<Object>.datasetProperties.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Data type: Array

<Object>.datasetProperties.fieldDetails	List of UnscriptedObjects that specify field properties.
	
	Data type: Array of Objects
	<pre>[
	  {
	  "name": "String",
	  "type": "String"
	  }
	]</pre>

<Object>.datasetProperties.fieldDetails.name	Name of the field. Use <Object>.name information to restrict this dataset to. Data type: String
<Object>.datasetProperties.fieldDetails.type	Field data type. Data type: String
<Object>.datasetProperties.filterQuery	Encoded query string in Standard Glide format. See Encoded query strings. Data type: String
<Object>.domainName	Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String
<Object>.encoder	Encoder object assigned to this solution. See Encoder - Encoder(Object config). Data type: Object
<Object>.groupByFieldName	Field name by which the system groups records to build classification solutions. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.inputFieldNames	List of input field names as strings. The model uses these fields used to make predictions. Data type: String
<Object>.isActive	Flag that indicates whether this version is active. Valid values: • true: Version is active. • false: Version is not active. Data type: String
<Object>.label	Identifies the prediction task. `{ "label": "my first prediction" }` Data type: String
<Object>.name	System-assigned name. Data type: String
<Object>.predictedFieldName	Identifies a field to be trained for predictability. Data type: String
<Object>.processingLanguage	Processing language in two-letter ISO 639-1 language code format. Data type: String
<Object>.scope	Object scope. Currently the only valid value is `global`. Data type: String
<Object>.stopwords	Optional. Preset list of strings that the system automatically generates based on the *`language`* property setting. For details, see Create a custom stopwords list. Data type: Array
<Object>.trainingFrequency	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• every_180_days • run_once Default: run_once Data type: String
<Object>.versionNumber	Version number of the *ClassificationSolution* object. Data type: String

The following example gets properties of the active object version in the store.

```
// Get properties
var mlSolution =
 sn_ml.ClassificationSolutionStore.get('ml_incident_categorizati
on');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getProperties()), null, 2));
```

Output:

```
*** Script: {
  "datasetProperties": {
    "encodedQuery": "activeANYTHING^EQ",
    "fieldNames": [
      "short_description",
      "category"
    ],
    "tableName": "incident"
  },
  "domainName": "global",
  "inputFieldNames": [
    "short_description"
  ],
  "isActive": "true",
  "label": "Incident Categorization_Trainer",
  "name": "ml_incident_categorization",
  "predictedFieldName": "category",
  "processingLanguage": "en",
  "stopwords": [
    "Default English Stopwords"
  ],
  "versionNumber": "1"
}
```

ClassificationSolutionVersion - getStatus(Boolean includeDetails)

Gets training completion status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
includeDetails	Boolean	Flag that indicates whether to return status *details*. Valid values: • true: Return additional details. • false: Don't return additional details. Default: False

Returns

Type	Description
Object	JavaScript object containing training status information for a ClassificationSolution object. `{ "state": "String", "percentComplete": "Number as a String", "hasJobEnded": "Boolean value as a String", "details": {Object} }`
<Object>.state	Training completion state. If the training job reaches a terminal state, the job does not leave that state. If the state is terminal, the *hasJobEnded* property is set to `true`. Possible values: • `fetching_files_for_training` • `preparing_data` • `retry` • `solution_cancelled` (terminal) • `solution_complete` (terminal) • `solution_error` (terminal) • `solution_incomplete` • `training_request_received` • `training_request_timed_out` (terminal) • `training_solution` • `uploading_solution` • `waiting_for_training` Data type: String
<Object>.hasJobEnded	Flag that indicates whether training is complete. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: Training is complete. • false: Training is incomplete. Data type: Boolean value as a String
<Object>.percentComplete	Training percent complete. If the completion percentage is less than 100, the job might be in a terminal state. For example, if training times out. Data type: Number as a String Range: 0 thru 100
<Object>.details	Object containing a list of additional training details. Data type: Object

The following example shows a successful result with training complete.

```
// Get status
var mlSolution =
 sn_ml.ClassificationSolutionStore.get('ml_incident_categorizati
on');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getStatus(true), null, 2)));
```

Output:

```
{
 "state":"solution_complete",
 "percentComplete":"100",
 "hasJobEnded":"true",
 "details":{"stepLabel":"Solution Complete"} // This information
 is only returned if getStatus(true);
}
```

The following example shows an unsuccessful result with training complete.

```
// Get status
var solutionName =
 'ml_x_snc_global_global_classification_solution';
var mlSolution =
 sn_ml.ClassificationSolutionStore.get(solutionName);
var trainingStatus = mlSolution.getLatestVersion().getStatus();

gs.print(JSON.stringify(JSON.parse(trainingStatus), null, 2));
```

Output:

```
{
 "state":"solution_error",
 "percentComplete":"100",
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 "hasJobEnded":"true"
}
```

ClassificationSolutionVersion - getTrainingStatistics()

Gets all the training statistics for a given solution.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	JavaScript object with statistics for each class included in training and values for each class that was excluded from training. For details, see Predictive model components. `{ "includedClasses": {Object}, "excludedClasses": {Object} }`
<Object>.includedClasses	Object containing precision, coverage, recall, and distribution values of each class in the trained model. Data type: Object `"includedClasses": { "<class name>": { "distribution": "String", "statistics": [Array] },`
<Object>.includedClasses.<class name>.distribution	Value of the outcome probability distribution for this class. Data type: String
<Object>.includedClasses.<class name>.statistics	List of objects providing training statistics data. For more information, see Configuring target metrics. Data type: Array of Objects `[ { "coverage": "String", "precision": "String", "recall": "String", "selected": "String" } ]`
<Object>.includedClasses.<class name>.statistics.coverage	Estimated solution coverage metric for this class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String (numerical value)
<Object>.includedClasses.<class name>.statistics.precision	Estimated solution precision metric for this class. Data type: String (numerical value)
<Object>.includedClasses.<class name>.statistics.recall	Estimated solution recall metric for this class. Data type: String (numerical value)
<Object>.includedClasses.<class name>.statistics.selected	Flag that indicates whether this class contains records included in solution training. Valid values: • true: This class contains records selected for training the solution. • false: This class is excluded from training. Data type: String (Boolean value) Default: false
<Object>.excludedClasses	Distribution and row count of all the classes excluded from training. Data type: Object `"excludedClasses": { "<class name>": { "distribution": "0.11", "rowCount": "9" }`
<Object>.excludedClasses.<class name>.distribution	Value of the outcome probability distribution for this class. Data type: String
<Object>.excludedClasses.<class name>.rowCount	Number of rows excluded from training. Data type: String (numerical value)

The following example shows how to get training statistics from the active solution.

```
// Get training stats
var mlSolution =
 sn_ml.ClassificationSolutionStore.get('ml_incident_categorizati
on');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getTrainingStatistics()), null, 2));
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "includedClasses": {
    "Approvals": {
      "distribution": "0.43",
      "statistics": [
        {
          "precision": "100",
          "coverage": "0",
          "recall": "0",
          "selected": "true"
        }
      ]
    },
    "Authentication": {
      "distribution": "4.3",
      "statistics": [
        {
          "precision": "39.33",
          "coverage": "95.31",
          "recall": "54.69",
          "selected": "false"
        },
        {
          "precision": "100",
          "coverage": "0",
          "recall": "0",
          "selected": "false"
        },
     ...
    }
    ...
  "excludedClasses": {
    "ACE": {
      "distribution": "0.11",
      "rowCount": "9"
    },
    "AHA": {
      "distribution": "0.01",
      "rowCount": "1"
    },
    ...
}
```

ClassificationSolutionVersion - getVersionNumber()

Gets the version number of a solution object.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Version number.

The following example shows how to get a version number.

```
// Get version number
var mlSolution =
 sn_ml.ClassificationSolutionStore.get('ml_incident_categorizati
on');

gs.print("Version number:
 "+JSON.stringify(JSON.parse(mlSolution.getActiveVersion().getVe
rsionNumber()), null, 2));
```

Output:

```
Version number: 1
```

ClassificationSolutionVersion - predict(Object input, Object options)

Gets the input data for a prediction.

Parameters

Name	Type	Description
input	Object	*GlideRecord* or array of JSON objects containing field names and values as key-value pairs.
options	Object	Optional values for filtering prediction results. `{ "apply_threshold": Boolean, "top_n": Number }`
options.apply_threshold	Boolean	Flag that indicates whether to check the threshold value for the solution and apply it to the result set. Valid values: • true: Return results in which confidence is greater than threshold. • false: Return all results. Default: True
options.top_n	Number	If provided, returns the top results, up to the specified number of predictions.

Returns

Type	Description
Object	JSON object containing the prediction results sorted by sys_id or record_number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	`{ <identifier>: [Array] }`
<Object>.<identifier>	List of objects with details for each prediction result. Data type: Array of Objects `<identifier>: [ { "confidence": Number, "predictedSysId": "String", "predictedValue": "String", "threshold": Number } ]`
<Object>.<identifier>.confidence	Value of the confidence associated with the prediction. For example, 53.84. Data type: Number
<Object>.<identifier>.predictedSysId	The sys_id of the predicted value. Results can be from any table on which information is being predicted. Data type: String
<Object>.<identifier>.predictedValue	Value of the prediction result. Data type: String
<Object>.<identifier>.threshold	Value of the configured threshold associated with the prediction. Data type: Number

The following example shows how to display prediction results for a *`predict()`* method that takes a GlideRecord by sys_id for input and includes optional parameters to restrict to top three results and exclude the threshold value.

```
var mlSolution =
 sn_ml.ClassificationSolutionStore.get('ml_incident_categorizati
on');

// single GlideRecord input
var input = new GlideRecord("incident");
input.get("<sys_id>");

// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;

var results = mlSolution.getVersion(1).predict(input, options);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));
```

Output:

```
{
  "<sys_id/gr>": [
    {
      "confidence": 62.10782320780268,
      "threshold": 20.36,
      "predictedValue": "Clone Issues",
      "predictedSysId": ""
    },
    {
      "confidence": 6.945237375770391,
      "threshold": 16.63,
      "predictedValue": "Instance Administration",
      "predictedSysId": ""
    },
    {
      "confidence": 5.321061076300759,
      "threshold": 23.7,
      "predictedValue": "Administration",
      "predictedSysId": ""
    }
  ]
}
```

The following example shows how to display prediction results for a *predict()* method that takes an array of field names as key-value pairs for input and includes optional parameters to restrict to top three results and exclude the threshold value.

```
var mlSolution =
 sn_ml.ClassificationSolutionStore.get('ml_incident_categorizati
on');

// key-value pairs input
var input = [{"short_description":"my email is not working"},
 {short_description:"need help with password"}];

// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;
var results = mlSolution.predict(input, options);

// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));
```

Output:

```
{
  "1": [
    {
      "confidence": 37.5023032262591,
      "threshold": 10.72,
      "predictedValue": "Authentication",
      "predictedSysId": ""
```

      "predictedSysId": ""
    },
    {
      "confidence": 2.8773826570713514,
      "threshold": -1,
      "predictedValue": "Email (I/f)",
      "predictedSysId": ""
    }
  ]
}
```

ClassificationSolutionVersion - setPredictionSettings(Object options)

Sets precision, coverage, or recall values at solution level or class level.

Parameters

Name	Type	Description
options	Object	Metric configuration values. For information about these features, see Configuring target metrics. `{ "metricName" : "String", "metricValue" : "String", "className" : "String" }`
options.metricName	String	Name of the metric to set. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• *coverage* • *precision* • *recall*
options.metricValue	String	Numeric value to assign to the metric.
options.className	String	Optional. Name of the class to restrict results to. Use the *getTrainingStatistics()* method to retrieve a complete list of classes for a solution.

Returns

Type	Description
None	

The following example shows how to set a precision metric to 89.5 for a class named `Clone Issues`.

