note.text	The note text. Maps to the **Work notes** or **Additional comments** field. Data type: String
relatedEntity	List of impacted assets, products, sold products (product inventory), configuration items, or services. Data type: Array `"relatedEntity": [ { "id": "String", "@referredType": "String" } ]`
relatedEntity.id	Sys_id of the impacted item or service. For cases, this value is from one of the following tables: • Asset [alm_asset] • Product Model [cmdb_model] • Sold Product [sn_install_base_sold_product] • Product Inventory [sn_prd_invt_product_inventory], which extends the Sold Product [sn_install_base_sold_product] table For incidents, this value is from one of the following tables: • Configuration Item [cmdb_ci] • Service [cmdb_ci_service]

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
relatedEntity.@referredType	The type of item or service. Valid values for case tickets: • asset • product • product_inventory Valid values for incident tickets: • cmdb_ci • cmdb_ci_service Data type: String
relatedParty	Details about contacts for the ticket. For cases, this parameter populates the **Contact** or **Account** field. For incidents, this parameter populates the **Caller** or **Company** field. Data type: Array `"relatedParty": [ { "id": "String", "@referredType": "String" } ]`
relatedParty.id	Sys_id of the related party. For cases, the sys_id is from the Contact [customer_contact] or Account [customer_account] tables. For incidents, the sys_id is from the User [sys_user] or Company [core_company] tables. If you provide a contact or a user (caller), their account or company is automatically populated on the ticket. Data type: String
relatedParty.@referredType	The type of related party. Valid values: • customer: The company or account for the ticket. • customer_contact: The caller or contact for the ticket. Data type: String
severity	Required. The severity of the issue described by the trouble ticket. Maps to the **Priority** field. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	• 1: Critical. • 2: High. • 3: Moderate. • 4: Low. • 5: Planning. Incident only. Valid values are the choices for the **Priority** field. You must provide the choice value only. For example, `1`. If an invalid value is provided, the severity is set to Low. Data type: String
status	Required. The current status of the trouble ticket. Maps to the **State** field. Valid values are the choices for the **State** field. You can provide the choice label or value. For example, `New` or `1`. If you provide an invalid value, the status is set to New. Data type: String
ticketType	The type of ticket. This value determines whether the record is created in the Case [sn_customerservice_case] or Incident [incident] table. Valid values: • Case • Incident Data type: String Default: Incident

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected for one or more of the following reasons. • Empty payload. • Invalid payload. Mandatory field missing. • Invalid ticketType.

Response body parameters (JSON)

Name	Description
@type	This value is always `TroubleTicket`. Data type: String
channel	The method of contact that the ticket was created through. Data type: Object `"channel":{ "name": "String" }`
channel.name	The name of the contact method. Data type: String
creationDate	The date that the case or incident record was created. Data type: String
description	The description of the issue from the ticket. Data type: String
href	Relative link to the case or incident record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
id	The sys_id of the case or incident record that was created. Data type: String
lastUpdate	The date that the case or incident record was last updated. Data type: String
name	The name of the trouble ticket, typically a short description of the issue. Data type: String
note	A list of all comments on the ticket. This list does not include work notes. Data type: Array `"note":[ { "author": "String", "date": "String", "text": "String", "@type": "String" } ]`
note.@type	The type of note. Only comments are returned (not work notes) so this value is always `comments`. Data type: String
note.author	The name of the user who wrote the comment. Data type: String
note.date	The date the comment was created in the ServiceNow instance. Data type: String
note.text	The comment text. Data type: String
relatedEntity	List of impacted assets, products, sold products (product inventory), configuration items, or services. Data type: Array `"relatedEntity": [ { "id": "String", "href": "String", "name": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"role": "String",
	"@referredType": "String",
	"@type": "String"
	}
	]</pre>

relatedEntity.id	Sys_id of the impacted item or service. For cases, this value is from one of the following tables: • Asset [alm_asset] • Product Model [cmdb_model] • Sold Product [sn_install_base_sold_product] • Product Inventory [sn_prd_invt_product_inventory], which extends the Sold Product [sn_install_base_sold_product] table For incidents, this value is from one of the following tables: • Configuration Item [cmdb_ci] • Service [cmdb_ci_service] Data type: String
relatedEntity.href	Returns an empty string. Data type: String
relatedEntity.name	Name of the impacted item or service. Data type: String
relatedEntity.role	Description of the impacted item or service. Data type: String
relatedEntity.@referredType	The type of item or service. Valid values for case tickets: • asset • product • product_inventory Valid values for incident tickets: • cmdb_ci • cmdb_ci_service Data type: String
relatedEntity.@type	This value is always `relatedEntity`. Data type: String
relatedParty	Details about contacts for the ticket.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array `"relatedParty": [ { "id": "String", "name": "String", "@referredType": "String" } ]`
relatedParty.id	Sys_id of the related party. The sys_id can be from the following tables depending on the ticket type and the related party type. Case: • Account [customer_account] - Related party type is `customer` • Contact [customer_contact] - Related party type is `customer_contact` Incident: • Company [core_company] - Related party type is `customer` • User [sys_user] - Related party type is `customer_contact` Case or incident: • Group [sys_user_group] - Related party type is `assignment_group` • User [sys_user] - Related party type is `assigned_to` Data type: String
relatedParty.name	Name of the related party. Data type: String
relatedParty.@referredType	The type of related party. Possible values: • `assigned_to`: The user assigned to work on the ticket. • `assignment_group`: The group assigned to work on the ticket. • `customer`: The company or account for the ticket. • `customer_contact`: The caller or contact for the ticket. Data type: String
severity	The severity of the issue described by the trouble ticket. Data type: String
status	The current status of the trouble ticket.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
ticketType	The type of ticket. Possible values: • Case • Incident Data type: String

Example: cURL request

This example creates a trouble ticket case record.

```
curl
 "https://instance.servicenow.com/api/sn_ind_tsm_sdwan/ticket/tr
oubleTicket" \
--request POST \

Trouble Ticket - POST /sn_ind_tsm_sdwan/troubleticket/{ticketType}

Creates a record in the Case [sn_customerservice_case] or Incident [incident] table.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Trouble Ticket - POST /sn_ind_tsm_sdwan/ticket/troubleTicket.

URL format

Default URL: `/api/sn_ind_tsm_sdwan/troubleticket/{ticketType}`

Supported request parameters

Path parameters

Name	Description
ticketType	The type of ticket. This value determines whether the record is created in the Case [sn_customerservice_case] or Incident [incident] table. Valid values: • case • incident Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
channel	The method of contact that the ticket was created through. Data type: Object `"channel":{ "name": "String" }`
channel.name	The name of the contact method. Maps to the **Channel** [contact_type] field for cases and the **Contact type** [contact_type] field for incidents. Valid values are the choices for the contact_type field. You can provide the choice label or value. For example, `Virtual Agent` or `virtual_agent`. Data type: String
description	Required. A description of the issue. Maps to the **Description** field. Data type: String
name	The name of the trouble ticket, typically a short description of the issue. Maps to the **Short description** field. Data type: String
note	A list of work notes and comments to add to the ticket. Data type: Array `"note":[ { "text": "String", "@type": "String" } ]`
note.@type	The type of note. This value determines whether the note is recorded in the **Work notes** or **Additional comments** field. Valid values: • work_notes • comments Data type: String
note.text	The note text. Maps to the **Work notes** or **Additional comments** field. Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
relatedEntity	List of impacted assets, products, sold products (product inventory), configuration items, or services. Data type: Array `"relatedEntity": [ { "id": "String", "@referredType": "String" } ]`
relatedEntity.id	Sys_id of the impacted item or service. For cases, this value is from one of the following tables: • Asset [alm_asset] • Product Model [cmdb_model] • Sold Product [sn_install_base_sold_product] • Product Inventory [sn_prd_invt_product_inventory], which extends the Sold Product [sn_install_base_sold_product] table For incidents, this value is from one of the following tables: • Configuration Item [cmdb_ci] • Service [cmdb_ci_service] Data type: String
relatedEntity.@referredType	The type of item or service. Valid values for case tickets: • asset • product • product_inventory Valid values for incident tickets: • cmdb_ci • cmdb_ci_service Data type: String
relatedParty	Details about contacts for the ticket. For cases, this parameter populates the **Contact** or **Account** field. For incidents, this parameter populates the **Caller** or **Company** field. Data type: Array `"relatedParty": [ { "id": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	<pre>"@referredType": "String"
	}
	]</pre>

relatedParty.@referredType	The type of related party. Valid values: • customer: The company or account for the ticket. • customer_contact: The caller or contact for the ticket. Data type: String
relatedParty.id	Sys_id of the related party. For cases, the sys_id is from the Contact [customer_contact] or Account [customer_account] tables. For incidents, the sys_id is from the User [sys_user] or Company [core_company] tables. If you provide a contact or a user (caller), their account or company is automatically populated on the ticket. Data type: String
severity	Required. The severity of the issue described by the trouble ticket. Maps to the **Priority** field. Valid values: • 1: Critical. • 2: High. • 3: Moderate. • 4: Low. • 5: Planning. Incident only. Valid values are the choices for the **Priority** field. You must provide the choice value only. For example, `1`. If an invalid value is provided, the severity is set to Low. Data type: String
status	The current status of the trouble ticket. Maps to the **State** field. Valid values are the choices for the **State** field. You can provide the choice label or value. For example, `New` or `1`. Data type: String Default: New
ticketType	Required. The type of ticket. This value determines whether the record is created in the Case [sn_customerservice_case] or Incident [incident] table. Valid values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• case • incident Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected for one or more of the following reasons. • Empty payload. • Invalid payload. Mandatory field missing. • Invalid ticketType or ticketType does not match path parameter ticketType. For example, ticketType is `case` but path parameter is `incident`.

Response body parameters (JSON or XML)

Name	Description
@type	This value is always `TroubleTicket`. Data type: String
channel	The method of contact that the ticket was created through. Data type: Object `"channel":{ "name": "String" }`
channel.name	The name of the contact method. Data type: String
creationDate	The date that the case or incident record was created. Data type: String
description	The description of the issue from the ticket. Data type: String
id	The sys_id of the case or incident record that was created. Data type: String
lastUpdate	The date that the case or incident record was last updated. Data type: String
name	The name of the trouble ticket, typically a short description of the issue. Data type: String
note	A list of the comments and work notes that were added to the ticket by the POST request. Data type: Array `"note":[ { "author": "String", "date": "String", "text": "String", "@type": "String" } ]`
note.@type	The type of note. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• work_notes • comments Data type: String
note.author	The name of the ServiceNow integration user who made the POST request that created the note. Data type: String
note.date	The date the note was created in the ServiceNow instance. Data type: String
note.text	The note text. Data type: String
relatedEntity	List of impacted assets, products, sold products (product inventory), configuration items, or services. Data type: Array `"relatedEntity": [ { "id": "String", "href": "String", "name": "String", "role": "String", "@referredType": "String", "@type": "String" } ]`
relatedEntity.id	Sys_id of the impacted item or service. For cases, this value is from one of the following tables: • Asset [alm_asset] • Product Model [cmdb_model] • Sold Product [sn_install_base_sold_product] • Product Inventory [sn_prd_invt_product_inventory], which extends the Sold Product [sn_install_base_sold_product] table For incidents, this value is from one of the following tables: • Configuration Item [cmdb_ci] • Service [cmdb_ci_service] Data type: String
relatedEntity.href	Returns an empty string. Data type: String

User Role Inheritance API

The *User Role Inheritance* API provides endpoints that allow you to see the roles that a specific user inherited.

This API requires the Contextual Security: Role Management V2 REST API (com.glide.role_management.inh_count.rest_api) plugin, automatically activated on new instances starting with the Jakarta release, or the Contextual Security: Role Management Enhancements REST API plugin, automatically activated starting with the Geneva release. The Contextual Security: Role Management V2 REST API is dependent on the Contextual Security: Role Management V2 (com.glide.role_management.inh_count) plugin.

A user's role can be directly granted, inherited from other roles, or inherited from groups. You must have the user_admin role to access this API.

User Role Inheritance - GET /global/user_role_inheritance

Returns a specified user's granted and inherited roles.

URL format

Versioned URL: `/api/global/{api_version}/user_role_inheritance`

Default URL: `/api/global/user_role_inheritance`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
user_sysid	Required. Sys_id of the user for which to return role information.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
from_group	List of roles that are inherited from groups that have roles. Data type: Array
from_role	List of roles that are either granted directly or inherited from other roles. Data type: Array
user_name	Full name of user. Data type: String

Example: Sample cURL request

```
curl
 "https://instance.service-now.com/api/global/user_role_inherita
nce?user_sysid=62826bf03710200044e0bfc8bcbe5df1" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  "result": {
    "user_name": "abel.tuter",
    "from_group": [
      "[Azure Operators]/sn_azure.operator",
      "[Azure Operators]/sn_azure.operator/sn_azure.user"
    ],
    "from_role": [
      "/snc_internal",
      "/cloud_user",
      "/cloud_user/pa_viewer",
      "/cloud_user/sn_azure.user",
      "/cloud_user/aws_user"
    ]
  }
}
```

Verify Entitlements API

The *`Verify Entitlements API`* provides endpoints that enable you to obtain a list of valid entitlements, details about the characteristics of entitlements, and an entitlement's latest usage information.

To access this API, the Entitlement Verification (sn_ent_verify) plugin must be activated.

This API is provided within the `sn_ent_verify` namespace.

The calling user must have the sn_pss_core.pss_integrator role.

The REST endpoints of this API query data from the following tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Account [customer_account]
- Consumer [csm_consumer]
- Entitlement [service_entitlement]
- Entitlement Characteristic [sn_pss_core_entitlement_characteristic]
- Entitlement Usages [sn_pss_core_entitlement_usage]
- Household [csm_household]
- Install Base [sn_install_base_item]
- Product Model [cmdb_model]
- Product Offering [sn_prd_pm_product_offering]
- Product Specification [sn_prd_pm_product_specification]
- Service Contract [sn_pss_core_service_contract]
- Service Contract Line [sn_pss_core_service_contract_line]
- Sold Product [sn_install_base_sold_product]

Verify Entitlements - GET /sn_ent_verify/verifyentitlements

Returns the valid entitlement records based on the provided filter.

You can filter entitlements based on:

- Account
- Consumer
- Contract
- Household
- Install base
- Product model
- Product offering
- Product specification
- Service contract line
- Sold entitlement
- Sold product
- State

At a minimum, you must specify either the account or the consumer on which to filter the entitlements.

When multiple filter parameters are passed, the endpoint applies the AND operator to the parameters. For example, if you pass filter parameters such as `"account = boxeo"` and `“state = draft”`, the endpoint returns all the entitlements with Account = boxeo AND state = draft.

You can implement pagination for the return results by passing the system pagination parameters *`sysparm_offset`* and *`sysparm_limit`*. By default *`sysparm_offset`* is set to 0 and *`sysparm_limit`* is set to 10. So, if after applying the filter, 100 entitlements satisfy the criteria, the response will include the first 10 entitlements. You can modify these values by passing them in the endpoint call.

URL format

Versioned URL: `/api/sn_ent_verify/{api_version}/verifyentitlements`

Default URL: `/api/sn_ent_verify/verifyentitlements`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sysparm_limit	Optional. Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. In the response, the boolean parameter *`hasMore`* is returned. It indicates whether there are more records to return that meet the filter criteria. Data type: Number Default: 10 Maximum: 100
sysparm_offset	Optional. Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Do not pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0

Query parameters

Name	Description
account	Either the *`account`* or *`consumer`* parameter must be passed. They are mutually exclusive. Sys_id of the account record for which to return entitlement records. Data type: String Default: None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Table: Account [customer_account]
consumer	Either the *account* or *consumer* parameter must be passed. They are mutually exclusive. Sys_id of the consumer record for which to return entitlement records. Data type: String Default: None Table: Consumer [csm_consumer]
contract	Sys_id of the contract record for which to return entitlement records. Data type: String Default: None Table: Contract [sn_pss_core_service_contract]

display_value	Flag that indicates whether to return the associated field value, display value, or both.
	
	Valid values:
	• true: Response contains only the display values of the fields. For example: `"state": "Draft"`.
	• false: Response contains only the values of the fields. For example: `"state": "draft"`.
	• all: Response contains all the information for the fields.
	
	For example:
	`"state": {`
	`"name": "state",`
	`"label": "State",`
	`"value": "draft",`
	`"display_value": "Draft",`
	`"type": "string"`
	`},`
	
	Data type: String
	
	Default: false

household	Sys_id of the household record for which to return entitlement records. Data type: String Default: None Table: Household [csm_household]
install_base	Sys_id of the install base record for which to return entitlement records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	The endpoint uses the sys_id of the install base record to search the Sold Product Covered [sn_install_base_m2m_contract_sold_product] table to return all entitlements covered by the associated install base. Data type: String Default: None Table: Install Base [sn_install_base_item]
product	Sys_id of the product record for which to return entitlement records. Data type: String Default: None Table: Product Model [cmdb_model]
product_offering	Sys_id of the product offering record for which to return entitlement records. Data type: String Default: None Table: Product Offering [sn_prd_pm_product_offering]
product_specification	Sys_id of product specification record for which to return entitlement records. Data type: String Default: None Table: Product Specification [sn_prd_pm_product_specification]
service_contract_line	Sys_id of the service contract line record for which to return entitlement records. Data type: String Default: None Table: Service Contract Line [sn_pss_core_service_contract_line]
sold_entitlement	Sys_id of the sold entitlement record for which to return entitlement records. Data type: String Default: None Table: Sold Product [sn_install_base_sold_product]
sold_product	Sys_id of the sold product record for which to return entitlement records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	The endpoint uses the sys_id of the Sold Product record to search the Sold Product Covered [sn_install_base_m2m_contract_sold_product] table to return all entitlements covered by the associated sold product. Data type: String Default: None Table: Sold Product [sn_install_base_sold_product]
state	State of the entitlements to return. Valid values: • active • cancelled • draft • expired • suspended Data type: String Default: All

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
entitlements	List of entitlements that match the passed filter criteria. Data type: Array of Objects `"entitlements": [{ "account": "String", "consumer": "String", "contract": "String", "end_date": "String", "entitlement_name": "String", "household": "String", "product": "String", "product_offering": "String", "product_specification": "String", "service_contract_line": "String", "sold_entitlement": "String", "start_date": "String", "state": "String", "sys_id": "String" }]`
entitlements.account	Sys_id of the account record associated with this entitlement. Data type: String Table: Account [customer_account]
entitlements.consumer	Sys_id of the consumer record associated with this entitlement. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: Consumer [csm_consumer]
entitlements.contract	Sys_id of the contract record associated with this entitlement. Data type: String Table: Contract [sn_pss_core_service_contract]
entitlements.end_date	Value of the End Date field on the associated entitlement record. Data type: String
entitlements.entitlement_name	Name of the entitlement. Data type: String
entitlements.household	Sys_id of the household record associated with this entitlement. Data type: String Table: Household [csm_household]
entitlements.product	Sys_id of the product record associated with this entitlement. Data type: String Table: Product Model [cmdb_model]
entitlements.product_offering	Sys_id of the product offer record associated with this entitlement. Data type: String Table: Product Offer [sn_prd_pm_product_offering]
entitlements.product_specification	Sys_id of the product specification record associated with this entitlement. Data type: String Table: Product Specification [sn_prd_pm_product_specification]
entitlements.service_contract_line	Sys_id of the service contract line record associated with this entitlement. Data type: String Table: Service Contract Line [sn_pss_core_service_contract_line]
entitlements.sold_entitlement	Sys_id of the sold entitlement record associated with this entitlement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Table: Sold Product [sn_install_base_sold_product]
entitlements.start_date	Value of the Start Date field on the associated entitlement record. Data type: String
entitlements.state	State of the entitlements record. Possible values: • active • cancelled • draft • expired • suspended Data type: String
entitlements.sys_id	Sys_id of the entitlement record. Data type: String Table: Entitlement [service_entitlement]
error	Describes the error that occurred. Data type: Object `"error": { "detail": "String", "message": "String" }` Examples of error responses: • Error message: Page size -20 is Invalid. Page size must be an integer between 1 and 100 Error condition: Invalid *sysparm_limit* parameter passed. The *sysparm_limit* parameter must be between 1 and 100. • Error message: Page offset -23 is invalid. Offset must be an integer greater than or equal to 0 Error condition: Invalid *sysparm_offset* parameter passed. The *sysparm_offset* parameter must be a whole number. • Error message: Invalid Query Parameter - accnt Error condition: Invalid query parameter, "accnt", was passed. Parameter should be "account".

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Error message: Invalid choice value: state = drft Error condition: Invalid value, "drft", was passed. Parameter value should be "draft".
error.detail	Detailed information as to why the endpoint call failed. Data type: String
error.message	Message that describes the error at a high-level. Data type: String
hasMore	Flag that indicates whether there are more entitlement records to return. Possible values: • true: More entitlement records to return. • false: No more entitlement records. Data type: Boolean
status	Status of the endpoint call. Possible values: • failure: An error occurred when processing the request. • success: The call was processed successfully. Data type: String
sysparm_limit	If the *sysparm_limit* parameters was passed in the endpoint call, it contains the passed value, otherwise it contains the default value. Data type: Number
sysparm_offset	If the *sysparm_offset* parameters was passed in the endpoint call, it contains the passed value, otherwise it contains the default value. Data type: Number

Example: cURL request

The following code example shows how to return entitlements for a specific account.

```
curl
 "https://instance.service-now.com/api/sn_ent_verify/verifyentit
lements?account=9e2fd2ee11b43110f877366201dea674" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

Verify Entitlements - GET /sn_ent_verify/verifyentitlements/getEntitlementCharacteristic/{id}

Returns details of the specified entitlement characteristic record and its latest usage record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The latest usage record for a characteristic is defined as the record where the period start date is less than or equal to the current date and the period end date is greater than or equal to the current date.

URL format

Versioned URL: `/api/sn_ent_verify/{api_version}/verifyentitlements/getEntitlementCharacteristic/{id}`

Default URL: `/api/sn_ent_verify/verifyentitlements/getEntitlementCharacteristic/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the entitlement characteristic record to return. Data type: String Table: Entitlement Characteristic [sn_pss_core_entitlement_characteristic]

Query parameters

Name	Description

display_value	Flag that indicates whether to return the associated field value, display value, or both.
	
	Valid values:
	• true: Response contains only the display values of the fields. For example: `"state": "Draft"`.
	• false: Response contains only the values of the fields. For example: `"state": "draft"`.
	• all: Response contains all the information for the fields.
	
	For example:
	`"state": {`
	`"name": "state",`
	`"label": "State",`
	`"value": "draft",`
	`"display_value": "Draft",`
	`"type": "string"`
	`},`
	
	Data type: String
	
	Default: false

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
characteristic	Sys_id of the associated entitlement characteristic record. Data type: String Table: Characteristic [sn_prd_pm_characteristic]
characteristic_option	Sys_id of the associated characteristic options record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Table: Characteristic Option [sn_prd_pm_characteristic_option]
entitlement_usage	Details about the entitlement usage record associated with the specified entitlement characteristic record. Data type: Array of Objects `"entitlement_usage": [ { "entitlement_characteristic": "String", "period_end": "String", "period_start": "String", "sys_id": "String", "total_units": "String", "used_units": "String" } ]`
entitlement_usage. entitlement_characteristic	Sys_id of the associated entitlement characteristic record. Data type: String Table: Entitlement Characteristic [sn_pss_core_entitlement_characteristic]
entitlement_usage. period_end	Value of the period end field in the entitlement usage record. This value is the date that the usage tracking ends for this entitlement. Data type: String
entitlement_usage. period_start	Value of the period start field in the entitlement usage record. This value is the date that the usage tracking starts for this entitlement. Data type: String
entitlement_usage.sys_id	Sys_id of the returned entitlement usage record. Data type: String Table: Entitlement Usages [sn_pss_core_entitlement_usage]
entitlement_usage. total_units	Total number of units purchased. Data type: String Table: In the total_units field of the Entitlement Usages [sn_pss_core_entitlement_usage] table.
entitlement_usage. used_units	Number of units that have been used. Data type: String Table: In the used_units field in the Entitlement Usages [sn_pss_core_entitlement_usage] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
sys_id	Sys_id of the entitlement characteristic record. Data type: String Table: Entitlement Characteristic [sn_pss_core_entitlement_characteristic]
type	Value of the type field in the entitlement characteristic record. Possible values: • coverage • coverage_and_usage Data type: String
value	Coverage to give the characteristic. For some characteristics, coverages are defined in the Characteristic Option table. However, if there are no coverages defined in the Characteristic Option table, then you can pass the coverage information in the *value* parameter. Characteristic options are only defined for the characteristic types of: • check box • choice • yes/no For all other types of characteristics, the *value* parameter should contain the coverage value. For example, if the characteristic is “Number of Replacements” and its coverages are not defined in the Characteristic Option table, you can specify the coverages, such as "10", "20", in this parameter. **Note:** This parameter contains the final coverage value for the characteristic. If there is information in the Characteristic Option table, it is propagated to this parameter. Data type: String

Example: cURL request

The following code example shows how to call this endpoint using all of its default values.

```
curl
 "https://instance.servicenow.com/api/sn_ent_verify/verifyentitl
ements/getEntitlementCharacteristic/3c817faa43823110341605ed0bb8
f23a" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

Virtual Agent Bot Integration API

The *Virtual Agent Bot Integration* API provides endpoints that allow users to integrate any chat interface or a bot ecosystem with the ServiceNow Virtual Agent and/or Live Agent.

This API is built on the conversational custom chat integration framework provided with Virtual Agent and operates in the `sn_va_as_service` namespace.

For additional information on installing and configuring the Virtual Agent Bot Integration API, see Virtual Agent API.

VA Bot Integration - POST /sn_va_as_service/bot/integration

Sends a specified message, attachment, or URL to a specified secondary ServiceNow Virtual Agent (VA) bot.

A customer's site can have one or more secondary ServiceNow bots. In addition to passing messages to a ServiceNow VA secondary bot, the primary bot or chat client can use this endpoint to pass messages to an agent through Live Agent chat. Use the *action* parameter passed in the request body to specify how the specified content should be handled.

Note: This endpoint can be either synchronous or asynchronous depending on how it's configured. If asynchronous, when the request is received by the endpoint, it validates the request and responds with a call status of success or failure and the appropriate HTTP status code. The VA then processes the request and sends a second response to the configured response endpoint. For example, for a bot-to-bot integration, the second response would be to the URL of your primary bot. Both of these responses are defined below. For additional information on this configured response endpoint, see Configure the output response REST endpoint and outbound authentication for the Virtual Agent API.

Note: The responses in the code examples for this endpoint show what is sent from the VA to the configured response endpoint. They don't show the actual response to this endpoint which is a simple success or failure response.

URL format

Default URL: `/api/sn_va_as_service/bot/integration`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description

Request body parameters

Name	Description
action	Action that the VA should take. Valid values: • AGENT: Switches the conversation from VA to Live Agent. • END_CONVERSATION: Ends the chat conversation. The *`message.text`* parameter should be empty when using this action. • START_CONVERSATION: Starts a chat conversation. • SWITCH: Switch the conversation to a topic that matches what is specified in the *`intent.id`* or *`topic.name`* parameters. **Note:** Only use the `SWITCH` action for topic switching when the intent discovery happens in the primary bot. If the intent discovery happens in the ServiceNow® VA, use the *`message.text`* parameter. • SET_USER_TIMEZONE: Sets the user's time zone to the time zone specified in the *`timezone`* parameter. This time zone remains in effect until you reset it using this same parameter. • TYPING/VIEWING: Displays the typing indicator in Live Agent. First send `TYPING` and then after the user finishes typing, send `VIEWING`. • Null or parameter not passed: Sends the message to the ServiceNow VA. Data type: String Default: Null
botToBot	Flag that indicates whether the conversation is between bots, such as between a primary bot and secondary bot. Possible values: • true: Bot-to-bot conversation. • false: Standalone ServiceNow bot conversation. Data type: Boolean Default: true

Request body parameters (continued)

Name	Description
clientSessionId	Unique client session identifier of the application/service that the end user is using to communicate with the ServiceNow bot. This ID helps identify the set of request/responses for a specific user conversation. The format of this parameter is determined by the implementer. Data type: String Default: Null
clientVariables	Pass-through JSON-formatted name-value pairs that are sent back in the response. These values aren't processed by the endpoint, but can be used to keep specific customer information attached to the conversation. Data type: Object Default: Null
contextVariables	JSON-formatted name-value pairs that provide addition information about the user. Provide this information to customize the conversation experience. For additional information on context variables, see Define and publish chat context variables. For example: `"contextVariables": { "requester_session_language": "es", "deviceTimeZone": "America/Los_Angeles" "live_agent_only": "true", "liveagent_deviceType": "test_device_type" "topic": "7c3c819073a3101066c7e9344ef6a7e4" }` Data type: Object Default: Null
emailId	Required when enabling account linking, otherwise all users are considered guest users. Email address of the chat client end user, the person the bot is interacting with. For additional information on account linking, see Link your ServiceNow user account to a messaging application for Virtual Agent conversations.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Data type: String

history	History of the primary bot's conversation with the user, starting with the initial request by the user.
	
	Data type: Object
	
	`"history": { "displayName": "String", "isBotMessage": Boolean, "type": "String", "value": "String" }`
	
	For example:
	
	`{ "isBotMessage": true, "value": "message 1", "displayName": "Bot", "type": "text" }, { "isBotMessage": false, "value": "message 2", "displayName": "User", "type": "text" }`

history.displayName	Name of the user to whom the message was sent. If the primary bot, pass `Bot`. Data type: String
history.isBotMessage	Flag that indicates whether the message was sent by the primary bot. Valid values: • true: Message was sent by the primary bot. • false: Message was sent by the user. Data type: Boolean
history.type	Type of message sent. Valid values: text Data type: String
history.value	Content of the information. For example, the message text.

Request body parameters (continued)

Name	Description
	Data type: String
intent	Describes the intent of the conversation. Provide this information when the *action* parameter is set to SWITCH. Data type: Object `"intent": { "id": "String" }`
intent.id	NLU Intent ID of the system topic to switch the conversation to. Located in the CS Topic Language [sys_cs_topic_language] table. The *intent.id* is resolved based on the language passed in the chat session. If no language is passed when starting a conversation, it obtains the language from the user's session/profile. Data type: String
message	Required. Details of the message to send to the ServiceNow bot. Data type: Object `"message": { "attachment": {Object}, "clientMessageId": "String", "text": "String", "typed": Boolean }`
message.attachment	Required if sending attachments. Details of each attachment to send. You can only pass attachments as a URL. A virus scan is triggered on all attachments. There is no restriction on the size of an attachment, however, large files can take significant time to transfer. Data type: Array of Objects `"attachment": [ { "clientAttachmentId": "String", "contentType": "String", "fileName": "String", "headers":{Object}, "url": "String"`

Request body parameters (continued)

Name	Description
	<pre> }]</pre>
message.attachment.clientAttachmentId	Unique identifier of the attachment to send to the ServiceNow bot. The format of this identifier is determined by the implementer. Data type: String Default: Null
message.attachment.contentType	Required if attachment specified. Standard mime type of the attachment. Valid values (not case-sensitive): • application/pdf • application/msword • image/png • image/jpeg • text/plain • video/mpeg Data type: String
message.attachment.fileName	Required if attachment specified. File name of the attachment. Data type: String

message.attachment.headers	Additional information needed if the attachment file is private and protected.
	
	Data type: Object
	<pre>"headers":{
	  "Authorization":"String"
	}</pre>

message.attachment.headers.Authorization	Information needed to obtain authorization to access the attachment, such as a user name and password. Data type: String
message.attachment.url	Required if attachment specified. URL where the attachment is located. The VA obtains the attachment from this URL, runs a virus scan, and then processes the file. If the attachment isn't a public file, you must pass an *message.attachment.header* object that contains the authorization information so that the attachment can be accessed. You must also

Request body parameters (continued)

Name	Description
	ensure that URL domain is present in the trusted domains filed in *sys_cs_provider*. Data type: String
message.clientMessageId	Unique alphanumeric identifier for the message. The format of this identifier is determined by the implementer. Data type: String Default: Null
message.text	Required if *attachment* parameter isn't specified. Message text. The language of the message should be passed in the *contextVariables* parameter. Data type: String Maximum length: Unlimited
message.typed	Required. Flag that indicates whether the message was typed in or was an option selection (selected). Valid values: • true: Message was typed in by the user. • false: Message was an option selection. Data type: Boolean
requestId	Required. Unique alphanumeric identifier for this request. The format of this identifier is determined by the implementer. Data type: String
silentMessage	Flag that indicates whether this is a silent message. A silent message is a message that doesn't require a response. Valid values: • true: Silent message, no response message expected. • false: Regular message, response message expected.

Request body parameters (continued)

Name	Description
	Note: If a request with `silentMessage = true` is sent, all subsequent bot messages remain suppressed until a request to turn off silent mode is sent by passing `silentMessage = false`. Data type: Boolean Default: false
timestamp	Unix epoch time when the message was sent from the end user of the chat client. Data type: Number Unit: Milliseconds Default: Current time
timezone	GMT time zone of the end user of the chat client. For example: `"timezone":"Asia/Kolkata"` For a list of the available time zone values, see https://en.wikipedia.org/wiki/List_of_tz_database_time_zones. Data type: String Default: GMT time zone of the ServiceNow instance.

topic	Required if the user wants to switch to a particular topic by specifying a topic name. Name-value pair of the topic to switch to. You can either specify the topic name or the topic sys_id.
	
	Note: You can only specify a single topic name or id in the object.
	
	Data type: Object
	
	`"topic": { "name": "String", "id": "String" }`
	
	For example:
	
	`{ "requestId": "xxxx-xxxx-xxxx-xxxx", "clientSessionId": "xxx-xxx-xxx-xxx",`

	"userId": "beth"
	}</pre>

topic.name	Name of the topic to switch to. Located in the name field of the Virtual Agent topics [sys_cs_topic] table. Data type: String
topic.id	Sys_id of the topic to switch to. Located in the sys_id field of the Virtual Agent topics [sys_cs_topic] table. Data type: String
userId	Required. Unique user identifier. This is the identifier of the end user who is interacting with the bot. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.
token	Required if using token-based authentication; optional for Basic or OAuth authentication. Authentication token to use if token authentication has been set up for this endpoint. Data type: String

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed. If you receive a 200 status code, but don't receive a response back, check the following things: • Whether the request is failing in Static, JWT, or Hash Based Token validation, which generally happens in the worker thread of Virtual Agent. • Whether the request body format is correct. If incorrect, the conversion doesn't happen correctly. • Whether the request body is missing some required parameters. You can trace exceptions and errors in the System Logs on the ServiceNow instance. • Whether the site defined in the REST Message to receive the response is operational; able to detect in logs. • Ensure the REST Message that defines where to post the response is set correctly.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Status of the endpoint call. This is sent in response when the initial call request is received. The request hasn't yet been processed.

Name	Description

error	Description of the detected error. Only returned if an error occurs.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Details about the encountered error. Data type: String
error.message	Error message thrown. Data type: String

Name	Description
status	Status of the endpoint call. Valid values: • failure • success Data type: String

VA response body parameters

Response body sent from the VA to the configured response endpoint.

Name	Description
agentChat	Flag that indicates whether the conversation is connected to the ServiceNow Live Agent. Possible values: • true: Chat messages are coming from a live agent. • false: Chat messages are coming from a bot and this parameter isn't returned in the response. Data type: Boolean
body	List of objects that describe the elements of the response message body. Data type: Array

```
"body": [
  {
    "actionType": "String",
    "agentInfo": {Object},
    "data": "String",
    "group": "String",
    "header": "String",
    "height": Number,
    "itemType": "String",
    "label": "String",
    "maskType": "String",
    "maxCount": Number,
    "maxSize": Number,
    "message": "String",
    "multiSelect": Boolean,
    "nluTextEnabled": Boolean,
    "options": {Object},
    "promptMsg": "String",
    "required": Boolean,
    "style": "String",
    "templateName": "String",
    "type": "String",
    "uiType": "String",
    "value": "String/{Object}",
```

Name	Description

	<pre>"width": Number
	}
	]</pre>

body.actionType	Type of action message dispatched by the secondary bot to the primary bot. For example, typing indicator or agent wait time.
	
	Valid values:
	• EndTypingIndicator
	• StartSpinner
	• StartTypingIndicator
	
	For example:
	
	Sending `StartTypeIndicator` to the primary bot when the typing indicator is enabled.
	<pre>"body": {
	"uiType":"ActionMsg",
	"actionType":"StartTypingIndicator"
	}</pre>
	Sending `StartSpinner` when transferring to Live Agent to display the wait time to the end user.
	<pre>"body": {
	"uiType":"ActionMsg",
	"actionType":"StartSpinner",
	"spinnerType":"wait_time",
	"message":"Routing you to a live agent...",
	"waitTime":"8 Seconds"
	}</pre>
	Data type: String

body.agentInfo	If enabled in the agent chat setup, the name and avatar of the associated agent.
	
	Data type: Object
	<pre>"agentInfo":{
	"agentAvatar":"String",
	"agentName": "String",
	"sentFromAgent": Boolean
	}</pre>
	For example:
	<pre>"agentInfo":{
	"sentFromAgent": true,
	"agentName":"Beth Anglin",
	
	"agentAvatar":"https://</pre>

Name	Description

	<pre>instance.servicenow.com/ee4eebf30a0004d963b5c5ac0d734dc4.iix?t=small"
	}</pre>

body.agentInfo.agentAvatar	URL of the agent's associated avatar file. For example: "https://instance.servicenow.com/ee4eebf30a0004d963b5c5ac0d734dc4.iix?t=small" Data type: String
body.agentInfo.agentName	Display name of the agent. Data type: String
body.agentInfo.sentFromAgent	Flag that indicates whether the message was sent by a live agent. Possible values: • true: Sent by a live agent. • false: Sent by a virtual agent. Data type: Boolean
body.data	JSON string that defines the data within the card. Data type: String
body.group	Rich control group to which the body element belongs. You can further transform these default controls by writing outbound transformation scripts. For additional information on these scripts, see Virtual Agent action scripts. Possible values: • DefaultOutputCard • DefaultDate • DefaultGroupedPartsOutputControl • DefaultHtml • DefaultOutputImage • DefaultOutputLink • DefaultText • DefaultPicker Data type: String
body.header	Link header. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
body.height	Height of the HTML element. Data type: Number Unit: Pixels

body.itemType	Type of body element.
	
	Possible values: (case-sensitive)
	• DefaultText
	  ○ File
	  ○ Image
	  ○ Inputtext
	  ○ outputtext
	• DefaultPicker
	  ○ Picture: Items appear in a carousel.
	  ○ List: Items appear in a dropdown-style list.
	
	Data type: String

body.label	Label to display for the associated element. Data type: String
body.maskType	Indicates the sensitivity of the associated data. Possible values: • NONE: Associated data is of a general nature and doesn't need to be secured. • SECURE: Associated data is of a sensitive nature and should be handled securely. Data type: String
body.maxCount	Only returned when *uiType* is `FileUpload`. Maximum number of attachments that can be uploaded at one time. Data type: Number (Integer)
body.maxSize	Only returned when *uiType* is `FileUpload`. Maximum size of the attachment that can be uploaded. Data type: Number (Integer) Unit: Megabytes
body.message	Only returned when *actionType* is `StartSpinner`. Message to display to user.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
body.multiSelect	Flag that indicates whether the user can select multiple options. Possible values: • true: Multiple selections. • false: Single selection. Data type: Boolean
body.nluTextEnabled	Flag that indicates whether the user chat client can receive Natural Language Understanding (NLU) text messages. Possible values: • true: Can receive NLU messages. • false: Can't receive NLU messages. Data type: Boolean
body.options	List of objects that describe the options available for a picker control. Data type: Array `"options": [ { "attachment": "String", "description": "String", "enabled": Boolean, "label": "String", "renderStyle": "String", "value": "String" } ]`
body.options.attachment	URL of the image in the carousel to retrieve. Data type: String
body.options.description	Description of the carousel item. Data type: String
body.options.enabled	Flag that indicates whether the picker control is enabled on the end user's chat client. In bot-to-bot implementations, the primary bot is responsible for ensuring the picker control is disabled. Possible values: • true: Enabled • false: Disabled

Name	Description
	Data type: Boolean
body.options.label	Label to display for the associated *`body.options.value`* parameter. Data type: String
body.options.renderStyle	Style to use when rendering the associated element. Possible value: data Data type: String
body.options.value	Value to display for the associated *`body.options.label`* parameter. Data type: String
body.promptMsg	Prompt message to display with the picker control. Data type: String
body.required	Flag that indicates whether the end user must respond to the query in the body element. Possible values: • true: Required • false: Optional Data type: Boolean
body.spinnerType	Only returned when *`actionType`* is `StartSpinner`. Type of spinner shown to chat user. Possible values: `wait_time` : Message indicating the amount of delay before being transferred to a live agent. Data type: String
body.style	Style of body element. Possible values: • button • carousel • list • null Data type: String
body.templateName	Name of the template to use to display the associated card.

Name	Description
	Data type: String
body.type	Only returned for DefaultOutputLink. Type of return data. Possible values: link Data type: String
body.uiType	Type of body element. The possible values depend on the value in the *body.group* parameter. These values map back to the controls defined in the Virtual Agent Designer. For more information, see Getting started with Virtual Agent Designer. Possible values: • ActionMsg • DefaultOutputCard OutputCard • DefaultDate ○ Date ○ DateTime ○ Time • DefaultGroupedPartsOutputControl GroupedPartsOutputControl • DefaultHtml OutputHtml • DefaultOutputImage OutputImage • DefaultOutputLink OutputLink • DefaultText ○ InputText ○ OutputText ○ FileUpload • DefaultPicker ○ Picker ○ TopicPickerControl ○ Boolean

Name	Description
	Data type: String
body.value	Data to use to process the body element. The type of information that is passed back depends on the type of body element. OutputLink: Object. `"value": { "action": "String" }` OutputImage: String. Image URL. OutputHtml: String. HTML that the client needs to render. Data type: String or Object
body.value.action	Only returned for DefaultOutputLink. URL of returned link. Data type: String
body.waitTime	Amount of time that the user has to wait before being connected to a live agent. Data type: String
body.width	Width of the associated HTML element. Data type: Number Unit: Pixels
clientSessionId	Unique client session identifier of the chat application/service that the end user is using to communicate with the ServiceNow bot. Data type: String
clientVariables	JSON-formatted name-value pairs that are copied from what is passed in the *`clientVariables`* parameter in the request body. These values aren't processed by the endpoint, but can be used to keep specific customer information attached to the conversation. Data type: Object
completed	Flag that indicates whether the ServiceNow Virtual Agent has successfully completed the conversation. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Conversation has been successfully completed. • false: Conversation isn't complete and this parameter isn't returned in the response. Data type: Boolean
enterpriseId	Currently unused.
message	Details of the message sent to the ServiceNow VA. This is the same as the passed in message object. Data type: Object `"message": { "attachment": {Object}, "clientMessageId": "String", "text": "String", "typed": Boolean }`
message.attachment	Details of the attachment. Attachments can be either a file or a URL. Data type: Object `"attachment": { "clientAttachmentId": "String", "contentType": "String", "fileName": "String", "url": "String"`
message.attachment.clientAttachmentId	Unique identifier of the attachment sent to the ServiceNow VA. The format of this identifier is determined by the implementer. Data type: String
message.attachment.contentType	Standard mime type of the attachment. Possible values (not case-sensitive): • text/plain • application/pdf • application/msword • image/png • image/jpeg • video/mpeg Data type: String
message.attachment.fileName	File name of the attachment. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
message.attachment.url	URL where the attachment is located. Data type: String
message.clientMessageId	Unique alphanumeric identifier for the message. Data type: String
message.text	Message text. Data type: String Maximum length: Unlimited
message.typed	Flag that indicates whether the message was typed in or was an option selection (selected). Valid values: • true: Message was typed in by the user. • false: Message was an option selection. Data type: Boolean
nowBotId	Currently unused.
nowSessionId	Currently unused.
requestId	Unique identifier for this request. Data type: String
score	Intent confidence score from the ServiceNow NLU model, specified as a percent, such as 87.3%. This score enables the primary bot to make the decision whether to surface the associated intent based on the primary bot's NLU model's confidence threshold. The ServiceNow NLU model's confidence threshold is ignored on the ServiceNow instance so that the primary bot's NLU model's confidence threshold can be consistently applied across all secondary bots. Data type: Number
takeControl	Flag that indicates that the ServiceNow Virtual Agent wants to hand control back over to the primary bot. Valid values: • true: Return control to the primary bot. • false: Keep control. Data type: Boolean Default: false
userId	Identifier of the end user who is interacting with the bot.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String

Example: Start a conversation using the START_CONVERSATION action to start a conversation

The following example shows how to use the START_CONVERSATION action to start a conversation with Virtual Agent. This call directs the user to the greeting topic.

```
curl
 "https://instance.servicenow.com/api/sn_va_as_service/bot/integ
ration" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  "requestId": "asd2423-sda23-qwe23-we23",
  "action": "START_CONVERSATION",
  "enterpriseId": "ServiceNow",
  "nowBotId": "A85PWLERF",
  "clientSessionId": "",
  "nowSessionId": "",
  "message":{
    "text": "",
    "typed": true,
    "clientMessageId": "ABC-123"
  },
  "userId": "beth.anglin",
  "emailId": "beth.anglin@example.com",
  "timestamp": 1588824102,
  "timezone": "America/New_York"
}"
--user "username":"password"
```

The following is the response body sent from the VA to the configured response endpoint.

```
{
  "requestId":"asd2423-sda23-qwe23-we23",
  "clientSessionId":"",
  "nowSessionId":"",
  "message":{
    "text":"",
    "typed":true,
    "clientMessageId":"ABC-123"
  },
  "userId":"beth.anglin",
  "body":[
    {
      "uiType":"OutputText",
      "group":"DefaultText",
      "value":"Hi, I'm your Virtual Agent. Let me know how I can
 help you today.",
      "maskType":"NONE"
    },
    {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "uiType":"TopicPickerControl",
      "group":"DefaultPicker",
      "nluTextEnabled":false,
      "promptMsg":"Hi guest, please enter your request or make a
 selection of what I can help with. You can type help any time
 when you need help.",
      "label":"Show me everything",
      "options":[
        {
          "label":"b2b topic",
          "value":"2bb7bd7670de6010f877c7f188266fc7",
          "enabled":true
        },
        {
           "label":"Live Agent Support.",
           "value":"ce2ee85053130010cf8cddeeff7b12bf",
           "enabled":true
        }
      ]
    }
  ],
  "score":1
}
```

Example: Transfer a conversation to Live Agent using utterance

The following example illustrates how to transfer a conversation to Live Agent, bypassing the greeting topic, by passing `agent` as an utterance in the *`message.text`* parameter. Possible utterance values are defined in the sys_cs_contextual_action table. For additional information on contextual actions, see Contextual actions for custom chat integrations.

```
curl
 "https://instance.servicenow.com/api/sn_va_as_service/bot/integ
ration" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \

  "emailId": "beth.anglin@example.com",
  "timestamp": 1588824102,
  "timezone": "America/New_York"
}"
--user "username":"password"
```

The following is the response body sent from the VA to the configured response endpoint showing the conversation ended.

```
{
  "requestId":"sad-sjg554-qwe23-we23",
  "clientSessionId":"",
  "nowSessionId":"",
  "message":{
    "text":"",
    "typed":true,
    "clientMessageId":"ABC-123"
  },
  "userId":"beth.anglin",
  "body":[
    {
      "uiType":"OutputText",
      "group":"DefaultText",
      "value":"The conversation has ended. If you need help
 again, type hi.",
      "maskType":"NONE"
    }
  ],
  "completed":true,
  "score":1
}
```

Example: Use commands defined in the sys_cs_contextual_action table as an utterance to start a conversation with Virtual Agent

The following example shows how to use the *Hi* command defined in the sys_cs_contextual_action table as an utterance to start a conversation with Virtual Agent instead of setting the *action* parameter to START_CONVERSATION as shown in prior examples. This example shows using one of the language variants of the *Hi* command, "hola".

```

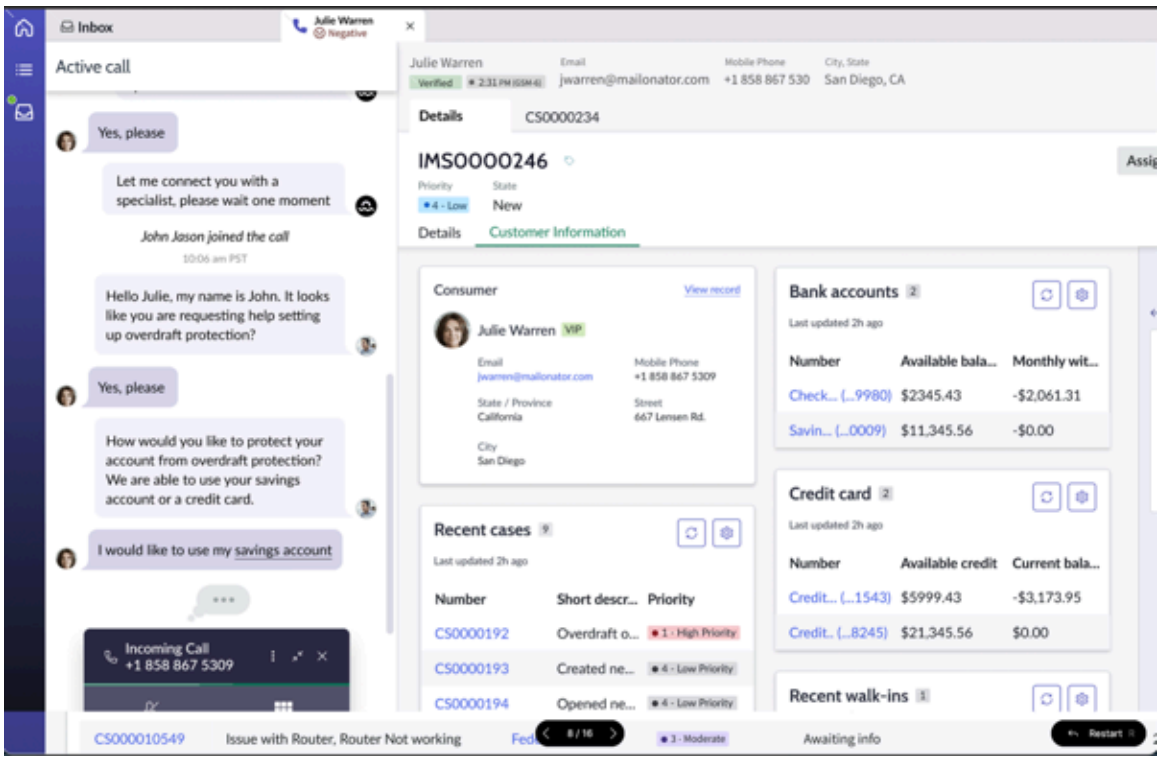
Voice Interaction Resource API

The *Voice Interaction* API provides endpoints to transcribe and store voice interactions between agents and callers during a telephone conversation. It works in conjunction with Virtual Agent and Live Agent chats.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use this API to persist transcribed messages from an on-going phone call in real-time or to transcribe and store an existing voice conversation recording for historical purposes. Transcribed messages appear in Agent Workspace, allowing agents to leverage features such as agent assist and search, while talking to a caller. Transcribed messages are persisted in the Conversation Message [sys_cs_message] table.



Call flow

The following call flow shows how to use the *`Voice Interaction`* API to create a voice interaction record, transcribe and store the messages within that voice conversation, and then close the voice conversation record. You can also use business rules and other scripts to perform this functionality, however, this type of implementation is not covered in this section.

1. First, call the Voice Interaction Resource - POST /cs/voice-interactions endpoint to create a voice interaction record in the Interaction [interaction] table.
2. Then call the Voice Interaction Resource - POST /cs/voice-interactions/{interactionId}/messages endpoint to store translated messages from the voice conversation into the Conversation Message table. If you are processing a real-time conversation, you should call this endpoint frequently, so that the messages appear in Agent Workspace in a timely manner. When processing a recording for historical purposes, you can pass all messages in a single endpoint call.
3. Once you are finished persisting the voice messages, call the Voice Interaction Resource - PATCH /cs/voice-interactions/{interactionId}/state endpoint to terminate the capture and close the voice interaction record.

Availability

This API is available in the base ServiceNow system. Access is restricted by the ACLs imposed on the Interaction [interaction] and Conversation [sys_cs_conversation] tables.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Voice Interaction Resource - PATCH /cs/voice-interactions/{interactionId}/state

Terminates the specified voice interaction. Once called, no additional voice messages are translated and stored for the phone conversation.

URL format

Versioned URL: `/api/now/{api_version}/cs/voice-interactions/{interactionId}/state`

Default URL: `/api/now/v1/cs/voice-interactions/{interactionId}/state`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
interactionId	Sys_id of the interaction record whose voice interaction to terminate. Located in the Interaction [interaction] table and passed back by the Voice Interaction Resource - POST /cs/voice-interactions endpoint. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
recordingURL	URL where the original voice recording is located. If configured to do so, this URL appears in Agent Workspace. Data type: String Default: None
state	Required. State of the voice interaction. Only supported value: closed_complete Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Badly formed JSON or required parameters were not passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Status of the operation. Possible values: • `Success` • `Failed` If an error is encountered, a message that describes the error is also returned. If the error is on the ServiceNow instance, the instance logs the associated stack trace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: cURL request

The following example shows how to terminate a voice instance.

```
curl "http://instance.servicenow.com/api/now/v1/
 cs/voice-interactions/86837a386f0331003b3c498f5d3ee4ca/state" \
--request PATCH \
--header "Content-Type: application/json" \
--header "Accept:application/json" \
--user 'username':'password' \
-d {
  "state": "closed_complete",
  "recordingURL": "https: //zoom_instance/rec/QbF7XmPFHPlX1LG"
}'
```

Response:

```
{
  "result": "Success"
}
```

Voice Interaction Resource - POST /cs/voice-interactions

Creates a voice interaction record within the Interaction [interaction] table.

You must create this record before trying to save any transcribed voice messages. You can also use this endpoint to assign a call to a specific agent by passing in their specific user ID.

URL format

Versioned URL: `/api/now/{api_version}/cs/voice-interactions`

Default URL: `/api/now/v1/cs/voice-interactions`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
agentId	Unique identifier of the agent to assign the voice interaction to. Located in the User ID field in the User [sys_user] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String Default: Invoke Virtual Agent
callerPhoneNumber	Caller's callback phone number. This is the number the agent uses to reach the caller in case the call drops. Data type: String Format: E.164 standard compliant Default: None
clientSessionId	Unique identifier of a record in an external system used to track this phone call. This information links the records between the two systems. Data type: String Default: None
inboundId	Unique identifier of the application provider for the voice service. Located in the Inbound ID field in the Provider Channel Application [sys_cs_provider_application] table. Data type: String Default: Pulled from chat
userId	Required. Phone number of the caller who made the call associated with the voice transaction. Data type: String Format: Defined by the software that created the voice conversation script. Typically E.164 standard compliant.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Badly formed JSON or required parameters were not passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
interactionId	Sys_id of the newly created voice interaction record. Located in the Interaction [interaction] table. Use this sys_id when: • Calling the Voice Interaction Resource - POST /cs/voice-interactions/{interactionId}/messages endpoint to add a message to the voice interaction. • Calling the Voice Interaction Resource - PATCH /cs/voice-interactions/{interactionId}/state endpoint to end the voice interaction. Data type: String

Example: cURL request

The following code example shows how to initiate a voice interaction and transfer the call to a specific agent.

```
curl
 "http://instance.servicenow.com/api/now/v1/cs/voice-interactio
ns" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password' \
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--header "Content-Type: application/json"\
-d '{
  "userId": "+14089178877",
  "agentId": "beth.anglin",
  "callerPhoneNumber": "+14089178878",
  "clientSessionId": "f8453abb-a33d-45b7-bf01-52b7a821e99z"
}'
```

Response:

```
{
  "result": {
    "interactionId": "4462cb4753751110b6e8ddeeff7b12ca"
  }
}
```

Voice Interaction Resource - POST /cs/voice-interactions/{interactionId}/conversation

Creates a conversation record within the Conversation [sys_cs_conversation] table for the specified interaction.

URL format

Versioned URL: `/api/now/{api_version}/cs/voice-interactions/{interactionId}/conversation`

Default URL: `/api/now/v1/cs/voice-interactions/{interactionId}/conversation`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
interactionId	Sys_id of the interaction record for which to create the conversation record. This value is returned by the Voice Interaction Resource - POST /cs/voice-interactions endpoint and stored in the Interaction [interaction] table. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
agentId	Unique identifier of the agent to assign the voice interaction to. Located in the User ID field in the User [sys_user] table. Data type: String Default: Invoke Virtual Agent
callerPhoneNumber	Caller's callback phone number. This is the number the agent uses to reach the caller in case the call drops. Data type: String Format: E.164 standard compliant Default: None
clientSessionId	Unique identifier of a record in an external system used to track this phone call. This information links the records between the two systems. Data type: String Default: None
inboundId	Unique identifier of the application provider for the voice service. Located in the Inbound ID field in the Provider Channel Application [sys_cs_provider_application] table. Data type: String Default: Pull from the chat
userId	Required. Phone number of the caller who made the call associated with the voice transaction. Data type: String Format: Defined by the software that created the voice conversation script. Typically E.164 standard compliant.

{
  "result": "a47e1afdb7471110b6e8bc15ae11a934"
}
```

Voice Interaction Resource - POST /cs/voice-interactions/{interactionId}/messages

Adds the specified voice conversations messages to the specified voice transaction record. These messages are typically generated using third-party vendor software. Currently, only Amazon Connect is supported.

You can call this endpoint multiple times during real-time transcribing of the call or pass all messages in a single call if you are transcribing the call for historical purposes. If you are processing a real-time conversation, you should call this endpoint frequently, so that the messages appear in Agent Workspace in a timely manner. Messages are ordered based on their start and end times in relation to the start of the call.

URL format

Versioned URL: `/api/now/{api_version}/cs/voice-interactions/{interactionId}/messages`

Default URL: `/api/now/v1/cs/voice-interactions/{interactionId}/messages`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
interactionId	Sys_id of the interaction record to add the specified messages to. This value is returned by the Voice Interaction Resource - POST /cs/voice-interactions endpoint and stored in the Interaction [interaction] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (Amazon Connect)

Name	Description
<json_string>	List of messages to attach to the specified voice interaction. `"<json_string>":[ { "attributes": [Array],`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (Amazon Connect) (continued)

Name	Description

	<pre>"beginOffsetMillis": Long,
	"content": "String"
	"endOffsetMillis": Long,
	"id": "String",
	"isEvent": Boolean,
	"isInternalMessage": Boolean,
	"loudnessScore": "Number",
	"participantId": "String",
	"sentiment": "String"
	}
	]</pre>

<json_string>.attributes	Key-value pairs to associate to the voice interaction. These can be any type of data object, from simple objects to complex compound objects. They are used as unique identifiers when invoking Amazon Web Services APIs. Data type: Array of Objects Default: None
<json_string>.beginOffsetMillis	Required. Time offset between the start of the voice interaction and the start of the associated message. For example: "beginOffsetMillis": 2650. Data type: Long Unit: Milliseconds
<json_string>.content	Required. Text of the message to add to the voice interaction. Data type: String
<json_string>.endOffsetMillis	Required. Time offset between the start of the voice interaction and the end of the message. For example: "endOffsetMillis": 9380. Data type: Long Unit: Milliseconds
<json_string>.id	Message UUID of the source of this voice conversation, such as for AmazonConnect. Sets the source message ID column value. Data type: String Default: None
<json_string>.isEvent	Set by Amazon Connect but not currently used by the method. Flag that indicates whether the associated message is an event. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (Amazon Connect) (continued)

Name	Description
	• true: Message is an event. • false: Message is not an event. Data type: Boolean Default: false
<json_string>.isInternalMessage	Flag that indicates whether this is an internal message and should not be shown to the caller. Transcriptions are typically considered internal messages and only appear for the agent and not to the caller. In addition, Agent Whisper is used when a silent third-party is chatting with or is brought into a phone conversation without the caller knowing and offers advice to an agent. The caller does not hear or see these messages, but the agent does. Valid values: • true: Internal message, do not display to the caller. • false: Not an internal message, display to caller. Data type: Boolean Default: false
<json_string>.loudnessScore	Measurement as to how loudly a customer or agent is speaking during a call. Contact Lens displays an analysis of the conversation that shows where they may be talking loudly and have a negative sentiment. Data type: Number Range: -1.0 (negative) to 1.0 (positive) Default: Null
<json_string>.participantId	Required. Participant associated with the message. Valid values: • CUSTOMER • AGENT Data type: String
<json_string>.sentiment	Sentiment of the message. This value is generated by a third-party provider. Based on the ServiceNow instance configuration settings, this value is then translated to be either positive, negative, or neutral and is stored in the conversation and interaction record.

Name	Description
transcript.isInternalMessage	Flag that indicates whether this is an internal message and should not be shown to the caller. Transcriptions are typically considered internal messages and only appear for the agent and not to the caller. In addition, Agent Whisper is used when a silent third-party is chatting with or is brought into a phone conversation without the caller knowing and offers advice to an agent. The caller does not hear or see these messages, but the agent does. Valid values: • true: Internal message, do not display to the caller. • false: Not an internal message, display to caller. Data type: Boolean Default: false
transcript.loudnessScore	Measurement as to how loudly a customer or agent is speaking during a call. Contact Lens displays an analysis of the conversation that shows where they may be talking loudly and have a negative sentiment. Data type: Number Range: -1.0 (negative) to 1.0 (positive) Default: Null
transcript.participantId	Required. Participant associated with the message. Valid values: • CUSTOMER • AGENT Data type: String
transcript.sentiment	Sentiment of the message. This value is generated by a third-party provider. Based on the ServiceNow instance configuration settings, this value is then translated to be either positive, negative, or neutral and is stored in the conversation and interaction record. Valid values: • NEGATIVE • NEUTRAL • POSITIVE

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String Default: Null

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Badly formed JSON or required parameters were not passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Message that describes the results of the call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
Conversation id	Sys_id of the voice conversation table where the messages were attached. Located in the Conversation [sys_cs_message_conversation] table. Data type: String

Example: cURL request

The following example shows how to add messages to an existing voice interaction record.

```
curl "http://
instance.servicenow.com/api/now/v1/cs/voice-interactions/transcr
ipt" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type: application/json"\
--user 'username':'password' \
-d ' {
  "interactionId": "e67a6c30c7233010967a34c91dc26068",
  "source": "Amazon Connect",
  "conversationStarted": "2021-08-06 15:07:51",
  "transcript": [
    {
      "isEvent": "False",
      "isInternalMessage": "False",
      "beginOffsetMillis": 100000,
      "content": "This is John. How can I help you?",
      "endOffsetMillis": 150000,
      "id": "954c4edc-31a8-48b0-8f6e-7fa0c4ca00a8",
      "participantId": "AGENT",
      "sentiment": "NEUTRAL"
    },
    {
      "isEvent": "False",
      "isInternalMessage": "False",
      "beginOffsetMillis": 200000,
      "content": "Uh, yes, John. Um, I'm a little frustrated
 right now.",
      "endOffsetMillis": 25000,
      "id": "18bcf19c-4a9b-4af1-9bd7-7bfb5ba53b9f",
      "participantId": "CUSTOMER",
      "sentiment": "NEGATIVE"
    }
  ]
} '
```

Response:

```
{
  "result": "Voice conversation transcript has been successfully saved. C
onversation id: 8439d3c753b51110b6e8ddeeff7b12e2"
}
```

Workplace Connector Webhook API

The *Workplace Connector Webhook* API is a generic interface that enables data from different kinds of workplace hardware or sensors (such as badging systems or occupancy sensors) to be stored in Workplace Service Delivery tables.

This API runs in the `sn_wsd_wc` namespace. To access this API the Workplace Connectors (com.sn_wsd_wc) plugin must be activated.

Before calling this API, you must configure records in the Connector Configuration [sn_wsd_wc_connector_config] and Provider Configuration [sn_wsd_wc_provider_config] tables. For information on how to configure these records, see Configure Workplace Connectors.

In addition, you must set up an extension point that defines the data conversion/mapping from the hardware/sensor-based event payload to the target ServiceNow table, such as the Employee Attendance Data [sn_wsd_wc_employee_attendance_data] table.

For additional information on workplace connector webhooks, see Workplace Connectors.

Workplace Connector Webhook - POST /workplace_connector_webhook/event

Creates a record in the Connector Events [sn_wsd_wc_connector_events] table and then stores the hardware/sensor-based event data passed in the endpoint's payload into the Payload field of that record.

After the endpoint stores the payload, it sets the State field within the Connector Events record to `new`, indicating the payload hasn't been processed.

A scheduled job locates the new badging records in the Connector Events table and transforms and writes them to the Employee Attendance Data [sn_wsd_wc_employee_attendance_data] table. The State field is then set to `processed`.

The mapping of the data between the payload data in the Connector Events record and the Employee Attendance Data record is defined in an extension point. This extension point is identified in the Extension Point Definition field in the associated Connector Configuration [sn_wsd_wc_connector_config] table. For this endpoint, this is the BadgingDataHandler extension point.

Note: Records in the Connector Events table in the `processed` state are purged after two days from the creation date. Records in the `error` state are purged after seven days from the date of creation. Records in the `new` state are never purged.

URL format

Versioned URL: `/api/sn_wsd_wc/v1/workplace_connector_webhook/event`

Default URL: `/api/sn_wsd_wc/workplace_connector_webhook/event`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
ni.nolog.id	Required. Sys_id of the provider configuration record associated with the hardware that generated the event information. Located in the Provider Configuration [sn_wsd_wc_provider_config] table. Data type: String
token_name	Name of the security token, such as a user name or other value that identifies the security token. Used for authenticating the request. Located in the Provider configuration [sn_wsd_wc_provider_config] table. Data type: String
token_value	Value associated with the security token, such as a password. Used for authenticating the request. Located in the Provider configuration [sn_wsd_wc_provider_config] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
<payload>	Name-value pairs of the hardware/sensor-based event data. The names must correspond to the names identified in the BadgingDataHandler extension point. For example: `{ "Time zone": "(UTC-08:00) Pacific Time (US & Canada)", "Event": "Access granted", "Door": "L_SJC005_B1.101_ELEVATOR 2 INT", "Side": "Reader - In", "Cardholder": "ninat.salem", "First name": "Nina T", "Last name": "Salem", "Credential": " ninat.salem's credential", "Employee ID (Cardholder)": "10097", "Event timestamp": "11/07/2022 00:56:57" }` You can pass multiple event's data within a single endpoint call. Pass each event's data in a separate object. Each event's data is stored in a separate Employee Attendance Data record. **Note:** Ensure that any provided timestamp adheres to ISO 8601 formatting to avoid any issues with date parsing. Data type: JSON object

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

error	Description of any error that occurred during the processing of the data.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`"status": "String"`
	`}`

error.detail	Information that provides details about the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
error.message	Error message. Data type: String
status	Status of the endpoint processing. Possible values: • failure: Endpoint failed. Refer to the *error* object for additional details. • success: Endpoint completed successfully. Record was added. Data type: String

Example: cURL request

The following code example shows how to call this endpoint to add multiple card reader events to the Connector Events table. Before processing the request, the request is authenticated.

```
curl
 http://instance.servicenow.com/api/sn_wsd_wc/v1/workplace_conne
ctor_webhook/event?token_name=token&ni.nolog.id=8e666cb0a3053110
bc6e146546fcdad1&token_value=babugosha  \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data --data "{
  \"Time zone\": \"(UTC+02:00) Jerusalem\",
  \"Event\": \"Access granted\",
  \"Door\": \"L_TLV001_A3.07_KITCHEN AREA INT\",
  \"Side\": \"Reader - In\",
  \"Cardholder\": \" ninat.alem\",
  \"First name\": \" Nina T\",
  \"Last name\": \" Salem\",
  \"Credential\": \" ninat.salem's credential\",
  \"Employee ID (Cardholder)\": 10097,
  \"Event timestamp\": \"11/07/2022 10:57:24\"
}
{
  \"Time zone\": \"(UTC+02:00) Jerusalem\",
  \"Event\": \"Access granted\",
  \"Door\": \"L_TLV003_A4.07_FRONT ENT\",
  \"Side\": \"Reader - In\",
  \"Cardholder\": \" joe.blue\",
  \"First name\": \" Joe\",
  \"Last name\": \" Blue\",
  \"Credential\": \" joe.blue's credential\",
  \"Employee ID (Cardholder)\": 24098,
  \"Event timestamp\": \"11/07/2022 10:59:33\"
}"
```

WSD Extra Service Request API

The Workplace Service Delivery (WSD) *`Extra Service Request`* API provides endpoints to manage extra service requests for reservations.

To access this API, the caller must have the sn_wsd_core.workplace_user role.

This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Extra Service - GET /sn_wsd_rsv/extra_service/list_loc_layouts

Returns the details about the associated location layouts for a specified workplace location.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/extra_service/list_loc_layouts`

Default URL: `/api/sn_wsd_rsv/extra_service/list_loc_layouts`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
location	Required. Sys_id of the workplace location for which to return the location layout details. Located in the Workplace Location [sn_wsd_core_workplace_location] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String

Request body parameters

Name	Description
None	Required.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters

Name	Description
result	List of the layouts associated with the specified workplace location. Data type: Array of Objects `"result": [ { "capacity": Number, "cleanup_duration": "String", "image": {Object}, "is_default": Boolean, "max_capacity": Number, "name": "String", "preparation_duration": "String", "short_description": "String", "sys_id": "String" } ]`
result.capacity	Number of people that will attend the meeting. Data type: Number
result.cleanup_duration	Amount of time it takes to clean the reservable for this layout. Data type: Number Unit: Milliseconds
result.image	Details about an image that represents the layout for the associated reservable. Located in the Images [db_image] table. `"image": { "link": "String", "sys_id": "String" }`
result.image.link	Link to an image that represents the layout for this reservable. Located in the Images [db_image] table. Data type: String
result.image.sys_id	Sys_id of the associated image record. Data type: String
result.is_default	Flag that indicates whether the associated layout is the default for the reservable. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Default. • false: Not default. Data type: Boolean
result.name	Name of the location layout. Data type: String
result.max_capacity	Maximum number of people that the layout associated with the reservable can accommodate. Data type: Number
result.preparation_duration	Amount of time it takes to prepare the associated location layout. Data type: Number Unit: Milliseconds
result.short_description	Brief description of the location layout. Data type: String
result.sys_id	Sys_id of the location layout. Located in the Layout [sn_wsd_rsv_layout] table. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
"http://instance.servicenow.com/api/sn_wsd_rsv/extra_service/list_loc_layouts&location=d2716d4adb7210106c731dcd13961994" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": [
    {
      "sys_id": "f4fee556534301103cf7ddeeff7b12ed",
      "name": "Test",
      "short_description": "test",
      "is_default": false,
      "image": {

```
      "cleanup_duration": 86400000
    }
  ]
}
```

WSD Extra Service - GET /api/sn_wsd_rsv/extra_service/list_loc_standard_services

Returns the details about the associated standard services for a specified workplace location.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/extra_service/list_loc_standard_services`

Default URL: `/api/sn_wsd_rsv/extra_service/list_loc_standard_services`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
location	Required. Sys_id of the workplace location for which to return the location layout standard services. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*.

© 2026 ServiceNow, Inc. All rights reserved.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result.standard_services	Associated standard services, such as flip chart, projector screen, and whiteboard and markers. Data type: Array of Objects `"standard_services": [ { "font_awesome_icon": "String", "name": "String", "short_description": "String", "sys_id": "String" } ]`
result.standard_services.font_awesome_icon	Name of the thumbnail icon associated with the standard service. Data type: String
result.standard_services.name	Name of the standard service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.standard_services.short_description	Brief description of the standard service. Data type: String
result.standard_services.sys_id	Sys_id of the standard service record. Located in the Standard Service [sn_wsd_rsv_standard_service] table. Data type: String

Example: cURL request

The following code example shows how to call this endpoint to obtain the standard services.

