@type	Part of TMF Open API standard. Annota always `ProductOrder`. This informal Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
	If there are any issues with the characteristics or characteristics option information, the endpoint stores the following comments in the work notes fields of the associated Customer Order Line Item record: • `The following Order Item characteristics does not exist: Review specification <characteristic.name> and correct the characteristic and characteristic option in the order line item prior to approving the order.` • `Order Item characteristic: <characteristic.name> with characteristic value: <characteristic.value>is invalid. Correct the characteristic values before approving the order.`
202	Accepted. Successful request for an order in asynchronous mode. That is, the request was made with the *mode* parameter set to `async` and the record is scheduled to be processed in the Inbound Queue [sn_tmt_core_inbound_queue] table.
400	Bad Request. Could be any of the following reasons: • `Invalid payload: Request body missing` - Payload was not passed in the request body. • `Invalid payload: productOrderItem is missing` - Product order line item object or JSON is missing. • `Invalid payload: productOrderItem id is missing` - The *id* parameter is missing in the product order line item of the payload. • `Invalid payload: productOrderItem action is missing` - The *action* parameter is missing in the product order line item of the payload. • `Invalid payload: productOrderItem productOffering is missing` - The product offering object or JSON is missing from the product order line item in the payload. • `Invalid payload: productOffering id is missing` - The *id* parameter is missing in the product order line item of the product offering object in the payload. • `Invalid payload: Product offering does not exist` - The product offering in the product order line item is not valid. • `Invalid payload: productOrderItem product is missing` - The product object or JSON in the product order line item is missing from the payload. • `Invalid payload: product productSpecification is missing` - The product specification object or JSON in the product order line item is missing from the payload. • `Invalid payload: productSpecification id is missing` - The *id* parameter in the product order line item of the product specification object is missing from the payload. • `Invalid payload: Product specification does not exist` - The product specification in the product order line item is not valid. • `Invalid payload: Product Inventory does not exist` - In a change order (action = change), the quantity of an item is greater than what is in stock.

Status codes (continued)

Status code	Description
	• `Invalid payload: Product inventory ID is missing` - In change order, the *`product.id`* is missing in the payload. • `Invalid payload: Sold Product is inactive` - In a change order, a product specified in the payload is inactive. • `Invalid payload: relatedParty is missing` - The related party object is missing from the payload. • `Invalid payload: Customer Account or Consumer is missing` - The related party customer or consumer object is missing from the payload. • `Invalid payload: Consumer does not exist` - The specified related party consumer does not exist in the ServiceNow instance. • `Invalid payload: Customer Account does not exist` - The specified related party customer does not exist in the ServiceNow instance. • `Invalid payload: Order creation failed` - Not able to create the requested order. • `Invalid payload: orderCurrency is required` - The *`orderCurrency`* parameter is missing from the payload. • `Inactive Currency Code: <currency>` - The provided currency is inactive in the ServiceNow instance. • `One or more line items has a different currency code than the order currency` - All line items do not have the same currency code as the order currency. • `In-flight revision to order currency not supported` - The *`orderCurrency`* parameter can't be updated after the order is created.

Response body parameters (JSON)

Name	Description
channel	Array of objects that describe the channels to use for selling the products. Data type: Array `"channel": [ { "id": "String", "name": "String" } ]`
channel.id	Unique identifier of the channel to use to sell the associated products. Channel ID values are located in the external_id

Name	Description
	field of the Distribution Channel [sn_prd_pm_distribution_channel] table. Data type: String
channel.name	Name of the channel to use to sell the associated products. Data type: String
committedDueDate	Date and time when the action must be performed on the order. This value must be the same as or later than the *committedDueDate* values for each order line item. Data type: String
externalId	External identifier for the customer order, such as a purchase order number. Data type: String
href	Relative link to the product order record. Data type: String
id	Sys_id of the customer order created for this request. Data type: String
note	Array of objects that describe additional notes made by the customer when ordering. Data type: Array `"note": [ { "text": "String" } ]`
note.text	Additional notes/comments made by the customer while ordering. Data type: String
orderCurrency	Currency code for the order and order line items.

Name	Description

	<pre>"recurringChargePeriod": "String"
	}
	]</pre>

productOrderItem.itemPrice.price	Description of the price of the associated product.
	
	Data type: Object
	<pre>"price": {
	"taxIncludedAmount": {Object}
	}</pre>

productOrderItem.itemPrice.price.taxIncludeAmount	Description of the price of the associated product, including the tax.
	
	Data type: Object
	<pre>"taxIncludedAmount": {
	"unit": "String",
	"value": Number
	}</pre>

productOrderItem.itemPrice.price.taxIncludeAmount.unit	Currency code in which the price is depicted. Data type: String
productOrderItem.itemPrice.price.taxIncludeAmount.value	Price of product, including any tax. Data type: Number
productOrderItem.itemPrice.priceType	Type of item price, recurring or non-recurring. Data type: String
productOrderItem.itemPrice.recurringChargePeriod	If the price is recurring, the recurring period, such as `month`. Data type: String

productOrderItem.product	Description of the instance details of the product purchased by the customer.
	
	Data type: Object
	<pre>"product": {
	"id": "String",
	"place": {Object},</pre>

Name	Description

	<pre>"productCharacteristic": [Array],
	"productSpecification": {Object},
	"relatedParty": {Object},
	"@type": "String"
	}</pre>

productOrderItem.product.id	Unique identifier of the product sold. Located in the sys_id or sn_ind_tmt_orm_external_id field of the Product Inventory [sn_ind_tmt_orm_product_inventory] table. This parameter is only returned if *`productOrderItem.action`* is `change` or `delete`. If both sys_id and external_id are present, the external_id is returned. Data type: String

productOrderItem.product.place	Maps of the locations on which to install the product.
	
	Data type: Object
	<pre>"place": {
	"id": "String",
	"@type": "String"
	}</pre>

productOrderItem.product.place.id	Sys_id of the associated location record in the Location [cmn_location] table. Data type: String

productOrderItem.product.productCharacteristic	Array of objects that describe the characteristics of the associated product.
	
	Data type: Array
	<pre>"productCharacteristic": [
	{
	"name": "String",
	"previousValue": "String",
	"value": "String"
	}
	]</pre>

Name	Description
productOrderItem.product.productCharacteristic.name	Name of the characteristic record to associate with the product. Located in the Characteristic [sn_prd_pm_characteristic] table. Data type: String
productOrderItem.product.productCharacteristic.previousValue	Previous characteristic option values if the update is for a change order. The request is a change order if the *`productOrderItem.action`* parameter is other than `add`. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productCharacteristic.value	Characteristic option values associated with the product. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productRelationship	List of product relationship details for an order line item. Data type: Array `"productRelationship": [ { "id": "String", "relationshipType": "String" } ]`
productOrderItem.product.productRelationship.id	Sys_id or sn_prd_invt_external_id of the product inventory. Located in the sys_id or sn_prd_invt_external_id field of the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
productOrderItem.product.productRelationship.relationshipType	Type of relationship between the order line item and the product inventory. Possible value: Requires

Name	Description
	Data type: String
productOrderItem.product.productSpecification	Description of the product specification associated with the product. Data type: Object `"productSpecification :" { "id": "String", "internalId": "String", "internalVersion": "String", "name": "String", "version": "String", "@type": "String" }`
productOrderItem.product.productSpecification.id	Initial_version or external_id of the product specification. The initial_version is the sys_id of the first version of the specification. Located in the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] table. If both sys_id and external_id are present, the external_id is returned. Data type: String
productOrderItem.product.productSpecification.internalId	Initial_version of the product specification. The initial_version is the sys_id of the first version of the specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.internalVersion	Version of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.name	Name of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String

Name	Description
productOrderItem.product.productSpecification.version	External_version of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.@type	Part of the TMF Open API standard. This value is always `ProductSpecificationRef`. This information is not stored. Data type: String
productOrderItem.product.relatedParty	List of contacts for line items. Data type: Array `"relatedParty:" [ { "email": "String", "firstName": "String", "lastName": "String", "phone": "String", "@referredType": "String", "@type": "String" } ]`
productOrderItem.product.relatedParty.email	Email address of the contact. Data type: String
productOrderItem.product.relatedParty.firstName	First name of the contact. Data type: String
productOrderItem.product.relatedParty.lastName	Last name of the contact. Data type: String Data type: String
productOrderItem.product.relatedParty.phone	Business phone number of the contact. Data type: String
productOrderItem.product.relatedParty.@referredType	Type of customer. Possible value: OrderLineItemContact

Name	Description
	Data type: String
productOrderItem.product.relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. This value is always `RelatedParty`. This information is not stored. Data type: String
productOrderItem.product.@type	Part of TMF Open API standard. Annotation for the product. This value is always `Product`. This information is not stored. Data type: String
productOrderItem.productOffering	Description of the product offering associated with the product. Data type: Object `"productOffering:" { "id": "String", "internalId": "String", "internalVersion": "String", "name": "String", "version": "String" }`
productOrderItem.productOffering.id	Initial_version or external_id of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the sys_id or external_id field of the Product Offering [sn_prd_pm_product_offering] table. If both sys_id and external_id are present, the external_id is returned. Data type: String
productOrderItem.productOffering.internalId	Initial_version of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOffering.internalVersion	Version of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table.

Name	Description
	Data type: String
productOrderItem.productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOffering.version	External_version of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOrderItemRelationship	Array of objects that describe the relationships between order line items. Data type: Array `"productOrderItemRelationship": [ { "id": "String", "relationshipType": "String" } ]`
productOrderItem.productOrderItemRelationship.id	Unique identifier of the related line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table. Data type: String
productOrderItem.productOrderItemRelationship.relationshipType	Type of relationship between the two line items. This information is used to identify the relationship hierarchy. Possible values: • HasChild • HasParent • Requires `HasChild` and `HasParent` are used for parent/child relationships. `Requires` is used for horizontal relationships (a line item requires another line item).

Name	Description
	Data type: String
productOrderItem.quantity	Number of the associated items to order. Data type: Number
productOrderItem.state	Current state of the product order item. This value is always `new`. Data type: String
productOrderItem.@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrderItem`. This information is not stored. Data type: String
relatedParty	List of contacts for the order. Each contact is an object in the array. Must list at least one item which contains customer account or consumer account information. Data type: Array `"relatedParty": [ { "id": "String", "name": "String", "@referredType": "String", "@type": "String" } ]`
relatedParty.id	Sys_id or external_id of the account, customer contact, or consumer associated with the order. Located in the Account [customer_account], Contact [customer_contact] table, or Consumer [csm_consumer] table. Data type: String
relatedParty.name	Name of the account, customer, or consumer. Data type: String
relatedParty.type	Type of customer. Possible values:

Name	Description
	• Consumer • Customer • CustomerContact Data type: String
requestedCompletionDate	Delivery date requested by the customer. Data type: String
requestedStartDate	Order start date requested by the customer. Data type: String
state	Current state of the order. For this endpoint, this value is always `new`. Data type: String
@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrder`. This information is not stored. Data type: String

Example: Processing asynchronously

This example shows how to use the *mode* query parameter to create an order asynchronously. The order is added to the Inbound Queue [sn_tmt_core_inbound_queue] table on a schedule to be created.

```
curl -X POST
 'https://instance.service-now.com/api/sn_ind_tmt_orm/order/prod
uctOrder?mode=async' \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
-d '{

Product Order Open API - POST /sn_ind_tmt_orm/productorder

Creates the specified customer order and customer order line items.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Order Open API - POST /sn_ind_tmt_orm/order/productOrder.

Once processed, new records are created in the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]

URL format

Default URL: `/api/sn_ind_tmt_orm/productorder`

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. If there are any issues with the characteristics or characteristics option information, the endpoint stores the following comments in the work notes fields of the associated Customer Order Line Item record: • `The following Order Item characteristics does not exist: Review specification <characteristic.name> and correct the characteristic and characteristic option in the order line item prior to approving the order.` • `Order Item characteristic: <characteristic.name> with characteristic value: <characteristic.value>is invalid. Correct the characteristic values before approving the order.`
400	Bad Request. Could be any of the following reasons: • `Invalid payload: Request body missing` - Payload was not passed in the request body. • `Invalid payload: productOrderItem is missing` - Product order line item object or JSON is missing. • `Invalid payload: productOrderItem id is missing` - The *`id`* parameter is missing in the product order line item of the payload. • `Invalid payload: productOrderItem action is missing` - The *`action`* parameter is missing in the product order line item of the payload. • `Invalid payload: productOrderItem productOffering is missing` - The product offering object or JSON is missing from the product order line item in the payload. • `Invalid payload: productOffering id is missing` - The *`id`* parameter is missing in the product order line item of the product offering object in the payload. • `Invalid payload: Product offering does not exist` - The product offering in the product order line item is not valid. • `Invalid payload: productOrderItem product is missing` - The product object or JSON in the product order line item is missing from the payload. • `Invalid payload: product productSpecification is missing` - The product specification object or JSON in the product order line item is missing from the payload. • `Invalid payload: productSpecification id is missing` - The *`id`* parameter in the product order line item of the product specification object is missing from the payload. • `Invalid payload: Product specification does not exist` - The product specification in the product order line item is not valid.

Status codes (continued)

Status code	Description
	• `Invalid payload: Product Inventory does not exist` - In a change order (action = change), the quantity of an item is greater than what is in stock. • `Invalid payload: Product inventory ID is missing` - In change order, the *`product.id`* is missing in the payload. • `Invalid payload: Sold Product is inactive` - In a change order, a product specified in the payload is inactive. • `Invalid payload: relatedParty is missing` - The related party object is missing from the payload. • `Invalid payload: Customer Account or Consumer is missing` - The related party customer or consumer object is missing from the payload. • `Invalid payload: Consumer does not exist` - The specified related party consumer does not exist in the ServiceNow instance. • `Invalid payload: Customer Account does not exist` - The specified related party customer does not exist in the ServiceNow instance. • `Invalid payload: Order creation failed` - Not able to create the requested order.

Response body parameters (JSON)

Name	Description
channel	Array of objects that describe the channels to use for selling the products. Data type: Array `"channel": [ { "id": "String", "name": "String" } ]`
channel.id	Unique identifier of the channel to use to sell the associated products. Channel ID values are located in the external_id field of the Distribution Channel [sn_prd_pm_distribution_channel] table. Data type: String
channel.name	Name of the channel to use to sell the associated products.

Name	Description
	Data type: String
id	Sys_id of the customer order created for this request. Data type: String
externalId	External identifier for the customer order, such as a purchase order number. Data type: String
note	Array of objects that describe additional notes made by the customer when ordering. Data type: Array `"note": [ { "text": "String" } ]`
note.text	Additional notes/comments made by the customer while ordering. Data type: String
productOrderItem	List that describes items associated with the product order and their associated action. Data type: Array `"productOrderItem:" [ { "action": "String", "id": "String", "itemPrice": [Array], "product": {Object}, "productOffering": {Object}, "productOrderItemRelea tionship": [Array], "quantity": Number, "state": "String", "@type": "String" } ]`
productOrderItem.action	Action to carry out on the product. Possible actions are defined

Name	Description
	on the Choice List tab in the Action Dictionary Entry of the sn_ind_tmt_orm_order_line_item table. Data type: String
productOderItem.actionReason	The reason for adding the order line item. Data type: String Table/field updated: sn_ind_tmt_orm_order_line_item/ action_reason
productOrderItem.id	Unique identifier of the line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table. Data type: String
productOrderItem.itemPrice	Array of objects that describe the price associated with the product. Data type: Array `"itemPrice": [ { "price": {Object}, "priceType": "String", "recurringChargePeriod": "String" } ]`
productOrderItem.itemPrice.price	Description of the price of the associated product. Data type: Object `"price": { "taxIncludedAmount": {Object} }`
productOrderItem.itemPrice.price.taxIncludeAmount	Description of the price of the associated product, including the tax. Data type: Object

Name	Description

	<pre>"taxIncludedAmount": {
	  "unit": "String",
	  "value": Number
	}</pre>

productOrderItem.itemPrice.price.taxIncludeAmount.unit	Currency code in which the price is depicted. Data type: String
productOrderItem.itemPrice.price.taxIncludeAmount.value	Price of product, including any tax. Data type: Number
productOrderItem.itemPrice.priceType	Type of item price, recurring or non-recurring. Data type: String
productOrderItem.itemPrice.recurringChargePeriod	If the price is recurring, the recurring period, such as `month`. Data type: String

productOrderItem.product	Description of the instance details of the product purchased by the customer.
	
	Data type: Object
	<pre>"product": {
	  "id": "String",
	  "place": {Object},
	
	 "productCharacteristic": [Array],
	
	 "productSpecification": {Object},
	  "relatedParty": {Object},
	  "@type": "String"
	}</pre>

productOrderItem.product.id	Unique identifier of the product sold. Located in the sys_id or sn_ind_tmt_orm_external_id field of the Product Inventory [sn_ind_tmt_orm_product_inventory] table. This parameter is only returned if *`productOrderItem.action`* is `change` or `delete`. If both sys_id and external_id are present, the external_id is returned.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
productOrderItem.product.place	Maps of the locations on which to install the product. Data type: Object `"place": { "id": "String", "@type": "String" }`
productOrderItem.product.place.id	Sys_id of the associated location record in the Location [cmn_location] table. Data type: String
productOrderItem.product.productCharacteristic	Array of objects that describe the characteristics of the associated product. Data type: Array `"productCharacteristic": [ { "name": "String", "previousValue": "String", "value": "String" } ]`
productOrderItem.product.productCharacteristic.name	Name of the characteristic record to associate with the product. Located in the Characteristic [sn_prd_pm_characteristic] table. Data type: String
productOrderItem.product.productCharacteristic.previousValue	Previous characteristic option values if the update is for a change order. The request is a change order if the *`productOrderItem.action`* parameter is other than `add`. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productCharacteristic.value	Characteristic option values associated with the product. For additional information on characteristic option values, see

Name	Description
	Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productSpecification	Description of the product specification associated with the product. Data type: Object `"productSpecification": { "id": "String", "internalVersion": "String", "name": "String", "version": "String", "@type": "String" }`
productOrderItem.product.productSpecification.id	Initial_version or external_id of the product specification. The initial_version is the sys_id of the first version of the specification. Located in the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] table. If both sys_id and external_id are present, the external_id is returned. Data type: String
productOrderItem.product.productSpecification.name	Name of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.@type	Part of the TMF Open API standard. This value is always `ProductSpecificationRef`. This information is not stored. Data type: String
productOrderItem.product.relatedParty	List of contacts for line items. Data type: Array `"relatedParty:" [ { "email": "String", "firstName": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	<pre>"lastName": "String", "phone": "String", "@referredType": "String", "@type": "String" }]</pre>
productOrderItem.product.relatedParty.email	Email address of the contact. Data type: String
productOrderItem.product.relatedParty.firstName	First name of the contact. Data type: String
productOrderItem.product.relatedParty.lastName	Last name of the contact. Data type: String Data type: String
productOrderItem.product.relatedParty.phone	Business phone number of the contact. Data type: String
productOrderItem.product.relatedParty.@referredType	Type of customer. Possible value: OrderLineItemContact Data type: String
productOrderItem.product.relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. This value is always `RelatedParty`. This information is not stored. Data type: String
productOrderItem.product.@type	Part of TMF Open API standard. Annotation for the product. This value is always `Product`. This information is not stored. Data type: String
productOrderItem.productOffering	Description of the product offering associated with the product. Data type: Object <pre>"productOffering": { "id": "String",</pre>

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	<pre>"internalVersion": "String", "name": "String", "version": "String" }</pre>
productOrderItem.productOffering.id	Initial_version or external_id of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the sys_id or external_id field of the Product Offering [sn_prd_pm_product_offering] table. If both sys_id and external_id are present, the external_id is returned. Data type: String
productOrderItem.productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOrderItemRelationship	Array of objects that describe the relationships between order line items. Data type: Array <pre>"productOrderItemRelationship": [{ "id": "String", "relationshipType": "String" }]</pre>
productOrderItem.productOrderItemRelationship.id	Unique identifier of the related line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table. Data type: String
productOrderItem.productOrderItemRelationship.relationshipType	Type of relationship between the two line items. This information is used to identify the relationship hierarchy. Data type: String
productOrderItem.quantity	Number of the associated items to order.

Name	Description
	Data type: Number
productOrderItem.state	Current state of the product order item. This value is always new. Data type: String
productOrderItem.@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrderItem`. This information is not stored. Data type: String
relatedParty	List of contacts for the order. Each contact is an object in the array. Must list at least one item which contains customer account or consumer account information. Data type: Array `"relatedParty": [ { "id": "String", "name": "String", "@referredType": "String", "@type": "String" } ]`
relatedParty.id	Sys_id or external_id of the account, customer contact, or consumer associated with the order. Located in the Account [customer_account], Contact [customer_contact] table, or Consumer [csm_consumer] table. Data type: String
relatedParty.name	Name of the account, customer, or consumer. Data type: String
relatedParty.type	Type of customer. Possible values: • Consumer • Customer • CustomerContact Data type: String

Name	Description
requestedCompletionDate	Delivery date requested by the customer. Data type: String
requestedStartDate	Order start date requested by the customer. Data type: String
state	Current state of the order. For this endpoint, this value is always new. Data type: String
@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrder`. This information is not stored. Data type: String

Example: cURL request

The following code example creates a customer order.

```
curl -X POST
 "https://servicenow-instance/api/sn_ind_tmt_orm/productorder" \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \

Project Portfolio Management API

The *Project Portfolio Management* API provides endpoints to bulk import cost plans and project tasks.

The PPM Standard plugin (com.snc.financial_planning_pmo) is required to access this API. The calling user must have the it_project_manager role.

This API is provided within the `now` namespace.

Project Portfolio Management - POST /now/ppm/insert_cost_plans

Creates cost plans in the Cost Plan [cost_plan] table.

URL format

Default URL: `/api/now/ppm/insert_cost_plans`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
end_fiscal_period	Required. Sys_id of the ending fiscal period for the cost plan. Located in the Fiscal Period [fiscal_period] table. Data type: String
name	Required. Name of the cost plan. Data type: String
resource_type	Required. Sys_id of the resource type. Located in the Resource Type Definition [resource_type_definition] table. Data type: String
start_fiscal_period	Required. Sys_id of the starting fiscal period for the cost plan. Located in the Fiscal Period [fiscal_period] table. Data type: String
task	Required. Sys_id of the project or demand for the cost plan. Located in the Project [pm_project] or Demand [dmn_demand] table. Data type: String
unit_cost	Required. Unit cost for the cost plan. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Response body parameters (JSON)

Name	Description
result	Object containing information about the status of the API request. Data type: Object `"result": { "status": "String" }`
result.status	Status of the API request. Data type: String

Example: cURL request

This example imports two cost plans.

```
curl
 "https://instance.servicenow.com/api/now/ppm/insert_cost_plans"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "[
   {
      "name": "Cost plan 1",
      "resource_type": "3d16eaf79330120064f572edb67ffb04",
      "start_fiscal_period": "ed47e5d90b3010108d9ac74363673a98",
      "end_fiscal_period": "0a47e5d90b3010108d9ac74363673afd",
      "task": "0fc9f992db601810852ca6dc13961951",
      "unit_cost": 1200
   },
   {
      "name": "Cost plan 2",
```

```
      "resource_type": "3d16eaf79330120064f572edb67ffb04",
      "start_fiscal_period": "ed47e5d90b3010108d9ac74363673a98",
      "end_fiscal_period": "7947e5d90b3010108d9ac74363673ac9",
      "task": "0fc9f992db601810852ca6dc13961951",
      "unit_cost": 3600
   }
]" \
--user 'username':'password'
```

Response body.

```
{
   "result": {
      "status": "success"
   }
}
```

Project Portfolio Management - POST /now/ppm/insert_project_tasks

Creates a project and associated project tasks.

Projects are created in the Project [pm_project] table and project tasks are created in the Project Task [pm_project_task] table.

URL format

Default URL: `/api/now/ppm/insert_project_tasks`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
child_tasks	Array of tasks for the project. Each task is an object in the array. Data type: Array `"child_tasks": [ { "child_tasks": [Array], "external_id": "String", "short_description": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
child_tasks.child_tasks	Array of child tasks for the parent task. Each child task is an object in the array. Each child task can have its own array of child tasks. Data type: Array `"child_tasks": [ { "child_tasks": [Array], "external_id": "String", "short_description": "String" } ]`
child_tasks.external_id	Unique identifier of the task from the external system. Data type: String
child_tasks.short_description	Short description of the task. Data type: String
end_date	End date for the project. Data type: String
external_id	Unique identifier of the project from the external system. Data type: String
short_description	Short description of the project. Data type: String
start_date	Start date for the project. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Response body parameters (JSON)

Name	Description
result	Object containing information about the status of the API request. Data type: Object `"result": { "status": "String" }`
result.status	Status of the API request. Data type: String

Example: cURL request

This example imports a project with two tasks (zpq_T1 and zpq_T2). The first task contains several child tasks, and the second task has dependencies on the child tasks from the first task.

```
curl
 "https://instance.servicenow.com/api/now/ppm/insert_project_tas
ks" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   "start_date": "2022-05-18 08:00:00",
   "end_date": "2022-05-18 17:00:00",
   "short_description": "zpq_Project",
   "external_id": "0",
   "child_tasks": [
      {
         "short_description": "zpq_T1",
         "external_id": "1",
         "child_tasks": [
```

               "lag": -1,
               "type": "fs"
            },
            {
               "external_id": "1.2",
               "lag": 2,
               "type": "fs"
            }
         ]
      }
   ]
}" \
--user 'username':'password'
```

Response body.

```
{
   "result": {
      "status": "success"
   }
}
```

Push Installation API

The *Push Installation* API provides endpoints to register and unregister the tokens that enable mobile devices to receive push notifications from an application.

A push notification is a text message that appears on a user's mobile device to alert them about something important or to ask them to perform an action.

When creating custom mobile applications, in order to set up Push notifications, you must register the device with the manufacturer's service. The service must know the address of a user's device so it can properly send notifications to that device using push tokens. The device also needs to be able to receive the notifications and act on them. For instructions on how to register a device and get a push token, refer to the device's operating systems

developer documentation. For example, for Apple devices, refer to https://developer.apple.com/documentation/usernotifications/registering_your_app_with_apns.

Push Installation - POST /now/push/{pushApplicationName}/installation

Adds or updates tokens that enable devices to receive push notifications from the specified application.

URL format

Versioned URL: `/api/now/{api_version}/push/{pushApplicationName}/installation`

Default URL: `/api/now/push/{pushApplicationName}/installation`

Supported request parameters

Path parameters

Parameter	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
pushApplicationName	Name of the application for which to register the push notifications. This parameter must be the same as the value in the Name column for the associated application in the Push Application [sys_push_application] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Element	Description
platform	Platform on which to register the push notification. This parameter must be the Name value from the Push Platform [sys_push_platform] table. Data type: String
token	Token supplied by the device manufacturer, such as Apple, when the mobile application registers to receive push notifications. The endpoint writes the token value to the Push Notification Installation [sys_push_notif_app_install] table. Data type: String

Request headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
None	

Example: Sample cURL request

```
curl -X POST \

 https://instance.servicenow.com/api/now/push/ServiceNowPushA
pp/installation \
--header "Content-Type: application/json" \
--user "username":"password" \
--data
 '{"platform":"Apple","token":"544836d77ac2e551bbf78204630509a7d
494fc87f52e85da52e5b5d42910e2cf"}' \
```

None

Push Installation - POST /now/push/{pushApplicationName}/removeInstallation

Deactivates the tokens that enable mobile devices to receive push notifications from the specified application.

URL format

Versioned URL: `/api/now/{api_version}/push/{pushApplicationName}/removeInstallation`

Default URL: `/api/now/push/{pushApplicationName}/removeInstallation`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
pushApplicationName	Name of the application for which to unregister the push notifications. This parameter must be the same as the value in the Name column for the associated application in the Push Application [sys_push_application] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Element	Description
platform	Platform on which to register the push notification. This parameter must be the Name value from the Push Platform [sys_push_platform] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
None	

Example: Sample cURL request

```
curl -X POST \

 https://instance.servicenow.com/api/now/push/ServiceNowPushA
pp/removeInstallation \
--header "Content-Type: application/json" \
--user "username":"password" \
--data '{"platform":"Apple"}' \
```

```
None
```

Push Metrics API

The *Push Metrics* API provides endpoints that enable you to push raw Metric Intelligence data from an external source to the MID Server.

This API is based on client-side tools that push the raw data from the external source to the MID Server. The Metric Intelligence extension is required to be configured with the **Enable REST Listener** option enabled. For more information on setting up the MID Server, see Get started with Metric Intelligence.

For information on authentication requirements, see Configure the MID Web Server extension.

Push Metrics - POST /mid/sa/metrics

Pushes raw Operational Intelligence data from an external source to the MID Server.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Default URL: `/api/mid/sa/metrics`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
ci2metric_id	List of key-value pairs to use to identify the configuration item (CI). It is formerly known as *`ci_identifier`*. The script continues to accept *`ci_identifier`*. Data type: Object
metric_type	Name of the metric. Data type: String
node	IP address, FQDN, name of the CI, or host. In the example below, the name of the Linux server where the disks are installed. Data type: String
resource_path	The path of the resource for which metric data is being collected. In the example below, `C:\` is the resource for which metric data is collected. Data type: String
source	Data source monitoring the metric type. Data type: String
timestamp	Epoch time stamp of the metric. Data type: Number Unit: Milliseconds
unit	Unit type that is associated with the source metric type. Table: Monitoring System Metric Types [sa_source_metric_type] Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
value	Value of the metric. Data type: Number

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
None	

Example: cURL request

The request body must be surrounded by square brackets, as shown in this example.

```
curl -X POST "https://<mid-server-host>/api/mid/sa/metrics"
-H "Content-Type: application/json"
-U "username":"password"
-d "[{
    "metric_type": "Disk C: % Free Space",
    "resource_path": "C:\\",
    "node": "lnux100",
    "value": 50,
    "timestamp": 1473183012000,
    "ci2metric_id": {
        "node": "lnux100"
    },
    "source": "Splunk"
}]"
```

Remote help request API

The *Remote help request* API provides endpoints to create, view, and fetch lists of IT service requests and their details from an electronic medical record (EMR) system. An IT service request is associated with a task type such as an incident in the ServiceNow instance.

You can only use this API when the EMR Help application (sn_ind_rmt_help) is installed from the ServiceNow Store. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Role required to access the endpoints of this API: sn_ind_rmt_help.requester.

Remote help request - POST /remote_help_request/{req_defn_id}

Inserts electronic medical record (EMR) system data into the corresponding ServiceNow tables.

You need to specify a request definition ID in addition to the parameters for the task and additional data from the EMR system persisted in the request data table associated with the task. You pass two types of data into this endpoint. The first is the request data, which the endpoint inserts into the Remote Request Data [sn_ind_rmt_help_request_data] table and its associated child tables. The second is the task parameters of the IT service request, which the endpoint inserts into the Remote Request Parameter [sn_ind_rmt_help_request_param] table. Only data or fields that are defined in the request definitions are processed by the endpoint. For additional information on this data model, see EMR Help data model.

Records are identified using the request definition ID.

URL format

Versioned URL: `/api/sn_ind_rmt_help/{api_version}/remote_help_request/{req_defn_id}`

Default URL: `/api/sn_ind_rmt_help/remote_help_request/{req_defn_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String
req_defn_id	Unique ID of the request definition. This value corresponds to the ID column in the Remote Request Definition [sn_ind_rmt_help_request_defn] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
request_data	Required. Name-value pairs of the request data from the EMR system to add in the Remote Request Data [sn_ind_rmt_help_request_data] table and its child tables. For example: `"request_data":{ "additional_info": "String", "application": "String", "environment": "String", "issue_type": "String", "millennium_username": "String", "position": "String", "server": "String", "session_recording_id": "String", "user_is_physician": "String", "work_station": "String" }` **Note:** Only pass parameters configured in a request definition in the *request_data* object. Any other parameters are ignored. To learn more, see Configure request definitions for EMR systems. Data type: Object
source	Required. Name of the EMR system invoking the endpoint as specified in a request definition. For example: `"source":"Cerner"` Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
task_parameters	Required. Name-value pairs that describe the task parameters of the IT service request. Each element in the object corresponds to a column in the corresponding task tables such as the Incident [incident] table. For example: `"task_parameters": { "caller_id": "String", "contact_type": "String", "impact": "String", "short_description": "String" }` **Note:** Only pass parameters configured in a request definition in the *task_parameters* object. Any other parameters are ignored. To learn more, see Configure request definitions for EMR systems. Data type: Object

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
result	Result object. `"result": { "code": "String", "error": "String", "errorTranslated": "String", "status": "String", "task_id": "String", "task_table": "String", "warning": "String", "warningTranslated": "String" }` Data type: Object
result.code	Application error code when the *`result.status`* is returned as `failure`. Data type: String
result.error	Error message that is included if the *`result.status`* is failure. This message is in English only. Data type: String
result.errorTranslated	Optional localized error message. Data type: String
result.status	Status of the response. Valid values: • success • failure Data type: String
result.task_id	Sys_id of the created task. Data type: String
result.task_table	Name of the task table in which the task was created as defined in the request definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.warning	Optional warning message. May be included if the *result.status* is success. This message is in English only. Data type: String
result.warningTranslated	Optional localized warning message. Data type: String

Example: cURL request

Insert data from a Cerner EMR system.

```
curl
 "https://instance.servicenow.com/api/sn_ind_rmt_help/v1/remote_
help_request/sn_it_request"
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--data "{
  "source":"Cerner",
  "task_parameters":{
    "short_description":"Unable to load patient data",
    "caller_id":"82d4ecb4db40e8100e28aa594b96195c",
    "impact":"2",
    "contact_type":"email"
  },
  "request_data":{
    "application":"Powerchart",
    "server":"CTXCHSITN453",
    "environment":"CTX24",
    "issue_type":"Helpdesk",
    "millennium_username":"JOHN JASON",
    "position":"Lab Tech",
    "session_recording_id":"s5ds34dd96491b959a35010651896k",
    "user_is_physician":"Yes",
    "work_station":"PC354FLR3STATION7",
    "additional_info":"MRN 222333"
  }
}" \
--user "username":"password"
```

The following output shows both a successful response and an error response.

```
// Successful response
{
  "result": {
    "task_id": "75b09061db2cac100e28aa594b9619fa",
    "status": "success",
    "task_table": "incident",
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "warning": "Ignored invalid fields on table incident :
 test1",
    "warningTranslated": "Ignored invalid fields on table
 incident : test1"
  }
}

// Error response
{
      "result": {
      "status": "failure",
      "code": "1001",
      "error": "Invalid request definition: test_request1",
      "errorTranslated": "Invalid request definition:
 test_request1"
      }
      }
```

Remote help request - PUT /remote_help_request/{req_defn_id/task/{task_id}

Updates a record in the specified remote request data table for the task.

Enables you to specify a request definition ID in addition to the task sys_id to update a remote request that was created earlier.

URL format

Versioned URL: `/api/sn_ind_rmt_help/{api_version}/remote_help_request/{req_defn_id/task/{task_id}`

Default URL: `/api/sn_ind_rmt_help/remote_help_request/{req_defn_id/task/{task_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
req_defn_id	Unique ID of the request definition. This value corresponds to the ID column in the Remote Request Definition [sn_ind_rmt_help_request_defn] table. Data type: String
task_id	Sys_id of the task to update. This field is provided by the EMR system. Data type: String

Name	Description
	Data type: String
result.errorTranslated	Optional localized error message. Data type: String
result.status	Status of the response. Valid values: • success • failure Data type: String
result.warning	Optional warning message. May be included if the *result.status* is success. This message is in English only. Data type: String
result.warningTranslated	Optional localized warning message. Data type: String

Example: cURL request

Update an IT service request created earlier in a Cerner EMR system

```
curl
 "https://instance.servicenow.com/api/sn_ind_rmt_help/v1/remote_
help_request/sn_it_request/task/207e57c1db60a410f50fdc5b4b9619
2e"
--request PUT \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--data "{
  "source":"Cerner",
  "task_parameters":{
    "impact":"1",
    "contact_type":"phone"
  },
  "request_data":{
    "additional_info" : "Please contact my office for more
 information."
  }
}" \
--user "username":"password"
```

The following output shows both a successful response and an error response.

```
// Successful response
{
  "result": {
    "status": "success"
  }
```

```
}

// Error response
{
      {
      "result": {
      "status": "failure",
      "code": "1018",
      "error": "Record with sys_id
 207e57js1db60a410f50fdc5b4b96192e does not exist in table
 incident",
      "errorTranslated": "Record with sys_id
 207e57js1db60a410f50fdc5b4b96192e incident does not exist in
 table incident"
      }
      }
      }
```

Remote help request - GET /remote_help_request/{req_defn_id}

Fetches a list of tasks that match the specified ID and query filter.

Note:

- Reference and choice type fields are always returned as JSON objects with the value and display_value.
- DateTime fields are returned as strings and always in UTC.

URL format

Versioned URL: `/api/sn_ind_rmt_help/{api_version}/remote_help_request/{req_defn_id}`

Default URL: `/api/sn_ind_rmt_help/remote_help_request/{req_defn_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
req_defn_id	Unique ID of the request definition to update. This value corresponds to the ID column in the Remote Request Definition [sn_ind_rmt_help_request_defn] table. Data type: String

Query parameters

Name	Description
query	Required. Encoded query used to filter the result set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description

result	Return results.
	`"result": {`
	`  "code": "String",`
	`  "error": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre> "errorTranslated": "String",
	  "status": "String",
	  "task_list": [Array],
	  "warning": "String",
	  "warningTranslated": "String"
	}</pre>
	Data type: Object

result.code	Application error code when the *`result.status`* is returned as `failure`. Data type: String
result.error	Error message that is included if the *`result.status`* is failure. This message is in English only. Data type: String
result.errorTranslated	Optional localized error message. Data type: String
result.status	Status of the response. Possible values: • failure • success Data type: String
result.task_list	List of tasks. Data type: Array
result.warning	Optional warning message. May be included if the *`result.status`* is `success`. This message is in English only. Data type: String
result.warningTranslated	Optional localized warning message. Data type: String

Example: cURL request

Fetch data from a Cerner EMR system

```
curl
 "https://instance.servicenow.com/api/remote_help_request/v1/sn_
it_request/?query=active=true" \
--header "Accept: application/json" \
--header "Content-Type: application/json"
```

```

Remote help request - GET /remote_help_request/{req_defn_id}/task/{task_id}

Fetches a single task as specified in the *task_id*.

Enables you to specify a request definition ID and task ID and retrieve the task details.

Note:

- Reference and choice type fields are always returned as JSON objects with the value and display_value.
- DateTime fields are returned as strings and always in UTC.
- Only additional comments are supported in journal type fields.
- Additional comments are passed back as a JSON array of objects. Each object represents a comment with *created_on*, *created_by*, and *value* fields. The latest comments are sent first.

URL format

Versioned URL: `/api/sn_ind_rmt_help/{api_version}/remote_help_request/{req_defn_id}/task/{task_id}`

Default URL: `/api/sn_ind_rmt_help/remote_help_request/{req_defn_id}/task/{task_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
req_defn_id	Unique ID of the request definition. This value corresponds to the ID column in the Remote Request Definition [sn_ind_rmt_help_request_defn] table. Data type: String
task_id	Sys_id of the task to return. This field is provided by the EMR system. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description

result	Return results.
	`"result": {`
	`  "code": "String",`
	`  "error": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>{
	  "errorTranslated": "String",
	  "status": "String",
	  "task_parameters": {Object},
	  "warning": "String",
	  "warningTranslated": "String"
	}</pre>
	Data type: Object

result.code	Application error code when the *`result.status`* is returned as `failure`. Data type: String
result.error	Error message that is included if the *`result.status`* is failure. This message is in English only. Data type: String
result.errorTranslated	Optional localized error message. Data type: String
result.status	Status of the response. Possible values: • failure • success Data type: String
result.task_parameters	Required. Name-value pairs that describe the task parameters of the IT service request. Each element in the object corresponds to a column in the corresponding task tables such as the Incident [incident] table. Data type: Object
result.warning	Optional warning message. May be included if the *`result.status`* is `success`. This message is in English only. Data type: String
result.warningTranslated	Optional localized warning message. Data type: String

Example: cURL request

Fetch data from a Cerner EMR system

```
curl
 "https://instance.servicenow.com/api/sn_ind_rmt_help/v1/remote_
```

```

Resource Inventory Open API

The *Resource Inventory Open* API provides endpoints to create, retrieve, and delete resources.

Use this API to manage resources in the following tables.

- Cable [cmdb_ci_cable]
- Equipment Holder [cmdb_ci_equipment_holder]
- Interface Card [cmdb_ci_interface_card]
- IP Address [cmdb_ci_ip_address]
- Logical Connection [cmdb_ci_ni_logical_path]
- Network Interface [cmdb_ci_ni_interface]
- Network Site [cmdb_ci_ni_site]
- Physical Connection [cmdb_ci_ni_physical_link]
- Strand [cmdb_ci_strand]
- Topology [cmdb_ci_topology]
- Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables.
- Tables that extend Equipment Holder [cmdb_ci_equipment_holder].
- Child tables that extend any of the following tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Cable [cmdb_ci_cable]
- Equipment Holder [cmdb_ci_equipment_holder]
- Strand [cmdb_ci_strand]

This API is included in the Network Inventory Core application, which is available on the ServiceNow Store.

This API is provided within the `sn_ni_core` namespace.

The calling user must have the sn_ni_core.inventory_integrator role.

This API can be extended to make customizations around required parameters, request body validation, and field mappings. For more information, see the Resource Inventory Open API Developer Guide.

The *`Resource Inventory Open`* API is a ServiceNow® implementation of the TM Forum Resource Inventory API REST specification. This implementation is based on the TMF639 Resource Inventory API User Guide v4.0.1, July 2020.

Resource Inventory Open API - DELETE /sn_ni_core/resource/{id}

Deletes a specified resource record.

URL format

Default URL: `/api/sn_ni_core/resource/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the resource. Located in one of the following tables depending on the type of resource. • Interface Card [cmdb_ci_interface_card] • Logical Connection [cmdb_ci_ni_logical_path] • Network Interface [cmdb_ci_ni_interface] • Network Site [cmdb_ci_ni_site] • Physical Connection [cmdb_ci_ni_physical_link] • Tables specified by the *`sn_ni_core.equipment_tables`* sys_property, and any tables that extend the specified tables. • Tables that extend Equipment Holder [cmdb_ci_equipment_holder]. **Note:** Resources in the IP Address [cmdb_ci_ip_address] table can't be deleted using this API. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
215	Request successfully received for processing. The request will be completed asynchronously.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. Resource deletion failed. The resource might be required by its related resources.
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
None	

Example: cURL request

This example deletes a resource.

```
curl
 "https://instance.service-now.com/api/sn_ni_core/resource/54ada
05e875c15109a9c0f65dabb3586" \
--request DELETE \
--header "Accept:application/json" \
--user 'username':'password'
```

Response body.

```
""
```

Resource Inventory Open API - GET /sn_ni_core/resource

Retrieves a list of all resource records.

URL format

Default URL: `/api/sn_ni_core/resource`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
@type	Required. Table name of the type of resource to retrieve. You can only retrieve one type of resource per API call. Valid values: • `cmdb_ci_cable` (Cable) • `cmdb_ci_interface_card` (Interface Card) • `cmdb_ci_ip_address` (IP Address) • `cmdb_ci_ni_logical_path` (Logical Connection) • `cmdb_ci_ni_interface` (Network Interface) • `cmdb_ci_ni_site` (Network Site) • `cmdb_ci_ni_physical_link` (Physical Connection) • `cmdb_ci_strand` (Strand)

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• `cmdb_ci_topology` (Topology) • Name of a table specified by the *`sn_ni_core.equipment_tables`* sys_property, or name of a table that extends the specified tables. • Name of a table that extends Equipment Holder [cmdb_ci_equipment_holder]. Data type: String
description	Description to use to filter resources. Only resources with the specified description are returned in the response. Data type: String
fields	List of fields to return in the response. Invalid fields are ignored. Valid values: • description • href • id • name • note • place • relatedParty • resourceCharacteristic • resourceRelationship • resourceSpecification • startOperatingDate Default: Returns all fields. Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the *`offset`* parameter to paginate record retrieval. Default: 20 Data type: Number
name	Name to use to filter resources. Only resources with the specified name are returned in the response. Data type: String
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all

Query parameters (continued)

Name	Description
	records, regardless of the number of records, in small manageable chunks. Default: 0 Data type: Number
resourceSpecification.id	Resource specification sys_id to use to filter resources. The sys_id must be from a model in one of the following tables. • Equipment Holder Models [sn_ni_core_equipment_holder_product_model] • Equipment Models [sn_ni_core_equipment_product_model] • Interface Card Models [sn_ni_core_interface_card_product_model] • Logical Connection Models [sn_ni_core_logical_connection_product_model] • Network Interface Models [sn_ni_core_network_interface_product_model] • Physical Connection Models [sn_ni_core_physical_connection_product_model] Only resources with a model matching the specified sys_id are returned in the response. Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
Content-Range	Specifies the range of content returned in a paginated call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers (continued)

Header	Description
	For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server. **Note:** If the total number of records is more than 100,000 this header always returns 100,000.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
206	Partial content. The request was successfully processed and returned a partial range of content specified by a paginated call.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Response body parameters (JSON)

Name	Description
@type	The type of resource. Valid values: • `cmdb_ci_cable` (Cable) • `cmdb_ci_interface_card` (Interface Card) • `cmdb_ci_ip_address` (IP Address)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• `cmdb_ci_ni_logical_path` (Logical Connection) • `cmdb_ci_ni_interface` (Network Interface) • `cmdb_ci_ni_site` (Network Site) • `cmdb_ci_ni_physical_link` (Physical Connection) • `cmdb_ci_strand` (Strand) • `cmdb_ci_topology` (Topology) • Name of a table specified by the *`sn_ni_core.equipment_tables`* sys_property, or name of a table that extends the specified tables. • Name of a table that extends Equipment Holder [cmdb_ci_equipment_holder]. Data type: String
description	Description of the resource. Data type: String
href	Relative link to the resource record. Data type: String
id	Sys_id of the resource. Located in one of the following tables depending on the type of resource. • Cable [cmdb_ci_cable] • Equipment Holder [cmdb_ci_equipment_holder] • Interface Card [cmdb_ci_interface_card] • IP Address [cmdb_ci_ip_address] • Logical Connection [cmdb_ci_ni_logical_path] • Network Interface [cmdb_ci_ni_interface] • Network Site [cmdb_ci_ni_site] • Physical Connection [cmdb_ci_ni_physical_link] • Strand [cmdb_ci_strand] • Topology [cmdb_ci_topology] • Tables specified by the *`sn_ni_core.equipment_tables`* sys_property, and any tables that extend the specified tables. • Tables that extend Equipment Holder [cmdb_ci_equipment_holder]. • Child tables that extend any of the following tables:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	○ Cable [cmdb_ci_cable] ○ Equipment Holder [cmdb_ci_equipment_holder] ○ Strand [cmdb_ci_strand] Data type: String
name	Name of the resource. Data type: String
note	List of notes about the resource. Data type: Array `"note": [ { "text": "String" } ]`
note.text	The note text. Data type: String
place	Network site for the resource. This parameter is not supported for Network Site, Physical Connection, or Logical Connection resources. Data type: Object `"place": { "@referredType": "String", "href": "String", "id": "String" }`
place.@referredType	The type of place. This value is always `GeographicAddress`. Data type: String
place.href	Relative link to the place record. Data type: String
place.id	Sys_id of the place record in the Network Site [cmdb_ci_ni_site] table. Data type: String
relatedParty	Details about contacts for the resource. Data type: Array `"relatedParty": [ { "@referredType": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"href": "String",
	"id": "String",
	"role": "String"
	}
	]</pre>

relatedParty.@referredType	The type of related party. Located in the Group [sys_user_group] table in the **Type** field. Data type: String
relatedParty.href	Relative link to the related party record. Data type: String
relatedParty.id	Sys_id of the related party record in the Group [sys_user_group] table. Data type: String
relatedParty.role	The role of the related party. Located in the Teams [cmdb_rel_team] table in the **Group type** field. Data type: String

resourceCharacteristic	List of characteristics of the resource. The following resource types require specific resource characteristics.
	• For Physical Connection and Logical Connection resources, a `Port A` or `Port Z` characteristic is required. If the Lifecycle Stage Status of the resource is In Use, both `Port A` and `Port Z` are required.
	• For Equipment Holder resources, a `Container Type` characteristic is required.
	
	Data type: Array
	<pre>"resourceCharacteristic": [
	{
	"name": "String",
	"value": "String",
	"valueType": "String"
	}
	]</pre>

resourceCharacteristic.name	Field name from the resource table specified by the *`@type`* parameter. You can't use the fields model_id, name, network_site, operation_notes, operational_status, short_description, start_date, or any sys_ prefixed fields such as sys_id. Data type: String
resourceCharacteristic.value	The value of the characteristic. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
resourceCharacteristic.valueType	The type of value. Valid values: • boolean • datetime • float • integer • ph_number • reference • string Data type: String
resourceRelationship	List of related resources. The following resource types require specific related resources. • For Interface Card resources, a relationship to an Equipment Holder resource where Container Type is Slot or Sub Slot is required. • For Network Interface resources, a relationship to an Equipment or Interface Card resource is required. • For Equipment Holder resources where Container Type is Slot or Sub Slot, a relationship to an Equipment or Interface Card resource is required. Data type: Array `"resourceRelationship": [ { "relationshipType": "String", "resource": {Object} } ]`
resourceRelationship.relationshipType	Type of relationship between the two resources in the format `[this resource descriptor]::[related resource descriptor]`. For example, `Contains::Contained by` indicates that the related resource is the child of this resource. Valid values for the descriptors are located in the CI Relationship Type [cmdb_rel_type] table in the **Parent descriptor** and **Child descriptor** columns. Data type: String
resourceRelationship.resource	Details about the related resource. The related resource must be one of the following resource types. • Cable • Equipment • Equipment Holder

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Interface Card • Logical Connection • Network Interface • Network Site • Physical Connection • Strand • Topology Data type: Object `"resource": { "id": "String", "href": "String" }`
resourceRelationship.resource.id	Sys_id of the related resource. Located in one of the following tables depending on the type of related resource. • Interface Card [cmdb_ci_interface_card] • Logical Connection [cmdb_ci_ni_logical_path] • Network Interface [cmdb_ci_ni_interface] • Network Site [cmdb_ci_ni_site] • Physical Connection [cmdb_ci_ni_physical_link] • Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables. • Tables that extend Equipment Holder [cmdb_ci_equipment_holder] Data type: String
resourceRelationship.resource.href	Relative link to the related resource record. Data type: String
resourceSpecification	Resource specification. Data type: Object `"resourceSpecification": { "id": "String" }`
resourceSpecification.id	Sys_id of the associated model for the resource. Located in one of the following tables depending on the type of model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Cable Models [sn_ent_cable_model] • Equipment Holder Models [sn_ent_nw_holder_model] • Equipment Models [sn_ent_nw_equipment_model] • Interface Card Models [sn_ent_nw_interface_model] • Logical Connection Models [sn_ent_logical_nw_connection_model] • Network Interface Models [sn_ent_nw_interface_model] • Physical Connection Models [sn_ent_physical_nw_connection_model] • Strand Models [sn_ent_strand_model] • Topology Models [sn_ent_network_topology_model] Data type: String
startOperatingDate	Date and time that the resource first started operating. Data type: String

Example: cURL request

This example retrieves the *name*, *id*, and *href* fields for the first five Network Site resource records.