```
var mlSolution =
 sn_ml.ClassificationSolutionStore.get('ml_x_snc_global_global_c
lassification');
var input = {"metricName" : "precision", "metricValue" : "89.5",
 "className" : "Clone Issues"};

mlSolution.getActiveVersion().setTrainingStatistics(input);
```

ClassificationSolution - Global

The *ClassificationSolution* API is a scriptable object used in Predictive Intelligence stores.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

The solution setup-to-training flow is as follows:

1. Create a dataset using the *DatasetDefinition* API.
2. Optional. Build an encoder using the *Encoder* API.
3. Use the constructor to create a classification solution object.
4. Add the solution object to the classification solution store using the *ClassificationSolutionStore - add()* method.
5. Train the solution using the *submitTrainingJob()* method. This creates a version of the object that you can manage using the *ClassificationSolutionVersion* API.
6. Get predictions using the *ClassificationSolutionVersion - predict()* method.

Note: This API runs with full privileges before the Vancouver Patch 7 Hotfix 2b and Washington DC Patch 7 releases. With later releases, grant access using ACLs. For more information see Query ACLs.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For usage guidelines, refer to Using ML APIs.

ClassificationSolution - ClassificationSolution(Object config)

Creates a classification solution.

Parameters

Name	Type	Description
config	Object	JavaScript object containing configuration properties of the solution. `{ "algorithmConfig": {Object}, "dataset": {Object}, "domainName": "String", "encoder": {Object}, "groupByFieldName": "String", "inputFieldNames": [Array], "label": "String", "minRowCount": "String", "predictedFieldName": "String", "processingLanguage": "String", "stopwords": [Array], "trainingFrequency": "String" }`
config.algorithmConfig	Object	JavaScript object containing algorithm configuration properties. `'algorithmConfig' : { "algorithm": "String", "targetClassRecall": "String" }`
config.algorithmConfig.algorithm	String	Method for encoding your solution. Possible values: • *xgboost*: XGBoost encoding to optimize the training. • *logisticRegression*: Method using the logistic regression model for categorical targets such as nominal or ordinal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
config.algorithmConfig.targetClassRecall	String	Applies a class recall parameter to steer a solution's training to bias a specific class. Format is `"<ClassName:RecallValue>"` where the recall value is a number between 0 and 100 representing a percentage. For example, to set and apply this solution parameter to 90% accuracy for all records you train in the Email class, the value is set to `"Email:90"`.
config.dataset	Object	*`DatasetDefinition`* name.
config.domainName	String	Optional. Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Default: Current domain, for example, `"global"`.
config.encoder	Object	Optional. Trained encoder object to assign to this solution. See Encoder - Encoder(Object config).
config.groupByFieldName	String	Optional. Field name by which the system groups records to build classification solutions. For usage information, see Using group by for classification.
config.inputFieldNames	Array	List of input field names as strings. The model uses these fields used to make predictions.
config.label	String	Identifies the prediction task.
config.minRowCount	String	Optional. Minimum number of records required in the dataset for training. Default: 10000
config.predictedFieldName	String	Identifies a field to be trained for predictability.
config.processingLanguage	String	Optional. Processing language in two-letter ISO 639-1 language code format. Default: "en"
config.stopwords	Array	Optional. Preset list of strings that the system automatically generates based on the *`language`* property

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		setting. For details, see Create a custom stopwords list. Default: English Stopwords
config.trainingFrequency	String	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once

The following example shows how to create an object and add it to the ClassificationSolution store.

```
var myData = new sn_ml.DatasetDefinition(
  {
     'tableName' : 'incident',
     'fieldNames' : ['category', 'short_description',
 'priority'],
     'fieldDetails' : [
       {
         'name' : 'category',
         'type' : 'nominal'
       },
       {
         'name' : 'short_description',
         'type' : 'text'
       }],
     'encodedQuery' : 'activeANYTHING'
  });

var mySolution = new sn_ml.ClassificationSolution({
  'label': "my solution definition",
  'dataset' : myData,
  'predictedFieldName' : 'category',
  'inputFieldNames': ['short_description']
});

var myClassificationName =
 sn_ml.ClassificationSolutionStore.add(mySolution);
```

ClassificationSolution - cancelTrainingJob()

Cancels a job for a solution object that has been submitted for training.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to cancel an existing training job.

```
var mySolution =
 sn_ml.ClassificationSolutionStore.get('ml_sn_global_global_clas
sification');

mySolution.cancelTrainingJob();
```

ClassificationSolution - getActiveVersion()

Gets the active *ClassificationSolutionVersion* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Active *ClassificationSolutionVersion* object.

The following example shows how to get an active *ClassificationSolution* version from the store and return its training status.

```
var mlSolution =
 sn_ml.ClassificationSolutionStore.get('ml_x_snc_global_global_c
lassification');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getStatus()), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

ClassificationSolution - getAllVersions()

Gets all versions of a classification solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	Existing versions of a solution object. See also *ClassificationSolutionVersion* API.

The following example shows how to get all *ClassificationSolution* version objects and call the *getVersionNumber()* and *getStatus()* solution version methods on them.

```
var mlSolution =
 sn_ml.ClassificationSolutionStore.get('ml_x_snc_global_global_c
lassification');

var mlSolutionVersions = mlSolution.getAllVersions();

for (i = 0; i < mlSolutionVersions.length; i++) {
gs.print("Version " + mlSolutionVersions[i].getVersionNumber() +
 " Status: " + mlSolutionVersions[i].getStatus() +"\n");
};
```

Output:

```
Version 3 Status:
 {"state":"solution_complete","percentComplete":"100","hasJobEnd
ed":"true"}

Version 2 Status:
 {"state":"solution_complete","percentComplete":"100","hasJobEnd
ed":"true"}

Version 1 Status:
 {"state":"solution_cancelled","percentComplete":"0","hasJobEnde
d":"true"}
```

ClassificationSolution - getLatestVersion()

Gets the latest version of a solution.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	*ClassificationSolutionVersion* object corresponding to the latest version of a *ClassificationSolution()*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to get the latest version of a solution and return its training status.

```
var mlSolution =
 sn_ml.ClassificationSolutionStore.get('ml_x_snc_global_global_c
lassification');

gs.print(JSON.stringify(JSON.parse(mlSolution.getLatestVersion()
.getStatus()), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

ClassificationSolution - getName()

Gets the name of the object to use for interaction with the store.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the solution object.

The following example shows how to update *ClassificationSolution* dataset information and print the name of the object.

```
// Update solution
var myIncidentData = new sn_ml.DatasetDefinition({
   'tableName' : 'incident',
   'fieldNames' : ['category', 'short_description', 'priority'],
   'encodedQuery' : 'activeANYTHING'
});

var eligibleFields =
 JSON.parse(myIncidentData.getEligibleFields('classification'));

var myClassification = new sn_ml.ClassificationSolution({
   'label': "my classification solution",
   'dataset' : myIncidentData,
   'inputFieldNames': eligibleFields['eligibleInputFieldNames'],
   'predictedFieldName': 'category'
});

// update solution
sn_ml.ClassificationSolutionStore.update('ml_x_snc_global_global
_my_solution_definition_4', myClassification);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// print solution name
gs.print('Solution Name: '+myClassification.getName());
```

Output:

```
Solution Name: ml_x_snc_global_global_my_solution_definition_4
```

ClassificationSolution - getProperties()

Gets solution object properties.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Contents of the Dataset and *ClassificationSolution()* object details in the *ClassificationSolutionStore*. `{ "algorithmConfig": { "algorithm": "String", "targetClassRecall": "String" }, "datasetProperties": {Object}, "domainName": "String", "encoder": {Object}, "groupByFieldName": "String", "inputFieldNames": [Array], "label": "String", "name": "String", "predictedFieldName": "String", "processingLanguage": "String", "scope": "String", "stopwords": [Array], "trainingFrequency": "String" }`
<Object>.algorithmConfig	Method for encoding the solution. Data type: Object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.algorithmConfig.algorithm	Name of the encoding algorithm for training this solution. Possible values: • *xgboost*: XGBoost encoding to optimize the training. • *logisticRegression*: Method using the logistic regression model for categorical targets such as nominal or ordinal. Data type: String.
<Object>.algorithmConfig.targetClassRecall	Class recall parameter to steer a solution's training to bias a specific class. The recall value is a number between 0 and 100 representing a percentage. Data type: String
<Object>.datasetProperties	Lists the properties of the *DatasetDefinition()* object associated with the solution. `{ "encodedQuery": "String", "fieldDetails": [Array], "fieldNames": [Array], "tableName": "String" }` Data type: Object.
<Object>.datasetProperties.tableName	Name of the table for the dataset. For example, `"tableName" : "Incident"`. Data type: String.
<Object>.datasetProperties.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Data type: Array.
<Object>.datasetProperties.fieldNames.fieldDetails	List of JavaScript objects that specify field properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>[
	  {
	  "name": "String",
	  "type": "String"
	  }
	]</pre>
	Data type: Array.

<Object>.datasetProperties.fieldNames.fieldDetails.<object>.name	Name of the field defining the type of information to restrict this dataset to. Data type: String.
<Object>.datasetProperties.fieldDetails.<object>.type	Machine-learning field type. Data type: String.
<Object>.datasetProperties.fieldDetails.encodedQuery	Encoded query string in standard Glide format. See Encoded query strings. Data type: String.
<Object>.domainName	Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String.
<Object>.encoder	Encoder object assigned to this solution. See Encoder - Encoder(Object config). Data type: Object.
<Object>.groupByFieldName	Field name by which the system groups records to build classification solutions. Data type: String
<Object>.inputFieldNames	List of input field names as strings. The model uses these fields used to make predictions. Data type: String.

<Object>.label	Identifies the prediction task.
	
	<pre>{
	  "label": "my first prediction"
	}</pre>
	Data type: String.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.name	System-assigned name. Data type: String.
<Object>.predictedFieldName	Identifies a field to be trained for predictability. Data type: String.
<Object>.processingLanguage	Processing language in two-letter ISO 639-1 language code format. Data type: String.
<Object>.scope	Object scope. Currently the only valid value is `global`. Data type: String
<Object>.stopwords	Optional. Preset list of strings that the system automatically generates based on the *language* property setting. For details, see Create a custom stopwords list.
<Object>.trainingFrequency	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once Data type: String.

The following example gets properties of a solution object in the store.