```
"http://instance.servicenow.com/api/sn_wsd_rsv/extra_service/lis
t_loc_standard_services&location=d2716d4adb7210106c731dcd139619
94" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": [
    {
      "sys_id": "9b01458edb7650106c731dcd13961945",
      "name": "Flip chart",
      "short_description": "Flip chart with paper sheets",
      "font_awesome_icon": "fa-calendar-o"
    },
    {
      "sys_id": "abd0c18edb7650106c731dcd13961965",
      "name": "Projector screen",
      "short_description": "Connect laptop to screen (HDMI and
 DVI)",
      "font_awesome_icon": "fa-caret-square-o-right"
    },
    {
      "sys_id": "9841858edb7650106c731dcd1396193c",
      "name": "Whiteboard",
      "short_description": "Whiteboard and markers",
      "font_awesome_icon": "fa-pencil-square-o"
    }
  ]
}
```

WSD Extra Service API

The Workplace Service Delivery (WSD) *`Extra Service`* API provides endpoints to retrieve extra services, such as location layouts and standard services of a workplace location.

To access this API, the caller must have the sn_wsd_core.workplace_user role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API runs in the `sn_wsd_rsv` namespace. To access this API the Workplace Reservation Management (sn_wsd_rsv) plugin must be activated.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Extra Service Request - PATCH /api/sn_wsd_rsv/wsd_extra_service_request/reservation/{sys_id}

Returns the extra service requests that are associated to a single reservation.

Note: This endpoint does not work for group or multi reservations.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/wsd_extra_service_request/reservation/{sys_id}`

Default URL: `/api/sn_wsd_rsv/wsd_extra_service_request/reservation/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation record for which to return the extra service request details. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Reservation sys_id is missing, invalid, or does not exist.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Details about the specified extra service request. Data type: Object `{ "result": { "reservableId": "String", "reservationId": "String", "serviceCategories": {Object}, "serviceTimes": {Object} } }`
result.reservableId	Sys_id of the workplace location that the reservation is created against. Located in the Workplace Location [sn_wsd_core_workplace_location] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.reservationId	Sys_id of the reservation for which to return the extra service request details. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
result.serviceCategories	Details about the service category of the associated extra services. Data type: `"serviceCategories": { "String": { "categoryFriendlyName": "String", "categoryCurrencyCode": "String", "comment": "String", "flexibleServices": [Array], "serviceTimes": {Object} } }`
result.serviceCategories.categoryFriendly Name	User friendly name of the category of the workplace service or extra service, such as Space arrangement. Data type: String
result.serviceCategories. categoryCurrencyCode	Currency code used to calculate the cost of the workplace service item or extra service. Data type: String
result.serviceCategories.comment	Comments about the service category. Data type: String
result.flexibleServices	Details about each of the workplace service items or extra service requested for the reservation. Data type: Array of Objects `"flexibleServices": [ { "capacity": Number, "capacityEnabled": Boolean, "category": "String", "categoryComment": "String", "categoryFriendlyName": "String",`

WSD Extra Service Request - PATCH /api/sn_wsd_rsv/wsd_extra_service_request/submit

Adds an new or updates an existing extra service request to a specified single reservation.

Note: This endpoint does not work for group or multi reservations.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/wsd_extra_service_request/submit`

Default URL: `/api/sn_wsd_rsv/wsd_extra_service_request/submit`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None

Request body parameters

Name	Description
reservationDateTimeChanged	Flag that indicates whether the reservation date and time has changed. Valid values: • true: The reservation date and time was changed. • false: The reservation date and time was not changed. Data type: Boolean Default: false
reservableId	Required. Sys_id of the workplace location that the reservation is created against. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
reservationId	Required. Sys_id of the reservation for which to add the extra service requests. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
serviceCategories	Required. List of workplace service items or extra services to add to the reservation. Data type: Array of Objects `"serviceCategories": [ { "category": "String", "comment": "String", "flexibleServices": [Array] } ]`
serviceCategories.category	Required. Sys_id or name of the workplace service to add to the reservation. Located in the Workplace Service [sn_wsd_case_workplace_service] table. Data type: String
serviceCategories.comment	Required. Comments about the service category. Data type: String

Request body parameters (continued)

Name	Description
serviceCategories.flexibleServices	Required. Details about each of the workplace service items or extra service to add to or cancel from the reservation. Data type: Array of Objects `"flexibleServices": [ { "cancelFlag": Boolean, "comment": "String", "deliveryTime": "String", "extraServiceRequestId": "String", "flexibleServiceId": "String", "quantity": Number } ]`
serviceCategories.flexibleServices.cancelFlag	Flag that indicates whether to cancel the specified extra service request. Possible values: • true: Delete the associated extra service request. • false: No operation. Data type: Boolean Default: false
serviceCategories.flexibleServices.comment	Required. Additional comments about the workplace service item or extra service. Data type: String
serviceCategories.flexibleServices. deliveryTime	Required. Delivery time of the workplace service item or extra service. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
serviceCategories.flexibleServices. extraServiceRequestId	Sys_id of the existing extra service request. Provide this parameter to update an existing extra service request. Located in the Request Service Items [sn_wsd_case_service_item_request] table. Data type: String

Request body parameters (continued)

Name	Description
serviceCategories.flexibleServices. flexibleServiceId	Required. Sys_id of the extra service or workplace service item. Located in the Workplace Service Item [sn_wsd_case_workplace_service_item] table. Data type: String
serviceCategories.flexibleServices.quantity	Required. Number of extra service items requested. Data type: Number

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Return results for the request. Data type: Object `"result": { "extraServiceRequests": [Array], "reservableId": "String", "reservationId": "String", "success": Boolean }`
result.extraServiceRequests	Details about the added or cancelled extra service request. Data type: Array of Object `"result": { "extraServiceRequests": [ { "flexibleServiceId": "String", "requestId": "String" } ] }`
result.extraServiceRequests.flexibleServiceId	Sys_id of the extra service item request that was added to the reservation. Located in the Workplace Service Item [sn_wsd_case_workplace_service_item] table. Data type: String
result.extraServiceRequests.requestId	Sys_id of the extra service item that was added to the request. Located in the Request Service Items [sn_wsd_case_service_item_request] table. Data type: String
result.reservableId	Sys_id of the workplace location that the reservation is created against. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
result.reservationId	Sys_id of the reservation for which the extra service request was added. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.success	Flag that indicates whether the extra service request was successfully added to the reservation. Possible values: • true: Successfully added. • false: Operation failed. Data type: Boolean

Example: cURL request

The following code example shows how to add an extra service item request to a reservation.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/wsd_extra_servic
e_request/submit" \
--request POST \
--header "Accept:application/json" \
--header "Concept-Type:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "reservationId": "2dc2efdf531701103cf7ddeeff7b1227",
    "reservableId": "02000d4edb7650106c731dcd13961914",
    "extraServiceRequests": [
      {
        "requestId": "bea46dbc53e701103cf7ddeeff7b1236",
        "flexibleServiceId": "e2ecf7b307500110c9b36b6e0ad30033"
      }
],
    "success": true
  }
}
```

WSD Group Reservation API

The Workplace Service Delivery (WSD) *`Group Reservation`* API provides endpoints for managing group reservations.

Group reservations allow you to reserve different locations for various people (groups) for the same meeting.

This API runs in the `sn_wsd_rsv` namespace. To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Reservation Management (sn_wsd_rsv) plugin must be activated.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Group Reservation - GET /api/sn_wsd_rsv/group_reservation/{parent_id}

Returns the parent and all child reservations for a specified group reservation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/group_reservation/{parent_id}`

Default URL: `/api/sn_wsd_rsv/group_reservation/{parent_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
parent_id	Sys_id of the parent reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. When a group reservation is created, one group parent record and one or more child reservation records are created. Reservation records contain a field called reservation_subtype, that indicates the type of reservation record. For group parent records, this field is set to "Group parent" to indicate that it is a group parent record. For child records, this field is set to "Single". Within a child record, the sys_id of the associated parent reservation record is in the source_reservation field. Data type: String

Query parameters

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Invalid or no parent reservation sys_id provided.
404	Access denied. Unable to cancel group reservation. User has insufficient rights to cancel the requested group reservation.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Details about the parent and children reservations associated with the group reservation. Data type: Object `{ "result": { "parent": {Object}, "children": [Array] }`

Example: cURL request

The following code example shows how to retrieve the details for a group reservation.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/group_reservati
on/e2245051533b01103cf7ddeeff7b12d6" \
--request GET \
```

WSD Group Reservation - PATCH /api/sn_wsd_rsv/group_reservation/cancel/{id}

Cancels a specified group reservation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/group_reservation/cancel/{id}`

Default URL: `/api/sn_wsd_rsv/group_reservation/cancel/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the parent reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. When a group reservation is created, one group parent record and one or more child reservation records are created. Reservation records contain a field called reservation_subtype, that indicates the type of reservation record. For group parent records, this field is set to "Group parent" to indicate that it is a group parent record. For child records, this field is set to "Single". Within a child record, the sys_id of the associated parent reservation record is in the source_reservation field. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
cancel_notes	Reason for cancelling the reservation. Data type: String Default: "Canceled reservation via Group cancel"

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Invalid or no parent reservation sys_id provided.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Access denied. Unable to cancel group reservation. User has insufficient rights to cancel the requested group reservation.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Results of the group reservation cancel request.
	
	Data type: Object
	
	`"result": {`
	`  "allChildrenCanceled": Boolean,`
	`  "cancelledParent": Boolean,`
	`  "canceledReservations": [Array],`
	`  "failedChildMeetings": [Array],`
	`  "msg": "String",`
	`  "parent": "String",`
	`  "success": Boolean,`
	`  "user_msg": "String"`
	`}`

Name	Description
result.allChildrenCanceled	Flag that indicates whether all child reservations associated with the group reservation were successfully cancelled. Possible values: • true: Successfully cancelled. • false: Not all child reservations were cancelled. The *failedChildMeetings* parameter contains a list of the sys_ids of the child reservations that were not cancelled. Data type: Boolean
result.cancelledParent	Flag that indicates whether the parent reservation for the group reservation were successfully cancelled. Possible values: • true: Parent reservation was cancelled. • false: Parent reservation was not cancelled. Data type: Boolean
result.canceledReservations	List of sys_ids of the child reservations that were successfully canceled. Data type: Array
result.failedChildMeetings	List of sys_ids of the child reservations that were not canceled. Data type: Array
result.msg	If any reservation failed to cancel, this parameter contains a message about the cause of failure. Data type: String
result.parent	Sys_id of the parent reservation that was cancelled. Data type: String
result.success	Flag that indicates whether the group reservation was successfully cancelled. Possible values: • true: Group reservation was successfully cancelled. • false: One or more of the associated group reservations were not cancelled. Additional details are provided within the results. Data type: Boolean
result.user_msg	Reserved for future use. If any reservation failed to cancel, this parameter contains a translated message about the cause of failure that you can display in the UI.

Name	Description
	Data type: String

Example: cURL request

The following code example shows how to cancel a group reservation.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/group_reservati
on/cancel/22c1aee353af01103cf7ddeeff7b12d5" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"cancel_notes\":\"Need to postpone until next quarter\"
}" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "success": true,
    "canceledReservations": [
      "6ec1aee353af01103cf7ddeeff7b12d8",
      "aac1aee353af01103cf7ddeeff7b12db"
    ],
    "failedChildMeetings": [],
    "cancelledParent": true,
    "allChildrenCanceled": true,
    "msg": "",
    "user_msg": "",
    "parent": "22c1aee353af01103cf7ddeeff7b12d5"
  }
}
```

WSD Group Reservation - PATCH /api/sn_wsd_rsv/group_reservation/update/{id}

Updates a specified group reservation.

You can update the following reservation parameters:

- Subject
- Start date and time
- End date and time
- Shift associated with the reservation
- Workplace location of any child reservation

Note: You must specify at least one of these parameters in the request body of the endpoint call. Parameters that are not passed in are not modified in the associated records.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/group_reservation/update/{id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/sn_wsd_rsv/group_reservation/update/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the parent reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. When a group reservation is created, one group parent record and one or more child reservation records are created. Reservation records contain a field called reservation_subtype, that indicates the type of reservation record. For group parent records, this field is set to "Group parent" to indicate that it is a group parent record. For child records, this field is set to "Single". Within a child record, the sys_id of the associated parent reservation record is in the source_reservation field. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
children	Updated list of child reservations records to associate with the reservation. Data type: Array of Objects `"children": [ { "is_private": Boolean, "location": "String", "requested_for": "String" } ]`
children.is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner. For additional information on these privacy settings, see Location privacy settings and impact. Valid values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	• true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.
children.location	Updated sys_id of the location to reserve. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
children.requested_for	Updated sys_id of the user for whom the reservation is being requested. Located in the User [sys_user] table. Data type: String
end	Updated end time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
requested_for	Sys_id or email address of the user for which the reservation is being made. Located in the User [sys_user] table. Data type: String
reservable_module	Required. Sys_id of the reservable module to associate with the reservation. A reservable module defines the workplace items needed for a reservation. Located in the Reservable Module [sn_wsd_rsv_reservable_module] table. Data type: String
shift	Updated sys_id of the shift to associate with the reservation. Located in the Shift [sn_wsd_core_shift] table. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String
start	Updated start time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss) Default: Empty - start time is specified in child reservations
subject	Updated subject of the meeting associated with the reservation. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Default: Empty
workplace_location	Updated sys_id of the workplace location to associate with the group reservation. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String Default: Empty - locations are specified in child reservations

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Return results from the multi-reservation creation or update. Data type: Object `"result": { "parent": "String", "success": Boolean, "successfulReservations": Array, "unSuccessfulReservations": Array }`
result.parent	Sys_id of the parent reservation that was updated. Data type: String
result.success	Flag that indicates whether the reservation was successfully created. Possible values: • true: Successfully created. • false: Operation failed. Data type: Boolean
result.successfulReservations	List of the reservations that were successfully updated. Data type: Array `"successfulReservations": [ { "msg": "String", "operation": "String" "sys_id": "String", "user_msg": "String" } ]`
result.successfulReservations.msg	Internal message about the update. Provides technical information about the operation. Data type: String
result.successfulReservations.operation	Type of operation that was performed, such as create or update. If a new reservable is added to the group reservation, such as an added room, this value is returned as `create`, otherwise it is set to `update`.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.successfulReservations.sys_id	Sys_id of the reservation that was created. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
result.successfulReservations.user_msg	User message about the update. This message may be translated based on the user's language preference and should be the one that appears in the UI. Data type: String
result.unSuccessfulReservations	List of the reservations that were unsuccessfully updated. Data type: Array `"unSuccessfulReservations": [ { "msg": "String", "operation": "String" "sys_id": "String", "user_msg": "String" } ]`
result.unSuccessfulReservations.msg	Message about the update error. Data type: String
result.unSuccessfulReservations.operation	Type of operation that was performed, such as create or update. Data type: String
result.unSuccessfulReservations.sys_id	Sys_id of the reservation that was created. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
result.unSuccessfulReservations.user_msg	Message about the update error. Data type: String

Example: cURL request

The following example shows how to call this endpoint to update a group reservation.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/group_reservati
on/update/b84e218a87586550cfaa99b73cbb35ec" \
--request PATCH \
--header "Accept:application/json" \
```

Name	Description
	Data type: String
result.parent	Sys_id of the parent reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. When a group reservation is created, one group parent record and one or more child reservation records are created. Reservation records contain a field called reservation_subtype, that indicates the type of reservation record. For group parent records, this field is set to "Group parent" to indicate that it is a group parent record. For child records, this field is set to "Single". Within a child record, the sys_id of the associated parent reservation record is in the source_reservation field. Data type: String
result.success	Flag that indicates whether the reservation was successfully created. Possible values: • true: Successfully created. • false: Operation failed. Data type: Boolean
result.userMsg	If the request fails, message that describes the error. Data type: String

Example: cURL request

The following code example shows how to use this endpoint to create a group reservations.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/group_reservati
on/add" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"reservable_module\": \"5db44502dbb650106c731dcd13961937\",
    \"subject\": \"Test-123\",
    \"reservation_purpose\": \"meeting\",
    \"timezone\": \"US/Pacific\",
    \"children\": [
        {
            \"location\": \"6a11a94adb7210106c731dcd1396194e\",
            \"requested_for\":
 \"62826bf03710200044e0bfc8bcbe5df1\",
            \"is_private\": false
        },
```

```

WSD Multi Reservation API

The Workplace Service Delivery (WSD) *`Multi Reservation`* API provides endpoints for managing reservations with multiple workplace locations.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Safety Management (sn_wsd_core) and Workplace Reservation Management (sn_wsd_rsv) plugins must be activated.

This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Multi Reservation - PATCH /api/sn_wsd_rsv/multi_reservation/cancel/{sys_id}

Cancels a specified multi-reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/multi_reservation/cancel/{sys_id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/sn_wsd_rsv/multi_reservation/cancel/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the multi-reservation to cancel. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
cancel_notes	Reason for cancelling the reservation. Data type: String

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Details of the results of the cancel request. Data type: Object `"result": { "error": "String", "parent": "String", "success": Boolean, "successfulReservations": [Array], "unSuccessfulReservations": [Array] }`
result.error	Message that describes the associated error. Data type: String
result.parent	Sys_id of the parent reservation. A parent may have one or more child reservations associated to it. Data type: String
result.success	Flag that indicates whether the reservation was successfully cancelled. Possible values: • true: Successfully cancelled. • false: Reservation was not cancelled. Data type: Boolean
result.successfulReservations	Details about the successful cancellation of the multi-reservation.

Name	Description
	Data type: Array of Objects `"successfulReservations": [ { "msg": "String", "success": Boolean, "sys_id": "String" } ]`
result.successfulReservations.msg	Cancellation message. Data type: String
result.successfulReservations.success	Flag that indicates whether the reservation was successfully cancelled. Possible values: • true: Successfully cancelled. • false: Operation failed. Data type: Boolean
result.successfulReservations.sys_id	Sys_id of the reservation that was cancelled. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
result.unSuccessfulReservations	Details about the unsuccessful cancellation of the multi-reservation. Data type: Array of Objects `"unSuccessfulReservations": [ { "msg": "String", "success": Boolean, "sys_id": "String" } ]`
result.unSuccessfulReservations.msg	Cancellation message. Data type: String
result.unSuccessfulReservations.success	Flag that indicates whether the reservation was successfully cancelled. Possible values: • true: Successfully cancelled. • false: Operation failed. Data type: Boolean

Name	Description
result.unSuccessfulReservations.sys_id	Sys_id of the reservation that was not cancelled. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

Example: cURL request

The following code example shows how to cancel a multi-reservations.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/multi_reservati
on/cancel/1b1fdf5987ab01506342b846dabb35ec" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"cancel_notes\":\"Meeting no longer needed.\"}" \
--user "username":"password'"
```

Return results:

```
{
  "result": {
    "success": true,
    "successfulReservations": [
      {
        "success": true,
        "msg": "Cancelled successfully.",
        "sys_id": "5b1f9f1d87ab01506342b846dabb35a4"
      },
      {
        "success": true,
        "msg": "Cancelled successfully.",
        "sys_id": "931f9f1d87ab01506342b846dabb35a0"
      }
    ],
    "unSuccessfulReservations": [],
    "error": null,
    "parent": "1b1fdf5987ab01506342b846dabb35ec"
  }
}
```

WSD Multi Reservation - PATCH /api/sn_wsd_rsv/multi_reservation/update/{sys_id}

Updates the reservations associated with a multi-reservation where the same reservation (meeting) has multiple workplace locations.

This endpoint can handle four different update scenarios:

1. Update the content of the multi-reservation record, such as the subject, date, or time.
2. Convert the multi-reservation into a single reservation based on the parent (reservation for a single workplace location).
3. Convert a single reservation (reservation for a single workplace location) into a multi-reservation.
4. Add or remove a workplace location to an existing multi-reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/multi_reservation/update/{sys_id}`

Default URL: `/api/sn_wsd_rsv/multi_reservation/update/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation to update. • Single reservation to multi-reservation: Sys_id of the single reservation. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. • Update content of multi-reservation: Sys_id of the parent reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. To get the details of a multi parent reservation from the child record, refer to the sys_id in the source_reservation field of the child record. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
end	Required if the *`shift`* parameter isn't passed in. Requested end time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
requested_for	Sys_id or email address of the user for which the reservation is being made. Located in the User [sys_user] table. Data type: String

reservables	List of details about the reservables associated with the reservation.
	
	Data type: Array of Objects
	`"reservables": [`
	`{`

Request body parameters (continued)

Name	Description

	<pre>"is_private": Boolean,
	"sys_id": "String"
	}
	]</pre>

reservables.is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.
reservables.sys_id	Sys_id of the location at which to make the reservations. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
reservable_module	Required. Sys_id of the reservable module to associate with the reservation. A reservable module defines the workplace items needed for a reservation. Located in the Reservable Module [sn_wsd_rsv_reservable_module] table. Data type: String
shift	Sys_id of the shift to associate with the reservation. Located in the Shift [sn_wsd_core_shift] table. If this parameter is passed in, the *end* parameter isn't required. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String
start	Required. Requested start time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
subject	Subject of the meeting associated with the reservation. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Return results from the multi-reservation creation or update. Data type: Object `"result": { "parent": "String", "success": Boolean, "successfulReservations": Array,`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"unSuccessfulReservations": Array
	}</pre>

result.parent	Sys_id of the parent reservation. A parent may have one or more child reservations associated to it. Data type: String
result.success	Flag that indicates whether the reservation was successfully created. Possible values: • true: Successfully created. • false: Operation failed. Data type: Boolean

result.successfulReservations	List of the reservations that were successfully created.
	
	Data type: Array
	<pre>"successfulReservations": [
	  {
	  "cancelled": Boolean,
	  "error": "String",
	  "reservable": "String"
	  "success": Boolean,
	  "sys_id": "String",
	  "updated": Boolean
	  }
	]</pre>

result.successfulReservations.cancelled	Flag that indicates whether the reservation was successfully cancelled. Possible values: • true: Successfully cancelled. • false: Not cancelled. Data type: Boolean
result.successfulReservations.error	Error message if there was a problem while creating the reservation. Data type: String
result.SuccessfulReservations.insert	Flag that indicates whether the reservation was successfully inserted. Such as when a reservation is added. Possible values:

Name	Description
	• true: Successfully inserted. • false: Operation failed. Data type: Boolean
result.successfulReservations.reservable	Sys_id of the workplace for which the reservation was made. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
result.successfulReservations.success	Flag that indicates whether the associated operation was successful. Possible values: • true: Operation was successful. • false: Operation failed. Data type: Boolean
result.successfulReservations.sys_id	Sys_id of the reservation that was created. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
result.successfulReservations.update	Flag that indicates whether the reservation was successfully updated. Possible values: • true: Successfully updated. • false: Not updated. Data type: Boolean
result.unSuccessfulReservations	List of the reservations that were unsuccessful. Data type: Array `"unSuccessfulReservations": [ { "cancelled": Boolean, "error": "String", "insert": Boolean "reservable": "String" "success": Boolean, "sys_id": "String", "updated": Boolean } ]`
result.unSuccessfulReservations.cancelled	Flag that indicates whether the reservation was successfully cancelled.

Example: cURL request

The following code example shows how to modify the content of an existing multi-reservation.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/multi_reservati
on/update/02000d4edb7650106c731dcd13961914" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"reservables\":[
        {
            \"sys_id\":\"fe1f744edb7650106c731dcd139619ca\"
        },
        {
            \"sys_id\":\"02000d4edb7650106c731dcd13961914\"
        }
    ],
    \"reservable_module\":\"c31241cedb7650106c731dcd13961917\",
    \"subject\":\"Test 1\",
    \"start\":\"2022-05-27 13:00:00\",
    \"end\":\"2022-05-27 14:00:00\",
    \"requested_for\": \"workplace_user@example.com\"
}" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "parent": "98ccb4348723cd106342b846dabb359a",
    "success": true,
    "successfulReservations": [
      {
        "success": true,
        "updated": true,
        "cancelled": false,
        "sys_id": "6cccb4348723cd106342b846dabb359d",
        "error": null,
        "reservable": "5eafb44edb7650106c731dcd13961943"
      },
      {
        "success": true,
        "updated": true,
        "cancelled": false,
        "sys_id": "74af283c87ef8d106342b846dabb3592",
        "error": null,
        "reservable": "fe1f744edb7650106c731dcd139619ca"
      }
    ],
    "unSuccessfulReservations": []
  }
}

WSD Multi Reservation - POST /api/sn_wsd_rsv/multi_reservation/add

Creates workplace reservations for the same time at different workplace locations.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/multi_reservation/add`

Default URL: `/api/sn_wsd_rsv/multi_reservation/add`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
end	Required if the *`shift`* parameter isn't passed in. Requested end time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
requested_for	Sys_id or email address of the user for which the reservation is being made. Located in the User [sys_user] table. Data type: String
reservables	List of details about the reservables associated with the reservation. Data type: Array of Objects

Request body parameters (continued)

Name	Description

	<pre>"reservables": [
	  {
	  "is_private": Boolean,
	  "sys_id": "String"
	  }
	]</pre>

reservables.is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.
reservables.sys_id	Sys_id of the location at which to make the reservations. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
reservable_module	Required. Sys_id of the reservable module to associate with the reservation. A reservable module defines the workplace items needed for a reservation. Located in the Reservable Module [sn_wsd_rsv_reservable_module] table. Data type: String
shift	Sys_id of the shift to associate with the reservation. Located in the Shift [sn_wsd_core_shift] table. If this parameter is passed in, the *end* parameter isn't required. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String
start	Required. Requested start time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
subject	Required. Subject of the meeting associated with the reservation. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Return results from the multi-reservation creation or update. Data type: Object `"result": { "parent": "String", "success": Boolean, "successfulReservations": Array,`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"unSuccessfulReservations": Array
	}</pre>

result.parent	Sys_id of the parent reservation. A parent may have one or more child reservations associated to it. Data type: String
result.success	Flag that indicates whether the reservation was successfully created. Possible values: • true: Successfully created. • false: Operation failed. Data type: Boolean

result.successfulReservations	List of the reservations that were successfully created.
	
	Data type: Array
	<pre>"successfulReservations": [
	  {
	  "error": "String",
	  "inserted": Boolean,
	  "reservable": "String"
	  "success": Boolean,
	  "sys_id": "String"
	  }
	]</pre>

result.successfulReservations.error	Error message if there was a problem while creating the reservation. Data type: String
result.successfulReservations.inserted	Flag that indicates whether the reservation was successfully inserted. Such as when a reservation is added. Possible values: • true: Successfully inserted. • false: Operation failed. Data type: Boolean
result.successfulReservations.reservable	Sys_id of the workplace for which the reservation was made. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.successfulReservations.success	Flag that indicates whether the reservation was successfully created. Possible values: • true: Successfully created. • false: Operation failed. Data type: Boolean
result.successfulReservations.sys_id	Sys_id of the reservation that was created. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
result.unSuccessfulReservations	List of the reservations that were unsuccessfully. Data type: Array `"unSuccessfulReservations": [ { "error": "String", "inserted": Boolean, "reservable": "String" "success": Boolean, "sys_id": "String" } ]`
result.unSuccessfulReservations.error	Error message if there was a problem while creating the reservation. Data type: String
result.unSuccessfulReservations.inserted	Flag that indicates whether the reservation was successfully inserted. Possible values: • true: Successfully inserted. • false: Operation failed. Data type: Boolean
result.unSuccessfulReservations.reservable	Sys_id of the workplace for which the reservation was trying to be made. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
result.unSuccessfulReservations.success	Flag that indicates whether the reservation was successfully created. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Successfully created. • false: Operation failed. Data type: Boolean
result.unSuccessfulReservations.sys_id	Sys_id of the unsuccessful reservation. Always null. Data type: String

Example: cURL request

This code example shows how to reserve two different workplaces for the same reservation.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/multi_reservati
on/add" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"reservable_module\": \"c31241cedb7650106c731dcd13961917\",
    \"subject\": \"Test-123\",
    \"reservation_purpose\": \"meeting\",
    \"timezone\": \"US/Pacific\",
    \"requested_for\": \"6816f79cc0a8016401c5a33be04be441\",
    \"reservables\": [
        {
            \"sys_id\": \"fe1f744edb7650106c731dcd139619ca\",
            \"is_private\": false
        },
        {
            \"sys_id\": \"d1208d4edb7650106c731dcd1396194a\",
            \"is_private\": false
        }
    ],
    \"start\": \"2023-01-12T11:30:00Z\",
    \"end\": \"2023-01-12T12:30:00Z\",
    \"reservation_type\": \"space\"
}" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "success": true,
    "parent": "08e8a18687586550cfaa99b73cbb354f",
    "successfulReservations": [
      {
        "success": true,
        "inserted": true,
        "sys_id": "44e8a18687586550cfaa99b73cbb3552",
        "error": null,
```

      }
    ],
    "unSuccessfulReservations": []
  }
}
```

WSD Recurring Reservation API

The Workplace Service Delivery (WSD) *Recurring Reservation* API provides endpoints for managing reservations that occur at the same time, but have different dates.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Safety Management (sn_wsd_core) and Workplace Reservation Management (sn_wsd_rsv) plugins must be activated.

This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Recurring Reservation - GET /api/sn_wsd_rsv/recurring_reservation/list/{parent_id}

Returns the specified recurring reservation.

If more than six recurring meeting occurrences are available for the reservation, you can paginate through the occurrences using the query parameters. You can also specify occurrence records not to return.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/recurring_reservation/list/{parent_id}`

Default URL: `/api/sn_wsd_rsv/recurring_reservation/list/{parent_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
parent_id	Sys_id of the recurring parent reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. When a recurring reservation is created, one recurring parent record and one or more child reservation records are created. Reservation records contain a field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	called reservation_subtype, that indicates the type of reservation record. For recurring parent records, this field is set to "Recurring parent". For child records, this field is set to "Occurrence". Within a child record, the sys_id of the associated recurring parent record is in the source_reservation field. Data type: String

Query parameters

Name	Description
end_index	When paginating through a recurring record set, the zero-based record number at which to stop returning occurrence records. **Note:** If the number of recurring occurrences is less than six the endpoint returns all of the occurrences, otherwise it returns the first six occurrences. To retrieve the occurrences beyond six, you must pass the end_index parameter accordingly. Data type: Number
occurrence_sys_id	Sys_id of an occurrence record in the recurring series not to return. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table.
start_index	When paginating through a recurring record set, the zero-based record number at which to start returning occurrence records. Data type: Number Default: 0

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *`application/json`*, *`application/xml`* or, *`text/xml`*.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Return results for the requested recurring reservation. Data type: Object `"result": { "occurencesTotalCount": "String", "reservation": {Object} }`
result.occurencesTotalCount	Total number of meeting occurrences in the recurring series. Data type: String
result.reservation	Details about the requested recurring reservation. Data type: Object `"reservation": { "active": Boolean,`

Name	Description
	Data type: Boolean
result.reservation.attendees	List of attendees for the reservation. Data type: Array of Objects `"attendees": [ { "avatar": "String", "displayValue": "String", "display_value": "String", "email": "String", "initials": "String", "label": "String", "name": "String", "sys_id": "String", "table": "String", "user_name": "String", "value": "String" } ]`
result.reservation.attendees.avatar	Sys_id of the avatar associated with the attendee. Located in the Attachments [sys_attachment] table. Data type: String
result.reservation.attendees.displayValue	Display value for the attendee. Data type: String
result.reservation.attendees.display_value	Display value of the attendee. Same as *`displayValue`*. Data type: String
result.reservation.attendees.email	Attendee's email address. Data type: String
result.reservation.attendees.initials	Attendee's initials. Data type: String
result.reservation.attendees.name	Attendee's name. Data type: String
result.reservation.attendees.sys_id	Sys_id_of the attendee record. Data type: String
result.reservation.attendees.table	Table in which the attendee record exists. Data type: String
result.reservation.attendees.user_name	Attendee's user name.

Name	Description
	Data type: String
result.reservation.attendees.value	Internal value of the attendee. Data type: String

result.reservation.check_in_state	Details about the check-in state of the reservation.
	
	Data type: Object
	
	`"check_in_state": {`
	`  "display_value": "String,"`
	`  "value": "String"`
	`}`

result.reservation.check_in_state.display_value	Display value for the current check-in state of the reservation, such as In progress or complete. Data type: String
result.reservation.check_in_state.value	Internal value for the current check-in state of the reservation, such as 2. Data type: String

result.reservation.edit_restriction	Description of the user edit restrictions for the reservation, such as no_restrictions, service_only, or fully_restricted.
	
	Data type: Object
	
	`"edit_restriction": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.edit_restriction.display_value	Display value for the edit restrictions for the reservation, such as `No restriction`. Data type: String
result.reservation.edit_restriction.value	Internal value for the edit restrictions for the reservation, such as `no_restriction`. Data type: String
result.reservation.end	Reservation end date and time. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservation.external_ical	Unique external iCalendar identification of the reservation. Use this value to identify

Name	Description
	the reservation when this is a calendar sync related reservation. Data type: String
result.reservation.external_id	Unique external identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Data type: String
result.reservation.is_parent	Flag that indicates whether this reservation is a parent reservation. Possible values: • true: Parent reservation. • false: No a parent reservation. Data type: Boolean
result.reservation.last_updated_sub_source	Details about the last updated sub-source for the reservation. Sub-sources are used when integrating reservations with an external calendar. This object contains information such as "servicenow_workplace_service_delivery", "google_calendar", or "microsoft_exchange". Data type: Object `"last_updated_sub_source": { "display_value": "String," "value": "String" }`
result.reservation.last_updated_sub_source.display_value	Display value for the last updated sub-source of the reservation, such as `ServiceNow Workplace Service Delivery` or `Google Calendar`. Used when integrating the reservation with an outside service such as Google calendar or Microsoft Outlook. Data type: String
result.reservation.last_updated_sub_source.value	Internal value for the last updated sub-source of the reservation, such as `servicenow_workplace_service_delivery` or `google_calendar`. Used when integrating the reservation with an outside service such as Google calendar or Microsoft Outlook. Data type: String

Name	Description
result.reservation.location.area.sys_id	Sys_id of the area to which this location belongs. Located in the Area [sn_wsd_core_area] table. Data type: String

result.reservation.location.building	Details about the building associated with the location.
	
	Data type: Object
	
	`"building": {`
	`  "active": Boolean,`
	`  "display_value": "String",`
	`  "sys_id": "String",`
	`  "timezone": {Object}`
	`}`

result.reservation.location.building.active	Flag that indicates whether the building is active. Valid values: • true: Building is active. • false: Building is inactive. Data type: Boolean
result.reservation.location.building.display_value	Display value of the building to which this location belongs, such as AMS - Bld1. Data type: String
result.reservation.location.building.sys_id	Sys_id of the building to which this location belongs. Located in the building [sn_wsd_core_building] table. Data type: String

result.reservation.location.building.timezone	Details of the time zone for the building.
	
	`"timezone": {`
	`  "displayValue": "String",`
	`  "value": "String"`
	`}`

result.reservation.location.building.timezone.display_value	Display value of the time zone in which the associated building resides. Data type: String
result.reservation.location.building.timezone.value	Internal value for the time zone to which this location belongs. Data type: String

Name	Description
result.reservation.location.campus	Details about the campus associated with the location. Data type: Object `"campus": { "active": Boolean, "display_value": "String," "sys_id": "String" }`
result.reservation.location.campus.active	Flag that indicates whether the campus is active. Valid values: • true: Campus is active. • false: Campus is inactive. Data type: Boolean
result.reservation.location.campus.display_value	Display value of the campus to which this location belongs, such as Amsterdam Campus. Data type: String
result.reservation.location.campus.sys_id	Sys_id of the campus to which this location belongs. Located in the Campus [sn_wsd_core_campus] table. Data type: String
result.reservation.location.capacity	Maximum number of occupants for the location. Data type: Number
result.reservation.location.description	Brief description of the location. Data type: String
result.reservation.location.display_value	Value to display in the UI for this location. Data type: String
result.reservation.location.email	Email address for the location. Data type: String
result.reservation.location.floor	Details about the floor associated with the location. Data type: Object `"floor": { "active": Boolean, "display_value": "String,"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"sys_id": "String"
	}</pre>

result.reservation.location.floor.active	Flag that indicates whether the floor is active. Valid values: • true: Floor is active. • false: Floor is inactive. Data type: Boolean
result.reservation.location.floor.display_value	Display value of the floor to which this location belongs, such as First floor. Data type: String
result.reservation.location.floor.sys_id	Sys_id of the floor to which this location belongs. Located in the Floor [sn_wsd_core_floor] table. Data type: String
result.reservation.location.label_value	Type of value specified in the *name* parameter, such as Room name. Data type: String
result.reservation.location.name	Name of the location. Data type: String
result.reservation.location.number	Reservation number. Data type: String
result.reservation.location.number_of_attendees	Number of attendees for the reservation. Data type: Number

result.reservation.location.reservable_module	Details about the reservable module associated with the reservation.
	
	Data type: Object
	<pre>"reservable_module": {
	"inline_title": "String",
	"name": "String",
	"sys_id": "String",
	"title": "String",
	},</pre>

result.reservation.location.reservable_module.inline_title	Inline title of the reservable module. The title appears in line with the descriptive text on the Workplace service portal.

Name	Description

	<pre>"state": {Object},
	"sys_id": "String"
	}</pre>

result.reservation.location.reservation.active	Flag that indicates whether the reservation is active. Valid values: • true: Reservation is active. • false: Reservation is inactive. Data type: Boolean
result.reservation.location.reservation.number	Reservation number. Data type: String
result.reservation.location.reservation.number_of_attendees	Number of attendees of the reservation. Data type: Number

result.reservation.location.reservation.requested_for	Details about the person for whom the reservation was requested on behalf of.
	
	Data type: Object
	<pre>"requested_for": {
	"name": "String",
	"sys_id": "String",
	"user_name": "String"
	}</pre>

result.reservation.location.reservation.requested_for.name	Name of the user for whom the reservation was requested for. Data type: String
result.reservation.location.reservation.requested_for.sys_id	Sys_id of the requested for user. Located in the User [sys_user] table. Data type: String
result.reservation.location.reservation.requested_for.user_name	User name of the user for whom the reservation was requested for. Data type: String

result.reservation.location.reservation.state	Details about the state of the reservation for the location.
	
	Data type: Object
	<pre>"state": {
	"display_value": "String,"
	"value": "String"
	}</pre>

Name	Description
result.reservation.location.reservation. .state.display_value	Display value for the current state of the reservation, such as confirmed. Data type: String
result.reservation.location.reservation. .state.value	Internal value for the current state of the reservation, such as 2. Data type: String
result.reservation.location.site	Site to which the location belongs. Located in the Site [sn_wsd_core_site] table. Data type: Object `"site": { "active": Boolean, "display_value": "String", "sys_id": "String", }`
result.reservation.location.site.active	Flag that indicates whether the site is active. Valid values: • true: Site is active. • false: Site is inactive. Data type: Boolean
result.reservation.location.site.display_value	Display value of the site to which this location belongs, such as Western Europe. Data type: String
result.reservation.location.site.sys_id	Sys_id of the site to which this location belongs. Located in the Site [sn_wsd_core_site] table. Data type: String
result.reservation.location.standard_services	
result.reservation.location.state	Details about the state of the reservation for the location. Data type: Object `"state": { "display_value": "String," "value": "String" }`
result.reservation.location.state.display_value	Display value for the current state of the reservation, such as confirmed. Data type: String

Name	Description
result.reservation.location.state.value	Internal value for the current state of the reservation, such as 2. Data type: String
result.reservation.location.sys_id	Sys_id of the associated location record. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
result.reservation.notification_custom_message	Custom message for the notification sent to the recipients listed in *reservation.notification_recipients*. Data type: String
result.reservation.notification_recipients	List of recipients that receive notification about the reservation. Data type: Array of Objects `"notification_recipients":[ { "name": "String", "sys_id": "String", "user_name": "String" } ]`
result.reservation.notification_recipients.name	Name of the recipient. Data type: String
result.reservation.notification_recipients.sys_id	Sys_id of the recipient. Located in the User [sys_user] table. Data type: String
result.reservation.notification_recipients.user_name	User name of the recipient. Data type: String
result.reservation.number	Unique number of the reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. You can use this value to query the reservation. Data type: String
result.reservation.number_of_attendees	Number of attendees in this reservation. Data type: number
result.reservation.opened_by	Details about the user that created the reservation.

Name	Description

	<pre>"recording_details": [
	  "recording_url": "String"
	]</pre>

result.reservation.recording_details.recording_url	URL of the recordings associated with the reservation. Data type: String

result.reservation.recurring_pattern	Details about the recurring pattern for the reservation.
	
	Data type: Object
	<pre>"recurring_pattern": {
	  "amountOfDates": "String",
	  "duration": Number,
	  "label": "String",
	  "options": {Object},
	  "repeats": "String",
	  "startDate":"String",
	  "startDateGdt": Object,
	}</pre>

result.reservation.recurring_pattern.amountOfDates	Number of dates for which the reservables are reserved. Data type: String
result.reservation.recurring_pattern.duration	Length of time to reserve the reservable. Data type: Number Unit: Seconds
result.reservation.recurring_pattern.label	Descriptive name for the recurring reservation. Data type: String

result.reservation.recurring_pattern.options	Details about the options associated with the recurring reservation.
	
	Data type: Object
	<pre>"options": {
	  "count": Number,
	  "daysOfWeek": "String",
	  "every": Number,
	  "endDate": "String"
	  "endDateGdt": Object
	}</pre>

result.reservation.recurring_pattern.options.count	Number of times to repeat the pattern. Data type: Number
result.reservation.recurring_pattern.options.daysOfWeek	Days of the week that the reservable is needed.

Name	Description
	Valid values: • 1 = Monday • 2 = Tuesday • 3 = Wednesday • 4 = Thursday • 5 = Friday • 6 = Saturday • 7 = Sunday For example, to specify Tuesday, Thursday, and Friday, pass 245 (no delimiter). If *repeats* is `weekly`, *count* is 5, and *daysOfWeek* is `245`, then in the return results, the total is equal to `count*daysOfWeek.length` (5*3=15). Data type: String
result.reservation.recurring_pattern.options.every	Pattern repeat interval. For example, the value '2' indicates that the pattern repeats every 2 days or 2 months depending on the value of the *repeats* property. **Note:** This setting is not applicable to weekly repeat intervals. You can set the *repeats* property to `daily` and this value to `14` for biweekly repeat intervals. Data type: Number Default value: 1
result.reservation.recurring_pattern.options.endDate	End date and time of the recurrence of the meeting, such as "2022-07-08T14:00:00Z". Data type: String Format: UTC yyyy-mm-dd hh:mm:ss
result.reservation.recurring_pattern.options.endDateGdt	End date and time of the recurrence of the meeting, such as "2022-07-08T14:00:00Z". Data type: String Format: UTC yyyy-mm-dd hh:mm:ss
result.reservation.recurring_pattern.repeats	Repeating pattern for the reservable. Valid values: (case-sensitive) • daily • monthly • weekly

Name	Description
	Note: The pattern repeat interval is set in the *options.every* property. The only valid repeat interval for weekly patterns is one. Data type: String
result.reservation.recurring_pattern.startDate	Start date and time for the recurring pattern, such as "2022-07-08T14:00:00Z". Data type: String Format: UTC yyyy-mm-dd hh:mm:ss
result.reservation.recurring_pattern.startDateGdt	Start date and time for the recurring pattern, such as "2022-07-08T14:00:00Z". Data type: String Format: UTC yyyy-mm-dd hh:mm:ss
result.reservation.requested_for	Details about the user that the reservation was made on behalf of. Data type: Object `"requested_for": { "avatar": "String", "displayValue": "String", "display_value": "String", "email": "String", "initials": "String", "label": "String", "name": "String", "sys_id": "String", "table": "String", "user_name": "String", "value": "String" }`
result.reservation.requested_for.avatar	Avatar for the user that the reservation was made on behalf of. Data type: String
result.reservation.requested_for.displayValue	Display value of the user that the reservation was made on behalf of. Data type: String
result.reservation.requested_for.display_value	Display value of the user that the reservation was made on behalf of. Same as *displayValue*. Data type: String
result.reservation.requested_for.email	Email address for the user that the reservation was made on behalf of.

Name	Description
result.reservation.reservable_module.display_sensitivity	Flag that indicates whether users can set the sensitivity of the reservation, such as normal or private. Valid values: • true: Able to set sensitivity. • false: Not able to set sensitivity. Defaults to normal. Data type: Boolean
result.reservation.reservable_module.display_value	Display value of the reservable module. Data type: String
result.reservation.reservable_module.enable_browse_by_area	Flag that indicates whether users are able to search for reservable modules by area. Same as *browse_by_area_enabled*. Valid values: • true: Allow users to browse reservable modules by area. • false: Don't allow users to browse reservable modules by area. Data type: Boolean
result.reservation.reservable_module.enable_browse_near_a_person	Flag that indicates whether users are able to search for reservable modules located by a specified person. Same as *browse_near_a_person_enabled*. Valid values: • true: Allow users to browse reservable modules near a person. • false: Don't allow users to browse reservable modules near a person. Data type: Boolean
result.reservation.reservable_module.enable_facet_filter	Flag that indicates whether facet filtering on workplace items is enabled. When enabled, the filter options that appear are based on the search results. Only the items that are available in the generated search result are available to users for selection in the filter. Valid values: • true: Facet filters are enabled. • false: Facet filters aren't enabled.

Name	Description
result.reservation.reservable_module.reservable_container_field	Level of the container, such as a group of desks in a specific area. Data type: String
result.reservation.reservable_module.reservable_filter	Filter conditions used to filter out reservable items in the associated Reservable table. Reservable table is a field in the Reservable Module [sn_wsd_rsv_reservable_module] table. These filter conditions were applied to the table contained in the field Reservable table. Data type: String
result.reservation.reservable_module.reservable_quantity_field	Reservable quantity of all the spaces. The quantity is used when assigning neighbourhood spaces to an area. For additional information, see Assign neighborhood spaces to an area. Data type: String
result.reservation.reservable_module.reservable_table	Table that contains the reservable workplace items. Data type: String
result.reservation.reservable_module.reservable_type	Type of the reservable item, such as location. Data type: String
result.reservation.reservable_module.reservable_views	Details about the different views associated with the reservable module, such as card view or schedule view. Located in the Reservable View [sn_wsd_rsv_reservable_view] table. Data type: Object `"reservable_views": { "iconClass": "String", "isDefault": Boolean, "label": "String", "order": Number, "type": "String" }`
result.reservation.reservable_module.reservable_views.iconClass	Icon class of the reservable view. Data type: String
result.reservation.reservable_module.reservable_views.isDefault	Flag that indicates whether to make this reservable view the default for reservable modules.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Valid values: • true: Make default. • false: Don't make default. Data type: Boolean
result.reservation.reservable_module.reservable_views.label	Name of the reservable view. Data type: String
result.reservation.reservable_module.reservable_views.order	Order in which the views are displayed for the reservable module in the UI. The lower order number come first in the UI. In case of the same order number, it is assigned random ordering. Data type: Number
result.reservation.reservable_module.reservable_views.type	Backend name of the reservable view. Used for internal processing. Data type: String
result.reservation.reservable_module.reservation_paths	Reservation paths associated with the reservable modules such as Browse all, Browse near a person. Data type: Array of Objects `"reservation_paths": [ { "displayValue": "String", "value": "String" }`
result.reservation.reservable_module.reservation_paths.display_value	Display value for the reservation path, such as "Browse near a person". Data type: String
result.reservation.reservable_module.reservation_paths.value	Internal value for the reservation path, such as "browse_near_a_person". Data type: String
result.reservation.reservable_module.search_limit	Maximum number of search results to return when a user searches for a workplace location. Data type: Number
result.reservation.reservable_module.selection_type	Type of selection to display in the search results. Can be one of the following options:

Name	Description
	• Specific unit: The search result displays every workplace item. • Container: The search result displays the parent or container of the workplace items. Data type: String
result.reservation.reservable_module.short_description	Brief description of the reservable module. Data type: String
result.reservation.reservable_module.show_map_view	Flag that indicates whether to enable the map view for reservable modules. Valid values: • true: Enable map view. • false: Don't enable map view. Data type: Boolean
result.reservation.reservable_module.sys_id	Sys_id of the reservable module. Data type: String
result.reservation.reservable_module.timeSlots	Details about the time slots associated for a reservable module. Data type: Array of Objects `[ { "name": "String", "short_description": "String", "slot_end": "String", "slot_start": "String", "sys_id": "String" } ]`
result.reservation.reservable_module.timeSlots.name	Name of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.short_description	Brief description of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.slot_end	End time of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.slot_start	Start time of the slot. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
result.reservation.reservable_module.timeSlots.sys_id	Sys_id of the time slot record. Located in the Time Slot [sn_wsd_rsv_time_slot] table. Data type: String
result.reservation.reservable_module.title	Title of the reservable module. Data type: String
result.reservation.reservable_module.virtual_meeting_provider	Details about the virtual provider associated with the reservable module. Data type: Object `"virtual_meeting_provider": { "display_value": "String", "sys_id": "String" }`
result.reservation.reservable_module.virtual_meeting_provider.display_value	Display value of the virtual meeting provider. Data type: String
result.reservation.reservable_module.virtual_meeting_provider.sys_id	Sys_id of the virtual meeting provider. Data type: String
result.reservation.reservationAcl	Details of the user access control levels (ACL) checks set on the associated reservation. Data type: Object `"reservationAcl": { "read": Boolean, "write": {Object} }`
result.reservation.reservationAcl.read	Flag that indicates whether to check if the user can read this reservation. Valid values: • true: Check if user can read the reservation. • false: Don't check if user can read the reservation. Data type: Boolean
result.reservation.reservationAcl.write	Details about the user's write capabilities for the associated reservation. Data type: Object `"write": { "allFields": Boolean, "fields": {Object},`

Name	Description

	<pre>"record": Boolean
	}</pre>

result.reservation.reservationAcl.write.allFields	Flag that indicates whether to check if the user can write to all fields specified in the *reservationACL.write.fields* object. If the user only has access to some specific fields, then only those fields are true in the *reservationACL.write.fields* object. Valid values: • true: Check if user can write to all fields specified in the *reservationACL.write.fields* object. • false: Don't check if user can write to all fields specified in the *reservationACL.write.fields* object Data type: Boolean

result.reservation.reservationAcl.write.fields	Details of the access controls on various fields of the reservation.
	
	Data type: Object
	<pre>"fields": {
	"location": Boolean,
	"number_of_attendees":
	Boolean,
	"requested_for": Boolean,
	"sensitivity": Boolean,
	"subject": Boolean
	}</pre>

result.reservation.reservationAcl.write.fields.location	Flag that indicates whether to check if the user can write to the location fields in this reservation. Valid values: • true: Check if user can write to the location fields. • false: Don't check if user can write to the location fields. Data type: Boolean
result.reservation.reservationAcl.write.fields.number_of_attendees	Flag that indicates whether to check if the user can write to the number of attendees fields in this reservation. Valid values:

Name	Description
	• true: Check if user can write to the number of attendees field. • false: Don't check if user can write to the number of attendees field. Data type: Boolean
result.reservation.reservationAcl.write.fields.requested_for	Flag that indicates whether to check if the user can write to the requested for fields in this reservation. Valid values: • true: Check if user can write to the requested for field. • false: Don't check if user can write to the requested for field. Data type: Boolean
result.reservation.reservationAcl.write.fields.sensitivity	Flag that indicates whether to check if the user can write to the sensitivity fields in this reservation. Valid values: • true: Check if user can write to the sensitivity field. • false: Don't check if user can write to the sensitivity field. Data type: Boolean
result.reservation.reservationAcl.write.fields.subject	Flag that indicates whether to check if the user can write to the subject fields in this reservation. Valid values: • true: Check if user can write to the subject field. • false: Don't check if user can write to the subject fields. Data type: Boolean
result.reservation.reservationAcl.write.record	Flag that indicates whether to check if the user can write to the entire reservation record. Valid values: • true: Check if user can write to the entire reservation record. • false: Don't check if user can write to the entire reservation record.

Name	Description
	Data type: Boolean
result.reservation.reservation_purpose	Details about the purpose of the reservation. Data type: Object `"reservation_purpose": { "display_value": "String," "value": "String" }`
result.reservation.reservation_purpose.display_value	Display value for the purpose of the reservation, such as Company meeting. Data type: String
result.reservation.reservation_purpose.value	Internal value for the purpose of the reservation, such as company_meeting. Data type: String
result.reservation.reservation_type	Details about the type of the reservation. Data type: Object `"reservation_type": { "display_value": "String," "value": "String" }`
result.reservation.reservation_type.display_value	Display value for the type of the reservation, such as Space. Data type: String
result.reservation.reservation_type.value	Internal value for the type of the reservation, such as space. Data type: String
result.reservation.reservation_subtype	Details about the subtype of the reservation. Subtypes indicate the type of reservation, such as single, Multi parent, Multi child, Recurring parent, or occurrence. Data type: Object `"reservation_subtype": { "display_value": "String," "value": "String" }`
result.reservation.reservation_subtype.display_value	Display value for the subtype of the reservation, such as Single. Data type: String

Name	Description
result.reservation.reservation_subtype.value	Internal value for the subtype of the reservation, such as single. Data type: String

result.reservation.sensitivity	Details about the sensitivity of the reservation.
	
	Data type: Object
	
	`"sensitivity": {`
	`  "display_value": "String,"`
	`  "value": "String"`
	`}`

result.reservation.sensitivity.display_value	Display value for the sensitivity of the reservation, such as high or low. Data type: String
result.reservation.sensitivity.value	Internal value for the sensitivity of the reservation, such as 1 or 3. Data type: String

result.reservation.shift	Details about the shift applied to the reservation.
	
	Data type: Object
	
	`"shift": {`
	`  "display_value": "String",`
	`  "name": "String",`
	`  "shiftDetails": "String",`
	`  "sys_id": "String"`
	`}`

result.reservation.shift.display_value	Display value of the shift. Data type: String
result.reservation.shift.name	Name of the shift. Same as *`display_value`*. Data type: String
Result.reservation.shift.shiftDetails	Details of shift. Data type: String
result.reservation.shift.sys_id	Sys_id of the shift record. Located in the Shift [sn_wsd_core_shift] table. Data type: String
result.reservation.source	Details about the source for the reservation, such as Workplace Services or Google Mail.. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	<pre>"source": {
	  "display_value": "String",
	  "value": "String"
	}</pre>

result.reservation.source.display_value	Display value for the reservation source, such as Workplace Services. Data type: String
result.reservation.source.value	Internal value for the reservation source, such as servicenow. Data type: String

result.reservation.source_icon	Details about the source of the icon used in the reservation. This icon is used in the UI.
	
	Data type: Object
	<pre>"source_icon": {
	  "classNames": "String",
	  "imgSrc": "String",
	  "tooltip": "String"
	}</pre>

result.reservation.source_icon.classNames	Comma-separated class names for the source icon. Data type: String
result.reservation.source_icon.imgSrc	Name of the image source for source icon. This icon is stored in the Images [db_image] table. Data type: String
result.reservation.source_icon.tooltip	Tooltip associated with the source icon. Data type: String

result.reservation.source_reservation	Source reservation of the current reservation. For example, for recurring reservations, the recurring parent reservation is the source of the series of occurrence reservations.
	
	Data type: Object
	<pre>"source_reservation": {
	  "display_value": "String",
	  "name": "String",
	  "sys_id": "String"
	}</pre>

result.reservation.source_reservation. display_value	Display value for the source reservation. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservation.source_reservation.name	Name of the source reservation. Data type: String
result.reservation.source_reservation.sys_id	Sys_id of the source reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
result.reservation.source_reservation_requester	The user who requested the recurring reservation. Data type: Object `"source_reservation": { "name": "String", "sys_id": "String", "user_name": "String" }`
result.reservation.source_reservation_requester.name	Name of the recurring reservation requester. Data type: String
result.reservation.source_reservation_requester.sys_id	Sys_id of the user who requested the recurring reservation. Located in the User [sys_user] table. Data type: String
result.reservation.source_reservation_requester.user_name	User name of the recurring reservation requester. Data type: String
result.reservation.start	Reservation start date and time. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservation.state	Details about the state of the reservation. Data type: Object `"state": { "display_value": "String," "value": "String" }`
result.reservation.state.display_value	Display value for the current state of the reservation, such as confirmed. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservation.state.value	Internal value for the current state of the reservation, such as 2. Data type: String
result.reservation.subject	Reservation's subject. Data type: String
result.reservation.sub_source	Details about the sub-source of the reservation. The sub-source specifies where the reservation originated such as Google Calendar or Microsoft Exchange. Data type: Object `"sub_source": { "display_value": "String," "value": "String" }`
result.reservation.sub_source.display_value	Display value for the sub-source of the reservation, such as Google Calendar. Data type: String
result.reservation.sub_source.value	Internal value of the sub-source field of the reservation, such as google_calendar. Data type: String
result.reservation.sync_state	Details about the synchronization state of a reservation from another service, such as "sync_enqueued" or "synchronized". Data type: Object `"sync_state": { "display_value": "String," "value": "String" }`
result.reservation.sync_state.display_value	Display value for the current sync state of the reservation, such as synchronized. Data type: String
result.reservation.sync_state.value	Internal value of the current sync state of the reservation, such as synchronized. Data type: String
result.reservation.sys_created_on	Date and time when the reservation was created. Data type: String

Name	Description
result.reservation.sys_id	Sys_id of the reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
Result.reservation.sys_updated_on	Date and time when the reservation was last updated. Data type: String
result.reservation.virtual_meeting	URL of the virtual meeting link. Data type: String

Example: cURL request

The following code example shows how to retrieve a specific recurring reservation.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/recurring_reser
vation/list/d98a381587b789506342b846dabb3563" \
--request GET \
--header "Accept:application/json" \
--user "username": "password"
```

Return results:

```

WSD Recurring Reservation - PATCH /api/sn_wsd_rsv/recurring_reservation/cancel_series/{sys_id}

Cancels an entire specified recurring series reservation or a specific meeting occurrence within the series.

Note: You cannot delete multiple meeting occurrences in a single call.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/recurring_reservation/cancel_series/{sys_id}`

Default URL: `/api/sn_wsd_rsv/recurring_reservation/cancel_series/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	To cancel the entire series, pass the sys_id of the recurring parent reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. To cancel a specific occurrence of the series, pass the sys_id of the occurrence of the series. The recurring parent record has the column reservation_subtype set to `Recurring parent`. Individual occurrence records have the reservation_subtype field set to `Occurrence`. To get the details of recurring parent reservation from the occurrence record, refer to the sys_id of the source_reservation field of the occurrence record. Data type: String

Query parameters

Name	Description
cancel_notes	Reason for cancelling the reservation. Data Type: String

Request body parameters

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Return results for the cancel recurring reservation request.
	
	Data type: Object
	
	`"result": {`
	
	`"failedToCancelOccurrenceReservations": [Array],`
	`"seriesId": "String",`
	`"success": Boolean,`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre>"successCanceledOccurrences": [Array], "user_msg": "String" }</pre>
result.failedToCancelOccurrenceReservations	List of sys_ids of the individual meeting occurrence records that failed to be cancelled. Data type: Array of Strings
result.seriesId	Sys_id of the recurring parent when the whole series is cancelled or the sys_id of a specific occurrence if a single occurrence is cancelled. Data type: String
result.success	Flag that indicates whether the reservation was successfully cancelled. Possible values: • true: Successfully cancelled. • false: Operation failed. Data type: Boolean
result.failedToCancelOccurrenceReservations	List of sys_ids of the individual meeting occurrence records that were successfully cancelled. Data type: Array of Strings
result.user_msg	Message about the request. Data type: String

Example: cURL request

The following code example shows how to cancel an entire recurring reservation.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/recurring_reser
vation/cancel_series/f64983a347274550003a4587746d43b8" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "failedToCancelOccurrenceReservations": [],
    "successCanceledOccurrences": [
      "cb4983a347274550003a4587746d43bd",
```

```
      "cf4983a347274550003a4587746d43ba"
    ],
    "user_msg": "Your Recurring reservation has been canceled
 successfully!",
    "seriesId": "f64983a347274550003a4587746d43b8",
    "success": true
  }
}
```

WSD Recurring Reservation - POST /api/sn_wsd_rsv/recurring_reservation/create_series

Creates workplace reservations for the same time but different dates, such as weekly, monthly, or every other week.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/recurring_reservation/create_series`

Default URL: `/api/sn_wsd_rsv/recurring_reservation/create_series`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
recurringPattern	Details about the recurring pattern for the reservation. Data type: Object `"recurringPattern": { "duration": Number, "label": "String", "options": {Object}, "repeats": "String", "startDate": "String" }`
recurringPattern.duration	Required if not a shift-based reservation. Length of time to reserve the reservable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Data type: Number Unit: Seconds
recurringPattern.label	Descriptive name for the recurring reservation. Data type: String
recurringPattern.options	Required. Details about the options set for the recurring pattern. Data type: Object `"options": { "count": Number, "daysOfWeek": "String", "every": Number, "endDate": "String" }`
recurringPattern.options.count	Required if not a shift-based reservation; ignored for shift-based reservations. Number of times to repeat the pattern. Data type: Number
recurringPattern.options.daysOfWeek	Required if the *repeats* parameter is set to `weekly`. Days of the week that the reservable is needed. Valid values: • 1 = Monday • 2 = Tuesday • 3 = Wednesday • 4 = Thursday • 5 = Friday • 6 = Saturday • 7 = Sunday For example, to specify Tuesday, Thursday, and Friday, pass 245 (no delimiter). If *repeats* is `weekly`, *count* is 5, and *daysOfWeek* is `245`, then in the return results, the total is equal to `count*daysOfWeek.length` (5*3=15). Data type: String
recurringPattern.options.every	Pattern repeat interval. For example, the value '2' indicates that the pattern repeats every 2 days or 2 months depending on the value of the *repeats* property.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Note: This setting is not applicable to weekly repeat intervals. You can set the *repeats* property to `daily` and this value to `14` for biweekly repeat intervals. Data type: Number Default value: 1
recurringPattern.options.endDate	End date and time of the recurrence of the meeting, such as "2022-07-08T14:00:00Z". Data type: String Format: UTC yyyy-mm-dd hh:mm:ss
recurringPattern.repeats	Required if not a shift-based reservation. Repeating pattern for the reservable. Valid values: (case-sensitive) • daily • monthly • weekly **Note:** The pattern repeat interval is set in the *options.every* property. The only valid repeat interval for weekly patterns is one. Data type: String
recurringPattern.startDate	Required. Start date and time for the recurring pattern, such as "2022-07-08T14:00:00Z". Data type: String Format: UTC yyyy-mm-dd hh:mm:ss
reservation	Details about the recurring reservation to create. Data type: Object `"reservation": { "is_private": Boolean, "location": "String", "reservable_module": "String", "shift": "String", "subject": "String" }`
reservation.is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner.

Request body parameters (continued)

Name	Description
	For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.
reservation.location	Required. Sys_id of the location to reserve. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
reservation.reservable_module	Required. Sys_id of the reservable module to associate with the reservation. A reservable module defines the workplace items needed for a reservation. Located in the Reservable Module [sn_wsd_rsv_reservable_module] table. Data type: String
reservation.shift	Sys_id of the shift to associate with the reservation. Located in the Shift [sn_wsd_core_shift] table. If this parameter is passed in, the *end* parameter isn't required. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String
reservation.subject	Required. Subject of the meeting associated with the reservation. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: `application/json` or `application/xml`.

Request headers (continued)

Header	Description
	Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Return results from the multi-reservation creation or update. Data type: Object `"result": { "isValid": Boolean, "parent": "String", "successfulReservations": Array, "unSuccessfulReservations": Array }`
result.isValid	Flag that indicates whether the reservation was successfully created. Possible values: • true: Successfully created. • false: Operation failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Boolean
result.parent	Sys_id of the parent reservation that was updated. Data type: String
result.successfulReservations	List of the reservations that were successfully updated. Data type: Array of Objects `"successfulReservations": [ { "collision": Boolean, "end": "String", "error": "String", "inserted": Boolean, "start": "String" "sys_id": "String" } ]`
result.successfulReservations.collision	Flag that indicates whether a reservation already exists for the specified time and collides with the current reservation. Possible values: • true: Collision. • false: No collision. Data type: Boolean
result.successfulReservations.end	Reservation end date and time. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.successfulReservations.error	Error message if there was a problem while creating the reservation. Data type: String
result.successfulReservations.inserted	Flag that indicates whether the reservation was successfully inserted. Such as when a reservation is added. Possible values: • true: Successfully inserted. • false: Operation failed. Data type: Boolean
result.successfulReservations.start	Reservation start date and time.

Name	Description
	• true: Successfully inserted. • false: Operation failed. Data type: Boolean
result.unSuccessfulReservations.start	Reservation start date and time. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.unSuccessfulReservations.sys_id	Sys_id of the reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

Example: cURL request

The following code example shows how to create a daily recurring reservation for two consecutive days.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/recurring_reser
vation/create_series" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"reservation\": {
        \"reservable_module\":
 \"5db44502dbb650106c731dcd13961937\",
        \"subject\": \"Test-123\",
        \"reservation_purpose\": \"meeting\",
        \"timezone\": \"US/Pacific\",
        \"requested_for\": \"6816f79cc0a8016401c5a33be04be441\",
        \"location\": \"6a11a94adb7210106c731dcd1396194e\",
        \"attendees\": \"6816f79cc0a8016401c5a33be04be441\",
        \"is_private\": false
    },
    \"recurringPattern\": {
        \"duration\": 3600000,
        \"repeats\": \"daily\",
        \"options\": {
            \"count\": 2,
            \"daysOfWeek\": \"\",
            \"every\": 1
        },
        \"label\": \"Repeats daily, 2 times\",
        \"startDate\": \"2023-01-12T12:00:00Z\"
    }
}" \
```

Return results:

WSD Reservable API

The Workplace Service Delivery (WSD) *Reservable* API provides endpoints to retrieve details of a reservable, an entity that can be reserved, such as a workplace location, from a ServiceNow instance.

Note: A newer version of this API, WSD Reservable V2 API, is available for use. The new version allows you to include all reservables in a POST request to avoid character limitations of the *sys_Id* parameter.

To access this API, the caller must have the sn_wsd_core.workplace_user role.