```
curl
 "https://instance.service-now.com/api/sn_ni_core/resource?@type
=cmdb_ci_ni_site&fields=name%2Cid%2Chref&limit=5" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Response body.

```

Resource Inventory Open API - GET /sn_ni_core/resource/{id}

Retrieves a specified resource record.

URL format

Default URL: `/api/sn_ni_core/resource/{id}`

Supported request parameters

Path parameters

Name	Description

id	Sys_id of the resource. Located in one of the following tables depending on the type of resource.
	• Cable [cmdb_ci_cable]
	• Equipment Holder [cmdb_ci_equipment_holder]
	• Interface Card [cmdb_ci_interface_card]
	• IP Address [cmdb_ci_ip_address]
	• Logical Connection [cmdb_ci_ni_logical_path]
	• Network Interface [cmdb_ci_ni_interface]
	• Network Site [cmdb_ci_ni_site]
	• Physical Connection [cmdb_ci_ni_physical_link]
	• Strand [cmdb_ci_strand]
	• Topology [cmdb_ci_topology]
	• Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables.
	• Tables that extend Equipment Holder [cmdb_ci_equipment_holder].
	• Child tables that extend any of the following tables:
	  ○ Cable [cmdb_ci_cable]
	  ○ Equipment Holder [cmdb_ci_equipment_holder]
	  ○ Strand [cmdb_ci_strand]

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid values: • description • href • id • name • note • place • relatedParty • resourceCharacteristic • resourceRelationship • resourceSpecification • startOperatingDate Default: Returns all fields. Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
@type	The type of resource. Valid values: • `cmdb_ci_cable` (Cable) • `cmdb_ci_interface_card` (Interface Card) • `cmdb_ci_ip_address` (IP Address) • `cmdb_ci_ni_logical_path` (Logical Connection) • `cmdb_ci_ni_interface` (Network Interface) • `cmdb_ci_ni_site` (Network Site) • `cmdb_ci_ni_physical_link` (Physical Connection) • `cmdb_ci_strand` (Strand) • `cmdb_ci_topology` (Topology) • Name of a table specified by the *sn_ni_core.equipment_tables* sys_property, or name of a table that extends the specified tables. • Name of a table that extends Equipment Holder [cmdb_ci_equipment_holder]. Data type: String
description	Description of the resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
href	Relative link to the resource record. Data type: String

id	Sys_id of the resource. Located in one of the following tables depending on the type of resource.
	• Cable [cmdb_ci_cable]
	• Equipment Holder [cmdb_ci_equipment_holder]
	• Interface Card [cmdb_ci_interface_card]
	• IP Address [cmdb_ci_ip_address]
	• Logical Connection [cmdb_ci_ni_logical_path]
	• Network Interface [cmdb_ci_ni_interface]
	• Network Site [cmdb_ci_ni_site]
	• Physical Connection [cmdb_ci_ni_physical_link]
	• Strand [cmdb_ci_strand]
	• Topology [cmdb_ci_topology]
	• Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables.
	• Tables that extend Equipment Holder [cmdb_ci_equipment_holder].
	• Child tables that extend any of the following tables:
	  ○ Cable [cmdb_ci_cable]
	  ○ Equipment Holder [cmdb_ci_equipment_holder]
	  ○ Strand [cmdb_ci_strand]
	
	Data type: String

name	Name of the resource. Data type: String
note	List of notes about the resource. Data type: Array `"note": [ { "text": "String" } ]`
note.text	The note text. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
place	Network site for the resource. This parameter is not supported for Network Site, Physical Connection, or Logical Connection resources. Data type: Object `"place": { "@referredType": "String", "href": "String", "id": "String" }`
place.@referredType	The type of place. This value is always `GeographicAddress`. Data type: String
place.href	Relative link to the place record. Data type: String
place.id	Sys_id of the place record in the Network Site [cmdb_ci_ni_site] table. Data type: String
relatedParty	Details about contacts for the resource. Data type: Array `"relatedParty": [ { "@referredType": "String", "href": "String", "id": "String", "role": "String" } ]`
relatedParty.@referredType	The type of related party. Located in the Group [sys_user_group] table in the **Type** field. Data type: String
relatedParty.href	Relative link to the related party record. Data type: String
relatedParty.id	Sys_id of the related party record in the Group [sys_user_group] table. Data type: String
resourceCharacteristic	List of characteristics of the resource. The following resource types require specific resource characteristics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• For Physical Connection and Logical Connection resources, a `Port A` or `Port Z` characteristic is required. If the Lifecycle Stage Status of the resource is In Use, both `Port A` and `Port Z` are required. • For Equipment Holder resources, a `Container Type` characteristic is required. Data type: Array `"resourceCharacteristic": [ { "name": "String", "value": "String", "valueType": "String" } ]`
resourceCharacteristic.name	Field name from the resource table specified by the *`@type`* parameter. You can't use the fields model_id, name, network_site, operation_notes, operational_status, short_description, start_date, or any sys_ prefixed fields such as sys_id. Data type: String
resourceCharacteristic.value	The value of the characteristic. Data type: String
resourceCharacteristic.valueType	The type of value. Valid values: • boolean • datetime • float • integer • ph_number • reference • string Data type: String
resourceRelationship	List of related resources. The following resource types require specific related resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• For Interface Card resources, a relationship to an Equipment Holder resource where Container Type is Slot or Sub Slot is required. • For Network Interface resources, a relationship to an Equipment or Interface Card resource is required. • For Equipment Holder resources where Container Type is Slot or Sub Slot, a relationship to an Equipment or Interface Card resource is required. Data type: Array `"resourceRelationship": [ { "relationshipType": "String", "resource": {Object} } ]`
resourceRelationship.relationshipType	Type of relationship between the two resources in the format `[this resource descriptor]::[related resource descriptor]`. For example, `Contains::Contained by` indicates that the related resource is the child of this resource. Valid values for the descriptors are located in the CI Relationship Type [cmdb_rel_type] table in the **Parent descriptor** and **Child descriptor** columns. Data type: String
resourceRelationship.resource	Details about the related resource. The related resource must be one of the following resource types. • Cable • Equipment • Equipment Holder • Interface Card • Logical Connection • Network Interface • Network Site • Physical Connection • Strand • Topology Data type: Object `"resource": { "id": "String", "href": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
resourceRelationship.resource.id	Sys_id of the related resource. Located in one of the following tables depending on the type of related resource. • Interface Card [cmdb_ci_interface_card] • Logical Connection [cmdb_ci_ni_logical_path] • Network Interface [cmdb_ci_ni_interface] • Network Site [cmdb_ci_ni_site] • Physical Connection [cmdb_ci_ni_physical_link] • Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables. • Tables that extend Equipment Holder [cmdb_ci_equipment_holder] Data type: String
resourceRelationship.resource.href	Relative link to the related resource record. Data type: String
resourceSpecification	Resource specification. Data type: Object `"resourceSpecification": { "id": "String" }`
resourceSpecification.id	Sys_id of the associated model for the resource. Located in one of the following tables depending on the type of model. • Cable Models [sn_ent_cable_model] • Equipment Holder Models [sn_ent_nw_holder_model] • Equipment Models [sn_ent_nw_equipment_model] • Interface Card Models [sn_ent_nw_interface_model] • Logical Connection Models [sn_ent_logical_nw_connection_model] • Network Interface Models [sn_ent_nw_interface_model] • Physical Connection Models [sn_ent_physical_nw_connection_model] • Strand Models [sn_ent_strand_model] • Topology Models [sn_ent_network_topology_model] Data type: String
startOperatingDate	Date and time that the resource first started operating.

Request body parameters (XML or JSON) (continued)

Name	Description

	<pre>"id": "String"
	}</pre>

place.@referredType	The type of place. This value is always `GeographicAddress`. Data type: String
place.href	Relative link to the place record. Data type: String
place.id	Required if the *`place`* parameter is used. Sys_id of the place record in the Network Site [cmdb_ci_ni_site] table. Data type: String

relatedParty	Details about contacts for the resource.
	
	Data type: Array
	<pre>"relatedParty": [
	{
	"@referredType": "String",
	"href": "String",
	"id": "String",
	"role": "String"
	}
	]</pre>
	Note: Removing relatedParty records from a resource is not supported by this endpoint. Records can be manually deleted from the Teams [cmdb_rel_team] table.

relatedParty.@referredType	The type of related party. Located in the Group [sys_user_group] table in the **Type** field. Data type: String
relatedParty.href	Relative link to the related party record. Data type: String
relatedParty.id	Required if the *`relatedParty`* parameter is used. Sys_id of the related party record in the Group [sys_user_group] table. Data type: String
relatedParty.role	The role of the related party. Located in the Teams [cmdb_rel_team] table in the **Group type** field. Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
resourceCharacteristic	List of characteristics of the resource. The following resource types require specific resource characteristics. • For Physical Connection and Logical Connection resources, a `Port A` or `Port Z` characteristic is required. If the Lifecycle Stage Status of the resource is In Use, both `Port A` and `Port Z` are required. • For Equipment Holder resources, a `Container Type` characteristic is required. Data type: Array `"resourceCharacteristic": [ { "name": "String", "value": "String", "valueType": "String" } ]`
resourceCharacteristic.name	Required if the *`resourceCharacteristic`* parameter is used. Field name from the resource table specified by the *`@type`* parameter. You can't use the fields model_id, name, network_site, operation_notes, operational_status, short_description, start_date, or any sys_ prefixed fields such as sys_id. Data type: String
resourceCharacteristic.value	Required if the *`resourceCharacteristic`* parameter is used. The value of the characteristic. Data type: String
resourceCharacteristic.valueType	The type of value. Valid values: • boolean • datetime • float • integer • ph_number • reference • string Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
resourceRelationship	List of related resources. The following resource types require specific related resources. • For Interface Card resources, a relationship to an Equipment Holder resource where Container Type is Slot or Sub Slot is required. • For Network Interface resources, a relationship to an Equipment or Interface Card resource is required. • For Equipment Holder resources where Container Type is Slot or Sub Slot, a relationship to an Equipment or Interface Card resource is required. Data type: Array `"resourceRelationship": [ { "relationshipType": "String", "resource": {Object} } ]`
resourceRelationship.relationshipType	Required if the *resourceRelationship* parameter is used. Type of relationship between the two resources in the format `[this resource descriptor]::[related resource descriptor]`. For example, `Contains::Contained by` indicates that the related resource is the child of this resource. Valid values for the descriptors are located in the CI Relationship Type [cmdb_rel_type] table in the **Parent descriptor** and **Child descriptor** columns. Data type: String
resourceRelationship.resource	Required if the *resourceRelationship* parameter is used. Details about the related resource. The related resource must be one of the following resource types. • Cable • Equipment • Equipment Holder • Interface Card • Logical Connection • Network Interface • Network Site • Physical Connection • Strand • Topology

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: Object `"resource": { "id": "String", "href": "String" }`
resourceRelationship.resource.id	Required if the *resourceRelationship* parameter is used. Sys_id of the related resource. Located in one of the following tables depending on the type of related resource. • Interface Card [cmdb_ci_interface_card] • Logical Connection [cmdb_ci_ni_logical_path] • Network Interface [cmdb_ci_ni_interface] • Network Site [cmdb_ci_ni_site] • Physical Connection [cmdb_ci_ni_physical_link] • Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables. • Tables that extend Equipment Holder [cmdb_ci_equipment_holder] Data type: String
resourceRelationship.resource.href	Relative link to the related resource record. Data type: String
resourceSpecification	Resource specification. Data type: Object `"resourceSpecification": { "id": "String" }`
resourceSpecification.id	Required if the *resourceSpecification* parameter is used. Sys_id of the associated model for the resource. Located in one of the following tables depending on the type of model. • Cable Models [sn_ent_cable_model] • Equipment Holder Models [sn_ent_nw_holder_model] • Equipment Models [sn_ent_nw_equipment_model] • Interface Card Models [sn_ent_nw_interface_model]

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• Logical Connection Models [sn_ent_logical_nw_connection_model] • Network Interface Models [sn_ent_nw_interface_model] • Physical Connection Models [sn_ent_physical_nw_connection_model] • Strand Models [sn_ent_strand_model] • Topology Models [sn_ent_network_topology_model] Data type: String
startOperatingDate	Date and time that the resource first started operating. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/merge-patch+json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
404	Not found. The requested item wasn't found.
415	The request body is in an unsupported format or the Content-Type request header is set incorrectly.

Response body parameters (JSON or XML)

Name	Description
@type	The type of resource. Valid values: • `cmdb_ci_cable` (Cable) • `cmdb_ci_interface_card` (Interface Card) • `cmdb_ci_ip_address` (IP Address) • `cmdb_ci_ni_logical_path` (Logical Connection) • `cmdb_ci_ni_interface` (Network Interface) • `cmdb_ci_ni_site` (Network Site) • `cmdb_ci_ni_physical_link` (Physical Connection) • `cmdb_ci_strand` (Strand) • `cmdb_ci_topology` (Topology) • Name of a table specified by the *`sn_ni_core.equipment_tables`* sys_property, or name of a table that extends the specified tables. • Name of a table that extends Equipment Holder [cmdb_ci_equipment_holder]. Data type: String
description	Description of the resource. Data type: String
href	Relative link to the resource record. Data type: String
id	Sys_id of the resource. Located in one of the following tables depending on the type of resource. • Cable [cmdb_ci_cable] • Equipment Holder [cmdb_ci_equipment_holder] • Interface Card [cmdb_ci_interface_card]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	• IP Address [cmdb_ci_ip_address]
	• Logical Connection [cmdb_ci_ni_logical_path]
	• Network Interface [cmdb_ci_ni_interface]
	• Network Site [cmdb_ci_ni_site]
	• Physical Connection [cmdb_ci_ni_physical_link]
	• Strand [cmdb_ci_strand]
	• Topology [cmdb_ci_topology]
	• Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables.
	• Tables that extend Equipment Holder [cmdb_ci_equipment_holder].
	• Child tables that extend any of the following tables:
	  ○ Cable [cmdb_ci_cable]
	  ○ Equipment Holder [cmdb_ci_equipment_holder]
	  ○ Strand [cmdb_ci_strand]
	
	Data type: String

name	Name of the resource. Data type: String
note	List of notes about the resource. Data type: Array `"note": [ { "text": "String" } ]`
note.text	The note text. Data type: String
place	Network site for the resource. This parameter is not supported for Network Site, Physical Connection, or Logical Connection resources. Data type: Object `"place": { "@referredType": "String", "href": "String", "id": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
place.@referredType	The type of place. This value is always `GeographicAddress`. Data type: String
place.href	Relative link to the place record. Data type: String
place.id	Sys_id of the place record in the Network Site [cmdb_ci_ni_site] table. Data type: String
relatedParty	Details about contacts for the resource. Data type: Array `"relatedParty": [ { "@referredType": "String", "href": "String", "id": "String", "role": "String" } ]`
relatedParty.@referredType	The type of related party. Located in the Group [sys_user_group] table in the **Type** field. Data type: String
relatedParty.href	Relative link to the related party record. Data type: String
relatedParty.id	Sys_id of the related party record in the Group [sys_user_group] table. Data type: String
relatedParty.role	The role of the related party. Located in the Teams [cmdb_rel_team] table in the **Group type** field. Data type: String
resourceCharacteristic	List of characteristics of the resource. The following resource types require specific resource characteristics. • For Physical Connection and Logical Connection resources, a `Port A` or `Port Z` characteristic is required. If the Lifecycle Stage Status of the resource is In Use, both `Port A` and `Port Z` are required. • For Equipment Holder resources, a `Container Type` characteristic is required. Data type: Array

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"resourceCharacteristic": [
	  {
	  "name": "String",
	  "value": "String",
	  "valueType": "String"
	  }
	]</pre>

resourceCharacteristic.name	Field name from the resource table specified by the *@type* parameter. You can't use the fields model_id, name, network_site, operation_notes, operational_status, short_description, start_date, or any sys_ prefixed fields such as sys_id. Data type: String
resourceCharacteristic.value	The value of the characteristic. Data type: String
resourceCharacteristic.valueType	The type of value. Valid values: • boolean • datetime • float • integer • ph_number • reference • string Data type: String

resourceRelationship	List of related resources. The following resource types require specific related resources.
	• For Interface Card resources, a relationship to an Equipment Holder resource where Container Type is Slot or Sub Slot is required.
	• For Network Interface resources, a relationship to an Equipment or Interface Card resource is required.
	• For Equipment Holder resources where Container Type is Slot or Sub Slot, a relationship to an Equipment or Interface Card resource is required.
	
	Data type: Array
	<pre>"resourceRelationship": [
	  {
	  "relationshipType": "String",
	  "resource": {Object}</pre>

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre> }]</pre>
resourceRelationship.relationshipType	Type of relationship between the two resources in the format `[this resource descriptor]::[related resource descriptor]`. For example, `Contains::Contained by` indicates that the related resource is the child of this resource. Valid values for the descriptors are located in the CI Relationship Type [cmdb_rel_type] table in the **Parent descriptor** and **Child descriptor** columns. Data type: String

resourceRelationship.resource	Details about the related resource. The related resource must be one of the following resource types.
	• Cable
	• Equipment
	• Equipment Holder
	• Interface Card
	• Logical Connection
	• Network Interface
	• Network Site
	• Physical Connection
	• Strand
	• Topology
	
	Data type: Object
	<pre>"resource": {
	   "id": "String",
	   "href": "String"
	}</pre>

resourceRelationship.resource.id	Sys_id of the related resource. Located in one of the following tables depending on the type of related resource. • Interface Card [cmdb_ci_interface_card] • Logical Connection [cmdb_ci_ni_logical_path] • Network Interface [cmdb_ci_ni_interface] • Network Site [cmdb_ci_ni_site] • Physical Connection [cmdb_ci_ni_physical_link] • Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables. • Tables that extend Equipment Holder [cmdb_ci_equipment_holder]

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
resourceRelationship.resource.href	Relative link to the related resource record. Data type: String
resourceSpecification	Resource specification. Data type: Object `"resourceSpecification": { "id": "String" }`
resourceSpecification.id	Sys_id of the associated model for the resource. Located in one of the following tables depending on the type of model. • Cable Models [sn_ent_cable_model] • Equipment Holder Models [sn_ent_nw_holder_model] • Equipment Models [sn_ent_nw_equipment_model] • Interface Card Models [sn_ent_nw_interface_model] • Logical Connection Models [sn_ent_logical_nw_connection_model] • Network Interface Models [sn_ent_nw_interface_model] • Physical Connection Models [sn_ent_physical_nw_connection_model] • Strand Models [sn_ent_strand_model] • Topology Models [sn_ent_network_topology_model] Data type: String
startOperatingDate	Date and time that the resource first started operating. Data type: String

Example: cURL request

This example updates the name of a resource.

```
curl
 "http://instance.servicenow.com/api/sn_ni_core/resource/583e7b9
5405dc910f8772175cacd7292" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type: application/merge-patch+json" \
--user 'username':'password' \
--data '{"name": "new name"}'
```

Response body.

Request body parameters (JSON) (continued)

Name	Description
	• `cmdb_ci_topology` (Topology) • Name of a table specified by the *`sn_ni_core.equipment_tables`* sys_property, or name of a table that extends the specified tables. • Name of a table that extends Equipment Holder [cmdb_ci_equipment_holder]. Data type: String
description	Description of the resource. Data type: String
name	Required. Name of the resource. Data type: String
note	List of notes about the resource. Data type: Array `"note": [ { "text": "String" } ]`
note.text	Required if the *`note`* parameter is used. The note text. Data type: String
place	Required for Equipment Holder resources where Container Type is Cage, Bay, Cabinet, Rack, Line Up, or Inventory Model Bundle. Required for all Equipment resources. Network site for the resource. This parameter is not supported for Network Site, Physical Connection, or Logical Connection resources. Data type: Object `"place": { "@referredType": "String", "href": "String", "id": "String" }`
place.@referredType	The type of place. This value is always `GeographicAddress`.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
place.href	Relative link to the place record. Data type: String
place.id	Required if the *place* parameter is used. Sys_id of the place record in the Network Site [cmdb_ci_ni_site] table. Data type: String
relatedParty	Details about contacts for the resource. Data type: Array `"relatedParty": [ { "@referredType": "String", "href": "String", "id": "String", "role": "String" } ]`
relatedParty.@referredType	The type of related party. Located in the Group [sys_user_group] table in the **Type** field. Data type: String
relatedParty.href	Relative link to the related party record. Data type: String
relatedParty.id	Required if the *relatedParty* parameter is used. Sys_id of the related party record in the Group [sys_user_group] table. Data type: String
resourceCharacteristic	List of characteristics of the resource. The following resource types require specific resource characteristics. • For Physical Connection and Logical Connection resources, a `Port A` or `Port Z` characteristic is required. If the Lifecycle Stage Status of the resource is In Use, both `Port A` and `Port Z` are required. • For Equipment Holder resources, a `Container Type` characteristic is required. Data type: Array `"resourceCharacteristic": [ { "name": "String",`

Request body parameters (JSON) (continued)

Name	Description

	<pre>"value": "String",
	"valueType": "String"
	}
	]</pre>

resourceCharacteristic.name	Required if the *resourceCharacteristic* parameter is used. Field name from the resource table specified by the *@type* parameter. You can't use the fields model_id, name, network_site, operation_notes, operational_status, short_description, start_date, or any sys_ prefixed fields such as sys_id. Data type: String
resourceCharacteristic.value	Required if the *resourceCharacteristic* parameter is used. The value of the characteristic. Data type: String
resourceCharacteristic.valueType	The type of value. Valid values: • boolean • datetime • float • integer • ph_number • reference • string Data type: String

resourceRelationship	List of related resources. The following resource types require specific related resources.
	• For Interface Card resources, a relationship to an Equipment Holder resource where Container Type is Slot or Sub Slot is required.
	• For Network Interface resources, a relationship to an Equipment or Interface Card resource is required.
	• For Equipment Holder resources where Container Type is Slot or Sub Slot, a relationship to an Equipment or Interface Card resource is required.
	
	Data type: Array
	<pre>"resourceRelationship": [
	{
	"relationshipType": "String",</pre>

Request body parameters (JSON) (continued)

Name	Description

	<pre>"resource": {Object}
	}
	]</pre>

resourceRelationship.relationshipType	Required if the *resourceRelationship* parameter is used. Type of relationship between the two resources in the format `[this resource descriptor]::[related resource descriptor]`. For example, `Contains::Contained by` indicates that the related resource is the child of this resource. Valid values for the descriptors are located in the CI Relationship Type [cmdb_rel_type] table in the **Parent descriptor** and **Child descriptor** columns. Data type: String

resourceRelationship.resource	Required if the *resourceRelationship* parameter is used.
	Details about the related resource. The related resource must be one of the following resource types.
	• Cable
	• Equipment
	• Equipment Holder
	• Interface Card
	• Logical Connection
	• Network Interface
	• Network Site
	• Physical Connection
	• Strand
	• Topology
	
	Data type: Object
	<pre>"resource": {
	"id": "String",
	"href": "String"
	}</pre>

resourceRelationship.resource.id	Required if the *resourceRelationship* parameter is used. Sys_id of the related resource. Located in one of the following tables depending on the type of related resource. • Interface Card [cmdb_ci_interface_card] • Logical Connection [cmdb_ci_ni_logical_path] • Network Interface [cmdb_ci_ni_interface]

Request body parameters (JSON) (continued)

Name	Description
	• Network Site [cmdb_ci_ni_site] • Physical Connection [cmdb_ci_ni_physical_link] • Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables. • Tables that extend Equipment Holder [cmdb_ci_equipment_holder] Data type: String
resourceRelationship.resource.href	Relative link to the related resource record. Data type: String
resourceSpecification	Resource specification. Data type: Object `"resourceSpecification": { "id": "String" }`
resourceSpecification.id	Required if the *resourceSpecification* parameter is used. Sys_id of the associated model for the resource. Located in one of the following tables depending on the type of model. • Cable Models [sn_ent_cable_model] • Equipment Holder Models [sn_ent_nw_holder_model] • Equipment Models [sn_ent_nw_equipment_model] • Interface Card Models [sn_ent_nw_interface_model] • Logical Connection Models [sn_ent_logical_nw_connection_model] • Network Interface Models [sn_ent_nw_interface_model] • Physical Connection Models [sn_ent_physical_nw_connection_model] • Strand Models [sn_ent_strand_model] • Topology Models [sn_ent_network_topology_model] Data type: String
startOperatingDate	Date and time that the resource first started operating. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.
Location	URL of the created resource.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
215	Request successfully received for processing. The request will be completed asynchronously.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Response body parameters (JSON)

Name	Description
@type	The type of resource. Valid values: • `cmdb_ci_cable` (Cable) • `cmdb_ci_interface_card` (Interface Card) • `cmdb_ci_ip_address` (IP Address) • `cmdb_ci_ni_logical_path` (Logical Connection) • `cmdb_ci_ni_interface` (Network Interface) • `cmdb_ci_ni_site` (Network Site)

Name	Description
	• `cmdb_ci_ni_physical_link` (Physical Connection) • `cmdb_ci_strand` (Strand) • `cmdb_ci_topology` (Topology) • Name of a table specified by the *`sn_ni_core.equipment_tables`* sys_property, or name of a table that extends the specified tables. • Name of a table that extends Equipment Holder [cmdb_ci_equipment_holder]. Data type: String
description	Description of the resource. Data type: String
href	Relative link to the resource record. Data type: String

id	Sys_id of the resource. Located in one of the following tables depending on the type of resource.
	• Cable [cmdb_ci_cable]
	• Equipment Holder [cmdb_ci_equipment_holder]
	• Interface Card [cmdb_ci_interface_card]
	• IP Address [cmdb_ci_ip_address]
	• Logical Connection [cmdb_ci_ni_logical_path]
	• Network Interface [cmdb_ci_ni_interface]
	• Network Site [cmdb_ci_ni_site]
	• Physical Connection [cmdb_ci_ni_physical_link]
	• Strand [cmdb_ci_strand]
	• Topology [cmdb_ci_topology]
	• Tables specified by the *`sn_ni_core.equipment_tables`* sys_property, and any tables that extend the specified tables.
	• Tables that extend Equipment Holder [cmdb_ci_equipment_holder].
	• Child tables that extend any of the following tables:
	  ○ Cable [cmdb_ci_cable]
	  ○ Equipment Holder [cmdb_ci_equipment_holder]
	  ○ Strand [cmdb_ci_strand]
	
	Data type: String

Resource Inventory Open API - POST /sn_ni_core/resourceinventoryviatemplate

Creates a resource configuration item (CI) and related CI hierarchy based on a template.

Before calling this endpoint, you must create an inventory template in the Inventory Template [sn_ni_core_inventory_template] table. You can define the entire hierarchy of related CIs in an inventory template. You can then create all of the CIs and relationships via a single API request.

URL format

Default URL: `/api/sn_ni_core/resourceinventoryviatemplate`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
overrides	List of columns to override and the values to use. Data type: Object `"overrides": { "column_name": "String" }`
overrides.column_name	Required if the *overrides* parameter is used. Column name and value. Data type: String

parentId	Required. Sys_id of the parent CI. Located in one of the following tables depending on the type of parent CI.
	• Cable [cmdb_ci_cable]
	• Equipment Holder [cmdb_ci_equipment_holder]
	• Interface Card [cmdb_ci_interface_card]
	• IP Address [cmdb_ci_ip_address]
	• Logical Connection [cmdb_ci_ni_logical_path]
	• Network Interface [cmdb_ci_ni_interface]
	• Network Site [cmdb_ci_ni_site]
	• Physical Connection [cmdb_ci_ni_physical_link]
	• Strand [cmdb_ci_strand]
	• Topology [cmdb_ci_topology]
	• Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables.
	• Tables that extend Equipment Holder [cmdb_ci_equipment_holder].
	• Child tables that extend any of the following tables:
	  ○ Cable [cmdb_ci_cable]
	  ○ Equipment Holder [cmdb_ci_equipment_holder]
	  ○ Strand [cmdb_ci_strand]
	
	Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
templateId	Required. Sys_id of the template. Located in the Inventory Template [sn_ni_core_inventory_template] table. Data type: String
templateOverrides	List of template overrides. Data type: Array `"templateOverrides": [ { "overrideTemplateId": "String", "templateId": "String" } ]`
templateOverrides.overrideTemplateId	Required if the *templateOverrides* parameter is used. Available template sys_id. Data type: String
templateOverrides.templateId	Required if the *templateOverrides* parameter is used. Related template sys_id. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.
Location	URL of the created CI at the top of the hierarchy.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Resource created.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Error. An error occurred with the request. For example, the request failed validation checks.

Response body parameters (JSON)

Name	Description
result	Result object with information about the created CIs. Data type: Object `"result": { "sys_id": "String" }`
result.sys_id	Sys_id of the created CI at the top of the hierarchy. Data type: String

Example: cURL request

This example creates a CI hierarchy using a template.

```
curl
 "https://instance.service-now.com/api/sn_ni_core/resourceinvent
oryviatemplate" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   "templateId": "90475711ed6ec110f877d2f57b8accda",
   "parentId": "917dd8f6870e851079c40f2d0ebb353d",
   "overrides": {
      "equipment_clli": "test"
   },
   "templateOverrides": [
      {
         "templateId": "ac3b679ded6ec110f877d2f57b8acc29",
         "overrideTemplateId":
 "f9604efb54e18110f87749bbc4ad38d8"
      },
      {
```

"result": {
   "sys_id": "00598f0aed346259f388105f29f892c4"
}
```

Response Templates API

The *Response Templates* API provides endpoints to handle records in the Response Templates [sn_templated_snip_note_template] table.

This script include requires the Templated Responses plugin (com.sn_templated_snip), which is activated by default, and runs within the `sn_templated_snip` namespace.

For additional information on response templates, see Response templates.

Response Templates - POST /response_templates/get_templates

Returns records from the Response Templates [sn_templated_snip_note_template] table.

URL format

Default URL: `/api/sn_templated_snip/response_templates/get_templates`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
errorFormat	HTML formatting to use for errors. Data type: String Default: `"<span style='color:#ff0000'>${%s}</span>"`
includeEvaluatedBody	Flag that indicates whether to render the template variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	Valid values:
	• false: Do not render the template variables. The response contains the message variables.
	For example:
	`Please note that your case ${number} has been escalated to ${assignment_group}.`
	• true: Renders the template variables and returns *evaluated_response* in the return results.
	For example:
	`Please note that your case INC100001 has been escalated to Facilities.`
	Data type: Boolean
	Default: false

limit	Maximum number of response templates to return. Data type: Number Default: 50
offset	For pagination, the index at which to start the search. Data type: Number Default: 0
opts	Parameters to pass to the sn_templated_snip.response_template extension point. The format and content of these parameters are dependent on the implementation of the extension point. For additional information on extension points, see Using extension points to extend application functionality. Data type: Object
recordId	Required. Sys_id of the record to use to render the variables in the response template. Data type: String
searchTerm	Text to use to filter the list of matching response templates. The endpoint performs a CONTAINS search of this text on the name and body fields and a STARTS WITH search on the short name field. For example, if the search term is "crash", the endpoint returns any response template that matches the query criteria and has crash in the name or body or the short name starts with crash.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Response templates with exact matches on short name appear first in the return results. All other returned response templates are sorted by name. Data type: String Default: Return all matching response templates.
tableName	Required. Name of the table to use to search the Response Templates table to locate corresponding response templates. For example, "incident" or "sn_hr_core_case". Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Array of objects that list all of the templates that match the specified search criteria. Data type: Array `"result": [ {Object} ]`
result.<object>	Response templates with exact matches on short name appear first in the return results. All other returned response templates are sorted by name. Data type: Object `{ "evaluated_response": [Array], "name": "String", "short_name": "String", "short_name_match": Boolean, "sys_id": "String", "template_body": "String" }`
result.<object>.evaluated_response	Array that lists the results of the template evaluation. Data type: Array `"elevated_response":[ "error": [Array], "evaluated_body": "String", "success": Boolean ]`
result.<object>.evaluated_response.error	List of entries for each evaluation error that occurred.

Name	Description

	Data type: Array
	<pre>"error":[
	
	"inAccessibleVariables": "String",
	"message": "String",
	
	"unEvaluatedVariables": "String"
	]</pre>

result.<object>.evaluated_response.error.inAccessibleVariables	Variables in the response template body that could not be resolved. Data type: String
result.<object>.evaluated_response.error.message	Error message. Data type: String
result.<object>.evaluated_response.error.unEvaluatedVariables	Variables in the response template body that were not evaluated. Data type: String
result.<object>.evaluated_response.evaluated_body	Evaluated response template body in HTML. Data type: String
result.<object>.evaluated_response.success	Flag that indicates whether all of the variables rendered properly. Possible values: • true: All variables rendered properly. • false: Variables did not render properly. Data type: Boolean
result.<object>.name	Name of the response template. Data type: String
result.<object>.short_name	Short name of the response template. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.<object>.short_name_match	Flag that indicates whether an exact match occurred on the short name of the response template. Possible values: • true: Search term is an exact match. • false: Search term is not an exact match. Data type: Boolean
result.<object>.sys_id	Sys_id of the response template. Data type: String
result.<object>.template_body	Response template body in HTML. Data type: String

Example: Sample cURL request

```
curl
 "https://instance.service-now.com/api/sn_templated_snip/respons
e_templates/get_templates" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"tableName\": \"sn_hr_core_case_total_rewards\",
  \"recordId\": \"2c9e43320b30220097432da0d5673a9c\"
}" \
--user "username":"password"
```

```
{
   "result": [
      {
         "sys_id": "2552c4ec0b03320036e62c7885673a5a",
         "name": "Escalation Notes - Total Rewards",
         "short_name": "Escalation Notes - Total Rewards",
         "template_body": "<p>Dear
 ${subject_person},<\/p>\n<p>Please note that your case
 ${number} has been escalated to ${assignment_group}. An
 agent will be assigned on your case and will keep you
 updated. If you have more questions please reach out to our
 team.<\/p>\n<p>Regards,<\/p>\n<p>${sys_updated_by}<\/p>"
      },
      {
         "sys_id": "698388ec0b03320036e62c7885673ab5",
         "name": "Resolution Notes - Phone Inquiry",
         "short_name": "Resolution Notes - Phone Inquiry",
```

SAM-Software Usage Data Integration API

The *SAM-Software Usage Data Integration* API provides endpoints to create and update records in the Software Usage [samp_sw_usage] table.

This API requires activation of the Software Asset Management Professional (com.snc.samp) plugin. It also requires that you have either the sam_admin or sam_developer role to access the endpoint.

SAM-Software Usage Data Integration - POST /sam_software_usage_integration/createOrUpdate

Creates or updates a specified record in the Software Usage [samp_sw_usage] table.

You can create/update one or more software usage records in a single call.

URL format

Versioned URL: `/api/now/{api_version}/sam_software_usage_integration/createOrUpdate`

Default URL: `/api/now/sam_software_usage_integration/createOrUpdate`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
items	List of column names and values for each field to store in the software usage record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	The column information that you must pass depends on the value you specify for *reclamation_type* (which is a required field):
	
	Possible *reclamation_type* values and the column information that must be passed:
	• total_usage:
	  ○ configuration_item
	  ○ last_used_time
	  ○ month_used
	  ○ norm_product
	  ○ year
	• last_used_date:
	  ○ configuration_item
	  ○ norm_product
	
	The combination of these fields uniquely identify a record. If the record is not found in the table, a new record with the specified fields is created; otherwise the existing record is updated.
	
	Data type: Array

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
items	Name-value pair list of all fields in the software usage record. Data type: Array (content varies)

Example: cURL request

The following example illustrates how to create a new software usage record.

```
curl -X POST
 "https://instance.servicenow/api/now/sam_software_usage_integra
tion/createOrUpdate" \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-d "{'items': [\
  {
    'configuration_item':'eaa9604d3790200044e0bfc8bcbe5dc1',\
    'month_used':2,\
    'norm_product':'40209c060b3022002d6c650d37673a89',\
    'norm_publisher':'24dcccc20b3022002d6c650d37673ab3',\
    'reclamation_type':'total_usage',\
    'usage_count': 13,\
    'total_usage_time':13,\
    'year':2020
  }\
]}"
```

```
{
  "result": {
    "reply": {
      "items": [
        {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
          "configuration_item":
 "eaa9604d3790200044e0bfc8bcbe5dc1",
          "month_used": 2,
          "norm_product": "40209c060b3022002d6c650d37673a89",
          "norm_publisher": "24dcccc20b3022002d6c650d37673ab3",
          "reclamation_type": "total_usage",

Scorecards API

The *Scorecards* API provides endpoints that enable you to query data about Performance Analytics indicators. The query parameters equate to the functions available on the Analytics Hub for drilling down into an indicator.

Scorecards - GET /now/pa/scorecards

Retrieves details about indicators from the Analytics Hub .

Access to tables through the REST API is restricted by BasicAuth. Access control lists defined for tables are enforced to restrict access to data.

To make queries using the Performance Analytics API, you must also have the pa_viewer role.

Almost all queries use the *sysparm_uuid* parameter. This parameter consists of the indicator sys_id followed by a colon-separated list of additional, optional sys_ids. The *sysparm_uuid* is always the first parameter.

URL format

Versioned URL: `/api/now/{api_version}/pa/scorecards`

Default URL: `/api/now/pa/scorecards`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Parameter	Description
sysparm_breakdown	Sys_id of a breakdown to return chart information organized as defined by the breakdown. For example, the sys_id of a priority breakdown to return separate task chart information for each priority value, such as the number of open incidents / Priority / 2 - High. Data type: String
sysparm_breakdown_relation	Sys_id of a breakdown relation to break down the returned data using that relation. Data type: String
sysparm_contains	Comma-separated list of names or descriptions to return results only from indicators with a matching value. All the comma-separated list items must match, or no results are returned: The list follows AND logic, not OR logic.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
	Data type: String
sysparm_display	Flag that indicates the type of indicators to return. Valid values: • true: Return only indicators that display on the Analytics Hub . • all: Return all indicators. Data type: String Default: true
sysparm_display_value	Determines the type of data returned, either the actual values from the database or the display values of the fields. Display values are manipulated based on the actual value in the database and user or system settings and preferences. If returning display values, the value that is returned is dependent on the field type. • Choice fields: The database value may be a number, but the display value will be more descriptive. • Date fields: The database value is in UTC format, while the display value is based on the user's time zone. • Encrypted text: The database value is encrypted, while the displayed value is unencrypted based on the user's encryption context. • Reference fields: The database value is sys_id, but the display value is a display field of the referenced record. Data type: String Valid values: • true: Returns the display values for all fields. • false: Returns the actual values from the database. • all: Returns both actual and display values. Default: false **Note:** There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).
sysparm_elements_filter	Sys_id of an elements filter to apply to the returned data.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
	Data type: String
sysparm_exclude_reference_link	Flag that indicates whether to hide additional information provided for reference fields, such as the URI to the reference resource. Valid values: • true: Hide additional information provided for reference fields. • false: Do not hide additional information provided for reference fields. Data type: Boolean Default: false
sysparm_favorites	Flag that indicates whether to return only indicators that are favorites of the querying user. Valid values: • true: Return only indicators that are favorites of the querying user. • false: Return all indicators. Data type: Boolean Default: false
sysparm_from	Earliest date to return scores from. Only scores from this date or later are returned. This parameter requires that *include_scores* is set to `true`. Format: ISO-8601 standard Date type: String
sysparm_include_aggregates	Flag that indicates whether to return all possible aggregates for an indicator, including aggregates that have already been applied. Valid values: • true: Return all possible aggregates for an indicator, including aggregates that have already been applied. • false: Return no aggregates. Data type: Boolean Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
sysparm_include_available_aggregates	Flag that indicates whether to return all available aggregates for an indicator when no aggregate has been applied. Valid values: • true: Return all available aggregates for an indicator when no aggregate has been applied. • false: Return no aggregates. Data type: Boolean Default: false
sysparm_include_available_breakdowns	Flag that indicates whether to return all available breakdowns for an indicator. Valid values: • true: Return all available breakdowns for an indicator. • false: Return no breakdowns. Data type: Boolean Default: false
sysparm_include_forecast_scores	Flag that indicates whether to return the forecast_scores element that contains an array of date-value pairs that define the forecast data for the Analytics Hub . This parameter requires that the *`include_scores`* parameter is also set to `true`. Valid values: • true: Return the forecast_scores element. • false: Do not return the forecast_scores element. Data type: Boolean Default: false
sysparm_include_realtime	Flag that indicates whether to return the realtime_enabled element which indicates if real-time scores are enabled for the indicator, and the realtime_value element which contains the real-time score value. This parameter is not supported for formula indicators. Valid values: • true: Return the realtime_enabled element. • false: Do not return the realtime_enabled element. Data type: Boolean

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
	Default: false
sysparm_include_score_notes	Flag that indicates whether to return all notes associated with the score. The note element contains the note text as well as the author and timestamp when the note was added. Valid values: • true: Return all notes associated with the score. • false: Do not return all notes associated with the score. Data type: Boolean Default: false
sysparm_include_scores	Flag that indicates whether to return indicator scores for the entire time range selected on the Analytics Hub . If a value is not specified, this parameter defaults to false and returns only the most recent score value. To constrain the date range of the scores that are returned, combine this parameter with *from* and *to*. Valid values: • true: Return indicator scores for the entire selected time range. • false: Do not return indicator scores for the entire selected time range. Data type: Boolean Default: false
sysparm_include_target_color_scheme	Flag that indicates whether to return the target_color_scheme element that contains the minimum and maximum values, and the color of each section of the target color scheme for the Analytics Hub . Valid values: • true: Return the target_color_scheme element. • false: Do not return the target_color_scheme element. Data type: Boolean Default: false
sysparm_include_trendline_scores	Flag that indicates whether to return the trendline_scores element that contains an array of date-value pairs that define the Analytics Hub trendline. This parameter requires that the *include_scores* parameter is also set to `true`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
	Valid values: • true: Return the trendline_scores element. • false: Do not return the trendline_scores element. Data type: Boolean Default: false
sysparm_key	Flag that indicates whether to return results only for key indicators. Valid values: • true: Return the trendline_scores element. • false: Do not return the trendline_scores element . Data type: Boolean Default: false
sysparm_limit	Maximum number of scores to return. Data type: Number
sysparm_page	Page number. For example, when querying 20 indicators with the default sysparm_per_page value (10), specify a sysparm_page value of 2 to retrieve indicators 11-20. Data type: Number
sysparm_per_page	Maximum number of indicators each query can return on a page. Default: 10 Maximum: 100 Data type: Number
sysparm_sortby	Value to use when sorting results. Valid values: • bullet • change • changeperc • date • default • direction • duedate • frequency

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
	• gap • gapperc • group • indicator_group • name • order • target • trend • value Data type: String Default: value
sysparm_sortdir	Sort direction. Valid values: • asc: Denotes ascending • des: Denotes descending Data type: String Default: Descending
sysparm_step	Numeric value to skip scores, based on the indicator frequency. For example, specify a value of 3 to return only scores from every third day for a daily indicator, or from every third week for a weekly indicator. Data type: Number
sysparm_tags	Indicator group sys_id in which to return the indicators of that group. Do not use *sysparm_uuid* with this parameter. You cannot obtain the sys_id of an indicator group through this API. Instead, get the sys_id from the indicator group record. For more information about obtaining sys_ids from records, see Unique record identifier (sys_id). Data type: String
sysparm_target	Flag that indicates whether to return results only for indicators that have a target set on the Analytics Hub . Valid values: • true: Only return results for indicators that have a target set. • false: Return results for all applicable indicators.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
	Data type: Boolean Default: false
sysparm_to	Latest date from which to return scores. Only scores from this date or earlier are returned. This parameter requires that *include_scores* is set to `true`. Data type: String Format: ISO-8601 standard
sysparm_uuid	Colon-separated list of sys_id values to specify which indicators, breakdowns, aggregates, and domains to query. The parameter follows this format: <indicator_sys_id>:<breakdown_sys_id>:<elements_filter_sys_id or element_sys_ids>:<lvl-2 breakdown_sys_id>:<lvl-2 elements_filter_sys_id or element_sys_ids>:<aggregate_sys_id>;<domain_sys_id> The parameter must begin with the sys_id of an indicator record. Optionally, you can append the sys_id values of a breakdown and breakdown element to group the response based on the breakdown, and the sys_id of an aggregate to apply that aggregate. You can use a breakdown with an aggregate, or use only one. **Note:** If an indicator is configured to use a **Default time series**, all values that this API retrieves for that indicator use the selected aggregate. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
Depends on request parameters.	

Example: Retrieving all indicators on the Analytics Hub

```
# Request a list of all indicators that
# are displayed in the Analytics Hub,
# including their unique record identifiers.

curl --verbose --user "user:password" \
--header "Accept:application/json" \
"https://instance.service-now.com/api/now/v1/pa/scorecards"
```

```

Example: Return indicator details

You can query the Analytics Hub for a particular indicator by providing the *sysparm_uuid* parameter with an indicator sys_id value.

```
# In this example, you use the sys ID for the
# Number of open incidents indicator,
# which you retrieved in the first example,
```

Example: Return scores across a range of dates for two levels of breakdown

To request a list of individual scores for all available dates, set the sysparm_include_scores parameter to true.

To specify the date range of scores, also use the *sysparm_from* and *sysparm_to* parameters.

```
# In this example, the level 1 breakdown and
# element are Assignment Group: Software
# (sys_id baec0752bf130100b96dac808c0739ed
# and 8a4dde73c6112278017a6a4baf547aa7).
# The level 2 breakdown and element are Priority: 1 -
# Critical (sys_id 0df47e02d7130100b96d45a3ce610399
# and e590014020033100766597829 9a805f3).
# Only scores on and after 30 November 2018 are returned.

Example: Return breakdown relations for a breakdown and element

To obtain the sys_id values for all breakdown relations associated with an indicator, use the *sysparm_include_available_breakdowns* parameter. In the *sysparm_uuid*parameter, include the sys_ids of the first-level breakdown and element whose relations you want to find.

```
# In this example, the sysparm_uuid
# parameter includes the sys_id for the
# Assignment Group breakdown and the
# sys_id for the Software element.
# The sys_id of the Assignment Group
# was obtained in the example where all
# breakdowns and aggregates were returned.
# The sys_id of the Software element was
# obtained in the previous example, where
# all the elements of Assignment Group were
# returned. The sys_id of the Assignment
# Group breakdown is
# baec0752bf130100b96dac808c0739ed
# and of the Software element is
# 8a4dde73c6112278017a6a4baf547aa7.
# The breakdown relation is obtained for the
# Number of open incidents indicator,
# whose sys_id is
# fb007202d7130100b96d45a3ce6103b4.

Example: Return indicator using a breakdown relation

To use a breakdown relation, include the sys_id values of the indicator, breakdown, and element in the *sysparm_uuid* parameter, and the sys_id of the breakdown relation in the *sysparm_breakdown_relation* parameter.

```
# This example returns the
# Sibling Group values for Assignment
# Group: Software from the previous example.

 for every element in the Sibling Group
  ]
}
```

Example: Return a filtered set of elements for a breakdown

To apply an elements filter to the Analytics Hub data, use the **sysparm_elements_filter** parameter with the sys_id of a Performance Analytics element filter record.

```
# In this example, the element filter applies
# to the Groups breakdown source, with the
# condition [[Parent][is][Database]].
# The sys_id of this element filter is
# 7b9eb563eb11020065deac6aa206fe11.
# The example gets the elements of the Assignment
# Group breakdown that have the element Database
# as a parent.

Script Debugger API

The *Script Debugger* API provides endpoints to debug lines of server-side JavaScript code, such as business rules and script includes.

For more information about the Script Debugger, see Script Debugger and Session Log.

This API is available by default.

Script Debugger - GET /js/debugpoints/script/{tableName}/{sysId}/{fieldName}

Retrieve a list of breakpoints or logpoints in a server-side script, such as a business rule or script include.

URL format

Default URL: `/api/now/js/debugpoints/script/{tableName}/{sysId}/{fieldName}`

Supported request parameters

Path parameters

Name	Description
tableName	Name of the table that contains the server-side script, such as sys_script or sys_script_include. Data type: String
sysId	Sys_id for the server-side script. Data type: String
fieldName	Name of the field that contains the server-side script content. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	User Not Authorized. The user who executed the request does not have permission to access breakpoint or log point information for the specified record.

Response body parameters (JSON or XML)

Name	Description
canWrite	Flag indicating whether the currently logged in user can set or modify breakpoints for the script. Possible values: • true: You can set or modify breakpoints. • false: You cannot set or modify breakpoints. Data type: Boolean
debugpoints	List of all the breakpoints and logpoints in the script.

Name	Description

	<pre>"debugpoints": {
	  "breakpoint": {Object}
	  "logpoint": {Object}
	}</pre>
	Data type: Object

debugpoints.breakpoint	List of all the breakpoints in the script, presented as key-value pairs. The key is the line number for the breakpoint. The value is an object containing the breakpoint's sys_id and text.
	<pre>"breakpoint": {
	  <line_number>:
	 {Object}
	}</pre>
	Data type: Object

debugpoints.breakpoint.<line_number>	Line number for the breakpoint.
	<pre><line_number>: {
	  "evaluationString":
	 "String"
	  "sysId": "String"
	}</pre>
	Data type: Object

debugpoints.breakpoint.<line_number>.evaluationString	Text of the breakpoint. If the breakpoint is conditional, the evaluationString contains the condition text. If the breakpoint is not conditional, the evaluationString is an empty string. Data type: String
debugpoints.breakpoint.<line_number>.sysId	Sys_id of the breakpoint. Data type: String

debugpoints.logpoint	List of all the logpoints in the script, presented as key-value pairs.
	The key is the line number for the logpoint. The value is an object containing the logpoint's sys_id and text.
	<pre>"logpoint": {
	  <line_number>:
	 {Object}
	}</pre>

Name	Description
	Data type: Object
debugpoints.logpoint.<line_number>	Line number for the logpoint. `<line_number>: { "evaluationString": "String" "sysId": "String" }` Data type: Object
debugpoints.logpoint.<line_number>.evaluationString	Text of the logpoint. Contains the message being logged. Data type: String
debugpoints.logpoint.<line_number>.sysId	Sys_id of the logpoint. Data type: String
key	Object providing details about the script being debugged. `"key": { "scriptField": "String" "scriptId": "String" "scriptType": "String" "value": "String" }` Data type: Object
key.scriptField	Name of the field that contains the script. Data type: String
key.scriptId	Sys_id of the script. Data type: String
key.scriptType	Name of the table that contains the script. Data type: String
key.value	The path parameters used to make the request. Listed in the following order. • tableName • sysId • fieldName

Name	Description
	Data type: String
name	Name of the script. Data type: String
script	Text displaying the script's code. Data type: String

Example cURL request

Example: cURL request

Retrieves a list of logpoints and breakpoints for a server-side script. This script has a logpoint on line 2, a breakpoint on line 11, and a conditional breakpoint on line 18.

```
curl
 "https://instance.servicenow.com/api/now/js/debugpoints/scri
pt/sys_script_include/d65f78c40a0a0b6900196656f35913d3/script" \
--request GET \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user 'username':'password'
```

```
{
  "result": {
    "canWrite": true,
    "debugpoints": {
      "LOGPOINT": {
        "2": {
          "evaluationString": "A log message",
          "sysId": "ba28b0fa739310101c233096fbf6a75e"
        }
      },
      "BREAKPOINT": {
        "11": {
          "evaluationString": "",
          "sysId": "dc5f5bf341256010f877587fbdf5ec1d"
        },
        "18": {
          "evaluationString": "a == true",
          "sysId": "3d4f5bf341256010f877587bdf5ecf6"
        }
      }
    },
    "script": "// script code",
    "name": "AbstractAjaxProcessor",

    }
}
```

Script Debugger - POST js/debugpoints/process

Add, update, or remove breakpoints or logpoints in a server-side script, such as a business rule or script include. Process several breakpoints or logpoints at a time.

URL format

Default URL: `/api/now/js/debugpoints/process`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
fetchAll	When true, returns a list of all the breakpoints or logpoints added or updated by the user. Data type: Boolean Default: false
fetchAllFilter	Returns a filtered list of all the breakpoints or logpoints added or updated by the user. Valid values: • debugpointType. Set to either breakpoint or logpoint. • scriptId. Set to the sys_id of the script in which to search for debug points. • scope. Set to the name of the scope in which to search for debug points. Use the caret (^) symbol as a separator for multiple properties. For example, `fetchAllFilter=debugpointType=logpoint^scope=MyApp` Data type: String

Request body parameters (XML or JSON)

Name	Description
debugpointType	Required. Type of debug point to add, delete, or update. Valid values: • breakpoint • logpoint

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
evaluationString	Text for a logpoint or conditional breakpoint. For a logpoint, the *`evaluationString`* is the log message. For a conditional breakpoint, the *`evaluationString`* is the condition. For example, if you're looping through a list of user IDs and you want the debugger to pause only when the user ID is 38493, you can add a conditional breakpoint inside the loop with `userID == 38493` as the condition. The debugger will only pause at this breakpoint when the condition is true. If the breakpoint is not a conditional breakpoint, the *`evaluationString`* is an empty string. Data type: String
fieldName	Required. Name of the field that contains the server-side script content. Data type: String
lineNumber	Line number in the server-side script specifying where to add, delete, or update the breakpoint or logpoint. Data type: Number
operation	Required. Operation to perform for the breakpoint or logpoint. Valid values: • add • delete • update Data type: String
scriptId	Required. Sys_id for the server-side script. Data type: String
tableName	Required. Name of the table that contains the server-side script, such as sys_script or sys_script_include. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters (JSON or XML)

Name	Description
requestedDebugpoints	List of the requested breakpoints and logpoints. Presented as an array of objects. `"requestedDebugpoints": [ { "scriptId": "String", "evaluationString": "String", "operation": "String", "tableName": "String", "fieldName": "String", "status": "String", "lineNumber": Number, "debugpointType": "String" } ]` Data type: Array
requestedDebugpoints.ScriptId	Sys_id for the server-side script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
requestedDebugpoints.evaluationString	Text added for a logpoint or conditional breakpoint. For a logpoint, the *evaluationString* is the log message. For a conditional breakpoint, the *evaluationString* is the condition. Data type: String
requestedDebugpoints.operation	Operation performed for the breakpoint or logpoint. Possible values: • add • delete • update Data type: String
requestedDebugpoints.tableName	Name of the table that contains the server-side script, such as sys_script or sys_script_include. Data type: String
requestedDebugpoints.fieldName	Name of the field that contains the server-side script content. Data type: String
requestedDebugpoints.status	Result of the instruction to add, delete, or update a specific breakpoint or logpoint. Possible values: • failure • ignored • success A request to add, delete, or update a debug point is ignored in the following situations: • It requests to delete a breakpoint or logpoint that doesn't exist. • It requests to add a breakpoint or logpoint identical to one that already exists. Data type: String
requestedDebugpoints.lineNumber	Line number in the server-side script specifying where the breakpoint or logpoint was added, deleted, or updated. Data type: Number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
requestedDebugpoints.debugpointType	Type of debug point added, deleted, or updated. Possible values: • breakpoint • logpoint Data type: String
status	Result of the overall action. The status code for the HTTP call. Data type: Number

Example: cURL request

This example adds a conditional breakpoint at line 12 in the script.

```
curl
 "https://instance.servicenow.com/api/now/js/debugpoints/proce
ss" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data “[
{
\"tableName\": \"sys_script_include\",
\"scriptId\": \"d65f78c40a0a0b6900196656f35913d3\",
\"fieldname\": \"script\",
\"lineNumber\": 12,
\"evaluationString\": \"a == false\",
\"debugpointType\": \"breakpoint\",
\"operation\": \"add\"
}
]” \
--user 'username':'password'
```

```
{
  "result": {
    "requestedDebugpoints": [
      {
        "scriptId": "d65f78c40a0a0b6900196656f35913d3",
        "evaluationString": "a == false",
        "operation": "add",
        "tableName": "sys_script_include",
        "fieldName": "script",
        "status": "success",
        "lineNumber": 12,
        "debugpointType": "breakpoint"
      }
    ],
    "status": 200
  }
}
```

Service Catalog API

The `Service Catalog` API provides endpoints that access Service Catalog configuration and actions from within a Service Portal.

Service Catalog - DELETE /sn_sc/servicecatalog/cart/{cart_item_id}

Deletes the specified item from the current cart.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/cart/{cart_item_id}`

Default URL: `/api/sn_sc/servicecatalog/cart/{cart_item_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
cart_item_id	Sys_id of the item to delete from the current cart. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
204	Indicates that the request completed successfully and the specified item was deleted from the cart.
400	Indicates that either the specified *cart_item_id* is invalid or the user does not have access to the cart item.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
None	

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_sc/v1/servicecatalog/cart/1f4cc597db21120064301150f0b8f5fc" \
--request DELETE \
--user "username":"password"
```

```
None
```

Service Catalog - DELETE /sn_sc/servicecatalog/cart/{sys_id}/empty

Deletes a specified cart, and the contents of the cart.

The capabilities of what a user can delete (items and/or cart) depends on the role in which they use to authenticate.

User roles needed to delete cart and cart contents:

- admin/catalog_admin: Can empty any user cart.
- admin: Can delete the cart after all the contents of the cart are deleted.
- catalog_admin: Can delete all the items in the cart.

Status codes

Status code	Description
204	Request completed successfully and both empties and deletes the cart.
400	Indicates an error for one of the following reasons: • Invalid cartId. • User does not have admin/catalog_admin role, or is trying to empty another user cart.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
None	

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_sc/servicecatalog/ca
rt/dde34ad713426300027879d96144b072/empty" \
--request DELETE \
--user 'username':'password'
```

```
None
```

Service Catalog - GET /sn_sc/servicecatalog/cart

Retrieves the details of the items within the logged in user's cart.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/cart`

Default URL: `/api/sn_sc/servicecatalog/cart`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Indicates that the request completed successfully. If there is no item in the cart, it returns basic cart information and pricing for user. If the cart contains any items, then the information about the items and their individual pricing is also included.
400	Indicates that the cart is empty and cannot check out.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Parameter	Description
cart_id	Sys_id of the cart. Data type: String
<recurring_frequency>	List of items in the cart having a specific recurring frequency. Possible values include: • daily • monthly • yearly • none (no recurring fees) Data type: Object `"<recurring_frequency>": { "frequency_label": "String", "items": [Array], "show_subtotal_price": "String", "subtotal_price": "String", "subtotal_recurring_frequency": "String", "subtotal_recurring_price": "String", "subtotal_title": "String", "total_title": "String"`
<recurring_frequency>.frequency_label	Frequency of the associated recurring fee. Data type: String Default: Null
<recurring_frequency>.items	List of objects that contain details of each item associated with the specified recurring frequency category. Data type: Array `"items": [{ "cart_item_id": "String", "catalog_item_id": "String", "created.by": "String", "created_on": "String", "delivery_time": "String", "item_id": "String", "item_name": "String", "localized_price": "String", "localized_recurring_price": "String", "name": "String", "order_guide": "String",`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	"picture": "String", "price": "String", "quantity": "String", "recurring_frequency": "String", "recurring_price": "String", "recurring_subtotal": Number, "recurring_subtotal_price": "String", "short_description": "String", "show_price": Boolean, "show_quantity": Boolean, "show_recurring_price": Boolean, "subtotal": Number, "subtotal_price": "String", "sys_class_name": "String", "sys_id": "String", "updated_by": "String", "updated_on": "String", "variables": {Object} }]
<recurring_frequency>.items.cart_item_id	Sys_id of the item in this cart. Data type: String
<recurring_frequency>.items.catalog_item_id	Sys_id of catalog associated the item. Data type: String
<recurring_frequency>.items.created.by	User that initially placed the item in the cart. Data type: String
<recurring_frequency>.items.created_on	Date on which the item was initially placed in the cart. Data type: String
<recurring_frequency>.items.delivery_time	Time that the specified item takes to be delivered. Data type: String
<recurring_frequency>.items.item_id	Catalog sys_id of the item. Data type: String
<recurring_frequency>.items.item_name	Name of the specified item. Data type: String
<recurring_frequency>.items.localized_price	Price of the item in local currency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Parameter	Description
	Data type: String
<recurring_frequency>.items.localized_recurring_price	Recurring fee for the specified item in local currency. Data type: String
<recurring_frequency>.items.name	Item name. Data type: String
<recurring_frequency>.items.order_guide	Name of the order guide to which this item is associated. Data type: String
<recurring_frequency>.items.picture	File name of the picture of the item. Data type: String
<recurring_frequency>.items.price	Price of the item. Data type: String
<recurring_frequency>.items.quantity	Number of the specified item in the cart. Data type: String
<recurring_frequency>.items.recurring_frequency	How often the recurring fee is charged for the specified item. Data type: String Default: Null
<recurring_frequency>.items.recurring_price	Recurring fee for the specified item. Data type: String
<recurring_frequency>.items.recurring_subtotal	Subtotal of the recurring fees for the item (*recurring_price* x *quantity*). Data type: Number
<recurring_frequency>.items.recurring_subtotal_price	Subtotal of the recurring fees for the item. Data type: String
<recurring_frequency>.items.short_description	Short description of the item. Data type: String
<recurring_frequency>.items.show_price	Flag that indicates whether the price of the item is shown in the cart. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	• true: Show the price of the item in the cart. • false: Do not show the price of the item in the cart. Data type: Boolean
<recurring_frequency>.items.show_quantity	Flag that indicates whether to show the item quantity in the cart. Possible values: • true: Show the item quantity in the cart. • false: Do not show the item quantity in the cart. Data type: Boolean
<recurring_frequency>.items.show_recurring_price	Flag that indicates whether the recurring fees should appear in the cart. Possible values: • true: Show the recurring fees in the cart. • false: Do not show the recurring fees in the cart. Data type: Boolean
<recurring_frequency>.items.subtotal	Subtotal number of items. Data type: Number
<recurring_frequency>.items.subtotal_price	Subtotal for the item (*price* x *quantity*). Data type: String
<recurring_frequency>.items.sys_class_name	System classification name of the item. Data type: String
<recurring_frequency>.items.sys_id	Sys_id of the item record. Data type: String
<recurring_frequency>.items.updated_by	User that updated the item after it was initially placed in the cart. Data type: String
<recurring_frequency>.items.updated_on	Last date/time on which the item was either initially placed in the cart or updated. Data type: String
<recurring_frequency>.items.variables	List of name/value pairs of the item variables.

Parameter	Description
	Data type: Object
<recurring_frequency>.show_subtotal_price	Flag that indicates whether to show a subtotal for the associated recurring fee category. Possible values: • true: Show subtotals in the cart. • false: Do not show subtotals in the cart. Data type: Boolean
<recurring_frequency>.subtotal_price	Subtotal of the cost of all items for the associated recurring frequency category. Data type: String
<recurring_frequency>.subtotal_recurring_frequency	Type of subtotal recurring frequency, such as daily, monthly, etc. Same as *`subtotal_recurring_frequency`*. Data type: String
<recurring_frequency>.subtotal_recurring_price	Subtotal of the recurring fees of the items within the associated recurring frequency category. Data type: String
<recurring_frequency>.subtotal_title	If the *`show_subtotal_price`* is set to `true`, the text to display in the cart for the associated subtitle. Data type: String
<recurring_frequency>.total_title	Text to display for the total title for the associated recurring frequency category. Data type: String
show_subtotal_price	Flag that indicates whether to show the subtotal price in the cart. Possible values: • true: Show subtotals in the cart. • false: Do not show subtotals in the cart. Data type: String
subtotal_price	Subtotal of all items in the cart in whole dollars. Data type: String

Service Catalog - GET /sn_sc/servicecatalog/cart/delivery_address/{user_id}

Retrieves the shipping address of the specified user based on the *glide.sc.req_for.roles* property and the default behavior configured in the *glide.sc.req_for.roles.defaultproperty*.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/cart/delivery_address/{user_id}`

Default URL: `/api/sn_sc/servicecatalog/cart/delivery_address/{user_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
user_id	Sys_id of the user whose shipping address is to be retrieved. Located in the User [sys_user] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully; returns the shipping address of the specified user.
400	User sys_id is invalid.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
result	Address of the specified user. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_sc/servicecatalog/ca
rt/delivery_address/62826bf03710200044e0bfc8bcbe5df1" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
'result': '25 New Chardon Street, Boston\nBoston, MA,
 02114-1801\nUSA'
}
```

Service Catalog - GET /sn_sc/servicecatalog/catalogs

Retrieves a list of catalogs to which the user has access based on the passed in parameters.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/catalogs`

Default URL: `/api/sn_sc/servicecatalog/catalogs`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *`sysparm_limit`* values can impact system performance.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: Number Default: 10000
sysparm_text	Keyword to search for in the "title" field of the available service catalogs. Data type: String
sysparm_view	Device on which the item can display: • *desktop*: On the desktop. • *mobile*: On a mobile device. • *both*: Both on a desktop and on a mobile device. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Indicates that the request completed successfully. If a valid query returns no results, the response body only contains an empty result array.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
description	Description of the catalog. Data type: String
desktop_image	Image that appears on the desktop for this catalog. Data type: String
has_categories	Flag that indicates whether the catalog contains categories. Possible values: • true: Catalog contains categories. • false: Catalog does not contain categories. Data type: Boolean
has_items	Flag that indicates whether the catalog contains items. Possible values: • true: Catalog contains items. • false: Catalog does not contain items. Data type: Boolean
sys_id	Sys_id of the catalog. Data type: String
title	Catalog title. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_sc/servicecatalog/catal
ogs?sysparm_limit=10" \
--request GET \
```

}
```

Service Catalog - GET /sn_sc/servicecatalog/catalogs/{sys_id}/categories

Retrieves the list of available categories for the specified catalog.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/catalogs/{sys_id}/categories`

Default URL: `/api/sn_sc/servicecatalog/catalogs/{sys_id}/categories`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the catalog whose categories are requested. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *sysparm_offset* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *sysparm_limit* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0
sysparm_top_level_only	Only return those categories whose parent is a catalog. Valid values: • true: Only return those categories whose parent is a catalog. • false: Return all categories. Data type: Boolean
sysparm_view	UI view for which to render the data. Determines the fields returned in the response. Valid values: • desktop • mobile • both If you also specify the *sysparm_fields* parameter, it takes precedent. Data type: String

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Returns a list of categories in a catalog. If there are no query results, then an empty array is returned.
400	Indicates that the request or catalog sys_id is invalid.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
count	Number of items within the category. Data type: Number
description	Brief category description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
full _description	Detailed category description. Data type: String
header_icon	Icon used on category headers. Data type: String
homepage_image	Image that appears for this category on the category's home page. Data type: String
icon	Icon to use to signify this category. Data type: String
subcategories	List of subcategories within the category. Data type: Array `"subcategories": [ "sys_id": "String", "title": "String ]`
subcategories.sys_id	Sys_id of the subcategory. Data type: String
subcategories.title	Title of the subcategory. Data type: String
sys_id	Sys_id of the category. Data type: String
title	Category title. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_sc/servicecatalog/catal
ogs/e0d08b13c3330100c8b837659bba8fb4/categories?sysparm_limit=2
 \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```

Service Catalog - GET /sn_sc/servicecatalog/items

Retrieves a list of catalog items based on the specified parameters.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/items`

Default URL: `/api/sn_sc/servicecatalog/items`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_catalog	Catalog sys_id of the item. Use this parameter to locate items in a specific catalog. Data type: String
sysparm_category	Category sys_id of the item. Use this parameter to locate catalog items in a specific category. Data type: String
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *`sysparm_limit`* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply page through all available records, use

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	`sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0
sysparm_text	Specific text for which to search for in the category items. For example, `sysparm_text="iPhone"` or `sysparm_text="Mobile devices"`. Data type: String
sysparm_type	Type of item. Valid search values: • Record Producer • Order Guide If any other value is passed, the information is ignored. Data type: String
sysparm_view	UI view for which to render the data. Determines the fields returned in the response. Valid values: • desktop • mobile • both If you also specify the *`sysparm_fields`* parameter, it takes precedent. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Returns a list of catalogs and items based on the specified parameters. If a valid query results in no items, then the response body contains only an empty result array.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Parameter	Description
catalogs	List of objects that describe the catalogs that contain this item. Data type: Array `"catalogs": [{ "sys_id": "String", "title": "String" }]`
catalogs.sys_id	Sys_id of the catalog. Data type: String
catalogs.title	Catalog title. Data type: String
category	Describes the category that contains this item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Data type: Object `"catalogs": { "sys_id": "String", "title": "String" }`
category.sys_id	Sys_id of the category. Data type: String
category.title	Category title Data type: String
content_type	Type of content. Data type: String
description	Detailed description of the item. Data type: String
icon	Source of the small icon displayed beside the item name. Data type: String
kb_article	Knowledge based article associated with the item. Data type: String
local_currency	Country currency code for the local currency. Data type: String
localized_price	Price of the item expressed in the currency defined by *`local_currency`*. Data type: String
localized_recurring_price	Price of the recurring fee expressed in the currency defined by *`local_currency`*. Data type: String
name	Name of the item. Data type: String
order	Pre-defined order to which the item belongs. Data type: Number
picture	Path to the image to display for the item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Data type: String
price	Price of item expressed in the currency defined by *price_currency*. Data type: String
price_currency	Country currency code for which the item price is expressed. Data type: String
recurring_frequency	Frequency at which the recurring fees are applied, such as daily, monthly, or yearly; null if there are no fees for the item. Data type: String
recurring_price	Amount of the recurring fee associated with the item. Data type: String
recurring_price_currency	Country currency code for which the recurring fees are expressed. Data type: String
short_description	Brief description of the item. Data type: String
show_price	Flag that indicates whether to show item pricing in the cart. Possible values: • true: Name-value pairs are returned in the response parameters. • false: Name-value pairs are not returned in the response parameters. Data type: Boolean
show_quantity	Flag that indicates whether to display the item quantity in the cart. Possible values: • true: Display the item quantity in the cart. • false: Do not display the item quantity in the cart. Data type: Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
sys_class_name	Table to which the record belongs, such as sc_cat_item_producer. Data type: String
sys_id	Sys_id of the item. Data type: String
type	Type of item. Data type: String
url	URL of the item. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_sc/servicecatalog/ite
ms?sysparm_catalog=e0d08b13c3330100c8b837659bba8fb4&sysparm_limi
t=2" \

Service Catalog - GET /sn_sc/servicecatalog/items/{item_sys_id}/delegation/{user_sys_id}

Verifies whether the specified delegated user has acquisition rights to the specified service catalog item.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/items/{item_sys_id}/delegation/{user_sys_id}`

Default URL: `/api/sn_sc/servicecatalog/items/{item_sys_id}/delegation/{user_sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

Path parameters (continued)

Name	Description
	Data type: String
item_sys_id	Sys_id of the service catalog item to verify whether the specified user has acquisition rights. Located in the Service Catalog [sc_catalog] table. Data type: String
user_sys_id	Sys_id of the user to check whether they have acquisition rights to the specified service catalog item. Located in the Users [sys_users] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Flag that indicates whether the specified user has acquisition rights to the specified service catalog item. Valid values: • true: User has acquisition rights. • false: User does not have acquisition rights.