```
var mySolution =
 sn_ml.ClassificationSolutionStore.get('ml_sn_global_global_clas
sification_solution');

gs.print(JSON.stringify(JSON.parse(mySolution.getProperties()),
 null, 2));
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
*** Script: {
  "datasetProperties": {
    "tableName": "incident",
    "fieldNames": [
      "category",
      "short_description",
      "priority",
      "assignment_group.name"
    ],
    "fieldDetails": [
      {
        "name": "category",
        "type": "nominal"
      },
      {
        "name": "short_description",
        "type": "text"
      }
    ]
  },
  "domainName": "global",
  "inputFieldNames": [
    "short_description"
  ],
  "label": "my solution definition",

  "predictedFieldName": "category",
  "processingLanguage": "en",
  "scope": "global",
  "stopwords": [
    "Default English Stopwords"
  ],
  "trainingFrequency": "run_once"
}
```

ClassificationSolution - getVersion(String version)

Gets a solution by provided version number.

Parameters

Name	Type	Description
version	String	Existing version number of a solution.

Returns

Type	Description
Object	Specified version of the *ClassificationSolution()* object on which you can call *ClassificationSolutionVersion* API methods.

The following example shows how to get the training status of a solution by version number.

```
var mlSolution =
 sn_ml.ClassificationSolutionStore.get('ml_x_snc_global_global_c
lassification');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.print(JSON.stringify(JSON.parse(mlSolution.getVersion('1').ge
tStatus()), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

ClassificationSolution - setActiveVersion(String version)

Activates a specified version of a solution in the store.

Parameters

Name	Type	Description
version	String	Name of the *ClassificationSolution()* object version to activate. Activating this version deactivates any other version.

Returns

Type	Description
None	

The following example shows how to activate a solution version in the store.

```
sn_ml.ClassificationSolution.setActiveVersion("ml_incident_categ
orization");
```

ClassificationSolution - submitTrainingJob()

Submits a training job.

Note: Before running this method, you must first add a solution to the store using the *ClassificationSolutionStore - add()* method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	*ClassificationSolutionVersion* object corresponding to the *ClassificationSolution* being trained.

The following example shows how to create a dataset, apply it to a solution, add the solution to a store, and submit the training job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Create a dataset
var myData = new sn_ml.DatasetDefinition({

  'tableName' : 'incident',
  'fieldNames' : ['assignment_group', 'short_description',
 'description'],
  'encodedQuery' : 'activeANYTHING'

});

// Create a solution
var mySolution = new sn_ml.ClassificationSolution({

  'label': "my solution definition",
  'dataset' : myData,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames':['short_description']

});

// Add the solution to the store to later be able to retrieve
 it.
var my_unique_name =
 sn_ml.ClassificationSolutionStore.add(mySolution);

// Train the solution - this is a long running job
var myClassifierVersion = mySolution.submitTrainingJob();
```

ClassifierProbes - Global

The *ClassifierProbes* script include provides a classifier probe launch facility. Encapsulates an array of probe information records, initialized either from a JavaScript array or the XML serialized version.

Use in any server-side script where you need to define a classifier probe launch facility.

ClassifierProbes - launch()

Launches the next highest priority classifier from those in the list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if a classifier is launched; otherwise, false.

ClassifierProbes - launchSupplementary()

Launches a supplementary probe.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

ClassifierProbes - size()

Returns the probe length.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The probe length

Client - Scoped, Global

The `Client` API provides methods to add data to the MetricBase database, to execute transforms on the MetricBase database, and to receive the results of the transforms.

You can use the `Client` class in both scoped and global server scripts. This class is part of the MetricBase application and must run within the `sn_clotho` namespace.

Client - Client()

Create an instance of the client class to access the MetricBase database.

Parameters

Name	Type	Description
None		

```
var client = new sn_clotho.Client();
```

Client - accumulate(GlideRecord now_GR, String metric)

Accumulates metric values at specified timestamp and saves the result to the database rather than overwriting the value.

Use this method to handle metrics that can be summed for an accumulation, such as kilowatt-hours (kWhs) of electricity. Accumulate makes a call for each metric at the provided timestamp. For example, collected kilowatts for a heater, electric kettle, and washing machine would result in three calls to accumulate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
now_GR	GlideRecord	Name of the series GlideRecord from which to obtain the accumulated value. See also: getSeries()
default_value	Number	Optional. Default value for accumulation at a given timestamp. Used only during the first call to accumulate if a value is unavailable for a given timestamp. A use case could be accumulating a watts metric for a total_power. You want to accumulate watts for a router connected to an outlet without a power meter to measure it. If you know the consumption value and it is constant), you can use the constant value as a default value to accumulate total_power. For example, you would use 20 if the router is constantly plugged in and consumes 20 Watts. The timestamp value can be provided using the DataBuilder API. Default: 0

Returns

Type	Description
None	

The following example shows how to accumulate the `total_power` metric value in a record called `building_a`.

```
var time = new GlideDateTime();

// total_power is the name of a metric within building_a which
 stores accumulated values

var dataBuilder1 = new sn_clotho.DataBuilder(building_a,
 "total_power");
// values to be accumulated
dataBuilder1.add(time, 3.5);
new sn_clotho.Client().accumulate(dataBuilder1, 0);

var dataBuilder2 = new sn_clotho.DataBuilder(building_a,
 "total_power");
// values to be accumulated
dataBuilder2.add(time, 3.5);
new sn_clotho.Client().accumulate(dataBuilder2, 0);

var dataBuilder3 = new sn_clotho.DataBuilder(building_a,
 "total_power");
// values to be accumulated
dataBuilder3.add(time, 3.5);
new sn_clotho.Client().accumulate(dataBuilder3, 0);
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// As a result of these operations client will save value of
// 3.5+12+4.3+0(default value) at the timestamp 'time'
```

Client - deleteMetric(String tableName, String metricName)

Remove a specified metric from a specified table in the MetricBase database

Note: This method deletes data from the MetricBase database. There is no recovery mechanism.

Parameters

Name	Type	Description
tableName	String	The name of the table whose specified metric is to be deleted.
metricName	String	The name of the metric.

Returns

Type	Description
None	

The following example shows how to remove a metric from a table.

```
var client = new sn_clotho.Client();

// delete metric (Speed) from the Drones table
client.deleteMetric("mb_demo_drone", "mb_demo_mt_speed");
```

Client - deleteSeries(GlideRecord now_GR, String metric)

Remove the data in the MetricBase database associated with the specified metric in the specified GlideRecord. Use this method for removing test data.

Note: This method deletes data from the MetricBase database. There is no recovery mechanism.

Parameters

Name	Type	Description
now_GR	GlideRecord	The records whose time series data for the specified metric is to be deleted.
metric	String	The name of the metric.

Returns

Type	Description
void	

```
var client = new sn_clotho.Client();
//query drones of a specific model
var drones = new GlideRecord("mb_demo_drone");
drones.addQuery("model", "Kingfisher Phantom");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
drones.query();

client.deleteSeries(drones, 'mb_demo_mt_speed');
```

Client - getSeries(GlideRecord now_GR, String metricName, GlideDateTime lastUpdateBefore)

Get all series from a specific dimension.

Parameters

Name	Type	Description
now_GR	GlideRecord	The record from which to obtain the series.
metric	String	The name of the metric.
lastUpdateBefore	GlideDateTime	Optional. Date in the future representing the end of the period to be evaluated.

Returns

Type	Description
Array	List of string sys_ids representing the series containing data for the specified metric. If the *lastUpdateBefore* parameter is provided, returns series that have no data more recent than the lastUpdateBefore date (non-inclusive).

The following example shows how to get the complete list of speed values listed in the Drones [mb_demo_drone] table.

```
var client = new sn_clotho.Client();

// query subject records
var grDrone = new GlideRecord('mb_demo_drone');
grDrone.query();

var series = client.getSeries(grDrone,'mb_demo_mt_speed');
```

Client - put(Object metricData)

Saves metric data to the MetricBase database.

Parameters

Name	Type	Description
metricData	Object	One of the following: • DataBuilder object containing metric data. • Array of DataBuilder objects containing metric data.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var time = new GlideDateTime();
// two different GlideRecord instances and metrics
var dataBuilder = new sn_clotho.DataBuilder(now_GR,
 'cpu_percentage');
dataBuilder.add(time, 0.6);
var dataBuilder2 = new sn_clotho.DataBuilder(gr2,
 'disk_free_percentage');
dataBuilder2.add(time, 0.2);
new sn_clotho.Client().put([dataBuilder,dataBuilder2]);
```

Cloud Runner TestGenerationApi – Scoped, Global

Manages test job generation to be executed in a cloud runner for Automated Test Framework (ATF). This API is part of the CloudRunnerApi script include.

You can use this API for the following tasks:

- Start the test generation job.
- Check the progress of the test generation job.
- Cancel the test generation job.

In global scope, this API is executed within the sn_atf_tg namespace. You must have the ATF Test Generator and Cloud Runner (sn_atf_tg) plugin activated to use this API.

See also:

- Cloud Runner TestRunnerApi – Scoped, Global
- Cloud Runner TestUserApi – Scoped, Global
- Cloud Runner Test Generation REST API

TestGenerationApi – cancelJob(String snboqId)

Sets the test generation job and its associated update set record to complete status. Cancels the root trackers of any generated tests that are running. If any test jobs are in progress on cancellation, this method sets any of the in-progress test records generated to skipped.

