The following example requests the rendering of a specific agent call.

```
curl -X POST \

 https://instance.servicenow.com/api/sn_cti_core/cti_api/call_an
alysis/88f2d9b7dbd7101058f05214dc96192a \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password'
```

Rendered call data based on the processing specified in the sn_cti_core.CTICallAnalysisExtractor extension point.

```
{
  "result":{
    "status":"success",
    "recordingData":{
      "recordingUrls":[

 "https://instance.awsapps.com/connect/get-recording?format=wav&

  }
}
```

CTI_API - POST /sn_cti_core/cti_api/providers/{provider}/components/{component}/versions/{version}

Invokes Computer Telephony Integration (CTI) operations using a specified operation handlers within the Cloud Call Center framework.

Before calling this endpoint, you must create a provider configuration record and associated message transformers. This is typically done when the Cloud Call Center framework is initially implemented in your instance. For additional information, see Provider configuration in Cloud Call Center.

A message transformer is responsible for parsing the payload specified in the request body of this endpoint and setting the payload data on an associated CTIOperationRequest object. An operation handler is then responsible for getting the information from the CTIOperationRequest object and using the data to process the requested operation.

After the message transformer finishes parsing the passed in payload, the Cloud Call Center framework instantiates the specified operation handler. The operating handler uses the CTIOperationResponse CTIOperationResponse - Scoped, Global API GET methods to obtain the information that it needs from the associated CTIOperationRequest object to process the requested operation.

You define the operation handler to invoke, and its associated parameters, in the request body of this endpoint call. The specified operation handler must be defined in your instance within the Operation Handler [sn_cti_operation_handler] table. For additional information on creating operation handlers, see Configure a contact flow for an automated caller interaction.

The ServiceNow base system provides working operation handlers and message transformers that enable connection to Amazon Connect. When building contact flows within Amazon Connect, there are two integration points between Amazon services and a ServiceNow instance:

- Amazon Web Services (AWS) Lambda Proxy (Invoke AWS Lambda function)
- AWS Lex Bot (Get Customer Input)

You can find the available operation handlers and message transformers for these integration points in the Operation Handlers [sn_cti_operation_handler] and Provider Message Transformer [sn_cti_provider_msg_transormer] tables.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In addition, the user credentials that you pass in the call must have the sn_cti_core.service or admin role to access this endpoint.

For additional information on the Cloud Call Center, see Cloud Call Center.

URL format

Default URL: `/api/sn_cti_core/cti_api/providers/{provider}/components/{component}/versions/{version}`

Supported request parameters

Path parameters

Name	Description
component	Label of your provider component, such as sn_aws_connect_lambda_proxy_component or sn_aws_connect_lex_intent_processor_component. Located in the Component field of the Provider Component [sn_cti_provider_component] table. Data type: String
provider	Sys_id of your CTI provider record. Located in the Provider Component [sn_cti_provider_component] table. Data type: String
version	Version of the specified provider record. Located in the Version field of the Provider Component [sn_cti_provider_component] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
Depends on the operation handler being called and its specific implementation.	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

```

CTI_API - POST /sn_cti_core/cti_api/softphone/sources/{source}/actor/{actor}/events/{event}

Passes events from a Contact Control Panel (CCP) provider to a ServiceNow instance.

Typically you call this endpoint from your CCP UI page to perform various tasks (events), such as changing the presence state of an agent or changing the state of a record on call completion. To access this endpoint, the user credentials that you pass in the call must have the sn_openframe_user or admin role.

This endpoint has a corresponding extension point, sn_cti_core.SoftPhoneEventSink, that is responsible for determining the action that is actually performed by this endpoint call for each event. The base system provides an implementation for Amazon Connect events. If your implementation is different, you should customize this extension point before utilizing this endpoint. The request body and response formats of this endpoint correspond to the implementation of this extension point. For additional information on implementing extension points, see Using extension points to extend application functionality and Extension points in Cloud Call Center.

URL format

Default URL: `/api/sn_cti_core/cti_api/softphone/sources/{source}/actor/{actor}/events/{event}`

Supported request parameters

Path parameters

Name	Description
actor	Emitter of the event, such as agent or external_system. The specific values are determined by the implementer. Data type: String
event	Name of the event in the Computer Telephony Integration (CTI) vendor's system, such as Available or Offline. The specific values are determined by the implementer but must be a single word/phrase without spaces or special characters. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
sources	Identifier of the vendor's Softphone UI page, such as aws_ccp. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
Implementation specific. Determined by the implementation of the sn_cti_core.SoftPhoneEventSink extension point.	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

```

Customer Central API

The *Customer Central* API provides endpoints to access customer information and configuration details.

Use this API to obtain information records (cards) that were previously generated through the Customer Central interface.

You must have the admin or sn_esm_agent role to access this API. In addition, before this API is available in your instance you must activate the *com.sn_csm_customer_central* plugin.

For additional information, see Customer Central.

Customer Central - GET /cust_central/custinfo/{context}/{context_instance}/{target}

Returns customer information and configuration details for a specific customer context.

Customer context is determined by the customer content table that you specify, either the Consumer [csm_consumer] or Contact [customer_contact] table, and its associated target table. This information is located in the Customer Information Context [sn_customercentral_cust_info_config] table.

This endpoint returns all active records (cards) within the following Customer Central configuration tables for the specified customer context:

- List Configuration [sn_customercentral_list_config]
- Record Configuration [sn_customercentral_record_config]
- Report Configuration [sn_customercentral_report_config]
- Report Group Configuration [sn_customercentral_report_group_config]

You must define any additional configuration records that you need through the Customer Central interface. For details, see Configure customer central.

URL format

Versioned URL: `/api/sn_customercentral/{api_version}/cust_central/custinfo/{context}/{context_instance}/{target}`

Default URL: `/api/sn_customercentral/cust_central/custinfo/{context}/{context_instance}/{target}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String
context	Name of the customer context table to use. Valid values: • customer_contact • csm_consumer Data type: String
context_instance	Sys_id of the record in the table specified in the *context* parameter to return. Data type: String
target	Target table associated with the customer context table specified in the *context* parameter. The combination of the *context* parameter and *target* parameter define a unique customer information context. This information is located in the Customer Information Context [sn_customercentral_cust_info_config] table. Data type: String

Query parameters

Name	Description
before	Return all configuration records created before the specified date and time. Date type: String Format: YYYY-MM-DD or the format defined in the *glide.sys.date_format* system property Default: Return all configuration records created before current session time.
end	Last record to return. Use this value to paginate record retrieval or use with the *start* parameter to select a specific set of records to return. Data type: Number Default: Last record in file
start	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Do not pass a negative number. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. Ensure that the path parameters contain valid values.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Data Classification API

The *Data Classification* API provides endpoints to group data by type.

With the *Data Classification API*, you can:

- Assign data classifications to existing dictionary entries.
- Look up the data classifications for specific dictionary entries.
- Remove all data classifications associated with specific dictionary entries.
- Retrieve a list of all data classifications available in the current domain.

This API requires the Data Classification [com.glide.data_classification] plugin.

For more information, see Data Classification.

Data Classification - GET /data_classification/getAllDataClasses

Returns a list of all data classifications available in the current domain.

Requires the admin, data_classification_admin, or data_classification_auditor role.

URL format

Default URL: `/api/now/data_classification/getAllDataClasses`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters (JSON or XML)

Name	Description
result	Result of the request. Returns the sys_id and name for each available data classification. If there are no data classifications, it returns an empty array. Data classifications can be organized into parent-child relationships. If there are parent data classifications, they are identified in the result. Data type: Array `"result": [ { "parent": {Object}, "sys_id": "String", "name": "String" } ]`
result.parent	Entry for a parent data classification. Data type: Object `"parent": { "sys_id": "String", "name": "String" }`
result.parent.sys_id	Sys_id of the parent data classification from the Data Classification [data_classification] table. Data type: String
result.parent.name	Name of the parent data classification. Data type: String
result.sys_id	Sys_id of the data classification from the Data Classification [data_classification] table. Data type: String
result.name	Name of the data classification. Data type: String

Example: cURL request

Retrieves a list of all the available data classifications.

    }
  ]
}
```

Data Classification - POST /data_classification/classify

Assigns pre-defined or user-defined data classifications to existing dictionary entries.

Requires the admin or data_classification_admin role.

URL format

Default URL: `/api/now/data_classification/classify`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
dictionary_entries	Required. The sys_ids of the records you want to classify. The sys_ids are from the Dictionary [sys_dictionary] table. Entered as a comma-separated list enclosed in a string. Data type: String
data_classes	Required. The sys_ids of the data classifications you want to assign. The sys_ids are from the Data Classification [data_classification] table. Entered as a comma-separated list enclosed in a string. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Message describing the result of the operation. Data type: String

Example: cURL request

Assigns a data classification to a dictionary entry.

```
curl
 "https://instance.servicenow.com/api/now/data_classification/cl
assify" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"dictionary_entries\":

    \"data_classes\": \"40edb1f51bbcec50b92a10a61a4bcb8a\"
}" \
--user 'username':'password'
```

```
{
  "result": "Successfully stored the data classification
 configurations"
}
```

Data Classification - POST /data_classification/clear

Removes all data classifications for the specified dictionary entries.

Requires the admin or data_classification_admin role.

URL format

Default URL: `/api/now/data_classification/clear`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Response body parameters (JSON or XML)

Name	Description
result	Message describing the result of the operation. Data type: String

Example: cURL request

Clears the data classifications for a dictionary entry.

```
curl
 "https://instance.servicenow.com/api/now/data_classification/cl
ear" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"dictionary_entries\": \"445de0a6dba30300efc57416bf9619b0\"
}" \
--user 'username':'password'
```

```
{
  "result": "Classifications removed for the specified
 dictionary entries"
}
```

Data Classification - POST /data_classification/getClassification

Retrieves all data classifications for the specified dictionary entries.

Requires the admin, data_classification_admin, or data_classification_auditor role.

URL format

Default URL: `/api/now/data_classification/getClassification`

Supported request parameters

Path parameters

dictionary_entries	Required. The sys_ids of the records you want to retrieve classifications for. The sys_ids are from the Dictionary [sys_dictionary] table. Entered as a comma-separated list enclosed in a string. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Result of the request. Returns a JSON object containing each dictionary entry's sys_id with an array of its associated data classifications. If there are no associated data classifications, it returns a message describing the result of the operation. Data classifications can be organized into parent-child relationships. If there are parent data classifications, they are identified in the result. Data type: Object `"result": { <sys_dictionary_sys_id>: [ { "parent": {Object}, "sys_id": "String", "name": "String" } ] }`
result.name	Name of the data classification. Data type: String
result.parent	Entry for a parent data classification. Data type: Object `"parent": { "sys_id": "String", "name": "String" }`
result.parent.name	Name of the parent data classification. Data type: String
result.parent.sys_id	Sys_id of the parent data classification from the Data Classification [data_classification] table. Data type: String
result.sys_id	Sys_id of the data classification from the Data Classification [data_classification] table. Data type: String

Example: cURL request

Get the data classifications associated with a specific dictionary entry.

```
curl
 "https://instance.servicenow.com/api/now/data_classification/ge
tClassification" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"dictionary_entries\": \"445de0a6dba30300efc57416bf9619b0\"
}" \
--user 'username':'password'
```

```
{
  "result": {
    "445de0a6dba30300efc57416bf9619b0": [
      {
        "parent": {
          "sys_id": "a9670fc773fc1010ae8dd21efaf6a735",
          "name": "Confidential"
        },
        "sys_id": "348107b951d71010f877f3f178e7dd0d",
        "name": "Personally identifiable information"
      }
    ]
  }
}
```

DevOps API

The *DevOps* API provides endpoints that enable the interaction with external DevOps tools.

This REST API enables integrators to:

- Retrieve the available DevOps tools associated with an instance.
- Retrieve the schema object for a code resource, plan, or orchestration resource.
- Check if an orchestration task is under change control and check its change control status.
- Create callbacks to associate with task executions under change control.
- Send various event payloads, which are transformed into normalized objects and stored as code, orchestration, and plan objects.
- Search a commit, branch, or repository using encoded queries and specific search/sort criteria.
- Register artifact versions and packages along with their associated pipeline execution and commits.
- Create and manage onboarding application and tool events.

For additional information, see DevOps Config.

Starting with v2, this API supports token-based authentication. Tokens can be acquired by clicking the **Copy token** button on the tool record, located in the Tool [sn_devops_tool] table. The token can then be used in an authorization header in the format `Authorization: sn_devops.DevOpsToken <tool_sys_id>:<tool_token>`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If Basic Auth details (user name and password) are provided in addition to an authorization header with token, Basic Auth takes precedence.

If the *devops.system* user is not available in your instance, use the **Switch to this user after token based authentication is successful** property. This property enables setting any user that has the sn_devops.integration role, which is needed to complete the token authentication. For information, see DevOps Change Velocity properties.

DevOps - GET /devops/code/schema

Returns the schema object for a specified code resource: commit, repository, or branch.

Once you have the required schema object, use it to create the request body for your corresponding POST call; *POST /code/commit*, *POST /code/repository*, or *POST /code/branch*.

Note: This endpoint only returns the request body elements that are required.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/code/schema`

Default URL: `/api/sn_devops/devops/code/schema`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
resource	Required. Type of resource schema to return. Valid values (not case-sensitive): • commit • repository • branch Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
401	Invalid or missing authentication.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

branch	Description of the branch in which the code commit was made.
	
	Data type: Object
	
	`"branch": {`
	`  "name": "String",`
	`  "path": "String"`
	`}`

branch.name	Name of the branch in which the code commit was made. Data type: String
branch.path	Relative path of the branch. Data type: String
commits	Description of the commits.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array `"commits": [ { "committedDate": "String", "committer": Object, "details": Array, "id": "String", "url": "String" } ]`
commits.committedDate	Date/time on which the code was committed in source DevOps tool. Data type: String Format: ISO 8601 with time zone offset For example: 1970-01-01T08:15:30-05:00
commits.committer	Description of the person/entity that requested the commit. Data type: Object `"committer": { "email": "String" }`
commits.committer.email	Email address of the person that requested the commit. Data type: String
commits.details	Details of the commit. **Note:** Including details in a commit is not mandatory. This endpoint returns an empty array for details if they are not included in the commit. Data type: Array `"details": [ { "action": "String", "additions": Number, "changes": Number, "deletions": Number, "file": "String", "totalChanges": Number } ]`
commits.details.action	Action that was performed on the file. Data type: String
commits.details.additions	Total number of additions in the file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Number
commits.details.changes	Total number of changes that were made. Data type: Number
commits.details.deletions	Total number of deletions in the file. Data type: Number
commits.details.file	Path of the file that was modified relative to the branch. Data type: String
commits.details.totalChanges	Total number of additions and deletions. Data type: Number
commits.id	Source platform identifier or the commit SHA. Data type: String
commits.url	URL of the commit, such as "https://github.com/mycompany/mobileplatform/commit/3fa85f6457174562b3fc2c963f66afa6". Data type: String
name	Name of the branch or repository, such as "Master" or "Platform-Mobile". Data type: String
path	Relative path of the branch. Data type: String

repository	Description of the repository in which the commit was made.
	
	Data type: Object
	
	`"repository": {`
	`  "name": "String",`
	`  "url": "String"`
	`}`

repository.name	Name of the repository. Data type: String
repository.url	URL of the repository in the source DevOps tool. Data type: String
url	URL of the repository, such as "https://github.com/mycompany/mobileplatform". Data type: String

Example: Sample cURL request for resource=branch

```
curl
 "https://instance.servicenow.com/api/sn_devops/v1/devops/code/s
chema?resource=branch" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
   "result": {
      "name": "Master",
      "path": "refs/heads/master",
      "repository": {
         "name": "Platform-Mobile",
         "url": "https://github.com/mycompany/mobileplatform"
      }
   }
}
```

Example: Sample cURL request for resource=commit

```
curl
 "https://instance.servicenow.com/api/sn_devops/v1/devops/code/s
chema?resource=commit" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
   "result": {
      "repository": {
         "name": "Platform-Mobile",
         "url": "https://github.com/mycompany/mobileplatform"
      },
      "branch": {
         "name": "refs/heads/master"
      },
      "commits": [
         {
            "committer": {
               "email": "name@email.com"
            },
            "id": "3fa85f64-5717-4562-b3fc-2c963f66afa6",
            "url":
 "https://github.com/mycompany/mobileplatform/commit/3fa85f64571
74562b3fc2c963f66afa6",
            "committedDate": "2022-01-01T08:15:30-05:00",
            "details": [
               {
                  "action": "edit",
                  "changes": "",
                  "file": "/azure-pipelines.yml",
                  "additions": 1,
                  "deletions": 0,
                  "totalChanges": 1
               }
```

```
            ]
         }
      ]
   }
}
```

Example: Sample cURL request for resource=repository

```
curl
 "https://instance.servicenow.com/api/sn_devops/v1/devops/code/s
chema?resource=repository" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
    "result": {
        "name": "Platform-Mobile",
        "url": "https://github.com/mycompany/mobileplatform"
    }
}
```

DevOps - GET /devops/onboarding/status

Returns the current status of the specified onboarding event which is processed or being processed asynchronously by the DevOps service.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/onboarding/status`

Default URL: `/api/sn_devops/devops/onboarding/status`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
id	Unique identifier of the onboarding event whose status to return. This value is provided in the return results of the endpoint that invoked the event request, such as */devops/onboarding/app* or */devops/onboarding/tool*. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
202	Pending - The onboarding request has been created and the DevOps service is processing the request.
207	Partial Success - The onboarding request has been created and the DevOps service will process the request.
400	Failed - The onboarding event failed.
404	Failed - The endpoint failed to find any request matching the specified event ID.

Response body parameters

Name	Description

result	Results of the onboarding request.
	
	Data type: Object
	
	`"result": {`
	`  "code": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	<pre>"importRequestsSysIds
	"[Array],
	"messageDetails": {Ob
	"onboardingRequestID"
	"String",
	"status": "String"
	}</pre>

result.code	HTTP status code. Data type: String
result.importRequestsSysIds	List of import requests that have be a part on the onboarding request. Data type: Array of Strings

result.messageDetails	Details about the onboarding event
	
	Data type: Object
	<pre>"messageDetails": {
	"apps": [Array],
	"pipelines": [Array],
	"plans": [Array],
	"repositories": [Arra
	"status": "String",
	"toolResponse": [Arra
	}</pre>

result.messageDetails.apps	Array of objects that define the app
	within the associated ServiceNow i
	
	Data type: Array
	<pre>"apps": [{
	"appId": "String",
	"message": "String",
	"name": "String",
	"status": "String",
	}]</pre>

result.messageDetails.apps.appId	Sys_id of the application that was g when the application was onboarde the Apps [sn_devops_app] table. Data type: String
result.messageDetails.apps.message	Message that describes the status application onboarding. Data type: String
result.messageDetails.apps.name	Name of the application being onbo Data type: String
result.messageDetails.apps.status	Current status of the application on

Name	Description

	<pre>"configureStatus": {
	  "message": "String",
	  "status": "String",
	}</pre>

result.messageDetails.repositories.configureStatus.message	Message that describes the curren configuration status. Data type: String
result.messageDetails.repositories.configureStatus.status	Status of the webhook configuratio Data type: String
result.messageDetails.repositories.message	Message that describes the curren association status. Data type: String
result.messageDetails.repositories.name	Name of the repository. Data type: String
result.messageDetails.repositories.status	Status of the repository association Data type: String
result.messageDetails.status	Status of the onboarding request. Possible values: • Failed • Partial Success • Success Data type: String

result.messageDetails.toolResponse	Array of objects that define the tool within the associated ServiceNow i
	
	Data type: Array
	<pre>"toolResponse": [{
	  "configureStatus": {O
	  "connectStatus": {Obj
	  "createStatus": {Obje
	  "discoveryStatus": {O
	  "name": "String",
	  "status": "String",
	  "type": "String"
	}]</pre>

result.messageDetails.toolResponse.configureStatus	Describes the configuration status In case of success, it returns the *st* *message*. In case of error, it return and *error*.

Name	Description

	<pre>"status": "String"
	}</pre>

result.messageDetails.toolResponse.createStatus.error	Errors detected during tool creation Data type: String
result.messageDetails.toolResponse.createStatus.message	Message that describes the succes the tool creation. Data type: String
result.messageDetails.toolResponse.createStatus.status	Status of the tool creation. Data type: String

result.messageDetails.toolResponse.discoveryStatus	Describes the discovery status of th case of success, it returns the *sta message*. In case of error, it return and *error*.
	
	Data type: Object
	<pre>"discoveryStatus": {
	"error": "String",
	"imports: [Array],
	"message": "String",
	"status": "String"
	}</pre>

result.messageDetails.toolResponse.discoveryStatus.error	Errors detected during tool discove Data type: String

result.messageDetails.toolResponse.discoveryStatus.imports	Array of objects that describe each discovered.
	
	Data type: Array
	<pre>"imports": [{
	"details": "String",
	"id": "String",
	"status": "String"
	}]</pre>

result.messageDetails.toolResponse.discoveryStatus.imports.details	Details that describe the import per Data type: String
result.messageDetails.toolResponse.discoveryStatus.imports.id	Sys_id of the import request. Locate sn_devops_m2m_inbound_event_i table. Data type: String
result.messageDetails.toolResponse.discoveryStatus.imports.status	Status of the import.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.messageDetails.toolResponse.discoveryStatus.message	Message that describes the status discovery. Data type: String
result.messageDetails.toolResponse.discoveryStatus.status	Status of the tool discovery. Data type: String
result.messageDetails.toolResponse.name	Name of the tool being onboarded. Data type: String
result.messageDetails.toolResponse.status	Status of the tool onboarding. Data type: String
result.messageDetails.toolResponse.type	Type of tool, such as Jira or Jenkins Data type: String
result.onboardingRequestID	Unique identifier of the onboarding Use this value when calling the */de onboarding/status* endpoint status of the associated tool onboa Data type: String
result.status	Status of the onboarding request. Possible values: • Failed • Partial Success • Success Data type: String

Example: cURL request

The following example shows the status request of a tool onboarding.

```
curl -X GET
 "https://servicenow-instance/api/sn_devops/v1/devops/onboardi
ng/status?id=IBE0001603" \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
```

```
{
    "result": {
        "code": "207",
        "onboardingRequestID": "IBE0001603",
```

DevOps - GET /devops/orchestration/changeControl

Checks if the orchestration task is under change control.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/orchestration/changeControl`

Default URL: `/api/sn_devops/devops/orchestration/changeControl`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
orchestrationTaskName	Name of the orchestration task to check. Data type: String
testConnection	Flag that indicates whether to test the end-to-end connection between the instance and the DevOps tool. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• true: Test the end-to-end connection. • false: Do not test the end-to-end connection. Data type: Boolean Default: false
toolId	Required. Sys_id of the orchestration tool. Located in the Orchestration Tool [sn_devops_orchestration_tool] table. Data type: String
toolType	Type of tool. Valid values: jenkins Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Authorization	Starting with v2, this API supports token-based authentication. Tokens can be acquired by clicking the **Copy token** button on the tool record, located in the Tool [sn_devops_tool] table. The token can then be used in an authorization header in the format `Authorization: sn_devops.DevOpsToken <tool_sys_id>:<tool_token>`.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Note: If Basic Auth details (user name and password) are provided in addition to an authorization header with token, Basic Auth takes precedence. If the *devops.system* user is not available in your instance, use the **Switch to this user after token based authentication is successful** property. This property enables setting any user that has the sn_devops.integration role, which is needed to complete the token authentication. For information, see DevOps Change Velocity properties.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Invalid or missing authentication.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
changeControl	Flag that indicates whether the orchestration task is under change control. Possible values: • true: Under change control. • false: Not under change control Data type: Boolean

Example: Under change control and using API v2

```
curl -X GET
 "https://instance.servicenow.com/api/sn_devops/v2/devops/orches
tration/changeControl?toolId=1c219f7e8708f1508ca933383cbb3543&or
chestrationTaskName=Platform-Analytics-UAT-Deployment&orchestrat
```

```
ionTaskURL=https%253A%252F%252Fjenkins.mycompany.com%253A8080%25
2Fjob%252FMobile-Platform-deploy%252F&toolType=jenkins"
-H "accept: application/json"\
-H "Authorization: sn_devops.DevOpsToken
 1c219f7e8708f1508ca933383cbb3543:FtN13dfDuahYEtdfDvhHorh0QPp9na
3u"
```

Response body.

```
{
"result": {
  "changeControl": true,
  "status": "Success"
  }
}
```

Example: Not under change control and using API v1

```
curl -X GET
 "https://instance.servicenow.com/api/sn_devops/v1/devops/orches
tration/changeControl?toolId=f0ca45679323008b52f3b457415ae6&orch
estrationTaskName=Platform-Analytics-UAT-Deployment&orchestratio
nTaskURL=https%253A%252F%252Fjenkins.mycompany.com%253A8080%252F
job%252FMobile-Platform-deploy%252F&toolType=jenkins"
-H "accept: application/json"\
-u "username":"password"
```

Response body.

```
{
    "result": {
        "changeControl": false
    }
}
```

DevOps - GET /devops/orchestration/changeInfo

Retrieves change request details for a specified orchestration pipeline execution.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/orchestration/changeInfo`

Default URL: `/api/sn_devops/devops/orchestration/changeInfo`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
branchName	Name of the branch associated with the orchestration task. **Note:** You should provide this parameter when referencing multi-branch pipelines or the response may include incorrect change details. Data type: String
buildNumber	Required. Pipeline build number within the orchestration tool. Data type: String
pipelineName	Optional for Jenkins Freestyle or Maven projects, required for all others. Orchestration pipeline name. Data type: String
projectName	Required for Jenkins Freestyle or Maven projects, optional for all others. Orchestration tool project name. Data type: String
stageName	Optional for Jenkins Freestyle or Maven projects, required for all others. Orchestration stage name. Data type: String Maximum length: 160
toolId	Required. Sys_id of the orchestration tool. Located in the Orchestration Tool [sn_devops_orchestration_tool] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
changeFound	Flag that indicates whether the change request was located. Possible values: • true: Change request was found. • false: Change request was not found. Data type: Boolean
number	Change request number. Data type: String
phase	Current phase.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
phase_state	State of the current phase. Data type: String
priority	Priority of the change request. Priority is based on the impact and urgency of the request. It identifies how quickly the service desk should address the request. Possible values: • 1: Critical • 2: High • 3: Moderate • 4: Low Data type: String
risk	Level of risk for the change. Possible values: • Low • High • Moderate Data type: String
state	State of the change request. Possible values: • Assess • Authorize • Canceled • Closed • Implement • New • Review • Scheduled Data type: String Default: New
sys_id	Sys_id of the change request. Data type: String
type	Type of change request.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Possible values: • Emergency • Normal • Standard Data type: String
url	URL of the change request within the associated ServiceNow instance. Data type: String
changeAssignmentGroup	Assignment group of the change request. Data type: String
changeApprovers	List of approvers with whom the change is pending for approval. Data type: String
plannedStartDate	Planned start date and time of the change. Data type: String
plannedEndDate	Planned end date and time of the change. Data type: String

Example: cURL request

```
curl -X GET
 "https://instance.servicenow.com/api/sn_devops/v1/devops/orches

}
```

DevOps - GET /devops/orchestration/schema

Returns the schema object for a specified orchestration resource.

Once you have the required schema object, use it to create the request body for your corresponding POST call; `/orchestration/orchestrationTask` or `/orchestration/taskExecution`.

Note: This endpoint only returns the request body elements that are required.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/orchestration/schema`

Default URL: `/api/sn_devops/devops/orchestration/schema`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
resource	Type of resource schema to return. Valid values (not case-sensitive): • build_details • callback • orchestration_task • task_execution Data type: String

Request body parameters

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
401	Invalid or missing authentication.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
callbackURL	URL of the callback. Data type: String
endDateTime	Date/time that the task execution ended. Data type: String
name	Name of the orchestration task. Data type: String
number	Task execution number. Same as an incident number. Data type: String
orchestrationTaskDetails	Description of the orchestration task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object `"orchestrationTaskDetails": { "message": "String", "name": "String", "triggerType": "String", "url": "String" }`
orchestrationTaskDetails.message	Free-form text message. Data type: String
orchestrationTaskDetails.name	Name of the orchestration task. Data type: String
orchestrationTaskDetails.triggerType	The way the orchestration task was started. Data type: String
orchestrationTaskDetails.url	URL of the associated orchestration tool's orchestration task. Data type: String
orchestrationTaskURL	URL of the orchestration task. Data type: String
result	Execution result of the task execution. Valid values: • Failed • Success Data type: String
startDateTime	Date/time that the task execution started. Data type: String
taskExecutionURL	URL of the task to execute. Data type: String
triggerType	The way the orchestration task was started. Valid values: • scm: Git/scm tool code commit triggered the job. • upstream: Upstream job triggered this job. • user: User manually started the job. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
url	URL of the associated orchestration tool's orchestration task. Data type: String

Example: Sample cURL request with resource=task_execution

```
curl -X GET \
'https://instance.servicenow.com/api/sn_devops/v1/devops/orchest
ration/schema?resource=task_execution' \
-H 'Accept: application/json'\
-u 'username':'password'
```

```
{
"result": {
  "number": 40,
  "url":
 "https://jenkins.mycompany.com:8080/job/Mobile-Platform-CI/40
/",
  "startDateTime": "1970-01-01T08:15:30-05:00",
  "endDateTime": "1970-01-01T08:25:30-05:00",
  "triggerType": "upstream",
  "result": "Success",
  "orchestrationTaskDetails": {
    "name": "Mobile-Platform-CI",
    "url":
 "https://jenkins.mycompany.com:8080/job/Mobile-Platform-CI/"
    }
  }
}
```

Example: Sample cURL request with resource=orchestration_task

```
curl -X GET \
'https://instance.servicenow.com/api/sn_devops/v1/devops/orchest
ration/schema?resource=orchestration_task' \
-H 'Accept: application/json'\
-u 'username':'password'
```

```
{
"result": {
  "name": "Mobile-Platform-CI",
  "url":
 "https://jenkins.mycompnay.com:8080/job/Mobile-Platform-CI/"
  }
}
```

Example: Sample cURL request with resource=callback

```
curl -X GET \
'https://instance.servicenow.com/api/sn_devops/v1/devops/orchest
ration/schema?resource=task_execution' \
-H 'Accept: application/json' \
-u 'username':'password'
```

```
{
  "result": {
    "callbackURL":
 "http://127.0.0.1:8090/jenkins/sn-
devops/9b0feb79-f0b9-4661-83ef-2861b8924784",
    "orchestrationTaskURL":
 "http://127.0.0.1:8090/jenkins/job/felipe-downstream/",
    "orchestrationTaskDetails": {
      "message": "Started by upstream project
 \"felipe-upstream\" build number 27",
      "triggerType": "upstream"
    }
  }
}
```

DevOps - GET /devops/orchestration/stepMapping

Verifies that the information being passed is valid for the creation of an orchestration task and is valid for association to a previously created step.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/orchestration/stepMapping`

Default URL: `/api/sn_devops/devops/orchestration/stepMapping`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
branchName	Name of the branch associated with the orchestration task. Data type: String
isMultiBranch	If the orchestration tool is Jenkins, flag that indicates whether the project is of type Multibranch. Valid values: • true: Project is of type Multibranch. • false: Project is not of type Multibranch. Data type: Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: false
parentStageName	If the orchestration task is a child nested inside a parent orchestration task, the name of the parent orchestration task. Data type: String
parentStageURL	If the orchestration task is a child nested inside a parent orchestration task, the URL of the parent orchestration task. Data type: String
orchestrationTaskName	Required. Name of the orchestration task. Data type: String
orchestrationTaskURL	Required. URL of the orchestration task. **Note:** Must be percent (%) encoded, such as https%3A%2F%2Fjenkins.mycompany.com%3A8080%2Fjob%2FMobile-Platform-deploy%2F. Data type: String
testConnection	Flag that indicates whether to test the end-to-end connection between the instance and the DevOps tool. Valid values: • true: Test the end-to-end connection. • false: Do not test the end-to-end connection. Data type: Boolean Default: false
toolId	Required. Sys_id of the orchestration tool. Located in the Orchestration Tool [sn_devops_orchestration_tool] table. Data type: String
toolType	Required. Type of tool. Valid values: jenkins Data type: String

Request body parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Element	Description
status	Flag that indicates whether the verification was successful. Valid values: • true: Verification was successful. • false: Verification wasn't successful. Data type: Boolean
stepValid	Flag that indicates whether the information sent is valid. Valid values: • true: Information sent is valid. • false: Information sent isn't valid. Data type: Boolean

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Sample cURL request

```
curl -X GET
 "https://instance.servicenow.com/api/sn_devops/v1/devops/orches
tration/stepMapping?toolId=f0ca45679323008b52f3b457415ae6&orches
trationTaskName=Platform-Analytics-UAT-Deployment&orchestrationT
askURL=https%253A%252F%252Fjenkins.mycompany.com%253A8080%252F
job%252FMobile-Platform-deploy%252F&toolType=jenkins "
 -H "Accept: application/json" \
 -u "username":"password"
```

Results if information is valid.

```
{
  "result": {
    "stepValid": true,
    "status": "Success"
  }
}
```

Example: Sample cURL request

```
curl -X GET
 "https://instance.servicenow.com/api/sn_devops/v1/devops/orches
tration/stepMapping?toolId=f0ca45679323008b52f3b457415ae6&orches
trationTaskName=Platform-Analytics-UAT-Deployment&orchestrationT
askURL=https%253A%252F%252Fjenkins.mycompany.com%253A8080%252F
job%252FMobile-Platform-deploy%252F&toolType=jenkins "
 -H "Accept: application/json" \
 -u "username":"password"
```

Results if information is invalid.

```
{
"result": {
  "stepValid": false,
  "status": "Success"
}
```

DevOps - GET /devops/plan/schema

Returns the schema object for a specific plan: app, version, or work item.

Once you have the required schema object, use it to create the request body for your corresponding POST call; *`POST /plan/app`*, *`POST /plan/version`*, or *`POST /plan/workitem`*.

Note: This endpoint only returns the request body elements that are required.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/plan/schema`

Default URL: `/api/sn_devops/devops/plan/schema`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
resource	Type of resource schema to return. Valid values (not case-sensitive): • app • version • work_item Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Invalid or missing authentication.
404	Not Found. The specified record could not be found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
app	Description of the application to associate with the version. Data type: Object `"app": { "createdDateTime": "String", "id": "String", "shortDescription": "String", "team": {Object}, "url": "String" }`
app.createdDateTime	Date/time the application was created in the source DevOps tool. Data type: String
app.id	Unique identifier of the application. Generated by the source planning tool. Data type: String
app.shortDescription	Brief description of the associated application. Data type: String
app.team	Description of the team associated with the application. Data type: Object `"team": { "id": "String", "name": "String" }`
app.team.id	Unique identifier of the team associated with the application. Generated by the source planning tool. Data type: String
app.team.name	Name of the team associated with the application.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
app.url	URL of the application on the source planning tool site. Data type: String
assignedTo	Description of the person to which the work item is assigned. Data type: Object `"assignedTo": { "email": "String", "id": "String", "name": "String", "userName": "String" }`
assignedTo.email	Email address of the person assigned to the work item. Data type: String
assignedTo.id	Unique identifier of the person assigned to the work item. Data type: String
assignedTo.name	Name of the person assigned to the work item. Data type: String
assignedTo.userName	User name of the person assigned to the work item. Data type: String
createDateTime	Date and time that the application, version, or work item record was created. Data type: String
id	Unique identifier of the application, version, or work item. Generated by the source planning tool. Data type: String
name	Name of the application. Data type: String
path	Relative path to the application. Data type: String
shortDescription	Brief description of the application, version, or work item. Data type: String
state	State of the work item. Generated by the source planning tool. Data type: String

Name	Description
team	Description of the team associated with the application. Data type: Object `"team": { "id": "String", "name": "String" }`
team.id	Unique identifier of the team associated with the application. Generated by the source planning tool. Data type: String
team.name	Name of the team associated with the application. Data type: String
type	Type of work item. Generated by the planning tool. Data type: String
url	URL to use to access the application, version, or work item. Data type: String
version	Array that describes the version. Data type: Object `"version": { "app": {Object}, "createdDateTime": "String", "id": "String", "shortDescription": "String", "url": "String" }`
version.app	Description of the application to associate with the version. Data type: Object `"app": { "createdDateTime": "String", "id": "String", "shortDescription": "String", "team": {Object}, "url": "String" }`
version.app.createdDateTime	Date/time that the version was created on the source DevOps tool. Data type: String
version.app.id	Unique identifier of the application. Generated by the source planning tool.

  }
}
```

DevOps - POST /devops/artifact/registration

Enables orchestration tools to register artifacts into a ServiceNow instance.

This endpoint creates new artifacts and artifact versions, and associates them to commits. The following describes the endpoint process flow:

- If the *toolId* is passed in the request, the endpoint validates that the tool exists within the instance. It also checks if the artifact repository specified in *artifacts.repositoryName* exists, and if not, creates it under the associated artifact tool.
- If the *toolId* is not passed in the request, a repository is created but it is not linked to any artifact tool.
- It then checks if the artifact specified in *artifacts.name* already exists, and if not, creates it under the associated repository.
- If the *artifact.version* is passed in the request:
  - If it does not exist, a new artifact version record is created in the associated Artifact Version [sn_devops_artifact_version] table.
  - The endpoint then looks for associated task executions based on the provided build details (*pipelineName* or *projectName*, *taskExecutionNumber*, *branchName*, and *stageName*) and the *orchestrationToolId* parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If a task execution is found, and its post-processing is complete, the artifact version is linked to the task execution and stored in the Artifact to TaskExecution [sn_devops_m2m_artifact_execution] table. Commits linked to these task executions are also associated to the artifact version and stored in the Artifact Version to Commit [sn_devops_m2m_artifact_version_commit] table. Any commits that are linked to previous task executions that did not create an artifact, are also associated with the artifact version.
- If a task execution is found, and its post-processing is not complete, then the request is persisted in the Artifact Staged Request [sn_devops_artifact_staging] table. The staged request contains a reference to the task execution.
- If a task execution is not found, the request is persisted in the staging table. The staged request contains the build details.

- If the *`artifact.version`* is not passed in, then depending on the tool configuration, the artifact version is either retrieved by calling the *`/devops/tool/artifact`* endpoint if your artifact tool supports webhooks or through a custom subflow that retrieves the artifact version from the artifact tool.

For additional information on artifacts, see Using DevOps change acceleration for releases.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/artifact/registration`

Default URL: `/api/sn_devops/devops/artifact/registration`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
orchestrationToolId	Required. Sys_id of the orchestration tool associated with the artifact. Located in the Orchestration Tool [sn_devops_orchestration_tool] table. The endpoint uses this information to locate task execution information. Data type: String
toolId	Sys_id of the artifact tool associated with the artifact. Located in the Artifact Tool [sn_devops_artifact_tool] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
artifacts	At least one entry required. Array of objects in which each object uniquely identifies an artifact version to register. Data type: Array `"artifacts": [ { "name": "String", "repositoryName": "String", "semanticVersion": "String", "version": "String" } ]`
artifacts.name	Required. Artifact file name. Data type: String Maximum length: 160 characters
artifacts.repositoryName	Required. Artifact repository name. If the specified repository record does not exist, it is created. Data type: String Maximum length: 160 characters
artifacts.semanticVersion	Semantic version of the artifact. Data type: String Format: MAJOR.MINOR.PATCH Examples of possible values: • 2.0.0 • 2.0.0-rc.2 • 2.0.0-rc.1 • 1.0.0-beta Maximum length: 160 characters Default: Null
artifacts.version	Required if *toolId* is not passed. Artifact version. Data type: String Format: MAJOR.MINOR Maximum length: 160 characters Default: Null

Request body parameters (XML or JSON) (continued)

Name	Description
branchName	Required if it is a multi-branch project. Name of the branch in the repository where the artifact is stored. Data type: String Maximum length: 160 Default: Null
pipelineName	Required if *projectName* is not passed. Pipeline name. Data type: String Maximum length: 160 Default: Null
projectName	Required if *pipelineName* is not passed. Free-form project name. Data type: String Maximum length: 160 Default: Null
stageName	Required if *pipelineName* is passed. Stage name. Data type: String Maximum length: 160 Default: Null

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Authorization	Starting with v2, this API supports token-based authentication. Tokens can be acquired by clicking the **Copy token** button on the tool record, located in the Tool [sn_devops_tool] table. The token can then be used in an authorization header in the format `Authorization: sn_devops.DevOpsToken <tool_sys_id>:<tool_token>`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Note: If Basic Auth details (user name and password) are provided in addition to an authorization header with token, Basic Auth takes precedence. If the *devops.system* user is not available in your instance, use the **Switch to this user after token based authentication is successful** property. This property enables setting any user that has the sn_devops.integration role, which is needed to complete the token authentication. For information, see DevOps Change Velocity properties.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Success. Success with response body.
201	Created. Success with response body.
400	Bad Request. The request URI does not match the APIs in the system, or the operation failed for unknown reasons. Invalid headers can also cause this error.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
response	Results of the artifact registration request. Data type: Object `"response": { "artifact": {Object}, "artifact_register_requests": {Object}, "artifact_repository": {Object},`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"artifact_version": {Object}
	}</pre>

response.artifact	Results for each processed artifact.
	
	Data type: Object
	<pre>"artifact": {
	"create": [Array],
	"found": [Array],
	"update": [Array]
	}</pre>

response.artifact.create	If the request created artifact records, the list of sys_ids of the created records in the Artifacts [sn_devops_artifact] table.
	
	Data type: Array
	<pre>"create": [
	{
	"id": "String"
	}
	]</pre>

response.artifact.create.id	Sys_id of the artifact record created by the request. Data type: String

response.artifact.found	If an artifact already exists in the Artifacts table, the list of sys_ids of the existing artifact records.
	
	Note: No modifications are made to existing packages.
	
	Data type: Array
	<pre>"found": [
	{
	"id": "String"
	}
	]</pre>

response.artifact.found.id	Sys_id of the existing artifact record. Data type: String
response.artifact.update	Currently unused
response.artifact.update.id	Currently unused
response.artifact_register_requests	Results for any artifacts register requests that have not completed processing and have been stored in the Artifact Staged Request table. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"artifact_register_requests": {
	  "create": [Array],
	  "found": [Array],
	  "update": [Array]
	}</pre>

response.artifact_register_requests.create	If the request created artifact staging records, the list of sys_ids of the created records.
	
	Data type: Array
	<pre>"create": [
	  {
	  "id": "String"
	  }
	]</pre>

response.artifact_register_requests.create.id	Sys_id of the artifact staging record created by the request. Data type: String

response.artifact_register_requests.found	If artifacts already have associated artifact staging records, the list of sys_ids of the existing artifact staging records.
	
	Note: No modifications are made to existing packages.
	
	Data type: Array
	<pre>"found": [
	  {
	  "id": "String"
	  }
	]</pre>

response.artifact_register_requests.found.id	Sys_id of an existing artifact staging record. Data type: String
response.artifact_register_requests.update	Currently unused
response.artifact_register_requests.update.id	Currently unused

response.artifact_repository	Results for any artifact repository records that were manipulated during the processing of the request.
	
	Data type: Object
	<pre>"artifact_repository": {
	  "create": [Array],
	  "found": [Array],
	  "update": [Array]
	}</pre>

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
response.artifact_repository.create	If artifact repositories were created by the request, the list of sys_ids of the created records. Data type: Array `"create": [ { "id": "String" } ]`
response.artifact_repository.create.id	Sys_id of the artifact repository record created by the request. Data type: String
response.artifact_repository.found	If artifact repository records used in the register request already exist, the list of sys_ids of the existing records. **Note:** No modifications are made to existing packages. Data type: Array `"found": [ { "id": "String" } ]`
response.artifact_repository.found.id	Sys_id of an existing artifact repository record used by the request. Data type: String
response.artifact_repository.update	If the endpoint updates the track flag on a repository to true (from false), the list of sys_ids of the repository records that were modified. Data type: Array `"update": [ { "id": "String" } ]`
response.artifact_repository.update.id	Sys_id of the repository record whose track flag was modified. Data type: String
response.artifact_version	Results for any artifact version records that were manipulated during the processing of the request.

Name	Description
	Data type: Object `"artifact_version": { "create": [Array], "found": [Array], "update": [Array] }`
response.artifact_version.create	Results for any artifact version records that were created during the processing of the request. Data type: Array `"create": [ { "id": "String" } ]`
response.artifact_version.create.id	Sys_id of the artifact version record created by the request. Data type: String
response.artifact_version.found	If artifact version records used in the register request already exist, the list of sys_ids of the existing records. Data type: Array `"found": [ { "id": "String" } ]`
response.artifact_version.found.id	Sys_id of the existing artifact version record used by the request. Data type: String
response.artifact_version.update	Currently unused
response.artifact_version.update.id	Currently unused
status	Status of the registration request. Possible values: • Success: Response body contains return results. • Error: Response body contains list of all errors. Data type: String

```

DevOps - POST /devops/onboarding/app

Creates an onboarding app event that is asynchronously processed by the DevOps service.

This endpoint can perform the following actions:

- Create applications.
- Associate DevOps objects such as, plan, repository, and pipeline, to an application.
- Create a change step record and associate a change approval process to a pipeline.

All of these actions are tool and capability specific. The following table outlines the actions available for each supported tool.

Tool	Capabilities	Actions		
		App Association	Configure	Change Step creation
ServiceNow Agile	Plans	✓	NA	NA
Azure	Plans	✓	NA	NA
	Repos	✓	NA	NA
	Pipelines	✓	NA	✓
BitBucket	Repos	✓	✓	NA
GitHub	Repos	✓	✓	NA
GitLab	Repos	✓	✓	NA
	Pipelines	✓	✓	✓
Jenkins	Pipelines	✓	NA	✓
Jira	Plans	✓	NA	NA

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/onboarding/app`

Default URL: `/api/sn_devops/devops/onboarding/app`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
apps	Array of objects that define the apps to create within the associated ServiceNow instance. Data type: Array `"apps": [{ "bussinessApp": "String", "name": "String" }]`
apps.bussinessApp	Name of the cmdb_ci_business_app to which map the application. This ties the DevOps application to the specified CMDB application. Data type: String
apps.name	Required. User friendly name of the application to create to create. An app is a DevOps product container object that ties plans, repositories, and pipelines together. Data type: String
credentials	Required. Credentials to use for the webhook creation. The created webhook is used by the tool to send notifications.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Data type: Object `"credentials": { "name": "String", "password": "String" }`
credentials.name	Required. ServiceNow user ID of the user making the endpoint request. Located in the User [sys_user] table. This user must have the devops.integration.user role. Starting with version 1.34.1, this user must have the sn_devops.admin role. Data type: String
credentials.password	Required. Password of the user specified in the *credenitals.name* parameter. Data type: String
pipelines	Array of objects that define pipelines to associate with applications. Data type: Array `"pipelines": [{ "app": "String", "name": "String", "tool": "String" }]`
pipelines.app	Required if a *pipelines* object is specified. Name of the application to associate with the plan specified in the *pipelines.name* parameter. The application must have already been created or be specified in the *apps* object of this request. Data type: String
pipelines.changeSteps	Array of objects that define the change steps to create for the pipeline specified in the *pipelines.name* field. Data type: Array `"changeSteps": [{ "changeApprovalGroup": "String", "changeControlledBranches": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (continued)

Name	Description

	<pre> "changeType": "String",
	  "name": "String",
	  "type": "String"
	}]</pre>
	Data type: String

pipelines.changeSteps.changeApprovalGroup	Required if a *changeSteps* object is specified. Name of the change approval group to associate with the pipeline. Located in the Group [sys_user_group] table. This group must already exist on the ServiceNow instance. Data type: String
pipelines.changeSteps.changeControlledBranches	Comma-separated list of code branches that are under change control. This only applies for multi branch support. Data type: String Default: * (all branches)
pipelines.changeSteps.changeType	Required if a *changeSteps* object is specified. Type of change request to create. The available types are defined in the Type field of the Change Request [change_request] table. Data type: String
pipelines.changeSteps.name	Required if a *changeSteps* object is specified. Name of the step to create. The step name must match the name of the corresponding step in the orchestration tool's pipeline. Data type: String
pipelines.changeSteps.type	Required if a *changeSteps* object is specified. Type of step to create. The available step types are defined in the Type field of the Steps [sn_devops_step] table. Data type: String
pipelines.name	Required if a *pipelines* object is specified. Name of the pipeline to associate with the application specified in *pipelines.app* parameter. This pipeline must already be discovered on the ServiceNow instance.

Request body parameters (continued)

Name	Description
	Data type: String
pipelines.project	Required if a `pipelines` object is specified and the pipelines.tool supports projects entity (for example, the ADO tool). Project to associate with the pipeline to create a unique pipeline/tool identifier. Parameter value must derive from a project in the Project [sn_devops_project] table. Data type: String
pipelines.tool	Required if a *`pipelines`* object is specified. Tool to associate with the pipeline to create a unique pipeline/tool identifier. Data type: String
plans	Array of objects that define a plan to associate with an application. Data type: Array `"plans": [{ "app": "String", "name": "String", "tool": "String" }]`
plans.apps	Required if a *`plans`* object is specified. Names of applications to associate with the plan specified in the *`plans.name`* parameter. These applications must have already been created or be specified in the *`apps`* object of this request. Data type: Array of Strings
plans.name	Required if a *`plans`* object is specified. Name of the plan to associate with the application specified in *`plans.app`* parameter. This plan must already be discovered on the ServiceNow instance. Data type: String
plans.project	Required if a `plans` object is specified and the plans.tool supports projects entity (for example, the ADO tool). Tool to associate with the pipeline to create a unique plans/tool identifier. Parameter

Request body parameters (continued)

Name	Description
	value must derive from a project in the Project [sn_devops_project] table. Data type: String
plans.tool	Required if a *plans* object is specified. Tool to associate with the plan to create a unique plan/tool identifier. Data type: String
repositories	Array of objects that define the repositories associated with an application. If the repositories object contains an app parameter, then it maps the repository to the application. Data type: Array `"repositories": [{ "app": "String", "name": "String", "tool": "String" }]`
repositories.app	Required if a *repositories* object is specified. Name of the application to associate with this repository. The application must have already been created or be specified in the *apps* object of this request. Data type: String
repositories.name	Required if a *repositories* object is specified. Name of the repository to associate with the application specified in *repositories.app* parameter. This repository must already be discovered on the ServiceNow instance. Data type: String
repositories.project	Required if a `repositories` object is specified and the *repositories.tool* supports a projects entity (for example, the ADO tool). Tool to associate with the repositories to create a unique repository/tool identifier. Parameter value must derive from a project in the Project [sn_devops_project] table. Data type: String

Request body parameters (continued)

Name	Description
repositories.tool	Required if a *repositories* object is specified. User friendly tool name to associate with the repository to create a unique repository/tool identifier. The tool must already be created on the ServiceNow instance. Data type: String
artifactRepositories.app	Required if the `artifactRepositories` object is specified. Name of the application to associate with this artifactRepositories. The application must have already been created or be specified in the `apps` object of this request. Data type: String
artifactRepositories.name	Required if the `artifactRepositories` object is specified. Name of the artifactRepositories to associate with the application specified in *artifactRepositories*.app parameter. This artifactRepositories must already be discovered on the ServiceNow instance. Data type: String
artifactRepositories.tool	Required if the `artifactRepositories` object is specified. User friendly tool name to associate with the artifactRepositories to create a unique artifactRepositories / tool identifier. The tool must already be created on the ServiceNow instance. Data type: String
artifactRepositories.project	Required if the `artifactRepositories` object is specified and the *repositories.tool* supports projects entity (for example, the ADO tool). Tool to associate with the *artifactRepositories* to create a unique pipeline/tool identifier. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
202	Onboarding request was successfully created.

Response body parameters

Name	Description
result	Results of the onboarding request. Data type: Object `"result": { "code": "String", "details": "String", "errors": {Object], "onboardingRequestID": "String", "status": "String" }`
result.code	HTTP status code. Data type: String
result.details	Details about the onboarding request. Data type: String
result.errors	Description of any error that occurred.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object
result.error.message	Error message. Data type: String
result.onboardingRequestID	Unique identifier of the onboarding request. Use this value when calling the */devops/onboarding/status* endpoint to obtain the status of the associated onboarding process. Data type: String
result.status	Status of the onboarding request, either Success or Failed. Data type: String

Example: cURL request

This example creates the application Bike Rental Service and associates it with the Jenkins pipeline Bike Rentals, the GitHub repository nowDevops01/CorpSite, and the Azure plan testPlan_Bike_Rental.

```
curl -X POST
 "https://servicenow-instance/api/sn_devops/v1/devops/onboardi
ng/app" \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
-d "{
  "apps": [
    {
      "name": "Bike Rental Service"
    }
  ]
  "pipelines": [
    {
      "tool": "Primary Jenkins",
      "name": "Bike Rentals",
      "app": "Bike Rental Service",
      "changeSteps": [
        {
          "name": "Prod",
          "type": "deploy",
          "changeApprovalGroup": "Change Management",
          "changeType": "normal"
        }
      ]
    }
  ],
  "repositories": [
    {
      "tool": "Primary GitHub",
      "name": "nowDevops01/CorpSite",
      "app": "Bike Rental Service"
    }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  ]
  "plans": [
    {
      "tool": "Primary Azure",
      "name": "testPlan_Bike_Rental",
"project": "DemoProjecttt",
      "apps": [
        "Bike Rental Service"
      ]
    }
  ]
"artifactRepositories": [
{
"tool": "AdoTool",
"name": "empb5-sonar",
"apps": [
"appXXXXtz"
]
}
]

  "credentials" : {
    "name": "devops_user",
    "password": "devops_password"
  }
}
```

Output:

```
{
  "result":{
    "status": "Success",
    "details": "Onboarding request has been created. Please use
 the /status api and the onboarding request number to get the
 status of the request",
    "onboardingRequestID": "IBE0001045",
    "code": "202"
  }
}
```

DevOps - POST /devops/onboarding/tool

Creates an onboarding tool event that is asynchronously processed by the DevOps service.

Depending on the type of tool for which the request is posted, the endpoint performs the following actions:

- Creates the tool within the associated ServiceNow instance
- Connects to the tool
- Tries to configure the tool (only if the connection is successful)
- Discovers the tool (only if the connection is successful)

All of these actions are tool specific and are executed based on the integration capabilities for the specified tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tool	Action			
	Create	Connect	Discover	Configure
ServiceNow Agile	✓	✓	✓	NA
Azure	✓	✓	✓	✓
BitBucket	✓	✓	✓	✖
GitHub	✓	✓	✓	✖
GitLab	✓	✓	✓	✖
Jenkins	✓	✓	✓	✖
Jira	✓	✓	✓	✓

The return results for this endpoint only indicate whether the request was posted, it does not indicate whether the associated tools were created. The actual tool creation is processed asynchronously. To obtain the status of the tool creation and all other actions, you must call the *`/devops/onboarding/status`* endpoint and pass in the *`onboardingRequestID`* parameter that is returned by this endpoint.

Before you are able to access this endpoint, your admin must have configured the DevOps connection and credential alias (CreateDevOpsTool) to setup tools in the instance. For details, see Install DevOps Change Velocity. In addition, the calling entity must have the devops.integration.user role.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/onboarding/tool`

Default URL: `/api/sn_devops/devops/onboarding/tool`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Request body parameters

Name	Description
credentials	Required. Credentials to use for the webhook creation. The tool uses the created webhook to send notifications. Data type: Object `"credentials": { "name": "String", "password": "String" }`
credentials.name	Required. ServiceNow identifier of the user making the endpoint request. Located in the User [sys_user] table. This user must have the devops.integration.user role. Starting with version 1.34.1, this user must have the sn_devops.admin role. Data type: String
credentials.password	Required. Password of the user specified in the *credenitals.name* parameter. Data type: String
tools	Required. Array of objects that define the tools to create within the associated ServiceNow instance. You can create one or more tools in a single request. Data type: Array `"tools": [{ "name": "String", "password": "String", "type": "String", "useMidServer": Boolean, "username": "String", "url": "String" }]`
tools.name	Required. User friendly name or label of the tool to create. This name is used to identify the tool in the DevOps service. Data type: String
tools.password	Required except for Agile tool. Password to use to access the tool. Supported authentications are basic and token; OAuth is not supported. Data type: String
tools.type	Required. Type of tool to create, such as GitHub or BitBucket. The specified value must be one of the Tool labels in the Tool Integrations [sn_devops_tool_integration] table. Data type: String
tools.useMidServer	Flag that indicates whether the tool connects through a MID Server.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Valid values: • true: Connects through a MID Server. • false: Does not connect through a MID Server. Data type: Boolean
tools.username	Required except for Agile tool. User name to use to access the tool through this endpoint. Data type: String
tools.url	Required except for Agile tool. URL of the tool to create. The DevOps service uses this URL to integrate with the tool. If using the 'Azure DevOps' tool, *`tools.url`* can contain either the ADO Organization URL or the ADO Project URL. When providing an ADO Organization URL, the API discovers all projects under the specified organization and does not configure any projects. When providing an ADO Project URL, the API discovers entities related to the project like (pipelines, repositories, and plans) and also configures a project if the *`credentials`* object is present. To explicitly tell the API to skip the project configuration, configure a flag *`configureTool`* (type: boolean) to `false`. If *`configureTool`* is not explicitly provided in the payload or is set to `true`, the tool is automatically configured. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
202	Onboarding request was successfully created.

Response body parameters

Name	Description
result	Results of the onboarding request. Data type: Object `"result": { "code": "String", "details": "String", "errors": {Object}, "onboardingRequestID": "String", "status": "String" }`
result.code	HTTP status code. Data type: String
result.details	Detailed message about the onboarding request. Data type: String
result.errors	Description of any error that occurred. Data type: Object
result.error.message	Error message. Data type: String
result.onboardingRequestID	Unique identifier of the onboarding request. Use this value when calling the */devops/onboarding/status* endpoint to obtain the status of the associated tool onboarding process. Data type: String
result.status	Status of the onboarding request, either Success or Failed. Data type: String

Example: cURL request

The following example shows how to onboard GitHub.

    "code": "202"
  }
}
```

DevOps - POST /devops/orchestration/changeControl

Registers a callback with a ServiceNow instance for an orchestration task under change control, which can be called once a decision has been made on the change request.

Before you call this endpoint, you must have an orchestration task created in your ServiceNow instance. You can create this task either through Discovery or by calling the DevOps - POST /devops/orchestration/stepMapping endpoint. You must also ensure that the orchestration task is associated to a previously defined pipeline step and that change control is enabled (by selecting the **Change control** option on the App Stage form.) For details, see Accelerating DevOps change.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/orchestration/changeControl`

Default URL: `/api/sn_devops/devops/orchestration/changeControl`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
toolId	Required. Sys_id of the DevOps tool for which to place the specified task under change control. Located in the Orchestration Tool sn_devops_orchestration_tool table. Data type: String
toolType	Type of tool. Valid value: Any value that identifies the tool, such as "jenkins". Data type: String

Request body parameters

Name	Description
callbackURL	Required. URL that the ServiceNow instance can call back once the associated change request approval process is complete. This callback should let the pipeline execution continue or not, based on the approval result. Data type: String
changeRequestDetails	Name-value pairs of the fields to set when closing a change request. This object can contain any fields in the Change Request record except the following: • impact • number • risk • risk_impact_analysis • sys_id If these fields are included in the request, the endpoint returns a 400

Request body parameters (continued)

Name	Description
	error and the change request is not updated. Also, if you include fields that require other mandatory fields to be set, and those fields are not sent, the request will fail during later processing of the pipeline. This failure is noted in the work notes of the change request, along with an error message for that particular change request, such as: `Change request update failed with reason: <Error Message from platform>. Canceling change request and the related step execution.` You can also pass the boolean parameter *`setCloseCode`* in this object to specify whether to set closure information on the associated Change Request record. • If set to true, the close_code field is set to the status of the job and the close_notes field is set to a link to the step execution in the associated Change Request record. The default value is true. • If set to false, the close_code and close_notes fields are not set and a link to the step execution is set in the work_notes field. Data type: Object
isMultiBranch	If the orchestration tool is Jenkins, flag that indicates whether the project is of type Multibranch. Valid values: • true: Project is of type Multibranch. • false: Project is not of type Multibranch. Data type: Boolean Default: false
orchestrationTaskDetails	Required. Description of the orchestration task. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description

	<pre>"orchestrationTaskDetails": {
	  "message": "String",
	  "triggerType": "String",
	  "upstreamTaskExecutionURL": "String"
	}</pre>

orchestrationTaskDetails.message	Free-form text message. Data type: String
orchestrationTaskDetails.triggerType	Required. The way the orchestration task was started. Valid values: • scm: Git/scm tool code commit triggered the job. • upstream: Upstream job triggered this job. • user: User manually started the job. Data type: String
orchestrationTaskDetails.upstreamTaskExecutionURL	Required if *`triggerType`* is set to `upstream`. Upstream task execution URL. For example: https://jenkins.mycompany.com:8080/job/Mobile-Platform-test/40/ Data type: String
orchestrationTaskURL	Required. URL of the orchestration task for which to create the call back. For example: https://jenkins.mycompany.com:8080/orchestration_task/Mobile-Platform-deploy/ Data type: String

parentNode	If the orchestration task is a child nested inside a parent orchestration task, this value contains the parent node details.
	