This API runs in the `sn_wsd_rsv` namespace. To access this API, the Workplace Reservation Management (sn_wsd_rsv) plugin must be activated.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Reservable - GET /sn_wsd_rsv/reservable/list_reservables/{sys_ids}

Returns the details for one or more specified reservables.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservable/list_reservables/{sys_ids}`

Default URL: `/api/sn_wsd_rsv/reservable/list_reservables/{sys_ids}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_ids	Sys_ids of the reservables whose details to return. If specifying multiple reservables, comma separate the sys_ids. These sys_ids are located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String

Query parameters

Name	Description
include_flexible_services	Flag that indicates whether to return the flexible services associated with the reservable in to the response. A flexible service is an additional provision available with a reservable workplace item when a reservation is made. For example, Classroom style - Rows of tables arranged with all participants facing towards the front of the room. For additional information on flexible services, see Create a flexible service. Valid values: • true: Return the flexible service information. • false: Do not return the flexible service information. Data type: Boolean Default: false
include_layouts	Flag that indicates whether to return the location layout information in the response. Location layout information include such things as capacity, max capacity, preparation, and clean up duration. This information is located in the Location Layout [sn_wsd_rsv_m2m_location_layout] table. Valid values: • true: Return the location layout information. • false: Do not return the location layout information. Data type: Boolean Default: false

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
include_standard_services	Flag that indicates whether to return the standard services information in the response. A standard service describes basic provisions available with a reservable workplace item when the reservation is made, such as white boards, additional monitors, and similar services. For additional information on standard services, see Standard services. This information is located in the Standard Service [sn_wsd_rsv_standard_service] table. Valid values: • true: Return the standard services information. • false: Don't return the standard services information. Data type: Boolean Default: false
reservable_module_sys_id	Required. Sys_id of the reservable module. A reservable module groups similar types of workplace items. This sys_id is located in the Reservable Module [sn_wsd_rsv_reservable_module] table. For additional information on reservable modules, see Configure a reservable module. Data type: String
reservation_start_time	Reservation start time to validate the lead time of extra services. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Details on each matching reservable. Data type: Array of Objects `{ "result": [ { "allow_invitees": Boolean, "area": {Object}, "building": {Object}, "campus": {Object}, "capacity": Number, "description": "String", "display_number_of_attendees": Boolean,`

Name	Description
	"display_on_behalf_of": Boolean, "display_sensitivity": Boolean, "email": "String", "employee_override_privacy": Boolean "enable_group_reservations": Boolean, "enable_reservation_privacy": Boolean, "external_id": "String", "flexible_services": [Array], "floor": {Object}, "image": {Object}, "is_reservable": Boolean, "layouts": [Array], "location_type": {Object}, "meetingProviders": [Array], "moduleType": "String", "name": "String", "number": "String", "order": Number, "require_approval": Boolean, "requires_check_in": Boolean, "require_subject": Boolean, "reservable_quantity": Number, "site": {Object}, "standard_services": [Array], "sys_id": "String", "title": "String", "type": "String", "tableName": "String" }] }
result.allow_invitees	Flag that indicates whether employees are able to add invitees to the reservation. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Allow employees to add invitees to the reservation. • false: Don't allow employees to add invitees to the reservation. Data type: Boolean
result.area	Area where the reservable is located. This information is located in the Area [sn_wsd_core_area] table. `"area": { "display_value": "String", "sys_id": "String" }`
result.area.display_value	Display value for the area. Data type: String
result.area.sys_id	Sys_id of the associated area record. Data type: String
result.building	Building where the reservable is located. This information is located in the Building [sn_wsd_core_building] table. `"building": { "display_value": "String", "sys_id": "String", "timezone": {Object} }`
result.building.display_value	Display value for the building. Data type: String
result.building.sys_id	Sys_id of the associated building record. Data type: String
result.building.timezone	Details of the time zone for the building. `"timezone": { "displayValue": "String", "value": "String" }`
result.building.timezone.display_value	Display value of the time zone in which the associated building resides. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.building.timezone.value	Internal value of the time zone in which the associated building resides. Data type: String
result.campus	Campus where the reservable is located. This information is located in the Campus [sn_wsd_core_campus] table. `"campus": { "display_value": "String", "sys_id": "String" }`
result.campus.display_value	Display value for the campus. Data type: String
result.campus.sys_id	Sys_id of the associated campus record. Data type: String
result.capacity	Number of people that the reservable can accommodate. Data type: Number
result.description	Description of the reservable. Data type: String
result.display_number_of_attendees	Flag that indicates whether users can specify the number of attendees in the reservation. Valid values: • true: Users can specify the number of attendees. • false: Users can't specify the display number of attendees. Data type: Boolean
result.display_on_behalf_of	Flag that indicates whether reservations can be made on behalf of someone else. Valid values: • true: On behalf of supported. • false: On behalf of not supported. Data type: Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.display_sensitivity	Flag that indicates whether users can set the sensitivity of the reservation, such as normal or private. Valid values: • true: Able to set sensitivity. • false: Not able to set sensitivity. Defaults to normal. Data type: Boolean
result.email	Email address associated with the reservable. Data type: String
result.employee_override_privacy	Flag that indicates whether users can override the privacy setting for the associated reservable. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Users can override the privacy setting for the associated reservable. • false: Users cannot override the privacy setting for the associated reservable.
result.enable_group_reservations	Flag that indicates whether users can make a group reservation. Valid values: • true: Able to make group reservations. • false: Not able to make group reservations. Data type: Boolean
result.enable_reservation_privacy	Flag that indicates the default setting for reservation privacy. For additional information on these privacy settings, see Location privacy settings and impact. Possible values: • true: Reservations are private by default. • false: Reservations are not private by default. Data type: Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.external_id	External ID of the reservable. Data type: String
result.flexible_services	Populated only if the *include_flexible_services* parameter is set to true and the workplace case management plugin is installed. Description of the flexible services associated with the reservables. There can be a parent flexible service, and several child flexible services. This information is located in the [sn_wsd_case_workplace_service_item] table. `flexible_services": [ { "additional_text": "String", "allow_only_single_service_item_selection": Boolean, "category": "String", "currency_code": "String", "flexible_service": [Array], "label": "String", "sub_category": "String", "sub_title": "String", "text": "String", "title": {Object} } ]`
result.flexible_services.additional_text	Text to prompt user to select additional flexible services. Data type: String
result.flexible_services.allow_only_single_service_item_selection	Flag that indicates whether users can select only one service item among the group of flexible services within a reservation. Valid values: • true: Only able to make a single selection. • false: Able to make multiple selections. Data type: Boolean
result.flexible_services.category	Category of the flexible services. Data type: String

Name	Description

	<pre>"title": {Object}
	}
	]</pre>

result.flexible_services.flexible_service. flexible_service.additional_text	Text used to prompt a user to select additional flexible services. Data type: String
result.flexible_services.flexible_service. flexible_service.capacity_enabled	Flag that indicates whether the capacity of the room should appear in the reservation. If this is set to true, *quantity_enabled* will always be false. Valid values: • true: Capacity should appear. • false: Capacity should not appear. Data type: Boolean
result.flexible_services.flexible_service. flexible_service.category	Category of the flexible service. Data type: String
result.flexible_services.flexible_service. flexible_service.category_label	Category label of flexible service. Data type: String
result.flexible_services.flexible_service. flexible_service.cleanup_duration	Amount of time it takes to clean up or remove the service added to the reservable. Data type: Number Unit: Milliseconds
result.flexible_services.flexible_service. flexible_service.image	Link to the image of the flexible service. Data type: String
result.flexible_services.flexible_service. flexible_service.max_capacity	Maximum number of occupants that the reservable can accommodate. Data type: Number
result.flexible_services.flexible_service. flexible_service.name	Name of flexible service. Data type: String
result.flexible_services.flexible_service. flexible_service.preparation_duration	Amount of time it takes to add the service to the reservable. Data type: String Unit: Milliseconds
result.flexible_services.flexible_service. flexible_service.price_per_unit	Details of the cost of adding the flexible service to the reservable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Data type: Object `"price_per_unit": { "code": "String", "value": "String" }`
result.flexible_services.flexible_service.flexible_service.price_per_unit.code	Currency code to use when calculating the cost, such as GBP or USD. Data type: String
result.flexible_services.flexible_service.flexible_service.price_per_unit.value	Cost for each unit of the flexible service in the currency defined in the code parameter. Data type: String
result.flexible_services.flexible_service.flexible_service.quantity_enabled	Flag that indicates whether the quantity field should appear in the reservation. If this is set to true, *capacity_enabled* will always be false. Valid values: • true: Quantity should appear. • false: Quantity should not appear. Data type: Boolean
result.flexible_services.flexible_service.flexible_service.quantity_required	Flag that indicates whether the quantity is required. Valid values: • true: Quantity is required. • false: Quantity is not required. Data type: Boolean
result.flexible_services.flexible_service.flexible_service.short_description	Brief description of the flexible service. Data type: String
result.flexible_services.flexible_service.flexible_service.sub_category	Sub-category name of the flexible service, such as chair_layout. Data type: String
result.flexible_services.flexible_service.flexible_service.sub_category_label	Sub-category label of the flexible service, such as Chair layout. Data type: String
result.flexible_services.flexible_service.flexible_service.sub_title	Sub-title name of the child flexible service. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
result.flexible_services.flexible_service.flexible_service.sys_id	Sys_id of flexible service. Data type: String
result.flexible_services.flexible_service.flexible_service.text	Text used to prompt a user to select flexible services. Data type: String
result.flexible_services.flexible_service.flexible_service.title	Details for the titles to use when adding and editing the child flexible service in the UI. Data type: Object `"title": { "add": "String", "edit": "String" }`
result.flexible_services.flexible_service.flexible_service.title.add	Title used when adding a child flexible service in the UI. Data type: String
result.flexible_services.flexible_service.flexible_service.title.edit	Title used when editing a child flexible service in the UI. Data type: String
result.flexible_services.flexible_service.label	Flexible service label. Data type: String
result.flexible_services.flexible_service.sub_category	Sub-category of the parent flexible services, such as additional chair. Data type: String
result.flexible_services.flexible_service.sub_title	Sub-title name of the parent flexible service. Data type: String
result.flexible_services.flexible_service.text	Text used to prompt a user to select a parent flexible services. Data type: String
result.flexible_services.flexible_service.title	Details for the titles to use when adding and editing the parent flexible service in the UI. Data type: Object `"title": { "add": "String", "edit": "String" }`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.flexible_services.flexible_service.title.add	Title used when adding a parent flexible service in the UI. Data type: String
result.flexible_services.flexible_service.title.edit	Title used when editing a parent flexible service in the UI. Data type: String

result.floor	Details about the floor on which the reservable is located.
	
	Located in the Floor [sn_wsd_core_floor] table.
	
	`"floor": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

result.floor.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.floor.sys_id	Sys_id of the associated record in the Floor table. Data type: String

result.image	Details about an image that represents the associated reservable.
	
	Located in the Images [db_image] table.
	
	`"image": {`
	`  "link": "String",`
	`  "sys_id": "String"`
	`}`

result.image.link	Link to an image that represents the reservable. Data type: String
result.image.sys_id	Sys_id of the associated image record. Data type: String
result.is_reservable	Flag that indicates whether the flexible service can be reserved. Valid values: • true: Flexible service can be reserved. • false: Flexible service cannot be reserved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Boolean
results.layouts	Only populated if the *include_layouts* parameter is set to true. List of the layouts associated with the reservable. Data type: Array of Objects `"layouts": [ { "capacity": Number, "cleanup_duration": "String", "image": {Object}, "is_default": Boolean, "max_capacity": Number, "name": "String", "preparation_duration": "String", "short_description": "String", "sys_id": "String" } ]`
result.layouts.capacity	Number of people that will attend the meeting. Data type: Number
result.layouts.cleanup_duration	Amount of time it takes to clean the reservable for this layout. Data type: Number Unit: Milliseconds
result.layouts.image	Details about an image that represents the layout for the associated reservable. Located in the Images [db_image] table. `"image": { "link": "String", "sys_id": "String" }`
result.layouts.image.link	Link to an image that represents the layout for this reservable. Located in the Images [db_image] table. Data type: String
result.layouts.image.sys_id	Sys_id of the associated image record. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.layouts.is_default	Flag that indicates whether the associated layout is the default for the reservable. Valid values: • true: Default. • false: Not default. Data type: Boolean
result.layouts.max_capacity	Maximum number of people that the layout associated with the reservable can accommodate. Data type: Number
result.layouts.name	Name of the location layout. Data type: String
result.layouts.preparation_duration	Amount of time it takes to prepare the associated location layout. Data type: Number Unit: Milliseconds
result.layouts.short_description	Brief description of the location layout. Data type: String
result.layouts.sys_id	Sys_id of the location layout. Located in the Layout [sn_wsd_rsv_layout] table. Data type: String
result.location_type	Details about the type of location of the reservable, such as workplace/desk, cafe, or gym. Located in the Space Type [sn_wsd_core_space_type] table. `"location_type": { "display_value": "String", "sys_id": "String" }`
result.location_type.display_value	Display value of the location type. Data type: String
result.location_type.sys_id	Sys_id of the associated record in the Space Type [sn_wsd_core_space_type] table.

Name	Description
	Data type: String
result.meetingProviders	Details about the virtual meeting providers associated with the reservable. This information is located in the Virtual Meeting Provider [sn_wsd_rsv_virtual_meeting_provider] table. `"meetingProviders": [ { "display_value": "String", "value": "String" } ]`
result.meetingProviders.display_value	Display value of the virtual provider's name. Data type: String
result.meetingProviders.value	Actual value for the virtual provider's name in the record. Data type: String
result.moduleType	Reservable module associated with the reservable, such as desks or meeting room. Data type: String
result.name	Name of the reservable. Data type: String
result.number	Unique identifier of the reservable. This value is more human readable than the sys_id. Data type: String
result.order	Order number for the reservable. Data type: Number
result.require_approval	Flag that indicates whether reserving the reservable requires an approval. Possible values: • true: Approval required. • false: Approval isn't required. Data type: Boolean
result.requires_check_in	Flag that indicates whether the reservable requires the user to check in. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	• true: Check in required. • false: Check in isn't required. Data type: Boolean
result.require_subject	Flag that indicates whether the user must enter a subject when making the reservation. Valid values: • true: Subject required. • false: Subject isn't required. Data type: Boolean
result.reservable_quantity	Maximum number of times the associated reservable can be reserved for the same time. This value is used when assigning neighborhood spaces to an area. Data type: Integer

result.site	Details about the site where the reservable resides.
	
	Located in the Site [sn_wsd_core_site] table.
	
	`"site": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

result.site.display_value	Display value of the site. Data type: String

result.standard_services	Only populated if the *include_standard_services* parameter is set to true.
	Associated standard services, such as flip chart, projector screen, and whiteboard and markers.
	
	Data type: Array of Objects
	
	`"standard_services": [`
	`  {`
	`  "font_awesome_icon": "String",`
	`  "name": "String",`
	`  "short_description": "String",`
	`  "sys_id": "String"`
	`  }`
	`]`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.standard_services.font_awesome_icon	Name of the thumbnail icon associated with the standard service. Data type: String
result.standard_services.name	Name of the standard service. Data type: String
result.standard_services.short_description	Brief description of the standard service. Data type: String
result.standard_services.sys_id	Sys_id of the standard service record. Located in the Standard Service [sn_wsd_rsv_standard_service] table. Data type: String
result.site.sys_id	Sys_id of the associated site record in the Site [sn_wsd_core_site] table. Data type: String
result.tableName	Name of the table in which the reservable record resides. Data type: String
result.title	Title of the reservable. Data type: String
result.type	Type of a reservable, such as location. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/reservable/list_
reservables/dad3df5977220110b3d7be377b5a99ce,3ed3139977220110b3d
7be377b5a99d1?include_flexible_services=true&include_layouts=fal
se&include_reservable_purposes=true&include_standard_services=tr
ue&reservable_module_sys_id=c31241cedb7650106c731dcd13961917" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": [

WSD Reservable V2 API

The Workplace Service Delivery (WSD) *`Reservable V2`* API provides endpoints to retrieve details of a reservable, an entity that can be reserved, such as a workplace location, from a ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The *WSD Reservable V2* API is a new version of the WSD Reservable API. The *WSD Reservable V2* API fetches details of all reservable space(s) on the WSD Portal that you select while making a reservation. The original WSD Reservable API version used a GET call but limited the sys_ID path parameter to 35 characters. The new WSD Reservable V2 API version is a POST call and takes all the sys_ids in the request body to avoid character limitations.

To access this API, the caller must have the sn_wsd_core.workplace_user role.

This API runs in the `sn_wsd_rsv` namespace. To access this API, the Workplace Reservation Management (sn_wsd_rsv) plugin must be activated.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Reservable V2 API - POST /sn_wsd_rsv/v2/reservable/list_reservables

Returns the details for one or more specified reservables.

URL format

Default URL: POST `api/sn_wsd_rsv/v2/reservable/list_reservables`

Supported request parameters

Path parameters

Name	Description
api_version	Required. Version of the endpoint to access. Specify `v2` to employ this API, otherwise using `v1` employs the default version of the WSD Reservable API. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
include_flexible_services	Flag that indicates whether to return the flexible services associated with the reservable in to the response. A flexible service is an additional provision available with a reservable workplace item when a reservation is made. For example, Classroom style - Rows of tables arranged with all participants facing towards the front of the room. For additional information on flexible services, see Create a flexible service. Valid values: • true: Return the flexible service information. • false: Do not return the flexible service information. Data type: Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Default: false
include_standard_services	Flag that indicates whether to return the standard services information in the response. A standard service describes basic provisions available with a reservable workplace item when the reservation is made, such as white boards, additional monitors, and similar services. For additional information on standard services, see Standard services. This information is located in the Standard Service [sn_wsd_rsv_standard_service] table. Valid values: • true: Return the standard services information. • false: Don't return the standard services information. Data type: Boolean Default: false
include_reservable_purposes	Optional. Flag that indicates whether to return the purpose associated with the reservable. Valid values: • true: Return the purpose of the reservable. • false: Do not return the purpose of the reservable. Data type: Boolean Default: false
include_layouts	Flag that indicates whether to return the location layout information in the response. Location layout information include such things as capacity, max capacity, preparation, and clean up duration. This information is located in the Location Layout [sn_wsd_rsv_m2m_location_layout] table. Valid values: • true: Return the location layout information. • false: Do not return the location layout information. Data type: Boolean Default: false
reservable_module_sys_id	Required. Sys_id of the reservable module, for example: desk, meeting room, etc.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	A reservable module groups similar types of workplace items. This sys_id is located in the Reservable Module [sn_wsd_rsv_reservable_module] table. For additional information on reservable modules, see Configure a reservable module. Data type: String Default: Empty value
reservation_start_time	Reservation start time to validate the lead time of extra services. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
space_sys_ids	Required. Comma-separated sys_ids of selected spaces. Data type: String Default: Empty value

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the response body. Only supports application/json.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	Could not find reservables. Look for the WSD Core Spaces [sn_wsd_core_spaces] table and verify the space record is present.
500	Error occurred! Unable to retrieve reservables. This is a server error. Contact system administration.

Response body parameters

Name	Description
result	Details on each matching reservable. Data type: Array of Objects `{ "result": [{ "allow_invitees": Boolean, "area": {Object}, "building": {Object}, "campus": {Object}, "capacity": Number, "description": "String", "display_number_of_attendees": Boolean, "display_on_behalf_of": Boolean, "display_sensitivity": Boolean, "email": "String", "employee_override_privacy": Boolean "enable_group_reservations": Boolean, "enable_reservation_privacy": Boolean, "external_id": "String", "flexible_services": [Array], "floor": {Object}, "image": {Object},`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.area.sys_id	Sys_id of the associated area record. Data type: String
result.building	Building where the reservable is located. This information is located in the Building [sn_wsd_core_building] table. `"building": { "display_value": "String", "sys_id": "String", "timezone": {Object} }`
result.building.display_value	Display value for the building. Data type: String
result.building.sys_id	Sys_id of the associated building record. Data type: String
result.building.timezone	Details of the time zone for the building. `"timezone": { "displayValue": "String", "value": "String" }`
result.building.timezone.display_value	Display value of the time zone in which the associated building resides. Data type: String
result.building.timezone.value	Internal value of the time zone in which the associated building resides. Data type: String
result.campus	Campus where the reservable is located. This information is located in the Campus [sn_wsd_core_campus] table. `"campus": { "display_value": "String", "sys_id": "String" }`
result.campus.display_value	Display value for the campus. Data type: String
result.campus.sys_id	Sys_id of the associated campus record. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.capacity	Number of people that the reservable can accommodate. Data type: Number
result.description	Description of the reservable. Data type: String
result.display_number_of_attendees	Flag that indicates whether users can specify the number of attendees in the reservation. Valid values: • true: Users can specify the number of attendees. • false: Users can't specify the display number of attendees. Data type: Boolean
result.display_on_behalf_of	Flag that indicates whether reservations can be made on behalf of someone else. Valid values: • true: On behalf of supported. • false: On behalf of not supported. Data type: Boolean
result.display_sensitivity	Flag that indicates whether users can set the sensitivity of the reservation, such as normal or private. Valid values: • true: Able to set sensitivity. • false: Not able to set sensitivity. Defaults to normal. Data type: Boolean
result.email	Email address associated with the reservable. Data type: String
result.employee_override_privacy	Flag that indicates whether users can override the privacy setting for the associated reservable. For additional information on these privacy settings, see Location privacy settings and impact. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Users can override the privacy setting for the associated reservable. • false: Users cannot override the privacy setting for the associated reservable.
result.enable_group_reservations	Flag that indicates whether users can make a group reservation. Valid values: • true: Able to make group reservations. • false: Not able to make group reservations. Data type: Boolean
result.enable_reservation_privacy	Flag that indicates the default setting for reservation privacy. For additional information on these privacy settings, see Location privacy settings and impact. Possible values: • true: Reservations are private by default. • false: Reservations are not private by default. Data type: Boolean
result.external_id	External ID of the reservable. Data type: String
result.flexible_services	Populated only if the *include_flexible_services* parameter is set to true and the workplace case management plugin is installed. Description of the flexible services associated with the reservables. There can be a parent flexible service, and several child flexible services. This information is located in the [sn_wsd_case_workplace_service_item] table. `flexible_services": [ { "additional_text": "String", "allow_only_single_service_item_selection": Boolean, "category": "String", "currency_code": "String",`

Name	Description
	"flexible_service": [Array], "label": "String", "sub_category": "String", "sub_title": "String", "text": "String", "title": {Object} }]
result.flexible_services.additional_text	Text to prompt user to select additional flexible services. Data type: String
result.flexible_services.allow_only_single_service_item_selection	Flag that indicates whether users can select only one service item among the group of flexible services within a reservation. Valid values: • true: Only able to make a single selection. • false: Able to make multiple selections. Data type: Boolean
result.flexible_services.category	Category of the flexible services. Data type: String
result.flexible_services.currency_code	Currency code used to calculate the amount of currency when ordering flexible services. Data type: String
result.flexible_services.flexible_service	Flexible services corresponding to a parent flexible service. This information is located in the [sn_wsd_case_workplace_service_item] table. Data type: Array of Objects "flexible_service": [{ "flexible_service": [Array], "label": "String", "sub_category": "String" }]
result.flexible_services.flexible_service.flexible_service	Details of each flexible service corresponding to a parent flexible service. Data type: Array of Objects

Name	Description
result.flexible_services.flexible_service. flexible_service.category_label	Category label of flexible service. Data type: String
result.flexible_services.flexible_service. flexible_service.cleanup_duration	Amount of time it takes to clean up or remove the service added to the reservable. Data type: Number Unit: Milliseconds
result.flexible_services.flexible_service. flexible_service.image	Link to the image of the flexible service. Data type: String
result.flexible_services.flexible_service. flexible_service.max_capacity	Maximum number of occupants that the reservable can accommodate. Data type: Number
result.flexible_services.flexible_service. flexible_service.name	Name of flexible service. Data type: String
result.flexible_services.flexible_service. flexible_service.preparation_duration	Amount of time it takes to add the service to the reservable. Data type: String Unit: Milliseconds

result.flexible_services.flexible_service.
flexible_service.price_per_unit
	Details of the cost of adding the flexible service to the reservable.
	
	Data type: Object
	
	`"price_per_unit": {`
	`  "code": "String",`
	`  "value": "String"`
	`}`

result.flexible_services.flexible_service. flexible_service.price_per_unit.code	Currency code to use when calculating the cost, such as GBP or USD. Data type: String
result.flexible_services.flexible_service. flexible_service.price_per_unit.value	Cost for each unit of the flexible service in the currency defined in the code parameter. Data type: String
result.flexible_services.flexible_service. flexible_service.quantity_enabled	Flag that indicates whether the quantity field should appear in the reservation. If this is set to true, *capacity_enabled* will always be false. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.floor.sys_id	Sys_id of the associated record in the Floor table. Data type: String

result.image	Details about an image that represents the associated reservable.
	
	Located in the Images [db_image] table.
	
	`"image": {`
	`  "link": "String",`
	`  "sys_id": "String"`
	`}`

result.image.link	Link to an image that represents the reservable. Data type: String
result.image.sys_id	Sys_id of the associated image record. Data type: String
result.is_reservable	Flag that indicates whether the flexible service can be reserved. Valid values: • true: Flexible service can be reserved. • false: Flexible service cannot be reserved. Data type: Boolean

results.layouts	Only populated if the *include_layouts* parameter is set to true.
	
	List of the layouts associated with the reservable.
	
	Data type: Array of Objects
	
	`"layouts": [`
	`  {`
	`  "capacity": Number,`
	`  "cleanup_duration":`
	`"String",`
	`  "image": {Object},`

Name	Description
	<pre> }]</pre>
result.layouts.capacity	Number of people that will attend the meeting. Data type: Number
result.layouts.cleanup_duration	Amount of time it takes to clean the reservable for this layout. Data type: Number Unit: Milliseconds

result.layouts.image	Details about an image that represents the layout for the associated reservable.
	
	Located in the Images [db_image] table.
	<pre>"image": {
	  "link": "String",
	  "sys_id": "String"
	}</pre>

result.layouts.image.link	Link to an image that represents the layout for this reservable. Located in the Images [db_image] table. Data type: String
result.layouts.image.sys_id	Sys_id of the associated image record. Data type: String
result.layouts.is_default	Flag that indicates whether the associated layout is the default for the reservable. Valid values: • true: Default. • false: Not default. Data type: Boolean
result.layouts.max_capacity	Maximum number of people that the layout associated with the reservable can accommodate. Data type: Number
result.layouts.name	Name of the location layout. Data type: String
result.layouts.preparation_duration	Amount of time it takes to prepare the associated location layout. Data type: Number

Name	Description
	Unit: Milliseconds
result.layouts.short_description	Brief description of the location layout. Data type: String
result.layouts.sys_id	Sys_id of the location layout. Located in the Layout [sn_wsd_rsv_layout] table. Data type: String
result.location_type	Details about the type of location of the reservable, such as workplace/desk, cafe, or gym. Located in the Space Type [sn_wsd_core_space_type] table. `"location_type": { "display_value": "String", "sys_id": "String" }`
result.location_type.display_value	Display value of the location type. Data type: String
result.location_type.sys_id	Sys_id of the associated record in the Space Type [sn_wsd_core_space_type] table. Data type: String
result.meetingProviders	Details about the virtual meeting providers associated with the reservable. This information is located in the Virtual Meeting Provider [sn_wsd_rsv_virtual_meeting_provider] table. `"meetingProviders": [ { "display_value": "String", "value": "String" } ]`
result.meetingProviders.display_value	Display value of the virtual provider's name. Data type: String
result.meetingProviders.value	Actual value for the virtual provider's name in the record. Data type: String

Name	Description
result.moduleType	Reservable module associated with the reservable, such as desks or meeting room. Data type: String
result.name	Name of the reservable. Data type: String
result.number	Unique identifier of the reservable. This value is more human readable than the sys_id. Data type: String
result.order	Order number for the reservable. Data type: Number
result.require_approval	Flag that indicates whether reserving the reservable requires an approval. Possible values: • true: Approval required. • false: Approval isn't required. Data type: Boolean
result.requires_check_in	Flag that indicates whether the reservable requires the user to check in. Valid values: • true: Check in required. • false: Check in isn't required. Data type: Boolean
result.require_subject	Flag that indicates whether the user must enter a subject when making the reservation. Valid values: • true: Subject required. • false: Subject isn't required. Data type: Boolean
result.reservable_quantity	Maximum number of times the associated reservable can be reserved for the same time. This value is used when assigning neighborhood spaces to an area. Data type: Integer
result.site	Details about the site where the reservable resides.

Name	Description
	Located in the Site [sn_wsd_core_site] table. `"site": { "display_value": "String", "sys_id": "String" }`
result.site.display_value	Display value of the site. Data type: String
result.standard_services	Only populated if the *include_standard_services* parameter is set to true. Associated standard services, such as flip chart, projector screen, and whiteboard and markers. Data type: Array of Objects `"standard_services": [ { "font_awesome_icon": "String", "name": "String", "short_description": "String", "sys_id": "String" } ]`
result.standard_services.font_awesome_icon	Name of the thumbnail icon associated with the standard service. Data type: String
result.standard_services.name	Name of the standard service. Data type: String
result.standard_services.short_description	Brief description of the standard service. Data type: String
result.standard_services.sys_id	Sys_id of the standard service record. Located in the Standard Service [sn_wsd_rsv_standard_service] table. Data type: String
result.site.sys_id	Sys_id of the associated site record in the Site [sn_wsd_core_site] table. Data type: String
result.tableName	Name of the table in which the reservable record resides.

Name	Description
	Data type: String
result.title	Title of the reservable. Data type: String
result.type	Type of a reservable, such as location. Data type: String

Example: cURL request

The following code example shows how to call this endpoint to return details about the specified reservables.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/v2/reservable/li
st_reservables" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data
 "{\"space_sys_ids\":
\"3ed3139977220110b3d7be377b5a99d1\",\"reservable_module_sys
_id\":
\"c31241cedb7650106c731dcd13961917\",\"include_flexible_servi
ces\":true,\"include_standard_services\":true,\"include_reservab
le_purposes\":true,\"include_layouts\":false}" \
--user 'username:'password'
```

Response body. This example returns details about all the reservables listed in the request body.

WSD Reservable Module API

The Workplace Service Delivery (WSD) *`Reservable Module`* API provides endpoints to retrieve details of a reservable module from a ServiceNow instance.

A reservable module groups similar types of workplace items. Employees can view these similar items in a single category. For example, a room is a reservable module and it contains similar workplace items such as meeting rooms, conference rooms, and other rooms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Reservation Management (sn_wsd_rsv) plugin must be activated. This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Reservable Module - GET /sn_wsd_rsv/reservable_module/{sys_id}

Returns the details for a specified reservable module.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservable_module/{sys_id}`

Default URL: `/api/sn_wsd_rsv/reservable_module/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reversable module record to retrieve. Located in the Reservable Module [sn_wsd_rsv_reservable_module] table. Data type: String

Query parameters

Name	Description
is_buildings_tree_data_required	Flag that indicates whether to return the building data associated with the reservable model. Valid values: • true: Return the building data. • false: Don't return the building data. Data type: Boolean Default: false
neighborhood	Only available if the Space Management (sn_wsd_spc_mgmt_neighborhood) plugin is activated. Sys_id of the neighborhood record to use in the encoded query. Located in the Neighborhood [sn_wsd_spcmgmt_neighborhood] table.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	For additional information on neighborhood space reservations, see Create neighborhood reservations. The endpoint checks if the neighborhood is valid and then retrieves the data required for the browse-by-neighborhood path. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
results	Details for the requested reservable module. Data type: Object `{ "result": { "allow_invitees": Boolean, "allow_whole_day": Boolean, "apply_to_shift": Boolean, "browse_by_area_enabled": Boolean, "browse_by_neighborhood_enabled": Boolean, "browse_near_a_person_enabled": Boolean, "buildingsTreeData": [Array], "buildingSysIds": [Array], "checkin_before_minutes": Number, "display_number_of_attendees": Boolean, "display_on_behalf_of": Boolean, "display_sensitivity": Boolean, "display_value": "String", "enable_browse_by_area": Boolean, "enable_browse_by_neighborhood": Boolean, "enable_browse_near_a_person": Boolean, "enable_facet_filter": Boolean, "enable_group_reservations": Boolean,`

Name	Description

	<pre>}
	}</pre>

result.allow_invitees	Flag that indicates whether employees are able to add invitees to the reservation. Valid values: • true: Allow employees to add invitees to the reservation. • false: Don't allow employees to add invitees to the reservation. Data type: Boolean
result.allow_whole_day	Flag that indicates whether users can reserve the reservable for the entire day. Valid values: • true: Allow users to reserve for the entire day. • false: Don't allow users to reserve for the entire day. Data type: Boolean
result.apply_to_shift	Flag that indicates whether shift-based reservations are enabled for the reservable module. Valid values: • true: Allow shift-based reservations. • false: Don't allow shift-based reservations. Data type: Boolean
result.browse_by_area_enabled	Flag that indicates whether users are able to search for reservable modules by area. Valid values: • true: Allow users to browse reservable modules by area. • false: Don't allow users to browse reservable modules by area. Data type: Boolean
result.browse_by_neighborhood_enabled	Only available if the Space Management - sn_wsd_spc_mgmt plugin is installed. Flag that indicates whether users are able to search in the reservable modules by neighborhood.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Valid values: • true: Allow users to browse reservable modules by neighborhood. • false: Don't allow users to browse reservable modules by neighborhood. Data type: Boolean
result.browse_near_a_person_enabled	Flag that indicates whether users are able to search for reservable modules located by a specified person. Valid values: • true: Allow users to browse reservable modules near a person. • false: Don't allow users to browse reservable modules near a person. Data type: Boolean
result.buildingTreeData	Only returned if the *is_buildings_tree_data_required* query parameter is set to `true`. Hierarchy of the buildings associate with the reservable module. Hierarchy order: • Region: Located in the Region [sn_wsd_core_region] table. • Site: Located in the Site [sn_wsd_core_site] table. • Campus: Located in the Campus [sn_wsd_core_campus] table. • Building: Located in the Building [sn_wsd_core_building] table. Each `children[ ]` node reflects a different building level/hiearchy: • buildingsTreeData: Region • buildingsTreeData.children: Site • buildingsTreeData.children.children: Campus • buildingsTreeData.children.children.children: Building Data type: Array of Objects `"buildingsTreeData": [ { "children": [Array],`

Name	Description

	<pre>"data": {Object},
	"isSelectable": Boolean,
	"isValid": Boolean,
	"label": "String",
	"uId": "String"
	}
	]</pre>

result.buildingsTreeData.children	Details on the site, campus, or building associated with the reservable module. Each of the parameters in all `children[ ]` nodes are the same. They just apply to different building entities and are only described one time in this section.
	
	Data type: Array of Objects
	<pre>"children": [
	{
	"children": [Array],
	"data": {Object},
	"isSelectable": Boolean,
	"isValid": Boolean,
	"label": "String",
	"uId": "String"
	}
	]</pre>

result.buildingsTreeData.children.data	Details about the building entity.
	
	Data type: Object
	<pre>"data": {
	"sysId": "String",
	"table": "String",
	"timezone": {Object}
	}</pre>

result.buildingsTreeData.children.data.sys_id	Sys_id of the associated building entity. Data type: String
result.buildingsTreeData.children.data.table	Name of the table in which the building entity record identified in the sys_id is located. Data type: String

result.buildingsTreeData.children.data.timezone	Details about the time zone of the building entity.
	<pre>"timezone": {
	"displayValue": "String",
	"value": "String"
	}</pre>

result.buildingsTreeData.children.data.timezone.displayValue	Display value in the record for the time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.buildingsTreeData.children.data.timezone.value	Internal value in the record for the time zone. Data type: String
result.buildingsTreeData.children.isSelectable	Flag that indicates whether the associated building entity is available (selectable) for the reservable model. Valid values: • true: Building entity is available for the reservable module. • false: Building entity isn't available for the reservable module. Data type: Boolean
result.buildingsTreeData.children.isValid	Flag that indicates whether the associated building entity is valid for the reservable model. Valid values: • true: Building entity is valid for the reservable module. • false: Building entity isn't valid for the reservable module. Data type: Boolean
result.buildingsTreeData.children.label	Name of the building entity. Data type: String
result.buildingsTreeData.children.uId	Sys_id of the associated building entity record. Data type: String
result.buildingSysIds	List of sys_ids of the buildings associated with the reservable module. Data type: Array of Strings
result.checkin_before_minutes	Amount of time before a reservation starts that a user can check into their reservation. Unit: Minutes Data type: Number
result.display_number_of_attendees	Flag that indicates whether users can specify the number of attendees in the reservation. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Users can specify the number of attendees. • false: Users can't specify the display number of attendees. Data type: Boolean
result.display_on_behalf_of	Flag that indicates whether reservations can be made on behalf of someone else. Valid values: • true: On behalf of supported. • false: On behalf of not supported. Data type: Boolean
result.display_sensitivity	Flag that indicates whether users can set the sensitivity of the reservation, such as normal or private. Valid values: • true: Able to set sensitivity. • false: Not able to set sensitivity. Defaults to normal. Data type: Boolean
result.display_value	Display value of the reservable module. Data type: String
result.enable_browse_by_area	Flag that indicates whether users are able to search for reservable modules by area. Same as *`browse_by_area_enabled`*. Valid values: • true: Allow users to browse reservable modules by area. • false: Don't allow users to browse reservable modules by area. Data type: Boolean
result.enable_browse_by_neighborhood	Flag that indicates whether users are able to search for reservable modules by neighborhood. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	• true: Allow users to browse reservable modules by neighborhood. • false: Don't allow users to browse reservable modules by neighborhood. Data type: Boolean
result.enable_browse_near_a_person	Flag that indicates whether users are able to search for reservable modules located by a specified person. Same as *browse_near_a_person_enabled*. Valid values: • true: Allow users to browse reservable modules near a person. • false: Don't allow users to browse reservable modules near a person. Data type: Boolean
result.enable_facet_filter	Flag that indicates whether facet filtering on workplace items is enabled. When enabled, the filter options that appear are based on the search results. Only the items that are available in the generated search result are available to users for selection in the filter. Valid values: • true: Facet filters are enabled. • false: Facet filters aren't enabled. Data type: Boolean
result.enable_group_reservations	Flag that indicates whether users can make a group reservation. Valid values: • true: Able to make group reservations. • false: Not able to make group reservations. Data type: Boolean
result.enable_ical_generation	Flag that indicates whether users can generate an iCalendar for the reservation. Valid values: • true: iCalendar generation allowed. • false: iCalendar generation isn't allowed. Data type: Boolean

Name	Description
result.font_awesome_icon	Name of the font icon attached to the reservable module. Data type: String
result.inline_title	Inline title of the reservable module. The title appears in line with the descriptive text on the Workplace service portal. Data type: String
result.layout_mapping	Details about the structure of the layout mapping of locations. Use this data to lay out the information in the UI. Data type: Object `"layout_mapping": { "body": [Array], "description": [Array], "image": "String", "subtitle": [Array], "subtitle_asc": [Array], "title": [Array] }`
result.layout_mapping.body	Placeholder for mapping the front-end UI data. Data type: Array of Objects `"body": [ { "field": "String", "field_to_display": "String", "icon": "String", "label": "String" } ]`
result.layout_mapping.body.field	Placeholder for mapping the front-end UI data. Data type: String
result.layout_mapping.body.field_to_display	Placeholder for mapping the front-end UI data. Data type: String
result.layout_mapping.body.icon	Placeholder for mapping the front-end UI data. Data type: String
result.layout_mapping.body.label	Placeholder for mapping the front-end UI data. Data type: String

Name	Description
result.layout_mapping.description	Placeholder for mapping the front-end UI data. Description of the layout mapping. Data type: Array
result.layout_mapping.image	Placeholder for mapping the front-end UI data. Data type: String
result.layout_mapping.subtitle	Placeholder for mapping the front-end UI data. Data type: Array
result.layout_mapping.subtitle_asc	Placeholder for mapping the front-end UI data. Data type: Array
result.layout_mapping.title	Placeholder for mapping the front-end UI data. Data type: Array
result.max_days_in_future	Maximum number of the days in the future that a user can reserve the reservable module. Data type: Number
result.max_occurrences	Maximum number of recurring reservation occurrences if recurring reservations are available for the reservable module. Data type: Number
result.name	Name of the reservable module. Data type: String
result.nbhBuildingIds	Only returned if the Space Management plugin is installed, the *`browse_by_neighborhood_enabled`* parameter is set to `true`, and the *`neighborhood`* parameter is passed in the query parameters. List of sys_ids of the buildings associated with the reservable module and configured for the neighborhood. Data type: Array of Strings
result.nbhBuildingsData	Only returned if the Space Management plugin is installed, the *`browse_by_neighborhood_enabled`* parameter is set to `true`, and the *`neighborhood`* parameter is passed in the query parameters.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	List of sys_ids of the buildings associated with the reservable module and configured for the neighborhood. Each building element also contains a list of sys_ids of the corresponding floors available for the building.
	
	For example:
	
	`"nbhBuildingsData": {`
	
	`"4703a4cedb3650106c731dcd13961945": [`
	
	`"0f9e304edb7650106c731dcd13961911"`
	`],`
	
	`"6c0364cedb3650106c731dcd13961927": [`
	
	`"b23328cedb3650106c731dcd139619f9"`
	`]`
	`}`
	
	Records associated with the building sys_ids are located in the Building [sn_wsd_core_building] table. Records associated with the floor sys_ids are located in the Floor [sn_wsd_core_floor] table.
	
	Data type: Array of Objects

result.nbhBuildingsTreeData	Only returned if the Space Management plugin is installed, the *browse_by_neighborhood_enabled* parameter is set to `true`, and the *neighborhood* parameter is passed in the query parameters.
	
	Hierarchy of the buildings associate with the reservable module and neighborhood.
	
	Data type: Array of Objects
	
	`"buildingsTreeData": [`
	`{`
	`"children": [Array],`
	`"data": {Object},`
	`"isSelectable": Boolean,`
	`"isValid": Boolean,`
	`"label": "String",`
	`"uId": "String"`
	`}`
	`]`
	
	Hierarchy order:

Name	Description
	• Region: Located in the Region [sn_wsd_core_region] table. • Site: Located in the Site [sn_wsd_core_site] table. • Campus: Located in the Campus [sn_wsd_core_campus] table. • Building: Located in the Building [sn_wsd_core_building] table.
result.nbhBuildingsTreeData.children	Describes the hierarchy of the children associated with the building. Each `children[]` node reflects a different building level/hierarchy: • buildingsTreeData: Region • buildingsTreeData.children: Site • buildingsTreeData.children.children: Campus • buildingsTreeData.children.children.children: Building Data type: Array `"children": [ { "children": [Array], "data": {Object}, "isSelectable": Boolean, "isValid": Boolean, "label": "String", "uId": "String" } ]` The parameters in the `children[]` array are the same as those in the *`nbhBuildingsTreeData`* object, just for the associated location type; region, site, campus, or building.
result.nbhBuildingsTreeData.data	Details about the associated entity; region, site, campus, or building. Data type: Object `"data": { "sys_id": "String", "table": "String", "timezone": {Object} }`
result.nbhBuildingsTreeData.data.sysId	Sys_id of the associated entity record.

Name	Description
	Data type: String
result.nbhBuildingsTreeData.data.table	Table in which the associated record is located. Data type: String
result.nbhBuildingsTreeData.data.timezone	Information about the time zone in which the associated entity resides. Data type: Object `"timezone": { "displayValue": "String", "value": "String" }`
result.nbhBuildingsTreeData.data.timezone.displayValue	Time zone value to use in a user interface. Data type: String
result.nbhBuildingsTreeData.data.timezone.value	Internal time zone value. Data type: String
result.nbhBuildingsTreeData.isSelectable	Flag that indicates whether the associated entity is available (selectable) for the reservable model. Valid values: • true: Entity is available for the reservable module. • false: Entity isn't available for the reservable module. Data type: Boolean
result.nbhBuildingsTreeData.isValid	Flag that indicates whether the associated entity is valid for the reservable model. Valid values: • true: Entity is valid for the reservable module. • false: Entity isn't valid for the reservable module. Data type: Boolean
result.nbhBuildingsTreeData.label	Name of the reservable view. Data type: String
result.nbhBuildingsTreeData.uId	Sys_id of the associated entity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.override_approval_policy	Option to specify how to implement the approval policy. Choices are as follows: • No override: The approval policy is implemented as set in the **Requires approval** field of a workplace space or room. • Always require approval: The approval policy is required regardless of what is set in the **Requires approval** field of a workplace space or room. • Never require approval: The approval policy is removed regardless of what is set in the **Requires approval**l field of a workplace space or room. Data type: String
result.require_cancel_notes	Flag that indicates whether users must enter a cancellation note before cancelling a reservable module. Valid values: • true: Cancellation note required. • false: Cancellation note not required. Data type: Boolean
result.require_cc_dept_check	Flag that indicates whether to check if there's a cost center or department mismatch between the workspace item and the logged in user. Valid values: • true: Check for a mismatch. • false: Don't check for a mismatch. Data type: Boolean
result.require_subject	Flag that indicates whether the user must enter a subject when making the reservation. Valid values: • true: Subject required. • false: Subject isn't required. Data type: Boolean
result.reservable_columns	List of the columns of a reservable. Located in the Workplace Location [sn_wsd_core_workplace_location] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array
result.reservable_container_field	Level of the container, such as a group of desks in a specific area. Data type: String
result.reservable_filter	Filter conditions used to filter out reservable items in the associated Reservable table. Reservable table is a field in the Reservable Module [sn_wsd_rsv_reservable_module] table. These filter conditions were applied to the table contained in the field Reservable table. Data type: String
result.reservable_quantity_field	Reservable quantity of all the spaces. The quantity is used when assigning neighbourhood spaces to an area. For additional information, see Assign neighborhood spaces to an area. Data type: String
result.reservable_table	Table that contains the reservable workplace items. Data type: String
result.reservable_type	Type of the reservable item, such as location. Data type: String

result.reservable_views	Details about the different views associated with the reservable module, such as card view or schedule view.
	
	Located in the Reservable View [sn_wsd_rsv_reservable_view] table.
	
	Data type: Object
	
	`"reservable_views": {`
	`  "iconClass": "String",`
	`  "isDefault": Boolean,`
	`  "label": "String",`
	`  "order": Number,`
	`  "type": "String"`
	`}`

result.reservable_views.iconClass	Icon class of the reservable view. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservable_views.isDefault	Flag that indicates whether to make this reservable view the default for reservable modules. Valid values: • true: Make default. • false: Don't make default. Data type: Boolean
result.reservable_views.label	Name of the reservable view. Data type: String
result.reservable_views.order	Order in which the views are displayed for the reservable module in the UI. The lower order number come first in the UI. In case of the same order number, it is assigned random ordering. Data type: Number
result.reservable_views.type	Backend name of the reservable view. Used for internal processing. Data type: String
result.reservation_paths	Reservation paths associated with the reservable modules such as Browse all, Browse near a person. Data type: Array of Objects `"reservation_paths": [ { "displayValue": "String", "value": "String" }`
result.reservation_paths.displayValue	Display value for the reservation path, such as "Browse near a person". Data type: String
result.reservation_paths.value	Internal value for the reservation path, such as "browse_near_a_person". Data type: String
result.search_limit	Maximum number of search results to return when a user searches for a workplace location. Data type: Number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.selection_type	Type of selection to display in the search results. Can be one of the following options: • Specific unit: The search result displays every workplace item. • Container: The search result displays the parent or container of the workplace items. Data type: String
result.short_description	Brief description of the reservable module. Data type: String
result.show_map_view	Flag that indicates whether to enable the map view for reservable modules. Valid values: • true: Enable map view. • false: Don't enable map view. Data type: Boolean
result.sys_id	Sys_id of the reservable module. Data type: String

result.timeSlots	Details about the time slots associated for a reservable module.
	
	Data type: Array of Objects
	<pre>[
	  {
	  "name": "String",
	  "short_description":
	"String",
	  "slot_end": "String",
	  "slot_start": "String",
	  "sys_id": "String"
	  }
	]</pre>

result.timeSlots.name	Name of the time slot. Data type: String
result.timeSlots.short_description	Brief description of the time slot. Data type: String
result.timeSlots.slot_end	End time of the time slot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.timeSlots.slot_start	Start time of the slot. Data type: String
result.timeSlots.sys_id	Sys_id of the time slot record. Located in the Time Slot [sn_wsd_rsv_time_slot] table. Data type: String
result.title	Title of the reservable module. Data type: String
result.virtual_meeting_provider	Details about the virtual provider associated with the reservable module. Data type: Object `"virtual_meeting_provider": { "display_value": "String", "sys_id": "String" }`
result.virtual_meeting_provider.display_value	Display value of the virtual meeting provider. Data type: String
result.virtual_meeting_provider.sys_id	Sys_id of the virtual meeting provider. Data type: String

Example: cURL request

This code example shows how to request a reservable module with the buildings tree data.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/reservable_modu
le/5db44502dbb650106c731dcd13961937&is_buildings_tree_data_requi
red=true" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Response body:

```
{
  "result": {
    "sys_id": "5db44502dbb650106c731dcd13961937", "name":
 "Desks",
    "title": "Desks",
    "inline_title": "desk",
    "font_awesome_icon": "fa-desktop",
```

WSD Reservation API

The Workplace Service Delivery (WSD) *`Reservation`* API provides endpoints for managing workplace reservations.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Safety Management (sn_wsd_core) and Workplace Reservation Management (sn_wsd_rsv) plugins must be activated.

This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Reservation - GET /api/sn_wsd_rsv/reservation/get

Retrieves the specified workplace reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/get`

Default URL: `/api/sn_wsd_rsv/reservation/get`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
external_ical	Unique external iCalendar identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Obtain this value from the associated external iCalendar application. Data type: String
external_id	Unique external identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Obtain this value from the associated external application. Data type: String
include_multi_child_data	If the reservation_subtype field value in the associated Workplace Reservation [sn_wsd_rsv_reservation] record is set to multi_child, this flag indicates whether to return the reservation details. Valid values: • true: Return the reservation details. • false: Do not return the reservation details. Data type: Boolean Default value: false
include_standard_services	Flag that indicates whether to return the standard services information in the response.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	A standard service describes basic provisions available with a reservable workplace item when the reservation is made, such as white boards, additional monitors, and similar services. For additional information on standard services, see Standard services. This information is located in the Standard Service [sn_wsd_rsv_standard_service] table. Valid values: • true: Return the standard services information. • false: Don't return the standard services information. Data type: Boolean Default: false
sys_id	Required. Sys_id of the reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result.reservation	Details about the reservation. Data type: Object `"reservation": { "active": Boolean, "attendees": [Array], "check_in_state": {Object}, "end": "String", "external_ical": "String", "external_id": "String", "is_parent": Boolean, "is_private": Boolean, "informEmployeePrivacy": Boolean. "last_updated_sub_source": {Object}, "location" {Object}, "number": "String", "number_of_attendees": Number, "recording_details": [Array], "reservable_module": {Object}, "reservation_purpose": {Object}, "reservation_type": {Object}, "reservation_subtype": {Object}, "sensitivity": {Object}, "start": "String", "state": {Object},`

Name	Description
	"source_reservation": "String", "subject": "String", "sub_source": {Object}, "sync_state": {Object}, "sys_created_on: "String", "sys_id": "String", "sys_updated_on": "String", "virtual_meeting": "String" }
result.reservation.active	Flag that indicates whether the reservation is active. Valid values: • true: Reservation is active. • false: Reservation is inactive. Data type: Boolean
result.reservation.attendees	List of attendees for the reservation. Data type: Array of Objects "attendees": [{ "avatar": "String", "displayValue": "String", "display_value": "String", "email": "String", "initials": "String", "label": "String", "name": "String", "sys_id": "String", "table": "String", "user_name": "String", "value": "String" }]
result.reservation.attendees.avatar	Sys_id of the avatar associated with the attendee. Located in the Attachments [sys_attachment] table. Data type: String
result.reservation.attendees.displayValue	Display value for the attendee. Data type: String
result.reservation.attendees.display_value	Display value of the attendee. Same as *displayValue*. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservation.attendees.email	Attendee's email address. Data type: String
result.reservation.attendees.initials	Attendee's initials. Data type: String
result.reservation.attendees.name	Attendee's name. Data type: String
result.reservation.attendees.sys_id	Sys_id_of the attendee record. Data type: String
result.reservation.attendees.table	Table in which the attendee record exists. Data type: String
result.reservation.attendees.user_name	Attendee's user name. Data type: String
result.reservation.attendees.value	Internal value of the attendee. Data type: String

result.reservation.check_in_state	Details about the check-in state of the reservation.
	
	Data type: Object
	`"check_in_state": {`
	`  "display_value": "String,"`
	`  "value": "String"`
	`}`

result.reservation.check_in_state. display_value	Display value for the current check-in state of the reservation, such as In progress or complete. Data type: String
result.reservation.check_in_state.value	Internal value for the current check-in state of the reservation, such as 2. Data type: String

result.reservation.edit_restriction	Description of the user edit restrictions for the reservation, such as no_restrictions, service_only, or fully_restricted.
	
	Data type: Object
	`"edit_restriction": {`
	`  "display_value": "String",`

Name	Description

	<pre>"value": "String"
	}</pre>

result.reservation.edit_restriction.display_value	Display value for the edit restrictions for the reservation, such as `No restriction`. Data type: String
result.reservation.edit_restriction.value	Internal value for the edit restrictions for the reservation, such as `no_restriction`. Data type: String
result.reservation.end	Reservation end date and time. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservation.external_ical	Unique external iCalendar identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Data type: String
result.reservation.external_id	Unique external identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Data type: String
result.reservation.is_parent	Flag that indicates whether this reservation is a parent reservation. Possible values: • true: Parent reservation. • false: No a parent reservation. Data type: Boolean
result.reservation.is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private.

Name	Description
	Data type: Boolean Default: Value set for privacy in the system properties.
result.reservation.last_updated_sub_source	Details about the last updated sub-source for the reservation. Sub-sources are used when integrating reservations with an external calendar. This object contains information such as "servicenow_workplace_service_delivery", "google_calendar", or "microsoft_exchange". Data type: Object `"last_updated_sub_source": { "display_value": "String," "value": "String" }`
result.reservation.last_updated_sub_source.display_value	Display value for the last updated sub-source of the reservation, such as `ServiceNow Workplace Service Delivery` or `Google Calendar`. Used when integrating the reservation with an outside service such as Google calendar or Microsoft Outlook. Data type: String
result.reservation.last_updated_sub_source.value	Internal value for the last updated sub-source of the reservation, such as `servicenow_workplace_service_delivery` or `google_calendar`. Used when integrating the reservation with an outside service such as Google calendar or Microsoft Outlook. Data type: String
result.reservation.location	Details about the location associated with the reservation. Data type: Object `"location": { "active": Boolean, "area": {Object}, "building": {Object}, "campus": {Object}, "capacity": Number, "description": "String", "display_value": "String", "email": "String", "floor": {Object}, "label_value": "String", "name": "String",`

Name	Description

	<pre>"number_of_attendees": Number,
	"region": {Object},
	"reservable_module": {Object},
	"reservation": {Object},
	"site": {Object},
	"state": {Object},
	"sys_id": "String"
	}</pre>

result.reservation.location.area	Details about the area associated with the location.
	
	Data type: Object
	<pre>"area": {
	"active": Boolean,
	"display_value": "String,"
	"sys_id": "String"
	}</pre>

result.reservation.location.area.active	Flag that indicates whether the area is active. Valid values: • true: Area is active. • false: Area is inactive. Data type: Boolean
result.reservation.location.area.display_value	Display value of the area to which this location belongs, such as Desk A2. Data type: String
result.reservation.location.area.sys_id	Sys_id of the area to which this location belongs. Located in the Area [sn_wsd_core_area] table. Data type: String

result.reservation.location.building	Details about the building associated with the location.
	
	Data type: Object
	<pre>"building": {
	"active": Boolean,
	"display_value": "String",
	"sys_id": "String",
	"timezone": {Object}
	}</pre>

result.reservation.location.building.active	Flag that indicates whether the building is active.

Name	Description
	Valid values: • true: Building is active. • false: Building is inactive. Data type: Boolean
result.reservation.location.building.display_value	Display value of the building to which this location belongs, such as AMS - Bld1. Data type: String
result.reservation.location.building.sys_id	Sys_id of the building to which this location belongs. Located in the building [sn_wsd_core_building] table. Data type: String
result.reservation.location.building.timezone	Details about the time zone associated with the location. Data type: Object `"timezone": { "displayValue": "String", "value": "String" }`
result.reservation.location.building.timezone.display_value	Display value for the time zone to which this location belongs. Data type: String
result.reservation.location.building.timezone.value	Internal value for the time zone to which this location belongs. Data type: String
result.reservation.location.campus	Details about the campus associated with the location. Data type: Object `"campus": { "active": Boolean, "display_value": "String," "sys_id": "String" }`
result.reservation.location.campus.active	Flag that indicates whether the campus is active. Valid values: • true: Campus is active. • false: Campus is inactive.

Name	Description
	Data type: Boolean
result.reservation.location.campus.display_value	Display value of the campus to which this location belongs, such as Amsterdam Campus. Data type: String
result.reservation.location.campus.sys_id	Sys_id of the campus to which this location belongs. Located in the Campus [sn_wsd_core_campus] table. Data type: String
result.reservation.location.capacity	Maximum number of occupants for the location. Data type: Number
result.reservation.location.description	Brief description of the location. Data type: String
result.reservation.location.display_value	Value to display in the UI for this location. Data type: String
result.reservation.location.email	Email address for the location. Data type: String
result.reservation.location.floor	Details about the floor associated with the location. Data type: Object `"floor": { "active": Boolean, "display_value": "String," "sys_id": "String" }`
result.reservation.location.floor.active	Flag that indicates whether the floor is active. Valid values: • true: Floor is active. • false: Floor is inactive. Data type: Boolean
result.reservation.location.floor.display_value	Display value of the floor to which this location belongs, such as First floor. Data type: String

Name	Description
result.reservation.location.floor.sys_id	Sys_id of the floor to which this location belongs. Located in the Floor [sn_wsd_core_floor] table. Data type: String
result.reservation.location.label_value	Type of value specified in the *name* parameter, such as Room name. Data type: String
result.reservation.location.name	Name of the location. Data type: String
result.reservation.location.number	Reservation number. Data type: String
result.reservation.location.number_of_attendees	Number of attendees for the reservation. Data type: Number

result.reservation.location.region	Details about the region associated with the location.
	
	Data type: Object
	`"region": {`
	`"active": Boolean,`
	`"display_value": "String,"`
	`"sys_id": "String"`
	`}`

result.reservation.location.region.active	Flag that indicates whether the region is active. Valid values: • true: Region is active. • false: Region is inactive. Data type: Boolean
result.reservation.location.region.display_value	Display value of the region to which this location belongs, such as Europe. Data type: String
result.reservation.location.region.sys_id	Sys_id of the region to which this location belongs. Located in the Region [sn_wsd_core_region] table. Data type: String
result.reservation.location.requested_for	Details about the person for whom the reservation was requested on behalf of.

Name	Description
result.reservation.reservable_module.reservable_container_field	Level of the container, such as a group of desks in a specific area. Data type: String
result.reservation.reservable_module.reservable_filter	Filter conditions used to filter out reservable items in the associated Reservable table. Reservable table is a field in the Reservable Module [sn_wsd_rsv_reservable_module] table. These filter conditions were applied to the table contained in the field Reservable table. Data type: String
result.reservation.reservable_module.reservable_quantity_field	Reservable quantity of all the spaces. The quantity is used when assigning neighbourhood spaces to an area. For additional information, see Assign neighborhood spaces to an area. Data type: String
result.reservation.reservable_module.reservable_table	Table that contains the reservable workplace items. Data type: String
result.reservation.reservable_module.reservable_type	Type of the reservable item, such as location. Data type: String
result.reservation.reservable_module.reservable_views	Details about the different views associated with the reservable module, such as card view or schedule view. Located in the Reservable View [sn_wsd_rsv_reservable_view] table. Data type: Object `"reservable_views": { "iconClass": "String", "isDefault": Boolean, "label": "String", "order": Number, "type": "String" }`
result.reservation.reservable_module.reservable_views.iconClass	Icon class of the reservable view. Data type: String
result.reservation.reservable_module.reservable_views.isDefault	Flag that indicates whether to make this reservable view the default for reservable modules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Valid values: • true: Make default. • false: Don't make default. Data type: Boolean
result.reservation.reservable_module.reservable_views.label	Name of the reservable view. Data type: String
result.reservation.reservable_module.reservable_views.order	Order in which the views are displayed for the reservable module in the UI. The lower order number come first in the UI. In case of the same order number, it is assigned random ordering. Data type: Number
result.reservation.reservable_module.reservable_views.type	Backend name of the reservable view. Used for internal processing. Data type: String
result.reservation.reservable_module.reservation_paths	Reservation paths associated with the reservable modules such as Browse all, Browse near a person. Data type: Array of Objects `"reservation_paths": [ { "displayValue": "String", "value": "String" }`
result.reservation.reservable_module.reservation_paths.display_value	Display value for the reservation path, such as "Browse near a person". Data type: String
result.reservation.reservable_module.reservation_paths.value	Internal value for the reservation path, such as "browse_near_a_person". Data type: String
result.reservation.reservable_module.search_limit	Maximum number of search results to return when a user searches for a workplace location. Data type: Number
result.reservation.reservable_module.selection_type	Type of selection to display in the search results. Can be one of the following options:

Name	Description
	• Specific unit: The search result displays every workplace item. • Container: The search result displays the parent or container of the workplace items. Data type: String
result.reservation.reservable_module.short_description	Brief description of the reservable module. Data type: String
result.reservation.reservable_module.show_map_view	Flag that indicates whether to enable the map view for reservable modules. Valid values: • true: Enable map view. • false: Don't enable map view. Data type: Boolean
result.reservation.reservable_module.sys_id	Sys_id of the reservable module. Data type: String
result.reservation.reservable_module.timeSlots	Details about the time slots associated for a reservable module. Data type: Array of Objects `[ { "name": "String", "short_description": "String", "slot_end": "String", "slot_start": "String", "sys_id": "String" } ]`
result.reservation.reservable_module.timeSlots.name	Name of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.short_description	Brief description of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.slot_end	End time of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.slot_start	Start time of the slot. Data type: String

Name	Description

	<pre>"record": Boolean
	}</pre>

result.reservation.reservationAcl.write.allFields	Flag that indicates whether to check if the user can write to all fields specified in the *reservationACL.write.fields* object. If the user only has access to some specific fields, then only those fields are true in the *reservationACL.write.fields* object. Valid values: • true: Check if user can write to all fields specified in the *reservationACL.write.fields* object. • false: Don't check if user can write to all fields specified in the *reservationACL.write.fields* object Data type: Boolean

result.reservation.reservationAcl.write.fields	Details of the access controls on various fields of the reservation.
	
	Data type: Object
	<pre>"fields": {
	"location": Boolean,
	"number_of_attendees":
	Boolean,
	"requested_for": Boolean,
	"sensitivity": Boolean,
	"subject": Boolean
	}</pre>

result.reservation.reservationAcl.write.fields.location	Flag that indicates whether to check if the user can write to the location fields in this reservation. Valid values: • true: Check if user can write to the location fields. • false: Don't check if user can write to the location fields. Data type: Boolean
result.reservation.reservationAcl.write.fields.number_of_attendees	Flag that indicates whether to check if the user can write to the number of attendees fields in this reservation. Valid values:

Name	Description
	• true: Check if user can write to the number of attendees field. • false: Don't check if user can write to the number of attendees field. Data type: Boolean
result.reservation.reservationAcl.write.fields.requested_for	Flag that indicates whether to check if the user can write to the requested for fields in this reservation. Valid values: • true: Check if user can write to the requested for field. • false: Don't check if user can write to the requested for field. Data type: Boolean
result.reservation.reservationAcl.write.fields.sensitivity	Flag that indicates whether to check if the user can write to the sensitivity fields in this reservation. Valid values: • true: Check if user can write to the sensitivity field. • false: Don't check if user can write to the sensitivity field. Data type: Boolean
result.reservation.reservationAcl.write.fields.subject	Flag that indicates whether to check if the user can write to the subject fields in this reservation. Valid values: • true: Check if user can write to the subject field. • false: Don't check if user can write to the subject fields. Data type: Boolean
result.reservation.reservationAcl.write.record	Flag that indicates whether to check if the user can write to the entire reservation record. Valid values: • true: Check if user can write to the entire reservation record. • false: Don't check if user can write to the entire reservation record.

Name	Description
	Data type: Boolean
result.reservation.reservation_purpose	Details about the purpose of the reservation. Data type: Object `"reservation_purpose": { "display_value": "String," "value": "String" }`
result.reservation.reservation_purpose.display_value	Display value for the purpose of the reservation, such as Company meeting. Data type: String
result.reservation.reservation_purpose.value	Internal value for the purpose of the reservation, such as company_meeting. Data type: String
result.reservation.reservation_type	Details about the type of the reservation. Data type: Object `"reservation_type": { "display_value": "String," "value": "String" }`
result.reservation.reservation_type.display_value	Display value for the type of the reservation, such as Space. Data type: String
result.reservation.reservation_type.value	Internal value for the type of the reservation, such as space. Data type: String
result.reservation.reservation_subtype	Details about the subtype of the reservation. Subtypes indicate the type of reservation, such as single, Multi parent, Multi child, Recurring parent, or occurrence. Data type: Object `"reservation_subtype": { "display_value": "String," "value": "String" }`
result.reservation.reservation_subtype.display_value	Display value for the subtype of the reservation, such as Single. Data type: String

Name	Description
result.reservation.reservation_subtype.value	Internal value for the subtype of the reservation, such as single. Data type: String

result.reservation.sensitivity	Details about the sensitivity of the reservation.
	
	Data type: Object
	
	`"sensitivity": {`
	`  "display_value": "String,"`
	`  "value": "String"`
	`}`

result.reservation.sensitivity.display_value	Display value for the sensitivity of the reservation, such as high or low. Data type: String
result.reservation.sensitivity.value	Internal value for the sensitivity of the reservation, such as 1 or 3. Data type: String

result.reservation.shift	Details about the shift applied to the reservation.
	
	Data type: Object
	
	`"shift": {`
	`  "display_value": "String",`
	`  "name": "String",`
	`  "shiftDetails": "String",`
	`  "sys_id": "String"`
	`}`

result.reservation.shift.display_value	Display value of the shift. Data type: String
result.reservation.shift.name	Name of the shift. Same as *`display_value`*. Data type: String
Result.reservation.shift.shiftDetails	Details of shift. Data type: String
result.reservation.shift.sys_id	Sys_id of the shift record. Located in the Shift [sn_wsd_core_shift] table. Data type: String
result.reservation.source	Details about the source for the reservation, such as Workplace Services or Google Mail.. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	<pre>"source": {
	  "display_value": "String",
	  "value": "String"
	}</pre>

result.reservation.source.display_value	Display value for the reservation source, such as Workplace Services. Data type: String
result.reservation.source.value	Internal value for the reservation source, such as servicenow. Data type: String

result.reservation.source_icon	Details about the source of the icon used in the reservation. This icon is used in the UI.
	
	Data type: Object
	<pre>"source_icon": {
	  "classNames": "String",
	  "imgSrc": "String",
	  "tooltip": "String"
	}</pre>

result.reservation.source_icon.classNames	Comma-separated class names for the source icon. Data type: String
result.reservation.source_icon.imgSrc	Name of the image source for source icon. This icon is stored in the Images [db_image] table. Data type: String
result.reservation.source_icon.tooltip	Tooltip associated with the source icon. Data type: String
result.reservation.source_reservation	Source reservation of the current reservation. For example, in the case of multiple reservations, the parent reservation is the source of the child reservation. Data type: String
result.reservation.start	Reservation start date and time. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservation.subject	Reservation's subject.

Name	Description
	Data type: String
result.reservation.sub_source	Details about the sub-source of the reservation. The sub-source specifies where the reservation originated such as Google Calendar or Microsoft Exchange. Data type: Object `"sub_source": { "display_value": "String," "value": "String" }`
result.reservation.sub_source.display_value	Display value for the sub-source of the reservation, such as Google Calendar. Data type: String
result.reservation.sub_source.value	Internal value of the sub-source field of the reservation, such as google_calendar. Data type: String
result.reservation.sync_state	Details about the synchronization state of a reservation from another service, such as "sync_enqueued" or "synchronized". Data type: Object `"sync_state": { "display_value": "String," "value": "String" }`
result.reservation.sync_state.display_value	Display value for the current sync state of the reservation, such as synchronized. Data type: String
result.reservation.sync_state.value	Internal value of the current sync state of the reservation, such as synchronized. Data type: String
result.reservation.sys_created_on	Date and time when the reservation was created. Data type: String
result.reservation.sys_id	Required. Sys_id of the reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Result.reservation.sys_updated_on	Date and time when the reservation was last updated. Data type: String
result.reservation.virtual_meeting	URL of the virtual meeting link. Data type: String

result.reservationAcl	Details of the user access control levels (ACL) checks set on the associated reservation.
	
	Data type: Object
	
	`"reservationAcl": {`
	`  "read": Boolean,`
	`  "write": {Object}`
	`}`

result.reservationAcl.read	Flag that indicates whether to check if the user can read this reservation. Valid values: • true: Check if user can read the reservation. • false: Don't check if user can read the reservation. Data type: Boolean

result.reservationAcl.write	Details about the user's write capabilities for the associated reservation.
	
	Data type: Object
	
	`"write": {`
	`  "allFields": Boolean,`
	`  "fields": {Object},`
	`  "record": Boolean`
	`}`

result.reservationAcl.write.allFields	Flag that indicates whether to check if the user can write to all fields specified in the *reservationACL.write.fields* object. If the user only has access to some specific fields, then only those fields are true in the *reservationACL.write.fields* object. Valid values: • true: Check if user can write to all fields specified in the *reservationACL.write.fields* object.

Name	Description
	"font_awesome_icon": "String", "name": "String", "short_description": "String", "sys_id": "String" }]
result.standard_services.font_awesome_icon	Name of the thumbnail icon associated with the standard service. Data type: String
result.standard_services.name	Name of the standard service. Data type: String
result.standard_services.short_description	Brief description of the standard service. Data type: String
result.standard_services.sys_id	Sys_id of the standard service record. Located in the Standard Service [sn_wsd_rsv_standard_service] table. Data type: String

Example: cURL request

The following code example shows how to call this endpoint and include the standard services information.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/g
et?sys_id=8e87c722870741106342b846dabb3573&include_standard_serv
ices=true" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
 "result": {
   "reservation": {
     "sys_id": "bf3621de842c2110fa9b813be354f327",

WSD Reservation - GET /api/sn_wsd_rsv/reservation/get_user_reservations

Retrieves the list of reservation for a specified user for the next seven days.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/get_user_reservations`

Default URL: `/api/sn_wsd_rsv/reservation/get_user_reservations`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
userId	Sys_id of the user whose reservations to return. Located in the User [sys_user] table. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Reservation return results. Data type: Object `"result":{ "informEmployeePrivacy": Boolean, "reservationsByDate": {Object}, "searchEndDate": "String", "searchStartDate": "String", "sortedReservationDates" : [Array], "workplaceProfile": {Object} }`
result.informEmployeePrivacy	Flag that indicates whether to display a message when reservations are returned that are marked as private. Possible values: • true: Display a message to the user that there are private reservations that are not displayed. • false: Do not display any message. Data type: Boolean
result.reservationsByDate	Details about each reservation by date. Data type: Object - each date in its own Array `"reservationsByDate": { string: [ { "building": {Object}, "floor": {Object}, "location": {Object} } ] }`
result.reservationsByDate.building	Building where the reservable is located. This information is located in the Building [sn_wsd_core_building] table. `"building": { "display_value": "String", "sys_id": "String", "timezone": {Object} }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservationsByDate.building.display_value	Display value for the building. Data type: String
result.reservationsByDate.building.sys_id	Sys_id of the associated building record. Data type: String
result.reservationsByDate.building.timezone	Details of the time zone for the building. `"timezone": { "displayValue": "String", "value": "String" }`
result.reservationsByDate.building.timezone.display_value	Display value of the time zone in which the associated building resides. Data type: String
result.reservationsByDate.building.timezone.sys_id	Sys_id of the time zone record in which the associated building resides. Data type: String
result.reservationsByDate.building.value	Internal value for the building. Data type: String
result.reservationsByDate.floor	Details about the floor associated with the reservation. Data type: Object `"floor": { "displayValue": "String", "value": "String" }`
result.reservationsByDate.floor.displayValue	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.reservationsByDate.floor.value	Internal value of the floor on which the reservation resides. Data type: String
result.reservationsByDate.location	Details on the location of the reservation. Data type: Object `"location": { "displayValue": "String", "type": "String",`

Name	Description
	"value": "String" }
result.reservationsByDate.location.displayValue	Display value of the location, such as South Parks. Data type: String
result.reservationsByDate.location.type	Type of location, such as workplace/desk, cafe, or gym. Data type: String
result.reservationsByDate.location.value	Internal value for the location, such as south_parks. Data type: String
result.searchEndDate	End date of the reservation search. Seven days from the start date. Format: yyyy-mm-dd Data type: String
result.searchStartDate	Start date of the reservation search. Date on which the endpoint was called. Format: yyyy-mm-dd Data type: String
result.sortedReservationDates	Dates on which the specified user has reservations for the next seven days, sorted in date order. Data type: Array

result.workplaceProfile	Users workplace profile. Describes where the specified user works.
	
	Data type: Object
	"reservationsByDate": {
	"building": {Object},
	"floor": {Object},
	"location": {Object}
	}

result.workplaceProfile.building	Building where the user works. This information is located in the Building [sn_wsd_core_building] table. "building": { "display_value": "String", "sys_id": "String",

Name	Description

	<pre>"timezone": {Object}
	}</pre>

result.workplaceProfile.building.display_value	Display value for the building. Data type: String
result.workplaceProfile.building.sys_id	Sys_id of the associated building record. Data type: String

result.workplaceProfile.building.timezone	Details of the time zone for the building.
	<pre>"timezone": {
	"displayValue": "String",
	"value": "String"
	}</pre>

result.workplaceProfile.building.timezone.display_value	Display value of the time zone in which the associated building resides. Data type: String
result.workplaceProfile.building.timezone.sys_id	Sys_id of the time zone record in which the associated building resides. Data type: String
result.workplaceProfile.building.value	Internal value for the building. Data type: String

result.workplaceProfile.floor	Details about the floor on which the user works.
	
	Data type: Object
	<pre>"floor": {
	"displayValue": "String",
	"value": "String"
	}</pre>

result.workplaceProfile.floor.displayValue	Display number of the floor on which the user works, such as Floor 8. Data type: String
result.workplaceProfile.floor.value	Internal value of the floor on which the user works. Data type: String

result.workplaceProfile.location	Details on the location of the user.
	
	Data type: Object
	<pre>"location": {
	"displayValue": "String",</pre>

Name	Description

	<pre>"type": "String",
	"value": "String"
	}</pre>

result.workplaceProfile.location.displayValue	Display value of the location, such as San Diego. Data type: String
result.workplaceProfile.location.type	Type of location, such as desk or office. Data type: String
result.workplaceProfile.location.value	Internal value for the location, such as san_diego. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/get
_user_reservations?userId=2de07e1887cb89106342b846dabb35fe" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "sortedReservationDates": [
      "2023-01-24"
    ],
    "workplaceProfile": {
      "location": {

WSD Reservation - GET /api/sn_wsd_rsv/reservation/icalendar/{sys_id}

Generates an iCalendar file body for a specified reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/icalendar/{sys_id}`

Default URL: `/api/sn_wsd_rsv/reservation/icalendar/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation for which to generate an iCalendar file body. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	iCalendar file body for the specified reservation. Data type: String

Example: cURL request

The following code example shows how to call this endpoint to create an iCalender body.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/ica
lendar/60d26a0f47578910003a4587746d4331" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

WSD Reservation - GET /api/sn_wsd_rsv/reservation/list

Retrieves the list of reservations belonging to a specified user.

This endpoint only returns reservations that were requested for or opened by the specified user.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/list`

Default URL: `/api/sn_wsd_rsv/reservation/list`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
encodedQuery	Encoded query to use to filter the returned reservation record results. All fields within the Workplace Reservation [sn_wsd_rsv_reservation] table are valid within the query. For example, `active=true^requested_for=2de07e1887cb89106342b846dabb35fe^building=4703a4cedb3650106c731dcd13961945` Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
endIndex	Last reservation record in the results set to return when specifying indexes for pagination. If this value is greater than the available number of return results records, all remaining records are returned. Data Type: Number
orderByEndDesc	Flag that indicates whether to return the return results in start time descending order. Valid values: • true: Return the results in descending order. • false: Return the results in ascending order. Default: false
searchCriteria	Text that has to match within the reservation for it to be included in the return results. The endpoint checks for this value in the following fields: • configuration_item.name • location.name • private_subject • requested_for.name • subject Data Type: String
startIndex	Starting record for which to return records, zero-based. Use this parameter to paginate through large record sets. Data Type: String Default: 0
userId	Sys_id of a user to filter out of the returned reservation information. Located in the User [sys_user] table. When this value is passed, the endpoint filters out those reservations where the requested_for or opened_by field is equal to the currently logged-in user. From that reservation list, it then filters out those reservation where the requested_for or opened_by is equal to the passed *`userId`*. Data Type: String Default: Returns all reservations where the requested_for or opened_by fields is equal to currently logged-in user.

Name	Description
	Data type: String
result.reservation.check_in_state	Details about the check-in state of the reservation. Data type: Object `"check_in_state": { "display_value": "String," "value": "String" }`
result.reservation.check_in_state.display_value	Display value for the current check-in state of the reservation, such as In progress or complete. Data type: String
result.reservation.check_in_state.value	Internal value for the current check-in state of the reservation, such as 2. Data type: String
result.reservation.edit_restriction	Description of the user edit restrictions for the reservation, such as no_restrictions, service_only, or fully_restricted. Data type: Object `"edit_restriction": { "display_value": "String", "value": "String" }`
result.reservation.edit_restriction.display_value	Display value for the edit restrictions for the reservation, such as `No restriction`. Data type: String
result.reservation.edit_restriction.value	Internal value for the edit restrictions for the reservation, such as `no_restriction`. Data type: String
result.reservation.end	Reservation end date and time. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservation.external_ical	Unique external iCalendar identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.reservation.external_id	Unique external identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Data type: String
result.reservation.is_parent	Flag that indicates whether this reservation is a parent reservation. Possible values: • true: Parent reservation. • false: No a parent reservation. Data type: Boolean
result.reservation.is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.
result.reservation.last_updated_sub_source	Details about the last updated sub-source for the reservation. Sub-sources are used when integrating reservations with an external calendar. This object contains information such as "servicenow_workplace_service_delivery", "google_calendar", or "microsoft_exchange". Data type: Object `"last_updated_sub_source": { "display_value": "String," "value": "String" }`
result.reservation.last_updated_sub_source.display_value	Display value for the last updated sub-source of the reservation, such as `ServiceNow Workplace Service Delivery` or `Google Calendar`. Used when integrating

Name	Description
	Data type: String
result.reservation.location.email	Email address for the location. Data type: String
result.reservation.location.floor	Details about the floor associated with the location. Data type: Object `"floor": { "active": Boolean, "display_value": "String," "sys_id": "String" }`
result.reservation.location.floor.active	Flag that indicates whether the floor is active. Valid values: • true: Floor is active. • false: Floor is inactive. Data type: Boolean
result.reservation.location.floor.display_value	Display value of the floor to which this location belongs, such as First floor. Data type: String
result.reservation.location.floor.sys_id	Sys_id of the floor to which this location belongs. Located in the Floor [sn_wsd_core_floor] table. Data type: String
result.reservation.location.label_value	Type of value specified in the *name* parameter, such as Room name. Data type: String
result.reservation.location.name	Name of the location. Data type: String
result.reservation.location.number	Reservation number. Data type: String
result.reservation.location.number_of_attendees	Number of attendees for the reservation. Data type: Number
result.reservation.location.region	Details about the region associated with the location.

Name	Description
	Data type: String
result.reservation.location.site.sys_id	Sys_id of the site to which this location belongs. Located in the Site [sn_wsd_core_site] table. Data type: String

result.reservation.location.state	Details about the state of the reservation for the location.
	
	Data type: Object
	
	`"state": {`
	`  "display_value": "String,"`
	`  "value": "String"`
	`}`

result.reservation.location.state.display_value	Display value for the current state of the reservation, such as confirmed. Data type: String
result.reservation.location.state.value	Internal value for the current state of the reservation, such as 2. Data type: String
result.reservation.location.sys_id	Sys_id of the associated location record. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
result.reservation.notification_custom_message	Custom message for the notification sent to the recipients listed in *reservation.notification_recipients*. Data type: String

result.reservation.notification_recipients	List of recipients that receive notification about the reservation.
	
	Data type: Array of Objects
	
	`"notification_recipients":[`
	`  {`
	`  "name": "String",`
	`  "sys_id": "String",`
	`  "user_name": "String"`
	`  }`
	`]`

result.reservation.notification_recipients.name	Name of the recipient. Data type: String

Name	Description
result.reservation.notification_recipients.sys_id	Sys_id of the recipient. Located in the User [sys_user] table. Data type: String
result.reservation.notification_recipients.user_name	User name of the recipient. Data type: String
result.reservation.number	Unique number of the reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. You can use this value to query the reservation. Data type: String
result.reservation.opened_by	Details about the user that created the reservation. Data type: Object `"opened_by": { "avatar": "String", "displayValue": "String", "display_value": "String", "email": "String", "initials": "String", "label": "String", "name": "String", "sys_id": "String", "table": "String", "user_name": "String", "value": "String" }`
result.reservation.opened_by.avatar	Avatar for the user that opened the reservation. Data type: String
result.reservation.opened_by.displayValue	Display value of the opened by user. Data type: String
result.reservation.opened_by.display_value	Display value of the opened by user. Data type: String
result.reservation.opened_by.email	Email address for the user that opened the reservation. Data type: String
result.reservation.opened_by.initials	Initials of the user that opened the reservation. Data type: String

Name	Description
result.reservation.opened_by.label	Label for the user that opened the reservation. This is a combination of the title and department of the user. Data type: String
result.reservation.opened_by.name	Name of the user that opened the reservation. Data type: String
result.rservation.opened_by.sys_id	Sys_id_of the user that opened the reservation. Located in the User [sys_user] table. Data type: String
result.rservation.opened_by.table	Table that contains the user record. Data type: String
result.reservation.opened_by.user_name	User name of the user that opened the reservation. Data type: String
result.reservation.opened_by.value	Internal value of the user that opened the reservation. Data type: String
result.reservation.number	Reservation number. Data type: String
result.reservation.number_of_attendees	Number of attendees in this reservation. Data type: number
result.reservation.recording_details	Details about the recordings associated with the reservation (meeting). Data type: Array `"recording_details": [ "recording_url": "String" ]`
result.reservation.recording_details. recording_url	URL of the recordings associated with the reservation. Data type: String
result.reservation.requested_for	Details about the user that the reservation was made on behalf of. Data type: Object

Name	Description

	"requested_for": {
	"avatar": "String",
	"displayValue": "String",
	"display_value": "String",
	"email": "String",
	"initials": "String",
	"label": "String",
	"name": "String",
	"sys_id": "String",
	"table": "String",
	"user_name": "String",
	"value": "String"
	}

result.reservation.requested_for.avatar	Avatar for the user that the reservation was made on behalf of. Data type: String
result.reservation.requested_for.displayValue	Display value of the user that the reservation was made on behalf of. Data type: String
result.reservation.requested_for.display_value	Display value of the user that the reservation was made on behalf of. Same as *`displayValue`*. Data type: String
result.reservation.requested_for.email	Email address for the user that the reservation was made on behalf of. Data type: String
result.reservation.requested_for.initials	Initials of the user that the reservation was made on behalf of. Data type: String
result.reservation.requested_for.label	Label for the user that the reservation was made on behalf of. Data type: String
result.reservation.requested_for.name	Name of the user that the reservation was made on behalf of. Data type: String
result.rservation.requested_for.sys_id	Sys_id_of the user that the reservation was made on behalf of. Located in the User [sys_user] table. Data type: String
result.rservation.requested_for.table	Table that contains the user record.

Name	Description
	Data type: Boolean
result.reservation.reservable_module.allow_whole_day	Flag that indicates whether users can reserve the reservable for the entire day. Valid values: • true: Allow users to reserve for the entire day. • false: Don't allow users to reserve for the entire day. Data type: Boolean
result.reservation.reservable_module.apply_to_shift	Flag that indicates whether shift-based reservations are enabled for the reservable module. Valid values: • true: Allow shift-based reservations. • false: Don't allow shift-based reservations. Data type: Boolean
result.reservation.reservable_module.browse_by_area_enabled	Flag that indicates whether users are able to search for reservable modules by area. Valid values: • true: Allow users to browse reservable modules by area. • false: Don't allow users to browse reservable modules by area. Data type: Boolean
result.reservation.reservable_module.browse_near_a_person_enabled	Flag that indicates whether users are able to search for reservable modules located by a specified person. Valid values: • true: Allow users to browse reservable modules near a person. • false: Don't allow users to browse reservable modules near a person. Data type: Boolean
result.reservation.reservable_module.buildingSysIds	List of sys_ids of the buildings associated with the reservable module. Data type: Array of Strings

Name	Description
result.reservation.reservable_module.checkin_before_minutes	Amount of time before a reservation starts that a user can check into their reservation. Unit: Minutes Data type: Number
result.reservation.reservable_module.display_number_of_attendees	Flag that indicates whether users can specify the number of attendees in the reservation. Valid values: • true: Users can specify the number of attendees. • false: Users can't specify the display number of attendees. Data type: Boolean
result.reservation.reservable_module.display_on_behalf_of	Flag that indicates whether reservations can be made on behalf of someone else. Valid values: • true: On behalf of supported. • false: On behalf of not supported. Data type: Boolean
result.reservation.reservable_module.display_sensitivity	Flag that indicates whether users can set the sensitivity of the reservation, such as normal or private. Valid values: • true: Able to set sensitivity. • false: Not able to set sensitivity. Defaults to normal. Data type: Boolean
result.reservation.reservable_module.display_value	Display value of the reservable module. Data type: String
result.reservation.reservable_module.enable_browse_by_area	Flag that indicates whether users are able to search for reservable modules by area. Same as *browse_by_area_enabled*. Valid values: • true: Allow users to browse reservable modules by area. • false: Don't allow users to browse reservable modules by area.

Name	Description
	Data type: Boolean
result.reservation.reservable_module.enable_browse_near_a_person	Flag that indicates whether users are able to search for reservable modules located by a specified person. Same as *browse_near_a_person_enabled*. Valid values: • true: Allow users to browse reservable modules near a person. • false: Don't allow users to browse reservable modules near a person. Data type: Boolean
result.reservation.reservable_module.enable_facet_filter	Flag that indicates whether facet filtering on workplace items is enabled. When enabled, the filter options that appear are based on the search results. Only the items that are available in the generated search result are available to users for selection in the filter. Valid values: • true: Facet filters are enabled. • false: Facet filters aren't enabled. Data type: Boolean
result.reservation.reservable_module.enable_group_reservations	Flag that indicates whether users can make a group reservation. Valid values: • true: Able to make group reservations. • false: Not able to make group reservations. Data type: Boolean
result.reservation.reservable_module.enable_ical_generation	Flag that indicates whether users can generate an iCalendar for the reservation. Valid values: • true: iCalendar generation allowed. • false: iCalendar generation isn't allowed. Data type: Boolean
result.reservation.reservable_module.font_awesome_icon	Name of the font icon attached to the reservable module. Data type: String

Name	Description
result.reservation.reservable_module.inline_title	Inline title of the reservable module. The title appears in line with the descriptive text on the Workplace service portal. Data type: String
result.reservation.reservable_module.layout_mapping	Details about the structure of the layout mapping of locations. Use this data to lay out the information in the UI. Data type: Object `"layout_mapping": { "body": [Array], "description": [Array], "image": "String", "subtitle": [Array], "subtitle_asc": [Array], "title": [Array] }`
result.reservation.reservable_module.layout_mapping.body	Placeholder for mapping the front-end UI data. Data type: Array of Objects `"body": [ { "field": "String", "field_to_display": "String", "icon": "String", "label": "String" } ]`
result.reservation.reservable_module.layout_mapping.body.field	Placeholder for mapping the front-end UI data. Data type: String
result.reservation.reservable_module.layout_mapping.body.field_to_display	Placeholder for mapping the front-end UI data. Data type: String
result.reservation.reservable_module.layout_mapping.body.icon	Placeholder for mapping the front-end UI data. Data type: String
result.reservation.reservable_module.layout_mapping.body.label	Placeholder for mapping the front-end UI data. Data type: String
result.reservation.reservable_module.layout_mapping.description	Placeholder for mapping the front-end UI data. Description of the layout mapping. Data type: Array
	Placeholder for mapping the front-end UI data.

Name	Description
result.reservation.reservable_module.layout_mapping.image	Data type: String
result.reservation.reservable_module.layout_mapping.subtitle	Placeholder for mapping the front-end UI data. Data type: Array
result.reservation.reservable_module.layout_mapping.subtitle_asc	Placeholder for mapping the front-end UI data. Data type: Array
result.reservation.reservable_module.layout_mapping.title	Placeholder for mapping the front-end UI data. Data type: Array
result.reservation.reservable_module.max_days_in_future	Maximum number of the days in the future that a user can reserve the reservable module. Data type: Number
result.reservation.reservable_module.max_occurrences	Maximum number of recurring reservation occurrences if recurring reservations are available for the reservable module. Data type: Number
result.reservation.reservable_module.name	Name of the reservable module. Data type: String
result.reservation.reservable_module.override_approval_policy	Option to specify how to implement the approval policy. Choices are as follows: • No override: The approval policy is implemented as set in the **Requires approval** field of a workplace space or room. • Always require approval: The approval policy is required regardless of what is set in the **Requires approval** field of a workplace space or room. • Never require approval: The approval policy is removed regardless of what is set in the **Requires approval**l field of a workplace space or room. Data type: String
result.reservation.reservable_module.require_cancel_notes	Flag that indicates whether users must enter a cancellation note before cancelling a reservable module. Valid values: • true: Cancellation note required. • false: Cancellation note not required.

Name	Description
	Data type: Boolean
result.reservation.reservable_module.require_cc_dept_check	Flag that indicates whether to check if there's a cost center or department mismatch between the workspace item and the logged in user. Valid values: • true: Check for a mismatch. • false: Don't check for a mismatch. Data type: Boolean
result.reservation.reservable_module.require_subject	Flag that indicates whether the user must enter a subject when making the reservation. Valid values: • true: Subject required. • false: Subject isn't required. Data type: Boolean
result.reservation.reservable_module.reservable_columns	List of the columns of a reservable. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: Array
result.reservation.reservable_module.reservable_container_field	Level of the container, such as a group of desks in a specific area. Data type: String
result.reservation.reservable_module.reservable_filter	Filter conditions used to filter out reservable items in the associated Reservable table. Reservable table is a field in the Reservable Module [sn_wsd_rsv_reservable_module] table. These filter conditions were applied to the table contained in the field Reservable table. Data type: String
result.reservation.reservable_module.reservable_quantity_field	Reservable quantity of all the spaces. The quantity is used when assigning neighbourhood spaces to an area. For additional information, see Assign neighborhood spaces to an area. Data type: String
result.reservation.reservable_module.reservable_table	Table that contains the reservable workplace items.

Name	Description
	Data type: String
result.reservation.reservable_module.reservable_type	Type of the reservable item, such as location. Data type: String
result.reservation.reservable_module.reservable_views	Details about the different views associated with the reservable module, such as card view or schedule view. Located in the Reservable View [sn_wsd_rsv_reservable_view] table. Data type: Object `"reservable_views": { "iconClass": "String", "isDefault": Boolean, "label": "String", "order": Number, "type": "String" }`
result.reservation.reservable_module.reservable_views.iconClass	Icon class of the reservable view. Data type: String
result.reservation.reservable_module.reservable_views.isDefault	Flag that indicates whether to make this reservable view the default for reservable modules. Valid values: • true: Make default. • false: Don't make default. Data type: Boolean
result.reservation.reservable_module.reservable_views.label	Name of the reservable view. Data type: String
result.reservation.reservable_module.reservable_views.order	Order in which the views are displayed for the reservable module in the UI. The lower order number come first in the UI. In case of the same order number, it is assigned random ordering. Data type: Number
result.reservation.reservable_module.reservable_views.type	Backend name of the reservable view. Used for internal processing. Data type: String

Name	Description
result.reservation.reservable_module.reservation_paths	Reservation paths associated with the reservable modules such as Browse all, Browse near a person. Data type: Array of Objects `"reservation_paths": [ { "displayValue": "String", "value": "String" }`
result.reservation.reservable_module.reservation_paths.display_value	Display value for the reservation path, such as "Browse near a person". Data type: String
result.reservation.reservable_module.reservation_paths.value	Internal value for the reservation path, such as "browse_near_a_person". Data type: String
result.reservation.reservable_module.search_limit	Maximum number of search results to return when a user searches for a workplace location. Data type: Number
result.reservation.reservable_module.selection_type	Type of selection to display in the search results. Can be one of the following options: • Specific unit: The search result displays every workplace item. • Container: The search result displays the parent or container of the workplace items. Data type: String
result.reservation.reservable_module.short_description	Brief description of the reservable module. Data type: String
result.reservation.reservable_module.show_map_view	Flag that indicates whether to enable the map view for reservable modules. Valid values: • true: Enable map view. • false: Don't enable map view. Data type: Boolean
result.reservation.reservable_module.sys_id	Sys_id of the reservable module.

Name	Description
	Data type: String
result.reservation.reservable_module.timeSlots	Details about the time slots associated for a reservable module. Data type: Array of Objects `[ { "name": "String", "short_description": "String", "slot_end": "String", "slot_start": "String", "sys_id": "String" } ]`
result.reservation.reservable_module.timeSlots.name	Name of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.short_description	Brief description of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.slot_end	End time of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.slot_start	Start time of the slot. Data type: String
result.reservation.reservable_module.timeSlots.sys_id	Sys_id of the time slot record. Located in the Time Slot [sn_wsd_rsv_time_slot] table. Data type: String
result.reservation.reservable_module.title	Title of the reservable module. Data type: String
result.reservation.reservable_module.virtual_meeting_provider	Details about the virtual provider associated with the reservable module. Data type: Object `"virtual_meeting_provider": { "display_value": "String", "sys_id": "String" }`
result.reservation.reservable_module.virtual_meeting_provider.display_value	Display value of the virtual meeting provider.

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	Data type: String
result.reservation.reservable_module. virtual_meeting_provider.sys_id	Sys_id of the virtual meeting provider. Data type: String

result.reservation.reservationAcl	Details of the user access control levels (ACL) checks set on the associated reservation.
	
	Data type: Object
	
	`"reservationAcl": {`
	`  "read": Boolean,`
	`  "write": {Object}`
	`}`

result.reservation.reservationAcl.read	Flag that indicates whether to check if the user can read this reservation. Valid values: • true: Check if user can read the reservation. • false: Don't check if user can read the reservation. Data type: Boolean

result.reservation.reservationAcl.write	Details about the user's write capabilities for the associated reservation.
	
	Data type: Object
	
	`"write": {`
	`  "allFields": Boolean,`
	`  "fields": {Object},`
	`  "record": Boolean`
	`}`

result.reservation.reservationAcl.write.allFields	Flag that indicates whether to check if the user can write to all fields specified in the *`reservationACL.write.fields`* object. If the user only has access to some specific fields, then only those fields are true in the *`reservationACL.write.fields`* object. Valid values: • true: Check if user can write to all fields specified in the *`reservationACL.write.fields`* object. • false: Don't check if user can write to all fields specified in the *`reservationACL.write.fields`* object

Name	Description
result.reservation.reservationAcl.write.fields.sensitivity	Flag that indicates whether to check if the user can write to the sensitivity fields in this reservation. Valid values: • true: Check if user can write to the sensitivity field. • false: Don't check if user can write to the sensitivity field. Data type: Boolean
result.reservation.reservationAcl.write.fields.subject	Flag that indicates whether to check if the user can write to the subject fields in this reservation. Valid values: • true: Check if user can write to the subject field. • false: Don't check if user can write to the subject fields. Data type: Boolean
result.reservation.reservationAcl.write.record	Flag that indicates whether to check if the user can write to the entire reservation record. Valid values: • true: Check if user can write to the entire reservation record. • false: Don't check if user can write to the entire reservation record. Data type: Boolean

result.reservation.reservation_purpose	Details about the purpose of the reservation.
	
	Data type: Object
	`"reservation_purpose": {`
	`  "display_value": "String,"`
	`  "value": "String"`
	`}`

result.reservation.reservation_purpose.display_value	Display value for the purpose of the reservation, such as Company meeting. Data type: String
result.reservation.reservation_purpose.value	Internal value for the purpose of the reservation, such as company_meeting. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

result.reservation.reservation_type	Details about the type of the reservation.
	
	Data type: Object
	
	`"reservation_type": {`
	`  "display_value": "String,"`
	`  "value": "String"`
	`}`

result.reservation.reservation_type.display_value	Display value for the type of the reservation, such as Space. Data type: String
result.reservation.reservation_type.value	Internal value for the type of the reservation, such as space. Data type: String

result.reservation.reservation_subtype	Details about the subtype of the reservation. Subtypes indicate the type of reservation, such as single, Multi parent, Multi child, Recurring parent, or occurrence.
	
	Data type: Object
	
	`"reservation_subtype": {`
	`  "display_value": "String,"`
	`  "value": "String"`
	`}`

result.reservation.reservation_subtype.display_value	Display value for the subtype of the reservation, such as Single. Data type: String
result.reservation.reservation_subtype.value	Internal value for the subtype of the reservation, such as single. Data type: String

result.reservation.sensitivity	Details about the sensitivity of the reservation.
	
	Data type: Object
	
	`"sensitivity": {`
	`  "display_value": "String,"`
	`  "value": "String"`
	`}`

result.reservation.sensitivity.display_value	Display value for the sensitivity of the reservation, such as high or low. Data type: String
result.reservation.sensitivity.value	Internal value for the sensitivity of the reservation, such as 1 or 3.

Name	Description
	Data type: String
result.reservation.shift	Details about the shift applied to the reservation. Data type: Object `"shift": { "display_value": "String", "name": "String", "shiftDetails": "String", "sys_id": "String" }`
result.reservation.shift.display_value	Display value of the shift. Data type: String
result.reservation.shift.name	Name of the shift. Same as *display_value*. Data type: String
Result.reservation.shift.shiftDetails	Details of shift. Data type: String
result.reservation.shift.sys_id	Sys_id of the shift record. Located in the Shift [sn_wsd_core_shift] table. Data type: String
result.reservation.source	Details about the source for the reservation, such as Workplace Services or Google Mail.. Data type: Object `"source": { "display_value": "String", "value": "String" }`
result.reservation.source.display_value	Display value for the reservation source, such as Workplace Services. Data type: String
result.reservation.source.value	Internal value for the reservation source, such as servicenow. Data type: String
result.reservation.source_icon	Details about the source of the icon used in the reservation. This icon is used in the UI. Data type: Object

Name	Description

	<pre>"source_icon": {
	  "classNames": "String",
	  "imgSrc": "String",
	  "tooltip": "String"
	}</pre>

result.reservation.source_icon.classNames	Comma-separated class names for the source icon. Data type: String
result.reservation.source_icon.imgSrc	Name of the image source for source icon. This icon is stored in the Images [db_image] table. Data type: String
result.reservation.source_icon.tooltip	Tooltip associated with the source icon. Data type: String
result.reservation.source_reservation	Source reservation of the current reservation. For example, in the case of multiple reservations, the parent reservation is the source of the child reservation. Data type: String
result.reservation.start	Reservation start date and time. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservation.subject	Reservation's subject. Data type: String

result.reservation.sub_source	Details about the sub-source of the reservation. The sub-source specifies where the reservation originated such as Google Calendar or Microsoft Exchange.
	
	Data type: Object
	<pre>"sub_source": {
	  "display_value": "String,"
	  "value": "String"
	}</pre>

result.reservation.sub_source.display_value	Display value for the sub-source of the reservation, such as Google Calendar. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservation.sub_source.value	Internal value of the sub-source field of the reservation, such as google_calendar. Data type: String
result.reservation.sync_state	Details about the synchronization state of a reservation from another service, such as "sync_enqueued" or "synchronized". Data type: Object `"sync_state": { "display_value": "String," "value": "String" }`
result.reservation.sync_state.display_value	Display value for the current sync state of the reservation, such as synchronized. Data type: String
result.reservation.sync_state.value	Internal value of the current sync state of the reservation, such as synchronized. Data type: String
result.reservation.sys_created_on	Date and time when the reservation was created. Data type: String
result.reservation.sys_id	Required. Sys_id of the reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
Result.reservation.sys_updated_on	Date and time when the reservation was last updated. Data type: String
result.reservation.virtual_meeting	URL of the virtual meeting link. Data type: String
result.reservationAcl	Details of the user access control levels (ACL) checks set on the associated reservation. Data type: Object `"reservationAcl": { "read": Boolean, "write": {Object} }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservationAcl.read	Flag that indicates whether to check if the user can read this reservation. Valid values: • true: Check if user can read the reservation. • false: Don't check if user can read the reservation. Data type: Boolean
result.reservationAcl.write	Details about the user's write capabilities for the associated reservation. Data type: Object `"write": { "allFields": Boolean, "fields": {Object}, "record": Boolean }`
result.reservationAcl.write.allFields	Flag that indicates whether to check if the user can write to all fields specified in the *reservationACL.write.fields* object. If the user only has access to some specific fields, then only those fields are true in the *reservationACL.write.fields* object. Valid values: • true: Check if user can write to all fields specified in the *reservationACL.write.fields* object. • false: Don't check if user can write to all fields specified in the *reservationACL.write.fields* object Data type: Boolean
result.reservationAcl.write.fields	Details of the access controls on various fields of the reservation. Data type: Object `"fields": { "location": Boolean, "number_of_attendees": Boolean, "requested_for": Boolean, "sensitivity": Boolean, "subject": Boolean }`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservationAcl.write.fields.location	Flag that indicates whether to check if the user can write to the location fields in this reservation. Valid values: • true: Check if user can write to the location fields. • false: Don't check if user can write to the location fields. Data type: Boolean
result.reservationAcl.write.fields.number_of_attendees	Flag that indicates whether to check if the user can write to the number of attendees fields in this reservation. Valid values: • true: Check if user can write to the number of attendees field. • false: Don't check if user can write to the number of attendees field. Data type: Boolean
result.reservationAcl.write.fields.requested_for	Flag that indicates whether to check if the user can write to the requested for fields in this reservation. Valid values: • true: Check if user can write to the requested for field. • false: Don't check if user can write to the requested for field. Data type: Boolean
result.reservationAcl.write.fields.sensitivity	Flag that indicates whether to check if the user can write to the sensitivity fields in this reservation. Valid values: • true: Check if user can write to the sensitivity field. • false: Don't check if user can write to the sensitivity field. Data type: Boolean
result.reservationAcl.write.fields.subject	Flag that indicates whether to check if the user can write to the subject fields in this reservation.

Name	Description
	Valid values: • true: Check if user can write to the subject field. • false: Don't check if user can write to the subject fields. Data type: Boolean
result.reservationAcl.record	Flag that indicates whether to check if the user can write to the entire reservation record. Valid values: • true: Check if user can write to the entire reservation record. • false: Don't check if user can write to the entire reservation record. Data type: Boolean
result.standard_services	Only populated if the *include_standard_services* parameter is set to true. Associated standard services, such as flip chart, projector screen, and whiteboard and markers. Data type: Array of Objects `"standard_services": [ { "font_awesome_icon": "String", "name": "String", "short_description": "String", "sys_id": "String" } ]`
result.standard_services.font_awesome_icon	Name of the thumbnail icon associated with the standard service. Data type: String
result.standard_services.name	Name of the standard service. Data type: String
result.standard_services.short_description	Brief description of the standard service. Data type: String

Name	Description
result.standard_services.sys_id	Sys_id of the standard service record. Located in the Standard Service [sn_wsd_rsv_standard_service] table. Data type: String

Example: cURL request

This code example shows how to call this endpoint to retrieve a list of reservations associated with the specified user.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/li
st" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```

WSD Reservation - PATCH /api/sn_wsd_rsv/reservation/cancel/{sys_id}

Cancels a specified workplace reservation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/cancel/{sys_id}`

Default URL: `/api/sn_wsd_rsv/reservation/cancel/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation to cancel. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
cancel_notes	Reason for cancelling the reservation. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
sys_id	Sys_id of the cancelled reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

Example: cURL request

The following code example shows how to cancel a reservation using this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/can
cel/12e2da5e87c701106342b846dabb354d" \
--request PATCH \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
"result": {
  "sys_id": "73c316d2474b0150003a4587746d4337"
}
```

WSD Reservation - PATCH /api/sn_wsd_rsv/reservation/share_details/{sys_id}

Updates and shares the reservation details with a specified list of recipients through an email notification. Optionally you can send a specified message along with the reservation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/share_details/{sys_id}`

Default URL: `/api/sn_wsd_rsv/reservation/share_details/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation to share. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
notification_custom_message	Message to send to the specified recipients. Data Type: String
notification_recipients	Required. List of sys_ids of the users to send the email notification to. Located in the User [sys_user] table. Data Type: Array
notification_type	Type of notification to send. Valid types: • reservation_cancelled • reservation_created • reservation_updated Data Type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
sys_id	Sys_id of the reservation record that was shared. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

Example: cURL request

The following code example shows how to use this endpoint to share a reservation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/sha
re_details/60d26a0f47578910003a4587746d4331" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"notification_recipients\":
 [\"5dfb9fcf47d78910003a4587746d4367\"],
\"notification_type\":\"reservation_updated\",
\"notification_custom_message\": \"Please join our design
 brainstorming meeting!\"
}" \
--user "username":"password"
```

Return results:

```
"result": {
  "sys_id": "60d26a0f47578910003a4587746d4331"
}
```

WSD Reservation - PATCH /api/sn_wsd_rsv/reservation/update/{sys_id}

Updates a specified workplace reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/update/{sys_id}`

Default URL: `/api/sn_wsd_rsv/reservation/update/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation to modify. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

Query parameters

Name	Description
ignore_same_day_validation	Flag that indicates whether the reservation search ignores the change of the date validation between the start and end parameters. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• true: Ignore the change date validation. • false: Don't ignore the change date validation. Data type: Boolean Default: false

Request body parameters

Name	Description
end	Required if the *shift* parameter isn't passed in. Requested end time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.
location	Required. Sys_id of the location to reserve. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
requested_for	Sys_id or email address of the user for which the reservation is being made. Located in the User [sys_user] table. Data type: String
shift	Sys_id of the shift to associate with the reservation. Located in the Shift [sn_wsd_core_shift] table. If this parameter is passed in, the *end* parameter isn't required. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String
start	Required. Requested start time of the reservation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
subject	Required. Subject of the meeting associated with the reservation. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Details of the updated reservation. Data type: Object `"result": { "location_id": "String", "sys_id": "String", "type_of_change": "String" }`
result.location_id	Sys_id of the reservation location record. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
result.sys_id	Sys_id of the modified reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
result.type_of_change	Type of information updated in the reservation. Data type: String

Example: cURL request

The following code example shows how to update a reservation using this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/upd
ate/b537abc947db4510003a4587746d4351" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"subject\": \"Rsv Update_1\",
\"start\": \"2022-07-21 14:00:00\",
\"end\": \"2022-07-21 15:00:00\",
\"requested_for\": \"workplace_user@example.com\",
\"workplace_location\": \"fe1f744edb7650106c731dcd139619ca\",
\"is_private\": \false\
}" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "sys_id": "b537abc947db4510003a4587746d4351",
    "location_id": "fe1f744edb7650106c731dcd139619ca",
    "type_of_change": "location"
  }
}
```

WSD Reservation - POST /api/sn_wsd_rsv/reservation/add

Creates a new workplace reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/add`

Default URL: `/api/sn_wsd_rsv/reservation/add`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
ignore_same_day_validation	Flag that indicates whether the reservation search ignores the change of the date validation between the start and end parameters. Valid values: • true: Ignore the change date validation. • false: Don't ignore the change date validation. Data type: Boolean Default: false
timezone	Preferred time zone for performing the request validations. For example: Europe/Amsterdam. This validation checks whether the start and end time fall on the same day. Data type: String Default: User time zone

Request body parameters

Name	Description
end	Required if the *`shift`* parameter isn't passed in. Requested end time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Request body parameters (continued)

Name	Description
is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.
location	Required. Sys_id of the location to reserve. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
requested_for	Sys_id or email address of the user for which the reservation is being made. Located in the User [sys_user] table. Data type: String
reservable_module	Required. Sys_id of the reservable module to associate with the reservation. A reservable module defines the workplace items needed for a reservation. Located in the Reservable Module [sn_wsd_rsv_reservable_module] table. Data type: String
shift	Sys_id of the shift to associate with the reservation. Located in the Shift [sn_wsd_core_shift] table. If this parameter is passed in, the *end* parameter isn't required. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String
start	Required. Requested start time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
subject	Required. Subject of the meeting associated with the reservation. Data type: String

  \"is_private\": false,
  \"start\": \"2023-01-12T11:00:00Z\",
  \"end\": \"2023-01-12T12:00:00Z\"
}" \
--user "username":"password"
```

Return results:

```
"result": {
  "sys_id": "4b036a9e474b0150003a4587746d43b1"
}
```

WSD Reservation - POST /api/sn_wsd_rsv/reservation/quick_reserve

Creates a new workplace reservation using quick reserve.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/quick_reserve`

Default URL: `/api/sn_wsd_rsv/reservation/quick_reserve`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Response body parameters

Name	Description
sys_id	Sys_id of the created reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

Example: cURL request

The following code example shows how to use the quick reserve endpoint to create a reservation.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/quick_reserve" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  \"start\":\"2022-05-23 16:00:00\",
  \"end\": \"2022-05-23 17:00:00\",
  \"reservable_module\": \"5db44502dbb650106c731dcd13961937\",
  \"reference_location_id\":
 \"05f5290edb7210106c731dcd13961951\",
  \"ignore_same_day_validation\": \"true\"
}" \
--user "username":"password"
```

Return results:

```
"result": {
  "sys_id": "4b036a9e474b0150003a4587746d43b1"
}
```

WSD Reservation Invitees API

The Workplace Service Delivery (WSD) *Reservation Invitees* API provides endpoints to add invitees to reservations, fetch invitees of a reservation, and reassign invitees of a reservation.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Reservation Management (sn_wsd_rsv) plugin must be activated.

This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Reservation Invitees - GET /api/sn_wsd_rsv/wsd_reservation_invitees/reservation/{sys_id}

Retrieves details about the invitees associated with a specified reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/wsd_reservation_invitees/reservation/{sys_id}`

Default URL: `/api/sn_wsd_rsv/reservation/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation for which to return the invitee details. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Return results for the invitees associated with the specified reservation. Data type: Object `{ "result": { "invitees": [Array], "reservationId": "String", "reservationSubType": "String", "success": Boolean } }`
result.invitees	Details about the invitees associated with the reservation. Data type: Array of Objects `"invitees": [{ "email": "String", "firstName": "String", "inviteeId": "String", "inviteState": {Object}, "inviteeType": "String", "isVIP": Boolean, "isWifiRequired": Boolean, "isParkingRequired": Boolean, "lastName": "String", "licensePlate": "String", "location": {Object}, "name": "String", "org": "String", "parkingType": "String", "phoneNumber": "String", "privateNotes": "String", "reservationId": "String", "reservationInviteeId": "String", "title": "String", "visitorType": "String" }]`
result.invitees.email	Email address of the invitee. Data type: String
result.invitees.firstName	First name of the invitee. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.invitees.inviteeId	Sys_id of the employee's user record. Located in the User [sys_user] table. Data type: String
result.invitees.inviteState	Details about the current state of the invitee for the reservation. Data type: Object `"inviteState": { "displayValue": "String", "value": "String" }`
result.invitees.inviteState.displayValue	Display value for the invitee state, such as New or Removed. Data type: String
result.invitees.inviteState.value	Internal value for the invitee state. Data type: String
result.invitees.inviteeType	Type of invitee. Valid values: (case-sensitive) • employee • visitor Data type: String
result.invitees.isVIP	Flag that indicates whether the invitee is classified as a VIP. Valid values: • true: Invitee is a VIP. • false: Invitee isn't a VIP. Data type: Boolean
result.invitees.isWifiRequired	Flag that indicates whether the WIFI password should be provided to the visitor upon entry. Valid values: • true: Provide WIFI password. • false: Don't provide WIFI password. Data type: Boolean
result.invitees.isParkingRequired	Flag that indicates whether the invitee requires parking. Valid values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Parking needed. • false: Parking is not needed. Data type: Boolean
result.invitees.lastName	Last name of the invitee. Data type: String
result.invitees.licensePlate	License plate of the invitee. Data type: String
result.invitees.location	Details about the workplace location of the invitee. Data type: Object `"location": { "displayName": "String", "sysId": "String" }`
result.invitees.location.displayName	Display name of the invitee's workplace location, such as Dublin. Data type: String
result.invitees.location.sysId	Sys_id of the invitee workplace location. Located in the Workplace Location [sn_wsd_core_worplace_location] table. Data type: String
result.invitees.name	Name of the invitee. Data type: String
result.invitees.org	Organization of the invitee. Data type: String
result.invitees.parkingType	Type of parking required for invitee. Valid values: (case-sensitive) • ev_parking • none • normal_parking • van_accessible_parking Data type: String
result.invitees.phoneNumber	Phone number of the invitee. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.invitees.privateNotes	Any additional notes provided by the invitee. Data type: String
result.invitees.reservationId	Sys_id of the reservation to which the invitee is associated. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
result.invitees.reservationInviteeId	Sys_id of the reservation invitee for visitor. Located in the Reservation Invitee [sn_wsd_rsv_m2m_reservation_invitee] table. Data type: String
result.invitees.title	Title of the invitee. Data type: String
result.invitees.visitorType	Type of invitee. Valid values: (case-sensitive) • client • contractor • friend_family • others Data type: String
result.reservationId	Sys_id of the reservation to which the invitee is associated. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
result.reservationSubType	Sub-type of the reservation record, such as single or multi-child. Data type: String
result.success	Flag that indicates whether the call was successful. Possible values: • true: Endpoint call was successful. • false: Endpoint call failed. Data type: Boolean

Example: cURL request

The following code example shows how to retrieve the invitees for a reservation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

WSD Reservation Invitees - POST /api/sn_wsd_rsv/wsd_reservation_invitees/reassign

Reassigns the specified invitees from one reservation to another.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/wsd_reservation_invitees/reassign`

Default URL: `/api/sn_wsd_rsv/wsd_reservation_invitees/reassign`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters

Name	Description
reservationId	Required. Sys_id of the reservation for which to reassign the invitees. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
reservationInvitees	List of invitees to reassign to the reservation identified in the *`reservationId`* parameter. Located in the Reservation Invitee [sn_wsd_rsv_m2m_reservation_invitee] table. This removes the specified invitees from an earlier reservation in which they were present as per the reservation invitee table and moves them to this reservation. Data type: Array of Strings

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *`application/json`*, *`application/xml`* or, *`text/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Details about the invitee reassignment. Data type: Object `"result": { "reservationInviteeIds": Array, "success": Boolean }`
result.reservationInviteeIds	List of sys_ids of the reservation invitees that were re-assigned to the specified reservation. Data type: Array of Strings
result.success	Flag that indicates whether the invitees were reassigned to the reservation. Possible values: • true: Invitees were successfully reassigned. • false: Invitees were not reassigned. Data type: Boolean

Example: cURL request

The following code example shows how to reassign invitees to a reservation.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/wsd_reservation_
invitees/reassign" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"reservationId\":\"3984e6c1532f01103cf7ddeeff7b129b\",
\"reservationInvitees\":
{\"aa31427f531701103cf7ddeeff7b1243\",\"e231427f531701103cf7ddee
ff7b1243\"}
}" \
--user 'username':'password'
```

Return results:

Name	Description
	Data type: String
result.success	Flag that indicates whether the invitees were added to the reservation. Possible values: • true: Invitees were successfully added. • false: Invitees were not added. Data type: Boolean

Example: cURL request

The following code example shows how to add both a visitor and an employee to a reservation.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/v1/wsd_reservati
on_invitees/submit" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{[
  \"reservationId\": \"041c4a13532f01103cf7ddeeff7b12c0\",
  \"invitees\": [
  {
    \"inviteeType\": \"employee\",
    \"inviteeId\": \"62826bf03710200044e0bfc8bcbe5df1\"
  },
  {
    \"inviteeType\":  \"visitor\",
    \"email\": \"visitoruser@example.com\",
    \"firstName\": \"Visitor\",
    \"lastName\":\"User\",
    \"isVIP\":true,
    \"visitorType\":\"contractor\",
    \"title\": \"ServiceNow Developer\",
    \"phone\": \"+91 9876543210\",
    \"isWifiRequired\": true,
    \"parkingType\": \"ev_parking\",
    \"licensePlate\": \"TS00TS0000\",
    \"org\": \"ServiceNow\",
    \"privateNotes\": \"Remarks\"
  }
]}" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "success": true,
    "reservationId": "17979dc9536b01103cf7ddeeff7b12b3"
  }
}
```

WSD Search API

The Workplace Service Delivery (WSD) *Search* API provides endpoints to search for available locations and workplace items such as reservables, reservable modules, and available shifts.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Safety Management (sn_wsd_core) and Workplace Reservation Management (sn_wsd_rsv) plugins must be activated.

This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Search - GET /api/sn_wsd_rsv/search/availability

Checks whether the specified reservables are available for the specified times.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/search/availability`

Default URL: `/api/sn_wsd_rsv/search/availability`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
end	Required. End time to use to search for available reservable modules. This value must be later than the value specified in the *start* parameter. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
include_reservations_within_days	Flag that indicates whether to return all free slots of available times in the response for each reservable for the whole day. Valid values: • true: Return all free slots. • false: Don't return all free slots. Data type: Boolean

Query parameters (continued)

Name	Description
	Default: false
reservable_ids	Required. Comma-separated list of reservable sys_ids to evaluate for availability. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
reservation_ids	Comma-separated list of existing reservation sys_ids. Pass this parameter if you want to edit the associated reservations. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. The time blocked for these sys_ids for the corresponding reservables are treated as available. Data type: String Default: None
reservable_module	Required. Sys_id of the reservable module to include in the search. A reservable module groups similar types of workplace items. Located in the Reservable Module [sn_wsd_rsv_reservable_module] table. Data type: String
schedule_view_obj	Details about the schedule view to return. Pass this object if you need 24-hour availability data for reservations that span more than one day. The return results will only contain available times and reservations for the specified date. For this functionality to work properly, the parameters *ignore_same_day_validation* and *include_reservations_within_days* must be set to `true`. Data type: Object `"schedule_view_obj": { "schedule_view_date": "String", "timezone": "String" }`
schedule_view_obj.schedule_view_date	Date for which to start returning reservation availability. This date must be in the time zone specified in the

Query parameters (continued)

Name	Description
	schedule_view_obj.timezone parameter. Data type: String Format: YYYY-MM-DD
schedule_view_obj.timezone	Building time zone to use to determine the reservation availability data to return. For example: US/Pacific. Data type: String
shift	Required if the specified reservable modules are based on a shift. Sys_id of the shift to associate with the reservation. Located in the Shift [sn_wsd_core_shift] table. If this parameter is passed in, the *end* parameter isn't required. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String
start	Required. Start time to use to search for available reservable modules. This value must be prior to the value specified in the *end* parameter. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	List of all available resevables for the specified times. Data type: Array of Objects `"result": [ { "availableTimes": [Array], "building": {Object}, "campus": {Object}, "email": "String", "floor": {Object}, "is_available": Boolean, "name": "String", "reservations": [Array], "sys_id": "String" } ]`
result.availableTimes	List of dates/times that the associated reservable is available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array
result.building	Details about the building associated with the reservable. Data type: Object `"building": { "display_value": "String", "name": "String", "sys_id": "String" }`
result.building.display_value	Display value for the building. Data type: String
result.building.name	Name of the building. Data type: String
result.building.sys_id	Sys_id of the associated building record. Data type: String
result.campus	Details about the campus associated with the reservable. Data type: Object `"campus": { "display_value": "String", "name": "String", "sys_id": "String" }`
result.campus.display_value	Display number of the Campus on which the reservable resides, such as East Bay. Data type: String
result.campus.name	Name of the campus. Data type: String
result.campus.sys_id	Sys_id of the associated record. Located in the Campus [sn_wsd_core_campus] table. Data type: String
result.email	Email address for the associated reservable. Data type: String
result.floor	Details about the floor associated with the reservable.

Name	Description
	Data type: Object `"floor": { "display_value": "String", "name": "String", "sys_id": "String" }`
result.floor.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.floor.name	Name of the floor on which the reservable resides. Data type: String
result.floor.sys_id	Sys_id of the associated record in the Floor [sn_wsd_core_floor] table. Data type: String
result.is_available	Flag that indicates whether the reservable is available to reserve. Valid values: • true: Available to reserve. • false: Not available to reserve. Data type: Boolean
result.name	Name of the reservable. Data type: String
result.reservations	Details about the associated reservation. Data type: Array of Objects `"reservations": [ { "configuration_item": "String", "end": "String", "is_collided": Boolean, "location": {Object}, "number": "String", "requested_for": {Object}, "reservation_purpose": {Object}, "start": "String", "state": {Object}, "subject": "String", "sys_id": "String"`

Name	Description
	<pre> }]</pre>
result.reservations.configuration_item	Configuration items corresponding to the reservation. Located in the cmdb_ci table. Data type: String
result.reservations.end	Reservation end date and time. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservations.is_collided	Flag that indicates whether the reservation collides with the start and end time of the search. This indicates that the associated reservable location is already reserved for the specified search timespan. Possible values: • true: Collision. • false: No collision. Data type: Boolean

result.reservations.location	Details about the location of the reservation.
	
	Data type: Object
	<pre>"location": {
	  "location": "String",
	  "timezone": {Object}
	}</pre>

result.reservations.location.location	Sys_id of the associated location record. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String

result.reservations.location.timezone	Details about the time zone associated with the location.
	
	Data type: Object
	<pre>"timezone": {
	  "displayValue": "String",
	  "value": "String"
	}</pre>

result.reservations.location.timezone.displayValue	Display value for the time zone to which this location belongs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Data type: String
result.reservations.location.timezone.value	Internal value for the time zone to which this location belongs. Data type: String
result.reservations.number	Reservation number. Data type: String

result.reservations.requested_for	Details about the person for whom the reservation was requested on behalf of.
	
	Data type: Object
	
	`"requested_for": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

result.reservations.requested_for.name	Name of the user for whom the reservation was requested for. Data type: String
result.reservations.requested_for.sys_id	Sys_id of the user for whom the reservation is being requested. Located in the User [sys_user] table. Data type: String

result.reservations.reservation_purpose	Details about the purpose of the reservation.
	
	Data type: Object
	
	`"reservation_purpose": {`
	`  "display_value": "String,"`
	`  "value": "String"`
	`}`

result.reservations.reservation_purpose.display_value	Display value for the purpose of the reservation, such as Company meeting. Data type: String
result.reservations.reservation_purpose.value	Internal value for the purpose of the reservation, such as company_meeting. Data type: String
result.reservations.start	Reservation start date and time. Data type: String

Name	Description
	Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservations.state	Details about the state of the reservation for the location. Data type: Object `"state": { "display_value": "String," "value": "String" }`
result.reservations.state.display_value	Display value for the current state of the reservation, such as confirmed. Data type: String
result.reservations.state.value	Internal value for the current state of the reservation, such as 2. Data type: String
result.reservations.subject	Reservation's subject. Data type: String
result.reservations.sys_id	Required. Sys_id of the reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String

Example: cURL request

The following code example shows how to call this endpoint. Note: Line breaks have been added to the query parameters for easier reading.

```

```

WSD Search - GET /api/sn_wsd_rsv/search/best_match

Searches for the best reservable item match based on provided search criteria.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/search/best_match`

Default URL: `/api/sn_wsd_rsv/search/best_match`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
best_match_count	Number of best matched reservables to return. Data type: Number Default: 1
end	Required. End time to use to search for available reservable modules. This value must be later than the value specified in the *`start`* parameter. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
include_reservable_purposes	Flag that indicates whether to return the purpose of reserving the workplace location for each reservable in the return results. This information is located i the Reservable Purpose [sn_wsd_rsv_reservable_purpose] table. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• true: Return the reservable purposes. • false: Don't return the reservable purposes. Data type: Boolean Default: false
include_reservations_within_days	Flag that indicates whether to return all free slots of available times in the response for each reservable for the whole day. Valid values: • true: Return all free slots. • false: Don't return all free slots. Data type: Boolean Default: false
include_standard_services	Flag that indicates whether to return the standard services information in the response. A standard service describes basic provisions available with a reservable workplace item when the reservation is made, such as white boards, additional monitors, and similar services. For additional information on standard services, see Standard services. This information is located in th Standard Service [sn_wsd_rsv_standard_service] table. Valid values: • true: Return the standard services information. • false: Don't return the standard services information. Data type: Boolean Default: false
q	Required. Encoded query to use to filter the search return results. Within this query you must specify the building sys_id and you can specify parameters such as floor, area, capacity, standard services, and reservable_purposes. All passed parameters must be sys_ids, except for capacity, which is a number. For example: `q=building=94e264cedb3650106c731dcd1396191919^floorINfc7368cedb3650106c731dcd13961902^capacity>=1^standard_services=55c0818edb7650106c731dcd13961904^reservable_purposes=d6e5c7cd1ba4e01051848489cc4bcb8` You can locate this information in the following tables: • Area: sn_wsd_core_area • Building: sn_wsd_core_building

© 2026 ServiceNow, Inc. All rights reserved.

Query parameters (continued)

Name	Description
	• Floor: sn_wsd_core_floor • Reservable purposes: sn_wsd_rsv_reservable_purpose • Standard services: sn_wsd_rsv_standard_service Data type: String
reservable_module	Required. Sys_id of the reservable module to include in the search. A reservable module groups similar types of workplace items. Located in the Reservable Module [sn_wsd_rsv_reservable_module] table. Data type: String
start	Required. Start time to use to search for available reservable modules. This value must be prior to the value specified in the *end* parameter. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
time_slot	Sys_id of a time slot record for which we are trying to look for the best matching reservable. Located in the Time Slot [sn_wsd_rsv_time_slot] table. Data Type: String Default: None
timezone	Preferred time zone, such as Europe/Amsterdam. Data type: String Default: None

Request body parameters

Header	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Return results for the best reservable match. Data type: Object `"result": { "floorsOfSelectedBuilding": [Array], "hasMore": Boolean, "nextItemIndex": Number, "reservableContainers": [Array], "reservableUnits": [Array] }`
result.floorsOfSelectedBuilding	Details about the floors on which the reservable is located. Data type: Array of Objects `"floorsOfSelectedBuilding": [ { "display_value": "String", "external_id": "String", "name": "String", "sys_id": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.floorsOfSelectedBuilding.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.floorsOfSelectedBuilding.external_id	External identifier for the floor. Data type: String
result.floorsOfSelectedBuilding.name	Name of the floor on which the reservable resides. Data type: String
result.floorsOfSelectedBuilding.sys_id	Sys_id of the associated record in the Floor [sn_wsd_core_floor] table. Data type: String
result.hasMore	Flag that indicates whether there are more reservables in the return results. Possible values: • true: More reservables available. • false: No more reservables available. Data type: Boolean
result.nextItemIndex	Index for the next reservable record to fetch. Use this value when paginating through reservable records. Data type: Number
result.reservableContainers	Only returned for reservable modules whose selection_type field is set to `container`. A container is a grouping of similar items, such as a group of desks. Data type: Array of Objects `"reservableContainers": [ { "building": {Object}, "campus": {Object}, "capacity": Number, "display_value": "String", "floor": {Object}, "image": {Object} "sys_id": "String" } ]`
result.reservableContainers.building	Details about the building associated with the reservable container.

Name	Description
	Data type: Object `"building": { "display_value": "String", "name": "String", "sys_id": "String" }`
result.reservableContainers.building.display_value	Display value for the building. Data type: String
result.reservableContainers.building.name	Name of the building. Data type: String
result.reservableContainers.building.sys_id	Sys_id of the associated building record. Data type: String
result.reservableContainers.campus	Details about the campus on which the reservable is located. Located in the Campus [sn_wsd_core_campus] table. Data type: Object `"campus": { "display_value": "String", "name": "String", "sys_id": "String" }`
result.reservableContainers.campus.display_value	Display number of the Campus on which the reservable resides, such as East Bay. Data type: String
result.reservableContainers.campus.name	Name of the campus. Data type: String
result.reservableContainers.campus.sys_id	Sys_id of the associated record. Located in the Campus [sn_wsd_core_campus] table. Data type: String
result.reservableContainers.capacity	Maximum number of occupants for the reservable. Data type: Number
result.reservableContainers.display_value	Display value for the reservable container. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservableContainers.floor	Details about the floor associated with the reservable container. Data type: Object `"floor": { "display_value": "String", "name": "String", "sys_id": "String" }`
result.reservableContainers.floor.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.reservableContainers.floor.name	Name of the floor on which the reservable resides. Data type: String
result.reservableContainers.floor.sys_id	Sys_id of the associated record in the Floor [sn_wsd_core_floor] table. Data type: String
result.reservableContainers.image	Details about an image that represents the layout for the associated reservable. Located in the Images [db_image] table. `"image": { "link": "String", "sys_id": "String" }`
result.reservableContainers.image.link	Link to an image that represents the layout for this reservable. Located in the Images [db_image] table. Data type: String
result.reservableContainers.image.sys_id	Sys_id of the associated image record. Data type: String
result.reservableContainers.sys_id	Sys_id of the associated container record. The table in which this resides can be configured for any container type. By default it is in the Area [sn_wsd_core_area] table. Data type: String
result.reservableUnits	Details about the reservable units that match the specified search criteria. A reservable unit is a singe reservable item such as a desk or a chair.

Name	Description

	<pre>"sys_id": "String"
	}</pre>

result.reservableUnits.area.display_value	Display value for the reservable module area. Data type: String
result.reservableUnits.area.sys_id	Sys_id of the area record associated with the reservable. Data type: String
result.reservableUnits.availableTimes	List of dates/times that the associated reservable is available. Data type: Array

result.reservableUnits.building	Details about the building in which the reservable is located. Located in the Building [sn_wsd_core_building] table.
	
	Data type: Object
	<pre>"building": {
	"display_value": "String",
	"sys_id": "String"
	}</pre>

result.reservableUnits.building.display_value	Display value for the building. Data type: String
result.reservableUnits.building.sys_id	Sys_id of the associated building record. Data type: String

result.reservableUnits.campus	Details about the campus on which the reservable is located.
	
	Located in the Campus [sn_wsd_core_campus] table.
	
	Data type: Object
	<pre>"campus": {
	"display_value": "String",
	"sys_id": "String"
	}</pre>

result.reservableUnits.campus.display_value	Display number of the Campus on which the reservable resides, such as East Bay. Data type: String
result.reservableUnits.campus.sys_id	Sys_id of the associated record. Located in the Campus [sn_wsd_core_campus] table.

Name	Description
	Data type: String
result.reservableUnits.capacity	Maximum number of occupants for the reservable. Data type: Number
result.reservableUnits.defaultPrivacyValue	Flag that indicates the default privacy setting for the reservable. For additional information on these privacy settings, see Location privacy settings and impact. Possible values: • true: Privacy setting for the reservable can be overridden. • false: Privacy setting for the reservable cannot be overridden. Data type: Boolean
result.reservableUnits.description	Brief description of the reservable. Data type: String
result.reservableUnits.email	Email address for the reservable. Data type: String
result.reservableUnits.external_id	External ID of the reservable used to sync a space mapped in CMS. This value is only populated if there is a map associated with this location. Data type: String
result.reservableUnits.floor	Details about the floor on which the reservable is located. Located in the Floor [sn_wsd_core_floor] table. Data type: Object `"floor": { "display_value": "String", "sys_id": "String" }`
result.reservableUnits.floor.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.reservableUnits.floor.sys_id	Sys_id of the associated record in the Floor [sn_wsd_core_floor] table.

Name	Description
	Data type: String
result.reservableUnits.image	Details about an image that represents the layout for the associated reservable. Located in the Images [db_image] table. `"image": { "link": "String", "sys_id": "String" }`
result.reservableUnits.image.link	Link to an image that represents the layout for this reservable. Located in the Images [db_image] table. Data type: String
result.reservableUnits.image.sys_id	Sys_id of the associated image record. Data type: String
result.reservableUnits.includedInResult	Flag that indicates whether the current reservable is included in the return results. Valid values: • true: Included in the return results. • false: Not included in the return results. Data type: Boolean
result.reservableUnits.is_available	Flag that indicates whether the reservable is available to reserve. Valid values: • true: Available to reserve. • false: Not available to reserve. Data type: Boolean
result.reservableUnits.is_favorite	Flag that indicates whether the reservable is flagged as one of the associated user's favorites. Valid values: • true: Favorite. • false: Not a favorite. Data type: Boolean
result.reservableUnits.is_reservable	Flag that indicates whether it's possible to reserve this reservable.

Name	Description
	Note: If the *include_unavailable_items* query parameter is set to true, unavailable locations are also returned. In this case, if a location is already reserved, then the *is_available* parameter is false, but *is_reservable* is true. Valid values: • true: Available to reserve. • false: Not available to reserve. Data type: Boolean
result.reservableUnits.is_reserved	Flag that indicates whether the reservable is already reserved. Valid values: • true: Available to reserve. • false: Already reserved. Data type: Boolean
result.reservableUnits.is_selected	Flag that indicates whether the reservable is already reserved. Valid values: • true: Available to reserve. • false: Already reserved. Data type: Boolean
result.reservableUnits.location_type	Details about the type of location of the reservable, such as workplace/desk, cafe, or gym. Located in the Workplace Location [sn_wsd_core_workplace_location] table. `"location_type": { "display_value": "String", "name": "String", "sys_id": "String" }`
result.reservableUnits.location_type.display_value	Display value of the location type. Data type: String
result.reservableUnits.location_type.name	Name of the location type, such as basement or storage. Same as display value.

Name	Description
	Data type: String
result.reservableUnits.location_type.sys_id	Sys_id of the associated record in the Space Type [sn_wsd_core_space_type] table. Data type: String
result.reservableUnits.name	Name of the reservable. Data type: String
result.reservableUnits.number	Unique identifier of the reservable. This value is more human readable than the sys_id. Data type: String
result.reservableUnits.order	Order number for the reservable. Data type: Number
result.reservableUnits.require_approval	Flag that indicates whether reserving the reservable requires an approval. Possible values: • true: Approval required. • false: Approval isn't required. Data type: Boolean
result.reservableUnits.requires_check_in	Flag that indicates whether the reservable requires the user to check in. Valid values: • true: Check in required. • false: Check in isn't required. Data type: Boolean
result.reservableUnits.reservable_purposes	Details about the purpose for reserving the associated reservable. Data type: Array of Objects `"reservable_purposes": [ { "name": "String", "short_description": "String", "sys_id": "String" } ]`
result.reservableUnits.reservable_purposes.name	Name of the reservable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.reservableUnits.reservable_purposes.short_description	Brief description of the reservable. Data type: String
result.reservableUnits.reservable_purposes.sys_id	Sys_id of the reservable purpose record. Located in the Reservable Purpose [sn_wsd_rsv_reservable_purpose] table. Data type: String
result.reservableUnits.reservations	Details about the reservations associated with the reservable. Only populated if the *include_reservations_within_days* query parameter is true and the *reservation_ids* parameter contains reservation IDs, meaning there are reservations already present for this reservable. Data type: Array of Objects `"reservations": [ { "configuration_item": "String", "end": "String", "is_collided": Boolean, "location": {Object}, "number": "String", "requested_for": {Object}, "reservation_purpose": {Object}, "start": "String", "state": {Object}, "subject": "String", "sys_id": "String" } ]`
result.reservableUnits.reservations.configuration_item	Configuration items corresponding to the reservation. Located in the cmdb_ci table. Data type: String
result.reservableUnits.reservations.end	Reservation end date and time. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservableUnits.reservations.is_collided	Flag that indicates whether the reservation collides with the start and end time of the search.

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	This indicates that the associated reservable location is already reserved for the specified search timespan. Possible values: • true: Collision. • false: No collision. Data type: Boolean
result.reservableUnits.reservations.location	Details about the location of the reservation. Data type: Object `"location": { "location": "String", "timezone": {Object} }`
result.reservableUnits.reservations.location.location	Sys_id of the associated location record. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
result.reservableUnits.reservations.location.timezone	Details about the time zone associated with the location. Data type: Object `"timezone": { "displayValue": "String", "value": "String" }`
result.reservableUnits.reservations.location.timezone.displayValue	Display value for the time zone to which this location belongs. Data type: String
result.reservableUnits.reservations.location.timezone.value	Internal value for the time zone to which this location belongs. Data type: String
result.reservableUnits.reservations.number	Unique identifier of the reservable. This value is more human readable than the sys_id. Data type: String
result.reservableUnits.reservations.requested_for	Details about the person for whom the reservation was requested on behalf of. Data type: Object

Name	Description

	<pre>"requested_for": {
	  "name": "String",
	  "sys_id": "String"
	}</pre>

result.reservableUnits.reservations. requested_for.name	Name of the user for whom the reservation was requested for. Data type: String
result.reservableUnits.reservations. requested_for.sys_id	Sys_id of the user for whom the reservation is being requested. Located in the User [sys_user] table. Data type: String

result.reservableUnits.reservations.
reservation_purpose
	Details about the purpose of the reservation.
	
	Data type: Object
	<pre>"reservation_purpose": {
	  "display_value": "String,"
	  "value": "String"
	}</pre>

result.reservableUnits.reservations. reservation_purpose.display_value	Display value for the purpose of the reservation, such as Company meeting. Data type: String
result.reservableUnits.reservations. reservation_purpose.value	Internal value for the purpose of the reservation, such as company_meeting. Data type: String
result.reservableUnits.reservations.start	Reservation start date and time. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z

result.reservableUnits.reservations.state	Details about the state of the reservation for the location.
	
	Data type: Object
	<pre>"state": {
	  "display_value": "String,"
	  "value": "String"
	}</pre>

result.reservableUnits.reservations.state. display_value	Display value for the current state of the reservation, such as confirmed. Data type: String

Name	Description
result.reservableUnits.reservations.state.value	Internal value for the current state of the reservation, such as 2. Data type: String
result.reservableUnits.reservations.subject	Reservation's subject. Data type: String
result.reservableUnits.reservations.sys_id	Required. Sys_id of the reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
result.reservableUnits.reservable_quantity	Maximum number of times the associated reservable can be reserved for the same time. This value is used when assigning neighborhood spaces to an area. Data type: Integer
result.reservableUnits.showPrivacyOption	Flag that indicates whether an employee can override the privacy settings for the associated reservable. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Privacy settings can be overridden. • false: Privacy setting cannot be overridden. Data type: Boolean
result.reservableUnits.site	Details about the site where the reservable resides. Located in the Site [sn_wsd_core_site] table. `"site": { "display_value": "String", "sys_id": "String" }`
result.reservableUnits.site.display_value	Display value of the site. Data type: String
result.reservableUnits.site.sys_id	Sys_id of the associated site record in the Site [sn_wsd_core_site] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
result.reservableUnits.standard_services	Associated standard services, such as flip chart, projector screen, and whiteboard and markers. Data type: Array of Objects `"standard_services": [ { "font_awesome_icon": "String", "name": "String", "short_description": "String", "sys_id": "String" } ]`
result.reservableUnits.standard_services.font_awesome_icon	Name of the thumbnail icon associated with the standard service. Data type: String
result.reservableUnits.standard_services.name	Name of the thumbnail icon associated with the standard service. Data type: String
result.reservableUnits.standard_services.short_description	Brief description of the standard service. Data type: String
result.reservableUnits.standard_services.sys_id	Sys_id of the standard service record. Located in the Standard Service [sn_wsd_rsv_standard_service] table. Data type: String
result.reservableUnits.sys_id	Sys_id of the reservable record. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
result.reservableUnits.tableName	Name of the table in which the reservable record resides. Data type: String
result.reservableUnits.title	Title of the reservable. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

WSD Search - GET /api/sn_wsd_rsv/search/overlapping_reservation

Determines whether an overlapping reservation exists based on the passed parameters.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/search/overlapping_reservation`

Default URL: `/api/sn_wsd_rsv/search/overlapping_reservation`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
end	Required. End time to use to check for overlapping reservations. Data type: String Format: YYY-MM-DDTHH:MM:SSZ

recurring_pattern	Details about the recurring pattern for the reservation.
	
	Data type: Object
	
	`"recurring_pattern": {`
	`  "duration": Number,`
	`  "options": {Object},`
	`  "repeats": "String",`
	`  "startDate":"String"`
	`}`

recurring_pattern.duration	Length of time to check. Data type: Number Unit: Seconds

recurring_pattern.options	Details about the options associated with the recurring reservation.
	