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_sc/servicecatalog/items
/5c7e9fd20f1010108af26b198b767eb8/delegation/62826bf03710200044e
0bfc8bcbe5df1" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  "result": {
    "result": true
  }
}
```

Service Catalog - GET /sn_sc/servicecatalog/items/{sys_id}

Retrieves a specified catalog item.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/items/{sys_id}`

Default URL: `/api/sn_sc/servicecatalog/items/{sys_id}`

Service Catalog - GET /sn_sc/servicecatalog/wishlist

Retrieves the list of items in the logged in user's wish list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/wishlist`

Default URL: `/api/sn_sc/servicecatalog/wishlist`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
cart_id	Sys_id of the wish list cart. Data type: String
items	List of objects that describe the items in the wish list cart. Data type: Array `"items": [{ "cart_item_id": "String", "catalog_item_id": "String", "created_by": "String", "created_on": "String", "delivery_time": "String", "item_id": "String", "item_name": "String", "localized_price": "String", "localized_recurring_price": "String", "name": "String", "order_guide": "String", "picture": "String", "price": "String", "quantity": "String", "recurring_frequency": "String", "recurring_price": "String", "recurring_subtotal": Number, "recurring_subtotal_price": "String", "short_descriptions": "String", "show_price": Boolean, "show_quantity": Boolean, "show_recurring_price": Boolean, "subtotal": Number, "subtotal_price": "String", "sys_class_name": "String", "sys_id": "String", "updated_by": "String", "updated_on": "String", "variables": {Object} }]`
items.cart_item_id	Sys_id of the item. Same as *items.sys_id*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
items.catalog_item_id	Sys_id of the catalog identifier for this item in the wish list cart. Same as *items.item_id*. Data type: String
items.created_by	User that initially put the item in the wish list cart. Data type: String
items.created_on	Date and time that the item was initially placed in the wishlist cart. Data type: String
items.delivery_time	Amount of time that it takes to deliver the item. Data type: String
items.item_id	Unique catalog identifier for this item in the wish list cart (sys_id). Same as items.catalog_item_id. Data type: String
items.item_name	Name of the item. Data type: String
items.localized_price	Price of the item expressed in the local currency. Data type: String
items.localized_recurring_price	Price of the recurring fee expressed in the local currency. Data type: String
items.name	Name of the item. Data type: String
items.order_guide	Order guide to which the item is associated. Data type: String
items.picture	Path to the image to display for the item. Data type: String
items.price	Price of item. Data type: String
items.quantity	Number of this item in the wish list cart. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
items.recurring_frequency	Frequency at which the recurring fees are applied, such as daily, monthly, or yearly. Null if no recurring fees for this item. Data type: String
items.recurring_price	Amount of the recurring fee associated with the item. Data type: String
items.recurring_subtotal	Subtotal for the recurring fees for this item (recurring_price x quantity). Data type: Number
items.recurring_subtotal_price	Subtotal for the recurring fees for this item (recurring_price x quantity). Data type: String
items.short_description	Brief description of the item. Data type: String
items.show_price	Flag that indicates whether to show item pricing in the cart. If this parameter is set to "false", pricing name/value pairs are not returned in the response parameters. Data type: Boolean
items.show_quantity	Flag that indicates whether to display the item quantity in the cart. Data type: Boolean
items.show_recurring_price	Flag that indicates whether to display the recurring fees in the cart. Data type: Boolean
items.subtotal	Subtotal for this item - not including cents (price x quantity). Data type: Number
items.subtotal_price	Subtotal for this item - including cents (price x quantity). Data type: String
items.sys_class_name	Child class to which the associated item record belongs. Data type: String
items.sys_id	Unique identifier of the item (sys_id). Same as items.cart_item_id. Data type: String
items.updated_by	User that updated this item in the wish list cart.

Service Catalog - GET /sn_sc/servicecatalog/wishlist/{cart_item_id}

Retrieves the details of the specified item stored in the wish list cart.

URL format

Versioned URL: `/api/sn_sc/v1/servicecatalog/wishlist/{cart_item_id}`

Default URL: `/api/sn_sc/servicecatalog/wishlist/{cart_item_id}`

Supported request parameters

Path parameters

Name	Description
cart_item_id	Sys_id of the wish list cart item to retrieve. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Indicates a failed request. Incorrect cart item id or the item does not exist in the wish list cart.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
cart_item_id	Sys_id of the item. Data type: String
catalog_item_id	Sys_id of the catalog identifier for this item in the wish list cart. Data type: String
delivery_time	Amount of time that it takes to deliver the item. Data type: String
item_name	Name of the item. Data type: String
localized_price	Price of the item expressed in the local currency. Data type: String
localized_recurring_price	Price of the recurring fee expressed in the local currency. Data type: String
price	Price of item. Data type: String

  }
}
```

Service Catalog - POST /sn_sc/servicecatalog/cart/checkout

Retrieves and processes the checkout for the current cart based on whether the two-step checkout process is enabled.

If one-step checkout, the method checks out (saves) the cart and returns the request number and the request order ID. If two-step checkout, the method returns the cart order status and all the information required for two-step checkout.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Indicates that the request completed successfully. Returns the total and subtotal information and information on the items in the cart. If one-step checkout, the method checks out (saves) the cart and returns the request number and the request order ID. If two-step checkout, the method returns the cart order status and all the information required for two-step checkout.
400	Indicates that the cart is empty and cannot check out.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Parameter	Description
cart_id	Sys_id of the cart. Data type: String
delivery_address	Address to which to deliver the cart items. Data type: String
<recurring_frequency>	List of items in the cart having a specific recurring frequency. Possible values include: • daily • monthly • yearly • none (no recurring fees) Data type: Object `"<recurring_frequency>": { "frequency_label": "String", "items": [Array], "show_subtotal_price": "String", "subtotal_price": "String", "subtotal_recurring_frequency": "String", "subtotal_recurring_price": "String", "subtotal_title": "String", "total_title": "String" }`

Parameter	Description
<recurring_frequency>.frequency_label	Frequency of the associated recurring fee. If there are no recurring fees for the item, this parameter contains "null". Data type: String
<recurring_frequency>.items	Array of objects that contains details of each item associated with the specified recurring frequency category. Data type: Array `"items": [{ "cart_item_id": "String", "catalog_item_id": "String", "created.by": "String", "created_on": "String", "delivery_time": "String", "item_id": "String", "item_name": "String", "localized_price": "String", "localized_recurring_price": "String", "name": "String", "order_guide": "String", "picture": "String", "price": "String", "quantity": "String", "recurring_frequency": "String", "recurring_price": "String", "recurring_subtotal": Number, "recurring_subtotal_price": "String", "short_description": "String", "show_price": Boolean, "show_quantity": Boolean, "show_recurring_price": Boolean, "subtotal": Number, "subtotal_price": "String", "sys_class_name": "String", "sys_id": "String", "updated_by": "String", "updated_on": "String", "variables": {Object} }]`
<recurring_frequency>.items.cart_item_id	Sys_id of the item in this cart. Data type: String
<recurring_frequency>.items.catalog_item_id	Catalog sys_id of the item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Data type: String
<recurring_frequency>.items.created.by	User that initially placed the item in the cart. Data type: String
<recurring_frequency>.items.created_on	Date on which the item was initially placed in the cart. Data type: String
<recurring_frequency>.items.delivery_time	Time that the specified item takes to be delivered. Data type: String
<recurring_frequency>.items.item_id	Sys_id of the item. Data type: String
<recurring_frequency>.items.item_name	Name of the specified item. Data type: String
<recurring_frequency>.items.localized_price	Price of the item in local currency. Data type: String
<recurring_frequency>.items.localized_recurring_price	Recurring fee for the specified item in local currency. Data type: String
<recurring_frequency>.items.name	Item name. Data type: String
<recurring_frequency>.items.order_guide	Name of the order guide to which this item is associated. If this item is not associated with an order guide this parameter contains an empty string. Data type: String
<recurring_frequency>.items.picture	File name of the picture of the item. Data type: String
<recurring_frequency>.items.price	Price of the item. Data type: String
<recurring_frequency>.items.quantity	Number of the specified item in the cart. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
<recurring_frequency>.items.recurring_frequency	How often the recurring fee is charged for the specified item. If there are no recurring fees for the item, this parameter contains "null". Data type: String
<recurring_frequency>.items.recurring_price	Recurring fee for the specified item. Data type: String
<recurring_frequency>.items.recurring_subtotal	Subtotal of the recurring fees for the item (*recurring_price* x *quantity*). Data type: Number
<recurring_frequency>.items.recurring_subtotal_price	Subtotal of the recurring fees for the item. Data type: String
<recurring_frequency>.items.short_description	Short description of the item. Data type: String
<recurring_frequency>.items.show_price	Flag that indicates whether the price of the item is shown in the cart. Possible values: • true: Show the price of the item in the cart. • false: Do not show the price of the item in the cart. Data type: Boolean
<recurring_frequency>.items.show_quantity	Flag that indicates whether to show the item quantity in the cart. Possible values: • true: Show the item quantity in the cart. • false: Do not show the item quantity in the cart. Data type: Boolean
<recurring_frequency>.items.show_recurring_price	Flag that indicates whether the recurring fees should appear in the cart. Possible values: • true: Show the recurring fees in the cart. • false: Do not show the recurring fees in the cart. Data type: Boolean
<recurring_frequency>.items.subtotal	Subtotal number of items.

Parameter	Description
	Data type: Number
<recurring_frequency>.items.subtotal_price	Subtotal for the item (*price* x *quantity*). Data type: String
<recurring_frequency>.items.sys_class_name	System classification name of the item. Data type: String
<recurring_frequency>.items.sys_id	Sys_id of the item record. Data type: String
<recurring_frequency>.items.updated_by	User that updated the item after it was initially placed in the cart. Data type: String
<recurring_frequency>.items.updated_on	Last date/time on which the item was either initially placed in the cart or updated. Data type: String
<recurring_frequency>.items.variables	List of name-value pairs of the item variables. Data type: Object
<recurring_frequency>.show_subtotal_price	Flag that indicates whether to show a subtotal for the associated recurring fee category. Possible values: • true: Show subtotals in the cart. • false: Do not show subtotals in the cart. Data type: Boolean
<recurring_frequency>.subtotal_price	Subtotal of the cost of all items for the associated recurring frequency category. Data type: String
<recurring_frequency>.subtotal_recurring_frequency	Type of subtotal recurring frequency, such as daily, monthly, etc. Same as *subtotal_recurring_frequency*. Data type: String
<recurring_frequency>.subtotal_recurring_price	Subtotal of the recurring fees of the items within the associated recurring frequency category. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
<recurring_frequency>.subtotal_title	If the *show_subtotal_price* is set to `true`, the text to display in the cart for the associated subtitle. Data type: String
<recurring_frequency>.total_title	Text to display for the total title for the associated recurring frequency category. Data type: String
requested_for	Sys_id of the user for whom the item was ordered. Data type: String
requested_for_user	User that requested the item on behalf of someone else. Data type: String
show_subtotal_price	Flag that indicates whether to show the subtotal price in the cart. Possible values: • true: Show subtotals in the cart. • false: Do not show subtotals in the cart. Data type: String
special_instructions	Any instructions given by the customer on the item. Data type: String
subtotal_price	Subtotal of all items in the cart in whole dollars. Data type: String
subtotal_recurring_frequency	Type of subtotal recurring frequency, such as daily, monthly, etc. Same as *<recurring_frequency>.subtotal_recurring_fr* Data type: String
subtotal_recurring_price	Subtotal of the recurring frequency fees for all items in the cart. Data type: String
subtotal_title	Text to display in the cart for the subtotal field title. Data type: String

Service Catalog - POST /sn_sc/servicecatalog/cart/submit_order

Checks out the user cart, based on the current check-out type (one-step or two-step).

If one-step checkout, the method checks out (saves) the cart and returns the request number and the request order ID. If two-step checkout, the method returns the cart order status and all the information required for two-step checkout.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/cart/submit_order`

Default URL: `/api/sn_sc/servicecatalog/cart/submit_order`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Indicates that the request completed successfully and the items in the cart are successfully checked out. If one-step checkout, the method checks out (saves) the cart and returns the request number and the request order ID. If two-step checkout, the method returns the cart order status and all the information required for two-step checkout.
400	Indicates that the user cart is empty.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
parent_id	If available, sys_id of the parent record from which the request is created. For more information, see Configure a parent mapping for a request. Data type: String
parent_table	Name of the parent table. Data type: String
request_id	Sys_id of the order request generated. Data type: String
request_number	Number of the request generated. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com /
api/sn_sc/v1/servicecatalog/cart/submit_order " \
--request POST \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  "result": {
    "request_number": "REQ0010010",
    "request_id": "f89ed597db21120064301150f0b8f5ff"
  }
}
```

Service Catalog - POST /sn_sc/servicecatalog/items/{sys_id}/add_to_cart

Adds the specified item to the cart of the current user.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/items/{sys_id}/add_to_cart`

Default URL: `/api/sn_sc/servicecatalog/items/{sys_id}/add_to_cart`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the item to add to the current cart. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
sysparm_also_request_for	Comma-separated string of user sys_ids of other users for which to order the specified item. User sys_ids are located in the User [sys_user] table. • You cannot specify more than 50 additional users to receive the item. • If any person in the list doesn't qualify for the item, the entire request is rejected. • If the associated item does not have the *requested_for* variable set, the request is rejected. • If the associated item has the *requested_for* variable set, but the **Enable also Request for** variable is not configured, or the calling user doesn't have the proper roles, the request is rejected.
sysparm_quantity	Required. Quantity of the item. Cannot be a negative number. Data type: Number

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
sysparm_requested_for	Sys_id of the user for whom to order the specified item. Located in the User [sys_user] table. Data type: String
variables	Name-value pairs of all mandatory cart item variables. Mandatory variables are defined on the associated form. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	The following errors can occur: • *Invalid quantity value:* Indicates that either the `sysparm_quantity` parameter is not provided or contains an invalid value. • *Security constraints prevent ordering of Item:* Indicates that either the cart item sys_id specified in the path parameters is invalid or the user does not have access to the item. • *Mandatory Variables are required:* Indicates that one or more of the mandatory variables is not provided in the request.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
cart_id	Cart sys_id. Data type: String
items	Details of all of the items in the cart. Data type: Array `"items":[ { "cart_item_id":"String", "catalog_item_id":"String", "item_name":"String", "localized_recurring_price":"String", "localized_price":"String", "price":"String", "quantity":"String", "recurring_frequency":"String", "recurring_price":"String" } ]`
items.cart_item_id	Sys_id of the item. Data type: String
items.catalog_item_id	Catalog sys_id of the item. Data type: String
items.item_name	Name of the item. Data type: String
items.localized_price	Price of the item, in the user's local currency. Data type: String
items.localized_recurring_price	Recurring price of the item, in the user's local currency. Data type: String
items.price	Base price.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
items.quantity	Quantity of the item in the cart. Data type: String
items.recurring_frequency	Frequency at which the recurring price is applied. Data type: String
items.recurring_price	Recurring price. Data type: String
subtotal	Subtotal of the items in the cart. Data type: String

Example: Sample cURL request and response

```
curl
 "https://instance.servicenow.com/api/sn_sc/servicecatalog/items
/0d08837237153000158bbfc8bcbe5d02/add_to_cart" \
--request POST \
--header "Accept:application/json" \
--data "{ 'sysparm_quantity' : '1',
  'variables' : {
    'acrobat' : 'true'
  }
}" \
--user "username":"password"
```

```
{
  "result": {
    "cart_id": "0951c597db21120064301150f0b8f5cf",
    "subtotal": "$1,599.98",
    "items": [
      {
        "catalog_item_id": "0d08837237153000158bbfc8bcbe5d02",
        "quantity": "1",
        "localized_price": "$799.99",
        "price": "$799.99",
        "recurring_frequency": "Monthly",
        "localized_recurring_price": "$30.00",
        "recurring_price": "$29.00",
        "item_name": "Apple iPhone 5",
        "cart_item_id": "ac61c597db21120064301150f0b8f5f9"
      }
    ]
  }
}
```

Service Catalog - POST /sn_sc/servicecatalog/items/{sys_id}/add_to_wishlist

Adds the specified item to the wish list cart.

        "recurring_price": "$100.00",
        "item_name": "Standard Laptop &",
        "cart_item_id": "d31be364c3012200d68d3b0ac3d3aecf",
        "delivery_time": "5 Days"
      }
    ]
  }
}
```

Service Catalog - POST /sn_sc/servicecatalog/items/{sys_id}/checkout_guide

Retrieves an array of contents requested for checkout.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/items/{sys_id}/checkout_guide`

Default URL: `/api/sn_sc/servicecatalog/items/{sys_id}/checkout_guide`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the checkout guide for which to return the information. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
items	List of object that describe the items requested for checkout. Data type: Array `"items": [{ "sys_id": "String", "sysparm_quantity": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	`"variables": {Object}` `}]`
items.sys_id	Required. Sys_id of the catalog item. Data type: String
items.sysparm_quantity	Number of items. Data type: String Default: 1
items.variables	Name-value pairs of variables associated with the item. Data type: Object Default: No variables

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Indicates that the request has completed successfully. • *Is not two-step:* Items are added to the cart and the cart contents are returned. • *Is two-step:* Returns the request number and request sys_id after checkout.
400	Indicates that the request is invalid. Could be due to one of the following reasons: • One or more items sent do not exist. • User does not have access to one or more of the items. • Mandatory variables of one or more items have not been answered. (Only variables defined as mandatory are honored.) • Quantity value is sent and is not a positive integer.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Elements returned in the response body when two-step checkout is false

Name	Description
cart_id	Sys_id of the cart. Data type: String
items	List of objects that contain details of all the items in the cart. Data type: Array `"items": [{ "cart_item_id": "String", "catalog_item_id": "String", "delivery_time": "String", "item_name": "String", "localized_price": "String", "localized_recurring_price": "String", "price": "String", "quantity": "String", "recurring_frequency": "String", "recurring_price": "String", "variables": {Object} }]`
items.cart_item_id	Sys_id of the item in the cart. Data type: String
items.catalog_item_id	Sys_id of the catalog item in the cart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Elements returned in the response body when two-step checkout is false (continued)

Name	Description
	Data type: String
items.delivery_time	Amount of time it takes to deliver the item. Data type: String
items.item_name	Name of the item in the cart. Data type: String
items.localized_price	Price of the item in local currency. Data type: String
items.localized_recurring_price	Recurring price of the item in local currency. Data type: String
items.price	Price of the item. Data type: String
items.quantity	Number of the item in the cart. Data type: String
items.recurring_frequency	Recurring frequency of the item. Data type: String
items.recurring_price	Recurring price of the item. Data type: String
items.variables	Name-value pairs associated with the item in the cart. Data type: Object
parent_id	If available, the sys_id of the parent record from which the request is created. For more information, see Configure a parent mapping for a request. Data type: String
parent_table	Name of the parent table (case sensitive). Data type: String
request_number	Request record number. Data type: String
request_id	Sys_id of the request.

Service Catalog - POST /sn_sc/servicecatalog/items/{item_sys_id}/get_invalid_delegated_users

Returns a list of users whose request for the specified item cannot be delegated (requested by another user).

You can call this endpoint prior to calling an endpoint such as Service Catalog API - POST /sn_sc/servicecatalog/items/{sys_id}/add_to_cart or Service Catalog API - POST /sn_sc/servicecatalog/items/{sys_id}/order_now that allow the requisition of a service catalog item on behalf of another person. These calls fail if you pass in a user that is not authorized for the associated item. This endpoint allows you to verify your list of users prior to calling an endpoint that orders the item or tries to add the item to a cart.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/items/{item_sys_id}/get_invalid_delegated_users`

Default URL: `/api/sn_sc/servicecatalog/items/{item_sys_id}/get_invalid_delegated_users`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
item_sys_id	Sys_id of the service catalog item to verify whether the specified user has acquisition rights. Located in the Service Catalog [sc_catalog] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
sysparm_also_request_for	Comma separated string of valid user sys_ids. The endpoint verifies that these users have acquisition rights to the specified service catalog item. Located in the Users [sys_user] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Request failed. Bad request given for processing. Refer to the message in the return results for additional information on the error.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
errCode	Number associated with the error. Only returned if the endpoint fails. Data type: String
errMsg	Description of the error that the endpoint encountered when it failed.
invalidUsers	Names of the users that are not able to request the specified catalog item. Data type: Array

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_sc/servicecatalog/items
/04b7e94b4f7b4200086eeed18110c7fd/get_invalid_delegated_users" \
--request POST \
--header "Accept:application/json" \
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--header "Content-Type:application/json" \
--data
 "{\"sysparm_also_request_for\":
\"a8f98bb0eb32010045e1a5115206fe3a,62826bf03710200044e0bfc8bcbe5
df1\"}" \
--user "username":"password"
```

```
{
  "result": {
    "invalidUsers": [
      "Abel Tuter"
    ]
  }
}
```

Example: cURL request

```
curl
 "https://instance.servicenow.com /
api/sn_sc/servicecatalog/items/04b7e94b4f7b4200086eeed18110c7
fd/get_invalid_delegated_users" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data
 "{\"sysparm_also_request_for\":
\"a8f98bb0eb32010045e1a5115206fe3a,62826bf03710200044e0bfc8bcbe5
df1\"}" \
--user "username":"password"
```

```
{
  "result": {
    "errCode": "42202",
    "errMsg": "This item cannot be submitted for multiple people
 as it is not configured with Requested For"
  }
}
```

Service Catalog - POST /sn_sc/servicecatalog/items/{sys_id}/order_now

Orders the specified catalog item.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/items/{sys_id}/order_now`

Default URL: `/api/sn_sc/servicecatalog/items/{sys_id}/order_now`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String
sys_id	Sys_id of the service catalog item. Located in the Catalog Item [sc_cat_item] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
sysparm_also_request_for	Comma-separated string of user sys_ids of other users for which to order the specified item. User sys_ids are located in the User [sys_user] table. • You cannot specify more than 50 additional users to receive the item. • If any person in the list doesn't qualify for the item, the entire request is rejected. • If the associated item does not have the *requested_for* variable set, the request is rejected. • If the associated item has the *requested_for* variable set, but the **Enable also Request for** variable is not configured, or the calling user doesn't have the proper roles, the request is rejected.
sysparm_quantity	Required. Quantity of the item. Cannot be a negative number. Data type: Number
sysparm_requested_for	Sys_id of the user for whom to order the specified item. Located in the User [sys_user] table. The settings of the *glide.sc.req_for.roles* and *glide.sc.req_for.roles.default* properties determine the level at which a user can request items. • If a value is specified in the *glide.sc.req_for.roles* property, the system checks if the user has the specified role to request information of other users. • If the *glide.sc.req_for.roles* property value is empty and the *glide.sc.req_for.roles.default* property value is `deny`, no user can request items for other users. • If the *glide.sc.req_for.roles* property value is empty and the *glide.sc.req_for.roles.default* property value is `allow`, any user can request items for other users.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
variables	Name-value pairs of all mandatory cart item variables. Mandatory variables are defined on the associated form. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Indicates that the quantity value is invalid and the request is not placed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
number	Number of the generated request.
parent_id	If available, the sys_id of the parent record from which the request is created. For more information, see Configure a parent mapping for a request. Data type: String
parent_table	If available, the name of the parent table from which the request is created. Data type: String
request_id	Sys_id of the order request. Data type: String
request_number	Request number. Data type: String
sys_id	Sys_id of the order. Data type: String
table	Table name of the request. Data type: String

Example: Sample cURL request

```
curl
 "https://instance.servicenow.com/api/sn_sc/servicecatalog/ite
ms/d82ea08510247200964f77ffeec6c4ee/order_now" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  sysparm_quantity: 1,
  variables: {
    replacement: 'Yes',
    originalnumber: '1640000',
    data_plan: '500MB'
  }
}" \
--user "username":"password"
```

```
{
  "result": {
    "sys_id": "cf56a3fcdb3a2300e890f71fbf9619ac",
    "number": "REQ0010012",
    "request_number": "REQ0010012",
    "request_id": "cf56a3fcdb3a2300e890f71fbf9619ac",
    "table": "sc_request"
```

```
    }
}
```

Service Catalog - POST /sn_sc/servicecatalog/items/{sys_id}/submit_producer

Creates a record and returns the *Table* API relative path and redirect URL to access the created record.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/items/{sys_id}/submit_producer`

Default URL: `/api/sn_sc/servicecatalog/items/{sys_id}/submit_producer`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the table in which to create the record producer. Data type: String

Query parameters

Name	Description
sysparm_view	UI view for which to render the data. Determines the fields returned in the response. Valid values: • desktop • mobile • both If you also specify the *sysparm_fields* parameter, it takes precedent. Data type: String

Request body parameters (XML or JSON)

Name	Description
variables	Name-value pairs of the variables of the producer record to define.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Indicates successful request and returns the response object consisting of Table API and URL to access the created record.
400	Request is not processed due to incorrect request message.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Requested resource cannot be found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
number	Number of the ticket associated with the record producer. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
parent_id	If available, sys_id of the parent record from which the request is created. For more information, see Configure a parent mapping for a request. Data type: String
parent_table	Name of the parent table. Data type: String
record	Table API relative path of the newly created record producer. Data type: String
redirect_portal_url	URL to which to redirect the Service Portal. Data type: String
redirect_to	Redirect value. Data type: String
redirect_url	Redirect URL to access the created record producer. Data type: String
sys_id	Sys_id of the record created. Data type: String
table	Name of the table on which the request was made. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_sc/servicecatalog/items
/3f1dd0320a0a0b99000a53f7604a2ef9/submit_producer" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{'variables':{'urgency':'2','comments':'This is sample
 incident'}}" \
--user "username":"password"
```

```
{
  "result": {
    "sys_id": "6baf4e1ddbba2300e890f71fbf961963",

```
    "table": "incident",
    "redirect_to": ""
  }
}
```

Service Catalog - POST /sn/sc/servicecatalog/variables/{sys_id}/display_value

Returns the display value of the specified variable.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/variables/{sys_id}/display_value`

Default URL: `/api/sn_sc/servicecatalog/variables/{sys_id}/display_value`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the variable for which to return the display value. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
sysparm_value	Sys_id of the record that contains the display value to return. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Display value of the variable. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_sc/servicecatalog/variables/2a3947a10a0a020e007f12648f8790c0/display_value" \

--data
 "{\"sysparm_value\":\"62826bf03710200044e0bfc8bcbe5df1\"}" \
--user "username":"password"
```

```
{
  "result": "Abel Tuter (Architect)"
}
```

Service Catalog - PUT /sn_sc/servicecatalog/cart/{cart_item_id}

Updates the specified item in the logged in user's cart.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/cart/{cart_item_id}`

Default URL: `/api/sn_sc/servicecatalog/cart/{cart_item_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
cart_item_id	Sys_id of the cart item to update. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
sysparm_quantity	Required. Quantity of the item to update the cart. Data type: String
variables	Required if there are mandatory variables specified for the item. Object consisting of all mandatory variable names-value pairs. Data type: Object

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Indicates that the request completed successfully and that the item is added to the cart.
400	Following three errors can occur: • *Invalid quantity value:*Indicates that either the sysparm_quantity parameter is not provided or contains invalid value. • *Security constraints prevent ordering of Item:*Indicates that either the item ID specified in the path parameters is either invalid or the user does not have access to the item. • *Mandatory Variables are required:*Indicates that one or more of the mandatory variable values is not provided in the request.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Service Catalog - PUT /sn_sc/servicecatalog/items/{sys_id}/submit_guide

Retrieves a list of items based on the needs described for an order guide.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/items/{sys_id}/submit_guide`

Default URL: `/api/sn_sc/servicecatalog/items/{sys_id}/submit_guide`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the order guide whose items are to be retrieved. Located in the Order guide [sc_cat_item_guide] table. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
variables	Variables requested for an item. Each variable is a JSON object consisting of name-value pairs. Data type: Array

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Indicates that the request has completed successfully. Returns a list of items based on the passed-in variable list. If the result set does not contain any items, then an empty array is returned.
400	Indicates that the request is invalid. Could be due to one of the following reasons: • User does not have access to the item. • Mandatory variables of one or more items have not been answered. (Only variables defined as mandatory are honored.)

Status codes (continued)

Status code	Description
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal error while calculating items depending on options chosen.

Response body parameters (JSON or XML)

Name	Description
catalogs	List of of objects the catalogs to which the item belongs and each catalog title and sys_id of the catalog. Data type: Array `"catalogs": [{ "sys_id": "String", "title": "String" }]`
catalogs.sys_id	Sys_id of the catalog. Data type: String
catalogs.title	Catalog title. Data type: String
category	Describes the category that contains this item. Data type: Object `"catalogs": { "sys_id": "String", "title": "String" }`
category.sys_id	Sys_id of the category. Data type: String
category.title	Category title Data type: String
client_script	List of all the catalog client scripts defined on the catalog item. Data type: Object `"client_script": { "onChange": [Array], "onLoad": [Array], "onSubmit": [Array] }`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
client_script.onChange	List of onChange client scripts associated with the item. Data type: Array
client_script.onLoad	List of onLoad client scripts associated with the item. Data type: Array
client_script.onSubmit	List of onSubmit client scripts associated with the item. Data type: Array
data_lookup	Data lookups defined on the catalog item. Data type: Array
description	Full description of catalog item. Data type: String
icon	Path of the image that appears as an icon beside the catalog item. Data type: String
name	Name of the catalog item. Data type: String
short_description	Text on the service catalog homepage or search results page, or the title on the order form of the catalog item. Data type: String
show_price	Indicates whether to show the price details. If true, returns the following details. • local_currency • localized_price • localized_recurring_price • price • price_currency • recurring_frequency • recurring_price • recurring_price_currency Data type: Boolean
sys_id	Sys_id of the catalog item. Data type: String
type	Item type. Possible values:

Service Catalog Open API

The *`Service Catalog Open`* API provides endpoints to create and retrieve service specifications.

Use this API to manage service catalog information between external systems and the ServiceNow AI Platform. The *`Service Catalog Open`* API is a ServiceNow® implementation of the TM Forum Service Catalog API REST specification. This implementation is based on the TMF633 Service Catalog API REST Specification Version 4, October 2020.

This API is included in the Product Catalog Advanced application, which is available on the ServiceNow Store.

This API is provided within the `sn_prd_pm_adv` namespace.

The calling user must have the sn_prd_pm_adv.catalog_integrator role.

This API creates and updates data in the following tables.

- Characteristic [sn_prd_pm_characteristic]
- Characteristic Option [sn_prd_pm_characteristic_option]
- Service Specification [sn_prd_pm_service_specification]
- Specification Relationship [sn_prd_pm_specification_relationship]

Service Catalog Open - GET /servicespecification

Retrieves a list of all service specifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Default URL: `/api/sn_prd_pm_adv/catalogmanagement/servicespecification`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. If this parameter is not used, all fields are returned. Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Default: 20 Maximum: 100 Data type: Number
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Default: 0 Data type: Number
state	Filter service specifications by state. Only specifications with a state matching the value of this parameter are returned in the response. Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Specifies the range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Service Catalog Open - GET /servicespecification/{specificationId}

Retrieves a service specification.

URL format

Default URL: `/api/sn_prd_pm_adv/catalogmanagement/servicespecification/{specificationId}`

Supported request parameters

Path parameters

Name	Description
specificationId	Sys_id of the service specification to retrieve. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. If this parameter is not used, all fields are returned. Data type: String
state	Filter service specifications by state. Only specifications with a state matching the value of this parameter are returned in the response.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed.
400	Bad Request. Could be any of the following reasons: • Invalid path parameter • Invalid URI
404	Record not found. Record associated with the ID is not found in the table.

Response body parameters (JSON)

Name	Description
description	Description of the specification.

Name	Description
	Data type: String
externalId	External_id of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String
id	Initial_version or external_id of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String
internalId	Initial_version of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String
internalVersion	Version of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String
lastUpdate	Date the specification was last updated. Data type: String
name	Name of the specification. Data type: String
resourceSpecification	Resource specifications for this service specification. Data type: Array `"resourceSpecification": [ { "id": "String", "internalId": "String", "internalVersion": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

	<pre>"name": "String",
	"version":
	"String"
	}
	]</pre>

resourceSpecification.id	Initial_version or external_id of the resource specification. Data type: String
resourceSpecification.internalId	Initial_version of the resource specification. Data type: String
resourceSpecification.internalVersion	External_version of the resource specification. Data type: String
resourceSpecification.name	Name of the resource specification. Data type: String
resourceSpecification.version	Version of the resource specification. Data type: String

serviceSpecificationRelationship	This specification's relationships to other service specifications.
	
	Data type: Array
	<pre>"serviceSpecificationRelationship": [
	{
	"id": "String",
	"internalId":
	"String",
	
	"internalVersion":
	"String",
	
	"relationshipType":
	"String",
	"validFor":
	{Object},
	"version":
	"String"
	}
	]</pre>

serviceSpecificationRelationship.id	Initial_version or external_id of the related specification.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
serviceSpecificationRelationship.internalId	Initial_version of the related specification.
serviceSpecificationRelationship.internalVersion	Version of the related specification. Data type: String
serviceSpecificationRelationship.relationshipType	Type of relationship. Data type: String
serviceSpecificationRelationship.validFor	Date range the relationship is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
serviceSpecificationRelationship.validFor.endDateTime	End date of the relationship. Data type: String
serviceSpecificationRelationship.validFor.startDateTime	Start date of the relationship. Data type: String
serviceSpecificationRelationship.version	External_version of the related specification. Data type: String
specCharacteristic	Specification characteristic. Data type: Array `"specCharacteristic": [ { "characteristicValueSpecification": Array, "description": "String", "name": "String", "validFor": Object, "valueType": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
specCharacteristic.characteristicValueSpecification	Array containing the possible values of the characteristic. Data type: Array `"characteristicValueSpecification": [ { "value": "String" } ]`
specCharacteristic.characteristicValueSpecification.value	Value of the characteristic. Data type: String
specCharacteristic.description	Description of the characteristic. Data type: String
specCharacteristic.name	Name of the characteristic. Data type: String
specCharacteristic.validFor	Date range the characteristic is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
specCharacteristic.validFor.endDateTime	End date of the characteristic. Data type: String
specCharacteristic.validFor.startDateTime	Start date of the characteristic. Data type: String
specCharacteristic.valueType	The value type of the characteristic, such as choice or email. Data type: String
validFor	Date range the specification is valid for. Data type: Object `"validFor": { "endDateTime": "String",`

Name	Description

	<pre>"startDateTime": "String"
	}</pre>

validFor.endDateTime	End date of the specification. Data type: String
validFor.startDateTime	Start date of the specification. Data type: String
version	External_version of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String
@type	Type of specification. Data type: String

Example: cURL request

This example retrieves a service specification for a firewall service.

```
curl --location --request GET
 "https://instance.servicenow.com/api/sn_prd_pm_adv/catalogmanag
ement/servicespecification/31c5caff07266010a7955b7e0ad3006b" \
--user 'username':'password'
```

Response body.

Service Catalog Open - POST /servicespecification

Creates a service specification.

URL format

Default URL: `/api/sn_prd_pm_adv/catalogmanagement/servicespecification`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
description	Required. Description of the specification. Data type: String
externalId	External_id of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. If both *externalId* and *id* are provided, they must refer to the same specification. Data type: String Default: Blank string
id	Initial_version or external_id of the service specification. If *id* is not provided, this endpoint creates a new specification with version=1. If *id* is provided, this endpoint creates a new version of the given specification.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	If both *externalId* and *id* are provided, they must refer to the same specification. Data type: String Default: Blank string
internalVersion	Version of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String Default: Blank string
lastUpdate	Date the specification was last updated. Data type: String Default: Blank string
name	Required. Name of the specification. Data type: String
resourceSpecification	Required. Resource specifications for this service specification. Data type: Array `"resourceSpecification": [ { "id": "String", "internalVersion": "String", "name": "String", "version": "String" } ]`
resourceSpecification.id	Required. Initial_version or external_id of the resource specification. Data type: String
resourceSpecification.internalVersion	External_version of the resource specification. Data type: String Default: Blank string
resourceSpecification.name	Name of the resource specification. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Default: Blank string
resourceSpecification.version	Version of the resource specification. Data type: String Default: Blank string
serviceSpecificationRelationship	This specification's relationships to other service specifications. Data type: Array `"serviceSpecificationRelationship": [ { "id": "String", "internalVersion": "String", "relationshipType": "String", "validFor": {Object}, "version": "String" } ]`
serviceSpecificationRelationship.id	Required if using the *serviceSpecificationRelationship* parameter. Initial_version or external_id of the related specification. Data type: String
serviceSpecificationRelationship.internalVersion	Version of the related specification. Data type: String Default: Blank string
serviceSpecificationRelationship.relationshipType	Required if using the *serviceSpecificationRelationship* parameter. Type of relationship. Valid values: • composed_of • bundles Data type: String
serviceSpecificationRelationship.validFor	Date range the relationship is valid for. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description

	<pre>"validFor": {
	  "endDateTime": "String",
	  "startDateTime": "String"
	}</pre>

serviceSpecificationRelationship.validFor.endDateTime	End date of the relationship. Data type: String Default: Blank string
serviceSpecificationRelationship.validFor.startDateTime	Start date of the relationship. Data type: String Default: Blank string
serviceSpecificationRelationship.version	External_version of the related specification. Data type: String Default: Blank string

specCharacteristic	Specification characteristic.
	
	Data type: Array
	
	<pre>"specCharacteristic": [
	  {
	
	 "characteristicValueSpecification": Array,
	  "description": "String",
	  "name": "String",
	  "validFor": Object,
	  "valueType": "String"
	  }
	]</pre>

specCharacteristic.characteristicValueSpecification	Required. Array containing the possible values of the characteristic.
	
	Data type: Array
	
	<pre>"characteristicValueSpecification": [
	  {
	  "value": "String"
	  }
	]</pre>

specCharacteristic.characteristicValueSpecification.value	Required. Value of the characteristic. Data type: String

Request body parameters (JSON) (continued)

Name	Description
specCharacteristic.description	Description of the characteristic. Data type: String Default: Blank string
specCharacteristic.name	Required. Name of the characteristic. Data type: String
specCharacteristic.validFor	Date range the characteristic is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
specCharacteristic.validFor.endDateTime	End date of the characteristic. Data type: String Default: Blank string
specCharacteristic.validFor.startDateTime	Start date of the characteristic. Data type: String Default: Blank string
specCharacteristic.valueType	Required. The value type of the characteristic, such as choice or email. Data type: String
validFor	Required. Date range the specification is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
validFor.endDateTime	End date of the specification. Data type: String Default: Blank string
validFor.startDateTime	Start date of the specification. Data type: String

Request body parameters (JSON) (continued)

Name	Description
	Default: Blank string
version	External_version of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Version must be unique for the given version chain. Data type: String Default: Blank string
@type	Required. Type of specification. Valid values: • CustomerFacingServiceSpecification • ResourceFacingServiceSpecification Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request successfully processed.

Name	Description

	<pre>"internalVersion": "String",
	"relationshipType": "String",
	"validFor": {Object},
	"version": "String"
	}
	]</pre>

serviceSpecificationRelationship.id	Initial_version or external_id of the related specification. Data type: String
serviceSpecificationRelationship.internalId	Initial_version of the related specification.
serviceSpecificationRelationship.internalVersion	Version of the related specification. Data type: String
serviceSpecificationRelationship.relationshipType	Type of relationship. Data type: String

serviceSpecificationRelationship.validFor	Date range the relationship is valid for.
	
	Data type: Object
	<pre>"validFor": {
	"endDateTime": "String",
	"startDateTime": "String"
	}</pre>

serviceSpecificationRelationship.validFor.endDateTime	End date of the relationship. Data type: String
serviceSpecificationRelationship.validFor.startDateTime	Start date of the relationship. Data type: String
serviceSpecificationRelationship.version	External_version of the related specification. Data type: String
specCharacteristic	Specification characteristic. Data type: Array

Name	Description
	Data type: String
specCharacteristic.valueType	The value type of the characteristic, such as choice or email. Data type: String
validFor	Date range the specification is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
validFor.endDateTime	End date of the specification. Data type: String
validFor.startDateTime	Start date of the specification. Data type: String
version	External_version of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String
@type	Type of specification. Data type: String

Example: cURL request

This example creates a service specification for a firewall service.

```
curl
 "https://instance.servicenow.com/api/sn_prd_pm_adv/catalogmanag
ement/servicespecification" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   "externalId": "7655",
   "name": "Firewall Service",
   "description": "This service specification describes a
 firewall service that can be deployed in customer-premises
 equipment.",
   "validFor": {
```

Service Contract API

The *`Service Contract`* API provides endpoints to create and retrieve service contract records.

Note: This API is for creating data in the tables for the Customer Contracts and Entitlements application. It is not a general purpose API.

To access this API the following plugins must be activated on the associated instance:

- Customer Contracts and Entitlements (com.sn_pss_core)
- Customer Service Install Base Management (com.snc.install)
- Product Catalog Management Core (com.sn_prd)

In addition, to successfully call this API you must have the sn_pss_core.pss_integrator role. This API runs in the `sn_pss_core` namespace.

Before using this API, you should have associated data in the following tables. For additional information, see Create service contracts.

- Account [customer_account]
- Consumer [csm_consumer]
- Household [csm_household]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Install Base [sn_install_base_item]
- Product Offering [sn_prd_pm_product_offering]
- Product Model [cmdb_model]
- Sold Product [sn_install_base_sold_product]

Service Contract - GET /sn_pss_core/servicecontract/{id}

Retrieves a specified service contract record.

This endpoint retrieves data from the following tables when processing the request:

- Characteristic [sn_pss_core_entitlement_characteristic]
- Entitlement [service_entitlement]
- Entitlement Usage [sn_pss_core_entitlement_usage]
- Sold Product Covered [sn_install_base_m2m_contract_sold_product] - This table contains information for both sold products covered and install base items covered.
- Service Contract [sn_pss_core_service_contract]
- Service Contract Line [sn_pss_core_service_contract_line]

URL format

Versioned URL: `/api/sn_pss_core/{api_version}/servicecontract/{id}`

Default URL: `/api/sn_pss_core/servicecontract/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the service contract to retrieve. Data type: String Table: Service Contract [sn_pss_core_service_contract]

Query parameters

Name	Description
display_value	Type of data to return. Valid values: • false: Return the `value` for all fields. For example, `"state":"draft"`. • true: Return the `display_value` for all fields. For example, `"state":"Draft"` • all: Return all information for all fields.

Query parameters (continued)

Name	Description
	Data type: String Default: false

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have permission to access the API.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
account	Sys_id of the account record to which the service contract belongs. Data type: String Table: Account [customer_account]
consumer	Sys_id of the consumer record to which the service contract belongs. Data type: String Table: Consumer [csm_consumer]
ends	Date on which the service contract ends. Data type: String Format: yyyy-mm-dd
household	Sys_id of the household associated with the service contract. Data type: String Table: Household [csm_household]
install_base_items_covered	List of install base items covered under the service contract line. Data type: Array of Objects `"install_base_items_covered": [{ "added": "String", "contract": "String", "entitlement": "String", "install_base": "String", "removed": "String", "service_contract_line": "String", "sys_created_by": "String", "sys_created_on": "String", "sys_id": "String", "sys_updated_by": "String", "sys_updated_on": "String" }]`
install_base_items_covered.added	Date that the associated service contract starts to cover the install base item.

Name	Description
state	Current state of the service contract. Valid values: (case-sensitive) • active • cancelled • draft • expired Data type: String
sys_created_by	Name of the user that created the service contract record. Data type: String
sys_created_on	Date and time that the service contract was created record. Data type: String
sys_id	Sys_id of the service contract record. Data type: String Table: Service Contract [sn_pss_core_service_contract]
sys_updated_by	Name of the user that last updated the service contract record. Data type: String
sys_updated_on	Date and time that the service contract record was last updated. Data type: String
vendor_contract	Unique identifier for an associated external contract. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_pss_core/servicecontra
ct/fc73d2de8922611Of877430a4e008add" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Response:

Service Contract - GET /sn_pss_core/servicecontract/contractline/{id}

Retrieves the details of a specified service contract line record and its related entities.

This endpoint retrieves data in the following tables when processing the request:

- Characteristic [sn_pss_core_entitlement_characteristic]
- Entitlement [service_entitlement]
- Entitlement Usage [sn_pss_core_entitlement_usage]
- Sold Product Covered [sn_install_base_m2m_contract_sold_product] - This table contains information for both sold products covered and install base items covered.
- Service Contract Line [sn_pss_core_service_contract_line]

URL format

Versioned URL: `/api/sn_pss_core/{api_version}/servicecontract/contractline/{id}`

Default URL: `/api/sn_pss_core/servicecontract/contractline/{id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the service contract line record to retrieve. Data type: String Table: Service Contract Line [sn_pss_core_service_contract_line]

Query parameters

Name	Description
display_value	Type of data to return. Valid values: • false: Return the `value` for all fields. For example, `"state":"draft"`. • true: Return the `display_value` for all fields. For example, `"state":"Draft"` • all: Return all information for all fields. Data type: String Default: false

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have permission to access the API.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
child_contract_lines	List of child service contract lines associated with the service contract line. Data type: Array of Objects `"child_contract_lines": [ { "child_contract_lines": [Array], "contract": "String", "ends": "String", "entitlements": [Array], "entitlement_characteristics": [Array],`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	"install_base_items_covered": [Array], "name": "String", "number": "String", "parent_contract_line": "String", "product_model": "String", "product_offering": "String", "product_specification": "String", "sold_product": "String", "sold_products_covered": [Array], "starts": "String", "state": "String", "sys_created_by": "String", "sys_created_on": "String", "sys_id": "String", "sys_updated_by": "String", "sys_update_on": "String" }]
child_contract_lines.child_contract_lines	List of child service contract line objects created under the child service contract line. The objects in this array have the same elements as the objects in the *child_contract_lines* parameter. Data type: Array of Objects
child_contract_lines.contract	Sys_id of the service contract associated with the child service contract line. Data type: String Table: Service Contract [sn_pss_core_service_contract]
child_contract_lines.ends	Date on which the child service contract line ends. Data type: String Format: yyyy-mm-dd Default: Never ends until manually removed.
child_contract_lines.entitlements	List of entitlements associated with the child service contract line.

Name	Description
	Data type: String
sys_updated_on	Date and time that the service contract line record was last updated. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_pss_core/servicecontra
ct/contractline/fc73d2de8922611Of877430a4e008add" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Response:

```

Service Contract - POST /sn_pss_core/servicecontract

Creates a service contract record and all its related entities from a specified payload.

The *`Service Contract`* API stores data in various tables. The following is the list of tables in which records are created by this endpoint when creating a service contract:

- Characteristic [sn_pss_core_entitlement_characteristic]
- Entitlement [service_entitlement]
- Entitlement Usage [sn_pss_core_entitlement_usage]
- Sold Product Covered [sn_install_base_m2m_contract_sold_product] - This table contains information for both sold products covered and install base items covered.
- Service Contract [sn_pss_core_service_contract]
- Service Contract Line [sn_pss_core_service_contract_line]

The request body of this endpoint references fields in the following tables. This information needs to be added to your instance before utilizing this API. For additional information, see Create service contracts.

- Account [customer_account]
- Characteristic Option [sn_prd_pm_characteristic_option]
- Consumer [csm_consumer]
- Household [csm_household]

URL format

Versioned URL: `/api/sn_pss_core/{api_version}/servicecontract`

Default URL: `/api/sn_pss_core/servicecontract`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
account	Required if the *`consumer`* parameter is not specified. Sys_id of the account record to which the service contract belongs. Data type: String Table: Account [customer_account]
consumer	Required if the *`account`* parameter is not specified. Sys_id of the consumer record to which the service contract belongs. Data type: String Table: Consumer [csm_consumer]
ends	Date on which the service contract ends. Data type: String Format: yyyy-mm-dd Default: Never ends until manually removed.
household	Only valid for consumer service contracts. Sys_id of the household associated with the service contract. Data type: String Table: Household [csm_household] Default: null (no household)
install_base_items_covered	List of install base items covered under the service contract. For more information on Install Base Items Configure install base.

Request body parameters (XML or JSON) (continued)

Name	Description
	Valid values: (case-sensitive) • active • cancelled • draft • expired Data type: String
vendor_contract	Required. Unique identifier for an associated external contract. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed and the records were created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have permission to access the API.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
install_base_items_covered	List of sys_ids of the install base items covered under the service contract. Data type: Array of Objects `"install_base_items_covered": [ { "sys_id": "String" } ]`
install_base_items_covered.sys_id	Sys_id of the install base item covered. Data type: String Table: Sold Product Covered [sn_install_base_m2m_contract_sold_product]
number	Auto-generated service contract number. Data type: String
service_contract_lines	List of service contract lines associated with the service contract. Data type: Array of Objects `"service_contract_lines": [ { "child_contract_lines": [Array], "entitlements": [Array], "entitlement_characteristics": [Array], "install_base_items_covered": [Array], "name": "String", "number": "String", "sold_products_covered": [Array], "sys_id": "String" } ]`
service_contract_lines.child_contract_lines	List of child service contract line objects created under the service contract line.

Service Contract - POST /sn_pss_core/servicecontract/contractline

Creates a contract line record and all of its related entities.

This endpoint stores data in the following tables when processing the request:

- Characteristic [sn_pss_core_entitlement_characteristic]
- Entitlement [service_entitlement]
- Entitlement Usage [sn_pss_core_entitlement_usage]
- Sold Product Covered [sn_install_base_m2m_contract_sold_product] - This table contains information for both sold products covered and install base items covered.
- Service Contract Line [sn_pss_core_service_contract_line]

URL format

Versioned URL: `/api/sn_pss_core/{api_version}/servicecontract/contractline`

Default URL: `/api/sn_pss_core/servicecontract/contractline`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
child_contract_lines	List of child service contract line objects created under the service contract line. Data type: Array of Objects `"child_contract_lines": [ { "child_contract_lines": [Array], "contract": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	<pre>"ends": "String",
	"entitlements": [Array],
	"entitlement_characteristics": [Array],
	"install_base_items_covered": [Array],
	"name": "String",
	"parent_contract_line": "String",
	"product_model": "String",
	"product_offering": "String",
	"product_specification": "String",
	"sold_product": "String",
	"sold_products_covered": [Array],
	"starts": "String",
	"state": "String"
	}
	]</pre>
	Stored in: Service Contract [sn_pss_core_service_contract]

child_contract_lines.child_contract_lines	List of child service contract line objects to create under the child service contract line. The objects in this array have the same elements as the objects in the *child_contract_lines* parameter. Data type: Array of Objects
child_contract_lines.contract	Sys_id of the service contract associated with the child service contract line. Data type: String Table: Service Contract [sn_pss_core_service_contract]
child_contract_lines.ends	Date on which the child service contract line ends. Data type: String Format: yyyy-mm-dd Default: Never ends until manually removed.

child_contract_lines.entitlements	List of entitlements associated with the child service contract line.
	
	Data type: Array of Objects
	<pre>"entitlements:" [
	{
	"account": "String",
	"consumer": "String",
	"end_date": "String",
	"entitlement_characteristics": [Array],
	"entitlement_name": "String",</pre>

	"sold_products_covered": [Array],
	"start_date": "String",
	"state": "String"
	}
	]</pre>
	Stored in: Entitlement [service_entitlement]

child_contract_lines.entitlements.account	Required if the *consumer* parameter is not passed. Sys_id of the account record to which the entitlement belongs. Data type: String Table: Account [customer_account]
child_contract_lines.entitlements.consumer	Required if the *account* parameter is not passed. Sys_id of the consumer record to which the entitlement belongs. Data type: String Table: Consumer [csm_consumer]
child_contract_lines.entitlements.end_date	End date of the entitlement. Data type: String Format: yyyy-mm-dd Default: Never ends until manually removed.

child_contract_lines.entitlements.
entitlement_characteristics
	List of characteristics associated with the entitlement.
	
	Data type: Array of Objects
	<pre>"entitlement_characteristics": [
	{
	"characteristic": "String",
	"characteristic_option": "String",
	"entitlement_usage": {Object},
	"type": "String",

Request body parameters (XML or JSON) (continued)

Name	Description
child_contract_lines.entitlements. entitlement_characteristics.characteristic	Required. Sys_id of the characteristic record associated with the entitlement. Data type: String Table: Characteristic [sn_prd_pm_characteristic]
child_contract_lines.entitlements. entitlement_characteristics.characteristic_option	Sys_id of the characteristic option record associated with the entitlement. Data type: String Table: Characteristic Option [sn_prd_pm_characteristic_option]

child_contract_lines.entitlements.
entitlement_characteristics.entitlement_usage
	Used unit value for the associated entitlement characteristic.
	
	Only pass this parameter if the entitlement_characteristics are under the entitlement.
	
	Data type: Object
	`"entitlement_usage": {`
	`"used_units": "String"`
	`}`
	
	Stored in: Entitlement Usage [sn_pss_core_entitlement_usage]

child_contract_lines.entitlements. entitlement_characteristics.entitlement_usage. used_units	Usage of the associated entitlement characteristic. Data type: String
child_contract_lines.entitlements. entitlement_characteristics.type	Type of entitlement characteristic. Valid values: • coverage • coverage_and_usage Data type: String
child_contract_lines.entitlements. entitlement_characteristics.value	Required if the *input_type* parameter contained in the record specified in the *entitlement_characteristics.characteristic* parameter, is not `choice`. Value of the characteristic. Data type: String
child_contract_lines.entitlements. entitlement_name	Required. Name of the entitlement. Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
child_contract_lines.entitlements.household	Only passed when the household plugins are active and the *consumer* parameter is passed. Sys_id of the household record associated with the entitlement. Data type: String Table: Household [csm_household]
child_contract_lines.entitlements. install_base_items_covered	List of install base items covered under the entitlement. The information in this array is inserted in the Sold Product Covered#[sn_install_base_m2m_contract_sold_product] table. Data type: Array of Objects `"install_base_items_covered": [ { "added": "String", "install_base": "String", "removed": "String" } ]`
child_contract_lines.entitlements. install_base_items_covered.added	Date that the associated install base item was added to the entitlement. Data type: String Format: yyyy-mm-dd Default: Current date
child_contract_lines.entitlements. install_base_items_covered.install_base	Sys_id of the install base item covered by the entitlement. Data type: String Table: Install Base Item [sn_install_base_item]
child_contract_lines.entitlements. install_base_items_covered.removed	Date that the associated install base item was removed from the entitlement. Data type: String Format: yyyy-mm-dd Default: No end date
child_contract_lines.entitlements.product	Sys_id of the product model record associated with the entitlement. Data type: String Table: Product Model [cmdb_model]

Request body parameters (XML or JSON) (continued)

Name	Description
child_contract_lines.entitlement_characteristics.entitlement_usage	Used unit value for the associated entitlement characteristic. Only pass this parameter if the entitlement_characteristics are under the entitlement. Data type: Object `"entitlement_usage": { "used_units": "String" }` Stored in: Entitlement Usage [sn_pss_core_entitlement_usage]
child_contract_lines.entitlement_characteristics.entitlement_usage.used_units	Usage of the associated entitlement characteristic. Data type: String
child_contract_lines.entitlement_characteristics.type	Type of entitlement characteristic. Valid values: • coverage • coverage_and_usage Data type: String
child_contract_lines.entitlement_characteristics.value	Value of the characteristic. Data type: String
child_contract_lines.install_base_items_covered	List of install base items covered under the entitlement. The information in this array is inserted in the Sold Product Covered#[sn_install_base_m2m_contract_sold_product] table. Data type: Array of Objects `"install_base_items_covered": [ { "added": "String", "install_base": "String", "removed": "String" } ]`
child_contract_lines.install_base_items_covered.added	Date that the associated install base item was added to the child service contract line. Data type: String Format: yyyy-mm-dd Default: Current date

Name	Description
	Default: Current date
sold_products_covered.removed	Date that the associated service contract line ends coverage of the associated product. Data type: String Format: yyyy-mm-dd Default: No end date
sold_products_covered.sold_product	Sys_id of a product associated with the service contract line. Data type: String Table: Sold Product Covered [sn_install_base_m2m_contract_sold_product]
starts	Required. Start date of the service contract line. Data type: String Format: yyyy-mm-dd
state	Required. Current state of the contract line. Valid values: (case-sensitive) • active • cancelled • draft • expired • suspended Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed and the records were created.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have permission to access the API.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
child_contract_lines	List of child service contract line objects created under the service contract line. Data type: Array of Objects `"child_contract_lines": [ { "child_contract_lines": [Array], "entitlements": [Array], "entitlement_characteristics": [Array], "install_base_items_covered": [Array], "name": "String", "number": "String", "sold_products_covered": [Array], "sys_id" "String" } ]`

Name	Description
entitlement_characteristics.sys_id	Sys_id of the entitlement characteristics record. Data type: String
install_base_items_covered	List of sys_ids of the install base items covered under the service contract line. Data type: Array of Objects `"install_base_items_covered": [ { "sys_id": "String" } ]`
install_base_items_covered.sys_id	Sys_id of the install base item covered. Data type: String Table: Sold Product Covered [sn_install_base_m2m_contract_sold_product]
name	Name of the service contract line. Data type: String
number	Unique number of the service contract line. Automatically generated by the endpoint. For example: CTRL9812347. Data type: String
sold_products_covered	List of sys_ids of the products covered under the service contract line. Data type: Array of Objects `"sold_products_covered": [ { "sys_id": "String" } ]`
sold_products_covered.sys_id	Sys_id of a product covered by the service contract line. Data type: String Table: Sold Product Covered [sn_install_base_m2m_contract_sold_product]
sys_id	Sys_id of a service contract line record. Data type: String Table: Service Contract Line [sn_pss_core_service_contract_line]

Service Order Open API

The *Service Order Open* API provides endpoint that enable a standardized mechanism for placing service orders.

This API is a ServiceNow® implementation of the Open API TMForum TMF641 Service Ordering Management API specification.

To access this API, the Order Management for Telecommunications (sn_ind_tmt_orm) plugin must be activated. For more information, see . For information about Order Management tables, entities, and relationships, see Order Management data model .

This API is provided within the `sn_tmf_api` namespace.

The calling user must have the sn_ind_tmt_orm.order_integrator role.

This API can be extended to make customizations around required parameters, request body validation, additional REST operations, and field mappings. For more information, see the Service Order Open API Developer Guide.

Service Order Open API – GET /sn_tmf_api/order/serviceOrder

Retrieves all service orders.

This API retrieves service order information from the following related tables:

- Order [sn_ind_tmt_orm_order]
- Order Characteristic Value [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]
- Order Line Related Items [sn_ind_tmt_orm_order_line_related_items]

URL format