Parameters

Name	Type	Description
snboqId	String	Required. The sys_id of the BOQ record in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table.

Returns

Type	Description
null	Null if successful, error message otherwise.

The following example shows how to start generating tests for the incident table and cancel the test generation. In the global scope, use the sn_atf_tg namespace.

```
var insertedSnboqId =
 CloudRunnerAPI.TestGenerationAPI.startJob({
  tableEncodedQuery: "nameISincident",
  catalogEncodedQuery: "sysIdISEMPTY",
  maxTestCount: 10
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
});

CloudRunnerAPI.TestGenerationAPI.cancelJob({snboqId:
 insertedSnboqId});
```

TestGenerationApi – progress(String snboqId)

Provides the status of each generated test for a provided Browser Orchestration Queue (BOQ) record.

Parameters

Name	Type	Description
snboqId	String	Required. The sys_id of the BOQ record in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table.

Returns

Type	Description
Object	Information about the test job. You can find advanced test details in the Generated Tests [sn_atf_tg_generated_test] table. `{ "testsFailed": Number, "testsInProgress": Number, "testsPending": Number, "testsSkipped": Number, "testsSucceeded": Number }`
testsFailed	The number of failed tests generated. The failure reasons are listed in the Generated Tests [sn_atf_tg_generated_test] table. Data type: Number
testsInProgress	The number of use cases being created. Data type: Number
testsPending	The number of use cases remaining to be generated. Data type: Number
testsSkipped	The number of tests skipped due to job cancellation. Data type: Number
testsSucceeded	The number of successfully generated tests. Data type: Number

The following example shows how to start generating tests for the incident table, get the progress, and cancel the test generation. In the global scope, use the sn_atf_tg namespace.

```
var snboqId = CloudRunnerAPI.TestGenerationAPI.startJob({
  "tableEncodedQuery": "nameISincident",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "catalogEncodedQuery": "sysIdISEMPTY",
  "maxTestCount": 10
});

gs.info(JSON.stringify(CloudRunnerAPI.TestGenerationAPI.progress
({snboqId: snboqId})));

CloudRunnerAPI.TestGenerationAPI.cancelJob({"snboqId":
 snboqId});
```

Output:

```
{
  "testsSucceeded": 4,
  "testsFailed": 2,
  "testsPending": 2,
  "testsInProgress": 8,
  "testsSkipped": 0
}
```

TestGenerationApi – startJob(String tableEncodedQuery, String userEncodedQuery, String catalogEncodedQuery, Number maxTestCount, Number maxTestCountPerTable, Number maxTestCountPerItem, String email, Boolean separateUpdateSetPerScope, String scopeForGeneratingTests)

Inserts a record into the Browser Orchestration Queue (BOQ) [sn_atf_tg_sn_boq] table to start a test job.

Parameters

Name	Type	Description
catalogEncodedQuery	String	Optional. Encoded query specifying the catalog items (CIs) on which to generate tests. Default: All CIs (empty string)
email	String	Optional. Email address to send a notification to when the test generation is complete. Default: No email (empty string)
maxTestCount	Number	Optional. Maximum number of tests to generate. Possible values: 1-9999 Default: 9999 (maximum value)
maxTestCountPerItem	Number	Optional. Maximum number of tests to generate per CI. Possible values: 1-10 Default: 10 (maximum value)
maxTestCountPerTable	Number	Optional. Maximum number of tests to generate per table. Possible values: 1-10

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: 10 (maximum value)
scopeForGeneratingTests	String	Required when *separateUpdateSetPerScope* is set to false. Sys_id of the scope in which to place all generated tests. Default: No sys_id (empty string)
separateUpdateSetPerScope	Boolean	Optional. Flag that indicates whether to separate generated tests into respective suites, update sets, and scopes, or to place tests into one suite, update set, and scope. Valid values: • true: Tests are placed into their respective suite and update set according to the scope of each table or catalog item. • false: All generated tests are placed in the same suite, update set, and scope. If false, *scopeForGeneratingTests* is required in the request. Default: true
tableEncodedQuery	String	Optional. Encoded query specifying the tables on which to generate tests. See Encoded query strings. Default: All tables (empty string)
userEncodedQuery	String	Optional. Encoded query specifying the users on which to generate tests. Default: All users (empty string)

Returns

Type	Description
String	The sys_id of the BOQ record in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table.

The following example shows how to start generating tests for the incident table. In the global scope, use the sn_atf_tg namespace.

```
var insertedSnboqId =
 CloudRunnerAPI.TestGenerationAPI.startJob({
  tableEncodedQuery: "nameISincident",
  catalogEncodedQuery: "sysIdISEMPTY",
  maxTestCount: 10
});
```

```
gs.info(insertedSnboqId);
```

Output:

```
<sys_id of inserted BOQ record>
```

Cloud Runner TestRunnerApi – Scoped, Global

Manages tests to be executed in a cloud runner for Automated Test Framework (ATF). This API is part of the CloudRunnerApi script include.

You can use this API for the following tasks:

- Start an ATF test or test suite in the Cloud Runner browser.
- Check the progress of the test job.
- Cancel the test job.

In global scope, this API is executed within the sn_atf_tg namespace. You must have the ATF Test Generator and Cloud Runner (sn_atf_tg) plugin activated to use this API.

See also:

- Cloud Runner TestGenerationApi – Scoped, Global
- Cloud Runner TestUserApi – Scoped, Global
- Cloud Runner Test User REST API

TestRunnerApi – cancelJob(String snboqId)

Sets the test runner job to complete status and cancels the root trackers of any generated tests that are running.

Parameters

Name	Type	Description
snboqId	String	Required. The sys_id of the BOQ record in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table.

Returns

Type	Description
null	Null if successful, error message otherwise.

The following example shows how to start a test run an ATF test, display the progress, and stop the test run. In the global scope, use the sn_atf_tg namespace.

```
var snboqId = CloudRunnerAPI.TestRunnerAPI.startJob({
 "testId": "<sys_id>"
});

gs.info(JSON.stringify(CloudRunnerAPI.TestRunnerAPI.progress({"s
nboqId": snboqId})));

CloudRunnerAPI.TestRunnerAPI.cancelJob({"snboqId": snboqId});
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
{progress: 64, state: running}
```

TestRunnerApi – progress(String snboqId)

Provides the status of each test ran for a provided Browser Orchestration Queue (BOQ) record.

Parameters

Name	Type	Description
snboqId	String	Required. The sys_id of the BOQ record in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table.

Returns

Type	Description
Object	JSON object indicating test progress. `{ "progress": Number, "state": "String" }`
Object.progress	Indicates test progress percentage complete. Type: Number
Object.state	State of the BOQ record. Possible values: • Pending – The requested test activity has been created and is waiting to be executed. • Processing – The instance is scanning for records to ensure that the execution trackers are marked for cloud runner before the request is sent to the cloud infrastructure. • Browsers requested – A request has been sent to the cloud infrastructure to start browsers for test generation or test running. • Running – Cloud infrastructure browsers find and execute pending tests. • Completed – The test task is complete. • Failed state – The test task failed. Type: String
Error	If unsuccessful, possible error messages:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• No BOQ ID passed in – The JSON object provided doesn't have a BOQ ID entry. Verify that the JSON object is structured as `{snboqId: "<sys_id>"}`. • Invalid BOQ sys_id passed in – The ID provided must be for a BOQ record in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table.

The following example shows how to start a test run an ATF test, display the progress, and stop the test run. In the global scope, use the sn_atf_tg namespace.

```
var snboqId = CloudRunnerAPI.TestRunnerAPI.startJob({
 "testId": "<sys_id>"
});

gs.info(JSON.stringify(CloudRunnerAPI.TestRunnerAPI.progress({"s
nboqId": snboqId})));

CloudRunnerAPI.TestRunnerAPI.cancelJob({"snboqId": snboqId});
```

Output:

```
{progress: 64, state: running}
```

TestRunnerApi – startJob(String testId)

Starts an ATF test or a test suite on the Cloud Runner browser.

Parameters

Name	Type	Description
testId	String	Required. The sys_id of the ATF test or test suite to be run in the Cloud Runner browser. Located in one of the following tables: • Test [sys_atf_test] • Test Suites [sys_atf_test_suite]

Returns

Type	Description
String	The sys_id of the BOQ record in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table.

The following example shows how to start a test run an ATF test, display the progress, and stop the test run. In the global scope, use the sn_atf_tg namespace.

```
var snboqId = CloudRunnerAPI.TestRunnerAPI.startJob({
 "testId": "<sys_id>"
});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info(JSON.stringify(CloudRunnerAPI.TestRunnerAPI.progress({"snboqId": snboqId})));

CloudRunnerAPI.TestRunnerAPI.cancelJob({"snboqId": snboqId});
```

Output:

```
{progress: 64, state: running}
```

Cloud Runner TestUserApi – Scoped, Global

Manages test user jobs to be executed in a cloud runner for Automated Test Framework (ATF). This API is part of the CloudRunnerApi script include.

You can use this API for the following tasks:

- Start the user test job.
- Set the cloud user.
- Check if the user specified is valid.
- Check the progress of the user test job.
- Cancel the test job.

In global scope, this API is executed within the sn_atf_tg namespace. You must have the ATF Test Generator and Cloud Runner (sn_atf_tg) plugin activated to use this API.

See also:

- Cloud Runner TestGenerationApi – Scoped, Global
- Cloud Runner TestRunnerApi – Scoped, Global
- Cloud Runner Test Runner REST API

TestUserApi – cancelJob(String snboqId)

Sets the test user job status in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table to complete.

Parameters

Name	Type	Description
snboqId	String	Required. The sys_id of the BOQ record in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table.

Returns

Type	Description
null	Null if successful, error message otherwise.
Error	If unsuccessful, possible error messages:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• No BOQ ID passed in – The JSON object provided doesn't have a BOQ ID entry. Verify that the JSON object is structured as `{snboqId: "<sys_id>"}`. • Invalid BOQ sys_id passed in – The ID provided must be for a BOQ record in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table.