	Data type: Object
	
	<pre>"parentNode": {
	  "id": "String",</pre>

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description

	<pre>"name": "String",
	"upstreamStageName": "String",
	"upstreamTaskExecutionURL": "String"
	}</pre>

parentNode.id	Unique ID for the parent node. In Jenkins, this value corresponds to a pipeline stage ID. Data type: String
parentNode.name	Name of the parent node. In Jenkins, this value corresponds to a pipeline stage name. Data type: String
parentNode.upstreamStageName	Name of the parent node's upstream orchestration task. In Jenkins, this value corresponds to a pipeline stage name. Data type: String
parentNode.upstreamTaskExecutionURL	URL of the parent node's upstream task execution. In Jenkins, this value corresponds to a pipeline stage execution URL. Data type: String
parentStageName	If the orchestration task is a child nested inside a parent orchestration task, the name of the parent orchestration task. Data type: String
parentStageURL	If the orchestration task is a child nested inside a parent orchestration task, the URL of the parent orchestration task. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Authorization	Starting with v2, this API supports token-based authentication. Tokens can be acquired by clicking the **Copy token** button on the tool record, located in the Tool [sn_devops_tool] table. The token can then be used in an authorization header in the format `Authorization: sn_devops.DevOpsToken <tool_sys_id>:<tool_token>`. **Note:** If Basic Auth details (user name and password) are provided in addition to an authorization header with token, Basic Auth takes precedence. If the *devops.system* user is not available in your instance, use the **Switch to this user after token based authentication is successful** property. This property enables setting any user that has the sn_devops.integration role, which is needed to complete the token authentication. For information, see DevOps Change Velocity properties.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Invalid or missing authentication.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters

Name	Description
changeControl	Flag that indicates whether the orchestration task is under change control. Possible values: • true: Under change control. • false: Not under change control Data type: Boolean

Example: cURL request

```
curl -X POST
 "https://instance.servicenow.com/api/sn_devops/v1/devops/orches
tration/changeControl?toolId=f0ca45679323008b52f3b457415ae6&tool
Type=jenkins"
-H "accept: application/json"\
-H "Content-Type: application/json"\
-u "username":"password"\
-d "{

 \"orchestrationTaskURL\":
\"https://jenkins.mycompany.com:8080/orchestration
 task/Mobile-Platform-deploy/\",

 \"callbackURL\":\"https://jenkins.mycompany.com:8080/sn-
devops/964aca59-0cae-4d9b-a36d-5929f426cf31\",
  \"orchestrationTaskDetails\":{
    \"message\":\"Started by upstream project
 \\\"Mobile-Platform-test\\\" build number 40\",
    \"triggerType\":\"upstream\",

 \"upstreamTaskExecutionURL\":
\"https://jenkins.mycompany.com:8080/job/Mobile-Platform-test/
40/\"}
}"
```

Response body.

```
{
"result": {
   "changeControl": true,
   "status": "Success"
   }
}
```

Example: cURL request

This example shows how to pass fields in the *changeRequestDetails* object when closing a change request.

```
curl -X POST
 "https://instance.servicenow.com/api/sn_devops/v1/devops/orches
```

DevOps - POST /devops/orchestration/stepMapping

Verifies that the information being passed is valid for the creation of an orchestration task and is valid for association to a previously created step. If both are valid, it creates the orchestration task and makes the association.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/orchestration/stepMapping`

Default URL: `/api/sn_devops/devops/orchestration/stepMapping`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
toolId	Required. Sys_id of the orchestration tool. Located in the Orchestration Tool [sn_devops_orchestration_tool] table. Data type: String
toolType	Required. Type of tool. Valid values: jenkins Data type: String

Request body parameters

Name	Description
branchName	Name of the branch associated with the orchestration task. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
isMultiBranch	If the orchestration tool is Jenkins, flag that indicates whether the project is of type Multibranch. Valid values: • true: Project is of type Multibranch. • false: Project is not of type Multibranch. Data type: Boolean Default: false
parentNode	If the orchestration task is a child nested inside a parent orchestration task, this value contains the parent node details. Data type: Object `"parentNode": { "id": "String", "name": "String", "upstreamStageName": "String", "upstreamTaskExecutionURL": "String" }`
parentNode.id	Unique ID for the parent node. In Jenkins, this value corresponds to a pipeline stage ID. Data type: String
parentNode.name	Name of the parent node. In Jenkins, this value corresponds to a pipeline stage name. Data type: String
parentNode.upstreamStageName	Name of the parent node's upstream orchestration task. In Jenkins, this value corresponds to a pipeline stage name. Data type: String
parentNode.upstreamTaskExecutionURL	URL of the parent node's upstream task execution. In Jenkins, this value corresponds to a pipeline stage execution URL. Data type: String
parentStageName	If the orchestration task is a child nested inside a parent orchestration task, the name of the parent orchestration task.

Request body parameters (continued)

Name	Description
	Data type: String
parentStageURL	If the orchestration task is a child nested inside a parent orchestration task, the URL of the parent orchestration task. Data type: String
orchestrationTaskName	Required. Name of the orchestration task. This is the same task referenced in the *`orchestrationTaskURL`*. Data type: String
orchestrationTaskURL	Required. URL of the orchestration task. For example: https://jenkins.mycompany.com:8080/orchestration_task/Mobile-Platform-deploy/ Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Authorization	Starting with v2, this API supports token-based authentication. Tokens can be acquired by clicking the **Copy token** button on the tool record, located in the Tool [sn_devops_tool] table. The token can then be used in an authorization header in the format `Authorization: sn_devops.DevOpsToken <tool_sys_id>:<tool_token>`. **Note:** If Basic Auth details (user name and password) are provided in addition to an authorization header with token, Basic Auth takes precedence. If the *`devops.system`* user is not available in your instance, use the **Switch to this user after token based authentication is successful** property. This property enables setting any user that has the sn_devops.integration role, which is needed to complete the token authentication. For information, see DevOps Change Velocity properties.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Element	Description
status	Flag that indicates whether the verification was successful. Valid values: • true: Verification was successful. • false: Verification wasn't successful. Data type: Boolean
stepValid	Flag that indicates whether the information sent is valid. Valid values: • true: Information sent is valid. • false: Information sent isn't valid. Data type: Boolean

Example: Sample cURL request

```
curl -X POST
 "https://instance.servicenow.com/api/sn_devops/v1/devops/orches
tration/stepMapping?toolId=f0ca45679323008b52f3b457415ae6&toolTy
pe=jenkins"
-H "Accept: application/json"\
-H "Content-Type: application/json"\
-u "username":"password"\
-d "{
```

 PROD/\",
  \"orchestrationTaskName\":\" primary#deploy PROD\"
}"
```

Results if information is valid.

```
{
  "result": {
    "stepValid": true,
    "status": "Success"
  }
}
```

Results if information is invalid.

```
{
  "result": {
    "stepValid": false,
    "status": "Success"
  }
}
```

DevOps - POST /devops/package/registration

Enables orchestration tools to create new artifact packages that contain specified artifact versions.

Artifact packages are used to display commits to change approvers when they view a change request. For commits to show in change requests, the package must be created in the stage prior to the stage containing the change approval.

Any artifact versions included in the package registration request should already be registered with DevOps. For details on registering artifact versions, see DevOps - POST /devops/artifact/registration.

Typically, you will pass in the *artifacts.version* and *artifacts.name* parameters when identifying an artifact version to include in a package. You can also use the advanced features of this endpoint which allows you to pass the build details for each artifact version instead of the version itself. Artifact-specific build details include the following parameters:

- *artifacts.pipelineName* or *artifacts.projectName*
- *artifacts.taskExecutionNumber*
- *artifacts.stageName*
- *artifacts.branchName*

The endpoint uses these artifact-specific build details to look up task execution information and then copies the associated versions to the package. It uses non-artifact specific build details (*pipelineName* or *projectName*, *taskExecutionNumber*, *branchName*, and *stageName*) to associate the created package to a pipeline execution.

Note: This endpoint does not support updates. It always creates a new package even if one with same name already exists.

For additional information on artifact packages, see Using DevOps change acceleration for releases.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/package/registration`

Default URL: `/api/sn_devops/devops/package/registration`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
orchestrationToolId	Required. Sys_id of the orchestration tool associated with the artifact package. Located in the Orchestration Tool [sn_devops_orchestration_tool] table. The endpoint uses this information to locate task execution information. Data type: String
toolId	Sys_id of the artifact tool associated with the artifact package. Located in the Artifact Tool [sn_devops_artifact_tool] table. Data type: String

Request body parameters

Name	Description
artifacts	At least one entry required. Array of objects in which each object uniquely identifies an artifact version to include in the package. Data type: Array `"artifacts": [ { "branchName": "String", "name": "String", "pipelineName": "String", "projectName": "String", "repositoryName": "String", "stageName": "String", "taskExecutionNumber": "String", "version": "String" ]`

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (continued)

Name	Description
artifacts.branchName	Required if *artifact.version* is not passed and it is a multi-branch setup. Name of branch in which the artifact versions are stored. Data type: String Maximum length: 160 Default: Null
artifacts.name	Required. Artifact file name. Data type: String Maximum length: 160 characters
artifacts.pipelineName	Required if *artifact.version* and *artifacts.projectName* are not passed. Pipeline name. Data type: String Maximum length: 160 Default: Null
artifacts.projectName	Required if *artifact.version* and *artifact.pipelineName* are not passed. Free-form project name. Data type: String Maximum length: 160 Default: Null
artifacts.repositoryName	Required. Artifact repository name. Data type: String Maximum length: 160 characters
artifacts.stageName	Required if *artifact.version* is not passed. Stage name. Data type: String Maximum length: 160 Default: Null
artifacts.taskExecutionNumber	Required if *artifact.version* is not passed. Pipeline run number. Data type: String Default: Null

Request body parameters (continued)

Name	Description
artifacts.version	Required if build details are not provided. Version of the artifacts. Data type: String Format: <Major>.<Minor> Default: Null
branchName	Required if it is multi-branch project. Name of the branch in the repository where the artifacts are stored. Data type: String Maximum length: 200 characters Default: Null
name	Required. Name of package. Data type: String Maximum length: 160 characters
pipelineName	Required if *`projectName`* is not passed. Pipeline name. Data type: String Maximum length: 160 characters Default: Null
projectName	Required if *`pipelineName`* is not passed. Free-form project name. Data type: String Maximum length: 160 Default: Null
stageName	Required if *`pipelineName`* is passed. Stage name. Data type: String Maximum length: 160 characters Default: Null
taskExecutionNumber	Required. Pipeline run number. Data type: String Maximum length: 128 characters Default: Null

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Authorization	Starting with v2, this API supports token-based authentication. Tokens can be acquired by clicking the **Copy token** button on the tool record, located in the Tool [sn_devops_tool] table. The token can then be used in an authorization header in the format `Authorization: sn_devops.DevOpsToken <tool_sys_id>:<tool_token>`. **Note:** If Basic Auth details (user name and password) are provided in addition to an authorization header with token, Basic Auth takes precedence. If the *devops.system* user is not available in your instance, use the **Switch to this user after token based authentication is successful** property. This property enables setting any user that has the sn_devops.integration role, which is needed to complete the token authentication. For information, see DevOps Change Velocity properties.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Success. Success with response body.
201	Created. Success with response body.
400	Bad Request. The request URI does not match the APIs in the system, or the operation failed for unknown reasons. Invalid headers can also cause this error.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters

Name	Description
response	Results of the package registration request. Data type: Object `"response": { "artifact_register_requests": {Object}, "sn_devops_m2m_artifact_version_package": {Object}, "sn_devops_package": {Object} }`
response.artifact_register_requests	Results for any register requests that have not completed processing and have been stored in the Artifact Staged Request [sn_devops_artifact_staging] table. Data type: Object `"artifact_register_requests": { "create": [Array], "found": [Array], "update": [Array] }`
response.artifact_register_requests.create	If the request created package staging records, the list of sys_ids of the created staging records. Data type: Array `"create": [ { "id": "String" } ]`
response.artifact_register_requests.create.id	Sys_id of the package staging record created by the request. Data type: String
response.artifact_register_requests.found	If the associated package staging records already exist, the list of sys_ids of the existing records. **Note:** No modifications are made to existing packages. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"found": [
	  {
	  "id": "String"
	  }
	]</pre>

response.artifact_register_requests.found.id	Sys_id of an existing package staging record. Data type: String
response.artifact_register_requests.update	Currently unused.
response.artifact_register_requests.update.id	Currently unused.

response.sn_devops_m2m_artifact_version_package	Results for each artifact version associated with a package.
	
	Data type: Object
	<pre>"sn_devops_m2m_artifact_version_package": {
	  "create": [Array],
	  "found": [Array],
	  "update": [Array]
	}</pre>

response.sn_devops_m2m_artifact_version_package.create	If the request created records linking artifact versions to packages, the list of sys_ids of the created records in the Artifact Version to Package [sn_devops_m2m_artifact_version_package] table.
	
	Data type: Array
	<pre>"create": [
	  {
	  "id": "String"
	  }
	]</pre>

response.sn_devops_m2m_artifact_version_package.create.id	Sys_id of the Artifact Version to Package record created by the request. Data type: String

response.sn_devops_m2m_artifact_version_package.found	If a linking record already exists in the Artifacts Version to Package table, the list of sys_ids of the existing linking records.
	
	Note: No modifications are made to existing records.
	
	Data type: Array
	<pre>"found": [
	  {</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"id": "String"
	}
	]</pre>

response.sn_devops_m2m_artifact_version_package.found.id	Sys_id of the existing Artifact Version to Package record. Data type: String
response.sn_devops_m2m_artifact_version_package.update	Currently unused.
response.sn_devops_m2m_artifact_version_package.update.id	Currently unused.

response.sn_devops_package	Results for any package records in the Packages [sn_devops_package] table that were manipulated during the processing of the request.
	
	Data type: Object
	<pre>"sn_devops_package": {
	"create": [Array],
	"found": [Array],
	"update": [Array]
	}</pre>

response.sn_devops_package.create	If package records were created by the request, the list of sys_ids of the created records.
	
	Data type: Array
	<pre>"create": [
	{
	"id": "String"
	}
	]</pre>

response.sn_devops_package.create.id	Sys_id of the package record created by the request. Data type: String

response.sn_devops_package.found	If package records used in the register request already exist, the list of sys_ids of the existing records.
	
	Note: No modifications are made to existing records.
	
	Data type: Array
	<pre>"found": [
	{
	"id": "String"</pre>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	}]
response.sn_devops_package.found.id	Sys_id of an existing package record referenced by the request. Data type: String
response.sn_devops_package.update	Currently unused.
response.sn_devops_package.update.id	Currently unused.
status	Status of the registration request. Possible values: • Success: Response body contains return results. • Error: Response body contains list of all errors. Data type: String

Example: Sample cURL request

```
# Example passing the artifact version
curl -X POST
 "https://instance.servicenow.com/api/sn_devops/devops/package/registration?toolId=f0ca45679323008b52f3b457415ae6"\
-H "accept: application/json"\
-H "Content-Type: application/json"\
-u "username":"password"\
-d "{\
"name": "sentimentpackage",\
"artifacts": [\
{\
"name": "sa-web.jar",\
"repositoryName": "services-1031",\
"version": "3.1"\
},\
{\
"name": "sa-frontend.jar",\
"repositoryName": "services-1031",\
"version": "9.2"\
}\
],\
"pipelineName": "spring-boot-app",\
"taskExecutionNumber": "160",\
"stageName": "Build",\
"branchName": "primary"\
}"
```

Response - package created:

```
"result": {
"status": "Success",
```

      "update": [],
      "found": []
    }
  },
  "responseCode": 201
 }
}
```

DevOps - POST /devops/tool/{capability}

Posts the passed in payload to the Inbound Event [sn_devops_inbound] table for processing by a custom DevOps subflow.

Call this endpoint from the associated webhook in your tool, specified by the passed in *`capability`* parameter. A custom subflow, to process the passed in payload, must already be defined in your ServiceNow instance. Based on a predefined schedule, the DevOps Master Flow picks up the webhook event information from the Inbound Event table and passes it to the custom subflow, which then process the payload. For more information on creating a custom subflow, see Creating DevOps subflows.

For additional information on test tool integration, see DevOps test tool integration.

Before calling this endpoint for a custom DevOps tool, you must implement the *`handleTool()`* and *`getNativeIdForOrchestrationTask()`* methods from *`sn_devops.DevOpsOrchestrationToolIntegrationHandler`*. For more information, see DevOpsOrchestrationToolIntegrationHandler - ScopedDevOpsOrchestrationToolIntegrationHandler - Scoped.

Note: Starting with 1.34.1 version, a new version of this API has been introduced. With this API, Adaptive Authentication policies may not execute as expected. For more information about these policies, see Adaptive authentication.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/tool/{capability}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/sn_devops/devops/tool/{capability}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
capability	Type of tool passing in the payload to store in the Inbound Event table. Valid values (not case-sensitive): • artifact • code • orchestration • plan • test Data type: String

Query parameters

Name	Description
orchestrationToolId	Optional. The sys_id of the orchestration tool to which the related pipeline belongs. *`orchestrationToolId`* is required if the *`capability`* request parameter is set to `test` or `softwarequality`. *`toolId`* is the default orchestration tool if orchestrationToolId is not present.
testType	Required if *`capability`* is set to `test`. The type of test being run. The valid values for this parameter are those in the Test type column of the Test Types [sn_devops_test_type] table.
toolId	Required. Sys_id of the tool for which the endpoint is being called.

Request body parameters

Name	Description
Tool dependant	The tool determines the content of the payload.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Authorization	Starting with v2, this API supports token-based authentication. Tokens can be acquired by clicking the **Copy token** button on the tool record, located in the Tool [sn_devops_tool] table. The token can then be used in an authorization header in the format `Authorization: sn_devops.DevOpsToken <tool_sys_id>:<tool_token>`. **Note:** If Basic Auth details (user name and password) are provided in addition to an authorization header with token, Basic Auth takes precedence. If the *devops.system* user is not available in your instance, use the **Switch to this user after token based authentication is successful** property. This property enables setting any user that has the sn_devops.integration role, which is needed to complete the token authentication. For information, see DevOps Change Velocity properties.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Invalid or missing authentication.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters

Name	Description
details	Entry for all error conditions. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"details": {
	  "errors": [Array]
	}</pre>

details.errors	Description of a single error.
	
	Data type: Array
	<pre>"errors": [
	  {
	  "message": "String"
	  }
	]</pre>

details.errors.message	Detailed error message. • `The request does not have any path parameters`: No path parameters are included in the call. • `The request does not have capability path parameter`: The capability path parameter was not included in the call. • `Unsupported capability type`: The specified capability parameter is not a valid value. Data type: String
status	Response status such as "Success" or "Data Error". Data type: String
sys_id	Sys_id of the record created in the Inbound Event table. Data type: String

Example: Sample cURL request for artifact

```
curl -X POST
 "https://instance.service-now.com/api/sn_devops/v1/tool/artifa
ct?toolId=3b59043ee4ea556e6850d61bc1a77e8a"
-H "accept: application/json"\
-H "Content-Type: application/json"\
-u "username":"password"\
-d "{
   "artifacts": [
      {
         "name": "sp-boot-app",

DevOps - POST /devops/tool/event/{sn_tool_id}

Posts the passed in payload from GitHub, Jira, or Bitbucket to the Events [sn_devops_event] table for processing by a pre-built subflow.

Before calling this endpoint, you must create an integration with the tool you're using.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- GitHub integration with DevOps
- Jira integration with DevOps
- Bitbucket integration with DevOps

To process events from any other tool besides GitHub, Jira, or Bitbucket, use the DevOps - POST /devops/tool/{capability} endpoint instead.

Note: Starting with 1.34.1 version, a new version of this API has been introduced. With this API, Adaptive Authentication policies may not execute as expected. For more information about these policies, see Adaptive authentication.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/tool/event/{sn_tool_id}`

Default URL: `/api/sn_devops/devops/tool/event/{sn_tool_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sn_tool_id	Sys_id of the tool to use for the request. Data type: String Table: Devops Tools [sn_devops_tool]

Query parameters

Name	Description
None	

Request body parameters

Name	Description
Tool dependent	The tool determines the content of the payload. The payload can be located in the tool under the webhook information.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Authorization	Starting with v2, this API supports token-based authentication. Tokens can be acquired by clicking the **Copy token** button on the tool record, located in the Tool [sn_devops_tool] table. The token can then be used in an authorization header in the format `Authorization: sn_devops.DevOpsToken <tool_sys_id>:<tool_token>`. **Note:** If Basic Auth details (user name and password) are provided in addition to an authorization header with token, Basic Auth takes precedence. If the *devops.system* user is not available in your instance, use the **Switch to this user after token based authentication is successful** property. This property enables setting any user that has the sn_devops.integration role, which is needed to complete the token authentication. For information, see DevOps Change Velocity properties.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
201	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Invalid or missing authentication.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters

Name	Description
result	Response status. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• `failure`: Incorrect tool id. Event not created. • `success`: Event created in the Events [sn_devops_event] table. However, the event state may be **Error** if an incorrect payload was provided. Data type: String

Example: cURL request

```

DevOps - PUT /devops/orchestration/changeControl/{changeControlId}

Updates the change control information for the specified orchestration task.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/orchestration/changeControl/{changeControlId}`

Default URL: `/api/sn_devops/devops/orchestration/changeControl/{changeControlId}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
changeControlId	Sys_id of the change control task. Located in the Callback [sn_devops_callback] table. Data type: String

Query parameters

Name	Description
toolId	Required. Sys_id of the DevOps tool associated with the change control task. Located in the Orchestration Tool [sn_devops_orchestration_tool] table. Data type: String

Request body parameters

Name	Description
callbackURL	Required. URL that the ServiceNow instance can call back once the associated change request approval process is complete. This callback should let the pipeline execution continue or not, based on the approval result. Data type: String
orchestrationTaskDetails	Required. Description of the orchestration task. Data type: Object `"orchestrationTaskDetails": { "message": "String", "triggerType": "String", "upstreamTaskExecutionURL": "String" }`
orchestrationTaskDetails.message	Free-form text message. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
orchestrationTaskDetails.triggerType	Required. The way the orchestration task was started. Valid values: • scm: Git/scm tool code commit triggered the job. • upstream: Upstream job triggered this job. • user: User manually started the job. Data type: String
orchestrationTaskDetails.upstreamTaskExecutionURL	Required if *`triggerType`* is set to `upstream`. Upstream task execution URL. For example: https://jenkins.mycompany.com:8080/job/Mobile-Platform-test/40/ Data type: String
orchestrationTaskURL	Required. URL of the orchestration task. For example: https://jenkins.mycompany.com:8080/orchestration_task/Mobile-Platform-deploy/ Data type: String
toolType	Type of DevOps tool. Valid value: jenkins Data type: String
taskExecutionURL	Required. URL of the task to execute. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
Authorization	Starting with v2, this API supports token-based authentication. Tokens can be acquired by clicking the **Copy token** button on the tool record, located in the Tool [sn_devops_tool] table. The token can then be used in an authorization header in the format `Authorization: sn_devops.DevOpsToken <tool_sys_id>:<tool_token>`. **Note:** If Basic Auth details (user name and password) are provided in addition to an authorization header with token, Basic Auth takes precedence. If the *devops.system* user is not available in your instance, use the **Switch to this user after token based authentication is successful** property. This property enables setting any user that has the sn_devops.integration role, which is needed to complete the token authentication. For information, see DevOps Change Velocity properties.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Invalid or missing authentication.
404	Not Found. The specified record could not be found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
change_control	Flag that indicates whether the orchestration task is under change control.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Possible values: • true: Under change control. • false: Not under change control. Data type: Boolean
details	Entry for all error conditions. Data type: Object `"details": { "errors": [Array] }`
details.errors	Description of a single error. Data type: Array `"errors": [ { "message": "String" } ]`
details.errors.message	Detailed error message. Data type: String

Example: Sample cURL request

```
curl -X PUT
 "https://instance.service-now.com/api/sn_devops/v1/devops/orche
stration/changeControl/f0ca45679323008b52f3b457415ae6?toolId=f0c
a45679323008b52f3b457415ae6"
-H "accept: application/json"\
-H "Content-Type: application/json"\
-u "username":"password"\
-d "{

 \"orchestrationTaskURL\":
\"https://jenkins.mycompany.com:8080/job/Mobile-Platform-depl
oy/\",
  \"toolType\":\"jenkins\",

 \"callbackURL\":\"https://jenkins.mycompany.com:8080/sn-
devops/964aca59-0cae-4d9b-a36d-5929f426cf31\",
\"taskExecutionURL\":
\"https://jenkins.mycompany.com:8080/job/Mobile-Platform-test/
40/\",
"\orchestrationTaskName\":\"StageName\",
  \"orchestrationTaskDetails\":{
    \"message\":\"Started by upstream project
 \\\"Mobile-Platform-test\\\" build number 40\",
    \"triggerType\":\"upstream\",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 \"upstreamTaskExecutionURL\":
\"https://jenkins.mycompany.com:8080/job/Mobile-Platform-test/
40/\"}
}"
```

Response:

```
{
    "result": {
        "change_control": true
    }
}
```

DevOps - PUT /devops/orchestration/changeInfo/{changeInfo}

Updates fields in a specified change request.

URL format

Versioned URL: `/api/sn_devops/{api_version}/devops/orchestration/changeInfo/{changeInfo}`

Default URL: `/api/sn_devops/devops/orchestration/changeInfo/{changeInfo}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
changeRequestNumber	Required. Change request number associated with the orchestration task to update. Located in the Change Request [change_request] table. Data type: String

Request body parameters

Name	Description
data	Required. Name-value pairs for the field(s) to update in the associated change request. For example, to update the short description file, enter a name-value pair similar to the following: `"{\"short_description\": \"my short desc\" }"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description

	For the *state* parameter, only the following transitions are supported:
	• cancel:
	  ○ Change request state must be implemented to move the state to cancel.
	  ○ The *reason* parameter is a mandatory input to update the state to canceled.
	• closed:
	  ○ Change request state must be implement or post implement to move the state to close.
	  ○ close_code and close_notes are mandatory input for updating the state to closed.
	Possible values:
	▪ 4: Cancel (Value set in the sn_devops.change_request.cancel_state property.)
	▪ 3: Closed (Value set in the sn_devops.change_request.closed_state property.)
	Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Authorization	Starting with v2, this API supports token-based authentication. Tokens can be acquired by clicking the **Copy token** button on the tool record, located in the Tool [sn_devops_tool] table. The token can then be used in an authorization header in the format `Authorization: sn_devops.DevOpsToken <tool_sys_id>:<tool_token>`. **Note:** If Basic Auth details (user name and password) are provided in addition to an authorization header with token, Basic Auth takes precedence. If the *devops.system* user is not available in your instance, use the **Switch to this user after token based authentication is successful** property. This property enables setting any user that has the sn_devops.integration role, which is needed to complete the token authentication. For information, see DevOps Change Velocity properties.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters

Name	Description
message	Description of the results of the update. Data type: String
status	Status of the request. Possible values: • Success: Change request was found and change details were updated successfully. • Error: Change request was not found and change details were not updated. Data type: String
updateStatus	Status of the update. Possible values: • Done • Error Data type: String

Example: cURL request

The following code example shows how to update various fields in the CHG0030023 change request.

```
curl -X PUT"
https://instance.servicenow.com/api/sn_devops/v1/devops/orchestr
ation/changeInfo?changeRequestNumber=CHG0030023
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
-H "accept: application/json"\
-u "username":"password"
- D
{
  "short_description": "Test description",
  "priority": "1",
  "start_date": "2021-02-05 08:00:00",
  "end_date": "2022-04-05 08:00:00",
  "justification": "test justification",
  "description": "test description",
  "cab_required": true,
  "comments": "This update for work notes is from jenkins file",
  "work_notes": "test work notes",
  "assignment_group": "a715cd759f2002002920bde8132e7018"
}
```

Response:

```
{
  "result": {
    "updateStatus": "Done",
    "status": "Success",
    "message": "change request update successful"
  }
}
```

DevOps Config API

The *DevOps Config* API provides endpoints to manage your applications.

This API requires the DevOps Config application and is provided within the `sn_devops_config` namespace.

For DELETE, PATCH, and POST operations, the calling user must have the sn_devops_config.admin role. For GET operations, the calling user must have the sn_devops_config.viewer or sn_devops_config.admin role.

Use the *DevOps Config* API for application life cycle management. For more information about managing applications with DevOps Config, see Configuring DevOps Config.

DevOps Config - DELETE /devops_config/application/{appid}

Deletes an application.

URL format

Versioned URL: `/api/sn_devops_config/v1/devops_config/application/{appid}`

Default URL: `/api/sn_devops_config/devops_config/application/{appid}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String
appid	Sys_id of the application to delete. Located in the CDM Application [sn_cdm_application] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Invalid application id.
403	Forbidden. The user doesn't have permission to access the API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON)

Name	Description
error	Error information. This parameter is only returned if the request failed. Data type: Object `"error": { "message": "String", "detail": "String" }`
error.detail	Additional details about why the request failed. Data type: String
error.message	Error message containing the reason the request failed. Data type: String
result	Result object containing information about the request. Data type: Object `"result": { "errors": [Array], "success": [Array] }`
result.errors	Array of errors from the request. The array is empty for successful requests. Data type: Array
result.success	Success message for the request. The array is empty for failed requests. Data type: Array
status	Status of the request. This parameter is only returned if the request failed. Possible value: failure Data type: String

Example: cURL request

This example deletes an application.

```
curl
 "https://instance.service-now.com/api/sn_devops_config/devops_c
onfig/application/38e17dc3473d111072566862736d43c7" \
--request DELETE \
--header "Accept:application/json" \
--user 'username':'password'
```

Response body.

    "success": [
      "CDM Application Demo Application 1234 has been deleted
 successfully."
    ]
  }
}
```

Example: cURL request

This example shows an error response when a user doesn't have permission to access the API.

```
curl
 "https://instance.service-now.com/api/sn_devops_config/devops_c
onfig/application/38e17dc3473d111072566862736d43c7" \
--request DELETE \
--header "Accept:application/json" \
--user 'username':'password'
```

Error response.

```
{
  "error": {
    "message": "User Not Authorized",
    "detail": "Failed API level ACL Validation"
  },
  "status": "failure"
}
```

DevOps Config - GET /devops_config/application/{appid}

Retrieves an application.

URL format

Versioned URL: `/api/sn_devops_config/v1/devops_config/application/{appid}`

Default URL: `/api/sn_devops_config/devops_config/application/{appid}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
appid	Sys_id of the application to retrieve. Located in the CDM Application [sn_cdm_application] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Invalid application id.
403	Forbidden. The user doesn't have permission to access the API.

Response body parameters (JSON)

Name	Description

error	Error information. This parameter is only returned if the request failed.
	
	Data type: Object
	
	`"error": {`
	`  "message": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"detail": "String"
	}</pre>

error.detail	Additional details about why the request failed. Data type: String
error.message	Error message containing the reason the request failed. Data type: String

result	Result object containing information about the request.
	
	Data type: Object
	<pre>"result": {
	"data": {Object},
	"message": "String",
	"status": Number
	}</pre>

result.data	Data for the application.
	
	Data type: Object
	<pre>"data": {
	"appDescription": "String",
	"appId": "String",
	"appManagedByGroups": [Array],
	"appManufacturerId": "String",
	"appManufacturerName": "String",
	"appModelId": "String",
	"appModelName": "String",
	"appModelOwnerId": "String",
	"appModelOwnerName": "String",
	"appName": "String",
	"sdlcType": "String"
	}</pre>

result.data.appDescription	Description of the application. Data type: String
result.data.appId	Sys_id of the application. Located in the CDM Application [sn_cdm_application] table. Data type: String
result.data.appManagedByGroups	Comma-separated list of sys_ids of the groups that manage the application. Located in the Group [sys_user_group] table. Data type: String
result.data.appManufacturerId	Sys_id of the manufacturer. Located in the Company [core_company] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.data.appManufacturerName	Name of the manufacturer. Data type: String
result.data.appModelId	Sys_id of the application model. Located in the Application Model [cmdb_application_product_model] table. Data type: String
result.data.appModelName	Name of the application model. Located in the Application Model [cmdb_application_product_model] table. Data type: String
result.data.appModelOwnerId	Sys_id of the application model owner. Located in the User [sys_user] table. Data type: String
result.data.appModelOwnerName	Name of the application model owner. Data type: String
result.data.appName	Name of the application. Data type: String
result.data.error	Error information. This parameter is only returned if the request failed. Data type: String
result.data.sdlcType	The type of application. Possible values: • application • infrastructure Data type: String
result.message	Information about the successful or unsuccessful outcome of the request. Data type: String
result.status	Status code for the request. Possible values: • 200 • 400 • 403

Name	Description
	Data type: Number
status	Status of the request. This parameter is only returned if the request failed. Possible value: failure Data type: String

Example: cURL request

This example retrieves an application.

```
curl
 "https://instance.service-now.com/api/sn_devops_config/devops_c
onfig/application/38e17dc3473d111072566862736d43c7" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Response body.

```
{
  "result": {
    "status": 200,
    "message": "Success",
    "data": {
      "appName": "Demo Application 1234",
      "appId": "38e17dc3473d111072566862736d43c7",
      "appDescription": "Updated description of Demo Application
 created from REST API",
      "sdlcType": "application",
      "appModelId": "a4e13dc3473d111072566862736d4307",
      "appModelName": "Demo Application 1234",
      "appManufacturerId": "262702654725d950a34a3085d36d435e",
      "appManufacturerName": "",
      "appModelOwnerId": "6816f79cc0a8016401c5a33be04be441",
      "appModelOwnerName": "System Administrator",
      "appManagedByGroups": []
    }
  }
}
```

Example: cURL request

This example shows an error response when a user provides an invalid application id.

```
curl
 "https://instance.service-now.com/api/sn_devops_config/devops_c
onfig/application/18a17de3283d151072566862777777777" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Error response.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "result": {
    "status": 400,
    "message": "No valid Application",
    "data": {
      "error": "No valid Application"
    }
  }
}
```

DevOps Config - PATCH /devops_config/application/{appid}

Updates an application.

URL format

Versioned URL: `/api/sn_devops_config/v1/devops_config/application/{appid}`

Default URL: `/api/sn_devops_config/devops_config/application/{appid}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
appid	Sys_id of the application to update. Located in the CDM Application [sn_cdm_application] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
appDescription	Description of the application. Data type: String
appManagedByGroups	Comma-separated list of sys_ids of the groups that manage the application. The calling user must belong to these groups. Located in the Group [sys_user_group] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	`"appManagedByGroups": "sys_id, sys_id"`
appManufacturerId	Sys_id of the manufacturer. Located in the Company [core_company] table. Data type: String
appModelOwnerId	Sys_id of the application model owner. Located in the User [sys_user] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Application successfully updated.
403	Forbidden. The user doesn't have permission to access the API.
404	Application not updated. The *message* property in the *result* object contains additional information about the error.

Response body parameters (JSON)

Name	Description
error	Error information. This parameter is only returned if the request failed. Data type: Object `"error": { "message": "String", "detail": "String" }`
error.message	Error message containing the reason the request failed. Data type: String
error.detail	Additional details about why the request failed. Data type: String
result	Result object containing information about the application. Data type: Object `"result": { "message": "String", "data": "String" }`
result.message	Information about the successful or unsuccessful outcome of the request. Data type: String
result.data	Sys_id of the application. Located in the CDM Application [sn_cdm_application] table. Data type: String
status	Status of the request. This parameter is only returned if the request failed. Possible value: failure Data type: String

Example: cURL request

This example updates an existing application.

```
curl
 "https://instance.service-now.com/api/sn_devops_config/devops_c
onfig/application/38e17dc3473d11107256862736d43c7" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"appDescription\": \"Updated description of Demo Application
 created from REST API\",
```

  \"appModelOwnerId\": \"6816f79cc0a8016401c5a33be04be441\"
}" \
--user 'username':'password'
```

Response body.

```
{
  "result": {
    "message": "Application with name Demo Application 1234
 updated successfully.",
    "data": "38e17dc3473d1110725668627 36d43c7"
  }
}
```

DevOps Config - POST /devops_config/application

Creates an application.

URL format

Versioned URL: `/api/sn_devops_config/v1/devops_config/application`

Default URL: `/api/sn_devops_config/devops_config/application`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
appDescription	Description of the application. Data type: String
appManagedByGroups	Comma-separated list of sys_ids of the groups that manage the application. The calling user must belong to these groups. Located in the Group [sys_user_group] table. Data type: String `"appManagedByGroups": "sys_id, sys_id"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
appManufacturerId	Sys_id of the manufacturer. Located in the Company [core_company] table. Data type: String
appModelId	Sys_id of an existing application model to use to create the application. Located in the Application Model [cmdb_application_product_model] table. If this parameter is provided, don't provide the *appName*, *appModelName*, *appServiceName*, *appServiceId*, or *technicalServiceId* parameters. Data type: String
appModelName	Name of an existing application model to use to create the application. Located in the Application Model [cmdb_application_product_model] table. If this parameter is provided, don't provide the *appName*, *appModelId*, *appServiceName*, *appServiceId*, or *technicalServiceId* parameters. Data type: String
appModelOwnerId	Sys_id of the application model owner. Located in the User [sys_user] table. Data type: String
appName	Name of the application. Don't use the same name as any existing application. If this parameter is provided, don't provide the *appModelName*, *appModelId*, *appServiceName*, *appServiceId*, or *technicalServiceId* parameters. Data type: String
appServiceId	Sys_id of an existing application service to use to create the application. Located in the Application Service [cmdb_ci_service_auto] table. Use this parameter only when the *type* is `application`. If this parameter is provided, don't provide the *appName*, *appModelName*, *appModelId*, *appServiceName*, or *technicalServiceId* parameters. Data type: String
appServiceName	Name of an existing application service to use to create the application. Located in the Application Service [cmdb_ci_service_auto] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Use this parameter only when the *type* is `application`. If this parameter is provided, don't provide the *appName*, *appModelName*, *appModelId*, *appServiceId*, or *technicalServiceId* parameters. Data type: String
technicalServiceId	Sys_id of an existing dynamic CI group to use to create the application. Located in the Dynamic CI Group [cmdb_ci_query_based_service] table. Use this parameter only when the *type* is `infrastructure`. If this parameter is provided, don't provide the *appName*, *appModelName*, *appModelId*, *appServiceName*, or *appServiceId* parameters. Data type: String
type	Required. The type of application to create. Valid values: • application • infrastructure Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Application successfully created.
403	Forbidden. The user doesn't have permission to access the API.
404	Application not created. The *`message`* property in the *`result`* object contains additional information about the error.

Response body parameters (JSON)

Name	Description

error	Error information. This parameter is only returned if the request failed.
	
	Data type: Object
	
	`"error": {`
	`  "message": "String",`
	`  "detail": "String"`
	`}`

error.message	Error message containing the reason the request failed. Data type: String
error.detail	Additional details about why the request failed. Data type: String

result	Result object containing information about the application.
	
	Data type: Object
	
	`"result": {`
	`  "message": "String",`
	`  "data": "String"`
	`}`

result.message	Information about the successful or unsuccessful outcome of the request. Data type: String
result.data	Sys_id of the application. Located in the CDM Application [sn_cdm_application] table. Data type: String
status	Status of the request. This parameter is only returned if the request failed. Possible value: failure

Name	Description
	Data type: String

Example: cURL request

This example creates a new application.

```
curl
 "https://instance.service-now.com/api/sn_devops_config/devops_c
onfig/application" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"type\": \"application\",
  \"appName\": \"Demo Application 1234\",
  \"appDescription\": \"Description of Demo Application created
 from REST API\",
  \"appManufacturerId\": \"262702654725d950a34a3085d36d435e\",
  \"appModelOwnerId\": \"6816f79cc0a8016401c5a33be04be441\"
}" \
--user 'username':'password'
```

Response body.

```
{
  "result": {
    "message": "Application with name Demo Application 1234
 created successfully.",
    "data": "38e17dc3473d111072566862736d43c7"
  }
}
```

Email API

The *Email* API provides endpoints that enable you to receive and send email messages using REST.

Users must have the email_api_send role to send email.

Note: You might get errors if you do not have read/write access to the Email [sys_email] table.

Email - GET /now/email/{id}

Returns the email details for the specified email record.

URL format

Versioned URL: `/api/now/{api_version}/email/{id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the email for which to return details. Located in the Email [sys_email] table.

Query parameters

Name	Description
sysparm_fields	Comma-separated list of fields to return in the response. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Indicates the record is not found or the requesting user does not have access to the record. Verify the user has the proper role and access permissions.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
bcc	List of the email addresses of the blind copied recipients of the email message. Maps to the blind_copied field. Data type: Array
cc	List of the email addresses of the copied recipients for the email message. Maps to the copied field. Data type: Array
headers	Name-value pairs of the headers associated with the message and their values. Data type: Object
html	HTML-enabled body of the email message. Maps to the body field. Data type: String
id	Sys_id of the email record. Data type: String
importance	Importance of the email message. Maps to the importance field. Data type: String
state	Processing state of the email message. Indicates whether the system scheduled jobs have processed the email message. Values include: • error • ignored • processed • ready Data type: String
subject	Subject of the email message. Maps to the subject field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String
text	Text-only body of the email message. Maps to the body_text field. Data type: String
to	List of the email addresses of the direct recipients of the email message. Maps to the recipients field. Data type: Array
type	Current state of the email message as incoming or outgoing mail. Values include: • received • received-ignored • send-failed • send-ignored • send-ready • sent Data type: String

Example: Sample cURL request

```
curl
 "http://instance.servicenow.com/api/now/email/06e095427f0022007
f005212bdfa91b3" \
--request GET \
--header "Accept:application/json" \
--user "user-name":"password"
```

```

Request body parameters (XML or JSON)

Element	Description
bcc	List of the email addresses of the blind copied recipients of the email message. Maps to the blind_copied field. **Note:** You can only specify up to 100 addresses in this field. Data type: Array
cc	List of the email addresses of the copied recipients for the email message. Maps to the copied field. **Note:** You can only specify up to 100 addresses in this field. Data type: Array
headers	Name-value pairs of the headers associated with the message and their values. Data type: Object
html	HTML-enabled body of the email message. Maps to the body field. Data type: String
importance	Importance of the email message. Maps to the importance field. Data type: String
subject	Subject of the email message. Maps to the subject field. Data type: String
table_name	Name of the table to save the email. Use this parameter to associate an email message to a particular related record elsewhere in the system. **Note:** This parameter also requires specifying the *table_record_id* parameter. Data type: String
table_record_id	Target-related record to which the email applies. Use this parameter to associate an email message to a particular related record elsewhere in the system. **Note:** This parameter also requires specifying the *table_name* parameter. Data type: String
text	Text-only body of the email message. Maps to the body_text field. Data type: String
to	Required. List of the email addresses of the direct recipients for the email message. Maps to the recipients field.

Request body parameters (XML or JSON) (continued)

Element	Description
	Note: You can only specify up to 100 addresses in this field. Data type: Array

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Requesting user does not have access to the record. Verify that the user has the proper role and access permissions.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
href	Link to the email record as an Email API GET request. Data type: String
id	Sys_id of the Email record. Data type: String
links	List of links to the Email record. Data type: Array
rel	Type of link listed in the *href* parameter. Possible values: • self: The Email API GET request for the Email record. • status: The Email API GET request for the Email record showing only the id, type, state, and error fields. Data type: String

Example: Sample cURL request

```
curl "http://instance.servicenow.com/api/now/email" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user 'username':'password'\
--data "{
  \"to\": [
    \"User1 <user1@example.com>\",
    \"User2 <user2@example.com>\"
  ],
  \"cc\": [
    \"User3 <user3@example.com>\",
    \"User4 <user4@example.com>\"
  ],
  \"bcc\": [
    \"User5 <user5@example.com>\",
    \"User6 <user6@example.com>\"
  ],
  \"subject\": \"Hello There\",
  \"text\": \"Test Message\",
  \"html\": \"<b>Test Message</b>\",
  \"table_name\": \"incident\",
  \"table_record_id\": \"136b2140bd0312004d7d1371f1abbdb6\",
  \"headers\": {
    \"X-Custom\": \"header\"
  }
}"
```

     }
   ]
 }
}
```

Entitlement API

The *Entitlement* API provides endpoints to create and retrieve entitlement records from an instance.

Entitlement checks occur as part of post-sales support services for customers that purchase a product, such as an appliance or computer. Entitlement checks are made by agents to determine what services customers are eligible to receive for the products they've purchased. Use the *Entitlement* API to define and retrieve entitlements.

This API accesses and stores data in the following tables:

- Account [customer_account]
- Consumer [csm_consumer]
- Household [csm_household]
- Install Base [sn_install_base_item]
- Product Model [cmdb_model]
- Product Offering [sn_prd_pm_product_offering]
- Sold Product [sn_install_base_sold_product]

To access this API, the following plugins must be activated on the associated instance:

- Customer Contracts and Entitlements (com.sn_pss_core)
- Customer Service Install Base Management (com.snc.install_base)
- Product Catalog Management Core (com.sn_prd_pm)

In addition, to successfully call this API you must have the sn_pss_core.pss_integrator role. This API runs in the `sn_pss_core` namespace.

Entitlement - GET /sn_pss_core/entitlement/{id}

Returns the specified entitlement record, its associated coverage, and its latest usage details.

The following is the list of tables in which the entitlement data is stored:

- Characteristics [sn_pss_core_entitlement_characteristic]
- Entitlement [service_entitlement]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Entitlement Usage [sn_pss_core_entitlement_usage]
- Sold Product Covered [sn_install_base_m2m_contract_sold_product] - This table contains information for both sold products covered and install base items covered.

URL format

Versioned URL: `/api/sn_pss_core/v1/entitlement/{id}`

Default URL: `/api/sn_pss_core/entitlement/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the entitlement record to retrieve. Located in the Entitlement [service_entitlement] table. Data type: String

Query parameters

Name	Description
display_value	Type of data to return. Valid values: • false: Return the `value` for all fields. For example, `"state":"draft"`. • true: Return the `display_value` for all fields. For example, `"state":"Draft"` • all: Return all information for all fields. Data type: String Default: false

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
account	Sys_id of the account record to which the entitlement belongs. Data type: String Table: Account [customer_account]
consumer	Sys_id of the consumer record to which the entitlement belongs. Data type: String Table: Consumer [csm_consumer]
contract	Sys_id of the contract record to which the entitlement belongs. Data type: String

Name	Description
	Table: Service Contract [sn_pss_core_service_contract]
end_date	End date of the entitlement. Data type: String Format: yyyy-mm-dd Default: Never ends until manually removed.
entitlement_characteristics	List of characteristics associated with the entitlement. The data in this array is inserted in the Characteristic [sn_pss_core_entitlement_characteristic] table. Data type: Array of Objects `"entitlement_characteristics" [{ "characteristic": "String", "characteristic_option": "String", "entitlement": "String", "entitlement_usage": [Array], "service_contract_line": "String", "sys_created_by": "String", "sys_created_on": "String", "sys_id": "String", "sys_updated_by": "String", "sys_updated_on": "String", "type": "String", "value": "String" }]`
entitlement_characteristics. characteristic	Sys_id of the characteristic record associated with the entitlement. Data type: String Table: Characteristic [sn_prd_pm_characteristic]
entitlement_characteristics. characteristic_option	Sys_id of the characteristic option record associated with the entitlement. Data type: String Table: Characteristic Option [sn_prd_pm_characteristic_option]
entitlement_characteristics. entitlement	Sys_id of the associated entitlement record. Data type: String Table: Entitlement [service_entitlement]
entitlement_characteristics. entitlement_usage	List of entitlement usages associated with the entitlement characteristic. Data type: Array of Objects

}
```

Entitlement - POST /sn_pss_core/entitlement

Creates an entitlement record and all its related detail records.

The following is the list of tables in which the entitlement data is stored:

- Characteristic [sn_pss_core_entitlement_characteristic]
- Entitlement [service_entitlement]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Entitlement Usage [sn_pss_core_entitlement_usage]
- Sold Products Covered [sn_install_base_m2m_contract_sold_product] - This table contains information for both sold products covered and install base items covered.

URL format

Versioned URL: `/api/sn_pss_core/v1/entitlement`

Default URL: `/api/sn_pss_core/entitlement`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
account	Required if the *`consumer`* parameter is not passed. Sys_id of the account record to which the entitlement belongs. Data type: String Table: Account [customer_account]
consumer	Required if the *`account`* parameter is not passed. Sys_id of the consumer record to which the entitlement belongs. Data type: String Table: Consumer [csm_consumer]
end_date	End date of the entitlement. Data type: String Format: yyyy-mm-dd Default: Never ends until manually removed.
entitlement_characteristics	List of characteristics associated with the entitlement. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description

	<pre>"entitlement_characteristics": [
	  {
	  "characteristic": "String",
	  "characteristic_option": "String",
	  "entitlement_usage": {Object},
	  "type": "String",
	  "value": "String"
	  }
	]</pre>
	Stored in: Characteristic [sn_pss_core_entitlement_characteristic]

entitlement_characteristics.characteristic	Required. Sys_id of the characteristic record associated with the entitlement. Data type: String Table: Characteristic [sn_prd_pm_characteristic]
entitlement_characteristics.characteristic_option	Sys_id of the characteristic option record associated with the entitlement. Data type: String Table: Characteristic Option [sn_prd_pm_characteristic_option]

entitlement_characteristics.entitlement_usage	Used unit value for the associated entitlement characteristic.
	
	Only pass this parameter if the entitlement_characteristics are under the entitlement.
	
	Data type: Object
	<pre>"entitlement_usage": {
	  "used_units": "String"
	}</pre>
	Stored in: Entitlement Usage [sn_pss_core_entitlement_usage]

entitlement_characteristics.entitlement_usage.usage_units	Usage of the associated entitlement characteristic. Data type: String
entitlement_characteristics.type	Type of entitlement characteristic. Valid values: • coverage • coverage_and_usage Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
entitlement_characteristics.value	Required if the *input_type* parameter contained in the record specified in the *entitlement_characteristics.characteristic* parameter, is not `choice`. Value of the characteristic. Data type: String
entitlement_name	Required. Name of the entitlement. Data type: String
household	Only passed when the household plugins are active and the *consumer* parameter is passed. Sys_id of the household record associated with the entitlement. Data type: String Table: Household [csm_household]
install_base_items_covered	List of install base items covered under the entitlement. The information in this array is inserted in the Sold Product Covered#[sn_install_base_m2m_contract_sold_product] table. Data type: Array of Objects `"install_base_items_covered": [ { "added": "String", "install_base": "String", "removed": "String" } ]` For more information on Install Base Items Configure install base.
install_base_items_covered.added	Date that the associated install base item was added to the entitlement. Data type: String Format: yyyy-mm-dd Default: Current date
install_base_items_covered. install_base	Sys_id of the associated install base item record. Data type: String Table: Install Base Item [sn_install_base_item]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
install_base_items_covered.removed	Date that the associated install base item was removed from the entitlement. Data type: String Format: yyyy-mm-dd Default: No end date
product	Sys_id of the product model record associated with the entitlement. Data type: String Table: Product Model [cmdb_model]
product_offering	Sys_id of the product offering record associated with the entitlement. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
sold_entitlement	Sys_id of the sold product record associated with the entitlement. Data type: String Table: Sold Product [sn_install_base_sold_product]
sold_products_covered	List of products covered under the entitlement. The data in this parameter is inserted in the Sold Product Covered [sn_install_base_m2m_contract_sold_product] table. Data type: Array of Objects `"sold_products_covered": [ { "added": "String", "removed": "String", "sold_product": "String" } ]`
sold_products_covered.added	Date that the associated sold product was added to the entitlement. Data type: String Format: yyyy-mm-dd Default: Current date
sold_products_covered.removed	Date that the associated sold product was removed from the entitlement.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String Format: yyyy-mm-dd Default: No end date
sold_products_covered.sold_product	Sys_id of the product covered by the entitlement. Data type: String Table: Sold Product [sn_install_base_sold_product]
start_date	Required. Start date of the entitlement. Data type: String Format: yyyy-mm-dd
state	Required. Current state of the entitlement. Valid values: (case-sensitive) • active • cancelled • draft • expired • suspended Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed and the records were created.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have permission to access the API.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
entitlement_characteristics	List of the entitlement characteristic objects#created under the entitlement. Data type: Array of Objects `"entitlement_characteristics" [ { "entitlement_usage": {Object}, "sys_id": "String" } ]`
entitlement_characteristics.entitlement_usage	Entitlement usage object inserted under the entitlement_characteristic. Data type: Object `"entitlement_usage": { "sys_id": "String" }`
entitlement_characteristics.entitlement_usage.sys_id	Sys_id of the entitlement usage record. Data type: String Table: Entitlement Usage [sn_pss_core_entitlement_usage]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
entitlement_characteristics.sys_id	Sys_id of a entitlement characteristics record associated with the entitlement. Located in the Characteristic [sn_pss_core_entitlement_characteristic] table. Data type: String
entitlement_name	Name of the entitlement. Data type: String
install_base_items_covered	List of sys_ids of the install base items covered under the entitlement. Data type: Array of Objects `"install_base_items_covered": [ { "sys_id": "String" } ]`
install_base_items_covered.sys_id	Sys_id of a install base items covered by the entitlement. Data type: String Table: Sold Product Covered [sn_install_base_m2m_contract_sold_product]
sold_prodocts_covered	List of sys_ids of the products covered under the entitlement. Data type: Array of Objects `"sold_products_covered": [ { "sys_id": "String" } ]`
sold_products_covered.sys_id	Sys_id of a product associated with the entitlement. Data type: String Table: Sold Product Covered [sn_install_base_m2m_contract_sold_product]
sys_id	Sys_id of the associated entitlement record. Data type: String Table: Entitlement [service_entitlement]

Example: cURL request

The following example shows how to create an entitlement template.

```
curl
 "https://instance.servicenow.com/api/sn_pss_core/entitlement" \
--request POST \
```

    }
}
```

Event Management Topic Open API

The *Event Management Topic Open* API provides an endpoint that enables you to send a topic through your message broker and store it on a ServiceNow instance.

Using this API you can store topics created through your message broker in the ServiceNow Topic [topic] table.

This API runs in the `sn-api-notif-mgmt` namespace and requires the sn_api_notif_mgmt.event_mgmt_integration role.

Event Management Topic Open - POST /sn_api_notif_mgmt/topic

Creates a new record in the Topic [sn_api_notif_mgmt_topic] table and saves the passed topic information to that record.

Use this endpoint to synchronize topics created in your message-bus middleware with those in your ServiceNow instance.

When topics are created using this endpoint, the user_created field in the associated topic record is set to `false` and the type field is set to `egress`.

URL format

Versioned URL: `/api/sn_api_notif_mgmt/v1/topic`

Default URL: `/api/sn_api_notif_mgmt/topic`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
contentQuery	Filter to apply to the payload of the event. This query is a deeper event filter that is used to find in as event severity or ticket type. You can pass this parameter as a nested query. For example, for the following trouble ticket event payload, this query applies to the attributes tha *"event"* object of the payload:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description

	<pre>{
	  "eventId":"dc2003c2c3bb3550054e20bdc0013136",
	  "@type":"Troubleticket",
	  "eventType":"TroubleTicketCreateEvent",
	  "event":{
	  "troubleTicket":{
	  "short_description":"Test payload",
	  "severity":3,
	  "ticketType":"incident"
	  }
	  }
	}</pre>
	This parameter supports the following conditions:
	• AND: such as `variable1=value1&variable2=value2&variable3=value3`
	• OR: such as `variable1=value1,value2,value3`
	• Hierarchical variables: such as `variable1.variable2.variable3=value1`
	For example: `"contentQuery": "troubleTicket.ticketType=incident&troubleTicket.severity=1",`
	This field is mapped to the content_query field in the associated topic record.
	For additional information, refer to the TMF688 Event Management API User Guide.
	Data type: String

externalId	Unique external identifier for the topic, such as a GUID. This field is mapped to the topic_id field i associated Topic record. Data type: String
headerQuery	Filter to apply to the event header properties. This query defines the type of events to listen to fo associated topic. You can pass this parameter as a nested query. This parameter supports the following conditions: • AND: such as `variable1=value1&variable2=value2&variable3=value3` • OR: such as `variable1=value1,value2,value3` • Hierarchical variables: such as `variable1.variable2.variable3=value1` For example: `"headerQuery": "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttributeCh` This field is mapped to the header_query field in the associated topic record. For additional information, refer to the TMF688 Event Management API User Guide. Data type: String
name	Name of the topic. This field is mapped to the topic_name field in the associated topic record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Data type: String
namespace	Namespace for the topic. Empty if there is no associated namespace. This field is mapped to the namespace field in the associated topic record. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	`Topic external id passed already exists. Please pass the unique topic external id`: Indicates that passed external ID already exists in the Topic table. `Please pass the unique combination of topic name, header query, content query and namespace` : Indicates that the combination of topic name, namespace, header query, and content query already exists.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters

Name	Description
contentQuery	Value of the content_query field in the created topic record. Data type: String
externalId	Value of the topic_id field in the created topic record. Data type: String
headerQuery	Value of the header_query field in the created Topic record. This field is used by the topic picker framework to determine what event messages should be sent to a topic. Data type: String
id	Sys_id of the created topic record. Data type: String
name	Name of the topic. Data type: String
namespace	Value of the namespace field in the created topic record. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "http://instance.servicenow.com/api/sn_api_notif_mgmt/topic" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
--data
{
  "name": "HighPriorityTroubleTicket",
  "headerQuery":
 "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttribut
eChangeEvent",
  "contentQuery":
 "troubleTicket.ticketType=incident&troubleTicket.severity=1",
  "externalId": "ext001",
  "namespace": "telecomEvents"
}
```

Response:

```
{
  "externalId": "ext001",
  "name": "HighPriorityTroubleTicket",
```

```
  "headerQuery":
 "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttribut
eChangeEvent",
  "contentQuery":
 "troubleTicket.ticketType=incident&troubleTicket.severity=1",
  "namespace": "telecomEvents",
  "id": "7ee9850443c3f550461f99612bb8f223"
}
```

Event Notification Management Open API

The *Event Notification Management Open* API provides an endpoint to create, update, and delete events from the Events [em_event] table.

The *Event Notification Management Open* API (sn_ind_tmf688) is a ServiceNow implementation of the TM Forum Open API specification. This API is based on TMF688 Event Management API User Guide v4.0.0. You can locate additional alarm information in the TMF642 Alarm Management API User Guide.

This API can be extended to make customizations around required parameters, request body validation, additional REST operations, and field mappings. For more information, see the Event Notification Management Open API Developer Guide.

Event Notification Management Open API – POST instance_name/scope_id/GUID

Places the payload of the associated request in the NowMQ queue. This queue is then processed in the background to create, update, and delete events within the Events [em_event] table.

This endpoint is different than other endpoints in the ServiceNow platform. Instead of having an endpoint for each specific task, such as create, update, and delete, there's only a single endpoint for all functionality. The parameter *eventType* in the call payload determines the task to perform based on its passed value of `AlarmCreateEvent`, `AlarmUpdateEvent`, or `AlarmDeleteEvent`.

The format of the REST call is also different than standard REST implementations. Each external system that will use this API, such as Kafka, database monitors, or other applications, must first register with the ServiceNow platform. They must also have their own webhook in place that uses the information provided during registration to generate the signature required to call this endpoint, including the `instance_name`, application `scope_id`, and unique `GUID`. The `GUID` identifies the external network system that the request came from.

The payload that you pass for this endpoint must correlate with the payload that is defined in the `TMFAlarmAPIConstants` script include for the corresponding *eventType* parameter value. Any parameters that are passed in the payload and not defined in the schema are ignored by the endpoint.

- `AlarmCreateEvent`: `ALARM_CREATE_EVENT_SCHEMA`
- `AlarmUpdateEvent`: `ALARM_CHANGE_EVENT_SCHEMA`
- `AlarmDeleteEvent`: `ALARM_DELETE_EVENT_SCHEMA`

URL format

Default URL: `<instance_name>/<scope_id>/<GUID>`

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (continued)

Name	Description

	<pre>"id": "String"
	},
	]</pre>

event.alarm.affectedService.href	URL reference providing details of the affected service. Data type: String
event.alarm.affectedService.id	Identifier of the service affected by the alarm. This value maps to the affected configuration item (CI) on the alert. Data type: String

event.alarm.alarmedObject	Required when creating an event.
	Details of the alarm object.
	
	Data type: Object
	<pre>"alarmedObject":
	{
	"href": "String",
	"id": "String"
	}</pre>

event.alarm.alarmedObject.href	Required when creating an event. URL reference to get the details of the alarm object. Data type: String
event.alarm.alarmedObject.id	Required when *eventType* is `AlarmCreateEvent`. Unique identifier of the alarm object. This value maps to a CI in the system. Data type: String
event.alarm.alarmType	Required when *eventType* is `AlarmCreateEvent`. Type of alarm. Used to categorize the alarm. For example: "QualityOfServiceAlarm" Data type: String

event.alarm.crossedThresholdInfomation	Details about the crossed threshold.
	