	Data type: Object
	
	`"options": {`
	`  "count": Number,`
	`  "daysOfWeek": "String",`

Query parameters (continued)

Name	Description

	<pre>"every": Number
	}</pre>

recurring_pattern.options.count	Number of times the pattern is repeated. Data type: Number
recurring_pattern.options.daysOfWeek	Days of the week to check for overlap. Valid values: • 1 = Monday • 2 = Tuesday • 3 = Wednesday • 4 = Thursday • 5 = Friday • 6 = Saturday • 7 = Sunday For example, to specify Tuesday, Thursday, and Friday, pass 245 (no delimiter). Data type: String
recurring_pattern.options.every	Pattern repeat interval to check. For example, if this value is 2, it checks the repeat pattern based on the selection in the *repeats* parameter, such as every other day or every other week. Data type: Number
recurring_pattern.options.repeats	Repeating pattern for the reservation overlap check. Possible values: (case-sensitive) • daily • monthly • weekly • yearly Data type: String
reservable_id	Sys_id of the reservable module to check for overlapping reservations. Located in the Reservable Module [sn_wsd_rsv_reservable_module] table. Data type: String
reservation_id	Sys_id of the reservation to check for overlap. This value is needed in the edit flow of multi/group

Query parameters (continued)

Name	Description
	parents. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
shift_info_object	Details of the shift to check for overlap. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: Object `"shift_info_object": { "applyToShift": Boolean, "shift": "String", "timezone": "String" }`
shift_info_object.applyToShift	Flag that indicates whether shift-based reservations are enabled for the reservable module. Valid values: • true: Allow shift-based reservations. • false: Don't allow shift-based reservations. Data type: Boolean
shift_info_object.shift	Sys_id of the shift to associate with the reservation. Located in the Shift [sn_wsd_core_shift] table. If this parameter is passed in, the *end* parameter isn't required. Data type: String
shift_info_object.timezone	Time zone of the shift to check for overlap. Data type: String
start	Required. Start time to use to check for overlapping reservations. Data type: String Format: YYY-MM-DDTHH:MM:SSZ
user_id	Required. Sys_id of the user to check for overlapping reservations. Located in the User [sys_user] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
results	Details of the results of the overlap check. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"results": {
	  "isOverlapped": Boolean,
	  "reservableId": "String"
	}</pre>

results.isOverlapped	Flag that indicates whether an overlapping reservation exists. Valid values: • true: Overlapping reservation exists. • false: Overlapping reservation doesn't exist. Data type: Boolean
results.reservableId	In the case of a group reservation, the sys_id of the reservable for which the overlap occurs. Data type: String

Example: cURL request

The following code example shows how to check for a reservation overlap for a specific user and for a specific period of time denoted by the *start* and *end* parameters.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/search/overlappi
ng_reservation?user_id=2e617fecc3d365101e38b23bb00131ec&end=2023
-06-19T8:00:00Z&start=2023-06-19T07:00:00Z" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
"results": {
  "isOverlapped": True,
  "reservableId": ""
  }
}
```

WSD Search - GET /api/sn_wsd_rsv/search/reservable

Searches for available reservable items using a specified reservable model configuration.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/search/reservable`

Default URL: `/api/sn_wsd_rsv/search/reservable`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
end	Required. End time to use to search for available reservable modules. T value must be later than the value specified in the *`start`* parameter. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
exclude_reservables	List of one or more sys_ids of reservables to exclude from the search results. The table in which these sys_ids are located is specified in the reservable_table field in the Reservable Module [sn_wsd_rsv_reservable_module] table. It can be either the Space [sn_wsd_core_space] or Room [sn_wsd_core_room] table. Data type: String or Array
ignore_same_day_validation	Flag that indicates whether the reservation search ignores the change date validation between the start and end parameters. Valid values: • true: Ignore the change date validation. • false: Don't ignore the change date validation. Data type: Boolean Default: false
include_reservable_purposes	Flag that indicates whether to return the purpose of reserving the work location for each reservable in the return results. This information is loc the Reservable Purpose [sn_wsd_rsv_reservable_purpose] table. Valid values: • true: Return the reservable purposes. • false: Don't return the reservable purposes. Data type: Boolean Default: false
include_reservations_within_days	Flag that indicates whether to return all free slots of available times in t response for each reservable for the whole day.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Valid values: • true: Return all free slots. • false: Don't return all free slots. Data type: Boolean Default: false
include_standard_services	Flag that indicates whether to return the standard services information response. A standard service describes basic provisions available with a reserva workplace item when the reservation is made, such as white boards, additional monitors, and similar services. For additional information on standard services, see Standard services. This information is locate Standard Service [sn_wsd_rsv_standard_service] table. Valid values: • true: Return the standard services information. • false: Don't return the standard services information. Data type: Boolean Default: false
near_by_location_id	Required if the *rsv_path* parameter is set to `browse_near_a_pe` Sys_id of the location to use in the encoded query. Located in the Work Location [sn_wsd_core_workplace_location] table. Data type: String
neighborhood	Required if the `rsv_path` parameter is set to `browse_by_neighborhood`. Only available if the Space Management (sn_wsd_spc_mgmt_neighbo plugin is activated. Sys_id of the neighborhood record to use in the encoded query. Locate the Neighborhood [sn_wsd_spcmgmt_neighborhood] table. For additional information on neighborhood space reservations, see C neighborhood reservations. Data type: String
next_item_index	Index of next item to retrieve. Pass this parameter when paginating the results. Data type: Number Default: 0

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
page_size	Maximum number of records to return in the return results. Data type: Number Default: 6
q	Required. Encoded query to use to filter the search return results. Withi query you must specify the building sys_id and you can specify param such as floor, area, capacity, standard services, and reservable_purpos All passed parameters must be sys_ids, except for capacity, which is a number. For example: `q=building=94e264cedb3650106c731dcd1396 ^floorINfc7368cedb3650106c731dcd13961902^capacit ^standard_services=55c0818edb7650106c731dcd13961 ^reservable_purposes=d6e5c7cd1ba4e01051848489cc4` You can locate this information in the following tables: • Area: sn_wsd_core_area • Building: sn_wsd_core_building • Floor: sn_wsd_core_floor • Reservable purposes: sn_wsd_rsv_reservable_purpose • Standard services: sn_wsd_rsv_standard_service Data type: String
reservable_module	Required. Sys_id of the reservable module to include in the search. A reservable module groups similar types of workplace items. Located Reservable Module [sn_wsd_rsv_reservable_module] table. Data type: String
reservation_ids	Comma-separated list of existing reservation sys_ids. Pass this parame if you want to edit the associated reservations. Located in the Workplac Reservation [sn_wsd_rsv_reservation] table. The time blocked for these sys_ids for the corresponding reservables a treated as available. Data type: String Default: None
rsv_path	Reservation path to apply to the search. Valid values: • browse_all: Search all reservables. • browse_by_area: Search the reservables near a specific location. An identifier must be passed in the encoded query (*q* parameter).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• browse_by_neighborhood: Search the reservables near the neighbo specified in the *neighborhood* parameter. • browse_near_a_person: Search the reservables near the workplace location of the person specified in the *near_by_location_id* parameter. Data type: String Default: browse_all
schedule_view_obj	Details about the schedule view to return. Pass this object if you need hour availability data for reservations that span more than one day. The results will only contain available times and reservations for the specifi date. For this functionality to work properly, the parameters *ignore_same_day_validation* and *include_reservations_within_days* must be set to `true`. Data type: Object `"schedule_view_obj": { "schedule_view_date": "String", "timezone": "String" }`
schedule_view_obj.schedule_view_date	Date for which to start returning reservation availability. This date must in the time zone specified in the *schedule_view_obj.timezone* parameter. Data type: String Format: YYYY-MM-DD
schedule_view_obj.timezone	Building time zone to use to determine the reservation availability data return. For example: US/Pacific. Data type: String
start	Required. Start time to use to search for available reservable modules. value must be prior to the value specified in the *end* parameter. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
shift	Sys_id of the shift to associate with the reservation. Located in the Shif [sn_wsd_core_shift] table. If this parameter is passed in, the *end* paran isn't required. For additional information on shift-based reservations, see Enable shif reservation. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
sort_by	Desired sort order of the returned reservable items. Valid values: • a_z: Ascending sort order. • favorites_first: Sorted by the user's favorite workplace reservables fir ascending for the rest. • z_a: Descending sort order. Data type: String Default: a_z
timezone	Preferred time zone, such as Europe/Amsterdam. Data type: String Default: None

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Return results for the specified search. Data type: Object `"result": { "filter": {Object}, "hasMore": Boolean, "nextFavIndex": Number, "nextItemIndex": Number, "reservableContainers": [Array], "reservableUnits": [Array], "totalProcessed": Number }`
result.filter	Details about the floors, standard services, and reservable purposes of the reservables. If the *include_standard_services* or *include_reservable_purposes* parameters are set to false, *standard_services* and *reservable_purposes* are empty arrays. Data type: Object `"filter": { "floors": [Array], "reservable_purposes": [Array], "standard_services": [Array] }`
result.filter.floors	Details about the floor on which the reservable is located. Located in the Floor [sn_wsd_core_floor] table. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	"floors": [
	  {
	  "display_value": "String",
	  "sys_id": "String"
	  }
	]

result.filter.floors.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.filter.floors.sys_id	Sys_id of the associated record in the Floor [sn_wsd_core_floor] table. Data type: String

result.filter.standard_services	Only populated if the *include_standard_services* parameter is set to true.
	Associated standard services, such as flip chart, projector screen, and whiteboard and markers.
	
	Data type: Array of Objects
	"standard_services": [
	  {
	  "font_awesome_icon":
	"String",
	  "name": "String",
	  "short_description":
	"String",
	  "sys_id": "String"
	  }
	]

result.filter.standard_services. font_awesome_icon	Name of the thumbnail icon associated with the standard service. Data type: String
result.filter.standard_services.name	Name of the standard service. Data type: String
result.filter.standard_services.short_description	Brief description of the standard service. Data type: String
result.filter.standard_services.sys_id	Sys_id of the standard service record. Located in the Standard Service [sn_wsd_rsv_standard_service] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.filter.reservable_purposes	Details about the purpose for reserving the associated reservable. Data type: Array of Objects `"reservable_purposes": [ { "name": "String", "short_description": "String", "sys_id": "String" } ]`
result.filter.reservable_purposes.name	Name of the reservable. Data type: String
result.filter.reservable_purposes.short_description	Brief description of the reservable. Data type: String
result.filter.reservable_purposes.sys_id	Sys_id of the reservable purpose record. Located in the Reservable Purpose [sn_wsd_rsv_reservable_purpose] table. Data type: String
result.hasMore	Flag that indicates whether there are more reservables in the return results. Possible values: • true: More reservables available. • false: No more reservables available. Data type: Boolean
result.nextFavIndex	Index for the next favorite reservable for the user. Use this value when paginating through the user's favorite reservables. Data type: Number
result.nextItemIndex	Index for the next reservable record to fetch. Use this value when paginating through reservable records. Data type: Number
result.reservableContainers	Only returned for reservable modules whose selection_type field is set to `container`. A container is a grouping of similar items, such as a group of desks. Data type: Array of Objects

Name	Description

	<pre>"reservableContainers": [
	  {
	  "building": {Object},
	  "campus": {Object},
	  "capacity": Number,
	  "display_value": "String",
	  "floor": {Object},
	  "image": {Object}
	  "sys_id": "String"
	  }
	]</pre>

result.reservableContainers.building	Details about the building associated with the reservable container.
	
	Data type: Object
	<pre>"building": {
	  "display_value": "String",
	  "name": "String",
	  "sys_id": "String"
	}</pre>

result.reservableContainers.building.display_value	Display value for the building. Data type: String
result.reservableContainers.building.name	Name of the building. Data type: String
result.reservableContainers.building.sys_id	Sys_id of the associated building record. Data type: String

result.reservableContainers.campus	Details about the campus on which the reservable is located.
	
	Located in the Campus [sn_wsd_core_campus] table.
	
	Data type: Object
	<pre>"campus": {
	  "display_value": "String",
	  "name": "String",
	  "sys_id": "String"
	}</pre>

result.reservableContainers.campus.display_value	Display number of the Campus on which the reservable resides, such as East Bay. Data type: String
result.reservableContainers.campus.name	Name of the campus.

Name	Description
	Data type: String
result.reservableContainers.campus.sys_id	Sys_id of the associated record. Located in the Campus [sn_wsd_core_campus] table. Data type: String
result.reservableContainers.capacity	Maximum number of occupants for the reservable. Data type: Number
result.reservableContainers.display_value	Display value for the reservable container. Data type: String
result.reservableContainers.floor	Details about the floor associated with the reservable container. Data type: Object `"floor": { "display_value": "String", "name": "String", "sys_id": "String" }`
result.reservableContainers.floor.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.reservableContainers.floor.name	Name of the floor on which the reservable resides. Data type: String
result.reservableContainers.floor.sys_id	Sys_id of the associated record in the Floor [sn_wsd_core_floor] table. Data type: String
result.reservableContainers.image	Link to an image that represents the layout for this reservable. Located in the Images [db_image] table. Data type: String
result.reservableContainers.image.link	Link to an image that represents the layout for this reservable. Located in the Images [db_image] table. Data type: String
result.reservableContainers.image.sys_id	Sys_id of the associated image record.

Name	Description
	Data type: String
result.reservableContainers.sys_id	Sys_id of the associated container record. The table in which this resides can be configured for any container type. By default it is in the Area [sn_wsd_core_area] table. Data type: String
result.reservableUnits	Details about the reservable units that match the specified search criteria. A reservable unit is a singe reservable item such as a desk or a chair. Data type: Object `"reservableUnits": [{ "area": "String", "availableTimes": [Array], "building": {Object}, "campus": {Object}, "capacity": "String", "defaultPrivacyValue": Boolean, "description": "String", "email": "String", "external_id": "String", "floor": {Object}, "image": {Object}, "includedInResult": Boolean, "is_available": Boolean, "is_favorite": Boolean, "is_reservable": "String", "is_reserved": Boolean, "is_selected": Boolean, "location_type": {Object}, "name": "String", "number": "String", "order": "String", "require_approval": Boolean, "requires_check_in": Boolean, "reservable_quantity": "String", "showPrivacyOption": Boolean, "site": {Object}, "standard_services": [Array], "tableName": "String", "title": "String",`

Name	Description

	<pre>"reservable_purposes": [Array],
	"reservations": [Array],
	"sys_id": "String"
	}
	]</pre>

result.reservableUnits.area	Details about the area in which the reservable module is located. Located in the Area [sn_wsd_core_area] table.
	
	Data type: Object
	<pre>"area": {
	"display_value": "String",
	"sys_id": "String"
	}</pre>

result.reservableUnits.area.display_value	Display value for the reservable module area. Data type: String
result.reservableUnits.area.sys_id	Sys_id of the area record associated with the reservable. Data type: String
result.reservableUnits.availableTimes	List of dates/times that the associated reservable is available. Data type: Array

result.reservableUnits.building	Details about the building in which the reservable is located. Located in the Building [sn_wsd_core_building] table.
	
	Data type: Object
	<pre>"building": {
	"display_value": "String",
	"sys_id": "String"
	}</pre>

result.reservableUnits.building.display_value	Display value for the building. Data type: String
result.reservableUnits.building.sys_id	Sys_id of the associated building record. Data type: String
result.reservableUnits.campus	Details about the campus on which the reservable is located. Located in the Campus [sn_wsd_core_campus] table. Data type: Object

Name	Description

	<pre>"campus": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

result.reservableUnits.campus.display_value	Display number of the Campus on which the reservable resides, such as East Bay. Data type: String
result.reservableUnits.campus.sys_id	Sys_id of the associated record. Located in the Campus [sn_wsd_core_campus] table. Data type: String
result.reservableUnits.capacity	Maximum number of occupants for the reservable. Data type: Number
result.reservableUnits.description	Brief description of the reservable. Data type: String
result.reservableUnits.email	Email address for the reservable. Data type: String
result.reservableUnits.external_id	External ID of the reservable used to sync a space mapped in CMS. This value is only populated if there is a map associated with this location. Data type: String

result.reservableUnits.floor	Details about the floor on which the reservable is located.
	
	Located in the Floor [sn_wsd_core_floor] table.
	
	Data type: Object
	<pre>"floor": {
	  "display_value": "String",
	  "sys_id": "String"
	}</pre>

result.reservableUnits.floor.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.reservableUnits.floor.sys_id	Sys_id of the associated record in the Floor [sn_wsd_core_floor] table. Data type: String

Name	Description
result.reservableUnits.image	Details about an image that represents the layout for the associated reservable. Located in the Images [db_image] table. `"image": { "link": "String", "sys_id": "String" }`
result.reservableUnits.image.link	Link to an image that represents the layout for this reservable. Located in the Images [db_image] table. Data type: String
result.reservableUnits.image.sys_id	Sys_id of the associated image record. Data type: String
result.reservableUnits.includedInResult	Flag that indicates whether the current reservable is included in the return results. Valid values: • true: Included in the return results. • false: Not included in the return results. Data type: Boolean
result.reservableUnits.is_available	Flag that indicates whether the reservable is available to reserve. Valid values: • true: Available to reserve. • false: Not available to reserve. Data type: Boolean
result.reservableUnits.is_favorite	Flag that indicates whether the reservable is flagged as one of the associated user's favorites. Valid values: • true: Favorite. • false: Not a favorite. Data type: Boolean
result.reservableUnits.is_reservable	Flag that indicates whether it's possible to reserve this reservable.

Name	Description
	Note: If the *include_unavailable_items* query parameter is set to true, unavailable locations are also returned. In this case, if a location is already reserved, then the *is_available* parameter is false, but *is_reservable* is true. Valid values: • true: Available to reserve. • false: Not available to reserve. Data type: Boolean
result.reservableUnits.is_reserved	Flag that indicates whether the reservable is already reserved. Valid values: • true: Available to reserve. • false: Already reserved. Data type: Boolean
result.reservableUnits.is_selected	Flag that indicates whether the reservable is already reserved. Valid values: • true: Available to reserve. • false: Already reserved. Data type: Boolean
result.reservableUnits.location_type	Details about the type of location of the reservable, such as workplace/desk, cafe, or gym. Located in the Workplace Location [sn_wsd_core_workplace_location] table. `"location_type": { "display_value": "String", "name": "String", "sys_id": "String" }`
result.reservableUnits.location_type.display_value	Display value of the location type. Data type: String
result.reservableUnits.location_type.name	Name of the location type, such as basement or storage. Same as display value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.reservableUnits.location_type.sys_id	Sys_id of the associated record in the Space Type [sn_wsd_core_space_type] table. Data type: String
result.reservableUnits.name	Name of the reservable. Data type: String
result.reservableUnits.number	Unique identifier of the reservable. This value is more human readable than the sys_id. Data type: String
result.reservableUnits.order	Order number for the reservable. Data type: Number
result.reservableUnits.require_approval	Flag that indicates whether reserving the reservable requires an approval. Possible values: • true: Approval required. • false: Approval isn't required. Data type: Boolean
result.reservableUnits.requires_check_in	Flag that indicates whether the reservable requires the user to check in. Valid values: • true: Check in required. • false: Check in isn't required. Data type: Boolean
result.reservableUnits.reservable_purposes	Details about the purpose for reserving the associated reservable. Data type: Array of Objects `"reservable_purposes": [ { "name": "String", "short_description": "String", "sys_id": "String" } ]`
result.reservableUnits.reservable_purposes.name	Name of the reservable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.reservableUnits.reservable_purposes.short_description	Brief description of the reservable. Data type: String
result.reservableUnits.reservable_purposes.sys_id	Sys_id of the reservable purpose record. Located in the Reservable Purpose [sn_wsd_rsv_reservable_purpose] table. Data type: String
result.reservableUnits.reservations	Details about the reservations associated with the reservable. Only populated if the *include_reservations_within_days* query parameter is true and the *reservation_ids* parameter contains reservation IDs, meaning there are reservations already present for this reservable. Data type: Array of Objects `"reservations": [ { "configuration_item": "String", "end": "String", "is_collided": Boolean, "location": {Object}, "number": "String", "requested_for": {Object}, "reservation_purpose": {Object}, "start": "String", "state": {Object}, "subject": "String", "sys_id": "String" } ]`
result.reservableUnits.reservations.configuration_item	Configuration items corresponding to the reservation. Located in the cmdb_ci table. Data type: String
result.reservableUnits.reservations.end	Reservation end date and time. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservableUnits.reservations.is_collided	Flag that indicates whether the reservation collides with the start and end time of the search.

Name	Description
	This indicates that the associated reservable location is already reserved for the specified search timespan. Possible values: • true: Collision. • false: No collision. Data type: Boolean
result.reservableUnits.reservations.location	Details about the location of the reservation. Data type: Object `"location": { "location": "String", "timezone": {Object} }`
result.reservableUnits.reservations.location.location	Sys_id of the associated location record. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
result.reservableUnits.reservations.location.timezone	Details about the time zone associated with the location. Data type: Object `"timezone": { "displayValue": "String", "value": "String" }`
result.reservableUnits.reservations.location.timezone.displayValue	Display value for the time zone to which this location belongs. Data type: String
result.reservableUnits.reservations.location.timezone.value	Internal value for the time zone to which this location belongs. Data type: String
result.reservableUnits.reservations.number	Unique identifier of the reservable. This value is more human readable than the sys_id. Data type: String
result.reservableUnits.reservations.requested_for	Details about the person for whom the reservation was requested on behalf of. Data type: Object

Name	Description

	<pre>"requested_for": {
	  "name": "String",
	  "sys_id": "String"
	}</pre>

result.reservableUnits.reservations. requested_for.name	Name of the user for whom the reservation was requested for. Data type: String
result.reservableUnits.reservations. requested_for.sys_id	Sys_id of the user for whom the reservation is being requested. Located in the User [sys_user] table. Data type: String

result.reservableUnits.reservations.
reservation_purpose
	Details about the purpose of the reservation.
	
	Data type: Object
	<pre>"reservation_purpose": {
	  "display_value": "String,"
	  "value": "String"
	}</pre>

result.reservableUnits.reservations. reservation_purpose.display_value	Display value for the purpose of the reservation, such as Company meeting. Data type: String
result.reservableUnits.reservations. reservation_purpose.value	Internal value for the purpose of the reservation, such as company_meeting. Data type: String
result.reservableUnits.reservations.start	Reservation start date and time. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z

result.reservableUnits.reservations.state	Details about the state of the reservation for the location.
	
	Data type: Object
	<pre>"state": {
	  "display_value": "String,"
	  "value": "String"
	}</pre>

result.reservableUnits.reservations.state. display_value	Display value for the current state of the reservation, such as confirmed. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
result.reservableUnits.reservations.state.value	Internal value for the current state of the reservation, such as 2. Data type: String
result.reservableUnits.reservations.subject	Reservation's subject. Data type: String
result.reservableUnits.reservations.sys_id	Required. Sys_id of the reservation record. Located in the Workplace Reservation [sn_wsd_rsv_reservation] table. Data type: String
result.reservableUnits.reservable_quantity	Maximum number of times the associated reservable can be reserved for the same time. This value is used when assigning neighborhood spaces to an area. Data type: Integer
result.reservableUnits.site	Details about the site where the reservable resides. Located in the Site [sn_wsd_core_site] table. `"site": { "display_value": "String", "sys_id": "String" }`
result.reservableUnits.site.display_value	Display value of the site. Data type: String
result.reservableUnits.site.sys_id	Sys_id of the associated site record in the Site [sn_wsd_core_site] table. Data type: String
result.reservableUnits.standard_services	Associated standard services, such as flip chart, projector screen, and whiteboard and markers. Data type: Array of Objects `"standard_services": [ { "font_awesome_icon": "String", "name": "String", "short_description": "String", "sys_id": "String"`

Name	Description

	<pre>}
	]</pre>

result.reservableUnits.standard_services.font_awesome_icon	Name of the thumbnail icon associated with the standard service. Data type: String
result.reservableUnits.standard_services.name	Name of the thumbnail icon associated with the standard service. Data type: String
result.reservableUnits.standard_services.short_description	Brief description of the standard service. Data type: String
result.reservableUnits.standard_services.sys_id	Sys_id of the standard service record. Located in the Standard Service [sn_wsd_rsv_standard_service] table. Data type: String
result.reservableUnits.sys_id	Sys_id of the reservable record. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: String
result.reservableUnits.tableName	Name of the table in which the reservable record resides. Data type: String
result.reservableUnits.title	Title of the reservable. Data type: String
result.totalProcessed	Total number of records processed. Data type: Number

Example: cURL request

This example shows how to search for reservables using this endpoint. Note: Line breaks have been added to the query parameters for easier reading.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/search/reservable?
reservable_module=d9864189c3653910977396cb05013100&
start=2023-10-12T10:30:00Z&
end=2023-10-13T11:30:00Z&
include_standard_services=true&
include_reservable_purposes=true&
include_reservations_within_days=true&
include_unavailable_items=true&
```

WSD Search - GET /api/sn_wsd_rsv/search/shift/{building_id}/{module_id}

Returns an encoded query that you can use to search for available shifts in the Shift [sn_wsd_core_shift] table.

Only applicable if the appy_to_shift field in the specified reservable module is enabled. Otherwise, the returned encoded query string will be empty.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/search/shift/{building_id}/{module_id}`

Default URL: `/api/sn_wsd_rsv/search/shift/{building_id}/{module_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String
building_id	Sys_id of the building to include in the search query. Located in the Building [sn_wsd_core_building] table. Data type: String
module_id	Sys_id of the reservable module to include in the search query. Located in the Reservable Module [sn_wsd_core_reservable_module] table. A reservable module groups similar types of workplace items, such a chairs or desks. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
end_date	Shift end date and time to include in the encoded query. Data type: String Format: yyyy-mm-dd hh:mm:ss
start_date	Shift start date and time to include in the encoded query. Data type: String Format: yyyy-mm-dd hh:mm:ss

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *`application/json`*, *`application/xml`* or, *`text/xml`*. Default: *`application/json`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Encoded query to use to acquire the specified available shifts. Data type: Object `"result": { "moduleHasShift" : Boolean, "query": "String" }`
moduleHasShift	Flag that indicates whether the specified reservable module has shifts enabled. Valid values: • true: Reservable module has shifts enabled. • false: Reservable module does not has shifts enabled. No encoded query returned. Data type: Boolean
query	Encoded query to use to retrieve shift information for the specified reservable module. Data type: String

Example: cURL request

The following code example shows how to use this endpoint to obtain a shift encoded query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/search/shift/94
e264cedb3650106c731dcd13961919/fc71f64fdb42a01097acc900399619
a8?start_date=2022-04-23 16:00:00&end_date=2022-04-28 16:00:00"
 \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "moduleHasShift" : true,
    "query" :
 "active=true^state=2^building=94e264cedb3650106c731dcd13961919^
building.is_reservable=true^building.active=true^floorISEMPTY^OR
floor.is_reservable=true^floorISEMPTY^ORfloor.active=true^start<
=2022-04-26 16:00:00^ORstartISEMPTY^end>=2022-04-28
 16:00:00^ORendISEMPTY^start<=2022-04-28
 16:00:00^ORstartISEMPTY^end>=2022-04-28 16:00:00^ORendISEMPTY"
  }
}
```

WSD Search - POST /api/sn_wsd_rsv/search/availability_score

Returns an availability score for reservable items for specified timeslots.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/search/availability_score`

Default URL: `/api/sn_wsd_rsv/search/availability_score`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
recurringPattern	Required if *`startEndDateTimes`* parameter is not specified. Recurring pattern to use to search for

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description

	reservables that are available for the specified recurring events.
	
	Data type: Object
	
	`"recurringPattern": {`
	`  "duration": Number,`
	`  "label": "String",`
	`  "options": {Object},`
	`  "repeats": "String",`
	`  "startDate": "String"`
	`}`

recurringPattern.duration	Required. Length of time for which the reservable must be available. Data type: Number Unit: Milliseconds
recurringPattern.label	Description of the recurring pattern, such as `Repeats daily, 5 times`. Data type: String

recurringPattern.options	Availability options for the recurring reservation to search for.
	
	Data type: Object
	
	`"options": {`
	`  "count": Number,`
	`  "daysOfWeek": "String",`
	`  "endDate": "String"`
	`}`

recurringPattern.options.count	Required if *`endDate`* is not passed. If both are passed, *`count`* is used. Number of times to repeat the meeting pattern. Data type: Number
recurringPattern.options.daysOfWeek	Required if the *`recurringPattern.repeats`* parameter is set to `weekly`. Days of the week that the reservable is needed. Valid values: • 1 = Monday • 2 = Tuesday • 3 = Wednesday • 4 = Thursday • 5 = Friday

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	• 6 = Saturday • 7 = Sunday For example, to specify Tuesday, Thursday, and Friday, pass 245 (no delimiter). If *repeat* is weekly, *count* is 5, and *daysOfWeek* is 245, then in the return results, the total is equal to `count*daysOfWeek.length` (5*3=15). Data type: String
recurringPattern.options.endDate	Required if *recurringPattern.options.count* is not passed. If both are passed, *count* is used. End date and time of the recurrence of the meeting, such as "2022-07-08T14:00:00Z". Data type: String Format: UTC yyyy-mm-dd hh:mm:ss
recurringPattern.repeats	Required. Repeating pattern for the reservable. Valid values (case-sensitive): • daily • monthly • weekly • yearly Data type: String
recurringPattern.startDate	Required. Start date and time for the recurring pattern, such as "2022-07-08T14:00:00Z". Data type: String Format: UTC yyyy-mm-dd hh:mm:ss
reservableIds	Required. List of sys_ids of the reservables to include in the availability score. Located in the Workplace Location [sn_wsd_core_workplace_location] table. Data type: Array
reservableType	Required. Type of reservable to include in the availability score. Used to refine the search. Valid values (case-sensitive): • location • configuration_item

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Data type: String
startEndDateTimes	List of start and end dates and times in the user's timezone to search on. Data type: Array of Objects `"startEndDateTimes": [ { "end": "String", "start": "String" } ]` Default: Must specify *recurringPattern* parameter.
startEndDateTimes.end	End date and time of the reservable. Data type: String Format: yyyy-mm-dd hh:mm:ss
startEndDateTimes.start	Start date and time of the reservable. Data type: String Format: yyyy-mm-dd hh:mm:ss

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Return results for the specified availability score. Data type: Object `"result": { "reservable_sys_id": { "available": Number, "score": "String", "total": Number } }`
result.available	Number of available reservables that met the specified search criteria. Data type: Number
result.score	Availability score. Number of available reservables over the total number of reservables that met the specified search criteria. For example, if *available* is 2 and *total* is 4, the *score* value is 2/4. Data type: String
result.total	Total number of reservables that met the specified search criteria. Data type: Number

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/search/availabi
lity_score" \
--request POST \
--header "Accept:application/json" \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--header "Content-Type:application/json" \
--data "{
  \"reservableType\": \"location\",
  \"reservableIds\": [
    \"fe1f744edb7650106c731dcd139619ca\",
    \"5eafb44edb7650106c731dcd13961943\"
  ],
  \"recurringPattern\": {
    \"duration\": 3600000,
    \"repeats\": \"daily\",
    \"options\": {
      \"count\": 150,
      \"daysOfWeek\": \"\",
    },
    \"label\": \"Repeats daily, 5 times\",
    \"startDate\": \"2022-04-26T14:00:00Z\"
  },
  \"startEndDateTimes\": [
    {
      \"start\": \"2022-07-05 14:00:00\",
      \"end\": \"2022-07-05 15:00:00\"
    },
    {
      \"start\": \"2022-07-06 14:00:00\",
      \"end\": \"2022-07-06 15:00:00\"
    }
  ]
}" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "fe1f744edb7650106c731dcd139619ca": {
      "available": 2,
      "total": 2,
      "score": "2/2"
    },
    "5eafb44edb7650106c731dcd13961943": {
      "available": 2,
      "total": 2,
      "score": "2/2"
    }
  }
```

WSD Shift API

The Workplace Service Delivery (WSD) *Shift* API provides an endpoint that returns shift time spans for a specified date and time.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Safety Management (sn_wsd_core) and Workplace Reservation Management (sn_wsd_rsv) plugins must be activated.

This API runs in the `sn_wsd_rsv` namespace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Shift - GET /api/sn_wsd_rsv/wsd_shift/{shift_id}/timespan

Returns the shift time span for a specified date/time and shift.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/wsd_shift/{shift_id}/timespan`

Default URL: `/api/sn_wsd_rsv/wsd_shift/{shift_id}/timespan`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
shift_id	Sys_id of the shift to retrieve the time span for. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String Table: Shift [sn_wsd_core_shift]

Query parameters

Name	Description
attempt_earlier_start	Flag that indicates whether to set an early start time if the specified start value is within the shift's time span. Valid values: • true: If the specified shift includes the date/time specified in the *start* parameter, return the specified start date/time as the start of the time span. • false: Return the shift timespan as defined in the associated record. Data type: Boolean Default: false
start	Required. Date and time of the start of the shift time spans to return. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2022-05-23T08:00:00Z

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
timezone	Time zone to use when qualifying the shift time spans, such as ECT or PST. Also returns the shift time spans in this time zone. Data type: String Format: UTC Default: User's timezone

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *`application/json`*, *`application/xml`* or, *`text/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Details about the shift timespan that matched the search criteria. Data type: Object `"result":{ "end": "String", "start": "String" }`
result.end	End date and time of the shift timespan in the specified time zone. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2022-05-23T08:00:00Z
result.start	Start date and time of the shift timespan in the specified time zone. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2022-05-23T08:00:00Z

Example: cURL request

The following code example shows how to retrieve the timespan of a shift.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/wsd_shift/e5d23
acfdb42a01097acc9003996193a/timespan?attempt_earlier_start=true&
start=2022-05-23T08:00:00Z&timezone=ECT" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "start": "2022-05-23T08:00:00Z",
    "end": "2022-05-23T15:00:00Z"
  }
}
```

ServiceNow Fluent

Define application metadata in source code using the ServiceNow Fluent domain-specific programming language.

Overview of ServiceNow Fluent

ServiceNow Fluent is a domain-specific language (DSL) based on TypeScript for defining the metadata files [sys_metadata] that make up applications and includes APIs for the different types of metadata, such as tables, roles, ACLs, business rules, and Automated Test Framework tests.

Developers define this metadata in a few lines of code instead of through a form or builder tool user interface. Applications created or converted with the ServiceNow IDE or ServiceNow SDK support development in ServiceNow Fluent.

ServiceNow Fluent supports two-way synchronization, which allows changes to metadata to be synced from other ServiceNow AI Platform user interfaces into source code and changes to source code to be synced back to metadata across the instance.

To get started using the ServiceNow IDE or ServiceNow SDK, see the ServiceNow IDE or ServiceNow SDK documentation.

ServiceNow Fluent APIs

ServiceNow Fluent includes APIs for the following types of metadata. You can use the Record API to define application metadata that doesn't have a dedicated API.

For details about the APIs and examples, see ServiceNow Fluent API reference and the ServiceNow SDK examples GitHub repository.

- Access control lists (ACLs)
- Application menus
- Automated Test Framework tests
- Business rules
- Client scripts
- Cross-scope privileges
- Dashboards
- Email notifications
- Flows
- Import sets
- Lists
- Properties
- Records
- Roles
- Script actions
- Script includes
- Scripted REST APIs
- Service level agreements (SLAs)
- Service portal widgets

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Tables
- UI actions
- UI pages
- UI policies
- Workspaces

Note: A limited number of metadata types, such as Metadata Snapshots [sys_metadata_link] and UX Assets [sys_ux_lib_asset], can't be represented as ServiceNow Fluent code and aren't transformed. These metadata types remain as metadata XML files in the `metadata` directory of your application.

ServiceNow Fluent usage

In files with the `.now.ts` extension, use objects in the ServiceNow Fluent APIs to define metadata in the application. You must also include the required imports for the APIs from `@servicenow/sdk/core`. For objects with server-side scripts, such as the *`BusinessRule`* object, you can import and use code from JavaScript modules.

The following example includes the definitions of a table, client script, and business rule in the application. The client script uses a script from the `client-script.js` file. The business rule uses a function from the `script.js` JavaScript module.

```
import '@servicenow/sdk/global'
import { BusinessRule, ClientScript, DateColumn, StringColumn,
 Table } from '@servicenow/sdk/core'
import { showStateUpdate } from '../server/script.js'

//creates todo table, with three columns (deadline, status and task)
export const x_snc_example_to_do = Table({
    name: 'x_snc_example_to_do',
    schema: {
        deadline: DateColumn({ label: 'Deadline' }),
        state: StringColumn({
            label: 'State',
            choices: {
                ready: { label: 'Ready' },
                completed: { label: 'Completed' },
                inProgress: { label: 'In Progress' },
            },
        }),
        task: StringColumn({ label: 'Task', maxLength: 120 }),
    },
})

//creates a client script that pops up 'Table loaded successfully!!' message everytime todo
 record is loaded
ClientScript({
    $id: Now.ID['cs0'],
    name: 'my_client_script',
    table: 'x_snc_example_to_do',
    active: true,
    appliesExtended: false,
    global: true,
    uiType: 'all',
    description: 'Custom client script generated by Now SDK',
```

© 2026 ServiceNow, Inc. All rights reserved.

```
    isolateScript: false,
    type: 'onLoad',
    script: Now.include('../client/client-script.js'),
})

//creates a business rule that pops up state change message whenever a todo record is
 updated
BusinessRule({
    $id: Now.ID['br0'],
    action: ['update'],
    table: 'x_snc_example_to_do',
    script: showStateUpdate,
    name: 'LogStateChange',
    order: 100,
    when: 'after',
    active: true,
})
```

The client script referenced from the *`ClientScript`* object:

```
function onLoad() {
    g_form.addInfoMessage("Table loaded successfully!!")
}
```

The JavaScript module referenced from the *`BusinessRule`* object:

```
import { gs } from '@servicenow/glide'

export function showStateUpdate(current, previous) {
    const currentState = current.getValue('state')
    const previousState = previous.getValue('state')

    gs.addInfoMessage(`state updated from "${previousState}"
 to "${currentState}"`)
}
```

After building the application, this source code generates the following application metadata files on the instance.

© 2026 ServiceNow, Inc. All rights reserved.

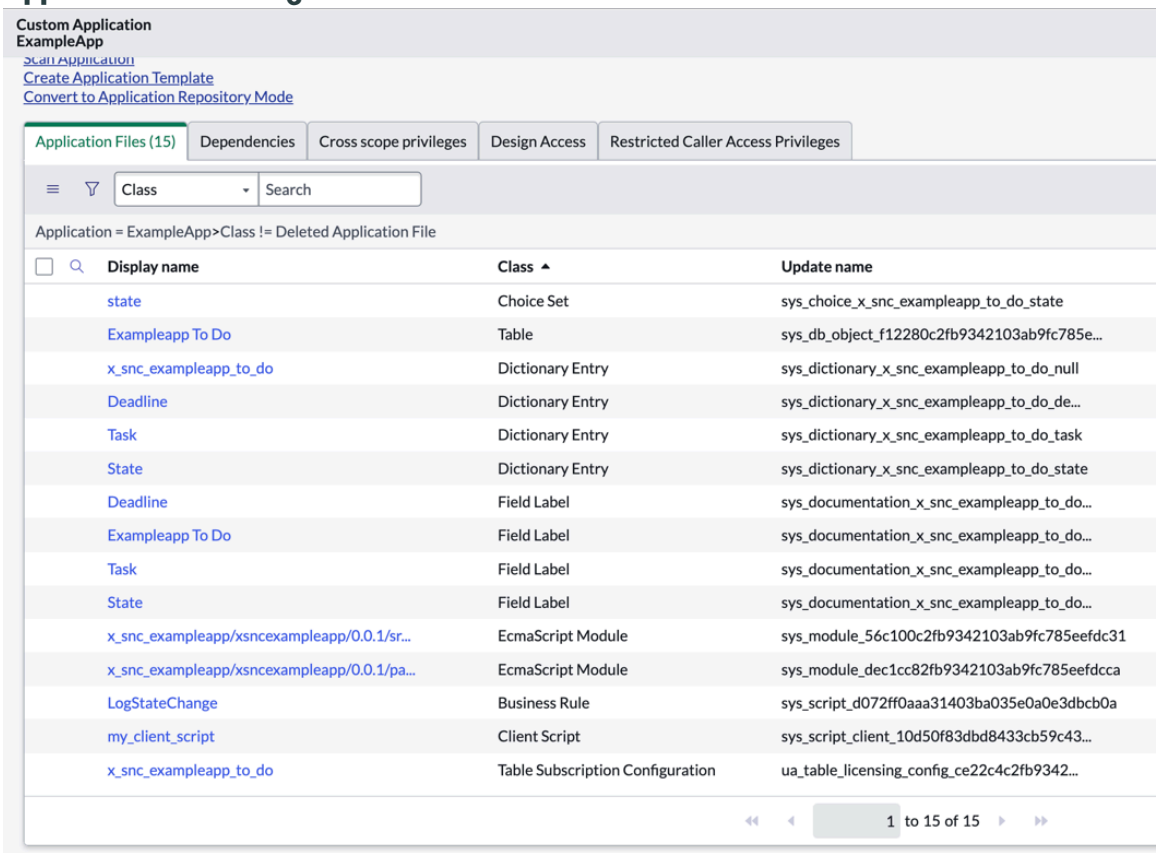
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application metadata generated from ServiceNow Fluent code



Tip: You can use the following directives in a code comment to help manage your code:

- `@fluent-ignore`: Suppresses ServiceNow Fluent diagnostic warnings and errors in the following line of code.
- `@fluent-disable-sync`: Turns off syncing changes to a ServiceNow Fluent object. Use before a call expression (for example, `Record({ ... })`) to turn off syncing for that object and its child objects. Only use this directive if you want to ignore changes made outside of the source code to the object and never update it when syncing.
- `@fluent-disable-sync-for-file`: Turns off syncing changes to a ServiceNow Fluent file (`.now.ts`). Use in the first line of the file to turn off syncing for all code in the file. Only use this directive if you want to ignore changes made outside of the source code to the file and never update it when syncing.

Browse APIs by product

Find APIs to use with your ServiceNow products.

Browse the table below to view which Server, REST, and Client APIs are supported by a specific ServiceNow product. All products and APIs display by default in alphabetical order. To see only APIs of those products you are interested in, select one or more product names in the **Product** filter drop-down on this page. Once you select a product in the filter, only the APIs for your selection(s) display in the table. Clear filter criteria by deselecting options in the filter drop-down.

Developer guides

These developer guides can help you integrate your applications with the ServiceNow AI Platform.

Each developer guide addresses a single ServiceNow product such as Financial Services Operations.

Available ServiceNow developer guides

Developer guides	Description
Alarm Management Open API Developer Guide	Use the *Alarm Management Open API* to create and update data in the Events [em_event] table. This developer guide provides information on how to extend the Alarm Management Open API to make various customizations.
Event Notification Management Open API Developer Guide	Use the *Event Notification Management Open* API to create, update, and delete event records in the Events [em_event] table. This developer guide provides information on how to extend the *Event Notification Management Open* API to make various customizations.
Financial Services Operations developer guide	ServiceNow® Financial Services Operations (FSO) enables financial services institutions (FSIs) to securely automate core operational processes through pre-built digital applications and workflows. FSO connects operations across all departments—front, middle, and back-office—for financial institutions with a single platform. This developer guide provides information on how to extend the FSO base capabilities as well as integrate your existing applications with ServiceNow FSO.
GlideGeoPoint Developer Guide	The GlideGeoPoint developer guide contains information about how to compute distances between latitude and longitude values (geopoints), return locations within geopoint and radius values, and additional functionality provided by supported *GlideGeoPoint* API functions.
Product Order Open API Developer Guide	Use the *Product Order Open API* to create, update, and retrieve product order information. This developer guide provides information on how to extend the Product Order Open API to make various customizations.
Resource Inventory Open API Developer Guide	Use the *Resource Inventory Open API* to create, retrieve, update, and delete resources such as interface cards, logical and physical connections, network sites, and more. This developer guide provides information on how to extend the Resource Inventory Open API to make various customizations.
ScopedCacheManager API Developer Guide	Scoped caches allow customers to store custom data in memory for faster access, and define when it becomes invalidated. This can be useful when working with data takes longer to obtainthat from

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available ServiceNow developer guides (continued)

Developer guides	Description
	scratch, such as the results of a query across multiple tables. Use the *ScopedCacheManager* API to retrieve, set, and flush cache data for scoped applications. This developer guide provides information on how to create a scoped cache and assign it a pair type.
Service Order Open API Developer Guide	Use the *Service Order Open API* to create, update, and retrieve service order information. This developer guide provides information on how to extend the Service Order Open API to make various customizations.
Trouble Ticket Open API Developer Guide	Use the *Trouble Ticket Open API* to manage ticket information between external ticketing systems and the ServiceNow AI Platform. This API creates, updates, and retrieves data from the Case [sn_customerservice_case] and Incident [incident] tables. This developer guide provides information on how to extend the Trouble Ticket Open API to make various customizations.

Alarm Management Open API Developer Guide

Use the *Alarm Management Open API* to create and update data in the Events [em_event] table.

This developer guide provides information on how to extend the Alarm Management Open API to make various customizations.

Extending the Alarm Management Open API

The *Alarm Management Open API* can be extended by editing script includes.

These script includes should only be edited with an understanding of the consequences of the changes.

- `TMFAlarmAPIConstants`: Contains constants and required parameter information.
- `TMFAlarmAPIUtil`: Contains functions to handle API requests.
- `AlarmAPIProcessor00B`: Contains helper functions that support functions in `TMFAlarmAPIUtil`.
- `AlarmAPIProcessor`: An empty script include file. Use this file to define any functions that you want to override from `AlarmAPIProcessor00B`.

Extend the *Alarm Management Open API* to make the following customizations.

Required parameters

The *Alarm Management* API utilizes JSON schemas to hold required parameters information. These JSON schemas are defined in the *TMFAlarmAPIConstants* script include. These schemas are used to validate whether request payloads are valid. These schemas are not referenced directly in script includes and are returned by the following methods in the *AlarmAPIProcessor00B* script include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `getCreateEventSchema`: Returns the validating schema for creating an event.
- `getClearEventSchema`: Returns the validating schema for clearing an event alarm.
- `getPatchEventSchema`: Returns the validating schema for patching an event.

To override existing schemas, define new schemas in the `AlarmAPIProcessor` script include and override the `AlarmAPIProcessorOOB` script include methods.

```
var AlarmAPIProcessor = Class.create();
AlarmAPIProcessor.prototype =
 Object.extendsObject(AlarmAPIProcessorOOB, {
 // Define overriding functions here

 // Define getCreateEventSchema here to override OOTB method in
 AlarmAPIProcessorOOB
 getCreateEventSchema: function() {
  return JSON.parse(AlarmAPIProcessor.CUSTOMIZED_SCHEMA);
 },
    type: 'AlarmAPIProcessor'
});

// Define a new schema
AlarmAPIProcessor.CUSTOMIZED_SCHEMA =
 "{\"title\":\"CreateAlarm\",\"type\":\"object\",
\"properties\":{\"externalAlarmId\":{\"type\":
\"string\"},\"alarmType\":{\"type\":\"string\"},
\"perceivedSeverity\":{\"type\":\"string\"},\"probableCause\":
{\"type\":\"string\"},
\"alarmedObject\":{\"type\":\"object\",\"properties\":{\"id\":
{\"type\":\"string\"},
\"href\":{\"type\":\"string\"}},\"required\":
[\"id\"]},\"sourceSystemId\":{\"type\":\"string\"}},
\"required\":[\"externalAlarmId\",\"alarmType\",
\"perceivedSeverity\",\"probableCause\",
\"alarmedObject\",\"sourceSystemId\"]}";
```

Request body validation

To perform additional validation on the request body, override the following functions in the `AlarmAPIProcessorOOB` script include . These functions are called by the specified functions in the `TMFAlarmAPIUtil` script include.

- `verifyCreateEventPayload()` - Called by `processCreateEvent()`.
- `verifyClearEventPayload()` - Called by `processClearEvent()`.
- `verifyPatchEventPayload()` - Called by `processPatchEvent()`.

All of these functions return `true` by defalut. If a helper function returns `false` , it stops the API operation.
To apply custom validations, override AlarmAPIProcessorOOB helper functions with identically-named function names and parameters in AlarmAPIProcessor. The new AlarmAPIProcessor functions are called by TMFAlarmAPIUtil to replace the default AlarmAPIProcessorOOB helper functions.

In this example, a function in a custom AlarmAPIProcessor script include overrides a default function in AlarmAPIProcessorOOB to perform validation on the name attribute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var AlarmAPIProcessor = Class.create();
AlarmAPIProcessor.prototype =
 Object.extendsObject(AlarmAPIProcessorOOB, {
 // Define overriding functions here

    verifyCreateEventPayload: function(eventPayload,
 apiResponseProcessor){
        // Returning false terminates the POST request
        // Make sure to assign error message and reason
        if (eventPayload.type != "unique") {
            apiResponseProcessor.setMessage("Failed");
            apiResponseProcessor.setReason("No reason needed");
            return false;
        }
    },

    type: 'AlarmAPIProcessor'
});
```

Additional REST operations

To create additional operations beyond the existing GET, PATCH, and POST operations, create additional scripted REST resources for the *Alarm Management Open* API. The logic of the new scripted REST resources should be consistent with the existing operations. Define functions for the new operations in TMFAlarmAPIUtil.

Field mapping

When creating or updating records, the *Alarm Management Open* API maps request body parameters to event record fields. When retrieving records, the API maps record fields to response object attributes.

The AlarmAPIProcessorOOB script include contains the following functions to map a PATCH or POST request body to a record in the Event [em_event] table.

- `mapCreateAlarmObjectToEvent()`
- `mapClearAlarmObjectToEvent()`
- `mapPatchAlarmObjectToEvent()`

It also contains the following functions to map an event GlideRecord to a JSON response object for GET, PATCH, or POST requests.

- `modifyCreateEventResponse()`
- `modifyClearEventResponse()`
- `modifyPatchEventResponse()`

You can customize field mappings to add and retrieve data for additional Event [em_event] table fields or change the default field mappings. To work with mappings, create functions with identical names and parameters in *AlarmAPIProcessor* to override *AlarmAPIProcessorOOB* mapping functions. *TMFAlarmAPIUtil* uses these *AlarmAPIProcessor* functions to replace the default *AlarmAPIProcessorOOB* mapping functions.

In the following example, two *AlarmAPIProcessor* functions override the default functions in *AlarmAPIProcessorOOB* to change the **Type** field mapping and add a mapping for the **Severity** field.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var AlarmAPIProcessor = Class.create();
AlarmAPIProcessor.prototype =
 Object.extendsObject(AlarmAPIProcessorOOB, {
 // Define overriding functions here

    // Function name and parameters must be identical to the
 function it overrides
    mapCreateAlarmObjectToEvent: function(eventGr, eventObject){
        // Override default mapping for the severity field
        eventGr.severity = "High";
    },

    modifyCreateEventResponse: function(eventGr, eventObject){
        // Override default mapping for the type field
        eventGr.type = "Customized Event";
    },

    type: 'AlarmAPIProcessor'
});
```

AP Invoice API Developer Guide

This developer guide describes how to define custom invoice fields that aren't provided by default with the *AP Invoice* API for Accounts Payable Invoice Processing. Instructions are also provided for setting authentication when using cXML as the payload.

You can define custom invoice fields for the request body. Use the following flow to add custom fields, map them to target tables, and format them for availability in the payload:

1. Add custom fields for invoice import
2. Map custom fields between source and target tables
3. Map custom fields to a payload source format

Define credentials for cXML payloads in the Source system credential [sn_spend_intg_source_system_credential] table. For instructions, see Setting credentials for authentication in the cXML payload.

See also:

- Accounts Payable Invoice Processing
- AP Invoice API

Add custom fields for invoice import

Use the following procedure to add custom fields for invoices, invoice lines, and invoice tax lines to be used with the *AP Invoice* API.

Before you begin

- Role required: admin
- Application scope: Source-to-Pay integration framework

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Select one of the following invoice import tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Invoice Import [sn_spend_intg_imp_invoice]
- Invoice Line Import [sn_spend_intg_imp_invoice_line]
- Invoice Tax Line Import [sn_spend_intg_imp_invoice_tax_line]

3. On the **Table Columns** tab, select **New**.
4. Select a type associated with the field value (for example, `Integer`) from the **Type** menu.

   Note: For a list of valid types, see Field types.

5. Enter a meaningful name in the **Column label** field.
   Text including the label is automatically populated in the **Column name** field.
6. Select **Save** or **Submit**.
7. Add a column of the same name and type to the Invoice [sn_shop_invoice] table.

   Note: For more information on columns and fields, see Field administration.

8. Map the fields between the source and target tables.

Map custom fields between source and target tables

Use the following procedure to map custom fields between source and target tables for the AP Invoice API.

Before you begin

- Role required: admin
- Application scope: Source-to-Pay integration framework

Create table columns for mapping the new field from the source table to the target table. Use the steps in Add custom fields for invoice import.

Procedure

1. Navigate to **All** > **System Import Sets** > **Transform Maps**.
2. Open the Invoice Import table transform map.
3. Click **New** on the **Field Maps** tab.
4. Select the name of the custom field from the **Source field** menu.
5. Select the name of the custom field from the **Target field** menu.
6. Select **Save** or **Submit**.
7. Map custom fields to a payload source format.

Map custom fields to a payload source format

Use the following procedure to map custom fields to a payload entry in JSON or cXML for the AP Invoice API.

Before you begin

- Role required: admin
- Application scope: Source-to-Pay integration framework

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Add custom fields for invoice import
- Map custom fields between source and target tables

Procedure

1. Navigate to **All** > **Procurement Integrations** > **Suppliers** > **Invoice Integration Field Mappings**.
2. Select **New**.
3. Add the name of the source system to the **Source system** field.
   - If this field mapping applies to all source systems, enter `Default`.
   - If the mapping is specific to a particular source system, this value must match the value of the Source-System header parameter received in the API.

     Note: All remaining field mappings must be configured specifically for this source system.
4. Select the format of the source system for which the mapping is being created from the **Source format** choice list (cXML or JSON).
5. Provide a name (JSON property) or path (cXML attribute or element) for the payload entry in the **Source field** field.
   You can view the Invoice integration field mapping [sn_spend_intg_invoice_intg_field_mapping] table for examples of cXML path settings.
6. Add the name of an attribute if the field is to be defined as an element attribute for cXML payloads, otherwise leave the field empty.
7. Select the name of the target table containing your custom field from the **Related table** list.
8. Select the name of the custom field from the **Target field** list.
9. Select **Save** or **Submit**.
   The mapped field is added to the Invoice integration field mapping [sn_spend_intg_invoice_intg_field_mapping] table.

Setting credentials for authentication in the cXML payload

The *sn_spend_intg/ap_invoice/cxml* endpoint is authenticated in the payload using credentials stored in the Source System Credential [sn_spend_intg_source_system_credential] table.

Before you begin

Role required: admin

Identify the payload source system listed in the Invoice integration field mappings [sn_spend_intg_invoice_intg_field_mapping] table.

See also AP Invoice – POST sn_spend_intg/ap_invoice/cxml.

Procedure

1. Navigate to **All** > **Procurement Integrations** > **Source System Credentials**.
2. Select **New**.
3. Add the name of the source system listed in the Invoice integration field mappings [sn_spend_intg_invoice_intg_field_mapping] table in the **Source System** field.
   The source system name must match the Source-System header parameter.
4. Add the user name to be fetched in the **User name** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use this value in the */cXML/Header/To/Credential [@domain='NetworkID']/Identity* element.

5. Add a strong combination of letters, numbers, and special characters to the **Password** field. Use this value in the */cXML/Header/Sender/Credential [@domain='NetworkID']/SharedSecret* element.
6. Select **Submit**.

Event Notification Management Open API Developer Guide

Use the *Event Notification Management Open* API to create, update, and delete event records in the Events [em_event] table.

This developer guide provides information on how to extend the *Event Notification Management Open* API to make various customizations.

Extending the Event Notification Management Open API

You can extend and modify the functionality of the *Event Notification Management Open* API by editing its associated script include files.

The following are the script includes that the *Event Notification Management Open* API uses to process event notification requests passed to the API:

- `AlarmAPIProcessor00B`: Contains helper functions that support functions in the `TMFTopicEventAPIUtil` script include. For additional information on the `AlarmAPIProcessor00B` script include, see the Alarm Management Open API Developer Guide.
- `AlarmAPIProcessor`: An empty script include file. Update this file to define any functions that you want to override in the `AlarmAPIProcessor00B` script include.
- `JSONSchemaValidation`: Contains functions to handle the validation of schemas for the payload defined in the `TMFAlarmAPIConstants` script include. This script include is under the tmt_core plugin.
- `TMFAlarmAPIConstants`: Contains constants and required parameter information. It also contains the schemas for the payloads passed in the *Event Notification Management Open* endpoint.
- `TMFTopicEventAPIUtil00B`: Contains functions to handle API requests that are triggered by external trigger definition flows that have the actions `AlarmCreateNotification`, `AlarmChangeNotification`, `AlarmDeleteNotification` which create, update, and delete events.
- `TMFTopicEventAPIUtil`: An empty script include file. Update this file to define any functions that you want to override in the `TMFTopicEventAPIUtil00B` script include.

The following sections provide examples of some of the customizations that you can make to the *Event Notification Management Open* API processing by extending/modifying these script include files.

Required parameters

The *Event Notification Management* API utilizes JSON schemas to define required parameters. These JSON schemas are defined in the `TMFAlarmAPIConstants` script include. These schemas are used to validate whether request payloads are valid. These schemas are not directly referenced in the script includes, but are returned by the following functions in the *TMFTopicEventAPIUtil00B* script include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `getAlarmCreateEventSchema()`: Returns the validating schema for creating an event.
- `getAlarmDeleteEventSchema()`: Returns the validating schema for deleting an event alarm.
- `getAlarmChangeEventSchema()`: Returns the validating schema for changing fields in an event.

To override the existing schemas, define new schemas in the `TMFTopicEventAPIUtilOOB` script include and override the `TMFTopicEventAPIUtil` script include functions.

For example:

```
var TMFTopicEventAPIUtil = Class.create();
TMFTopicEventAPIUtil.prototype =
 Object.extendsObject(TMFTopicEventAPIUtilOOB, {
 // Define overriding functions here
 // Define getAlarmCreateEventSchema here to override OOTB
 function in TMFTopicEventAPIUtilOOB
 getAlarmCreateEventSchema: function() {
  return JSON.parse(TMFTopicEventAPIUtil.CUSTOMIZED_SCHEMA);
 },
    type: 'TMFTopicEventAPIUtil'
});

// New schema
TMFTopicEventAPIUtil.CUSTOMIZED_SCHEMA = "{
  \"title\":\"AlarmCreateEvent\",
  \"type\":\"object\",
  \"properties\":{
    \"event\":{
      \"type\":\"object\",
      \"properties\":{
        \"alarm\":{
          \"type\":\"object\",
          \"properties\":{
            \"id\":{
              \"type\":\"string\"
            },
            \"href\":{
              \"type\":\"string\"
            },
            \"externalAlarmId\":{
              \"type\":\"string\"
            },
            \"alarmType\":{
              \"type\":\"string\"
            },
            \"perceivedSeverity\":{
              \"type\":\"string\"
            },
            \"probableCause\":{
              \"type\":\"string\"
            },
            \"alarmedObject\":{
              \"type\":\"object\",
              \"properties\":{
                \"id\":{
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                \"type\":\"string\"
              },
              \"href\":{
                \"type\":\"string\"
              }
            },
            \"required\":[
              \"id\"
            ]
          },
          \"crossedThresholdInformation\":{
            \"type\":\"object\",
            \"properties\":{
              \"thresholdId\":{
                \"type\":\"string\"
              }
            },
            \"required\":[
              \"thresholdId\"
            ]
          },
          \"affectedService\":{
            \"type\":\"array\",
            \"properties\":{
              \"id\":{
                \"type\":\"string\"
              },
              \"href\":{
                \"type\":\"string\"
              }
            },
            \"items\":{
              \"type\":\"object\",
              \"required\":[
                \"id\"
              ]
            }
          },
          \"sourceSystemId\":{
            \"type\":\"string\"
          },
          \"specificProblem\":{
            \"type\":\"string\"
          }
        },
        \"required\":[

 \"externalAlarmId\",\"alarmType\",\"perceivedSeverity\",
\"probableCause\",\"sourceSystemId\",\"alarmedObject\"
        ]
      }
    },
    \"required\":[
      \"alarm\"
    ]
  }
},
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  \"required\":[
    \"event\"
  ]
}";
```

Request body validation

To perform additional validation on the request body, override the following functions in the TMFTopicEventAPIUtil00B script include. These functions are called by the specified functions in the same script include.

- `verifyAlarmCreateEventPayload()`: Called by `processAlarmCreateEvent()`.
- `verifyAlarmDeleteEventPayload()`: Called by `processAlarmDeleteEvent()`.
- `verifyAlarmChangeEventPayload()`: Called by `processAlarmChangeEvent()`.

All of these functions return success by default. If a helper function returns an error, it stops the API operation.

To apply custom validations, override the helper functions in the TMFTopicEventAPIUtil00B script include with identical function names and parameters in the `TMFTopicEventAPIUtil` script include.

In this example, a function in a custom `TMFTopicEventAPIUtil` script include overrides the default function in the TMFTopicEventAPIUtil00B script include to perform validation on the name attribute.

```
var TMFTopicEventAPIUtil = Class.create();
TMFTopicEventAPIUtil.prototype =
 Object.extendsObject(TMFTopicEventAPIUtil00B, {

    // Define overriding functions here
    verifyAlarmCreateEventPayload:
 function(eventPayload,responseObject){

        // Returning error status terminates the POST request
        // Make sure to assign error message and reason
        if (eventPayload.type != "unique") {
            responseObject.setMessage("Failed");
            responseObject.setReason("No reason needed");
            return responseObject.status = “error”;
        }
    },

    type: ‘TMFTopicEventAPIUtil’
});
```

Request body subscription validation

To modify the request body subscription validation for the API, you need to override the `validateSubscription()` function in the TMFTopicEventAPIUtil00B script include. This function validates whether the callbackURL you are using to create the event notification is registered and determines whether the *`eventType`* is registered for the raised callback. This function is called by the *`processAlarmCreateEvent()`*, *`processAlarmDeleteEvent()`*, and *`processAlarmChangeEvent()`* functions which are also in the TMFTopicEventAPIUtil00B script include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field mapping

When creating or updating records, the *Event Notification Management Open* API maps request body parameters to Event record fields. When retrieving records, the API maps Event record fields to response object attributes.

The TMFTopicEventAPIUtil00B script include contains the following functions that map change, create, and delete requests, based on the value in the *eventType* parameter, to a record in the Event [em_event] table.

- *mapAlarmChangeObjectToEvent()*
- *mapCreateAlarmObjectToEvent()*
- *mapDeleteAlarmObjectToEvent()*

You can customize field mappings to add and retrieve data for additional Event [em_event] table fields or change the default field mappings. To work with mappings, create functions with identical names and parameters in TMFTopicEventAPIUtil to override TMFTopicEventAPIUtil00B mapping functions.

GlideGeoPoint Developer Guide

The GlideGeoPoint developer guide contains information about how to compute distances between latitude and longitude values (geopoints), return locations within given geopoint and radius values, and use additional functionality provided by supported *GlideGeoPoint* API functions.

The Geo point field type allows you to store a latitude and longitude pair in a single field. Geopoints can be useful anytime you want to store a geographical point of interest, to ask how far a part two points of interest are from one another, or to search for all points within a certain distance from another point. For example, you can use geopoint functionality to quickly determine all of your customer's delivery locations and then adjust delivery fees based on their distance from the store.

Key aspects of the geotype data type are:

- It consists of a pair of decimal numbers representing longitude and latitude values.
- The range for longitude is (-180, 180]. Any value outside this range is normalized to the equivalent value inside this range.
- The range for latitude is [-90, 90]. Any value outside this range is normalized to the equivalent value inside this range.
- Geopoint values are always accepted as input and display as a comma-separated pair: “longitude,latitude”. Parentheses may optionally surround the expression.
- Both longitude and latitude values are stored up to 6 decimal places of precision.

For more information about the geopoint data type, see Function field.

The examples in this guide assume that a custom table, `u_geopoint`, is populated with fields `u_name` and `u_location`, where `u_name` is of type 'string' and lists the names of major cities and `u_location` is of type 'geopoint' and lists the latitude/longitude points of each city respectively.

Create geopoints using the GlideGeoPoint API

Use the *GlideGeoPoint* API to insert new records and create new geopoints.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The GlideGeoPoint - Global API allows you to set and retrieve geopoint values. However, you can perform additional functionality to insert new records by setting geopoints directly in a script using string notation or a GlideGeoPoint object.

Inserting a new record using string notation.

Set the value of the geopoint field `u_location` using a string. The string consists of a comma-delimited pair of longitude and latitude values. The following example shows how to set a new geopoint in the `u_geopoint` table using string notation.

Note: *`GlideGeoPoint`* API values are always listed in longitude, latitude order.

```
const longitude = "-87.628018";
const latitude = "41.885778";
const geopoint = longitude + "," + latitude;

const myGeoPoint = new GlideRecord("u_geopoint");
myGeoPoint.initialize();
myGeoPoint.setValue("u_name", "Chicago");
myGeoPoint.setValue("u_location", geopoint);
myGeoPoint.insert();
```

Inserting a new record using the GlideGeoPoint object.

Set the value of the geopoint field `u_location` using a GlideGeoPoint object.

```
const longitude = -87.628018;
const latitude = 41.885778;
const geopoint = new GlideGeoPoint(longitude,
 latitude);

const myGeoPoint = new GlideRecord("u_geopoint");
myGeoPoint.initialize();
myGeoPoint.setValue("u_name", "Chicago");
myGeoPoint.setValue("u_location", geopoint);
myGeoPoint.insert();
```

Read geopoint values using the GlideGeoPoint API

Use the *`getDisplayValue()`* GlideGeoPoint API function to read all geopoint values from a specific table.

The standard GlideGeoPoint API allows you to retrieve a geopoint value via the GlideGeoPoint - getDisplayValue() function. However, it is possible to read all geopoints defined in an entire table. The following example script demonstrates how to use the *`getDisplayValue()`* function to retrieve all records from the `u_geopoint` table, which includes the `u_location` field of type 'geopoint'. You can this example script and adjust it to your own specific use case.

Note: *`GlideGeoPoint`* API values are always listed in longitude, latitude order.

```
const myGeoPoint = new GlideRecord("u_geopoint");
myGeoPoint.query();

while (gr.next())
  gs.info("Name: {0}  Location: {1}",
    myGeoPoint.getDisplayValue('u_name'),
    myGeoPoint.getDisplayValue('u_location'));
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The output returns all records in the `u_geopoint` table. The display value of a geopoint includes the longitude followed by the latitude, separated by a comma and surrounded in parentheses.

```
Name: London  Location: (-0.189937, 51.473584)
Name: Puerto Rico  Location: (-66.561301, 18.291136)
Name: Glasgow  Location: (-4.223964, 55.867846)
Name: Chicago  Location: (-87.628018, 41.885778)
Name: Tasmania  Location: (146.757677, -42.173578)
Name: Bermuda  Location: (-64.761595, 32.315798)
Name: Miami  Location: (-80.206458, 25.767242)
Name: Sydney  Location: (151.205230, -33.890115)
Name: Perth  Location: (115.871253, -31.971583)
Name: Dublin  Location: (-6.304994, 53.348317)
```

Calculate the distance between two geopoints

Use the `distance_sphere` glide function to return the distance between geopoints in meters.

The geopoint glide function, `distance_sphere`, allows you to compute the distance between two geopoints. The function returns the distance in meters. `distance_sphere` can be used in the definition of a function field element on a table or via a script. Three syntaxes are supported and all parameters are required:

- `glidefunction:distance_sphere(geopoint1, geopoint2)`
- `glidefunction:distance_sphere(geopoint1, longitude2, latitude2)`
- `glidefunction:distance_sphere(longitude1, latitude1, longitude2, latitude2)`

When using these syntaxes, note that:

- geopoint1 and geopoint2 are table elements of type 'geopoint'
- longitude1, longitude 2, latitude 1, latitude 2 are numerical table elements or constants
- In all cases, the return value of this function is a decimal representing the distance between two geopoints in meters

The following example script defines a `distance_sphere` function to compute the distance between all geopoints stored in the `u_location` field of the `u_geopoint` table and the point `-0.189937` longitude, `51.473584` latitude (which is roughly the location of London). The function is added to the GlideRecord query to produce results.

```
const distToLondon =
"glidefunction:distance_sphere(u_location, '-0.189937',
 '51.473584')";

const myGeoPoint = new GlideRecord('u_geopoint');
gr.addFunction(distToLondon);
gr.query();

while(myGeoPoint.next())
  gs.info("Name: {0}  Dist to London(m): {1}",
    myGeoPoint.u_name, gr.getValue(distToLondon));
```

The output lists the distance between London and cities in the `u_location` field in meters.

```
Name: London  Dist to London(m): 0
Name: Glasgow  Dist to London(m): 555985.58456358
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Name: Dublin  Dist to London(m): 464000.328892816
Name: Miami  Dist to London(m): 7123803.25406323
Name: Bermuda  Dist to London(m): 5547607.95564083
Name: Puerto Rico  Dist to London(m): 6799201.00905107
Name: Perth  Dist to London(m): 14485217.5596414
Name: Sydney  Dist to London(m): 17001034.4875494
Name: Tasmania  Dist to London(m): 17324634.4559516
```

Filter the distance between two geopoints

Use the `DISTANCE_SPHERE_WITHIN` query condition to filter for records having a geopoint value within the radius of a defined latitude, longitude point.

`DISTANCE_SPHERE_WITHIN` must follow syntax `geopointDISTANCE_SPHERE_WITHINlongitude,latitude<radius` where:

- `geopoint` is a geopoint field
- `longitude` and `latitude` are decimal constants
- `radius` is a decimal constant (in meters)

Note: The less-than symbol (<) in this expression is required and only used as a delimiter. Any other comparison operator is invalid.

The `DISTANCE_SPHERE_WITHIN` accepts kilometer or meter values in the request but always returns the output value in meters.

The following example script shows how to build an encoded query that returns only records having a `u_location` less than 1,000,000 kilometers away from the point `-0.189937` longitude, `51.473584` latitude (which is roughly the location of London). When executed, it returns three records representing cities within the specified radius of London.

```
const myGeoPoint = new GlideRecord("u_geopoint");
myGeoPoint.addEncodedQuery("u_locationDISTANCE_SPHERE_WITHIN-0.1
89937,51.473584<1000000");
myGeoPoint.query();

while(gr.next())
    gs.info("Name:" + myGeoPoint.getDisplayValue("u_name")
         + " Location:" +
 myGeoPoint.getDisplayValue("u_location"));
```

Output:

```
Name:London Location:(-0.189937, 51.473584)
Name:Dublin Location:(-6.304994, 53.348317)
Name:Glasgow Location:(-4.223964, 55.867846)
```

The following example script is equivalent to the first but uses an alternative syntax for GlideRecord.

```
const myGeoPoint = new GlideRecord("u_geopoint");
myGeoPoint.addQuery("u_location", "DISTANCE_SPHERE_WITHIN",
 "-0.189937,51.473584<1000000");
myGeoPoint.query();

while(myGeoPoint.next())
    gs.info("Name:" + myGeoPoint.getDisplayValue("u_name")
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        + " Location:" +
myGeoPoint.getDisplayValue("u_location"));
```

Output:

```
Name:London Location:(-0.189937, 51.473584)
Name:Dublin Location:(-6.304994, 53.348317)
Name:Glasgow Location:(-4.223964, 55.867846)
```

Mobile SDK Developer Guide - Android

The ServiceNow Mobile SDK enables you to leverage the functionality and resources of the ServiceNow platform within your standalone mobile Android applications.

Using the Mobile SDK, you can perform the following within your applications:

- Access data on your ServiceNow instance through its public REST APIs or custom scripted REST APIs that you develop.
- Embed and enable Virtual Agent within your application interface.
- Gather and track custom analytics events for analysis.
- Attach documents (attachments) to a record within your ServiceNow instance.
- Load web pages hosted on your ServiceNow instance in a native web view or Cabrillo.
- Provide simple authentication flows using JSON Web Tokens for third-party applications to authenticate users.
- Send push notifications.

The Mobile SDK provides a sample app that includes code examples for integration with different Mobile SDK modules. In the 2.1 release and later, the Engagement Messenger is included in the sample app. To learn more about the Engagement Messenger, see https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB1587611 .

NowSDK architecture

The NowSDK is the top-level entity of the Mobile SDK class framework.

It contains numerous classes, interfaces, and functions that enable you to leverage the significant capabilities provided by the Mobile SDK and your ServiceNow instance. This document focuses on describing the primary feature services exposed in the Mobile SDK that enable you to interact with your ServiceNow instance.

In order to use any of the feature services provided by the Mobile SDK, you need to integrate the NowSDK library into your code. You must call the core library to configure and initialize the SDK before using any SDK functionality.

NowSDK provides the following capabilities:

- SDK initialization and settings retrieval and configuration.
- Seamless authorization and user session handling.
- Logging interface. The NowSDK provides logging services to all feature services. By default, log messages are written to system logs using platform-specific functionality. You can control the logging threshold through a parameter that is part of the call to configure the SDK. There is also an option to suppress all log messages generated by the SDK and its feature services

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(`log level = none`). If you already have your own logging solution in place, the Mobile SDK allows you to use it.

- Build and release infrastructure.

NowSDK provides the following feature services and associated APIs:

- NowDataSDK

  Enables third party applications to access the public REST APIs exposed by your ServiceNow instance. Development is streamlined because the NowDataSDK utilizes the authentication and session handling features provided by the NowSDK.

  - Primary APIs:
    - NowAPIService: This API provides functionality that enables you to interact with the publicly exposed REST APIs on your ServiceNow instance.
    - NowAttachmentService: This API provides functionality to upload and query file attachments on your ServiceNow instance within your Android application.
    - NowGraphQLService: This API provides functionality that enables you to use GraphQL queries to obtain data from tables within your ServiceNow instance using the ServiceNow REST *`GraphQL API`*.
    - NowTableService: This API provides functionality that enables you to perform create, read, update, and delete (CRUD) operations on existing tables in your ServiceNow instance that get serviced through the ServiceNow REST *`Table API`*.
- NowAnalytics

  Enables you to gather and track usage analytics within your mobile applications.

  - Primary APIs:
    - NowAnalytics: This API provides functionality to gather user analytics data and store it within the ServiceNow platform for later analysis and tracking.
- NowChat

  Enables you to embed a native Virtual Agent chat window in your applications. This service includes UI/UX features.