```
/api/sn_tmf_api/order/serviceOrder
```

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: All fields returned.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Default: 20 Maximum: 100 Data type: Number
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Default: 0 Data type: Number
state	Filter orders by state. Only orders with a state matching the value of this parameter are returned in the response. Data type: String Default: All states returned.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
	Specifies the range of content returned in a paginated call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers (continued)

Header	Description
Content-Range	For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
committedDueDate	Date and time when the action must be performed on the order. This value must be the same as or later than the *`committedDueDate`* values each order line item. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
expectedCompletionDate	Date on which the order is to be completed. Data type: String
href	A relative link to the resource record. Data type: String Default: Blank string
id	Sys_id of the requested service order. Data type: String
note	Array of objects that describe additiona notes made by the customer when ordering. Data type: Array `"note": [ { "author": "String", "date": "String", "text": "String" } ]`
note.author	User name of the person that authored associated note. Data type: String
note.date	Date that the note was created. Data type: String
note.text	Additional notes/comments made by th customer while ordering. Data type: String
orderDate	The date and timestamp of the order. Format: YYYY-MM-DD HH:MM:SS Data type: String Default: Blank string
ponr	Flag that indicates whether the point of return for the order has been reached. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Point of no return for the order has been reached. The order can't be modified or canceled while fulfillmen in progress. • false: Point of no return for the order has not been reached. The order can modified or canceled. Data type: Boolean
relatedParty	List of contacts for the order. Each cont is an object in the array. Data type: Array `"relatedParty": [ { "id": "String", "name": "String", "@referredType": "String", "@type": "String" } ]`
relatedParty.id	Sys_id or external_id of the account, customer contact, or consumer associated with the order. Located in th Account [customer_account], Contact [customer_contact] table, or Consumer [csm_consumer] table. Data type: String
relatedParty.name	Name of the account, customer, or consumer. Data type: String
relatedParty.@referredType	Type of customer. Possible values: • Consumer • Customer • CustomerContact Data type: String
relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. T value is always `RelatedParty`. This information is not stored. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
requestedCompletionDate	Delivery date requested by the custome Data type: String
requestedStartDate	Order start date requested by the customer. Data type: String
serviceOrderItem	Array of objects that describes the line items in the service order and their associated action. `"serviceOrderItem:" [{ "action": "String", "actionReason": "String", "committedDueDate": "String", "externalProductInventory": [Array], "id": "String", "orderRelationship": [Array], "quantity": "Number", "place": {Object}, "ponr": Boolean, "relatedParty": {Object}, "service": {Object}, "state": "String", "@type": "String", "version": "String" }]` Data type: Array
serviceOrderItem.action	Action to perform on the service order item. Possible actions are defined on the Choice List tab in the Action Dictionary Entry field of the sn_ind_tmt_orm_order_line_item table. For details, see Action types for custom and service orders. Data type: String
serviceOrderItem.actionReason	The reason for adding the order line ite Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table/field updated: sn_ind_tmt_orm_order_line_item/ action_reason
serviceOrderItem.committedDueDate	Date and time when the action must be performed on the order line item. Data type: String
serviceOrderItem.externalProductInventory	Array of objects containing external ids mapped to the product inventories created for the order. Data type: Array `"externalProductInventory" [ { "externalProductInventoryId": "String" } ]`
serviceOrderItem.externalProductInventory.externalProductInventoryId	External id mapped to the product inventory. Data type: String
serviceOrderItem.id	Unique identifier of the line item. Locate in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table Data type: String
serviceOrderItem.orderRelationship	Array of objects that describe the relationships between order line items. Data type: Array `"orderRelationship:" [ { "id": "String", "relationshipType": "String" } ]`
serviceOrderItem.orderRelationship.id	Unique identifier of the related line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
serviceOrderItem.orderRelationship.relationshipType	Type of relationship between the two lir items. This information is used to identi the relationship hierarchy. Possible values: • HasChild • HasParent • Requires `HasChild` and `HasParent` are used for parent/child relationships. `Requir` is used for horizontal relationships (a lir item requires another line item). Data type: String
serviceOrderItem.quantity	Number of line items ordered. Data type: Number
serviceOrderItem.place	Map of the locations on which to install service. Data type: Object `"place:" { "id": "String", "@type": "String" }`
serviceOrderItem.place.id	Sys_id of the associated location record the Location [cmn_location] table. Data type: String
serviceOrderItem.place.@type	Part of TMF Open API standard. Annotation for order line item contact. T value is always `Place`. This information not stored. Data type: String
serviceOrderItem.ponr	Flag that indicates whether the point of no return for the order line item has bee reached. Valid values: • true: Point of no return for the order li item has been reached. The order lin item can't be modified or canceled w fulfillment is in progress. • false: Point of no return for the order l item has not been reached. The orde line item can be modified or canceled

Name	Description
	Data type: Boolean
serviceOrderItem.relatedParty	List of contacts for line items. Data type: Array `"relatedParty:" [ { "email": "String", "firstName": "String" "id": "String", "lastName": "String", "phone": "String", "@referredType": "String", "@type": "String" } ]`
serviceOrderItem.relatedParty.email	Email address of the contact. Data type: String
serviceOrderItem.relatedParty.firstName	First name of the contact. Data type: String
serviceOrderItem.relatedParty.id	Sys_id of the line item contact associated with the order line item. Located in the Order Line Item Contact [sn_ind_tmt_orm_order_line_item_cont table. Data type: String
serviceOrderItem.relatedParty.lastName	Last name of the contact. Data type: String
serviceOrderItem.relatedParty.phone	Business phone number of the contact Data type: String
serviceOrderItem.relatedParty.@referredType	Required. Type of customer. Possible value: OrderLineItemContact Data type: String
serviceOrderItem.relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. T value is always `RelatedParty`. This information is not stored. Data type: String
serviceOrderItem.service	Description of the instance details of th service purchased by the customer.

Name	Description
	Data type: Object `"service:" { "serviceCharacteristic": [Array], "serviceRelationship": [Array], "serviceSpecification": {Object}, "serviceType": "String", "state": "String", "@type": "String" }`
serviceOrderItem.service.serviceCharacteristic	List that describes the characteristics o the associated service. Only service characteristics with a current *value* different from the *previousValue* are returned. Data type: Array of Objects `"serviceCharacteristic:" [ { "name": "String", "previousValue": "String", "value": "String", "valueType": "String" } ]`
serviceOrderItem.service.serviceCharacteristic.value	Characteristic option values associated with the service. For additional informat on characteristic option values, see Cre product characteristics and characteris options. Data type: String
serviceOrderItem.service.serviceCharacteristic.valueType	Type of characteristic value. Data type: String
serviceOrderItem.service.serviceRelationship	List of product inventories related to the service. Data type: Array `"serviceRelationship": [ { "id": "String", "relationshipType": "String"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Service Order Open API – GET /sn_tmf_api/order/serviceOrder/{id}

Retrieves a specified service order.

This API retrieves service order information from the following related tables:

- Order [sn_ind_tmt_orm_order]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Characteristic Value [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]
- Order Line Related Items [sn_ind_tmt_orm_order_line_related_items]

URL format

`/api/sn_tmf_api/order/serviceOrder/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the service order to retrieve. Located in the Order [sn_ind_tmt_orm_order] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description

200	Request successfully processed. Full resource returned in response (no pagination).
	
	The response returns successful with an error message if the selected order has processing issues.
	
	• A 200 OK response happens if the order is in the Inbound Queue [sn_tmt_core_inbound_queue] table waiting for the scheduler to pick the record to be processed. The error message field includes details for the record. For example:
	
	`{ "code": 102, "reason": "Request in queue", "message": "Request in queue", "details": [ { "message": "This Order is still in the inbound queue table waiting to be processed.", "datapath": "" } ] }`
	
	• A 200 OK response happens if an order creation fails and the record in the Inbound Queue [sn_tmt_core_inbound_queue] table is in an error state. The error message field includes details in for the inbound queue table record. For example:
	
	`{ "code": 23, "reason": "Missing body field", "message": "Missing body field", "details": [ { "message": "Invalid payload: orderCurrency is missing", "datapath": "/" } ] }`

400	Bad request. Possible reasons: • Missing query parameter • Invalid URI
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
committedDueDate	Date and time when the action must be performed on the order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	This value must be the same as or later than the *committedDueDate* values each order line item. Data type: String
expectedCompletionDate	Date on which the order is to be completed. Data type: String
id	Sys_id of the requested service order. Data type: String
href	A relative link to the resource record. Data type: String Default: Blank string
note	Array of objects that describe additiona notes made by the customer when ordering. Data type: Array `"note": [ { "author": "String", "date": "String", "text": "String" } ]`
note.author	User name of the person that authored associated note. Data type: String
note.date	Date that the note was created. Data type: String
note.text	Additional notes/comments made by th customer while ordering. Data type: String
orderDate	The date and timestamp of the order. Format: YYYY-MM-DD HH:MM:SS Data type: String Default: Blank string

Name	Description
	Data type: String
serviceOrderItem.actionReason	The reason for adding the order line ite Data type: String Table/field updated: sn_ind_tmt_orm_order_line_item/ action_reason
serviceOrderItem.committedDueDate	Date and time when the action must be performed on the order line item. Data type: String
serviceOrderItem.externalProductInventory	Array of objects containing external ids mapped to the product inventories created for the order. Data type: Array `"externalProductInventory" [ { "externalProductInventoryId": "String" } ]`
serviceOrderItem.externalProductInventory.externalProductInventoryId	External id mapped to the product inventory. Data type: String
serviceOrderItem.id	Unique identifier of the line item. Locate in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table Data type: String
serviceOrderItem.orderRelationship	Array of objects that describe the relationships between order line items. Data type: Array `"orderRelationship:" [ { "id": "String", "relationshipType": "String" } ]`
serviceOrderItem.orderRelationship.id	Unique identifier of the related line item. Located in the sn_ind_tmt_orm_external_id

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table Data type: String
serviceOrderItem.orderRelationship.relationshipType	Type of relationship between the two lin items. This information is used to identi the relationship hierarchy. Possible values: • HasChild • HasParent • Requires `HasChild` and `HasParent` are used for parent/child relationships. `Requir` is used for horizontal relationships (a lin item requires another line item). Data type: String
serviceOrderItem.quantity	Number of line items ordered. Data type: Number
serviceOrderItem.place	Map of the locations on which to install service. Data type: Object `"place:" { "id": "String", "@type": "String" }`
serviceOrderItem.place.id	Sys_id of the associated location record the Location [cmn_location] table. Data type: String
serviceOrderItem.place.@type	Part of TMF Open API standard. Annotation for order line item contact. T value is always `Place`. This information not stored. Data type: String
serviceOrderItem.ponr	Flag that indicates whether the point of no return for the order line item has bee reached. Valid values:

Name	Description
@type	Part of the TMF Open API standard. Thi value is always `ServiceOrder`. This information is not stored. Data type: String

Example: cURL request

The following example retrieves a specified service order.

```
curl
 "https://instance.service-now.com/api/sn_tmf_api/order/serviceO
rder/4f2af65ac3a030106e2473ce3640ddcf" \
--request GET \
--user 'username':'password'
```

Response body.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
201	Successful. If there are any issues with the characteristics or characteristics option information, the endpoint stores the following comments in the work notes fields of the associated Customer Order Line Item record:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
	• `The following Order Item characteristics does not exist: Review specification <specification.name> and correct the characteristic and characteristic option in the order line item prior to approving the order.` • `Order Item characteristic: <characteristic.name> with characteristic value: <characteristic.value>is invalid. Correct the characteristic values before approving the order.`
400	Bad Request. Could be any of the following reasons: • `Invalid payload: Request body missing` - Payload was not passed in the request body. • `Invalid payload: serviceOrderItem is missing` - Service order line item object or JSON is missing. • `Invalid payload: serviceOrderItem id is missing` - The *`id`* parameter is missing in the service order line item of the payload. • `Invalid payload: serviceOrderItem action is missing` - The *`action`* parameter is missing in the service order line item of the payload. • `Invalid payload: serviceOrderItem serviceOffering is missing` - The service offering object or JSON is missing from the service order line item in the payload. • `Invalid payload: serviceOffering id is missing` - The *`id`* parameter is missing in the service order line item of the service offering object in the payload. • `Invalid payload: Service offering does not exist` - The service offering in the service order line item is not valid. • `Invalid payload: serviceOrderItem service is missing` - The service object or JSON in the service order line item is missing from the payload. • `Invalid payload: service serviceSpecification is missing` - The service specification object or JSON in the service order line item is missing from the payload. • `Invalid payload: serviceSpecification id is missing` - The *`id`* parameter in the service order line item of the service specification object is missing from the payload. • `Invalid payload: Service specification does not exist` - The service specification in the service order line item is not valid. • `Invalid payload: Service Inventory does not exist` - In a change order (action = change), the quantity of an item is greater than what is in stock. • `Invalid payload: Service inventory ID is missing` - In a change order, the *`service.id`* is missing in the payload. • `Invalid payload: Sold Service is inactive` - In a change order, a service specified in the payload is inactive. • `Invalid payload: relatedParty is missing` - The related party object is missing from the payload.

serviceOrderItem.service.serviceSpecification.id	Initial_version or external_id of the service specification. The initial_version is the sys_id of the first version of the specification. Located in the sys_id or external_id field of the Service Specification [sn_prd_pm_service_specification] table. Data type: String
serviceOrderItem.service.serviceSpecification.name	Name of the service specification. Located in the Service Specification [sn_prd_pm_service_specification] table. Data type: String
serviceOrderItem.service.serviceSpecification.@type	Part of the TMF Open API standard. This value is always `ServiceSpecificationRef`. This information is not stored. Data type: String
serviceOrderItem.@type	Part of the TMF Open API standard. This value is always `ServiceOrderItem`. This information is not stored. Data type: String
state	State of the service order. For more information, see. Data type: String

Example: cURL request

This example shows how to update a service order.

```
curl -X PATCH
 'https://instance.service-now.com/api/sn_tmf_api/order/serviceO
rder/a831e56e77602110c8b3a4d54b5a9954' \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
-d '{
  "externalId": "BSS748",
```

Service Order Open API - POST /sn_tmf_api/order/serviceOrder/cancelserviceorder

Cancels the specified service order.

Note: This endpoint cannot be used on orders for which the point of no return has been reached. An order line item can't be canceled while fulfillment is in progress.

URL format

Default URL: `/api/sn_tmf_api/order/serviceOrder/cancelserviceorder`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON)

Name	Description
cancellationReason	Reason for cancellation. Data type: String Default: Blank string

serviceOrder	Contains data about the service order.
	
	Data type: Object
	
	`"serviceOrder": {`
	`  "id": "String",`
	`  "href": "String",`
	`  "@referredType": "String"`
	`}`

serviceOrder.id	Required. Sys_id of the customer order to cancel. Located in the Customer Order [sn_ind_tmt_orm_order] table. Data type: String
serviceOrder.href	URL of the customer order to cancel. Data type: String Default: Blank string
serviceOrder.@referredType	The value for this parameter should be `ServiceOrder`. Data type: String Default: Blank string
requestedCancellationDate	Date to cancel the order. Data type: String Default: Blank string
@type	The value for this parameter should be `CancelServiceOrder`. Data type: String Default: Blank string

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Could be any of the following reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>. • Invalid order ID. • Invalid order ID: `This order is yet to be created in customer order table`. The cancel request was made for an order that has not been created yet. The order is in the Inbound Queue [sn_tmt_core_inbound_queue] table waiting for the scheduler to pick up the record.

Response body parameters (JSON)

Name	Description
cancellationReason	Reason for cancellation. Data type: String
id	Sys_id of the cancelled order. Data type: String

serviceOrder	Contains data about the service order.
	Data type: Object
	`"serviceOrder": {`
	`"id": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"@referredType": "String"
	}</pre>

serviceOrder.id	Sys_id of the cancelled order. Data type: String
serviceOrder.@referredType	The value for this parameter is `ServiceOrder`. Data type: String
requestedCancellationDate	Date to cancel the order. Data type: String
state	State of the cancellation. If the cancellation request was successfully processed (201 status code), the value for this parameter is `done`. Data type: String
@type	The value for this parameter is `CancelServiceOrder`. Data type: String

Example: cURL request

The following code example cancels a customer order.

```
curl -X POST
 "https://instance.servicenow.com/api/sn_tmf_api/cancelserviceor
der" \
-H "Content-Type: application/json" \
-u "username":"password" \
-d {

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
201	Successful. If there are any issues with the characteristics or characteristics option information, the endpoint stores the following comments in the work notes fields of the associated Customer Order Line Item record: • The following Order Item characteristics does not exist: Review specification <*specification.name*> and correct the characteristic and characteristic option in the order line item prior to approving the order. • Order Item characteristic: <*characteristic.name*> with characteristic value: <*characteristic.value*> is invalid. Correct the characteristic values before approving the order.
202	Accepted. Successful request for an order in asynchronous mode. That is, the request was made with the *mode* parameter set to `async` and the record is scheduled to be processed in the Inbound Queue [sn_tmt_core_inbound_queue] table.
400	Bad Request. Could be any of the following reasons: • Invalid payload: Request body missing. - Payload was not passed in the request body. • Invalid payload: serviceOrderItem missing. - Service order line item object or JSON is missing. • Invalid payload: serviceOrderItem ID is missing. – The ID is missing from the service order line item. • Invalid payload: serviceOrderItem action is missing. – The service object or JSON is missing from the payload. • Invalid payload: serviceOrderItem service is missing. – The service property is missing from the service order line item. • Invalid payload: serviceSpecification is missing. - The service specification object or JSON in the service order line item is missing from the payload.

Status codes (continued)

Status code	Description
	• Invalid payload: serviceSpecification ID is missing. - The *id* parameter in the service order line item of the service specification object is missing from the payload. • Invalid payload: Service specification does not exist. - The service specification in the service order line item is not valid. • Invalid payload: Product Inventory does not exist. - In a change or delete order (i.e., action = change or delete), the sold service sent is not present in the system. • Invalid payload: Product inventory ID is missing. – In a change or delete order, the Sold Product ID is missing from the payload. • Invalid payload: Customer Account or Consumer is missing - The related party customer or consumer object is missing from the payload. • Invalid payload: Sold Product is inactive. – In a change or delete order, the Sold Product sent in the payload is not in active state. • Invalid payload: Consumer does not exist - The specified related party consumer does not exist in the instance. • Invalid payload: Customer Account does not exist. – The related party customer provided in payload is not present in the system. • Invalid payload: Order creation failed. - Not able to create the requested order.
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
committedDueDate	Date and time when the action must be performed on the order. This value must be the same as or later than the *committedDueDate* values for each order line item. Data type: String
externalId	Unique order number for the external service order. Data type: String
href	A relative link to the resource record. Data type: String Default: Blank string
id	Sys_id of the service order.

Service Order Open API – POST /sn_tmf_api/order/serviceOrder/outboundresponse

Updates the fulfillment state for the specified domain order records in the Outbound Request [sn_tmt_core_outbound_request] table.

To use this method, the Outbound Request table must contain the specified domain order record. Also, the method validation throws an error if the records or states specified in the request body are not located in the existing outbound record.

Note: You can't create new records in this table using this endpoint.

For additional information on domain orders, see Order Management data model.

URL format

`/api/sn_tmf_api/order/serviceOrder/outboundresponse`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
externalId	Required. Outbound request identifier of the domain orders record sent for fulfillment. Located in the request_id field in the Outbound Request [sn_tmt_core_outbound_request] table. Data type: String
ServiceOrderItem	Required. List of domain orders whose external fulfillment state needs to be updated. Data type: Array of Objects `"ServiceOrderItem": [ { "id": "String", "state": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
ServiceOrderItem.id	Required. Sys_id of a domain order record for which to update the external fulfillment state. Located in the Domain Order [sn_ind_tmt_orm_domain_order] table. Data type: String
ServiceOrderItem.state	Required. External fulfillment state of the domain order. Valid values: • error • fulfilled • pending Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad Request. Could be any of the following reasons:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
	• `Invalid payload: externalId is missing`: Indicates that the external ID (*`externalId`*) was not passed. • `Invalid payload: serviceOrderItem state is missing`: Indicates that the external fulfillment state (*`ServiceOrderItem.state`*) was not passed in one or more domain orders. • `Invalid external id. Please pass the correct external id`: Indicates that the passed external ID (*`externalId`*) is not present in system. • `Invalid domain order id. Please pass the correct domain order id`: Indicates that the passed domain order ID (*`ServiceOrderItem.id`*) is not present in the system. • `Domain order id passed is not associated with external id`: Indicates that the external ID (*`externalId`*) is not associated with any domain orders. The system only updates domain orders that are associated with an external ID passed in the payload. • `Invalid fulfilment state: Please provide correct fulfilment state`: Indicates that the passed fulfilment state (*`ServiceOrderItem.state`*) for one or more domain orders is not valid.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
externalId	Outbound request identifier of the domain orders record sent for fulfillment. Located in the request_id field in the Outbound Request [sn_tmt_core_outbound_request] table. Data type: String
href	A relative link to the resource record. Data type: String Default: Blank string
orderDate	The date and timestamp of the order. Format: YYYY-MM-DD HH:MM:SS Data type: String Default: Blank string
ServiceOrderItem	List of domain orders whose external fulfillment state needs to be updated. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"ServiceOrderItem": [
	  {
	  "id": "String",
	  "state": "String"
	  }
	]</pre>

ServiceOrderItem.id	Sys_id of a domain order record for which to update the external fulfillment state. Located in the Domain Order [sn_ind_tmt_orm_domain_order] table. Data type: String
ServiceOrderItem.state	External fulfillment state of the domain order. Possible values: • error • fulfilled • pending Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/serviceorder/out
boundresponse" \
--request POST \
--header "Accept:application/json" \
--data "{
  "externalId": "607017d243322110461f99612bb8f25c",
  "serviceOrderItem": [
    {
      "id": "19913c3577b301108e191e599a5a9988",
      "state": "error"
    }
  ]
}"
--user 'username':'password'
```

Response:

```
{
  "externalId": "607017d243322110461f99612bb8f25c",
  "serviceOrderItem": [
    {
      "id": "19913c3577b301108e191e599a5a9988",
      "state": "error"
    }
  ]
}
```

Service Test Management Open API

The *Service Test Management Open* API provides endpoints to create and retrieve service test definitions and service tests.

Use this API to manage service problem management information between external systems and the ServiceNow AI Platform. The *Service Test Management Open* API is a ServiceNow implementation of the TM Forum Service Problem Management API REST specification. This implementation is based on https://www.tmforum.org/resources/specification/tmf653-service-test-management-api-user-guide-v4-1-0/ .

This REST API is designed to manage and execute service tests within a telecommunications environment. It allows users to define, trigger, and monitor service tests, ensuring that services meet quality and performance standards. The API provides capabilities for test management, including creating and updating test definitions, executing tests, retrieving test results, and managing test schedules.

The *Service Test Management Open* API requires the Customer Service Problem Management (com.sn_sprb_mgmt) plugin and the sn_sprb_mgmt.test_integrator role. This API belongs to the sn_sprb_mgmt namespace. For more information about Service Problem Management. See Customer Service Problem Management for more information about this application.

The *Service Test Management Open* API creates or updates data in the following tables:

- Test Run [sn_st_mgmt_test]
- Service Test definition [sn_st_mgmt_test_definition]
- Test Definition Characteristic [sn_st_mgmt_test_definition_characteristic]
- Test Characteristic [sn_st_mgmt_test_characteristic]
- Specification to Test Definition Relationship [sn_st_mgmt_test_definition_m2m]
- Test Definition Relationship [sn_st_mgmt_test_definition_rel]
- Test Measure [sn_st_mgmt_test_measure]
- Measure Consequence [sn_st_mgmt_measure_consequence]
- Test Measure Definition [sn_st_mgmt_test_measure_definition]
- Applied Consequence [sn_st_mgmt_applied_consequence]
- Threshold Rule [sn_st_mgmt_threshold_rule]
- Threshold Rule Violation [sn_st_mgmt_threshold_rule_violation]

Service Test Management Open API – GET /sn_sprb_mgmt/servicetestmanagement/serviceTest

Retrieves a list of all service tests.

URL format

Default URL: `/api/sn_sprb_mgmt/servicetestmanagement/serviceTest`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. If this parameter isn't used, all fields are returned. Located in the Service Test [sn_st_mgmt_test] table. Valid fields: • characteristic • description • endDateTime • id • mode • relatedService • startDateTime • state • testMeasure • testSpecification • validFor Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number Maximum value: 100 Default: 20
offset	Starting index at which to begin retrieving records. Use this parameter to paginate results in small and manageable chunks. The first record is indexed at 0. Data type: Number Default: 0
state	Filter test definitions by the test's current state. Only test definitions in the specified state are returned in the response. Valid values: • acknowledged • canceled

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• completed • failed • inProgress • pending • rejected Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Specifies the range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the Content-Range header is items 3 - 5.
Content-Type	Data format of the response body. Only supports application/json.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
206	Partial resource returned in response (with pagination).
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (XML or JSON)

Name	Description
characteristic	List that describes the characteristics of the associated service test. For more information about test definition characteristics, see Data type: Array of objects `"characteristic": [ { "id": "String", "name": "String", "value": "String", "valueType": "String" } ]`
characteristic.id	Sys_id or external_id of characteristics. Located in the Characteristics [sn_prd_pm_characteristic] table. If external_id is present for that record, the response returns the external_id otherwise it returns the sys_id. Data type: String
characteristic.name	Name of the characteristic. Data type: String
characteristic.value	Characteristic options associated with the service test. Characteristics vary based on the customer instance. Data type: String
characteristic.valueType	Type of characteristic value.

Response body parameters (XML or JSON) (continued)

Name	Description
	• yes/no • choice • date • date/time • duration • email • label • single line test Data type: String
description	Description of the service test. Data type: String
endDateTime	End date and time of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
href	Hyperlink reference to the service test. Data type: String
id	Sys_id or external_id of the service test definition. Located in the Service Test [sn_st_mgmt_test] table. Data type: String
mode	The mode that the service test is running in. Valid values: • ONDEMAND - Triggers the service test manually. • PROACTIVE - Triggers the service test automatically. Default: ONDEMAND
name	Required. Name of the service test. Data type: String
relatedService	Required. The test definition associated with the service test.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (XML or JSON) (continued)

Name	Description
	Data type: Object `"relatedService": { "href": "String", "id": "String", "name": "String" }`
relatedService.id	Sys_id or external_id of the product inventory. Located in the sys_id or external_id field of the product Inventory [sn_prd_invt_product_inventory] table. Data type: String
relatedService.name	Name of the product inventory. Data type: String
startDateTime	Start date and time of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
state	State the service test is in. Valid values: • acknowledged • canceled • completed • failed • inProgress • pending • rejected Data type: String
testMeasure	Measure of a specific aspect of a product, service, or resource test, such as lost packets or connectivity status. Data type: Array of Objects `"testMeasure": [ { "accuracy": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (XML or JSON) (continued)

Name	Description
	"captureDateTime": "String", "captureMethod": "String", "id": "String", "metricDescription": "String", "metricName": "String", "ruleViolation": [Array], "unitOfMeasure": "String", "value": {Object} }]
testMeasure.accuracy	Float decimal value representing the test measure accuracy captured for the associated metrics. Data type: Number Maximum value: 40
testMeasure.captureDateTime	The date and time that the metric was captured. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
testMeasure.id	Sys_id or external_id of the Test Measures. Located in the sys_id or external_id fields of the Test Measures table [sn_st_mgmt_test_measure] table. Data type: String
testMeasure.Measure.captureMethod	Method used to capture the metric. Valid values: • automatic - Automatically capture the metric. • manual - Manually capture the metric. • none - Don't capture the metric. Data type: String
testMeasure.metricDescription	Brief description of the metric.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
testMeasure.metricName	Name of the test measure metric. Data type: String
testMeasure.ruleViolation	An object for defining a rule in the threshold rule definition, along with consequences if the rule is violated. Data type: Array of objects `"ruleViolation"[ { appliedConsequence: [Array], conformanceTargetUpper: Number, conformanceComparatorUpper: "String", description: "String", id: "String", name: "String", numberOfAllowedCrossing: Number, thresholdRuleSeverity: "String", tolerancePeriod: "String" } ]`
testMeasure.ruleViolation.tolerancePeriod.amount	The number of periods before applying the consequence. Data type: Number
testMeasure.ruleViolation.appliedConsequence	Action (prescribed action or notification) to take when a threshold rule is crossed. Data type: Array of objects `"appliedConsequence": [ { "appliedAction": "String", "description": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (XML or JSON) (continued)

Name	Description

	<pre>"id": "String",
	"name": "String",
	"repeatAction": Boolean
	}
	]</pre>

testMeasure.ruleViolation.appliedConsequence.appliedAction	Action to take when a threshold rule is violated. For example, sending a warning or generating a report. Applied actions can vary between instances. Data type: String
testMeasure.ruleViolation.appliedConsequence.description	Description of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.id	Sys_id or external_id of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.name	Name of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.repeatAction	Flag that indicates whether to repeat the consequence when a second violation occurs. Valid values: • true: Repeat the action. • false: Dorepeat the action. Data type: Boolean Default: false
testMeasure.ruleViolation.conformanceComporatorExact	Flag that indicates whether a value is identical. Valid values: • true: The value is identical. • false: The value isn't identical. Data type: Boolean Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (XML or JSON) (continued)

Name	Description
testMeasure.ruleViolation.conformanceComporatorLower	Operator for checking if a value falls below the threshold. Valid values: • greater than • greater than or is Data type: String
testMeasure.ruleViolation.conformanceComporatorUpper	Operator for checking if a value is above the threshold. Valid values: • less than • less than or is Data type: String
testMeasure.ruleViolation.conformanceTargetExact	Required if *conformanceComparatorExact* is set to true. If the *conformanceComparatorExact* value is set to true, its value matches the value defined in *conformanceTargetExact*. Data type: Number
testMeasure.ruleViolation.conformanceTargetLower	Lower threshold value for comparing the test measure results. Determines if the threshold is crossed or no longer crossed. Data type: Number
testMeasure.ruleViolation.conformanceTargetUpper	Upper threshold value for comparing the test measure results. Determines if the threshold is crossed or no longer crossed. Data type: Number
testMeasure.ruleViolation.description	Description of the threshold rule. Data type: String
testMeasure.ruleViolation.id	Sys_id or external_id of the threshold rule violation. Located in the Threshold Rule Violation table [sn_st_mgmt_threshold_rule_violation] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
testMeasure.ruleViolation.name	Name of the threshold rule. Data type: String
testMeasure.ruleViolation.numberOfAllowedCrossing	Maximum crossings allowed within the tolerance period before consequences are applied. Data type: Number Maximum value: 40
testMeasure.ruleViolation.thresholdRuleSeverity	Severity of the threshold rule. Valid values: • high • medium • low Data type: String
testMeasure.ruleViolation.tolerancePeriod	Specified time interval during which crossing occurrences are enabled without triggering any immediate consequences or actions. Date type: Object `"tolerancePeriod": { "amount": Number, "units": "String" }`
testMeasure.ruleViolation.tolerancePeriod.units	Units of the period. Accepted values: • seconds • minutes • days • hours Data type: String
testMeasure.unitOfMeasure	Specifies the unit of measurement for the conformance target values of the test measure.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
testMeasure.value	The value of the test measure. Data type: Object `"value": { "id": "String", "name": "String", "valueType": "String", "value": "String }`
testMeasure.value.id	The ID of the test measure value. Data type: String
testMeasure.value.name	The name of the test measure value. Data type: String
testMeasure.value.value	The value of the test measure. Data type: String
testMeasure.value.valueType	The type of test measure value such as numeric, text, and so forth. Data type: String
testSpecification	Required. The test definition associated with this test. Data type: Object `"testSpecification": { "id": "String", "href": "String" }`
testSpecification.href	Hyperlink reference to the service test definition. Data type: String
testSpecification.id	The sys_id or external_id of the service test definition. Located in the sys_id or external_id field of the Service Test Definition [sn_st_mgmt_test_definition] table. Data type: String
validFor	Date range the service test is valid for.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (XML or JSON) (continued)

Name	Description
	Data type: Object `"validFor": { "startDateTime": "String", "endDateTime ": "String" }`
validFor.endDateTime	Validity end date of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
validFor.startDateTime	Validity start date of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String

Example: cURL request

The following example retrieves information about the two service tests in the instance.

```
curl --location --request GET
 “https://instance.servicenow.com/api/sn_sprb_mgmt/servicetestma
nagement/serviceTest” \
--user 'username’: ‘password'
```

Response body.

Service Test Management Open API – GET /sn_sprb_mgmt/servicetestmanagement/serviceTest/{id}

Retrieves a service test entity based on the given ID of a service test.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Default URL: `/api/sn_sprb_mgmt/servicetestmanagement/serviceTest/{id}`

Supported request parameters

Path parameters

Name	Description
id	Required. Sys_id or external_id of the service test to retrieve. Located in the Service Test [sn_st_mgmt_test] table. Data type: String

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. If this parameter isn't used, all fields are returned. Located in the Service Test [sn_st_mgmt_test] table. Valid fields: • characteristic • description • endDateTime • id • mode • relatedService • startDateTime • state • testMeasure • testSpecification • validFor Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports application/json.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
characteristic	List that describes the characteristics of the associated service test. Data type: Array of objects `"characteristic": [ { "id": "String", "name": "String", "value": "String", "valueType": "String" } ]`
characteristic.id	Sys_id or external_id of characteristics. Located in the Characteristics [sn_prd_pm_characteristic] table. If external_id is present for that record, the response returns the external_id otherwise it returns the sys_id. Data type: String
characteristic.name	Name of the characteristic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
characteristic.value	Characteristic options associated with the service test. Characteristics vary based on the customer instance. Data type: String
characteristic.valueType	Type of characteristic value. • yes/no • choice • date • date/time • duration • email • label • single line test Data type: String
description	Description of the service test. Data type: String
endDateTime	End date and time of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
href	Hyperlink reference to the service test. Data type: String
id	Sys_id or external_id of the service test definition. Located in the Service Test [sn_st_mgmt_test] table. Data type: String
mode	Mode that the service test is running in. Valid values: • ONDEMAND - Triggers the service test manually. • PROACTIVE - Triggers the service test automatically. Default: ONDEMAND

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
name	Name of the service test. Data type: String
relatedService	Test definition associated with this test. Data type: Object `"relatedService": { "href": "String", "id": "String", "name": "String" }`
relatedService.id	The sys_id or external_id of the product inventory. Located in the sys_id or external_id field of the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
relatedService.name	Name of the product inventory item. Data type: String
startDateTime	Start date and time of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
state	The state of the service test. Valid values: • acknowledged • canceled • completed • failed • inProgress • pending • rejected
testMeasure	Measure of a specific aspect of a product, service, or resource test, such as lost packets or connectivity status. Data type: Array of objects `"testMeasureDefinition": [ { "accuracy": "String", "captureDateTime": "String", "captureMethod": "String", "id": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre>"metricDescription": "String", "metricName": "String", "ruleViolation": [Array] "unitOfMeasure": "String", "value": {Object} }]</pre>
testMeasure.accuracy	Float decimal value representing the test measure accuracy captured for the associated metrics. Data type: Number Maximum value: 40
testMeasure.captureDateTime	The date and time that the metric was captured. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
testMeasure.captureMethod	Method used to capture the metric. Valid values: • automatic - Automatically capture the metric. • manual - Manually capture the metric. • none - Don't capture the metric. Data type: String
testMeasure.id	Sys_id or external_id of the test measure. Located in the Test Measures table [sn_st_mgmt_test_measure] table. Data type: String
testMeasure.metricDescription	Brief description of the metric. Data type: String
testMeasure.metricName	Name of a metric in the test measure. Data type: String
testMeasure.ruleViolation	Object for defining a rule in the threshold rule definition, along with consequences if the rule is violated. Data type: Array of Objects <pre>"RuleViolation": [{</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"appliedConsequence": [Array],
	"conformanceComparatorExact": Boolean,
	"conformanceComparatorLower": "String",
	"conformanceComparatorUpper": "String",
	"conformanceTargetExact": "String",
	"conformanceTargetLower": "String",
	"conformanceTargetUpper": "String",
	"description": "String",
	"id": "String",
	"name": "String",
	"numberOfAllowedCrossing": Number,
	"thresholdRuleSeverity": "String",
	"tolerancePeriod": {Object}
	}
	]</pre>

testMeasure.ruleViolation.appliedConsequence	Action (prescribed action or notification) to take when a threshold rule is violated.
	
	Data type: Array of Objects
	<pre>"appliedConsequence": [
	{
	"appliedAction": "String",
	"description": "String",
	"id": "String",
	"name": "String",
	"repeatAction": Boolean
	}
	]</pre>

testMeasure.ruleViolation.appliedConsequence.appliedAction	Applied action when a threshold rule is violated. For example, sending a warning or generating a report. Applied actions can vary between instances. Data type: String
testMeasure.ruleViolation.appliedConsequence.repeatAction	Flag that indicates whether to repeat the applied action or not. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Repeats the action. • false: Doesn't repeat the action. Data type: Boolean Default: false
testMeasure.ruleViolation.appliedConsequence.description	Description of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.id	Sys_id or external_id of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.name	Name of the applied consequence. Data type: String
testMeasure.ruleViolation.conformanceComparatorExact	Flag that indicates whether a value is identical to the value of *conformanceTargetExact*. Valid values: • true: The value is identical. • false: The value isn't identical. Data type: Boolean Default: false
testMeasure.ruleViolation.conformanceComparatorLower	An operator that checks if a value falls below the threshold. Valid values: • greater than • is Data type: String
testMeasure.ruleViolation.conformanceComparatorUpper	An operator that checks if a value exceeds the threshold. Valid values: • is • lesser than Data type: String
testMeasure.ruleViolation.conformanceTargetExact	Required if *conformanceComparatorExact*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	is set to true. If the *conformanceComparatorExact* value is set to true, its value matches the value defined in *conformanceTargetExact*. Data type: Number
testMeasure.ruleViolation.conformanceTargetLower	Lower threshold value for comparing the test measure results. Determines if the threshold is crossed or no longer crossed. Data type: Number
testMeasure.ruleViolation.conformanceTargetUpper	Upper threshold value for comparing the test measure results. Determines if the threshold is crossed or no longer crossed. Data type: Number
testMeasure.ruleViolation.description	Description of the threshold rule violation. Data type: String
testMeasure.ruleViolation.id	Sys_id or external_id of the threshold rule violation. Located in the Threshold Rule Violation table [sn_st_mgmt_threshold_rule_violation] table. Data type: String
testMeasure.ruleViolation.name	Name of the threshold rule violation. Date type: String
testMeasure.ruleViolation.numberOfAllowedCrossings	Minimum crossings allowed within the tolerance period before consequences are applied. Data type: Number Maximum: 40
testMeasure.ruleViolation.thresholdRuleSeverity	Severity of the threshold rule. Valid values: • high • low • medium Data type: String
testMeasure.ruleViolation.tolerancePeriod	Duration or time interval in which allowed crossings can occur before a consequence is initiated. Date type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"tolerancePeriod": {
	"amount": Number,
	"units": "String"
	}</pre>

testMeasure.ruleViolation.tolerancePeriod.amount	Amount of the period in number. Data type: Number
testMeasure.ruleViolation.tolerancePeriod.units	Units of the period. Accepted values: • seconds • minutes • days • hours Data type: String
testMeasure.unitOfMeasure	Measurable value of time used to calculate the performance of a service in days, minutes, and seconds. Data type: String

testMeasure.value	Value of metric in the test.
	
	Data type: Object
	<pre>"value": {
	"id": "String",
	"name": "String",
	"valueType": "String",
	"value": "String"
	}</pre>

testMeasure.value.id	ID of the metric value in the test. Data type: String
testMeasure.value.name	Name of the metric value in the test. Data type: String
testMeasure.value.value	Value of metric in the test. Data type: String
testMeasure.value.valueType	The type of test measure value such as numeric, text, and so forth. Data type: String
testSpecification	Test definition associated for this test.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object `"testSpecification": { "href": "String", "id": "String" }`
testSpecification.href	Hyperlink reference to the service test definition. Data type: String
testSpecification.id	Sys_id or external_id of the service test definition. Located in the sys_id or external_id field of the Service Test Definition [sn_st_mgmt_test_definition] table. Data type: String
validFor	Date range that the service test is valid for. Data type: Object `"validFor": { "startDateTime": "String", "endDateTime": "String" }`
validFor.endDateTime	End date and timestamp of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
validFor.startDateTime	Start date and timestamp of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String

Example: cURL request

The following example retrieves details about the service test entity associated with the given ID, 44b7a8ea3b6a42107222bf9985e45a45.

```
curl --location --request GET
 “https://instance.servicenow.com/api/sn_sprb_mgmt/servicetestma
nagement/serviceTest/44b7a8ea3b6a42107222bf9985e45a45 \
--user 'username’: ‘password'
```

Response body.

Service Test Management Open API - GET /sn_sprb_mgmt/servicetestmanagement/serviceTestSpecification

Retrieves a list of all service test definitions.

URL format

Default URL: GET `/api/sn_sprb_mgmt/servicetestmanagement/serviceTestSpecification`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. If this parameter isn't used, all fields are returned. Located in the Service Test Definition [sn_st_mgmt_test_definition] table. Valid values: • description • id • name • relatedServiceSpecification • serviceTestSpecRelationship • specCharacteristic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• testMeasureDefinition • validFor Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the *`offset`* parameter to paginate record retrieval. Data type: Number Maximum value: 100 Default: 20
offset	Starting index at which to begin retrieving records. Use this parameter to paginate results in small and manageable chunks. The first record is indexed at 0. Data type: Number Default: 0
state	Filter test definitions by the test's current state. Only test definitions in the specified state are returned in the response. Valid values: • archived • draft • published • retired Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
Content-Range	Specifies the range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the Content-Range header is items `3 - 5`.
Content-Type	Data format of the response body. Only supports application/json.
Link	Contains the following links to navigate through query results: • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
206	Partial resource returned in response (with pagination).
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
description	Description of the service test definit Data type: String
id	Sys_id or external_id of the service t Definition [sn_st_mgmt_test_definitio Data type: String

	"startDateTime": "Strin
	}</pre>

validFor.endDateTime	Date and time of the test definition o Format: YYYY-MM-DD 00:00:00. For Data type: String
validFor.startDateTime	Date and time of the test definition o Format: YYYY-MM-DD 00:00:00. For Data type: String

Example: cURL request

This example retrieves details about all test service test definitions in the instance. In this case, two definitions are returned.

```
curl --location --request GET
“https://instance.servicenow.com//
api/sn_sprb_mgmt/servicetestmanagement/serviceTestSpecification”
 \
--user 'username’: ‘password'
```

Response body.

Service Test Management Open API - GET /sn_sprb_mgmt/servicetestmanagement/serviceTestSpecification/{id}

Retrieves a service test definition entity.

URL format

Default URL: `/api/sn_sprb_mgmt/servicetestmanagement/serviceTestSpecification/{id}`

Supported request parameters

Path parameters

Name	Description
id	Required. Sys_id or external_id of the service test definition to retrieve. Located in the Service Test Definition [sn_st_mgmt_test_definition] table. Data type: String

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. If this parameter isn't used, all fields are returned. Located in the Service Test Definition [sn_st_mgmt_test_definition] table. Valid values: • description • id • name • relatedServiceSpecification • serviceTestSpecRelationship • specCharacteristic • testMeasureDefinition • validFor Data type: String
state	Filter test definitions by the test's current state. Only test definitions in the specified state are returned in the response. Valid values: • archived • draft

Query parameters (continued)

Name	Description
	• published • retired Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Service Test Management Open API - PATCH /sn_sprb_mgmt/servicetestmanagement/serviceTest/{id}

Updates a service test entity.

URL format

Default URL: `/api/sn_sprb_mgmt/servicetestmanagement/serviceTest/{id}`

Supported request parameters

Path parameters

Name	Description
id	Required. Sys_id or external_id of the service test to retrieve. Located in the Service Test [sn_st_mgmt_test] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
characteristic	List that describes the characteristics of the associated service test. For more information about test definition characteristics, see Data type: Array of objects `"characteristic": [ { "id": "String", "name": "String", "value": "String", "valueType": "String" } ]`
characteristic.id	Sys_id or external_id of characteristics. Located in the Characteristics [sn_prd_pm_characteristic] table. If external_id is present for that record, the response returns the external_id otherwise it returns the sys_id.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
characteristic.name	Name of the characteristic. Data type: String
characteristic.value	Characteristic options associated with the service test. Characteristics vary based on the customer instance. Data type: String
characteristic.valueType	Type of characteristic value. • yes/no • choice • date • date/time • duration • email • label • single line test Data type: String
description	Description of the service test. Data type: String
endDateTime	End date and time of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
mode	The mode that the service test is running in. Valid values: • ONDEMAND - Triggers the service test manually. • PROACTIVE - Triggers the service test automatically. Default: ONDEMAND
name	Required. Name of the service test.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Request body parameters (XML or JSON) (continued)

Name	Description
testMeasure.ruleViolation.appliedConsequence	Action (prescribed action or notification) to take when a threshold rule is crossed. Data type: Array of objects `"appliedConsequence": [ { "appliedAction": "String", "description": "String", "id": "String", "name": "String", "repeatAction": Boolean } ]`
testMeasure.ruleViolation.appliedConsequence.appliedAction	Action to take when a threshold rule is violated. For example, sending a warning or generating a report. Applied actions can vary between instances. Data type: String
testMeasure.ruleViolation.appliedConsequence.description	Description of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.id	Sys_id or external_id of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.name	Name of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.repeatAction	Flag that indicates whether to repeat the consequence when a second violation occurs. Valid values: • true: Repeat the action. • false: Dorepeat the action. Data type: Boolean Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
testMeasure.ruleViolation.conformanceComporatorExact	Flag that indicates whether a value is identical. Valid values: • true: The value is identical. • false: The value isn't identical. Data type: Boolean Default: false
testMeasure.ruleViolation.conformanceComporatorLower	Operator for checking if a value falls below the threshold. Valid values: • greater than • greater than or is Data type: String
testMeasure.ruleViolation.conformanceComporatorUpper	Operator for checking if a value is above the threshold. Valid values: • less than • less than or is Data type: String
testMeasure.ruleViolation.conformanceTargetExact	Required if *conformanceComparatorExact* is set to true. If the *conformanceComparatorExact* value is set to true, its value matches the value defined in *conformanceTargetExact*. Data type: Number
testMeasure.ruleViolation.conformanceTargetLower	Lower threshold value for comparing the test measure results. Determines if the threshold is crossed or no longer crossed. Data type: Number
testMeasure.ruleViolation.conformanceTargetUpper	Upper threshold value for comparing the test measure results. Determines if the threshold is crossed or no longer crossed.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: Number
testMeasure.ruleViolation.description	Description of the threshold rule. Data type: String
testMeasure.ruleViolation.id	Sys_id or external_id of the threshold rule violation. Located in the Threshold Rule Violation table [sn_st_mgmt_threshold_rule_violation] table. Data type: String
testMeasure.ruleViolation.name	Name of the threshold rule. Data type: String
testMeasure.ruleViolation.numberOfAllowedCrossing	Maximum crossings allowed within the tolerance period before consequences are applied. Data type: Number Maximum value: 40
testMeasure.ruleViolation.thresholdRuleSeverity	Severity of the threshold rule. Valid values: • high • medium • low Data type: String
testMeasure.ruleViolation.tolerancePeriod	Specified time interval during which crossing occurrences are enabled without triggering any immediate consequences or actions. Date type: Object `"tolerancePeriod": { "amount": Number, "units": "String" }`
testMeasure.ruleViolation.tolerancePeriod.units	Units of the period. Accepted values:

Request body parameters (XML or JSON) (continued)

Name	Description
	• seconds • minutes • days • hours Data type: String
testMeasure.unitOfMeasure	Specifies the unit of measurement for the conformance target values of the test measure. Data type: String

testMeasure.value	The value of the test measure.
	
	Data type: Object
	
	`"value": {`
	`"id": "String",`
	`"name": "String",`
	`"valueType": "String",`
	`"value": "String`
	`}`

testMeasure.value.id	The ID of the test measure value. Data type: String
testMeasure.value.name	The name of the test measure value. Data type: String
testMeasure.value.value	The value of the test measure. Data type: String
testMeasure.value.valueType	The type of test measure value such as numeric, text, and so forth. Data type: String

testSpecification	Required. The test definition associated with this test.
	
	Data type: Object
	
	`"testSpecification": {`
	`"id": "String",`
	`"href": "String"`
	`}`

testSpecification.href	Hyperlink reference to the service test definition.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
testSpecification.id	The sys_id or external_id of the service test definition. Located in the sys_id or external_id field of the Service Test Definition [sn_st_mgmt_test_definition] table. Data type: String
validFor	Date range the service test is valid for. Data type: Object `"validFor": { "startDateTime": "String", "endDateTime ": "String" }`
validFor.endDateTime	Validity end date of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
validFor.startDateTime	Validity start date of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
characteristic	List that describes the characteristics of the associated service test. Data type: Array of objects `"characteristic": [ { "id": "String", "name": "String", "value": "String", "valueType": "String" } ]`
characteristic.id	Sys_id or external_id of characteristics. Located in the Characteristics [sn_prd_pm_characteristic] table. If external_id is present for that record, the response returns the external_id otherwise it returns the sys_id. Data type: String
characteristic.name	Name of the characteristic. Data type: String
characteristic.value	Characteristic options associated with the service test. Characteristics vary based on the customer instance. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
characteristic.valueType	Type of characteristic value. • yes/no • choice • date • date/time • duration • email • label • single line test Data type: String
description	Description of the service test. Data type: String
id	Sys_id or external_id of the service test definition. Located in the Service Test [sn_st_mgmt_test] table. Data type: String
name	Name of the service test. Data type: String
relatedService	Test definition associated for this test. Data type: Object `"relatedService": { "href": "string", "id": "String", "name": "String" }`
relatedService.id	Sys_id or external_id of the product inventory. Located in the sys_id or external_id field of the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
relatedService.name	Name of the product inventory. Data type: String
testMeasure	Measure of a specific aspect of a product, service, or resource test, such as lost packets or connectivity status. Data type: Array of objects

Name	Description

	"testMeasureDefinition": [
	{
	"accuracy": "String",
	"captureDateTime": "String",
	"captureMethod": "String",
	"id": "String",
	"metricDescription":
	"String",
	"metricName": "String",
	"ruleViolation": [Array]
	"unitOfMeasure": "String",
	"value": {Object}
	}
	]

testMeasure.accuracy	Float decimal value representing the test measure accuracy captured for the associated metrics. Data type: Number Maximum value: 40
testMeasure.captureDateTime	The date and time that the metric was captured. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
testMeasure.captureMethod	Method used to capture the metric. Valid values: • automatic - Automatically capture the metric. • manual - Manually capture the metric. • none - Don't capture the metric. Data type: String
testMeasure.id	Sys_id or external_id of the test measure. Located in the Test Measures table [sn_st_mgmt_test_measure] table. Data type: String
testMeasure.metricDescription	Brief description of the metric. Data type: String
testMeasure.metricName	Name of a metric in the test measure. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
testMeasure.ruleViolation	Object for defining a rule in the threshold rule definition, along with consequences if the rule is violated. Data type: Array of Objects `"RuleViolation": [{ "appliedConsequence": [Array], "conformanceComparatorExact": Boolean, "conformanceComparatorLower": "String", "conformanceComparatorUpper": "String", "conformanceTargetExact": "String", "conformanceTargetLower": "String", "conformanceTargetUpper": "String", "description": "String", "id": "String", "name": "String", "numberOfAllowedCrossing": Number, "thresholdRuleSeverity": "String", "tolerancePeriod": {Object} }]`
testMeasure.ruleViolation.appliedConsequence	Action (prescribed action or notification) to take when a threshold rule is violated. Data type: Array of Objects `"appliedConsequence": [ { "appliedAction": "String", "description": "String", "id": "String", "name": "String", "repeatAction": Boolean } ]`
testMeasure.ruleViolation.appliedConsequence.appliedAction	Applied action when a threshold rule is violated. For example, sending a warning or generating a report. Applied actions can vary between instances.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
testMeasure.ruleViolation.appliedConsequence.applicableActionRepeat	Flag that indicates whether to repeat the applied action or not. Valid values: • true: Repeats the action. • false: Doesn't repeat the action. Data type: Boolean Default: false
testMeasure.ruleViolation.appliedConsequence.description	Description of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.id	Sys_id or external_id of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.name	Name of the applied consequence. Data type: String
testMeasure.ruleViolation.conformanceComparatorExact	Flag that indicates whether a value is identical to the value of *conformanceTargetExact*. Valid values: • true: The value is identical. • false: The value isn't identical. Data type: Boolean Default: false
testMeasure.ruleViolation.conformanceComparatorLower	An operator that checks if a value falls below the threshold. Valid values: • greater than • is Data type: String
testMeasure.ruleViolation.conformanceComparatorUpper	An operator that checks if a value exceeds the threshold. Valid values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• is • lesser than Data type: String
testMeasure.ruleViolation.conformanceTargetExact	Required if *conformanceComparatorExact* is set to true. If the *conformanceComparatorExact* value is set to true, its value matches the value defined in *conformanceTargetExact*. Data type: Number
testMeasure.ruleViolation.conformanceTargetLower	Lower threshold value for comparing the test measure results. Determines if the threshold is crossed or no longer crossed. Data type: Number
testMeasure.ruleViolation.conformanceTargetUpper	Upper threshold value for comparing the test measure results. Determines if the threshold is crossed or no longer crossed. Data type: Number
testMeasure.ruleViolation.description	Description of the threshold rule violation. Data type: String
testMeasure.ruleViolation.id	Sys_id or external_id of the threshold rule violation. Located in the Threshold Rule Violation table [sn_st_mgmt_threshold_rule_violation] table. Data type: String
testMeasure.ruleViolation.numberOfAllowedCrossings	Minimum crossings allowed within the tolerance period before consequences are applied. Data type: Number Maximum: 40
testMeasure.ruleViolation.thresholdRuleSeverity	Severity of the threshold rule. Valid values: • high • low • medium Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
testMeasure.ruleViolation.tolerancePeriod	Duration or time interval in which allowed crossings can occur before a consequence is initiated. Date type: Object `"tolerancePeriod": { "amount": Number, "units": "String" }`
testMeasure.ruleViolation.tolerancePeriod.amount	Amount of the period in number. Data type: Number
testMeasure.ruleViolation.tolerancePeriod.units	Units of the period. Accepted values: • seconds • minutes • days • hours Data type: String
testMeasure.unitOfMeasure	Measurable value of time used to calculate the performance of a service in days, minutes, and seconds. Data type: String
testMeasure.value	Value of metric in the test. Data type: Object `"value": { "id": "String", "name": "String", "valueType": "String", "value": "String" }`
testMeasure.value.id	ID of the metric value in the test. Data type: String
testMeasure.value.name	Name of the metric value in the test. Data type: String
testMeasure.value.value	Value of metric in the test. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
testMeasure.value.valueType	The type of test measure value such as numeric, text, and so forth. Data type: String
testSpecification	Test definition associated for this test. Data type: Object `"testSpecification": { "href": "String", "id": "String" }`
testSpecification.href	Hyperlink reference to the service test definition. Data type: String
testSpecification.id	Sys_id or external_id of the service test definition. Located in the sys_id or external_id field of the Service Test Definition [sn_st_mgmt_test_definition] table. Data type: String
validFor	Date range that the service test is valid for. Data type: Object `"validFor": { "startDateTime": "String", "endDateTime": "String" }`
validFor.endDateTime	End date and timestamp of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
validFor.startDateTime	Start date and timestamp of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String

Example: cURL request

The following example updates the given service test entity according to details provided in the request body.