	Data type: Object
	<pre>"crossedThresholdInformation":
	{
	"thresholdId": "String"
	}</pre>

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
event.alarm.crossedThresholdInfomation.thresholdId	Unique identifier of the threshold that caused the alarm. Data type: String
event.alarm.externalAlarmId	Required when *eventType* is `AlarmCreateEvent`. Required when *eventType* is `AlarmDeleteEvent` or `AlarmChangeEvent` if the *Id* parameter is not specified. Unique identifier for the alarm from the source system posting the alarm. Data type: String
event.alarm.href	URL reference to the alarm. For example: "http://api/alarm/ROUTER_IF@Cisco-0000-0-0-0-0-00-00-0--Xz0/00@00" Data type: String
event.alarm.id	Required when *eventType* is `AlarmDeleteEvent` or `AlarmChangeEvent` if *externalAlarmId* is not specified. Unique identifier of the alarm. Specified by the alarm owning system. For example: "8675399" Data type: String
event.alarm.perceivedSeverity	Required when *eventType* is `AlarmCreateEvent`. Possible severities associated with the alarm. The values are consistent with ITU-T Recommendation X.733. After an alarm has been cleared, its perceived severity is set to 'CLEAR' and can no longer be set. Possible values: • CLEAR • CRITICAL • MAJOR • MINOR • WARNING

Request body parameters (continued)

Name	Description
	Data type: String
event.alarm.probableCause	Required when *eventType* is `AlarmCreateEvent`. Most likely situation to trigger the alarm. Use with *alarmType* to qualify the alarm. The possible values are consistent with ITU-T Recommendation X.733 or 3GPP TS 32.111-2 Annex B. For example: "Threshold crossed" Data type: String
event.alarm.sourceSystemId	Required when *eventType* is `AlarmCreateEvent`. Unique identifier of the source system of the alarm. For example: "SOURCE_SYSTEM_vManage_00000_000_00" Data type: String
event.alarm.specificProblem	Specific problem that triggers the alarm. Use with *probableCause* to qualify the alarm. For example: "Inbound Traffic threshold crossed" Data type: String
eventType	Required. Type of event to process. Valid values: • AlarmChangeNotification • AlarmCreateNotification • AlarmDeleteNotification Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Returned for every call regardless of the actual processing status of the call. Only indicates that the endpoint received the request.

Response body parameters

Name	Description
None	This endpoint is asynchronous and therefore doesn't return any response data.

Example: cURL request

The following shows the possible payload for a create alarm event. This example reflects the parameters that are in the default implementation (`AlarmCreateEventSchema`).

```
--data "{
  "eventType": "AlarmCreateNotification",
  "event": {
    "alarm": {
      "id": "",
      "externalAlarmId": "ext123456",
      "alarmType": "QualityOfServiceAlarm",
      "perceivedSeverity": "MINOR",
      "alarmedObject": {
        "id": "vManage_OOOOOO",
        "href": " http://api/alarmedobject/OOOOOO"
      },
      "probableCause": "Threshold crossed",
      "sourceSystemId": "SOURCE_SYSTEM_vManage_OOOOO_OOO_OO",
      "href":
 "http://api/alarm/ROUTER_IF@Cisco-OOOO-O-O-O-O-OO-OO-O--
 XzO/OO@OO",
      "specificProblem": "Inbound Traffic threshold crossed",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "crossedThresholdInformation": {
        "thresholdId": "12fasdfasdfasd"
      },
      "affectedService": [
        {
          "id": "SD WAN Enterprise Solutions",
          "href": "http://api/service/vlan_dot0_dot0"
        }
      ]
    }
  }
}
```

No response returned.

Example: cURL request

The following shows the possible payload for a change alarm event. This example reflects the parameters that are in the default implementation (`AlarmChangeEventSchema`).

```
--data "{
  "eventType": "AlarmChangeEventSchema",
  "event": {
    "alarm": {
      "id": "",
      "externalAlarmId": "ext123456",
      "perceivedSeverity": "MAJOR",
      "probableCause": "Threshold crossed",
      "crossedThresholdInformation": {
        "thresholdId": "12fasdfasdfasd"
      },
      "affectedService": [
        {
          "id": "SD WAN Enterprise Solutions",
          "href": "http://api/service/vlan_dot0_dot0"
        }
      ]
    }
  }
}
```

No response returned.

Example: cURL request

The following shows the possible payload for a delete (clear) alarm event. This example reflects the parameters that are in the default implementation (`AlarmDeleteEventSchema`).

```
--data "{
  "eventType": "AlarmDeleteEventSchema",
  "event": {
    "alarm": {
      "id": "",
      "externalAlarmId": "ext123456",
      "perceivedSeverity": "MAJOR",
      "probableCause": "Threshold crossed",
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "crossedThresholdInformation": {
        "thresholdId": "12fasdfasdfasd"
      }
    }
  }
}
```

No response returned.

External Content Ingestion API

The *External Content Ingestion* API provides endpoints that enable ingestion of content from sources outside of your ServiceNow® instance into the ServiceNow® AI Search application's index.

External Content Ingestion API – DELETE /ais/external_content/deleteByQuery/{schema_table_name}

Deletes all external documents that match the specified query from the AI Search index.

URL format

Versioned URL: `/api/now/{api_version}/ais/external_content/deleteByQuery/{schema_table_name}?query={query}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
schema_table_name	The name of the external content schema table that defines the schema for the indexed documents to delete. For example, `u_ext_content`. Data type: String

Query parameters

Name	Description
query	A valid URL-escaped query for the schema table specified by *schema_table_name*. For example, `title=Introduction` to query for documents whose title is `Introduction`. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	Object describing the error encountered during processing of the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Details of the error encountered during processing of the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
error.message	Message for the error encountered during processing of the request. Data type: String
result	Result from a successfully processed request. Data type: String
status	Status of an unsuccessful request. Valid values: • *failure* Data type: String

Example: cURL request

Delete documents with title field values `Introduction` and `Report for 31 October 2020` from the u_ext_content schema table.

```
curl
 "https://instance.service-now.com/api/now/v2/ais/external_conte
nt/deleteByQuery/u_ext_content?query=title%3DIntroduction%20OR%2
0title%3DReport%20for%2031%20October%202020" \
--request DELETE \
--user "username":"password" \
--header "Accept: application/json"
```

```
{
  "result": "Delete By Query Successfully Executed"
}
```

External Content Ingestion API – DELETE /ais/external_content/deleteDocument/{schema_table_name}/{document_id}

Deletes the external document with a specified unique identifier from the AI Search index.

URL format

Versioned URL: `/api/now/{api_version}/ais/external_content/deleteDocument/{schema_table_name}/{document_id}`

Supported request parameters

Path parameters

Parameter	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Parameter	Description
	Data type: String
document_id	The unique identifier for the external document to delete. For example, `ADMIN-2027858531-16`. Data type: string
schema_table_name	The name of the external content schema table that defines the schema for the indexed document to delete. For example, `u_ext_content`. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
error	Object describing the error encountered during processing of the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Details of the error encountered during processing of the request. Data type: String
error.message	Message for the error encountered during processing of the request. Data type: String
result	Result from a successfully processed request. Data type: String
status	Status of an unsuccessful request. Valid values: • *failure* Data type: String

Example: cURL request

Delete the document with identifier `ADMIN-2587918521-27` from the u_ext_content schema table.

```
curl
 'https://instance.service-now.com/api/now/v2/ais/external_conte
nt/deleteDocument/u_ext_content/ADMIN-2587918521-27' \
--request DELETE \
```

```
--user 'username':'password' \
--header 'Accept: application/json'
```

```
{
  "result":"Document removed"
}
```

External Content Ingestion API – POST /ais/external_content/ingestDocument/{schema_table_name}

Sends a list of external documents to the AI Search ingestion batcher for indexing. After indexing completes, content from the ingested documents becomes searchable.

You can use this endpoint to feed external documents with text content and metadata.

If you need to associate searchable binary content and metadata with an external document, follow these steps:

1. Store the binary content in AI Search using the *POST /ais/external_content/storeContent* endpoint. Record the value of the *result* response body parameter.
2. Send the external document to AI Search using this endpoint. Set the document's *content_pointer* request body parameter to match the recorded *result* response body parameter value.

During ingestion, AI Search parses the binary content and adds its searchable content to the indexed record that represents the external document. Parsing removes the stored content object.

URL format

Versioned URL: `/api/now/{api_version}/ais/external_content/ingestDocument/{schema_table_name}`

Supported request parameters

Path parameters

Parameter	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
schema_table_name	The name of the external content schema table that defines the schema for external documents in the request. For example, `u_ext_content`. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Element	Description
[array]	Required. Unnamed array of objects in which each object represents an external document to ingest for indexing. Data type: Array `[ { "content_pointer": "String", "document_id": "String", "principals": {Object}, "properties": {Object} } ]`
[array].content_pointer	Identifier for an instance of binary content stored using the *POST /ais/external_content/storeContent* endpoint. During ingestion, AI Search parses the binary content and adds its searchable content to the indexed record that represents the external document. Parsing removes the stored content object. **Note:** This identifier should match the *result* response body element returned by the *storeContent* endpoint. Data type: String
[array].document_id	Required. Unique identifier for the external document in the external content schema table specified by the *schema_table_name* path parameter. **Note:** When you ingest a document, it overwrites any existing document in the same external content schema table that has the same *document_id*. If two or more documents in the same ingestion request have the same *document_id*, the request fails. Data type: String
[array].principals	Object containing key-value pairs that describe the external document's access permissions for externally defined security principals (users and groups).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Element	Description
	Note: If you omit this parameter for a document, the request succeeds, but AI Search rejects the document with the ingestion feedback message `The principal of the document is missing`. If this parameter object does not include any key-value pairs that grant access to a document, the request succeeds, but AI Search rejects the document with the ingestion feedback message `The principal of the document is invalid`. Data type: Object `"principals": { "everyone": Boolean, "groups.deny": [Array], "groups.read": [Array], "none": Boolean, "users.deny": [Array], "users.read": [Array] }` Versions supported: Available starting in v2 of the API.
[array].principals.everyone	Flag that indicates whether access to the external document is allowed for all users. When this parameter is set to *true*, all ServiceNow AI Platform users can view the indexed record created from the document. **Note:** If you set both this parameter and *[array].principals.none* to *true* for a document, the request succeeds, but AI Search rejects the document with ingestion feedback message `The principal of the document is invalid`. You can only set one of these two parameters to *true* in a request. Valid values: • *true*: Allow access to the document for all users. AI Search ignores all *[array].principals.groups.** and *[array].principals.users.** parameter settings for the document. • *false*: Do not allow all users to access the external document. Users can only access the document if *[array].principals.none* is set to false and if allowed by the interaction of their user mappings and the *[array].principals.groups.** and *[array].principals.users.** parameters. Data type: Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Element	Description
	Default: *true* Versions supported: Available starting in v2 of the API.
[array].principals.groups.deny	Array of strings where each string is the name of an externally defined group that is denied access to the external document. ServiceNow AI Platform users mapped to any of these external groups cannot view the indexed search result record created from the document. If either *[array].principals.everyone* or *[array].principals.none* is set to *true*, this parameter has no effect. This parameter takes precedence over *[array].principals.groups.read*. If the same user is mapped to external groups with both read and deny access permissions for a document, AI Search denies that user access to the indexed record. By default, *[array].principals.users.read* takes precedence over this parameter. To reverse this precedence order for an indexed source, see Change the precedence of user read and group deny permissions for an external content indexed source. . Data type: Array Values can be in any format, depending on the names of the externally defined groups specified. Examples include: `"groups.deny": [ "hr-admin", "legal" ]` Versions supported: Available starting in v2 of the API.
[array].principals.groups.read	Array of strings where each string is the name of an externally defined group that is allowed to access the external document. ServiceNow AI Platform users mapped to any of these external groups can view the indexed search result record created from the document. If either *[array].principals.everyone* or *[array].principals.none* is set to *true*, this parameter has no effect. *[array].principals.groups.deny* takes precedence over this parameter. If the same user is mapped to external groups with both read and deny access permissions for a document, AI Search denies that user access to the indexed record.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Element	Description
	Data type: Array Values can be in any format, depending on the names of the externally defined groups specified. Examples include: `"groups.read": [ "devops", "it", "report-admins" ]` Versions supported: Available starting in v2 of the API.
[array].principals.none	Boolean option indicating whether access to the external document is denied for all users. When this parameter is set to *true*, only ServiceNow AI Platform users with the ais_high_security_admin elevated privilege role can view the indexed record created from the document. **Note:** If you set both this parameter and *[array].principals.everyone* to *true* for a document, AI Search rejects the document during ingestion with error message `The principal of the document is invalid`. You can only set one of these two parameters to *true* in a request. Valid values: • *true*: Deny access to the document for all users except those with the ais_high_security_admin elevated privilege role. AI Search ignores all *[array].principals.groups.** and *[array].principals.users.** parameter settings for the document. • *false*: Do not deny access to the document for all users. Users can access the document if *[array].principals.everyone* is set to *true*, or if allowed by the interaction of their user mappings and the *[array].principals.groups.read* and *[array].principals.users.read* parameters. Data type: Boolean Default: *false* Versions supported: Available starting in v2 of the API.
[array].principals.users.deny	Array of strings where each string is the name of an externally defined user that is denied access to the external document. ServiceNow AI Platform users mapped to any of these external users cannot view the indexed search result record created from the document.

Request body parameters (XML or JSON) (continued)

Element	Description
	Versions supported: Available starting in v2 of the API.
[array].properties	Object containing name-value pairs where each pair represents a field name and value to ingest for the document. All field names and values must be specified as strings. After ingestion, these document field values are accessible through the indexed source defined for the external content schema table specified by the *schema_table_name* path parameter. Users can search for these field values in search sources derived from this indexed source. Data type: Object Field names can only contain lowercase letters and underscores. Values can include any characters. Value length is limited by the *max_length* attribute defined for the field in the external content schema table. Examples of field name-value pairs include: `"properties": { "creation_date": "2020-11-03 12:27:43", "file_size": "10285", "title": "Introduction", "url": "file:///myhost/reports/Introduction.pdf" }`

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
202	Partial Success. The request was processed. Some documents have ingestion feedback warning or error messages.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	Object describing the error encountered during processing of the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Details of the error encountered during processing of the request. Data type: String
error.message	Message for the error encountered during processing of the request. Data type: String
result	JSON-formatted string representing the result object for the ingestion request. Data type: String `"result": "{\"duration_in_ms\": Number, \"feedback\": [Array] }"`
result.duration_in_ms	Time spent ingesting the external documents. Data type: Number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Unit: Milliseconds
result.feedback	Array of objects in which each object represents feedback for a document ingested from the request body. Data type: Array `"feedback": [ { "document_id": "String", "messages": [Array] } ]`
result.feedback.document_id	Unique identifier for the external document as specified in the request body. Data type: String
result.feedback.messages	Array of unnamed objects in which each object represents an ingestion feedback message logged during indexing of the external document. Data type: Array `"messages": [ { "code": "String", "component": "String", "level": "String", "message": "String" } ]`
result.feedback.messages.code	Code for an exception thrown by the indexing workflow component that logged the ingestion feedback message. Data type: String
result.feedback.messages.component	Identifier for the indexing workflow component that logged the ingestion feedback message. Data type: String
result.feedback.messages.level	Logging level for the ingestion feedback message. Valid values: • *ERROR* • *INFO*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• *MINOR_ERROR* • *WARN* Data type: String
result.feedback.messages.message	Text logged for the ingestion feedback message. Data type: String
status	Status of an unsuccessful request. Valid values: • *failure* Data type: String

Precedence order for principal permissions

The precedence order for *[array].principals* permissions depends on the value of the *user_read_takes_precedence_over_group_deny* attribute for the indexed source used to ingest an external document.

Attribute value	Precedence order for principal permissions
true	From highest precedence to lowest: **1.** *[array].principals.everyone*, *[array].principals.none* **2.** *[array].principals.users.deny* **3.** *[array].principals.users.read* **4.** *[array].principals.groups.deny* **5.** *[array].principals.groups.read* **Note:** This is the default attribute value for external content indexed sources.
false	From highest precedence to lowest: **1.** *[array].principals.everyone*, *[array].principals.none* **2.** *[array].principals.users.deny*, *[array].principals.groups.deny* **3.** *[array].principals.users.read*, *[array].principals.groups.read*

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute value	Precedence order for principal permissions
	Note: For instructions on setting this attribute value, see Change the precedence of user read and group deny permissions for an external content indexed source.

Example: cURL request

Feed two external documents (with content pointers to binary content objects previously stored using the *POST /ais/external_content/storeContent* endpoint) for indexing into the u_ext_content schema table.

```
curl
 'https://instance.servicenow.com/api/now/v2/ais/external_conte
nt/ingestDocument/u_ext_content' \
  --request POST \
  --user 'username':'password' \
  --header 'Accept: application/json' \
  --header 'Content-Type: application/json' \
  --data '[
  {
    "document_id": "ADMIN-2027858531-16",
    "content_pointer": "749b52a1-baa8-4556-a4f3-00404c95e6a8",
    "properties": {
      "title": "Introduction",
      "url": "file:///myhost/reports/Introduction.pdf",
      "file_name": "Introduction.pdf",
      "file_size": "10285",
      "creation_date": "2020-11-01 12:27:43"
    },
    "principals": {
      "everyone": false,
      "groups.read": [
        "report-users",
        "report-admins"

External Content Ingestion API – POST ais/external_content/storeContent

Stores binary content as a content object in AI Search.

You can associate stored binary content with an external document by following these steps:

1. Store the binary content using this endpoint. Record the value of the *result* response body parameter.
2. Send the external document to AI Search using the *POST /ais/external_content/ingestDocument/{schema_table_name}* endpoint. Set the document's *content_pointer* request body parameter to match the recorded *result* response body parameter value.

During ingestion, AI Search parses the binary content and adds its searchable content to the indexed record that represents the external document. Parsing removes the stored content object.

URL format

Versioned URL: `/api/now/{api_version}/ais/external_content/storeContent`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Parameter	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Element	Description
[binary data]	Required. Binary content to store as a content object in AI Search.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Valid values: • *`application/msword`* • *`application/octet-stream`* • *`application/pdf`* • *`application/vnd.ms-excel`* • *`application/vnd.ms-powerpoint`* • *`application/vnd.ms-powerpoint.presentation.macroenabled.12`* • *`application/vnd.openxmlformats-officedocument.presentationml.presentation`* • *`application/vnd.openxmlformats-officedocument.presentationml.template`* • *`application/vnd.openxmlformats-officedocument.spreadsheetml.sheet`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	• *application/vnd.openxmlformats-officedocument.wordprocessingml.document* • *application/vnd.openxmlformats-officedocument.wordprocessingml.template* • *text/html* • *text/plain*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
error	Object describing the error encountered during processing of the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Details of the error encountered during processing of the request. Data type: String
error.message	Message for the error encountered during processing of the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String
result	Identifier for the binary content object stored by successful request. Data type: String `"result" : "91841766-2a5f-4c64-a20a-27ca485eca21"` **Note:** To attach the stored content to an ingested external document, specify this identifier as the *content_pointer* request body element for a request to the *ingestDocument* endpoint.
status	Status of an unsuccessful request. Valid values: • *failure* Data type: String

Example: cURL request

Store binary content for a PDF file as a content object.

```
curl
 'https://instance.servicenow.com/api/now/v2/ais/external_conte
nt/storeContent' \
--request POST \
--user 'username':'password' \
--header 'Content-Type: application/pdf' \
--data-binary '@Report-2020-08-31.pdf'
```

The response body includes the unique identifier for the new content object.

```
{
  "result" : "fb439a4f-62ad-4dab-9654-5088d99a6ff9"
}
```

HR REST API

The *HR REST* API provides endpoints that return information about employees that work or live in the United States.

To access this API you must have the sn_hr_core.usa_employee_only role and the Human Resources Scoped App: Core (com_sn_hr_core) plugin activated.

HR REST - GET /get_usa_employee_profile

Returns employee profile information for employees based in the United States.

The returned information can be either:

- Employee profile information for a specified employee ID.
- Information for employees that have been added, or whose information has been updated, on or after a specified date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Employees must either have their work or home country specified as the United States for this endpoint to include them in the return results.

In addition, the endpoint sends the following parameters to the integrated CIC Plus application (see the Returns section for descriptions):

- EmployeeIdentifier
- FirstName
- MiddleName
- LastName
- Email
- WorkAddress
- WorkCity
- WorkState
- WorkPostalCode
- WorkCountry
- HomeAddress
- HomeCity
- HomeState
- HomePostalCode
- HomeCountry
- BirthDate
- HireDate

URL format

Default URL: `/api/sn_hr_core/hr_rest_api/get_usa_employee_profile`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Parameter	Description
employee_identifier	Unique identifier of an employee. The calling system generates this value and can be in whatever format is consistent with their system. To obtain this value, first call the endpoint using the *updated_after* parameter. **Note:** This parameter is mutually exclusive with the *updated_after* parameter. This parameter defines a unique employee, whereas *updated_after* returns a group of employees created/updated after a specified date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
	Data type: String
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *sysparm_offset* parameter to paginate record retrieval. Data type: Number Default: 1000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records.
updated_after	Date to use to determine the employee data to return. All United States-based employees (work or home) that were added to your instance, or whose information was updated on or after this date, are included in the return results. **Note:** This parameter is mutually exclusive with the *employee_identifier* parameter. Data type: String Format: YYYY-MM-DD HH:MM:SS or YYYY-MM-DD (time defaults to 00:00:00)

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Next-Page	Flag that indicates whether there is additional data to obtain in a subsequent call. For example, if there are a total of 120 employee records that match the search criteria, and sysparm_limit is set to 100, then *Next-Page* is true. If no additional results are available, *Next-Page* is false. Valid values: • true: Additional data is available, another call must be made to obtain the next chunk of data. • false: No additional data.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
BirthDate	Employee's birth date. Data type: String
Company	Company name. Data type: String
Email	Employee's email address. Data type: String
EmployeeIdentifier	Unique employee identifier. Data type: String
FirstName	Employee's first name. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
HireDate	Date on which the employee was hired. Data type: String
LastName	Employee's last name. Data type: String
MiddleName	Employee's middle name. Data type: String
ReHire	For future use. Data type: String
ResidenceAddress	Employee's home street address. Data type: String
ResidenceCity	Employee's home city. Data type: String
ResidenceCountry	Employee's home country. Data type: String
ResidencePostalCode	Employee's home zip code. Data type: String
ResidenceState	Employee's home state. Data type: String
Suffix	Employee's suffix, such as Mr., Mrs., or Dr. Data type: String
WorkAddress	Employee's work street address. Data type: String
WorkCity	Employee's work city Data type: String
WorkCountry	Employee's work country. Data type: String
WorkPostalCode	Employee's work zip code. Data type: String
WorkState	Employee's work state.

  "ReHire": ""
  }
]}
```

Identification and Reconciliation API

The *Identification and Reconciliation* API provides endpoints that use the Identification and Reconciliation engine (IRE) to minimize creation of duplicate Configuration Items (CIs) and to reconcile CI attributes by only accepting information from authorized sources when updating the Configuration Management Database (CMDB).

Users must have the itil or asset role to use this API.

For more information on the IRE, see Identification and Reconciliation engine (IRE).

Identification and Reconciliation - POST /now/identifyreconcile

Inserts or updates configuration items (CIs) in the CMDB by applying identification and reconciliation rules to the specified payload (request body). Use this API instead of updating the CMDB directly.

Use the Identification and Reconciliation - POST /now/identifyreconcile/query endpoint to simulate submission of a payload to this endpoint without committing changes to the database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Identification and Reconciliation - POST /now/identifyreconcile/enhanced endpoint instead if you need to specify Enhanced IRE options. For more on Enhanced IRE options, see Identification and Reconciliation engine (IRE).

URL format

Versioned URL: `/api/now/{api_version}/identifyreconcile`

Default URL: `/api/now/identifyreconcile`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_data_source	Source of the CI information. This must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String Default: Insert the API payload into the incomplete payloads table.

Request body parameters (XML or JSON)

Name	Description
items	List of CIs to create or update. Data type: Array of Objects `"items": [ { "className": "String", "internal_id": "String", "lookup": [Array], "related": [Array], "settings": {Object}, "sys_object_source_info": {Object},`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	<pre>"values": {Object} }]</pre>
items.className	Required. The sys_class_name (class/ table name) of the CI to create or update. This value can be any CMDB table, such as cmdb_ci_linux_server or cmdb_ci_win_server. Data type: String
items.internal_id	Unique identifier for this item in this payload. Can be any value, but must be unique within the payload. Data type: String
items.lookup	Array of objects in which each object describes a lookup-based identification record. These records are used to identify the top-level configuration item based on a lookup table that has a reference back to the Configuration Item [cmdb_ci] table. Data type: Array off Objects <pre>"lookup": [{ "className": "String", "internal_id": "String", "sys_object_source_info": {Object}, "values": {Object} }]</pre>
items.lookup.className	Required. The sys_class_name or class/ table name of the CI to create or update. This

Request body parameters (XML or JSON) (continued)

Name	Description
	Default: false
items.sys_object_source_info	Object describing a unique CI identifier. Data type: Object `"sys_object_source_info": { "source_feed": "String", "source_name": "String", "source_native_key": "String", "source_recency_timestamp": "String" }`
items.sys_object_source_info.source_feed	Name that uniquely identifies the feed sending this CI. Use if the source can have multiple feeds. Data type: String
items.sys_object_source_info.source_name	Data source for the CI information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String
items.sys_object_source_info.source_native_key	Unique key/id from the source for the CI. Can be any string that is unique to the item. Data type: String
items.sys_object_source_info.source_recency_timestamp	UTC date and time that the CI was scanned. Data type: String Format: YYYY-MM-DD hh:mm:ss

Request body parameters (XML or JSON) (continued)

Name	Description
items.values	Object describing fields to create or update for this CI as name/value pairs, where the name is the field name. For a reference field, the value must be the referenced sys_id. Data type: Object Field names and types depend on the fields selected by the user, such as: `"values": { "host_name": "String", "ip_address": "String", "name": "String", "os_name": "String", "sys_class_name": "String" }`
referenceItems	List of reference between two items in the payload. Data type: Array of Objects `"referenceItems": [ { "referenced": "String", "referencedBy": "String", "referenceField": "String" } ]`
referenceItems.referenced	The *internal_id* defined for the item being referenced by another item. Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
referenceItems.referencedBy	The *internal_id* defined for the item that references another item. Data type: String
referenceItems.referenceField	Name of the reference field in the class/table for the *referencedBy* item. Data type: String
relations	List of relationships between two items defined in the payload. An object in this array can use either of two formats: • The object can define a relationship between two top-level items (only) using *parent* and *child* name-value pairs, with values representing item indexes from the payload *items* array. • The object can define a relationship between any two items, including top-level, related, or lookup items, using *parent_id* and *child_id* key/value pairs, with values representing *internal_id* values defined for those items. Data type: Array of Objects `"relations": [ { "child": Number, "parent": Number, "sys_rel_source_info": {Object}, "type": "String" } ]`

Request body parameters (XML or JSON) (continued)

Name	Description
	"relations": [{ "child_id": "String", "parent_id": "String", "sys_rel_source_info": {Object}, "type": "String" }]
relations.child	Integer index of the CI object in the *items* array that represents the child in the relationship. Data type: Number
relations.child_id	The *internal_id* of the child item in the relationship. Data type: String
relations.parent	Integer index of the CI object in the *items* array that represents the parent in the relationship. Data type: Number
relations.parent_id	The *internal_id* of the parent item in the relationship. Data type: String
relations.sys_rel_source_info	Discovery source information for the relationship. For non-dependency relationships, this information is in the Relationship Sources [sys_rel_source] table. Data type: Object "sys_rel_source_info": { "source_name": "String",

Request body parameters (XML or JSON) (continued)

Name	Description

	<pre>"source_feed": "String"
	}</pre>

relations.sys_rel_source_info.source_name	Discovery source name. Default: Discovery source passed in the API method parameter.
relations.sys_rel_source_info.source_feed	Any string that is a sub-discovery/scan within the discovery source. Default: 'UNKNOWN' is stored in the source_feed column when creating a record in sys_rel_source table.
relations.type	Type of relationship existing between the parent and child items. This must be a name field value from the CI Relationship Type [cmdb_rel_type] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	List of results produced by the query. Data type: Array `"result": [ "additionalCommitte tems": [Array], "additionalCommitte elations": [Array], "items": [Array], "relations": [Arra ]`
result.additionalCommittedItems	List of CIs not included in the request body *items* array to i or update. Data type: Array of Objects `"additionalCommitted ems": [ { "className": "String", "errorCount": Number, "identificationAtte ts": [Array], "inputIndices": [Array], "markers": [Array],`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

	<pre>"identiferName":
	"String",
	"searchOnTable":
	[Array]
	}
	]</pre>

result.additionalCommittedItems.identificationAttempts.attemptResult	Outcome of this additional CI identification attempt. Possible values: • MATCHED: Identification succeeded. A unique CI was found in the identifier rule ta which exactly matched the specified attributes. • MULTI_MATCH: Identificatio failed with an error. Duplicate were found in the identifier r table when matching against specified attributes. • NO_MATCH: Identification fa No CI was found in the identi rule table which matched the specified attributes. • SKIPPED: Identification not attempted. The attributes required for this identifier rul table search were not provid so the rule was not applied. Data type: String

result.additionalCommittedItems.identificationAttempts.attributes	Array of CI identifier entry attributes used during this additional CI identification atte
	
	Data type: Array
	
	Attribute names and types dep on the request body data and t identifier in use, such as:
	<pre>"attributes": [
	"serial_number":
	"String",
	
	"serial_number_type
	"String"
	]</pre>

result.additionalCommittedItems.identificationAttempts.hybridEntryCiAttributes	List of CI identifier entry attribu used during this additional CI identification attempt.

Name	Description

	<pre>"mainIndex": Number,
	"subIndex": Numb
	}
	]</pre>

result.items.relatedItems.inputIndices.mainIndex	Index value from the request b *items* array that corresponds the CI parent of the related iter Data type: Number
result.items.relatedItems.inputIndices.subIndex	Index value from the request body *items.lookup* array th corresponds to the related iten Data type: Number
result.items.relatedItems.markers	List of marker values for interna use. Data type: Array <pre>"markers": []</pre>

result.items.relatedItems.mergedPayloadIds	List of sys_id values for entries
	the CMDB IRE Partial Payloads
	[cmdb_ire_partial_payloads] ta
	that were merged into this CI
	during processing.
	
	Data type: Array
	<pre>"mergedPayloadIds":
	"String"
	]</pre>

result.items.relatedSysIds	List of sys_id values for related
	items (table lookup items) from
	request body *items.looku*
	array.
	
	Data type: Array
	
	Notable values:
	• null: No sys_id was identifie
	this related item.
	
	<pre>"relatedSysIds": [
	Number,
	Number
	]</pre>

result.items.sysId	Sys_id found for this CI through identification.

Name	Description
result.relations.warnings	List of warnings encountered while processing this depende relationship CI. Data type: Array of Objects `"warnings": [ { "error": "String "message": "String" } ]`
result.relations.warnings.error	Type of warning encountered while processing this depende relationship CI. Data type: String
result.relations.warnings.message	Warning message encountered while processing this depende relationship CI. Data type: String

Example: cURL request

Submit a payload containing a Linux server (with serial number and network adapter related-item lookups) and an IP switch, with an IP Connection dependent relationship between them.

```
curl "https://instance.servicenow.com/api/now/identifyreconcile"
 \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username:password" \
--data '{ \
  "items": [{ \
    "className": "cmdb_ci_linux_server", \
    "values": { \
      "sys_class_name": "cmdb_ci_linux_server", \
      "name": "lnux101", \
      "host_name": "lnux101.servicenow.com", \
      "ip_address": "10.11.12.173", \
      "os_name": "Linux Red Hat" \
    }, \
    "lookup": [{ \
      "className": "cmdb_serial_number", \
      "values": { \
        "serial_number": "lnux101", \
        "serial_number_type": "uuid", \
        "valid": "true" \
      } \
    }, { \
      "className": "cmdb_ci_network_adapter", \
```

```
      "values": { \
        "name": "eth0", \
        "ip_address": "10.11.12.173", \
        "mac_address": "00:55:51:21:26:2f" \
      } \
    }] \
  }, { \
    "className": "cmdb_ci_ip_switch", \
    "values": { \
      "name": "IP-Switch-1", \
      "serial_number": "Switch23587", \
      "serial_number_type": "uuid" \
    } \
  }], \
  "relations": [{ \
    "parent": 0, \
    "child": 1, \
    "type": "IP Connection::IP Connection" \
  }]
}'
```

The Linux server CI is identified via a Hardware Rule search for its name on the Hardware [cmdb_ci_hardware] table and is processed as an update to an existing CI in the Linux Server [cmdb_ci_linux_server] table. The IP switch is similarly identified via a Hardware Rule search for its name on the Hardware table and updates an existing CI in the IP Switch [cmdb_ci_ip_switch] table. Finally, the IP Connection dependent relationship between the server and the switch is inserted as a new record in the CI Relationship [cmdb_rel_ci] table.

Identification and Reconciliation - POST /now/identifyreconcile/enhanced

Inserts or updates configuration items (CIs) in the CMDB by applying identification and reconciliation rules to the specified payload (request body). Use this API instead of updating the CMDB directly.

Use the Identification and Reconciliation - POST /now/identifyreconcile/queryEnhanced endpoint to simulate submission of a payload to this endpoint without committing changes to the database.

This method is similar to the Identification and Reconciliation - POST /now/identifyreconcile method, but adds the following functionality:

- Partial payloads
  - In case of an item having a warning or error, indicates if an item operation is INSERT_AS_PARTIAL or INSERT_INCOMPLETE.
  - Returns the sys_ids of partial payloads that were merged with existing partial payloads.
- Supports payload deduplicate feature.
- Generates a summary.

URL format

Versioned URL: `/api/now/{api_version}/identifyreconcile/enhanced`

Default URL: `/api/now/identifyreconcile/enhanced`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
options	Comma-separated list of name-value pairs representing Enhanced IRE options applied f As an example, to override the default values for the partial payloads, partial commits, de Enhanced IRE options: `partial_payloads:false,partial_commits:false,deduplicate_pay`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Note: By default or if *partial_payloads* is set to true, both *partial_commi* enabled, even if they are set to false, as those features are essential for partial paylo For more on Enhanced IRE options, see Identification and Reconciliation engine (IRE) Valid values for each name-value pair: • true: Enable this Enhanced IRE option. • false: Disable this Enhanced IRE option. Data type: String
sysparm_data_source	Source of the CI information. This must be one of the choice values defined for the disco [cmdb_ci] table. Data type: String Default: Insert the API payload into the incomplete payloads table.

Request body parameters (XML or JSON)

Name	Description
items	List of CIs to create or update. Data type: Array of Objects `"items": [ { "className": "String", "internal_id": "String", "lookup": [Array], "related": [Array], "settings": {Object}, "sys_object_source_info": {Object}, "values": {Object} } ]`
items.className	Required. The sys_class_name (class/ table name) of the CI to create or update. This value can be any

Request body parameters (XML or JSON) (continued)

Name	Description
	CMDB table, such as cmdb_ci_linux_server or cmdb_ci_win_server. Data type: String
items.internal_id	Unique identifier for this item in this payload. Can be any value, but must be unique within the payload. Data type: String
items.lookup	Array of objects in which each object describes a lookup-based identification record. These records are used to identify the top-level configuration item based on a lookup table that has a reference back to the Configuration Item [cmdb_ci] table. Data type: Array off Objects `"lookup": [ { "className": "String", "internal_id": "String", "sys_object_source_info": {Object}, "values": {Object} } ]`
items.lookup.className	Required. The sys_class_name or class/table name of the CI to create or update. This value can be any CMDB class/table, such as cmdb_serial_number or cmdb_ci_network_adapter, or a non-CMDB hierarchy class. Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
items.lookup.internal_id	Unique identifier for this lookup record in this payload. Can be any value, but must be unique within the payload. Data type: String
items.lookup.sys_object_source_info	Object describing a unique CI identifier for a specified data source. Different sources may have different name-value pairs for the same CI. Data type: Object `"sys_object_source_info": { "source_feed": "String", "source_name": "String", "source_native_key": "String", "source_recency_timestamp": "String" }`
items.lookup.sys_object_source_info.source_feed	Name that uniquely identifies the feed sending this CI. Use if the source can have multiple feeds. Data type: String
items.lookup.sys_object_source_info.source_name	Data source for the CI information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String
items.lookup.sys_object_source_info.source_native_key	Unique key/id from the source for the CI. Can be any string that is unique to the item.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
items.lookup.sys_object_source_info.source_recency_timestamp	UTC date and time that the CI was scanned. Data type: String Format: YYYY-MM-DD hh:mm:ss
items.lookup.values	Object describing fields for this lookup item as name/value pairs, where the name is the field name. Data type: Object Field names and types depend on the fields selected by the user, such as: `"values": { "ip_address": "String", "mac_address": "String", "serial_number": "String", "serial_number_type": "String", "valid": "String" }`
items.related	Array of objects in which each object describes an item record to create or update, based on a related table that has a reference to the top-level CI that is being identified. Rules in the Related Entry [cmdb_related_entry] table define what type of records can be in this array. The related table may or may not extend the Configuration Item [cmdb_ci] table. These records are not used to

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String

relations	List of relationships between two items defined in the payload.
	
	An object in this array can use either of two formats:
	• The object can define a relationship between two top-level items (only) using *parent* and *child* name-value pairs, with values representing item indexes from the payload *items* array.
	• The object can define a relationship between any two items, including top-level, related, or lookup items, using *parent_id* and *child_id* key/value pairs, with values representing *internal_id* values defined for those items.
	
	Data type: Array of Objects
	`"relations": [ { "child": Number, "parent": Number, "sys_rel_source_info": {Object}, "type": "String" } ]`
	`"relations": [ { "child_id": "String", "parent_id": "String", "sys_rel_source_info": {Object},`

Request body parameters (XML or JSON) (continued)

Name	Description
	<pre>"type": "String" }]</pre>
relations.child	Integer index of the CI object in the *items* array that represents the child in the relationship. Data type: Number
relations.child_id	The *internal_id* of the child item in the relationship. Data type: String
relations.parent	Integer index of the CI object in the *items* array that represents the parent in the relationship. Data type: Number
relations.parent_id	The *internal_id* of the parent item in the relationship. Data type: String
relations.sys_rel_source_info	Discovery source information for the relationship. For non-dependency relationships, this information is in the Relationship Sources [sys_rel_source] table. Data type: Object <pre>"sys_rel_source_info": { "source_name": "String", "source_feed": "String" }</pre>
relations.sys_rel_source_info.source_name	Discovery source name. Default: Discovery source passed in the API method parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
relations.sys_rel_source_info.source_feed	Any string that is a sub-discovery/scan within the discovery source. Default: 'UNKNOWN' is stored in the source_feed column when creating a record in sys_rel_source table.
relations.type	Type of relationship existing between the parent and child items. This must be a name field value from the CI Relationship Type [cmdb_rel_type] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. Error message detail "Chunk [...] is not a valid entry" indicates that the *options* query parameter is not in the correct name-value pair format. For example, specifying an *options* parameter of `partial` produces a 500 status code with "Chunk [partial] is not a valid entry" in the message detail.

Response body parameters (JSON or XML)

Name	Description
result	List of results produced by the query. Data type: Array `"result": [ "additionalCommitte tems": [Array], "additionalCommitte elations": [Array], "items": [Array], "relations": [Arra ]`
result.additionalCommittedItems	List of CIs not included in the request body *items* array to i or update. Data type: Array of Objects `"additionalCommitted ems": [ { "className": "String", "errorCount": Number, "identificationAtte ts": [Array], "inputIndices": [Array], "markers": [Array], "mergedPayloads" [Array], "operation": "String",`

Name	Description

	<pre>"mainIndex": Number,
	"subIndex": Numb
	}
	]</pre>

result.items.relatedItems.inputIndices.mainIndex	Index value from the request b *items* array that corresponds the CI parent of the related iter Data type: Number
result.items.relatedItems.inputIndices.subIndex	Index value from the request body *items.lookup* array th corresponds to the related iten Data type: Number
result.items.relatedItems.markers	List of marker values for interna use. Data type: Array <pre>"markers": []</pre>

result.items.relatedItems.mergedPayloadIds	List of sys_id values for entries
	the CMDB IRE Partial Payloads
	[cmdb_ire_partial_payloads] ta
	that were merged into this CI
	during processing.
	
	Data type: Array
	<pre>"mergedPayloadIds":
	"String"
	]</pre>

result.items.relatedSysIds	List of sys_id values for related
	items (table lookup items) from
	request body *items.looku*
	array.
	
	Data type: Array
	
	Notable values:
	• null: No sys_id was identifie
	this related item.
	
	<pre>"relatedSysIds": [
	Number,
	Number
	]</pre>

result.items.sysId	Sys_id found for this CI through identification.

result.relations.warnings.error	Type of warning encountered while processing this depende relationship CI. Data type: String
result.relations.warnings.message	Warning message encountered while processing this depende relationship CI. Data type: String

Example: cURL request

Submit a partial payload for a computer CI.

```
curl
 "https://instance.servicenow.com/api/now/identifyreconcile/enha
nced" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username":"password" \
--data '{ \
  "items" : [ \
    { \
      "className" : "cmdb_ci_computer", \
      "sys_object_source_info" : { \
        "source_name" : "ServiceNow", \
        "source_native_key" : "ncomputer3367" \
      }, \
      "values" : { \
        "cpu_core_count" : "6", \
        "ram" : "8192", \
        "manufacturer" : "DELL", \
        "company" : "My Company" \
      } \
    } \
  ] \
}'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The response shows that the payload has been inserted into the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table.

```
{
  "result": {
    "items": [{
      "className": "cmdb_ci_computer",
      "operation": "INSERT_AS_PARTIAL",
      "sysId": "Unknown",

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "errorCount": 0,
      "markers": [],
      "warningCount": 1,
      "mergedPayloadIds": ["7ddcb9551bb45010593876a61a4bcb08"],
      "inputIndices": [0]
    }],
    "additionalCommittedItems": [],
    "relations": [],
    "additionalCommittedRelations": []
  }
}
```

Submit a second partial payload that completes the description of the computer CI, with the summary generation Enhanced IRE option enabled.

```
curl
 "https://instance.servicenow.com/api/now/identifyreconcile/enha
nced?options=generate_summary:true" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username":"password" \
--data '{ \
}'
```

The response shows that the computer CI is inserted, and displays a summary of operations performed.

```
{
  "result": {
    "relations": [],
    "hasError": false,
    "additionalCommittedItems": [],
    "hasWarning": false,

Identification and Reconciliation - POST /now/identifyreconcile/query

Determines the CMDB operation (insert/update) to perform with the specified payload (request body), without committing the operations in the database.

Use this endpoint to simulate submission of a payload (request body) to the Identification and Reconciliation - POST /now/identifyreconcile endpoint.

Use the Identification and Reconciliation - POST /now/identifyreconcile/enhanced endpoint instead if you need to specify Enhanced IRE options. For more on Enhanced IRE options, see Identification and Reconciliation engine (IRE).

URL format

Versioned URL: `/api/now/{api_version}/identifyreconcile/query`

Default URL: `/api/now/identifyreconcile/query`

© 2026 ServiceNow, Inc. All rights reserved.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_data_source	Source of the CI information. This must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String Default: Insert the API payload into the incomplete payloads table.

Request body parameters (XML or JSON)

Name	Description
items	List of CIs to create or update. Data type: Array of Objects `"items": [ { "className": "String", "internal_id": "String", "lookup": [Array], "related": [Array], "settings": {Object}, "sys_object_source_info": {Object}, "values": {Object} } ]`
items.className	Required. The sys_class_name (class/table name) of the CI to create or update.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	This value can be any CMDB table, such as cmdb_ci_linux_server or cmdb_ci_win_server. Data type: String
items.internal_id	Unique identifier for this item in this payload. Can be any value, but must be unique within the payload. Data type: String
items.lookup	Array of objects in which each object describes a lookup-based identification record. These records are used to identify the top-level configuration item based on a lookup table that has a reference back to the Configuration Item [cmdb_ci] table. Data type: Array off Objects `"lookup": [ { "className": "String", "internal_id": "String", "sys_object_source_info": {Object}, "values": {Object} } ]`
items.lookup.className	Required. The sys_class_name or class/table name of the CI to create or update. This value can be any CMDB class/table, such as cmdb_serial_number or cmdb_ci_network_adapter, or a non-CMDB hierarchy class. Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
items.lookup.internal_id	Unique identifier for this lookup record in this payload. Can be any value, but must be unique within the payload. Data type: String
items.lookup.sys_object_source_info	Object describing a unique CI identifier for a specified data source. Different sources may have different name-value pairs for the same CI. Data type: Object `"sys_object_source_info": { "source_feed": "String", "source_name": "String", "source_native_key": "String", "source_recency_timestamp": "String" }`
items.lookup.sys_object_source_info.source_feed	Name that uniquely identifies the feed sending this CI. Use if the source can have multiple feeds. Data type: String
items.lookup.sys_object_source_info.source_name	Data source for the CI information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String
items.lookup.sys_object_source_info.source_native_key	Unique key/id from the source for the CI. Can be any string that is unique to the item.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
items.lookup.sys_object_source_info.source_recency_timestamp	UTC date and time that the CI was scanned. Data type: String Format: YYYY-MM-DD hh:mm:ss
items.lookup.values	Object describing fields for this lookup item as name/value pairs, where the name is the field name. Data type: Object Field names and types depend on the fields selected by the user, such as: `"values": { "ip_address": "String", "mac_address": "String", "serial_number": "String", "serial_number_type": "String", "valid": "String" }`
items.related	Array of objects in which each object describes an item record to create or update, based on a related table that has a reference to the top-level CI that is being identified. Rules in the Related Entry [cmdb_related_entry] table define what type of records can be in this array. The related table may or may not extend the Configuration Item [cmdb_ci] table. These records are not used to

Request body parameters (XML or JSON) (continued)

Name	Description
	`imestamp": "String" }`
items.related.sys_object_source_info.source_feed	Name that uniquely identifies the feed sending this related item. Use if the source can have multiple feeds. Data type: String
items.related.sys_object_source_info.source_name	Data source for the related item information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String
items.related.sys_object_source_info.source_native_key	Unique key/id from the source for the related item. Can be any string that is unique to the item. Data type: String
items.related.sys_object_source_info.source_recency_timestamp	UTC date and time that the related item was scanned. Data type: String Format: YYYY-MM-DD hh:mm:ss
items.related.values	Object describing fields to create or update for this related item as name/value pairs, where the name is the field name. For a reference field, the value must be the referenced sys_id. Data type: Object Field names and types depend on the fields selected by the user, such as: `"values": { "host_name": "String",`

Request body parameters (XML or JSON) (continued)

Name	Description
	<pre>"ip_address": "String", "name": "String", "os_name": "String", "sys_class_name": "String" }</pre>
items.settings	Object containing parameters defining the types of updates that are permitted. Data type: Object <pre>"settings": { "skipReclassificationRestrictionRules": Boolean, "updateWithoutDowngrade": Boolean, "updateWithoutSwitch": Boolean, "updateWithoutUpgrade": Boolean }</pre>
items.settings.skipReclassificationRestrictionRules	Flag that indicates whether IRE should skip running the Reclassification Restriction rule that matches the class for the payload item. Valid values: • true: Skip running the rule. • false: Run the rule. Default: false
items.settings.updateWithoutDowngrade	Flag that indicates whether update and downgrade are both permitted for this CI. Valid values:

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String

relations	List of relationships between two items defined in the payload.
	
	An object in this array can use either of two formats:
	• The object can define a relationship between two top-level items (only) using *parent* and *child* name-value pairs, with values representing item indexes from the payload *items* array.
	• The object can define a relationship between any two items, including top-level, related, or lookup items, using *parent_id* and *child_id* key/value pairs, with values representing *internal_id* values defined for those items.
	
	Data type: Array of Objects
	`"relations": [ { "child": Number, "parent": Number, "sys_rel_source_info": {Object}, "type": "String" } ]`
	`"relations": [ { "child_id": "String", "parent_id": "String", "sys_rel_source_info": {Object},`

Request body parameters (XML or JSON) (continued)

Name	Description
	<pre>"type": "String" }]</pre>
relations.child	Integer index of the CI object in the *items* array that represents the child in the relationship. Data type: Number
relations.child_id	The *internal_id* of the child item in the relationship. Data type: String
relations.parent	Integer index of the CI object in the *items* array that represents the parent in the relationship. Data type: Number
relations.parent_id	The *internal_id* of the parent item in the relationship. Data type: String
relations.sys_rel_source_info	Discovery source information for the relationship. For non-dependency relationships, this information is in the Relationship Sources [sys_rel_source] table. Data type: Object <pre>"sys_rel_source_info": { "source_name": "String", "source_feed": "String" }</pre>
relations.sys_rel_source_info.source_name	Discovery source name. Default: Discovery source passed in the API method parameter.

Request body parameters (XML or JSON) (continued)

Name	Description
relations.sys_rel_source_info.source_feed	Any string that is a sub-discovery/scan within the discovery source. Default: 'UNKNOWN' is stored in the source_feed column when creating a record in sys_rel_source table.
relations.type	Type of relationship existing between the parent and child items. This must be a name field value from the CI Relationship Type [cmdb_rel_type] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	List of results produced by the query. Data type: Array `"result": [ "additionalCommitte tems": [Array], "additionalCommitte elations": [Array], "items": [Array], "relations": [Arra ]`
result.additionalCommittedItems	List of CIs not included in the request body *items* array to i or update. Data type: Array of Objects `"additionalCommitted ems": [ { "className": "String", "errorCount": Number, "identificationAtte ts": [Array], "inputIndices": [Array], "markers": [Array], "mergedPayloads" [Array], "operation": "String", "sysId": "String } ]`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.additionalCommittedItems.className	The sys_class_name of this additional CI. Data type: String
result.additionalCommittedItems.errorCount	Number of errors encountered while processing this additiona Data type: Number
result.additionalCommittedItems.errors	List of errors encountered whil processing this additional CI. Data type: Array of Objects `"errors": [ { "error": "String "message": "String" } ]`
result.additionalCommittedItems.errors.error	Type of error encountered whil processing this additional CI. Data type: String
result.additionalCommittedItems.errors.message	Error message encountered wh processing this additional CI. Data type: String
result.additionalCommittedItems.identificationAttempts	List of attempts made to identi this additional CI. Data type: Array of Objects `"identificationAttem s": [ { "attemptResult": "String", "attributes": [Array], "hybridEntryCiAttri tes": [Array], "identiferName": "String", "searchOnTable": [Array] } ]`
result.additionalCommittedItems.identificationAttempts.attemptResult	Outcome of this additional CI identification attempt.

Name	Description
	Possible values: • MATCHED: Identification succeeded. A unique CI was found in the identifier rule ta which exactly matched the specified attributes. • MULTI_MATCH: Identificatio failed with an error. Duplicate were found in the identifier r table when matching against specified attributes. • NO_MATCH: Identification fa No CI was found in the identi rule table which matched the specified attributes. • SKIPPED: Identification not attempted. The attributes required for this identifier rul table search were not provid so the rule was not applied. Data type: String
result.additionalCommittedItems.identificationAttempts.attributes	Array of CI identifier entry attributes used during this additional CI identification atte Data type: Array Attribute names and types dep on the request body data and t identifier in use, such as: `"attributes": [ "serial_number": "String", "serial_number_type": "String" ]`
result.additionalCommittedItems.identificationAttempts.hybridEntryCiAttributes	List of CI identifier entry attribu used during this additional CI identification attempt. Data type: Array Attribute names and types dep on the request body data and t identifier in use, such as: `"hybridEntryCiAttributes": [ "name": "String",`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"serial_number": "String"
	]</pre>

result.additionalCommittedItems.identificationAttempts.identifierName	Identifier rule used for this additional CI identification atte Data type: String
result.additionalCommittedItems.identificationAttempts.searchOnTable	Name of the table searched for additional CI identification atte Data type: String
result.additionalCommittedItems.identifierEntrySysId	Sys_id for the identifier rule use identify this additional CI. Notable values: • Unknown: Identification of th additional CI failed. See *err* for details. Data type: String

result.additionalCommittedItems.inputIndices	List of index values for CIs from the request body *items* array correspond to this additional C
	
	Data type: Array of Objects
	<pre>"inputIndices": [
	{
	Number
	}
	]</pre>

result.additionalCommittedItems.markers	List of marker values for interna use. Data type: Array <pre>"markers": []</pre>

result.additionalCommittedItems.mergedPayloads	List of sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged during processing of this additional C
	
	Data type: Array
	<pre>"mergedPayloadIds": "String"
	]</pre>

Name	Description
result.additionalCommittedItems.operation	Operation performed for this additional CI. Possible values: • DELETE: An existing CI is removed from the target tabl • INSERT: The additional CI is inserted into the target table new record. • NO_CHANGE: No operation i performed for the additional • UPDATE: An existing CI in the target table is updated. • UPDATE_WITH_DOWNGRAD An existing CI in the target table is updated and its class changed to a more generic c (ancestor class). • UPDATE_WITH_SWITCH: An existing CI in the target table updated and its class is char to another class which is not ancestor or descendent clas • UPDATE_WITH_UPGRADE: A existing CI in the target table updated and its class is char to a more specialized class (descendent class). Data type: String
result.additionalCommittedItems.sysId	Sys_id found for this additional through identification. Notable values: Unknown - Identification of this additional failed. See *errors* for details. Data type: String
result.additionalCommittedItems.warnings	List of warnings encountered w processing this additional CI. Data type: Array of Objects `"warnings": [ { "error": "String "message": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.additionalCommittedItems.warnings.error	Type of warning encountered w processing this additional CI. Data type: String
result.additionalCommittedItems.warnings.message	Warning message encountered while processing this additiona Data type: String
result.additionalCommittedRelations	List of dependent relationship CIs not included in the request body *relations* list to insert update. Data type: Array of Objects `"additionalCommitted lations": [ { "className": "String", "operation": "String", "markers": [Array], "inputIndices": [Array], "mergedPayloadIds": [Array] } ]`
result.additionalCommittedRelations.className	The sys_class_name of this additional dependent relations CI. Only supported value: • cmdb_rel_ci: The CI Relation table. Data type: String
result.additionalCommittedRelations.errorCount	Number of errors encountered while processing this additiona dependent relationship CI. Data type: Number
result.additionalCommittedRelations.errors	List of errors encountered whil processing this additional dependent relationship CI. Data type: Array of Objects

Name	Description

	<pre>"errors": [
	  {
	  "error": "String
	  "message":
	"String"
	  }
	]</pre>

result.additionalCommittedRelations.errors.error	Type of error encountered while processing this additiona dependent relationship CI. Data type: String
result.additionalCommittedRelations.errors.message	Error message encountered while processing this additiona dependent relationship CI. Data type: String

result.additionalCommittedRelations.inputIndices	List of index values for depend relationship CI objects in the request body *relations* arr that correspond to this additio dependent relationship CI.
	
	Data type: Array
	<pre>"inputIndices": [
	  Number
	]</pre>

result.additionalCommittedRelations.markers	List of marker values for interna use. Data type: Array <pre>"markers": []</pre>

result.additionalCommittedRelations.mergedPayloadIds	List of sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged during processing of this additional dependent relationship CI.
	
	Data type: Array
	<pre>"mergedPayloadIds":
	  "String"
	]</pre>

result.additionalCommittedRelations.operation	Operation performed for this additional dependent relations CI.

Name	Description
	<pre>"markers": [Array], "mergedPayloadIds": [Array], "operation": "String", "relatedItems": [Array], "relatedSysIds": [Array], "sysId": "String "warnings": [Array] }</pre>
result.items.additionalRelatedItems	List of related CIs (table lookup CI) from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] ta Data type: Array of Objects <pre>"additionalRelatedIt s": [{ "className": "String", "inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "sysId": "String }]</pre>
result.items.additionalRelatedItems.className	The sys_class_name of the rela item. Data type: String
result.items.additionalRelatedItems.inputIndices	List of index values for CIs from the request body *items* array correspond to this related item Data type: Array <pre>"inputIndices": [Number]</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.items.additionalRelatedItems.markers	List of marker values for interna use. Data type: Array `"markers": []`
result.items.additionalRelatedItems.mergedPayloadIds	List of sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged during processing of this related item. Data type: Array `"mergedPayloadIds": "String" ]`
result.items.additionalRelatedItems.sysId	Sys_id of this related CI. Data type: String
result.items.className	Sys_class_name of this CI. Data type: String
result.items.duplicateLookupIndices	Object containing arrays of ind values for *items.lookup* ar elements that reference the sa related CI. The array name indicates the first element from the request body *items.lookup* array th references a given related CI. I values are the set of additional elements from the same array t reference the same related CI. Data type: Object This example shows a case where the second element in t *items.lookup* array referen the same related CI as a later element from that array: `"duplicateLookupIndi s": [ "2": [Array] ]`
result.items.errorCount	Number of errors encountered while processing this CI.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Number
result.items.errors	List of errors encountered whil processing this CI. Data type: Array of Objects `"errors": [ { "error": "String "message": "String" } ]`
result.items.errors.error	Type of error encountered whil processing this CI. Data type: String
result.items.errors.message	Error message encountered wh processing this CI. Data type: String
result.items.identificationAttempts	List of attempts made to identi this CI. Data type: Array of Objects `"identificationAttem s": [ { "attemptResult": "String", "attributes": [Array], "hybridEntryCiAttri tes": [Array], "identiferName": "String", "searchOnTable": [Array] } ]`
result.items.identificationAttempts.attemptResult	Outcome of this CI identificatio attempt. Possible values: • MATCHED: Identification succeeded. A unique CI was found in the identifier rule ta which exactly matched the specified attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• MULTI_MATCH: Identificatio failed with an error. Duplicate were found in the identifier r table when matching against specified attributes. • NO_MATCH: Identification fa No CI was found in the identi rule table which matched the specified attributes. • SKIPPED: Identification not attempted. The attributes required for this identifier rul table search were not provid so the rule was not applied. Data type: String
result.items.identificationAttempts.attributes	List of CI identifier entry attribu used during this CI identificatio attempt. Data type: Array Attribute names and types dep on the request body data and t identifier in use, such as: `"attributes": [ "serial_number": "String", "serial_number_type "String", ]`
result.items.identificationAttempts.hybridEntryCiAttributes	List of CI identifier entry attribu used during this CI identificatio attempt. Data type: Array Attribute names and types dep on the request body data and t identifier in use, such as: `"hybridEntryCiAttrib es": [ "name": "String", "serial_number": "String" ]`
result.items.identificationAttempts.identifierName	Identifier rule used for this CI identification attempt.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.items.identificationAttempts.searchOnTable	Name of the table searched for CI identification attempt. Data type: String
result.items.identifierEntrySysId	Sys_id for the identifier rule use identify this CI. Notable values: • Unknown: Identification of th failed. For details, see *erro* Data type: String
result.items.info	List of additional information al the processing of the item. Data type: Array of Objects `"info": [ { "code": "String" "message": "String", "ruleSysId": "String" } ]`
result.items.info.code	Reclassification type that was skipped. Possible values: • SKIPPED_CLASS_SWITCH • SKIPPED_CLASS_DOWNGRA • SKIPPED_CLASS_UPGRADE
result.items.info.message	Message that provides additio insights into the reason for skipping the reclassification. Data type: String
result.items.info.ruleSysId	Sys_id of the reclassification restriction rule that was matche Applicable only when IRE skips reclassification due to reclassification restriction rule. This value is empty if the reclassification is skipped due payload or global flag.