  - Primary APIs:
    - NowChatService: This API provides Virtual Agent and Live Agent chat capabilities to your Android applications. Leverage the full service chat capabilities provided by the ServiceNow platform by simply implementing *`NowChatService`* within your application.
- NowPush

  Enables you to send unsolicited messages to your applications that leverage the NowChat/Virtual Agent functionality.

  - Primary APIs:
    - NowPushSDK: This API provides the function necessary to create a `NowPushService` that enables the sending of unsolicited (push) notifications to Android devices.
    - NowPushService: This API provides functions that enable interaction with the Push Service.
- NowWeb

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enables you to load web pages hosted on your ServiceNow instance in a native web view or Cabrillo. It automatically handles user authentication and session management instead of forcing users to log into the instance via a login web page.

When the webview is requested to load a web page hosted on a ServiceNow instance, it creates an HTTP request with the appropriate bearer header containing the OAuth access token provided by the NowSDK. When the instance receives this request, it starts a new user session and returns cookies related to that session. As the user interacts with the web pages in the webview, the instance uses the cookies to validate that the session is still valid. At this point, the bearer header is no longer relevant, only the cookies are used for session validation. The web session expires if the user stops interacting with the website for longer than the timeout period. After the session expires, if the user tries to interact with the web page, they are automatically redirected to the login page. The NowWebViewController detects the redirection and attempts to start a new web session by requesting a refreshed access token from the NowSDK and using the token to create a HTTP request (with bearer header) for the last known loaded page.

- Primary APIs:

  NowWebSDK: This API provides functionality to create a NowWeb service object that enables web pages from your ServiceNow instance to be displayed in your Android application.

Get started with Mobile SDK - Android

You must complete the tasks outlined in this section to prepare your development environment to support writing Android applications that integrate with the ServiceNow Mobile SDK.

- Download and install the ServiceNow Mobile SDK libraries. For detailed instructions, see Download and install the Mobile SDK library.
- Install and configure the Mobile SDK scoped application. For detailed instructions, see Install and configure the Mobile SDK scoped application.
- Configure your project. For more information, see Configure your project.
- Activate and configure the Mobile SDK on your ServiceNow instance. For details, see Configure certificate and create an OAuth Entity.

Once all of these tasks are completed, you can then start creating mobile applications that leverage the significant resources on your ServiceNow instance.

Download and install the Mobile SDK library

Before you can create mobile applications that interact with your ServiceNow instance, you must first download and install the ServiceNow Mobile SDK Android library.

Before you begin

Role required: none

Before you start the download and installation process, ensure that your development environment meets the following minimum requirements:

- ServiceNow instance must be Washington DC or later.
- Android version must be API 29 or later.

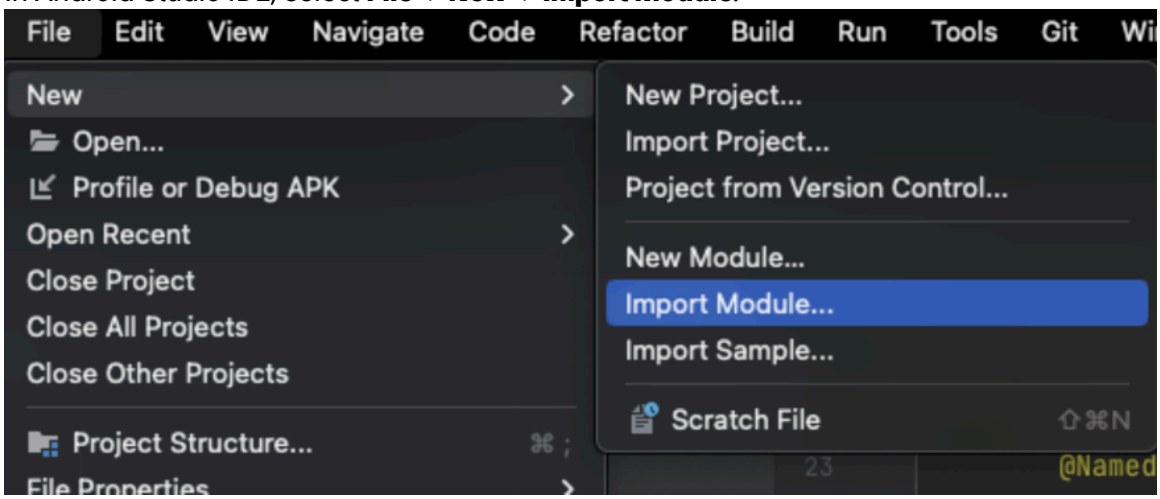
Procedure

1. Download the Mobile SDK Android library, called NowSDK, from the ServiceNow Store. You can find the Android libraries in the following locations:
   - Mobile SDK: https://store.servicenow.com/sn_appstore_store.do#!/store/application/528218468031201010 40fe43e5b9ee8c
   - Android library: https://store.servicenow.com/sn_appstore_store.do#!/store/application/f06b29b487ea3014970e2178cebb3511

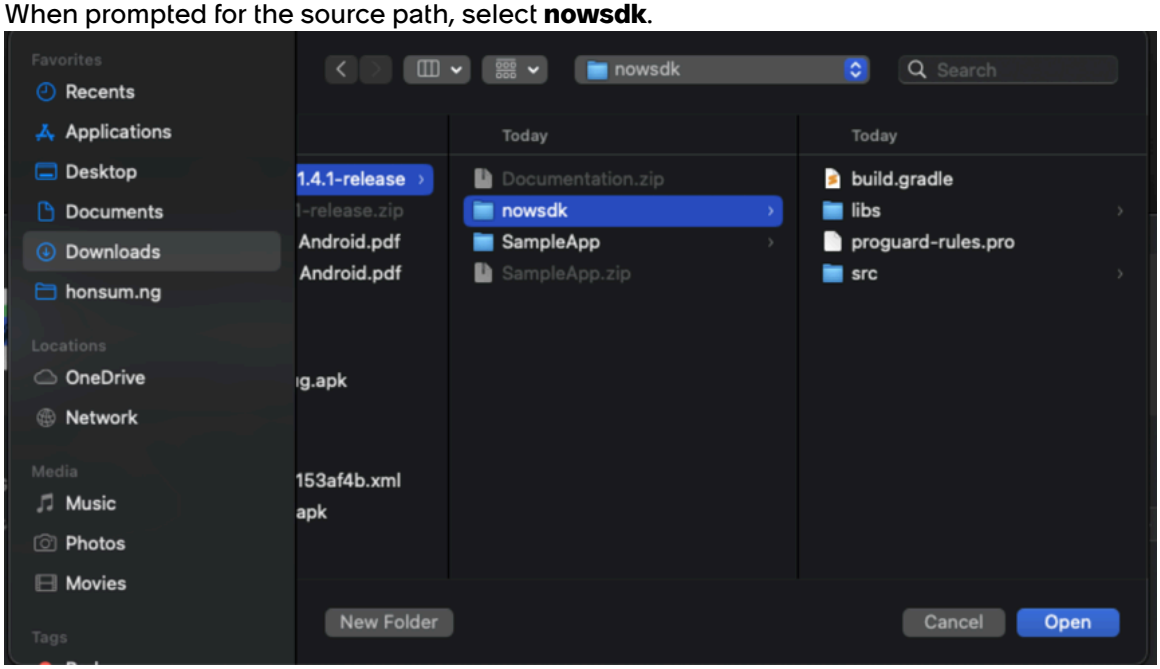
   For details on installing applications on your instance, see Administering applications.
2. Unzip the NowSDK file into a temporary folder.
3. Use Android Studio IDE to import the NowSDK as a module into your project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In Android Studio IDE, select **File -> New -> Import Module**.



b. When prompted for the source path, select **nowsdk**.



As the project is imported, the IDE will report a build error.

c. To resolve any build errors, make sure the following key-value pairs are added inside the nowsdk module's#`build.gradle` file.
This information defines the versions for each of the transitive dependencies of the NowSDK.

```
ext {
    kotlin_version = "2.1.0"
    hilt_version = "2.55"
    navigationVersion = '2.8.5'
    mapsKtxVersion = '3.4.0'
    mapsComposeVersion = '2.11.0'
    androidxCoreVersion = '1.13.1'
    recyclerViewVersion = '1.3.2'
    appCompatVersion = '1.6.1'
    constraintLayoutVersion = '2.2.0'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    lifecycleVersion = '2.8.7'
    roomRuntimeVersion = '2.6.1'
    roomRxJavaVersion = '2.6.1'
    timberVersion = '5.0.1'
    rxAndroidVersion = '3.0.2'
    rxJavaVersion = '3.1.10'
    rxKotlinVersion = '3.0.1'
    daggerVersion = '2.55'
    androidxAnnotationVersion = '1.9.1'
    materialVersion = '1.9.0'
    retrofitVersion = '2.11.0'
    okhttpVersion = '4.12.0'
    cardViewVersion = '1.0.0'
    gsonVersion = '2.11.0'
    firebaseBomVersion = '33.7.0'
    exifinterfaceVersion = '1.3.7'
    kotlinxCoroutinesVersion = '1.10.1'
    moshiVersion = '1.15.2'
    androidxBrowserVersion = '1.8.0'
    composeBomVersion = '2025.01.00'
    composeViewmodelVersion = '2.5.1'
    composeActivityVersion = '1.9.3'
    jsoupVersion= '1.18.3'
    cameraxVersion = '1.2.3'
    lottieVersion = '6.6.1'
    fragmentKtxVersion = '1.5.2'
    coroutinesCoreVersion = '1.5.1'
    coroutinesAndroidVersion = '1.5.1'
}
```

d. In the nowsdk module's#`build.gradle`#file, ensure that the following section is added to include the NowSDK repositories.

```
rootProject.allprojects {
  repositories {
    flatDir { dirs rootProject.rootDir.path +
 "/nowsdk/libs" }
  }
}
```

e. In the app level `build.gradle` file, add the NowSDK as a dependency.

```
dependencies {
  // NowSDK
  implementation project (":nowsdk")
```

Once `gradle` syncs, you should be able to reference the *NowSDK* APIs.

Install and configure the Mobile SDK scoped application

Before writing any application that leverages the Mobile SDK, you must install and configure the Mobile SDK scoped application.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the Mobile SDK page on the ServiceNow Store web site.
   For details, see Install a ServiceNow Store application.
2. Select **Request Install** to download the Mobile SDK scoped application onto your ServiceNow instance.
3. Verify that the Mobile SDK scoped application was properly installed on your ServiceNow instance.

   a. Open the plugin's form: `System Definition` > `Plugins`.

   b. In the search field, enter `mobile_sdk`.
   A screen similar to the following should appear:

   c. Verify that the plugin **Id** is `sn_mobile_sdk` and that the version is the latest.

4. Open the Mobile SDK Settings [sn_mobile_sdk] table and create a new application record for the application that will leverage the Mobile SDK.

   a. In the **Name** field, enter the name of your application that will leverage the Mobile SDK.

   b. In the **Android Application ID** and **Apple Bundle ID** fields, enter the ID of your mobile application.
   For example, if the Mobile SDK was added to your mobile applications, then these IDs would be the IDs of the mobile applications.

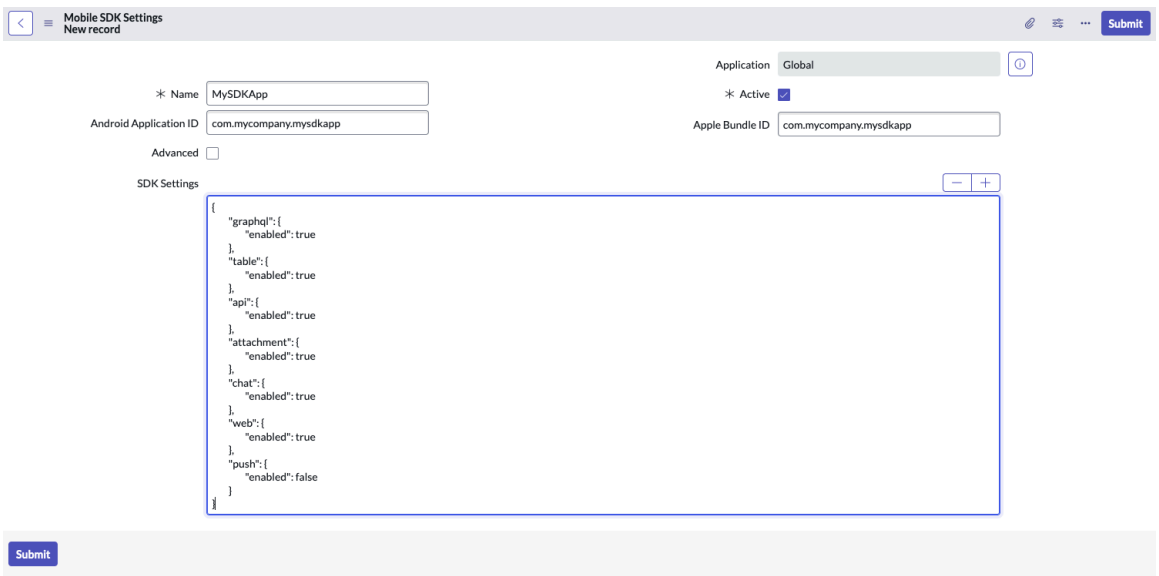
   c. In the **SDK Settings** field, enter JSON configuration properties for all of the feature services that your application will leverage, set to `true`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example:

```
{
    "graphql": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "table": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "api": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "attachment": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "chat": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "web": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "push": {
        "enabled" : true
    }
}
```

Ensure that the **Advanced** check box is unselected. This allows you to enter JSON in the **SDK Settings** field.



Any applicable configuration added in **SDK Settings** is used in conjunction with the ServiceNow instance configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

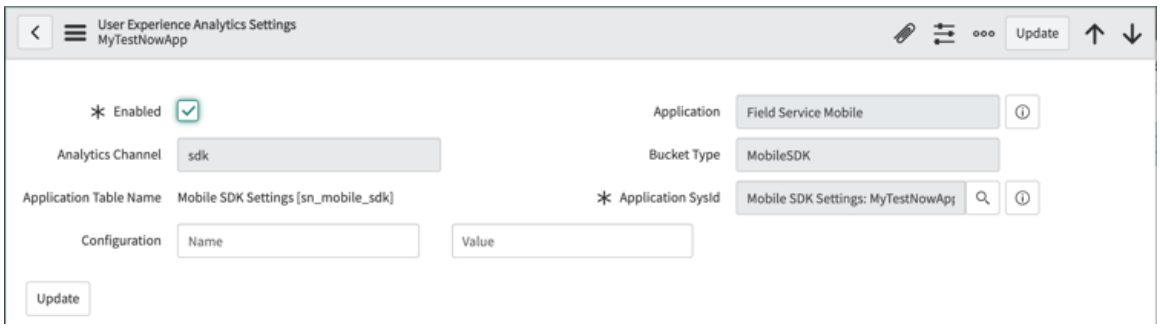
For example, if `chat: enabled = true`, your ServiceNow instance must have the Virtual Agent plugin installed to leverage the chat functionality. If the Virtual Agent plugin is installed, but **SDK Settings** contains `chat: enabled = false`, your application is not able to leverage the chat interface.

d. Select **Submit** to save your application settings.

5. Optional. If you want your application to leverage User Experience Analytics, register your application with the User Experience Analytics application.

a. Reopen your application's Mobile SDK Settings record.

b. In the bottom-left of the screen, select **Register for Analytics**.
A screen similar to the following appears:



c. Select **Update** to save the registration.

6. Verify your SDK Settings.

a. Navigate to the **REST API Explorer**.

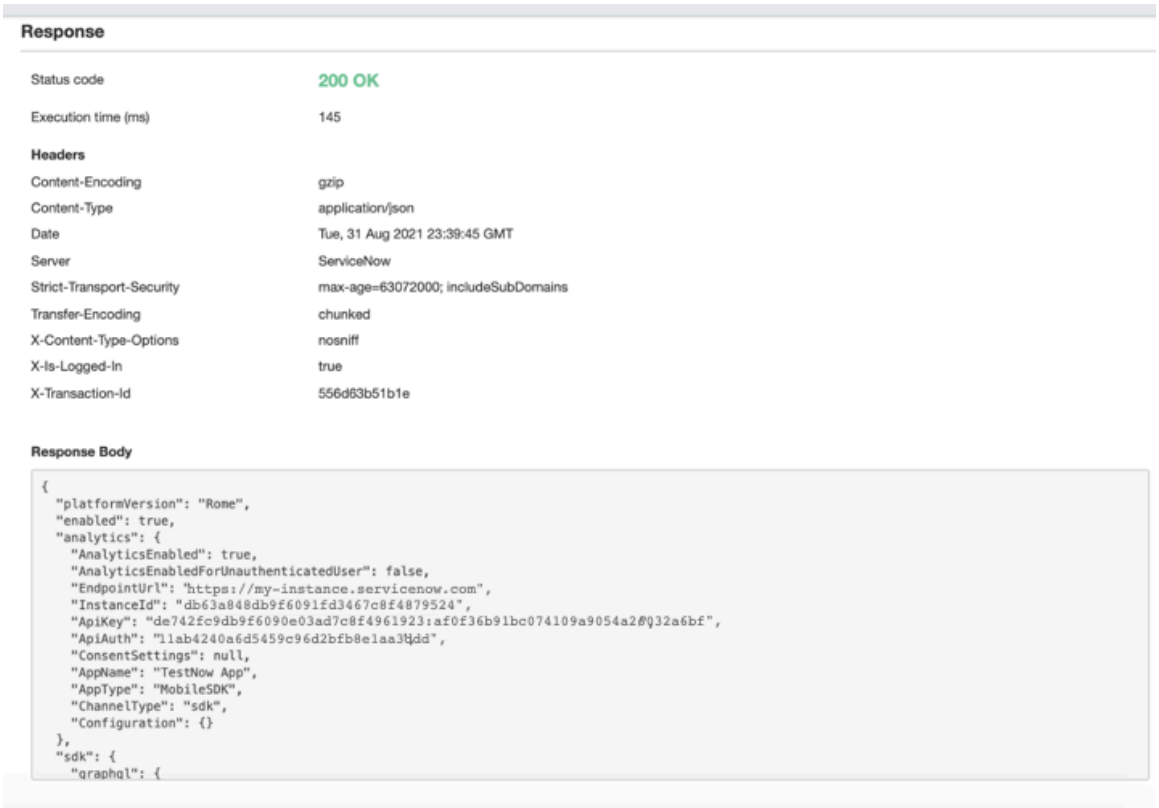
b. Enter the following in the specified fields:

- **Namespace**: `sn_mobile_sdk`
- **API Name**: `Mobile SDK`
- **API Version**: `latest`

c. Select **Get settings for Android App (GET)**.

d. In the **applicationID** field, enter the Android Application ID that you entered in the associated Mobile SDK Settings record and then select **Send**.
The response should look similar to the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The JSON **Response Body** should look similar to the following:

```
{
 "platformVersion": "utah",
 "enabled": true,
 "analytics": {
 "AnalyticsEnabled": true,
 "AnalyticsEnabledForUnauthenticatedUser": false,
 "EndpointUrl": "https://my-instance.servicenow.com.com",
 "InstanceId": "db63a848db9f6091fd3467c8f4879524",
 "ApiKey":
 "de742fc9db9f6090e03ad7c8f4961923:af0f36b91bc074109a9054a260
32a6bf",
 "ApiAuth": "11ab4240a6d5459c96d2bfb8e1aa3ddd",
 "ConsentSettings": null,
 "AppName": "TestNow App",
 "AppType": "MobileSDK",
 "ChannelType": "sdk",
 "Configuration": {}
 },
 "sdk": {
 "graphql": {
 "enabled": true
 },
 "table": {
 "enabled": true
 },
 "api": {
 "enabled": true
 },
 "attachment": {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 "enabled": true
 },
 "chat": {
 "enabled": true
 },
 "web": {
 "enabled": true
 },
   "push": {
   "enabled": true
 }
}
```

Configure your project

Before writing any application that leverages the Mobile SDK for Android, you must configure your project to use the SDK.

Before you begin

Role required: none

Procedure

To include the nowsdk module in your project, add the following line to the settings.gradle file in your application folder:

```
include ':nowsdk'
```

Configure certificate and create an OAuth Entity

You must configure your ServiceNow instance to accept and exchange a JSON Web Token (JWT) for an OAuth access token. To enable this functionality you must install a certificate that matches the JWT provider's private key on the ServiceNow instance that you will use as the JWT Token consumer and create an OAuth Entity on that instance.

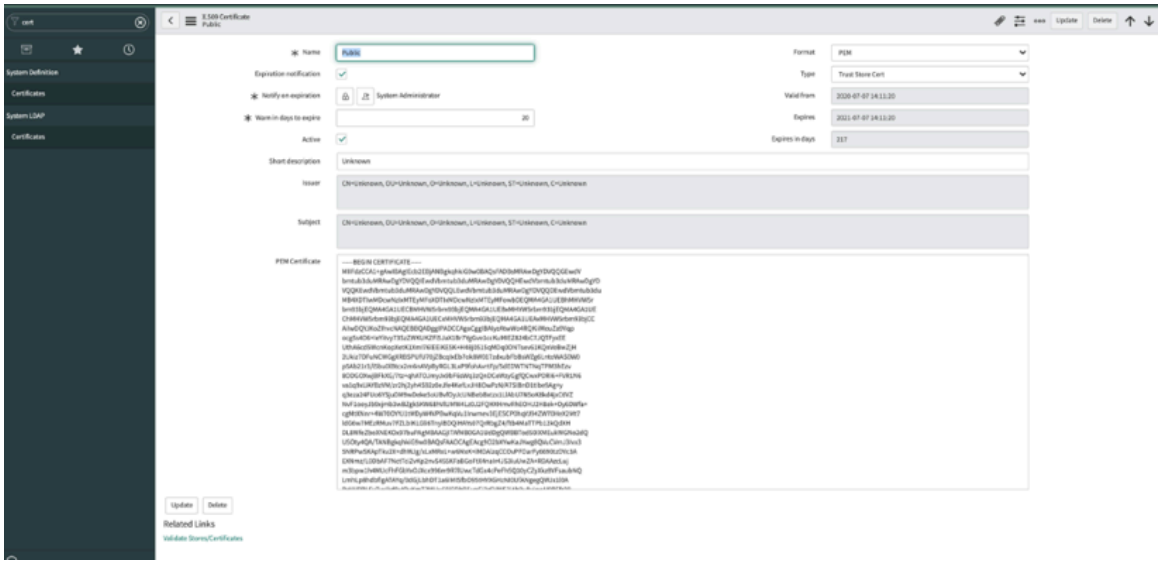
Before you begin

Role required: admin

Procedure

1. If not already configured, configure your ServiceNow instance as an OAuth JWT provider. For details, see Create an OAuth JWT API endpoint for external clients (machine to machine integration).
2. Navigate to **System Definition** > **Certificates**.
3. Select **New** and then create a new public certificate as shown in the following image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For details on creating this certificate, see Update your X.509 certificate.

4. Create an OAuth Entity.
   For details, see Create an OAuth JWT API endpoint for external clients (machine to machine integration).
5. Add and select the **Public Client** field to the form.

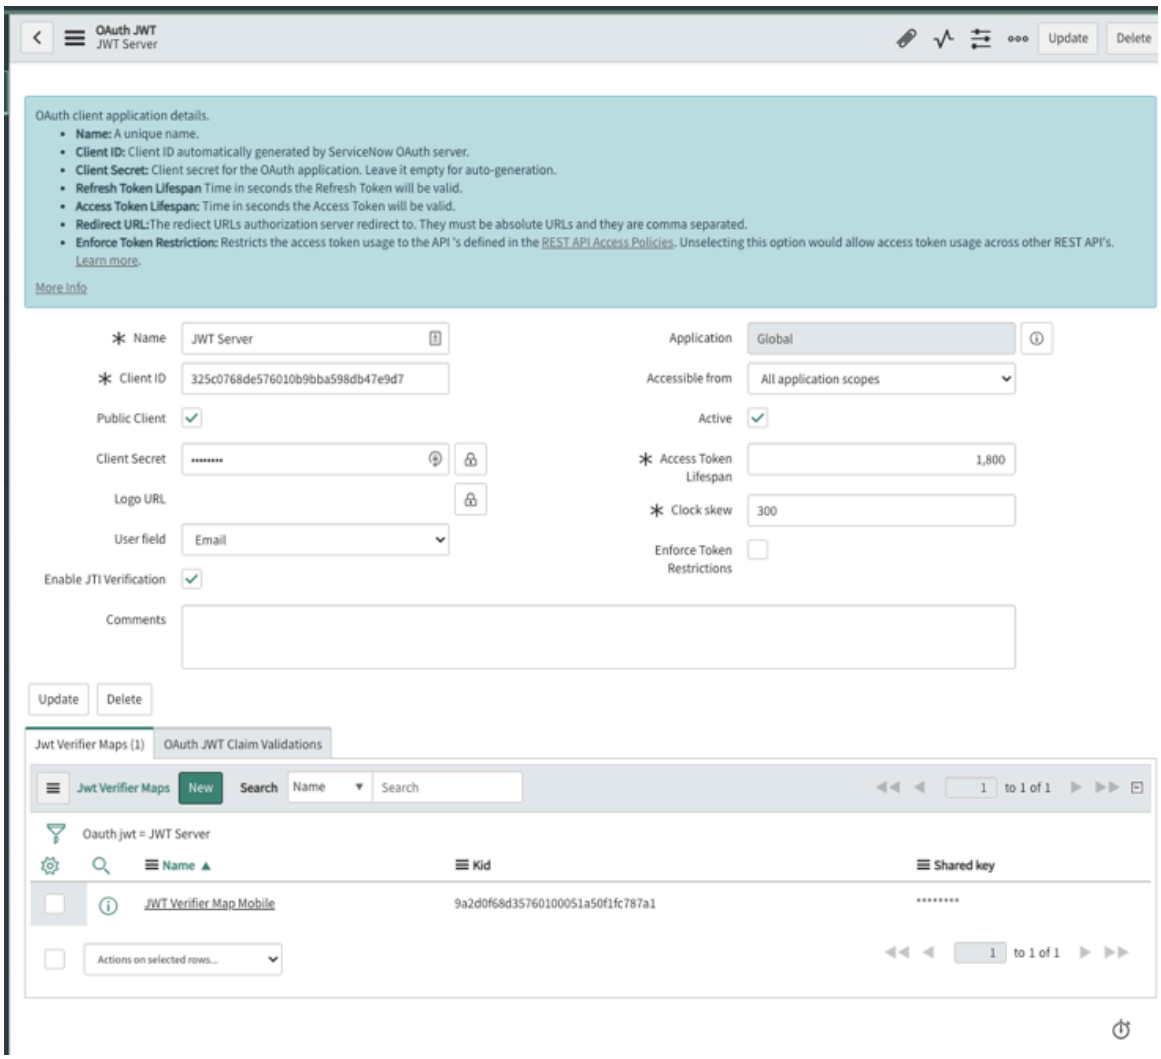
   Note: This field is not shown by default.

6. Save the record.
7. Add a JWT Verifier Map entry.
   After the record is saved, a new section called **Jwt Verifier Maps** appears at the bottom of the form.

   a. Add a name in the **Name** field, this can be whatever name you choose, and select the certificate that was added.
   The other fields, **Kid** and **Shared key**, can be left blank, as they are auto-filled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Ensure that the form contains information similar to the following once you are finished with your configuration:



Configure guest user access

To enable SDK services to be accessible by unauthenticated users, you must configure the Mobile SDK on your ServiceNow instance to allow guest user access. A guest user can view public web pages hosted in an instance using *NowWeb*, have a conversation as a guest using *NowChat*, access public data on the instance using *NowTableService* and *NowGraphQLService*, and access custom API services configured for unauthenticated users using *NowAPIService*.

Before you begin

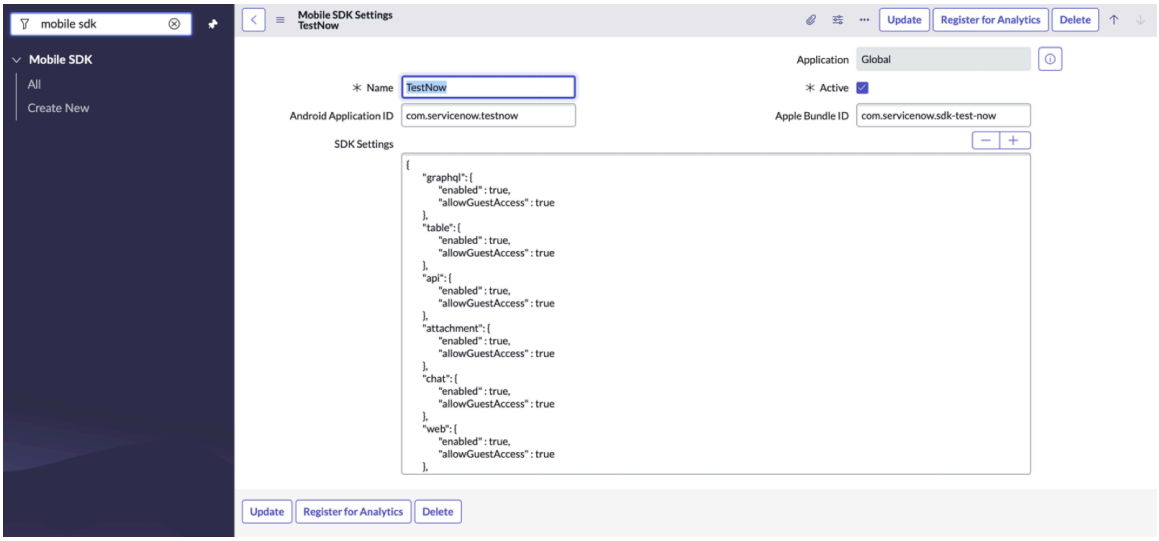
Role required: admin

Procedure

1. Navigate to **All** > **Mobile SDK** > **All** and select the application to which you want to allow guest access.
2. For each service that you want to enable guest access, add `"allowGuestAccess":true` to its configuration array.

Note: The *NowAttachment* service does not currently support guest access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select **Update** to save your changes.

Initialize the NowSDK in your application

In order to use the Mobile SDK in your application, you need to perform SDK initialization, authorization, and logging.

As you use the NowSDK, it makes a request to configure the SDK and provides callbacks from the SDK. Once the SDK is configured, an application can use the feature services and their associated APIs. This setup/configuration helps to make an authenticated call to a ServiceNow instance.

The following is an example of how to initialize the NowSDK in your Android application.

```
//Helper class to encapsulate value needed to initialize the sdk
data class NowSDKSettings(val instanceBaseURL : String, val
 clientId: String, val user: String?)

class SampleApplication : Application(),
 NowSDKAuthorizationProviding, DevicePermissionDelegate {

    private val nowSdkSettings = NowSDKSettings(
        instanceBaseURL =
 "https://instance-name.service-now.com",
        clientId = "client_id",
        user = "user"
    )

    private val coroutineScope = CoroutineScope(Dispatchers.IO)

    private val nowSDKConfiguration = NowSDKConfiguration(this,
 this, NowLogLevel.Debug)

    override fun onCreate() {
        super.onCreate()
        NowSDK.configure(this, nowSDKConfiguration)
    }

    override fun requestAuthorization(
        instanceURL: URL,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        callback: Consumer<List<AuthorizationToken>?>
    ) {
        coroutineScope.launch {
            when {
                nowSdkSettings.user.isNullOrBlank().not() ->
 authorizeWithJWT(
                    callback = callback,
                    user = nowSdkSettings.user,
                    clientId = nowSdkSettings.clientId
                )

                else -> authorizeWithGuest(callback = callback)
            }
        }
    }

    override fun canRequestPermission(permission:
 DevicePermission): Boolean {
        return true
    }

    private fun authorizeWithJWT(
        callback: Consumer<List<AuthorizationToken>?>,
        user: String?,
        clientId: String
    ) {
        //Get JWT token needed for the sdk initialization.
        val jwtToken ="jwt_token"

 callback.accept(listOf(AuthorizationToken(AuthorizationTokenTyp
e.JWT, jwtToken)))
    }

    private fun authorizeWithGuest(callback:
 Consumer<List<AuthorizationToken>?>) {
        callback.accept(
            listOf(
                AuthorizationToken(
                    AuthorizationTokenType.Guest,
                    ""
                )
            )
        )
    }
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Implement Virtual and Live Agent chat

The Mobile SDK enables you to easily implement Virtual and Live Agent chat services within your Android application.

You use the NowChatSDK API to create the chat service. Once the service is created, you must then start the chat user interface.

The following is a snippet that shows how to create the chat service and start the interface.

```
/**
 * Helper class used to handle different Now service instances.
 */
@Singleton
class SdkManager @Inject constructor() {

    private var chatService: NowChatService? = null

    /**
     * Create the NowChatService once in the lifetime of the
 application, inside the Application class or another manager
 class
     * that will be injected into other classes via dagger/hilt.
     * NowChatService should be created after initializing the
 NowSDK.
     */
    suspend fun getNowChatService(): NowChatService? {
        if (chatService != null) return chatService

        return
 NowChatSDK.makeChatService(URL("https://
instance-name.service-now.com"),
            object : NowChatSdkCallbacks {})
            .getOrThrow()
            .also { this.chatService = it }
    }
}

//Activity that will start the NowChat
class MainActivity : AppCompatActivity() {

    @Inject
    lateinit var sdkManager: SdkManager

    override fun onCreate(savedInstanceState: Bundle?) {
        super.onCreate(savedInstanceState)

        //Start NowChat using the activity
        lifecycleScope.launch {

 sdkManager.getNowChatService()?.start(this@MainActivity)
        }
    }
}
```

Before you can leverage the chat functionality within your application, you must configure Virtual Agent within your ServiceNow instance. For details, see Virtual Agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Passing context variables to Live Agent and Virtual Agent chat

You can pass chat context variables when starting a chat session by passing the *contextData* parameter in the NowChatService-start() function. For additional information on chat context variables, see Live agent chat context variables.

```
class MainActivity : AppCompatActivity() {
  @Inject

  lateinit var sdkManager: SdkManager

  override fun onCreate(savedInstanceState: Bundle?) {
    super.onCreate(savedInstanceState)

    val contextData = mapOf("sys_id" to "123456789", "table" to
 "wm_task")
    //Start NowChat using the activity
    lifecycleScope.launch {
      sdkManager.getNowChatService()?.start(this@MainActivity,
 contextData = contextData)
    }
  }
}
```

Theme the chat user interface

You can customize the colors of the Live Agent and Virtual Agent chat UI by passing a theme object in the *start()* call. For a list of elements that you can customize, see NowChatService - launchIntent(context:Context, nowChatTheme:NowChatTheme):Intent. By default, the chat UI uses the *nowUIColor* theme for all NowSDK UI elements. Refer to the sample application for an example on how to apply a theme to your chat UI.

Pass NowChatConfiguration to modify the behavior of NowChat

You can pass an optional *NowChatConfiguration* parameter when starting a chat session to modify some of the behavior of NowChat.

The NowChatConfiguration object contains the following options:

- *closePrompt*: Prompt text that appears before exiting a chat window. You define this prompt text through the following parameters:
  - *header*: Nullable string value that appears on the prompt's header.
  - *message*: String value that appears on the prompt's main body.
  - *acceptButtonTitle*: String value that appears on the primary button of the prompt. This button closes the chat window.
  - *declineButtonTitle*: String value that appears on the secondary button of the prompt. This button dismisses the prompt without closing the chat window.
- *disabledFeatures*: List of NowChat features to disable. Refer to the *NowChatConfiguration.Feature* enum class for the list of features that you can disable.
- *conversationOptions*: List of conversation options to apply to NowChat. Refer to the *NowChatConvestation.ConversationOption* enum class for the list of options that you can apply.
- *uiConfiguration*: UIConfiguration value used to configure UI components in NowChat.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to use *NowChatConfiguration()* to configure NowChat.

```
class MainActivity : AppCompatActivity() {
  @Inject

  lateinit var sdkManager: SdkManager

  override fun onCreate(savedInstanceState: Bundle?) {
    super.onCreate(savedInstanceState)

    //Drawable to use instead of the default NowChat back
 button.
    val myDrawable = ContextCompat.getDrawable(activity,
 R.drawable.my_drawable)

    val nowChatConfiguration = NowChatConfiguration(
      closePrompt = NowChatConfiguration.ClosePrompt(
        header = null,
        message = "Are you sure you want to leave?",
        acceptButtonTitle = "Yes",
        declineButtonTitle = "No"
      ),
      disabledFeatures =
 listOf(NowChatConfiguration.Feature.START_NEW_CONVERSATION),
      conversationOptions =
 listOf(NowChatConfiguration.ConversationOption.FORCE_NEW_CONVER
SATION),
      uiConfiguration = NowChatConfiguration.UIConfiguration(
        closeButton =  NowChatConfiguration.CloseButton(
          icon = myDrawable
        ),
        attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible = false)
      )
    )

    //Start NowChat
    lifecycleScope.launch {
      sdkManager.getNowChatService()?.start(this@MainActivity,
 nowChatConfiguration = nowChatConfiguration)
    }
  }
}
```

For additional information, see NowChatConfiguration - Android and NowChatService - start(activity: Activity, themeColors: NowChatTheme = object: NowChatTheme{}, contextData: Map<String, Any> = mapOf(), chatConfiguration: NowChatConfiguration? = null).

Interact with table data in a ServiceNow instance

The Mobile SDK enables you to interact with data in tables that reside on your ServiceNow instance. You can interact with this data through the ServiceNow REST *Table* API using the *NowTableService()* API that directly calls the REST interface, or through the *NowGraphQLService()* API that executes a specified GraphQL query against the REST *GraphQL* API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to return data from multiple tables within a single call, you will need to use the *NowGraphQLService()* API. If you need to interact with ServiceNow REST APIs other than the *Table* API, see Interact with the public REST API on a ServiceNow instance.

Using NowGraphQLService to interact with ServiceNow tables

The NowGraphQLService class provides methods that enable you to construct and execute GraphQL queries on a specified table within your ServiceNow instance if the logged in user has the proper authorization. You can define all CRUD operations within your GraphQL query.

The following example shows how to import the NowData framework and then initialize a NowGraphQLService object that you can then use to interact with tables in your ServiceNow instance.

```
/**
 * Helper class used to handle different Now service instances.
 */
@Singleton
class SdkManager @Inject constructor() {

    private var nowGraphQLService: NowGraphQLService? = null

    /**
     * Create the NowGraphQLService once in the lifetime of the
 application inside the Application class or another manager
 class
     * that will be injected into other classes via dagger/hilt.
     * NowGraphQLService should be created after initializing
 the NowSDK
     */
    suspend fun getNowGraphQLService(): NowGraphQLService? {
        if (nowGraphQLService != null) return nowGraphQLService

        return
 NowDataSDK.makeGraphQLService(URL("https://
instance-name.service-now.com")).getOrThrow()
            .also { this.nowGraphQLService = it }
    }
}
```

This example shows how to obtains published KB articles using a GraphQL query.

```
suspend fun loadList() = withContext(Dispatchers.IO) {
    val kbArticlesQuery = """
    {
        GlideRecord_Query {
            kb_knowledge(queryConditions:
 "active=true^ORDERBYpublishedDESC"
            pagination:{ limit: 10, offset: 0 }) {
                _results {
                    sys_id { value },
                    number { displayValue },
                    short_description { displayValue },
                    author { displayValue }
                    published { displayValue }
                }
            }
        }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
"""
    val graphQLService = sdkManager.getNowGraphQLService()

    //graphQLService?.graphQLRequest(kbArticlesQuery)?.execute()
can also be used
    graphQLService?.graphQLRequest(kbArticlesQuery)?.enqueue(
        { response ->
            response.body?.let {
                val resultString = String(it)
            }

        }, { nowDataError ->
            //handle error
        })
}
```

Using NowTableService to interact with ServiceNow tables

The NowTableService class provides methods to perform CRUD operations on the records in tables that reside on your ServiceNow instance. Through this interface you can directly access any of the records within any ServiceNow table for which the logged in user is authorized. *NowTableService* supports dot-walking for reference fields. For example, if a table contains a reference to the User table, the dot-walked value `user.name` returns the name of the user.

When returning the requested data, all applicable Access Control Lists (ACLs) are applied to the data, which may result in fewer results than expected, or authorization errors if the authenticated user does not have access rights to the specified table.

The following example shows how to import the *NowData* framework and then initialize a NowTableServce object that you can then use to interact with ServiceNow instance tables.

```
/**
 * Helper class used to handle different Now service instances.
 It has an application scope or is Singleton
 */
@Singleton
class SdkManager @Inject constructor() {

    private var nowTableService: NowTableService? = null

    /**
     * Create the NowTableService once in the lifetime of the
 application inside the Application class or another manager
 class
     * that will be injected into other classes via dagger/hilt.
     * NowTableService should be created after initializing the
 NowSDK
     */
    suspend fun getNowTableService(): NowTableService? {
        if (nowTableService != null) return nowTableService

        return
 NowDataSDK.makeTableService(URL("https://
instance-name.service-now.com")).getOrThrow()
            .also { this.nowTableService = it }
    }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 }

suspend fun loadCases() = withContext(Dispatchers.IO) {
    val tableService = sdkManager.getNowTableService()

    //configure what data to pass back
    val fetchConfiguration =
 FetchConfiguration(Filter("active=true"), 10)

    val response = runCatching {
        tableService?.records(
            "sn_customerservice_case",
            fetchConfiguration
        )?.execute()
    }

    if (response.isSuccess) {
        val resultString = response.getOrNull()?.body?.let
 { String(it) }
    } else {
        //handle unsuccessful result
    }
}
```

For additional code examples using the available *NowTableService* methods, refer to the NowTableService API documentation.

Configure return results data

Within the Mobile SDK, when interacting with data from a ServiceNow instance through a REST endpoint, you can configure what data is passed back in the return results.

You configure what data to pass back using the FetchConfiguration API. This interface enables you to configure:

- The specific records to return from a table.
- The specific fields to return from the records.
- The number of records to return.

Note: Generally you want to use the same FetchConfiguration for all of your CRUD operations for a certain model type as it determines which fields are returned. It should at least match the required properties on your model, or else JSON Decoding will fail.

Configuring the specific records to return

The Filter object within a *FetchConfiguration* call enables you to define the filter and sort requirements for the records that are fetched from a ServiceNow instance and passed back in the return results from a REST endpoint. This filter is passed in the *sysparm_query* parameter of the REST API endpoint. For additional information, see Table API.

You can initialize the *Filter* object in two different ways depending on the desired filtering capabilities:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Filter by criteria. This filter enables you to filter based on one or more filter criteria that are OR'd together.

   For example, a manager has an employee Abel Tuter who is on PTO. They want to know if there are active incidents that are not assigned to anyone or assigned to Abel Tuter so they can assign/reassign them. They also want to see in that same list, all of the incidents that have high or overdue escalation so that they can also address those. The following shows how to create the necessary filters to obtain this data:

```
val activeIncidents =
 BooleanSimpleCondition.conditionIs("active", true)
val assignedToEmpty =
 StringSimpleCondition.isEmpty("assigned_to")
val assignedToAbel =
 StringSimpleCondition.conditionIs("assigned_to", "Abel Tuter")

val assignedToAbelOrEmpty =
  CompoundCondition(
  ConditionUtils.CompoundOperator.OR,
  listOf(assignedToEmpty, assignedToAbel))

val needToReassign =
 Criteria().addConditions(listOf(activeIncidents,
  assignedToAbelOrEmpty))

val highEscelations =
 StringSimpleCondition.conditionIs("escalation", "2")
val overdueEscelations =
 StringSimpleCondition.conditionIs("escalation", "3")

val highOrOverdueEscelations =
  CompoundCondition(ConditionUtils.CompoundOperator.OR,
    listOf(highEscelations, overdueEscelations))

val needToHandleEscalation =
  Criteria().addCondition(highOrOverdueEscelations)

val myPrioritiesForTodayFilter = Filter(listOf(needToReassign,
  needToHandleEscalation))

// Get record using filter
val response = runCatching {
  getNowTableService()?.records(
    "sn_customerservice_case",
    FetchConfiguration(myPrioritiesForTodayFilter, 10)
  )?.execute()
}
```

   To use this type of filtering, use the Filter(criteriaList: List<Criteria>, sortBy: List<Sort>? = null) function.

2. Filter by keywords and conditions. This filter enables you to filter records based on specific keywords and conditions that can be AND'd or OR'd together.

   For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
val keywords = "iOS 13 | iOS 14"
val conditionA = BooleanSimpleCondition.conditionIs(testField,
 true)
val conditionB = BooleanSimpleCondition.conditionIs(testField2,
 false)
val sortA = Sort(testField,
 ConditionUtils.SortOperator.ORDER_ASC)
val filter = Filter(conditions = listOf(conditionA,
 conditionB), keywords = keywords, sortBy = listOf(sortA))
assertEquals(filter.query().second,
 "${conditionA.makeConditionQuery()}^${conditionB.makeCondition
Query()}^123TEXTQUERY321=$keywords^EQ^${sortA.makeSortQuery()
}")
```

To use this type of filtering, use the Filter - Filter(conditions: List<Condition>, keywords: String? = null, sortBy: List<Sort>? = null) function.

Configuring the specific fields to return

The FieldReadConfiguration object within the *`FetchConfiguration()`* method call allows you to configure what fields to pass back in the return results. In addition, you can configure the format/content of the returned fields as:

- display values
- actual values
- exclude reference links

Configure field write options

Within the Mobile SDK, when writing data to a ServiceNow instance through a REST endpoint, you can define field write options.

You configure field write options using the FieldWriteOptions API. This interface enables you to configure:

- Whether to suppress automatic generation of system fields.
- Whether to set field values using their display value display value rather than their actual value.

Paginate return results record sets

Within the Mobile SDK, when interacting with data from a ServiceNow instance through a REST endpoint using the *`NowTableService`*, you can create a Paginator object that enables you to iterate over the records in the return results.

You typically use paginated return results to provide infinite scroll capabilities for table records or to simplify page iteration of results in general.

The *`NowTableService`* class provides a method for creating a Paginator object that contains the return results from a REST endpoint call:

NowTableService - paginator(tableName: String, configuration: FetchConfiguration)

This method creates a Paginator object that contains the specified records from the specified table in raw data format. If you do not include the FetchConfiguration object in the call, it contains all records and their associated fields in the return results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The returned Paginator object provides the following methods that enable you to page through the returned records. You must first call the *observe()* function to set the Paginator's callback.

- *first()*
- *hasNext()*
- *hasPrevious*
- *isBusy*
- *last()*
- *next()*
- *observe()*
- *previous()*
- *reset()*

Note: Some *Paginator* methods may throw an exception, such as when there are no more pages to fetch.

The following code example shows how to paginate through data.

```
// Configure what data to pass back
val fetchConfiguration =
 FetchConfiguration(Filter("active=true"), 10)

val paginator = getNowTableService()?.paginator(
  "sn_customerservice_case", fetchConfiguration)
  ?.observe(object : PaginatorCallBack<ByteArray> {
    override fun onSuccess(response: Response<List<ByteArray>>)
 {
      val byteArray = response.rawBody ?: throw Exception("Null
 Result")
      val responseString = String(byteArray)
    }

    override fun onFailure(e: NowDataError) {
      // Handle error
    }
  })

// Use paginator operators to navigate. Example
while (paginator.hasNext() && !paginator.isBusy()) {
  paginator.next()
}
```

Configure tables to work with guests

If you want guest users to be able to interact with data within a table on your ServiceNow instance, you must configure the table to be guest accessible.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a Public Pages (sys_public) record for the table that you want to enable public access for.

   a. In the **All** tab search bar, enter `sys_public.do`.

   b. In the **Page** field, enter the name of the table for which to add public access.

   a. Select **Submit.**

2. Ensure the public role is enabled for the table.

   a. Navigate to the table for which you want to allow guest (public) access, **All → System Definition → Tables**, select the table.

   b. Select the **Controls** tab.

   c. Under the **Security Rules (ACLs)** section, ensure **Create access controls** is selected and that **User role** contains `public`, if not, add them.

3. Create the public ACL for each of the CRUD operations that you want to enable guest access for.
   There must already be ACLs specified for each of the CRUD operations for which you are adding public access. If not, you need to create these ACLs also. To do this, follow the instructions below, but don't add the "*" in the second part of the **Name** field and don't add the public role to the required roles.

   a. Select the **Access Controls** tab.

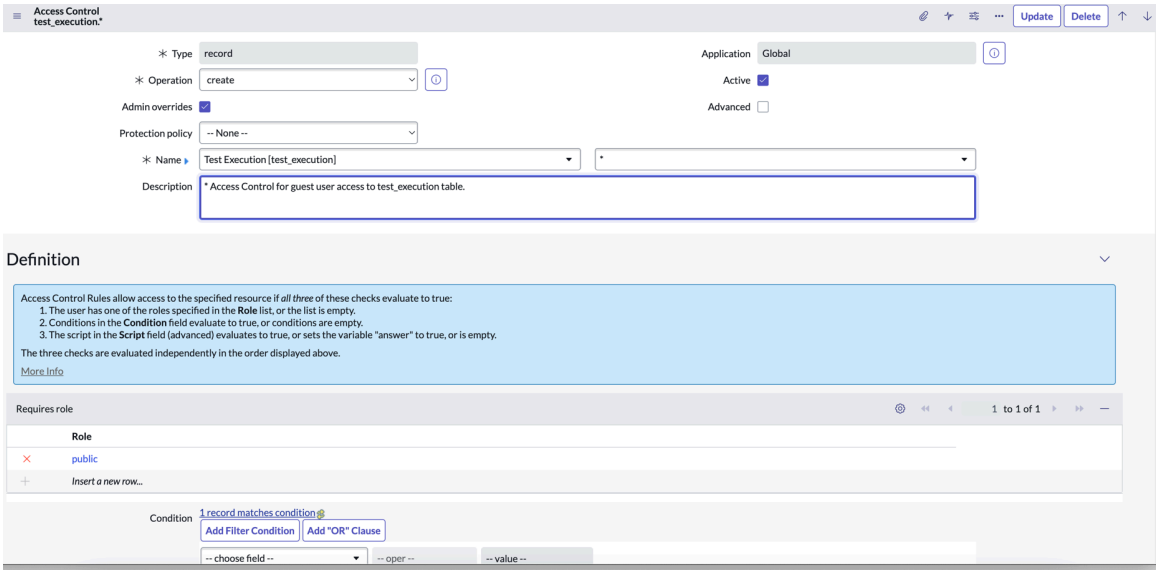
   b. Select **New**.

   c. Enter the following values:

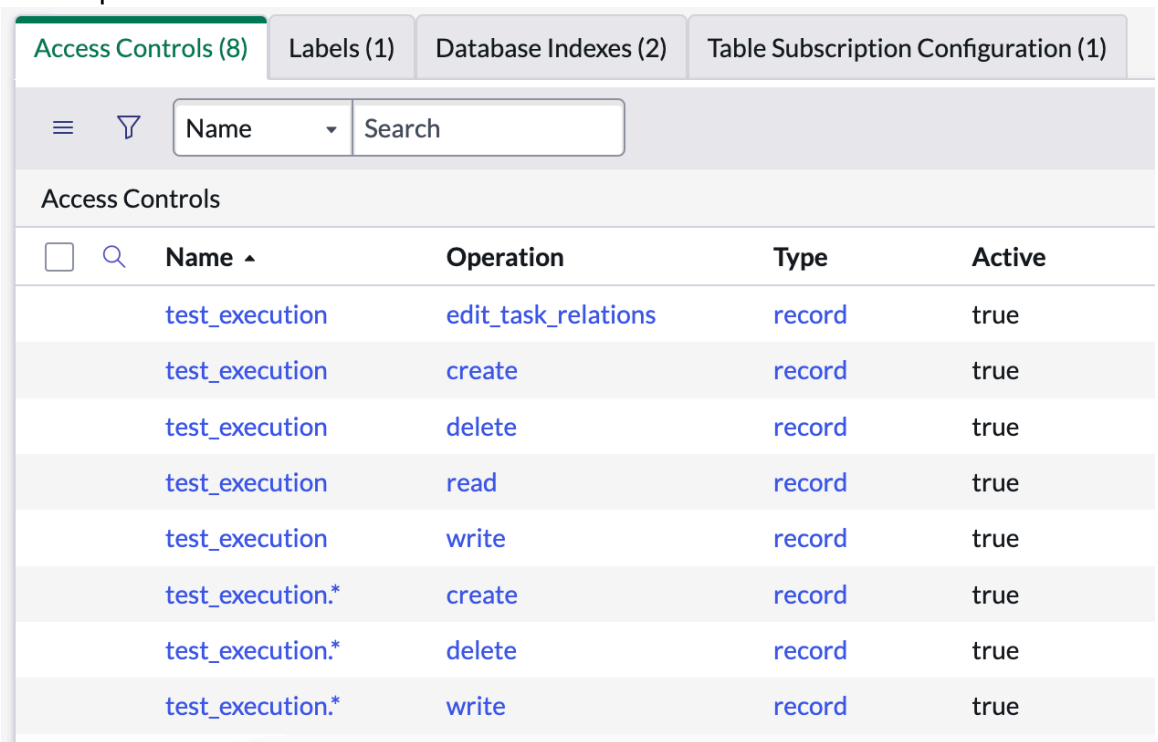
Field	Value
Type	record
Application	Global
Operation	<Operation for which you want to allow guest access, such as read or write>
Name (first part)	<Name of the table that you want to provide guest access for>
Name (second part)	*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In **Requires role**, insert a new row and select the `public` role.



4. Select **Submit** to save your changes.
When complete, there should be two ACLs for each guest user (public) CRUD operation. One with a ".*" at the end of the table name and one without.



Interact with the public REST API on a ServiceNow instance

The Mobile SDK provides functionality that enables Android applications to call the public REST API on a ServiceNow instance.

Using the NowAPIService API you can interact with any of the base ServiceNow public REST APIs, or create custom REST APIs within the instance and call those from your Android application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before making a call to a ServiceNow REST API, you must call themakeNowAPIService() method to create an instance of the service. The service instance is returned in the callback if successful otherwise, an error is thrown.

The following shows how to initialize a NowAPIService object:

```
/**
 * Helper class used to handle different Now service instances.
 It has an application scope or is Singleton
 */
@Singleton
class SdkManager @Inject constructor() {

    private var nowApiService: NowAPIService? = null

    /**
     * Create the NowAPIService once in the lifetime of the
 application inside the Application class or another manager
 class
     * that will be injected into other classes via dagger/hilt.
     * NowAPIService should be created after initializing the
 NowSDK
     */
    suspend fun getNowApiService(): NowAPIService? {
        if (nowApiService != null) return nowApiService

        return
 NowDataSDK.makeAPIService(URL("https://
instance-name.service-now.com")).getOrThrow()
            .also { this.nowApiService = it }
    }

}
```

Once the NowAPIService object is initialized, use the NowAPIService data() method to specify the REST endpoint to call and all of its associated parameters:

```
 suspend fun makeNowApiCall() {
  val apiService = sdkManager.getNowApiService()

  val apiPath = "api/now/table/sn_customerservice_case"
  val endpoint = NowAPIService.Endpoint(HttpMethod.GET, apiPath,
 true)
  val fieldNames =
 "sys_id,number,short_description,number,priority,state," +

 "opened_at,account.name,account.number,contact.name,contact.ema
il," +
    "contact_type,assignment_group.name,assigned_to.name"

  val queryParamsMap = mapOf("sysparm_fields" to fieldNames,
 "sysparm_limit" to "10")

  val queryParams =
 QueryParams.Builder().addAll(queryParamsMap).build()

  val response = runCatching {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    apiService?.data(endpoint = endpoint, queryParams =
 queryParams)?.execute()
  }

  if (response.isSuccess) {
    val resultString = response.getOrNull()?.body?.let
 { String(it) }
  } else {
    // Handle error
  }
}
```

Retrieve attachments and attachment metadata

The *NowAttachmentService* API enables you to perform CRUD operations on attachments and retrieve attachment metadata from your ServiceNow instance.

Note: The *NowAttachment* API works for guest users in the base ServiceNow system.

Using this API you can:

- Upload attachments to your ServiceNow instance and associated them to a specific record.
- Download one or more attachments.
- Delete attachments.
- Validate an attachment by comparing the computed hash of the attachment to the expected hash.
- Download attachment metadata. This metadata is generated by your ServiceNow instance when an attachment is uploaded.

For additional information on working with attachments, see Attachment API.

The following shows how to instantiate the NowAttachmentService:

```
/**
 * Helper class used to handle different Now service instances.
 * It has an application scope or is a Singleton.
 */
@Singleton
class SdkManager @Inject constructor() {

    private var nowAttachmentService: NowAttachmentService? =
 null

    /**
     * Create the NowAttachmentService once in the lifetime of
 the application
     * inside the Application class or another manager class
     * that will be injected into other classes via dagger/hilt.
     * NowAttachmentService should be created after initializing
 the NowSDK
     */
    suspend fun getNowAttachmentService(): NowAttachmentService?
 {
        if (nowAttachmentService != null) return
 nowAttachmentService
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        return
 NowDataSDK.makeAttachmentService(URL("https://
instance-name.service-now.com"))
            .getOrThrow()
            .also { this.nowAttachmentService = it }
    }
}
```

The following shows how to obtain a Call object that fetches metadata for a particular attachments. It creates an executable object that is able to perform the specified request and return `Response<NowAttachmentMetadata>`.

```
suspend fun fetchMetadata(sysId: String) {
    val response = runCatching {

 sdkManager.getNowAttachmentService()?.attachmentMetadata(sysId)
?.execute()
    }

    if (response.isSuccess) {
        val nowAttachmentMetadata = response.getOrNull()?.body
    } else {
        Log.e("NowSDK", "result not successful")
    }
}
```

The following shows how to obtain a Call object that fetches metadata for multiple attachments. It creates an executable object that is able to perform the specified request and return `Response< List<NowAttachmentMetadata>>`.

```
suspend fun fetchMultipleMetadata() {
    val filterQuery = "content_type=text/plain"
    val limit = 5

    val response = runCatching {

 sdkManager.getNowAttachmentService()?.attachmentMetadata(Filter
(filterQuery), limit)?.execute()
    }

    if (response.isSuccess) {
        val attachmentMetadataList = response.getOrNull()?.body
    } else {
        Log.e("NowSDK", "result not successful")
    }
}
```

Attachment metadata pagination

You can use the *`NowAttachmentService`* methods to download attachment metadata for one or more attachments. When downloading metadata from multiple attachments, you may want to use the NowAttachmentService - attachmentMetadataPaginator(filter: Filter? = null, limit: Int? = null) method, which returns a Paginator object that enables you to easily iterate over the potentially large amount of data that is returned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can then iterate through the returned metadata using Paginator methods and receiving the response in the *observe()* callback.

```
 suspend fun createAttachmentMetadataPaginator() {
  val filterQuery: String = "content_type=text/plain"
  val filter = filterQuery.let(::Filter)
  val limit = 10

  val paginator =
 sdkmanager.getNowAttachmentService()?.attachmentMetadataPaginat
or(filter, limit)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        // Handle response
      }

      override fun onFailure(e: NowDataError) {
        // Handle error
      }

    })
    ?: throw Exception("Response is null")

  // Use paginator operators to navigate. Example
  while (paginator.hasNext() && !paginator.isBusy()) {
    paginator.next()
  }
}
```

The returned Paginator object provides the following methods that enable you to page through the returned records. You must first call the *observe()* function to set the Paginator's callback.

- *first()*
- *hasNext()*
- *hasPrevious*
- *isBusy*
- *last()*
- *next()*
- *observe()*
- *previous()*
- *reset()*

Note: Some *Paginator* methods may throw an exception, such as when there are no more pages to fetch.

Display web pages hosted on your ServiceNow instance

You can display web pages hosted within your ServiceNow instance in your native Android application.

The Mobile SDK provides seamless handling of the required authentication and session management, while the NowWebSDK API provides the functionality required to handle pages

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

residing on your ServiceNow instance. These web pages have all the dynamic interactions that are possible on the ServiceNow platform.

To use these features, you must first create an instance of the *NowWebService*. To do this, you must call the makeWebService() method and provide the URL to your ServiceNow instance and an already initialized NowSDK. In addition, you must have imported NowWeb within your application. You should hold a reference to the *NowWebService* for as long as you're using the NowWeb service.

The following shows an example of how to create a NowWebService object:

```
/**
 * Helper class used to handle different Now service instances.
 */
@Singleton
class SdkManager @Inject constructor() {

    private var nowWebService: NowWebService? = null

    /**
     * Create the NowWebService once in the lifetime of the
 application inside the Application class or
     * another manager class that will be injected into other
 classes via dagger/hilt.
     * NowWebService should be created after initializing the
 NowSDK
     */
    suspend fun getNowWebService(): NowWebService? {
        if (nowWebService != null) return nowWebService

        return
 NowWebSDK.makeWebService(URL("https://
instance-name.service-now.com")).getOrThrow()
            .also { this.nowWebService = it }
    }
}
```

Pre-load pages to improve NowWeb load time

You can pre-load pages with cacheable resources in the background to improve initial *NowWeb* load times. The following example shows how to use the *webService.preloadWebCache()* function to pre-load the `mesp` page. This method takes a list of URIs to pre-fetch more pages.

```
suspend fun preloadNowWeb() {
  val webService = sdkmanager.getNowWebService()
  webService.preloadWebCache(listOf(URI("mesp")))
}
```

Create views to display web content

After you've instantiated an instance of *NowWebService*, you can use it to launch an activity to display web pages hosted on your ServiceNow instance.

The following example shows how to launch a NowWeb activity:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//Activity that will start the NowWeb
class MainActivity : AppCompatActivity() {

  @Inject
  lateinit var sdkManager: SdkManager

  override fun onCreate(savedInstanceState: Bundle?) {
    super.onCreate(savedInstanceState)

    // Start NowWeb
    lifecycleScope.launch {
      sdkManager.getNowWebService()?.launch(this@MainActivity,
 URL("https://instance-name.service-now.com"), object :
 NowWebTheme{})
    }
  }
}
```

In this example, *url* is the URL of the initial page to load within the view. This URL must point to a page that is hosted on the specified ServiceNow instance.

Color theme support for NowWeb UI elements

You can specify a custom color theme that applies to all UI elements within a view when calling the NowWebService *launch()* method. To create this custom color theme, create a type that implements the *NowWebTheme* interface and pass it in the theme parameter of the *NowWebService.launch()* call.

```
suspend fun launchNowWeb() {
    val webService = getNowWebService()

    val webTheme = object : NowWebTheme {
        override val brand: Int
            get() = Color.BLUE

        override val textPrimary: Int
            get() = Color.BLACK

        //Override remaining theme colors
    }
    webService?.launch(activity,
 URL("https://instance-name.service-now.com"), webTheme)
}
```

For additional information on applying color themes within a web view, see Use NowUIColoring to theme NowWebTheme and NowChatTheme.

Configure push notifications

Push notifications enable the sending of unsolicited messages (notifications) from a ServiceNow instance to a specific registered user and an application that leverages the ServiceNow Mobile SDK framework.

You must set up push notifications on both your ServiceNow instance and within the application that will receive the notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For the current release, only the Virtual Agent service supports the receipt of push notifications.

Setting up push notifications on your ServiceNow instance

For each Mobile SDK application that incorporates the Virtual Agent service and leverages push notifications, you must complete the following configuration process on your ServiceNow instance.

- Retrieve the Firebase push server key.
- Add a push application record in the Push Application [sys_push_application] table.
- Add a push notification message content record in the Push Notification Message Content [sys_push_notif_msg_content] table.
- Add a default push registration.
- Add a push notification message in the Push Notification Message [sys_push_notif_msg] table.
- Modify the push notification record in the Notification [sysevent_email_action] table.

Retrieve the Firebase push server key

You must retrieve your unique Google Firebase push server key from your Firebase account so that you can associate it to your Mobile SDK applications that leverage push notifications.

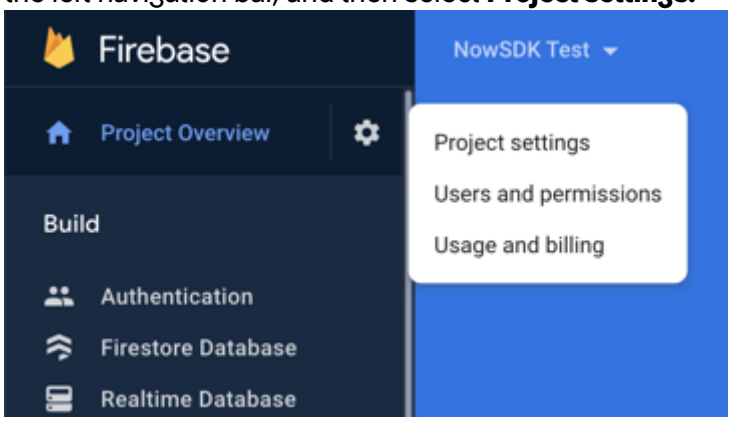
Before you begin

Role required: admin

You must already have a Firebase account set up. For information on how to create a Firebase account and download the corresponding SDK, refer to the Google Firebase website.

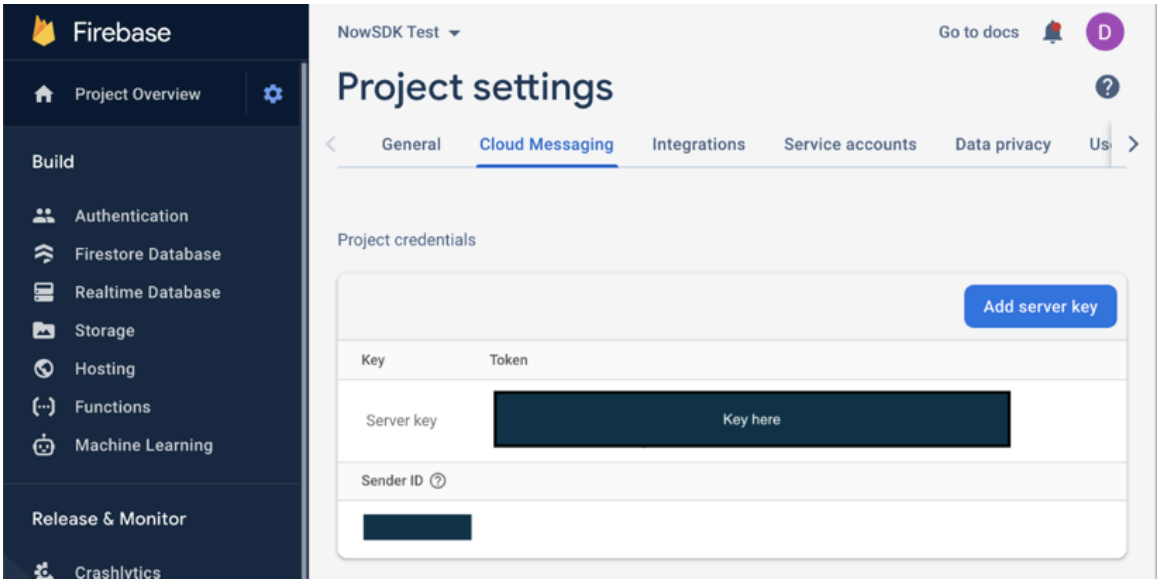
Procedure

1. From your Firebase account, select the configuration gear next to the **Project Overview** link on the left navigation bar, and then select **Project settings.**



2. From the Project settings page, select the **Cloud Messaging** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select and copy the Server key token.

> **Note:** For security purposes, this key has been blocked from view in the screen shot above; covered with "Key here".

Add a push application record

You must enter your Google Firebase Cloud Messaging server key in your push application record to use push notifications in a Mobile SDK application that leverages Virtual Agent and push notifications.

Before you begin

Role required: admin
This record is stored in the Push Application [sys_push_application] table.

Procedure

1. Navigate to **System Notification** > **Push** > **Push Application**.
2. Select **New** to add a new record.
3. In the **Display Name** and **Name** fields, enter the name of your application.
4. In the **Push** field, change the value from **REST API** to **Direct**.
5. In the **Google** tab, paste your Google Firebase server key in the **API Key** field.
6. Select **Submit**.

Add a default push registration

Register the push notification so that all users of your application receive the push notifications by default.

Before you begin

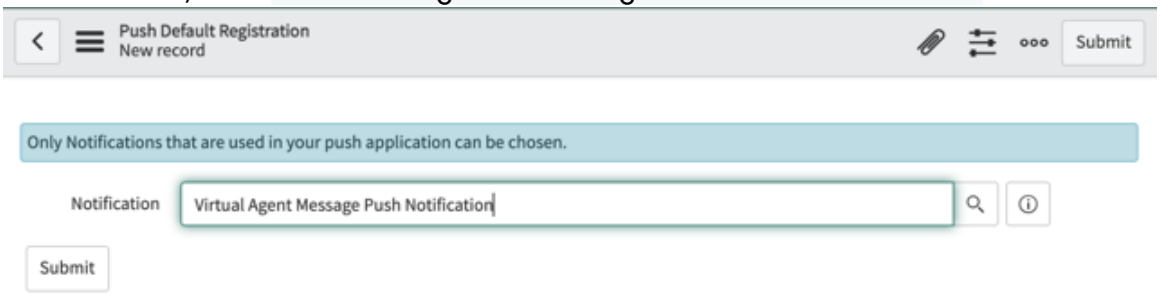
Role required: admin

Procedure

1. Navigate to **System Notification** > **Push** > **Push Application**.
2. Locate and open the push notification that you created earlier.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the related list, select the **Push Default Registrations** tab, then select **New**.
4. In **Notification**, enter `Virtual Agent Message Push Notification`.



5. Select **Submit**.

Add a push notification message content record

The push notification message content record contains the location users are directed to when they tap on a notification, as well as the appearance and layout of the notification.

Before you begin

Role required: admin

Complete the Push Notification Message Content form to:

- Name the notification.
- Select the mobile application to which the notification is sent.
- Optionally, customize the appearance of the notification message.

This information is saved in the Push Notification Message Contents [sys_push_notif_msg_content] table.

Procedure

1. Navigate to **System Notification** > **Push** > **Push Message Content**.
2. Select **New**.
3. In the Push Message Content form, fill in the following fields:

Push Notification Message Content form

Field	Description
Name	Descriptive name of the push message content record. **Note:** This name is not visible in the notification, it is only a reference for use during configuration.
Push app	Mobile application to send the notification to. This is the application that you added in "Add a push application record".
Push Message Generation	Script block that contains the notification link. To implement push notifications in a Mobile SDK Virtual Agent application, use the following script: `(function buildJSON(/*GlideRecord*/ current, /*String*/ message, /*Object*/ attributes) {`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	``
	var json = {
	  "aps": {
	  "alert": {
	  "title": current.push_title,
	  "body":
	sn_cs.VASystemObject.getTextValueForMessage(curren
	t.message_id)
	  },
	  "sound": "default",
	  "thread-id": "launch_virtual_agent"
	  },
	  "type": "launch_virtual_agent"
	};
	
	return json;
	
	})(current, message, attributes);
	``

4. Select **Submit**.

Add a push notification message

Configure the message displayed to users when they receive their push notification.

Before you begin

Role required: admin

Procedure

1. Navigate to **System Notification** > **Push** > **Push Messages**.
2. Select **New**.
3. In the Push Message form, fill in the following fields:

Push Message form

Field	Description
Name	Descriptive name for the push notification message record. **Note:** This name is not visible in the notification, it is only a reference for use during configuration.
Push app	Mobile application to which you want to send the notification. This is the application that you added in "Add a push application record".
Push message	Push notification message content record created in "Add a push notification message content record".
Table	Table the message originates from. Select `Push Notification [sys_cs_message_notification]`.

4. Select **Submit** to create the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Modify the push notification

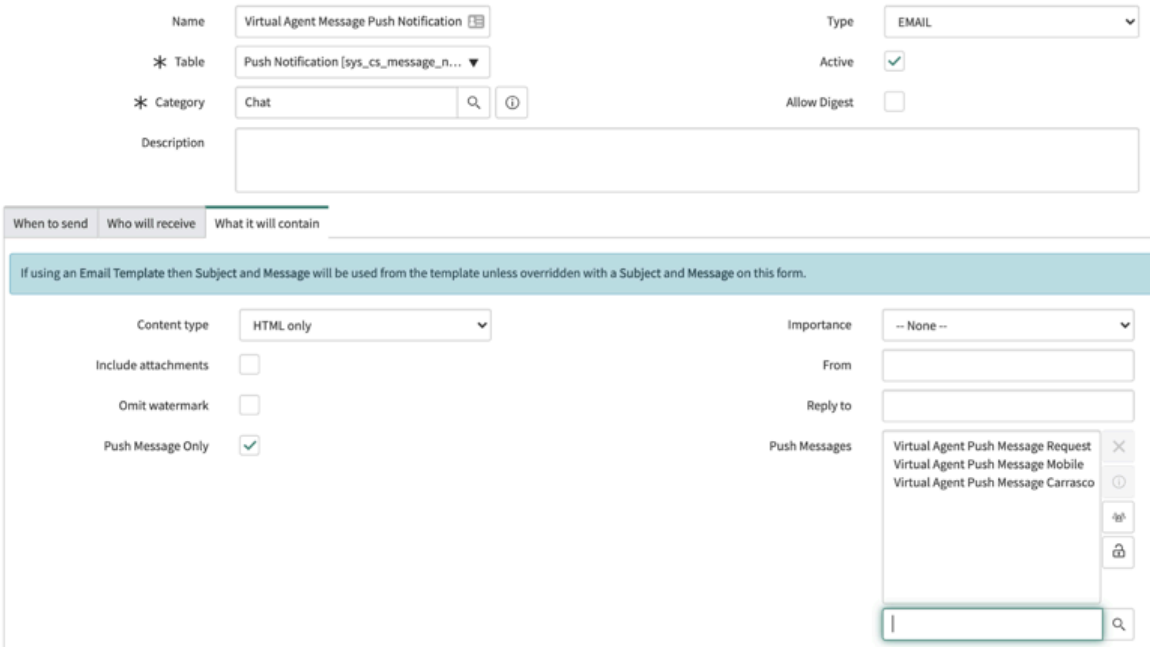
Modify the Virtual Agent Message Push Notification record to include your application. This record is used to trigger notifications to the Virtual Agent. All applications that will push notifications to the Virtual Agent must be configured in this record.

Before you begin

Role required: admin

Procedure

1. Navigate to **System Notification** > **Push** > **Push Notifications**.
2. Locate and open the push notification "Virtual Agent Message Push Notification".
   Ensure that the layout is set to the Advanced view. If not, switch to the Advanced view by selecting the associated link under **Related Links**.
3. Select the **What it will contain** tab.
4. In **Push Messages**, add the name of the push message record created in "Add a push notification message".



5. Select **Update**.

Setting up push notifications in your Android application

In addition to the tasks that you must perform on your ServiceNow® instance to configure a push notification, you must also include specific code in your Android application.

Create the NowSDK NowPushService

One of the first things that needs to be done in your application is to retrieve the NowSDK *`NowPushService`*. Add code similar to the following snippet early within your main code body.