The following example shows how to start a test user for the admin user, get the progress, and cancel the test user. After confirming the locked out user as a valid cloud user, the code sets the cloud user as an ITIL administrator. In the global scope, use the sn_atf_tg namespace.

```
var snboqId = CloudRunnerAPI.TestUserAPI.startJob({username:
 "abel.tuter"});

gs.info(JSON.stringify(CloudRunnerAPI.TestUserAPI.progress({snbo
qId: snboqId})));

CloudRunnerAPI.TestUserAPI.cancelJob({snboqId: snboqId});

gs.info(CloudRunnerAPI.TestUserAPI.isValidCloudUser({username:
 <name of the user who has been locked out>}));

CloudRunnerAPI.TestUserAPI.selectCloudUser({username:
 "itil_admin"});
```

Output:

```
{progress: 64, state: running}
User is missing the following criteria:
 User is locked out
False
```

TestUserApi – isValidCloudUser(String username)

Checks whether a provided user is a valid cloud user.

Parameters

Name	Type	Description
username	Object	Required. User ID of a valid user listed in the Users [sys_user] table. This value is provided as a string in a JSON object. For example, `{username: "abel.tuter"}`.

Returns

Type	Description
Boolean	Flag that indicates whether the user provided is a valid cloud user. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: The user provided is a valid cloud user. • false: The user provided is invalid for one or more of the following reasons: ○ The user wasn't found. ○ The user is inactive. ○ The user is locked out. ○ The user needs a password reset. ○ The user doesn't have an admin role. ○ The user has read-only access. ○ The user has web services only access.

The following example shows how to start a test user for the admin user, get the progress, and cancel the test user. After confirming the locked out user as a valid cloud user, the code sets the cloud user as an ITIL administrator. In the global scope, use the sn_atf_tg namespace.

```
var snboqId = CloudRunnerAPI.TestUserAPI.startJob({username:
 "abel.tuter"});

gs.info(JSON.stringify(CloudRunnerAPI.TestUserAPI.progress({snbo
qId: snboqId})));

CloudRunnerAPI.TestUserAPI.cancelJob({snboqId: snboqId});

gs.info(CloudRunnerAPI.TestUserAPI.isValidCloudUser({username:
 <name of the user who has been locked out>}));

CloudRunnerAPI.TestUserAPI.selectCloudUser({username:
 "itil_admin"});
```

Output:

```
{progress: 64, state: running}
User is missing the following criteria:
 User is locked out
False
```

TestUserApi – progress(String snboqId)

Provides the status of each user test for a provided Browser Orchestration Queue (BOQ) record.

Parameters

Name	Type	Description
snboqId	String	Required. The sys_id of the BOQ record in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	JSON object indicating test progress. `{ "progress": Number, "state": "String" }`
Object.progress	Indicates test progress percentage complete. Type: Number
Object.state	State of the BOQ record. Possible values: • Pending – The requested test activity has been created and is waiting to be executed. • Processing – The instance is scanning for records to ensure that the execution trackers are marked for cloud runner before the request is sent to the cloud infrastructure. • Browsers requested – A request has been sent to the cloud infrastructure to start browsers for test generation or test running. • Running – Cloud infrastructure browsers find and execute pending tests. • Completed – The test task is complete. • Failed state – The test task failed. Type: String
Error	If unsuccessful, possible error messages: • No BOQ ID passed in – The JSON object provided doesn't have a BOQ ID entry. Verify that the JSON object is structured as `{snboqId: "<sys_id>"}`. • Invalid BOQ sys_id passed in – The ID provided must be for a BOQ record in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table.

The following example shows how to start a test user for the admin user, get the progress, and cancel the test user. After confirming the locked out user as a valid cloud user, the code sets the cloud user as an ITIL administrator. In the global scope, use the sn_atf_tg namespace.

```
var snboqId = CloudRunnerAPI.TestUserAPI.startJob({username:
 "abel.tuter"});

gs.info(JSON.stringify(CloudRunnerAPI.TestUserAPI.progress({snbo
qId: snboqId})));

CloudRunnerAPI.TestUserAPI.cancelJob({snboqId: snboqId});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info(CloudRunnerAPI.TestUserAPI.isValidCloudUser({username:
 <name of the user who has been locked out>}));

CloudRunnerAPI.TestUserAPI.selectCloudUser({username:
 "itil_admin"});
```

Output:

```
{progress: 64, state: running}
User is missing the following criteria:
 User is locked out
False
```

TestUserApi – selectCloudUser(String username)

Starts an end-to-end test user job on cloud runner. If the user is able to log in correctly with the admin role, then the cloud user property is set as this user for future test runs and test generations on the cloud runner infrastructure.

Parameters

Name	Type	Description
username	Object	Required. User ID of a valid user listed in the Users [sys_user] table. This value is provided as a string in a JSON object. For example, `{username: "abel.tuter"}`.

Returns

Type	Description
Null	Null if successful. Error message otherwise. `Unable to set cloud user as cloud user not valid` – This error indicates that the user provided is invalid for one or more of the following reasons: • The user wasn't found. • The user is inactive. • The user is locked out. • The user needs a password reset. • The user doesn't have an admin role. • The user has read-only access. • The user has web services only access.

The following example shows how to start a test user for the admin user, get the progress, and cancel the test user. After confirming the locked out user as a valid cloud user, the code sets the cloud user as an ITIL administrator. In the global scope, use the sn_atf_tg namespace.

```
var snboqId = CloudRunnerAPI.TestUserAPI.startJob({username:
 "abel.tuter"});

gs.info(JSON.stringify(CloudRunnerAPI.TestUserAPI.progress({snbo
qId: snboqId})));

CloudRunnerAPI.TestUserAPI.cancelJob({snboqId: snboqId});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info(CloudRunnerAPI.TestUserAPI.isValidCloudUser({username:
 <name of the user who has been locked out>}));

CloudRunnerAPI.TestUserAPI.selectCloudUser({username:
 "itil_admin"});
```

Output:

```
{progress: 64, state: running}
User is missing the following criteria:
 User is locked out
False
```

TestUserApi – startJob(String username)

Starts an end to end test user job on cloud runner.

Parameters

Name	Type	Description
username	String	Required. User name of sys_user to test the end to end infrastructure of cloud runner.

Returns

Type	Description
String	The sys_id of the BOQ record in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table.

The following example shows how to start a test user for the admin user, get the progress, and cancel the test user. After confirming the locked out user as a valid cloud user, the code sets the cloud user as an ITIL administrator. In the global scope, use the sn_atf_tg namespace.

```
var snboqId = CloudRunnerAPI.TestUserAPI.startJob({username:
 "abel.tuter"});

gs.info(JSON.stringify(CloudRunnerAPI.TestUserAPI.progress({snbo
qId: snboqId})));

CloudRunnerAPI.TestUserAPI.cancelJob({snboqId: snboqId});

gs.info(CloudRunnerAPI.TestUserAPI.isValidCloudUser({username:
 <name of the user who has been locked out>}));

CloudRunnerAPI.TestUserAPI.selectCloudUser({username:
 "itil_admin"});
```

Output:

```
{progress: 64, state: running}
User is missing the following criteria:
 User is locked out
False
```

ClusteringSolution - Global

The *ClusteringSolution* API is a scriptable object used in Predictive Intelligence stores.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

The solution setup-to-training flow is as follows:

1. Create a dataset using the *DatasetDefinition* API.
2. Use the constructor to create a clustering solution object.
3. Add the solution object to the clustering solution store using the *ClusteringSolutionStore - add()* method.
4. Train the solution using the *submitTrainingJob()* method. This creates a version of the object that you can manage using the *ClusteringSolutionVersion* API.

Note: This API runs with full privileges before the Vancouver Patch 7 Hotfix 2b and Washington DC Patch 7 releases. With later releases, grant access using ACLs. For more information see Query ACLs.

For usage guidelines, refer to Using ML APIs.

ClusteringSolution - ClusteringSolution(Object config)

Creates a cluster solution.

Parameters

Name	Type	Description
config	Object	JavaScript object containing configuration properties of the solution. `{ "algorithmConfig": {Object}, "clusterConcept": "String", "clusterConceptFieldNames": [Array], "dataset": {Object}, "domainName": "String", "groupByFieldName": "String", "groupUnclusteredRecords": Boolean, "inputFieldNames": [Array], "label": "String", "maxTimeWindowForUpdate" : Number,`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>"minRecordsPerCluster" : Number,
		"minRowCount": "String",
		"processingLanguage": "String",
		"stopwords": [Array],
		"trainingFrequency": "String",
		"updateFrequency": "String"
		}</pre>

config.algorithmConfig	Object	Required. JavaScript object containing algorithm configuration properties. Property settings vary by the value set in the *algorithm* property.
		<pre>'algorithmConfig': {
		"algorithm": "String",
		// See algorithmConfig.algorithm setting description for property settings based on algorithm
		}</pre>

config.algorithmConfig.algorithm	String	Method for encoding your solution. Valid values: • *dbscan* – Density-Based Spatial Clustering of Applications with Noise (DBSCAN) clustering algorithm. Properties used with this algorithm: ◦ *distanceMetric* ◦ *epsilon* ◦ *minimumNeighbours* • *hdbscan* – Hierarchical Density Based Spatial Clustering of Applications with Noise (HDBSCAN) clustering algorithm. Properties used with this algorithm: ◦ *minimumSamples*

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		• *kmeans* – K-means clustering algorithm. Default. The *targetCoverage* property is used with this algorithm.
		
		Some users prefer DBSCAN because it doesn't require you to specify the number of clusters in the data before clustering.
		