Name	Description
result.relations.warnings.error	Type of warning encountered while processing this depende relationship CI. Data type: String
result.relations.warnings.message	Warning message encountered while processing this depende relationship CI. Data type: String

Example: cURL request

Simulate submission of a payload containing a Linux server (with serial number and network adapter related-item lookups) and an IP switch, with an IP Connection relationship between them.

```
curl
 "https://instance.servicenow.com/api/now/identifyreconcile/que
ry" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username":"password" \
--data '{ \
  "items": [{ \
    "className": "cmdb_ci_linux_server", \
    "values": { \
      "sys_class_name": "cmdb_ci_linux_server", \
      "name": "lnux101", \
      "host_name": "lnux101.servicenow.com", \
      "ip_address": "10.11.12.173", \
      "os_name": "Linux Red Hat" \
    }, \
    "lookup": [{ \
      "className": "cmdb_serial_number", \
      "values": { \
        "serial_number": "lnux101", \
        "serial_number_type": "uuid", \
        "valid": "true" \
      } \
    }, { \
      "className": "cmdb_ci_network_adapter", \
      "values": { \
        "name": "eth0", \
        "ip_address": "10.11.12.173", \
        "mac_address": "00:55:51:21:26:2f" \
      } \
    }] \
  }, { \
    "className": "cmdb_ci_ip_switch", \
    "values": { \
      "name": "IP-Switch-1", \
      "serial_number": "Switch23587", \
```

```
      "serial_number_type": "uuid" \
    } \
  }], \
  "relations": [{ \
    "parent": 0, \
    "child": 1, \
    "type": "IP Connection::IP Connection" \
  }] \
}'
```

The Linux server CI is identified via a Hardware Rule search for its name on the Hardware [cmdb_ci_hardware] table and is processed as an update to an existing CI in the Linux Server [cmdb_ci_linux_server] table. The IP switch is similarly identified via a Hardware Rule search for its name on the Hardware table and updates an existing CI in the IP Switch [cmdb_ci_ip_switch] table. Finally, the IP Connection relationship between the server and the switch is inserted as a new record in the CI Relationship [cmdb_rel_ci] table.

```

Identification and Reconciliation - POST /now/identifyreconcile/queryEnhanced

Determines the CMDB operation (insert/update) to perform with the specified payload (request body), without committing the operations in the database.

Use this endpoint to simulate submission of a payload (request body) to the Identification and Reconciliation - POST /now/identifyreconcile/enhanced endpoint.

This method is similar to the Identification and Reconciliation - POST /now/identifyreconcile/query method, but adds the following functionality:

- Partial payloads
  - In case of an item having a warning or error, indicates if an item operation is INSERT_AS_PARTIAL or INSERT_INCOMPLETE.
  - Returns the sys_ids of partial payloads that were merged with existing partial payloads.
- Supports payload deduplicate feature.
- Generates a summary.

URL format

Versioned URL: `/api/now/{api_version}/identifyreconcile/queryEnhanced`

Default URL: `/api/now/identifyreconcile/queryEnhanced`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
options	Comma-separated list of name-value pairs representing Enhanced IRE options applied f As an example, to override the default values for the partial payloads, partial commits, de Enhanced IRE options: `partial_payloads:false,partial_commits:false,deduplicate_pay` **Note:** By default or if *`partial_payloads`* is set to true, both *`partial_commi`* enabled, even if they are set to false, as those features are essential for partial paylo For more on Enhanced IRE options, see Identification and Reconciliation engine (IRE) Valid values for each name-value pair: • true: Enable this Enhanced IRE option. • false: Disable this Enhanced IRE option. Data type: String
sysparm_data_source	Source of the CI information. This must be one of the choice values defined for the disco [cmdb_ci] table. Data type: String Default: Insert the API payload into the incomplete payloads table.

Request body parameters (XML or JSON)

Name	Description
items	List of CIs to create or update. Data type: Array of Objects `"items": [ { `

Request body parameters (XML or JSON) (continued)

Name	Description

	<pre>"referenced": "String",
	"referencedBy": "String",
	"referenceField": "String"
	}
	]</pre>

referenceItems.referenced	The *internal_id* defined for the item being referenced by another item. Data type: String
referenceItems.referencedBy	The *internal_id* defined for the item that references another item. Data type: String
referenceItems.referenceField	Name of the reference field in the class/table for the *referencedBy* item. Data type: String
relations	List of relationships between two items defined in the payload. An object in this array can use either of two formats: • The object can define a relationship between two top-level items (only) using *parent* and *child* name-value pairs, with values representing item indexes from the payload *items* array. • The object can define a relationship between any two items, including top-level, related, or lookup items, using *parent_id* and *child_id* key/value pairs, with values representing *internal_id* values defined for those items.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	Data type: Array of Objects
	`"relations": [ { "child": Number, "parent": Number, "sys_rel_source_info": {Object}, "type": "String" } ]`
	`"relations": [ { "child_id": "String", "parent_id": "String", "sys_rel_source_info": {Object}, "type": "String" } ]`

relations.child	Integer index of the CI object in the *items* array that represents the child in the relationship. Data type: Number
relations.child_id	The *internal_id* of the child item in the relationship. Data type: String
relations.parent	Integer index of the CI object in the *items* array that represents the parent in the relationship. Data type: Number
relations.parent_id	The *internal_id* of the parent item in the relationship.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
relations.sys_rel_source_info	Discovery source information for the relationship. For non-dependency relationships, this information is in the Relationship Sources [sys_rel_source] table. Data type: Object `"sys_rel_source_info": { "source_name": "String", "source_feed": "String" }`
relations.sys_rel_source_info.source_name	Discovery source name. Default: Discovery source passed in the API method parameter.
relations.sys_rel_source_info.source_feed	Any string that is a sub-discovery/scan within the discovery source. Default: 'UNKNOWN' is stored in the source_feed column when creating a record in sys_rel_source table.
relations.type	Type of relationship existing between the parent and child items. This must be a name field value from the CI Relationship Type [cmdb_rel_type] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. Error message detail "Chunk [...] is not a valid entry" indicates that the *options* query parameter is not in the correct name-value pair format. For example, specifying an *options* parameter of `partial` produces a 500 status code with "Chunk [partial] is not a valid entry" in the message detail.

Response body parameters (JSON or XML)

Name	Description

result	List of results produced by the query.
	
	Data type: Array
	
	`"result": [`
	
	`"additionalCommitte`
	`tems": [Array],`
	
	`"additionalCommitte`
	`elations": [Array],`
	`"items": [Array],`
	`"relations": [Arra`
	`]`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.items.className	Sys_class_name of this CI. Data type: String
result.items.duplicateLookupIndices	Object containing arrays of ind values for *items.lookup* ar elements that reference the sa related CI. The array name indicates the first element from the request body *items.lookup* array th references a given related CI. I values are the set of additional elements from the same array reference the same related CI. Data type: Object This example shows a case where the second element in t *items.lookup* array referen the same related CI as a later element from that array: `"duplicateLookupIndi s": [ "2": [Array] ]`
result.items.errorCount	Number of errors encountered while processing this CI. Data type: Number
result.items.errors	List of errors encountered whil processing this CI. Data type: Array of Objects `"errors": [ { "error": "String "message": "String" } ]`
result.items.errors.error	Type of error encountered whil processing this CI. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.items.errors.message	Error message encountered wh processing this CI. Data type: String
result.items.identificationAttempts	List of attempts made to identif this CI. Data type: Array of Objects `"identificationAttem s": [ { "attemptResult": "String", "attributes": [Array], "hybridEntryCiAttri tes": [Array], "identiferName": "String", "searchOnTable": [Array] } ]`
result.items.identificationAttempts.attemptResult	Outcome of this CI identificatio attempt. Possible values: • MATCHED: Identification succeeded. A unique CI was found in the identifier rule tal which exactly matched the specified attributes. • MULTI_MATCH: Identificatior failed with an error. Duplicate were found in the identifier ru table when matching against specified attributes. • NO_MATCH: Identification fa No CI was found in the identi rule table which matched the specified attributes. • SKIPPED: Identification not attempted. The attributes required for this identifier rul table search were not provid so the rule was not applied. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.items.identificationAttempts.attributes	List of CI identifier entry attribu used during this CI identificatio attempt. Data type: Array Attribute names and types dep on the request body data and t identifier in use, such as: `"attributes": [ "serial_number": "String", "serial_number_type "String", ]`
result.items.identificationAttempts.hybridEntryCiAttributes	List of CI identifier entry attribu used during this CI identificatio attempt. Data type: Array Attribute names and types dep on the request body data and t identifier in use, such as: `"hybridEntryCiAttrib es": [ "name": "String", "serial_number": "String" ]`
result.items.identificationAttempts.identifierName	Identifier rule used for this CI identification attempt. Data type: String
result.items.identificationAttempts.searchOnTable	Name of the table searched for CI identification attempt. Data type: String
result.items.identifierEntrySysId	Sys_id for the identifier rule use identify this CI. Notable values: • Unknown: Identification of th failed. For details, see *erro* Data type: String
result.items.info	List of additional information al the processing of the item.

Name	Description
	Data type: Array of Objects `"info": [ { "code": "String" "message": "String", "ruleSysId": "String" } ]`
result.items.info.code	Reclassification type that was skipped. Possible values: • SKIPPED_CLASS_SWITCH • SKIPPED_CLASS_DOWNGRA • SKIPPED_CLASS_UPGRADE
result.items.info.message	Message that provides additio insights into the reason for skipping the reclassification. Data type: String
result.items.info.ruleSysId	Sys_id of the reclassification restriction rule that was matche Applicable only when IRE skips reclassification due to reclassification restriction rule. This value is empty if the reclassification is skipped due payload or global flag. Data type: String
result.items.inputIndices	List of index values for CIs from the request body *items* array correspond to this CI. Data type: Array of Objects `"inputIndices": [ { Number } ]`
result.items.markers	List of marker values for interna use. Data type: Array `"markers": []`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.items.mergedPayloadIds	List of sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged during processing of this CI. Data type: Array `"mergedPayloadIds": [ "String" ]`
result.items.operation	Operation performed for this C Possible values: • DELETE: An existing CI is removed from the target tabl • INSERT: The CI is inserted in the target table as a new rec • NO_CHANGE: No operation i performed for the CI. • UPDATE: An existing CI in the target table is updated. • UPDATE_WITH_DOWNGRAD An existing CI in the target table is updated and its class changed to a more generic c (ancestor class). • UPDATE_WITH_SWITCH: An existing CI in the target table updated and its class is char to another class which is not ancestor or descendent clas • UPDATE_WITH_UPGRADE: A existing CI in the target table updated and its class is char to a more specialized class (descendent class). Data type: String
result.items.relatedItems	List of related CIs (table lookup CI) from the request body *`items.lookup`* array. Data type: Array of Objects `"relatedItems": [ { "className": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre>"inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "sysId": "String" }]</pre>
result.items.relatedItems.className	The sys_class_name of the rela item. Data type: String
result.items.relatedItems.inputIndices	List of index values for CIs and lookup items from the request body *items* and *items.lookup* arrays that correspond to this related item Data type: Array of Objects <pre>"inputIndices": [{ "mainIndex": Number, "subIndex": Numb }]</pre>
result.items.relatedItems.inputIndices.mainIndex	Index value from the request b *items* array that corresponds the CI parent of the related iter Data type: Number
result.items.relatedItems.inputIndices.subIndex	Index value from the request body *items.lookup* array th corresponds to the related item Data type: Number
result.items.relatedItems.markers	List of marker values for interna use. Data type: Array <pre>"markers": []</pre>
result.items.relatedItems.mergedPayloadIds	List of sys_id values for entries the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] ta that were merged into this CI during processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array `"mergedPayloadIds": [ "String" ]`
result.items.relatedSysIds	List of sys_id values for related items (table lookup items) from request body *items.looku* array. Data type: Array Notable values: • null: No sys_id was identified this related item. `"relatedSysIds": [ Number, Number ]`
result.items.sysId	Sys_id found for this CI through identification. Notable values: • Unknown: Identification of th failed. See *errors* for detai Data type: String
result.items.warnings	List of warnings encountered w processing this CI. Data type: Array of Objects `"warnings": [ { "error": "String "message": "String" } ]`
result.items.warnings.error	Type of warning encountered w processing this CI. Data type: String
result.items.warnings.message	Warning message encountered while processing this CI. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.logContextId	Context ID reported for this payload. Data type: String
result.relations	List of dependent relationship CIs from the request body *relations* array. Data type: Array of Objects `"relations": [ { "className": "String", "errorCount": Number, "errors": [Array "inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "operation": "String", "warnings": [Array] } ]`
result.relations.className	The sys_class_name of this dependent relationship CI. Only supported value: • cmdb_rel_ci: The CI Relation table. Data type: String
result.relations.errorCount	Number of errors encountered while processing this depende relationship CI. Data type: Number
result.relations.errors	List of errors encountered whil processing this dependent relationship CI. Data type: Array of Objects `"errors": [ { "error": "String`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre>"message": "String" }]</pre>
result.relations.errors.error	Type of error encountered whil processing this dependent relationship CI. Data type: String
result.relations.errors.message	Error message encountered while processing this depende relationship CI. Data type: String
result.relations.inputIndices	List of index values for the dependent relationship CI obje in the request body *relatio* array that correspond to this dependent relationship CI. Data type: Array <pre>"inputIndices": [Number]</pre>
result.relations.markers	List of marker values for interna use. Data type: Array <pre>"markers": []</pre>
result.relations.mergedPayloadIds	List of sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged during processing of this dependent relationship CI. Data type: Array <pre>"mergedPayloadIds": "String"]</pre>
result.relations.operation	Operation performed for this dependent relationship CI. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• INSERT: The dependent relationship CI was inserted the target table as a new rec • INSERT_AS_INCOMPLETE: T dependent relationship CI ha errors and was inserted into CMDB IRE Incomplete Paylo [cmdb_ire_incomplete_paylo table. • INSERT_AS_PARTIAL: The dependent relationship CI ha errors and was inserted into the CMDB IRE Partial Payloa [cmdb_ire_partial_payloads] table. • NO_CHANGE: No operation w performed for the dependen relationship CI. • UPDATE: An existing depend relationship CI in the target t was updated. Data type: String
result.relations.warnings	List of warnings encountered while processing this depende relationship CI. Data type: Array of Objects `"warnings": [ { "error": "String "message": "String" } ]`
result.relations.warnings.error	Type of warning encountered while processing this depende relationship CI. Data type: String
result.relations.warnings.message	Warning message encountered while processing this depende relationship CI. Data type: String

Example: cURL request

Simulate submission of a partial payload for a computer CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "https://instance.servicenow.com/api/now/identifyreconcile/quer
yEnhanced" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username":"password" \
--data '{ \
  "items" : [ \
    { \
      "className" : "cmdb_ci_computer", \
      "sys_object_source_info" : { \
        "source_name" : "ServiceNow", \
        "source_native_key" : "ncomputer3367" \
      }, \
      "values" : { \
        "cpu_core_count" : "6", \
        "ram" : "8192", \
        "manufacturer" : "DELL", \
        "company" : "My Company" \
      } \
    } \
  ] \
}'
```

The response shows that the payload would be inserted into the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table.

```
{
  "result": {
    "relations": [],
    "items": [
      {
        "identifierEntrySysId": "Unknown",

```
    ],
    "additionalCommittedRelations": [],
    "additionalCommittedItems": []
  }
}
```

Simulate submission of a second partial payload that would complete the description of the computer CI, with the summary generation Enhanced IRE option enabled.

```
curl
 "https://instance.servicenow.com/api/now/identifyreconcile/quer
yEnhanced?options=generate_summary:true" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username:password" \
--data '{ \
}'
```

The response shows that the computer CI would be inserted, and displays a summary of operations that would be performed.

```
{

Import Set API

The *`Import Set`* API provides endpoints that allow you to interact with import set tables.

This API transforms incoming data based on associated transform maps. The import set API supports synchronous transforms. The Import Set API mirrors the existing SOAP interface.

Security

Access to tables via the REST API is restricted by BasicAuth. To allow access to tables without any authentication or authorization, add the table name to sys_public.list. ACLs defined on tables are still enforced, and it is the administrator's responsibility to deactivate ACLs.

Import Set - GET /now/import/{stagingTableName}/{sys_id}

Retrieves the specified import staging record and resulting transformation result.

URL format

Versioned URL: `/api/now/{api_version}/import/{stagingTableName}/{sys_id}`

Default URL: `/api/now/import/{stagingTableName}/{sys_id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
stagingTableName	Name of the table from which to obtain the import data. Data type: String
sys_id	Sys_id of the record that contains the data. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Indicates the specified resource was not available. As import set tables are deleted frequently based on a schedule, GET requests may return 404 Not Found responses if the transformation result no longer exists.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
import_set	Name of the import set. Data type: String
result	List of objects that contain information on the data sets that were imported. Data type: Array `"result": [ { "display_name": "String", "display_value": "String", "record_link": "String", "status": "String", "sys_id": "String", "table": "String", "transform_map": "String" } ]`
result.display_name	Display name of the specific column in the table for which the display value is true. For example, `number`. Data type: String
result.display_value	Display value of the *`display_name`* column. For example, `CHG0000123`. Data type: String
result.record_link	Table API GET request for the imported record. Data type: String
result.status	Status of the import. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.sys_id	Sys_id of the import record. Data type: String
result.table	Name of the table in which the data was imported. Data type: String
result.transform_map	Name of the transform map. Data type: String
staging_table	Name of the import staging table. Data type: String

Example: Sample cURL request

```
curl
 "https://instance.servicenow.com/api/now/import/imp_user/e2928b
e64f411200adf9f8e18110c777" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  "import_set": "ISET0010001",
  "staging_table": "imp_user",
  "result": [
    {
      "transform_map": "User",
      "table": "sys_user",
      "display_name": "name",
      "display_value": "John Public",
      "record_link":
 "https://instance.service-now.com/api/now/table/sys_user/ea928b
e64f411200adf9f8e18110c777",
      "status": "inserted",
      "sys_id": "ea928be64f411200adf9f8e18110c777"
    }
  ]
}
```

Import Set - POST /now/import/{stagingTableName}

Inserts incoming data into a specified staging table and triggers transformation based on predefined transform maps in the import set table.

Transformation occurs synchronously. For each transform map that you define, the responses include transformation results such as information on the target records.

Note: The status_message and error_message fields on transformation scripts are processed and returned in response, along with any custom response fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/now/{api_version}/import/{stagingTableName}`

Default URL: `/api/now/import/{stagingTableName}`

Supported request parameters

Note: The Import Set POST method accepts only name-value pairs of String data types in request body parameters. If any other data type is provided, the resulting value stored in the import set table might not conform to the intended format. For example, the ":" notion of the nested JSON object is changed to "=".

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
stagingTableName	Name of the table from which to import the data. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
Call specific	Name-value pairs to insert in the import fields. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
201	Successful. The request was successfully created.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
import_set	Name of the import set. Data type: String
result	List of objects that contain information on the data sets that were imported. Data type: Array

```
"result": [
  {
    "display_name": "String",
    "display_value": "String",
    "record_link": "String",
    "status": "String",
    "sys_id": "String",
    "table": "String",
    "transform_map": "String"
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre> }]</pre>
result.display_name	Display name of the specific column in the table for which the display value is true. For example, `number`. Data type: String
result.display_value	Display value of the *`display_name`* column. For example, CHG0000123. Data type: String
result.record_link	Table API GET request for the imported record. Data type: String
result.status	Status of the import. Data type: String
result.sys_id	Sys_id of the import record. Data type: String
result.table	Name of the table in which the data was imported. Data type: String
result.transform_map	Name of the transform map. Data type: String
staging_table	Name of the import staging table. Data type: String

Example: Sample cURL request

```
curl "https://instance.servicenow.com/api/now/import/imp_user" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data
 "{'first_name':'John','last_name':'Public','user_id':'john.publ
ic','email':'john.public@company.com'}" \
--user "username":"password"
```

```
{
  "import_set": "ISET0010001",
  "staging_table": "imp_user",
  "result": [
    {
      "transform_map": "User",
      "table": "sys_user",
      "display_name": "name",
      "display_value": "John Public",
```

```
      "record_link":
 "https://instance.servicenow.com/api/now/table/sys_user/ea928be
64f411200adf9f8e18110c777",
      "status": "inserted",
      "sys_id": "ea928be64f411200adf9f8e18110c777"
    }
  ]
}
```

Import Set - POST /now/import/{stagingTableName}/insertMultiple

Inserts multiple records into a specified staging table and triggers transformation based on predefined transform maps or Robust Transform Engine (RTE) configurations in a single request.

Transformation is asynchronous by default. To set synchronous transformation, create a new record in the Rest Insert Multiples [sys_rest_insert_multiple] table, select the source table, and set the transformation to synchronous.

This endpoint can send a request body in two possible formats.

Data source file format

If you generate a staging table from a JSON data source, match the JSON format of the source file.

Staging table column format

Default. Matches the staging table column request body format in key value pairs.

URL format

Versioned URL: `/api/now/{api_version}/import/{stagingTableName}/insertMultiple`

Default URL: `/api/now/import/{stagingTableName}/insertMultiple`

Supported request parameters

Note: The Import Set POST method accepts only name-value pairs of String data types in request body parameters. If any other data type is provided, the resulting value stored in the import set table might not conform to the intended format. For example, the ":" notion of the nested JSON object is changed to "=".

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
stagingTableName	Name of the import set table from which to import the data. Refer to Import sets key concepts. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
multi_import_set_id	Sys_id of an entry in the Multi Import Sets [sys_multi_import_set] table. If specified, adds the current import to this multiple import set instead of adding to a new multiple import set. Data type: String
run_after	Sys_id of an entry in the Import Sets [sys_import_set] table. Enables running the current import set after the specified import set is complete. You can use this parameter to enforce the sequential order of imports. This parameter is only valid in asynchronous transformations. Data type: String

Request body (JSON)

Format	Description
Data source file	This request body format matches the JSON file format used to create the data source. Provide the request body in the same format as the JSON in the data source. JSON input varies depending on the properties in your data source. Refer to JSON information in File type data source. • This option is only available if the staging table was created using a JSON data source. Refer to Create a File type data source. • You must define the path of the data source in the Data Source [sys_data_source] table in the **Path for each row** field. • To change the default behavior for the REST Insert Multiple user, create an entry in the REST Insert Multiples [sys_rest_insert_multiple] table. • Enable the **Use data source format** in the REST insert multiple entry. Data type: Object
Staging table column (default)	This request body format matches staging table columns. Use the *records* array of key-value pairs matching the staging table column to insert in the import fields. Each JSON key is maps the table column to a JSON value representing the value to be inserted. JSON input varies depending on what fields are in your staging table. The column mapping default key value is to the column table. `{ "records":[ { "<ColumnLabel1>":"<value>", "<ColumnLabel2>":"<value>" }, { "<ColumnLabel1>":"<value>", "<ColumnLabel2>":"<value>" } ] }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body (JSON) (continued)

Format	Description
	You can modify mapping settings by adding an entry in the Rest Insert Multiples [sys_rest_insert_multiple] table and changing the **Column mapping** from **Label** to **Column name**. `{ "records":[ { "<column_name1>":"<value>", "<column_name2>":"<value>" }, { "<column_name1>":"<value>", "<column_name2>":"<value>" } ] }` The Data dictionary tables provides details on table fields in the system. Data type: Array

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
201	Successful. The request was successfully created.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body (JSON)

Name	Description
import_set_id	Sys_id of the record added to the Import Sets [sys_import_set] table. For asynchronous requests, you can use this value to run another import set after this import set process is complete. Data type: String
multi_import_set_id	Sys_id of the record added to the Multi Import Sets [sys_multi_import_set] table. This value can be used to group multiple import sets into one set. Data type: String

Example: Sample cURL request

The following example shows how to run a transform on an import table called u_employee_import_set_table using the staging table column format.

```
curl
 "https://instance.servicenow.com/api/now/import/u_employee_impo
rt_set_table/insertMultiple" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"records\": [
  {
   \"Address\": \"Hollywood\",
   \"Name\": \"Tom\",
   \"ID\": \"123\"
  },
  {
   \"Address\": \"Vine\",
   \"Name\": \"Irene\",
   \"ID\": \"456\"
  }
  ]
}" \
--user 'username':'password'
```

Results include sys_ids for new records in the Import Sets [sys_import_set] and Multi Import Sets [sys_multi_import_set] tables.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "import_set_id": "<import_set_sys_id>",
  "multi_import_set_id": "<multi_import_set_sys_id>"
}
```

Install Base Item API

The *Install Base Item* API provides endpoints to access and manage install base items records within a ServiceNow instance.

An install base item represents an instance of a product that has been configured for a customer. Install base items enable you to track all purchases made by a customer.

You can also perform CRUD operations on the Install Base Related Parties related list using this API. In addition, you can read records in other install base items related lists, such as cases, contracts, entitlements, maintenance plans, sold products, and work orders.

To access this API you must have either the sn_install_base.ib_api_write or sn_install_base.ib_api_read role depending on the type of CRUD action that you are trying to perform.

To access the various endpoints in this API the following plugins must be installed:

- Customer Service Install Base Management (com.snc.install_base)
- Planned Work Management (sn_fsm_planned_wm) if you want to retrieve maintenance plan and work order data.

This API runs in the `sn_install_base` namespace.

Note: This API only returns non-empty fields in the endpoint responses. Also, none of the system level fields (those prefaced with "sys_") are returned except the sys_id field.

For additional information on install base items, see Create an install base item.

Install Base Item - DELETE /sn_install_base/integrations/installbaseitems/{id}/relatedparties/{related_party_sys_id}

Disassociates a specified related parties record from a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/relatedparties/{related_party_sys_id}`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/relatedparties/{related_party_sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
id	Sys_id of the install base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String
related_party_sys_id	Sys_id of the related party record. By default, this is located in the Install Base Related Party [sn_install_base_related_party] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	Details about the error that occurred when trying to process the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
result	Description of the endpoint results. Data type: Object
result.status	Status of the endpoint request. Possible values: • SUCCESS • FAILURE Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/f77c7542b7343300ece839a6ee11a991/relatedpart
ies/2a42dfae872521100b6afc86dabb356b" \
--request DELETE \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "status": "SUCCESS"
  }
}
```

Install Base Item - GET /sn_install_base/integrations/installbaseitems

Returns all install base items. You can pass parameters within the call to filter the return results.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems`

Default URL: `/api/sn_install_base/integrations/installbaseitems`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the install base item records. Located in the Install Base Item [sn_istall_base_item] table. If you specify a different table in *`sys_class_name`*, then specify the fields in that table. You can pass one or more field-value pairs to filter the return results. For example, to return only records where the state field is set to "in_use" and the status field is set to "replacement", pass the follow: `&state=in_use&status=replacement`. Data type: String Default: All fields
related_party	Sys_id of a related party record. Located in the Install Base Related Party [sn_install_base_related_party] table. Filters the install base item records based on the specified related party. A related party can be linked to an install base item or a sold product. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• account sys_id - located in the Account [customer_account] table. • consumer sys_id - located in the Consumer [csm_consumer] table. • contact sys_id - located in the Contact [customer-contact] table. • service organization sys_id - located in the Service Organization [sn_customer_service_organization] table. • user sys_id - located in the User [sys-user] table. Data type: String
responsibility	Sys_id of the associated responsibility record. This record defines the access level for the install base information. This parameter is only valid if the *related_party* field is also specified. If specified, it only returns the install base items that match both the *related_party* and *responsibility* parameters. For additional information, see Configure related parties for items received. Data type: String
sys_class_name	If the desired records are in a table that extends the Install Base Items [sn_install_base_item] table, the name of the extended table to query. Data type: String
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *sysparm_offset* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *sysparm_limit* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *sysparm_offset* parameter. Data type: Number

Name	Description
	Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

The following return results only describe the return values for records returned from the Install Base Items [sn_install_base_items] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
error	Details about the error that occurred when trying to process the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
has_more	Flag that indicates whether there are more records in the table to return. Possible values: • true: More records to return. • false: No more records to return. Data type: Boolean string
items	List of the install base items that matched the specified filter results. Data type: Array of Objects `"items":[{ "account": {Object}, "active": "String", "asset": {Object}, "configuration_item": {Object}, "consumer": {Object}, "consumer_profile": {Object}, "contact": {Object}, "health_status": {Object}, "health_status_last_updated": "String", "household": {Object}, "install_date": {Object}, "location": {Object}, "name": "String", "number": "String", "parent": {Object}, "product": {Object}, "service_context": {Object},`

Name	Description
	Data type: String
items.asset.sys_id	Sys_id of the asset record associated with the install base item record. Data type: String
items.configuration_item	Details about the configuration item associated with the install base item record. Data type: Object `"configuration_item": { "display_value": "String", "sys_id": "String" }`
items.configuration_item.display_value	Text name of the configuration item associated with the install base item record. Use this value to display the configuration item name in the UI. Data type: String
items.configuration_item.sys_id	Sys_id of the configuration item record associated with the install base item record. Data type: String
items.consumer	Details about the consumer associated with the install base item record. **Note:** The consumer field is only available if the B2B2C plugin is installed. Data type: Object `"consumer": { "display_value": "String", "sys_id": "String" }`
items.consumer.display_value	Text name of the consumer associated with the install base item record. Use this value to display the consumer name in the UI. Data type: String
items.consumer.sys_id	Sys_id of the consumer record associated with the install base item record. Data type: String
items.consumer_profile	Details about the consumer profile associated with the install base item record. **Note:** The consumer profile field is only available if the B2B2C plugin is installed.

Name	Description
	Data type: Object `"consumer_profile": { "display_value": "String", "sys_id": "String" }`
items.consumer_profile.display_value	Text name of the consumer profile associated with the install base item record. Use this value to display the consumer profile name in the UI. Data type: String
items.consumer_profile.sys_id	Sys_id of the consumer profile record associated with the install base item record. Data type: String
items.contact	Details about the account contact responsible for the install base item record. Data type: Object `"contact": { "display_value": "String", "sys_id": "String" }`
items.contact.display_value	Text name of the account contact associated with the install base item record. Use this value to display the account contact name in the UI. Data type: String
items.contact.sys_id	Sys_id of the account contact record associated with the install base item record. Data type: String
items.health_status	Details about the current health status of the install base item. Only returned if the Proactive Customer Service Operations (com.snc.proactive_cs_itom) plugin is installed. Data type: Object `"health_status": { "display_value": "String", "value": "String" }`
items.health_status.display_value	Text string of the current health status of the install base item. Use this value to display the health status in the UI. Data type: String

Name	Description
items.health_status.value	Internal value of the health status of the install base item. Data type: String
items.health_status_last_updated	Date and time when the health status was last updated for the install base item. Data type: String
items.household	Details about the household associated with the install base item record. Only returned if the Customer Service Household (com.snc.household) plugin is installed. Data type: Object `"household": { "display_value": "String", "sys_id": "String" }`
items.household.display_value	Text name of the household associated with the install base item record. Use this value to display the household name in the UI. Data type: String
items.household.sys_id	Sys_id of the household associated with the install base item record. Data type: String
items.install_date	Details about the date when the install base item became active. Data type: Object `"install_date": { "display_value": "String", "value": "String" }`
items.install_date.display_value	Text install date. Use this value to display the install date in the UI. Data type: String
items.install_date.value	Internal value of the install date. Data type: String
items.location	Details about the location of the install base item. Data type: Object `"location": { "display_value": "String",`

Name	Description

	<pre>"sys_id": "String"
	}</pre>

items.location.display_value	Text name of the install base item location. Use this value to display the location name in the UI. Data type: String
items.location.sys_id	Sys_id of the location record associated with the install base item record. Data type: String
items.name	Name of the install base item. Data type: String
items.number	Unique ID of the install base item. Data type: String

items.parent	Details about the parent record of the install base item record.
	
	Data type: Object
	<pre>"parent": {
	"display_value": "String",
	"sys_id": "String"
	}</pre>

items.parent.display_value	Text name of the parent record associated with the install base item record. Use this value to display the parent name in the UI. Data type: String
items.parent.sys_id	Sys_id of the parent record associated with the install base item record. Data type: String

items.product	Details about the product model associated with the install base item record. Use this information to identify the services associated with any product model.
	
	Data type: Object
	<pre>"product": {
	"display_value": "String",
	"sys_id": "String"
	}</pre>

items.product.display_value	Text name of the product model associated with the install base item record. Use this value to display the product name in the UI.

Name	Description
	Data type: String
items.product.sys_id	Sys_id of the product model record associated with the install base item record. Data type: String
items.service_context	Details about the service context associated with the install base item record. Data type: Object `"service_context": { "display_value": "String", "sys_id": "String" }`
items.service_context.display_value	Text name of the service context associated with the install base item record. Use this value to display the service context name in the UI. Data type: String
items.service_context.sys_id	Sys_id of the service context record associated with the install base item record. Data type: String
items.service_organization	Details about the service organization associated with the install base item record. Only returned if the Service Organization (com.snc.service_organization) plugin is installed. Data type: Object `"service_organization": { "display_value": "String", "sys_id": "String" }`
items.service_organization.display_value	Text name of the service organization associated with the install base item record. Use this value to display the service organization name in the UI. Data type: String
items.service_organization.sys_id	Sys_id of the service organization record associated with the install base item record. Data type: String
items.sys_class_name	Table containing the install base item record. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
items.sys_id	Sys_id of the install base item record. Located in the table specified in the *sys_class_name* parameter. Data type: String
items.sys_mod_count	Number of times that the associated install base item record has been modified. Data type: String
items.state	Details about the current state of the install base item. Data type: Object `"state": { "display_value": "String", "value": "String" }`
items.state.display_value	Text string of the current state of the install base item. Use this value to display the state in the UI. Data type: String
items.state.value	Internal value of the state of the install base item. Data type: String
items.status	Details about the status of the install base item. Data type: Object `"status": { "display_value": "String", "value": "String" }`
items.status.display_value	Text string of the status of the install base item. Use this value to display the status in the UI. Data type: String
items.status.value	Internal value of the status of the install base item. Data type: String
items.uninstall_date	Details about the date when the install base item became inactive. Data type: Object `"uninstall_date": { "display_value": "String", "value": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
items.uninstall_date.display_value	Text uninstall date. Use this value to display the uninstall date in the UI. Data type: String
items.uninstall_date.value	Internal value of the uninstall date. Data type: String
status	Status of the endpoint call. Data type: String
sysparm_depth	Number of levels deep the returned child install base item is in the hierarchy. Data type: Integer
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String

Example: cURL request

The following code example shows a simple call that only returns a single record starting at offset 5.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/v1/integra
tions/installbaseitems?sysparm_limit=1&sysparm_offset=5" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "sysparm_offset": "5",
    "sysparm_limit": 1,
    "has_more": true,
    "items": [
      {
        "sys_class_name": "sn_install_base_item",
        "number": "IBITM0011OO",
        "sys_id": "181df7ff530a1110539dddeeff7b12f4",
        "state": {
          "value": "in_use",
          "display_value": "In Use"
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        },
        "sys_mod_count": "2",
        "active": "true",
        "configuration_item": {
          "sys_id": "62446ae8535e5510539dddeeff7b12db",
          "display_value": "boxeoproderp"
        },
        "name": "boxeoproderp",
        "account": {
          "sys_id": "86837a386f0331003b3c498f5d3ee4ca",
          "display_value": "Boxeo"
        }
      }
    ],
    "status": "SUCCESS"
  }
}
```

Example: cURL request

The following code example shows how to search for the fields *state* = "in_use" and *status* = "replacement" within the Install Base Item table.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems?state=in_use&status=replacement" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "sysparm_offset": "0",
    "sysparm_limit": "10",
    "has_more": false,
    "items": [
      {
        "parent": {
          "sys_id": "ffd023f453de9910539dddeeff7b1264",
          "display_value": "Point of Sale System"
        },
        "sys_class_name": "sn_install_base_item",
        "number": "IBITM001140",

Install Base Item - GET /sn_install_base/integrations/installbaseitem/{id}

Returns a specified install base item record and its child hierarchy.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitem/{id}`

Default URL: `/api/sn_install_base/integrations/installbaseitem/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String

Query parameters

Name	Description
sys_class_name	If the desired record is in a table that extends the Install Base Items [sn_install_base_item] table, the name of the extended table to query. This table must extend the sn_install_base_item table.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String
sysparm_depth	Maximum depth of the child install base item's hierarchy to return. Data type: Integer Default: 7 Maximum: 10
sysparm_limit	Maximum number records to return in each child hierarchy. Data type: Integer Default: 10 Maximum: 100

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

childinstallbase	List of child install base item records associated with the specified install base item.
	
	Data type: Object
	
	`"childinstallbase": {`
	`  "items": [Array],`
	`  "sysparm_depth": Integer`
	`}`

childinstallbase.items	Child install base items associated with the specified install base item. The values within this array are defined under the *`items[]`* array further down in this section.
childinstallbase.sysparm_depth	Child-level of the install base item. Data type: Integer

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String

Name	Description
has_children	Flag that indicates whether the requested install base item record has child install base item records. • true: Has child install base item records. • false: Doesn't have child install base item records. Data type: Boolean
item	Install base item that matched the specified filter results. Data type: Array of Objects `"item": { "account": {Object}, "active": "String", "asset": {Object}, "configuration_item": {Object}, "consumer": {Object}, "consumer_profile": {Object}, "contact": {Object}, "health_status": "Object", "health_status_last_updated": "String", "household": {Object}, "install_date": {Object}, "location": {Object}, "name": "String", "number": "String", "parent": {Object}, "product": {Object}, "service_context": {Object}, "service_organization" {Object}, "sys_class_name": "String", "sys_id": "String", "state": {Object}, "status": {Object}, "uninstall_date": "String" }`
item.account	Details about the customer account associated with the install base item record. Data type: Object `"account": { "display_value": "String", "sys_id": "String" }`
item.account.display_value	Text name of the customer account associated with the install base item record. Use this value to display the customer account name in the UI. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
item.account.sys_id	Sys_id of the customer account record associated with the install base item record. Data type: String
item.active	Flag that indicates whether the install base item is active. Possible values: • true: Install base item is active. • false: Install base item is inactive. Data type: Boolean String
item.asset	Details about the asset associated with the install base item record. Data type: Object `"asset": { "display_value": "String", "sys_id": "String" }`
item.asset.display_value	Text name of the asset associated with the install base item record. Use this value to display the asset name in the UI. Data type: String
item.asset.sys_id	Sys_id of the asset record associated with the install base item record. Data type: String
item.configuration_item	Details about the configuration item associated with the install base item record. Data type: Object `"configuration_item": { "display_value": "String", "sys_id": "String" }`
item.configuration_item.display_value	Text name of the configuration item associated with the install base item record. Use this value to display the configuration item name in the UI. Data type: String
item.configuration_item.sys_id	Sys_id of the configuration item record associated with the install base item record. Data type: String

Name	Description
item.consumer	Details about the consumer associated with the install base item record. **Note:** The consumer field is only available if the B2B2C plugin is installed. Data type: Object `"consumer": { "display_value": "String", "sys_id": "String" }`
item.consumer.display_value	Text name of the consumer associated with the install base item record. Use this value to display the consumer name in the UI. Data type: String
item.consumer.sys_id	Sys_id of the consumer record associated with the install base item record. Data type: String
item.consumer_profile	Details about the consumer profile associated with the install base item record. **Note:** The consumer profile field is only available if the B2B2C plugin is installed. Data type: Object `"consumer_profile": { "display_value": "String", "sys_id": "String" }`
item.consumer_profile.display_value	Text name of the consumer profile associated with the install base item record. Use this value to display the consumer profile name in the UI. Data type: String
item.consumer_profile.sys_id	Sys_id of the consumer profile record associated with the install base item record. Data type: String
item.contact	Details about the account contact responsible for the install base item record. Data type: Object `"contact": { "display_value": "String", "sys_id": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
item.contact.display_value	Text name of the account contact associated with the install base item record. Use this value to display the account contact name in the UI. Data type: String
item.contact.sys_id	Sys_id of the account contact record associated with the install base item record. Data type: String
item.health_status	Details about the current health status of the install base item. Only returned if the Proactive Customer Service Operations (com.snc.proactive_cs_itom) plugin is installed. Data type: Object `"health_status": { "display_value": "String", "value": "String" }`
item.health_status.display_value	Text string of the current health status of the install base item. Use this value to display the health status in the UI. Data type: String
item.health_status.value	Internal value of the health status of the install base item. Data type: String
item.health_status_last_updated	Date and time when the health status was last updated for the install base item. Data type: String
item.household	Details about the household associated with the install base item record. Only returned if the Customer Service Household (com.snc.household) plugin is installed. Data type: Object `"household": { "display_value": "String", "sys_id": "String" }`
item.household.display_value	Text name of the household associated with the install base item record. Use this value to display the household name in the UI. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
item.household.sys_id	Sys_id of the household associated with the install base item record. Data type: String
item.install_date	Details about the date when the install base item became active. Data type: Object `"install_date": { "display_value": "String", "value": "String" }`
item.install_date.display_value	Text install date. Use this value to display the install date in the UI. Data type: String
item.install_date.value	Internal value of the install date. Data type: String
item.location	Details about the location of the install base item. Data type: Object `"location": { "display_value": "String", "sys_id": "String" }`
item.location.display_value	Text name of the install base item location. Use this value to display the location name in the UI. Data type: String
item.location.sys_id	Sys_id of the location record associated with the install base item record. Data type: String
item.name	Name of the install base item. Data type: String
item.number	Unique ID of the install base item. Data type: String
item.parent	Details about the parent record of the install base item record. Data type: Object `"parent": { "display_value": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

	<pre>"sys_id": "String"
	}</pre>

item.parent.display_value	Text name of the parent record associated with the install base item record. Use this value to display the parent name in the UI. Data type: String
item.parent.sys_id	Sys_id of the parent record associated with the install base item record. Data type: String

item.product	Details about the product model associated with the install base item record. Use this information to identify the services associated with any product model.
	
	Data type: Object
	<pre>"product": {
	"display_value": "String",
	"sys_id": "String"
	}</pre>

item.product.display_value	Text name of the product model associated with the install base item record. Use this value to display the product name in the UI. Data type: String
item.product.sys_id	Sys_id of the product model record associated with the install base item record. Data type: String

item.service_context	Details about the service context associated with the install base item record.
	
	Data type: Object
	<pre>"service_context": {
	"display_value": "String",
	"sys_id": "String"
	}</pre>

item.service_context.display_value	Details about the service context associated with the install base item record.
	
	Data type: Object
	<pre>"service_context": {
	"display_value": "String",
	"sys_id": "String"
	}</pre>

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
item.service_context.sys_id	Sys_id of the service context record associated with the install base item record. Data type: String
item.service_organization	Details about the service organization associated with the install base item record. Only returned if the Service Organization (com.snc.service_organization) plugin is installed. Data type: Object `"service_organization": { "display_value": "String", "sys_id": "String" }`
item.service_organization.display_value	Text name of the service organization associated with the install base item record. Use this value to display the service organization name in the UI. Data type: String
item.service_organization.sys_id	Sys_id of the service organization record associated with the install base item record. Data type: String
item.sys_class_name	Table containing the install base item record. Data type: String
item.sys_id	Sys_id of the install base item record. Located in the table specified in the *sys_class_name* parameter. Data type: String
item.sys_mod_count	Number of times that the associated install base item record has been modified. Data type: String
item.state	Details about the current state of the install base item. Data type: Object `"state": { "display_value": "String", "value": "String" }`
item.state.display_value	Text string of the current state of the install base item. Use this value to display the state in the UI. Data type: String
item.state.value	Internal value of the state of the install base item.

Name	Description
	Data type: String
item.status	Details about the status of the install base item. Data type: Object `"status": { "display_value": "String", "value": "String" }`
item.status.display_value	Text string of the status of the install base item. Use this value to display the status in the UI. Data type: String
item.status.value	Internal value of the status of the install base item. Data type: String
item.uninstall_date	Details about the date when the install base item became inactive. Data type: Object `"uninstall_date": { "display_value": "String", "value": "String" }`
item.uninstall_date.display_value	Text uninstall date. Use this value to display the uninstall date in the UI. Data type: String
item.uninstall_date.value	Internal value of the uninstall date. Data type: String
status	Status of the endpoint call. Data type: String

Example: cURL request

The following code example shows how to call this endpoint. The associated install base item doesn't have any children.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitem/f77c7542b7343300ece839a6ee11a991" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

Install Base Item - GET /sn_install_base/integrations/installbaseitems/{id}/cases

Returns the cases associated with a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/cases`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/cases`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the case records. By default this references the fields in the Case [sn_customerservice_case] table. If you specify a different table in *`sys_class_name`*, then specify the fields in that table. You can pass one or more field-value pairs to filter the return results. For example, to return only records where the approval field is set to "rejected" and the category field is set to "2", pass the follow: `&approval=rejected&category=2`. Data type: String Default: All fields
sys_class_name	If using an extended case table (not sn_customerservice_case), the name of the extended table to query. Data type: String Default: sn_customerservice_case
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *sysparm_limit* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
cases	List of cases associated with the specified install base item record. Data type: Array of Objects `"cases": [{ "account": "String", "active": Boolean, "active_account_escalation": "String", "active_escalation": "String", "activity_due": "String", "additional_assignee_list": "String", "approval": "String", "approval_history": "String", "approval_set": "String", "asset": "String", "assigned_on": "String", "assigned_to": "String", "assignment_group": "String", "auto_close": Boolean, "business_duration": "String", "business_impact": "String", "business_service": "String", "calendar_duration": "String", "case": "String", "case_report": "String", "category": Number, "cause": "String", "caused_by": "String", "change": "String",`

Element	Description
	"rejection_goto": "String", "resolution_code": "String", "resolved_at": "String", "resolved_by": "String", "route_reason": "String", "service_offering": "String", "short_description": "String", "skills": "String", "sla_due": "String", "sn_app_cs_social_social_profile": "String", "sold_product": "String", "stage": "String", "state": Number, "subcategory": Number, "support_manager" "String", "sync_driver": Boolean, "sys_class_name": "String", "sys_domain": "String", "sys_domain_path": "String", "sys_id": "String", "task_effective_number": "String", "time_worked": "String", "universal_request": "String", "upon_approval": "String", "upon_reject": "String", "urgency": Number, "user_input": "String", "variables": "String", "watch_list": [Array], "wf_activity": "String", "work_end": "String", "work_notes": "String", "work_notes_list": [Array], "work_start": "String"
cases.account	Sys_id of the account record associated with the case. Located in the Account [customer_account] table. Data type: String
cases.active	Flag that indicates whether the case is open and active. Possible values: • true: Case is active • false: Case is closed Data type: Boolean Default: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
cases.active_account_escalation	Sys_id of the active account escalation record associated with the case. Located in the Escalation [sn_customerservice_escalation] table. Data type: String
cases.active_escalation	Sys_id of the active escalation record associated with the case. Located in the Escalation [sn_customerservice_escalation] table. Data type: String
cases.activity_due	Date for which the associated case is expected to be completed. Data type: String
cases.additional_assignee_list	List of the sys_ids of the additional persons (other than the primary assignee) that have been assigned to the account. Located in the User [sys_user] table. Data type: Array Maximum: 4,000
cases.approval	String that describes the type of approval required. Possible values: • approved • cancelled • duplicate • not_required • not requested • rejected • requested Data type: String Maximum characters: 40 Default: not requested
cases.approval_history	List of all approvals associated with the case. Data type: String Maximum characters: 4,000
cases.approval_set	Date and time that the associated action was approved. Data type: String

Element	Description
cases.asset	Sys_id of the asset record associated with the case. Located in the Asset [alm_asset] table. Data type: String
cases.assigned_on	Date and time that the case was assigned to the person identified in the *assigned_to* parameter. Data type: String (Date) Maximum length: 40
cases.assigned_to	Sys_id of the person assigned to the case. Located in the User [sys_user] table. Data type: String
cases.assignment_group	Sys_id of the customer service agent group assigned to the case. Located in the Group [sys_user_group] table. Data type: String
cases.auto_close	Flag that indicates whether the case was automatically closed. Possible values: • true: Case was auto closed • false: Case wasn't auto closed Data type: Boolean Default: false
cases.business_duration	Length in calendar work hours, work days, and work weeks that it took to complete the case. Data type: String
cases.business_impact	Impact of the issue on the associated customer. Data type: String Maximum characters: 4,000
cases.business_service	Sys_id of the service record associated with the case. Located in the Service [cmdb_ci_service] table. Data type: String
cases.calendar_duration	Length in calendar hours, days, and weeks that it took to complete the case. Data type: String (Duration) Maximum length: 40

Element	Description
cases.case	Case short description and case number. Data type: String Maximum length: 300
cases.case_report	Sys_id of the associated case report. Located in the Case Report [sn_customerservice_case_report] table. Data type: String
cases.category	Case category. Possible values: • 0: Question • 1: Issue • 2: Feature Data type: Number (Integer) Default: 1
cases.cause	Details about the cause of the problem. Data type: String Maximum length: 4,000
cases.caused_by	Sys_id of the change request that caused the case to be created. Located in the Change Request [change_request] table. Data type: String
cases.change	Sys_id of the change request that caused the case to be created. Located in the Change Request [change_request] table. Data type: String
cases.child_case_creation_progress	Flag that indicates whether the case is a child case that was created from a major case. Possible values: • true: Child case created from a major case • false: Not a child case Data type: Boolean
cases.closed_at	Date and time that the case was closed. Data type: String

Element	Description
cases.closed_by	Sys_id of the user that closed the case. Located in the User [sys_user] table. Data type: String
cases.close_notes	Notes made when the case was closed. Data type: String Maximum length: 4,000
cases.cmdb_ci	Sys_id of the configuration item associated with the case. Located in the Configuration Item [cmdb_ci] table. Data type: String
cases.comments	Additional comments about the case. Data type: String Maximum length: 4,000
cases.comments_and_work_notes	Comments and work notes entered for the case. Data type: String Maximum length: 4,000
cases.company	Sys_id of the company associated with the case. Located in the Company [core_company] table. Data type: String
cases.consumer	Business-to-consumer cases only. Sys_id of the person to contact with regard to this case. Located in the Consumer [csm_consumer] table. Data type: String
cases.contact	Business-to-business based cases only. Sys_id of the person to contact regarding this case. Located in the Contact [customer_contact] table. Data type: String
cases.contact_local_time	Contact local time. Data type: String Maximum length: 70
cases.contact_time_zone	Time zone of the contact associated with the case. Data type: String Maximum length: 40

Element	Description
cases.contact_type	Method in which the case was initially reported. Possible values: • chat • email • phone • social • web Data type: String Maximum length: 40
cases.contract	Sys_id of the contract associated with the case. Located in the Contract [ast_contract] table. This contract contains information about the type of support that is provided to the company associated to the case. A contract can include a company and contact and the specific assets that are covered. A contract can also include multiple service entitlements and SLAs. Data type: String
cases.contributor_groups	List of sys_ids of the user groups that have contributed to the case. Located in the Group [sys_user_group] table. Data type: String
cases.contributor_users	List of sys_ids of the users that have contributed to the case. Located in the User [sys_user] table. Data type: String
cases.correlation_display	Correlation display. Data type: String Maximum length: 100
cases.correlation_id	Correlation identifier. Data type: String Maximum length: 100
cases.delivery_plan	Sys_id of the parent execution plan for this case. Located in the Execution Plan [sc_cat_item_delivery_plan] table. Data type: String
cases.delivery_task	Sys_id of the execution plan task. Located in the Execution Plan Task [sc_cat_item_delivery_task] table.

Element	Description
	Data type: String
cases.description	Detailed description of the problem associated with the case. Data type: String Maximum length: 4,000
cases.due_date	Date that the case is due to be closed. Data type: String
cases.entitlement	Sys_id of the entitlement record associated with the case. Located in the Entitlement [service_entitlement] table. Entitlements define the type of support that a customer receives as well as the supported communication channels. An entitlement can be associated with a product, an asset, an account, or a contract. Data type: String
cases.escalation	Current escalation level. Possible values: • 0: Normal • 1: Moderate • 2: High • 3: Overdue Data type: Number (Integer) Default: 0
cases.expected_start	Date and time when work is scheduled to begin on the case. Data type: String
cases.first_response_time	Date and time when the first action was taken on the case. Data type: String
cases.follow_the_sun	Flag that indicates whether the case should be handed-off for global follow-up. If a customer enters additional comments on a Priority 1 - Critical or a Priority 2 - High case, or if the case is escalated, the flag is automatically set to true. Possible values:

Element	Description
	• true: Case should be handed-off for global follow-up • false: Case shouldn't be handed-off for global follow-up Data type: Boolean Default: false
cases.follow_up	Date and time of the next follow-up action. Data type: String
cases.group_list	List of sys_ids of the group records associated with the case. Located in the Group [sys_user_group] table. Data type: Array
cases.impact	Impact on customer. Possible values: • 1: High • 2: Medium • 3: Low Data type: Number (Integer) Default: 3
cases.internal_user	Sys_id of the internal user for this case. Located in the User [sys_user] table. Data type: String
cases.initiated_as_request	Flag that indicates if this inquiry was initiated as a request by the customer. Possible values: • true: Inquiry initiated by customer. • false: Inquiry wasn't initiated by customer. Data type: Boolean Default: false
cases.knowledge	Flag that indicates if there is a knowledge base article available for the specified issue. Possible values: • true: Knowledge base article is available for this issue • false: Knowledge base article is not available for this issue

Element	Description
	Data type: Boolean Default: false
cases.location	Sys_id of the record describing the company location. Located in the Location [cmn_location] table. Data type: String
cases.made_sla	Flag that indicates whether the case was resolved in alignment with the associated service level agreement. Possible values: • true: Case was resolved in alignment with SLA • false: Case was not resolved according to the SLA Data type: Boolean Default: true
cases.major_case_state	Current state of the major case. Possible values: • accepted: Initial state when a manager creates a major case or when a manager promotes a candidate case. • canceled: Case is canceled. • proposed: Initial state when an agent or manager creates or proposes a candidate case. • rejected: Manager rejected candidate case. Data type: String Maximum length: 40
needs_attention	Flag that indicates whether the case needs attention. Possible values: • true: Case needs additional attention • false: Case does not need additional attention Data type: Boolean Default: false
cases.notes_to_comments	Flag that indicates whether to add the resolution notes to the comments. Possible values:

Element	Description
	• true: Resolutions notes, when added, are also added to the comments • false: Resolution notes in comments are not required Data type: Boolean
cases.notify	Method to use to notify contact/consumer. Possible values: • 1: Do not notify • 2: Send email • 3: Telephone Data type: Number (Integer) Default: 1
cases.number	Case number. Data type: String Maximum length: 40
cases.opened_at	Date and time that the case was opened. Data type: String
cases.opened_by	Sys_id of the person that initially opened the case. Located in the User [sys_user] table. Data type: String
cases.order	Order of the case. Data type: Number (Integer)
cases.parent	Sys_id of the parent case to which this case (child) is associated. Located in the Task [task] table. Data type: String
cases.partner	Sys_id of the partner associated with the case. Located in the Account [customer_account] table. Data type: String
cases.partner_contact	Sys_id of the partner contact associated with the case. Located in the Contact [customer_contact] table. Data type: String
cases.priority	Priority of the case. Possible values:

Element	Description
	• 1: Critical • 2: High • 3: Moderate • 4: Low Data type: Number (Integer) Default: 4
cases.proactive	Flag that indicates whether the inquiry is being proactively monitored. Possible values: • true: Being proactively monitored. • false: Not being monitored. Data type: Boolean Default:false
cases.probable_cause	Possible cause of the issue associated with the case. Data type: String Maximum length: 4,000
cases.problem	Sys_id of the issue that the customer is encountering. Located in the Problem [problem] table. Data type: String
cases.product	Sys_id of the product model of the asset associated to the case. Located in the Product Model [cmdb_model] table. A model is a specific version or configuration of an asset (for example, Apple Mac Book Pro). Data type: String
cases.reassignment_count	Number of times that the case was reassigned to a person that is responsible for moving the case forward. Data type: Number (Integer) Default: 0
cases.recipient_list	Sys_id of the record that contains the list of recipients for communications about this case. Located in the Recipients List [sn_publications_recipients_list] table. Data type: String
cases.rejection_goto	Sys_id of the task to execute if the case is rejected. Located in the Task [task] table.

Element	Description
	Data type: String
cases.resolution_code	Resolution state for the case, such as "Solved - Fixed by Support/Guidance provided". Data type: String Maximum length: 40
cases.resolved_at	Date and time that the case was resolved. Data type: String
cases.resolved_by	Sys_id of the person that resolved the case. Located in the User [sys_user] table. Data type: String
cases.route_reason	Reason that the case was routed to a different assignee. Data type: Number (Integer) Maximum length: 40
cases.service_offering	Sys_id of the service offering associated with the payment inquiry. Service offerings uniquely define the level of service in terms of availability, scope, pricing, and packaging options. Located in the Service Offering [service_offering] table. Data type: String
cases.short_description	Concise description of the case. Data type: String Maximum length: 160
cases.skills	List of the unique identifiers (sys_id) of the skills needed to complete the case. Located in the Skill [cmn_skill] table. Data type: String
cases.sla_due	Date/time at which the case must be closed based on the associated service level agreement. Data type: String
cases.sn_app_cs_social_social_profile	Sys_id of the social media profile associated with the case. Located in the Social Profile [sn_app_cs_social_social_profile] table. Data type: String

Element	Description
cases.sold_product	Sys_id of the associated product. Located in the Sold Product [sn_install_base_sold_product] table. Data type: String
cases.stage	Stage of the inquiry, such as Closed Complete, Closed Rejected, Document Check, Authorization, and so on. Data type: String Maximum length: 40
cases.state	Current state of the case. Possible values: • 1: New • 3: Closed • 6: Resolved • 10: Open • 18: Awaiting Info Data type: Number (Integer) Default: 1
cases.subcategory	Case subcategory. Possible values: 0: Question Data type: Number (Integer) Default: 0
cases.support_manager	Sys_id of the CSM manager assigned to the case. Located in the User [sys_user] table. Data type: String
cases.sync_driver	Flag that indicates whether there's driver synchronization. Possible values: • true: Driver is synchronized • false: Driver isn't synchronized Data type: Boolean
cases.sys_class_name	Table that contains the case record. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Maximum length: 80
cases.sys_domain	Domain associated with the case. Data type: String Maximum length: 32 Default: global
cases.sys_domain_path	Domain path. Data type: String Maximum length: 255 Default: /
cases.sys_id	Unique identifier for the case. Data type: String Maximum length: 32
cases.task_effective_number	Identifying number. If the task has a Universal Request associated with it, it's the UR number. Otherwise, it's the current task number. Data type: String Maximum length: 40
cases.time_worked	Total amount of time worked on the case. Data type: String
cases.universal_request	Sys_id of a universal task that this inquiry is part of. Located in the Task [task] table. Data type: String
cases.upon_approval	Action to take if the case is approved. Possible values: • do_nothing • proceed Data type: String Maximum length: 40 Default: proceed
cases.upon_reject	Action to take if the case is rejected.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Possible values: • cancel • goto Data type: String Maximum length: 40 Default: cancel
cases.urgency	Urgency of the case. Possible values: • 1: High • 2: Medium • 3: Low Data type: Number (Integer) Default: 3
cases.user_input	Additional user input. Data type: String Maximum length: 4,000
cases.variables	Name-value pairs of variables associated with the case. Data type: String Maximum length: 40
cases.watch_list	List of sys_ids of the users who receive notifications about this case when additional comments are added or if the state of a case is changed to Resolved or Closed. Located in the User [sys_user] table. Data type: Array
cases.wf_activity	Sys_id of the workflow activity record associated with the case. Located in the Workflow Activity [wf_activity] table. Data type: String
cases.work_end	Date and time work ended on the case. Data type: String
cases.work_notes	Information about how to resolve the case, or steps taken to resolve it.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String Maximum length: 4,000
cases.work_notes_list	List of sys_ids of the internal users who receive notifications about this case when work notes are added. Located in the User [sys_user] table. Data type: Array
cases.work_start	Date and time that work started on the case. Data type: String
has_more	Flag that indicates whether there are more records in the table to return. Possible values: • true: More records to return. • false: No more records to return. Data type: Boolean string
status	Status of the endpoint call. Data type: String
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *sysparm_offset* parameter to paginate record retrieval. In the response, the boolean parameter *hasMore* is returned. It indicates whether there are more records to return that meet the filter criteria. Data type: Number Default: 10
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset +sysparm_limit`, until you reach the end of all records. Do not pass a negative number in the *sysparm_offset* parameter.

Element	Description
	Data type: Number Default: 0

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/1474a3c853500010df5dddeeff7b12ec/cases" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```

Install Base Item - GET /sn_install_base/integrations/installbaseitems/{id}/childinstallbaseitems

Returns the child install base items associated with a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/childinstallbaseitems`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/childinstallbaseitems`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the child install base item records. Located in the Install Base Item [sn_install_base_item] table. If you specify a different table in *`sys_class_name`*, then specify the fields in that table. You can pass one or more field-value pairs to filter the return results. For example, to return only records where the state field is set to "in_use" and the status field is set to "replacement", pass the follow: `&state=in_use&status=replacement`. Data type: String Default: All fields
sys_class_name	If using an extended install base items table (not sn_install_base_item), the name of the extended table to query. Data type: String Default: sn_install_base_item
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *`sysparm_limit`* values can impact system performance. Data type: Number Default: 10000

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	Details about the error that occurred when trying to process the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
has_more	Flag that indicates whether there are more records in the table to return. Possible values: • true: More records to return. • false: No more records to return. Data type: Boolean string
items	List of the install base items that matched the specified filter results. Data type: Array of Objects `"items":[ { "account": {Object}, "active": "String", "asset": {Object},`

Name	Description
	"configuration_item": {Object}, "consumer": {Object}, "consumer_profile": {Object}, "contact": {Object}, "health_status": {Object}, "health_status_last_updated": "String", "household": {Object}, "install_date": {Object}, "location": {Object}, "name": "String", "number": "String", "parent": {Object}, "product": {Object}, "service_context": {Object}, "service_organization" {Object}, "sys_class_name": "String", "sys_id": "String", "sys_mod_count": "String", "state": {Object}, "status": {Object}, "uninstall_date": "String" }]

items.account	Details about the customer account associated with the install base item record.
	
	Data type: Object
	"account": {
	"display_value": "String",
	"sys_id": "String"
	}

items.account.display_value	Text name of the customer account associated with the install base item record. Use this value to display the customer account name in the UI. Data type: String
items.account.sys_id	Sys_id of the customer account record associated with the install base item record. Data type: String
items.active	Flag that indicates whether the install base item is active. Possible values: • true: Install base item is active. • false: Install base item is inactive.

Name	Description
	Data type: Boolean String
items.asset	Details about the asset associated with the install base item record. Data type: Object `"asset": { "display_value": "String", "sys_id": "String" }`
items.asset.display_value	Text name of the asset associated with the install base item record. Use this value to display the asset name in the UI. Data type: String
items.asset.sys_id	Sys_id of the asset record associated with the install base item record. Data type: String
items.configuration_item	Details about the configuration item associated with the install base item record. Data type: Object `"configuration_item": { "display_value": "String", "sys_id": "String" }`
items.configuration_item.display_value	Text name of the configuration item associated with the install base item record. Use this value to display the configuration item name in the UI. Data type: String
items.configuration_item.sys_id	Sys_id of the configuration item record associated with the install base item record. Data type: String
items.consumer	Details about the consumer associated with the install base item record. **Note:** The consumer field is only available if the B2B2C plugin is installed. Data type: Object `"consumer": { "display_value": "String", "sys_id": "String" }`

Name	Description
items.consumer.display_value	Text name of the consumer associated with the install base item record. Use this value to display the consumer name in the UI. Data type: String
items.consumer.sys_id	Sys_id of the consumer record associated with the install base item record. Data type: String
items.consumer_profile	Details about the consumer profile associated with the install base item record. **Note:** The consumer profile field is only available if the B2B2C plugin is installed. Data type: Object `"consumer_profile": { "display_value": "String", "sys_id": "String" }`
items.consumer_profile.display_value	Text name of the consumer profile associated with the install base item record. Use this value to display the consumer profile name in the UI. Data type: String
items.consumer_profile.sys_id	Sys_id of the consumer profile record associated with the install base item record. Data type: String
items.contact	Details about the account contact responsible for the install base item record. Data type: Object `"contact": { "display_value": "String", "sys_id": "String" }`
items.contact.display_value	Text name of the account contact associated with the install base item record. Use this value to display the account contact name in the UI. Data type: String
items.contact.sys_id	Sys_id of the account contact record associated with the install base item record. Data type: String

Name	Description
items.health_status	Details about the current health status of the install base item. Only returned if the Proactive Customer Service Operations (com.snc.proactive_cs_itom) plugin is installed. Data type: Object `"health_status": { "display_value": "String", "value": "String" }`
items.health_status.display_value	Text string of the current health status of the install base item. Use this value to display the health status in the UI. Data type: String
items.health_status.value	Internal value of the health status of the install base item. Data type: String
items.health_status_last_updated	Date and time when the health status was last updated for the install base item. Data type: String
items.household	Details about the household associated with the install base item record. Only returned if the Customer Service Household (com.snc.household) plugin is installed. Data type: Object `"household": { "display_value": "String", "sys_id": "String" }`
items.household.display_value	Text name of the household associated with the install base item record. Use this value to display the household name in the UI. Data type: String
items.household.sys_id	Sys_id of the household associated with the install base item record. Data type: String
items.install_date	Details about the date when the install base item became active. Data type: Object `"install_date": { "display_value": "String",`

Name	Description

	<pre>"value": "String"
	}</pre>

items.install_date.display_value	Text install date. Use this value to display the install date in the UI. Data type: String
items.install_date.value	Internal value of the install date. Data type: String

items.location	Details about the location of the install base item.
	