```
/**
 * Helper class used to handle different Now service instances.
 */
@Singleton
class SdkManager @Inject constructor() {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    private var nowPushService: NowPushService? = null

    /**
     * Create the NowPushService once in the lifetime of the
 application inside the Application
     * class or another manager class that will be injected into
 other classes via dagger/hilt.
     * NowPushService should be created after initializing the
 NowSDK
     */
    suspend fun getNowPushService(): NowPushService? {
        if (nowPushService != null) return nowPushService

        return
 NowPushSDK.makePushService(URL("https://
instance-name.service-now.com")).getOrThrow()
            .also { this.nowPushService = it }
    }
}
```

For additional information on the *NowPushSDK.makePushService()* method, refer to NowPushSDK - makePushService(instanceURL: URL).

Register the push token

Google Firebase provides a unique push token that identifies the device and application to receive push notifications. In order for an application to receive push notification, you must register this token using the *NowPushService*. Add a function similar to the following code snippet in your Android application. Ensure that you change *PushAppName* to the name of your Android application. This application must be registered with your ServiceNow® instance.

```
FirebaseMessaging.getInstance().token.addOnCompleteListener
 {task ->
  val token = task.result

  if (!task.isSuccessfull || token == null) {
    throw Exception("Unable to fetch token"))
  }

  pushService.registerPushToken(token, "PushAppName", {
      Log.v(TAF, "Successfully registered push token")
  }, { e ->
      Log.e(TAG, "Error registrating push", e)
  })
}
```

For additional information on the *registerPushToken()* method, refer to NowPushService - registerPushToken(pushToken: String, pushApp: String, successCallback: Runnable, errorCallback: Consumer<Throwable>).

Unregister the push token

You need to unregister the push token whenever the user exits your application, such as when the user logs out. Use code similar to the following code snippet to unregister the push token. Ensure that you change *PushAppName* to the name of your Android application.

```
pushService.unregisterPushToken(token, "PushAppName", {
      Log.v(TAG, "Successfully unregistered push token")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
}, { e ->
      Log.e(TAG, "Error unregistering push", e)
})
```

For additional information on the *unregisterPushToken()* method, refer to NowPushService - unregisterPushToken(pushToken: String, pushApp: String, successCallback: Runnable, errorCallback: Consumer<Throwable>).

Implement the FirebaseMessagingService

You must implement the FirebaseMessagingService within your application. To setup and implement this service, follow the instructions in the Android Firebase documentation.

Once setup, override the *onMessageReceived()* method and pass the *RemoteMessage* through to the NowPushService. If the NowPushService recognizes the notification, it will process it and return the notification object for the application to handle. Currently, the only implemented notification is NowPushVirtualAgent. An unknown notification returns a NotSupportedPushError object.

```
//Custom coroutineScope created in the Firebase service class
private val serviceCoroutineScope =
 CoroutineScope(Dispatchers.IO)

override fun onMessageReceived(remoteMessage: RemoteMessage) {
  serviceCoroutineScope.launch {
    val result = handleNowPush(remoteMessage)

    if (result.isSuccess) {
      when (val push = result.getOrNull()) {
        is NowPushVirtualAgent -> handleVirtualAgentPush(push)
      }
    } else {
      // Not a NowPush. Handle host app push notification
 message here
    }
  }
}

private suspend fun handleNowPush(remoteMessage: RemoteMessage):
 Result<NowPushPayload> {
  val nowPushService = sdkManager.getNowPushService()

  return suspendCoroutine { cont ->
    nowPushService?.handlePush(remoteMessage,
      { cont.resume(Result.success(it)) },
 { cont.resumeWithException(it) })
  }
}
```

For additional information on the *handlePush()* method, refer to NowPushService - handlePush(remoteMessage: RemoteMessage, successCallback: Consumer<NowPushPayload>, errorCallback: Consumer<Throwable>).

In addition, you must override *onNewToken(token: String)*. Be sure to pass the token through to the *pushService.registerPushToken()*, similar to what was done in the "Register the push token" section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use NowUIColoring to theme NowWebTheme and NowChatTheme

The *NowUIColoring* interface contains all the colors used by all NowSDK modules.

For scenarios where you use similar color variables across multiple SDK modules, you can implement the *NowUIColoring* interface. Using this interface you can override color values and then use that implementation to override the nowUIColoring values inside the theme classes NowWebTheme and NowChatTheme. If color variables aren't overridden, the *NowUIColoring* interface uses the default colors.

The following code example shows how to override colors for both a web UI and a chat UI.

```
// Implement the NowUIColoring and override desired color
 variables
val nowUIColoringImpl = object : NowUIColoring {
    override val brand: Int
        get() = Color.BLUE

    override val textPrimary: Int
        get() = Color.WHITE

    //override the rest of color variables

}

// Override the nowUIColoring for NowWeb value using the
 NowUIColoring implementation
lifecycleScope.launch {
    sdkManager.getNowWebService()?.launch(activity,
 URL("https://instance-name.service-now.com"), object :
 NowWebTheme {
        override val nowUIColoring: NowUIColoring
            get() = nowUIColoringImpl
    })
}

//Override the nowUIColoring for NowChat value using the
 NowUIColoring implementation
lifecycleScope.launch {
    sdkManager.getNowChatService()?.start(activity, object :
 NowChatTheme {
        override val nowUIColoring: NowUIColoring
            get() = nowUIColoringImpl
    })
}
```

Dark theme support

To support a dark theme in NowChat, you can either provide your own dark theme implementation of the NowChatTheme and use that in the *NowChatService.start()* and *NowChatService.updateTheme()* functions. Or you can use a NowChatThemeDark class that implements the NowChatTheme interface with default dark theme colors. You can also use this class as a base for your custom dark theme implementation.

```
val chatService = serviceManager.getNowChatService()

val chatThemeLight = object : NowChatTheme {
    override val backgroundPrimary: Int
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        get() = Color.WHITE

    override val textPrimary: Int
        get() = Color.BLACK

    // Override remaining theme colors
}

//create dark theme using the NowChatThemeDark class
val chatThemeDark = object : NowChatThemeDark(){
    override val backgroundPrimary: Int
        get() = Color.BLACK

    override val textPrimary: Int
        get() = Color.WHITE

    // Override remaining theme colors
}

//start NowChat with light theme
chatService?.start(activity, chatThemeLight)

//update NowChat theme to dark theme
chatService?.updateTheme(chatThemeDark)
```

Mobile SDK Developer Guide - iOS

The ServiceNow Mobile SDK enables you to leverage the functionality and resources of the ServiceNow platform within your standalone mobile iOS applications.

Using the Mobile SDK, you can perform the following within your applications:

- Access data on your ServiceNow instance through its public REST APIs or custom scripted REST APIs that you develop.
- Embed and enable Virtual Agent within your application interface.
- Gather and track custom analytics events for analysis.
- Attach documents (attachments) to a record within your ServiceNow instance.
- Load web pages hosted on your ServiceNow instance in a native web view or Cabrillo.
- Provide simple authentication flows using JSON Web Tokens for third-party applications to authenticate users.

The Mobile SDK provides a sample app that includes code examples for integration with different Mobile SDK modules. In the 2.1 release and later, the Engagement Messenger is included in the sample app. To learn more about the Engagement Messenger, see https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB1587276.

NowSDK architecture

The NowSDK is the top-level entity of the Mobile SDK class framework.

It contains numerous classes, structures, protocols, type aliases, and functions that enable you to leverage the significant capabilities provided by the Mobile SDK and your ServiceNow

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

instance. This document focuses on describing the primary feature services exposed in the Mobile SDK that enable you to interact with your ServiceNow instance.

To use any of the feature services provided by the Mobile SDK, you must integrate the NowSDK library into your code. You must call the core library to configure and initialize the SDK before using any SDK functionality.

NowSDK provides the following capabilities:

- SDK initialization and settings retrieval and configuration.
- Seamless authorization and user session handling.
- Logging interface. The NowSDK provides logging services to all feature services. By default, log messages are written to system logs using platform-specific functionality. You can control the logging threshold through a parameter that is part of the call to configure the SDK. There's also an option to suppress all log messages generated by the SDK and its feature services (`log level = none`). If you already have your own logging solution in place, the Mobile SDK allows you to use it.
- Build and release infrastructure.

NowSDK provides the following feature services and associated APIs:

- NowData

  Enables third party applications to access the public REST APIs exposed by your ServiceNow instance. Development is streamlined because NowData utilizes the authentication and session handling features provided by the NowSDK.

  - Primary APIs:
    - NowAPIService: This API provides functionality that enables you to interact with the publicly exposed REST APIs on your ServiceNow instance.
    - NowAttachmentService: This API provides functionality to upload and query file attachments on your ServiceNow instance within your iOS application.
    - NowGraphQLService: This API provides functionality that enables you to use GraphQL queries to obtain data from tables within your ServiceNow instance using the ServiceNow REST *`GraphQL API`*.
    - NowTableService: This API provides functionality that enables you to perform create, read, update, and delete (CRUD) operations on existing tables in your ServiceNow instance that are serviced through the ServiceNow REST *`Table API`*.
- NowAnalytics

  Enables you to gather and track usage analytics within your mobile applications.

  - Primary APIs:
    - NowAnalyticsService: This API provides functionality to gather user analytics data and store it within the ServiceNow platform for later analysis and tracking.
- NowChat

  Enables you to embed a native Virtual Agent chat window in your applications. This service includes UI/UX features.

  - Primary APIs:
    - NowChatService: This API provides Virtual Agent and Live Agent chat capabilities to your iOS applications. Leverage the full-service chat capabilities provided by the ServiceNow platform by simply implementing NowChatService within your application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- NowPush

  Enables you to send unsolicited messages to your applications that leverage the NowChat/Virtual Agent functionality.

  - Primary APIs:
    - NowPushPayload: This is a generic protocol that you can use to define a push notification protocol within the NowSDK framework.
    - NowPushService: This API provides functions that enable interaction with the Push Notification service.
- NowWeb

  Enables you to load web pages hosted on your ServiceNow instance in a native web view, with support for Cabrillo. It automatically handles user authentication and session management instead of forcing users to log in to the instance via a login web page.

  - Primary APIs:
    - NowWebService: This API provides functionality that enables the browsing of web pages on your ServiceNow instance.

Get started with Mobile SDK - iOS

You must complete the tasks outlined in this section to prepare your development environment to support writing iOS applications that integrate with the ServiceNow Mobile SDK.

- Download and install the ServiceNow Mobile SDK libraries. For detailed instructions, see Download and install the Mobile SDK libraries.
- Install and configure the Mobile SDK scoped application. For detailed instructions, see Install and configure the Mobile SDK scoped application.
- Configure your project. For more information, see Configure your project.
- Activate and configure the Mobile SDK on your ServiceNow instance. For details, see Configure certificate and create an OAuth Entity.
- Configure guest users. For details, see Configure guest user access.

After all of these tasks are completed, you can then start creating mobile applications that leverage the significant resources on your ServiceNow instance.

Download and install the Mobile SDK libraries

Before you are able to create mobile applications that interact with your ServiceNow instance, you must first download and install the ServiceNow Mobile SDK libraries.

Before you begin

Role required: none

Before you start the download and installation process, ensure that your development environment meets the following minimum requirements:

- ServiceNow instance must be Washington DC or later.
- iOS version must be 16.0 or later.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In your development environment, create a folder alongside the rest of your application code in which to download the Mobile SDK iOS library.

   It is a good practice to create a folder named `vendor` in the root of your project's location on the file system and download the unzipped Mobile SDK folder into that folder. It is also a good practice to check the SDK contents into your repository. This allows for a portable codebase and makes any accidental change to the SDK highly visible.

2. Download the Mobile SDK iOS library, called NowKit from the ServiceNow Store.
   You can find the iOS libraries in the following locations:
   - Mobile SDK: https://store.servicenow.com/sn_appstore_store.do#!/store/application/52821846803120101040fe43e5b9ee8c
   - iOS library: https://store.servicenow.com/sn_appstore_store.do#!/store/application/1539a1f087ea3014970e2178cebb3564

   For details on installing applications on your instance, see Administering applications.
3. Navigate to the packaged_sdk folder and unzip the `NowKit.zip` file which contains the NowSDK libraries.

   Note: It is important not to edit any ServiceNow Mobile SDK files or file structure. If you are experiencing issues with the SDK, open a support issue through your standard ServiceNow support process.

Install and configure the Mobile SDK scoped application

Before writing any application that leverages the Mobile SDK, you must install and configure the Mobile SDK scoped application.

Before you begin
Role required: admin

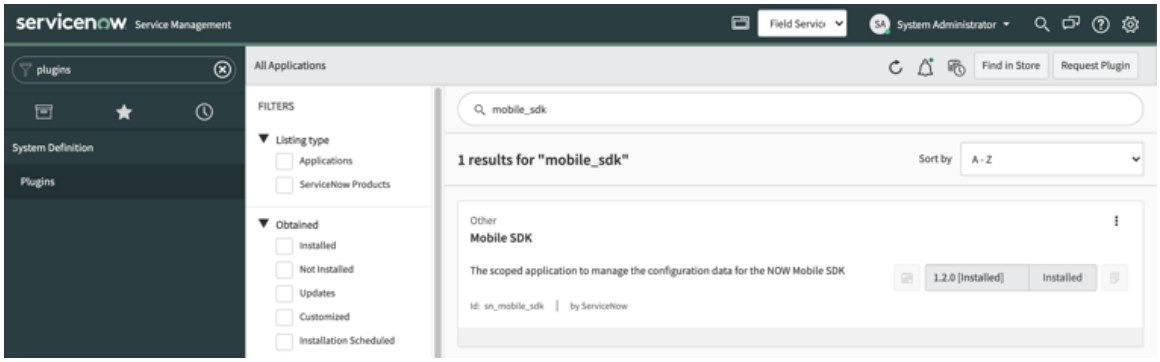
Procedure

1. Navigate to the Mobile SDK page on the ServiceNow Store web site.
   For details, see Install a ServiceNow Store application.
2. Select **Request Install** to download the Mobile SDK scoped application onto your ServiceNow instance.
3. Verify that the Mobile SDK scoped application was properly installed on your ServiceNow instance.

   a. Open the plugin's form: `System Definition` > `Plugins`.

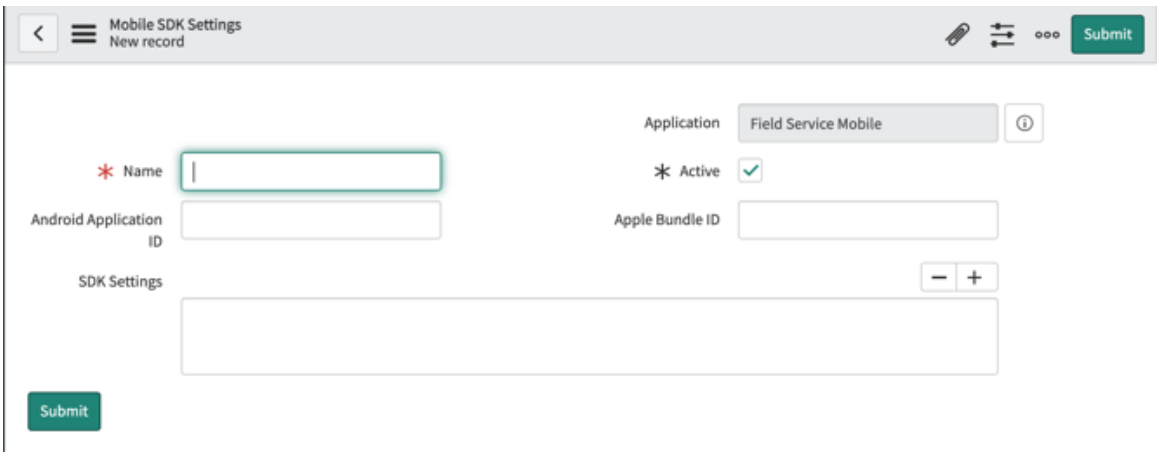
   b. In the search field, enter `mobile_sdk`.
   A screen similar to the following should appear:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Verify that the plugin **Id** is `sn_mobile_sdk` and that the version is the latest.

4. Open the Mobile SDK Settings [sn_mobile_sdk] table and create a new application record for the application that will leverage the Mobile SDK.



a. In the **Name** field, enter the name of your application that will leverage the Mobile SDK.

b. In the **Android Application ID** and **Apple Bundle ID** fields, enter the ID of your mobile application.
For example, if the Mobile SDK was added to your mobile applications, then these IDs would be the IDs of the mobile applications.

c. In the **SDK Settings** field, enter JSON configuration properties for all of the feature services that your application will leverage, set to `true`.

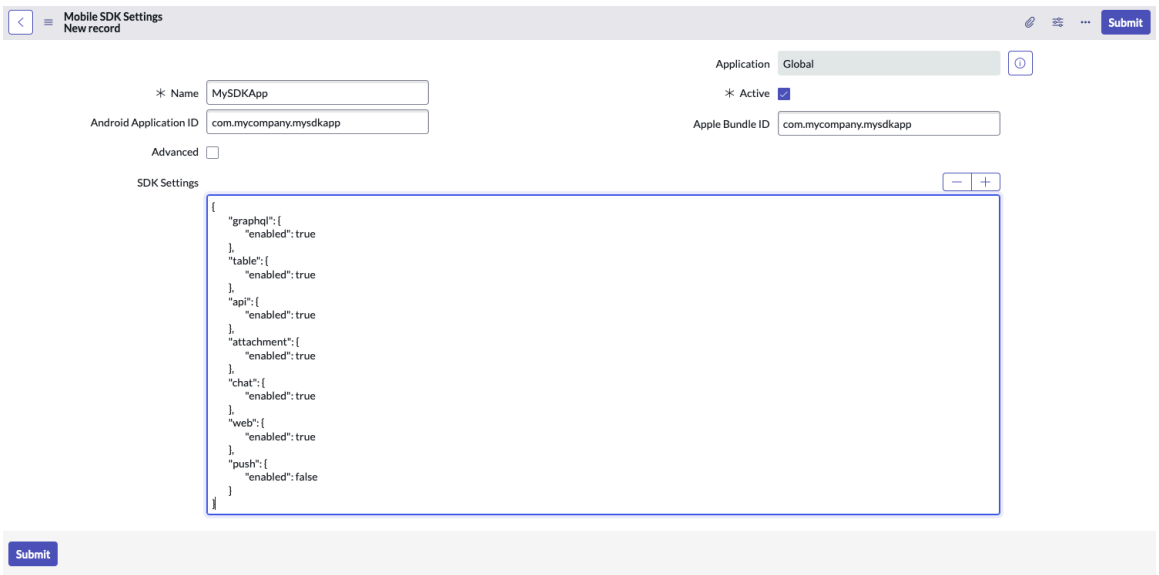
For example:

```
{
    "graphql": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "table": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "api": {
        "enabled" : true,
                "allowGuestAccess" : true
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    },
    "attachment": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "chat": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "web": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "push": {
        "enabled" : true
    }
}
```

Ensure that the **Advanced** check box is unselected. This allows you to enter JSON in the **SDK Settings** field.



Any applicable configuration added in **SDK Settings** is used in conjunction with the ServiceNow instance configuration.

For example, if `chat: enabled = true`, your ServiceNow instance must have the Virtual Agent plugin installed to leverage the chat functionality. If the Virtual Agent plugin is installed, but **SDK Settings** contains `chat: enabled = false`, your application is not able to leverage the chat interface.

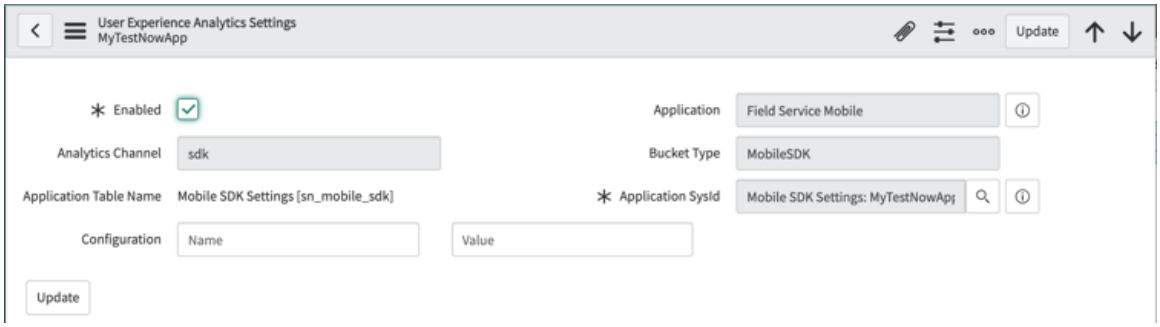
d. Select **Submit** to save your application settings.

5. Optional. If you want your application to leverage User Experience Analytics, register your application with the User Experience Analytics application.

a. Reopen your application's Mobile SDK Settings record.

b. In the bottom-left of the screen, select **Register for Analytics**.
A screen similar to the following appears:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Select **Update** to save the registration.

6. Verify your SDK Settings.

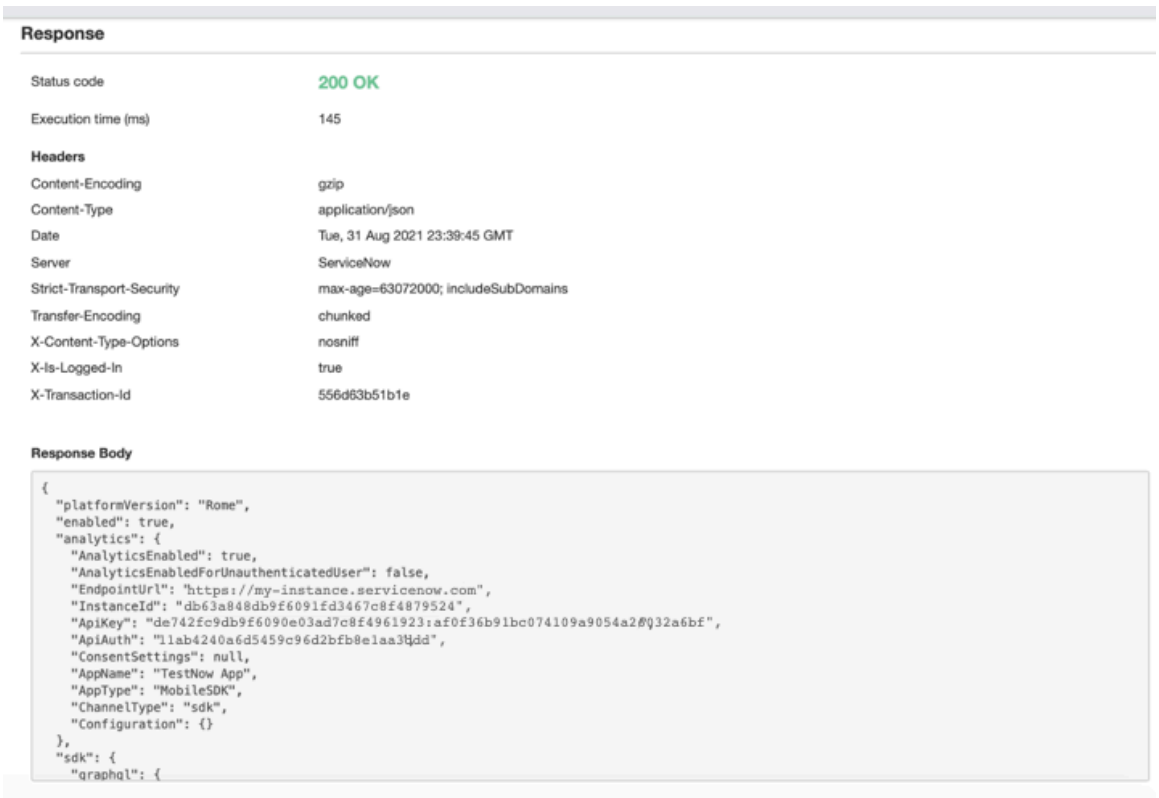
a. Navigate to the **REST API Explorer**.

b. Enter the following in the specified fields:

- **Namespace**: `sn_mobile_sdk`
- **API Name**: `Mobile SDK`
- **API Version**: `latest`

c. Select **Get settings for Android App (GET)**.

d. In the **applicationID** field, enter the Android Application ID that you entered in the associated Mobile SDK Settings record and then select **Send**.
The response should look similar to the following:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The JSON **Response Body** should look similar to the following:

```
{
 "platformVersion": "utah",
 "enabled": true,
 "analytics": {
 "AnalyticsEnabled": true,
 "AnalyticsEnabledForUnauthenticatedUser": false,
 "EndpointUrl": "https://my-instance.servicenow.com.com",
 "InstanceId": "db63a848db9f6091fd3467c8f4879524",
 "ApiKey":
 "de742fc9db9f6090e03ad7c8f4961923:af0f36b91bc074109a9054a260
32a6bf",
 "ApiAuth": "11ab4240a6d5459c96d2bfb8e1aa3ddd",
 "ConsentSettings": null,
 "AppName": "TestNow App",
 "AppType": "MobileSDK",
 "ChannelType": "sdk",
 "Configuration": {}
 },
 "sdk": {
 "graphql": {
 "enabled": true
 },
 "table": {
 "enabled": true
 },
 "api": {
 "enabled": true
 },
 "attachment": {
 "enabled": true
 },
 "chat": {
 "enabled": true
 },
 "web": {
 "enabled": true
 },
   "push": {
   "enabled": true
 }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

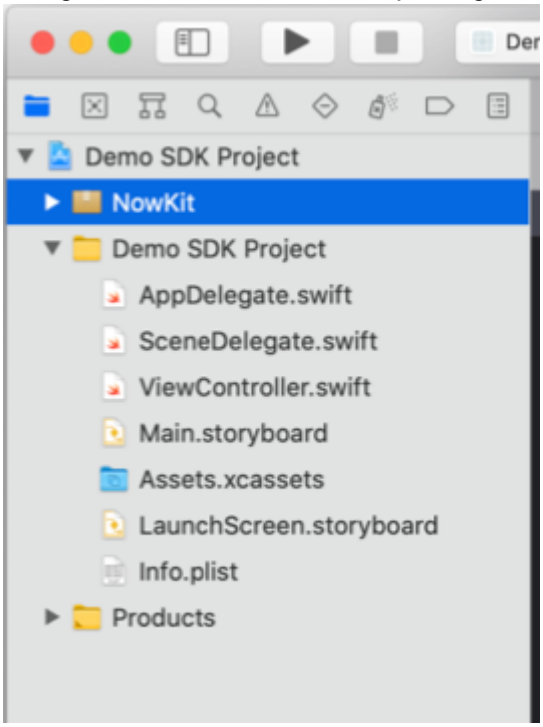
Configure your project

Before writing any application that leverages the Mobile SDK for iOS, you must configure your project to use the SDK.

Procedure

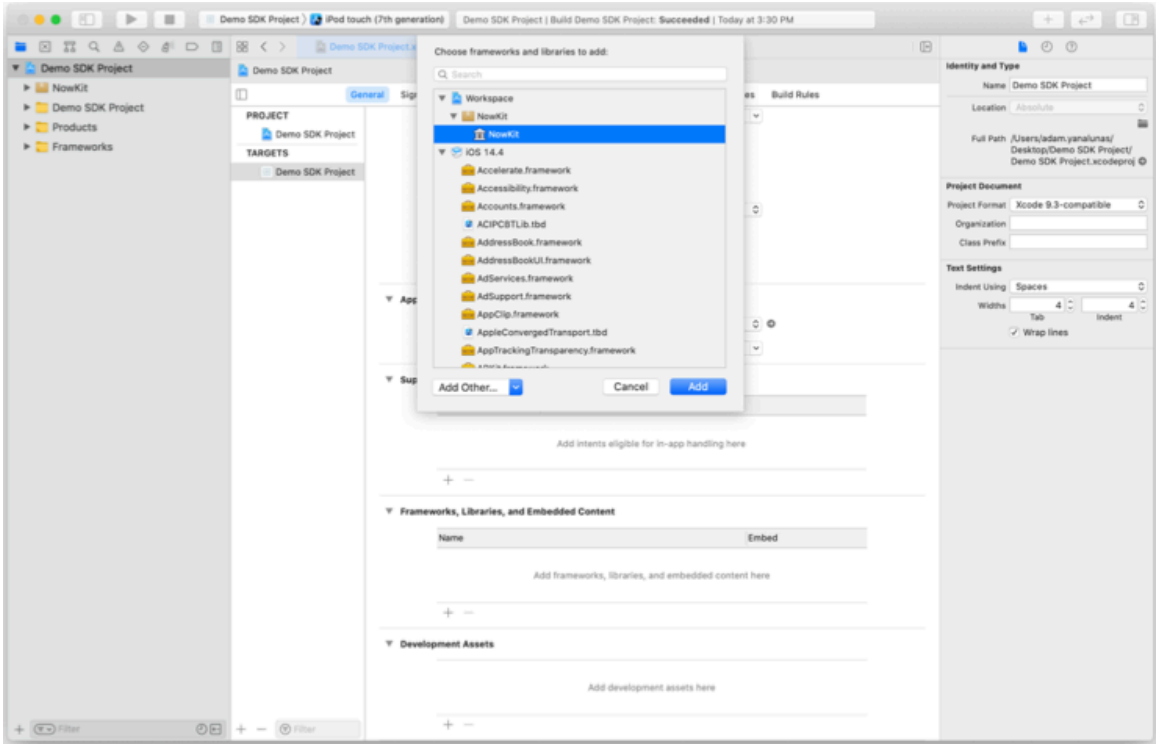
1. Add the Mobile SDK to your project.

   a. In Xcode, drag the NowKit folder from Finder on to your Project Navigator pane (#+1). Xcode recognizes the folder as a Swift package and displays a folder icon next to **NowKit**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Add the Mobile SDK to your target in the **Frameworks, Libraries, and Embedded Content** section of the project's general settings by pressing the **+** icon and selecting the **NowKit** framework from the presented list.



2. Update your project settings.

The SDK uses several device features which require user permissions. You'll need to add SDK feature grouped entries to your project's Info.plist for the following keys:

- NowChat
  - NSLocationWhenInUseUsageDescription
  - NSLocationAlwaysAndWhenInUseUsageDescription
  - NSMicrophoneUsageDescription
  - NSSpeechRecognitionUsageDescription
- NowWeb
  - NSCameraUsageDescription
  - NSPhotoLibraryUsageDescription

Ensure that you provide messages that are helpful to customers, such as the following:

```
...
<key>NSCameraUsageDescription</key>
<string>[Your App] requires permission to access your camera to
 take attachment photos and scan barcodes.</string>
<key>NSPhotoLibraryUsageDescription</key>
<string>[Your App] requires permission to upload your photos to
 a record.</string>
...
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure certificate and create an OAuth Entity

You must configure your ServiceNow instance to accept and exchange a JSON Web Token (JWT) for an OAuth access token. To enable this functionality you must install a certificate that matches the JWT provider's private key on the ServiceNow instance that you will use as the JWT Token consumer and create an OAuth Entity on that instance.

Before you begin

Role required: admin

Procedure

1. If not already configured, configure your ServiceNow instance as an OAuth JWT provider.
   For details, see Create an OAuth JWT API endpoint for external clients (machine to machine integration).
2. Navigate to **System Definition** > **Certificates**.
3. Select **New** and then create a new public certificate as shown in the following image.

   For details on creating this certificate, see Update your X.509 certificate.
4. Create an OAuth Entity.
   For details, see Create an OAuth JWT API endpoint for external clients (machine to machine integration).
5. Add and select the **Public Client** field to the form.

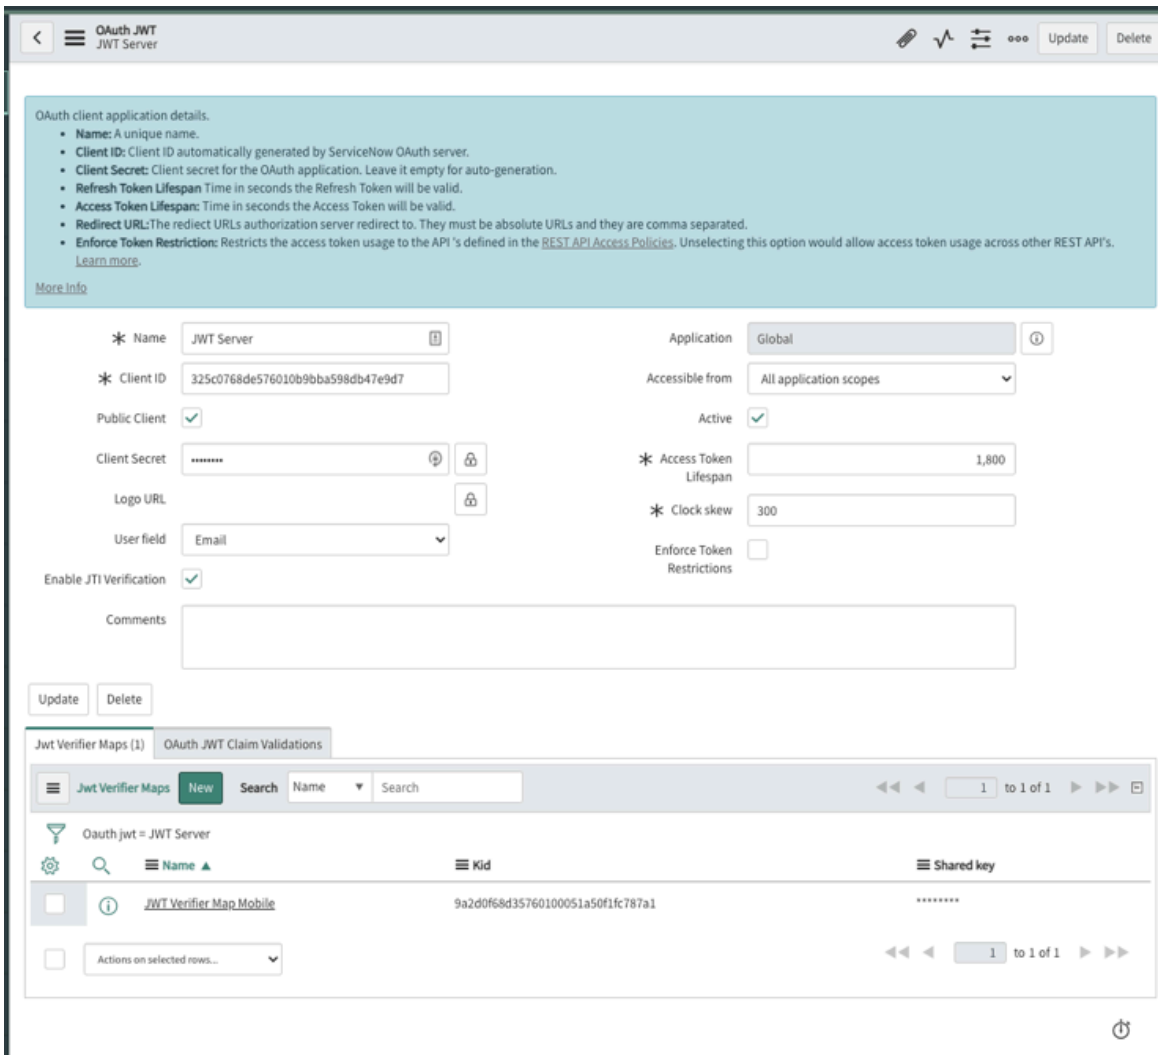
   Note: This field is not shown by default.

6. Save the record.
7. Add a JWT Verifier Map entry.
   After the record is saved, a new section called **Jwt Verifier Maps** appears at the bottom of the form.

   a. Add a name in the **Name** field, this can be whatever name you choose, and select the certificate that was added.
   The other fields, **Kid** and **Shared key**, can be left blank, as they are auto-filled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Ensure that the form contains information similar to the following once you are finished with your configuration:



Configure guest user access

To enable SDK services to be accessible by unauthenticated users, you must configure the Mobile SDK on your ServiceNow instance to allow guest user access. A guest user can view public web pages hosted in an instance using *NowWeb*, have a conversation as a guest using *NowChat*, access public data on the instance using *NowTableService* and *NowGraphQLService*, and access custom API services configured for unauthenticated users using *NowAPIService*.

Before you begin

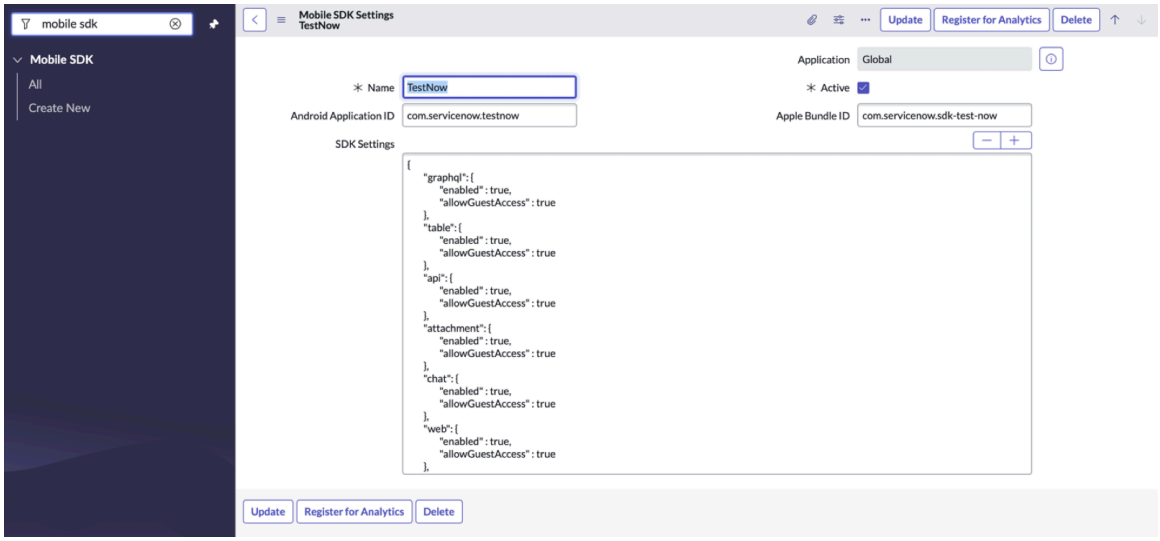
Role required: admin

Procedure

1. Navigate to **All** > **Mobile SDK** > **All** and select the application to which you want to allow guest access.
2. For each service that you want to enable guest access, add `"allowGuestAccess":true` to its configuration array.

Note: The *NowAttachment* service does not currently support guest access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select **Update** to save your changes.

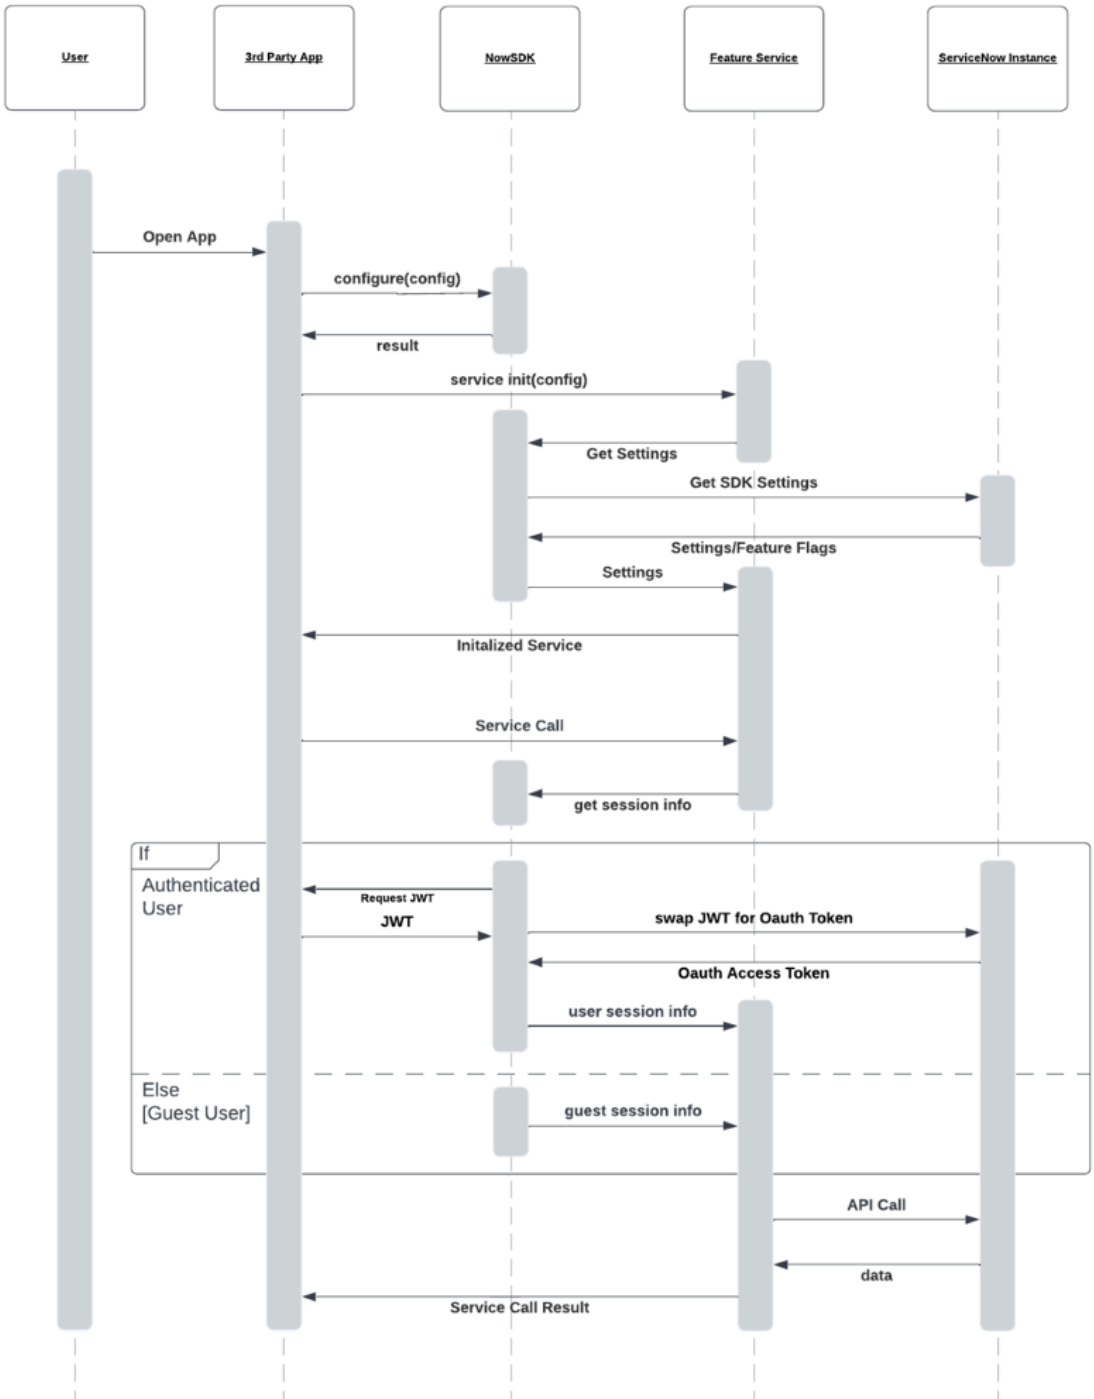
Initialize the NowSDK in your application

To access the functionality provided by the NowSDK, you must first initialize the NowSDK in your application.

The Mobile SDK initialization is asynchronous. It is a good practice to start the initialization process as early as possible, such as in the application delegate's `application(application:didFinishLaunchingWithOptions:)` function. Initialization only needs to occur once per application launch. There is no need to reinitialize when foregrounded or when a new scene is detected.

The following diagram shows the initialization sequence for NowSDK and feature services:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To initialize the ServiceNow Mobile SDK in your iOS application you'll need an authorization provider conforming to `NowSDKAuthorizationProviding`, which uses your JWT provider information, and a delegate conforming to `DevicePermissionDelegate`.

The following is an example of a structure of an SDK initialization. For additional code examples, refer to the ServiceNow Mobile SDK sample application.

```
//

//  JWTProvider.swift

import Foundation
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
import NowSDK

class JWTProvider: NowSDKAuthorizationProviding {
  let token: String

  init(token: String) {
    self.token = token
  }

  func requestAuthorization(for instanceUrl: URL, completion:
 @escaping ([AuthorizationToken]?) -> Void) {
    completion([AuthorizationToken(type: .jwt, token: token)])
  }
}
```

```
//
//  PermissionProvider.swift

import Foundation
import NowSDK

class PermissionProvider: DevicePermissionDelegate {
  var isUserPermissionAllowed: Bool { Bool.random() }

  func canRequestPermission(_ permission: DevicePermission) ->
 Bool {
    guard isUserPermissionAllowed else { false }
    return true
  }
}
```

```
//
//  AppDelegate.swift

import Foundation
import NowSDK

@main
class AppDelegate: UIResponder, UIApplicationDelegate {
  func application(_ application: UIApplication,
 didFinishLaunchingWithOptions launchOptions:
 [UIApplication.LaunchOptionsKey: Any]?) -> Bool {

    let jwtProvider = JWTProvider(token: "a_valid_token”)
    let permissionDelegate = PermissionProvider()
    let logLevel: NowLogLevel = .debug

    let config = NowSDKConfiguration(authorizationProvider:
 jwtProvider, permissionDelegate: permissionProvider, logLevel:
 logLevel)

    do {
      try NowSDK.configure(with: config)
    } catch {
      // Handle 'error'
    }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    return true

}
```

Guest users

If the current user is not authenticated, it is possible to for them to access SDK functionality as a guest. To indicate that the current user is a guest, the *requestAuthorization* function in the authorization provider should complete with a guest type of *AuthorizationToken*, as shown below. The token value in this case is not important so long as the *AuthorizationTokenType* is set to `.guest`. For additional information on guest users, see Configure guest user access.

```
//  GuestTokenProvider.swift
import Foundation
import NowSDK
class GuestTokenProvider: NowSDKAuthorizationProviding {
    func requestAuthorization(for instanceUrl: URL,
        completion: @escaping ([AuthorizationToken]?) -> Void) {
        completion([AuthorizationToken(type: .guest, token:
 "")])
    }
}
```

Logging users out of the SDK

After a user is logged out of a host application, you should call the NowSDK`.logout()` method to clear that user's ServiceNow sessions and tokens from the SDK. For example:

```
func onLogout() {
  NowSDK.logout()
}
```

Implement Virtual and Live Agent chat

The Mobile SDK enables you to easily implement Virtual and Live Agent chat services within your iOS application.

You use the NowChatService API to create the chat user interface. Once the UI is created, you must then start the chat session, and then start the chat service. Similar to other Mobile SDK feature services, the *NowChatService* API provides two implementations for some of its methods, including the *startChat()* method. One implementation returns a Combine publisher, and the other calls a completion handler with the return results.

The following is a snippet from the sample application that shows how to initialize and start a chat UI and session.

```
// Create the chat UI
func makeChatScreen() -> UIViewController? {
  guard let chatService = chatService else { return nil }
  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(baseTheme: CarrascoTheme()))
  switch result {
  case .success(let chatViewController):
    return chatViewController
  case .failure(let error):
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    debugPrint("Chat screen creation failed with error:
 \(error)")
    return nil
  }
}

// Start the chat session
func startChat() {
  guard let chatService = chatService else {
    debugPrint("Chat service is invalid")
    viewState = makeViewState()
    return
  }
  chatService.startChat { [weak self] result in
    if case .failure(let error) = result {
      debugPrint("Chat session initialization failed with error:
 \(error)")
      self?.resetChat()
    }
  }
}

// Initialize the chat service
private func initializeChatService() {
  NowChat.makeChatService(instanceUrl: instanceUrl, delegate:
 self) { [weak self] result in
    guard let self = self else { return }

    switch result {
    case .success(let service):
      self.chatService = service
    case .failure(let error):
      debugPrint("Creating the chat service failed with error:
 \(error)")
    }
    self.viewState = self.makeViewState()
  }
}
```

Before you can leverage the chat functionality within your application, you must configure Virtual Agent within your ServiceNow instance. For details, see Virtual Agent.

Passing context variables to Live Agent and Virtual Agent chat

You can pass chat context variables when starting a chat session by passing the *contextData* parameter in the NowChatService - startChat(contextData: [String: Any]?) or NowChatService - startChat(contextData: [String: Any]? = nil, _ completion: @escaping (Result<Void, NowChatServiceError>)) functions. For additional information on chat context variables, see Live agent chat context variables.

```
func startChat() {
  guard let chatService = chatService else {
    debugPrint("Chat service is invalid")
    viewState = makeViewState()
    return
  }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  let contextData = ["sys_id": "123456789", "table_name":
 "wm_task", "active": true] as [String: Any]
  chatService.startChat(contextData: contextData) { [weak self]
 result in
    if case .failure(let error) = result {
      debugPrint("Chat session initialization failed with error:
 \(error)")
      self?.resetChat()
    }
  }
}
```

Theme the chat user interface

You can customize the colors of the Live Agent and Virtual Agent chat UI by passing a theme object in the *makeChatUI()* call. For a list of all of the elements that you can customize, see NowChatColoring protocol - iOS. By default, the chat UI uses the *NowUIColor* theme for all NowSDK UI elements. Refer to the NowChatThemeable protocol - iOS for sample code snippets on how to apply a theme to your chat UI.

Interact with table data in a ServiceNow instance

The Mobile SDK enables you to interact with data in tables that reside on your ServiceNow instance. You can interact with this data through the ServiceNow REST *Table* API using the *NowTableService()* API that directly calls the REST interface, or through the *NowGraphQLService()* API that executes a specified GraphQL query against the REST *GraphQL* API.

If you want to return data from multiple tables within a single call, you will need to use the *NowGraphQLService()* API. If you need to interact with other ServiceNow REST APIs, see Interact with the public REST API on a ServiceNow instance.

Using NowGraphQLService to interact with ServiceNow tables

The NowGraphQLService class provides methods that enable you to construct and execute GraphQL queries on a specified table within your ServiceNow instance if the logged in user has the proper authorization. You can define all CRUD operations within your GraphQL query.

NowGraphQLService supports fetching results for a query by returning a completion handler:

```
func execute(_ query: GraphQLQuery, completion: @escaping
 (Result<Data, NowDataError>) -> Void)
```

Through async/await:

```
func execute(_ query: GraphQLQuery) async throws -> Data
```

Or, a Combine publisher (which is currently deprecated):

```
func publisher(for query: GraphQlQuery) -> AnyPublisher<Data,
 NowDataError>
```

The following example shows how to import the NowData framework and then initialize a NowGraphQLService object that you can then use to interact with tables in your ServiceNow instance.

```
// Import the NowData framework
import NowData

// Initialize a NowGraphQLService
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// The makeGraphQLService completion handler returns a result
 that wraps
// the NowGraphQLService upon success or error.

private func initializeGraphQLService(instanceUrl: URL) {
  makeGraphQLService(instanceUrl: instanceUrl) { [weak self]
 result in
    switch result {
    case .success(let service):
      self?.graphQLService = service
    case .failure(let error):
      debugPrint("Creating GraphQL service failed with error:
 \(error.localizedDescription)")
      self?.graphQLService = nil
    }
  }
}
```

This example shows how to create an async function that fetches and publishes the most recently published KB articles.

```
private func fetchArticles() async throws -> [Article] {
    guard let graphQLService = graphQLService else {
        throw ArticleListError.invalidGraphQLService
    }

    do {
        let data = try await
 graphQLService.execute(GraphQLQuery(query:
 recentlyPublishedQuery))
        let articles = try dataToArticleList(data)
    } catch let error as NowDataError {
        throw ArticleListError.fetchError(error)
    } catch {
        throw error
    }
}
private let recentlyPublishedQuery =
"""

{
  GlideRecord_Query {
    kb_knowledge(queryConditions:
 "active=true^ORDERBYpublishedDESC" pagination: { limit: 10,
 offset: 0 }) {
      _results {
        sys_id {
          value
        },
        number {
          displayValue
        },
        short_description {
          displayValue
        },
        author {
          displayValue
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        }
        published {
          displayValue
        }
      }
    }
  }
}
""""
```

Using NowTableService to interact with ServiceNow tables

The NowTableService class provides methods to perform CRUD operations on the records in tables that reside on your ServiceNow instance. Through this interface you can directly access any of the records within any ServiceNow table for which the logged in user is authorized. *`NowTableService`* supports dot-walking for reference fields. For example, if a table contains a reference to the User table, the dot-walked value `user.name` returns the name of the user.

When returning the requested data, all applicable Access Control Lists (ACLs) are applied to the data, which may result in fewer results than expected, or authorization errors if the authenticated user does not have access rights to the specified table.

Most *`NowTableService`* methods provide three implementations for returning results data. One that uses async/await, one that calls a completion handler with a *`Result`* enumeration, and one that returns a Combine publisher, which is currently deprecated.

For example, all *`createRecord()`* methods insert a constructed record into a specified table, however, the

NowTableService - createRecord(with fields: [FieldName: FieldValue], in tableName: String, writeOptions: FieldWriteOptions, configuration: FieldReadConfiguration, completion: @escaping (Result<Data, NowDataError>)

method calls a completion handler with a *`Result`* enumeration (the `.success` case contains the results as its associated value).

The

NowTableService - createRecord(with fields: [FieldName: FieldValue], in tableName: String, writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil) async throws

method performs an async/await function. While the

NowTableService - createRecord(with fields: [FieldName: FieldValue], in tableName: String, writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil)

method returns a Combine publisher, but is currently deprecated.

In addition, *`NowTableService`* provides two different implementations of CRUD methods, one that returns raw data, and one that returns Codable models. For example, both the *`update()`* and *`updateRecord()`* methods update a specified record in a specified table, but the *`update()`* methods return a Codable model and the *`updateRecord()`* methods return raw data. In some cases, Codable methods might be preferable, as a strongly typed Codable structure provides more flexibility than a collection of raw data fields.

The following example shows how to import the *`NowData`* framework and then initialize a NowTableService object that you can then use to interact with ServiceNow instance tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Import the NowData framework
import NowData

// Initialize a NowTableService
// The makeTableService completion handler returns a result that
 wraps
// the NowTableService upon success or error.

makeTableService(instanceUrl: instanceUrl) { [weak self] result
 in
  guard let self = self else { return }

  switch result {
  case .success(let tableService):
    debugPrint("Successfully created a table service
 \(tableService)")
    self.tableService = tableService
  case .failure(let error):
    debugPrint("Creating table service failed with error:
 \(error.localizedDescription)")
  }
}
```

For additional code examples using the available *NowTableService* methods, refer to the NowTableService class - iOS API documentation.

Configure return results data

Within the Mobile SDK, when interacting with data from a ServiceNow instance through a REST endpoint, you can configure what data is passed back in the return results.

You configure what data to pass back using the FetchConfiguration structure. This structure enables you to configure:

- The specific records to return from a table.
- The specific fields to return from the records.
- The number of records to return.

Note: Generally you want to use the same FetchConfiguration for all of your CRUD operations for a certain model type as it determines which fields are returned. It should at least match the required properties on your model, or else JSON Decoding will fail.

Configuring the specific records to return

The Filter structure within a *FetchConfiguration* call enables you to filter and sort the records that are fetched from a ServiceNow instance and passed back in the return results from a REST endpoint. This filter is passed in the *sysparm_query* parameter of the REST API endpoint. For additional information, see Table API.

You can initialize the *Filter* structure in four different ways depending on the desired filtering capabilities:

1. Filter by encoded query encoded query. This type of filter enables you to pass an encoded query that is applied to the records within the specified table.

   For example, the following call only returns those records that are active and whose short description field contains the word "broken":

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Filter(query: "active=true^short_descriptionLIKEbroken"
```

To use this type of filtering, initialize the *Filter* structure using the Filter - init(query: String, queryCategory: String? = nil) function.

2. Filter by criteria. This filter enables you to filter based on one or more filter criteria that are OR'd together.

   For example, a manager has an employee Abel Tuter who is on PTO. They want to know if there are active incidents that are not assigned to anyone or assigned to Abel Tuter so they can assign/reassign them. They also want to see in that same list, all of the incidents that have high or overdue escalation so that they can also address those. The following shows how to create the necessary filters to obtain this data:

```
let activeIncidents = Condition.boolean(field:
 "active", .is(true))

let assignedToEmpty = Condition.string(field:
 "assigned_to", .isEmpty)

let assignedToAbel = Condition.string(field:
 "assigned_to", .is("Abel Tuter"))

let assignedToAbelOrEmpty =
 CompoundCondition.or([assignedToEmpty, assignedToAbel])

let needToReassign = Criteria(conditions: [activeIncidents,
 assignedToAbelOrEmpty])

let highEscelations = Condition.string(field:
 "escalation", .is("2"))

let overdueEscelations = Condition.string(field:
 "escalation", .is("3"))

let highORoverdueEscelations =
 CompoundCondition.or([highEscelations, overdueEscelations])

let needToHandleEscalation = Criteria(condition:
 highOrOverdueEscelations)

let myPrioritiesForTodayFilter = Filter(criteria:
 [needToReassign, needToHandleEscalation])
```

   To use this type of filtering, initialize the *Filter* structure using the Filter - init(criteria criteriaList: [Criteria], sortBy: [Sort]? = nil, queryCategory: String? = nil) function.

3. Filter by keywords and conditions. This filter enables you to filter records based on specific keywords and conditions that are AND'd together.

   For example, the following filters for all records that contain the keyword "iOS13 or iOS 14" and meet the specified condition sorted by testField.

```
testKeywordsAndConditionsAndSort() {
  let keywords = "iOS 13 | iOS 14"
  let conditionA = Condition.boolean(field:
 testField, .is(true))
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  let conditionB = Condition.boolean(field:
 testField2, .is(false))
  let sortA = Sort.asc(testField)
  let filter = Filter(keywords: keywords, conditions:
 [conditionA, conditionB], sortBy: [sortA])

  XCTAssertEqual(filter.query,
 "123TEXTQUERY321=\(keywords)^\(conditionA.query)^\(conditionB.
query)^EQ^\(sortA.query)")
}
```

To use this type of filtering, initialize the *Filter* structure using the Filter - init(keywords: String? = nil, conditions: [Condition], sortBy: [Sort]? = nil) function.

4. Filter by conditions. This filter enables you to filter records that meet all specified conditions (AND'd together).

   For example, the following filters for all records in which the Active field is "true" and the date value of the SLA due field is on "today" or any date after today.

```
// Where the record is active
let condition1 = Condition.boolean(field: "active", .is(true))

// AND the date value of the SLA due field is on "today" or any
 date after today.
let condition2 = Condition.dateTime(field:
 "sla_due", .atOrAfter(0, .daysAgoStart))

let filter = Filter(conditions: [condition1, condition2])
```

   To use this type of filtering, initialize the *Filter* structure using the Filter - init(conditions: [QueryProviding], sorts: [Sort]? = nil) function.

Configuring the specific fields to return

The FieldReadConfiguration structure - iOS within the *FetchConfiguration* method call allows you to configure what fields to pass back in the return results. In addition, you can configure the format/content of the returned fields as:

- display values
- actual values
- exclude reference links

Note: Configuring the fields to match a Codable model may reduce the payload returned by the ServiceNow instance, improving network efficiency by reducing data transfer.

Configure field write options

Within the Mobile SDK, when writing data to a ServiceNow instance through a REST endpoint, you can define field write options.

You configure field write options using the FieldWriteOptions class - iOS structure. This structure enables you to configure:

- Whether to suppress automatic generation of system fields.
- Whether to set field values using their display value display value rather than their actual value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Paginate return results record sets

Within the Mobile SDK, when interacting with data from a ServiceNow instance through a REST endpoint using the *NowTableService*, you can create a Paginator object that enables you to iterate over the records in the return results.

You typically use paginated return results to provide infinite scroll capabilities for table records presented inside a UITableView, a UICollectionView (UIKit), or a List (SwiftUI), or to simplify page iteration of results in general.

The *NowTableService* class provides two methods for creating a Paginator object that contains the return results from a REST endpoint call:

- NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil)

  This method creates a Paginator object that contains the specified records from the specified table. If you do not include the FetchConfiguration object, it contains all records and their associated fields in the return results. This method returns raw data.

- NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil)

  This method creates a Paginator object that contains the specified records from the specified table. If you do not include the FetchConfiguration object, it contains all records and their associated fields in the return results. This method returns Codable models and enables you to define a custom `Coder` for Codable models that require custom decoding. You can supply a custom `JSONDecoder` by supplying a `NowData.Coder.custom` enumeration value that contains the custom `JSONDecoder` and `JSONEncoder`.

The paginator type is determined by the Generics and the compiler type inference.

In the following example, the compiler infers that `service.paginator(...)` returns a paginator of type `Paginator<[User]>`, a paginator that publishes a collection of users, such as, Codable User structures, through its Combine publisher.

```
let paginator: Paginator<[User]> = service.paginator(from:
 "sys_user", path: "result")
```

After obtaining a Paginator object, subscribe to its publisher to start receiving data.

```
paginator.publisher
  .subscribe(on: DispatchQueue.global())
  .receive(on: DispatchQueue.main)
  .sink { ... }
  .store(in: &subscriptions)
```

The returned Paginator object provides the following methods that enable you to page through the returned records:

- *first()*
- *last()*
- *next()*
- *previous()*
- *reset()*

Note: Some *Paginator* methods may throw an exception, such as when there are no more pages to fetch.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In addition, the Paginator object provides properties that enable you to obtain insights into the paginated data. For additional details on these properties and the available methods, see Paginator API - iOS.

Transform data

The *NowData* framework provides the ability to easily transform data into records.

Using the NowRecord convenience structure, which contains the properties `sysId` and `fields`, you can easily transform data into a record. Whenever you obtain a `Data` wrapping `Result` or `Publisher`, you can easily transform it into a `NowRecord` wrapping `Result` or `Publisher` using the *convertToRecord()* and *convertToRecords()* methods. For additional information, see NowTableService class - iOS.

Note: While *NowRecord* makes it very easy to quickly obtain data, depending on your use case, the Codable methods might be preferable as a strongly typed Codable structure provides more flexibility than a collection of "any" fields.

Interact with the public REST API on a ServiceNow instance

The Mobile SDK provides functionality that enables iOS applications to call the public REST API on a ServiceNow instance.

Using the NowAPIService API you can interact with any of the base ServiceNow public REST APIs, or create custom REST APIs within the instance and call those from your iOS application.

Retrieve attachments and attachment metadata

The *NowAttachmentService* API enables you to perform CRUD operations on attachments and retrieve attachment metadata from your ServiceNow instance.

Using this API you can:

- Upload attachments to your ServiceNow instance and associated them to a specific record.
- Download one or more attachments.
- Delete attachments.
- Validate an attachment by comparing the computed hash of the attachment to the expected hash.
- Download attachment metadata. This metadata is generated by your ServiceNow instance when an attachment is uploaded.

For additional information on working with attachments, see Attachment API.

All NowAttachmentService methods provide three implementations for returning results data. One that calls a completion handler with the return results, one that preforms an async/await, and another that returns a Combine publisher (deprecated). For example, each *upload()* method uploads and associates a specified attachment to a specified record. However, the NowAttachmentService - upload(data: Data, configuration: NowAttachmentUploadConfiguration, progressUpdate: @escaping ProgressUpdate, completion: @escaping (Result<NowAttachmentMetadata, NowDataError>)) method calls a completion handler with the return results, the NowAttachmentService - upload(data: Data, configuration: NowAttachmentUploadConfiguration, progressUpdate: @escaping ProgressUpdate) async throws method performs an async/await, and the NowAttachmentService - upload(data: Data, configuration: NowAttachmentUploadConfiguration, progressUpdate: @escaping ProgressUpdate) method returns a Combine publisher.

Before you are able to use the *NowAttachmentService* API, you must import *NowData* and then initialize a NowAttachmentService object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Import the NowData framework
import NowData

func makeAttachmentService(instanceUrl: URL,
  completion: @escaping ((Result<NowAttachmentService,
 NowServiceErrors>) -> Void))
```

Attachment metadata pagination

You can use the *NowAttachmentService* methods to download attachment metadata for one or more attachments. When downloading metadata from multiple attachments, you may want to use the NowAttachmentService - attachmentMetadataPaginator(filter: Filter, limit: Int) method, which returns a Paginator object that enables you to easily iterate over the potentially large amount of data that is returned. You typically use paginated return results to provide infinite scroll capabilities for data presented inside a UITableView, a UICollectionView (UIKit), or a List (SwiftUI), or to simplify page iteration of results in general.

After obtaining a Paginator object, subscribe to its publisher to start receiving data.

```
paginator.publisher
  .subscribe(on: DispatchQueue.global())
  .receive(on: DispatchQueue.main)
  .sink { ... }
  .store(in: &subscriptions)
```

The returned Paginator object provides the following methods that enable you to page through the returned records:

- *first()*
- *last()*
- *next()*
- *previous()*
- *reset()*

Note: Some *Paginator* methods may throw an exception, such as when there are no more pages to fetch.

In addition, the Paginator object provides properties that enable you to obtain insights into the paginated data. For additional details on these properties and the available methods, see Paginator API - iOS.

Display web pages hosted on your ServiceNow instance

You can display web pages hosted within your ServiceNow instance in your native iOS application.

The Mobile SDK provides seamless handling of the required authentication and session management, while the NowWebService API provides the functionality required to handle pages residing on your ServiceNow instance. These web pages have all the dynamic interactions that are possible on the ServiceNow platform.

When the webview is requested to load a web page hosted on a ServiceNow instance, it creates an HTTP request with the appropriate bearer header containing the OAuth access token provided by the NowSDK. When the instance receives this request, it starts a new user session and returns cookies related to that session. As the user interacts with the web pages in the webview, the instance uses the cookies to validate that the session is still valid. At this point, the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

bearer header is no longer relevant, only the cookies are used for session validation. The web session expires if the user stops interacting with the website for longer than the timeout period. After the session expires, if the user tries to interact with the web page, they are automatically redirected to the login page. The NowWebViewController detects the redirection and attempts to start a new web session by requesting a refreshed access token from the NowSDK and using the token to create a HTTP request (with bearer header) for the last known loaded page.

To use these features, you must first create an instance of the *NowWebService*. To do this you must call the *makeWebService()* method and provide the URL to your ServiceNow instance and an already initialized NowSDK. In addition, you must have imported NowWeb within your application. You should hold a reference to the *NowWebService* for as long as you are using the NowWeb service.