```
curl
 "http://instance.servicenow.com/api/sn_sprb_mgmt/servicetestman
agement/serviceTest/2b406ec043b202104fefe4511fb8f211" \
```

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
testMeasureDefinition.thresholdRule.conformanceTargetExact	Required if *conformanceCompar* *conformanceComparatorExac* defined in *conformanceTargetE* Data type: Number
testMeasureDefinition.thresholdRule.conformanceTargetLower	Lower threshold value for comparing Data type: Number
testMeasureDefinition.thresholdRule.conformanceTargetUpper	Upper threshold value for comparing Data type: Number
testMeasureDefinition.thresholdRule.consequence	Action (prescribed action or notificat more information, see Define measu Data type: Array of objects `"consequence": [ { "description": "String "id": "String", "name": "String", "prescribeAction": "St "repeatAction": Boolea "validFor": { "endDateTime": "String "startDateTime": "Stri } ]`
testMeasureDefinition.thresholdRule.consequence.description	Description of the consequence. Data type: String
testMeasureDefinition.thresholdRule.consequence.id	Sys_id or external_id of the measure Data type: String
testMeasureDefinition.thresholdRule.consequence.name	Name of the consequence. Data type: String
testMeasureDefinition.thresholdRule.consequence.prescribeAction	User-defined action to take for thresh Data type: String
testMeasureDefinition.thresholdRule.consequence.repeatAction	Flag that indicates whether to repeat Valid values:

Request body parameters (XML or JSON) (continued)

Name	Description
	• true: Repeats the action. • false: Doesn't repeat the action. Data type: Boolean Default: false

testMeasureDefinition.thresholdRule.consequence.validFor	Date range that the consequence is
	
	Data type: Object
	
	`"validFor": {`
	`"startDateTime": "Strin`
	`"endDateTime ": "String`
	`}`

testMeasureDefinition.thresholdRule.consequence.validFor.endDateTime	Validity end date of the consequenc Format: YYYY-MM-DD 00:00:00. For Data type: String
testMeasureDefinition.thresholdRule.consequence.validFor.startDateTime	Validity start date of the consequenc Format: YYYY-MM-DD 00:00:00. For Data type: String
testMeasureDefinition.thresholdRule.description	Description of the threshold rule. Data type: String
testMeasureDefinition.thresholdRule.id	Sys_id or external_id of the threshol external_id field of the Threshold Rul Data type: String
testMeasureDefinition.thresholdRule.name	Name of the threshold rule. Data type: String
testMeasureDefinition.thresholdRule.numberOfAllowedCrossing	Maximum crossings allowed within th applied. Maximum value: 40 Data type: Number
testMeasureDefinition.thresholdRule.thresholdRuleSeverity	Severity level of the threshold rule. Valid values:

Request body parameters (XML or JSON) (continued)

Name	Description
	• high • medium • low Data type: String
testMeasureDefinition.unitOfMeasure	Measurable value of time used to cal minutes, and seconds. Data type: String

testMeasureDefinition.validFor	Date range that the test measure def
	
	Data type: String
	
	`"validFor": {`
	`"endDateTime": "String"`
	`"startDateTime": "Strin`
	`}`

testMeasureDefinition.validFor.endDateTime	Validity end date of the test measure Format: YYYY-MM-DD 00:00:00. For Data type: String
testMeasureDefinition.validFor.startDateTime	Validity start date of the test measure Format: YYYY-MM-DD 00:00:00. For Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports application/json.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
description	Description of the service test definition. Data type: String
id	The sys_id or external_id of the service test definition. Located in the Service Test [sn_st_mgmt_test] table Data type: String
name	Name of the service test definition. Data type: String
relatedServiceSpecification	Service specifications for the test definitions. Data type: Array of objects `"relatedServiceSpecification": [ { "id": "String", "name": "String" } ]`
relatedServiceSpecification.id	The sys_id or external_id of the service specification. Located in the sys_id or external_id

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	field of the Specification [sn_prd_pm_specification] table. Data type: String
relatedServiceSpecification.name	Name of the service specification. Data type: String
serviceTestSpecRelationship	Related service test definition. Data type: Array of objects `"serviceTestSpecRelationship": [ { "id": "String", "name": "String", "relationshipType": "String" } ]`
serviceTestSpecRelationship.id	Sys_id or external_id of the related service test definition. Located in the sys_id or external_id field of the Test Definition [sn_st_mgmt_test_definition] table. Data type: String
serviceTestSpecRelationship.name	Name of the related test definition. Data type: String
serviceTestSpecRelationship.relationshipType	Type of relationship. Accepted values: • substitution • dependency • exclusivity Data type: String
specCharacteristic	Test definition characteristics. Data type: Array of objects `"specCharacteristic": [ { "characteristicValueSpecification": Array, "description": "String", "name": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

	<pre>"validFor": Object,
	"valueType": "String"
	}
	]</pre>

specCharacteristic.characteristicValueSpecification	Array containing the possible values of the characteristic.
	
	Data type: Array of objects
	<pre>"characteristicValueSpecification": [
	{
	"value": "String"
	}
	]</pre>

specCharacteristic.characteristicValueSpecification.value	Value of the characteristic. Data type: String
specCharacteristic.description	Description of the characteristic. Data type: String
specCharacteristic.name	Name of the characteristic. Data type: String

specCharacteristic.validFor	Date range the characteristic is valid for.
	
	Data type: Object
	<pre>"validFor": {
	"endDateTime":
	"String",
	"startDateTime":
	"String"
	}</pre>

specCharacteristic.validFor.endDateTime	End date of the characteristic. Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:4 Data type: String
specCharacteristic.validFor.startDateTime	Start date of the characteristic. Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:4 Data type: String
specCharacteristic.valueType	Type of characteristic value.

Name	Description
	• once • weekly Data type: String
testMeasureDefinition.captureMethod	Method used to capture the metric. Valid values: • manual - Manually capture the metric. • automatic - Automatically capture the metric. • none - Don't capture the metric. Data type: String
testMeasureDefinition.capturePeriod	A duration or period of the capture. Data type: Object `"capturePeriod": { "amount": Number, "units": "String" }`
testMeasureDefinition.capturePeriod.amount	Number of capture periods. Data type: Number
testMeasureDefinition.capturePeriod.units	Units of the period. Accepted values: • seconds • minutes • days • hours Data type: String
testMeasureDefinition.id	Sys_id or external_id of the Test Measure definitions. Located in the Test Measure definition table [sn_st_mgmt_test_measure_definitio table. Data type: String
testMeasureDefinition.metricDescription	Brief description of the metric. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
testMeasureDefinition.metricName	User-defined name of a metric in the test measure. Data type: String
testMeasureDefinition.name	Name of the test measure definition. Data type: String
testMeasureDefinition.thresholdRule	Rule that defines the condition (raise or clear) to achieve to apply consequences when a threshold is crossed or ceased to be crossed for particular test measure definition. Data type: Array of objects `{ "thresholdRule": { "conformanceComparatorExact": Boolean, "conformanceComparatorLower": "String", "conformanceComparatorUper": "String", "conformanceTargetExact": "String", "conformanceTargetLower": "String", "conformanceTargetUpper": "String", "consequence": Array "description": "String", "id": "String", "name": "String", "numberOfAllowedCrossing": Number, "thresholdRuleSeverity": "String", "tolerancePeriod": Object } }`
testMeasureDefinition.thresholdRule.conformanceComparatorExact	Flag that indicates whether a value is identical to the value of *conformanceTargetExact*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Valid values: • true: The value is identical to the value of *conformanceTargetExact*. • false: The value isn't identical *conformanceTargetExact*. Data type: Boolean Default: false
testMeasureDefinition.thresholdRule.conformanceComparatorLower	Operator that checks if a value falls below the threshold. Valid values: • greater than • is Data type: String
testMeasureDefinition.thresholdRule.conformanceComparatorUpper	Operator that checks if a value exceeds the threshold. Valid values: • lesser than • is Data type: String
testMeasureDefinition.thresholdRule.conformanceTargetExact	Required if *conformanceComparatorExac* is set to true. If the *conformanceComparatorExac* value is set to true, its value matches the value defined in *conformanceTargetExact*. Data type: Number
testMeasureDefinition.thresholdRule.conformanceTargetLower	Lower threshold value for comparing the test measure results. Data type: Number
testMeasureDefinition.thresholdRule.conformanceTargetUpper	Upper threshold value for comparing the test measure results. Data type: Number
testMeasureDefinition.thresholdRule.consequence	Action (prescribed action or notification) to take when a threshold rule is crossed.

Service Test Management Open API - POST /sn_sprb_mgmt/servicetestmanagement/serviceTest

Creates a service test.

URL format

Default URL: `/api/sn_sprb_mgmt/servicetestmanagement/serviceTest`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
characteristic	List that describes the characteristics of the associated service test. For more information about test definition characteristics, see Data type: Array of objects `"characteristic": [ { "id": "String", "name": "String", "value": "String", "valueType": "String" } ]`
characteristic.id	Sys_id or external_id of characteristics. Located in the Characteristics [sn_prd_pm_characteristic] table. If external_id is present for that record, the response returns the external_id otherwise it returns the sys_id. Data type: String
characteristic.name	Name of the characteristic. Data type: String
characteristic.value	Characteristic options associated with the service test. Characteristics vary based on the customer instance. Data type: String
characteristic.valueType	Type of characteristic value. • yes/no • choice • date • date/time • duration • email

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• label • single line test Data type: String
description	Description of the service test. Data type: String
endDateTime	End date and time of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
id	Sys_id or external_id of the service test. Located in the Service Test [sn_st_mgmt_test] table. This ID creates a service test and is used as the external_id. Data type: String
mode	The mode that the service test is running in. Valid values: • ONDEMAND - Triggers the service test manually. • PROACTIVE - Triggers the service test automatically. Default: ONDEMAND
name	Required. Name of the service test. Data type: String
relatedService	Required. The test definition associated with the service test. Data type: Object `"relatedService": { "href": "String", "id": "String", "name": "String" }`
relatedService.href	Hyperlink reference to the related service.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
relatedService.id	Sys_id or external_id of the product inventory. Located in the sys_id or external_id field of the product Inventory [sn_prd_invt_product_inventory] table. Data type: String
relatedService.name	Name of the product inventory item. Data type: String
startDateTime	Start date and time of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
state	State the service test is in. Valid values: • acknowledged • canceled • completed • failed • inProgress • pending • rejected Data type: String
testMeasure	Measure of a specific aspect of a product, service, or resource test, such as lost packets or connectivity status. Data type: Array of Objects `"testMeasure": [ { "accuracy": "String", "captureDateTime": "String", "captureMethod": "String", "id": "String",`

Request body parameters (XML or JSON) (continued)

Name	Description
	<pre>"metricDescription": "String", "metricName": "String", "ruleViolation": [Array], "unitOfMeasure": "String", "value": {Object} }]</pre>
testMeasure.accuracy	Float decimal value representing the test measure accuracy captured for the associated metrics. Data type: Number Maximum value: 40
testMeasure.captureDateTime	The date and time that the metric was captured. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
testMeasure.id	Sys_id or external_id of the Test Measures. Located in the sys_id or external_id fields of the Test Measures table [sn_st_mgmt_test_measure] table. Data type: String
testMeasure.Measure.captureMethod	Method used to capture the metric. Valid values: • automatic - Automatically capture the metric. • manual - Manually capture the metric. • none - Don't capture the metric. Data type: String
testMeasure.metricDescription	Brief description of the metric. Data type: String
testMeasure.metricName	Name of the test measure metric.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
testMeasure.ruleViolation	An object for defining a rule in the threshold rule definition, along with consequences if the rule is violated. Data type: Array of objects `"ruleViolation"[ { appliedConsequence: [Array], conformanceTargetUpper: Number, conformanceComparatorUpper: "String", description: "String", id: "String", name: "String", numberOfAllowedCrossing: Number, thresholdRuleSeverity: "String", tolerancePeriod: "String" } ]`
testMeasure.ruleViolation.appliedConsequence	Action (prescribed action or notification) to take when a threshold rule is crossed. Data type: Array of objects `"appliedConsequence": [ { "appliedAction": "String", "description": "String", "id": "String", "name": "String", "repeatAction": Boolean } ]`
testMeasure.ruleViolation.appliedConsequence.appliedAction	Action to take when a threshold rule is violated. For example, sending

Request body parameters (XML or JSON) (continued)

Name	Description
	a warning or generating a report. Applied actions can vary between instances. Data type: String
testMeasure.ruleViolation.appliedConsequence.description	Description of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.id	Sys_id or external_id of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.name	Name of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.repeatAction	Flag that indicates whether to repeat the consequence when a second violation occurs. Valid values: • true: Repeat the action. • false: Dorepeat the action. Data type: Boolean Default: false
testMeasure.ruleViolation.conformanceComporatorExact	Flag that indicates whether a value is identical. Valid values: • true: The value is identical. • false: The value isn't identical. Data type: Boolean Default: false
testMeasure.ruleViolation.conformanceComporatorLower	Operator for checking if a value falls below the threshold. Valid values: • greater than • greater than or is

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
testMeasure.ruleViolation.conformanceComporatorUpper	Operator for checking if a value is above the threshold. Valid values: • less than • less than or is Data type: String
testMeasure.ruleViolation.conformanceTargetExact	Required if *conformanceComparatorExact* is set to true. If the *conformanceComparatorExact* value is set to true, its value matches the value defined in *conformanceTargetExact*. Data type: Number
testMeasure.ruleViolation.conformanceTargetLower	Lower threshold value for comparing the test measure results. Determines if the threshold is crossed or no longer crossed. Data type: Number
testMeasure.ruleViolation.conformanceTargetUpper	Upper threshold value for comparing the test measure results. Determines if the threshold is crossed or no longer crossed. Data type: Number
testMeasure.ruleViolation.description	Description of the threshold rule. Data type: String
testMeasure.ruleViolation.id	Sys_id or external_id of the threshold rule violation. Located in the Threshold Rule Violation table [sn_st_mgmt_threshold_rule_violation] table. Data type: String
testMeasure.ruleViolation.name	Name of the threshold rule. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
testMeasure.ruleViolation.numberOfAllowedCrossing	Maximum crossings allowed within the tolerance period before consequences are applied. Data type: Number Maximum value: 40
testMeasure.ruleViolation.thresholdRuleSeverity	Severity of the threshold rule. Valid values: • high • medium • low Data type: String
testMeasure.ruleViolation.tolerancePeriod	Specified time interval during which crossing occurrences are enabled without triggering any immediate consequences or actions. Date type: Object `"tolerancePeriod": { "amount": Number, "units": "String" }`
testMeasure.ruleViolation.tolerancePeriod.amount	The number of periods before applying the consequence. Data type: Number
testMeasure.ruleViolation.tolerancePeriod.units	Units of the period. Accepted values: • seconds • minutes • days • hours Data type: String
testMeasure.unitOfMeasure	Specifies the unit of measurement for the conformance target values of the test measure. Data type: String
testMeasure.value	The value of the test measure.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: Object `"value": { "id": "String", "name": "String", "valueType": "String", "value": "String }`
testMeasure.value.id	The ID of the test measure value. Data type: String
testMeasure.value.name	The name of the test measure value. Data type: String
testMeasure.value.value	The value of the test measure. Data type: String
testMeasure.value.valueType	The type of test measure value such as numeric, text, and so forth. Data type: String
testSpecification	Required. The test definition associated with this test. Data type: Object `"testSpecification": { "id": "String", "href": "String" }`
testSpecification.href	Hyperlink reference to the service test definition. Data type: String
testSpecification.id	The sys_id or external_id of the service test definition. Located in the sys_id or external_id field of the Service Test Definition [sn_st_mgmt_test_definition] table. Data type: String
validFor	Date range the service test is valid for. Data type: Object

Request body parameters (XML or JSON) (continued)

Name	Description
	`"validFor": { "startDateTime": "String", "endDateTime ": "String" }`
validFor.endDateTime	Validity end date of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
validFor.startDateTime	Validity start date of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. A bad request type or malformed request was detected.

Response body parameters (JSON or XML)

Name	Description
characteristic	List that describes the characteristics of the associated service test. Data type: Array of objects `"characteristic": [ { "id": "String", "name": "String", "value": "String", "valueType": "String" } ]`
characteristic.id	Sys_id or external_id of characteristics. Located in the Characteristics [sn_prd_pm_characteristic] table. If external_id is present for that record, the response returns the external_id otherwise it returns the sys_id. Data type: String
characteristic.name	Name of the characteristic. Data type: String
characteristic.value	Characteristic options associated with the service test. Characteristics vary based on the customer instance. Data type: String
characteristic.valueType	Type of characteristic value. • yes/no • choice • date • date/time • duration • email • label • single line test

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
description	Description of the service test. Data type: String
endDateTime	End date and time of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
id	Sys_id or external_id of the service test definition. Located in the Service Test [sn_st_mgmt_test] table. Data type: String
mode	Mode that the service test is running in. Valid values: • ONDEMAND - Triggers the service test manually. • PROACTIVE - Triggers the service test automatically. Default: ONDEMAND
name	Name of the service test. Data type: String
relatedService	Test definition associated for this test. Data type: Object `"relatedService": { "href": "string", "id": "String", "name": "String" }`
relatedService.id	Sys_id or external_id of the product inventory. Located in the sys_id or external_id field of the Product Inventory [sn_prd_invt_product_inventory] table. Data type: String
relatedService.name	Name of the product inventory. Data type: String
startDateTime	Start date and time of the service test.

Name	Description

	<pre>"tolerancePeriod": {Object}
	}
	]</pre>

testMeasure.ruleViolation.appliedConsequence	Action (prescribed action or notification) to take when a threshold rule is violated.
	
	Data type: Array of Objects
	<pre>"appliedConsequence": [
	{
	"appliedAction": "String",
	"description": "String",
	"id": "String",
	"name": "String",
	"repeatAction": Boolean
	}
	]</pre>

testMeasure.ruleViolation.appliedConsequence.appliedAction	Applied action when a threshold rule is violated. For example, sending a warning or generating a report. Applied actions can vary between instances. Data type: String
testMeasure.ruleViolation.appliedConsequence.repeatAction	Flag that indicates whether to repeat the applied action or not. Valid values: • true: Repeats the action. • false: Doesn't repeat the action. Data type: Boolean Default: false
testMeasure.ruleViolation.appliedConsequence.description	Description of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.id	Sys_id or external_id of the applied consequence. Data type: String
testMeasure.ruleViolation.appliedConsequence.name	Name of the applied consequence. Data type: String
testMeasure.ruleViolation.conformanceComparatorExact	Flag that indicates whether a value is identical to the value of *conformanceTargetExact*. Valid values:

Name	Description
	• true: The value is identical. • false: The value isn't identical. Data type: Boolean Default: false
testMeasure.ruleViolation.conformanceComparatorLower	An operator that checks if a value falls below the threshold. Valid values: • greater than • is Data type: String
testMeasure.ruleViolation.conformanceComparatorUpper	An operator that checks if a value exceeds the threshold. Valid values: • is • lesser than Data type: String
testMeasure.ruleViolation.conformanceTargetExact	Required if *conformanceComparatorExact* is set to true. If the *conformanceComparatorExact* value is set to true, its value matches the value defined in *conformanceTargetExact*. Data type: Number
testMeasure.ruleViolation.conformanceTargetLower	Lower threshold value for comparing the test measure results. Determines if the threshold is crossed or no longer crossed. Data type: Number
testMeasure.ruleViolation.conformanceTargetUpper	Upper threshold value for comparing the test measure results. Determines if the threshold is crossed or no longer crossed. Data type: Number
testMeasure.ruleViolation.description	Description of the threshold rule violation. Data type: String
testMeasure.ruleViolation.id	Sys_id or external_id of the threshold rule violation. Located in the

Name	Description
testMeasure.unitOfMeasure	Measurable value of time used to calculate the performance of a service in days, minutes, and seconds. Data type: String
testMeasure.value	Value of metric in the test. Data type: Object `"value": { "id": "String", "name": "String", "valueType": "String", "value": "String" }`
testMeasure.value.id	ID of the metric value in the test. Data type: String
testMeasure.value.name	Name of the metric value in the test. Data type: String
testMeasure.value.name	Name of the metric value in the test. Data type: String
testMeasure.value.value	Value of metric in the test. Data type: String
testMeasure.value.valueType	The type of test measure value such as numeric, text, and so forth. Data type: String
testSpecification	Test definition associated for this test. Data type: Object `"testSpecification": { "href": "String", "id": "String" }`
testSpecification.href	Hyperlink reference to the service test definition. Data type: String
testSpecification.id	Sys_id or external_id of the service test definition. Located in the sys_id or external_id field of the Service Test Definition [sn_st_mgmt_test_definition] table.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
validFor	Date range that the service test is valid for. Data type: Object `"validFor": { "startDateTime": "String", "endDateTime": "String" }`
validFor.endDateTime	End date and timestamp of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
validFor.startDateTime	Start date and timestamp of the service test. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String

Example: cURL request

The following example creates a new service test according to specific details provided in the request body.

```
curl
 "https:/instance.servicenow.com/api/sn_sprb_mgmt/servicetestman
agement/serviceTest" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data {
  "description": "Service test",
  "endDateTime": "2025-01-31 15:05:43",
  "mode": "proactive",
  "name": "Speed Test TR0001002",
  "startDateTime": "2024-06-05 09:07:10",
  "validFor": {
    "startDateTime": "",
    "endDateTime": ""
  },

	• greater than • is Data type: String
testMeasureDefinition.thresholdRule.conformanceComparatorUpper	Operator that checks if a value exceeds the threshold. Valid values: • lesser than • is Data type: String
testMeasureDefinition.thresholdRule.conformanceTargetExact	Required if *conformanceComparatorExac* is set to true. If the *conformanceComparatorExac* value is set to true, its value matches the value defined in *conformanceTargetExact*. Data type: Number
testMeasureDefinition.thresholdRule.conformanceTargetLower	Lower threshold value for comparing the test measure results. Data type: Number
testMeasureDefinition.thresholdRule.conformanceTargetUpper	Upper threshold value for comparing the test measure results. Data type: Number
testMeasureDefinition.thresholdRule.consequence	Action (prescribed action or notification) to take when a threshold rule is crossed. Data type: Array of objects `"consequence": [ { "description": "String", "id": "String", "name": "String", "prescribeAction": "String", "repeatAction": Boolean, "validFor": { "endDateTime": "String",`

Name	Description
	<pre>"startDateTime": "String" }]</pre>
testMeasureDefinition.thresholdRule.consequence.description	Description of the consequence. Data type: String
testMeasureDefinition.thresholdRule.consequence.id	Sys_id or external_id of the measure consequence. Data type: String
testMeasureDefinition.thresholdRule.consequence.name	Name of the consequence. Data type: String
testMeasureDefinition.thresholdRule.consequence.prescribeAction	User-defined action to take for threshold violations. Actions vary between instances. Data type: String
testMeasureDefinition.thresholdRule.consequence.repeatAction	Flag that indicates whether to repeat the applied action or not. Valid values: • true: Repeats the action. • false: Doesn't repeat the action. Data type: Boolean Default: false
testMeasureDefinition.thresholdRule.consequence.validFor	Date range that the consequence is valid for. Data type: Object <pre>"validFor": { "startDateTime": "String", "endDateTime ": "String }</pre>
testMeasureDefinition.thresholdRule.consequence.validFor.endDateTime	Validity end date of the consequence Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:4` Data type: String
testMeasureDefinition.thresholdRule.consequence.validFor.startDateTime	Validity start date of the consequenc

Name	Description
	Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:4 Data type: String
testMeasureDefinition.thresholdRule.description	Description of the threshold rule. Data type: String
testMeasureDefinition.thresholdRule.id	Sys_id or external_id of the threshold rules. Located in the Threshold Rules [sn_st_mgmt_threshold_rule] table. Data type: String
testMeasureDefinition.thresholdRule.name	Name of the threshold rule. Data type: String
testMeasureDefinition.thresholdRule.numberOfAllowedCrossing	Maximum crossings allowed within the tolerance period before consequences are applied. Data type: Number Maximum value: 40
testMeasureDefinition.thresholdRule.thresholdRuleSeverity	Severity of the threshold rule. Valid values: • high • low • medium Data type: String
testMeasureDefinition.unitOfMeasure	Measurable value of time used to calculate the performance of a servic in days, minutes, and seconds. Data type: String
testMeasureDefinition.validFor	Date range the test measure definitio is valid for. Data type: Object `"validFor": { "startDateTime": "String", "endDateTime": "String" }`
testMeasureDefinition.validFor.endDateTime	Validity end date of the test measure definition.

Name	Description
	Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:4 Data type: String
testMeasureDefinition.validFor.startDateTime	Validity start date of the test measure definition. Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:4 Data type: String
validFor	Date range the service test is valid fo Data type: Object `"validFor": { "startDateTime": "String", "endDateTime ": "String }`
validFor.endDateTime	End date and time of the service test Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:4 Data type: String
validFor.startDateTime	Start date and time of the service tes Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:4 Data type: String

Example: cURL request

The following example creates a new service test definition.

```
curl
 "https:/instance.servicenow.com/api/sn_sprb_mgmt/servicetestman
agement/serviceTestSpecification" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user 'username':'password'
-- data {
  "description": "Upstream and Downstream speed ",
  "name": "Speed Test",
  "validFor": {
    "startDateTime": "2024-05-31",
    "endDateTime": "2024-06-27"
  },
  "testMeasureDefinition": [

SG Services API

The *SG Services* API provides endpoints to create and manage application services and the upstream relationships between them.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store release notes.

This API can only be used when the CMDB Application API and CLI (sn_service_graph) plugin is activated. This API is used within the `sn_service_graph` namespace.

Using this API does not require details regarding source tables or relationship types.

To script critical operations which support automation across the enterprise, you can leverage APIs or run command line operations that the CMDB Application CLI and API store app provide instead of using the user interface. The CMDB Application CLI and API store app provides a robust framework which consolidates all the APIs that are related to application services and the command lines that let you access the interface to those APIs.

CMDB Application CLI and API commands enable the following tasks:

- Registering and creating an application service and establishing upstream relationships
- Getting details of a given application service and its upstream relationships
- Connecting higher level constructs such as business applications and business service offerings
- Populating an application service with a given population type
- Changing the state of an application service

For the command line solution, see CMDB Application CLI and API available commands.

SG Services – POST – /sg_services/app_service/convert

Converts a manual or empty type application service to a calculated application service. During conversion, the application service record moves into the [cmdb_ci_service_calculated] table with the newly assigned class.

The following properties for identifying a CI take precedence as follows:

1. sys_id – If sys_id, the system only uses the sys_id and ignores any additional values.
2. number – If provided without the sys_id, the system only uses the number and ignores any additional values.
3. <IRE field name> – The system only uses these values if the sys_id or number are not provided.

URL format

Versioned URL: `/api/sn_service_graph/{api_version}/sg_services/app_service/convert`

Default URL: `/api/sn_service_graph/sg_services/app_service/convert`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
<IRE field name>	One or more IRE fields identifying the application service. For example, name or version. Data type: String
levels	Number of levels to include in the conversion. Data type: String
number	Unique number that identifies the application service. Data type: String
sys_id	Sys_id of the application service listed in the Application Service [cmdb_ci_service_auto] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or the user does not have the app_service_admin role.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
status	Indicates success or failure. Data type: String

Example: cURL request

The following example shows how to convert an application service type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "https://instance.service-now.com/api/sn_service_graph/sg_servi
ces/app_service/convert" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
 \"name\": \"Test Register\",
 \"environment\": \"Test\",
 \"version\": \"1.0\",
 \"levels\" : 8
}" \
--user 'username':'password'
```

Results indicating a successful conversion to a calculated application service.

```
{
  "result": {
  "status": "success"
  }
}
```

SG Services – POST – /sg_services/app_service/delete

Deletes an application service.

The following properties for identifying a CI take precedence as follows:

1. sys_id – If sys_id, the system only uses the sys_id and ignores any additional values.
2. number – If provided without the sys_id, the system only uses the number and ignores any additional values.
3. <IRE field name> – The system only uses these values if the sys_id or number are not provided.

URL format

Versioned URL: `/api/sn_service_graph/{api_version}/sg_services/app_service/delete`

Default URL: `/api/sn_service_graph/sg_services/app_service/delete`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None

Response body parameters (JSON)

Name	Description
status	Indicates success or failure. Data type: String

Example: cURL request

The following example shows how to delete an application service.

```
curl
 "https://instance.service-now.com/api/sn_service_graph/sg_servi
ces/app_service/delete" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   \"name\": \"Test Register\",
   \"environment\": \"Test\",
   \"version\": \"1.0\"
}" \
--user 'username':'password'
```

Results indicating a successful removal of an application service.

```
{
  "result": {
  "status": "success"
  }
}
```

SG Services – POST – /sg_services/app_service/find

Finds the details of a given application service and its upstream relationships.

Users with the app_service_user role can use this API, but results are restricted to application services in Operational status. The app_service_admin role provides unlimited viewing of application services.

The following properties for identifying a CI take precedence as follows:

1. sys_id – If sys_id, the system only uses the sys_id and ignores any additional values.
2. number – If provided without the sys_id, the system only uses the number and ignores any additional values.
3. <IRE field name> – The system only uses these values if the sys_id or number are not provided.

URL format

Versioned URL: `/api/sn_service_graph/{api_version}/sg_services/app_service/find`

Default URL: `/api/sn_service_graph/sg_services/app_service/find`

© 2026 ServiceNow, Inc. All rights reserved.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
<IRE fields>	One or more IRE fields identifying the application service. For example, name or version. Data type: String
number	Unique number that identifies the application service. Data type: String
sys_id	Sys_id of the application service listed in the Application Service [cmdb_ci_service_auto] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or the user does not have the app_service_admin role.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
<IRE field name>	One or more IRE fields identifying the application service. For example, name or version. Data type: String
number	Unique number that identifies the application service. Data type: String
operational_status	Operational status of the application service. For example, active. Data type: String
relationships	List of objects defining the application service's upstream relationships. Data type: Array `"relationships": [ { "name": "String", "number": "String", "sys_id": "String", "class_name": "String", "relationship": "String" } ]`
relationships.class_name	Name of the class that contains the application service. Data type: String
relationships.name	Name of the relationship.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
relationships.number	Unique number of the relationship. Data type: String
relationships.relationship	The relationship rule. Data type: String
relationships.sys_id	Sys_id of the relationship. Data type: String
sys_id	Sys_id of the application service listed in the Application Service [cmdb_ci_service_auto] table. Data type: String

Example: cURL request

The following example shows how to find details of an application service.

```
curl
 "https://instance.service-now.com/api/sn_service_graph/sg_servi
ces/app_service/find" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   \"name\": \"Test App Service1\"
 }" \
--user 'username':'password'
```

The response body includes the application service and relationship information.

SG Services – POST – /sg_services/app_service/populate

Populates an application service with a service population method.

The following properties for identifying a CI take precedence as follows:

1. sys_id – If sys_id, the system only uses the sys_id and ignores any additional values.
2. number – If provided without the sys_id, the system only uses the number and ignores any additional values.
3. <IRE field name> – The system only uses these values if the sys_id or number are not provided.

URL format

Versioned URL: `/api/sn_service_graph/{api_version}/sg_services/app_service/populate`

Default URL: `/api/sn_service_graph/sg_services/app_service/populate`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
<IRE field name>	One or more IRE fields identifying the application service. For example, name or version. Data type: String
number	Unique number that identifies the application service. Data type: String
population_method	Required. Identifies the population method and its accompanying property to identify the content for population.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Only one accompanying object is valid per type. Data type: Object
population_method.group_id	Group ID of the CMDB group configured with the cmdb_group population type. Data type: "String" `"population_method": { "group_id": "String", "type": "cmdb_group" }` Associated population type: cmdb_group
population_method.levels	Number of levels to use in building the service. If the level value is not provided, the system checks the sys_property for the value. If svc.manual.convert.levels.default_value is not populated, a default value of 3 is used. Data type: Number `"population_method": { "levels": Number, "type": "dynamic_service" }` Associated population type: dynamic_service Default: 3 if no level value is set for the sys_property
population_method.service_candidate	Unique identifier of the service candidate. Data type: String `"population_method": { "service_candidate": "String", "type": "tag_based_service_family" }` Associated population type: tag_based_service_family
population_method.service_relations	List of objects containing hierarchy data for the CIs within the application service. All CIs form pairs with a parent and child CI. The top-level CI, referred to as the entry point of an application service, does not have a parent CI. Data type: Array

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description

	<pre>"population_method": {
	
	  "service_relations":[
	  {
	  "child": "String",
	  "parent": "String"
	  }
	  ],
	
	  "type": "service_hierarchy"
	}</pre>
	Associated population type: service_hierarchy

population_method.service_relations.child	Name of a child CI related to the CI. Data type: String
population_method.service_relations.parent	Name of a parent CI related to the CI. Data type: String

population_method.tags	List of objects containing tags to associate with the CI. This information is located in the Key Values [cmdb_key_value] table.
	
	Data type: Array
	<pre>"population_method": {
	
	  "tags": [
	  {
	  "tag": "String",
	  "value": "String"
	  }
	  ],
	
	  "type": "tag_list"
	}</pre>
	Associated population type: tag_list

population_method.tags.tag	Tag name. Data type: String
population_method.tags.value	Tag value. Data type: String
population_method.type	Required. Population type to add to the application service. Data type: Object

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Valid values: • cmdb_group • service_hierarchy • dynamic_service • tag_list • tag_based_service_family
sys_id	Sys_id of the application service listed in the Application Service [cmdb_ci_service_auto] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or the user does not have the app_service_admin role.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
status	Indicates success or failure. Data type: String

Example: cURL request

The following example shows how to populate an application service with a dynamic_service type.

```
curl
 "https://instance.service-now.com/api/sn_service_graph/sg_servi
ces/app_service/populate" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"name\": \"Test Register\",
  \"environment\": \"Test\",
  \"version\": \"1.0\",

 \"population_method\": {
   \"type\": \"dynamic_service\",
   \"levels\" : 8
  }
}" \
--user 'username':'password'
```

Results indicating a successful population of an application service.

```
{
  "result": {
  "status": "success"
  }
}
```

SG Services – POST – /sg_services/app_service/register

Creates an application service, tags and constructs upstream relationships such as business applications, business service offerings, and other application services.

The following properties for identifying a CI take precedence as follows:

1. sys_id – If sys_id, the system only uses the sys_id and ignores any additional values.
2. number – If provided without the sys_id, the system only uses the number and ignores any additional values.
3. <IRE field name> – The system only uses these values if the sys_id or number are not provided.

URL format

Versioned URL: `/api/sn_service_graph/{api_version}/sg_services/app_service/register`

Default URL: `/api/sn_service_graph/sg_services/app_service/register`

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (JSON) (continued)

Name	Description
tags.value	Tag value. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

cHeader	Description
none	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or the user does not have the app_service_admin role.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

cHeader	Description

app_service	Application service details.
	
	Data type: Object
	
	`"app_service": {`
	`  "name": "String",`
	`  "number": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

cHeader	Description
	<pre> "sys_id": "String" }</pre>
app_service.name	Name of the application service. Data type: String
app_service.number	Unique number that identifies the application service. Data type: String
app_service.sys_id	Sys_id of the application service listed in the Application Service [cmdb_ci_service_auto] table. Data type: String
message	Message describing the status. Possible values: • Service already exists • Service registered successfully Data type: String
status	Status indicating whether the service has been registered. Possible values: • Insert: The application service was successfully created. • No action: The application service already exists. No action taken. Data type: String

Example: cURL request

The following example shows how to register an application service.

```
curl
 "instance.service-now.com/api/sn_service_graph/sg_services/app_
service/register" \--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"name\": \"Test Register\",
  \"environment\": \"Test\",
  \"version\": \"1.0\",
  \"number\": \" SNSVC0001014\",
  \"relationships\": {
    \"business_application\": [
      {
        \"sys_id\": \"0250a9404069741 0f87713b656474250\"
      },
      {
        \"number\": \"APM0001002\"
      },
```

}
```

SG Services – POST – /sg_services/app_service/relationship/create

Constructs upstream relations such as business applications, business service offerings, and other application services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API creates a relationship, taking input with a single parent and a corresponding child object.

The following properties for identifying a CI take precedence as follows:

1. sys_id – If sys_id, the system only uses the sys_id and ignores any additional values.
2. number – If provided without the sys_id, the system only uses the number and ignores any additional values.
3. <IRE field name> – The system only uses these values if the sys_id or number are not provided.

URL format

Versioned URL: `/api/sn_service_graph/{api_version}/sg_services/app_service/relationship/create`

Default URL: `/api/sn_service_graph/sg_services/app_service/relationship/create`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
child	Information identifying the child application service with which to create a relationship. The child is located in the Application Service [cmdb_ci_service_auto] table. A dynamic CI group can be added as a child but cannot be parent. Data type: Object `"child": { "<service_app_identifier>": "String" }`
child.<service_app_identifier>	Details identifying the child application service with which to create a relationship. Only one option is required. Each option is listed by processing precedence:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	• sys_id – Sys_id of the child application service. • number – Unique number that identifies the child application service. • <IRE field name> – IRE fields identifying the application service. For example, name or version. Data type: String
parent	Details identifying the parent application service with which to create a relationship. Data type: Object `"parent": { "<service_app_identifier>": "String", "class_name": "String" }`
parent.<service_app_identifier>	Information identifying the application service. Only one option is required. Each option is listed by processing precedence: • sys_id – Sys_id the application service listed in the Application Service [cmdb_ci_service_auto]. • number – Unique number that identifies the application service. • <IRE field name> – One or more IRE fields identifying the application service. For example, name or version. Data type: String
parent.class_name	Name of the class that contains the application service. The parent class name should be from one of the following tables: • cmdb_ci_service_auto • cmdb_ci_service_discovered • cmdb_ci_service_by_tags • cmdb_ci_service_calculated • service_offering • cmdb_ci_business_app Default: cmdb_ci_service_auto Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or the user does not have the app_service_admin role.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
status	Indicates success or failure. Data type: String

Example: cURL request

The following example shows how create a relationship from an application service.

```
curl
 "https://instance.service-now.com/api/sn_service_graph/sg_servi
ces/app_service/relationship/create" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  \"child\": {
   \"name\": \"wdfsdf\",
   \"environment\": \"Test\",
   \"version\": \"1.0\"
   },
  \"parent\": {
   \"sys_id\": \"abcdefg\",
   \"name\": \"business App1\",
   \"class_name\": \"service_offering\"
  }
}" \
--user 'username':'password'
```

Results indicating a successful creation of an application service relationship.

```
{
  "result": {
  "status": "success"
  }
}
```

SG Services – POST – /sg_services/app_service/relationship/delete

Deletes an application service upstream relationship.

The following properties for identifying a CI take precedence as follows:

1. sys_id – If sys_id, the system only uses the sys_id and ignores any additional values.
2. number – If provided without the sys_id, the system only uses the number and ignores any additional values.
3. <IRE field name> – The system only uses these values if the sys_id or number are not provided.

URL format

Versioned URL: `/api/sn_service_graph/{api_version}/sg_services/app_service/relationship/delete`

Default URL: `/api/sn_service_graph/sg_services/app_service/relationship/delete`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON)

Name	Description
child	Information describing the child relationship to be deleted from the service application. Data type: Object `"child": { "<IRE field name>": "String", "number": "String", "sys_id": "String" }`
child.<IRE field name>	One or more IRE fields identifying the child application service. For example, name or version. Data type: String
child.number	Unique number that identifies the child application service. Data type: String
child.sys_id	Sys_id of the child application service listed in the Application Service [cmdb_ci_service_auto]. Data type: String
parent	Details identifying the parent application service from which to remove a relationship. Data type: Object `"parent": { "<IRE field name>": "String", "number": "String", "sys_id": "String", "class_name": "String" }`
parent.<IRE field name>	One or more IRE fields identifying the application service. For example, name or version. Data type: String
parent.number	Unique number that identifies the application service. Data type: String
parent.sys_id	Sys_id of the application service listed in the Application Service [cmdb_ci_service_auto] table. Data type: String
parent.class_name	Name of the class that contains the application service. The parent class name should be from one of the following tables:

© 2026 ServiceNow, Inc. All rights reserved.

Response body parameters (JSON)

Name	Description
status	Indicates success or failure. Data type: String

Example: cURL request

The following example shows how to remove a relationship from an application service.

```
curl
 "https://instance.service-now.com/api/sn_service_graph/sg_servi
ces/app_service/relationship/delete" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"child\": {
  \"name\": \"Test Register\",
  \"environment\": \"Test\",
  \"version\": \"1.0\"

  },
  \"parent\": {
   \"sys_id\": \"abcdefg\",
   \"name\": \"business App1\",
   \"class_name\": \"service_offering\"
     }
 }" \
--user 'username':'password'
```

Results indicating a successful removal of an application service relationship.

```
{
  "result": {
  "status": "success"
  }
}
```

SG Services – POST – /sg_services/app_service/state

Changes the application service lifecycle state to activate, deactivate, or retire.

The following properties for identifying a CI take precedence as follows:

1. sys_id – If sys_id, the system only uses the sys_id and ignores any additional values.
2. number – If provided without the sys_id, the system only uses the number and ignores any additional values.
3. <IRE field name> – The system only uses these values if the sys_id or number are not provided.

URL format

Versioned URL: `/api/sn_service_graph/{api_version}/sg_services/app_service/state`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/sn_service_graph/sg_services/app_service/state`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
<IRE field name>	One or more IRE fields identifying the application service. For example, name or version. Data type: String
number	Unique number that identifies the application service. Data type: String

state	Required. Lifecycle state of the application service. These values are updated in the Application Services [cmdb_ci_service_auto] table.
	
	Valid values:
	• ACTIVATE – Life cycle is operational and in use.
	  ○ operational_status=Operational
	  ○ life_cycle_stage=Operational
	  ○ life_cycle_stage_status=In Use
	• DEACTIVATE – Life cycle is not operational and is in the design stage.
	  ○ operational_status=Non-Operational
	  ○ life_cycle_stage=Design
	  ○ life_cycle_stage_status=Build
	• RETIRE – End of life.
	  ○ operational_status=Retired
	  ○ life_cycle_stage=End Of Life
	  ○ life_cycle_stage_status=Retired
	
	Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
sys_id	Sys_id of the application service listed in the Application Service [cmdb_ci_service_auto] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or the user does not have the app_service_admin role.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
status	Indicates success or failure. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: cURL request

The following example shows how to change an application service lifecycle state to activate.

```
curl
 "https://instance.service-now.com/api/sn_service_graph/sg_servi
ces/app_service/state" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  {
  \"name\": \"Test Register\",
  \"environment\": \"Test\",
  \"version\": \"1.0\",
  \"state\": \"activate\"
  }
}" \
--user 'username':'password'
```

Results indicating a successful operation.

```
{
  "result": {
  "status": "success"
  }
}
```

SG Services – POST – /sg_services/app_service/update

Updates an existing application service provided and creates tags for the given application service.

The following properties for identifying a CI take precedence as follows:

1. sys_id – If sys_id, the system only uses the sys_id and ignores any additional values.
2. number – If provided without the sys_id, the system only uses the number and ignores any additional values.
3. <IRE field name> – The system only uses these values if the sys_id or number are not provided.

URL format

Versioned URL: `/api/sn_service_graph/{api_version}/sg_services/app_service/update`

Default URL: `/api/sn_service_graph/sg_services/app_service/update`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON)

Name	Description
<fields or tags to update>	Use key-value pairs to identify each field or tag to be updated. Only basic information can be updated, no upstream relationships can be updated. Data type: String
<IRE field name>	One or more IRE fields identifying the application service. For example, name or version. You can send the sys_id, number or IRE to identify an application service; however, none of these fields can be updated when used as an identifier. To update the IRE fields, input should include the sys_id or number as an identifier. Data type: String
number	Unique number that identifies the application service. Data type: String
sys_id	Sys_id of the application service listed in the Application Service [cmdb_ci_service_auto] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or the user does not have the app_service_admin role.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
<IRE field name>	One or more IRE fields identifying the application service. For example, name or version. Data type: String
number	Unique number that identifies the application service. Data type: String
sys_id	Sys_id of the application service listed in the Application Service [cmdb_ci_service_auto] table. Data type: String
<updated fields>	If the update is successful, each modified field sent in the payload is listed in the response body.

Example: cURL request

The following example shows how to update an application service, using name as an IRE field.

```
curl
 "https://instance.service-now.com/api/sn_service_graph/sg_servi
ces/app_service/update" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  {
   \"name\": \"Test Register\",
   \"environment\": \"Test\",
   \"version\": \"1.0\"
  }
}" \
--user 'username':'password'
```

Response includes application service identification information and updated fields.

```
{
  "result": {
  "sys_id": "123456",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "number": "SVCKji0w9e",
  "name": "Test Register",
  "environment": "Test",
  "version": "1.0"
  }
}
```

Spendint API

The *Spendint* API provides endpoints that push the catalog, price, availability, order, shipment, and invoice information from a third party to the ServiceNow instance. This API is part of the Source-to-Pay Integration Framework application.

This API requires the Procurement Integration Framework (com.glide.sn_spend_intg) store application and is provided within the `sn_spend_intg` namespace. For information, see Procurement File Transfer Framework.

To access this API, you must have the sn_spend_intg.procurement_integrator role.

Spendint API - POST /sn_spend_intg/spendint/catalog

Allows suppliers to post multiple catalogs for creating supplier products, model products, contracts, and pricing records.

In the *catalog* API integration, when you receive data from a third-party catalog, you can:

1. Create any new third-party categories and map these categories to model categories.
   - If available, use the United Nations Standard Products and Services Code (UNSPSC) and then the category name.
   - If UNSPSC is not available, use just the category name.
2. After you map a third-party category to a model category, use the Manufacturer Part Number (MPN) to find an existing product model, if one is available.
   a. If a product model is found for the MPN, update the product model with any changes, and then create or update any supplier products that are related to the product model.
   b. If a product model does not exist for the MPN, do the following:
      i. A product model class is usually available on the model category that is referenced by the third-party category for the product. Use this product model class to get the product model table in which the product model should be created, for example, hardware, software, consumable, and so on. If no product model class is available, create the product model in the base product model table.
      ii. After the correct product model class is identified, create a new product model in the correct class as follows:
         - Manufacturer, publisher, or provider should map to the manufacturer on the product model.
         - Product name from the API should map to the name on the product model.
         - MPN from the API should update the model number.
         - Product description from the API should update the description on the product model.
         - Model category should be updated with the product category referenced on the third-party category record.
         - Product category should be updated with the product category referenced on the third-party category record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If there are values in the substitute products in the API, create the substitute product records between the current product model and the other product models.
- If there are values in the compatible products in the API, create the compatible product records between the current product model and the other product models.
- Product attributes from the API should be created or updated in the product attribute related list for the product model.

3. If a product model is available, use the supplier part number to create or update the supplier products that are related to the product model.

Third-party mapping

Use the following tables to perform the third-party category, model, and unit mappings:

- Third-Party Categories: Stores all the third-party category records for the Shopping Hub administrator to map with internal existing model categories.
- Third-Party Model Mappings: Stores all the mapping information between product models and third-party model categories.
- Third-Party Units: Stores all the third-party unit records for the Shopping Hub administrator to map with supplier product units.
- Third-Party Unit Mappings: Stores all the mapping information between product models and third-party units.

Note: A third-party integration product is auto-published when both the third-party category and third-party unit are mapped appropriately.

Supplier product sales dates

A supplier product is discontinued and no longer published in the catalog when it has reached its sales end date. The **Sales start date** and **Sales end date** fields on the Supplier product form are populated through third-party integration from the *Catalog* API.

Status tables

To know the status of the bulk product import request, make a REST call into the ServiceNow database using the *Table* REST API. The response from the API lists the records where the bulk import request failed. For bulk product import response, query the Catalog Error table with the following parameter:

```
sysparm_query=outbound_error.supplier_id=<supplier_id>^outbound_error.state=2
```

Details on the customer id, supplier id, error type, unique import set id, and state can be found in the Outbound Status table, which is the parent error table.

URL format

```
/api/sn_spend_intg/spendint/catalog
```

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
mode	Support for asynchronous and synchronous modes for third-party integration. Data type: String Valid values: • async: Asynchronous mode. • sync: Synchronous mode. Default: async

Request body parameters (XML or JSON)

Name	Description
customer_id	Identifier for the customer. Data type: String Maximum length: 100
catalog_id	Identifier for the catalog content that can be purchased by a customer. Data type: String Maximum length: 100
products	List of objects that define products to create or update. Each transaction has a limit of 1000 products. Data type: Array `"products": [ { "available_units": "String", "available_for_country": [Array], "bundled_components": [Array], "contract_agreement": {Object}, "delivery_time": "String", "images": [Array], "manufacturer": "String", "mpn": "String", "parent_bundle": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	<pre>"product_attributes": {Object},
	"product_category_name": "String",
	"product_description": "String",
	"product_name": "String",
	"sku": "String",
	"unit": "String",
	"unspsc": "String",
	}
	]</pre>

products.available_units	Required for products that are kept in stock. This value indicates the quantity of units that are available for this product. Data type: String Maximum length: 40
products.available_for_country	List of country codes where the supplier product can be purchased. If no country is provided, a user from any country can purchase the product. Data type: Array <pre>"available_for_country": ["US","IN","GB"]</pre>
products.bundled_components	Valid only for scenarios when sending a product bundle as part of the catalog payload, and applicable only for the parent bundle payloads. This value contains the reference to the child bundle components. The list of the MPN and quantities for the child bundle components are maintained here. **Note:** Since the same child bundle component can be added more than once within a bundle, the entered quantity is the differentiator between the same children bundle components. The child bundle components and their details (MPN and quantities) should be mapped to the same supplier. Data type: Array

Request body parameters (XML or JSON) (continued)

Name	Description
	Maximum length: 40
products.contract_agreement.negotiated_price	Required. Unit price of a product as negotiated through a contract with the supplier or reseller. Data type: String Maximum length: 40
products.delivery_time	Estimated number of days it takes to ship a product to the customer. This value must represent the number of days and be a whole integer. Data type: String Maximum length: 40
products.images	List of strings that specify the image URLs for the supplier product. Data type: Array
products.manufacturer	Required. Company that manufactures, publishes, or provides the product. This is not the supplier or reseller of the product. Data type: String Maximum length: 100
products.mpn	Required. Identifier for a product that is provided by the manufacturer, publisher, or provider. **Note:** This is not required for reseller parent bundles if the SKU value is available. Data type: String Maximum length: 100
products.parent_bundle	Valid only for scenarios when sending a product bundle as part of the catalog payload, and applicable only for the child bundle component payloads. In the case of a child bundle component, the reference to the parent is maintained here. The parent MPN and SKU values are also set here. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Maximum length: 100
products.product_attributes	List of key-value pairs that define product attributes, for example, `"Color": "Space Grey"`. Multiple attributes for a product are allowed. However, only those attributes that impact pricing or stock availability should be provided through the API. Data type: Object
products.product_category_name	Required. Name that you enter if you are not setting the *unspsc* property. This name is the category to which a product belongs. This category name can be used in a commerce scenario to shop for the product. For example, a power strip product could belong to an Office Equipment category. Data type: String Maximum length: 100
products.product_description	Full description of the product that appears to a shopper within a commerce experience. **Note:** It is recommended that the supplier be as descriptive as possible here, especially for product bundle catalog items where there are child bundle components. Data type: String Maximum length: 65000
products.product_name	Required. Name of the product. Data type: String Maximum length: 1000
products.sku	Required. Number that is generated by a supplier that uniquely identifies a product that is sold by that supplier. Data type: String Maximum length: 100

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
products.unit	Required. Unit or rate at which the product is sold by the supplier. For example, pieces, hours, and so on. Data type: String Maximum length: 40
products.unspsc	Required. Identifier that you enter if you are not setting the *product_category_name* property. This identifier is the UNSPSC for the category to which a product belongs. For example, UNSPSC code 43210000 is the identifier for the product category Computers. Data type: String Maximum length: 100
supplier_id	Required. Identifier for the reseller or supplier with whom the customer can place orders. Data type: String Maximum length: 100
third_party_import_id	Identifier that enables a third party to pass a string value to uniquely identify a set of imported data. Data type: String Maximum length: 100

Headers

The following request and response headers apply to this HTTP action only or apply to this action in a distinct way.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Note: Only the *application/json* data format is supported for Procurement Integration Framework.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action.

Status codes

Status code	Description
success	Successful. The request was successfully processed.
failure	Unsuccessful. The request was processed with errors.

Response body parameters (JSON)

These response body parameters are received when queried in synchronous mode.

Name	Description
error_response_body	Description of the errors, listed by sku, mpn, and the error message. Data type: Array
error_response_body.error_message	Detailed error message. Data type: String
status_code	Response status such as "success" or "failure." Data type: String

Example: cURL request

```
curl
 "https://instance.service-now.com/api/sn_spend_intg/spendint/ca
talog" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'

```

Spendint API - POST /sn_spend_intg/spendint/price

Updates any pricing for supplier product records.

When pricing is available for supplier product records, the API uses the product SKU to find an existing supplier product. If a matching supplier product exists, the corresponding contract price is updated. If no matching supplier product is found, an error message is generated, stating that the product for which you are trying to update pricing for does not exist.

Status tables

To know the status of the price import request, make a REST call into the ServiceNow database using the *Table* REST API. The response from the API lists the records where the price import request failed. For a price import response, query the Price Error table with the following parameter:

```
sysparm_query=outbound_error.supplier_id=<supplier_id>^outbound_error.state=2
```

You can find the details on the customer ID, supplier ID, error type, unique import set ID, and state can in the Outbound Status table, which is the parent error table.

URL format

```
/api/sn_spend_intg/spendint/price
```

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
mode	Support for asynchronous and synchronous modes for third-party integration. Data type: String Valid values: • async: Asynchronous mode. • sync: Synchronous mode. Default: async

© 2026 ServiceNow, Inc. All rights reserved.

```

Spendint API - POST /sn_spend_intg/spendint/availability

Updates the availability for supplier product records.

When supplier product records are available, the API uses the product SKU to find an existing supplier product. If a matching supplier product exists, the corresponding **available_units** field is updated. If no matching supplier product is found, an error message generates stating that the product for which you are trying to update availability for does not exist.

Status tables

To know the status of the update availability request, make a REST call into the ServiceNow database using the *Table* REST API. The response from the API lists the records where the update availability request failed. For update availability response, query the Availability Error table with the following parameter:

```
sysparm_query=outbound_error.supplier_id=<supplier_id>^outbound_error.state=2
```

The details on the customer ID, supplier ID, error type, unique import set ID, and state can be found in the Outbound Status table, which is the parent error table.

URL format

```
/api/sn_spend_intg/spendint/availability
```

```

Spendint API - POST /sn_spend_intg/spendint/orderack

Updates order information for when a user shops for a product from a third-party catalog. When the user checks out, a purchase line is created so that approvals or other tasks for the purchase can be completed.

When a purchase order is generated in the ServiceNow database, the order is pushed into the following tables:

- Outbound Order: Contains the order header.
- Outbound Order Line: Contains the order lines.

Suppliers need to query these tables and fetch the orders that are pending against them. Suppliers should create a scoped app for Workflow Studio actions for integrating with the ServiceNow database.

Query the tables with the following parameters:

- `sysparm_query=supplier_id=<supplier_id>^purchase_order.status=20 for header`
- `sysparm_query=purchase_order.supplier_id=<supplier_id>^purchase_order.statu for header`

When a purchase line is converted to a purchase order line, the following processes are run:

1. The purchase order and purchase order line are submitted to the Enterprise Resource Planning (ERP), if applicable.
2. The purchase order and purchase order line are transferred through integration to the third party with the customer ID, supplier ID, purchase order number, order date, purchase order amount, purchase order amount currency, and purchase order lines.
3. The purchase order and purchase order line remain in the Pending Submission state until confirmation messages are received by both the third-party catalog integration and the ERP. After confirmation is received, the state is updated to Ordered. If there is no ERP integration involved, a confirmation message is required only from the third-party integration.

Status tables

To know the status of the order acknowledgment request, make a REST call into the ServiceNow database using the *Table* REST API. The response from the API lists the records where the order acknowledgment request failed. For an order acknowledgment response, query the Order Acknowledgment Error table with the following parameter:

`sysparm_query=outbound_error.supplier_id=<supplier_id>^outbound_error.state=2`

The details on the customer ID, supplier ID, error type, unique import set ID, and state can be found in the Outbound Status table, which is the parent error table.

Request body parameters (XML or JSON) (continued)

Name	Description
third_party_import_id	Identifier that enables a third party to pass a string value to uniquely identify a set of imported data. Data type: String Maximum length: 100

Headers

The following request and response headers apply to this HTTP action only or apply to this action in a distinct way.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Note: Only the *`application/json`* data format is supported for Procurement Integration Framework.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action.

Status codes

Status code	Description
success	Successful. The request was successfully processed.
failure	Unsuccessful. The request was processed with errors.

Response body parameters (JSON)

These response body parameters are received when queried in synchronous mode.

Name	Description
error_response_body	Description of the errors, listed by the sales order number, sales order line number, and the error message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array
error_response_body.error_message	Detailed error message. Data type: String
status_code	Response status such as "success" or "failure." Data type: String

Example: cURL request

```
curl
 "https://instance.service-now.com/api/sn_spend_intg/spendint/or
derack" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
{"root":[{
  "customer_id": "ACME CORP",
  "supplier_id": "SUP-123456",
  "third_party_import_id": "undefined",

            }
        ]
    }
}
```

Spendint API - POST /sn_spend_intg/spendint/shipment

Use this endpoint to accept updates on purchases from third parties.

When you receive data, you must match the shipment data to a purchase order line by using the sales order line number. You can use the tracking number to find an existing shipment detail record that is related to the purchase order line. If no such record is found, create a new shipment detail record. If no purchase order or purchase order line exists for the shipment data, you see an error message that states that the purchase order for this shipment does not exist.

Note: If the purchase order and purchase order lines are in the Pending Submission status, and the sales order and sales order lines are not populated, then the shipment and invoice posting from the third-party reseller is not allowed. It is only allowed when the status of the purchase order and purchase order lines are Ordered. Also, there is no sequential restriction on shipment and invoice posting.

Status tables

To know the status of the shipping request, make a REST call into the ServiceNow database using the *Table* REST API. The response from the API lists the records where the shipping update failed. To get a shipping response, query the Shipment Error table with the following parameter:

```
sysparm_query=outbound_error.supplier_id=<supplier_id>^outbound_error.state=2
```

The details on the customer ID, supplier ID, error type, unique import set ID, and state can be found in the Outbound Status table, which is the parent error table.

URL format

```
/api/sn_spend_intg/spendint/shipment
```

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
mode	Support for asynchronous and synchronous modes for third-party integration.

}
```

Spendint API - POST /sn_spend_intg/spendint/invoice

Accepts invoices from third-party providers.

If the purchase order and purchase order lines are in the Pending Submission status, and the sales order and sales order lines are not populated, then the shipment and invoice posting from the third-party reseller is not allowed. It is only allowed when the status of the purchase order and purchase order lines are Ordered. Also, there is no sequential restriction on shipment and invoice posting.

After an invoice is submitted, the invoice and invoice lines are mapped to a purchase order. On a successful mapping, the state of the invoice is set as follows:

- Awaiting Delivery: When no receipts exist, the order is partially delivered, or the invoice requires approval.
- Invoice Confirmed: When the purchase order is delivered and the amount invoiced matches the purchase order total amount.
- Requires Review: When the purchase order is delivered and the amount invoiced does not match the purchase order total amount.

When a valid invoice is posted for a line item, the same invoice cannot be updated.

If the provided invoice does not have a purchase order number, the invoice is rejected and you see an error message that states that one or more of the provided invoices does not have a purchase order number. If the provided invoice has a purchase order number, but it doesn't match the purchase order or no purchase order exists, you see an error message. The message states that one or more invoices do not have a corresponding purchase order that matches the purchase order number of the invoice. Also, if the amount invoiced sent from the third-party reseller does not match with the invoiced amount, the invoice is rejected.

Status tables

To know the status of the invoice request, make a REST call into the ServiceNow database using the *Table* REST API. The response from the API lists the records where the invoice creation failed. For invoice response, query the Invoice Error table with the following parameter:

```
sysparm_query=outbound_error.supplier_id=<supplier_id>^outbound_error.state=2
```

The details on the customer ID, supplier ID, error type, unique import set ID, and state can be found in the Outbound Status table, which is the parent error table.

URL format

```
/api/sn_spend_intg/spendint/invoice
```

System for Cross-domain Identity Management (SCIM) API

The *System for Cross-domain Identity Management (SCIM)* API provides endpoints to create, read, update, and delete operations on users and groups using the SCIM protocol.

The SCIM protocol is an application-level HTTP-based protocol based on the HTTP [RFC7230] standard. Use this API for provisioning and managing identity data, such as users and groups, on the web and in cross-domain environments, such as enterprise-to-cloud service providers or inter-cloud scenarios.

To access this API, you must activate the SCIM v2 - ServiceNow® Cross-domain Identity Management (com.snc.integration.scim2) plugin.

Resource mapping

The SCIM service has six resources:

- User (core and extension)
- Group (core and extension)
- Company
- CostCenter
- Department
- Location

Most of the attributes in these SCIM resources map to corresponding fields in an existing ServiceNow table. The following tables define these mappings. Attributes that do not correspond to fields in existing ServiceNow tables map to two SCIM-specific tables. For additional information on these tables, see SCIM-specific tables.

The SCIM User resource has both core (schema: urn:ietf:params:scim:schemas:core:2.0:User) and extension (urn:ietf:params:scim:schemas:extension:servicenow:2.0:User) schemas. Most of the User core and extension schema attributes map to the User [sys_user] table.