	Data type: Object
	<pre>"location": {
	"display_value": "String",
	"sys_id": "String"
	}</pre>

items.location.display_value	Text name of the install base item location. Use this value to display the location name in the UI. Data type: String
items.location.sys_id	Sys_id of the location record associated with the install base item record. Data type: String
items.name	Name of the install base item. Data type: String
items.number	Unique ID of the install base item. Data type: String

items.parent	Details about the parent record of the install base item record.
	
	Data type: Object
	<pre>"parent": {
	"display_value": "String",
	"sys_id": "String"
	}</pre>

items.parent.display_value	Text name of the parent record associated with the install base item record. Use this value to display the parent name in the UI. Data type: String
items.parent.sys_id	Sys_id of the parent record associated with the install base item record.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
items.product	Details about the product model associated with the install base item record. Use this information to identify the services associated with any product model. Data type: Object `"product": { "display_value": "String", "sys_id": "String" }`
items.product.display_value	Text name of the product model associated with the install base item record. Use this value to display the product name in the UI. Data type: String
items.product.sys_id	Sys_id of the product model record associated with the install base item record. Data type: String
items.service_context	Details about the service context associated with the install base item record. Data type: Object `"service_context": { "display_value": "String", "sys_id": "String" }`
items.service_context.display_value	Text name of the service context associated with the install base item record. Use this value to display the service context name in the UI. Data type: String
items.service_context.sys_id	Sys_id of the service context record associated with the install base item record. Data type: String
items.service_organization	Details about the service organization associated with the install base item record. Only returned if the Service Organization (com.snc.service_organization) plugin is installed. Data type: Object `"service_organization": { "display_value": "String",`

Name	Description

	<pre>"sys_id": "String"
	}</pre>

items.service_organization.display_value	Text name of the service organization associated with the install base item record. Use this value to display the service organization name in the UI. Data type: String
items.service_organization.sys_id	Sys_id of the service organization record associated with the install base item record. Data type: String
items.sys_class_name	Table containing the install base item record. Data type: String
items.sys_id	Sys_id of the install base item record. Located in the table specified in the *sys_class_name* parameter. Data type: String
items.sys_mod_count	Number of times that the associated install base item record has been modified. Data type: String

items.state	Details about the current state of the install base item.
	
	Data type: Object
	<pre>"state": {
	"display_value": "String",
	"value": "String"
	}</pre>

items.state.display_value	Text string of the current state of the install base item. Use this value to display the state in the UI. Data type: String
items.state.value	Internal value of the state of the install base item. Data type: String

items.status	Details about the status of the install base item.
	
	Data type: Object
	<pre>"status": {
	"display_value": "String",
	"value": "String"
	}</pre>

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
items.status.display_value	Text string of the status of the install base item. Use this value to display the status in the UI. Data type: String
items.status.value	Internal value of the status of the install base item. Data type: String
items.uninstall_date	Details about the date when the install base item became inactive. Data type: Object `"uninstall_date": { "display_value": "String", "value": "String" }`
items.uninstall_date.display_value	Text uninstall date. Use this value to display the uninstall date in the UI. Data type: String
items.uninstall_date.value	Internal value of the uninstall date. Data type: String
status	Status of the endpoint call. Data type: String
sysparm_depth	Number of levels deep the returned child install base item is in the hierarchy. Data type: Integer
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/767f34d378d21110f877d304c76fdd2a/childinstal
lbaseitems?sysparm_limit=1" \
--request GET \
```

    "status": "SUCCESS"
  }
}
```

Install Base Item - GET /sn_install_base/integrations/installbaseitems/{id}/contracts

Returns the contracts associated with a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/contracts`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/contracts`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the contract records. By default this references the fields in the Contract [ast_contract] table. If you specify a different table in *`sys_class_name`*, then specify the fields in that table. You can pass one or more field-value pairs to filter the return results. For example, to return only records where the renewable field is set to "true", pass the follow: `&renewable=true`. Data type: String Default: All fields
sys_class_name	If using an extended contracts table (not ast_contract), the name of the extended table to query. Data type: String Default: ast_contract
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *`sysparm_limit`* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.

Status codes (continued)

Status code	Description
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
contracts	List of the contracts associated with the specified install base item record. Data type: Array of Object `"contracts": [{ "active": "String", "approver": {Object}, "commitment": "String", "consumer": {Object}, "cost_adjustment": "String", "cost_adjustment_percentage": "String", "cost_per_unit": "String", "contract_composite": "String", "ends": "String", "expiration": {Object}, "lifetime_cost": "String", "monthly_cost": "String", "number": "String", "payment_amount": "String", "payment_schedule": {Object}, "ratecard": "String", "renewable": "String", "sales_tax": "String", "short_description": "String", "starts": "String", "state": {Object}, "sub_total_cost": "String", "sys_class_name": "String", "sys_domain_path": "String", "sys_id": "String", "tax_cost": "String", "tax_exempt": "String", "tax_rate": "String", "total_cost": "String", "vendor_contract": "String", "yearly_cost": "String"`

Name	Description
	<pre> }]</pre>
contracts.active	Flag that indicates whether the contract is active. Possible values: • true: Contract is active. • false: Contract is inactive. Data type: Boolean string

contracts.approver	Details about the person authorized to approve the contract.
	
	Data type: Object
	<pre>"approver": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

contracts.approver.display_value	Text name of the approver associated with the contracts record. Use this value to display the approver name in the UI. Data type: String
contracts.approver.sys_id	Sys_id of the approver record associated with the contracts record. Data type: String

contracts.consumer	Details about the consumer associated with the contracts record.
	
	Note: The consumer field is only available if the B2B2C plugin is installed.
	
	Data type: Object
	<pre>"consumer": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

contracts.consumer.display_value	Text name of the consumer associated with the contracts record. Use this value to display the consumer name in the UI. Data type: String
contracts.consumer.sys_id	Sys_id of the consumer record associated with the contracts record. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
contracts.cost_adjustment	Type of cost adjustment applied to the contract. Possible values: • Fixed • Manual • CPI (consumer price index) Data type: String
contracts.cost_adjustment_percentage	Percentage increase or decrease in price of contract. To indicate a decrease in price, enter a negative percentage. Either a Cost adjustment or Cost adjustment percentage can be specified, but not both. Data type: String
contracts.cost_per_unit	Cost per unit from the product provider. Data type: String
contracts.ends	Date that the contract terminates. Data type: String
contracts.expiration	Details about the expiration status of the associated contract. Data type: Object `"expiration": { "display_value": "String", "sys_id": "String" }`
contracts.expiration.display_value	Expiration status of the associated contract. Use this value to display the expiration status in the UI. Data type: String
contracts.expiration.sys_id	Sys_id of the expiration record associated with the contracts record. Data type: String
contracts.lifetime_cost	Lifetime cost of the contract. Data type: String
contracts.monthly_cost	Monthly cost of the contract. Data type: String
contracts.number	Contract number.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
contracts.payment_amount	Amount of money that has been directly paid to the receiving party of this contract. Data type: String
contracts.payment_schedule	Details about the payment schedule associated with the contract. Data type: Object `"payment_schedule": { "display_value": "String", "sys_id": "String" }`
contracts.payment_schedule.display_value	Payment schedule for the associated contract. Use this value to display the payment schedule in the UI. Data type: String
contracts.payment_schedule.value	Internal value of the payment schedule for this contract, such as daily, weekly, or monthly. Data type: String
contracts.ratecard	Flag that indicates whether there's a rate card associated with this contract. Located in the Rate Care [fm_contract_rate_card] table. Possible values: • true: Rate card. • false: No rate card. Data type: Boolean string
contracts.renewable	Flag that indicates whether the contract is renewable. Possible values: • true: Contract is renewable. • false: Contract isn't renewable. Data type: Boolean string
contracts.sales_tax	Flag that indicates whether sales tax is charged for items referenced by this contract. Possible values: • true: Sales tax is charged. • false: No sales tax is charged.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Data type: Boolean string
contracts.short_description	Brief description of the contract. Data type: String
contracts.starts	Date that the contract begins. Data type: String
contracts.state	Details about the current state of the contract. Data type: Object `"state": { "display_value": "String", "value": "String" }`
contracts.state.display_value	Text string of the current state of the contract. Use this value to display the state in the UI. Data type: String
contracts.state.value	Internal value or the state of the contract. Data type: String
contracts.sub_total_cost	Subtotal of the cost of the contract. Data type: String
contracts.sys_class_name	Table containing the contract record. Data type: String
contracts.sys_domain_path	Path to the domain in which this contract is available. Data type: String Default: "/" = Global domain
contracts.sys_id	Sys_id of the associated contract record. Data type: String
contracts.tax_cost	Total tax on the contract. This field is visible only if the applicable taxes field is selected as `Sales`. Data type: String
contracts.tax_exempt	Flag that indicates whether the items associated with this contract are tax exempt. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Items are tax exempt. • false: Items aren't tax exempt. Data type: Boolean string
contracts.tax_rate	Tax rate charged for taxable items associated with the contract. Data type: String
contracts.total_cost	Final cost of the contract after adjustments have been applied. If a contract has one or more rate cards, this field shows the combined value of all rate cards. Data type: String
contracts.vendor_contract	Vendor's contract number. Data type: String
contracts.yearly_cost	Cost per year of the contract. Data type: String

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
has_more	Flag that indicates whether there are more records in the table to return. Possible values: • true: More records to return. • false: No more records to return. Data type: Boolean string
status	Status of the endpoint call.

Install Base Item - GET /sn_install_base/integrations/installbaseitems/{id}/entitlements

Returns the entitlements associated with a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/entitlements`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/entitlements`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
id	Sys_id of the install base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the entitlements records. By default this references the fields in the Entitlement [service_entitlement] table. If you specify a different table in *sys_class_name*, then specify the fields in that table. You can pass one or more field-value pairs to filter the return results. For example, to return only records that are active, pass the following: `&active=true`. Data type: String Default: All fields
sys_class_name	If using an extended entitlements table (not service_entitlement), the name of the extended table to query. Data type: String Default: service_entitlement
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *sysparm_offset* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *sysparm_limit* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *sysparm_offset* parameter.

None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
entitlements	List of the entitlements associated with the specified install base item record. Data type: Object `"entitlements": { "account": {Object}, "active": "String", "business_hour": {Object}, "contract": {Object}, "end_date": "String", "entitlement_name": "String", "install_base_item": {Object}, "per_unit": "String", "start_date": "String", "sys_id": "String", "total_units": "String", "remaining_units": "String", "unit": {Object} }`
entitlements.account	Details about the account associated with the entitlements record. Data type: Object `"account": { "display_value": "String", "sys_id": "String" }`
entitlements.account.display_value	Text name of the account associated with the entitlements record. Use this value to display the account name in the UI. Data type: String
entitlements.account.sys_id	Sys_id of the account record associated with the entitlements record. Data type: String
entitlements.active	Flag that indicates whether the entitlement is active. Possible values: • 0: Entitlement isn't active. • 1: Entitlement is active. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Default: 1
entitlements.business_hour	Details about the business hours for the entitlements record. Data type: Object `"business_hour": { "display_value": "String", "sys_id": "String" }`
entitlements.business_hour.display_value	Text name of the business hours record associated with the entitlements record. Use this value to display the business hours in the UI. Data type: String
entitlements.business_hour.sys_id	Sys_id of the business hours record associated with the entitlements record. Data type: String
entitlements.contract	Details about the contract associated with the entitlement record. Data type: Object `"contract": { "display_value": "String", "sys_id": "String" }`
entitlements.contract.display_value	Text name of the contract associated with the entitlement record. Use this value to display the contract name in the UI. Data type: String
entitlements.contract.sys_id	Sys_id of the contract record associated with the entitlement record. Data type: String
entitlements.end_date	End date of the entitlement. Data type: String
entitlements.entitlement_name	Name of the entitlement. Data type: String
entitlements.install_base_item	Details about the install base item associated with the entitlements record. Data type: Object

Name	Description

	<pre>"install_base_item": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

entitlements.install_base_item.display_value	Text name of the install base item associated with the entitlements record. Use this value to display the install base item name in the UI. Data type: String
entitlements.install_base_item.sys_id	Sys_id of the install base item record associated with the entitlements record. Data type: String
entitlements.per_unit	Number of products in a unit. For example, if the *unit* is `case`, this value would be 12 if there are 12 items per case. Data type: String
entitlements.start_date	Start date of the entitlement. Data type: String
entitlements.sys_id	Sys_id of the associated entitlements record. Data type: String
entitlements.total_units	Number of units that were originally available. Data type: String
entitlements.remaining_units	Number of units that are remaining. Data type: String

entitlements.unit	Details about the unit of the item associated with the entitlements record.
	
	Data type: Object
	<pre>"unit": {
	  "display_value": "String",
	  "value": "String"
	}</pre>

entitlements.unit.display_value	Text name of the unit of the item associated with the entitlements record. Use this value to display the unit name in the UI. Data type: String
entitlements.unit.value	Internal name of the unit of the item associated with the entitlements record.

Name	Description
	Data type: String
error	Details about the error that occurred when trying to process the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
has_more	Flag that indicates whether there are more records in the table to return. Possible values: • true: More records to return. • false: No more records to return. Data type: Boolean string
status	Status of the endpoint call. Data type: String
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/42746a3b876121100b6afc86dabb3597/entitlemen
ts" \
--request GET \
```

```

Install Base Item - GET /sn_install_base/integrations/installbaseitems/{id}/maintenanceplans

Returns the maintenance plans associated with a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/maintenanceplans`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/maintenanceplans`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the maintenance plan records. By default this references the fields in the Maintenance Plan [sm_maint_plan] table. If you specify a different table in *`sys_class_name`*, then specify the fields in that table. You can pass one or more field-value pairs to filter the return results. For example, to return only records that are active, pass the follow: `&active=true`. Data type: String Default: All fields
sys_class_name	If using an extended maintenance plans table (not maintenanceplans), the name of the extended table to query. Data type: String Default: maintenanceplans
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *`sysparm_limit`* values can impact system performance. Data type: Number Default: 10000

Query parameters (continued)

Name	Description
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0

Name	Description
	"maintenance_override_policy": {Object}, "model": "String", "name": "String", "number": "String", "propagation_flag": "String", "sys_class_name": "String", "sys_id": "String", "table": "String", "type": {Object} }]
maintenanceplans.active	Flag that indicates whether the maintenance plan is active. Possible values: • true: Maintenance plan is active. • false: Maintenance plan is inactive. Data type: String
maintenanceplans. apply_to_new	Flag that indicates whether the schedules defined for this maintenance plan are applied to all records that have been added to the specified table since the last time the plan was executed, and that they meet the conditions entered in the Filter condition. Possible values: • true: Applied to all new record. • false:Not applied to all new records. Data type: String
maintenanceplans. allow_future_wo	Flag that indicates whether work orders can be associated with the maintenance plan. Possible values: • true: New work orders can be associated. • false: No new work orders can be associated. Data type: String

maintenanceplans.
maintenance_override_policy
	Details about the maintenance override policy for the maintenance plan.
	
	Data type: Object
	"maintenance_override_policy": {
	"display_value": "String",
	"value": "String"
	}

Name	Description
maintenanceplans.maintenance_override_policy.display_value	Text string describing the override policy. Use this value to display the override policy in the UI. Data type: String
maintenanceplans.maintenance_override_policy.value	Internal value of the override policy. Data type: String
maintenanceplans.model	Sys_id of the model record associated with the maintenance plan. Data type: String
maintenanceplans.number	Maintenance plan number. Data type: String
maintenanceplans.propagation_flag	Flag that indicates whether the maintenance plan can be propagated. Possible values: • true: Maintenance plan can be propagated. • false: Maintenance plan can't be propagated. Data type: String
maintenanceplans.sys_class_name	Table containing the maintenance plan record. Data type: String
maintenanceplans.sys_id	Sys_id of the associated maintenance plan. Data type: String
maintenanceplans.table	Table that contains the associated install base time record. Data type: String

maintenanceplans.type	Details about the type of maintenance plan.
	
	Data type: Object
	`"type": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

maintenanceplans.type.display_value	Text string describing the maintenance plan type. Use this value to display the type in the UI. Data type: String
maintenanceplans.type.value	Internal value of the maintenance plan type. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
relatedparties.responsibility.display_value	Text display value for the access level for the install base information. Data type: String
relatedparties.responsibility.sys_id	Sys_id of the associated responsibility record. This record defines the access level for the install base information. Located in the Responsibility Definition [sn_customerservice_responsibility_def] table. This parameter is only valid if the *related_party* field is also specified. If specified, it only returns the install base items that match both the *related_party* and *responsibility* parameters. For additional information, see Configure related parties for items received Data type: String
relatedparties.service_organization	Details about the service organization associated with the related parties record. Data type: Object `"service_organization": { "display_value": "String", "sys_id": "String" }`
relatedparties.service_organization.display_value	Text name of the service organization associated with the related parties record. Use this value to display the service organization name in the UI. Data type: String
relatedparties.service_organization.sys_id	Sys_id of the service organization record associated with the related parties record. Located in the Service Organization [sn_customer_service_organization] table. Data type: String
relatedparties.sys_class_name	Table containing the related parties record. Data type: String Default: sn_install_base_related_party
relatedparties.sys_id	Sys_id of the associated related parties record.

Name	Description
	Data type: String
relatedparties.type	Details about the type of contact associated with the related parties record. Data type: Object `"type": { "display_value": "String", "sys_id": "String" }`
relatedparties.type.display_value	Text name of the type of contact associated with the related parties record. Use this value to display the type of contact in the UI. For additional information, see Add related party configurations to cases, sold products, install bases, or service organizations. Possible types: • Authorized Account • Authorized Consumer • Authorized Contact • Authorized Contributor • Authorized Member • Authorized Service Organization • Listed Account • Listed Consumer • Listed Contact • Listed Contributor • Listed Member • Listed Service Organization Data type: String
relatedparties.type.sys_id	Sys_id of the type record associated with the related parties record. Data type: String
relatedparties.user	Details about the user associated with the related parties record. Data type: Object `"user": { "display_value": "String", "sys_id": "String" }`

Name	Description
relatedparties.user.display_value	Text name of the user associated with the related parties record. Use this value to display the user name in the UI. Data type: String
relatedparties.user.sys_id	Sys_id of the user record associated with the related parties record. Located in the User [sys_user] table. Data type: String
status	Status of the endpoint call. Data type: String
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/42746a3b876121100b6afc86dabb3597/relatedpart
ies" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
  "result": {
    "sysparm_offset": 0,
    "sysparm_limit": 10,
    "has_more": false,
    "relatedparties": [
      {
        "type": {
          "sys_id": "68ec8b2965e99110f87764df53db779f",
          "display_value": "Authorized Contact"
        },
        "install_base_item": {
          "sys_id": "42746a3b876121100b6afc86dabb3597",
          "display_value": "KX Series - KX5000"
        },
```

        }
      }
    ],
    "status": "SUCCESS"
  }
}
```

Install Base Item - GET /sn_install_base/integrations/installbaseitems/{id}/soldproducts

Returns the sold products records associated with a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/soldproducts`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/soldproducts`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the related parties records. By default this references the fields in the Sold Products [sn_install_base_sold_product] table. If you specify a different table in *`sys_class_name`*, specify the fields in that table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	You can pass one or more field-value pairs to filter the return results. For example, if you wanted to filter on the products sold to a specific account, pass something similar to the following, where the passed value is the sys_id of the account: `&account=86837a386f0331003b3c498f5d3ee4ca`. Data type: String Default: All fields
sys_class_name	If using an extended sold products table (not sn_install_base_sold_product), the name of the extended table to query. Data type: String Default: sn_install_base_sold_product
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *`sysparm_limit`* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error.

Name	Description
	Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
has_more	Flag that indicates whether there are more records in the table to return. Possible values: • true: More records to return. • false: No more records to return. Data type: Boolean string
soldproducts	List of the sold products associated with the specified install base item record. Data type: Array of Objects `"soldproducts":[ { "account": {Object}, "contact": {Object}, "name": "String", "number": "String", "product": {Object}, "sys_class_name": "String", "sys_id": "String", "state": {Object} } ]`
soldproducts.account	Details about the account associated with the product record. Data type: Object `account": { "display_value": "String", "sys_id": "String" }`
soldproducts.account.display_value	Text name of the account associated with the product record. Use this value to display the account name in the UI. Data type: String
soldproducts.account.sys_id	Sys_id of the account record associated with the product record. Data type: String

Name	Description
soldproducts.contact	Details about the account contact responsible for the product. Data type: Object `"contact": { "display_value": "String", "sys_id": "String" }`
soldproducts.contact.display_value	Text name of the contact associated with the product. Use this value to display the contact name in the UI. Data type: String
soldproducts.contact.sys_id	Sys_id of the contact record associated with the product record. Data type: String
soldproducts.name	Name of the product. Data type: String
soldproducts.number	Product number. Data type: String
soldproducts.sys_class_name	Table containing the product record. Data type: String
soldproducts.sys_id	Sys_id of the associated product. Data type: String
soldproducts.state	Details about the current state of the product. Data type: Object `"state": { "display_value": "String", "value": "String" }`
soldproducts.state.display_value	Text string of the current state of the product. Use this value to display the state in the UI. Data type: String
soldproducts.state.value	Internal value of the state of the product. Data type: String
status	Status of the endpoint call. Data type: String

Name	Description
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/f77c7542b7343300ece839a6ee11a991/soldproduc
ts?sysparm_limit=1" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "sysparm_offset": 0,
    "sysparm_limit": 1,
    "has_more": true,
    "soldproducts": [
      {
        "product": {
          "sys_id": "a9a2d0c3c6112276010db16c5ddd3461",
          "display_value": "Lenovo ThinkStation S20"

Name	Description
	<pre> }]</pre>
workorders.active	Flag that indicates whether the work order is active. Possible values: • true: Work order is active. • false: Work order is inactive. Data type: Boolean string

workorders.approval	Details about the current approval process for the work order.
	
	Data type: Object
	<pre>"approval": {
	  "display_value": "String",
	  "value": "String"
	}</pre>

workorders.approval.display_value	Text string of the current state of the approval process. Use this value to display the approval state in the UI. Data type: String
workorders.approval.value	Internal value of the state of the approval process. Data type: String
workorders.billable	Flag that indicates whether the work order is billable. Possible values: • true: Work order is billable. • false: Work order isn't billable Data type: Boolean string
workorders.escalation	Level of escalation of the work order. Data type: String
workorders.has_appointment	Flag that indicates whether the work order has a scheduled appointment. Possible values: • true: Work order has an appointment. • false: Work order doesn't have an appointment. Data type: Boolean string
workorders.install_base_item	Details about the install base item associated with the work order record.

Name	Description
	Data type: Object `"install_base_item": { "display_value": "String", "sys_id": "String" }`
workorders.install_base_item.display_value	Text name of the install base item associated with the work order record. Use this value to display the install base item name in the UI. Data type: String
workorders.install_base_item.sys_id	Sys_id of the install base item record associated with the work order record. Data type: String
workorders.is_catalog	Flag that indicates whether is part of a catalog. Possible values: • true: Work order is part of a catalog. • false: Work order isn't part of a catalog. Data type: Boolean string
workorders.knowledge	Flag that indicates if there's a knowledge base article available for the specified work order issue. Possible values: • true: Knowledge base article is available for this issue. • false: Knowledge base article isn't available for this issue. Data type: Boolean string
workorders.location	Details about the location of the item that needs to be worked on. Data type: Object `"location": { "display_value": "String", "sys_id": "String" }`
workorders.location.display_value	Text name of the location of the item to be worked on. Use this value to display the location in the UI. Data type: String
workorders.location.sys_id	Sys_id of the location record associated with the work order record.

Name	Description
	Data type: String
workorders.made_sla	Flag that indicates whether the work associated with the work order met the associated Service Level Agreement (SLA). Possible values: • true: SLA was met. • false: SLA wasn't met. Data type: Boolean string
workorders.needs_attention	Flag that indicates whether this work order needs attention. Possible values: • true: Work order needs attention. • false: Work order doesn't need attention. Data type: Boolean string
workorders.number	Unique number used to identify the work order. Data type: String
workorders.opened_at	Details about when the work order was opened. Data type: Object `"opened_at": { "display_value": "String", "value": "String" }`
workorders.opened_at.display_value	Date and time that the work order was opened. Use this value to display the value in the UI. Data type: String
workorders.opened_at.value	Date and time that the work order was opened. Data type: String
workorders.opened_by	Details about the person that opened the work order. Data type: Object `"opened_by": { "display_value": "String", "sys_id": "String" }`
workorders.opened_by.display_value	Text name of the person that opened the work order. Use this value to display this name in the UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
workorders.opened_by.sys_id	Sys_id of the user record of the person that opened the work order. Data type: String

workorders.opened_for	Details about the person that the work order was opened for if different than the *opened_by* person.
	
	Data type: Object
	
	`"opened_for": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

workorders.opened_for.display_value	Text name of the person that the work order was opened for. Use this value to display this name in the UI. Data type: String
workorders.opened_for.sys_id	Sys_id of the user record of the person that the work order was opened for. Data type: String
workorders.priority	Priority of the work order. Data type: String
workorders.reassignment_count	Number of times that the work order was reassigned to a person that is responsible for moving the work order forward. Data type: String
workorders. reschedule_maintenance_if_canceled	Flag that indicates whether the work should be rescheduled if the associated work order is canceled. Possible values: • true: Reschedule the work. • false: Check before rescheduling the work. Data type: Boolean string
workorders.short_description	Brief text that describes the work associated with the work order. Data type: String
workorders.sla_suspended	Flag that indicates whether the SLA associated with the work order has been suspended. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	• true: SLA has been suspended. • false: SLA hasn't been suspended. Data type: Boolean string
workorders.state	Current state of the work order. Data type: String
workorders.sys_class_name	Table containing the work order record. Data type: String
workorders.sys_domain_path	Domain path. Data type: String
workorders.sys_id	Sys_id of the associated work order record. Data type: String
workorders.task_created	Flag that indicates whether a task has been created for this work order. Possible values: • true: Task has been created for this work order. • false: Task hasn't been created for this work order. Data type: Boolean string
workorders.task_effective_number	Unique number used to identify the work order. Data type: String
workorders. template_workflow_invoked	Flag that indicates whether the associated workflow has been invoked for this work order. Possible values: • true: Workflow has been invoked. • false: Worflow hasn't been invoked. Data type: Boolean string
workorders.upon_approval	Details about the next action to take if the work order is approved. Data type: Object `"upon_approval": { "display_value": "String", "value": "String" }`

Name	Description
workorders.upon_approval. display_value	Text string of the action to take if the work order is approved. Use this value to display this information in the UI. Data type: String
workorders.upon_approval.value	Action to take if the work order is approved. Possible values: • do_nothing • proceed Data type: String

workorders.upon_reject	Details about the next action to take if the work order is rejected.
	
	Data type: Object
	
	`"upon_reject": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

workorders.upon_reject.display_value	Text string of the action to take if the work order is rejected. Use this value to display this information in the UI. Data type: String
workorders.upon_reject.value	Action to take if the work order is rejected. Possible values: • cancel • goto Data type: String
workorders.urgency	Urgency of the work order. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/f77c7542b7343300ece839a6ee11a991/workorde
rs?sysparm_limit=1" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Install Base Item - PATCH /sn_install_base/integrations/installbaseitems/{id}

Updates a specified install base item record with specified field values.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
account	Required when creating an install base item for an account. Sys_id of the account to associate with the install base item. Located in the Account [customer_account] table. **Note:** If you pass the *account* parameter, you can't also pass the *consumer* parameter. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
active	Flag that indicates whether the install base item is active. Valid values: • true, "true", or "0": Item is active. • false, "false", or "1": Item isn't active. Data type: Boolean Default: true
asset	Sys_id of the asset associated with the install base item record. Located in the Asset [alm_asset] table. Data type: String
child_install_base_items	List of the child install base items associated with this install base item. **Note:** The following child install base item fields can't be different from its parent: • account • consumer • contact • service organization Data type: Array of Objects `"child_install_base_items": [ { "name": "String", "product": "String" } ]`
child_install_base_items.name	Name of the child install base item. Data type: String
child_install_base_items.product	Sys_id of the associated child base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String
configuration_item	Sys_id of the configuration item associated with the install base item record. Located in the Configuration Item [cmdb_ci] table. Data type: String
consumer	Required when creating an install base item for a consumer.

Request body parameters (XML or JSON) (continued)

Name	Description
	Sys_id of the consumer associated with the install base item record. Located in the Consumer [csm_consumer] table. **Note:** If you pass the *consumer* parameter, you can't also pass the *account* parameter. In addition, you can only associate a consumer with an install base item if the B2B2C plugin is installed on your instance. Data type: String
consumer_profile	Sys_id of the consumer profile associated with the install base item record. Located in the Consumer Profile [sn_csm_consumer_profile] table. Data type: String
contact	Sys_id of the account contact record that is primarily responsible for the install base item. Located in the Contact [customer_contact] table. **Note:** Contacts can only be specified for account install base items. Data type: String
household	Sys_id of the household associated with the install base item record. Located in the Household [csm_household] table. **Note:** This field is only valid when the Customer Service Household (com.snc.household) plugin is installed. Data type: String
install_date	Date on which the install base item becomes active. Data type: String Format: yyyy-MM-dd HH:mm:ss
location	Sys_id of the location of the associated product. Located in the Location [cmn_location] table. Data type: String
name	Name of the install base item. Data type: String
number	Unique identifier for the install base item. Data type: String Default: Automatically generated by the endpoint.

Request body parameters (XML or JSON) (continued)

Name	Description
parent	Sys_id of the parent record for this install base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String
product_model	Sys_id of the product model associated with the install base item record. Located in the Product Model [cmdb_model] table. Data type: String
quantity	Number of items installed. Data type: Integer
service_context	Sys_id of the service that is associated to the underlying CI for calculating the impact severity from Event Management. For more information, see Service health status for install base. **Note:** This field is only valid if the Proactive Customer Service Operations with Event Management plugin is installed. Data type: String
service_organization	Required when creating an install base item for a service organization. Sys_id of the service organization record that is involved in providing service to the customer. Located in the Service Organization [sn_customer_service_organization] table. **Note:** If you pass this parameter, you shouldn't also pass the account, contact, or consumer parameters. The *service_organization* parameter is only available when the Service Organization (com.snc.service_organization) plugin is installed on your instance. Data type: String
state	Current state of the install base item. Valid values: • in_use • inactive Data type: String
status	Status of the product. Valid values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• original • replacement Data type: String
sys_class_name	Name of the extended install base table in which to update the install base item record. Data type: String
uninstall_date	Date on which the install base becomes inactive. Data type: String Format: yyyy-MM-dd HH:mm:ss

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	Details about the error that occurred when trying to process the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
item	Details about the install base item that was updated. Data type: Object `"item": { "account": {Object}, "active": Boolean, "name": "String", "number": "String", "state": {Object}, "sys_class_name": {Object}, "sys_id": "String" }`
item.account	Details about the customer account associated with the install base item record. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"account": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

item.account.display_value	Text name of the customer account associated with the install base item record. Use this value to display the customer account name in the UI. Data type: String
item.account.sys_id	Sys_id of the customer account record associated with the install base item record. Data type: String
item.active	Flag that indicates whether the install base item is active. Possible values: • true: Install base item is active. • false: Install base item is inactive. Data type: Boolean String
item.name	Name of the install base item. Data type: String
item.number	Unique ID of the install base item. Data type: String

item.state	Details about the current state of the install base item.
	
	Data type: Object
	<pre>"state": {
	  "display_value": "String",
	  "value": "String"
	}</pre>

item.state.display_value	Text string of the current state of the install base item. Use this value to display the state in the UI. Data type: String
item.state.value	Internal value of the state of the install base item. Data type: String

item.sys_class_name	Details about the table that contains the install base item.
	
	Data type: Object
	<pre>"sys_class_name": {
	  "display_value": "String",</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre> "value": "String" }</pre>
item.sys_class_name.display_value	Text string of the name of the table that contains the install base item. Use this value to display the table name in the UI. Data type: String
item.sys_class_name.value	Internal value of the table that contains the install base item Data type: String
item.sys_id	Sys_id of the install base item record. Located in the table specified in the *sys_class_name* parameter. Data type: String
status	Status of the endpoint call. Data type: String

Example: cURL request

The following code example shows how to update the name and active fields in the install base item record.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/f77c7542b7343300ece839a6ee11a991" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"name\": \"KX Series - KX5001\",
  \"active\":true
}" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "status": "SUCCESS",
    "item": {
      "sys_class_name": {
        "value": "sn_install_base_item",
        "display_value": "Install Base Item"
      },
      "number": "IBITM0001001",
      "sys_id": "bc610d38cb76211050501ebfe8076d8b",
      "state": {
        "value": "inactive",
        "display_value": "Inactive"
      },
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "active": "false",
      "name": "NewTestIB",
      "account": {
        "sys_id": "8637a386f0331003b3c498f5d3ee4ca",
        "display_value": "Boxeo"
      }
    }
  }
}

}
```

Install Base Item - PATCH /sn_install_base/integrations/installbaseitems/{id}/relatedparties/{related_party_sys_id}

Updates the specified related party record, associated with a specified install base item, with the values in the request body.

If you need to modify the type of related party associated with an Install Base Item, you must remove the type-specific fields for the current related party type and replace them with the type-specific fields of the new related party type. For example, to change from a type of Authorized Account to Authorized Consumer, pass the following:

- *type* = "Authorized Consumer"
- *account* = ""
- *consumer* = "<sys_id of consumer record>"
- *responsibility* = "<sys_id of responsibility of consumer>"

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/relatedparties/{related_party_sys_id}`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/relatedparties/{related_party_sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String
related_party_sys_id	Sys_id of the related party record. By default, this is located in the Install Base Related Party [sn_install_base_related_party] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
account	Required if the *type* parameter is one of the following: • `Authorized Account` • `Authorized Contact` • `Listed Account` • `Listed Contact` Sys_id of the account to associate with the install base item. Located in the Account [customer_account] table. **Note:** If you pass the *account* parameter, you can't also pass the *consumer* parameter. Data type: String
consumer	Required if the *type* parameter is `Authorized Consumer` or `Listed Consumer`. Sys_id of the consumer associated with the install base item record. Located in the Consumer [csm_consumer] table. **Note:** If you pass the *consumer* parameter, you can't also pass the *account* parameter. In addition, you can only associate a consumer with an install base item if the B2B2C plugin is installed on your instance. Data type: String
contact	Sys_id of the contact record associated with the related parties record. Located in the Contact [customer_contact] table. Data type: String
responsibility	Sys_id of the associated responsibility record. This record defines the access level for the install base information. Located in the Responsibility Definition [sn_customerservice_responsibility_def] table. This parameter is only valid if the *related_party* field is also specified. If specified, it only returns the install base items that match both the *related_party* and *responsibility* parameters. For additional information, see Configure related parties for items received Data type: String
service_organization	Required if the *type* parameter is one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• `Authorized Member` • `Authorized Service Organization` • `Listed Member` • `Listed Service Organization` Sys_id of the service organization record that is involved in providing service to the customer. Located in the Service Organization [sn_customer_service_organization] table. **Note:** If you pass this parameter, you shouldn't also pass the account, contact, or consumer parameters. The *`service_organization`* parameter is only available when the Service Organization (com.snc.service_organization) plugin is installed on your instance. Data type: String
sys_class_name	Table containing the related parties record. Data type: String Default: sn_install_base_related_party
type	Required. Sys_id of the type of related party to create. Located in the Related Party Configuration [sn_customerservice_related_party_configuration] table. Possible types: • Authorized Account • Authorized Consumer • Authorized Contact • Authorized Contributor • Authorized Member • Authorized Service Organization • Listed Account • Listed Consumer • Listed Contact • Listed Contributor • Listed Member • Listed Service Organization Data type: String
user	Required if the *`type`* parameter is one of the following related party types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• `Authorized Contributor` • `Authorized Member` • `Listed Contributor` • `Listed Member` Sys_id of the user record associated with the related parties record. Located in the User [sys_user] table. Data type: String For `Authorized Member` and `Listed Member`, this user must be associated with the specified *`service_organization`* record.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	Details about the error that occurred when trying to process the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
item	Details about the related parties record. Data type: Array `"item": { "account": {Object}, "consumer": {Object}, "contact": {Object}, "install_base_item": {Object}, "responsibility": {Object}, "service_organization": {Object}, "sys_class_name": "String", "sys_id": "String", "type": {Object}, "user": {Object} }`
item.account	Details about the account associated with the related parties record. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>account": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

item.account.display_value	Text name of the account associated with the related parties record. Use this value to display the account name in the UI. Data type: String
item.account.sys_id	Sys_id of the account record associated with the related parties record. Data type: String

item.consumer	Details about the consumer associated with the related parties record.
	
	Data type: Object
	<pre>"consumer": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

item.consumer.display_value	Text name of the consumer associated with the related parties record. Use this value to display the consumer name in the UI. Data type: String
item.consumer.sys_id	Sys_id of the consumer record associated with the related parties record. Data type: String

item.contact	Details about the account contact responsible for the related parties record.
	
	Data type: Object
	<pre>"contact": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

item.contact.display_value	Text name of the contact associated with the related parties record. Use this value to display the contact name in the UI. Data type: String
item.contact.sys_id	Sys_id of the contact record associated with the related parties record. Located in the Contact [customer_contact] table.

Name	Description
	Data type: String
item.install_base_item	Details about the install base item associated with the related parties record. Data type: Object `"install_base_item": { "display_value": "String", "sys_id": "String" }`
item.install_base_item.display_value	Text name of the install base item associated with the related parties record. Use this value to display the install base item name in the UI. Data type: String
item.install_base_item.sys_id	Sys_id of the install base item record associated with the related parties record. Data type: String
item.responsibility	Details about the access level for the install base information. Data type: Object `"responsibility": { "display_value": "String", "sys_id": "String" }`
item.responsibility.display_value	Text display value for the access level for the install base information. Data type: String
item.responsibility.sys_id	Sys_id of the associated responsibility record. This record defines the access level for the install base information. Located in the Responsibility Definition [sn_customerservice_responsibility_def] table. This parameter is only valid if the *related_party* field is also specified. If specified, it only returns the install base items that match both the *related_party* and *responsibility* parameters. For additional information, see Configure related parties for items received Data type: String
item.sys_class_name	Table containing the related parties record. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Default: sn_install_base_related_party
item.sys_id	Sys_id of the associated related parties record. Data type: String
item.type	Details about the type of contact associated with the related parties record. Data type: Object `"type": { "display_value": "String", "sys_id": "String" }`
item.type.display_value	Text name of the type of contact associated with the related parties record. Use this value to display the type of contact in the UI. For additional information, see Add related party configurations to cases, sold products, install bases, or service organizations. Possible types: • Authorized Account • Authorized Consumer • Authorized Contact • Authorized Contributor • Authorized Member • Authorized Service Organization • Listed Account • Listed Consumer • Listed Contact • Listed Contributor • Listed Member • Listed Service Organization Data type: String
item.type.sys_id	Sys_id of the type record associated with the related parties record. Data type: String
item.user	Details about the user associated with the related parties record. Data type: Object `"user": { "display_value": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"sys_id": "String"
	}</pre>

item.user.display_value	Text name of the user associated with the related parties record. Use this value to display the user name in the UI. Data type: String
item.user.sys_id	Sys_id of the user record associated with the related parties record. Located in the User [sys_user] table. Data type: String
status	Status of the endpoint call. Data type: String
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String

Example: cURL request

The following code example shows how to call this endpoint to update the contact record associated with the related party.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/relatedparties/f77c7542b7343300ece839a6ee11a991" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"contact\": \"dc0185d94f341200025ba3618110c77c\"
}" \
--user 'username':'password'
```

Return results:

```
{
"result":
  {
    "type": {
      "display_value":"Authorized Contact",
      "sys_id":"68ec8b2965e99110f87764df53db779f"
    },
    "install_base_item": {
      "display_value":"KX Series - KX5000",
      "sys_id":"f77c7542b7343300ece839a6ee11a991"
    },
    "sys_class_name":"sn_install_base_related_party",
```

    },
    "status":"SUCCESS",
  }
}
```

Install Base Item - PATCH /sn_install_base/integrations/installbaseitems/{id}/uninstall

Uninstalls the specified install base item.

An uninstall consists of setting the *active* field to `false` and setting the *unistall_date* field to a specified date. Empty if a date value isn't provided.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/uninstall`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/uninstall`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
uninstall_date	Date on which to uninstall the specified install base item. If not specified, it's uninstalled immediately. Data type: String Format: yyyy-mm-dd hh:mm:ss

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	Details about the error that occurred when trying to process the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
item	Description of the uninstalled item. Data type: Object `"item": { "account": {Object}, "active": "String", "asset": {Object}, "configuration_item": {Object}, "consumer": {Object}, "consumer_profile": {Object}, "contact": {Object}, "health_status": {Object}, "health_status_last_updated": "String", "household": {Object}, "install_date": {Object}, "location": {Object}, "name": "String", "number": "String", "parent": {Object}, "product": {Object}, "service_context": {Object}, "service_organization" {Object}, "sys_class_name": "String", "sys_id": "String", "state": {Object}, "status": {Object}, "uninstall_date": "String" }`
item.account	Details about the customer account associated with the install base item record. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

	<pre>"account": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

item.account.display_value	Text name of the customer account associated with the install base item record. Use this value to display the customer account name in the UI. Data type: String
item.account.sys_id	Sys_id of the customer account record associated with the install base item record. Data type: String
item.active	Flag that indicates whether the install base item is active. Possible values: • true: Install base item is active. • false: Install base item is inactive. Data type: Boolean String

item.asset	Details about the asset associated with the install base item record.
	
	Data type: Object
	<pre>"asset": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

item.asset.display_value	Text name of the asset associated with the install base item record. Use this value to display the asset name in the UI. Data type: String
item.asset.sys_id	Sys_id of the asset record associated with the install base item record. Data type: String
item.child_install_base_items	List of the child install base items associated with this install base item.

Name	Description

	<pre>"consumer": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

item.consumer.display_value	Text name of the consumer associated with the install base item record. Use this value to display the consumer name in the UI. Data type: String
item.consumer.sys_id	Sys_id of the consumer record associated with the install base item record. Data type: String

item.consumer_profile	Details about the consumer profile associated with the install base item record.
	
	Note: The consumer profile field is only available if the B2B2C plugin is installed.
	
	Data type: Object
	<pre>"consumer_profile": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

item.consumer_profile.display_value	Text name of the consumer profile associated with the install base item record. Use this value to display the consumer profile name in the UI. Data type: String
item.consumer_profile.sys_id	Sys_id of the consumer profile record associated with the install base item record. Data type: String

item.contact	Details about the account contact responsible for the install base item record.
	
	Data type: Object
	<pre>"contact": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

item.contact.display_value	Text name of the account contact associated with the install base item record. Use this value to display the account contact name in the UI. Data type: String

Name	Description
item.contact.sys_id	Sys_id of the account contact record associated with the install base item record. Data type: String
item.health_status	Details about the current health status of the install base item. Only returned if the Proactive Customer Service Operations (com.snc.proactive_cs_itom) plugin is installed. Data type: Object `"health_status": { "display_value": "String", "value": "String" }`
item.health_status.display_value	Text string of the current health status of the install base item. Use this value to display the health status in the UI. Data type: String
item.health_status.value	Internal value of the health status of the install base item. Data type: String
item.health_status_last_updated	Date and time when the health status was last updated for the install base item. Data type: String
item.household	Details about the household associated with the install base item record. Only returned if the Customer Service Household (com.snc.household) plugin is installed. Data type: Object `"household": { "display_value": "String", "sys_id": "String" }`
item.household.display_value	Text name of the household associated with the install base item record. Use this value to display the household name in the UI. Data type: String
item.household.sys_id	Sys_id of the household associated with the install base item record. Data type: String

Name	Description
item.install_date	Details about the date when the install base item became active. Data type: Object `"install_date": { "display_value": "String", "value": "String" }`
item.install_date.display_value	Text install date. Use this value to display the install date in the UI. Data type: String
item.install_date.value	Internal value of the install date. Data type: String
item.location	Details about the location of the install base item. Data type: Object `"location": { "display_value": "String", "sys_id": "String" }`
item.location.display_value	Text name of the install base item location. Use this value to display the location name in the UI. Data type: String
item.location.sys_id	Sys_id of the location record associated with the install base item record. Data type: String
item.name	Name of the install base item. Data type: String
item.number	Unique ID of the install base item. Data type: String
item.parent	Details about the parent record of the install base item record. Data type: Object `"parent": { "display_value": "String", "sys_id": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
item.parent.display_value	Text name of the parent record associated with the install base item record. Use this value to display the parent name in the UI. Data type: String
item.parent.sys_id	Sys_id of the parent record associated with the install base item record. Data type: String

item.product	Details about the product model associated with the install base item record. Use this information to identify the services associated with any product model.
	
	Data type: Object
	
	`"product": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.product.display_value	Text name of the product model associated with the install base item record. Use this value to display the product name in the UI. Data type: String
item.product.sys_id	Sys_id of the product model record associated with the install base item record. Data type: String
item.quantity	Number of items installed. Data type: Integer

item.service_context	Details about the service context associated with the install base item record.
	
	Data type: Object
	
	`"service_context": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.service_context.display_value	Details about the service context associated with the install base item record.
	
	Data type: Object
	
	`"service_context": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

Name	Description
item.service_context.sys_id	Sys_id of the service context record associated with the install base item record. Data type: String

item.service_organization	Details about the service organization associated with the install base item record. Only returned if the Service Organization (com.snc.service_organization) plugin is installed.
	
	Data type: Object
	
	`"service_organization": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.service_organization.display_value	Text name of the service organization associated with the install base item record. Use this value to display the service organization name in the UI. Data type: String
item.service_organization.sys_id	Sys_id of the service organization record associated with the install base item record. Data type: String
item.sys_class_name	Table containing the install base item record. Data type: String
item.sys_id	Sys_id of the install base item record. Located in the table specified in the *sys_class_name* parameter. Data type: String

item.state	Details about the current state of the install base item.
	
	Data type: Object
	
	`"state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.state.display_value	Text string of the current state of the install base item. Use this value to display the state in the UI. Data type: String
item.state.value	Internal value of the state of the install base item. Data type: String
item.status	Details about the status of the install base item. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

	<pre>"status": {
	  "display_value": "String",
	  "value": "String"
	}</pre>

item.status.display_value	Text string of the status of the install base item. Use this value to display the status in the UI. Data type: String
item.status.value	Internal value of the status of the install base item. Data type: String

item.uninstall_date	Details about the date when the install base item became inactive.
	
	Data type: Object
	<pre>"uninstall_date": {
	  "display_value": "String",
	  "value": "String"
	}</pre>

item.uninstall_date.display_value	Text uninstall date. Use this value to display the uninstall date in the UI. Data type: String
item.uninstall_date.value	Internal value of the uninstall date. Data type: String
status	Status of the endpoint call. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/42746a3b876121100b6afc86dabb3597/uninstall"
 \
--request PATCH \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "status": "SUCCESS",
    "item": {
      "sys_class_name": {
        "value": "sn_install_base_item",
```

        "display_value": "Boxeo"
      }
    }
  }
}
```

Install Base Item - POST /sn_install_base/integrations/installbaseitems

Creates one or more install base item records in the default Install Base Item table, or in its extended table if specified, and populates them with the specified field values.

When creating a single install base item record, you pass an object in the request body that contains all of the fields to include in the request body. When you create multiple install base item records in a single call, you pass an array of objects in the request body that contains all of the records to create. The endpoint processes and reports on each of the record creation objects individually. If one or more of the records fail to be created, it doesn't affect the creation of other record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems`

Default URL: `/api/sn_install_base/integrations/installbaseitems`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
account	Required when creating an install base item for an account. Sys_id of the account to associate with the install base item. Located in the Account [customer_account] table. **Note:** If you pass the *account* parameter, you can't also pass the *consumer* parameter. Data type: String
active	Flag that indicates whether the install base item is active. Valid values: • true, "true", or "0": Item is active. • false, "false", or "1": Item isn't active. Data type: Boolean Default: true
asset	Sys_id of the asset associated with the install base item record. Located in the Asset [alm_asset] table. Data type: String
child_install_base_items	List of the child install base items associated with this install base item. **Note:** The following child install base item fields can't be different from its parent: • account • consumer • contact • service organization Data type: Array of Objects `"child_install_base_items": [ { "name": "String", "product": "String" } ]`
child_install_base_items.name	Name of the child install base item.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
child_install_base_items.product	Sys_id of the associated child base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String
configuration_item	Sys_id of the configuration item associated with the install base item record. Located in the Configuration Item [cmdb_ci] table. Data type: String
consumer	Required when creating an install base item for a consumer. Sys_id of the consumer associated with the install base item record. Located in the Consumer [csm_consumer] table. **Note:** If you pass the *consumer* parameter, you can't also pass the *account* parameter. In addition, you can only associate a consumer with an install base item if the B2B2C plugin is installed on your instance. Data type: String
consumer_profile	Sys_id of the consumer profile associated with the install base item record. Located in the Consumer Profile [sn_csm_consumer_profile] table. Data type: String
contact	Sys_id of the account contact record that is primarily responsible for the install base item. Located in the Contact [customer_contact] table. **Note:** Contacts can only be specified for account install base items. Data type: String
household	Sys_id of the household associated with the install base item record. Located in the Household [csm_household] table. **Note:** This field is only valid when the Customer Service Household (com.snc.household) plugin is installed. Data type: String
install_date	Date on which the install base item becomes active. Data type: String Format: yyyy-MM-dd HH:mm:ss

Request body parameters (XML or JSON) (continued)

Name	Description
location	Sys_id of the location of the associated product. Located in the Location [cmn_location] table. Data type: String
name	Name of the install base item. Data type: String
number	Unique identifier for the install base item. Data type: String Default: Automatically generated by the endpoint.
parent	Sys_id of the parent record for this install base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String
product_model	Sys_id of the product model associated with the install base item record. Located in the Product Model [cmdb_model] table. Data type: String
quantity	Number of items installed. Data type: Integer
service_context	Sys_id of the service that is associated to the underlying CI for calculating the impact severity from Event Management. For more information, see Service health status for install base. **Note:** This field is only valid if the Proactive Customer Service Operations with Event Management plugin is installed. Data type: String
service_organization	Required when creating an install base item for a service organization. Sys_id of the service organization record that is involved in providing service to the customer. Located in the Service Organization [sn_customer_service_organization] table. **Note:** If you pass this parameter, you shouldn't also pass the account, contact, or consumer parameters. The *service_organization* parameter is only available when the Service Organization (com.snc.service_organization) plugin is installed on your instance.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
state	Current state of the install base item. Valid values: • in_use • inactive Data type: String
status	Status of the product. Valid values: • original • replacement Data type: String
sys_class_name	Name of the extended install base table in which to create the install base item record. Data type: String Default: Install Base Item [sn_install_base_item] table
uninstall_date	Date on which the install base becomes inactive. Data type: String Format: yyyy-MM-dd HH:mm:ss

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	Details about the error that occurred when trying to process the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
item	Install base item that matched the specified filter results. Only non-empty fields are returned. Data type: Array of Objects `"item": { "account": {Object}, "active": "String", "asset": {Object},`

Name	Description
	"child_install_base_items": {Object}, "condition": "String", "configuration_item": {Object}, "consumer": {Object}, "consumer_profile": {Object}, "contact": {Object}, "health_status": {Object}, "health_status_last_updated": "String", "household": {Object}, "install_date": {Object}, "location": {Object}, "name": "String", "number": "String", "parent": {Object}, "product": {Object}, "quantity": Integer, "service_context": {Object}, "service_organization" {Object}, "sys_id": "String", "state": {Object}, "status": {Object}, "uninstall_date": "String" }
item.account	Details about the customer account associated with the install base item record. Data type: Object "account": { "display_value": "String", "sys_id": "String" }
item.account.display_value	Text name of the customer account associated with the install base item record. Use this value to display the customer account name in the UI. Data type: String
item.account.sys_id	Sys_id of the customer account record associated with the install base item record. Data type: String
item.active	Flag that indicates whether the install base item is active. Possible values: • true: Install base item is active. • false: Install base item is inactive.

Name	Description
	Data type: Boolean String
item.asset	Details about the asset associated with the install base item record. Data type: Object `"asset": { "display_value": "String", "sys_id": "String" }`
item.asset.display_value	Text name of the asset associated with the install base item record. Use this value to display the asset name in the UI. Data type: String
item.asset.sys_id	Sys_id of the asset record associated with the install base item record. Data type: String
item.child_install_base_items	List of the child install base items associated with this install base item. **Note:** The following child install base item fields can't be different from its parent: • account • consumer • contact • service organization Data type: Array of Objects `"child_install_base_items": [ { "name": "String", "product": "String" } ]`
item.child_install_base_items.name	Name of the child install base item. Data type: String
item.child_install_base_items.product	Sys_id of the associated child base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String
item.configuration_item	Details about the configuration item associated with the install base item record.

Name	Description
	Data type: Object `"configuration_item": { "display_value": "String", "sys_id": "String" }`
item.configuration_item.display_value	Text name of the configuration item associated with the install base item record. Use this value to display the configuration item name in the UI. Data type: String
item.configuration_item.sys_id	Sys_id of the configuration item record associated with the install base item record. Data type: String
item.consumer	Details about the consumer associated with the install base item record. **Note:** The consumer field is only available if the B2B2C plugin is installed. Data type: Object `"consumer": { "display_value": "String", "sys_id": "String" }`
item.consumer.display_value	Text name of the consumer associated with the install base item record. Use this value to display the consumer name in the UI. Data type: String
item.consumer.sys_id	Sys_id of the consumer record associated with the install base item record. Data type: String
item.consumer_profile	Details about the consumer profile associated with the install base item record. **Note:** The consumer profile field is only available if the B2B2C plugin is installed. Data type: Object `"consumer_profile": { "display_value": "String", "sys_id": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
item.consumer_profile.display_value	Text name of the consumer profile associated with the install base item record. Use this value to display the consumer profile name in the UI. Data type: String
item.consumer_profile.sys_id	Sys_id of the consumer profile record associated with the install base item record. Data type: String

item.contact	Details about the account contact responsible for the install base item record.
	
	Data type: Object
	
	`"contact": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.contact.display_value	Text name of the account contact associated with the install base item record. Use this value to display the account contact name in the UI. Data type: String
item.contact.sys_id	Sys_id of the account contact record associated with the install base item record. Data type: String

item.health_status	Details about the current health status of the install base item. Only returned if the Proactive Customer Service Operations (com.snc.proactive_cs_itom) plugin is installed.
	
	Data type: Object
	
	`"health_status": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.health_status.display_value	Text string of the current health status of the install base item. Use this value to display the health status in the UI. Data type: String
item.health_status.value	Internal value of the health status of the install base item. Data type: String
item.health_status_last_updated	Date and time when the health status was last updated for the install base item.

Name	Description
	Data type: String
item.household	Details about the household associated with the install base item record. Only returned if the Customer Service Household (com.snc.household) plugin is installed. Data type: Object `"household": { "display_value": "String", "sys_id": "String" }`
item.household.display_value	Text name of the household associated with the install base item record. Use this value to display the household name in the UI. Data type: String
item.household.sys_id	Sys_id of the household associated with the install base item record. Data type: String
item.install_date	Details about the date when the install base item became active. Data type: Object `"install_date": { "display_value": "String", "value": "String" }`
item.install_date.display_value	Text install date. Use this value to display the install date in the UI. Data type: String
item.install_date.value	Internal value of the install date. Data type: String
item.location	Details about the location of the install base item. Data type: Object `"location": { "display_value": "String", "sys_id": "String" }`
item.location.display_value	Text name of the install base item location. Use this value to display the location name in the UI.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
item.location.sys_id	Sys_id of the location record associated with the install base item record. Data type: String
item.name	Name of the install base item. Data type: String
item.number	Unique ID of the install base item. Data type: String
item.parent	Details about the parent record of the install base item record. Data type: Object `"parent": { "display_value": "String", "sys_id": "String" }`
item.parent.display_value	Text name of the parent record associated with the install base item record. Use this value to display the parent name in the UI. Data type: String
item.parent.sys_id	Sys_id of the parent record associated with the install base item record. Data type: String
item.product	Details about the product model associated with the install base item record. Use this information to identify the services associated with any product model. Data type: Object `"product": { "display_value": "String", "sys_id": "String" }`
item.product.display_value	Text name of the product model associated with the install base item record. Use this value to display the product name in the UI. Data type: String
item.product.sys_id	Sys_id of the product model record associated with the install base item record.

Name	Description
	Data type: String
item.quantity	Number of items installed. Data type: Integer
item.service_context	Details about the service context associated with the install base item record. Data type: Object `"service_context": { "display_value": "String", "sys_id": "String" }`
item.service_context.display_value	Details about the service context associated with the install base item record. Data type: Object `"service_context": { "display_value": "String", "sys_id": "String" }`
item.service_context.sys_id	Sys_id of the service context record associated with the install base item record. Data type: String
item.service_organization	Details about the service organization associated with the install base item record. Only returned if the Service Organization (com.snc.service_organization) plugin is installed. Data type: Object `"service_organization": { "display_value": "String", "sys_id": "String" }`
item.service_organization.display_value	Text name of the service organization associated with the install base item record. Use this value to display the service organization name in the UI. Data type: String
item.service_organization.sys_id	Sys_id of the service organization record associated with the install base item record. Data type: String
item.sys_class_name	Table containing the install base item record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
item.sys_id	Sys_id of the install base item record. Located in the table specified in the *sys_class_name* parameter. Data type: String
item.state	Details about the current state of the install base item. Data type: Object `"state": { "display_value": "String", "value": "String" }`
item.state.display_value	Text string of the current state of the install base item. Use this value to display the state in the UI. Data type: String
item.state.value	Internal value of the state of the install base item. Data type: String
item.status	Details about the status of the install base item. Data type: Object `"status": { "display_value": "String", "value": "String" }`
item.status.display_value	Text string of the status of the install base item. Use this value to display the status in the UI. Data type: String
item.status.value	Internal value of the status of the install base item. Data type: String
item.uninstall_date	Details about the date when the install base item became inactive. Data type: Object `"uninstall_date": { "display_value": "String", "value": "String" }`
item.uninstall_date.display_value	Text uninstall date. Use this value to display the uninstall date in the UI. Data type: String

Name	Description
item.uninstall_date.value	Internal value of the uninstall date. Data type: String
status	Status of the endpoint call. Data type: String

Example: cURL request

The following code example shows how to create a single Install Base Item record.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"name\":\"Base Monitor\",
  \"quantity\": 4,
  \"account\":\"86837a386f0331003b3c498f5d3ee4ca\",
  \"contact\": \"dc0185d94f341200025ba3618110c77c\",
  \"configuration_item\":\"0c43baaac61122750182c132ee74bcf0\",
  \"state\":\"in_use\"
}" \
--user 'username':'password'
```

Return results: Only non-empty fields are returned.

```
{
  "result": {
    "status": "SUCCESS",
    "item": {
      "sys_class_name": "sn_install_base_item",
      "number": "IBITM0001003",
      "sys_id": "27cb093114c66910f877324710112fd6",
      "contact": {
        "sys_id": "dc0185d94f341200025ba3618110c77c",
        "display_value": "Cindy Contact"
      },
      "state": {
        "value": "in_use",
        "display_value": "In Use"
      },
      "quantity": "4",
      "active": "true",
      "configuration_item": {
        "sys_id": "0c43baaac61122750182c132ee74bcf0",
        "display_value": "3D Pinball"
      },
      "name": "Base Monitor",
      "account": {
        "sys_id": "86837a386f0331003b3c498f5d3ee4ca",
        "display_value": "Boxeo"
      }

```
    }
  }
}
```

Example: cURL request

The following code example shows how to create multiple Install Base Item records.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "[
  {
    \"name\":\"AST4 Laptop\",
    \"consumer\":\"b119803fdb1b1200b6075200cf961917\",
    \"status\":\"replacement\",
    \"install_date\":\"2023-05-18 12:00:00\",
    \"uninstall_date\":\"2023-09-28 12:00:00\"
  },
{
    \"name\":\"Base Monitor\",
    \"quantity\": 4,
    \"account\":\"86837a386f0331003b3c498f5d3ee4ca\",
    \"contact\": \"dc0185d94f341200025ba3618110c77c\",
    \"configuration_item\":\"0c43baaac61122750182c132ee74bcf0\",
    \"state\":\"in_use\"
  }
]" \
--user 'username':'password'
```

Return results: Only non-empty fields are returned.

```
{
  "result": {
    "status": "SUCCESS",
    "items": [
      {
        "status": "SUCCESS",

        }
      }
    ]
  }
}
```

Install Base Item - POST /sn_install_base/integrations/installbaseitems/{id}/relatedparties

Creates a related party record and associates it with a specified install base item record. The values specified in the request parameters are stored in the newly created related party record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/relatedparties`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/relatedparties`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Located in the Install Base Item [sn_install_base_item] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
account	Required if the *type* parameter is one of the following: • `Authorized Account` • `Authorized Contact` • `Listed Account` • `Listed Contact` Sys_id of the account to associate with the install base item. Located in the Account [customer_account] table. **Note:** If you pass the *account* parameter, you can't also pass the *consumer* parameter. Data type: String
consumer	Required if the *type* parameter is `Authorized Consumer` or `Listed Consumer`. Sys_id of the consumer associated with the install base item record. Located in the Consumer [csm_consumer] table. **Note:** If you pass the *consumer* parameter, you can't also pass the *account* parameter. In addition, you can only associate a consumer with an install base item if the B2B2C plugin is installed on your instance. Data type: String
contact	Sys_id of the contact record associated with the related parties record. Located in the Contact [customer_contact] table.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
install_base_item	Sys_id of the install base item record associated with the related parties record. Data type: String
responsibility	Sys_id of the associated responsibility record. This record defines the access level for the install base information. Located in the Responsibility Definition [sn_customerservice_responsibility_def] table. This parameter is only valid if the *related_party* field is also specified. If specified, it only returns the install base items that match both the *related_party* and *responsibility* parameters. For additional information, see Configure related parties for items received Data type: String
service_organization	Required if the *type* parameter is one of the following: • `Authorized Member` • `Authorized Service Organization` • `Listed Member` • `Listed Service Organization` Sys_id of the service organization record that is involved in providing service to the customer. Located in the Service Organization [sn_customer_service_organization] table. **Note:** If you pass this parameter, you shouldn't also pass the account, contact, or consumer parameters. The *service_organization* parameter is only available when the Service Organization (com.snc.service_organization) plugin is installed on your instance. Data type: String
sys_class_name	Table containing the related parties record. Data type: String Default: sn_install_base_related_party
type	Required. Sys_id of the type of related party to create. Located in the Related Party Configuration [sn_customerservice_related_party_configuration] table. Possible types: • Authorized Account • Authorized Consumer

Request body parameters (XML or JSON) (continued)

Name	Description
	• Authorized Contact • Authorized Contributor • Authorized Member • Authorized Service Organization • Listed Account • Listed Consumer • Listed Contact • Listed Contributor • Listed Member • Listed Service Organization Data type: String
user	Required if the *type* parameter is one of the following related party types: • `Authorized Contributor` • `Authorized Member` • `Listed Contributor` • `Listed Member` For `Authorized Member` and `Listed Member`, this user must be associated with the specified *service_organization* record. Sys_id of the user record associated with the related parties record. Located in the User [sys_user] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

account	Details about the account associated with the related parties record.
	