		Properties for *dbscan*:
		`'algorithmConfig': { "algorithm": "dbscan", "distanceMetric": "String", "epsilon": Number, "minimumNeighbours": Number }`
		
		Properties for *hdbscan*:
		`'algorithmConfig': { "algorithm": "hdbscan", "minimumSamples": Number }`
		
		Properties for *kmeans*:
		`'algorithmConfig': { "algorithm": "kmeans", "targetCoverage": Number }`

config.algorithmConfig.distanceMetric	String	DBSCAN algorithm only. Distance metric to scan for similar data objects. Valid values: *levenshteinDistance*
config.algorithmConfig.epsilon	Number	DBSCAN algorithm only. Decimal value between 0 and 1 representing the size of the neighborhood search radius.
config.algorithmConfig.minimumNeighbours	Number	DBSCAN algorithm only. Minimum number of neighbors required in a point to be a part of a cluster. For

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		levenshteinDistance the value must be 1 so that no points are excluded from the dataset.
config.algorithmConfig.minimumSamples	Number	Minimum number of data samples in a neighborhood required to determine if a point is a core point. Default: None
config.algorithmConfig.targetCoverage	Number	K-means algorithm only. Percentile field to filter out records that are less similar to each other.
config.clusterConcept	String	Optional. Concept type. A concept is a set of words listed in descending order of frequency. To generate a TFIDF-based cluster concept, set the value to `tfidf`. Concept types are listed in the Clustering Definitions [ml_capability_definition_clustering] table. Default: Frequency-based cluster concept
config.clusterConceptFieldNames	Array	Optional. List of cluster concept field names. These values are external columns for creating a cluster concept and not used for cluster solution training. If external columns are provided, those columns are only used for the cluster concept and not for clustering solution training. Cluster concept fields are listed in the Clustering Definitions [ml_capability_definition_clustering] table. Default: Input text columns generate the cluster concept
config.dataset	Object	DatasetDefinition object name.
config.domainName	String	Optional. Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Default: Current domain, for example, `"global"`.
config.groupByFieldName	String	Optional. Field name by which the system groups records into one or more clusters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		In the following setup example, the system groups each type into an individual cluster, rendering 10 clusters. • *groupByFieldName* value is `'category'` • DatasetDefinition *tableName* value is `'incident'` • Incident [incident] table has 10 category types
config.groupUnclusteredRecords	Boolean	Flag that indicates whether to group unclustered records in results. Valid values: • true: Group unclustered records separately in results. • false: Do not group unclustered records in results. Unclustered values (-1) display with the rest of the results. Default: false
config.inputFieldNames	Array	List of input field names as strings. The model uses these fields used to make predictions.
config.label	String	Identifies the prediction task.
config.maxTimeWindowForUpdate	Number	Optional. Number of minutes preceding the model update point to look for records. For example, if the value is 15, the system only looks for records created in the preceding 15 minutes. By default, the system scans all records.
config.minRecordsPerCluster	Number	Optional. Minimum number of records to allow in any cluster. The value must be greater than or equal to 2. Default: 2
config.minRowCount	String	Optional. Minimum number of records required in the dataset for training. Default: 10000

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
config.processingLanguage	String	Processing language in two-letter ISO 639-1 language code format.
config.stopwords	Array	Optional. Preset list of strings that the system automatically generates based on the *language* property setting. For details, see Create a custom stopwords list. Default: English Stopwords
config.trainingFrequency	String	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once
config.updateFrequency		The frequency at which the model for the solution definition must be rebuilt. Possible values: • do_not_update • every_1_day • every_1_hour • every_6_hours • every_12_hours • every_1_minute • every_15_minutes • every_30_minutes Default: do_not_update

The following example shows how to create an object and add it to the ClusteringSolution store. The example also shows how to submit the object for training.

```
try{
    var myData = new sn_ml.DatasetDefinition({
        'tableName' : 'incident',
        'fieldNames' : ['category', 'short_description',
 'state', 'description'],
        'encodedQuery' : 'activeANYTHING'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    });

    var mySolution = new sn_ml.ClusteringSolution({
        'label': "clustering solution",
        'dataset' : myData,
        'inputFieldNames':['short_description'],
        'groupByFieldName' : 'category',
        'algorithmConfig' : {
            'algorithm' : 'kmeans',
            'targetCoverage' : '90'
        }
    });

    // add solution
    var solutionName =
 sn_ml.ClusteringSolutionStore.add(mySolution);
    var solutionVersion = mySolution.submitTrainingJob();
    var trainingStatus = solutionVersion.getStatus();
    gs.print(JSON.stringify(JSON.parse(trainingStatus), null,
 2));
} catch(ex){
    gs.print('Exception caught: '+ ex.getMessage());
}
```

Output:

```
{
  "state": "waiting_for_training",
  "percentComplete": "0",
  "hasJobEnded": "false"
}
```

The following example shows how to include the 'description' field as a cluster concept field.

```
var myIncidentData = new sn_ml.DatasetDefinition({
    'tableName' : 'incident',
    'fieldNames' : ['category', 'short_description',
 'description'],
});

var mySolution = new sn_ml.ClusteringSolution({
 'label': 'clustering_test',
 'dataset': myIncidentData,
 'inputFieldNames': ['short_description'],
 'clusterConceptFieldNames': ['description']
});

var solutionNameFromStore =
 sn_ml.ClusteringSolutionStore.add(mySolution);
var myClassifier = mySolution.submitTrainingJob();
```

ClusteringSolution - cancelTrainingJob()

Cancels a job for a solution object that has been submitted for training.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to cancel an existing training job.

```
var mySolution =
 sn_ml.ClusteringSolutionStore.get('ml_sn_global_global_clusteri
ng');

mySolution.cancelTrainingJob();
```

ClusteringSolution - getActiveVersion()

Gets the active ClusteringSolutionVersion object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Active *ClusteringSolutionVersion* object.

The following example shows how to get an active *ClusteringSolution* version from the store and return its training status.

```
var mlSolution =
 sn_ml.ClusteringSolutionStore.get('ml_x_snc_global_global_clust
ering');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getStatus()), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

ClusteringSolution - getAllVersions()

Gets all versions of a clustering solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	Existing versions of a solution object. See also *ClusteringSolutionVersion* API.

The following example shows how to get all *ClusteringSolution* version objects and call the *getVersionNumber()* and *getStatus()* solution version methods on them.

```
var mlSolution =
 sn_ml.ClusteringSolutionStore.get('ml_x_snc_global_global_clust
ering');

var mlSolutionVersions = mlSolution.getAllVersions();

for (i = 0; i < mlSolutionVersions.length; i++) {
gs.print("Version " + mlSolutionVersions[i].getVersionNumber() +
 " Status: " + mlSolutionVersions[i].getStatus() +"\n");
};
```

Output:

```
Version 3 Status:
 {"state":"solution_complete","percentComplete":"100","hasJobEnd
ed":"true"}

Version 2 Status:
 {"state":"solution_complete","percentComplete":"100","hasJobEnd
ed":"true"}

Version 1 Status:
 {"state":"solution_cancelled","percentComplete":"0","hasJobEnde
d":"true"}
```

ClusteringSolution - getLatestVersion()

Gets the latest version of a solution.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	*ClusteringSolutionVersion* object corresponding to the latest version of a *ClusteringSolution()*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to get the latest version of a solution and return its training status.

```
var mlSolution =
 sn_ml.ClusteringSolutionStore.get('ml_x_snc_global_global_clust
ering');

gs.print(JSON.stringify(JSON.parse(mlSolution.getLatestVersion()
.getStatus()), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

ClusteringSolution - getName()

Gets the name of the object to use for interaction with the store.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the solution object.

The following example shows how to update *ClusteringSolution* dataset information and print the name of the object.

```
// Update solution
var myIncidentData = new sn_ml.DatasetDefinition({
   'tableName' : 'incident',
   'fieldNames' : ['category', 'short_description', 'priority'],
   'encodedQuery' : 'activeANYTHING'
});

var eligibleFields =
 JSON.parse(myIncidentData.getEligibleFields('clustering'));

var myCluster = new sn_ml.ClusteringSolution({
   'label': "my clustering solution",
   'dataset' : myIncidentData,
   'inputFieldNames': eligibleFields['eligibleInputFieldNames'],
   'predictedFieldName': 'category'
});

// update solution
sn_ml.ClusteringSolutionStore.update('ml_x_snc_global_global_clu
stering_solution', myCluster);
```

```
// print solution name
gs.print('Solution Name: '+myCluster.getName());
```

Output:

```
Solution Name: ml_x_snc_global_global_clustering_solution
```

ClusteringSolution - getProperties()

Gets solution object properties.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Contents of the Dataset and *ClusteringSolution()* object details in the *ClusteringSolutionStore*. `{ "algorithmConfig": {Object}, "datasetProperties": {Object}, "domainName": "String", "groupByFieldName": "String", "inputFieldNames": [Array], "label": "String", "minRecordsPerCluster" : Number, "name": "String", "processingLanguage": "String", "scope": "String", "stopwords": [Array], "trainingFrequency": "String", "updateFrequency": "String" }`
<Object>.algorithmConfig	JavaScript object containing algorithm configuration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	properties. Property results vary by the value set in the *algorithm* property. `'algorithmConfig' : { "algorithm": "String", // See algorithmConfig.algorithm setting description for property settings based on algorithm }` Data type: Object.

<Object>.algorithmConfig.algorithm	Method for encoding your solution.
	Properties for *dbscan*:
	`'algorithmConfig': { "algorithm": "dbscan", "distanceMetric": "String", "epsilon": Number, "minimumNeighbours": Number }`
	Properties for *kmeans*:
	`'algorithmConfig': { "algorithm": "kmeans", "targetCoverage": Number }`
	Data type: String.

<Object>.algorithmConfig.distanceMetric	DBSCAN algorithm only. Distance metric to scan for similar data objects. Data type: String.
<Object>.algorithmConfig.epsilon	DBSCAN algorithm only. Decimal value between 0 and 1 representing the size of the neighborhood search radius.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Number.
<Object>.algorithmConfig.minimumNeighbours	DBSCAN algorithm only. Minimum number of neighbors required in a point to be a part of a cluster. For *`levenshteinDistance`* the value must be 1 so that no points are excluded from the dataset. Data type: Number.
<Object>.algorithmConfig.targetCoverage	K-means algorithm only. Percentile field to filter out records that are less similar to each other. Data type: Number.
<Object>.datasetProperties	Lists the properties of the *`DatasetDefinition()`* object associated with the solution. `{ "encodedQuery": "String", "fieldDetails": [Array], "fieldNames": [Array], "tableName": "String" }` Data type: Object.
<Object>.datasetProperties.tableName	Name of the table for the dataset. For example, `"tableName" : "Incident"`. Data type: String.
<Object>.datasetProperties.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Data type: Array.
<Object>.datasetProperties.fieldNames.fieldDetails	List of JavaScript objects that specify field properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>[
	  {
	  "name": "String",
	  "type": "String"
	  }
	]</pre>
	Data type: Array.

<Object>.datasetProperties.fieldNames.fieldDetails.<object>.name	Name of the field defining the type of information to restrict this dataset to. Data type: String.
<Object>.datasetProperties.fieldDetails.<object>.type	Machine-learning field type. Data type: String.
<Object>.datasetProperties.fieldDetails.encodedQuery	Encoded query string in standard Glide format. See Encoded query strings. Data type: String.
<Object>.domainName	Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String.
<Object>.groupByFieldName	Field name by which the system groups records into one or more clusters. Data type: String
<Object>.inputFieldNames	List of input field names as strings. The model uses these fields used to make predictions. Data type: String.