User resource to User [sys_user] table mapping

SCIM attribute name	User field name
active	active
addresses.country	country
addresses.default.country	country
addresses.home.country	country
addresses.locality	city

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User resource to User [sys_user] table mapping (continued)

SCIM attribute name	User field name
addresses.default.locality	city
addresses.home.locality	city
addresses.postalCode	zip
addresses.default.postalCode	zip
addresses.home.postalCode	zip
addresses.region	state
addresses.default.region	state
addresses.home.region	state
addresses.streetAddress	street
addresses.default.streetAddress	street
addresses.home.streetAddress	street
displayName	name
emails.value	email
emails.default.value	email
emails.work.value	email
id	sys_id
meta.created	sys_created_on
meta.lastModified	sys_updated_on
name.familyName	last_name
name.givenName	first_name
name.honorificPrefix	introduction
name.middleName	middle_name
phoneNumbers.value	phone
phoneNumbers.home.value	home_phone
phoneNumbers.mobile.value	mobile_phone
phoneNumbers.work.value	phone
preferredLanguage	preferred_language
timezone	time_zone
title	title
userName	user_name

User resource to Sys Scim User [sys_scim_user] table mapping

SCIM attribute name	Sys Scim User field name
externalId	external_id

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The SCIM User extended schema (urn:ietf:params:scim:schemas:extension:servicenow:2.0:User) maps to the User [sys_user] table.

User extended resource to User [sys_user] table mapping

SCIM attribute name	User field name
company.name	company.name
company.value	company.sys_id
costCenter.name	cost_center.name
costCenter.value	cost_center.sys_id
department.name	department.name
department.value	department.sys_id
employeeNumber	employee_number
gender	gender
location.name	location.name
location.value	location.sys_id
manager.displayName	manager.name
manager.value	manager.sys_id

The SCIM Group resource schema (urn:ietf:params:scim:schemas:core:2.0:Group) maps to the Group [sys_user_group] table.

Group resource to Group [sys_user_group] table mapping

SCIM attribute name	Group field name
displayName	name
id	sys_id
meta.created	sys_created_on
meta.lastModified	sys_updated_on

The SCIM Group externalId parameter maps to the Sys Scim Group [sys_scim_group] table.

Group resource to Sys Scim Group [sys_scim_group] table mapping

SCIM attribute name	Sys Scim Group field name
externalId	external_id

The SCIM Group ServiceNow extension schema (urn:ietf:params:scim:schemas:extension:servicenow:2.0:Group) maps to the Group [sys_user_group] table.

Group resource to Group [sys_user_group] table mapping

SCIM attribute name	Group field name
company.value	company.sys_id

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Group resource to Group [sys_user_group] table mapping (continued)

SCIM attribute name	Group field name
company.name	company.name

The SCIM Company resource schema (urn:ietf:params:scim:schemas:custom:servicenow:2.0:Company) maps to the Company [core_company] table.

Company resource to Company [core_company] table mapping

SCIM attribute name	Company field name
id	sys_id
meta.created	sys_created_on
meta.lastModified	sys_updated_on
name	name

The SCIM CostCenter resource schema (urn:ietf:params:scim:schemas:custom:servicenow:2.0:CostCenter) maps to the Cost Center [cmn_cost_center] table.

CostCenter resource to Cost Center [cmn_cost_center] table mapping

SCIM attribute name	Cost Center field name
id	sys_id
meta.created	sys_created_on
meta.lastModified	sys_updated_on
name	name

The SCIM Department resource schema (urn:ietf:params:scim:schemas:custom:servicenow:2.0:Department) maps to the Department [cmn_department] table.

Department resource to Department [cmn_department] table mapping

SCIM attribute name	Department field name
id	sys_id
meta.created	sys_created_on
meta.lastModified	sys_updated_on
name	name

The SCIM Location resource schema (urn:ietf:params:scim:schemas:custom:servicenow:2.0:Location) maps to the Location [cmn_location] table.

Location resource to Location [cmn_location] table mapping

SCIM attribute name	Location field name
id	sys_id
meta.created	sys_created_on
meta.lastModified	sys_updated_on
name	name

SCIM-specific tables

Two tables, Sys Scim User [sys_scim_user] and Sys Scim Group [sys_scim_group], contain the SCIM attributes that do not map to existing ServiceNow tables. The following define the contents of these tables.

Sys Scim User [sys_scim_user] table

Field name	Description
Created	Date and time that the associated record was created. Data type: String Maximum length: 40
Created by	Name of the entity that created the record. Data type: String Maximum length: 40
External ID	External ID used by the entity that created this user record to reference the user in their system. Data type: String Maximum length: 255
Sys ID	Unique identifier for the record within a ServiceNow instance. Data type: String Maximum length: 32
Updated	Date and time that the associated record was last updated. Data type: String Maximum length: 40
Updated by	Name of the entity that last updated the associated record. Data type: String Maximum length: 40
Updates	Number of times that the record has been updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sys Scim User [sys_scim_user] table (continued)

Field name	Description
	Data type: Integer Maximum length: 40
User	Reference to the user associated with this record Reference: User [sys_user] table Maximum length: 32
User type	Type of user record. This value is used to identify the organization to user relationship. This can be any value, but typical values might include: • Contractor • Employee • External • Intern • Temp • Unknown Data type: String Maximum length: 40

Sys Scim Group [sys_scim_group] table

Field name	Description
Created	Date and time that the associated record was created. Data type: String Maximum length: 40
Created by	Name of the entity that created the record. Data type: String Maximum length: 40
External ID	External ID used by the entity that created this group record to reference the group in their system. Data type: String Maximum length: 255
Group	Reference to the group associated with this record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sys Scim Group [sys_scim_group] table (continued)

Field name	Description
	Reference: Group [sys_user_group] table Maximum length: 32
Sys ID	Unique identifier for the record within a ServiceNow instance. Data type: String Maximum length: 32
Updated	Date and time that the associated record was last updated. Data type: String Maximum length: 40
Updated by	Name of the entity that last updated the associated record. Data type: String Maximum length: 40
Updates	Number of times that the record has been updated. Data type: Integer Maximum length: 40

Roles and access control lists

The scim_admin role is required to access the SCIM-specific tables and the private SCIM endpoints and enables access to the User [sys_user] and Group [sys_user_group] tables.

The SCIM service has four ACLs for accessing the Sys Scim User [sys_scim_user] table and the Sys Scim Group [sys_scim_group] table that enable create, delete, read, and write. These ACLs are only mapped to the scim_admin role.

SCIM - DELETE /scim/Groups/{group_id}

Deletes the specified group record from the Group [sys_user_group] table of a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

URL format

Versioned URL: `/api/now/{api_version}/scim/Groups/{group_id}`

Default URL: `/api/now/scim/Groups/{group_id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
group_id	Sys_id of the group record to delete. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/scim+json`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.

Status codes

Status code	Description
204	No Content. The request was successfully processed.
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
errors	Response that describes any errors that may have occurred during processing the request. Data type: Object `"errors": { "details": "String", "schemas": "String", "scimType": "String", "status": "String" }`
errors.detail	Detailed error message on why the request failed. Data type: String
errors.scimType	SCIM error detail keyword. Data type: String
errors.schemas	URI of the SCIM Schemas used to process the error response. Data type: Array of Strings
errors.status	HTTP status code for the error response. Data type: String

Example: cURL request to delete a group

This example shows how to delete a group record from the Group [sys_user_group] table.

```
curl
 "https://instance-servicenow.com/api/now/scim/Groups/a0a9e9fb1b
7e3010593876a61a4bcbe0" \
--request DELETE \
--header "Accept:application/scim+json" \
```

SCIM - GET /scim/Groups

Returns one or more group records from the Group [sys_user_group] table within a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

Note: A query that does not return any matches returns success (HTTP status code 200) with *totalResults* set to 0.

URL format

Versioned URL: `/api/now/{api_version}/scim/Groups`

Default URL: `/api/now/scim/Groups`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *`excludedAttributes`* parameter. Data type: String Default: Return all fields unless *`excludedAttributes`* is specified.
count	Number of records to return. A negative value is interpreted as zero. Data type: Number Maximum: 500 - A value greater than this results in a bad request error. Default: 10
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *`attributes`* parameter. Data type: String Default: Do not exclude any fields.
filter	Filter expression to apply to the return results. Field filters are expressed as `<field_name> <operator> <"value">`. Refer to RFC7644 for a list of the valid operators. **Note:** The `NOT` operator is not supported by this method. For example, to filter for all groups whose name starts with "HR", enter `displayName SW "HR"`. To specify more than one field filter, concatenate the filters using the AND operand. For example, to filter for all groups whose name starts with "HR" and were last modified before October 3, 2021, enter

Query parameters (continued)

Name	Description
	`displayName SW "HR" AND meta.lastModified lt "2021-10-33T00:00:00Z"`. Use dot-walking to specify nested attributes. Only the following SCIM group fields are available for use in filters: • displayName • externalId: Only supports `EQ` operator. • id • meta.created • meta.lastModified Data type: String Default: No filtering
sortBy	Must be specified with the *`sortOrder`* parameter. Field by which to sort the return results. Sorting is case-insensitive. You can only use those parameters available for filtering for the *`sortBy`* parameter, except that *`externalId`* is not allowed. For values that are null: • sorted by ascending - Null values are sorted to the top. • sorted by descending - Null values are sorted to the bottom. Data type: String Default: No sort
sortOrder	Must be specified with the *`sortBy`* parameter. Order in which the *`sortBy`* parameter is applied to the return results. Valid values: • ascending • descending Data type: String Default: ascending
startIndex	One-based index into the table at which to start retrieving records. For example, if you set this parameter to 100, and the *`count`* parameter to 20, the endpoint returns records 100 through 119. **Note:** Any value that is set to less than one is interpreted as one. Data type: String Default: 1

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. • Ensure that both the *attributes* and *excludedAttributes* query parameters have not been passed in the request. • Ensure that the *count* parameter is not greater than 500. • Ensure that all *filter* parameters are valid.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Response body parameters (JSON)

Name	Description
itemsPerPage	Number of records returned in the return results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Number
Resources	List of group records. Data type: Array of Objects `"Resources": [ { "company": {Object}, "displayName": "String", "externalId": "String", "id": "String", "meta": [Array] } ]`
Resources.company	Details about the group's company or organization. Data type: Object `"company": { "display": "String", "$ref": "String", "value": "String" }`
Resources.company.display	Name of the company. Data type: String
Resources.company.$ref	Reference URI of the company. Format: `<host>/Companies/<company sys_id>`, such as: `http://instance-servicenow.com/api/now/scim/Companies/81fd65ecac1d55eb42a426568fc87a63` . Data type: String
Resources.company.value	Sys_id of the associated company. Data type: String
Resources.displayName	Human-readable name of the group, such as HR Team. Data type: String
Resources.externalId	Unique identifier assigned to the group by the entity provisioning it. Data type: String
Resources.id	Sys_id of the group. Data type: String
Resources.meta	Metadata pertaining to the group. Data type: Object

SCIM - GET /scim/Groups/{group_id}

Returns the specified group record from the Group [sys_user_group] table within a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

URL format

Versioned URL: `/api/now/{api_version}/scim/Groups/{group_id}`

Default URL: `/api/now/scim/Groups/{group_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
group_id	Sys_id of the group record to return.

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *`excludedAttributes`* parameter. Data type: String Default: Return all fields unless *`excludedAttributes`* is specified.
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *`attributes`* parameter. Data type: String Default: Do not exclude any fields.

Request body parameters (JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. • Ensure that both the *attributes* and *excludedAttributes* query parameters have not been passed in the request. • Ensure that the *count* parameter is not greater than 500. • Ensure that all *filter* parameters are valid.
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description

company	Details about the group's company or organization.
	
	Data type: Object
	
	`"company": {`
	`  "display": "String",`
	`  "$ref": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"value": "String"
	}</pre>

company.display	Name of the company. Data type: String
company.$ref	Reference URI of the company. Format: `<host>/Companies/<company sys_id>`, such as: `http://instance-servicenow.com/api/now/scim/Companies/81fd65ecac1d55eb42a426568fc87a63` . Data type: String
company.value	Sys_id of the associated company. Data type: String
displayName	Human-readable name of the group, such as HR Team. Data type: String
externalId	Unique identifier assigned to the group by the entity provisioning it. Data type: String
id	Sys_id of the group. Data type: String

meta	Metadata pertaining to the group.
	
	Data type: Object
	<pre>"meta": {
	"created": "String",
	"lastModified": "String",
	"location": String",
	"resourceType": String"
	}</pre>

meta.created	Date and time when the group record was created. Data type: String
meta.lastModified	Date and time when the group record was last modified. Data type: String
meta.location	URI of the group being retrieved. Data type: String
meta.resourceType	SCIM Groups' resource type. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
members	List of the users and groups associated with the group. Data type: Array of Objects `"members": [ { "display": "String", "value": "String", "$ref": "String" } ]`
members.display	Name of the associated group member. Data type: String
members.value	Sys_id of the associated user or group record. Data type: String
members.$ref	URI of the associated group member. Data type: String
schemas	List of URIs of the SCIM Group schemas used to process the request. Supported group schemas: • urn:ietf:params:scim:schemas:core:2.0:Group - Core schema specified in the Internet Engineering Task Force System for Cross-domain Identity Management: Core Schema document (https://datatracker.ietf.org/doc/html/rfc7643#section-4.2) • urn:ietf:params:scim:schemas:extension:servicenow:2.0:Group - ServiceNow extension schema. This schema contains attributes that are present in the Groups [sys_user_group] table in a base ServiceNow system, but are not part of the core schema. • urn:ietf:params:scim:schemas:extension:servicenow:custom:2.0:Group" - Custom extension schema. This schema is part of "Group" resourceType in the sys_scim_schema_extension table. If the schema is not active, the schema URN is not returned in the response. Data type: Array of Strings

Example: cURL request for specific group

This example shows how to retrieve a specific group record.

```
curl
 "https://instance-servicenow.com/api/now/scim/Groups/e0140d671b
be3010593876a61a4bcb11" \
--request GET \

```

SCIM - PATCH /scim/Groups/{group_id}

Enables you to add, update, and delete specified fields in a group record in the Group [sys_user_group] table of a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

For additional information, refer to the Modifying with PATCH section of RFC 7644.

URL format

Versioned URL: `/api/now/{api_version}/scim/Groups/{group_id}`

Default URL: `/api/now/scim/Groups/{group_id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
group_id	Sys_id of the group record to update.

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *`excludedAttributes`* parameter. Data type: String Default: Return all fields unless *`excludedAttributes`* is specified.
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *`attributes`* parameter. Data type: String Default: Do not exclude any fields.

Request body parameters (JSON)

Name	Description
Operations	Required. List of operation objects to patch the specified Group record with. Data type: Array of Objects `"Operations": [ { "op": "String", "path": "String", "value": Any } ]`
Operations.op	Required. Operation to perform. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	• add: Add the specified field and value to the Group record. • remove: Remove the value from the specified field. Replaced with data type "null". • replace: Replace the value of the specified field. Data type: String
Operations.path	Required for `remove` operations, optional for others. Name/path of the field to modify. The *`path`* parameter can have one of the following formats: • A direct field, such as `displayName` • In case of complex array, a pointer to a specific element with a filter, such as: `emails[type eq "work"]` `{ "schemas": [ "urn:ietf:params:scim:api:messages:2.0:PatchOp" ], "Operations": [ { "op": "add", "path": "displayName", "value": "HR Group" }, { "op": "replace", "path": "members[value eq \"sysid1\"]", "value": { "value": "sysid2" } } ] }` Data type: String Default: Considers the field to be a resource.
Operations.value	Value of the field specified in the *`Operations.path`* parameter. The format of this parameter depends on the data-type of the associated field. For example, if updating a simple string, such as the title, the *`value`* field is expressed as a string. `"Operations": [ { "op": "add",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description

	<pre> "path": "displayName",
	    "value": "HR Group"
	  }
	]</pre>
	You can also declare simple string values without a *path* parameters, such as:
	<pre> "Operations": [
	  {
	    "op": "add",
	    "value": {
	      "displayName": "HR Group"
	    }
	  }
	]</pre>
	The following shows how to add a member to the group:
	<pre>{
	  "op": "add",
	  "value": {
	    "members": {
	      "value":
	 "62826bf03710200044e0bfc8bcbe5df1",
	    }
	  }
	}</pre>
	If the field being updated is not in the base-schema, you must enclose the name-value pair in an object that specifies the URN of the associated schema.
	<pre>"value": {
	  "<schema_urn>": {
	    "<field_name>": "<new_value>"
	  },
	}</pre>
	For example:
	<pre>"value": {
	
	 "urn:ietf:params:scim:schemas:extension:servi
	cenow:2.0:Group": {
	    "groupNumber": "13454"
	  },
	}</pre>
	Data type: Any

Operations.value.type	Name of the field to update. Data type: String
Operations.value.value	Value to update the field with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
schemas	Required. SCIM Schema URI of the Patch Operation: "urn:ietf:params:scim:api:messages:2.0:PatchOp" Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
204	`Successful. No Content (Applicable only for SCIM Group Patch API)` - This 204 status is dependent on the state of the SCIM UI property, `Enable Group Patch API response with No Content`, and is subject to the attribute parameter passed as per RFC: https://www.rfc-editor.org/rfc/rfc7644#page-35.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
	Default property value: false The `Enable Group Patch API response with No Content` property can be used to get additional response execution performance gains if the client does not plan to consume any response resources.

400	Bad Request. A bad request type or malformed request was detected.
	• Check for invalid values:
	  ○ Malformed request body.
	  ○ Required field is not provided or empty.
	  ○ Invalid user or group sys_id is provided.
	• Check if a read-only or immutable field is trying to be modified.
	• Ensure that both the *attributes* and *excludedAttributes* query parameters have not been passed in the request or that the request does not exceed the maximum number of members.

404	Not found. The requested item wasn't found.
409	Group already exists. The *displayName* parameter must be unique.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
company	Details about the group's company or organization. Data type: Object `"company": { "display": "String", "$ref": "String", "value": "String" }`
company.display	Name of the company. Data type: String
company.$ref	Reference URI of the company. Format: `<host>/Companies/<company sys_id>`, such as: `http://instance-servicenow.com/api/now/scim/Companies/81fd65ecac1d55eb42a426568fc87a63` . Data type: String
company.value	Sys_id of the associated company.

Name	Description
	Data type: String
displayName	Human-readable name of the group, such as HR Team. Data type: String
externalId	Unique identifier assigned to the group by the entity provisioning it. Data type: String
errors	Response that describes any errors that may have occurred during processing the request. Data type: Object `"errors": { "details": "String", "schemas": "String", "scimType": "String", "status": "String" }`
errors.detail	Detailed error message on why the request failed. Data type: String
errors.scimType	SCIM error detail keyword. Data type: String
errors.schemas	URI of the SCIM Schemas used to process the error response. Data type: Array of Strings
errors.status	HTTP status code for the error response. Data type: String
displayName	Human-readable name of the group, such as HR Team. Data type: String
externalId	Unique identifier assigned to the group by the entity provisioning it. Data type: String
id	Sys_id of the group. Data type: String
members	List of the users and groups associated with the group. Data type: Array of Objects `"members": [ { "display": "String", "value": "String",`

Name	Description

	<pre>"$ref": "String"
	}
	]</pre>

members.display	Name of the associated group member. Data type: String
members.value	Sys_id of the associated user or group record. Data type: String
members.$ref	URI of the associated group member. Data type: String

meta	Metadata pertaining to the group.
	
	Data type: Object
	<pre>"meta": {
	"created": "String",
	"lastModified": "String",
	"location": String",
	"resourceType": String"
	}</pre>

meta.created	Date and time when the group record was created. Data type: String
meta.lastModified	Date and time when the group record was last modified. Data type: String
meta.location	URI of the group being retrieved. Data type: String
meta.resourceType	SCIM Groups' resource type. Data type: String
schemas	List of URIs of the SCIM Group schemas used to process the request. Supported group schemas: • urn:ietf:params:scim:schemas:core:2.0:Group - Core schema specified in the Internet Engineering Task Force System for Cross-domain Identity Management: Core Schema document (https://datatracker.ietf.org/doc/html/rfc7643#section-4.2) • urn:ietf:params:scim:schemas:extension:servicenow:2.0:Group - ServiceNow extension schema. This schema contains attributes that are present in the Groups [sys_user_group] table in a base ServiceNow system, but are not part of the core schema.

```

SCIM - POST /scim/Groups

Creates a group record in the Group [sys_user_group] table of a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

You can define the display name of the group, an external ID used to correlate this group to an external system, and add members (users/groups) to the group.

Note: The search and bulk modifications functionality as noted in the RFC7643 specification are not supported by this endpoint.

URL format

Versioned URL: `/api/now/{api_version}/scim/Groups`

Default URL: `/api/now/scim/Groups`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *`excludedAttributes`* parameter. Data type: String Default: Return all fields unless *`excludedAttributes`* is specified.
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *`attributes`* parameter. Data type: String Default: Do not exclude any fields.

Request body parameters (JSON)

Name	Description

company	Details about the group's company or organization.
	
	Data type: Object
	
	`"company": {`
	`  "display": "String",`
	`  "$ref": "String",`
	`  "value": "String"`
	`}`

company.display	Name of the company. Data type: String
company.$ref	Reference URI of the company. Format: `<host>/Companies/<company sys_id>`, such as: `http://instance-servicenow.com/api/now/scim/Companies/81fd65ecac1d55eb42a426568fc87a63` .

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
company.value	Sys_id of the associated company. Data type: String
displayName	Required. Human-readable name of the group, such as HR Team. Data type: String
externalId	Unique identifier assigned to the group by the entity provisioning it. Data type: String
members	List of users or other groups to associate with the group. Data type: Array of Objects `"members:" [ { "value": "String" } ]` Maximum size: 100 - You can modify this maximum size by updating the system property com.snc.interation.scim2.max.member.count.
members.value	Sys_id of the associated user or group record. Data type: String
schemas	Required. List of URIs of the SCIM Group schemas used to process the request. Supported group schemas: • urn:ietf:params:scim:schemas:core:2.0:Group - Core schema specified in the Internet Engineering Task Force System for Cross-domain Identity Management: Core Schema document (https://datatracker.ietf.org/doc/html/rfc7643#section-4.2) • urn:ietf:params:scim:schemas:extension:servicenow:2.0:Group - ServiceNow extension schema. This schema contains attributes that are present in the Groups [sys_user_group] table in a base ServiceNow system, but are not part of the core schema. • urn:ietf:params:scim:schemas:extension:servicenow:custom:2.0:Group” - Custom extension schema. This schema is part of “Group” resourceType in the sys_scim_schema_extension table. If the schema is not active, the schema URN is not returned in the response. Data type: Array of Strings

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.

400	Bad Request. A bad request type or malformed request was detected.
	• Check for invalid values:
	  ○ Malformed request body.
	  ○ Required field is not provided or empty.
	  ○ Invalid user or group sys_id is provided.
	• Check if a read-only or immutable field is trying to be modified.
	• Ensure that both the *attributes* and *excludedAttributes* query parameters have not been passed in the request or that the request does not exceed the maximum number of members.

409	Group already exists. The *displayName* parameter must be unique.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
meta.location	URI of the group being retrieved. Data type: String
meta.resourceType	SCIM Groups' resource type. Data type: String
members	List of the users and groups associated with the group. Data type: Array of Objects `"members": [ { "display": "String", "value": "String", "$ref": "String" } ]`
members.display	Name of the associated group member. Data type: String
members.value	Sys_id of the associated user or group record. Data type: String
members.$ref	URI of the associated group member. Data type: String
schemas	List of URIs of the SCIM Group schemas used to process the request. Supported group schemas: • urn:ietf:params:scim:schemas:core:2.0:Group - Core schema specified in the Internet Engineering Task Force System for Cross-domain Identity Management: Core Schema document (https://datatracker.ietf.org/doc/html/rfc7643#section-4.2) • urn:ietf:params:scim:schemas:extension:servicenow:2.0:Group - ServiceNow extension schema. This schema contains attributes that are present in the Groups [sys_user_group] table in a base ServiceNow system, but are not part of the core schema. • urn:ietf:params:scim:schemas:extension:servicenow:custom:2.0:Group" - Custom extension schema. This schema is part of "Group" resourceType in the sys_scim_schema_extension table. If the schema is not active, the schema URN is not returned in the response. Data type: Array of Strings

Example: cURL request POST a new group and add member

This example creates group51 and adds the user Abel Tutor as a member.

}
```

SCIM - PUT /scim/Groups/{group_id}

Updates the specified group record in the Group [sys_user_group] table of a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

Fields that are omitted in the request are not updated. You can explicitly clear a field by setting its value to null for a single valued field and to an empty array for array type fields such as *members*.

URL format

Versioned URL: `/api/now/{api_version}/scim/Groups/{group_id}`

Default URL: `/api/now/scim/Groups/{group_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
group_id	Sys_id of the group record to update.

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *excludedAttributes* parameter. Data type: String Default: Return all fields unless *excludedAttributes* is specified.
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *attributes* parameter. Data type: String Default: Do not exclude any fields.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
members.$ref	URI of the associated group member. Data type: String

meta	Metadata pertaining to the group.
	
	Data type: Object
	
	`"meta": {`
	`  "created": "String",`
	`  "lastModified": "String",`
	`  "location": String",`
	`  "resourceType": String"`
	`}`

meta.created	Date and time when the group record was created. Data type: String
meta.lastModified	Date and time when the group record was last modified. Data type: String
meta.location	URI of the group being retrieved. Data type: String
meta.resourceType	SCIM Groups' resource type. Data type: String
schemas	List of URIs of the SCIM Group schemas used to process the request. Supported group schemas: • urn:ietf:params:scim:schemas:core:2.0:Group - Core schema specified in the Internet Engineering Task Force System for Cross-domain Identity Management: Core Schema document (https://datatracker.ietf.org/doc/html/rfc7643#section-4.2) • urn:ietf:params:scim:schemas:extension:servicenow:2.0:Group - ServiceNow extension schema. This schema contains attributes that are present in the Groups [sys_user_group] table in a base ServiceNow system, but are not part of the core schema. • urn:ietf:params:scim:schemas:extension:servicenow:custom:2.0:Group" - Custom extension schema. This schema is part of "Group" resourceType in the sys_scim_schema_extension table. If the schema is not active, the schema URN is not returned in the response. Data type: Array of Strings

Example: cURL request updating group members using PUT

The following example changes the member associated with the group to Abraham Lincoln instead of Abel Tutor and changes the name of the group to HR Team.

  }
}
```

SCIM - DELETE /scim/Users/{user_id}

Deletes the specified user record from the User [sys_user] table of a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

URL format

Versioned URL: `/api/now/{api_version}/scim/Users/{user_id}`

Default URL: `/api/now/scim/Users/{user_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
user_id	Sys_id of the user record to delete.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
204	No Content. The request was successfully processed.
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
errors	Response that describes any errors that may have occurred during processing the request. Data type: Object `"errors": { "details": "String", "schemas": "String", "scimType": "String", "status": "String" }`
errors.detail	Detailed error message on why the request failed. Data type: String
errors.scimType	SCIM error detail keyword. Data type: String
errors.schemas	URI of the SCIM Schemas used to process the error response. Data type: Array of Strings
errors.status	HTTP status code for the error response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String

Example: cURL request

This example shows how to delete a user record from the User [sys_user] table.

```
curl
 "https://instance-servicenow.com/api/now/scim/Users/b7c5015f778
330102e8cc5179e5a9992" \
--request DELETE \
--header "Accept:application/scim+json"  \
```

SCIM - GET /scim/Users

Returns one or more user records from the User [sys_user] table within a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

Note: A query that does not return any matches returns success (HTTP status code 200) with *totalResults* set to 0.

URL format

Versioned URL: `/api/now/{api_version}/scim/Users`

Default URL: `/api/now/scim/Users`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *excludedAttributes* parameter. Data type: String Default: Return all fields unless *excludedAttributes* is specified.
count	Number of records to return. A negative value is interpreted as zero. Data type: Number Maximum: 500 - A value greater than this results in a bad request error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: 10
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *attributes* parameter. Data type: String Default: Do not exclude any fields.

filter	Filter expression to apply to the return results. Field filters are expressed as `<field_name> <operator> <"value">`. Refer to RFC7644 for a list of the valid operators.
	
	Note: The `NOT` operator is not supported.
	
	For example, to filter for all users whose name starts with "Jo", enter `userName SW "jo"` (case-insensitive).
	
	To specify more than one field filter, concatenate the filters using the `AND` operand. For example, to filter for all users whose name starts with "Jo" and whose last name contains "smi", enter `userName SW "john" AND name.familyName CO "smi"`. Use dot-walking to specify nested attributes.
	
	Only the following SCIM user fields are available for use in filters and some, as noted, only support fixed format:
	• active
	• addresses - Fixed format only, such as:
	  ○ [type eq "home" and streetAddress eq "xxxx"]
	  ○ [type eq "home" and locality eq "xxxx"]
	  ○ [type eq "home" and region eq "xxxx"]
	  ○ [type eq "home" and postalCode eq "xxxx"]
	  ○ [type eq "home" and country eq "xxxx"]
	• displayName
	• emails - Fixed format only, such as: [type eq "work" and value eq "emailValue"]
	• externalId - Only `EQ` operator is supported.
	• id
	• meta.created
	• meta.lastModified
	• name.familyName
	• name.givenName
	• name.middleName
	• preferredLanguage
	• phoneNumbers - Fixed format only, such as:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	◦ [type eq “work” and value eq “xxxx”] ◦ [type eq “mobile” and value eq “xxxx”] ◦ [type eq “home” and value eq “xxxx”] • timezone • title • userName • urn:ietf:params:scim:schemas:extension:servicenow:2.0:User:employeeNumber • urn:ietf:params:scim:schemas:extension:servicenow:2.0:User:gender • urn:ietf:params:scim:schemas:extension:servicenow:2.0:User:department.name • urn:ietf:params:scim:schemas:extension:servicenow:2.0:User:department.value • urn:ietf:params:scim:schemas:extension:servicenow:2.0:User:manager.displayName • urn:ietf:params:scim:schemas:extension:servicenow:2.0:User:manager.value • urn:ietf:params:scim:schemas:extension:servicenow:2.0:User:costCenter.name • urn:ietf:params:scim:schemas:extension:servicenow:2.0:User:costCenter.value • urn:ietf:params:scim:schemas:extension:servicenow:2.0:User:company.name • urn:ietf:params:scim:schemas:extension:servicenow:2.0:User:company.value • urn:ietf:params:scim:schemas:extension:servicenow:2.0:User:location.name • urn:ietf:params:scim:schemas:extension:servicenow:2.0:User:location.value Data type: String Default: No filtering
sortBy	Must be specified with the *sortOrder* parameter. Field by which to sort the return results. Sorting is case-insensitive. You can only use the parameters available for filtering for the *sortBy* parameter, with the exception of *externalId*, which is not allowed. Also, only the following dot-walked parameters are supported: • *addressess* - Only the following values are allowed: ◦ *addresses.streetAddress* - Maps to home street address. ◦ *addresses.home.streetAddress* ◦ *addresses.locality* - Maps to home locality. ◦ *addresses.home.locality* ◦ *addresses.region* - Maps to home region. ◦ *addresses.home.region* ◦ *addresses.postalCode* - Maps to home postal code. ◦ *addresses.home.postalCode*

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	◦ *addresses.country* - Maps to home country. ◦ *addresses.home.country* • *emails* - Only the following values are allowed: ◦ *emails.value* - Maps to the email type work. ◦ *emails.work.value* • *phoneNumbers* - Only the following values are allowed: ◦ *phoneNumbers.value* - Maps to the phone number type work. ◦ *phoneNumbers.home.value* ◦ *phoneNumbers.mobile.value* ◦ *phoneNumbers.work.value* For values that are null: • sorted by ascending - Null values are sorted to the top. • sorted by descending - Null values are sorted to the bottom. Data type: String Default: No sort performed
sortOrder	Must be specified with the *sortBy* parameter. Order in which the *sortBy* parameter is applied to the return results. Valid values: • ascending • descending Data type: String Default: ascending
startIndex	One-based index into the User [sys_user] table at which to start retrieving records. For example, if you set this parameter to 100, and the *count* parameter to 20, the endpoint returns records 100 through 119. **Note:** Any value that is set to less than one is interpreted as one. Not valid with the *id* path parameter. Data type: String Default: 1

Request body parameters (XML or JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. • Ensure that both the *attributes* and *excludedAttributes* query parameters have not been passed in the request. • Ensure that the *count* parameter is not greater than 500. • Ensure that all *filter* parameters are valid.

Response body parameters (JSON)

Name	Description
itemsPerPage	Number of records returned in the return results. Data type: Number
Resources	List of user records. Data type: Array of Objects `"Resources": [ { "active": Boolean,`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	"addresses": {Object}, "displayName": "String", "emails": [Array], "externalId": "String", "groups": [Array], "id": "String", "meta": {Object}, "name": {Object}, "phoneNumbers": [Array], "preferredLanguage": "String", "schemas": [Array], "timezone": "String", "title": "String", "userName": "String", "userType": "String" }]
Resources.active	Flag that indicates whether the associated user is active within the ServiceNow instance. Possible values: • true: User is active. • false: User is inactive. Data type: Boolean

Resources.adresses	Details of the user's current mailing address.
	
	Data type: Object
	"addresses": {
	"country": "String",
	"locality": "String",
	"postalCode": "String",
	"region": "String",
	"streetAddress": "String",
	"type": "String"
	}

Resources.addresses.country	Country name. Data type: String
Resources.addresses.locality	City or locality name. Data type: String
Resources.addresses.postalCode	Zip or postal code. Data type: String
Resources.addresses.region	State or region. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Resources.addresses.streetAddress	Full street address. This can include the house number, street name, PO Box, and multi-line extended street address information. Data type: String
Resources.addresses.type	Type of address. Currently only supports `home`. Data type: String
Resources.displayName	User display name. This value is auto-generated by concatenating the *name* fields. Data type: String
Resources.emails	List of email accounts associated with the user. Data type: Array of Objects `"emails:" [ { "type": "String", "value": "String" } ]`
Resources.emails.type	User email type. Currently only supports type of "work". Data type: String
Resources.emails.value	User's email address. This is a unique key for the associated user. Data type: String
Resources.externalId	Unique identifier assigned to the user by the entity provisioning it. Data type: String
Resources.groups	List of groups to which the user belongs, either through direct membership, nested groups, or dynamically calculated. Data type: Array of Objects `"groups": [ { "display": "String", "type": "String", "value": "String", "$ref": "String" } ]`
Resources.groups.display	Name of the associated group.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
Resources.groups.type	Type of group association, such as direct or indirect. Data type: String
Resources.groups.value	Sys_id of an associated group record. Data type: String
Resources.groups.ref	URI of the associated group. Data type: String
Resources.id	Sys_id of the associated User record. Data type: String

Resources.meta	Metadata pertaining to the user.
	
	Data type: Object
	
	`"meta": {`
	`  "created": "String",`
	`  "lastModified": "String",`
	`  "location": String",`
	`  "resourceType": String"`
	`}`

Resources.meta.created	Date and time when the user record was created. Data type: String
Resources.meta.lastModified	Date and time when the user record was last modified. Data type: String
Resources.meta.location	URI of the user being retrieved. Data type: String
Resources.meta.resourceType	SCIM Users' resource type. Data type: String

Resources.name	User's name information.
	
	Data type: Object
	
	`"name": {`
	`  "familyName": "String",`
	`  "givenName": "String",`
	`  "honorificPrefix": "String",`
	`  "middleName": "String"`
	`}`

Resources.name.familyName	User's family or last name.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
Resources.name.givenName	User's given or first name. Data type: String
Resources.name.honorificPrefix	User's honorific name or title, such as Dr., Bishop, or Baron. Data type: String
Resources.name.middle	User's middle name. Data type: String
Resources.phoneNumbers	List of phone numbers associated with the user. Data type: Array of Objects `"phoneNumbers": [ { "type": "String", "value": "String" } ]`
Resources.phoneNumbers.type	Type of phone number. Possible values: • home • mobile • work Data type: String
Resources.phoneNumbers.value	User's phone number. Data type: String
Resources.preferredLanguage	User's preferred spoken and written language. Data type: String
Resources.schemas	List of URIs of the SCIM User schemas used to process the request. Data type: Array of Strings
Resources.timezone	User's time zone. Data type: String
Resources.title	User's title, such as CEO or President.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
Resources.userName	Unique user name for the associated user. Data type: String
Resources.userType	User type. This value is used to identify the organization to user relationship. This can be any value, but typical values might include: • Contractor • Employee • Intern • Temp • External • Unknown Data type: String
schemas	List of URIs of the SCIM ListResponse schemas used to process the request. Data type: Array of Strings
startIndex	One-based index into the User [sys_user] table at which the records were returned. Data type: String
totalResults	Total number of records that match the request. Data type: Number

Extension parameters returned

Name	Description
company	Details about the user's associated company. Data type: Object `"company": { "display": "String", "value": "String", "$ref": "String" }`
company.display	Name of the company. Data type: String
company.value	Sys_id of the company record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
company.$ref	Reference URI for the company. Data type: String
costCenter	Details about the user's associated cost center. Data type: Object `"costCenter": { "display": "String", "value": "String", "$ref": "String" }`
costCenter.display	Name of the cost center. Data type: String
costCenter.value	Sys_id of the cost center record. Data type: String
costCenter.$ref	Reference URI for the cost center. Data type: String
department	Details about the user's associated department. Data type: Object `"department": { "display": "String", "value": "String", "$ref": "String" }`
department.display	Name of the department. Data type: String
department.value	Sys_id of the department record. Data type: String
department.$ref	Reference URI for the department. Data type: String
employeeNumber	Numeric or alphanumeric employee number. Data type: String
gender	Gender of the user, such as male or female. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
location	Details about the user's associated location. Data type: Object `"location": { "display": "String", "value": "String", "$ref": "String" }`
location.display	Name of the location. Data type: String
location.value	Sys_id of the location record. Data type: String
location.$ref	Reference URI for the location. Data type: String
manager	Details about the user's associated manager. Data type: Object `"manager": { "display": "String", "value": "String", "$ref": "String" }`
manager.display	Name of the manager. Data type: String
manager.value	Sys_id of the manager record. Data type: String
manager.$ref	Reference URI for the manager. Data type: String

Example: cURL request using attributes

The following example shows how to obtain two users starting at the sixth record and only returning the display name.

```
curl
 "https://instance-servicenow.com/api/now/scim/Users?attributes=
displayName&startIndex=6&count=2" \
--request GET \
--header "Accept:application/scim+json" \
```

Response:

SCIM - GET /scim/Users/{user_id}

Returns the specified user record from the User [sys_user] table within a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

URL format

Versioned URL: `/api/now/{api_version}/scim/Users/{user_id}`

Default URL: `/api/now/scim/Users/{user_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
user_id	Sys_id of the user record to return. Data type: String

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *`excludedAttributes`* parameter. Data type: String Default: Return all fields unless *`excludedAttributes`* is specified.
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *`attributes`* parameter. Data type: String Default: Do not exclude any fields.

Request body parameters (JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. • Ensure that both the *attributes* and *excludedAttributes* query parameters have not been passed in the request. • Ensure that the *count* parameter is not greater than 500. • Ensure that all *filter* parameters are valid.
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
active	Flag that indicates whether the associated user is active within the ServiceNow instance. Possible values: • true: User is active. • false: User is inactive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Boolean
addresses	Details of the user's current mailing address. Data type: Object `"addresses": { "country": "String", "locality": "String", "postalCode": "String", "region": "String", "streetAddress": "String", "type": "String" }`
addresses.country	Country name. Data type: String
addresses.locality	City or locality name. Data type: String
addresses.postalCode	Zip or postal code. Data type: String
addresses.region	State or region. Data type: String
addresses.streetAddress	Full street address. This can include the house number, street name, PO Box, and multi-line extended street address information. Data type: String
addresses.type	Type of address. Currently only supports `home`. Data type: String
displayName	User display name. This value is auto-generated by concatenating the *name* fields. Data type: String
emails	List of email accounts associated with the user. Data type: Array of Objects `"emails:" [ { "type": "String", "value": "String" } ]`
emails.type	User email type. Currently only supports type of "work".

Name	Description
	Data type: String
emails.value	User's email address. This is a unique key for the associated user. Data type: String
externalId	Unique identifier assigned to the user by the entity provisioning it. Data type: String
groups	List of groups to which the user belongs, either through direct membership, nested groups, or dynamically calculated. Data type: Array of Objects `"groups": [ { "display": "String", "type": "String", "value": "String", "$ref": "String" } ]`
groups.display	Name of the associated group. Data type: String
groups.type	Type of group association, such as direct or indirect. Data type: String
groups.value	Sys_id of an associated group record. Data type: String
groups.$ref	URI of the associated group. Data type: String
id	Sys_id of the associated User record. Data type: String
meta	Metadata pertaining to the user. Data type: Object `"meta": { "created": "String", "lastModified": "String", "location": String", "resourceType": String" }`
meta.created	Date and time when the user record was created.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
meta.lastModified	Date and time when the user record was last modified. Data type: String
meta.location	URI of the user being retrieved. Data type: String
meta.resourceType	SCIM Users' resource type. Data type: String

name	User's name information.
	
	Data type: Object
	
	`"name": {`
	`  "familyName": "String",`
	`  "givenName": "String",`
	`  "honorificPrefix": "String",`
	`  "middleName": "String"`
	`}`

name.familyName	User's family or last name. Data type: String
name.givenName	User's given or first name. Data type: String
name.honorificPrefix	User's honorific name or title, such as Dr., Bishop, or Baron. Data type: String
name.middle	User's middle name. Data type: String

phoneNumbers	List of phone numbers associated with the user.
	
	Data type: Array of Objects
	
	`"phoneNumbers": [`
	`  {`
	`  "type": "String",`
	`  "value": "String"`
	`  }`
	`]`

phoneNumbers.type	Type of phone number. Possible values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• home • mobile • work Data type: String
phoneNumbers.value	User's phone number. Data type: String
preferredLanguage	User's preferred spoken and written language. Data type: String
schemas	List of URIs of the SCIM User schemas used to process the request. Data type: Array of Strings
timezone	User's time zone. Data type: String
title	User's title, such as CEO or President. Data type: String
userName	Unique user name for the associated user. Data type: String
userType	User type. This value is used to identify the organization to user relationship. This can be any value, but typical values might include: • Contractor • Employee • Intern • Temp • External • Unknown Data type: String

Extension parameters returned

Name	Description
company	Details about the user's associated company. Data type: Object

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
department.$ref	Reference URI for the department. Data type: String
employeeNumber	Numeric or alphanumeric employee number. Data type: String
gender	Gender of the user, such as male or female. Data type: String

location	Details about the user's associated location.
	
	Data type: Object
	
	`"location": {`
	`  "display": "String",`
	`  "value": "String",`
	`  "$ref": "String"`
	`}`

location.display	Name of the location. Data type: String
location.value	Sys_id of the location record. Data type: String
location.$ref	Reference URI for the location. Data type: String

manager	Details about the user's associated manager.
	
	Data type: Object
	
	`"manager": {`
	`  "display": "String",`
	`  "value": "String",`
	`  "$ref": "String"`
	`}`

manager.display	Name of the manager. Data type: String
manager.value	Sys_id of the manager record. Data type: String
manager.$ref	Reference URI for the manager. Data type: String

Example: cURL request using user sys_id

The following example shows how to obtain a specific user record by passing their sys_id.

```
curl
 "https://instance-servicenow.com/api/now/scim/Users/62826bf0371
0200044e0bfc8bcbe5df1" \
--request GET \
--header "Accept:application/scim+json" \
```

Response:

```
{"schemas":
  [

 "urn:ietf:params:scim:schemas:extension:servicenow:2.0:User",
    "urn:ietf:params:scim:schemas:core:2.0:User"

```

SCIM - PATCH /scim/Users/{user_id}

Enables you to add, replace, and remove specified fields in a user record in the User [sys_user] table of a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

URL format

Versioned URL: `/api/now/{api_version}/scim/Users/{user_id}`

Default URL: `/api/now/scim/Users/{user_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
user_id	Sys_id of the user record to modify.

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *`excludedAttributes`* parameter. Data type: String Default: Return all fields unless *`excludedAttributes`* is specified.
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *`attributes`* parameter. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: Do not exclude any fields.

Request body parameters (JSON)

Name	Description
Operations	Required. List of operation objects to patch the specified user record with. Data type: Array `"Operations": [ { "op": "String", "path": "String", "value": Any } ]`
Operations.op	Required. Operation to perform. Valid values: • add: Add the specified field and value to the user record. • remove: Remove the value from the specified field. • replace: Replace the value of the specified field. Data type: String
Operations.path	Required for `remove` operations. Name/path of the field to modify. The *`path`* parameter can have one of the following formats: • A direct field, such as `title` • A nested fields, such as `name.givenName` • In case of complex array, it can point to a specific element with a filter, such as: `emails[type eq "work"]` `{ "schemas": [ "urn:ietf:params:scim:api:messages:2.0:PatchOp" ], "Operations": [ { "op": "add", "path": "title", "value": "xyz" }, { "op": "replace",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description

	<pre>{
	  "Operations": [
	    {
	      "path": "name.givenName",
	      "value": "Jennifer"
	    },
	    {
	      "op": "replace",
	      "path": "emails[type eq \"work\"]",
	      "value": "xyz@test.com"
	    }
	  ]
	}</pre>
	Data type: String
	
	Default: Considers the field to be a user resource.

Operations.value	Value of the field specified in the *Operations.path* parameter. The format of this parameter depends on the data-type of the associated field.
	
	For example, if updating a simple string, such as the title, the *value* field is expressed as a string.
	<pre>"Operations": [
	  {
	    "op": "add",
	    "path": "title",
	    "value": "xyz"
	  }
	]</pre>
	You can also declare simple string values without using *value* or *path* parameters, such as:
	<pre>"Operations": [
	  {
	    "op": "add",
	    "title": "xyz"
	  }
	]</pre>
	However, when updating a phone number, which is an array that contains objects that define additional fields to add to the user record and their associated values, the *value* field is expressed as an array of objects.
	<pre>"Operations": [
	  {
	    "op": "add",
	    "path": "phoneNumbers",
	    "value": [
	      {
	        "type": "work",
	        "value": "9876543210"
	      },</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description

	<pre>{
	"type": "home",
	"value": "9876783216"
	}
	]
	}
	]</pre>
	When specifying attribute nodes, the entry can include the nesting as follows:
	<pre>{
	"op": "replace",
	"value": {
	"name": {
	"familyName": "Jones",
	"givenName": "Jennifer"
	}
	}
	}</pre>
	Or you can specify the nesting in the *Operations.path*:
	<pre>{
	"op": "replace",
	"path": "name.givenName",
	"value": "Jennifer"
	}</pre>
	If the field being updated is not in the base-schema, you must enclose the name-value pair in an object that specifies the URN of the associated schema.
	<pre>"value": {
	"<schema_urn>": {
	"<field_name>": "<new_value>"
	},
	}</pre>
	For example:
	<pre>"value": {
	
	"urn:ietf:params:scim:schemas:extension:servicenow:2.0:User": {
	"employeeNumber": "13454"
	},
	}</pre>
	Data type: Any

Operations.value.type	Name of the field to update. Data type: String
Operations.value.value	Value to update the field with.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
schemas	Required. SCIM Schema URI of Patch Operation `urn:ietf:params:scim:api:messages:2.0:PatchOp`. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

400	Bad Request. A bad request type or malformed request was detected.
	• Check for invalid values:
	  ○ Malformed request body.
	  ○ Required field is not provided or empty.
	  ○ Invalid user or group sys_id is provided.

Status codes (continued)

Status code	Description
	• Check if a read-only or immutable field is trying to be modified. • Ensure that both the *attributes* and *excludedAttributes* query parameters have not been passed in the request or that the request does not exceed the maximum number of members.
404	Not found. The requested item wasn't found.
409	User already exists. The *userName* parameter must be unique.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
active	Flag that indicates whether the associated user is active within the ServiceNow instance. Possible values: • true: User is active. • false: User is inactive. Data type: Boolean
addresses	Details of the user's current mailing address. Data type: Object `"addresses": { "country": "String", "locality": "String", "postalCode": "String", "region": "String", "streetAddress": "String", "type": "String" }`
addresses.country	Country name. Data type: String
addresses.locality	City or locality name. Data type: String
addresses.postalCode	Zip or postal code. Data type: String
addresses.region	State or region.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
addresses.streetAddress	Full street address. This can include the house number, street name, PO Box, and multi-line extended street address information. Data type: String
addresses.type	Type of address. Currently only supports `home`. Data type: String
displayName	User display name. This value is auto-generated by concatenating the *name* fields. Data type: String
emails	List of email accounts associated with the user. Data type: Array of Objects `"emails:" [ { "type": "String", "value": "String" } ]`
emails.type	User email type. Currently only supports type of "work". Data type: String
emails.value	User's email address. This is a unique key for the associated user. Data type: String
errors	Response that describes any errors that may have occurred during processing the request. Data type: Object `"errors": { "details": "String", "schemas": "String", "scimType": "String", "status": "String" }`
errors.detail	Detailed error message on why the request failed. Data type: String
errors.scimType	SCIM error detail keyword. Data type: String
errors.schemas	URI of the SCIM Schemas used to process the error response.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array of Strings
errors.status	HTTP status code for the error response. Data type: String
externalId	Unique identifier assigned to the user by the entity provisioning it. Data type: String
groups	List of groups to which the user belongs, either through direct membership, nested groups, or dynamically calculated. Data type: Array of Objects `"groups": [ { "display": "String", "type": "String", "value": "String", "$ref": "String" } ]`
groups.display	Name of the associated group. Data type: String
groups.type	Type of group association, such as direct or indirect. Data type: String
groups.value	Sys_id of an associated group record. Data type: String
groups.$ref	URI of the associated group. Data type: String
id	Sys_id of the associated User record. Data type: String
meta	Metadata pertaining to the user. Data type: Object `"meta": { "created": "String", "lastModified": "String", "location": String", "resourceType": String" }`
meta.created	Date and time when the user record was created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
meta.lastModified	Date and time when the user record was last modified. Data type: String
meta.location	URI of the user being retrieved. Data type: String
meta.resourceType	SCIM Users' resource type. Data type: String

name	User's name information.
	
	Data type: Object
	
	`"name": {`
	`  "familyName": "String",`
	`  "givenName": "String",`
	`  "honorificPrefix": "String",`
	`  "middleName": "String"`
	`}`

name.familyName	User's family or last name. Data type: String
name.givenName	User's given or first name. Data type: String
name.honorificPrefix	User's honorific name or title, such as Dr., Bishop, or Baron. Data type: String
name.middle	User's middle name. Data type: String

phoneNumbers	List of phone numbers associated with the user.
	
	Data type: Array of Objects
	
	`"phoneNumbers": [`
	`  {`
	`  "type": "String",`
	`  "value": "String"`
	`  }`
	`]`

phoneNumbers.type	Type of phone number. Possible values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• home • mobile • work Data type: String
phoneNumbers.value	User's phone number. Data type: String
preferredLanguage	User's preferred spoken and written language. Data type: String
schemas	List of URIs of the SCIM User schemas used to process the request. Data type: Array of Strings
timezone	User's time zone. Data type: String
title	User's title, such as CEO or President. Data type: String
userName	Unique user name for the associated user. Data type: String
userType	User type. This value is used to identify the organization to user relationship. This can be any value, but typical values might include: • Contractor • Employee • Intern • Temp • External • Unknown Data type: String

Extension parameters returned

Name	Description
company	Details about the user's associated company. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
department.$ref	Reference URI for the department. Data type: String
employeeNumber	Numeric or alphanumeric employee number. Data type: String
gender	Gender of the user, such as male or female. Data type: String

location	Details about the user's associated location.
	
	Data type: Object
	
	`"location": {`
	`  "display": "String",`
	`  "value": "String",`
	`  "$ref": "String"`
	`}`

location.display	Name of the location. Data type: String
location.value	Sys_id of the location record. Data type: String
location.$ref	Reference URI for the location. Data type: String

manager	Details about the user's associated manager.
	
	Data type: Object
	
	`"manager": {`
	`  "display": "String",`
	`  "value": "String",`
	`  "$ref": "String"`
	`}`

manager.display	Name of the manager. Data type: String
manager.value	Sys_id of the manager record. Data type: String
manager.$ref	Reference URI for the manager. Data type: String

Example: cURL request

The following example shows how to add, remove, and replace values within a user record.

```
curl -X PATCH \

 https://instance-servicenow.com/api/now/scim/Users/005d500b5360
73005e0addeeff7b12f4 \
  -d '{
  "schemas": [
    "urn:ietf:params:scim:api:messages:2.0:PatchOp"
  ],
  "Operations": [
    {
      "op" : "remove",
      "path" : "title"
    },
    {
      "op" : "add",
      "path" : "phoneNumbers",
      "value" : [
        {
          "type" : "work",
          "value" : "9876543210"
        }
      ]
    },
    {
      "op": "replace",
      "value": {

 "urn:ietf:params:scim:schemas:extension:servicenow:2.0:User": {
            "employeeNumber": "13454"
        },
        "name": {
            "familyName": "John",
            "givenName": "Smith"
        }
      }
    }
  ]
}'
```

Response:

```
{
  "schemas":[

 "urn:ietf:params:scim:schemas:extension:servicenow:2.0:User",
    "urn:ietf:params:scim:schemas:core:2.0:User"
  ],

```

SCIM - POST /scim/Users

Creates a user record in the User [sys_user] table of a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

Note: The search and bulk modifications functionality as noted in the RFC7643 specification are not supported by this endpoint.

URL format

Versioned URL: `/api/now/{api_version}/scim/Users`

Default URL: `/api/now/scim/Users`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *excludedAttributes* parameter. Data type: String Default: Return all fields unless *excludedAttributes* is specified.
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *attributes* parameter. Data type: String Default: Do not exclude any fields.

Request body parameters (XML or JSON)

Name	Description
active	Flag that indicates whether the associated user is active within the ServiceNow instance. Possible values: • true: User is active. • false: User is inactive. Data type: Boolean

addresses	Details of the user's current mailing address.
	
	Data type: Object
	`"addresses": {`
	`  "country": "String",`
	`  "locality": "String",`
	`  "postalCode": "String",`
	`  "region": "String",`
	`  "streetAddress": "String",`
	`  "type": "String"`
	`}`

addresses.country	Country name. Data type: String
addresses.locality	City or locality name. Data type: String
addresses.postalCode	Zip or postal code.

phoneNumbers.type	Type of phone number. Possible values: • home • mobile • work Data type: String
phoneNumbers.value	User's phone number. Data type: String
preferredLanguage	User's preferred spoken and written language. Data type: String
schemas	List of URIs of the SCIM User schemas used to process the request. Data type: Array of Strings
timezone	User's time zone. Data type: String
title	User's title, such as CEO or President. Data type: String
userName	Unique user name for the associated user. Data type: String
userType	User type. This value is used to identify the organization to user relationship. This can be any value, but typical values might include: • Contractor • Employee • Intern • Temp • External • Unknown Data type: String

Example: cURL request to POST user

This example shows how to POST the user Jack Sparrow to the User [sys_user] table.

SCIM - PUT /scim/Users/{user_id}

Updates the specified user record in the User [sys_user] table of a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

URL format

Versioned URL: `/api/now/{api_version}/scim/Users/{user_id}`

Default URL: `/api/now/scim/Users/{user_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
user_id	Sys_id of the user record to update.

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *`excludedAttributes`* parameter. Data type: String Default: Return all fields unless *`excludedAttributes`* is specified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *attributes* parameter. Data type: String Default: Do not exclude any fields.

Request body parameters (JSON)

Name	Description
active	Flag that indicates whether the associated user is active within the ServiceNow instance. Possible values: • true: User is active. • false: User is inactive. Data type: Boolean
addresses	Details of the user's current mailing address. Data type: Object `"addresses": { "country": "String", "locality": "String", "postalCode": "String", "region": "String", "streetAddress": "String", "type": "String" }`
addresses.country	Country name. Data type: String
addresses.locality	City or locality name. Data type: String
addresses.postalCode	Zip or postal code. Data type: String
addresses.region	State or region. Data type: String
addresses.streetAddress	Full street address. This can include the house number, street name, PO Box, and multi-line extended street address information.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
addresses.type	Type of address. Currently only supports home. Data type: String
displayName	User display name. This value is auto-generated by concatenating the *name* fields. Data type: String
emails	List of email accounts associated with the user. Data type: Array of Objects `"emails:" [ { "type": "String", "value": "String" } ]`
emails.type	User email type. Currently only supports type of "work". Data type: String
emails.value	User's email address. This is a unique key for the associated user. Data type: String
externalId	Unique identifier assigned to the user by the entity provisioning it. Data type: String
name	User's name information. Data type: Object `"name": { "familyName": "String", "givenName": "String", "honorificPrefix": "String", "middleName": "String" }`
name.familyName	User's family or last name. Data type: String
name.givenName	User's given or first name. Data type: String
name.honorificPrefix	User's honorific name or title, such as Dr., Bishop, or Baron.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
name.middle	User's middle name. Data type: String
phoneNumbers	List of phone numbers associated with the user. Data type: Array of Objects `"phoneNumbers": [ { "type": "String", "value": "String" } ]`
phoneNumbers.type	Type of phone number. Possible values: • home • mobile • work Data type: String
phoneNumbers.value	User's phone number. Data type: String
preferredLanguage	User's preferred spoken and written language. Data type: String
timezone	User's time zone. Data type: String
title	User's title, such as CEO or President. Data type: String
userName	Required. Unique user name for the associated user. Data type: String
userType	User type. This value is used to identify the organization to user relationship. This can be any value, but typical values might include: • Contractor • Employee

Request body parameters (JSON) (continued)

Name	Description
	• Intern • Temp • External • Unknown Data type: String
Extended Schema	
company	Details about the user's associated company. Data type: Object `"company": { "value": "String" }`
company.value	Required if company is included in post. Sys_id of the company record. Data type: String
costCenter	Details about the user's associated cost center. Data type: Object `"costCenter": { "value": "String" }`
costCenter.value	Required if costCenter is included in post. Sys_id of the cost center record. Data type: String
department	Details about the user's associated department. Data type: Object `"department": { "value": "String" }`
department.value	Required if department is included in post. Sys_id of the department record. Data type: String
employeeNumber	Numeric or alphanumeric employee number. Data type: String
gender	Gender of the user, such as male or female.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
location	Details about the user's associated location. Data type: Object `"location": { "value": "String" }`
location.value	Required if location is included in post. Sys_id of the location record. Data type: String
manager	Details about the user's associated manager. Data type: Object `"manager": { "value": "String" }`
manager.value	Required if manager is included in post. Sys_id of the manager record. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	Not found. The requested item wasn't found.
409	User already exists. The *userName* parameter must be unique.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
active	Flag that indicates whether the associated user is active within the ServiceNow instance. Possible values: • true: User is active. • false: User is inactive. Data type: Boolean
addresses	Details of the user's current mailing address. Data type: Object `"addresses": { "country": "String", "locality": "String", "postalCode": "String", "region": "String", "streetAddress": "String", "type": "String" }`
addresses.country	Country name. Data type: String
addresses.locality	City or locality name. Data type: String
addresses.postalCode	Zip or postal code. Data type: String
addresses.region	State or region.

Name	Description
	Data type: Array of Strings
errors.status	HTTP status code for the error response. Data type: String
externalId	Unique identifier assigned to the user by the entity provisioning it. Data type: String
groups	List of groups to which the user belongs, either through direct membership, nested groups, or dynamically calculated. Data type: Array of Objects `"groups": [ { "display": "String", "type": "String", "value": "String", "$ref": "String" } ]`
groups.display	Name of the associated group. Data type: String
groups.type	Type of group association, such as direct or indirect. Data type: String
groups.value	Sys_id of an associated group record. Data type: String
groups.$ref	URI of the associated group. Data type: String
id	Sys_id of the associated User record. Data type: String
meta	Metadata pertaining to the user. Data type: Object `"meta": { "created": "String", "lastModified": "String", "location": String", "resourceType": String" }`
meta.created	Date and time when the user record was created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Data type: String
meta.lastModified	Date and time when the user record was last modified. Data type: String
meta.location	URI of the user being retrieved. Data type: String
meta.resourceType	SCIM Users' resource type. Data type: String

name	User's name information.
	
	Data type: Object
	
	`"name": {`
	`  "familyName": "String",`
	`  "givenName": "String",`
	`  "honorificPrefix": "String",`
	`  "middleName": "String"`
	`}`

name.familyName	User's family or last name. Data type: String
name.givenName	User's given or first name. Data type: String
name.honorificPrefix	User's honorific name or title, such as Dr., Bishop, or Baron. Data type: String
name.middle	User's middle name. Data type: String

phoneNumbers	List of phone numbers associated with the user.
	
	Data type: Array of Objects
	
	`"phoneNumbers": [`
	`  {`
	`  "type": "String",`
	`  "value": "String"`
	`  }`
	`]`

phoneNumbers.type	Type of phone number. Possible values:

SCIM - GET /scim/ResourceTypes

Retrieves information about all System for Cross-domain Identity Management (SCIM) resource types supported by the associated ServiceNow instance.

This is a public endpoint and does not require any roles to access.

URL format

Versioned URL: `/api/now/{api_version}/scim/ResourceTypes`

Default URL: `/api/now/scim/ResourceTypes`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters (JSON)

Name	Description
itemsPerPage	Number of records returned in the return results. Data type: Number
Resources	List of available resource types. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	<pre>"Resources": [
	  {
	  "description": "String",
	  "endpoint": "String",
	  "id": "String",
	  "meta": {Object},
	  "name": "String",
	  "schema": "String"
	  "schemas": [Array],
	  "schemaExtensions": [Array]
	  }
	]</pre>

Resources.description	Brief description of the resource type. Data type: String
Resources.endpoint	Name of the HTTP-addressable endpoint relative to the Base URL of the service provider, for example "Users". Data type: String
Resources.id	Unique identifier for the resource. Use this attribute when calling GET /s ResourceType/{resource_id} endpoint. Data type: String

Resources.meta	Information that further describes the associated resource.
	
	Data type: Object
	<pre>"metadata": {
	  "location": "String",
	  "resourceType": "String"
	}</pre>

Resources.meta.location	URI of the associated resource type on the associated ServiceNow inst Data type: String
Resources.meta.resourceType	Always "ResourceType". Data type: String
Resources.name	Name of the resource type, such as User or Group. Data type: String
Resources.schema	Resource type's primary/base schema URI. For example: `"urn:ietf:params:scim:schemas:core:2.0:User"`. Data type: String
Resources.schemas	Schema used to process the `/ResourceType` request. For example: `"urn:ietf:params:scim:schemas:core:2.0:ResourceT`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
Resources.schemaExtensions	List of schema extensions that apply to the associated resource type. For example: `"urn:ietf:params:scim:schemas:extension servicenow:2.0:User"`. Data type: Array of Object `"schemaExtensions": { "required": Boolean, "schema": "String" }`
Resources.schemaExtensions.required	Flag that indicates whether the schema extension is required for the resource type. Possible values: • true: A resource of this type must include this schema extension and include any attributes declared as required in this schema extension. • false: A resource of this type may omit this schema extension. Data type: Boolean
Resources.schemaExtensions.schema	URI of an extended schema. For example: `"urn:ietf:params:scim:schemas:extension:servicen 2.0:User"`. Data type: String
schemas	Schema used to process the list response to the request. For example: `"urn:ietf:params:scim:api:messages:2.0:ListRespo` Data type: String
startIndex	One-based index into the Resource table at which records were retriev Data type: String
totalResults	Total number of records that match the request. Data type: Number

Example: cURL request

The following example shows how to obtain the SCIM resource types supported by a ServiceNow instance.