	Data type: Object
	`account": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

account.display_value	Text name of the account associated with the related parties record. Use this value to display the account name in the UI. Data type: String
account.sys_id	Sys_id of the account record associated with the related parties record. Data type: String

consumer	Details about the consumer associated with the related parties record.
	
	Data type: Object
	`"consumer": {`
	`  "display_value": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"sys_id": "String"
	}</pre>

consumer.display_value	Text name of the consumer associated with the related parties record. Use this value to display the consumer name in the UI. Data type: String
consumer.sys_id	Sys_id of the consumer record associated with the related parties record. Data type: String

contact	Details about the account contact responsible for the related parties record.
	
	Data type: Object
	<pre>"contact": {
	"display_value": "String",
	"sys_id": "String"
	}</pre>

contact.display_value	Text name of the contact associated with the related parties record. Use this value to display the contact name in the UI. Data type: String
contact.sys_id	Sys_id of the contact record associated with the related parties record. Located in the Contact [customer_contact] table. Data type: String

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	<pre>"error": {
	"detail": "String",
	"message": "String"
	}</pre>

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
install_base_item	Details about the install base item associated with the related parties record. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"install_base_item": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

install_base_item.display_value	Text name of the install base item associated with the related parties record. Use this value to display the install base item name in the UI. Data type: String
install_base_item.sys_id	Sys_id of the install base item record associated with the related parties record. Data type: String

responsibility	Details about the access level for the install base information.
	
	Data type: Object
	<pre>"responsibility": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

responsibility.display_value	Text display value for the access level for the install base information. Data type: String
responsibility.sys_id	Sys_id of the associated responsibility record. This record defines the access level for the install base information. Located in the Responsibility Definition [sn_customerservice_responsibility_def] table. This parameter is only valid if the *related_party* field is also specified. If specified, it only returns the install base items that match both the *related_party* and *responsibility* parameters. For additional information, see Configure related parties for items received Data type: String
status	Status of the endpoint call. Data type: String
sys_class_name	Table containing the related parties record. Data type: String Default: sn_install_base_related_party
sys_id	Sys_id of the associated related parties record.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String
type	Details about the type of contact associated with the related parties record. Data type: Object `"type": { "display_value": "String", "sys_id": "String" }`
type.display_value	Text name of the type of contact associated with the related parties record. Use this value to display the type of contact in the UI. For additional information, see Add related party configurations to cases, sold products, install bases, or service organizations. Possible types: • Authorized Account • Authorized Consumer • Authorized Contact • Authorized Contributor • Authorized Member • Authorized Service Organization • Listed Account • Listed Consumer • Listed Contact • Listed Contributor • Listed Member • Listed Service Organization Data type: String
type.sys_id	Sys_id of the type record associated with the related parties record. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
user	Details about the user associated with the related parties record. Data type: Object `"user": { "display_value": "String", "sys_id": "String" }`
user.display_value	Text name of the user associated with the related parties record. Use this value to display the user name in the UI. Data type: String
user.sys_id	Sys_id of the user record associated with the related parties record. Located in the User [sys_user] table. Data type: String

Example: cURL request

The following code example shows how to call this endpoint to create an Authorized Account related record and associate it with an install base item.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/relatedparties/f77c7542b7343300ece839a6ee11a991" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  "contact":"0a232a0013691200042ab3173244b075",
  "type":"68ec8b2965e99110f87764df53db779f",
  "account":"86837a386f0331003b3c498f5d3ee4ca",
  "install_base_item":"f77c7542b7343300ece839a6ee11a991",
  "responsibility":"c009bbedb3730010700b4d43c6a8dcef",
  "sys_class_name":"sn_install_base_related_party"
}" \
--user 'username':'password'
```

Return results:

```
{
"result":
  {
    "type": {
      "display_value":"Authorized Contact",
      "sys_id":"68ec8b2965e99110f87764df53db779f"
    },
    "install_base_item": {
      "display_value":"KX Series - KX5000",
      "sys_id":"f77c7542b7343300ece839a6ee11a991"
    },
    "sys_class_name":"sn_install_base_related_party",
    "sys_id":"4659539814ac6910f877ae314c1fb43a",
```

    },
    "status":"SUCCESS",
  }
}
```

Knowledge Management REST API

The *Knowledge Management* API provides endpoints for searching, viewing, and fetching lists of the most-viewed and featured knowledge articles.

You can only use this API when the Knowledge API (sn_km_api) plugin is activated. The *Knowledge Management REST* API was originally released in Orlando using the Knowledge API app available in the ServiceNow Store.

Note: The *Knowledge Management REST API* is publicly accessible and makes any knowledge base that is publicly accessible available to all users, including unauthenticated users. For version 1.0.1 and later, the API was made editable, allowing admins to configure each endpoint to disallow unauthenticated access by selecting the **Requires Authentication** flag on the Scripted REST Service Security tab associated with the API.

To enable other domains to use *Knowledge Management REST API* endpoints, define a Cross-Origin Resource Sharing (CORS) rule. For more information, see Define a CORS rule.

To view an article from the scoped knowledge base using this REST API, allow the sn_km_api scope read access from the requesting scope in the Restricted Caller Access Privileges [sys_restricted_caller_access] table. For more information, see Define cross-scope access to an application resource.

By default, this API has a rate limit of 500 per hour for unauthenticated and snc_external users. For more information about rate limiting, see Inbound REST API rate limiting.

Knowledge Management - GET /knowledge/articles

Returns a list of knowledge base (KB) articles which can be searched and filtered using various parameters.

URL format

Versioned URL: `/api/sn_km_api/{api_version}/knowledge/articles`

Default URL: `/api/sn_km_api/knowledge/articles`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
filter	Encoded query to use to filter the result set. Syntax: `filter=<attr><operator><value>`. • `<attr>`: Name of the table column. • `<operator>`: Valid values: ○ =: Exactly matches <value>. ○ !=: Does not match <value>. ○ ^: Enables you to specify more than one condition and logically AND them. ○ ^OR: Enables you to specify more than one condition and logically OR them. ○ LIKE: <attr> contains the specified string. Only works for <attr> fields whose data type is string. ○ STARTSWITH: <attr> starts with the specified string. Only works for <attr> fields whose data type is string. ○ ENDSWITH: <attr> ends with the specified string. Only works for <attr> fields whose data type is string. • `<value>`: Value to match against. All parameters are case-sensitive. Query can contain more than one entry, such as `filter=<attr><operator><value>[<operator><attr><operator><value>]`. Data type: String Default: empty
fields	Comma-separated list of fields from the Knowledge [kb_knowledge] table to show details in results. Data type: String Default: None
kb	Comma-separated list of knowledge base sys_ids from the Knowledge Bases [kb_knowledge_base] table to restrict results to. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
language	List of comma-separated languages in two-letter ISO 639-1 language code format to restrict results to. Alternatively type 'all' to search in all valid installed languages on an instance. Data type: String Default: User's session language or en
limit	Maximum number of records to return. Unusually large *`limit`* values can impact system performance. For requests that exceed this number of records, use the *`offset`* parameter to paginate record retrieval. Data type: Number Default: 30
offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time this endpoint is called, *`offset`* is set to "0". To page through all available records, use `offset=offset+limit` until the end of the all records is reached. Data type: Number Default: 0
query	Text to search for, can be empty. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
articles	List of articles returned in response. Data type: Array `"articles": [ { "fields": {Object}, "link": "String", "id": "String", "number": "String", "rank": Number, "score": Number, "snippet": "String", "title": "String" } ]`
articles.fields	Values of requested fields, if any. Data type: Object `"fields": { "<field_name>": {Object} }`
articles.fields.<field_name>	Lists each field requested using the fields parameter, if any. Data type: Object `"<field_name>": { "display_value": "String", "label": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>{
	  "name": "String",
	  "type": "String",
	  "value": "String"
	}</pre>

articles.fields.<field_name>.display_value	Display value of the requested field. Data type: String
articles.fields.<field_name>.label	Label representing the requested field. For example, `Knowledge`. Data type: String
articles.fields.<field_name>.name	Name of the requested field. Matches *<field_name>*. Data type: String
articles.fields.<field_name>.type	Data type of requested field. Data type: String
articles.fields.<field_name>.value	Value of the requested field. Data type: String
articles.id	Knowledge article sys_id from the Knowledge [kb_knowledge] table. Data type: String
articles.link	Link to the article. Data type: String
articles.number	Knowledge article number. Data type: String
articles.rank	Search rank of article specific to this search. Data type: Number (Float)
articles.snippet	Text showing a small portion of the knowledge article. Data type: String
articles.score	Relevancy score, results sorted in descending order by score. Data type: String
articles.title	Short description or title of the knowledge article. Data type: String

Name	Description
meta	Meta information of the results and request parameters. Data type: Object `"meta": { "count": Number, "end": Number, "fields": "String", "filter": "String", "kb": "String", "language": "String", "query": "String", "start": Number, "status": {Object}, "ts_query_id": "String" }`
meta.count	Number of available KB articles. Data type: Number
meta.end	Ending index of the result set. Data type: Number
meta.fields	Fields in the article. Data type: String
meta.filter	Filter used to acquire the data. Data type: String
meta.kb	List of knowledge base article sys_ids. Data type: String
meta.language	List of comma-separated languages of the KB articles that were requested. Data type: String
meta.query	Specified request query. Data type: String
meta.start	Starting index of result set. Data type: Number
meta.status	Status of the call. Data type: String
meta.ts_query_id	Sys_id of the query.

}
```

Knowledge Management - GET /knowledge/articles/{article_sys_id}/attachments/{attachment_sys_id}

Returns a knowledge article attachment as a file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_km_api/{api_version}/knowledge/articles/{article_sys_id}/attachments/{attachment_sys_id}`

Default URL: `/api/sn_km_api/knowledge/articles/{article_sys_id}/attachments/{attachment_sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
article_sys_id	Sys_id of the knowledge article with the attachment you intend to retrieve. Located in the Knowledge Bases [kb_knowledge] table. Data type: String
attachment_sys_id	Sys_id of record to which the attachment belongs. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Type	The content type of the response, for example, `image/gif` or `*/*`.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
File is returned as a response.	

Example: Sample cURL request

```
curl
 "https://instance.service-now.com/api/sn_km_api/knowledge/articles/0b48fd75474321009db4b5b08b9a71c2/attachments/fedf5614294f4010f877796e70786956" \
--request GET \
--header "Accept:*/*" \

Knowledge Management - GET /knowledge/articles/featured

Returns a list of the most-viewed knowledge articles and featured knowledge articles.

URL format

Versioned URL: `/api/sn_km_api/{api_version}/knowledge/articles/featured`

Default URL: `/api/sn_km_api/knowledge/articles/featured`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
fields	Comma-separated list of fields from the Knowledge [kb_knowledge] table to show details in results. Data type: String Default: None
kb	Comma-separated list of knowledge base sys_ids from the Knowledge Bases [kb_knowledge_base] table to restrict results to. Data type: String
language	List of comma-separated languages in two-letter ISO 639-1 language code format to restrict results to. Alternatively type 'all' to search in all valid installed languages on an instance. Data type: String Default: User's session language or en
limit	Maximum number of records to return. Unusually large *`limit`* values can impact system performance. For requests that exceed this number of records, use the *`offset`* parameter to paginate record retrieval. Data type: Number Default: 30
offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time this endpoint is called, *`offset`* is set to "0". To page through all available records, use `offset=offset+limit` until the end of the all records is reached. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
articles	List of articles returned in response. Data type: Array `"articles":[ { "fields": {Object}, "id": "String", "link": "String", "number": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"rank": Number,
	"score": Number,
	"snippet": "String",
	"title": "String"
	}
	]</pre>

articles.fields	Values of requested fields, if any.
	
	Data type: Object
	<pre>"fields": {
	"<field_name>": {Object}
	}</pre>

articles.fields.<field_name>	Lists each field requested using the fields parameter, if any.
	
	Data type: Object
	<pre>"<field_name>": {
	"display_value": "String",
	"name": "String",
	"label": "String",
	"type": "String",
	"value": "String"
	}</pre>

articles.fields.<field_name>.display_value	Display value of the requested field. Data type: String
articles.fields.<field_name>.name	Name of the requested field. Matches *<field_name>*. Data type: String
articles.fields.<field_name>.label	Label representing the requested field. For example, `Knowledge`. Data type: String
articles.fields.<field_name>.type	Data type of requested field. Data type: String
articles.fields.<field_name>.value	Value of the requested field. Data type: String
articles.id	Knowledge article sys_id from the Knowledge [kb_knowledge] table. Data type: String
articles.link	Link to the article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
articles.number	Knowledge article number. Data type: String
articles.rank	Search rank of article specific to this search. Data type: Number (Float)
articles.score	Relevancy score, results sorted in descending order by score. Data type: String
articles.snippet	Text showing a small portion of the knowledge article. Data type: String
articles.title	Short description or title of the knowledge article. Data type: String

meta	Meta information of the results and request parameters.
	
	Data type: Object
	
	`"meta": {`
	`  "count": Number,`
	`  "end": Number,`
	`  "fields": "String",`
	`  "filter": "String",`
	`  "kb": "String",`
	`  "language": "String",`
	`  "query": "String",`
	`  "start": Number,`
	`  "status": {Object},`
	`  "ts_query_id": "String"`
	`}`

meta.count	Number of available KB articles. Data type: Number
meta.end	Ending index of the result set. Data type: Number
meta.fields	Fields in the article. Data type: String
meta.filter	Filter used to acquire the data.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
meta.kb	List of knowledge base article sys_ids. Data type: String
meta.language	List of comma-separated languages of the KB articles that were requested. Data type: String
meta.query	Specified request query. Data type: String
meta.start	Starting index of result set. Data type: Number
meta.status	HTTP status of the call. Data type: String
meta.ts_query_id	Sys_id of the query. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_km_api/knowledge/articl
es/featured?fields=short_description&limit=3" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{

Knowledge Management - GET /knowledge/articles/{id}

Returns specific knowledge article content and its field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_km_api/{api_version}/knowledge/articles/{id}`

Default URL: `/api/sn_km_api/knowledge/articles/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id or knowledge base (KB) number of a knowledge article in the Knowledge [kb_knowledge] table. Data type: String

Query parameters

Name	Description
fields	Comma-separated list of fields from the Knowledge [kb_knowledge] table to show details in results. Data type: String Default: None
language	Two letter ISO 639-1 language code; for example, "fr" for French. Results display only when searches use the knowledge article KB number as the *id* and a translated version of the article is available in the language specified. **Note:** Only valid when setting the *id* parameter as a KB number (not sys_id). Data type: String
search_id	Optional unless using *search_rank*. Unique identifier of search that returned this article. You can retrieve *search_id* using one of the following APIs that returns the *articles.id* element: • Knowledge Management - GET /knowledge/articles • Knowledge Management - GET /knowledge/articles/featured • Knowledge Management - GET knowledge/articles/most_viewed Passing the *search_id* and *search_rank* parameter increments the article view count and records an entry for the article in the Knowledge Use [kb_use] table. You can also verify incremented view counts in Knowledge Base [kb_view2] page.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String
search_rank	Optional unless using *search_id*. Article search rank by click-rate that you can retrieve using one of the following APIs that returns the *articles.rank* element: • Knowledge Management - GET /knowledge/articles • Knowledge Management - GET /knowledge/articles/featured • Knowledge Management - GET knowledge/articles/most_viewed Data type: Number
update_view	Update view count and record an entry for the article in the Knowledge Use [kb_use] table. True whether present as a standalone parameter or set to true. **Note:** If you pass *update_view* with *search_id* and *search_rank*, *update_view* is ignored because the view count will already be incremented. Data type: Boolean that is always handled as true when passed whether set to `"true"`, `"false"`, or not set at all.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
attachments	Provides attachment details for each instance if attachment exists. Only displays if `display_attachments = true`. Data type: Array `"attachments": [ { "file_name": "String", "size_bytes": "String", "state": "String", "sys_id": "String" } ]`
attachments.file_name	File name of attachment. Data type: String
attachments.size_bytes	File size. Data type: String Unit: Bytes
attachments.state	State. Possible values: • available • available_conditionally • not_available • pending Data type: String
attachments.sys_id	Sys_id of the attachment.

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	Data type: String
content	Entire HTML content of the article. Data type: String
display_attachments	Flag that indicates whether the *display_attachments* flag is active for that article. Attachments are returned only if *display_attachments* is true (active) in the knowledge article record. • true: *display_attachments* is active. • false: *display_attachments* is inactive. Data type: Boolean
embedded_content	Lists each attachment containing embedded content by sys_id and includes relevant attachment information. Only displays if `display_attachments = true`. Data type: Array `"attachments": [ { "file_name": "String", "size_bytes": "String", "state": "String", "sys_id": "String" } ]`
embedded_content.file_name	File name of the attachment. Data type: String
embedded_content.size_bytes	Size of the attachment. Data type: String Unit: Bytes
embedded_content.state	State of the attachment. Possible values: • available • available_conditionally • not_available • pending Data type: String
embedded_content.sys_id	Sys_id of the attachment.

Name	Description
	Data type: String

fields	Values of requested fields (if any).
	
	Data type: Object
	
	`"fields": {`
	`  "<field_name>": {Object}`
	`}`

fields.<field_name>	Lists each field requested using the fields parameter, if any.
	
	Data type: Object
	
	`"<field_name>": {`
	`  "display_value": "String",`
	`  "label": "String",`
	`  "name": "String",`
	`  "type": "String",`
	`  "value": "String"`
	`}`

fields.<field_name>.display_value	Display value of the requested field. Data type: String
fields.<field_name>.label	Label representing the requested field. For example, `Knowledge`. Data type: String
fields.<field_name>.name	Name of the requested field. Matches *<field_name>*. Data type: String
fields.<field_name>.type	Data type of requested field. Data type: String
fields.<field_name>.value	Value of the requested field. Data type: String
language	Two-letter ISO 639-1 language code for the current article (if translation is available). Data type: String

languages	For each translated version of a knowledge article (if translated):
	
	`"languages": [`
	`  {`
	`  "label": "String",`
	`  "language": "String",`
	`  "sys_id": "String"`

Name	Description
	<pre> }]</pre> Data type: Array
languages.label	String representation for language. Data type: String
languages.language	Two-letter ISO 639-1 code language. Data type: String
languages.sys_id	Unique identifier for translated version of knowledge article. Data type: String
number	Article number. Data type: String
short_description	Short description or title of the knowledge article. Data type: String
sys_id	Knowledge article sys_id from the Knowledge [kb_knowledge] table. Data type: String
template	Flag that indicates whether a returned article is a template. Possible values: • true: Article is a template. • false: Article is not a template. Data type: Boolean
template_table	Name of template table, only returns if knowledge article is a template. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_km_api/knowledge/articl
es/0b48fd75474321009db4b5b08b9a71c2?search_id=spam&search_rank=2
6.426" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Knowledge Management - GET knowledge/articles/most_viewed

Returns a list of knowledge articles prioritized by most-viewed.

URL format

Versioned URL: `/api/sn_km_api/{api_version}/knowledge/articles/most_viewed`

Default URL: `/api/sn_km_api/knowledge/articles/most_viewed`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
fields	Comma-separated list of fields from the Knowledge [kb_knowledge] table to show details in results. Data type: String Default: None
kb	Comma-separated list of knowledge base sys_ids from the Knowledge Bases [kb_knowledge_base] table to restrict results to. Data type: String
language	List of comma-separated languages in two-letter ISO 639-1 language code format to restrict results to. Alternatively type 'all' to search in all valid installed languages on an instance. Data type: String Default: User's session language or en
limit	Maximum number of records to return. Unusually large *`limit`* values can impact system performance. For requests that exceed this number of records, use the *`offset`* parameter to paginate record retrieval. Data type: Number Default: 30
offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks.

articles.rank	Search rank of article specific to this search. Data type: Float
articles.score	Relevancy score, results sorted in descending order by score. Data type: String
articles.snippet	Text showing a small portion of the knowledge article. Data type: String
articles.title	Short description or title of the knowledge article. Data type: String

meta	Meta information of the results and request parameters.
	
	Data type: Object
	
	`"meta": {`
	`  "count": Number,`
	`  "end": Number,`
	`  "fields": "String",`
	`  "filter": "String",`
	`  "kb": "String",`
	`  "language": "String",`
	`  "query": "String",`
	`  "start": Number,`
	`  "status": {Object},`
	`  "ts_query_id": "String"`
	`}`

meta.count	Number of available KB articles. Data type: Number

Name	Description
meta.end	Ending index of the result set. Data type: Number
meta.fields	Fields in the article. Data type: String
meta.filter	Filter used to acquire the data. Data type: String
meta.kb	List of knowledge base article sys_ids. Data type: String
meta.language	List of comma-separated languages of the KB articles that were requested. Data type: String
meta.query	Specified request query. Data type: String
meta.start	Starting index of result set. Data type: Number
meta.status	HTTP status of the call. Data type: String
meta.ts_query_id	Sys_id of the query. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_km_api/knowledge/articl
es/most_viewed?limit=5" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

MetricBase Time Series API

The *MetricBase Time Series* API provides endpoints to insert data into, retrieve information from, and to run transforms against a MetricBase database.

This API can only be used when the MetricBase plugin (com.snc.clotho) is installed and activated.

Role required to write to this API: clotho_rest_put.

The examples in this section were created using data in the MetricBase (com.snc.clotho) plugin.

MetricBase Time Series - GET /now/clotho/table/{table}/{subject}/{metric}

Retrieves specified time series data from the MetricBase database.

URL format

Versioned URL: `/api/now/{api_version}/clotho/table/{table}/{subject}/{metric}`

Supported request parameters

Path parameters

Name	Description
api_version	
metric	Name of the column in the table identified in the *`subject`* parameter to use as the metric. Data type: String
subject	Sys_id of the GlideRecord associated with this series. Data type: String
table	Name of the table containing the GlideRecord associated with this series. Data type: String

Query parameters

Name	Description
sysparm_display_value	Flag that indicates whether to label the result data with the subject record display value if no other label is specified. Valid values: • true: Result data is labeled with the subject record display value. • false: Result data is not labeled with the subject record display value. Data type: Boolean Default: false
sysparm_end	Required. End time of the evaluation period. An empty or missing value is treated as the current time. Time values are inclusive of this end time. Data type: String Format: ISO 8601 (UTC), either:

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• Absolute date format [YYYY-MM-DDThh:mm:ss], such as `2019-03-20T17:04:55`. • Relative to current time duration format `[P(n)Y(n)M(n)DT(n)H(n)M(n)S]`, such as `P1M`.
sysparm_start	Required. Start time of the evaluation period. The special value `all` can be used to set the start time as the current time minus the maximum retention period for the specified metrics. An empty or missing value is treated as an implicit `all`. Time values are inclusive of this start time. Data type: String Format: ISO 8601 (UTC), either: • Absolute date format [YYYY-MM-DDThh:mm:ss], such as `2019-03-20T17:04:55` • Relative to current time duration format `[P(n)Y(n)M(n)DT(n)H(n)M(n)S]`, such as `P1M`.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
label	The label used to identify this metric's result set. Data type: String
seriesRef	Data series results. Data type: Array `"seriesRef": [ { "metric": "String", "subject": "String", "table": "String" } ]`
seriesRef.metric	The name of the metric from which the data series was obtained. Only appears if the *`metrics`* object is passed in the request. Data type: String
seriesRef.subject	The sys_id of the data series record. Located in the table specified in *`seriesRef.table`*. Data type: String
seriesRef.table	The name of the table from where the data series was obtained. Data type: String
values	The transformed series values. Data type: Array `"values": [ { "timestamp": "String", "value": Number } ]`
values.timestamp	The ISO 8601 timestamp of the value.

Query parameters (continued)

Name	Description
sysparm_start	Required. Start time of the evaluation period. The special value `all` can be used to set the start time as the current time minus the maximum retention period for the specified metrics. An empty or missing value is treated as an implicit `all`. Time values are inclusive of this start time. Data type: String Format: ISO 8601 (UTC), either: • Absolute date format [YYYY-MM-DDThh:mm:ss], such as `2019-03-20T17:04:55` • Relative to current time duration format `[P(n)Y(n)M(n)DT(n)H(n)M(n)S]`, such as `P1M`.
sysparm_subject_limit	Limit size of the subject query result. Data type: Number Default: 10,000
sysparm_transforms	Comma separated list of transforms. Valid transforms: • add • avg • label • mul • resample • sum • top Data type: String Default: None

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
label	The label used to identify this metric's result set. Data type: String
seriesRef	Data series results. Data type: Array `"seriesRef": [ { "metric": "String", "subject": "String", "table": "String" } ]`
seriesRef.metric	The name of the metric from which the data series was obtained. Only appears if the *metrics* object is passed in the request. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
seriesRef.subject	The sys_id of the data series record. Located in the table specified in *seriesRef.table*. Data type: String
seriesRef.table	The name of the table from where the data series was obtained. Data type: String
values	The transformed series values. Data type: Array `"values": [ { "timestamp": "String", "value": Number } ]`
values.timestamp	The ISO 8601 timestamp of the value. Data type: String
values.value	The metric values. Data type: Number

Example: cURL request

```
curl "https://instance.servicenow.com/api/now/v1/clotho/
  transform/mb_demo_drone/mb_demo_mt_speed?
  sysparm_query=model%3DKingfisher%20Phantom&
  sysparm_start=2019-03-25T17%3A04%3A55&
  sysparm_end=2019-03-25T17%3A05%3A10" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Output:

```
[
  {
    "seriesRef": {
      "subject": "2a6b051787333200a328c5b836cb0b92",
      "table": "mb_demo_drone",
      "metric": "mb_demo_mt_speed"
    },

```

MetricBase Time Series - POST /now/clotho/accumulate

Accumulates metric values at specified timestamp and saves the result to the database rather than overwriting the value.

Use this API to handle metrics that can be summed for an accumulation, such as kilowatt-hours (kWhs) of electricity. Accumulate makes a call for each metric at the provided timestamp. For example, collected kilowatts for a heater, electric kettle, and washing machine would result in three calls to accumulate.

URL format

Versioned URL: `/api/now/{api_version}/clotho/accumulate`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
default_value	Default value for accumulation at a given timestamp. Used only during the first call to accumulate if a value is unavailable for a given timestamp. A use case could be accumulating a watts metric for a total_power. You want to accumulate watts for a router connected to an outlet without a power meter to measure it. If you know the consumption value and it is constant), you can use the constant value as a default value to accumulate total_power. For example, you would use 20 if the router is constantly plugged in and consumes 20 Watts. Data type: String Default: 0
sysparm_ignore_unknown_series	Flag that indicates whether to ignore an unknown series and continue the transaction without returning an error. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• true: Ignore unknown series. • false: Do not ignore unknown series. Default: true

Request body parameters (XML or JSON)

Name	Description
seriesRef	List of strings representing data series information to update. Data type: Array `"seriesRef": [ { "metric": "String", "subject": "String", "table": "String" } ]`
seriesRef.metric	Required. The name of the accumulating metric to update. Data type: String
seriesRef.subject	Required. The sys_id of the record in which to update the data. Located in the table specified in *`seriesRef.table`*. Data type: String
seriesRef.table	Required. The name of the table in which to save the data. Data type: String
values	Required. The series values to accumulate and store. Values with the same timestamp are summed up with the *`default_value`* query parameter. Data type: Array `"values": [ { "timestamp": "String", "value": Number } ]`
values.timestamp	Required. The ISO 8601 timestamp of the value. Data type: String Format: YYYY-MM-ddTHH:mm:ddZ

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	The character represented by 'Z' denotes the UTC time zone in an ISO-formatted timestamp. This portion of the timestamp format is optional. Example: `2019-03-21T17:05:00Z`
values.value	Required. The metric value. Data type: Number

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
message	Message indicating success (OK) or error.

Example: cURL request

This example shows how to accumulate metric values at a given timestamp.

```
curl
 "https://instance.servicenow.com/api/now/v1/clotho/accumulate"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"seriesRef\": {
    \"subject\": \"3D666b051787333200a328c5b836cb0b92\",
    \"table\": \"power_monitoring\",
    \"metric\": \"total_power\"
  },
  \"values\": [
    {
      \"timestamp\": \"2019-03-21T17:05:00Z\",
      \"value\": 0.150185
    },
    {
      \"timestamp\": \"2019-03-21T17:05:00Z \",
      \"value\": 0.46074
    },
    {

MetricBase Time Series - POST /now/clotho/transform

Retrieves and optionally groups time series data for one or more metrics after applying a specified list of transforms that form a linear pipeline.

URL format

Versioned URL: `/api/now/{api_version}/clotho/transform`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_display_value	Flag that indicates whether to label the result data with the subject record display value if no other label is specified. Valid values: • true: Result data is labeled with the subject record display value. • false: Result data is not labeled with the subject record display value. Data type: Boolean Default: false

Request body parameters (XML or JSON)

Name	Description
end	Required. End time of the evaluation period. An empty or missing value is treated as the current time. Time values are inclusive of this end time. Data type: String Format: ISO 8601 (UTC), either: • Absolute date format [YYYY-MM-DDThh:mm:ss], such as `2019-03-20T17:04:55`. • Relative to current time duration format `[P(n)Y(n)M(n)DT(n)H(n)M(n)S]`, such as `P1M`.
limit	Maximum number of records to return. Unusually large values can impact system performance. Data type: Number Default: 10,000
metrics	List of metrics objects to use in the transform. For more information on metrics, see Metrics. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	<pre>"metrics": [
	  {
	  "groupBy": "String"
	  "label": "String",
	  "metric": "String",
	  "transforms": [Array]
	  }
	]</pre>

metrics.groupBy	Comma-separated list of fields, contained in the table specified in the *table* parameter, to group the series by before collecting or applying aggregated transformations. The order of the items in the list is the order in which the data is grouped by. For example, if there are two items in the list, "state, zip code", then the series is first grouped by state and then by zip code within the state. Data type: String Default: Data is not grouped.
metrics.label	Label to use for this metric's result set. It replaces any labels generated by the transform chain. Data type: String Default: Generated default label.
metrics.metric	Required if *metrics* object is passed. Metric field to use in the transform. This field must be in the table specified in the *table* parameter. Data type: String

metrics.transforms	List of transforms (transform chain) to apply to the retrieved time series data. Each transform builds on the results of the previous transform. For a list of available transforms, see Supported Transforms below.
	
	Data type: Array
	<pre>"transforms": [
	  {
	  "arg": {Object},
	  "name": "String"
	  }
	]</pre>

metrics.transforms.arg	Dependent on the transform. Parameter or parameters to pass into the transform. General guidelines:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• Do not use the *arg* parameter when specifying transformations that do not take a parameter. • Use Number, String, or Boolean for transforms that take a single parameter. • Use a JSON object, with the appropriate name-value pairs, for transforms that take more than one parameter. Data type: Number, String, Boolean, or JSON object, depending on transform. (For a list of available transforms, refer to the table Supported transforms below.)
metrics.transforms.name	Required if a *transforms* object is specified. Name of the transform. For a list of available transforms, refer to the table Supported transforms below. Data type: String
query	Encoded query to use to filter the result set. You can compose the query using the specified table's filter editor. Once created, select **Copy URL** from the filter's breadcrumbs context menu. Data type: String Default: None
start	Required. Start time of the evaluation period. The special value `all` can be used to set the start time as the current time minus the maximum retention period for the specified metrics. An empty or missing value is treated as an implicit `all`. Time values are inclusive of this start time. Data type: String Format: ISO 8601 (UTC), either: • Absolute date format [YYYY-MM-DDThh:mm:ss], such as `2019-03-20T17:04:55` • Relative to current time duration format `[P(n)Y(n)M(n)DT(n)H(n)M(n)S]`, such as `P1M`.
table	Required. Name of the table that contains the GlideRecord associated with this series. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
results	Zero or more return result objects that satisfy the query. Contains either a *series* array or a *grouped* array. Data type: Array `"results":[ { "grouped": [Array], "marker": "String", "series": [Array]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre> }]</pre>

results.grouped	List of grouped result objects where each *grouped* result object corresponds to a specific group. This format is returned when the *metrics.groupBy* parameter is passed in the request body.
	
	Data type: Array
	<pre>"grouped": [
	  {
	  "groupingBy": "String",
	  "groups": [Array]
	  }
	]</pre>

results.grouped.groupingBy	Value passed in the *metrics.groupBy* parameter in the request. Data type: String

results.grouped.groups	List of generated groups based on the content of the *metrics.groupBy* parameter in the request.
	
	Data type: Array
	<pre>"groups": [
	  {
	  "group": "String",
	  "label": "String",
	  "series": {Object}
	  }
	]</pre>

results.grouped.groups.group	Name of the group. Data type: String
results.grouped.groups.label	Label of the group. Data type: String

results.grouped.groups.series	Transformed values for the group's result.
	
	Data type: Array
	<pre>"series": [
	  {
	  "label": "String",
	  "seriesRef": {Object},
	  "values": [Array]
	  }
	]</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
results.grouped.groups.series.label	Label of the series. Data type: String

results.grouped.groups.series.seriesRef	Results of a single data series. Does not appear if there are multiple data series in the response.
	
	Data type: Object
	
	`"seriesRef": {`
	`  "metric": "String",`
	`  "subject": "String",`
	`  "table": "String"`
	`}`

results.grouped.groups.series.seriesRef.metric	Name of the metric from which the data series was obtained. Only appears if the *`metrics`* object is passed in the request. Data type: String
results.grouped.groups.series.seriesRef.subject	Sys_id of the data series record. Located in the table specified in *`results.series.seriesRef.table`*. Data type: String
results.grouped.groups.series.seriesRef.table	Name of the table from where the data series was obtained. Data type: String

results.grouped.groups.series.values	List of result values for the group.
	
	Data type: Array
	
	`"values": [`
	`  {`
	`  "timestamp": "String",`
	`  "value": Number`
	`  }`
	`]`

results.grouped.groups.series.values.timestamp	ISO 8601 timestamp of the value. Data type: String
results.grouped.groups.series.values.value	Transformed value. Data type: Number
results.marker	Unique identifier for the corresponding results. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
results.series	List of ungrouped series of result objects. Data type: Array `"series": [ { "label": "String", "seriesRef": {Object}, "values": [Array] } ]`
results.series.label	Data series label. This value is either generated by the endpoint or is the value passed in the *`metrics.label`* parameter. Data type: String
results.series.seriesRef	Results of a single data series. Does not appear if there are multiple data series in the response. Data type: Object `"seriesRef": { "metric": "String", "subject": "String", "table": "String" }`
results.series.seriesRef.metric	Name of the metric from which the data series was obtained. Only appears if the *`metrics`* object is passed in the request. Data type: String
results.series.seriesRef.subject	Sys_id of the data series record. Located in the table specified in *`results.series.seriesRef.table`*. Data type: String
results.series.seriesRef.table	Name of the table from where the data series was obtained. Data type: String
results.series.values	Transformed series values. Data type: Array `"values": [ { "timestamp": "String", "value": Number } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
results.series.values.timestamp	ISO 8601 timestamp of the value. Data type: String
results.series.values.value	Transformed value. Data type: Number

Supported transforms

Transform data types

Transform	Description
add	Adds the specified number to each timestamp value. Argument: arg (Decimal data type) – Number to add. For example: `"transforms": [ { "name": "add", "arg": 8 } ]`
autocorrelate	Calculates the correlation between timestamp values separated by an increasing number of periods starting at 1.
avg	Aggregates the time series into one series containing the average value for each corresponding timestamp across the input.
bottom	Returns the specified number of series that have the lowest values. Argument: `arg` (Integer) – The number of series to return. For example, the following returns the two time series that contain the lowest sets of values. `"transforms": [ { "name": "bottom", "arg": 2 } ]`
ceil	Rounds the value in each timestamp up to the specified precision: `ceil(value / <arg>) * <arg>)` Argument: arg (Decimal data type) – Decimal precision to round up to.
collect	Displays the transform results of the transform chain up to the point of the collect transform call. Collect transform results contain a unique marker, but you may want to also define a label. For example:

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description

	<pre>{
	  "start": "PT1H",
	  "end": "",
	  "table": "mb_demo_drone",
	  "limit": 5000,
	  "metrics": [
	  {
	  "metric": "mb_demo_mt_altitude",
	  "transforms": [
	  {
	  "name": "label",
	  "arg": "Series Timestamp Values"
	  },
	  {
	  "name": "collect"
	  },
	  {
	  "name": "avg"
	  },
	  {
	  "name": "label",
	  "arg": "Average Timestamp Values"
	  }
	  ]
	  }
	  ]
	}</pre>

constrainValues	Replaces any value outside the specified range with the corresponding maximum or minimum value.
	
	For example, if you specified the following, the transform replaces any value that is less than 0 with 0, and any value that is more than 100 with 100.
	
	<pre>"transforms": [
	  {
	  "name": "constrainValues",
	  "val1": 0,
	  "val2": 100
	  }
	]</pre>
	Arguments:
	
	• val1 (Decimal data type): Minimum or maximum value.
	• val2 (Decimal data type): Minimum or maximum value.

count	Aggregates the time series into one series. The new series contains the number of values that are not NaN (Not a Number) for each corresponding timestamp across the series.
derivative	Determines the rate of change between timestamps. Divides the difference between the value in each timestamp and the value in the next timestamp by the timestamp's period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
	Note: This transform returns one less value than the number of values in the series.
div	Divides the value in each timestamp by the specified number (arg). Argument: arg (Decimal – The number by which to divide the value of each timestamp.
envelope	Returns two time series, where, at any point in time, one contains the largest value and the other contains the smallest value. **Note:** NaNs are ignored, but are returned if there are no other return values.
exp	Raises the value of the specified base to the power of the value in each timestamp. Argument: arg (Decimal data type) – The base value.
filter	Applies an aggregator to the contents of a sliding window, such as producing a moving average. Arguments: • aggregator (Aggregator data type): Type of aggregation to perform. • window (Duration data type): The duration of the sliding window.
floor	Rounds the value in each timestamp down to the specified precision: `floor(value / <arg>) * <arg>` Argument: arg (Decimal data type) – The decimal precision to round down to.
fractiles	Returns a time series for each fraction in the specified array. Each timestamp value is the value at which the specified fraction of values, for the corresponding timestamp across the input series, is below the specified percentage. For example, if the fraction is 0.5, then the value in the timestamp is the value where half the values in the input series are below 0.5. Argument: arg (Array of Decimal) – The fractions to use on the input series. For example: `"transforms": [ { "name": "fractiles", "arg": [0.25, 0.5, 0.75, 1] } ]`
groupBy	Groups data by the specified fields before collecting or applying aggregated transformations. Argument: arg (String) - A comma separated list of fields in the table to use to group the transform results.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
	For example: `"transforms": [ { "name": "groupBy", "arg": "model" }, { "name": "avg" }, { "name": "label", "arg": "Model: %g" } ]`
integrate	Multiplies the value in each timestamp by its period.
interpolate	Creates a data value for a NaN data item by interpolating from adjacent data values. Argument: arg (Integer) – Number of data samples in each direction to check for a non-NaN value. If a non-NaN value is not found, then NaN is used.
inverse	Computes the inverse of each timestamp value.
iqr	Performs an interquartile range transform and creates a result set that contains four series: **1.** -IQR: The median of all entries below `Q1 - (1.5 * IQR)`. **2.** Q1: The median of the smallest half of entries. **3.** Q3: The median of the largest half of entries. **4.** +IQR: The median of all entries above `Q3 + (1.5 * IQR)`. **Note:** `IQR = Q3 - Q1`
label	Labels a transformation chain. **Note:** Subsequent transformations may modify or replace the label. Argument: arg (String) – Text of the label. Can contain the following formatting expressions: • %%: Escape a "%" literal. • %l: Current label that is being replaced. • %s: Series subject. • %g: Value of the group by field. If this is a referenced record, then the value of the record's name field. If multiple groups are specified in the *groupBy* transform, labels are comma separated. • %G: Value of the group by field. If this is a referenced record, then the record's sys_id. If multiple groups are selected, values are comma separated.

Transform data types (continued)

Transform	Description

	For example:
	`"transforms": [ { "name": "label", "arg": "Series Timestamp Values" }, ]`
	`"transforms": [ { "name": "groupBy", "arg": "model" }, { "name": "avg" }, { "name": "label", "arg": "Model: %g" } ]`

limit	Returns, at most, the specified duration or number of values, starting with the most recently saved value. Arguments: • arg (Integer): Number of timestamp values to return for each time series. OR • arg (Duration data type): Duration to limit each time series to.
log	Runs a logarithm on the value in each timestamp where the result is the log of the specified base for the timestamp value. Argument: arg (Decimal data type) – Base for the logarithm calculation.
mapValues	Replaces any values within the specified range (inclusive) with the specified value. If both *lowerBound* and *upperBound* are specified as NaN, then it replaces any NaN value with the *targetValue*. Arguments: • lowerBound (Decimal data type): The lowest value in the range. • upperBound (Decimal data type): The highest value in the range. • targetValue (Decimal data type): Replacement value. For example, the following changes all values in the time series that are between .1 and .9 to 1: `"transforms": [ { "name": "mapValues", "lowerBound": .1,`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description

	<pre>"upperBound": .9,
	"targetValue": 1
	}
	]</pre>

max	Returns a series that contains the maximum value for each corresponding timestamp across the input.
median	Creates a series that contains the median of values for each timestamp across a set of series. If there are `n` series: • If `n` is odd, the median is the `(n / 2 + 1)` value for a timestamp. • If `n` is even, the median is the average of the `(n / 2)` and `(n / 2 + 1)` values for a timestamp.
min	Returns a series that contains the minimum value for each corresponding timestamp across the input.
mul	Multiplies the value in each timestamp by the specified number. Argument: arg (Decimal data type) – Number by which to multiply the value of each timestamp.
partition	Produces a new series with values filtered by applying a specified aggregator to a non-overlapping window. Arguments: • aggregator (Aggregator data type): Type of aggregation to perform. • window (Duration data type): The duration of the non-overlapping window to apply the aggregator. • base (DateTime data type): The zero offset to use for partitioning. For example, to partition by day (24h), set this value to Monday at midnight in your time zone. To partition by a 30-day period, set this value to the first day of the most recent month. Default: Beginning of the EPOCH.
pow	Raises each timestamp value to the specified power. Argument: arg (Decimal data type) – Power to which to raise each value.
product	Aggregates the selected metric series into a single series that contains the product of all values for each timestamp. NaNs are excluded. If all numbers in the series are NaN, the output is also NaN.
resample	Resamples a time series to either a fixed number of points or from one frequency to another. Use the resample transformation to reduce the number of samples in the result set to more closely match the number of samples that you want to display.

© 2026 ServiceNow, Inc. All rights reserved.

Transform data types (continued)

Transform	Description
	Arguments: You can pass various arguments for this transform. Below is a list of each of the possible argument groups. Only one of these argument groups can be passed within a single transform. The following argument groups are delineated by AND/OR. AND meaning the argument is part of the current group; OR meaning it is the start of a new argument group. • arg (Integer): Number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by averaging them. OR • arg (Duration data type): The frequency at which to resample. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by averaging them. OR • minValues (Integer): The minimum number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. AND • maxValues (Integer): The maximum number of samples to include in the result set. If there are more samples than this number, they are reduced by averaging them. OR • aggregator (Aggregator data type): The aggregator to use when resampling. AND • values (Integer): The number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by applying the specified *`aggregator`* to them. OR • aggregator (Aggregator data type): The aggregator to use when resampling. AND • period (Duration data type): The frequency at which to resample. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by applying the specified *`aggregator`* to them. OR

© 2026 ServiceNow, Inc. All rights reserved.

Transform data types (continued)

Transform	Description
	• aggregator (Aggregator data type): The aggregator to use when resampling. AND • minValues (Integer): The minimum number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. AND • maxValues (Integer): The maximum number of samples to include in the result set. If there are more samples than this number, they are reduced by averaging them.
round	Rounds the value in each timestamp up to the specified precision: `(value / <arg>) * <arg>` Argument: arg (Decimal data type) – The decimal precision to round up to.
root	Calculates the root of each timestamp value using the specified index. Argument: arg (Decimal data type) – The index of the root. For example, the following returns the square root of each timestamp: `"transforms": [ { "name": "root", "arg": "2" }, ]`
stddev	Creates a series that contains the standard deviation of values for each timestamp across a set of series.
sub	Subtracts the specified number from the value in each timestamp. Argument: arg (Number) – The number to subtract from the value in each timestamp.
sum	Aggregates the selected metric series into one series that contains the sum of all values for each timestamp, excluding any NaNs. If all numbers in the series are NaN, the output is NaN.
timeshift	Shifts the time range by adding the specified offset to a value's timestamp without modifying the value. Use this transform to shift timestamps to another timezone. Argument: arg (Duration data type) – The amount of time to shift by.
top	Returns the specified number of series that have the highest values. Argument: arg (Integer) – The number of series to return. For example, the following returns the two time series that contain the highest sets of values.

Transform data types (continued)

Transform	Description

	<pre>"transforms": [
	  {
	  "name": "top",
	  "arg": 2
	  }
	]</pre>

Data type	Description
Aggregator	Available aggregators to use within the transform. • AVG: Calculates the arithmetic mean of all currently selected series. • CHISQUARE: Shows how well a statistical model fits the metric dataset. • LAST: Returns the last defined value in the period window. • MAX: Shows the largest value for the metric dataset, at each point in time. • MEDIAN: Shows the median of the metric dataset. The median separates the higher values of the metric dataset from the lower values. • MIN: Shows the smallest value for the metric dataset, at each point in time. • STDDEV: Calculates the standard deviation across the underlying data. Used to quantify the variation or dispersion of a set of data values in the metric dataset. • SUM: Calculates the sum across all currently selected series.
DateTime	Absolute date/time values are specified by the ISO 8601 date and time format: `YYYY-MM-DDThh:mm:ss`. For example: 2020-02-28T13:10:42. Where: • [YYYY]: Four-digit year. • [MM]: Zero-padded month between 01 and 12. • [DD]: Zero-padded day between 01 and 31. • T: Represents time and is mandatory before any of the time components are specified. • [hh]: Zero-padded hour between 00 and 23. • [mm]: Zero-padded minutes between 00 and 59. • [ss]: Zero-padded seconds between 00 and 59. Note that leap seconds are spread out evenly across the previous 1,000 seconds. Relative date/time values are specified using a duration (Duration data type), which is subtracted from the current time. For example: P7D = seven days ago.
Decimal	Decimal value that can either be:

Data type	Description
	• A signed decimal number of arbitrary precision that can use exponential notation. Such as: ○ 2 ○ 1.7 ○ -3.47 ○ 1.0E+2 • A string representation of: ○ A signed decimal number that may use exponential notation and is guaranteed to be a double-precision 64-bit IEEE 754 floating-point number. ○ "NaN" ○ "-Infinity" ○ "+Infinity"
Duration	Amount of time in a time interval. Duration values are specified by the ISO 8601 duration format: `P[n]Y[n]M[n]DT[n]H[n]M[n]S` Where: • P: Duration designator, referred to as "period", and is always placed at the beginning of the duration. • [n]Y: Number of years. • [n]M: Number of months. • [n]D: Number of days. • T: Time designator and is mandatory before any of the time components are specified. • [n]H: Number of hours. • [n]M: Number of minutes. • [n]S: Number of seconds. For example: • P7D: Period of seven days. • P1M: Period of one month. • PT15M: Period of 15 minutes. • P1DT12H: Period of one day and twelve hours.

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/now/v1/clotho/transform \
--request POST \
--header "Accept:application/json",
 "Content-Type:application/json" \
--user "username":"password"
```

```

MetricBase Time Series - POST /now/clotho/transform/stream

Returns a stream of transformed time series data for one or more metrics after applying the specified list of transforms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Streaming data in this manner allows you to process the data as individual transforms are completed and returned, rather than waiting for all transform results to be completed and downloaded. If large amounts of data need to be processed by the client, this type of processing reduces the end-to-end processing time and potentially reduces the memory usage on the client.

By setting the corresponding Accept header value in your request, you can:

- Specify the streamed data to be encoded in a binary format,
- Serialize streamed data into a JSON array, or
- Stream data back to the client in a wide or narrow CSV format.

The endpoint streams the data as transforms are completed on the MetricBase server, without groupings or a predetermined ordering. Data streamed in binary format is smaller in size than the JSON representation returned by the MetricBase Time Series - POST /now/clotho/transform endpoint.

URL format

Versioned URL: `/api/now/{api_version}/clotho/transform/stream`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_display_value	Flag that indicates whether to label the result data with the subject record display value if no other label is specified. Valid values: • true: Result data is labeled with the subject record display value. • false: Result data is not labeled with the subject record display value. Data type: Boolean Default: false

Request body parameters (XML or JSON)

Name	Description
end	Required. End time of the evaluation period. An empty or missing value is treated as the current time. Time values are inclusive of this end time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String Format: ISO 8601 (UTC), either: • Absolute date format [YYYY-MM-DDThh:mm:ss], such as `2019-03-20T17:04:55`. • Relative to current time duration format `[P(n)Y(n)M(n)DT(n)H(n)M(n)S]`, such as `P1M`.
limit	Maximum number of records to return. Unusually large values can impact system performance. Data type: Number Default: 10,000
metrics	List of metrics objects to use in the transform. For more information on metrics, see Metrics. Data type: Array `"metrics": [ { "label": "String", "metric": "String", "transforms": [Array] } ]`
metrics.label	Label to use for this metric's result set. It replaces any labels generated by the transform chain. Data type: String Default: Generated default label.
metrics.metric	Required if *`metrics`* object is passed. Metric field to use in the transform. This field must be in the table specified in the *`table`* parameter. Data type: String
metrics.transforms	List of transforms (transform chain) to apply to the retrieved time series data. Each transform builds on the results of the previous transform. For a list of available transforms, see Supported Transforms below. Data type: Array `"transforms": [ { "arg": {Object}, "name": "String"`

Request body parameters (XML or JSON) (continued)

Name	Description
	}]
metrics.transforms.arg	Dependent on the transform. Parameter or parameters to pass into the transform. General guidelines: • Do not use the *arg* parameter when specifying transformations that do not take a parameter. • Use Number, String, or Boolean for transforms that take a single parameter. • Use a JSON object, with the appropriate name-value pairs, for transforms that take more than one parameter. Data type: Number, String, Boolean, or JSON object, depending on transform. (For a list of available transforms, refer to the table Supported transforms below.)
metrics.transforms.name	Required if a *transforms* object is specified. Name of the transform. For a list of available transforms, refer to the table Supported transforms below. Data type: String
query	Encoded query to use to filter the result set. You can compose the query using the specified table's filter editor. Once created, select **Copy URL** from the filter's breadcrumbs context menu. Data type: String Default: None
start	Required. Start time of the evaluation period. The special value `all` can be used to set the start time as the current time minus the maximum retention period for the specified metrics. An empty or missing value is treated as an implicit `all`. Time values are inclusive of this start time. Data type: String Format: ISO 8601 (UTC), either: • Absolute date format [YYYY-MM-DDThh:mm:ss], such as `2019-03-20T17:04:55` • Relative to current time duration format `[P(n)Y(n)M(n)DT(n)H(n)M(n)S]`, such as `P1M`.
table	Required. Name of the table that contains the GlideRecord associated with this series.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supports the following: • *application/json* • *application/octet-stream* or • *text/csv* To specify the CSV format, use `text/csv;format=narrow` or `text/csv;format=wide`.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	Data format of the response body. Based on the specified Accept values of the request, use: • *application/json* • *application/octet-stream* or • *text/csv* If multiple Accept types are specified, the first supported type is returned.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed and data will begin streaming. **Note:** A 200 response can still incur a processing error midstream as the transforms are computed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (Octet-stream or JSON)

Name	Description
Output Stream (Octet-Stream)	If the Accept request header is set to *application/octet-stream*, the matching MetricBase data is returned as a binary serialized stream. The Clotho-Util for Java applications provide a deserializer that enables you to parse this data. The stream consists of a binary serialization of each datum, preceded by an integer representing its length. The following entries describe the data within the binary representation and the order of that data.
CSV Stream (UTF-8 Stream)	If the Accept request header is set to *text/csv*, the matching MetricBase data is returned as UTF-8 encoded CSV data in wide or narrow formats. A narrow format returns subject and time stamp columns and a column for each returned metric. A wide format returns a time stamp column with a separate column for each metric-subject pair.
Subject	Source of the data. For example, if the metric for the data is drone altitudes, this value may be the ID of a specific drone. If a colon is included in the value, the parts after the subject represent the metric that the data is a part of. Null values are represented by an encoded empty string. Size: 2+ bytes Data type: Java Modified UTF String
Dimension	Metric that the data is from. Null values are represented by an encoded empty string. Size: 2+ bytes Data type: Java Modified UTF String
Label	Label of the data. Null values are represented by an encoded empty string. Size: 2+ bytes Data type: Java Modified UTF String
Type	Type of data encoded into a byte.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Possible values: • Float Signal • Double Signal • Float Mode • Double Model Size: 1 byte Data type: Byte
Flags	Encoded *serializeFlags* variable. If *serializeTags* is true and the data contains tags, the value is 2, otherwise it is 0. Size: 1 byte Data type: Byte
Period	Period associated with the data. Size: 4 bytes Data type: Integer
Number of Tags	If *serializeTags* is true, then this is the number of tags stored in the data. Size: 4 bytes Data type: Integer
Tags	If *serializeTags* is true, each tag is stored in the data. Size: Depends on number of tags (2+ bytes). Data type: Java modified UTF Strings
Start Epoch Second	Epoch UTC time representing the start time of this data series. Size: 8 bytes Data type: Long
Number of Values	Number of values stored in this data. Size: 4 bytes Data type: Integer
Values	If *Type* is `Float Signal`, then the remainder consists of float values. Size: *Number of Values* * 4 Data type: Floats
Values	If *Type* is `Double Signal`, then the remainder consists of double values. Size: *Number of Values* * 4 bytes

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Doubles
Model Json (Model)	If *Type* is `Float Model` or `Double Model`, the remainder is a Java Modified UTF String representing the model as JSON. Size: 2+ bytes Data type: JSON (Java Modified UTF String)
Big Model Marker (Big Model)	If the length of the model's JSON is greater than 65,535 bytes, then this field is written instead of the *Model Json*. Size: 5 Data type: Java Modified UTF String
Big Model Size (Big Model)	Length of the JSON representation of the big model. Size: 4 bytes Data type: Integer
Big Model Json (Big Model)	JSON representation of the model as a series of UTF characters, The size is dictated by the *Big Model Size* field. Size: 65535-256000 bytes Data type: UTF chars
JSON Stream (JSON)	If the Accept request header is set to *application/json*, the matching MetricBase data is returned as a stream of new line separated JSON objects. The following entries describe the possible elements in each returned object.
label	Data's label. This value is either generated by the endpoint or is the value passed in the *metrics.label* parameter. Data type: String
period	Amount of time between each value. For example, a period of 60 would mean that each value is a minute apart. Unit: Seconds Data type: Number
range	Start and end times of the data in ISO 8601 (UTC) format. Data type: Array
series	Identifies the individual data. If present, is typically in the form of `[glide record id]:[metric]`. This may not be present when using transforms. Data type: String
species	Type of return data. For a series of either float or double values, this is either FLOAT_SIGNAL or DOUBLE_SIGNAL. For a model meant to analyze float or double data, this is either FLOAT_MODEL or DOUBLE_MODEL.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
tags	Tags associated with the data. Data type: Array of String
value	Float or Double values for the data. Data type: Array of Numbers
error	Error message if the transformation of the specified data series fails. Data type: String

Supported transforms

Transform data types

Transform	Description
add	Adds the specified number to each timestamp value. Argument: arg (Decimal data type) – Number to add. For example: `"transforms": [ { "name": "add", "arg": 8 } ]`
autocorrelate	Calculates the correlation between timestamp values separated by an increasing number of periods starting at 1.
avg	Aggregates the time series into one series containing the average value for each corresponding timestamp across the input.
bottom	Returns the specified number of series that have the lowest values. Argument: `arg` (Integer) – The number of series to return. For example, the following returns the two time series that contain the lowest sets of values. `"transforms": [ { "name": "bottom", "arg": 2 } ]`
ceil	Rounds the value in each timestamp up to the specified precision: `ceil(value / <arg>) * <arg>)` Argument: arg (Decimal data type) – Decimal precision to round up to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
collect	Displays the transform results of the transform chain up to the point of the collect transform call. Collect transform results contain a unique marker, but you may want to also define a label. For example: `{ "start": "PT1H", "end": "", "table": "mb_demo_drone", "limit": 5000, "metrics": [ { "metric": "mb_demo_mt_altitude", "transforms": [ { "name": "label", "arg": "Series Timestamp Values" }, { "name": "collect" }, { "name": "avg" }, { "name": "label", "arg": "Average Timestamp Values" } ] } ] }`
constrainValues	Replaces any value outside the specified range with the corresponding maximum or minimum value. For example, if you specified the following, the transform replaces any value that is less than 0 with 0, and any value that is more than 100 with 100. `"transforms": [ { "name": "constrainValues", "val1": 0, "val2": 100 } ]` Arguments: • val1 (Decimal data type): Minimum or maximum value. • val2 (Decimal data type): Minimum or maximum value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
count	Aggregates the time series into one series. The new series contains the number of values that are not NaN (Not a Number) for each corresponding timestamp across the series.
derivative	Determines the rate of change between timestamps. Divides the difference between the value in each timestamp and the value in the next timestamp by the timestamp's period. **Note:** This transform returns one less value than the number of values in the series.
div	Divides the value in each timestamp by the specified number (arg). Argument: arg (Decimal – The number by which to divide the value of each timestamp.
envelope	Returns two time series, where, at any point in time, one contains the largest value and the other contains the smallest value. **Note:** NaNs are ignored, but are returned if there are no other return values.
exp	Raises the value of the specified base to the power of the value in each timestamp. Argument: arg (Decimal data type) – The base value.
filter	Applies an aggregator to the contents of a sliding window, such as producing a moving average. Arguments: • aggregator (Aggregator data type): Type of aggregation to perform. • window (Duration data type): The duration of the sliding window.
floor	Rounds the value in each timestamp down to the specified precision: `floor(value / <arg>) * <arg>` Argument: arg (Decimal data type) – The decimal precision to round down to.
fractiles	Returns a time series for each fraction in the specified array. Each timestamp value is the value at which the specified fraction of values, for the corresponding timestamp across the input series, is below the specified percentage. For example, if the fraction is 0.5, then the value in the timestamp is the value where half the values in the input series are below 0.5. Argument: arg (Array of Decimal) – The fractions to use on the input series. For example: `"transforms": [ { "name": "fractiles", "arg": [0.25, 0.5, 0.75, 1]`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
	<pre> }]</pre>

groupBy	Groups data by the specified fields before collecting or applying aggregated transformations.
	