The following shows an example of how to create a NowWebService object using async/await:

```
do {
    let service = try await NowWeb.makeWebService(instanceUrl:
 instanceUrl)
    self.webService = service
} catch {
    debugPrint("Web Service creation failed with error:
 \(error.localizedDescription)")
}
```

The following shows an example of how to create a NowWebService object using a completion handler:

```
import Combine
import NowWeb
import UIKit
...
public func makeWebService(instanceUrl: URL,
  completion: @escaping ((Result<NowWeb.NowWebService,
 NowSDK.NowServiceError>) -> Void))
```

Pre-load pages to improve NowWeb load time

You can pre-load pages with cacheable resources in the background to improve initial *NowWeb* load times. The following example shows how to use the *webService.preloadWebCache()* function to pre-load specified pages.

```
private func preloadURLs(urls: [URL]) {
  guard let webService = webService else {
    debugPrint("Web service not initialized")
    return
  }
  do {
       try webService.preloadWebCache(urls: urls) {
         debugPrint("URLs did complete preloading")
       }

  } catch {
      debugPrint(error.localizedDescription)
  }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create views to display web content

Once you have instantiated an instance of NowWebService, you can use it to create views to display web pages hosted on your ServiceNow instance.

The following example shows how to create a NowWebViewController view:

```
let result = webService.makeWebViewController(for: url,
  delegate: self, theme: MyWebTheme(nowUITheme: MyUITheme()))
switch result {
case .success(let viewController):
  return viewController
case .failure(let error):
  debugPrint("Web view creation failed with error:
 \(error.localizedDescription)")
}
```

In this example, *url* is the URL of the initial page to load within the view. This URL must point to a page that is hosted on the specified ServiceNow instance. Relative URLs also work and are relative to the ServiceNow instance targeted by the NowWebService.

Once created, you can push the NowWebViewController onto an existing navigation stack. The initial page is not loaded until you call the loadPage() method.

Theme the web user interface

You can customize the colors of the web UI by passing a theme object in the *makeWebViewController()* call. For a list of all of the elements that you can customize, see NowWebColoring protocol - iOS. By default, the web UI uses the NowUIColor theme for all NowSDK UI elements. Refer to the NowWebThemeable protocol - iOS for sample code snippets on how to apply a theme to your web UI.

Configure push notifications

Push notifications enable the sending of unsolicited messages (notifications) from a ServiceNow instance to a specific registered user and an application that leverages the ServiceNow Mobile SDK framework.

You must set up push notifications on both your ServiceNow instance and within the application that will receive the notifications.

Note: For the current release, only the Virtual Agent service supports the receipt of push notifications.

Setting up push notifications on your ServiceNow instance

For each Mobile SDK application that incorporates the Virtual Agent service and leverages push notifications, you must complete the following configuration process on your ServiceNow instance.

- Generate and retrieve an iOS push certificate.
- Add a push application record in the Push Application [sys_push_application] table.
- Add a push notification message content record in the Push Notification Message Content [sys_push_notif_msg_content] table.
- Add a default push registration.
- Add a push notification message in the Push Notification Message [sys_push_notif_msg] table.
- Modify the push notification record in the Notification [sysevent_email_action] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generate and retrieve an iOS push certificate

You must retrieve your unique iOS push certificate from your Apple Developer account so that you can associate it to your Mobile SDK applications that leverage push notifications.

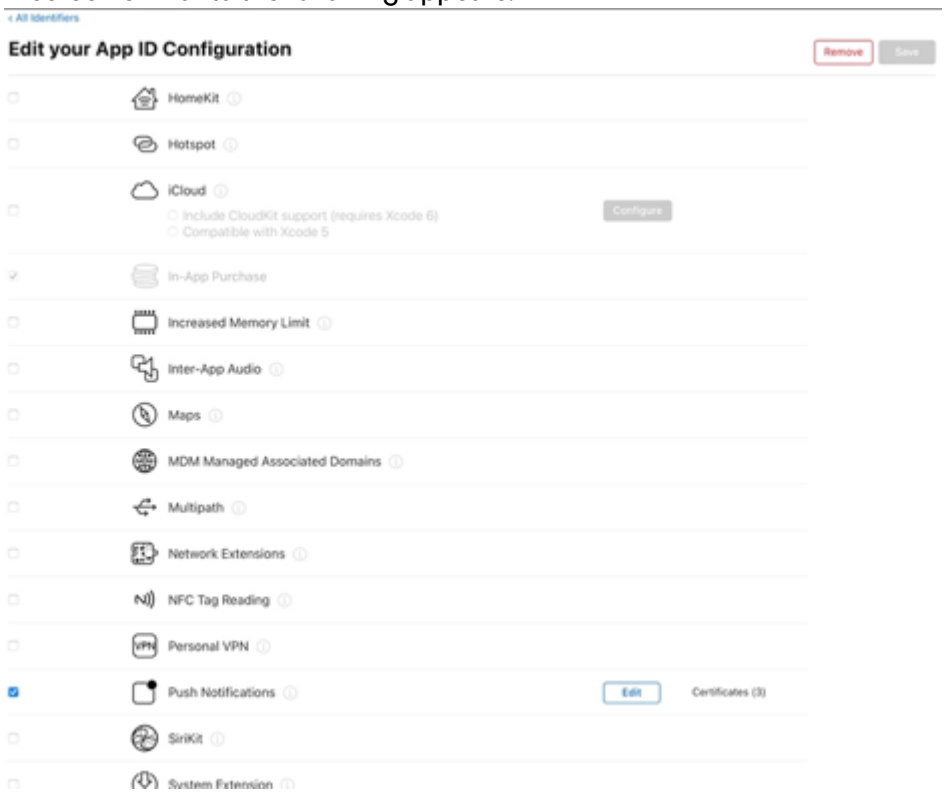
Before you begin

Role required: admin

You must already have an Apple Developer account set up. For information on how to create an Apple Developer account and download the corresponding SDK, refer to the Apple Developer website.

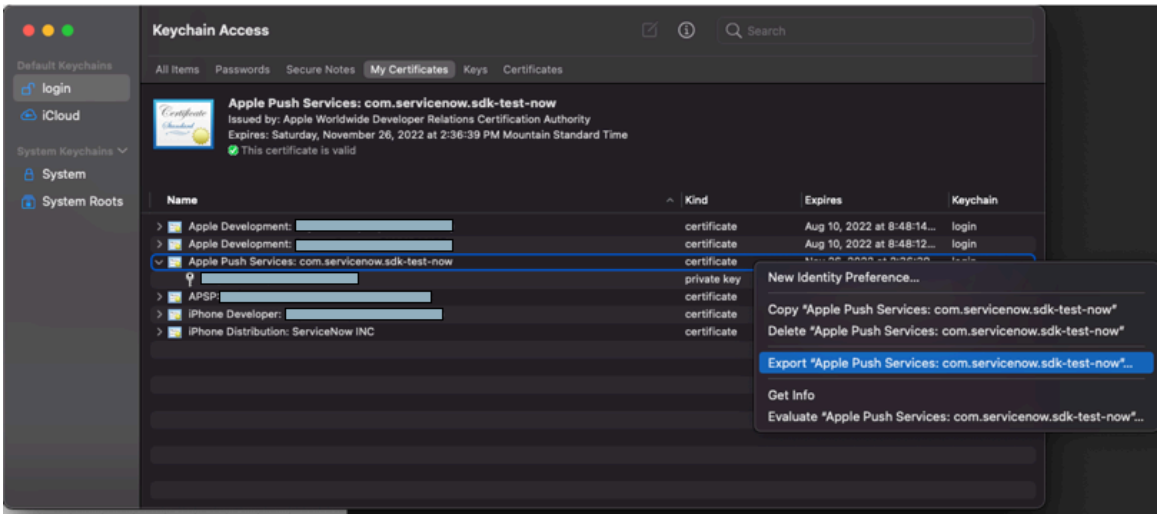
Procedure

1. From your Apple Developer account, select **Identifiers**, and then select your application's bundle ID from the displayed list.
   A screen similar to the following appears.



2. Select the **Push Notifications** check box and then select **Edit**.
3. Using the instructions provided by Apple, create a production SSL certificate.
4. Once created, double-click the downloaded certificate, which saves it to the KeyChain Access application.
5. From your Applications folder, open the Keychain Access application, and locate the certificate that you created.
6. Right-click the certificate and then select the **Export** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Ensure that the **File Format** field is set to `Personal Information Exchange (.p12)`.
8. Enter a secure password for the certificate.

Add a push certificate record

After generating your iOS push certificate, you must save the push certificate record to your instance. The push certificate is stored in the X.509 Certificate [sys_certificate] table.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. In the search field, select **Name** and enter `sys_certificate`.
3. Open the X.509 Certificate [sys_certificate] table.
4. Create a certificate record by selecting the **New** button.
5. Add the Personal Information Exchange (.p12) certificate that you exported in Generate and retrieve an iOS push certificate to the certificate record as an attachment.

   a. In the upper-right corner, select the attachment icon.

   b. In the **Name** field, enter a name for the certificate.
   You can enter any name that clearly identifies the purpose of the certificate to other team members.

   c. In the **Type** field, enter or select `PKCS12 Key Store`.

   d. In the **Notify on expiration** field, select the person to receive a notification when the certificate is about to expire.

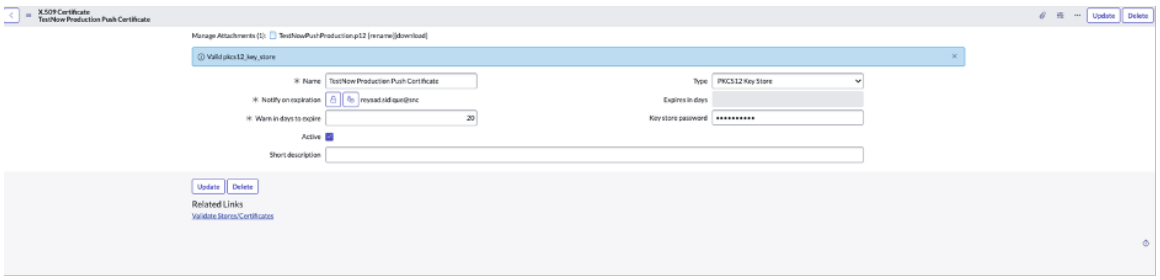
   e. In the **Warn in days to expire** field, enter the number of days prior to when the certificate is scheduled to expire, to send a notification about the expiration.

   f. In the **Key store password** field, enter the password that you used when exporting the certificate from the keychain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. At the bottom left-corner of the form, select the **ValidateStores/Certificates** link.
The system validates the attached certificate.

h. After the certificate validation is confirmed, select **Update** to submit the form.



Add a push application record

You must create a push application record and enter your Apple Push Notification certificate in that record to use push notifications in a Mobile SDK application that leverages Virtual Agent and push notifications.

Before you begin

Role required: admin

This record is stored in the Push Application [sys_push_application] table.

Procedure

1. Navigate to **System Notification** > **Push** > **Push Application**.
2. Select **New** to add a new record.
3. In the **Display Name** and **Name** fields, enter the name of your application.
4. In the **Push** field, change the value from **REST API** to **Direct**.
5. In the **iOS** tab, select the search icon to the left of the **Certificate** field and select the certificate that you created.
6. Select **Submit**.

Add a default push registration

Register the push notification so that all users of your application receive the push notifications by default.

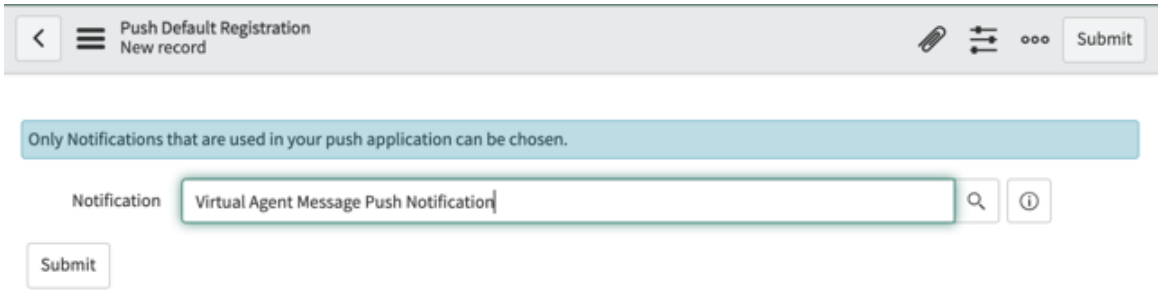
Before you begin

Role required: admin

Procedure

1. Navigate to **System Notification** > **Push** > **Push Application**.
2. Locate and open the push notification that you created earlier.
3. In the related list, select the **Push Default Registrations** tab, then select **New**.
4. In **Notification**, enter `Virtual Agent Message Push Notification`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select **Submit**.

Add a push notification message content record

The push notification message content record contains the location users are directed to when they tap on a notification, as well as the appearance and layout of the notification.

Before you begin

Role required: admin

Complete the Push Notification Message Content form to:

- Name the notification.
- Select the mobile application to which the notification is sent.
- Optionally, customize the appearance of the notification message.

This information is saved in the Push Notification Message Contents [sys_push_notif_msg_content] table.

Procedure

1. Navigate to **System Notification** > **Push** > **Push Message Content**.
2. Select **New**.
3. In the Push Message Content form, fill in the following fields:

Push Notification Message Content form

Field	Description
Name	Descriptive name of the push message content record. **Note:** This name is not visible in the notification, it is only a reference for use during configuration.
Push app	Mobile application to send the notification to. This is the application that you added in "Add a push application record".

Push Message Generation	Script block that contains the notification link. To implement push notifications in a Mobile SDK Virtual Agent application, use the following script:
	`(function buildJSON(/*GlideRecord*/ current, /*String*/ message, /*Object*/ attributes) {`
	`var json = {`
	`"aps": {`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	<pre>"alert": {
	"title": current.push_title,
	"body":
	sn_cs.VASystemObject.getTextValueForMessage(curren
	t.message_id)
	},
	"sound": "default",
	"thread-id": "launch_virtual_agent"
	},
	"type": "launch_virtual_agent"
	};
	
	return json;
	
	})(current, message, attributes);</pre>

4. Select **Submit**.

Add a push notification message

Configure the message displayed to users when they receive their push notification.

Before you begin

Role required: admin

Procedure

1. Navigate to **System Notification** > **Push** > **Push Messages**.
2. Select **New**.
3. In the Push Message form, fill in the following fields:

Push Message form

Field	Description
Name	Descriptive name for the push notification message record. **Note:** This name is not visible in the notification, it is only a reference for use during configuration.
Push app	Mobile application to which you want to send the notification. This is the application that you added in "Add a push application record".
Push message	Push notification message content record created in "Add a push notification message content record".
Table	Table the message originates from. Select `Push Notification [sys_cs_message_notification]`.

4. Select **Submit** to create the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Modify the push notification

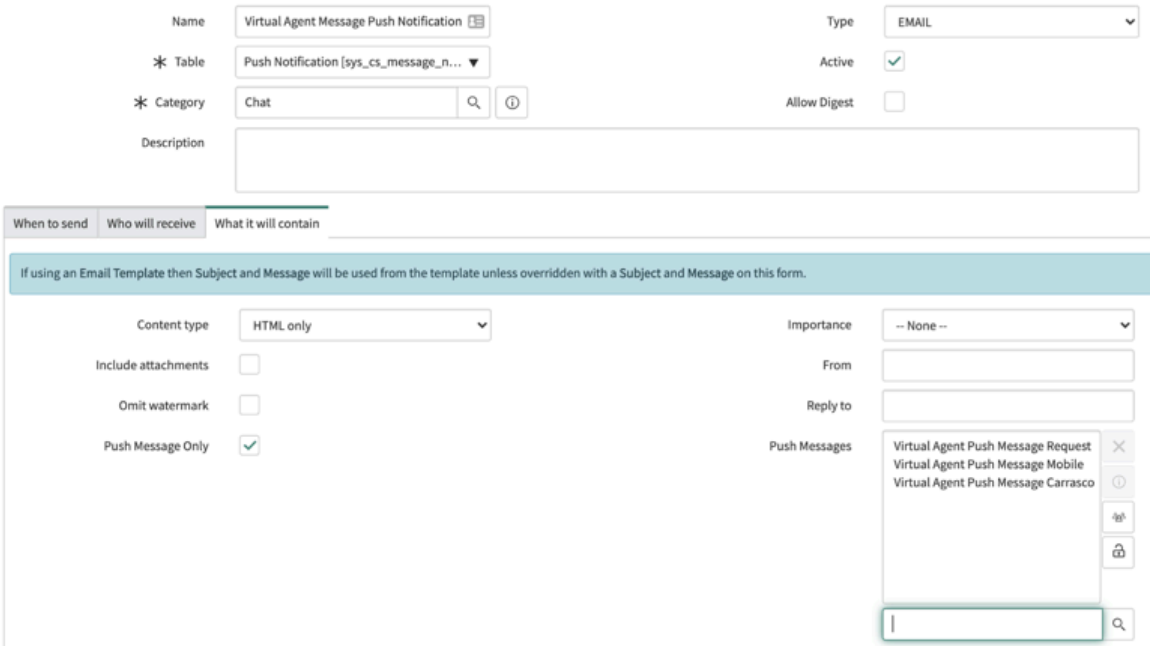
Modify the Virtual Agent Message Push Notification record to include your application. This record is used to trigger notifications to the Virtual Agent. All applications that will push notifications to the Virtual Agent must be configured in this record.

Before you begin

Role required: admin

Procedure

1. Navigate to **System Notification** > **Push** > **Push Notifications**.
2. Locate and open the push notification "Virtual Agent Message Push Notification". Ensure that the layout is set to the Advanced view. If not, switch to the Advanced view by selecting the associated link under **Related Links**.
3. Select the **What it will contain** tab.
4. In **Push Messages**, add the name of the push message record created in "Add a push notification message".



5. Select **Update**.

Setting up push notifications in your iOS application

In addition to the tasks that you must perform on your ServiceNow instance to configure a push notification, you must also include specific code in your iOS application.

Create the NowSDK NowPushService

One of the first things that needs to be done in your application is to create a `NowPushService`. The NowPush SDK provides a factory function to create this service. Add code similar to the following snippet early within your main code body.

```
func setup(with instanceURL: URL) -> AnyPublisher<NowService,
 ConfigurationError> {
  NowPush.makePushService(instanceUrl: instanceURL)
    .mapError { .sdkError($0) }
    .map { $0 as NowService }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    .eraseToAnyPublisher()
}
```

For additional information on the *NowPush.makePushService()* method, refer to NowPush API - iOS.

Register the push token

Apple provides a unique push notification token that identifies the device and application to receive push notifications. In order for an application to receive push notification, you must register this token using the NowPushService. Add a function similar to the following code snippet in your iOS application. This application must be registered with your ServiceNow instance.

```
func registerForPushNotifications(deviceToken: Data) {
  pushService.registerPushToken(deviceToken,
      pushAppName: "TestPushApp", // Modify this to be your iOS
 application name
      environment: environment) { [weak self] result in
    guard let self = self else { return }
    switch result {
    case .success:
      UserDefaults.standard.set(true, forKey:
 "pushNotificationsRegistered")
      self.pushRegistrationState = .registrationSuccess
    case .failure:
      UserDefaults.standard.set(false, forKey:
 "pushNotificationsRegistered")
      self.pushRegistrationState = .registrationFailed
    }
  }
}
```

For additional information on the *registerPushToken()* method, refer to NowPushService - registerPushToken(_token: Data, pushAppName: String, environment: NowPushEnvironment, completion: @escaping (Result<Data, NowPushError>) -> Void).

Unregister the push token

You need to unregister a push token whenever the user exits your application, such as when the user logs out. Use code similar to the following code snippet to unregister a push token. Ensure that you change *pushAppName* to the name of your iOS application.

```
func unregisterFromPushNotifications(deviceToken: Data) {
  pushService.unregisterPushToken(deviceToken, pushAppName:
 "TestPushApp", environment: environment) { [weak self] result
 in
    guard let self = self else { return }
    switch result {
    case .success:
      UserDefaults.standard.set(false, forKey:
 "pushNotificationsRegistered")
      self.pushRegistrationState = .unregisterSuccess
    case .failure:
      self.pushRegistrationState = .unregisterFailed
    }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
}
```

For additional information on the *unregisterPushToken()* method, refer to NowPushService - unregisterPushToken(_token: Data, pushAppName: String, environment: NowPushEnvironment, completion: @escaping (Result<Data, NowPushError>) -> Void).

Parse push payload

You will need to parse push notification payloads into a NowPushPayload object to collect information and to use the data in other parts of the application. Currently, this is only available for Virtual Agent push notifications. Use code similar to the following

```
func userNotificationCenter(_ center: UNUserNotificationCenter,
    didReceive response: UNNotificationResponse,
    withCompletionHandler completionHandler: @escaping () ->
 Void) {
  guard let pushService = pushService else {
    completionHandler()
    return
  }
  let userInfo = response.notification.request.content.userInfo
  _ = pushService.payloadFromUserInfo(userInfo)
    .flatMap(handleNowPushPayload)
}

func handleNowPushPayload(_ payload: NowPushPayload) ->
 Result<Void, NowPushError> {
  guard payload is NowPushVirtualAgent else {
    return .failure(NowPushError.unsupportedData)
  }
  launchVirtualAgent()
  return .success(())
}
```

Work with coders and Codable models

The iOS implementation of the Mobile SDK provides the additional functionality of coders and Codable models.

Coder enumeration

The Coder enumeration wraps a JSONEncoder with an accompanying JSONDecoder so that both provide the same coding strategy. Since many of the NowData framework APIs that handle Codable models rely on coding and decoding from JSON, the Coder simplifies and standardizes the way to specify encoders and decoders. Typically, using the default Coder (.default), which encodes and decodes dates using the nonISO8601UTC date formatting, is sufficient. The DateFormatter.nonISO8601UTC is a static date formatter provided by the NowData framework. It is responsible for encoding and decoding dates that were stored by the ServiceNow platform in the UTC (GMT+0) time zone, and are used by the *Table* API in yyyy-MM-dd HH:MM:SS format, by taking a device's locale and time zone into consideration.

If custom JSON coding is required, such as when handling specific date formats, you can create a custom Coder by supplying the custom JSONEncoder and JSONDecoder as the custom Coder's associated types. Both the encoder and decoder must use the same coding strategy.

For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
let myEncoder = JSONEncoder()
myEncoder.dateEncodingStrategy = .formatted(.nonISO8601UTC)
let myDecoder = JSONDecoder()
myDecoder.dateDecodingStrategy = .formatted(.nonISO8601UTC)

let myCoder: Coder = .custom(myEncoder, myDecoder)
```

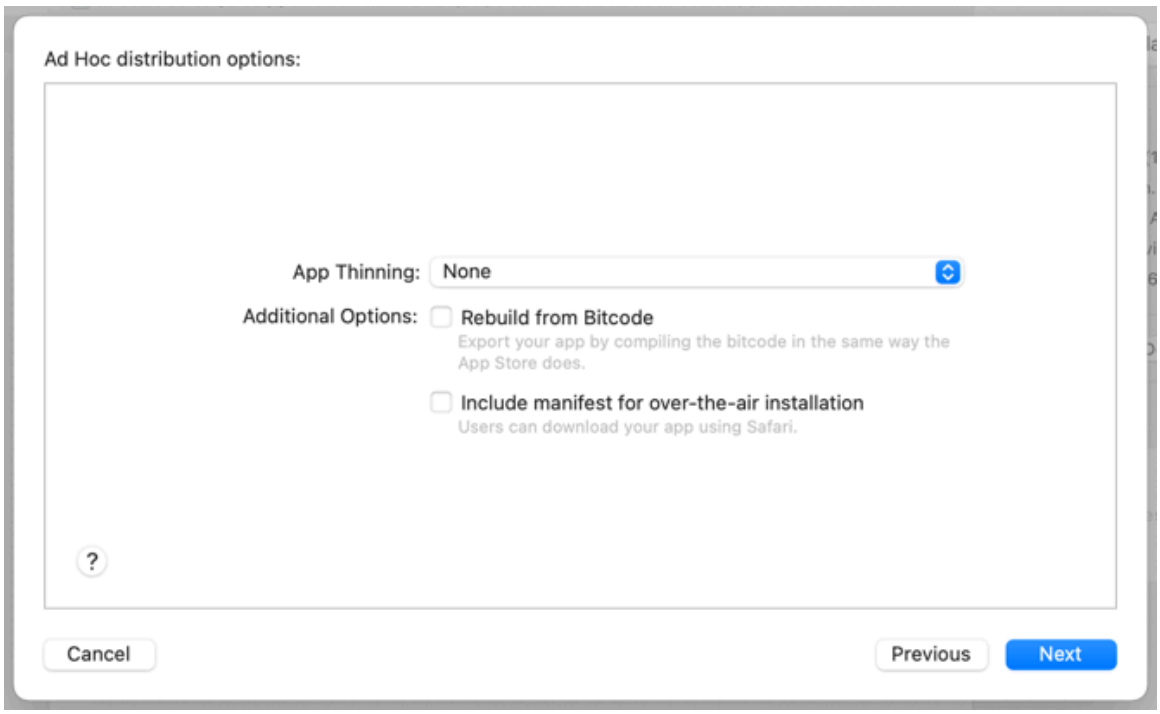
Codable extension for nested structures

The NowData framework provides functionality to decode nested structures by dot-separated path. This functionality makes it easier to consume nested data by removing the necessity of using wrapper structure and nested JSON decoding.

Archive your application for publishing

It is important to disable **rebuild from bitcode** when archiving your application for publication for release.

To disable rebuild from bitcode, either set **ENABLE_BITCODE** to `NO` in your project settings or clear the **Rebuild from Bitcode** check box when using Xcode to distribute your application.



Use NowUIColoring when theming NowWebThemeable and NowChatThemeable

The *`NowUIColoring`* interface contains all the colors used by all NowSDK modules.

For scenarios where you use similar color variables across multiple SDK modules, you can implement the *`NowUIColoring`* interface. Using this interface you can override color values and then use that implementation to override the nowUIColoring values inside the theme classes NowChatThemeable and NowWebThemeable. If color variables aren't overridden, the *`NowUIColoring`* interface uses the default colors.

The *`NowWebThemeable`* protocol contains specific colors that only pertain to NowWeb and the *`NowChatThemeable`* protocol contains specific colors that only pertain to NowChat. Common colors are in defined by *`NowUIColor`*. *`NowUIColor`* also contains all the default colors.

Producer Event Notification Framework developer guide

The Producer Event Notification Framework for Telecommunications, Media, and Technology enables the external distribution of events, such as trouble tickets, using a message-bus implemented in your network.

The Producer Event Notification Framework supports two different message-bus use cases:

1. Publishing events through the Hermes Messaging Service: If you plan to publish events using Hermes Kafka, you must configure the Producer Event Notification Framework for the Kafka message-bus. You can only use this message-bus for cloud-based instances. For details, see Configure the Producer Event Notification Framework to use the Hermes Messaging Service.

   For additional information on how to publish trouble ticket notifications using Hermes, see Producing outbound API notifications using Hermes.

   Note: Before you are able to implement this use case, you must already have the Hermes Messaging Service installed and configured on your instance. For details, see Hermes Messaging Service.

2. Publishing events through the open message bus: If your instance uses a custom message-bus, you must configure the Producer Event Notification Framework to use the open message bus to send events from your ServiceNow instance to consumers on your network. Both cloud-based and on-premise ServiceNow instances can publish events through the open message bus. For details, see Configure the Producer Event Notification Framework to use the Open Message Bus.

   For additional information on how to publish trouble ticket notifications using the open message bus, see Producing outbound API notifications using the open message bus.

This document describes the system configuration that must be performed, including the script includes that must be overridden to deploy these message-bus implementations in your ServiceNow ecosystem.

Producer system properties

The following table lists the properties within your ServiceNow instance that control the functionality of the Producer Event Notification Framework. Review the default values of these properties and if necessary, modify them for your specific implementation. To modify these properties, in the ServiceNow UI go to **All** > **System Properties** > **All Properties**.

Property	Description
sn_api_notif_mgmt.event.log	Level of logging to written to the debug logs. Valid values: • alert • crit • debug • emerg • err • info

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• notice • warning Default: err
sn_api_notif_mgmt.glide.mutex.script.maxspins	Maximum number of attempts to acquire a mutex lock on the records in the inbound queue. Default: 100
sn_api_notif_mgmt.glide.mutex.script.spinwait	Time to wait between attempts to acquire a lock on the records in the inbound queue. Unit: Milliseconds Default: 100
sn_api_notif_mgmt.inboundqueue.batch.limit	Number of records that the scheduler will pull and process from the inbound queue at one time (one batch). Default: 200
sn_api_notif_mgmt.inboundqueue.maxrecords	Maximum number of records that the scheduler will pull from the inbound queue for one scheduler run. This value is used in conjunction with the *sn_api_notif_mgmt.inboundqueue.batch.limit* parameter. For example, if the batch limit is set to 50 and the maxrecords is set to 200, and the number of records that are in the inbound queue is 130, the scheduler would pull three different batches of records in a single run; two with 50 records and one with 30 records. If the number of records in the inbound queue is 220, the scheduler would pull four batches of 50 records and the remaining 20 records would not be processed until the next time the scheduler runs. When setting this value, you must also consider the time that it will take for the scheduler to process multiple batches and set the *sn_api_notif_mgmt.schedule.max.runtime* value accordingly. Default: 200
sn_api_notif_mgmt.publisher_message_bus_configuration	Defines whether messages are published using the Hermes Messaging Service, the open message bus, or both message buses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Valid values: • hermes = Hermes Messaging Service • openMessageBus = open message bus • both = Event/message is sent out on both message buses. Default: openMessageBus
sn_api_notif_mgmt.schedule.max.runtime	Max time that a schedule job can run before it fails and reports an error. Unit: Milliseconds Default: 90,000

Configure the Producer Event Notification Framework to use the Hermes Messaging Service

If you are using the Hermes Messaging Service in your instance, you must configure the Producer Event Notification Framework for the Kafka message-bus.

Before you begin

Role required: admin

The Hermes Messaging Service must be activated. For details, see Hermes Messaging Service activation.

The following code snippet shows the *HermesEventPublisher* methods that must be called to configure the elements needed to send a message to a topic using the Hermes Messaging Service. The ProducerV2 API is then called to send the message.

```
publishEventToHermesKafka: function(tmfEventPayload) {
  if (gs.nil(tmfEventPayload)) {
    return;
  }
  this.publishMessageThroughProducerV2API(tmfEventPayload)

},

publishMessageThroughProducerV2API: function(message) {
  if (gs.nil(message)) return;
  var comptableTopicSysIds =
 this.fetchTopicsForMessage(message);
  if (gs.nil(comptableTopicSysIds)) return;

  for (var i = 0; i < comptableTopicSysIds.length; i++) {
    var partitionKey = this.fetchPartionKey(message);
    var headers = this.fetchMessageHeaders(message)
    try {
      var producer = new sn_ih_kafka.ProducerV2();
      producer.send(comptableTopicSysIds[i], partitionKey,
 JSON.stringify(message), false, headers);
    } catch (ex) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      this._logger.logErr("Publishing message to Hermes Kafka
 Failed, error is: " + ex);
    }
  }
},
```

Procedure

1. Set up a secure connection to the Hermes Messaging Service.
   For details, see Set up a secure connection to the Hermes Messaging Service.
2. Override the default functionality in the HermesEventPublisherOOB - fetchTopicsForMessage(Object message) method with your custom topic picker logic when publishing a message to the Hermes Messaging Service.
   In the *HermesEventPublisher - fetchTopicsForMessage()* method, you must provide logic that determines which Kafka topic or topics to send a specified message to. You then return the sys_ids of those topic records in an array.

   You can select a topic based on an attribute in the message payload or you can return the same topic for each message if your implementation only utilizes a single topic.

   The following example shows how to return the same topic record sys_id for each passed message.

   ```
   // Return the same topic for all messages if your
    // implementation only supports one kind of topic

   fetchTopicsForMessage: function(message) {
   // Return the same sys_id for all passed messages which
   // implies that all of the messages are published to the same
    topic.
   return ['91564fc087f8351063151f473cbb35f8'];
   },
   ```

   The following example shows how to identify topics to send a message to based on the event type in the message.

   ```
   // Fetch the topic based on the message content.
   // This could be based on the message domain type or the
    message event type.

   fetchTopicsForMessage: function(message) {
   // Implement to return topic based on a message content
   // Implementor may decide a topic based on 'eventType' or any
    other attribute.

   var eventType = message.eventType;

   var topicSysIdsArr =
    this.fetchTopicBasedOnEventType(eventType);
   return topicSysIdsArr

   },
   ```

3. Override the default functionality in the HermesEventPublisherOOB - fetchPartionKey(Object message) method with your custom logic to return the partition key to use when publishing a message to the Hermes Messaging Service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following list includes some possible types of partition keys to return and their associated benefits:

- An auto-generated unique ID. This type of partition key ensures that messages are evenly published across topic partitions. This is the default implementation.
- A unique key based on the message event type (or any other message attribute). This type of partition key ensures sequencing of messages of that event type (or other message attribute).
- The same partition key, which causes messages to be sent on the same partition. This type of partition key ensures strict sequencing of messages at the Kafka consumer group level.

The following example shows how to return a random ID for each partition key.

```
fetchPartionKey: function(message) {
// Implement it for custom partition key
// Random message keys ensure better distribution of message
 across partitions.
// Same message keys ensure that message always goes to the
 same partition.
// This ensures strict sequencing of messages at the Kafka
 consumer group level.
return gs.generateGUID();
},
```

The following example shows how to return a partition key based on the event type in the message.

```
// Implementation where the partition key is decided based on
 the event type.
fetchPartionKey: function(message) {

var eventType = message.eventType;
var partionKey = fetchPartionKeyForMessage(eventType);
return partionKey;
},
```

4. Override the default functionality in the HermesEventPublisherOOB - fetchMessageHeaders(Object message) method with your custom logic to fetch the header for a specified message before publishing the message through the Hermes Messaging Service. Refer to the Apache Kafka documentation for more information on these headers.

   The following example shows how to return headers based on the event type in the message.

```
fetchMessageHeaders: function(message) {
// Returned headers are based on the event type passed in the
 message object.
  var eventType = message.eventType;
  var headerObject = fetchHeadersBasedOnEventType(eventType);
  return headerObject;
},
```

Configure the Producer Event Notification Framework to use the Open Message Bus

If you have deployed or plan to deploy the Open Message Bus in your instance, you must configure the Producer Event Notification Framework for this message-bus. You can deploy this message-bus for both cloud and on-premise instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

For additional information on the publishing of messages using the open message bus, see Producing outbound API notifications using the open message bus.

Procedure

1. Synchronize the topics in your current message-bus with your ServiceNow instance.

   For additional information on synchronizing topics, see Producing outbound API notifications using the open message bus.

2. Customize the OpenMessageBusEventPublisherOOB - publishMessageToComptibleRestProxy(Object tmfEventPayload, Array compatibleTopicArr) method to send messages directly to a preconfigured REST action.
   This method is responsible for sending a message to the custom message platform's REST proxy using spoke selector. The custom message platform is your message-bus through which messages are published.

   The following code example shows how to customize this method to use spoke selector flow and a custom action instead of a spoke selector.

```
publishMessageToComptibleRestProxy: function(tmfEventPayload,
 compatibleTopicArr) {

  if (gs.nil(tmfEventPayload) || gs.nil(compatibleTopicArr)) {
    return;
  }
  for (var i = 0; i < compatibleTopicArr.length; i++) {

    // Invoking spoke selector flow which will in turn pick the
 rest proxy based on the input condition
    var topicGr = new GlideRecord(Constants.TABLE_TOPIC);
    topicGr.get(compatibleTopicArr[i]);
    if (!topicGr.isValidRecord()) {
      this._logger.debug("Invalid topic sys_id passed
 to open message publisher. Sys_id passed is " +
 compatibleTopicArr[i]);
      return;
    }

    // NOTE THAT IN THIS IMPLEMENTATION INVOKES A CUSTOM ACTION
 INSTEAD OF SPOKE SELECTOR
    var restProxyResponse = new
 sn_appss.RequestAPI(spokeSelectorRequestTypeId,
 spokeSelectorRequestTypeInputMap,
 spokeSelectorRequestTypeContextObject).execute();

    // var restProxyResponse =
 sn_fd.FlowAPI.executeActionQuick('sn_api_notif_mgmt.demo_topic
_rest_proxy_response', spokeSelectorRequestTypeInputMap);
    var responseCode = restProxyResponse.response.code;
    if
 (Constants.REGISTRATION_RESPONSE_SUCCESS_CODES.indexOf(respons
eCode) == -1) {
      this._logger.logErr("Publishing message to Message bus
 rest proxy failed with HTTP response code " + responseCode);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      }
    }
},
```

3. Configure the REST proxy for the topics.
   After the spoke is configured, messages are published in the specified REST proxy for topics configured in the spoke.

   a. Navigate to **All** > **Spoke selector** > **Request type**

   b. Select **Topic Rest Proxy Outbound Request**.

   c. Select the tab **Integration request definitions**.

   d. Create an integration request definition entry to configure the spoke.
   You can also refer to the **Demo Rest Proxy Response Def** entry for additional guidance.

Configure trouble ticket notifications using the Producer Event Notification Framework

The base implementation of trouble ticket notification includes a set of trouble ticket events to demonstrate the capabilities of the system.

These trouble ticket events include:

- Trouble ticket created (incident): `TROUBLE_TICKET_CREATE: "TroubleTicketCreateEvent"`
- Trouble ticket created (case): `TROUBLE_TICKET_CREATE_FOR_CASE: "TroubleTicketCreateEventForCase"`
- Trouble ticket status change (incident): `TROUBLE_TICKET_STATUS_CHANGE: "TroubleTicketStatusChangeEvent"`
- Trouble ticket attribute value change (incident): `TROUBLE_TICKET_ATTRIBUTE_CHANGE: "TroubleTicketAttributeChangeEvent"`

If needed, you can add trouble ticket events to your implementation by performing the following steps:

1. Add a new business rule. This business rule must be associated with the table in which the record, incident or case, is stored. For additional information, see Add a business rule for a new trouble ticket event.
2. Configure the payload generation for the new trouble ticket event. For additional information see, Generate the payload for a new trouble ticket event

You can also modify the payload of existing trouble ticket events. For details, see Modify a trouble ticket event payload.

Add a business rule for a new trouble ticket event

When adding a new trouble ticket event to your implementation, you must add a business rule to your ServiceNow instance.

This business rule must push the Glide snapshot of the corresponding incident or case record into the Producer Notification Framework inbound queue, Inbound Queue [sn_tmt_core_inbound_queue] table, where it is then processed and published by the Producer Notification Framework.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code snippet shows an example of a business rule for processing the `ResolveTroubleTicketEventForIncident` ticket notification event on the Incident [incident] table. When calling the *`pushEventsToQueue()`* method to push the event onto the inbound queue, you must pass the event type. For this example it is `ResolveTroubleTicketEventForIncident`. This event type can be any alphanumeric value that you want, but it must be unique as it is used by the system to determine how to process the trouble ticket event. The list of event types for the base system are defined in the *`Constants.EVENT_TYPES`* object in the `Constants [sn_api_notif_mgmt.Constants]` script include.

For details on creating a business rule, see Create a business rule for your service.

```
// Add following lines of code in script section (Advanced tab)
 of BR for pushing 'ResolveTroubleTicketEventForIncident' to the
 inbound queue.

(function executeRule(current, previous /*null when async*/ ) {

// Note that event needs to be passed at BR level itself as
 after this step, we would be left with glide snapshot only

new
 TroubleTicketNotificationUtil().pushEventsToQueue(current,'Reso
lveTroubleTicketEventForIncident',
 Constants.TROUBLE_TICKET_TYPE.INCIDENT);

})(current, previous)
```

Generate the payload for a new trouble ticket event

When adding a trouble ticket event to your implementation, you must create a function that generates the required TMF-compliant payload for that event type. In addition, you must add that function to the case statement that directs the logic to this function when processing this type of event record.

Create a method that generates the payload for the new trouble ticket event

In the `TroubleTicketNotificationUtil` script include, you must add a method that constructs the required TMF-compliant payload for the new trouble ticket event and then return that payload.

For examples of methods that create payloads for the base system trouble ticket events, refer to the following methods in the `TroubleTicketNotificationUtilOOB` script include:

- *`generateCreateTroubleTicketEventPaylaod()`*
- *`generateCreateTroubleTicketEventPaylaodForCase()`*
- *`generateTroubleTicketAttributeChangePayload()`*
- *`generateTroubleTicketStatusChangePayload()`*

Add the event to the fetchEventHandlerAndCreateTMFEvent() switch/case logic

For the function that you created to be executed, you must add it in the `switch/case` logic within the *`fetchEventHandlerAndCreateTMFEvent()`* method of the `EventProcessorUtil` script include. The following code snippet shows the updates necessary to add the `ResolveTroubleTicketEventForIncident` event type to this method. For details on the *`fetchEventHandlerAndCreateTMFEvent()`* method, see

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

EventProcessorUtilOOB - fetchEventHandlerAndCreateTMFEvent(Object eventSnapshot, String eventType, String eventId).

```
fetchEventHandlerAndCreateTMFEvent: function(eventSnapshot,
 eventType, eventId) {
  var eventPayload;
  switch (eventType) {
    case Constants.EVENT_TYPES.TROUBLE_TICKET_STATUS_CHANGE:
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateTroubl
eTicketStatusChangePayload(eventSnapshot, eventType, eventId);
      break;

    case Constants.EVENT_TYPES.TROUBLE_TICKET_CREATE:
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateCreate
TroubleTicketEventPaylaod(eventSnapshot, eventType, eventId);
      break;

    case Constants.EVENT_TYPES.TROUBLE_TICKET_ATTRIBUTE_CHANGE:
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateTroubl
eTicketAttributeChangePayload(eventSnapshot, eventType,
 eventId);
      break;

    case Constants.EVENT_TYPES.TROUBLE_TICKET_CREATE_FOR_CASE:
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateCreate
TroubleTicketEventPaylaodForCase(eventSnapshot, eventType,
 eventId);
      break;

    // Add a new case statement for the
 ResolveTroubleTicketEventForIncident event type
    case 'ResolveTroubleTicketEventForIncident':
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateResolv
eTroubleTicketEventPyaload(eventSnapshot, eventType, eventId);
      break;

    default:
      this._logger.debug("Event with id " + eventId + " could
 not find the matching payload generator");
      eventPayload = null;
  }
  return eventPayload;
},
```

Modify a trouble ticket event payload

The base trouble ticket event notification implementation provides multiple default trouble ticket event type examples. You may need to alter the payloads for these events within your implementation to meet your actual needs. You may also need to configure the payload for any new trouble ticket events that you add to your implementation.

This section describes how to modify the payload for the "Attribute change event for Incident" trouble ticket event. Use these same steps to modify the payload of any trouble ticket event type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add event header attributes to all trouble ticket event payloads

To add event header attributes to all trouble ticket event payloads, you must override the *addAdditionalEventAttributes()* method in the TroubleTicketNotificationUtil script include. Adding new attributes in this method adds header-level attributes to all trouble ticket event payloads.

The following code example shows how to add the attribute schemaLocation to all trouble ticket event payloads.

```
addAdditionalEventAttributes': function(tmfEventPayload) {
  // Add "schemaLocation" as a header attribute
  TroubleTicketEventObject.schemaLocation =
 "http://xx/Event.schema.json",
}
```

Add attributes to a specific trouble ticket event payload

To add attributes to a specific trouble ticket event payload, you must override the method associated with that event such as the *addAttributeChangeTroubleTicketAttributes()* method in the TroubleTicketNotificationUtil script include. Adding new attributes in this method adds event-level attributes to that specific trouble ticket event payload.

The following code example shows how to add the attribute correlationId to the "Attribute change event for Incident" trouble ticket event.

```
addAttributeChangeTroubleTicketAttributes:
 function(troubleTicketGr) {
  var troubleTicketResource = {};
  var troubleTicketAttributesObj = {};

 this.addMandatoryTroubleTicketAttributes(troubleTicketAttribute
sObj, troubleTicketGr);

// Add the new attribute correlation id.
  TroubleTicketAttributesObj.correlationId =
 troubleTicketGr._value.correlation_id;
  troubleTicketResource.troubleTicket =
 troubleTicketAttributesObj;
  return troubleTicketResource;
},
```

Override Event Management Topic Open API functionality

The *Event Management Topic Open API* enables you to save topic records in the Topic [sn_api_notif_mgmt_topic] table after validating the topic payload.

You can override the processing of a topic record by updating the methods in the TopicAPIUtilsOOB API in the *TopicAPIUtils* API.

The following is the list of available methods within this API and the default functionality that they provide:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- TopicAPIUtilsOOB - createTopicHelper(Object topicObject, Array warnings): Inserts the payload passed in the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint into the Topic [sn_api_notif_mgmt_topic] table.
- TopicAPIUtilsOOB - getCreateTopicSchema(): Returns the defined schema for the payload used by the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint to validate the topic payload. The default payload schema, *Constants.SCHEMA*, is located in the `sn_api_notif_mgmt.Constants` script include.
- TopicAPIUtilsOOB - isValidCreateTopicPayload(Object topicObject, String schema, Array warnings): Validates the payload passed into the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint. This validation is performed on the request body and the schema.
- TopicAPIUtilsOOB - prepareCreateTopicResponse(Object topicObject, String topicSysId, Array warnings): Generates and returns the response to a *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint call.
- TopicAPIUtilsOOB - processTopicCreation(Object topicObject): Processes the request made by the *Event Management Topic Open API* endpoint. This method invokes the helper methods needed for data insertion, schema validation, request body validation, and response-orchestration. Override this method if you need to customize the fundamental processing of the Event Management Topic Open - POST /sn_api_notif_mgmt/topic request. Otherwise, override the individual helper methods.
- TopicAPIUtilsOOB - transformCreateTopicResponse(Object topicObject, String topicSysId): Provides the ability to add custom data to the response object returned to the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint.
- TopicAPIUtilsOOB - validateTopicAttributes(Object topicObject, Array details): Validates whether the topic name, header-query, content-query, and namespace combination passed in the *Event Management Topic Open API* endpoint payload is unique. The endpoint uses this attribute combinations to determine whether the topic currently exists in the Topic [sn_api_notif_mgmt_topic] table. The default implementation also checks whether the *name* attribute, which is defined as required in the default topic payload schema, is included in the passed payload.
- TopicAPIUtilsOOB - validateTopicExternalId(Object topicObject, Array details): Validates the topic external ID passed in the request body of the *Event Management Topic Open API* endpoint. In the base implementation this only validates that the external ID is not empty.

Product Order Open API Developer Guide

Use the *Product Order Open API* to create, update, and retrieve product order information.

This developer guide provides information on how to extend the Product Order Open API to make various customizations.

Extending the Product Order Open API

The *Product Order Open API* can be extended by editing script includes.

These script includes should only be edited with an understanding of the consequences of the changes.

- `TMFProductOrderAPIUtil`: Contains functions to handle POST requests.
- `TMFProductOrderGetAPIUtil`: Contains functions to handle GET requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `ProductOrderExtensionOOB`: Contains helper functions that support functions in `TMFProductOrderAPIUtil` and `TMFProductOrderGetAPIUtil`.
- `ProductOrderProcessor`: An empty script include file. Use this file to define any functions that you want to override from `ProductOrderExtensionOOB`.

Extend the *`Product Order Open API`* to make the following customizations.

Required parameters

To change which request body parameters are required or not required to create a product order, override the function `getProductOrderSchema()` contained in the `ProductOrderExtensionOOB` script include.

The function `getProductOrderSchema()` reads the schema from the `TMFOrderAPIConstants` script include. `TMFOrderAPIConstants` is protected and can't be edited, so you can't just update the schema. Instead, a new schema must be read from a different file. You can override `getProductOrderSchema()` to read a new schema. To override `getProductOrderSchema()`, write a function with the same name in the `ProductOrderProcessor` script include. The new function in `ProductOrderProcessor` will be called by `TMFProductOrderAPIUtil` to replace the default `getProductOrderSchema()` function in `ProductOrderExtensionOOB`.

In this example, `getProductOrderSchema()` returns a custom schema that is defined in a new constant file.

```
// ProductOrderProcessor

var ProductOrderProcessor = Class.create();
ProductOrderProcessor.prototype =
 Object.extendsObject(ProductOrderExtensionOOB, {
   // Define overriding functions here
   // Function name and parameters must be identical to the
 function it overrides

   getProductOrderSchema: function() {
     //Define your own custom schema in a new constant file
       return JSON.parse(Constants.SCHEMA.CREATE_PRODUCT_ORDER);
   },

   type: 'ProductOrderProcessor'
});
```

Request body validation

To perform additional validation on the request body, override `ProductOrderExtensionOOB` functions. `ProductOrderExtensionOOB` contains the following four helper functions that return `true` by default.

- `validatePostRequest()` - Called by `processCreateOrder()` in `TMFProductOrderAPIUtil`.
- `validateProductObj()` - Called by `processCreateOrder()` in `TMFProductOrderAPIUtil`.
- `validateRelatedPartyObj()` - Called by `processCreateOrder()` in `TMFProductOrderAPIUtil`.
- `validateGetRequest()` - Called by `processGetOrder()` in `TMFProductOrderGetAPIUtil`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If a helper function returns `false`, it stops the API operation. To apply custom validation, override `ProductOrderExtensionOOB` helper functions by creating functions with identical names and parameters in `ProductOrderProcessor`. These new `ProductOrderProcessor` functions will be called by `TMFProductOrderAPIUtil` and `TMFProductOrderGetAPIUtil` to replace the default `ProductOrderExtensionOOB` helper functions.

In this example, a function in `ProductOrderProcessor` overrides a default function in `ProductOrderExtensionOOB` to perform validation on the *`productOrderItem`* attribute.

```
// ProductOrderProcessor

var ProductOrderProcessor = Class.create();
ProductOrderProcessor.prototype =
 Object.extendsObject(ProductOrderExtensionOOB, {
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides

    validatePostRequest: function(orderObject, details) {
        // Returning false terminates the POST request
        // Make sure to push error message in details array in
 case of error
        if (gs.nil(orderObject.productOrderItem)) {
            details.push(new
 TMFCommonOrderAPIUtil().getErrorDetailsObj(TMFOrderAPIConstants
.MESSAGES.MISSING_ORDER_ITEM, '/'));
            return false;
        }
        return true;
    },

    type: 'ProductOrderProcessor'
});
```

Additional REST operations

To create additional operations beyond the existing GET and POST operations, create additional scripted REST resources for the *`Product Order Open API`*. The logic of the new scripted REST resources should be consistent with the existing operations. Define functions for the new operations in a new script include.

Field mapping

When creating records, the API maps request body parameters to record fields. When retrieving records, the API maps record fields to response object attributes.

`ProductOrderExtensionOOB` contains the following functions to map a POST request body to a GlideRecord.

- `transformOrderGr()`
- `transformOrdLineItemGr()`
- `getLineItemPrice()`
- `transformPriceOrderTypeAndState()`
- `transformCustLineItmContact()`
- `transformOrderItemChar()`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ProductOrderExtensionOOB contains the following functions to map a GlideRecord to a response object for GET or POST requests.

- `transformPostOrderResponse()`
- `transformGetOrderResponse()`
- `transformProductObj()`
- `transformRelatedPartyCustomerLineItem()`
- `transformOrderItemRelationship()`
- `transformGetOrdLineItmResponse()`
- `transformProductCharacteristics()`
- `transformProductSpecification()`

Customize field mappings to add and retrieve data for additional fields, or to change the default mappings for fields. To customize the field mappings, override ProductOrderExtensionOOB mapping functions by creating functions with identical names and parameters in ProductOrderProcessor. These new ProductOrderProcessor functions will be used by TMFProductOrderAPIUtil and TMFProductOrderGetAPIUtil to replace the default ProductOrderExtensionOOB mapping functions.

In this example, two functions in ProductOrderProcessor override the default functions in ProductOrderExtensionOOB to create mappings for the *external_id* and *sys_id* fields.

```
// ProductOrderProcessor

var ProductOrderProcessor = Class.create();
ProductOrderProcessor.prototype =
 Object.extendsObject(ProductOrderExtensionOOB, {
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides

    transformOrderGr: function(requestObject, orderGr) {
        orderGr.external_id = requestObject.externalId;
        return orderGr;
    },

    transformPostOrderResponse: function(orderObject, orderGr) {
        orderObject.id = orderGr.getValue('sys_id');
        return orderObject;
    },

    type: 'ProductOrderProcessor'
});
```

Resource Inventory Open API Developer Guide

Use the *Resource Inventory Open API* to create, retrieve, update, and delete resources such as interface cards, logical and physical connections, network sites, and more.

This developer guide provides information on how to extend the Resource Inventory Open API to make various customizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extending the Resource Inventory Open API

The *Resource Inventory Open API* can be extended using extension points and script includes.

Extension points

The *Resource Inventory Open API* includes extension points that can be used to modify the existing schema for the API, which defines required parameters. Extension points can also be used to add new parameters and map them to fields on the ServiceNow AI Platform, or to change the mapping for existing parameters. For example, you can add new resource characteristics and map them to the appropriate fields.

The following extension points are included with the *Resource Inventory Open API*.

- `TNITMFResourceInventoryAPICreateResource`: Extension point to create a resource.
- `TNITMFResourceInventoryAPIPatchResource`: Extension point to update a resource.
- `TNITMFResourceInventoryAPITransformToIREPayload`: Extension point to create an Identification and Reconciliation engine (IRE) payload from a TMF request.
- `TNITMFResourceInventoryAPITransformToResponse`: Extension point to create a TMF response from a resource *GlideRecord*.
- `TNITMFResourceInventoryAPIValidateCreate`: Extension point to validate a TMF POST request.
- `TNITMFResourceInventoryAPIValidatePatch`: Extension point to validate a TMF PATCH request.

Script includes

Use script includes to override the default validation and transformation functions. Default functions are defined in the `sn_ni_core` . `TNITMFResourceInventoryProcessor00B` script include. To override the default functions, create functions with identical names and parameters in the `sn_ni_core` . `TNITMFResourceInventoryProcessor` script include.

ScopedCacheManager API Developer Guide

Scoped caches allow customers to store custom data in memory for faster access, and define when it becomes invalidated. This can be useful when working with data takes longer to obtainthat from scratch, such as the results of a query across multiple tables. Use the *ScopedCacheManager* API to retrieve, set, and flush cache data for scoped applications.

This guide includes instructions for creating a scoped cache and table pair to use with the ScopedCacheManager API.

You can assign the following types of table pairs to a scoped cache:

- **Table pair cache**: When you need to perform any update operation in the table, all the entries in the cache are also flushed.
- **Table row pair cache**: When you need to perform any update operation in the table, only the entries that have the same sys_id as the edited record get flushed from the cache. The other entries remain the same.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Table column pair cache**: When you edit a field in the list of selected columns, the entire cache is flushed.
- **Table column and row pair cache**: When you edit a field in the list of selected columns, the entries that have the same sys_id as the edited record get flushed from the cache.

Creating a scoped cache and table pair

Create a scoped cache and define its cache pair.

Before you begin

Role required: admin

Procedure

1. Create a scoped cache. Go to **All** > **System Definition** > **Scoped Caches**.
2. Click **New** and enter a meaningful name in the **Cache Name** field.
3. Enter a number in the **Max Entries** field. This value represents the maximum number of entries allowed for this cache. The maximum value is 100.

   Note: The **Application** field should automatically include the name of the scoped application for which this cache is being created.

4. Make sure the **Active** check box is selected.
5. Check the **Always Compress** check box if you want the scoped cache values to occupy less memory space by compressing it.
6. Click **Submit**.
   The scoped cache has been created.
7. Create a cache pair. Go to **All** > **System Definition** > **Scoped Cache Pairs**.
8. Click **New** and click the magnifying glass to select a cache in the **Scoped Cache** field.
9. Select a table from the **Table** menu.
10. Select an option from the **Pair type** menu.
    - **Table pair cache**: When you need to perform any update operation in the table, all the entries in the cache are also flushed.
    - **Table row pair cache**: When you need to perform any update operation in the table, only the entries that have the same sys_id as the edited record get flushed from the cache. The other entries remain the same.
    - **Table column pair cache**: When you edit a field in the list of selected columns, the entire cache is flushed.
    - **Table column and row pair cache**: When you edit a field in the list of selected columns, the entries that have the same sys_id as the edited record get flushed from the cache.
11. Click **Submit**.
    The scoped cache table pair has been created and is ready to use with the `ScopedCacheManager` API.

Service Order Open API Developer Guide

Use the `Service Order Open API` to create, update, and retrieve service order information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This developer guide provides information on how to extend the Service Order Open API to make various customizations.

Extending the Service Order Open API

The *Service Order Open API* can be extended by editing script includes.

These script includes should only be edited with an understanding of the consequences of the changes.

- TMFServiceOrderAPIUtil: Contains functions to handle POST requests.
- TMFServiceOrderGetAPIUtil: Contains functions to handle GET requests.
- ServiceOrderExtensionOOB: Contains helper functions that support functions in TMFServiceOrderAPIUtil and TMFServiceOrderGetAPIUtil.
- ServiceOrderProcessor: An empty script include file. Use this file to define any functions that you want to override from ServiceOrderExtensionOOB.

Extend the *Service Order Open API* to make the following customizations.

Required parameters

To change which request body parameters are required or not required to create a service order, override the function `getServiceOrderSchema()` contained in the ServiceOrderExtensionOOB script include.

The function `getServiceOrderSchema()` reads the schema from the TMFOrderAPIConstants script include. TMFOrderAPIConstants is protected and can't be edited, so you can't just update the schema. Instead, a new schema must be read from a different file. You can override `getServiceOrderSchema()` to read a new schema. To override `getServiceOrderSchema()`, write a function with the same name in the ServiceOrderProcessor script include. The new function in ServiceOrderProcessor will be called by TMFServiceOrderAPIUtil to replace the default `getServiceOrderSchema()` function in ServiceOrderExtensionOOB.

In this example, `getServiceOrderSchema()` returns a custom schema that is defined in a new constant file.

```
// ServiceOrderProcessor

var ServiceOrderProcessor = Class.create();
ServiceOrderProcessor.prototype =
 Object.extendsObject(ServiceOrderExtensionOOB, {
   // Define overriding functions here
   // Function name and parameters must be identical to the
 function it overrides

   getServiceOrderSchema: function() {
     //Define your own custom schema in a new constant file
       return JSON.parse(Constants.SCHEMA.CREATE_SERVICE_ORDER);
   },

   type: 'ServiceOrderProcessor'
});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body validation

To perform additional validation on the request body, override `ServiceOrderExtensionOOB` functions. `ServiceOrderExtensionOOB` contains the following four helper functions that return `true` by default.

- `validatePostRequest()` - Called by `processPostOrder()` in `TMFServiceOrderAPIUtil`.
- `validateServiceObj()` - Called by `processPostOrder()` in `TMFServiceOrderAPIUtil`.
- `validateRelatedPartyObj()` - Called by `processPostOrder()` in `TMFServiceOrderAPIUtil`.
- `validateGetRequest()` - Called by `processGetOrder()` in `TMFServiceOrderGetAPIUtil`.

If a helper function returns `false`, it stops the API operation. To apply custom validation, override `ServiceOrderExtensionOOB` helper functions by creating functions with identical names and parameters in `ServiceOrderProcessor`. These new `ServiceOrderProcessor` functions will be called by `TMFServiceOrderAPIUtil` and `TMFServiceOrderGetAPIUtil` to replace the default `ServiceOrderExtensionOOB` helper functions.

In this example, a function in `ServiceOrderProcessor` overrides a default function in `ServiceOrderExtensionOOB` to perform validation on the *`serviceOrderItem`* attribute.

```
// ServiceOrderProcessor

var ServiceOrderProcessor = Class.create();
ServiceOrderProcessor.prototype =
 Object.extendsObject(ServiceOrderExtensionOOB, {
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides

    validatePostRequest: function(orderObject, details) {
        // Returning false terminates the POST request
        // Make sure to push error message in details array in
 case of error
        if (gs.nil(orderObject.serviceOrderItem)) {
            details.push(new
 TMFCommonOrderAPIUtil().getErrorDetailsObj(TMFOrderAPIConstants
.MESSAGES.MISSING_ORDER_ITEM, '/'));
            return false;
        }
        return true;
    },

    type: 'ServiceOrderProcessor'
});
```

Additional REST operations

To create additional operations beyond the existing GET and POST operations, create additional scripted REST resources for the *`Service Order Open API`*. The logic of the new scripted REST resources should be consistent with the existing operations. Define functions for the new operations in a new script include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field mapping

When creating records, the API maps request body parameters to record fields. When retrieving records, the API maps record fields to response object attributes.

`ServiceOrderExtensionOOB` contains the following functions to map a POST request body to a GlideRecord.

- `transformOrderGr()`
- `transformOrdLineItemGr()`
- `transformCustLineItmContact()`
- `transformOrderItemChar()`

`ServiceOrderExtensionOOB` contains the following functions to map a GlideRecord to a response object for GET or POST requests.

- `transformPostOrderResponse()`
- `transformGetOrderResponse()`
- `transformServiceObj()`
- `transformRelatedPartyCustomerLineItem()`
- `transformOrderItemRelationship()`
- `transformGetOrdLineItmResponse()`
- `transformServiceCharacteristics()`
- `transformServiceSpecification()`

Customize field mappings to add and retrieve data for additional fields, or to change the default mappings for fields. To customize the field mappings, override `ServiceOrderExtensionOOB` mapping functions by creating functions with identical names and parameters in `ServiceOrderProcessor`. These new `ServiceOrderProcessor` functions will be used by `TMFServiceOrderAPIUtil` and `TMFServiceOrderGetAPIUtil` to replace the default `ServiceOrderExtensionOOB` mapping functions.

In this example, two functions in `ServiceOrderProcessor` override the default functions in `ServiceOrderExtensionOOB` to create mappings for the *`external_id`* and *`sys_id`* fields.

```
// ServiceOrderProcessor

var ServiceOrderProcessor = Class.create();
ServiceOrderProcessor.prototype =
 Object.extendsObject(ServiceOrderExtensionOOB, {
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides

    transformOrderGr: function(requestObject, orderGr) {
        orderGr.external_id = requestObject.externalId;
        return orderGr;
    },

    transformPostOrderResponse: function(orderObject, orderGr) {
        orderObject.id = orderGr.getValue('sys_id');
        return orderObject;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    },

    type: 'ServiceOrderProcessor'
});
```

Trouble Ticket Open API Developer Guide

Use the *Trouble Ticket Open API* to manage ticket information between external ticketing systems and the ServiceNow AI Platform. This API creates, updates, and retrieves data from the Case [sn_customerservice_case] and Incident [incident] tables.

This developer guide provides information on how to extend the Trouble Ticket Open API to make various customizations.

Extending the Trouble Ticket Open API

The *Trouble Ticket Open API* can be extended by editing script includes.

These script includes should only be edited with an understanding of the consequences of the changes.

- `TMFTroubleTicketAPIConstants`: Contains constants and required parameter information.
- `TMFTroubleTicketAPIUtil`: Contains functions to handle POST, GET, and PATCH requests.
- `TroubleTicketProcessorOOB`: Contains helper functions that support functions in TMFTroubleTicketAPIUtil.
- `TroubleTicketProcessor`: An empty script include file. Use this file to define any functions that you want to override from TroubleTicketProcessorOOB.

Extend the *Trouble Ticket Open API* to make the following customizations.

Required parameters

To change which request body parameters are required or not required, update the TMFTroubleTicketAPIConstants script include. By default, the request body to create a ticket (POST) requires the parameters *description*, *severity*, and *ticketType*. By default, the request body to update a ticket (PATCH) doesn't have required parameters.

- `TMFTroubleTicketAPIConstants.TROUBLE_TICKET_CREATION_SCHEMA`: Sets the required request body parameters to create a ticket.
- `TMFTroubleTicketAPIConstants.TROUBLE_TICKET_UPDATE_SCHEMA`: Sets the required request body parameters to update a ticket.

In this example, the *description*, *severity*, *status*, and *ticketType* parameters are required to create a ticket.

```
// TMFTroubleTicketAPIConstants
TMFTroubleTicketAPIConstants.TROUBLE_TICKET_CREATION_SCHEMA = {
    "title": "CreateTroubleTicket",
    "type": "object",
    "properties": {
        "description": {
            "type": "string"
        },
        "severity": {
            "type": "string"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        },
        "status": {
            "type": "string"
        },
        "ticketType": {
            "type": "string"
        }
    },
    "required": [
        "description",
        "severity",
        "status",
        "ticketType"
    ]
};
```

Request body validation

To perform additional validation on the request body, override TroubleTicketProcessorOOB functions. TroubleTicketProcessorOOB contains the following six helper functions that return `true` by default. These functions are called in TMFTroubleTicketAPIUtil.

- `verifyGetRequestForCase()` - Called by `processGetRequestForCase()`.
- `verifyPatchRequestForCase()` - Called by `processPatchRequestForCase()`.
- `verifyPostRequestForCase()` - Called by `processPostRequestForCase()`.
- `verifyGetRequestForIncident()` - Called by `processGetRequestForIncident()`.
- `verifyPatchRequestForIncident()` - Called by `processPatchRequestForIncident()`.
- `verifyPostRequestForIncident()` - Called by `processPostRequestForIncident()`.

If a helper function returns `false`, it stops the API operation. To apply custom validation, override TroubleTicketProcessorOOB helper functions by creating functions with identical names and parameters in TroubleTicketProcessor. These new TroubleTicketProcessor functions will be called by TMFTroubleTicketAPIUtil to replace the default TroubleTicketProcessorOOB helper functions.

In this example, a function in TroubleTicketProcessor overrides a default function in TroubleTicketProcessorOOB to perform validation on the name attribute.

```
// TroubleTicketProcessor
var TroubleTicketProcessor = Class.create();
TroubleTicketProcessor.prototype =
 Object.extendsObject(TroubleTicketProcessorOOB, {
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides

    verifyPostRequestForCase: function(caseObject,
 apiResponseProcessor){
        // Returning false terminates the POST request
        // Make sure to assign error message and reason
        if (caseObject.name != "Hello world") {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 apiResponseProcessor.setMessage(TMFTroubleTicketAPIConstants.ME
SSAGES.CASE_CREATION_FAILURE);
            apiResponseProcessor.setReason("No reason needed");
            return false;
        }
    },

    type: 'TroubleTicketProcessor'
});
```

Additional REST operations

To create additional operations beyond the existing GET, PATCH, and POST operations, create additional scripted REST resources for the Trouble Ticket Open API. The logic of the new scripted REST resources should be consistent with the existing operations. Define functions for the new operations in TMFTroubleTicketAPIUtil.

Field mapping

When creating or updating records, the API maps request body parameters to case and incident record fields. When retrieving records, the API maps record fields to response object attributes.

TroubleTicketProcessorOOB contains the following functions to map a PATCH or POST request body to a case or incident GlideRecord.

- `mapPatchRequestToCase()`
- `mapPostRequestToCase()`
- `mapPatchRequestToIncident()`
- `mapPostRequestToIncident()`

TroubleTicketProcessorOOB contains the following functions to map a case or incident GlideRecord to a JSON response object for GET, PATCH, or POST requests.

- `createGetResponseForCase()`
- `createPatchResponseForCase()`
- `createPostResponseForCase()`
- `createGetResponseForIncident()`
- `createPatchResponseForIncident()`
- `createPostResponseForIncident()`

Customize field mappings to add and retrieve data for additional case and incident fields, or to change the default mappings for fields. To customize the field mappings, override TroubleTicketProcessorOOB mapping functions by creating functions with identical names and parameters in TroubleTicketProcessor. These new TroubleTicketProcessor functions will be used by TMFTroubleTicketAPIUtil to replace the default TroubleTicketProcessorOOB mapping functions.

In this example, two functions in TroubleTicketProcessor override the default functions in TroubleTicketProcessorOOB to change the Description field mapping and add a mapping for the Contract field.

```
// TroubleTicketProcessor
var TroubleTicketProcessor = Class.create();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
TroubleTicketProcessor.prototype =
 Object.extendsObject(TroubleTicketProcessorOOB, {
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides

    mapPostRequestToCase: function(caseGr, caseObject){
        // Override default mapping for the Description field
        caseGr.description = "All cases will be created with
 this description";
        // Add new mapping to the Contract field
        caseGr.contract = caseObject.contract;
     },

    createPostResponseForCase: function(caseGr, caseObject){
        // Override default mapping for the description
 attribute
        caseObject.description = "This will always be the
 retrieved description";
        // Add new contract attribute to the response object
        caseObject.contract = caseGr.contract;
    },

    type: 'TroubleTicketProcessor'
});
```

Mapping logic for choice fields

The **State**, **Priority**, and **contact_type** fields are choice fields, where each choice is composed of a label and a corresponding value. For example, if the **State** field is set to **New**, the label is **New** and the value is **1**. The mapping between choice labels and values can be changed by overriding the choice field mapping functions.

TroubleTicketProcessorOOB contains the following choice field mapping functions.

- `transformCaseSeverity()`
- `transformCaseChannel()`
- `transformCaseStatus()`
- `transformIncidentSeverityToUrgency()`
- `transformIncidentSeverityToImpact()`
- `transformIncidentChannel()`
- `transformIncidentStatus()`

Override TroubleTicketProcessorOOB choice field mapping functions by creating functions with identical names and parameters in TroubleTicketProcessor. These new TroubleTicketProcessor functions will be used by TMFTroubleTicketAPIUtil to replace the default TroubleTicketProcessorOOB choice field mapping functions.

In this example, a function in TroubleTicketProcessor overrides a default function in TroubleTicketProcessorOOB to change the choice mapping for the **Status** field.

```
// TroubleTicketProcessor
var TroubleTicketProcessor = Class.create();
TroubleTicketProcessor.prototype =
 Object.extendsObject(TroubleTicketProcessorOOB, {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides

    transformCaseStatus: function(status){
        if (status == "Draft")
            return 1;
        else return 10;
    },

    type: 'TroubleTicketProcessor'
});
```

Use the client GlideList API in the Workspace Experience UI

Add a custom button to the Agent Workspace Lists page that returns list information in the current view. Define the information to return by adding client *GlideList* API methods to an action assignment.

Before you begin

Role required: admin

GlideList API methods are provided in the Action Assignments [sys_declarative_action_assignment] **List Action** view. You can add *GlideList* functionality to a custom button in the Workspace Experience UI. You can use the button to apply a *GlideList* method to the current view. Use the *GlideList* methods to manage table lists by getting list view details, setting filters, sorting by column, and more.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Actions & Components** > **List Actions**.
   If you are using *getFixedQuery()*, navigate to **Related List Actions** instead of **List Actions**.
2. Create a new action assignment by selecting **New**.
3. In the **Action label** field, type a button label.
4. Type a name into the **Action** name field.
   Providing text in this field ensures that you can add multiple buttons to the view.
5. From the **Implemented as** menu, select **Client Script**.
6. Right-click in the form header and select **Save**.
7. Select **Advanced View**.
8. Select the **Client Script** tab and add one or more method calls into the `onClick{}` method definition.
   This method defines what actions to take when the button is selected. For a list of available methods, see GlideList (Now Experience).

9. Select **Update**.
   You can test your button in a Workspace Experience table list view.

   Note: If the button uses the `getFixedQuery()` method, select the tab on a record in a Workspace Experience list to test your button.

   The following table illustrates successful button implementation in the Agent Workspace **Incidents (All)** table. The button implements the `GlideList addFilter()` method to display only active records.

Example button action applying a filter to a list

List before clicking	List after clicking
Before selecting the button, an assortment of active and inactive (closed) records display in the view.	Selecting the button filters the view to display only active records.