```
curl "https://instance-servicenow.com/api/now/scim/ResourceTypes
 \
--request GET \
--header "Accept:application/scim+json" \
```

Response

```
{
  "schemas":[
```

SCIM - GET /scim/ResourceTypes/{ResourceName}

Retrieves information about the specified System for Cross-domain Identity Management (SCIM) resource type.

This is a public endpoint and does not require any roles to access.

URL format

Versioned URL: `/api/now/{api_version}/scim/ResourceTypes/{ResourceName}`

Default URL: `/api/now/scim/ResourceTypes/{ResourceName}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
ResourceName	Unique ID of the resource type to retrieve. Valid values: • Company • CostCenter • Department • Group • Location • User Data type: String

None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
description	Brief description of the resource type. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
endpoint	Name of the HTTP-addressable endpoint relative to the Base URL of the service provider, for example "Companies". Data type: String
id	Unique identifier for the resource. Use this attribute when calling GET /scim/ResourceType/{resource_id} endpoint. Data type: String

meta	Information that further describes the associated resource.
	
	Data type: Object
	`"metadata": {`
	`  "location": "String",`
	`  "resourceType": "String"`
	`}`

meta.location	URI of the associated resource type on the associated ServiceNow instance. Data type: String
meta.resourceType	Always "ResourceType". Data type: String
name	Name of the resource type, such as User or Group. Data type: String
schema	Resource type's primary/base schema URI. For example: `"urn:ietf:params:scim:schemas:core:2.0:User"`. Data type: String
schemas	Schema used to process the `/ResourceType` request. For example: `"urn:ietf:params:scim:schemas:core:2.0:ResourceType"`. Data type: String

schemaExtensions	List of schema extensions that apply to the associated resource type. For example: `"urn:ietf:params:scim:schemas:extension:servicenow:2.0:User"`.
	
	Data type: Array of Object
	`"schemaExtensions": {`
	`  "required": Boolean,`
	`  "schema": "String"`
	`}`

schemaExtensions.required	Flag that indicates whether the schema extension is required for the resource type. Possible values:

  }
}
```

SCIM - GET /scim/Schemas

Retrieves information about all System for Cross-domain Identity Management (SCIM) resource schemas supported by a ServiceNow instance. These schemas define the attributes available for each resource type.

This is a public endpoint and does not require any roles to access.

URL format

Versioned URL: `/api/now/{api_version}/scim/Schemas`

Default URL: `/api/now/scim/Schemas`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters (JSON)

Name	Description
Standard RFC7643 return results	Method returns results in compliance with the RFC7643 standard. For details see Schema Definition in the RFC7643 specification.

Example: cURL request

The following example shows how to obtain the SCIM schemas supported by a ServiceNow instance.

```
curl "https://instance-servicenow.com/api/now/scim/Schemas \
--request GET \
--header "Accept:application/scim+json" \
```

SCIM - GET /scim/Schemas/{SchemaName}

Retrieves information about the specified System for Cross-domain Identity Management (SCIM) resource schemas supported by a ServiceNow instance. These schemas define the attributes available for each resource type.

This is a public endpoint and does not require any roles to access.

URL format

Versioned URL: `/api/now/{api_version}/scim/Schemas/{SchemaName}`

Default URL: `/api/now/scim/Schemas/{SchemaName}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
SchemaName	URI of the resource schema to return. Valid values: • urn:ietf:params:scim:schemas:core:2.0:User • urn:ietf:params:scim:schemas:extension: enterprise:2.0:User • urn:ietf:params:scim:schemas:extension: servicenow:2.0:User • urn:ietf:params:scim:schemas:core:2.0:Group • urn:ietf:params:scim:schemas:custom: servicenow:2.0:Company • urn:ietf:params:scim:schemas:custom: servicenow:2.0:Department • urn:ietf:params:scim:schemas:custom: servicenow:2.0:CostCenter • urn:ietf:params:scim:schemas:custom: servicenow:2.0:Location Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
Standard RFC7643 return results	Method returns results in compliance with the RFC7643 standard. For details see Schema Definition in the RFC7643 specification.

Example: cURL request

The following example shows how to obtain the core Group SCIM schema from a ServiceNow instance.

```
curl
 "https://instance-servicenow.com/api/now/scim/Schemas/"urn:ietf
:params:scim:schemas:core:2.0:Group" \
--request GET \
--header "Accept:application/scim+json" \
```

Response

SCIM - GET /scim/ServiceProviderConfig

Returns the configuration metadata to use to obtain information about the service capabilities, configurations, schemas, and resource types for the System for Cross-domain Identity Management (SCIM) endpoints available within a ServiceNow instance.

This is a public endpoint and does not require any roles to access.

URL format

Versioned URL: `/api/now/{api_version}/scim/ServiceProviderConfig`

Default URL: `/api/now/scim/ServiceProviderConfig`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

```

SCIM - GET /scim/Companies

Returns one or more company records from the Company [core_company] table within a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

Note: A query that does not return any matches returns success (HTTP status code 200) with *totalResults* set to 0.

URL format

Versioned URL: `/api/now/{api_version}/scim/Companies`

Default URL: `/api/now/scim/Companies`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *`excludedAttributes`* parameter. Data type: String Default: Return all fields unless *`excludedAttributes`* is specified.
count	Number of records to return. A negative value is interpreted as zero. Data type: Number Maximum: 500 - A value greater than this results in a bad request error. Default: 10
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *`attributes`* parameter. Data type: String Default: Do not exclude any fields.
filter	Filter expression to apply to the return results. Field filters are expressed as `<field_name> <operator> <"value">`. Refer to RFC7644 for a list of the valid operators. **Note:** The NOT operator is not supported by this method. For example, to filter for all companies whose name starts with "Acme", enter `displayName SW "Acme"`. To specify more than one field filter, concatenate the filters using the AND operand. For example, to filter for all companies whose name starts with "Acme" and were last modified before October 3, 2021, enter `displayName SW "Acme" AND meta.lastModified lt "2021-10-03T00:00:00Z"`. Use dot-walking to specify nested attributes. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: No filtering
sortBy	Must be specified with the *sortOrder* parameter. Field by which to sort the return results. Sorting is case-insensitive. You can only use those parameters available for filtering for the *sortBy* parameter, except that *externalId* is not allowed. For values that are null: • sorted by ascending - Null values are sorted to the top. • sorted by descending - Null values are sorted to the bottom. Data type: String Default: No sort
sortOrder	Must be specified with the *sortBy* parameter. Order in which the *sortBy* parameter is applied to the return results. Valid values: • ascending • descending Data type: String Default: ascending
startIndex	One-based index into the table at which to start retrieving records. For example, if you set this parameter to 100, and the *count* parameter to 20, the endpoint returns records 100 through 119. **Note:** Any value that is set to less than one is interpreted as one. Data type: String Default: 1

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. • Ensure that both the *attributes* and *excludedAttributes* query parameters have not been passed in the request. • Ensure that the *count* parameter is not greater than 500. • Ensure that all *filter* parameters are valid.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Response body parameters (JSON)

Name	Description
itemsPerPage	Number of records returned in the return results. Data type: Number
Resources	List of returned cost center records. Data type: Object `"Resources": { "id": "String", "meta": {Object}, "name": "String", "schemas": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Resources.id	Sys_id of the company record. Data type: String
Resources.meta	Information pertaining to the company record. Data type: Object `"meta": { "created": "String", "lastModified": "String", "location": "String", "resourcType": "String" }`
Resources.meta.created	Date and time the associated company record was created. Data type: String
Resources.meta.lastModified	Date and time the associated company record was last modified. Data type: String
Resources.meta.location	URI of the associated company record. Data type: String
Resources.meta.resourceType	SCIM resource type; always Company. Data type: String
Resources.name	Company name. Data type: String
Resources.schemas	Schema used when processing the request. Data type: String
schemas	Schema used to process the list response to the request. For example: `"urn:ietf:params:scim:api:messages:2.0:ListResponse"` Data type: String
startIndex	One-based index into the Company [core_company] table at which the records were returned. Data type: String
totalResults	Total number of records that match the request. Data type: Number

Example: cURL request

This example shows how to retrieve the first two company records.

SCIM - GET /scim/CostCenters

Returns one or more cost center records from the Cost Center [cmn_cost_center] table within a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

Note: A query that does not return any matches returns success (HTTP status code 200) with *totalResults* set to 0.

URL format

Versioned URL: `/api/now/{api_version}/scim/CostCenters`

Default URL: `/api/now/scim/CostCenters`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *excludedAttributes* parameter. Data type: String Default: Return all fields unless *excludedAttributes* is specified.
count	Number of records to return. A negative value is interpreted as zero. Data type: Number Maximum: 500 - A value greater than this results in a bad request error. Default: 10
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *attributes* parameter. Data type: String Default: Do not exclude any fields.
filter	Filter expression to apply to the return results. Field filters are expressed as `<field_name> <operator> <"value">`. Refer to RFC7644 for a list of the valid operators.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Note: The `NOT` operator is not supported by this method. For example, to filter for all cost center whose name starts with "HR", enter `displayName SW "HR"`. To specify more than one field filter, concatenate the filters using the AND operand. For example, to filter for all cost center whose name starts with "HR" and were last modified before October 3, 2021, enter `displayName SW "HR" AND meta.lastModified lt "2021-10-03T00:00:00Z"`. Use dot-walking to specify nested attributes. Data type: String Default: No filtering
sortBy	Must be specified with the *`sortOrder`* parameter. Field by which to sort the return results. Sorting is case-insensitive. You can only use those parameters available for filtering for the *`sortBy`* parameter, except that *`externalId`* is not allowed. For values that are null: • sorted by ascending - Null values are sorted to the top. • sorted by descending - Null values are sorted to the bottom. Data type: String Default: No sort
sortOrder	Must be specified with the *`sortBy`* parameter. Order in which the *`sortBy`* parameter is applied to the return results. Valid values: • ascending • descending Data type: String Default: ascending
startIndex	One-based index into the table at which to start retrieving records. For example, if you set this parameter to 100, and the *`count`* parameter to 20, the endpoint returns records 100 through 119. **Note:** Any value that is set to less than one is interpreted as one. Data type: String Default: 1

Request body parameters (SON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. • Ensure that both the *attributes* and *excludedAttributes* query parameters have not been passed in the request. • Ensure that the *count* parameter is not greater than 500. • Ensure that all *filter* parameters are valid.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Response body parameters (JSON)

Name	Description
itemsPerPage	Number of records returned in the return results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Number
Resources	List of returned cost center records. Data type: Object `"Resources": { "id": "String", "meta": {Object}, "name": "String", "schemas": "String" }`
Resources.id	Sys_id of the cost center record. Data type: String
Resources.meta	Information pertaining to the cost center record. Data type: Object `"meta": { "created": "String", "lastModified": "String", "location": "String", "resourcType": "String" }`
Resources.meta.created	Date and time the associated cost center record was created. Data type: String
Resources.meta.lastModified	Date and time the associated cost center record was last modified. Data type: String
Resources.meta.location	URI of the associated cost center record. Data type: String
Resources.meta.resourceType	SCIM resource type; always CostCenter. Data type: String
Resources.name	Cost center name. Data type: String
Resources.schemas	Schema used when processing the request. Data type: String
schemas	Schema used to process the list response to the request. For example: `"urn:ietf:params:scim:api:messages:2.0:ListResponse"` Data type: String

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *excludedAttributes* parameter. Data type: String Default: Return all fields unless *excludedAttributes* is specified.
count	Number of records to return. A negative value is interpreted as zero. Data type: Number Maximum: 500 - A value greater than this results in a bad request error. Default: 10
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *attributes* parameter. Data type: String Default: Do not exclude any fields.
filter	Filter expression to apply to the return results. Field filters are expressed as `<field_name> <operator> <"value">`. Refer to RFC7644 for a list of the valid operators. **Note:** The `NOT` operator is not supported by this method. For example, to filter for all locations whose name starts with "Ch", enter `displayName SW "Ch"`. To specify more than one field filter, concatenate the filters using the AND operand. For example, to filter for all locations whose name starts with "Ch" and were last modified before October 3, 2021, enter `displayName SW "Ch" AND meta.lastModified lt "2021-10-03T00:00:00Z"`. Use dot-walking to specify nested attributes. Data type: String Default: No filtering
sortBy	Must be specified with the *sortOrder* parameter. Field by which to sort the return results. Sorting is case-insensitive.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	You can only use those parameters available for filtering for the *sortBy* parameter, except that *externalId* is not allowed. For values that are null: • sorted by ascending - Null values are sorted to the top. • sorted by descending - Null values are sorted to the bottom. Data type: String Default: No sort
sortOrder	Must be specified with the *sortBy* parameter. Order in which the *sortBy* parameter is applied to the return results. Valid values: • ascending • descending Data type: String Default: ascending
startIndex	One-based index into the table at which to start retrieving records. For example, if you set this parameter to 100, and the *count* parameter to 20, the endpoint returns records 100 through 119. **Note:** Any value that is set to less than one is interpreted as one. Data type: String Default: 1

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/scim+json*.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. • Ensure that both the *attributes* and *excludedAttributes* query parameters have not been passed in the request. • Ensure that the *count* parameter is not greater than 500. • Ensure that all *filter* parameters are valid.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Response body parameters (JSON)

Name	Description
itemsPerPage	Number of records returned in the return results. Data type: Number

Resources	List of returned location records.
	Data type: Object
	`"Resources": {`
	`  "id": "String",`
	`  "meta": {Object},`
	`  "name": "String",`
	`  "schemas": "String"`
	`}`

Resources.id	Sys_id of the location record. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Resources.meta	Information pertaining to the location record. Data type: Object `"meta": { "created": "String", "lastModified": "String", "location": "String", "resourceType": "String" }`
Resources.meta.created	Date and time the associated location record was created. Data type: String
Resources.meta.lastModified	Date and time the associated location record was last modified. Data type: String
Resources.meta.location	URI of the associated location record. Data type: String
Resources.meta.resourceType	SCIM resource type; always Location. Data type: String
Resources.name	Location name. Data type: String
Resources.schemas	Schema used when processing the request. Data type: String
schemas	Schema used to process the list response to the request. For example: `"urn:ietf:params:scim:api:messages:2.0:ListResponse"` Data type: String
startIndex	One-based index into the Location [cmn_location] table at which the records were returned. Data type: String
totalResults	Total number of records that match the request. Data type: Number

Example: cURL request

This example shows how to retrieve a the first two company records.

```
curl
 "https://instance-servicenow.com/api/now/scim/Locations?count
=2" \
```

SCIM - GET /scim/Locations/{location_id}

Returns the specified location record from the Location [cmn_location] table within a ServiceNow instance using the System for Cross-domain Identity Management (SCIM) protocol.

URL format

Versioned URL: `/api/now/{api_version}/scim/Locations/{location_id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/now/scim/Locations/{location_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
location_id	Sys_id of the location record to return. Data type: String

Query parameters

Name	Description
attributes	Comma-separated list of fields to return in the response. No other fields are returned. Cannot be used with the *`excludedAttributes`* parameter. Data type: String Default: Return all fields unless *`excludedAttributes`* is specified.
excludedAttributes	Comma-separated list of fields to exclude from the records returned in the response. All other fields are returned. Cannot be used with the *`attributes`* parameter. Data type: String Default: Do not exclude any fields.

Request body parameters (JSON)

 "location":"https://
instance-servicenow.com/api/now/scim/Locations/0594ed7437d020004
4e0bfc8bcbe5df0"
  },
  "name":"Colombia"
}
```

Table API

The *Table* API provides endpoints that allow you to perform create, read, update, and delete (CRUD) operations on existing tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The calling user must have sufficient roles to access the data in the table specified in the request.

Table - DELETE /now/table/{tableName}/{sys_id}

Deletes the specified record from the specified table.

URL format

Versioned URL: `/api/now/{api_version}/table/{tableName}/{sys_id}`

Default URL: `/api/now/table/{tableName}/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the record to delete. Data type: String
tableName	Name of the table from which to delete the specified record, such as "incident" or "asset". Data type: String

Query parameters

Name	Description
sysparm_query_no_domain	Flag that indicates whether to restrict the record search to only the domains for which the logged in user is configured. Valid values: • false: Exclude the record if it is in a domain that the currently logged in user is not configured to access. • true: Include the record even if it is in a domain that the currently logged in user is not configured to access. Data type: Boolean Default: false **Note:** The *sysparm_query_no_domain* parameter is available only to system administrators or users who have the query_no_domain_table_api role.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
204	Indicates that the request completed successfully.

Response body parameters (JSON or XML)

Name	Description
None	

Example: cURL request

Delete a record from the Incident table.

```
curl
 "https://instance.servicenow.com/api/now/table/incident/d977b66
a4f411200adf9f8e18110c7b2" \
--request DELETE \
--header "Accept:application/json" \
--user 'username':'password'
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There is no response body.

```
None
```

Table - GET /now/table/{tableName}

Retrieves multiple records for the specified table.

For basic instructions, see Retrieve existing incidents.

URL format

Versioned URL: `/api/now/{api_version}/table/{tableName}`

Default URL: `/api/now/table/{tableName}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Depending on the version, this endpoint returns different results on a valid query. • Version 1 returns error code 404 with no results. • Version 2 returns success code 200 and an empty array as the response body. Data type: String
tableName	Name of the table from which to retrieve the records. Data type: String

Query parameters

Name	Description
name-value pairs	Name-value pairs to use to filter the result set. This parameter is mutual example, instead of using `&sysparm_query=active=true`, you c `&active=true`. You can also use the display value when the field is a `&state=closed` instead of `&state=7`. To specify multiple key-value such as `&active=true&assigned_to=john.smith`. Data type: String
sysparm_display_value	Determines the type of data returned, either the actual values from the fields. Display values are manipulated based on the actual value in the preferences. If returning display values, the value that is returned is dependent on th • Choice fields: The database value may be a number, but the display v • Date fields: The database value is in UTC format, while the display va

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• Encrypted text: The database value is encrypted, while the displayed encryption context. • Reference fields: The database value is sys_id, but the display value Data type: String Valid values: • true: Returns the display values for all fields. • false: Returns the actual values from the database. • all: Returns both actual and display values. Default: false **Note:** There is no preferred method for setting this parameter. Ho cause performance issues since it is not reading directly from the d other fields and records. For more information on display values an (KB0534905).
sysparm_exclude_reference_link	Flag that indicates whether to exclude Table API links for reference field Valid values: • true: Exclude Table API links for reference fields. • false: Include Table API links for reference fields. Data type: Boolean Default: false
sysparm_fields	Comma-separated list of fields to return in the response. Data type: String
sysparm_limit	Maximum number of records to return. For requests that exceed this nu parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, includin record order so records you have access to return first. **Note:** Unusually large *sysparm_limit* values can impact syste Data type: Number Default: 10000
sysparm_no_count	Flag that indicates whether to execute a `select count(*)` query o associated table. Valid values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• true: Do not execute a `select count(*)`. • false: Execute a `select count(*)`. Data type: Boolean Default: false
sysparm_offset	Starting record index for which to begin retrieving records. Use this valu functionality enables the retrieval of all records, regardless of the numb For example, the first time you call this endpoint, *sysparm_offset* is available records, use `sysparm_offset=sysparm_offset+sys` records. Don't pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0
sysparm_query	Encoded query used to filter the result set. You can use a UI filter to c Syntax: `sysparm_query=<col_name><operator><value>`. • <col_name>: Name of the table column to filter against. • <operator>: Supports the following values: ○ =: Exactly matches <value>. ○ !=: Does not match <value>. ○ ^: Logically AND multiple query statements. ○ ^OR: Logically OR multiple query statements. ○ LIKE: <col_name> contains the specified string. Only works for <col ○ STARTSWITH: <col_name> starts with the specified string. Only wo string. ○ ENDSWITH: <col_name> ends with the specified string. Only works string. <value>: Value to match against. All parameters are case-sensitive. Queries can contain more than one e `sysparm_query=<col_name><operator><value>[<opera` For example: `(sysparm_query=caller_id=javascript:gs.getUserID` Encoded queries also support order by functionality. To sort responses and ORDERBYDESC clauses in *sysparm_query*. Syntax: • `ORDERBY<col_name>` • `ORDERBYDESC<col_name>`

Query parameters (continued)

Name	Description
	For example: `sysparm_query=active=true^ORDERBYnumber` This query filters all active records and orders the results in ascending order by category. If part of the query is invalid, such as by specifying an invalid field name It then returns rows using only the valid portion of the query. You can co *`glide.invalid_query.returns_no_rows`*. Set this property to **Note:** The *`glide.invalid_query.returns_no_rows`* pro across the instance, such as in lists, scripts (*`GlideRecord.que`* Data type: String
sysparm_query_category	Name of the category to use for queries. Data type: String
sysparm_query_no_domain	Flag that indicates whether to restrict the record search to only the dom configured. Valid values: • false: Exclude the record if it is in a domain that the currently logged i • true: Include the record even if it is in a domain that the currently logg Data type: Boolean Default: false **Note:** The *`sysparm_query_no_domain`* parameter is availab have the query_no_domain_table_api role.
sysparm_suppress_pagination_header	Flag that indicates whether to remove the Link header from the respons relative pages in the record set which you can use to paginate the retur Valid values: • true: Remove the Link header from the response. • false: Do not remove the Link header from the response. Data type: Boolean Default: false
sysparm_view	UI view for which to render the data. Determines the fields returned in th Valid values: • desktop • mobile • both

Query parameters (continued)

Name	Description
	If you also specify the *sysparm_fields* parameter, it takes precede Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description

Link	Relative URLs, based on the previous request, that you can use to page through the available record set.
	
	For example:
	
	`https://<instance name>.servicenow.com/api/now/table/cmdb_ci?sysparm_offset=40&sysparm_limit=1000>;rel="next",`
	
	`https://<instance name>.servicenow.com/api/now/table/cmdb_ci?sysparm_offset=40&sysparm_limit=1000>;rel="prev",`
	
	`https://<instance name>.servicenow.com/api/now/table/cmdb_ci?sysparm_offset=0&sysparm_limit=1000>;rel="first",`
	
	`https://<instance name>.servicenow.com/api/now/table/cmdb_ci?sysparm_offset=2780&sysparm_limit=1000>;rel="last"`
	
	For additional information on the *rel* parameter, refer to https://html.spec.whatwg.org/multipage/links.html#linkTypes.

X-Total-Count	Total count of records returned by the query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully. If a valid query returned no results, the response body contains only an empty result array.

Response body parameters (JSON or XML)

Parameter	Description
name-value pairs	Field names and values of all parameters within the specified record or those specified in the query parameters.

Example: cURL request

Retrieve the first record from the Problem table.

```
curl
 "https://instance.servicenow.com/api/now/table/problem?sysparm_
limit=1" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

The response contains the name-value pairs for the requested record.

```

Table - GET /now/table/{tableName}/{sys_id}

Retrieves the record identified by the specified sys_id from the specified table.

URL format

Versioned URL: `/api/now/{api_version}/table/{tableName}/{sys_id}`

Default URL: `/api/now/table/{tableName}/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the record to retrieve. Data type: String
tableName	Name of the table from which to retrieve the record. Data type: String

Query parameters

Name	Description
sysparm_display_value	Determines the type of data returned, either the actual values from the database or the display values of the fields. Display values are manipulated based on the actual value in the database and user or system settings and preferences. If returning display values, the value that is returned is dependent on the field type. • Choice fields: The database value may be a number, but the display value will be more descriptive. • Date fields: The database value is in UTC format, while the display value is based on the user's time zone.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• Encrypted text: The database value is encrypted, while the displayed value is unencrypted based on the user's encryption context. • Reference fields: The database value is sys_id, but the display value is a display field of the referenced record. Data type: String Valid values: • true: Returns the display values for all fields. • false: Returns the actual values from the database. • all: Returns both actual and display values. Default: false **Note:** There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).
sysparm_exclude_reference_link	Flag that indicates whether to exclude Table API links for reference fields. Valid values: • true: Exclude Table API links for reference fields. • false: Include Table API links for reference fields. Data type: Boolean Default: false
sysparm_fields	Comma-separated list of fields to return in the response. Data type: String
sysparm_query_no_domain	Flag that indicates whether to restrict the record search to only the domains for which the logged in user is configured. Valid values: • false: Exclude the record if it is in a domain that the currently logged in user is not configured to access. • true: Include the record even if it is in a domain that the currently logged in user is not configured to access. Data type: Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: false **Note:** The *sysparm_query_no_domain* parameter is available only to system administrators or users who have the query_no_domain_table_api role.
sysparm_view	UI view for which to render the data. Determines the fields returned in the response. Valid values: • desktop • mobile • both If you also specify the *sysparm_fields* parameter, it takes precedent. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Parameter	Description
name-value pairs	Field names and values of all parameters within the specified record or those specified in the query parameters.

Example: cURL request

Retrieve a record from the Incident table.

```
curl
 "https://instance.servicenow.com/api/now/table/incident/a9e30c7
dc61122760116894de7bcc7bd" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

The response contains the name-value pairs for the requested record.

Table - PATCH /now/table/{tableName}/{sys_id}

Updates the specified record with the name-value pairs included in the request body.

URL format

Versioned URL: `/api/now/{api_version}/table/{tableName}/{sys_id}`

Default URL: `/api/now/table/{tableName}/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the record to update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String
tableName	Name of the table in which to the specified record is located. Data type: String

Query parameters

Name	Description
sysparm_display_value	Determines the type of data returned, either the actual values from the database or the display values of the fields. Display values are manipulated based on the actual value in the database and user or system settings and preferences. If returning display values, the value that is returned is dependent on the field type. • Choice fields: The database value may be a number, but the display value will be more descriptive. • Date fields: The database value is in UTC format, while the display value is based on the user's time zone. • Encrypted text: The database value is encrypted, while the displayed value is unencrypted based on the user's encryption context. • Reference fields: The database value is sys_id, but the display value is a display field of the referenced record. Data type: String Valid values: • true: Returns the display values for all fields. • false: Returns the actual values from the database. • all: Returns both actual and display values. Default: false **Note:** There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).
sysparm_fields	Comma-separated list of fields to return in the response. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
sysparm_input_display_value	Flag that indicates whether to set field values using the display value or the actual value. Depending on the different types of fields, the endpoint may manipulate the passed in display values to store the proper values in the database. For example, if you send the display name for a reference field, the endpoint stores the sys_id for that value in the database. For date and time fields, when this parameter is true, the date and time value is adjusted for the current user's timezone. When false, the date and time value is inserted using the GMT timezone. Valid values: • true: Treats input values as display values and they are manipulated so they are stored properly in the database. • false: Treats input values as actual values and stores them in the database without manipulation. Data type: Boolean Default: false - This matches the data type that is returned during data retrieval (GET methods), which is the actual values. **Note:** To set the value of an encrypted field, you must set this parameter to `true`. If this parameter is not set to true, values submitted to encrypted fields are not saved. Additionally, the requesting user must have the appropriate encryption context prior to submitting the request. Encrypted fields are hidden for users without the appropriate encryption context. For more information on field encryption see Column Level Encryption.
sysparm_query_no_domain	Flag that indicates whether to restrict the record search to only the domains for which the logged in user is configured. Valid values: • false: Exclude the record if it is in a domain that the currently logged in user is not configured to access. • true: Include the record even if it is in a domain that the currently logged in user is not configured to access. Data type: Boolean Default: false **Note:** The *`sysparm_query_no_domain`* parameter is available only to system administrators or users who have the query_no_domain_table_api role.
sysparm_view	UI view for which to render the data. Determines the fields returned in the response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Valid values: • desktop • mobile • both If you also specify the *sysparm_fields* parameter, it takes precedent. Data type: String

Request body parameters (XML or JSON)

Name	Description
name-value pairs	Field name and the new value for each parameter to update in the specified record. **Note:** All fields within a record may not be available for update. For example, fields that have a prefix of "sys_" are typically system parameters that are automatically generated and cannot be updated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*
X-no-response-body	By default, responses include body content detailing the modified record. Set this request header to true to suppress the response body.

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	Field names and values of all parameters within the specified record or those specified in the query parameters.

Example: cURL request

Update a record in the Incident table.

```
curl
 "https://instance.servicenow.com/api/now/table/incident/ef43c6d
40a0a0b5700c77f9bf387afe3" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data
 "{'assigned_to':'681b365ec0a80164000fb0b05854a0cd','urgency':'1
','comments':'Elevating urgency, this is a blocking issue'}" \
--user 'username':'password'
```

The response contains the name-value pairs for the updated record.

```

Table - POST /now/table/{tableName}

Inserts one record in the specified table. Multiple record insertion is not supported by this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/now/{api_version}/table/{tableName}`

Default URL: `/api/now/table/{tableName}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
tableName	Name of the table in which to save the record. Data type: String

Query parameters

Name	Description
sysparm_display_value	Determines the type of data returned, either the actual values from the database or the display values of the fields. Display values are manipulated based on the actual value in the database and user or system settings and preferences. If returning display values, the value that is returned is dependent on the field type. • Choice fields: The database value may be a number, but the display value will be more descriptive. • Date fields: The database value is in UTC format, while the display value is based on the user's time zone. • Encrypted text: The database value is encrypted, while the displayed value is unencrypted based on the user's encryption context. • Reference fields: The database value is sys_id, but the display value is a display field of the referenced record. Data type: String Valid values: • true: Returns the display values for all fields. • false: Returns the actual values from the database. • all: Returns both actual and display values. Default: false

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Note: There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).
sysparm_exclude_reference_link	Flag that indicates whether to exclude Table API links for reference fields. Valid values: • true: Exclude Table API links for reference fields. • false: Include Table API links for reference fields. Data type: Boolean Default: false
sysparm_fields	Comma-separated list of fields to return in the response. Data type: String
sysparm_input_display_value	Flag that indicates whether to set field values using the display value or the actual value. Depending on the different types of fields, the endpoint may manipulate the passed in display values to store the proper values in the database. For example, if you send the display name for a reference field, the endpoint stores the sys_id for that value in the database. For date and time fields, when this parameter is true, the date and time value is adjusted for the current user's timezone. When false, the date and time value is inserted using the GMT timezone. Valid values: • true: Treats input values as display values and they are manipulated so they are stored properly in the database. • false: Treats input values as actual values and stores them in the database without manipulation. Data type: Boolean Default: false - This matches the data type that is returned during data retrieval (GET methods), which is the actual values.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Note: To set the value of an encrypted field, you must set this parameter to `true`. If this parameter is not set to true, values submitted to encrypted fields are not saved. Additionally, the requesting user must have the appropriate encryption context prior to submitting the request. Encrypted fields are hidden for users without the appropriate encryption context. For more information on field encryption see Column Level Encryption.
sysparm_view	UI view for which to render the data. Determines the fields returned in the response. Valid values: • desktop • mobile • both If you also specify the *sysparm_fields* parameter, it takes precedent. Data type: String

Request body parameters (XML or JSON)

Name	Description
name-value pairs	Field name and the associated value for each parameter to define in the specified record. **Note:** All fields within a record may not be available for update. For example, fields that have a prefix of "sys_" are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto generated by the system are set to the associated data type's null value.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*
X-no-response-body	By default, responses include body content detailing the new record. Set this header to true in the request to suppress the response body.

Response headers

Header	Description
Location	Location of the created resource.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Indicates that the request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	Field names and values of all parameters within the newly created record or those specified in the query parameters.

Example: cURL request

Insert a new record into the Incident table.

```
curl "https://instance.servicenow.com/api/now/table/incident" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{'short_description':'Unable to connect to office
 wifi','assignment_group':'287ebd7da9fe198100f92cc8d1d2154e','ur
gency':'2','impact':'2'}" \
--user 'username':'password'
```

The response contains the name-value pairs for the new record.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Unique identifier of the record to update. Data type: String
tableName	Name of the table in which the record is located. Data type: String

Query parameters

Name	Description
sysparm_display_value	Determines the type of data returned, either the actual values from the database or the display values of the fields. Display values are manipulated based on the actual value in the database and user or system settings and preferences. If returning display values, the value that is returned is dependent on the field type. • Choice fields: The database value may be a number, but the display value will be more descriptive. • Date fields: The database value is in UTC format, while the display value is based on the user's time zone. • Encrypted text: The database value is encrypted, while the displayed value is unencrypted based on the user's encryption context. • Reference fields: The database value is sys_id, but the display value is a display field of the referenced record. Data type: String Valid values: • true: Returns the display values for all fields. • false: Returns the actual values from the database. • all: Returns both actual and display values. Default: false

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Note: There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).
sysparm_exclude_reference_link	Flag that indicates whether to exclude Table API links for reference fields. Valid values: • true: Exclude Table API links for reference fields. • false: Include Table API links for reference fields. Data type: Boolean Default: false
sysparm_fields	Comma-separated list of fields to return in the response. Data type: String
sysparm_input_display_value	Flag that indicates whether to set field values using the display value or the actual value. Valid values: • true: Treats input values as display values and they are manipulated so they can be stored properly in the database. • false: Treats input values as actual values and stored them in the database without manipulation. Data type: Boolean Default: false

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Note: • If this parameter is set to *true*, pay attention to input values, especially date values, as these are interpreted as being supplied via the user time zone preference and are transformed into UTC format. • To set the value of an encrypted field, you must set this parameter to `true`. If this parameter is not set to true, values submitted to encrypted fields are not saved. Additionally, the requesting user must have the appropriate encryption context prior to submitting the request. Encrypted fields are hidden for users without the appropriate encryption context. For more information on display values and actual values, see Table API FAQs (KB0534905). For more information on field encryption see Encryption support.
sysparm_query_no_domain	Flag that indicates whether to restrict the record search to only the domains for which the logged in user is configured. Valid values: • false: Exclude the record if it is in a domain that the currently logged in user is not configured to access. • true: Include the record even if it is in a domain that the currently logged in user is not configured to access. Data type: Boolean Default: false **Note:** The *sysparm_query_no_domain* parameter is available only to system administrators or users who have the query_no_domain_table_api role.
sysparm_view	UI view for which to render the data. Determines the fields returned in the response. Valid values: • desktop • mobile • both If you also specify the *sysparm_fields* parameter, it takes precedent. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
name-value pairs	Name-value pairs for the field(s) to update in the associated table. For example, to update the short description file, enter a name-value pair similar to the following: `--data "{\"short_description\": \"my short desc\" }" \`.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*.
X-no-response-body	By default, responses include body content detailing the modified record. Set this header to true in the request to suppress the response body.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	All fields (not just modified) with their associated values for the change request.

Example: cURL request

Update a record in the Incident table.

```
curl
 "https://instance.servicenow.com/api/now/table/incident/ef43c6d
40a0a0b5700c77f9bf387afe3" \
--request PUT \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data
 "{'assigned_to':'681b365ec0a80164000fb0b05854a0cd','urgency':'1
','comments':'Elevating urgency, this is a blocking issue'}" \
--user 'username':'password'
```

The response contains the name-value pairs for the updated record.

Technical Service Qualification Open API

The *Technical Service Qualification Open* API provides endpoints to check the availability of resources and services before submitting orders for fulfillment.

This API is a ServiceNow implementation of the TMF645 Service Qualification API REST Specification. For more information about service qualification requests, see .

The *Technical Service Qualification Open* API is provided within the `sn_ord_qual_mgmt` namespace and requires the following plugins:

- Product Catalog Management Core [com.sn_prd_pm]
- Product Catalog Advanced [com.sn_prd_pm_adv]
- Order Qualification Management [com.sn_ord_qual_mgmt]
- Order Management for Telecom, Media & Tech [com.sn_tmt_core]
- Telecom Core [com.sn_tmt_core]

The sn_ind_tmt_orm.order_integrator role is required to use this API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Technical Service Qualification Open API - GET sn_ord_qual_mgmt/qualification/checkServiceQualification/{id}

Retrieves a technical qualification request that is associated with a given customer order ID.

This endpoint retrieves order information from the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Line Item [sn_ind_tmt_orm_order_line_item]

URL format

Versioned URL: `/api/sn_ord_qual_mgmt/qualification/checkServiceQualification/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the qualification customer order to retrieve. Located in the Customer Order [sn_ind_tmt_orm_order] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*.

Technical Service Qualification Open API - GET sn_ord_qual_mgmt/qualification/checkServiceQualification

Retrieves a list of all technical qualification requests.

This endpoint retrieves order information from the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Line Item [sn_ind_tmt_orm_order_line_item]

This endpoint returns 20 records by default but can return a maximum of 100 records. Use query filters to narrow results according to status, field name(s), description, and qualification result.

URL format

Versioned URL: `/api/sn_ord_qual_mgmt/qualification/checkServiceQualification`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query Parameters

Parameter	Description
description	Filters qualification orders by the 'short_description' field of the customer order. Only orders with a short description matching the value of this parameter are returned in the response. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Parameters (continued)

Parameter	Description
fields	List of field names to return in the response. Invalid fields are ignored. If this parameter is not provided in the request, all fields are returned. Data type: String, comma separated
limit	Maximum number of records to return. For requests that exceed this number of records, use the offset parameter to paginate record retrieval. Default: 20 Maximum: 100 Data type: Number
qualificationResult	Filters qualification orders by result. Only orders with a result matching the value of this parameter are returned in the response. Data type: String
state	Filters qualification orders by state. Only orders with a state matching the value of this parameter are returned in the response. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	No record found for the filter criteria.

Response body parameters (JSON or XML)

Name	Description
id	Sys_id of the qualifica order. Located in the C [sn_ind_tmt_orm_orde Data type: String
href	Relative link to the qua record. Data type: String
description	Description of the qua request which is fetch short_description fiel order. Located in the C [sn_ind_tmt_orm_orde Data type: String
externalId	External ID from the ex field of the customer c Located in the Custom [sn_ind_tmt_orm_orde Data type: String
qualificationResult	Qualification status of the customer order. Po • alternate • none

Technical Service Qualification Open API - POST sn_ord_qual_mgmt/qualification/checkServiceQualification

Creates a technical service qualification request entity containing a list of qualification items.

The service qualification request is persisted as a customer order with the qualify fulfillment type. Each qualification item is persisted as a customer line order in the Order [sn_ind_tmt_orm_order_line_item] table.

Using this endpoint

You can use this API method for three specific use cases:

1. Request to qualify a service at a specified address.
2. Request to qualify a new service at the same location of an existing and active access service.
3. Request to upgrade or downgrade an existing service.

Each use case requires the same request structure but uses different request parameters. Details about each use case and accepted parameters are provided:

- To qualify a service at a specified address, use the *`place`* array (*`serviceQualificationItem.service.place)`* to provide a specific location and the service specification. You can optionally define additional service characteristics in your request.
- To qualify a new service at the same location of an existing and active service, use the *`referenceServiceInventory`* object (serviceQualificationItem.service.referenceServiceInventory) instead of the *`place`* array. This object allows you to create a request and define service specifications without needing to provide location details. You can optionally define additional service characteristics in your request.
- To upgrade or downgrade an existing service, use the *`serviceInventory`* object (serviceQualificationItem.service.ServiceInventory) instead of the *`place`* array or the *`referenceServiceInventory`* object. In this use case, location information and specification details are fetched from an existing service. In your request, define any service characteristics that you wish to change.

  For example, say that you want to verify that you can upgrade the download speed of an existing, active service from 100Mb/s to 600Mb/s. In this case, you can use the *`serviceInventory`* parameter to define the request by changing the 'Speed' characteristic from 'Low' to 'High'. The API obtains remaining characteristics from the existing service.

To understand how to form your API request per your particular use case, refer to the example calls provided in the **Example** section of this page.

URL format

Versioned URL: `/api/sn_ord_qual_mgmt/qualification/checkServiceQualification`

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request successfully processed. **Note:** If there are any issues with the characteristics or characteristics option information, the endpoint stores the following comments in the work notes fields of the associated Customer Order Line Item record similar to existing delivery orders
400	Bad Request. Could be any of the following reasons: • Empty payload. • Invalid payload: Mandatory field missing: <field name> • Invalid payload: Request body missing - Payload was not passed in the request body. • Invalid payload: relatedParty is missing. • Invalid payload: serviceQualificationItem is missing. • Invalid payload: serviceQualificationItem id is missing. • Invalid payload: serviceQualificationItem service is missing. • Invalid payload: The location information is missing. Please provide place, serviceInventory or referenceServiceInventory. • Invalid payload: The specification information is missing, please provide serviceSpecification or serviceInventory. • Invalid payload: Service Specification does not exist. • Invalid payload: Customer Account does not exist. • Invalid payload: Consumer does not exist.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Elements returned in the response body

Element	Description
id	Sys_id of the qualification customer order. Located in the Customer Order [sn_ind_tmt_orm_order] table. Data type: String
href	Relative link to the qualification order record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Elements returned in the response body (continued)

Element	Description
	Data type: String
description	Description of the qualification request which is fetched from the short_description field of the customer order. Located in the Customer Order [sn_ind_tmt_orm_order] table. Data type: String
externalId	External ID from the external_id field of the customer order. Located in the Customer Order [sn_ind_tmt_orm_order] table. Data type: String
qualificationResult	Qualification status of the result field of the customer order. Possible values: • alternate • none • pending • qualified • unqualified Data type: String
state	State of customer order from the status field of customer order. Data type: String
@type	Part of TMF Open API standard. Annotation for the qualification. This value is always `CheckServiceQualification`. This information is not stored. Data type: String
checkServiceQualificationDate	Date and time the qualification request that was created from the order_date field of the customer order. Located in the Customer Order [sn_ind_tmt_orm_order] table. Format: YYYY-MM-DDTHH:MM:SS.SSSZ

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad Request. Could be any of the following reasons: • Invalid payload: Qualification Result should be one of [alternate, pending, qualified, unqualified]. • Invalid payload: Qualification Item id does not exist. • All Qualification Items must belong to same Top Order Line Item.

TISC API

The *TISC* API provides endpoints to add and retrieve threat intelligence data in the Threat Intelligence Security Center (TISC) application.

Data retrieved by this API can be used by other security tools such as Security Information Event Management (SIEM) systems. SIEM systems can integrate with TISC using this API to retrieve observables related to threats in TISC and automatically detect and monitor these threats within an organization's network. This API enables bidirectional sharing of observables from security tools. SIEM systems observe anomalous activity in the environment and can provide a list of observables associated with the anomalous activity to TISC.

This API can also be used to enrich SIEM alerts with threat intelligence context. For example, if a SIEM alert is generated based on unusually high traffic from an IP address, TISC can provide additional information such as whether the IP address or domain involved is linked to known malicious activities. This enrichment data enables security analysts to triage the alerts and use the contextual information for efficient remediation.

This API requires the Threat Intelligence Security Center application, which is available on the ServiceNow Store.

For additional information about TISC, see Threat Intelligence Security Center.

This API runs in the `sn_sec_tisc` namespace.

The current version of this API is `v1`.

For information about API authentication, see the REST API security section in REST APIs.

TISC API - POST /sn_sec_tisc/threat_intel_data/add_observables

Adds observable source records to the Threat Intelligence Security Center (TISC) application.

The observable source records are created in the Observable Source [sn_sec_tisc_observable_source] table and are processed through de-duplication and aggregation in the TISC data flow.

Note: Observable source records can't be directly updated using this endpoint. Only new records can be created. Therefore, even if only a few fields require an update, all fields must still be included in the request.

To access this endpoint, the caller must have the sn_sec_tisc.api_obs_write_access role, which by default is included in the Threat Intelligence administrator role (sn_sec_tisc.admin).

URL format

Versioned URL: `/api/sn_sec_tisc/{api_version}/threat_intel_data/add_observables`

Default URL: `/api/sn_sec_tisc/threat_intel_data/add_observables`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
observables	Required. List of observable objects to add to TISC. For each observable object, an observable source record is created if all validations are passed, with the source as defined by the *`source`* parameter in the request body. Data type: Array of Objects `"observables": [ { "attributes": {Object}, "<field>": "String" } ]`
observables.attributes	Field-value pairs containing attribute data about the observable. Attributes are specific to an observable type, such as the AS number for an IP address or the socket type for a network. All attributes for all observable types are supported. For a complete list of valid attributes, see the Observable attributes section below. Data type: Object `"attributes": { "<field>": "<value>" }`
observables.<field>	Name-value pairs containing general data about the observable. The fields that can be provided in this parameter are common to all observable types. The *`type`* and *`value`* fields are required for all observables.

Request body parameters (JSON) (continued)

Name	Description
	Note: Follow these guidelines for providing values: • All dates must be in ISO format in the UTC timezone. • Some fields require values from a specified table or have a list of possible values. If invalid values are provided for these fields, the observable source record is still created but the invalid values are skipped. Valid fields: **additional_context** Additional context about the observable. **attack_phases** List of attack phase names as a comma separated value. For a complete list of valid attack phases, see the **Kill Chain Phase Name** field in the Kill Chain Phase [sn_sec_tisc_kill_chain_phase] table. For example: `"attack_phases": "Lockheed Martin: Reconnaissance,Lockheed Martin: Installation"` **author** Author for the observable. **confidence** The confidence that the source system has in the correctness of the observable data. Must be a number from 0–100. **description** Description of the observable. **expiration_time** Expiration date of the observable record. **external_source_id** External ID of the observable from the source system. **first_observed** Date the data was first seen. **first_seen** Date this observable was first seen performing malicious activities. **last_observed** Date the data was last seen. **last_seen** Date this observable was last seen performing malicious activities.

Request body parameters (JSON) (continued)

Name	Description
	notes Any additional notes for the observable. Can be formatted as HTML. **reputation** Reputation of the observable. Possible values: • clear • malicious • suspicious • unknown **source_reported_score** Maliciousness score of the observable reported by the source system. Must be a number from 0–100. **tags** List of tags as a comma-separated value. For a complete list of valid tags, see the **Name** field in the Tag [sn_sec_tisc_tag] table. If the provided tag doesn't exist, the tag is automatically created and associated with the observable. **taxonomies** List of taxonomies as a comma-separated value. For a complete list of valid taxonomies, see the **Taxonomy Value** field in the Taxonomy Value [sn_sec_tisc_taxonomy_value] table. **threat_level** Threat level of the observable. Possible values: • low • medium • high **threat_severity** Threat severity of the observable. Possible values: • low • medium • high • critical **tlp**

Request body parameters (JSON) (continued)

Name	Description
	Data sensitivity level for the observable using the traffic light protocol (TLP). Possible values: • CLEAR • GREEN • AMBER • AMBER+STRICT • RED Table: In the Label field in the TLP Label [sn_sec_tisc_tlp_label] table. **type** Required. Type of observable. For a complete list of valid observable types, see the **Value** field in the Observable Type [sn_sec_tisc_observable_type] table, or the Observable attributes section below. **usage_categories** List of usage categories as a comma-separated value. For a complete list of valid usage categories, see the **Usage Category** field in the Usage Category [sn_sec_tisc_usage_category] table. **value** Required. Value associated with the observable, such as an IP address or URL. Data type: String Table: Observable Source [sn_sec_tisc_observable_source]
source	Required. Source that originally detected the observables, such as a SIEM system. The source is used for all observables listed in the API request. Data type: String Stored in: Sources provided in the request body are added to the API Integration [sn_sec_tisc_api_integration] table.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. The request parameters are invalid or the request body JSON has a syntactical error. To view details about the error, see the *error* parameter in the response body.
401	Unauthorized. The user authentication is invalid. Check the user name and password or OAuth token.
403	Forbidden. The calling user is missing a required role. The sn_sec_tisc.api_obs_write_access role is required to access this endpoint.
429	Too many requests. The number of API requests exceeds the rate limit for the API. By default, the limit is 100 requests per hour.
500	Internal server error. Check application logs in the Log [syslog] table for more information about the error.

Response body parameters (JSON)

Name	Description
error	Error information. This parameter is only returned if the request failed. Data type: Object `"error": { "message": "String", "detail": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
error.message	Error message containing the reason the request failed. Data type: String
error.detail	Additional details about why the request failed. Data type: String
error_records	Details about the observables included in the request that couldn't be added to TISC. Data type: Array of Objects `"error_records": [ { "error_message": "String", "type": "String", "value": "String" } ]`
error_records.error_message	Error message that explains why a record couldn't be created for the observable. Data type: String
error_records.type	Type of observable. For a complete list of valid observable types, see the **Value** field in the Observable Type [sn_sec_tisc_observable_type] table, or the Observable attributes section below. Data type: String
error_records.value	Value associated with the observable, such as an IP address or URL. Data type: String
metadata	Metadata about the number of records created by the API request. `"metadata": { "error_records": Number, "success_records": Number, "total_records": Number }` Data type: Object
metadata.error_records	Number of observables included in the request that couldn't be added to TISC. Data type: Number
metadata.success_records	Number of observable records that were successfully created in TISC.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Number
metadata.total_records	Total number of observables included in the request. Data type: Number
status	Status of the API request. Possible values: • `error`: No observables successfully added to TISC. • `failure`: The request failed due to a bad request or system error. See the *`error`* parameter in the response body for more information about the error. • `partial_success`: Some observables successfully added to TISC. • `success`: All observables successfully added to TISC. Data type: String
success_records	Details about the observable records that were successfully created. Data type: Array of Objects `"success_records": [ { "sys_id": "String", "type": "String", "value": "String" } ]`
success_records.sys_id	Sys_id of the observable record. Data type: String
success_records.type	Type of observable. For a complete list of valid observable types, see the **Value** field in the Observable Type [sn_sec_tisc_observable_type] table, or the Observable attributes section below. Data type: String
success_records.value	Value associated with the observable, such as an IP address or URL. Data type: String

Observable attributes

The following table lists valid attributes for each observable type.

Note: All dates must be in ISO format in the UTC timezone.

Example: cURL request

This example request contains three observables to create records for in TISC.

```
curl
 'http://instance.servicenow.com/api/sn_sec_tisc/v1/threat_intel
_data/add_observables' \
--request POST \
--header 'Content-Type: application/json' \
--header 'Authorization: Basic YWRtaW46YWRtaW4=' \
--data '{
   "source": "Sentinel",
   "observables": [
      {
         "value": "1.2.1.45",
         "type": "ip_v4_address",
         "reputation": "malicious",
         "confidence": "90",
         "tags": "critical,important",
         "taxonomies": "MITRE: T121",
         "attack_phases": "Lockheed Martin: Reconnaissance",
         "usage_categories": "Infected Bot",
         "first_seen": "2023-10-14T18:01:34.000Z",
         "attributes": {
            "as_number": "14280"
         }
      },
      {
         "value": "https://example.com",
         "type": "url",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            "tags": "important",
            "confidence": "50",
            "reputation": "malicious"
        },
        {
            "value": "1.1.1.1",
            "type": "ip_add",
            "confidence": "50",
            "reputation": "malicious"
        }
    ]
}'
```

Two of the three observables were successfully added to TISC. One record wasn't created because the observable type is invalid.

```
{
    "status": "partial_success",
    "metadata": {
        "total_records": 3,
        "success_records": 2,

        }
    ]
}
```

TISC API - POST /sn_sec_tisc/threat_intel_data/observables

Retrieves observables data, including relationships between observables and other threat intelligence data such as Structured Threat Information Expression (STIX) objects.

Observables returned in the response are sorted by *sys_id* in ascending order.

For more information about observables and STIX objects, see IoC Repository.

To access this endpoint, the caller must have the sn_sec_tisc.api_obs_read_access role, which by default is included in the Threat Intelligence administrator role (sn_sec_tisc.admin).

URL format

Versioned URL: `/api/sn_sec_tisc/{api_version}/threat_intel_data/observables`

Default URL: `/api/sn_sec_tisc/threat_intel_data/observables`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
included_fields	Fields to return for observables, obs references, and STIX objects in the response. Different fields can be rel observables, references, and each STIX object. ServiceNow system fields, except fo sys_created_on, sys_updated_on, a aren't returned in the response. Data type: Object `"included_fields": { "observable": {Objec "reference": {Object "<stix_object>": {Ob }`
included_fields.observable	Fields to return for observables. Data type: Object `"observable": { "attributes": {Objec "common_fields": {Ob }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Default: Returns the fields syd_id, ty value for all observable types.
included_fields.observable.attributes	Fields to return for specified observ Data type: Object `"attributes": { "<observable_type>": {Object} }` Default: No fields specific to an obs type are returned. Only the fields sy and value are returned.
included_fields.observable.attributes.<observable_type>	Fields to return for an observable ty Data type: Object `"<observable_type>": { "include_all_fields": Boolean, "values": [Array] }` Replace `<observable_type>` with the name of the observable typ such as `artifact`. For a complete list of valid observable types, see th Value field in the Observable Type [sn_sec_tisc_observable_type] tabl
included_fields.observable.attributes.<observable_type>.include_all_fields	Flag that indicates whether to return available fields for the observable ty Valid values: • true: Return all fields for the obse • false: Only return fields specified *values* parameter for the obser Data type: Boolean
included_fields.observable.attributes.<observable_type>.values	List of fields to return for the observ type. Only use this parameter if the *include_all_fields* is false. Data type: Array of Strings `"values": [ "String" ]`

Request body parameters (JSON) (continued)

Name	Description
	• note • observable • observed_data • opinion • reference • report • threat_actor • tool • vulnerability For example, passing the array `["observable", "threat_a` returns all related observables and actors for each observable in the re Data type: Array Default: Empty array (no relationshi returned)

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. The request parameters are invalid or the request body JSON has a syntactical error. To view details about the error, see the *error* parameter in the response body.
401	Unauthorized. The user authentication is invalid. Check the user name and password or OAuth token.
403	Forbidden. The calling user is missing a required role. The sn_sec_tisc.api_obs_read_access role is required to access this endpoint.
429	Too many requests. The number of API requests exceeds the rate limit for the API. By default, the limit is 500 requests per hour.
500	Internal server error. Check application logs in the Log [syslog] table for more information about the error.

Response body parameters (JSON)

Name	Description

error	Error information. This parameter is only returned if the request failed.
	
	Data type: Object
	
	`"error": {`
	`  "message": "String",`
	`  "detail": "String"`
	`}`

error.message	Error message containing the reason the request failed. Data type: String
error.detail	Additional details about why the request failed. Data type: String
is_last_page	Flag that indicates whether this is the last page of observables data. Valid values: • true: This response contains the last page of data. • false: There are additional pages that can be returned. Data type: Boolean
next_page_token	Use this value in the next API request to get the next page of observables data. Provide this value in the *page_token* parameter in the request body. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
observables	Observables objects. Data type: Array of Objects `"observables": [ { "attributes": {Object}, "relationships": {Object}, "sys_id": "String", "type": "String", "value": "String" } ]` Each observables object also includes the fields specified by the *included_fields.observable.common_fields* parameter in the request body.
observables.attributes	Name-value pairs for the fields specified by the *included_fields.observable.attributes.<observable_type>* parameter in the request body. Data type: Object `"attributes": { "<field>": "<value>" }`
observables.relationships	Relationships for the observable. The types of relationships returned are specified by the *relationships* parameter in the request body, and the fields returned for each relationship are specified by the *included_fields* parameter in the request body. This example shows the basic structure of this parameter. However, the relationship types and fields returned vary based on the request body parameters. Data type: Object `"relationships": { "observable": [ { "sys_id": "String", "type": "String", "value": "String" } ], "indicator": [ { "id": "String", "name": "String", "sys_id": "String" } ], "attack_pattern": [ { "id": "String", "name": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"sys_id": "String"
	}
	]
	}</pre>

observables.sys_id	Sys_id of the observable. Data type: String Table: Observable [sn_sec_tisc_observable]
observables.type	Type of observable. For a complete list of valid observable types, see the **Value** field in the Observable Type [sn_sec_tisc_observable_type] table. Data type: String
observables.value	Value associated with the observable, such as an IP address or URL. Data type: String
origin	Origin application of the response, which is Threat Intelligence Security Center (TISC). The value of this parameter is `sn_sec_tisc`. This value can optionally be used by SIEMs consuming the API response to trace whether the intelligence from TISC resulted in the creation of security incidents. Data type: String
page_size	Maximum number of observables returned in the response. Used for pagination. Data type: String
status	Status of the API request. Possible values: • failure • success If the request failed, see the *error* parameter in the response body for more information about the error. Data type: String

Example: cURL request

This example returns the first page of observables data. The *observable_filters* parameter specifies to return only observables that match the condition `status = active AND [threat_score >= 70 OR confidence >= 50]`.