<Object>.label	Identifies the prediction task.
	<pre>{
	  "label": "my first prediction"
	}</pre>
	Data type: String.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.minRecordsPerCluster	Minimum number of records to allow in any cluster. Data type: Number.
<Object>.name	System-assigned name. Data type: String.
<Object>.predictedFieldName	Identifies a field to be trained for predictability. Data type: String.
<Object>.processingLanguage	Processing language in two-letter ISO 639-1 language code format. Data type: String.
<Object>.scope	Object scope. Currently the only valid value is `global`. Data type: String
<Object>.stopwords	Optional. Preset list of strings that the system automatically generates based on the *language* property setting. For details, see Create a custom stopwords list. Data type: Array.
<Object>.trainingFrequency	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once Data type: String.
<Object>.updateFrequency	The frequency at which the model for the solution definition must be rebuilt.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Possible values: • do_not_update • every_1_day • every_1_hour • every_6_hours • every_12_hours • every_1_minute • every_15_minutes • every_30_minutes Default: do_not_update Datatype: String

The following example gets properties of a solution object in the store.

```
var myCluster = new
 sn_ml.ClusteringSolutionStore.get("ml_x_snc_global_global_clust
ering_solution");

gs.print(JSON.stringify(JSON.parse(myCluster.getProperties()),
 null, 2));
```

Output:

```
*** Script: {
  "algorithmConfig": {
    "algorithm": "kmeans",
    "targetCoverage": "90"
  },
  "datasetProperties": {
    "tableName": "incident",
    "fieldNames": [
      "category",
      "short_description",
      "state",
      "description"
    ],
    "encodedQuery": "activeANYTHING"
  },
  "domainName": "global",
  "groupByFieldName": "category",
  "inputFieldNames": [
    "short_description"
  ],
  "label": "clustering solution",
  "minRecordsPerCluster": 2,
  "name": "ml_x_snc_global_global_clustering_solution",
  "processingLanguage": "en",
  "scope": "global",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "stopwords": [
    "Default English Stopwords"
  ],
  "trainingFrequency": "run_once",
  "updateFrequency": "do_not_update"
}}
```

ClusteringSolution - getVersion(String version)

Gets a solution by provided version number.

Parameters

Name	Type	Description
version	String	Existing version number of a solution.

Returns

Type	Description
Object	Specified version of the *ClusteringSolution()* object on which you can call *ClusteringSolutionVersion* API methods.

The following example shows how to get the training status of a solution by version number.

```
var mlSolution =
 sn_ml.ClusteringSolutionStore.get('ml_x_snc_global_global_clust
ering');

gs.print(JSON.stringify(JSON.parse(mlSolution.getVersion('1').ge
tStatus()), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

ClusteringSolution - setActiveVersion(String version)

Activates a specified version of a solution in the store.

Parameters

Name	Type	Description
version	String	Name of the *ClusteringSolution()* object version to activate. Activating this version deactivates any other version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to activate a solution version in the store.

```
sn_ml.ClusteringSolution.setActiveVersion("ml_incident_categoriz
ation");
```

ClusteringSolution - submitTrainingJob()

Submits a training job.

Note: Before running this method, you must first add a solution to the store using the *ClusteringSolutionStore - add()* method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	*ClusteringSolutionVersion* object corresponding to the *ClusteringSolution* being trained.

The following example shows how to create a dataset, apply it to a solution, add the solution to a store, and submit the training job.

```
// Create a dataset
var myData = new sn_ml.DatasetDefinition({

  'tableName' : 'incident',
  'fieldNames' : ['assignment_group', 'short_description',
 'description'],
  'encodedQuery' : 'activeANYTHING'

});

// Create a solution
var mySolution = new sn_ml.ClusteringSolution({

  'label': "my solution definition",
  'dataset' : myData,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames':['short_description']

});

// Add the solution to the store to later be able to retrieve
 it.
var my_unique_name =
 sn_ml.ClusteringSolutionStore.add(mySolution);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Train the solution - this is a long running job
var myClusterVersion = mySolution.submitTrainingJob();
```

ClusteringSolutionStore - Global

Enables storing and retrieving solutions.

The *ClusteringSolutionStore* API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

ClusteringSolutionStore - add(Object mlSolution)

Adds a new solution object to the store and returns a unique name.

Note: Label values do not need to be unique. For example, if you run this method with the same label 10 times, this method adds 10 different uniquely-named objects to the store.

Parameters

Name	Type	Description
mlSolution	ClusteringSolution	*ClusteringSolution()* object to add to the store.

Returns

Type	Description
String	System-generated solution name.

The following example shows how to add a solution to the store. Use *ClusteringSolution - submitTrainingJob()* to run the training job after adding it to the store.

```
// Create a dataset
var myData = new sn_ml.DatasetDefinition({

  'tableName' : 'incident',
  'fieldNames' : ['assignment_group', 'short_description',
 'description'],
  'encodedQuery' : 'activeANYTHING'

});

// get a trained encoder from the store
var myEncoder =
 sn_ml.EncoderStore.get('ml_x_snc_global_global_encoder');

// Create a solution
var mySolution = new sn_ml.ClusteringSolution({

  'label': "my solution definition",
  'dataset' : myData,
  'encoder' : myEncoder,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames':['short_description']

});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Add the solution to the store to later be able to retrieve
 it.
var my_unique_name =
 sn_ml.ClusteringSolutionStore.add(mySolution);
```

ClusteringSolutionStore - deleteObject(String name)

Removes a specified solution object from the store.

Parameters

Name	Type	Description
name	String	Name of the *ClusteringSolution()* object to be deleted.

Returns

Type	Description
None	

The following example shows how to delete a solution from the store.

```
sn_ml.ClusteringSolutionStore.deleteObject("ml_sn_global_global_
solution");
```

ClusteringSolutionStore - get(String name)

Gets a solution object from the store.

Parameters

Name	Type	Description
name	String	Name of a solution in the store.

Returns

Type	Description
Object	*ClusteringSolution* object. Returns an error if the object does not exist.

The following example shows how to get a solution object from the store using the *get()* method and view its training status using the ClusteringSolution - getActiveVersion() and ClusteringSolutionVersion - getStatus() methods.

```
// Get status
var mlSolution =
 sn_ml.ClusteringSolutionStore.get('ml_incident_categorization
');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getStatus(), null, 2)));
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
 "state":"solution_complete",
 "percentComplete":"100",
 "hasJobEnded":"true"
}
```

ClusteringSolutionStore - getAllNames(Object options)

Gets the names of all solution definition records in the store.

Parameters

Name	Type	Description
options	Object	Options for restricting results within the specified properties. `{ "label": "String", "domainName": "String", "scope": "String" };`
options.label	String	Optional. Label of your solution object.
options.domainName	String	Optional. Name of the domain for your solution object. Refer to Domain separation and Predictive Intelligence.
options.scope	String	Optional. Name of an application scope for your solution object.

Returns

Type	Description
Array	List of strings representing solution object names in the store.

In the following example, the *getAllNames()* method returns a list of all names in the store.

```
gs.print(JSON.stringify(JSON.parse(sn_ml.ClusteringSolutionStore
.getAllNames()), null, 2));
```

Output:

```
[
  "ml_x_snc_global_global_clustering_solution_1",
  "ml_x_snc_global_global_clustering_solution"
]
```

In the following example, the *getAllNames()* method returns only names associated with values set in the *options* parameter.

```
var options = {
  'label' : 'my solution definition',
  'domainName' : 'global',
  'scope' : 'global'
};
var solNames =
 sn_ml.ClusteringSolutionStore.getAllNames(options);
gs.print(JSON.stringify(JSON.parse(solNames), null, 2));
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
[
  "ml_x_snc_global_global_my_solution_definition"
]
```

ClusteringSolutionStore - update(String name, Object mlSolution)

Replaces an existing object in the store with the object passed as a parameter. The object name provided must be empty or match.

Parameters

Name	Type	Description
name	String	Name of the solution to update.
mlSolution	*ClusteringSol* *ClusteringSolution()* object properties to update.

Returns

Type	Description
None	

The following example shows how to update a solution object in the store.

```
var solutionUpdate = new sn_ml.ClusteringSolution({
  'label': 'my solution definition',
  'dataset' : myData,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames': ['short_description']
});

sn_ml.ClusteringSolutionStore.update('ml_sn_global_global_incide
nt_service', solutionUpdate);
```

ClusteringSolutionVersion - Global

The *ClusteringSolutionVersion* API is a scriptable object used in Predictive Intelligence stores.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

It is used for working with solution versions based on ClusteringSolution API objects in the ClusteringSolution store.

The system creates a solution version each time you train a solution definition. Most versions are created during scheduled solution training.

Methods in this API are accessible using the following *ClusteringSolution* methods:

- *getActiveVersion()*
- *getAllVersions()*
- *getLatestVersion()*
- *getVersion()*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ClusteringSolutionVersion - cancelUpdateJob()

Cancels an update job on a trainer.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to cancel an active training job that has been submitted using the *submitTrainingJob()* method.

```
var myCluster = new
 sn_ml.ClusteringSolutionStore.get("ml_x_snc_global_global_clust
ering_solution");
var mlSolutionVersion = myCluster.getActiveVersion();

mlSolutionVersion.cancelUpdateJob();
```

ClusteringSolutionVersion - deleteClusterAssignments(Object options)

Deletes cluster assignments from rows by position in table sequence or GlideDateTime.

Parameters

Name	Type	Description
options	Object	Object defining one option for deleting cluster assignments. **Note:** Only one delete option is valid.
options.updatedUntil	String	Deletes rows for clusters with `updated_since` values occurring before this value. Format must be provided as GlideDateTime. `{ "updatedUntil" : "String" }`
options.sequenceUntil	String	Deletes rows for clusters with `insert_sequence` values occurring before this value in the ML Cluster Detail [ml_cluster_detail] table. The sequence position starting point value is 1. `{ "sequenceUntil" : Number }`

Returns

Type	Description
Number	Number of rows deleted from the ML Cluster Detail [ml_cluster_detail] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to delete rows for clusters with `updated_since` time preceding `'2020-06-28 02:50:53'`.

```
var mlSolution =
 sn_ml.ClusteringSolutionStore.get("ml_x_snc_global_global_clust
ering_solution");

var mlSolutionVersion = mlSolution.getActiveVersion();

var options = {};
options.updatedUntil = '2020-06-28 02:50:53';

var results =
 mlSolutionVersion.deleteClusterAssignments(options);

gs.print("Number of deleted rows: "+results);
```

Output:

```
Number of deleted rows: 6417
```

The following example shows how to delete rows for clusters with `updated_since` that are sequentially positioned prior to 1000.