	Argument: arg (String) - A comma separated list of fields in the table to use to group the transform results.
	
	For example:
	<pre>"transforms": [
	  {
	    "name": "groupBy",
	    "arg": "model"
	  },
	  {
	    "name": "avg"
	  },
	  {
	    "name": "label",
	    "arg": "Model: %g"
	  }
	]</pre>

integrate	Multiplies the value in each timestamp by its period.
interpolate	Creates a data value for a NaN data item by interpolating from adjacent data values. Argument: arg (Integer) – Number of data samples in each direction to check for a non-NaN value. If a non-NaN value is not found, then NaN is used.
inverse	Computes the inverse of each timestamp value.
iqr	Performs an interquartile range transform and creates a result set that contains four series: **1.** -IQR: The median of all entries below `Q1 - (1.5 * IQR)`. **2.** Q1: The median of the smallest half of entries. **3.** Q3: The median of the largest half of entries. **4.** +IQR: The median of all entries above `Q3 + (1.5 * IQR)`. **Note:** `IQR = Q3 - Q1`
label	Labels a transformation chain. **Note:** Subsequent transformations may modify or replace the label. Argument: arg (String) – Text of the label. Can contain the following formatting expressions: • %%: Escape a "%" literal. • %l: Current label that is being replaced.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description

	• %s: Series subject.
	• %g: Value of the group by field. If this is a referenced record, then the value of the record's name field. If multiple groups are specified in the *groupBy* transform, labels are comma separated.
	• %G: Value of the group by field. If this is a referenced record, then the record's sys_id. If multiple groups are selected, values are comma separated.
	
	For example:
	`"transforms": [ { "name": "label", "arg": "Series Timestamp Values" }, ]`
	`"transforms": [ { "name": "groupBy", "arg": "model" }, { "name": "avg" }, { "name": "label", "arg": "Model: %g" } ]`

limit	Returns, at most, the specified duration or number of values, starting with the most recently saved value. Arguments: • arg (Integer): Number of timestamp values to return for each time series. OR • arg (Duration data type): Duration to limit each time series to.
log	Runs a logarithm on the value in each timestamp where the result is the log of the specified base for the timestamp value. Argument: arg (Decimal data type) – Base for the logarithm calculation.
mapValues	Replaces any values within the specified range (inclusive) with the specified value. If both *lowerBound* and *upperBound* are specified as NaN, then it replaces any NaN value with the *targetValue*. Arguments:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
	• lowerBound (Decimal data type): The lowest value in the range. • upperBound (Decimal data type): The highest value in the range. • targetValue (Decimal data type): Replacement value. For example, the following changes all values in the time series that are between .1 and .9 to 1: `"transforms": [ { "name": "mapValues", "lowerBound": .1, "upperBound": .9, "targetValue": 1 } ]`
max	Returns a series that contains the maximum value for each corresponding timestamp across the input.
median	Creates a series that contains the median of values for each timestamp across a set of series. If there are `n` series: • If `n` is odd, the median is the `(n / 2 + 1)` value for a timestamp. • If `n` is even, the median is the average of the `(n / 2)` and `(n / 2 + 1)` values for a timestamp.
min	Returns a series that contains the minimum value for each corresponding timestamp across the input.
mul	Multiplies the value in each timestamp by the specified number. Argument: arg (Decimal data type) – Number by which to multiply the value of each timestamp.
partition	Produces a new series with values filtered by applying a specified aggregator to a non-overlapping window. Arguments: • aggregator (Aggregator data type): Type of aggregation to perform. • window (Duration data type): The duration of the non-overlapping window to apply the aggregator. • base (DateTime data type): The zero offset to use for partitioning. For example, to partition by day (24h), set this value to Monday at midnight in your time zone. To partition by a 30-day period, set this value to the first day of the most recent month. Default: Beginning of the EPOCH.
pow	Raises each timestamp value to the specified power.

Transform data types (continued)

Transform	Description
	Argument: arg (Decimal data type) – Power to which to raise each value.
product	Aggregates the selected metric series into a single series that contains the product of all values for each timestamp. NaNs are excluded. If all numbers in the series are NaN, the output is also NaN.
resample	Resamples a time series to either a fixed number of points or from one frequency to another. Use the resample transformation to reduce the number of samples in the result set to more closely match the number of samples that you want to display. Arguments: You can pass various arguments for this transform. Below is a list of each of the possible argument groups. Only one of these argument groups can be passed within a single transform. The following argument groups are delineated by AND/OR. AND meaning the argument is part of the current group; OR meaning it is the start of a new argument group. • arg (Integer): Number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by averaging them. OR • arg (Duration data type): The frequency at which to resample. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by averaging them. OR • minValues (Integer): The minimum number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. AND • maxValues (Integer): The maximum number of samples to include in the result set. If there are more samples than this number, they are reduced by averaging them. OR • aggregator (Aggregator data type): The aggregator to use when resampling. AND • values (Integer): The number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by applying the specified *aggregator* to them.

Transform data types (continued)

Transform	Description
	OR • aggregator (Aggregator data type): The aggregator to use when resampling. AND • period (Duration data type): The frequency at which to resample. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by applying the specified *aggregator* to them. OR • aggregator (Aggregator data type): The aggregator to use when resampling. AND • minValues (Integer): The minimum number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. AND • maxValues (Integer): The maximum number of samples to include in the result set. If there are more samples than this number, they are reduced by averaging them.
round	Rounds the value in each timestamp up to the specified precision: `(value / <arg>) * <arg>` Argument: arg (Decimal data type) – The decimal precision to round up to.
root	Calculates the root of each timestamp value using the specified index. Argument: arg (Decimal data type) – The index of the root. For example, the following returns the square root of each timestamp: `"transforms": [ { "name": "root", "arg": "2" }, ]`
stddev	Creates a series that contains the standard deviation of values for each timestamp across a set of series.
sub	Subtracts the specified number from the value in each timestamp. Argument: arg (Number) – The number to subtract from the value in each timestamp.

Transform data types (continued)

Transform	Description
sum	Aggregates the selected metric series into one series that contains the sum of all values for each timestamp, excluding any NaNs. If all numbers in the series are NaN, the output is NaN.
timeshift	Shifts the time range by adding the specified offset to a value's timestamp without modifying the value. Use this transform to shift timestamps to another timezone. Argument: arg (Duration data type) – The amount of time to shift by.
top	Returns the specified number of series that have the highest values. Argument: arg (Integer) – The number of series to return. For example, the following returns the two time series that contain the highest sets of values. `"transforms": [ { "name": "top", "arg": 2 } ]`

Data type	Description
Aggregator	Available aggregators to use within the transform. • AVG: Calculates the arithmetic mean of all currently selected series. • CHISQUARE: Shows how well a statistical model fits the metric dataset. • LAST: Returns the last defined value in the period window. • MAX: Shows the largest value for the metric dataset, at each point in time. • MEDIAN: Shows the median of the metric dataset. The median separates the higher values of the metric dataset from the lower values. • MIN: Shows the smallest value for the metric dataset, at each point in time. • STDDEV: Calculates the standard deviation across the underlying data. Used to quantify the variation or dispersion of a set of data values in the metric dataset. • SUM: Calculates the sum across all currently selected series.
DateTime	Absolute date/time values are specified by the ISO 8601 date and time format: `YYYY-MM-DDThh:mm:ss`. For example: 2020-02-28T13:10:42. Where: • [YYYY]: Four-digit year. • [MM]: Zero-padded month between 01 and 12. • [DD]: Zero-padded day between 01 and 31. • T: Represents time and is mandatory before any of the time components are specified.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data type	Description
	• [hh]: Zero-padded hour between 00 and 23. • [mm]: Zero-padded minutes between 00 and 59. • [ss]: Zero-padded seconds between 00 and 59. Note that leap seconds are spread out evenly across the previous 1,000 seconds. Relative date/time values are specified using a duration (Duration data type), which is subtracted from the current time. For example: P7D = seven days ago.
Decimal	Decimal value that can either be: • A signed decimal number of arbitrary precision that can use exponential notation. Such as: ○ 2 ○ 1.7 ○ -3.47 ○ 1.0E+2 • A string representation of: ○ A signed decimal number that may use exponential notation and is guaranteed to be a double-precision 64-bit IEEE 754 floating-point number. ○ "NaN" ○ "-Infinity" ○ "+Infinity"
Duration	Amount of time in a time interval. Duration values are specified by the ISO 8601 duration format: `P [ n ] Y [ n ] M [ n ] DT [ n ] H [ n ] M [ n ] S` Where: • P: Duration designator, referred to as "period", and is always placed at the beginning of the duration. • [n]Y: Number of years. • [n]M: Number of months. • [n]D: Number of days. • T: Time designator and is mandatory before any of the time components are specified. • [n]H: Number of hours. • [n]M: Number of minutes. • [n]S: Number of seconds. For example: • P7D: Period of seven days. • P1M: Period of one month.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data type	Description
	• PT15M: Period of 15 minutes. • P1DT12H: Period of one day and twelve hours.

Example: cURL request

The following example shows how to call this endpoint to return a JSON stream for metrics on the mb_demo_drone table. Note: While the objects in this example are expanded to multiple lines for legibility, in an actual result each returned object is on its own line. You can make the same call and return an octet stream by setting `--header "Accept:application/octet-stream" \`.

```
curl "localhost:8080/api/now/v1/clotho/transform/stream" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user "username":"password" \
-d "{\
  \"start\": \"PT5M\",\
  \"end\": \"\",\
  \"table\": \"mb_demo_drone\",\
  \"query\": \"fleet.nameSTARTSWITHB\",\
  \"limit\": 5000,\
  \"metrics\": [\
    {\
      \"metric\": \"mb_demo_mt_altitude\",\
      \"label\": \"Series - Avg\",\
      \"transforms\": [\
        {\
          \"name\": \"partition\",\
          \"arg\": {\
            \"aggregator\": \"AVG\",\
            \"window\": \"PT5M\"\
          }\
        },
        {\
          \"name\": \"avg\"\
        }\
      ]\
    },
    {\
      \"metric\": \"mb_demo_mt_altitude\",\
      \"groupBy\": \"fleet\",\

The following cURL example uses the CSV format option to stream back the altitude values (stored in the database as "mb_demo_mt_altitude") of the last day for each drone stored in the mb_demo_drone [Drones] table of the Metricbase Demo plugin. In the example, the data is returned in a narrow table format with three columns: the Sys_id of the subject identifying the drone, the time stamp of value, and the altitude value.

```
curl
 "https://instance.servicenow.com/api/now/v1/clotho/transform/st
ream" \
--request POST \
--header "Accept:text/csv;format=narrow" \
--header "Content-Type:application/json" \
--user "user name":"password" \
-d "{\
  \"start\": \"P1D\",\
  \"end\": \"\",\
  \"table\": \"mb_demo_drone\",\
  \"metrics\": [\
    {\
      \"metric\": \"mb_demo_mt_altitude\",\
      \"transforms\": []\
    }]\
}"
```

Output:

```
Subject, Timestamp,"mb_demo_drone|mb_demo_mt_altitude"

MetricBase Time Series - POST /now/clotho/put

Adds time series data to the MetricBase database.

URL format

Versioned URL: `/api/now/{api_version}/clotho/put`

Supported request parameters

Path parameters

Name	Description
api_version	Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_ignore_unknown_series	Flag that indicates whether to ignore unknown series and continue the transaction without returning an error. Valid values: • true: Ignore unknown series. • false: Do not ignore unknown series. Default: true

Request body parameters (XML or JSON)

Name	Description
seriesRef	Required. Information to update. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	<pre>"seriesRef": [
	  {
	  "metric": "String",
	  "subject": "String",
	  "table": "String"
	  }
	]</pre>

seriesRef.metric	Required. The name of the metric to update. Data type: String
seriesRef.subject	Required. The sys_id of the record in which to update the data. Located in the table specified in *`seriesRef.table`*. Data type: String
seriesRef.table	Required. The name of the table in which to save the data. Data type: String

values	Required. The series values to store.
	
	Data type: Array
	<pre>"values": [
	  {
	  "timestamp": "String",
	  "value": Number
	  }
	]</pre>

values.timestamp	Required. The ISO 8601 timestamp of the value. Data type: String Format: `YYYY-MM-ddTHH:mm:ddZ` The ending 'Z', which denotes the UTC time zone in an ISO-formatted timestamp, is optional.
values.value	Required. The metric value. Data type: Number

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
message	Message that indicates the status of the request, such as ok if the request processed successfully.

Example: cURL request

```
curl "https://instance.servicenow.com/api/now/v1/clotho/put" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"seriesRef\": {
    \"subject\": \"3D666b051787333200a328c5b836cb0b92\",
    \"table\": \"mb_demo_drone\",
    \"metric\": \"mb_demo_mt_altitude\"
  },
  \"values\": [
    {
      \"timestamp\": \"2019-03-21T17:05:00Z\",
      \"value\": 0.150185
    },
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    {
      \"timestamp\": \"2019-03-21T17:06:00Z\",
      \"value\": 0.46074
    },
    {
      \"timestamp\": \"2019-03-21T17:07:00Z\",
      \"value\": 0.83104
    },
    {
      \"timestamp\": \"2019-03-21T17:08:00Z\",
      \"value\": 1.260635
    },
    {
      \"timestamp\": \"2019-03-21T17:09:00Z\",
      \"value\": 1.749
    }
  ]
}" \
--user "username":"password"
```

```
{
    "result": {
        "message": "ok"
    }
}
```

Order API

The *Order* API provides endpoints for retrieving and creating orders with order line items for the Customer Service Management application.

This API requires the Order Management (app-csm-order-mgmt) store application and is provided within the `sn_ind_tmt_orm` namespace. For information, see Sales Customer Relationship Management.

This API requires sn_csm_om.order_integrator for access, and one of the following:

- sn_csm_om.consumer_agent – API write access restricted to B2C orders.
- sn_csm_om.customer_agent – API write access restricted to B2B orders.
- sn_csm_om.order_admin – API write access for B2B or B2C orders.

For information on B2B and B2C orders, see Customer Data Models for B2B2C.

Order API – GET /sn_ind_tmt_orm/order/{id}

Retrieves complete order details by specifying the sys_id or order number.

URL format

Versioned URL: `/api/sn_ind_tmt_orm/{api_version}/order/{id}`

Default URL: `/api/sn_ind_tmt_orm/order/{id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id or order number (order_id) of the record to retrieve located in the Orders [sn_csm_om_order] table. Data type: String

Query parameters

Name	Description
sysparm_display_value	Flag that indicates whether to show the display value of the reference fields. Valid values: • true: Show the display value of the reference fields, choice fields, and date field in the response. • false: Show the actual value of the reference fields, choice fields, and date field in the response. Default: false

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user is not authenticated.
403	The user is not authorized. • The user does not have required roles to access the API. • The user does not have authorization to read the order. This API requires sn_csm_om.order_integrator for access, and one of the following: • sn_csm_om.consumer_agent – API write access restricted to B2C orders. • sn_csm_om.customer_agent – API write access restricted to B2B orders. • sn_csm_om.order_admin – API write access for B2B or B2C orders.

Response body parameters (JSON or XML)

Name	Description
account	Sys_id of a record located in the Accounts [customer_account] table. Identifies the account for B2B orders. Data type: String
actual_end_date	End date of order. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
actual_start_date	Start date of order. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
billing_city	Name of the billing city. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
billing_country	Abbreviation of the billing country. Data type: String
billing_state	Abbreviation of the billing state or province. Data type: String
billing_street	Billing street address. Data type: String
billing_zip	Billing ZIP or postal code. Data type: String
comments	Additional information for the order. Data type: String
consumer	Sys_id of a record located in the Consumers [csm_consumer] table. Identifies the consumer for B2C orders. Data type: String
contact	Sys_id of the customer contact related to the account. Listed in the Contacts [customer_contact] table. Data type: String
contract	Sys_id of the Customer Service contract listed in the Contracts [ast_contract] table. Data type: String

error	Details describing an error encountered during the request process.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Details of the error encountered during the request process. Data type: String
error.message	Message for the error encountered during the request process. Each error message has a corresponding description in the *`detail`* property.

Name	Description
	Data type: String
expected_end_date	Expected end date of order. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
expected_start_date	Expected start date of order. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
external_id	External ID representing a related record on a third party's system. Data type: String
external_system	Name of the customer's system. Data type: String
order_category	Customer order type. Possible values: • product • service Data type: String
order_currency	Currency code representing the currency in which the order was purchased. For example, USD for United States Dollars. This currency is used for all amount fields in the order and line orders. Currency codes are listed in the Currencies [fx_currency] table. **Note:** This property might not be available in earlier versions of Order Management. Data type: String
order_date	Date and time of order creation. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
order_id	Order number of the order listed in the Orders [sn_csm_om_order] table. Data type: String
order_line_items	Required. List of objects that define each order line item in the order. Located in the Order Line Items [sn_csm_om_order_line_item] table.

Name	Description
	Data type: String
order_line_items.effective_date	Effective date of order line. Format: yyyy-MM-dd HH:mm:ss in UTC time zone Data type: String
order_line_items.expiration_date	Expiration date of order line. Format: yyyy-MM-dd HH:mm:ss in UTC time zone Data type: String
order_line_items.external_id	External ID of the order line item. Data type: String
order_line_items.external_system	External sys_id of the order line item. Data type: String
order_line_items.list_price	List price of the product offering per unit. **Note:** This property might not be available in earlier versions of Order Management. Data type: String
order_line_items.location	Sys_id of a shipping location listed in the Locations [cmn_location] table. Data type: String
order_line_items.order	This line item's order number as listed in the Orders [sn_csm_om_order] table. Data type: String
order_line_items. order_line_characteristics	List of objects defining associated order line characteristics. Order line characteristics are located in the Order Line Characteristics [sn_csm_om_order_characteristic_value] table. `"order_line_characteristics": [ { "characteristic": "String", "characteristic_option": "String" } ]` Data type: Array
order_line_items. order_line_characteristics. characteristic_option	Product characteristic unique option that triggers the exclusion rule. For example, product size or color.

Name	Description
	Data type: String
order_line_items. order_line_characteristics. characteristic_option_value	Value of a characteristic option. Data type: String
order_line_items. order_line_characteristics. external_id	External ID of the order line characteristic. Data type: Object
order_line_items. order_line_characteristics. number	Order line characteristic number listed in the Order Line Characteristics [sn_csm_om_order_characteristic_value] table. Data type: String
order_line_items. order_line_characteristics. order_line_item	Sys_id of this characteristic's order line item in the Order Line Items [sn_csm_om_order_line_item] table. Data type: String
order_line_items. order_line_characteristics. previous_characteristic_option_value	Name of the previous characteristic option associated with product model in the order line. Data type: Object
order_line_items. order_line_characteristics.specification	Service specification that is associated with the service order characteristic. Data type: String
order_line_items. order_line_characteristics. sys_class_name	System name of the table in which this order line characteristic record is located. Data type: String
order_line_characteristics. sys_created_by	System name of the user who created this record. Data type: String
order_line_items. order_line_characteristics. sys_created_on	Date and time at which the record was originally created. Data type: String
order_line_items. order_line_characteristics. sys_domain	Domain scope in which the order record is accessible. For example, global. Data type: String
order_line_items. order_line_characteristics. sys_domain_path	Domain path for the record. Data type: String Default: / (global)

Name	Description
order_line_items. order_line_characteristics. sys_id	Sys_id of the order record located in the Order Line Characteristics [sn_csm_om_order_characteristic_value] table. Data type: String
order_line_items. order_line_characteristics. sys_mod_count	Number of times this record has been modified. Data type: String
order_line_items. order_line_characteristics. sys_tags	System tags for the content. Data type: String
order_line_items. order_line_characteristics. sys_updated_by	System name of the user who most recently updated this record. Data type: String
order_line_items. order_line_characteristics. sys_updated_on	Date and time at which the record was most recently updated. Data type: String
order_line_items. order_line_characteristics.type	Type of order line characteristic. Possible values: • product • service Data type: String
order_line_items.order_line_id	Order number of the order associated with this order line item. Data type: String
order_line_items.parent_line_item	If applicable, identifies a parent line item to this line item. Data type: String
order_line_items.previous_product_model	Identifies the product model for the product listed prior to this item in the order line. Sys_id of the product listed in the Product Models [cmdb_model] table. Data type: String
order_line_items.price_list	Sys_id of a price list record in the Price Lists [sn_csm_pricing_price_list] table. **Note:** This property might not be available in earlier versions of Order Management. Data type: String

Name	Description
order_line_items.product	Sys_id of the product listed in the Product Models [cmdb_model] table. Data type: String
order_line_items.product_offering	Sys_id of the product listed in the Product Offerings [sn_prd_pm_product_offering] table. Data type: String
order_line_items.product	Sys_id of the product model listed in the Product Models [cmdb_model] table. Must be provided with matching order line item Data type: String
order_line_items.product_specification	Sys_id of the product specification associated with the order line item. Listed in the Product Specifications [sn_prd_pm_product_specification] table. Data type: String
order_line_items.quantity	Number of product models ordered. Data type: String
order_line_items.shipping_city	Name of the destination city. Data type: String
order_line_items.shipping_country	Abbreviation of the destination country. Data type: String
order_line_items.shipping_state	Abbreviation of the destination state or province. Data type: String
order_line_items.shipping_street	Destination street address. Data type: String
order_line_items.shipping_zip	Destination ZIP or postal code. Data type: String
order_line_items.short_description	Short description of the order line item. Data type: String
order_line_items.sku	Number that is generated by a supplier that uniquely identifies a product that is sold by that supplier. Data type: String

Name	Description
order_line_items.sold_product	Sys_id of an install base sold product listed in the Sold Products [sn_install_base_sold_product] table. Data type: String
order_line_items.specification	Specification of order line item. Data type: String
order_line_items.state	State of order line. For example, draft, new, in_progress, or completed. Data type: String
order_line_items.status	Status of the order line item. Possible values: • success • failure Data type: String
order_line_items.sys_class_name	System name of the table in which this order line item record is located. Data type: String
order_line_items.sys_created_by	System name of the user who created this record. Data type: String
order_line_items.sys_created_on	Date and time at which the record was originally created. Data type: String
order_line_items.sys_domain	Domain scope in which the order record is accessible. For example, global. Data type: String
order_line_items.sys_domain_path	Domain path for the record. Data type: String Default: / (global)
order_line_items.sys_id	Sys_id of the line item record located in the Order Line Items [sn_csm_om_order_line_item] table. Data type: String
order_line_items.sys_mod_count	Number of times this record has been modified. Data type: String

Name	Description
order_line_items.sys_tags	System tags for the content. Data type: String
order_line_items.sys_updated_by	System name of the user who most recently updated this record. Data type: String
order_line_items.sys_updated_on	Date and time at which the record was most recently updated. Data type: String
order_line_items.top_line_item	Total price of all order line items accumulated in this order. Data type: String
order_line_items.total_price	Total price of order line. The API does not calculate the total based on net price and quantity. Data type: String
order_line_items.unit_of_measurement	Sys_id for the ordered unit of measure listed in the Unit of Measures [sn_prd_pm_uom] table. **Note:** This property might not be available in earlier versions of Order Management. Data type: String
order_line_items.unit_of_measurement	Required. Sys_id for the ordered unit of measure listed in the Unit of Measures [sn_prd_pm_uom] table. **Note:** This property might not be available in earlier versions of Order Management. Data type: String
order_line_items.unit_price	Net price of the product offering per unit listed in the Currency Instances [fx_currency_instance] table. Data type: String
order_line_items.work_notes	Free-form internal work notes for the order line item. Data type: String
order_type	Order action that determines how the order is added. Possible values:

Name	Description
	• add • change Data type: String
partner	For B2B orders, sys_id of the associated partner for an account listed in the Accounts [customer_account] table. Data type: String
partner_contact	For B2B orders, sys_id of the primary contact of the partner for the partner account. Listed in the Contacts [customer_contact] table. Data type: String
payment_ref_id	Unique identifier of the payment. For example, check number. Data type: String
price_list	Sys_id of the associated price list listed in the Price Lists [sn_csm_pricing_price_list] table. The price is not calculated based on net price and quantity by this API. **Note:** This property might not be available in earlier versions of Order Management. Data type: String
quote_id	Unique ID for the order price quote. Data type: String
same_as_shipping_address	Flag that indicates whether the address of the purchaser is the same as the shipping address. Valid values: • true: Address of the purchaser is the same as the shipping address. • false: Address of the purchaser is different from the shipping address. Data type: Boolean
shipping_city	Name of the destination city. Data type: String
shipping_country	Abbreviation of the destination country. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
shipping_location	Sys_id of a shipping location listed in the Locations [cmn_location] table. Data type: String
shipping_state	Abbreviation of the destination state or province. Data type: String
shipping_street	Destination street address. Data type: String
shipping_zip	Destination ZIP or postal code. Data type: String
short_description	Short description of the order. Data type: String
special_instructions	Special instructions for the order. Data type: String
state	State of the order. For example, new, in_progress, or completed. Data type: String
status	Status of the order. Possible values: • success • failure Data type: String
sys_class_name	System name of the table in which this order record is located. Data type: String
sys_created_by	System name of the user who created this record. Data type: String
sys_created_on	Date and time at which the record was originally created. Data type: String
sys_domain	Domain scope in which the order record is accessible. For example, global. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
sys_domain_path	Domain path for the record. Data type: String Default: / (global)
sys_id	Sys_id of the order listed in the Orders [sn_csm_om_order] table. Data type: String
sys_mod_count	Number of times this record has been modified. Data type: String
sys_tags	System tags for the content. Data type: String
sys_updated_by	System name of the user who most recently updated this record. Data type: String
sys_updated_on	Date and time at which the record was most recently updated. Data type: String
total_amount	Total cost for the entire order. Data type: String

Example: cURL request

The following example shows how to get an order by its order number.

```
curl
 "https://instance.service-now.com/api/sn_ind_tmt_orm/order/ORDO
OO1034" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```

Order API – POST /sn_ind_tmt_orm/order

Creates a new order with line items and characteristics.

Orders with line items are defined using request body parameters. The following properties are required in most versions of Order Management:

- *account* for B2B orders or *consumer* for B2C orders.
  - *account* – Sys_id of a record located in the Accounts [customer_account] table.
  - *consumer* – Sys_id of a record located in the Consumers [csm_consumer] table.
- *order_currency* – Currency code representing the currency in which the order was purchased. For example, USD for United States Dollars. This currency is used for all amount fields in the order and line orders. Currency codes are listed in the Currencies [fx_currency] table.
- *order_line_items* – List of objects that define each order line item in the order. Located in the Order Line Items [sn_csm_om_order_line_item] table. Required properties in each order line item object:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *account* for B2B orders or *consumer* for B2C orders.
  - *account* – Sys_id of the business account assigned to this order line item. Located in the Accounts [customer_account] table.
  - *consumer* – Sys_id of the consumer assigned to this order line item. Located in the Consumers [csm_consumer] table.
- *order_line_characteristics* – List of objects defining associated order line characteristics. Order line characteristics are located in the Order Line Characteristics [sn_csm_om_order_characteristic_value] table.
- *product_offering* – Sys_id of the product listed in the Product Offerings [sn_prd_pm_product_offering] table.
- *quantity* – Number of product models ordered.
- *unit_of_measurements* – Sys_id for the ordered unit of measure listed in the Unit of Measures [sn_prd_pm_uom] table.

The Request body parameters table contains more details.

URL format

Versioned URL: `/api/sn_ind_tmt_orm/{api_version}/order`

Default URL: `/api/sn_ind_tmt_orm/order`

Request body parameters (XML or JSON) (continued)

Name	Description
	Note: This property might not be available in earlier versions of Order Management. Data type: String
quote_id	Unique ID for the order price quote. Data type: String
shipping_city	Name of the destination city. Data type: String
shipping_country	Abbreviation of the destination country. Data type: String
shipping_state	Abbreviation of the destination state or province. Data type: String
shipping_street	Destination street address. Data type: String
shipping_zip	Destination ZIP or postal code. Data type: String
short_description	Short description of the order. Data type: String
special_instructions	Special instructions for the order. Data type: String
state	State of the order. For example, new, in_progress, or completed. Data type: String
total_amount	Total cost for the entire order. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Payload is not in the expected format.
401	The user is not authenticated.
403	The user is not authorized. • The user does not have required roles to access the API. • The user does not have authorization to read the order. This API requires sn_csm_om.order_integrator for access, and one of the following: • sn_csm_om.consumer_agent – API write access restricted to B2C orders. • sn_csm_om.customer_agent – API write access restricted to B2B orders. • sn_csm_om.order_admin – API write access for B2B or B2C orders.
500	Internal server error. One or more validations have failed. Possible issues: • *Account* or *consumer* parameter is missing. These fields are mandatory on header and item. • *Account*/*contact* and *consumer* parameters have been passed. These parameters cannot be passed together. • Choice parameters: Invalid choice values passed. • Quantity parameter: Invalid value. • Invalid reference field.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
	• Missing mandatory fields. • Invalid date and time format. • Start date is greater than end date. • Invalid characteristic. • Invalid characteristic option. • More than one product model was found for provided characteristics. • Product model not found for the provided characteristics. • User does not have access to create an order. • B2B order contains consumer order lines. • B2C order contains account, contact, partner, or partner contact parameters. • Amount fields currency does not match the order currency. • *`Order_line_characteristics`* were passed for an order line with *`product_offering`* associated with product model. • The unit of measurement specified for an offer type=configuration does not belong to the allowed units of measure defined on the product offering. • No characteristics were passed for an offer type of configuration when the product offering is expecting configuration. • Unable to create orders that have a bundle item plus simple configurations on the order line. • Passed parameters contain characteristics for a bundle offering. • Unable to create parent order line and/or child order line. Only parent bundle items are valid in bundle offering calls. • The specified unit_of_measurement record for a bundle offering contains a value other than "EACH".

Response body parameters (JSON or XML)

Name	Description

error	Details describing an error encountered during the request process.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Details of the error encountered during the request process. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
error.message	Message for the error encountered during the request process. Each error message has a corresponding description in the *detail* property. Data type: String
order_id	Order number of the order listed in the Orders [sn_csm_om_order] table. Data type: String
status	Failure message included in addition to the error object. Data type: String
sys_id	Sys_id of the order listed in the Orders [sn_csm_om_order] table. Data type: String

Example: cURL request

The following example shows how to create a single-item order for a stainless steel microwave.

```
curl "https://instance.service-now.com/api/sn_ind_tmt_orm/order"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"account\": \"c480021553ab70101aaeddeeff7b120f\",
\"contact\":\"96d0461553ab70101aaeddeeff7b120b\",
\"order_currency\": \"USD\",
\"order_line_items\": [
{
\"account\": \"c480021553ab70101aaeddeeff7b120f\",
\"action\": \"add\",
\"contact\": \"96d0461553ab70101aaeddeeff7b120b\",
\"list_price\": \"2000\",
\"order_line_characteristics\": [
{
\"characteristic\" : \"Solana color\",
\"characteristic_option\" : \"Stainless steel\"
},
{
\"characteristic\" :\"Microvawe Capacity\",
\"characteristic_option\" : \"1.2 cu\"
}
],
\"product_offering\": \"2d4376760f740110603bf634a7767e46\",
\"quantity\": \"1\",
\"shipping_city\": \"Santa Clara\",
\"shipping_country\": \"USA\",
\"shipping_state\": \"CA\",
\"shipping_street\": \"222 Star St\",
\"shipping_zip\": \"94560\",
\"state\": \"draft\",
\"status\": \"new\",
\"total_price\": \"2000\",
```

\"unit_price\": \"2000\"
}
]
}" \
--user 'user':'password'
```

Response:

```
{
  "result": {
    "sys_id": "24fdf5bd75eec510f877f30c01a15aa0",
    "order_id": "ORD0001034"
  }
}
```

Predictive Intelligence API

The *Predictive Intelligence* API provides endpoints that predict a field value based on one or more input fields and a trained solution.

You can only use this API when the Predictive Intelligence (com.glide.platform_ml) plugin is activated.

Predictive Intelligence - GET /agent_intelligence/solution/{solution_name}/prediction

Predicts an output field value using a specific solution.

URL format

Default URL: `/api/now/agent_intelligence/solution/{solution_name}/prediction`

Supported request parameters

Path parameters

Name	Description
solution_name	Name of solution to use for predictions. For example, `ml_incident_categorization`. Data type: String

Query parameters

Name	Description
Solution definition input field key-value pair	Name-value pair of the solution input field. For example, enter the name: `short_description` and the value: `Unable to connect to` VPN. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
input	Name-value pairs that were specified as input to the call. Data type: Object
output	Predicted outcome values based on the specified solution. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description

	<pre>"output": {
	  "confidence": Number",
	  "outcome": "String",
	  "threshold": Number"
	}</pre>

output.confidence	Estimated precision of the prediction as a percentage. For example, **53.84615375762915**. Data type: Number
output.outcome	Prediction output field value. For example, an incident categorization solution would return an incident category such as **inquiry**. Data type: String
output.threshold	Value of the configured threshold associated with the prediction. Data type: Number

Example: Sample cURL request

```
curl
 "https://instance.service-now.com/api/now/predictive_intelligen
ce/solution/ml_incident_categorization/prediction?short_descript
ion=unable%20to%20connect%20to%20VPN" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  "result": {
    "input": {
      "short_description": "unable to connect to VPN",
      "api": "api"
    },
    "output": {
      "outcome": "inquiry",
      "confidence": 53.84615375762915,
      "threshold": 5
    }
  }
}
```

Predictive Intelligence - GET /agent_intelligence/solution/prediction

Returns predictions for multiple solutions.

Note: Outcome result objects are grouped by solution name and sys_id in the format `result.<solutionname>.<sys_id>.[{ <result1> },{ <result2>}]`.

For customization information, see MLSolutionFactory scriptable objects.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/now/{api_version}/agent_intelligence/solution/prediction`

Default URL: `/now/agent_intelligence/solution/prediction`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Parameter	Description
input_filter	Required parameter if *`input_table`* is used, don't use this parameter with *`input_maps`* parameter. Filter to select records on which to run predictions. For example: `sys_id 0ef47232db801300864adfea5e961912` Data type: String

input_maps	Required unless using *`input_table`* parameter. Array of input name-value pairs. For example:
	
	`[{"short_description":"my email is not working"},`
	`{"short_description":"need help with password"}]`
	
	Data type: Array of Objects

input_table	Required unless using *`input_maps`* parameter. Table name on which you want to run predictions. For example: `incident` Data type: String
options	JSON object with optional arguments. For example: `{"top_n" : 5, "apply_threshold":false}` Valid options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
	• top_n: Number. If provided, returns the top results, up to the specified number of predictions. • apply_threshold: Boolean. Checks the threshold value for the solution and applies it to the result set. The threshold value is solution threshold for similarity or class-level threshold for classification. Default value is true. • custom_results_filter: String. Similarity solutions only. Specifies the allowed set from which results are returned using an encoded query. Data type: Object
solution_names	Required. Comma-separated list of solution names for which you want to run predictions. For example: `ml_incident_categorization,ml_incident_assignment` Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
confidence	Value of the confidence associated with the prediction. For example, 53.84. Data type: Number
predictedSysId	The sys_id of the predicted value. Results can be from any table on which information is being predicted. Data type: String
predictedValue	Value representing the prediction result. Data type: String
threshold	Value of the configured threshold associated with the prediction. Data type: Number

Example: Sample cURL request

```
curl
 "http://instance.servicenow.com/api/now/agent_intelligence/solu
tion/prediction?input_table=incident&input_filter=sys_id%3D0ef47
232db801300864adfea5e961912&solution_names=ml_incident_categoriz
ation%2Cml_incident_assignment&options=%7B
%22top_n%22%20%3A%202%2C%20%22apply_threshold%22%3Afalse%7D" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```

  }
}
```

Proactive Engagement API

The *Proactive Engagement* API provides an endpoint for creating digital experience issues.

This API is available as a custom scripted REST API. It requires the Proactive Engagement (proactive-engagement) plugin and sn_pren.experience_issue_create role. This API belongs to the `sn_pren` namespace.

Use the *Proactive Engagement* API to create an experience issue when an issue is detected on a user's instance. The created experience issue drives engagement with the user and helps them self-resolve the issue.

To use this API, ensure the following tables are populated with records:

- Issue Registry Template [sn_pren_issue_registry_template]
- Issue Registry [sn_pren_issue_registry]
- Resolution [sn_pren_resolution]
- Notification Content [sn_pren_notification_content]
- Provider [sn_pren_provider]

For more information, see Proactive Engagement

Proactive Engagement - CREATE /api/sn_pren/self_remediation/experience_issue/create

Creates an experience issue when an issue is detected on the user's endpoint. Updates the Experience Issues [sn_pren_experience_issue] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Default URL: `/api/sn_pren/self_remediation/experience_issue/create`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
endpoint	Required. An object containing configuration item (CI) and user information used to detect issue details. **Note:** All parameters within this object are optional. You must pass at least one parameter within the object to identify the user or device." Data type: Object `"endpoint": { "CI": "String", "email": "String", "user_id": "String", "user_name": "String" }`
endpoint.CI	Sys_id of the CI device on which the issue was detected. Located in the Computer [cmdb_ci_computer] table. Data type: String
endpoint.email	Email address of the user for whom the issue was detected. Data type: String
endpoint.user_id	Sys_id of the user for whom the issue was detected. Located in the User [sys_user] table. Data type: String
endpoint.user_name	User name of the user for whom the issue was detected. Located in the User [sys_user] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
experience_id	Optional. The user-defined ID to assign to the created issue. An ID is automatically generated if this parameter is not specified. Data type: Number
input_parameters	Optional. Parameters to pass to the action that will be executed on the device. The input parameters sent are passed to the configured resolution-remedial action such as a sub flow, flow action, or CI action. Data type: Object `"input_parameters": { "process_id": "String" }`
input_parameters.process_id	Optional. The sys_id of the process to terminate or restart. Data type: String
investigative_details	Optional. Details that could be useful for a manual investigation if the Power Usage Effectiveness (PUE) resolution fails. The investigative details are copied over to the incident which is created as a fallback when the PUE resolution fails. Data type: Object `"investigative_details": { "cpu_usage": "String", "processes_running": "String", "available_memory": "String" }`
investigative_details.cpu_usage	How much CPU usage is used on the device. Data type: Number (parsed as a string)
investigative_details.processes_running	How many processes are running on the device. Data type: Number (parsed as a string)
investigative_details.available_memory	Available memory on the device. Data type: Number (parsed as a string)
issue_code	Required. Issue code to associate with the problem. The issue code must be available and deployed in the instance. Located in the Issue Registry

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (XML or JSON) (continued)

Name	Description
	[sn_pren_issue_registry] table. The API returns an error if an empty or invalid issue is provided. Data type: String
provider	Required. The unique code for the provider. This code has to match *provider_code* field in *sn_pren_provider* table on the instance. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status code	Description
200	An experience issue was created successfully.
400	Invalid request. Provide endpoint details. An empty *endpoint* object was sent in the request.
400	Invalid issue code, please provide a valid issue code.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status code	Description
	An empty *issue_code* was sent in the request.
400	Invalid provider, please provide a valid provider. An empty provider was sent in the request.
400	Invalid issue code or provider, please provide valid details. Issue can't be detected in the instance. Verify *issue_code* and *provider* details.
400	Issue code does not have a proper resolution. A valid resolution is not configured in the PUE framework for the issue identified.
400	Could not resolve user from endpoint details, please provide valid details. This error is returned if the PUE framework ID is unable to identify the user from the given endpoint details.
400	An experience issue is being resolved with given issue code for specified user. The specified experience issue is currently in an in-progress or open state.
400	Existing experience issue with given *experience_id* is still under execution or is closed. This error occurs when an experience issue is in a chaining scenario. For instance, if a new *issue_code* key is sent with an existing *experience_id*, and the earlier experience issue is running or is in closed state. The experience issue with this experience_id must be in action_wait state to send a new issue_code with the previous experience_id.
400	Error occurred while creating experience issue. This indicates a technical error.

Response body parameters (JSON or XML)

Name	Description
experienceId	The experience ID of the created experience issue. Generated from the *experience_id* request parameter. The experience issue is created in the Experience Issues [sn_pren_experience_issue] table. If *experience_id* is not passed, the resultant ID is always the sys_id of the created record.

Example: cURL request

The following example creates an experience issue for user Abel Tuter. The issue code in the body allows Proactive Engagement to identify the resolution from the Issue Registry Template and engage with the end-user via Virtual Agent to help them self-solve the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "http://instance.servicenow.com//
api/sn_srf/self_remediation/experience_issue/create" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
--data “{
  "endpoint": {
    "CI": "d049b28e936aa1106f98f6db5cba10d5",
    "user_id": "62826bf03710200044e0bfc8bcbe5df1",
    "user_name": "abel.tuter",
    "email": ""
  },
  "issue_code": "100",
  "provider": "sn",
  "experience_id": "09ed4830f393739df33",
  "input_parameters": {
    "process_id": "10644"
  },
  "investigative_details": {
    "cpu usage": "78%",
    "processes running": "35",
    "available memory": "23%"
  }
}”\
```

The response body returns the experience ID, indicating that the issue creation was successful.

```
{
  "result": {
    "experience_id": “09ed4830f393739df33”
  }
}
```

Product Catalog Open API

The *`Product Catalog Open`* API provides endpoints to create and retrieve product catalogs, product offerings, and product specifications.

Use this API to manage product catalog information between external systems and the ServiceNow AI Platform. The *`Product Catalog Open`* API is a ServiceNow® implementation of the TM Forum Product Catalog Management API REST specification. This implementation is based on the TMF620 Product Catalog Management API REST Specification Version 4, April 2021.

This API is included in the Product Catalog Advanced application, which is available on the ServiceNow Store.

This API is provided within the `sn_tmf_api` namespace.

The calling user must have the sn_prd_pm_adv.catalog_integrator role.

This API creates and updates data in the following tables.

- Characteristic [sn_prd_pm_characteristic]
- Characteristic Option [sn_prd_pm_characteristic_option]
- Product Offering [sn_prd_pm_product_offering]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Product Offering Catalog [sn_prd_pm_product_offering_catalog]
- Product Offering Characteristic [sn_prd_pm_product_offering_characteristic]
- Product Specification [sn_prd_pm_product_specification]
- Specification Relationship [sn_prd_pm_specification_relationship]

Product Catalog Open API - DELETE /sn_tmf_api/catalogmanagement/productOffering/{id}

Deletes the specified product offering.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOffering/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product offering to delete. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.

Response body parameters (JSON or XML)

Name	Description
message	A failure or success message about the deletion or archival of the product specification.

Example: cURL request

The following example deletes the product offering with an ID of d6f8d9995b020210235d85cced81c7eb.

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/productOffering/d6f8d9995b020210235d85cced81c7eb" \
--request DELETE\
--header "Accept:application/json" \
--user 'username':'password'
```

The response body returns a successful deletion message:

```
"The product offering (d6f8d9995b020210235d85cced81c7eb) is
 successfully deleted"
```

Product Catalog Open API - DELETE /sn_tmf_api/catalogmanagement/productSpecification/{id}

Deletes or archives the specified product specification.

When calling this DELETE method, a product specification may either be deleted or archived depending on the state it is in:

- A product specification in the draft state is successfully deleted. The response returns a success message.
- A product specification in the archived state can't be deleted. The response returns a message that the specification is already archived.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A product specification not in the draft state and associated with other product specifications or offerings is archived but not deleted. The response returns a message that the specification is moved from an active state to an archived state.
- A product specification associated with an active product specification or offering cannot be deleted. The response returns an error message.

URL format

Default URL: `/sn_tmf_api/catalogmanagement/productSpecification/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product specification to delete. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.

Response body parameters (JSON or XML)

Name	Description
message	A failure or success message about the deletion or archival of the product specification.

Example: cURL request

The following example deletes the product specification with an ID of 8ef57fa05b308210235d85cced81c7d8.

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/productSpecification/8ef57fa05b308210235d85cced81c7d8" \
--request DELETE\
--header "Accept:application/json" \
--user 'username':'password'
```

The response body returns a success or failure message:

```
"The product specification (8ef57fa05b308210235d85cced81c7d8) is
 successfully deleted"
```

Product Catalog Open API - GET /sn_tmf_api/catalogmanagement/catalog

Retrieves a list of all product offering catalogs.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/catalog`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. If this parameter is not used, all fields are returned. Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the *`offset`* parameter to paginate record retrieval. Default: 20 Maximum: 100 Data type: Number
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Default: 0 Data type: Number

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Specifies the range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers (continued)

Header	Description
	• first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
description	Description of the product offering catalog. Data type: String
id	Sys_id of the product offering catalog from the Product Offering Catalog [sn_prd_pm_product_offering_catalog] table. Data type: String
name	Name of the product offering catalog. Data type: String

Example: cURL request

This example retrieves all product offering catalogs.

```
curl --location --request GET
 "https://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/catalog" \
--user 'username':'password'
```

Response body.

```
[
    {
        "id": "SD-WAN1344314wrfw14345",
        "name": "New Catalog",
        "description": "New Catalog"
    },
    {
        "id": "9919291ac34c20105252716b7d40dd0f",
        "name": "Enterprise Mobile Plan",
        "description": " Product Catalog for Enterprise Mobile
 Plan"
    }
]
```

Product Catalog Open API - GET /sn_tmf_api/catalogmanagement/catalog/{id}

Retrieves a product offering catalog.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/catalog/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product offering catalog to retrieve. Located in the Product Offering Catalog [sn_prd_pm_product_offering_catalog] table. Data type: String

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. If this parameter is not used, all fields are returned. Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Could be any of the following reasons: • Invalid path parameter • Invalid URI
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
description	Description of the product offering catalog. Data type: String
id	Sys_id of the product offering catalog from the Product Offering Catalog [sn_prd_pm_product_offering_catalog] table. Data type: String
name	Name of the product offering catalog.

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	Data type: String

Example: cURL request

This example retrieves a product offering catalog for an enterprise mobile plan.

```
curl --location --request GET
 "https://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/catalog/9919291ac34c20105252716b7d40dd0f" \
--user 'username':'password'
```

Response body.

```
{
   "id": "9919291ac34c20105252716b7d40dd0f",
   "name": "Enterprise Mobile Plan",
   "description": " Product Catalog for Enterprise Mobile Plan"
}
```

Product Catalog Open API - GET /sn_tmf_api/catalogmanagement/productOffering

Retrieves all product offerings.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOffering`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • category • channel • description • externalId • id • internalId • internalVersion • lastUpdate

© 2026 ServiceNow, Inc. All rights reserved.

Product Catalog Open API - GET /sn_tmf_api/catalogmanagement/productOffering/{id}

Retrieves a product offering.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOffering/{id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
id	Initial_version of the product offering to retrieve. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • category • channel • description • externalId • id • internalId • internalVersion • lastUpdate • name • productCharacteristic • productOfferingPrice • productOfferingTerm • productSpecification • prodSpecCharValueUse • validFor • version Default: All fields are returned. Data type: String
specification	Filter product offerings by product specification sys_id. Only product offerings with the specified product specification sys_id are returned in the response. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
state	Filter product offerings by state. Only product offerings in the specified state are returned in the response. Accepted values:

Query parameters (continued)

Name	Description
	• archived • draft • published • retired Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
category	List of categories that the product belongs to. Data type: Array `"category:" [ { "id": "String", "name": "String" } ]`
category.id	Id of the category. Data type: String
category.name	Name of the category. Data type: String
channel	Channels to use for selling the product offering. Data type: Array `"channel:" [ { "description": "String", "id": "String", "name": "String" } ]`
channel.description	Description of the channel. Data type: String
channel.id	Sys_id of the channel from the Distribution Channel [sn_prd_pm_distribution_channel] table. Data type: String
channel.name	Name of the channel. Data type: String
description	Description of the product offering. Data type: String

Name	Description
externalId	external_id of the product offering from the Product Offering [sn_prd_pm_product_offering] table. Data type: String
href	A relative link to the resource record. Data type: String Default: Blank string
id	Required. initial_version or external_id of the product offering from the Product Offering [sn_prd_pm_product_offering] table. Data type: String
internalId	initial_version of the product offering from the Product Offering [sn_prd_pm_product_offering] table. Data type: String
internalVersion	Version of the product offering from the Product Offering [sn_prd_pm_product_offering] table. Data type: String
lastUpdate	Date the product offering was last updated. Data type: String
lifecycleStatus	Indicates the current lifecycle status of the product offering. Accepted values: • Active • Inactive • Draft Data type: String Default: Blank string
name	Name of the product offering. Data type: String

Name	Description
productCharacteristic	List of product characteristics. Data type: Array `"productCharacteristic": [ { "name": "String", "value": "String" } ]`
productCharacteristic.name	Name of the characteristic. Data type: String
productCharacteristic.value	Value of the characteristic. Data type: String
productOfferingPrice	Price information for the product offering. Data type: Array `"productOfferingPrice": [ { "price": Object, "priceType": "String" } ]`
productOfferingPrice.price	Price information for the product offering. Data type: Object `"price": { "taxIncludedAmount": Object }`
productOfferingPrice.price.taxIncludedAmount	Price information for the product offering. Data type: Object `"taxIncludedAmount": { "unit": "String", "value": "String" }`
productOfferingPrice.price.taxIncludedAmount.unit	Currency code for the product offering price.

Name	Description
	Data type: String
productOfferingPrice.price.taxIncludedAmount.value	Price of the product offering including tax. Data type: String
productOfferingPrice.priceType	Identifies if the product offering price is a one-time or recurring payment. Valid values: • nonRecurring • recurring Data type: String
productOfferingTerm	Valid contract term length for the product offering. Data type: String
productSpecification	Product specification for the product. Data type: Object `"productSpecification": { "id": "String", "internalId": "String", "internalVersion": "String", "version": "String" }`
productSpecification.id	initial_version of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productSpecification.internalId	initial_version of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productSpecification.internalVersion	Version of the product specification. Located in

Name	Description
prodSpecCharValueUse.validFor	Date range the characteristic is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
prodSpecCharValueUse.validFor.endDateTime	End date of the characteristic. Data type: String
prodSpecCharValueUse.validFor.startDateTime	Start date of the characteristic. Data type: String
prodSpecCharValueUse.valueType	The value type of the characteristic, such as choice or email.
validFor	Date range the product offering is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
validFor.endDateTime	End date of the product offering. Data type: String
validFor.startDateTime	Start date of the product offering. Data type: String
version	external_version of the product offering from the Product Offering [sn_prd_pm_product_offering] table. Data type: String

Example: cURL request

This example retrieves a product offering.

Product Catalog Open API - GET /sn_tmf_api/catalogmanagement/productSpecification

Retrieves all product specifications.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productSpecification`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • description • externalId

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• id • internalId • internalVersion • lastUpdate • name • productSpecCharacteristic • productSpecificationRelationship • resourceSpecification • serviceSpecification • validFor • version Default: All fields are returned. Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the *`offset`* parameter to paginate record retrieval. Default: 20 Maximum: 100 Data type: Number
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Default: 0 Data type: Number
state	Filter product specifications by state. Only product specifications in the specified state are returned in the response. Accepted values: • archived • draft • published • retired Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Specifies the range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
description	Description of the specification. Data type: String
externalId	Required. External_id of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String
href	Relative link to the resource record. Data type: String Default: Blank string
id	Initial_version or external_id of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String
internalId	Required. Initial_version of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String
internalVersion	Version of the product specification from the Product Specification [sn_prd_pm_product_specification] table.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
isBundle	Flag that indicates whether *productSpecification* represents a single product or a bundle of products. Valid values: • true: The product specification is a product bundle and contains multiple products. • false: The product specification contains a single product. Data type: Boolean Default: false
lastUpdate	Date the specification was last updated. Data type: String
lifecycleStatus	Current lifecycle status of the product specification. Accepted values: • Active • Inactive • Draft Data type: String Default: Blank string
name	Name of the specification. Data type: String
productSpecCharacteristic	Specification characteristic. Data type: Array of Objects `"productSpecCharacteristic": [ { "description": "String", "name": "String", "productSpecCharacteristicValue": [Array],`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	<pre>"validFor": {Object}, "valueType": "String" }]</pre>
productSpecCharacteristic.description	Description of the characteristic. Data type: String
productSpecCharacteristic.name	Name of the characteristic. Data type: String
productSpecCharacteristic.productSpecCharacteristicValue	List of possible values of the characteristic. Data type: Array of Objects <pre>"productSpecCharacteristicValue": [{ "value": "String" }]</pre>
productSpecCharacteristic.productSpecCharacteristicValue.value	Value of the characteristic. Data type: String
productSpecCharacteristic.validFor	Date range the characteristic is valid for. Data type: Object <pre>"validFor": { "endDateTime": "String", "startDateTime": "String" }</pre>
productSpecCharacteristic.validFor.endDateTime	End date of the characteristic. Data type: String
productSpecCharacteristic.validFor.startDateTime	Start date of the characteristic. Data type: String
productSpecCharacteristic.valueType	Value type of the characteristic, such as choice or email. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
productSpecificationRelationship	This specification's relationships to other product specifications. Data type: Array of Objects `"productSpecificationRelationship": [ { "id": "String", "type": "String", "validFor": {Object} } ]`
productSpecificationRelationship.id	ID of the related specification. Data type: String
productSpecificationRelationship.type	Type of relationship. Data type: String
productSpecificationRelationship.validFor	Date range the relationship is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
productSpecificationRelationship.validFor.endDateTime	End date of the relationship. Data type: String
productSpecificationRelationship.validFor.startDateTime	Start date of the relationship. Data type: String
resourceSpecification	List of resource specifications related to this product specification. Data type: Array of Objects `"resourceSpecification": [ { "id": "String", "internalId": "String", "internalVersion": "String", "name": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre>"internalVersion": "String", "name": "String", "version": "String" }]</pre>
serviceSpecification.id	Initial_version or external_id of the service specification. Located in the sys_id or external_id field of the Service Specification [sn_prd_pm_service_specification] table. Data type: String
serviceSpecification.internalId	Initial_version of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String
serviceSpecification.internalVersion	Version of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String
serviceSpecification.name	Name of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String
serviceSpecification.version	External_version of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String
validFor	Date range the specification is valid for. Data type: Object <pre>"validFor": { "endDateTime": "String",</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"startDateTime": "String"
	}</pre>

validFor.endDateTime	End date of the specification. Data type: String
validFor.startDateTime	Start date of the specification. Data type: String
version	External_version of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String

Example: cURL request

This example retrieves all product specifications.

```
curl --location --request GET
 "https://instance.service-now.com/api/sn_tmf_api/catalogmanagem
ent/productSpecification" \
--user 'username':'password'
```

Response body:

Name	Description
	Default: Blank string
id	Initial_version or external_id of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String
internalId	Required. Initial_version of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String
internalVersion	Version of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String
isBundle	Flag that indicates whether *`productSpecification`* represents a single product or a bundle of products. Valid values: • true: The product specification is a product bundle and contains multiple products. • false: The product specification contains a single product. Data type: Boolean Default: false
lastUpdate	Date the specification was last updated. Data type: String
lifecycleStatus	Indicates the current lifecycle status of the product specification. Valid values: • Active • Inactive • Draft

Name	Description
	Data type: String Default: Blank string
name	Name of the specification. Data type: String
productSpecCharacteristic	Specification characteristics. Data type: Array of Objects `"productSpecCharacteristic": [ { "description": "String", "name": "String", "productSpecCharacteristicValue": [Array], "validFor": {Object}, "valueType": "String" } ]`
productSpecCharacteristic.description	Description of the characteristic. Data type: String
productSpecCharacteristic.name	Name of the characteristic. Data type: String
productSpecCharacteristic.productSpecCharacteristicValue	Possible values of the characteristic. Data type: Array of Objects `"productSpecCharacteristicValue": [ { "value": "String" } ]`
productSpecCharacteristic.productSpecCharacteristicValue.value	Value of the characteristic. Data type: String
productSpecCharacteristic.validFor	Date range the characteristic is valid for. Data type: Object

Name	Description

	<pre>"validFor": {
	  "endDateTime":
	 "String",
	  "startDateTime":
	 "String"
	}</pre>

productSpecCharacteristic.validFor.endDateTime	End date of the characteristic. Data type: String
productSpecCharacteristic.validFor.startDateTime	Start date of the characteristic. Data type: String
productSpecCharacteristic.valueType	Value type of the characteristic, such as choice or email. Data type: String

productSpecificationRelationship	This specification's relationships to other product specifications.
	
	Data type: Array of Objects
	<pre>"productSpecificationRelationship": [
	  {
	  "id": "String",
	  "type": "String",
	  "validFor":
	 {Object}
	  }
	]</pre>

productSpecificationRelationship.id	ID of the related specification. Data type: String
productSpecificationRelationship.type	Type of relationship. Data type: String

productSpecificationRelationship.validFor	Date range that the relationship is valid for.
	
	Data type: Object
	<pre>"validFor": {
	  "endDateTime":
	 "String",
	  "startDateTime":
	 "String"
	}</pre>

productSpecificationRelationship.validFor.endDateTime	End date of the relationship.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
serviceSpecification.version	External_version of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String
validFor	Date range that the specification is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
validFor.endDateTime	End date of the specification. Data type: String
validFor.startDateTime	Start date of the specification. Data type: String
version	External_version of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String

Example: cURL request

This example retrieves a product specification.

```
curl --location --request GET
 "https://instance.service-now.com/api/sn_tmf_api/catalogmanagem
ent/productSpecification/0c47f2257441c110f877ca57242ff9bd" \
--user 'username':'password'
```

Response body:

```
{
   "id": "0c47f2257441c110f877ca57242ff9bd",
   "name": "SD-WAN My Device",
   "version": "v1",
   "internalVersion": "1",
   "internalId": "0c47f2257441c110f877ca57242ff9bd",
   "description": "This is my product specification ...",
```

Product Catalog Open API - PATCH /sn_tmf_api/catalogmanagement/productOffering/{id}

Updates the specified product offering.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOffering/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product offering to update. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
category	List of categories that the prod belongs to. Located in the Cat [sc_category] table. Data type: Array of Objects `"category:" [ { "id": "String", "name": "String" } ]`
category.id	Required if using the *catego* parameter. ID of the category. Located in the Category [sc_category] table. Data type: String
category.name	Name of the category. Data type: String Default: Blank string

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
channel	Required. Channels to use for selling the product offering. Data type: Array of Objects `"channel:" [ { "description": "String", "id": "String", "name": "String" } ]`
channel.description	Description of the channel. Data type: String Default: Blank string
channel.id	Required. Sys_id of the channe from the Distribution Channel [sn_prd_pm_distribution_char table. Data type: String
channel.name	Name of the channel. Data type: String Default: Blank string
description	Required. Description of the product offering. Data type: String
externalId	external_id of the product offering from the Product Offer [sn_prd_pm_product_offering] table. Data type: String
id	Required. initial_version or external_id of the product offering from the Product Offer [sn_prd_pm_product_offering] table. Data type: String
internalId	initial_version of the product offering from the Product Offer

Request body parameters (JSON) (continued)

Name	Description

	<pre>"productOfferingPric
	[
	{
	"price": {Object
	"priceType":
	"String"
	}
	]</pre>

productOfferingPrice.price	Price information for the produ offering.
	
	Data type: Object
	<pre>"price": {
	"taxIncludedAmount
	{Object}
	}</pre>

productOfferingPrice.price.taxIncludedAmount	Price information for the produ offering.
	
	Data type: Object
	<pre>"taxIncludedAmount":
	"unit": "String",
	"value": "String"
	}</pre>

productOfferingPrice.price.taxIncludedAmount.unit	Currency code for the product offering price. Data type: String Default: Blank string
productOfferingPrice.price.taxIncludedAmount.value	Price of the product offering including tax. Use a decimal va for example 123.45. Data type: String Default: Blank string
productOfferingPrice.priceType	The type of product offering type. Required if using the *productOfferingPrice* parameter. Valid values: • nonRecurring (one-time) • recurring

Request body parameters (JSON) (continued)

Name	Description

	<pre>"startDateTime": "String"
	}</pre>

validFor.endDateTime	Required. End date and time o product offering. Format: YYYY-MM-DD 00:00:0 Data type: String
validFor.startDateTime	Required. Start date and time product offering. Format: YYYY-MM-DD 00:00:0 Data type: String
version	external_version of the produc offering from the Product Offer [sn_prd_pm_product_offering] table. Data type: String

Response body parameters (JSON)

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
Content-Type	Data format of the response body. Supported types: *application/json* or *application/xml*.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers (continued)

Header	Description
	Default: *application/json*

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
category	List of categories that the prod belongs to. Data type: Array of Objects `"category:" [ { "id": "String", "name": "String" } ]`
category.id	ID of the category. Data type: String
category.name	Name of the category. Data type: String
channel	Channels to use for selling the product offering. Data type: Array of Objects `"channel:" [ { "description": "String", "id": "String", "name": "String"`

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Content-Type	Data format of the request body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed.
400	Bad request. Possible reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
description	Description of the specificatio Data type: String
href	A relative link to the resource r Data type: String
id	Initial_version or external_id of the product specification from the Product Specification [sn_prd_pm_product_specific table. Data type: String
internalId	Required. Initial_version of the product specification from the Product Specification [sn_prd_pm_product_specific table. Data type: String
internalVersion	Version of the product specific from the Product Specification [sn_prd_pm_product_specific table.

Product Catalog Open API - POST /sn_tmf_api/catalogmanagement/catalog

Creates a product offering catalog.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/catalog`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON)

Name	Description
description	Description of the product offering catalog. Data type: String Default: Blank string
externalId	Unique identifier for the product offering catalog from the external system. Data type: String Default: Blank string
name	Required. Name of the product offering catalog. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request successfully processed.
400	Bad Request. Could be any of the following reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON)

Name	Description
description	Description of the product offering catalog. Data type: String
id	Sys_id of the product offering catalog from the Product Offering Catalog [sn_prd_pm_product_offering_catalog] table. Data type: String
name	Name of the product offering catalog. Data type: String

Example: cURL request

This example creates a product offering catalog.