```
curl
 'http://instance.servicenow.com/api/sn_sec_tisc/v1/threat_intel
_data/observables' \
--request POST \
--header 'Content-Type: application/json' \
--header 'Authorization: Basic YWRtaW46YWRtaW4=' \
```

TISC Intel Exchange API

Enables external systems to share threat intelligence data with the Threat Intelligence Security Center (TISC) application.

This API requires the Threat Intelligence Security Center application, which is available on the ServiceNow Store.

For additional information about TISC, see Threat Intelligence Security Center.

This API runs in the `sn_sec_tisc` namespace. The calling user must have the sn_sec_tisc.api_post_intel role.

The current version of this API is `v1`.

TISC Intel Exchange - POST /sn_sec_tisc/tisc_intel_sharing_api/post_intel

Shares threat intelligence data from an external source with the Threat Intelligence Security Center (TISC) application.

This endpoint creates an inbound intelligence record, as well as records for indicators, objects, and observables.

Indicator records are created in the Indicator Source [sn_sec_tisc_indicator_source] table.

Object records are created in the following tables that extend Object Source [sn_sec_tisc_object_source].

- Attack Pattern Source [sn_sec_tisc_attack_pattern_source]
- Campaign Source [sn_sec_tisc_campaign_source]
- Course of Action Source [sn_sec_tisc_course_of_action_source]
- Data Component [sn_sec_tisc_data_component]
- Data Source [sn_sec_tisc_data_source]
- Identity Source [sn_sec_tisc_identity_source]
- Infrastructure Source [sn_sec_tisc_infrastructure_source]
- Intrusion Set Source [sn_sec_tisc_intrusion_set_source]
- Location Source [sn_sec_tisc_location_source]
- Malware Analysis Source [sn_sec_tisc_malware_analysis_source]
- Malware Source [sn_sec_tisc_malware_source]
- Marking Definition Source [sn_sec_tisc_marking_definition_source]
- Object Sighting Source [sn_sec_tisc_object_sighting_source]
- Observed Data Source [sn_sec_tisc_observed_data_source]
- Threat Actor Source [sn_sec_tisc_threat_actor_source]
- Threat Event Source [sn_sec_tisc_threat_event_source]
- Threat Grouping Source [sn_sec_tisc_threat_grouping_source]
- Threat Note Source [sn_sec_tisc_threat_note_source]
- Threat Opinion Source [sn_sec_tisc_threat_opinion_source]
- Threat Report Source [sn_sec_tisc_threat_report_source]

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
<Object>	STIX 2.1 or MISP payload containing the threat intelligence data to share with TISC. When using MISP, it must be an array of MISP event payloads.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Profile-GUID	Unique identifier of the inbound intelligence profile configured in the receiving instance that data is being shared with. To obtain the unique identifier, navigate to the **Administration** tab of **Threat Intelligence Security Center**, then go to **Inbound Intelligence Profiles** and click the profile you want to use. On the profile page, select **Copy Profile ID** or **Email Profile Details**.
Shared-Intel-Format	Format of the data being shared. Possible values: • STIX 2.1 • MISP

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Possible errors: • Missing `Shared-Intel-Format` in request header. • Missing `Profile-GUID` in request header. • `Shared-Intel-Format` header contains unsupported values. • `Profile-GUID` header refers to a profile that isn't enabled or doesn't exist. • Profile doesn't support intelligence sharing in the format specified by the `Shared-Intel-Format` header. • Authenticated user doesn't have permission to submit intelligence to the specified profile.
422	Unprocessable Content. The request body doesn't follow the format specified by the `Shared-Intel-Format` request header.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
error	Error information. This parameter is only returned if the request failed. Data type: Object `"error": { "message": "String", "detail": "String" }`
error.message	Error message containing the reason the request failed. Data type: String
error.detail	Additional details about why the request failed. Data type: String
result	Details about the records that were successfully created. `"result": { "createdEntitiesCount": {Object}, "receivedIntelligenceRecord": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object
result.createdEntitiesCount	Count of each type of created entity. `"createdEntitiesCount": { "indicators": Number, "objects": Number, "observables": Number }` Data type: Object
result.createdEntitiesCount.indicators	Count of created indicators. Data type: Number
result.createdEntitiesCount.objects	Count of created objects. Data type: Number
result.createdEntitiesCount.observables	Count of created observables. Data type: Number
result.receivedIntelligenceRecord	Identification number of the created inbound intelligence record. Data type: String Table: Inbound Intelligence [sn_sec_tisc_inbound_intelligence] Column: Number

Example: cURL request

This example creates records for an indicator, object (malware), and observable (domain name) based on data in STIX 2.1 format.

```
curl
 "https://instancename.service-now.com/api/sn_sec_tisc/v1/tisc_i
ntel_sharing_api/post_intel" \
  --request POST \
  --header 'Shared-Intel-Format: STIX 2.1' \
  --header 'Profile-GUID: a87febc22b80b210ceeaf5486e91bfdb' \
  --header 'Content-Type: application/json' \
  --user 'username:password' \
  --data '{
    "type": "bundle",
    "objects": [
      {
        "id":

TISC RPZ API

The *TISC* RPZ API provides an endpoint to export domains and IP addresses in Response Policy Zone (RPZ) format.

Use this API to retrieve filtered threat intelligence data in RPZ format for use in firewalls, DNS servers, or other security systems that support RPZ policies. RPZ is used to block, allow, or redirect domains and IP addresses. The API response is served as *text/plain* to facilitate straightforward integration into security workflows.

This API requires the Threat Intelligence Security Center application, which is available on the ServiceNow Store.

For additional information about TISC, see Threat Intelligence Security Center.

This API runs in the `sn_sec_tisc` namespace. The calling user must have the sn_sec_tisc.api_obs_read_access role.

The current version of this API is `v1`.

TISC RPZ - POST /sn_sec_tisc/rpz_export

Exports domains and IP addresses in Response Policy Zone (RPZ) format.

Note: You can generate a wildcard entry (`*.<domain_name>`) for a domain in the export. A wildcard entry provides the flexibility to block or allow all subdomains of a domain. To enable this functionality, navigate to the domain record in Threat Intelligence Security Center. In the TISC Tags & Taxonomies section of the Details tab, fill in the Taxonomy fields.

- In the **Select Taxonomy** field, select **RPZ Domain**.
- In the **Add Taxonomy Values** field, select **Add Wildcard Entry**.

Click **Add** to save the taxonomy for the domain.

Default URL: `/api/sn_sec_tisc/rpz_export`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
feed_type	Required. Type of observables to export. Valid values (case-insensitive): • `IP` – Include only IP addresses (IPv4 address, IPv4 CIDR, IPv6 address, and IPv6 CIDR). • `Domain` – Include only domain names. • `IP_Domain` – Include both IP addresses and domain names. Data type: String
observable_filters	Filters to apply to the observables. Only observables that match the filter criteria are returned in the response. Data type: Object `"observable_filters": { "boolean_operator": "String", "filters": [Array] }` Default: Empty object (no filters applied)
observable_filters.boolean_operator	Boolean operator to use for the filter conditions. Valid values: • AND: Return observables that meet all filter conditions. • OR: Return observables that meet at least one of the filter conditions. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
observable_filters.filters	Filters to apply to the observables. Each filter object can be simple or complex. • Simple filters contain a field name, operator, and value. • Complex filters contain a Boolean operator and an array of simple filters. The Boolean operator is applied to the array of simple filters. Data type: Array of Objects `"filters": [ //Simple filter { "field_name": "String", "operator": "String", "field_value": "String" }, //Complex filter { "boolean_operator": "String", "filters": [ { "field_name": "String", "operator": "String", "field_value": "String" } ] } ]`
observable_filters.filters.field_name	Name of the field to use to filter the observables. Valid values: • confidence • reputation • security_type • status • sys_created_on • sys_updated_on • tags • taxonomies • threat_score • value • watch_list Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
observable_filters.filters.field_value	Value of the field. For choice fields, the value must be the internal value, not the display value. For date-time fields, the value must be in ISO format in the UTC timezone. **Note:** This parameter isn't required when using the ISEMPTY or ISNOTEMPTY operators. Data type: String
observable_filters.filters.operator	Operator to use for the filter. For more information about operators, see Operators available for filters and queries. The data type of the filter field determines the valid operators. The following operators are valid for each data type. **Boolean** Applicable field: watch_list • != • = • ISEMPTY • ISNOTEMPTY **Choice** Applicable fields: reputation, security_type, status • != • = • ENDSWITH • IN • LIKE • NOT IN • NOT LIKE • STARTSWITH **Date-time** Applicable fields: sys_created_on, sys_updated_on • < • <=

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	• > • >= • ISEMPTY • ISNOTEMPTY • NOTON • ON **GlideList** Applicable fields: tags, taxonomies • IN • NOT IN **Note:** Must use a single valid, existing value for the filter condition, and empty observable field values aren't considered a match. • ISEMPTY • ISNOTEMPTY • LIKE **Note:** Must use a single value for the filter condition. • NOT LIKE **Note:** Must use a single value for the filter condition, and empty observable field values aren't considered a match. **Number** Applicable fields: confidence, threat_score • != • <= • = • >= • ISEMPTY • ISNOTEMPTY **String** Applicable field: value

Request body parameters (JSON) (continued)

Name	Description
	• != • <= • = • >= • ENDSWITH • IN • ISEMPTY • ISNOTEMPTY • LIKE • NOT LIKE • STARTSWITH Data type: String
page_size	Limits the number of observables that are returned in the API response. Used for pagination. Data type: Number Default: 1000 Maximum value: 10,000
page_token	Used to get observables data for the current page. To get the first page, this parameter can be omitted or the value for this parameter must be an empty string. To get the next page in the following request, use the *X-Next-Page-Token* value from the response header as the value for this parameter. Data type: String Default: Empty string
policy	Required. Action to take for the domains or IP addresses. Valid values (case-insensitive): • NXDOMAIN – Returns an NXDOMAIN response (non-existent domain). • DROP – Silently drops the query without a response. • NODATA – Returns a NOERROR response with no data. • PASSTHRU – Allows the query to proceed normally (no action taken). • LOCAL-DATA – Responds with locally defined DNS data. This can be used for sinkholing (redirecting

Request body parameters (JSON) (continued)

Name	Description
	malicious domains or IPs to a safe internal address for monitoring or blocking outbound connections). • `TCP-ONLY` – Forces the client to retry the query over TCP. Data type: String
soa_email	Required. Admin contact email for the zone. Use a dot (.) instead of the @ symbol to separate the username and domain, such as `admin.example.com.` instead of `admin@example.com.`. This parameter is included in the DNS SOA record. Data type: String
soa_expiry	Required. Expiration time. Determines the maximum amount of time a secondary server continues to use zone data if the primary server becomes unreachable. Data type: Number Unit: Seconds Minimum: 0 Maximum: 4294967295
soa_minimum_ttl	Required. Minimum time to live for negative responses. Determines how long resolvers cache negative responses. **Note:** This parameter is always required for a valid request body, but the value is only used if the policy is NXDOMAIN, NODATA, or LOCAL-DATA. For other policies, this parameter has no effect. Data type: Number Unit: Seconds Minimum: 0 Maximum: 4294967295
soa_named_server	Required. Primary name server for the zone. Must be a fully qualified domain name (FQDN) ending with a dot (.), such as `ns1.example.com.`. This parameter is the first field in the DNS SOA record. Data type: String
soa_named_server_alt	Alternate name server for redundancy. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
soa_refresh	Required. Refresh interval. Determines how often secondary DNS servers check the primary server for updates to the zone. Data type: Number Unit: Seconds Minimum: 0 Maximum: 4294967295
soa_retry	Required. Retry interval. Determines how long a secondary server waits before retrying a failed zone transfer. Data type: Number Unit: Seconds Minimum: 0 Maximum: 4294967295
soa_ttl	Required. Time to live (TTL) for RPZ records. Determines how long resolvers cache the records before checking for updates. Data type: Number Unit: Seconds Minimum: 0 Maximum: 4294967295
walled_garden	IP address or domain name to use as the redirect target. Used to redirect users to a walled garden (a controlled page or network location, typically for security, compliance, or informational purposes). **Note:** Required when *policy* is LOCAL - DATA. Don't use this parameter for any other policy types. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *text/plain* or *application/json*. Success responses are returned as plain text while error responses are returned as JSON. Default: *text/plain*
Authorization	Basic. For more information about API authentication and authorization, see the REST API security section in REST APIs.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
X-Next-Page-Token	Use this value in the next API request to get the next page of results. Provide this value in the *page_token* parameter in the request body. If this header is not present, no further pages are available.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
429	Too many requests. The number of API requests exceeds the rate limit for the API. By default, the limit is 500 requests per hour.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
errorCode	HTTP status code for the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result	Details about the request. This parameter is only returned if the request failed. Data type: Object `"result": { "error": {Object}, "status": "String" }`
result.error	Error information. Data type: Object `"error": { "detail": "String", "message": "String" }`
result.error.detail	Additional details about why the request failed. Data type: String
result.error.message	Error message containing the reason the request failed. Data type: String
result.status	Status of the API request. This parameter is only returned if the request failed so the only possible value is *failure*. Data type: String

Example: cURL request

This example exports selected domains in RPZ format and sets the policy as NXDOMAIN.

```
curl --location
 'https://instance.service-now.com/api/sn_sec_tisc/v1/rpz_expo
rt' \
--header 'Authorization: Basic YWJlbC50dXRlcjpTbm93QDEyMw==' \
--data '{
    "policy": "nxdomain",
    "feed_type": "DOMAIN",
    "soa_retry": 85,
    "soa_expiry": 1,
    "soa_minimum_ttl": 7,
    "soa_refresh": 3600,
    "soa_ttl": 7678,
    "soa_named_server": "localhost.",
    "soa_email": "root.localhost.",
    "page_size": 100,
    "page_token": "",
    "observable_filters": {
        "boolean_operator": "AND",
        "filters": [
            {
```

```
                "field_name": "status",
                "operator": "=",
                "field_value": "active"
            },
            {
                "boolean_operator": "OR",
                "filters": [
                    {
                        "field_name": "threat_score",
                        "operator": ">=",
                        "field_value": "70"
                    },
                    {
                        "field_name": "confidence",
                        "operator": ">=",
                        "field_value": "50"
                    }
                ]
            }
        ]
    }
}'
```

Response body containing the domains that match the filter criteria.

```
$TTL 7678;
@ SOA localhost. root.localhost. (1759835257654 3600 85 1 7)
 IN NS localhost.

; The following Domain records will be blocked (NXDOMAIN):
domain autuo.xicp.net CNAME .
microsofta.byinter.net CNAME .
www.webserver.freetcp.com CNAME .
mongoles.3322.org CNAME .
imddos.my03.com CNAME .
weile3322b.3322.org CNAME .
*.weile3322b.3322.org CNAME .
```

Example: cURL request

This example shows a request that uses an invalid policy value.

```
curl --location
 'https://instance.service-now.com/api/sn_sec_tisc/v1/rpz_expo
rt' \
--header 'Authorization: Basic YWJlbC5OdXRlcjpTbm93QDEyMw==' \
--data '{
    "policy": "LocalData",
    "feed_type": "DOMAIN",
    "soa_retry": 85,
    "soa_expiry": 1,
    "soa_minimum_ttl": 7,
    "soa_refresh": 3600,
    "soa_ttl": 7678,
    "soa_named_server": "localhost.",
    "soa_email": "root.localhost.",
    "page_size": 100,
```

                        "field_name": "confidence",
                        "operator": ">=",
                        "field_value": "50"
                    }
                ]
            }
        ]
    }
}'
```

Response body containing error information for a failed request.

```
{
   "result": {
      "status": "failure",
      "error": {
         "message": "Error occurred while processing request
 body.",
         "detail": "Invalid policy: 'LocalData'. Supported
 values are: NXDOMAIN, DROP, NODATA, PASSTHRU, LOCAL-DATA,
 TCP-ONLY"
      }
   },
   "errorCode": 400
}
```

TISC TAXII Server API

Provides Trusted Automated Exchange of Intelligence Information (TAXII) server endpoints for sharing threat intelligence data in Threat Intelligence Security Center (TISC) from one ServiceNow instance to another.

This API requires the Threat Intelligence Security Center application, which is available on the ServiceNow Store.

For additional information about TISC, see Threat Intelligence Security Center.

This API runs in the `sn_sec_tisc` namespace. The calling user must have the sn_sec_tisc.taxii_server_api_user role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The current version of this API is `v1`.

TISC TAXII Server - GET /sn_sec_tisc/taxii_server/taxii2

Discovery endpoint for the TAXII server. Provides metadata about available API roots, services offered by the TISC TAXII server, and how to interact with it.

URL format

Versioned URL: `/api/sn_sec_tisc/{api_version}/taxii_server/taxii2`

Default URL: `/api/sn_sec_tisc/taxii_server/taxii2`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/taxii +json;version=2.1`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/taxii +json;version=2.1`*.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
api_roots	List of API roots available in the server. **Note:** The only API root currently supported by Threat Intelligence Security Center is `api/sn_sec_tisc/taxii_server/api_root`. Data type: Array
contact	Contact information related to the TAXII server. Data type: String
default	Default API root that a TAXII client can use. Data type: String
description	Description of the TAXII server. Data type: String
title	Title of the TAXII server. Data type: String

Example: cURL request

This example returns metadata about available API roots.

```
curl
 "https://instance.servicenow.com/api/sn_sec_tisc/taxii_server/taxii2" \
--request GET \
--header "Accept:application/taxii+json;version=2.1" \
--user 'username':'password'
```

Response body.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
    "title": "ServiceNow TAXII Server",
    "description": "Discovery endpoint for sharing cyber threat
 intelligence via TAXII",
    "contact": "TAXII Server Contact",
    "default":
 "https://instance.servicenow.com/api/sn_sec_tisc/taxii_server/a
pi_root",
    "api_roots": [

 "https://instance.servicenow.com/api/sn_sec_tisc/taxii_server/a
pi_root"
    ]
}
```

TISC TAXII Server - GET /sn_sec_tisc/taxii_server/{api_root}

Provides information about an API root.

Note: The only API root currently supported by Threat Intelligence Security Center is `api/sn_sec_tisc/taxii_server/api_root`.

URL format

Versioned URL: `/api/sn_sec_tisc/{api_version}/taxii_server/{api_root}`

Default URL: `/api/sn_sec_tisc/taxii_server/{api_root}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
api_root	The API root to retrieve information about. **Note:** The only value currently supported is `api_root`.

Query parameters

Name	Description
None	

Request body parameters

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/taxii +json;version=2.1*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/taxii +json;version=2.1*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
description	Description of the API root. Data type: String
max_content_length	Maximum size of a request body that can be supported by the TAXII server. Data type: Number Unit: Octets (8-bit bytes)
title	Title of the API root. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
versions	List of TAXII versions that the API root is compatible with. **Note:** The only version currently supported is TAXII 2.1, so this array contains only the value `application/taxii+json;version=2.1`. Data type: Array

Example: cURL request

This example returns information about an API root.

```
curl
 "https://instance.servicenow.com/api/sn_sec_tisc/taxii_server/api_root" \
--request GET \
--header "Accept:application/taxii+json;version=2.1" \
--user 'username':'password'
```

Response body.

```
{
    "title": "ServiceNow TAXII Server",
    "description": "API root endpoint for sharing cyber threat
 intelligence via TAXII",
    "versions": [
        "application/taxii+json;version=2.1"
    ],
    "max_content_length": 1024
}
```

TISC TAXII Server - GET /sn_sec_tisc/taxii_server/{api_root}/collections

Returns data about all available TAXII collections at the specified API root.

A TAXII collection is a logical grouping of threat intelligence data that enables the exchange of information between a TAXII client and a TAXII server.

URL format

Versioned URL: `/api/sn_sec_tisc/{api_version}/taxii_server/{api_root}/collections`

Default URL: `/api/sn_sec_tisc/taxii_server/{api_root}/collections`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
api_root	The API root to retrieve information about. **Note:** The only value currently supported is `api_root`.

Query parameters

Name	Description
None	

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/taxii +json;version=2.1`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/taxii +json;version=2.1`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.

© 2026 ServiceNow, Inc. All rights reserved.

Status codes (continued)

Status code	Description
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
collections	List of collection objects available at the requested API root. Data type: Array `"collections": [ { "can_read": Boolean, "can_write": Boolean, "description": "String", "id": "String", "media_types": [Array], "title": "String" } ]`
collections.can_read	Flag that indicates whether the calling user can read data from the collection. Valid values: • true: The user can read collection data. • false: The user can't read collection data. Data type: Boolean
collections.can_write	Flag that indicates whether the calling user can write data to the collection. Valid values: • true: The user can write collection data. • false: The user can't write collection data. **Note:** The TISC TAXII server doesn't support writing data to collections. Data type: Boolean
collections.description	Description of the collection. Data type: String
collections.id	Sys_id of the collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: TAXII Collection [sn_sec_tisc_taxii_server_collection] Data type: String
collections.media_types	List of supported media types for objects in the collection. **Note:** The only version currently supported is TAXII 2.1, so this array contains only the value `application/taxii+json;version=2.1`. Data type: Array
collections.title	Title of the collection. Data type: String

Example: cURL request

This example returns data about all available TAXII collections at the specified API root.

```
curl
 "https://instance.servicenow.com/api/sn_sec_tisc/taxii_server/api_root/collections" \
--request GET \
--header "Accept:application/taxii+json;version=2.1" \
--user 'username':'password'
```

Response body.

```
{
    "collections": [
        {
            "id": "308accee37cd22107253a2d734924baf",
            "title": " Collection-1",
            "can_read": true,
            "can_write": false,
            "media_types": [
                "application/taxii+json;version=2.1"
            ]
        },
        {
            "id": "308accee37cd22107253a2d734926ghy",
            "title": " Collection-2",
            "can_read": true,
            "can_write": false,
            "media_types": [
                "application/taxii+json;version=2.1"
            ]
        }
    ]
}
```

TISC TAXII Server - GET /sn_sec_tisc/taxii_server/{api_root}/collections/{id}

Returns data about a specified collection.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/taxii+json;version=2.1*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
can_read	Flag that indicates whether the calling user can read data from the collection. Valid values: • true: The user can read collection data. • false: The user can't read collection data. Data type: Boolean
can_write	Flag that indicates whether the calling user can write data to the collection. Valid values: • true: The user can write collection data. • false: The user can't write collection data. **Note:** The TISC TAXII server doesn't support writing data to collections. Data type: Boolean
description	Description of the collection. Data type: String
id	Sys_id of the collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: TAXII Collection [sn_sec_tisc_taxii_server_collection] Data type: String
media_types	List of supported media types for objects in the collection. **Note:** The only version currently supported is TAXII 2.1, so this array contains only the value `application/taxii+json;version=2.1`. Data type: Array
title	Title of the collection. Data type: String

Example: cURL request

This example returns data about a specified collection.

```
curl
 "https://instance.servicenow.com/api/sn_sec_tisc/taxii_server/a
pi_root/collections/308accee37cd22107253a2d734924baf" \
--request GET \
--header "Accept:application/taxii+json;version=2.1" \
--user 'username':'password'
```

Response body.

```
{
    "id": "308accee37cd22107253a2d734924baf",
    "title": " Collection-1",
    "can_read": true,
    "can_write": false,
    "media_types": [
        "application/taxii+json;version=2.1"
    ]
}
```

TISC TAXII Server - GET /sn_sec_tisc/taxii_server/{api_root}/collections/{id}/objects

Returns objects from a specified collection.

URL format

Versioned URL: `/api/sn_sec_tisc/{api_version}/taxii_server/{api_root}/collections/{id}/objects`

Default URL: `/api/sn_sec_tisc/taxii_server/{api_root}/collections/{id}/objects`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
api_root	The API root to retrieve information about. **Note:** The only value currently supported is `api_root`.
id	Sys_id of the collection. Table: TAXII Collection [sn_sec_tisc_taxii_server_collection]

Query parameters

Name	Description
added_after	Returns only objects added after the specified time. The timestamp must be in ISO 8601 format, such as `2025-10-27T16:36:20.000Z`. Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the *`next`* parameter to paginate record retrieval. Data type: Number Default: 100 records per page Maximum: 1000
match[id]	Unique identifiers of the objects to return, formatted as a string of comma separated values. Object ids can be retrieved using the GET /sn_sec_tisc/taxii_server/{api_root}/collections/{id}/objects endpoint. They are located in the *`objects.id`* parameter in the response body. Data type: String
match[spec_version]	Specification versions of objects to return, formatted as a string of comma separated values. **Note:** The only value currently supported is `2.1`. Data type: String
match[type]	Types of objects to return, formatted as a string of comma separated values. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
match[version]	Versions of objects to return, formatted as a string of comma separated values. Data type: String
next	Starting page index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/taxii +json;version=2.1`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/taxii +json;version=2.1`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
more	Flag that indicates whether the response has a next page. Valid values: • true: There is a next page. • false: There isn't a next page. Data type: Boolean
next	Index of the next page of the response. Data type: String
objects	Array of objects in the collection. Objects are returned in standard STIX format. The properties included in each object vary based on the object type. Data type: Array

Example: cURL request

This example returns all objects in the specified collection.

```
curl
 "https://instance.servicenow.com/api/sn_sec_tisc/taxii_server/a
pi_root/collections/308accee37cd22107253a2d734924baf/objects" \
--request GET \
--header "Accept:application/taxii+json;version=2.1" \
--user 'username':'password'
```

Response body containing one URL object.

```
{
  "more": false,
  "objects": [
    {
      "id": "url--624ca0a8-ffd1-5210-8253-fffffffffbe",

TISC TAXII Server - GET /sn_sec_tisc/taxii_server/{api_root}/collections/{id}/objects/{object_id}

Returns a specified object from a collection.

URL format

Versioned URL: `/api/sn_sec_tisc/{api_version}/taxii_server/{api_root}/collections/{id}/objects/{object_id}`

Default URL: `/api/sn_sec_tisc/taxii_server/{api_root}/collections/{id}/objects/{object_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
api_root	The API root to retrieve information about. **Note:** The only value currently supported is `api_root`.
id	Sys_id of the collection. Table: TAXII Collection [sn_sec_tisc_taxii_server_collection]
object_id	Unique identifier of the object. Object ids can be retrieved using the GET /sn_sec_tisc/taxii_server/{api_root}/collections/{id}/objects endpoint. They are located in the *`objects.id`* parameter in the response body.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
added_after	Returns only objects added after the specified time. The timestamp must be in ISO 8601 format, such as `2025-10-27T16:36:20.000Z`. Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the *`next`* parameter to paginate record retrieval. Data type: Number Default: 100 records per page Maximum: 1000
match[spec_version]	Specification versions of objects to return, formatted as a string of comma separated values. **Note:** The only value currently supported is `2.1`. Data type: String
match[version]	Versions of objects to return, formatted as a string of comma separated values. Data type: String
next	Starting page index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/taxii+json;version=2.1`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/taxii+json;version=2.1*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
objects	The requested object returned in standard STIX format. The properties included in the object vary based on the object type. Data type: Array

Example: cURL request

This example returns a specified URL object.

```
curl
 "https://instance.servicenow.com/api/sn_sec_tisc/taxii_server/a
pi_root/collections/308accee37cd22107253a2d734924baf/objects/url
--624ca0a8-ffd1-5210-8253-fffffffffbe" \
--request GET \
--header "Accept:application/taxii+json;version=2.1" \
--user 'username':'password'
```

Response body.

```
{
    "objects": [
        {
            "id": "url--624ca0a8-ffd1-5210-8253-fffffffffbe",
            "type": "url",
            "defanged": false,
            "value": "http://testurl.com ",
```

TISC TAXII Server - GET /sn_sec_tisc/taxii_server/{api_root}/collections/{id}/manifest

Provides a summary of the objects in a collection.

This endpoint enables clients to quickly understand what data is available without retrieving the full objects.

URL format

Versioned URL: `/api/sn_sec_tisc/{api_version}/taxii_server/{api_root}/collections/{id}/manifest`

Default URL: `/api/sn_sec_tisc/taxii_server/{api_root}/collections/{id}/manifest`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
api_root	The API root to retrieve information about. **Note:** The only value currently supported is `api_root`.
id	Sys_id of the collection. Table: TAXII Collection [sn_sec_tisc_taxii_server_collection]

Query parameters

Name	Description
added_after	Returns only objects added after the specified time. The timestamp must be in ISO 8601 format, such as `2025-10-27T16:36:20.000Z`. Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the *`next`* parameter to paginate record retrieval. Data type: Number Default: 100 records per page Maximum: 1000
match[id]	Unique identifiers of the objects to return, formatted as a string of comma separated values. Object ids can be retrieved using the GET /sn_sec_tisc/taxii_server/{api_root}/collections/{id}/objects endpoint. They are located in the *`objects.id`* parameter in the response body.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
more	Flag that indicates whether the response has a next page. Valid values: • true: There is a next page. • false: There isn't a next page. Data type: Boolean
next	Index of the next page of the response. Data type: String
objects	Array of manifests for each object in the collection. A manifest provides a brief overview of an object. Data type: Array `"objects": [ { "date_added": "String", "id": "String", "media_types": "String", "version": "String" } ]`
objects.date_added	Date the object was added to the collection in ISO 8601 format, such as `2025-10-27T16:36:20.000Z`. Data type: String
objects.id	Unique identifier of the object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Object ids can be retrieved using the GET /sn_sec_tisc/taxii_server/{api_root}/collections/{id}/objects endpoint. They are located in the *`objects.id`* parameter in the response body. Data type: String
objects.media_types	Media type of the object. **Note:** The only currently supported type is TAXII 2.1, so this value is always `application/taxii+json;version=2.1`. Data type: String
objects.version	Version of the object. Data type: String

Example: cURL request

This example returns manifests for all objects in a collection.

```
curl
 "https://instance.servicenow.com/api/sn_sec_tisc/taxii_server/a
pi_root/collections/308accee37cd22107253a2d734924baf/manifest" \
--request GET \
--header "Accept:application/taxii+json;version=2.1" \
--user 'username':'password'
```

Response body containing a manifest for one object.

```

Trouble Ticket Open API

The *Trouble Ticket Open* API provides endpoints to create, update, and retrieve data from the Case [sn_customerservice_case] and Incident [incident] tables.

Use this API to manage ticket information between external ticketing systems and the ServiceNow AI Platform.

This API is included in the Telecommunications Assurance Workflows application, which is available on the ServiceNow Store. The Customer Service (com.sn_customerservice) and Customer Service Install Base Management (com.snc.install_base) applications are required to use this API with the Case [sn_customerservice_case] table.

This API is provided within the `sn_ind_tsm_sdwan` namespace.

The calling user must have the ticket_integrator role.

This API can be extended to make customizations around required parameters, request body validation, additional REST operations, and field mappings. For more information, see the Trouble Ticket Open API Developer Guide.

The *Trouble Ticket Open* API is a ServiceNow® implementation of the TM Forum Trouble Ticket Management API REST specification. This implementation is based on the TMF621 Trouble Ticket Management API REST Specification Release 19, June 2019. The *Trouble Ticket Open* API is conformance certified by TM Forum.

Trouble Ticket - GET /sn_ind_tsm_sdwan/ticket/troubleTicket

Retrieves a list of all trouble ticket records from the Case [sn_customerservice_case] and Incident [incident] tables.

URL format

Default URL: `/api/sn_ind_tsm_sdwan/ticket/troubleTicket`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• channel • creationDate • description • href • id • lastUpdate • name • note • relatedEntity • relatedParty • severity • status • ticketType • @type Default: Returns all fields. Data type: String
id	Filter trouble tickets by sys_id. Only tickets with the specified sys_id are returned in the response. Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Default: 25 Maximum: 100 You can change the default and maximum values by updating the *sn_ind_tsm_sdwan.pagination.set_limit* and *sn_ind_tsm_sdwan.pagination.max_limit* system properties. Data type: Number
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Default: 0 Data type: Number
severity	Filter trouble tickets by severity. Only tickets with the specified severity are returned in the response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String
status	Filter trouble tickets by status. Only tickets with the specified status are returned in the response. Data type: String
ticketType	Filter trouble tickets by ticket type. Only tickets of the specified type are returned in the response. Valid values: • Case • Incident Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Specifies the range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers (continued)

Header	Description
	• next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
channel	The method of contact that the ticket was created through. Data type: Object `"channel":{ "name": "String" }`
channel.name	The name of the contact method. Maps to the **Channel** [contact_type] field for cases and the **Contact type** [contact_type] field for incidents. Data type: String
creationDate	The date that the case or incident record was created. Maps to the **Created** field. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
description	The description of the issue from the ticket. Maps to the **Description** field. Data type: String
href	Relative link to the case or incident record. Data type: String
id	The sys_id of the case or incident record. Data type: String
lastUpdate	The date the record was last updated. Maps to the **Updated** field. Data type: String
name	The name of the trouble ticket, typically a short description of the issue. Maps to the **Short description** field. Data type: String
note	A list of all comments on the ticket. This list does not include work notes. Data type: Array `"note":[ { "author": "String", "date": "String", "text": "String", "@type": "String" } ]`
note.@type	The type of note. Only comments are returned (not work notes) so this value is always `comments`. Data type: String
note.author	The name of the ServiceNow integration user who made the POST or PATCH request that created the comment. Data type: String
note.date	The date the comment was created in the ServiceNow instance. Data type: String
note.text	The comment text. Data type: String
relatedEntity	List of impacted assets, products, sold products (product inventory), configuration items, or services. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"relatedEntity": [
	  {
	  "id": "String",
	  "href": "String",
	  "name": "String",
	  "role": "String",
	  "@referredType": "String",
	  "@type": "String"
	  }
	]</pre>

relatedEntity.id	Sys_id of the impacted item or service. For cases, this value is from one of the following tables: • Asset [alm_asset] • Product Model [cmdb_model] • Sold Product [sn_install_base_sold_product] • Product Inventory [sn_prd_invt_product_inventory], which extends the Sold Product [sn_install_base_sold_product] table For incidents, this value is from one of the following tables: • Configuration Item [cmdb_ci] • Service [cmdb_ci_service] Data type: String
relatedEntity.href	Returns an empty string. Data type: String
relatedEntity.name	Name of the impacted item or service. Data type: String
relatedEntity.role	Description of the impacted item or service. Data type: String
relatedEntity.@referredType	The type of item or service. Valid values for case tickets: • asset • product • product_inventory Valid values for incident tickets: • cmdb_ci • cmdb_ci_service Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
relatedEntity.@type	This value is always `relatedEntity`. Data type: String
relatedParty	Details about contacts for the ticket. Data type: Array `"relatedParty": [ { "id": "String", "name": "String", "@referredType": "String" } ]`
relatedParty.id	Sys_id of the related party. The sys_id can be from the following tables depending on the ticket type and the related party type. Case: • Account [customer_account] - Related party type is `customer` • Contact [customer_contact] - Related party type is `customer_contact` Incident: • Company [core_company] - Related party type is `customer` • User [sys_user] - Related party type is `customer_contact` Case or incident: • Group [sys_user_group] - Related party type is `assignment_group` • User [sys_user] - Related party type is `assigned_to` Data type: String
relatedParty.name	Name of the related party. Data type: String
relatedParty.@referredType	The type of related party. Possible values: • `assigned_to`: The user assigned to work on the ticket. • `assignment_group`: The group assigned to work on the ticket. • `customer`: The company or account for the ticket. • `customer_contact`: The caller or contact for the ticket. Data type: String

Name	Description
severity	The severity of the issue described by the trouble ticket. Maps to the **Priority** field. Data type: String
status	The current status of the trouble ticket. Maps to the **State** field. Data type: String
ticketType	The type of ticket. Possible values: • Case • Incident Data type: String
@type	This value is always `TroubleTicket`. Data type: String

Example: cURL request

This example returns specified fields for the first five trouble ticket case records.

```
curl
 "https://instance.servicenow.com/api/sn_ind_tsm_sdwan/ticket/tr
oubleTicket?limit=5&fields=id%2Cname%2Cdescription%2Cstatus%2Cse
verity%2CticketType&ticketType=case" \
--request GET \
--user 'username':'password'
```

Response body.

Trouble Ticket - GET /sn_ind_tsm_sdwan/ticket/troubleTicket/{id}

Retrieves a specified record from the Case [sn_customerservice_case] or Incident [incident] table.

URL format

Default URL: `/api/sn_ind_tsm_sdwan/ticket/troubleTicket/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the case or incident record to retrieve. Located in the Case [sn_customerservice_case] or Incident [incident] table. Data type: String

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid values: • channel • creationDate • description • href • id

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• lastUpdate • name • note • relatedEntity • relatedParty • severity • status • ticketType • @type Default: Returns all fields. Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected for one or more of the following reasons. • Invalid path parameter. • Invalid URI.
404	Record not found. A record associated with the ID is not found in the Case [sn_customerservice_case] or Incident [incident] table.

Response body parameters (JSON)

Name	Description
channel	The method of contact that the ticket was created through. Data type: Object `"channel":{ "name": "String" }`
channel.name	The name of the contact method. Maps to the **Channel** [contact_type] field for cases and the **Contact type** [contact_type] field for incidents. Data type: String
creationDate	The date that the case or incident record was created. Maps to the **Created** field. Data type: String
description	The description of the issue from the ticket. Maps to the **Description** field. Data type: String
href	Relative link to the case or incident record. Data type: String
id	The sys_id of the case or incident record. Data type: String
lastUpdate	The date the record was last updated. Maps to the **Updated** field. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
name	The name of the trouble ticket, typically a short description of the issue. Maps to the **Short description** field. Data type: String
note	A list of all comments on the ticket. This list does not include work notes. Data type: Array `"note":[ { "author": "String", "date": "String", "text": "String", "@type": "String" } ]`
note.@type	The type of note. Only comments are returned (not work notes) so this value is always `comments`. Data type: String
note.author	The name of the user who wrote the comment. Data type: String
note.date	The date the comment was created in the ServiceNow instance. Data type: String
note.text	The comment text. Data type: String
relatedEntity	List of impacted assets, products, sold products (product inventory), configuration items, or services. Data type: Array `"relatedEntity": [ { "id": "String", "href": "String", "name": "String", "role": "String", "@referredType": "String", "@type": "String" } ]`
relatedEntity.id	Sys_id of the impacted item or service. For cases, this value is from one of the following tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Asset [alm_asset] • Product Model [cmdb_model] • Sold Product [sn_install_base_sold_product] • Product Inventory [sn_prd_invt_product_inventory], which extends the Sold Product [sn_install_base_sold_product] table For incidents, this value is from one of the following tables: • Configuration Item [cmdb_ci] • Service [cmdb_ci_service] Data type: String
relatedEntity.href	Returns an empty string. Data type: String
relatedEntity.name	Name of the impacted item or service. Data type: String
relatedEntity.role	Description of the impacted item or service. Data type: String
relatedEntity.@referredType	The type of item or service. Valid values for case tickets: • asset • product • product_inventory Valid values for incident tickets: • cmdb_ci • cmdb_ci_service Data type: String
relatedEntity.@type	This value is always `relatedEntity`. Data type: String
relatedParty	Details about contacts for the ticket. Data type: Array `"relatedParty": [ { "id": "String", "name": "String", "@referredType": "String"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre> }]</pre>
relatedParty.id	Sys_id of the related party. The sys_id can be from the following tables depending on the ticket type and the related party type. Case: • Account [customer_account] - Related party type is `customer` • Contact [customer_contact] - Related party type is `customer_contact` Incident: • Company [core_company] - Related party type is `customer` • User [sys_user] - Related party type is `customer_contact` Case or incident: • Group [sys_user_group] - Related party type is `assignment_group` • User [sys_user] - Related party type is `assigned_to` Data type: String
relatedParty.name	Name of the related party. Data type: String
relatedParty.@referredType	The type of related party. Possible values: • `assigned_to`: The user assigned to work on the ticket. • `assignment_group`: The group assigned to work on the ticket. • `customer`: The company or account for the ticket. • `customer_contact`: The caller or contact for the ticket. Data type: String
severity	The severity of the issue described by the trouble ticket. Maps to the **Priority** field. Data type: String
status	The current status of the trouble ticket. Maps to the **State** field. Data type: String
ticketType	The type of ticket. Possible values: • Case • Incident

Trouble Ticket - GET /sn_ind_tsm_sdwan/troubleticket/{ticketType}/{id}

Retrieves a specified record from the Case [sn_customerservice_case] or Incident [incident] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Trouble Ticket - GET /sn_ind_tsm_sdwan/ticket/troubleTicket/{id}.

URL format

Default URL: `/api/sn_ind_tsm_sdwan/troubleticket/{ticketType}/{id}`

Supported request parameters

Path parameters

Name	Description
ticketType	The type of ticket. This value determines whether a record is retrieved from the Case [sn_customerservice_case] or Incident [incident] table. Valid values: • case • incident Data type: String
id	Sys_id of the case or incident record to retrieve. Data type: String

Query parameters

Name	Description
fields	Comma-separated list of fields to return in the response. Invalid fields are ignored. If this value is not passed in, all fields are returned. Valid fields: • channel • creationDate • description • id • lastUpdate • name • note • relatedEntity • relatedParty • severity • status • ticketType • @type Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected for one or more of the following reasons. • Invalid path parameter. • Invalid URI.
404	Record not found. A record associated with the ID is not found in the Case [sn_customerservice_case] or Incident [incident] table.

Response body parameters (JSON or XML)

Name	Description
@type	This value is always `TroubleTicket`. Data type: String
channel	The method of contact that the ticket was created through.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object `"channel":{ "name": "String" }`
channel.name	The name of the contact method. Maps to the **Channel** [contact_type] field for cases and the **Contact type** [contact_type] field for incidents. Data type: String
creationDate	The date that the case or incident record was created. Maps to the **Created** field. Data type: String
description	The description of the issue from the ticket. Maps to the **Description** field. Data type: String
id	The sys_id of the case or incident record. Data type: String
lastUpdate	The date the record was last updated. Maps to the **Updated** field. Data type: String
name	The name of the trouble ticket, typically a short description of the issue. Maps to the **Short description** field. Data type: String
note	A list of all comments on the ticket. This list does not include work notes. Data type: Array `"note":[ { "author": "String", "date": "String", "text": "String", "@type": "String" } ]`
note.@type	The type of note. Only comments are returned (not work notes) so this value is always `comments`. Data type: String
note.author	The name of the ServiceNow integration user who made the POST or PATCH request that created the comment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
note.date	The date the comment was created in the ServiceNow instance. Data type: String
note.text	The comment text. Data type: String
relatedEntity	List of impacted assets, products, sold products (product inventory), configuration items, or services. Data type: Array `"relatedEntity": [ { "id": "String", "href": "String", "name": "String", "role": "String", "@referredType": "String", "@type": "String" } ]`
relatedEntity.id	Sys_id of the impacted item or service. For cases, this value is from one of the following tables: • Asset [alm_asset] • Product Model [cmdb_model] • Sold Product [sn_install_base_sold_product] • Product Inventory [sn_prd_invt_product_inventory], which extends the Sold Product [sn_install_base_sold_product] table For incidents, this value is from one of the following tables: • Configuration Item [cmdb_ci] • Service [cmdb_ci_service] Data type: String
relatedEntity.href	Returns an empty string. Data type: String
relatedEntity.name	Name of the impacted item or service. Data type: String
relatedEntity.role	Description of the impacted item or service. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
relatedEntity.@referredType	The type of item or service. Valid values for case tickets: • asset • product • product_inventory Valid values for incident tickets: • cmdb_ci • cmdb_ci_service Data type: String
relatedEntity.@type	This value is always `relatedEntity`. Data type: String
relatedParty	Details about the companies and contacts associated with the ticket. Data type: Array `"relatedParty": [ { "id": "String", "name": "String", "@referredType": "String" } ]`
relatedParty.@referredType	The type of related party. Valid values: • customer: The company or account for the ticket. • customer_contact: The caller or contact for the ticket. Data type: String
relatedParty.id	Sys_id of the related party. For cases, the sys_id is from the Contact [customer_contact] or Account [customer_account] tables. For incidents, the sys_id is from the User [sys_user] or Company [core_company] tables. If you provide a contact or a user (caller), their account or company is automatically populated on the ticket. Data type: String
relatedParty.name	The name of the related party. For cases, maps to the **Contact** or **Account** field. For incidents, maps to the **Caller** or **Company** field. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
severity	The severity of the issue described by the trouble ticket. Maps to the **Priority** field. Data type: String
status	The current status of the trouble ticket. Maps to the **State** field. Data type: String
ticketType	The type of ticket (case or incident). Data type: String

Example: cURL request

This example gets the name, description, severity, and status of a case.

```
curl
 "https://instance.servicenow.com/api/sn_ind_tsm_sdwan/troubleti
cket/case/a78e2c8cdb68b41015364c9b0b96193e?fields=name%2Cdescrip
tion%2Cseverity%2Cstatus" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Response body.

```
{
  "name": "Short description of issue",
  "description": "Example description of an issue",
  "severity": "2 - High",
  "status": "Open"
}
```

Trouble Ticket - PATCH /sn_ind_tsm_sdwan/ticket/troubleTicket/{id}

Updates a specified record in the Case [sn_customerservice_case] or Incident [incident] table.

URL format

Default URL: `/api/sn_ind_tsm_sdwan/ticket/troubleTicket/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the case or incident record to update. Located in the Case [sn_customerservice_case] or Incident [incident] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
channel	The method of contact that the ticket was created through. Data type: Object `"channel":{ "name": "String" }`
channel.name	The name of the contact method. Maps to the **Channel** [contact_type] field for cases and the **Contact type** [contact_type] field for incidents. Valid values are the choices for the contact_type field. You can provide the choice label or value. For example, `Virtual Agent` or `virtual_agent`. Data type: String
description	A description of the issue. Maps to the **Description** field. Data type: String
name	The name of the trouble ticket, typically a short description of the issue. Maps to the **Short description** field. Data type: String
note	A list of work notes and comments to add to the ticket. Data type: Array `"note":[ { "text": "String", "@type": "String" } ]`
note.@type	The type of note. This value determines whether the note is recorded in the **Work notes** or **Additional comments** field. Valid values: • work_notes • comments Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (JSON) (continued)

Name	Description
note.text	The note text. Maps to the **Work notes** or **Additional comments** field. Data type: String
relatedEntity	List of impacted assets, products, sold products (product inventory), configuration items, or services. Data type: Array `"relatedEntity": [ { "id": "String", "@referredType": "String" } ]`
relatedEntity.id	Sys_id of the impacted item or service. For cases, this value is from one of the following tables: • Asset [alm_asset] • Product Model [cmdb_model] • Sold Product [sn_install_base_sold_product] • Product Inventory [sn_prd_invt_product_inventory], which extends the Sold Product [sn_install_base_sold_product] table For incidents, this value is from one of the following tables: • Configuration Item [cmdb_ci] • Service [cmdb_ci_service] Data type: String
relatedEntity.@referredType	The type of item or service. Valid values for case tickets: • asset • product • product_inventory Valid values for incident tickets: • cmdb_ci • cmdb_ci_service Data type: String
relatedParty	Details about contacts for the ticket. For cases, this parameter populates the **Contact** or **Account** field. For incidents, this parameter populates the **Caller** or **Company** field.

Request body parameters (JSON) (continued)

Name	Description
	Data type: Array `"relatedParty": [ { "id": "String", "@referredType": "String" } ]`
relatedParty.id	Sys_id of the related party. For cases, the sys_id is from the Contact [customer_contact] or Account [customer_account] tables. For incidents, the sys_id is from the User [sys_user] or Company [core_company] tables. If you provide a contact or a user (caller), their account or company is automatically populated on the ticket. Data type: String
relatedParty.@referredType	The type of related party. Valid values: • customer: The company or account for the ticket. • customer_contact: The caller or contact for the ticket. Data type: String
severity	The severity of the issue described by the trouble ticket. Maps to the **Priority** field. Valid values: • 1: Critical. • 2: High. • 3: Moderate. • 4: Low. • 5: Planning. Incident only. Valid values are the choices for the **Priority** field. You must provide the choice value only. For example, `1`. If an invalid value is provided, the severity is set to Low. Data type: String
status	The current status of the trouble ticket. Maps to the **State** field. Valid values are the choices for the **State** field. You can provide the choice label or value. For example, `New` or `1`. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected for one or more of the following reasons. • Invalid path parameter. • Invalid URI.
404	Record not found. A record associated with the ID is not found in the Case [sn_customerservice_case] or Incident [incident] table.

Response body parameters (JSON)

Name	Description
channel	The method of contact that the ticket was created through. Data type: Object `"channel":{ "name": "String" }`
channel.name	The name of the contact method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
creationDate	The date the record was created. Data type: String
description	The description of the issue from the ticket. Data type: String
href	Relative link to the case or incident record. Data type: String
id	The sys_id of the case or incident record. Data type: String
lastUpdate	The date the record was last updated. Data type: String
name	The name of the trouble ticket, typically a short description of the issue. Data type: String
note	A list of all comments on the ticket. This list does not include work notes. Data type: Array `"note":[ { "author": "String", "date": "String", "text": "String", "@type": "String" } ]`
note.@type	The type of note. Only comments are returned (not work notes) so this value is always `comments`. Data type: String
note.author	The name of the user who wrote the comment. Data type: String
note.date	The date the comment was created in the ServiceNow instance. Data type: String
note.text	The comment text.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
relatedEntity	List of impacted assets, products, sold products (product inventory), configuration items, or services. Data type: Array `"relatedEntity": [ { "id": "String", "href": "String", "name": "String", "role": "String", "@referredType": "String", "@type": "String" } ]`
relatedEntity.id	Sys_id of the impacted item or service. For cases, this value is from one of the following tables: • Asset [alm_asset] • Product Model [cmdb_model] • Sold Product [sn_install_base_sold_product] • Product Inventory [sn_prd_invt_product_inventory], which extends the Sold Product [sn_install_base_sold_product] table For incidents, this value is from one of the following tables: • Configuration Item [cmdb_ci] • Service [cmdb_ci_service] Data type: String
relatedEntity.href	Returns an empty string. Data type: String
relatedEntity.name	Name of the impacted item or service. Data type: String
relatedEntity.role	Description of the impacted item or service. Data type: String
relatedEntity.@referredType	The type of item or service. Valid values for case tickets: • asset • product • product_inventory

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Valid values for incident tickets: • cmdb_ci • cmdb_ci_service Data type: String
relatedEntity.@type	This value is always `relatedEntity`. Data type: String
relatedParty	Details about contacts for the ticket. Data type: Array `"relatedParty": [ { "id": "String", "name": "String", "@referredType": "String" } ]`
relatedParty.id	Sys_id of the related party. The sys_id can be from the following tables depending on the ticket type and the related party type. Case: • Account [customer_account] - Related party type is `customer` • Contact [customer_contact] - Related party type is `customer_contact` Incident: • Company [core_company] - Related party type is `customer` • User [sys_user] - Related party type is `customer_contact` Case or incident: • Group [sys_user_group] - Related party type is `assignment_group` • User [sys_user] - Related party type is `assigned_to` Data type: String
relatedParty.name	Name of the related party. Data type: String
relatedParty.@referredType	The type of related party. Possible values: • `assigned_to`: The user assigned to work on the ticket. • `assignment_group`: The group assigned to work on the ticket.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• `customer`: The company or account for the ticket. • `customer_contact`: The caller or contact for the ticket. Data type: String
severity	The severity of the issue described by the trouble ticket. Data type: String
status	The current status of the trouble ticket. Data type: String
ticketType	The type of ticket. Possible values: • Case • Incident Data type: String
@type	This value is always `TroubleTicket`. Data type: String

Example: cURL request

This example updates a case record.

```
curl
 "https://instance.servicenow.com/api/sn_ind_tsm_sdwan/ticket/tr
oubleTicket/6467508d47e345508761b955d36d43f6" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   description: "Updated description",
   "note": [
      {
         "text": "Adding another comment",
         "@type": "comments"
      }
   ]
}" \
--user 'username':'password'
```

Response body.

```

Trouble Ticket - PATCH /sn_ind_tsm_sdwan/troubleticket/{ticketType}/{id}

Updates a record in the Case [sn_customerservice_case] or Incident [incident] table.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Trouble Ticket - PATCH /sn_ind_tsm_sdwan/ticket/troubleTicket/{id}.

URL format

Default URL: `/api/sn_ind_tsm_sdwan/troubleticket/{ticketType}/{id}`

Supported request parameters

Path parameters

Name	Description
ticketType	The type of ticket. This value determines whether a record is updated in the Case [sn_customerservice_case] or Incident [incident] table. Valid values: • case • incident Data type: String
id	The sys_id of the case or incident record to update. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
channel	The method of contact that the ticket was created through. Data type: Object `"channel":{ "name": "String" }`
channel.name	The name of the contact method. Maps to the **Channel** [contact_type] field for cases and the **Contact type** [contact_type] field for incidents. Valid values are the choices for the contact_type field. You can provide the choice label or value. For example, `Virtual Agent` or `virtual_agent`. Data type: String
description	A description of the issue. Maps to the **Description** field. Data type: String
name	The name of the trouble ticket, typically a short description of the issue. Maps to the **Short description** field. Data type: String
note	A list of work notes and comments to add to the ticket. Data type: Array `"note":[ { "text": "String", "@type": "String" } ]`
note.@type	The type of note. This value determines whether the note is recorded in the **Work notes** or **Additional comments** field. Valid values: • work_notes • comments Data type: String
note.text	The note text. Maps to the **Work notes** or **Additional comments** field. Data type: String
relatedEntity	List of impacted assets, products, sold products (product inventory), configuration items, or services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: Array `"relatedEntity": [ { "id": "String", "@referredType": "String" } ]`
relatedEntity.id	Sys_id of the impacted item or service. For cases, this value is from one of the following tables: • Asset [alm_asset] • Product Model [cmdb_model] • Sold Product [sn_install_base_sold_product] • Product Inventory [sn_prd_invt_product_inventory], which extends the Sold Product [sn_install_base_sold_product] table For incidents, this value is from one of the following tables: • Configuration Item [cmdb_ci] • Service [cmdb_ci_service] Data type: String
relatedEntity.@referredType	The type of item or service. Valid values for case tickets: • asset • product • product_inventory Valid values for incident tickets: • cmdb_ci • cmdb_ci_service Data type: String
relatedParty	Details about contacts for the ticket. For cases, this parameter populates the **Contact** or **Account** field. For incidents, this parameter populates the **Caller** or **Company** field. Data type: Array `"relatedParty": [ { "id": "String", "@referredType": "String"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	<pre>}
	]</pre>

relatedParty.@referredType	The type of related party. Valid values: • customer: The company or account for the ticket. • customer_contact: The caller or contact for the ticket. Data type: String
relatedParty.id	Sys_id of the related party. For cases, the sys_id is from the Contact [customer_contact] or Account [customer_account] tables. For incidents, the sys_id is from the User [sys_user] or Company [core_company] tables. If you provide a contact or a user (caller), their account or company is automatically populated on the ticket. Data type: String
severity	The severity of the issue described by the trouble ticket. Maps to the **Priority** field. Valid values: • 1: Critical. • 2: High. • 3: Moderate. • 4: Low. • 5: Planning. Incident only. Valid values are the choices for the **Priority** field. You must provide the choice value only. For example, `1`. If an invalid value is provided, the severity is set to Low. Data type: String
status	The current status of the trouble ticket. Maps to the **State** field. Valid values are the choices for the **State** field. You can provide the choice label or value. For example, `New` or `1`. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected for one or more of the following reasons. • Invalid path parameter. • Invalid URI.
404	Record not found. A record associated with the ID is not found in the Case [sn_customerservice_case] or Incident [incident] table.

Response body parameters (JSON or XML)

Name	Description
@type	This value is always `TroubleTicket`. Data type: String
channel	The method of contact that the ticket was created through. Data type: Object `"channel":{ "name": "String" }`
channel.name	The name of the contact method. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
creationDate	The date the record was created. Data type: String
description	The description of the issue from the ticket. Data type: String
id	The sys_id of the case or incident record. Data type: String
lastUpdate	The date the record was last updated. Data type: String
name	The name of the trouble ticket, typically a short description of the issue. Data type: String
note	A list of all comments on the ticket. This list does not include work notes. Data type: Array `"note":[ { "author": "String", "date": "String", "text": "String", "@type": "String" } ]`
note.@type	The type of note. Only comments are returned (not work notes) so this value is always `comments`. Data type: String
note.author	The name of the ServiceNow integration user who made the POST or PATCH request that created the comment. Data type: String
note.date	The date the comment was created in the ServiceNow instance. Data type: String
note.text	The comment text. Data type: String
relatedEntity	List of impacted assets, products, sold products (product inventory), configuration items, or services. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	<pre>"relatedEntity": [
	  {
	  "id": "String",
	  "href": "String",
	  "name": "String",
	  "role": "String",
	  "@referredType": "String",
	  "@type": "String"
	  }
	]</pre>

relatedEntity.id	Sys_id of the impacted item or service. For cases, this value is from one of the following tables: • Asset [alm_asset] • Product Model [cmdb_model] • Sold Product [sn_install_base_sold_product] • Product Inventory [sn_prd_invt_product_inventory], which extends the Sold Product [sn_install_base_sold_product] table For incidents, this value is from one of the following tables: • Configuration Item [cmdb_ci] • Service [cmdb_ci_service] Data type: String
relatedEntity.href	Returns an empty string. Data type: String
relatedEntity.name	Name of the impacted item or service. Data type: String
relatedEntity.role	Description of the impacted item or service. Data type: String
relatedEntity.@referredType	The type of item or service. Valid values for case tickets: • asset • product • product_inventory Valid values for incident tickets: • cmdb_ci • cmdb_ci_service Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
relatedEntity.@type	This value is always `relatedEntity`. Data type: String
relatedParty	Details about the companies and contacts associated with the ticket. Data type: Array `"relatedParty": [ { "id": "String", "name": "String", "@referredType": "String" } ]`
relatedParty.@referredType	The type of related party. Valid values: • customer: The company or account for the ticket. • customer_contact: The caller or contact for the ticket. Data type: String
relatedParty.id	Sys_id of the related party. For cases, the sys_id is from the Contact [customer_contact] or Account [customer_account] tables. For incidents, the sys_id is from the User [sys_user] or Company [core_company] tables. If you provide a contact or a user (caller), their account or company is automatically populated on the ticket. Data type: String
relatedParty.name	The name of the related party. Data type: String
severity	The severity of the issue described by the trouble ticket. Data type: String
status	The current status of the trouble ticket. Data type: String
ticketType	The type of ticket (case or incident). Data type: String

Example: cURL request

This example updates a case record.

Trouble Ticket - POST /sn_ind_tsm_sdwan/ticket/troubleTicket

Creates a record in the Case [sn_customerservice_case] or Incident [incident] table.

URL format

Default URL: `/api/sn_ind_tsm_sdwan/ticket/troubleTicket`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
channel	The method of contact that the ticket was created through. Data type: Object `"channel":{ "name": "String" }`
channel.name	The name of the contact method. Maps to the **Channel** [contact_type] field for cases and the **Contact type** [contact_type] field for incidents. Valid values are the choices for the contact_type field. You can provide the choice label or value. For example, `Virtual Agent` or `virtual_agent`. Data type: String
description	Required. A description of the issue. Maps to the **Description** field. Data type: String
name	The name of the trouble ticket, typically a short description of the issue. Maps to the **Short description** field.