```
curl --location --request POST
 "https://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/catalog" \
--header "Content-Type: application/json" \
--data-raw '{
    "id": "testId",
    "name": "Catalog",
    "description": "Description"
}'
--user 'username':'password'
```

Response body.

```
{
   "id": "45715d02c3510110bc0526083c40dd6b",
   "description": "Description",
   "name": "Catalog1"
}
```

Product Catalog Open API - POST /sn_tmf_api/catalogmanagement/productOffering

Creates a product offering.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOffering`

Request body parameters (JSON) (continued)

Name	Description

	<pre>"taxIncludedAmount": {
	  "unit": "String",
	  "value": "String"
	}</pre>

productOfferingPrice.price.taxIncludedAmount.unit	Currency code for the product offering price. Data type: String
productOfferingPrice.price.taxIncludedAmount.value	Price of the product offering including tax. Data type: String
productOfferingPrice.priceType	Required if using the *productOfferingPrice* parameter. Product offering price type, one-time or recurring payment. Valid values: • nonRecurring (one-time) • recurring Data type: String
productOfferingTerm	Valid contract term length for the product offering. Data type: String

productSpecification	Required. Product specification for the product.
	
	Data type: Object
	<pre>"productSpecification":
	{
	  "id": "String",
	  "internalId":
	"String",
	  "internalVersion":
	"String",
	  "version": "String"
	}</pre>

productSpecification.id	Required. Initial_version or external_id of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table.

Request body parameters (JSON)

Name	Description
description	Required. Description of the specification. Data type: String
externalId	Unique identifier for the product specificatio from the external system. Data type: String Default: Blank string
id	Required. Initial_version or external_id of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String
internalId	Required. Initial_version of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String
internalVersion	Version of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String
lastUpdate	Date the specification was last updated. Format: YYYY-MM-DD 00:00:00. For exampl 2025-01-31 09:35:43. Data type: String Default: Blank string
name	Required. Name of the specification. Data type: String
productSpecCharacteristic	Specification characteristic. Data type: Array `"productSpecCharacteristic": { "description": "String" "name": "String", "productSpecCharacteristicVa ue": Array, "validFor": Object,`

Request body parameters (JSON) (continued)

Name	Description

	<pre>"valueType": "String"
	}
	]</pre>

productSpecCharacteristic.description	Description of the characteristic. Data type: String Default: Blank string
productSpecCharacteristic.name	Required. Name of the characteristic. Data type: String

productSpecCharacteristic.productSpecCharacteristicValue	Required. Array containing the possible valu of the characteristic.
	
	Data type: Array
	
	<pre>"productSpecCharacteristicVal e": [
	{
	"value": "String"
	}
	]</pre>

productSpecCharacteristic.productSpecCharacteristicValue.value	Required. Value of the characteristic. Data type: String

productSpecCharacteristic.validFor	Date range the characteristic is valid for.
	
	Data type: Object
	
	<pre>"validFor": {
	"endDateTime": "String",
	"startDateTime": "String"
	}</pre>

productSpecCharacteristic.validFor.endDateTime	End date of the characteristic. Format: YYYY-MM-DD 00:00:00. For exampl 2025-01-31 09:35:43. Data type: String Default: Blank string
productSpecCharacteristic.validFor.startDateTime	Start date of the characteristic. Format: YYYY-MM-DD 00:00:00. For exampl 2025-01-31 09:35:43. Data type: String

Request body parameters (JSON) (continued)

Name	Description
	Default: Blank string
productSpecCharacteristic.valueType	The value type of the characteristic, such as choice or email. Data type: String Default: Blank string
productSpecificationRelationship	This specification's relationships to other product specifications. Data type: Array `"productSpecificationRelationship": [ { "id": "String", "type": "String", "validFor": Object } ]`
productSpecificationRelationship.id	ID of the related specification. Data type: String Default: Blank string
productSpecificationRelationship.type	Required if using the *productSpecificationRelationsh* parameter. Type of relationship. Valid values: • composed_of • bundles Data type: String
productSpecificationRelationship.validFor	Date range the relationship is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
productSpecificationRelationship.validFor.endDateTime	End date of the relationship. Format: YYYY-MM-DD 00:00:00. For exampl `2025-01-31 09:35:43`. Data type: String

Request body parameters (JSON) (continued)

Name	Description
	Default: Blank string
productSpecificationRelationship.validFor.startDateTime	Start date of the relationship. Format: YYYY-MM-DD 00:00:00. For exampl `2025-01-31 09:35:43`. Data type: String Default: Blank string
resourceSpecification	Required. Array of resource specifications related to this product specification. Data type: Array `"resourceSpecification": [ { "id": "String", "internalId": "String", "internalVersion": "String", "name": "String", "version": "String" } ]`
resourceSpecification.id	Required. The initial_version or external_id of the resource specification. Located in the sys_id or external_id field of the Resource Specification [sn_prd_pm_resource_specification] table. Data type: String
resourceSpecification.internalId	Initial_version of the resource specification. Located in the Resource Specification [sn_prd_pm_resource_specification] table. Data type: String
resourceSpecification.internalVersion	Version of the resource specification. Located in the Resource Specification [sn_prd_pm_resource_specification] table. Data type: String
resourceSpecification.name	Name of the resource specification. Located in the Resource Specification [sn_prd_pm_resource_specification] table. Data type: String

Request body parameters (JSON) (continued)

Name	Description
validFor	Required. Date range the specification is vali for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
validFor.endDateTime	End date of the specification. Format: YYYY-MM-DD 00:00:00. For exampl `2025-01-31 09:35:43`. Data type: String Default: Blank string
validFor.startDateTime	Start date of the specification. Format: YYYY-MM-DD 00:00:00. For exampl `2025-01-31 09:35:43`. Data type: String Default: Blank string
version	External_version of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request successfully processed.
400	Bad request. Possible reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>

Response body parameters (JSON)

Name	Description
description	Description of the specification. Data type: String
href	Relative link to the resource record. Data type: String Default: Blank string
id	Initial_version or external_id of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String
internalId	Required. Initial_version of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String
internalVersion	Version of the product specification from the Product Specification [sn_prd_pm_product_specification] table. Data type: String
isBundle	Flag that indicates whether *`productSpecification`* represents a single product or a bundle of products.

Name	Description
	Valid values: • true: The product specification is a product bundle and contains multiple products. • false: The product specification contains a single product. Data type: Boolean Default: false
lastUpdate	Date the specification was last updated. Format: YYYY-MM-DD 00:00:00. Data type: String
lifecycleStatus	Current lifecycle status of the product specification. Possible values: • Active • Inactive • Draft Data type: String Default: Blank string
name	Name of the specification. Data type: String
productSpecCharacteristic	Specification characteristic. Data type: Array `"productSpecCharacteristic": [ { "description": "String", "name": "String", "productSpecCharacteristicValue": Array, "validFor": Object, "valueType": "String" } ]`
productSpecCharacteristic.description	Description of the characteristic.

Product Inventory Open API

The *Product Inventory Open* API provides endpoints to create and retrieve product inventories.

Use this API to manage product inventory information between external systems and the ServiceNow AI Platform.

This API is included in the Product Inventory Advanced application, which is available on the ServiceNow Store.

This API is provided within the `sn_prd_invt` namespace.

The calling user must have the sn_prd_invt.product_inventory_integrator role.

This API creates and updates data in the following tables.

- Product Characteristics [sn_prd_invt_product_characteristics]
- Product Inventory [sn_prd_invt_product_inventory]
- Product Model [cmdb_model]
- Product Model Characteristic [sn_prd_pm_product_model_characteristic]

The *Product Inventory Open* API is a ServiceNow® implementation of the TM Forum Product Inventory Management API REST specification. This implementation is based on the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

TMF637 Product Inventory Management API REST Specification Release 19, August 2019. The `Product Inventory Open` API is conformance certified by TM Forum.

Product Inventory Open API - GET /sn_prd_invt/product

Retrieves a list of all product inventories.

URL format

Default URL: `api/sn_prd_invt/product`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
customer	Filter product inventories by customer. Only product offerings with a customer sys_id or external ID matching the value of this parameter are returned in the response. Data type: String
fields	List of fields to return in the response. Invalid fields are ignored. If this parameter is not used, all fields are returned. Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the `offset` parameter to paginate record retrieval. Default: 20 Maximum: 100 Data type: Number
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Default: 0

Query parameters (continued)

Name	Description
	Data type: Number
place	Filter product inventories by place. Only product offerings with a place sys_id or external id matching the value of this parameter are returned in the response. Data type: String
status	Filter product inventories by status. Only product inventories with a status matching the value of this parameter are returned in the response. Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Specifies the range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
href	Relative link to the product inventory record. Data type: String
id	Sys_id of the product inventory from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
name	Name of the product inventory. Data type: String
place	Place associated with the product. Data type: String
productCharacteristic	List of product characteristics. Data type: Array `"productCharacteristic": [ { "name": "String", "value": "String" } ]`
productCharacteristic.name	Name of the characteristic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
productCharacteristic.value	Value of the characteristic. Data type: String
productOffering	Product offering that the product inventory is associated with. Data type: Object `"productOffering": { "id": "String", "internalId": "String", "internalVersion": "String", "name": "String", "version": "String" }`
productOffering.id	Initial_version or external_id of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.internalId	Initial_version of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.internalVersion	Version of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.version	External_version of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productPrice	Returns an empty array. Data type: Array
productRelationship	List of related products. Data type: Array `"productRelationship": [ { "productId": "String", "relationshipType": "String"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre> }]</pre>
productRelationship.productId	Sys_id of the related product from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
productRelationship.relationshipType	Type of relationship. Data type: String

productSpecification	Product specification for the product.
	
	Data type: Object
	<pre>"productSpecification": {
	  "id": "String",
	  "internalId": "String",
	  "internalVersion": "String",
	  "version": "String"
	}</pre>

productSpecification.id	Initial_version or external_id of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productSpecification.internalId	Initial_version of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productSpecification.internalVersion	Version of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productSpecification.version	External_version of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String

realizingResource	Resource that realizes the product. The realizing resource is a child product inventory of this product inventory.
	
	Data type: Object
	<pre>"realizingResource": {
	  "id": "String",
	  "type": "String"
	}</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
realizingResource.id	Sys_id of the realizing resource. Located in the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
realizingResource.type	Type of the realizing resource. Valid value: child Data type: String
realizingService	Service that realizes the product. The realizing service is a child product inventory of this product inventory. Data type: Object `"realizingService": { "id": "String", "type": "String" }`
realizingService.id	Sys_id of the realizing service. Located in the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
realizingService.type	Type of the realizing service. Valid value: child Data type: String
relatedParty	List of parties associated with the ticket. Data type: Array `"relatedParty": [ { "id": "String", "@referredType": "String" } ]`
relatedParty.id	Sys_id of the account or customer contact associated with the ticket. Located in the Account [customer_account], Contact [customer_contact], or Consumer [csm_consumer] table. Data type: String
relatedParty.@referredType	Type of customer. Possible values: • Customer • CustomerContact • Consumer

Product Inventory Open API - GET /sn_prd_invt/product/{id}

Retrieves a specified product inventory record.

URL format

Default URL: `/api/sn_prd_invt/product/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product inventory to retrieve. Located in the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String

Query parameters

Name	Description
customer	Filter product inventories by customer. Only product offerings with a customer sys_id or external id matching the value of this parameter are returned in the response. Data type: String
fields	List of fields to return in the response. Invalid fields are ignored. If this parameter is not used, all fields are returned. Data type: String
place	Filter product inventories by place. Only product offerings with a place sys_id or external id matching the value of this parameter are returned in the response. Data type: String
status	Filter product inventories by status. Only product inventories with a status matching the value of this parameter are returned in the response. Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed.
400	Bad Request. Could be any of the following reasons: • Invalid path parameter • Invalid URI
404	Record not found. Record associated with the ID is not found in the table.

Response body parameters (JSON)

Name	Description
href	Relative link to the product inventory record. Data type: String
id	Sys_id of the product inventory from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
name	Name of the product inventory.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers (continued)

Header	Description
Content-Range	For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
id	Sys_id of the product inventory from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
name	Name of the product inventory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
place	Place associated with the product. Data type: String
productCharacteristic	List of product characteristics. Data type: Array `"productCharacteristic": [ { "name": "String", "value": "String" } ]`
productCharacteristic.name	Name of the characteristic. Data type: String
productCharacteristic.value	Value of the characteristic. Data type: String
productOffering	Product offering that the product inventory is associated with. Data type: Object `"productOffering": { "id": "String", "name": "String" }`
productOffering.id	Sys_id of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productRelationship	List of related products. Data type: Array `"productRelationship": [ { "productId": "String", "relationshipType": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
productRelationship.productId	Sys_id of the related product from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
productRelationship.relationshipType	Type of relationship. Data type: String

productSpecification	Product specification for the product.
	
	Data type: Object
	
	`"productSpecification": {`
	`"id": "String"`
	`}`

productSpecification.id	Sys_id of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String

realizingResource	Realizing resource.
	
	Data type: Object
	
	`"realizingResource": {`
	`"id": "String",`
	`"type": "String"`
	`}`

realizingResource.id	Sys_id of the realizing resource from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
realizingResource.type	Type of the realizing resource. Data type: String

realizingService	Realizing service.
	
	Data type: Object
	
	`"realizingService": {`
	`"id": "String",`
	`"type": "String"`
	`}`

realizingService.id	Sys_id of the realizing service from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
realizingService.type	Type of the realizing service.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
relatedParty	List of parties associated with the ticket. Data type: Array `"relatedParty": [ { "id": "String", "@referredType": "String" } ]`
relatedParty.id	Sys_id of the account or customer contact associated with the ticket. Located in the Account [customer_account], Contact [customer_contact] or Consumer [csm_consumer] table. Data type: String
relatedParty.@referredType	Type of customer. Possible values: • customer • customerContact • consumer Data type: String
state	Current state of the product. Data type: String

Example: cURL request

This example retrieves all product inventories.

```
curl
 "https://instance.servicenow.com/api/sn_prd_invt/productinventory" \
--request GET \
--user 'username':'password'
```

Response body.

```

Product Inventory Open API - GET /sn_prd_invt/productinventory/{inventoryId}

Retrieves a product inventory.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Inventory Open API - GET /sn_prd_invt/product/{id}.

URL format

Default URL: `/api/sn_prd_invt/productinventory/{inventoryId}`

Supported request parameters

Path parameters

Name	Description
inventoryId	Sys_id of the product inventory to retrieve. Located in the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String

Query parameters

Name	Description
customer	Filter product inventories by customer. Only product offerings with a customer sys_id or external id matching the value of this parameter are returned in the response. Data type: String
fields	List of fields to return in the response. Invalid fields are ignored. If this parameter is not used, all fields are returned. Data type: String
place	Filter product inventories by place. Only product offerings with a place sys_id or external id matching the value of this parameter are returned in the response. Data type: String
status	Filter product inventories by status. Only product inventories with a status matching the value of this parameter are returned in the response. Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed.
400	Bad Request. Could be any of the following reasons: • Invalid path parameter • Invalid URI
404	Record not found. Record associated with the ID is not found in the table.

Response body parameters (JSON)

Name	Description
id	Sys_id of the product inventory from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
name	Name of the product inventory. Data type: String
place	Place associated with the product.

Name	Description
	Data type: String
productCharacteristic	List of product characteristics. Data type: Array `"productCharacteristic": [ { "name": "String", "value": "String" } ]`
productCharacteristic.name	Name of the characteristic. Data type: String
productCharacteristic.value	Value of the characteristic. Data type: String
productOffering	Product offering that the product inventory is associated with. Data type: Object `"productOffering": { "id": "String", "name": "String" }`
productOffering.id	Sys_id of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productRelationship	List of related products. Data type: Array `"productRelationship": [ { "productId": "String", "relationshipType": "String" } ]`
productRelationship.productId	Sys_id of the related product from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String

Name	Description
productRelationship.relationshipType	Type of relationship. Data type: String
productSpecification	Product specification for the product. Data type: Object `"productSpecification": { "id": "String" }`
productSpecification.id	Sys_id of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
realizingResource	Realizing resource. Data type: Object `"realizingResource": { "id": "String", "type": "String" }`
realizingResource.id	Sys_id of the realizing resource from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
realizingResource.type	Type of the realizing resource. Data type: String
realizingService	Realizing service. Data type: Object `"realizingService": { "id": "String", "type": "String" }`
realizingService.id	Sys_id of the realizing service from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
realizingService.type	Type of the realizing service. Data type: String
relatedParty	List of parties associated with the ticket. Data type: Array

Name	Description

	<pre>"relatedParty": [
	   {
	      "id": "String",
	      "@referredType": "String"
	   }
	]</pre>

relatedParty.id	Sys_id of the account or customer contact associated with the ticket. Located in the Account [customer_account], Contact [customer_contact], or Consumer [csm_consumer] table. Data type: String
relatedParty.@referredType	Type of customer. Possible values: • Customer • CustomerContact • Consumer Data type: String
state	Current state of the product. Data type: String

Example: cURL request

This example retrieves a product inventory for an SD-WAN service package.

```
curl --location --request GET 'https://
 instance.servicenow.com/api/sn_prd_invt/productinventory/074450
fc74918d10f877ca57242ff9e3' \
--user 'username':'password'
```

Output:

```

Request body parameters (JSON)

Name	Description
name	Required. Name of the product inventory. Data type: String
pid	Unique identifier for the product inventory from the external system. Data type: String Default: Blank string
productCharacteristic	List of product characteristics. Data type: Array `"productCharacteristic": [ { "name": "String", "value": "String" } ]`
productCharacteristic.name	Name of the characteristic. Data type: String Default: Blank string
productCharacteristic.value	Value of the characteristic. Data type: String Default: Blank string
productOffering	Required. Product offering that the product inventory is associated with. Data type: Object `"productOffering": { "id": "String", "internalVersion": "String", "name": "String", "version": "String" }`
productOffering.id	Required. Initial_version or external_id of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.internalVersion	Version of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request successfully processed.
400	Bad Request. Could be any of the following reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>

Response body parameters (JSON)

Name	Description
href	Relative link to the product inventory record. Data type: String
id	Sys_id of the product inventory from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
name	Name of the product inventory. Data type: String
pid	Unique identifier for the product inventory from the external system. Data type: String
productCharacteristic	List of product characteristics. Data type: Array

Name	Description

	<pre>"productCharacteristic": [
	   {
	      "name": "String",
	      "value": "String"
	   }
	]</pre>

productCharacteristic.name	Name of the characteristic. Data type: String
productCharacteristic.value	Value of the characteristic. Data type: String

productOffering	Product offering that the product inventory is associated with.
	
	Data type: Object
	<pre>"productOffering": {
	   "id": "String",
	   "internalId": "String",
	   "internalVersion": "String",
	   "name": "String",
	   "version": "String"
	}</pre>

productOffering.id	Initial_version or external_id of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.internalId	Initial_version of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.internalVersion	Version of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.version	External_version of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productPrice	Returns an empty array.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array
productRelationship	List of related products. Data type: Array `"productRelationship": [ { "productId": "String", "relationshipType": "String" } ]`
productRelationship.productId	Sys_id of the related product from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
productRelationship.relationshipType	Type of relationship. Data type: String
productSpecification	Product specification for the product. Data type: Object `"productSpecification": { "id": "String", "internalId": "String", "internalVersion": "String", "version": "String" }`
productSpecification.id	Initial_version or external_id of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productSpecification.internalId	Initial_version of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productSpecification.internalVersion	Version of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productSpecification.version	External_version of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String

Name	Description
realizingResource	Resource that realizes the product. The realizing resource is a child product inventory of this product inventory. Data type: Object `"realizingResource": { "id": "String", "type": "String" }`
realizingResource.id	Sys_id of the realizing resource. Located in the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
realizingResource.type	Type of the realizing resource. Valid value: child Data type: String
realizingService	Service that realizes the product. The realizing service is a child product inventory of this product inventory. Data type: Object `"realizingService": { "id": "String", "type": "String" }`
realizingService.id	Sys_id of the realizing service. Located in the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
realizingService.type	Type of the realizing service. Valid value: child Data type: String
relatedParty	List of parties associated with the ticket. Data type: Array `"relatedParty": [ { "id": "String", "@referredType": "String" } ]`
relatedParty.id	Sys_id of the account or customer contact associated with the ticket. Located in the Account [customer_account], Contact [customer_contact], or Consumer [csm_consumer] table.

Product Inventory Open API - POST /sn_prd_invt/productinventory

Creates a product inventory.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Inventory Open API - POST /sn_prd_invt/product.

URL format

Default URL: `/api/sn_prd_invt/productinventory`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
name	Required. Name of the product inventory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
pid	Unique identifier for the product inventory from the external system. Data type: String Default: Blank string
productCharacteristic	List of product characteristics. Data type: Array `"productCharacteristic": [ { "name": "String", "value": "String" } ]`
productCharacteristic.name	Name of the characteristic. Data type: String Default: Blank string
productCharacteristic.value	Value of the characteristic. Data type: String Default: Blank string
productOffering	Required. Product offering that the product inventory is associated with. Data type: Object `"productOffering": { "id": "String", "name": "String" }`
productOffering.id	Required. Sys_id of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String Default: Blank string
productRelationship	List of related products.

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (JSON) (continued)

Name	Description
	Data type: Array `"productRelationship": [ { "productId": "String", "relationshipType": "String" } ]`
productRelationship.productId	Required if using the *productRelationship* parameter. Sys_id of the related product from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
productRelationship.relationshipType	Type of relationship. The only valid value is `child`. Data type: String Default: Blank string
productSpecification	Required. Product specification for the product. Data type: Object `"productSpecification": { "id": "String" }`
productSpecification.id	Required. Sys_id of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
realizingResource	Realizing resource. Data type: Object `"realizingResource": { "id": "String", "type": "String" }`
realizingResource.id	Required if using the *realizingResource* parameter. Sys_id of the realizing resource from the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
realizingResource.type	Type of the realizing resource. The only valid value is `child`.

Product Order Open API

The *Product Order Open* API provides endpoints that enable a standardized mechanism for placing product orders.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A product order is created based on a product offering that is defined and published in a product catalog. The product offering identifies the product or set of products that are available to a customer and includes the relevant product characteristics that capture the unique options of a product, and other relevant attributes such as pricing, contract terms, and availability.

To access this API, the Order Management for Telecommunications (sn_ind_tmt_orm) plugin must be activated.

This API is provided within the `sn_ind_tmt_orm` namespace.

The calling user must have the sn_ind_tmt_orm.order_integrator role.

This API can be extended to make customizations around required parameters, request body validation, additional REST operations, and field mappings. For more information, see the Product Order Open API Developer Guide.

The *`Product Order Open`* API is a ServiceNow® implementation of TM Forum TMF622 Product Ordering Management API REST Specification and is conformance certified by TM Forum.

Product Order Open API - GET /sn_ind_tmt_orm/order/productOrder

Retrieves all product orders.

This endpoint retrieves order information from the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]
- Order Line Related Items [sn_ind_tmt_orm_order_line_related_items]

URL format

Default URL: `/api/sn_ind_tmt_orm/order/productOrder`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. If this parameter is not used, all fields are returned. Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the *`offset`* parameter to paginate record retrieval. Default: 20 Maximum: 100 Data type: Number
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Default: 0 Data type: Number
state	Filter orders by state. Only orders with a state matching the value of this parameter are returned in the response. Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Specifies the range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers (continued)

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
channel	Array of objects that describe the channels to use for selling the product Data type: Array `"channel": [ { "id": "String", "name": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
channel.id	Unique identifier of the channel to use to sell the associated products. Chann ID values are located in the external_id field of the Distribution Channel [sn_prd_pm_distribution_channel] tab Data type: String
channel.name	Name of the channel to use to sell the associated products. Data type: String
committedDueDate	Date and time when the action must be performed on the order. This value must be the same as or later than the *committedDueDate* values each order line item. Data type: String
expectedCompletionDate	Date on which the order will be comple Data type: String
href	Relative link to the product order recor Data type: String
id	Sys_id of the product order. Data type: String
note	Array of objects that describe additiona notes made by the customer when ordering. Data type: Array `"note": [ { "author": "String", "date": "String", "text": "String" } ]`
note.author	User name of the person that authored associated note. Data type: String
note.date	Date that the note was created. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
note.text	Additional notes/comments made by t customer while ordering. Data type: String
orderCurrency	Currency code for the order and order items. Data type: String
ponr	Flag that indicates whether the point o return for the order has been reached. Valid values: • true: The point of no return for the or has been reached. • false: The point of no return for the o has not been reached. Data type: Boolean
productOrderItem	List that describes items associated wi the product order and their associated action. Data type: Array `"productOrderItem:" [ { "action": "String", "committedDueDate": "String", "externalProductInventory": [Array], "id": "String", "itemPrice": [Array], "product": {Object}, "productOffering": {Object}, "productOrderItemRelationship": [Array], "quantity": Number, "state": "String", "@type": "String" } ]`
productOrderItem.action	Action to carry out on the product. Possible actions are defined on the Choice List tab in the Action Dictionary Entry of the sn_ind_tmt_orm_order_line_item table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
productOrderItem.actionReason	The reason for adding the order line ite Data type: String Table/field updated: sn_ind_tmt_orm_order_line_item/ action_reason
productOrderItem.committedDueDate	Date and time when the action must be performed on the order line item. Data type: String
productOrderItem.externalProductInventory	Array of objects containing external ids mapped to the product inventories created for the order. Data type: Array `"externalProductInventory [ { "externalProductInventor d": "String" } ]`
productOrderItem.externalProductInventory.externalProductInventoryId	External id mapped to the product inventory. Data type: String
productOrderItem.id	Unique identifier of the line item. Locat in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] tabl Data type: String
productOrderItem.itemPrice	Array of objects that describe the price associated with the product. Data type: Array `"itemPrice": [ { "price": {Object}, "priceType": "String" "recurringChargePeriod": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
productOrderItem.itemPrice.price	Description of the price of the associat product. Data type: Object `"price": { "taxIncludedAmount": {Object} }`
productOrderItem.itemPrice.price.taxIncludedAmount	Description of the price of the associat product, including the tax. Data type: Object `"taxIncludedAmount": { "unit": "String", "value": Number }`
productOrderItem.itemPrice.price.taxIncludedAmount.unit	Currency code in which the price is depicted. Data type: String
productOrderItem.itemPrice.price.taxIncludedAmount.value	Price of product, including any tax. Data type: Number
productOrderItem.itemPrice.priceType	Type of item price, recurring or non-recurring. Data type: String
productOrderItem.itemPrice.recurringChargePeriod	If the price is recurring, the recurring period, such as `month`. Data type: String
productOrderItem.ponr	Flag that indicates whether the point o return for the order has been reached. Valid values: • true: The point of no return for the or has been reached. • false: The point of no return for the o has not been reached. Data type: Boolean
productOrderItem.product	Description of the instance details of th product purchased by the customer. Data type: Object `"product:" { "place": {Object},`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre>"productCharacteristic" [Array], "productRelationship": [Array], "productSpecification": {Object}, "relatedParty": {Object "@type": "String" }</pre>
productOrderItem.product.place	Maps of the locations on which to insta the product. Data type: Object <pre>"place": { "id": "String", "@type": "String" }</pre>
productOrderItem.product.place.id	Sys_id of the associated location recor the Location [cmn_location] table. Data type: String
productOrderItem.product.place.@type	Part of TMF Open API standard. Annotation for order line item contact. value is always `Place`. This informatio not stored. Data type: String
productOrderItem.product.productCharacteristic	Array of objects that describe the characteristics of the associated produ Only product characteristics whose *`value`* are different than the *`previousValue`* are returned. Data type: Array <pre>"productCharacteristic": { "name": "String", "previousValue": "String", "value": "String" }]</pre>
productOrderItem.product.productCharacteristic.name	Name of the characteristic record to associate with the product. Located in Characteristic [sn_prd_pm_characteris table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
productOrderItem.product.productCharacteristic.previousValue	Previous characteristic option values if the update is for a change order. The request is a change order if the *productOrderItem.action* parameter is other than `add`. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productCharacteristic.value	Characteristic option values associated with the product. For additional information on characteristic option values, see Create product characteris and characteristic options. Data type: String
productOrderItem.product.productRelationship	List of product relationship details for a order line item. Data type: Array `"productRelationship": [ { "id": "String", "relationshipType": "String" } ]`
productOrderItem.product.productRelationship.id	Sys_id or sn_prd_invt_external_id of the product inventory. Located in the sys_id or sn_prd_invt_external_id field of the Product Inventory [sn_prd_invt_product_inventory] table Data type: String
productOrderItem.product.productRelationship.relationshipType	Type of relationship between the order item and the product inventory. Possible value: Requires Data type: String
productOrderItem.product.productSpecification	Description of the product specificatio associated with the product. Data type: Object `"productSpecification:" { "id": "String", "internalId": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre>"internalVersion": "String", "name": "String", "version": "String", "@type": "String" }</pre>
productOrderItem.product.productSpecification.id	Initial_version or external_id of the product specification. The initial_version is the sys_id of the first version of the specification. Located in the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] ta Data type: String
productOrderItem.product.productSpecification.internalId	Initial_version of the product specificat The initial_version is the sys_id of the first version of the specification. Located in the Product Specification [sn_prd_pm_product_specification] ta Data type: String
productOrderItem.product.productSpecification.internalVersion	Version of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] ta Data type: String
productOrderItem.product.productSpecification.name	Name of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] ta Data type: String
productOrderItem.product.productSpecification.version	External_version of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] ta Data type: String
productOrderItem.product.productSpecification.@type	Part of the TMF Open API standard. This value is always `ProductSpecificationRef`. This information is not stored. Data type: String
productOrderItem.product.relatedParty	List of contacts for line items. Data type: Array <pre>"relatedParty:" [{</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"email": "String",
	"firstName": "String"
	"id": "String",
	"lastName": "String",
	"phone": "String",
	"@referredType":
	"String",
	"@type": "String"
	}
	]</pre>

productOrderItem.product.relatedParty.email	Email address of the contact. Data type: String
productOrderItem.product.relatedParty.firstName	First name of the contact. Data type: String
productOrderItem.product.relatedParty.id	Sys_id of the line item contact associated with the order line item. Located in the Order Line Item Contact [sn_ind_tmt_orm_order_line_item_con table. Data type: String
productOrderItem.product.relatedParty.lastName	Last name of the contact. Data type: String Data type: String
productOrderItem.product.relatedParty.phone	Business phone number of the contact Data type: String
productOrderItem.product.relatedParty.@referredType	Type of customer. Possible value: OrderLineItemContact Data type: String
productOrderItem.product.relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. T value is always `RelatedParty`. This information is not stored. Data type: String

productOrderItem.productOffering	Description of the product offering associated with the product.
	
	Data type: Object
	
	<pre>"productOffering:" {
	"id": "String",
	"internalId": "String",</pre>

Name	Description
	<pre>"internalVersion": "String", "name": "String", "version": "String" }</pre>
productOrderItem.productOffering.id	Initial_version or external_id of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the sys_id or external_id field of the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOffering.internalId	Initial_version of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOffering.internalVersion	Version of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOffering.version	External_version of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.quantity	Number of product items purchased. Data type: Number
productOrderItem.productOrderItemRelationship	Array of objects that describe the relationships between order line items Data type: Array <pre>"productOrderItemRelationship": [{ "id": "String", "relationshipType": "String"</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	}]
productOrderItem.productOrderItemRelationship.id	Unique identifier of the related line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] tabl Data type: String
productOrderItem.productOrderItemRelationship.relationshipType	Type of relationship between the two li items. This information is used to ident the relationship hierarchy. Possible values: • HasChild • HasParent • Requires `HasChild` and `HasParent` are used for parent/child relationships. `Requir` is used for horizontal relationships (a li item requires another line item). Data type: String
productOrderItem.state	State of the order of the associated product item. Data type: String
productOrderItem.version	Order version. Data type: String
productOrderItem.@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrderItem`. This information is not stored. Data type: String

relatedParty	List of contacts for the order. Each con is an object in the array. Must list at least one item which contains custome account or consumer account informat
	
	Data type: Array
	`"relatedParty:" [`
	`{`
	`"id": "String",`

Product Order Open API - GET /sn_ind_tmt_orm/order/productOrder/{id}

Retrieves the specified product order.

This endpoint retrieves order information from the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]
- Order Line Related Items [sn_ind_tmt_orm_order_line_related_items]

URL format

Default URL: `/api/sn_ind_tmt_orm/order/productOrder/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id or external_id of the customer order to retrieve. Located in the Customer Order [sn_ind_tmt_orm_order] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination). The response returns successful with an error message if the selected order has processing issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description

	• A 200 OK response happens if the order is in the Inbound Queue [sn_tmt_core_inbound_queue] table waiting for the scheduler to pick the record to be processed. The error message field includes details for the record. For example:
	<pre>{
	"code": 102,
	"reason": "Request in queue",
	"message": "Request in queue",
	"details": [
	{
	"message": "This Order is still in the inbound queue table waiting to be processed.",
	"datapath": ""
	}
	]
	}</pre>
	• A 200 OK response happens if an order creation fails and the record in the Inbound Queue [sn_tmt_core_inbound_queue] table is in an error state. The error message field includes details in for the inbound queue table record. For example:
	<pre>{
	"code": 23,
	"reason": "Missing body field",
	"message": "Missing body field",
	"details": [
	{
	"message": "Invalid payload: orderCurrency is missing",
	"datapath": "/"
	}
	]
	}</pre>

206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
channel	Array of objects that describe the channels to use for selling the product Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"channel": [
	  {
	  "id": "String",
	  "name": "String"
	  }
	]</pre>

channel.id	Unique identifier of the channel to use to sell the associated products. Chann ID values are located in the external_id field of the Distribution Channel [sn_prd_pm_distribution_channel] tab Data type: String
channel.name	Name of the channel to use to sell the associated products. Data type: String
committedDueDate	Date and time when the action must be performed on the order. This value must be the same as or later than the *committedDueDate* values each order line item. Data type: String
expectedCompletionDate	Date on which the order will be comple Data type: String
href	Relative link to the product order recor Data type: String
id	Sys_id of the product order. Data type: String

note	Array of objects that describe additiona notes made by the customer when ordering.
	
	Data type: Array
	<pre>"note": [
	  {
	  "author": "String",
	  "date": "String",
	  "text": "String"
	  }
	]</pre>

note.author	User name of the person that authored associated note.

Product Order Open API - GET /sn_ind_tmt_orm/productorder

Retrieves all product orders.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Order Open API - GET /sn_ind_tmt_orm/order/productOrder.

This endpoint retrieves order information from the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]

URL format

Default URL: `/api/sn_ind_tmt_orm/productorder`

© 2026 ServiceNow, Inc. All rights reserved.

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: All fields returned.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Default: 20 Maximum: 100 Data type: Number
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Default: 0 Data type: Number
state	Filter orders by state. Only orders with a state matching the value of this parameter are returned in the response. Data type: String Default: All states returned.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Specifies the range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
channel	Array of objects that describe the channels to use for selling the products. Data type: Array `"channel": [ { "id": "String", "name": "String" } ]`
channel.id	Unique identifier of the channel to use to sell the associated products. Channel ID values are located in the external_id field of the Distribution Channel [sn_prd_pm_distribution_channel] table. Data type: String
channel.name	Name of the channel to use to sell the associated products. Data type: String
expectedCompletionDate	Date on which the order will be completed. Data type: String
note	Array of objects that describe additional notes made by the customer when ordering. Data type: Array `"note": { "author": "String", "date": "String", "text": "String" }`
note.author	User name of the person that authored the associated note. Data type: String
note.date	Date that the note was created. Data type: String
note.text	Additional notes/comments made by the customer while ordering. Data type: String

Name	Description
ponr	Flag that indicates whether the point of no return for the order has been reached. Valid values: • true: The point of no return for the order has been reached. • false: The point of no return for the order has not been reached. Data type: Boolean
productOrderItem	List that describes items associated with the product order and their associated action. Data type: Array `"productOrderItem:" [ { "action": "String", "actionReason": "String", "id": "String", "itemPrice": [Array], "product": {Object}, "productOffering": {Object}, "productOrderItemReleationship": [Array], "quantity": Number, "state": "String", "@type": "String" } ]`
productOrderItem.action	Action to carry out on the product. Possible actions are defined on the Choice List tab in the Action Dictionary Entry of the sn_ind_tmt_orm_order_line_item table. Data type: String
productOrderItem.actionReason	The reason for adding the order line item. Data type: String Table/field updated: sn_ind_tmt_orm_order_line_item/ action_reason
productOrderItem.id	Unique identifier of the line item. Located in the sn_ind_tmt_orm_external_id

Name	Description
	field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table. Data type: String
productOrderItem.itemPrice	Array of objects that describe the price associated with the product. Data type: Array `"itemPrice": [ { "price": {Object}, "priceType": "String", "recurringChargePeriod": "String" } ]`
productOrderItem.itemPrice.price	Description of the price of the associated product. Data type: Object `"price": { "taxIncludedAmount": {Object} }`
productOrderItem.itemPrice.price.taxIncludedAmount	Description of the price of the associated product, including the tax. Data type: Object `"taxIncludedAmount": { "unit": "String", "value": Number }`
productOrderItem.itemPrice.price.taxIncludedAmount.unit	Currency code in which the price is depicted. Data type: String
productOrderItem.itemPrice.price.taxIncludedAmount.value	Price of product, including any tax. Data type: Number
productOrderItem.itemPrice.priceType	Type of item price, recurring or non-recurring. Data type: String
productOrderItem.itemPrice.recurringChargePeriod	If the price is recurring, the recurring period, such as `month`.

Name	Description
	Data type: String
productOrderItem.ponr	Flag that indicates whether the point of no return for the order has been reached. Valid values: • true: The point of no return for the order has been reached. • false: The point of no return for the order has not been reached. Data type: Boolean
productOrderItem.product	Description of the instance details of the product purchased by the customer. Data type: Object `"product:" { "place": {Object}, "productCharacteristic": [Array], "productSpecification": {Object}, "relatedParty": {Object}, "@type": "String" }`
productOrderItem.product.place	Maps of the locations on which to install the product. Data type: Object `"place": { "id": "String", "@type": "String" }`
productOrderItem.product.place.id	Sys_id of the associated location record in the Location [cmn_location] table. Data type: String
productOrderItem.product.place.@type	Part of TMF Open API standard. Annotation for order line item contact. This value is always `Place`. This information is not stored. Data type: String
productOrderItem.product.productCharacteristic	Array of objects that describe the characteristics of the associated product. Only product characteristics whose *`value`* are different than the *`previousValue`* are returned.

Name	Description
	Data type: Array `"productCharacteristic": [ { "name": "String", "previousValue": "String", "value": "String" } ]`
productOrderItem.product.productCharacteristic.name	Name of the characteristic record to associate with the product. Located in the Characteristic [sn_prd_pm_characteristic] table. Data type: String
productOrderItem.product.productCharacteristic.previousValue	Previous characteristic option values if the update is for a change order. The request is a change order if the *`productOrderItem.action`* parameter is other than `add`. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productCharacteristic.value	Characteristic option values associated with the product. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productSpecification	Description of the product specification associated with the product. Data type: Object `"productSpecification:" { "id": "String", "name": "String", "@type": "String" }`
productOrderItem.product.productSpecification.id	Initial_version or external_id of the product specification. The initial_version is the sys_id of the first version of the specification. Located in the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] table.

Name	Description
	Data type: String
productOrderItem.product.productSpecification.name	Name of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.@type	Part of the TMF Open API standard. This value is always `ProductSpecificationRef`. This information is not stored. Data type: String
productOrderItem.product.relatedParty	List of contacts for line items. Data type: Array `"relatedParty:" { "email": "String", "firstName": "String", "id": "String", "lastName": "String", "phone": "String", "@referredType": "String", "@type": "String" }`
productOrderItem.product.relatedParty.email	Email address of the contact. Data type: String
productOrderItem.product.relatedParty.firstName	First name of the contact. Data type: String
productOrderItem.product.relatedParty.id	Sys_id of the line item contact associated with the order line item. Located in the Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact] table. Data type: String
productOrderItem.product.relatedParty.lastName	Last name of the contact. Data type: String Data type: String
productOrderItem.product.relatedParty.phone	Business phone number of the contact. Data type: String
productOrderItem.product.relatedParty.@referredType	Type of customer.

Name	Description
	Possible value: OrderLineItemContact Data type: String
productOrderItem.product.relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. This value is always `RelatedParty`. This information is not stored. Data type: String
productOrderItem.productOffering	Description of the product offering associated with the product. Data type: Object `"productOffering": { "id": "String", "internalVersion": "String", "name": "String", "version": "String" }`
productOrderItem.productOffering.id	Initial_version or external_id of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the sys_id or external_id field of the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.quantity	Number of product items purchased. Data type: Number
productOrderItem.productOrderItemRelationship	Array of objects that describe the relationships between order line items. Data type: Array `"productOrderItemRelationship": [ { "id": "String", "relationshipType": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
productOrderItem.productOrderItemRelationship.id	Unique identifier of the related line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table. Data type: String
productOrderItem.productOrderItemRelationship.relationshipType	Type of relationship between the two line items. This information is used to identify the relationship hierarchy. Possible values: • HasChild • HasParent • Requires `HasChild` and `HasParent` are used for parent/child relationships. `Requires` is used for horizontal relationships (a line item requires another line item). Data type: String
productOrderItem.state	State of the order of the associated product item. Data type: String
productOrderItem.version	Order version. Data type: String
productOrderItem.@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrderItem`. This information is not stored. Data type: String
relatedParty	List of contacts for the order. Each contact is an object in the array. Must list at least one item which contains customer account or consumer account information. Data type: Array `"relatedParty:" [ { "id": "String", "name": "String", "@referredType": "String", "@type": "String"`

Name	Description
	}]
relatedParty.id	Sys_id or external_id of the account, customer contact, or consumer associated with the order. Located in the Account [customer_account], Contact [customer_contact] table, or Consumer [csm_consumer] table. Data type: String
relatedParty.name	Name of the account, customer, or consumer. Data type: String
relatedParty.@referredType	Type of customer. Possible values: • Consumer • Customer • CustomerContact Data type: String
relatedParty.@type	Part of TMF Open API standard. Annotation for the product. This value is always `RelatedParty`. This information is not stored. Data type: String
requestedCompletionDate	Delivery date requested by the customer. Data type: String
requestedStartDate	Order start date requested by the customer. Data type: String
state	Current state of the order. Data type: String
version	Order version. Data type: String
@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrder`. This information is not stored.

Product Order Open API - GET /sn_ind_tmt_orm/productorder/{id}

Retrieves the specified product order.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Order Open API - GET /sn_ind_tmt_orm/order/productOrder/{id}.

This endpoint retrieves order information from the following tables:

© 2026 ServiceNow, Inc. All rights reserved.

- Customer Order [sn_ind_tmt_orm_order]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]

URL format

Default URL: `/api/sn_ind_tmt_orm/productorder/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id or external_id of the customer order to retrieve. Located in the Customer Order [sn_ind_tmt_orm_order] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

© 2026 ServiceNow, Inc. All rights reserved.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad Request. Can be for any of the following reasons: • Missing query parameter • Invalid URI
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
channel	Array of objects that describe the channels to use for selling the products. Data type: Array `"channel": [ { "id": "String", "name": "String" } ]`
channel.id	Unique identifier of the channel to use to sell the associated products. Channel ID values are located in the external_id field of the Distribution Channel [sn_prd_pm_distribution_channel] table. Data type: String
channel.name	Name of the channel to use to sell the associated products. Data type: String
expectedCompletionDate	Date on which the order will be completed. Data type: String
note	Array of objects that describe additional notes made by the customer when ordering. Data type: Array

Name	Description

	<pre>"note": {
	  "author": "String",
	  "date": "String",
	  "text": "String"
	}</pre>

note.author	User name of the person that authored the associated note. Data type: String
note.date	Date that the note was created. Data type: String
note.text	Additional notes/comments made by the customer while ordering. Data type: String
ponr	Flag that indicates whether the point of no return for the order has been reached. Valid values: • true: The point of no return for the order has been reached. • false: The point of no return for the order has not been reached. Data type: Boolean

productOrderItem	List that describes items associated with the product order and their associated action.
	
	Data type: Array
	<pre>"productOrderItem:" [
	  {
	  "action": "String",

Name	Description
productOrderItem.action	Action to carry out on the product. Possible actions are defined on the Choice List tab in the Action Dictionary Entry of the sn_ind_tmt_orm_order_line_item table. Data type: String
productOrderItem.actionReason	The reason for adding the order line item. Data type: String Table/field updated: sn_ind_tmt_orm_order_line_item/ action_reason
productOrderItem.id	Unique identifier of the line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table. Data type: String
productOrderItem.itemPrice	Array of objects that describe the price associated with the product. Data type: Array `"itemPrice": [ { "price": {Object}, "priceType": "String", "recurringChargePeriod": "String" } ]`
productOrderItem.itemPrice.price	Description of the price of the associated product. Data type: Object `"price": { "taxIncludedAmount": {Object} }`
productOrderItem.itemPrice.price.taxIncludedAmount	Description of the price of the associated product, including the tax. Data type: Object `"taxIncludedAmount": { "unit": "String",`

Name	Description

	<pre>"value": Number
	}</pre>

productOrderItem.itemPrice.price.taxIncludedAmount.unit	Currency code in which the price is depicted. Data type: String
productOrderItem.itemPrice.price.taxIncludedAmount.value	Price of product, including any tax. Data type: Number
productOrderItem.itemPrice.priceType	Type of item price, recurring or non-recurring. Data type: String
productOrderItem.itemPrice.recurringChargePeriod	If the price is recurring, the recurring period, such as `month`. Data type: String
productOrderItem.ponr	Flag that indicates whether the point of no return for the order has been reached. Valid values: • true: The point of no return for the order has been reached. • false: The point of no return for the order has not been reached. Data type: Boolean

productOrderItem.product	Description of the instance details of the product purchased by the customer.
	
	Data type: Object
	<pre>"product:" {
	"place": {Object},
	"productCharacteristic":
	[Array],
	"productSpecification":
	{Object},
	"relatedParty": {Object},
	"@type": "String"
	}</pre>

productOrderItem.product.place	Maps of the locations on which to install the product.
	
	Data type: Object
	<pre>"place": {
	"id": "String",</pre>

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"@type": "String"
	}</pre>

productOrderItem.product.place.id	Sys_id of the associated location record in the Location [cmn_location] table. Data type: String
productOrderItem.product.place.@type	Part of TMF Open API standard. Annotation for order line item contact. This value is always `Place`. This information is not stored. Data type: String

productOrderItem.product.productCharacteristic	Array of objects that describe the characteristics of the associated product.
	
	Only product characteristics whose *`value`* are different than the *`previousValue`* are returned.
	
	Data type: Array
	<pre>"productCharacteristic": [
	  {
	  "name": "String",
	  "previousValue":
	"String",
	  "value": "String"
	  }
	]</pre>

productOrderItem.product.productCharacteristic.name	Name of the characteristic record to associate with the product. Located in the Characteristic [sn_prd_pm_characteristic] table. Data type: String
productOrderItem.product.productCharacteristic.previousValue	Previous characteristic option values if the update is for a change order. The request is a change order if the *`productOrderItem.action`* parameter is other than `add`. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productCharacteristic.value	Characteristic option values associated with the product. For additional information on characteristic option

Name	Description
	values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productSpecification	Description of the product specification associated with the product. Data type: Object `"productSpecification:" { "id": "String", "name": "String", "@type": "String" }`
productOrderItem.product.productSpecification.id	Initial_version or external_id of the product specification. The initial_version is the sys_id of the first version of the specification. Located in the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.name	Name of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.@type	Part of the TMF Open API standard. This value is always `ProductSpecificationRef`. This information is not stored. Data type: String
productOrderItem.product.relatedParty	List of contacts for line items. Data type: Array `"relatedParty:" { "email": "String", "firstName": "String", "id": "String", "lastName": "String", "phone": "String", "@referredType": "String", "@type": "String" }`
productOrderItem.product.relatedParty.email	Email address of the contact.

Name	Description
	Data type: String
productOrderItem.product.relatedParty.firstName	First name of the contact. Data type: String
productOrderItem.product.relatedParty.id	Sys_id of the line item contact associated with the order line item. Located in the Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact] table. Data type: String
productOrderItem.product.relatedParty.lastName	Last name of the contact. Data type: String
productOrderItem.product.relatedParty.phone	Business phone number of the contact. Data type: String
productOrderItem.product.relatedParty.@referredType	Type of customer. Possible value: OrderLineItemContact Data type: String
productOrderItem.product.relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. This value is always `RelatedParty`. This information is not stored. Data type: String
productOrderItem.productOffering	Description of the product offering associated with the product. Data type: Object `"productOffering": { "id": "String", "internalVersion": "String", "name": "String", "version": "String" }`
productOrderItem.productOffering.id	Initial_version or external_id of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the sys_id or external_id field of the Product Offering [sn_prd_pm_product_offering] table. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
productOrderItem.productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.quantity	Number of product items purchased. Data type: Number
productOrderItem.productOrderItemRelationship	Array of objects that describe the relationships between order line items. Data type: Array `"productOrderItemRelationship": [ { "id": "String", "relationshipType": "String" } ]`
productOrderItem.productOrderItemRelationship.id	Unique identifier of the related line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table. Data type: String
productOrderItem.productOrderItemRelationship.relationshipType	Type of relationship between the two line items. This information is used to identify the relationship hierarchy. Possible values: • HasChild • HasParent • Requires `HasChild` and `HasParent` are used for parent/child relationships. `Requires` is used for horizontal relationships (a line item requires another line item). Data type: String
productOrderItem.state	State of the order of the associated product item. Data type: String
productOrderItem.version	Order version.

Name	Description
	Data type: String
productOrderItem.@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrderItem`. This information is not stored. Data type: String
relatedParty	List of contacts for the order. Each contact is an object in the array. Must list at least one item which contains customer account or consumer account information. Data type: Array `"relatedParty:" [ { "id": "String", "name": "String", "@referredType": "String", "@type": "String" } ]`
relatedParty.id	Sys_id or external_id of the account, customer contact, or consumer associated with the order. Located in the Account [customer_account], Contact [customer_contact] table, or Consumer [csm_consumer] table. Data type: String
relatedParty.name	Name of the account, customer, or consumer. Data type: String
relatedParty.@referredType	Type of customer. Possible values: • Consumer • Customer • CustomerContact Data type: String
relatedParty.@type	Part of TMF Open API standard. Annotation for the product. This value is always `RelatedParty`. This information is not stored.

Name	Description
	Data type: String
requestedCompletionDate	Delivery date requested by the customer. Data type: String
requestedStartDate	Order start date requested by the customer. Data type: String
state	Current state of the order. Data type: String
version	Order version. Data type: String
@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrder`. This information is not stored. Data type: String

Example: cURL request

The following code example requests an existing customer order.

```
curl -X GET
 "https://servicenow-instance/api/sn_ind_tmt_orm/productorder/8d
75939453126010a795ddeeff7b126a" \
-u "username":"password"
```

Response body.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. If there are any issues with the characteristics or characteristics option information, the endpoint stores the following comments in the work notes fields of the associated Customer Order Line Item record: • `The following Order Item characteristics does not exist: Review specification <`*`characteristic.name`*`> and correct the characteristic and characteristic option in the order line item prior to approving the order.` • `Order Item characteristic: <`*`characteristic.name`*`> with characteristic value: <`*`characteristic.value`*`>is invalid. Correct the characteristic values before approving the order.`

Name	Description
	Data type: String
productOrderItem.product.relatedParty.id	Sys_id of the line item contact associated with the order line item. Located in the Order Line Item Contact [sn_ind_tmt_orm_order_line_item_con table. Data type: String
productOrderItem.product.relatedParty.lastName	Last name of the contact. Data type: String
productOrderItem.product.relatedParty.phone	Business phone number of the contact Data type: String
productOrderItem.product.relatedParty.@referredType	Type of customer. Possible value: OrderLineItemContact Data type: String
productOrderItem.product.relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. value is always `RelatedParty`. This information is not stored. Data type: String
productOrderItem.product.@type	Part of TMF Open API standard. Annotation for the product. This value i always `Product`. This information is n stored. Data type: String
productOrderItem.productOffering	Description of the product offering associated with the product. Data type: Object `"productOffering:" { "id": "String", "internalId": "String", "internalVersion": "String", "name": "String", "version": "String" }`
productOrderItem.productOffering.id	Initial_version or external_id of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the sys_id or

Name	Description
	Data type: String
requestedCompletionDate	Delivery date requested by the custom Data type: String
requestedStartDate	Order start date requested by the customer. Data type: String
state	Current state of the order. Data type: String
@type	Part of TMF Open API standard. Annotation for the product. This value i always `ProductOrder`. This informa is not stored. Data type: String

Example: cURL request

This example updates the channel for a product order.

```
curl -X PATCH
 "https://instance.service-now.com/api/sn_ind_tmt_orm/order/prod
uctOrder/8d75939453126010a795ddeeff7b126a" \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
-d {
  "channel": [
    {
      "id": "1",
      "name": "Agent Assist"
    }
  ]
}
```

Response body.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. If there are any issues with the characteristics or characteristics option information, the endpoint stores the following comments in the work notes fields of the associated Customer Order Line Item record: • `The following Order Item characteristics does not exist: Review specification <characteristic.name> and correct the characteristic and characteristic option in the order line item prior to approving the order.` • `Order Item characteristic: <characteristic.name> with characteristic value: <characteristic.value>is invalid. Correct the characteristic values before approving the order.`
400	Bad Request. Could be any of the following reasons: • `Invalid payload: Request body missing` - Payload was not passed in the request body. • `Invalid payload: productOrderItem is missing` - Product order line item object or JSON is missing. • `Invalid payload: productOrderItem id is missing` - The *id* parameter is missing in the product order line item of the payload. • `Invalid payload: productOrderItem action is missing` - The *action* parameter is missing in the product order line item of the payload. • `Invalid payload: productOrderItem productOffering is missing` - The product offering object or JSON is missing from the product order line item in the payload. • `Invalid payload: productOffering id is missing` - The *id* parameter is missing in the product order line item of the product offering object in the payload. • `Invalid payload: Product offering does not exist` - The product offering in the product order line item is not valid.

Name	Description
	[sn_ind_tmt_orm_product_inventory] table. Data type: String
productOrderItem.product.place	Maps of the locations on which to install the product. Data type: Object `"place": { "id": "String", "@type": "String" }`
productOrderItem.product.place.id	Sys_id of the associated location record in the Location [cmn_location] table. Data type: String
productOrderItem.product.productCharacteristic	Array of objects that describe the characteristics of the associated product. Data type: Array `"productCharacteristic": [ { "name": "String", "previousValue": "String", "value": "String" } ]`
productOrderItem.product.productCharacteristic.name	Name of the characteristic record to associate with the product. Located in the Characteristic [sn_prd_pm_characteristic] table. Data type: String
productOrderItem.product.productCharacteristic.previousValue	Previous characteristic option values if the update is for a change order. The request is a change order if the *`productOrderItem.action`* parameter is other than `add`. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productCharacteristic.value	Characteristic option values associated with the product. For additional information on characteristic option

Name	Description
	values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productSpecification	Description of the product specification associated with the product. Data type: Object `"productSpecification": { "id": "String", "internalVersion": "String", "name": "String", "version": "String", "@type": "String" }`
productOrderItem.product.productSpecification.id	Initial_version or external_id of the product specification. The initial_version is the sys_id of the first version of the specification. Located in the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.name	Name of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.@type	Part of the TMF Open API standard. This value is always `ProductSpecificationRef`. This information is not stored. Data type: String
productOrderItem.product.relatedParty	List of contacts for line items. Data type: Array `"relatedParty": [ { "email": "String", "firstName": "String", "id": "String", "lastName": "String", "phone": "String", "@referredType": "String", "@type": "String"`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	<pre> }]</pre>
productOrderItem.product.relatedParty.email	Email address of the contact. Data type: String
productOrderItem.product.relatedParty.firstName	First name of the contact. Data type: String
productOrderItem.product.relatedParty.id	Sys_id of the line item contact associated with the order line item. Located in the Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact] table. Data type: String
productOrderItem.product.relatedParty.lastName	Last name of the contact. Data type: String Data type: String
productOrderItem.product.relatedParty.phone	Business phone number of the contact. Data type: String
productOrderItem.product.relatedParty.@referredType	Type of customer. Possible value: OrderLineItemContact Data type: String
productOrderItem.product.relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. This value is always `RelatedParty`. This information is not stored. Data type: String
productOrderItem.product.@type	Part of TMF Open API standard. Annotation for the product. This value is always `Product`. This information is not stored. Data type: String

productOrderItem.productOffering	Description of the product offering associated with the product.
	
	Data type: Object
	
	<pre>"productOffering": {
	  "id": "String",
	  "internalVersion":
	 "String",</pre>

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

	<pre>"name": "String",
	"version": "String"
	}</pre>

productOrderItem.productOffering.id	Initial_version or external_id of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the sys_id or external_id field of the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String

productOrderItem.productOrderItemRelationship	Array of objects that describe the relationships between order line items.
	
	Data type: Array
	<pre>"productOrderItemRelationship": [
	{
	"id": "String",
	"relationshipType": "String"
	}
	]</pre>

productOrderItem.productOrderItemRelationship.id	Unique identifier of the related line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table. Data type: String
productOrderItem.productOrderItemRelationship.relationshipType	Type of relationship between the two line items. This information is used to identify the relationship hierarchy. Data type: String
productOrderItem.quantity	Number of the associated items to order. Data type: Number
productOrderItem.state	Current state of the product order item. Data type: String
productOrderItem.@type	Part of TMF Open API standard. Annotation for the product. This value

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	is always `ProductOrderItem`. This information is not stored. Data type: String
relatedParty	List of contacts for the order. Each contact is an object in the array. Must list at least one item which contains customer account or consumer account information. Data type: Array `"relatedParty": [ { "id": "String", "name": "String", "@referredType": "String", "@type": "String" } ]`
relatedParty.id	Sys_id or external_id of the account, customer contact, or consumer associated with the order. Located in the Account [customer_account], Contact [customer_contact] table, or Consumer [csm_consumer] table. Data type: String
relatedParty.name	Name of the account, customer, or consumer. Data type: String
relatedParty.type	Type of customer. Possible values: • Consumer • Customer • CustomerContact Data type: String
requestedCompletionDate	Delivery date requested by the customer. Data type: String
requestedStartDate	Order start date requested by the customer. Data type: String
state	Current state of the order.

Name	Description
	Data type: String
@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrder`. This information is not stored. Data type: String

Example: cURL request

The following code example updates the channel for a customer order.

```
curl -X PATCH
 "https://instance.servicenow.com/api/sn_ind_tmt_orm/productord
er/6be0a925c3a220103e2e73ce3640ddfe" \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
-d {
  "channel": [
    {
      "id": "1",
      "name": "Agent Assist"
    }
  ]
}
```

Response body.

```
{
    "requestedCompletionDate": "2021-05-02T08:13:59.506Z",

Product Order Open API - POST /sn_ind_tmt_orm/cancelproductorder

Cancels the specified customer order.

URL format

Default URL: `/api/sn_ind_tmt_orm/cancelproductorder`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
cancellationReason	Reason for cancellation. Data type: String Default: Blank string
productOrder	Contains data about the product order. Data type: Object `"productOrder": { "id": "String", "href": "String", "@referredType": "String" }`
productOrder.id	Required. Sys_id of the customer order to cancel. Located in the Customer Order [sn_ind_tmt_orm_order] table. Data type: String
productOrder.href	URL of the customer order to cancel. Data type: String

Request body parameters (JSON) (continued)

Name	Description
	Default: Blank string
productOrder.@referredType	The value for this parameter should be `ProductOrder`. Data type: String Default: Blank string
requestedCancellationDate	Date to cancel the order. Data type: String Default: Blank string
@type	The value for this parameter should be `CancelProductOrder`. Data type: String Default: Blank string

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. Could be any of the following reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>. • Invalid order ID. • Invalid order ID: `This order is yet to be created in customer order table`. The cancel request was made for an order that has not been created yet. The order is in the Inbound Queue [sn_tmt_core_inbound_queue] table waiting for the scheduler to pick up the record.

Response body parameters (JSON)

Name	Description
cancellationReason	Reason for cancellation. Data type: String
href	URL of the cancelled order. Data type: String
id	Sys_id of the cancelled order. Data type: String
productOrder	Contains data about the product order. Data type: Object `"productOrder": { "id": "String", "href": "String", "@referredType": "String" }`
productOrder.id	Sys_id of the cancelled order. Data type: String
productOrder.href	URL of the cancelled order. Data type: String
productOrder.@referredType	The value for this parameter is `ProductOrder`. Data type: String
requestedCancellationDate	Date to cancel the order.

Product Order Open API - POST /sn_ind_tmt_orm/order/productOrder

Creates the specified customer order and customer order line items.

Once processed, records are created in the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]
- Order Line Related Items [sn_ind_tmt_orm_order_line_related_items]

URL format

Default URL: `/api/sn_ind_tmt_orm/order/productOrder`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
mode	Enables asynchronous order processing. That is, the order is added to the Inbound Queue [sn_tmt_core_inbound_queue] table to be created. If not included, the order is processed synchronously. Possible value: async Data type: String

Request body parameters (JSON)