```
var mlSolution =
 sn_ml.ClusteringSolutionStore.get("ml_x_snc_global_global_clust
ering_solution");

var mlSolutionVersion = mlSolution.getActiveVersion();

var options = {};
options.sequenceUntil = 1000;

var results =
 mlSolutionVersion.deleteClusterAssignments(options);

gs.print("Number of deleted rows: "+results);
```

Output:

```
Number of deleted rows: 999
```

ClusteringSolutionVersion - getClusterAssignments(Object options)

Gets assignments for a clustering solution.

Parameters

Name	Type	Description
options	Object	Values to use to narrow down the returned results by group, level, system update times, and table row number within a clustering solution. Minimum of one argument must be specified. `{ "cluster_id": "String", "group_by": "String", "limit": Number,`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>"sequenceSince": Number,
		"sequenceUntil": Number,
		"topNPerCluster": Number,
		"updatedSince": "String",
		"updatedUntil": "String"
		}</pre>

options.cluster_id	String	Optional. Cluster ID of a trained solution in the Cluster Summary [ml_cluster_summary] table.
options.group_by	String	Optional. Identifies the segmentation field for which to retrieve cluster memberships, for example, assignment_group. This field provides the same grouping as options provided in the **Use Group By** check box in the **Clustering Definition** form. The information provided varies based on the table selected in the **Table** field. For more information, see Create and train a clustering solution .
options.limit	Number	Optional. Maximum number of cluster assignments to retrieve.
options.sequenceSince	Number	Starting position in a table sequence. Returns information for clusters with insert_sequence enabled and positioned after this value in the ML Cluster Detail [ml_cluster_detail] table. The sequence position starting point value is 1.
options.sequenceUntil	Number	Returns assignments for clusters with `insert_sequence` values occurring before this value in the ML Cluster Detail [ml_cluster_detail] table. The sequence position starting point value is 1.
options.topNPerCluster	Number	Number of top results to receive for each cluster.
options.updatedSince	String	Optional. Date and time. Returns information for clusters with `sys_updated_on` after the value provided in GlideDateTime.
options.updatedUntil	String	Optional. Date and time. Returns information for clusters with `sys_updated_on` before the value provided in GlideDateTime.

Returns

Type	Description

Array	List of objects containing cluster information in increasing order by cluster_id.
	<pre>[
	{
	"cluster_id": "String",
	"group_by": "String",
	"rec_display_id": "String",
	"rec_sys_id": "String"
	}
	]</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<object>.cluster_id	Unique cluster number within a solution of clusters.
<object>.group_by	If grouped, name of the segmentation field associated with this cluster.
<object>.rec_display_id	Record type and number.
<object>.rec_sys_id	Record sys_id.

The following example shows how to use the *options* object to filter clustering results.

```
var mlSolution =
 sn_ml.ClusteringSolutionStore.get("solution_name");

var mlSolutionVersion = mlSolution.getActiveVersion();

var options = {};
options.clusterId = 56;
options.topNPerCluster = 10;
options.updatedUntil = '2020-01-17 23:16:14';
options.updatedSince = '2020-01-17 23:16:13';
options.sequenceUntil = 1000;
options.sequenceSince = 1100;
options.limit = 100;

var results = mlSolutionVersion.getClusterAssignments(options)

gs.print(results);
```

Output:

```
[{"cluster_id":"1","rec_display_id":"Incident":
 "INC0014483","rec_sys_id":"04e33e7adb401300864adfea5e961900","g
roup_by":"network"},
 {"cluster_id":"1","rec_display_id":"Incident":
 "INC0011133","rec_sys_id":"5bd23af2db401300864adfea5e96194d","g
roup_by":"network"}]
```

ClusteringSolutionVersion - getClusterInfo(Object options)

Gets information for a specified clustering solution in the store. The purity measurement provides insights as a percentage for the clustering fields on which the purity is based.

Parameters

Name	Type	Description
options	Object	Optional. Object containing properties that enable filtering results within a clustering solution. `{ "clusterId": "String", "groupBy": "String", "limit": "String", "recSysId": "String", "sequenceSince": Number, "sequenceUntil": Number,`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>"updatedSince": "String",
		"updatedUntil": "String"
		}</pre>
		Default: Return cluster memberships for all clusters.

options.clusterId	String	Optional. Cluster ID of a trained solution in the Cluster Summary [ml_cluster_summary] table.
options.groupBy	String	Optional. Identifies the segmentation field for which to retrieve cluster memberships, for example, assignment_group. This field provides the same grouping as options provided in the **Use Group By** check box in the **Clustering Definition** form. The information provided varies based on the table selected in the **Table** field. For more information, see Create and train a clustering solution .
options.limit	Number	Optional. Maximum number of cluster assignments to retrieve.
options.recSysId	String	Optional. Sys_id of a record by which to find cluster information.
options.sequenceStart	Number	Starting position in a table sequence. Returns information for clusters with insert_sequence enabled and positioned after this value in the ML Cluster Detail [ml_cluster_detail] table. The sequence position starting point value is 1.
options.sequenceUntil	Number	Optional. Ending position in a table sequence. Returns assignments for clusters with `insert_sequence` values occurring before this value in the ML Cluster Detail [ml_cluster_detail] table. The sequence position starting point value is 1.
options.updatedSince	String	Optional. Date and time. Returns information for clusters with `sys_updated_on` after the value provided in GlideDateTime format.
options.updatedUntil	String	Optional. Date and time. Returns information for clusters with `sys_updated_on` before the value provided in GlideDateTime.

Returns

Type	Description

Array	List of objects containing cluster information.
	
	<pre>[
	{
	"cluster_concept": "String",
	"cluster_id": "String",
	"cluster_quality": "String",
	"cluster_size": "String",
	"group_by": "String",
	"insert_sequence": "String",</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"purity": "String",
	"sys_updated_on": "String"
	}
	]</pre>

<object>.cluster_concept	Set of words that describe the cluster in descending order of frequency. Data type: String
<object>.cluster_id	Unique cluster number within a solution of clusters.
<object>.cluster_quality	Number from 0 to 100. Higher numbers indicate higher cluster density. Data type: String
<object>.cluster_size	Number of records in a cluster. Data type: String
<object>.group_by	If grouped, name of the segmentation field associated with this cluster. Data type: String
<object>.insert_sequence	Sequential position number of the cluster in the Cluster Summary [ml_cluster_summary] table. Data type: String
<object>.purity	Percentage value representing the purity of cluster quality.
<object>.sys_updated_on	System GlideDateTime value representing the date and time at which this cluster was last updated. Data type: String

The following example shows how to set the options object parameter and print the filtered cluster results.

```
var mlSolution =
 sn_ml.ClusteringSolutionStore.get("ml_x_snc_global_global_clust
ering_solution");

ClusteringSolutionVersion - getProperties()

Gets solution object properties and version number.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Contents of the Dataset and ClusteringSolution version details. Results vary by object property setup. `{ "algorithmConfig": {Object}, "datasetProperties": {Object},`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>{
	  "domainName": "String",
	  "groupByFieldName": "String",
	  "inputFieldNames": [Array],
	  "isActive": Boolean,
	  "label": "String",
	  "minRecordsPerCluster": Number,
	  "name": "String",
	  "processingLanguage": "String",
	  "scope": "String",
	  "stopwords": [Array],
	  "trainingFrequency": "String",
	  "updateFrequency": "String",
	  "versionNumber": Number
	}</pre>

<Object>.algorithmConfig	JavaScript object containing algorithm configuration properties. Property results vary by the value set in the *algorithm* property.
	
	Data type: Object
	<pre>'algorithmConfig' : {
	  "algorithm": "String",
	  // See algorithmConfig.algorithm setting
	 description for property settings based on
	 algorithm
	}</pre>

<Object>.algorithmConfig.algorithm	Method for encoding your solution.
	
	Properties for *dbscan*:
	<pre>'algorithmConfig': {
	  "algorithm": "dbscan",
	  "distanceMetric": "String",
	  "epsilon": Number,
	  "minimumNeighbours": Number
	}</pre>
	Properties for *kmeans*:
	<pre>'algorithmConfig': {
	  "algorithm": "kmeans",
	  "targetCoverage": Number
	}</pre>
	Data type: String

<Object>.algorithmConfig.distanceMetric	DBSCAN algorithm only. Distance metric to scan for similar data objects. Data type: String
<Object>.algorithmConfig.epsilon	DBSCAN algorithm only. Decimal value between 0 and 1 representing the size of the neighborhood search radius.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Number
<Object>.algorithmConfig.minNumNeighbors	DBSCAN algorithm only. Minimum number of neighbors required in a point to be a part of a cluster. For *levenshteinDistance* the value must be 1 so that no points are excluded from the dataset. Data type: Number
<Object>.algorithmConfig.targetPercentile	K-means algorithm only. Percentile field to filter out records that are less similar to each other. Data type: Number
<Object>.datasetProperties	Lists the properties of the DatatsetDefinition object associated with the solution. `{ "encodedQuery": "String", "fieldDetails": [Array], "fieldNames": [Array], "tableName": "String" }` Data type: Object
<Object>.datasetProperties.encodedQuery	Encoded query string in standard Glide format. See Encoded query strings. Data type: String
<Object>.datasetProperties.fieldDetails	List of JavaScript objects that specify field properties. Data type: Array of Objects `[ { "name": "String", "type": "String" } ]`
<Object>.datasetProperties.tableName	Name of the field defining the type of information to restrict this dataset to. Data type: String
<Object>.datasetProperties.fieldDetails.type	Machine learning field type. Data type: String
<Object>.datasetProperties.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Array
<Object>.datasetProperties.tableName	Name of the table for the dataset. For example, `"tableName" : "Incident"`. Data type: String
<Object>.domainName	Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String
Object.groupByFieldName	Field name by which the system groups records into one or more clusters. Data type: String
Object.inputFieldNames	List of input field names as strings. The model uses these fields used to make predictions. Data type: String
<Object>.isActive	Flag that indicates whether this version is active. Valid values: • true: Version is active. • false: Version is not active. Data type: String
<Object>.label	Identifies the prediction task. `{ "label": "my first prediction" }` Data type: String
<Object>.minRecordsPerCluster	Minimum number of records to allow in any cluster. Data type: Number
<Object>.name	System-assigned name. Data type: String
<Object>.processingLanguage	Processing language in two-letter ISO 639-1 language code format. Data type: String
<Object>.scope	Object scope. Currently the only valid value is `global`. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.stopwords	Optional. Preset list of strings that the system automatically generates based on the *language* property setting. For details, see Create a custom stopwords list. Data type: Array
<Object>.trainingFrequency	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once Data type: String
<Object>.updateFrequency	The frequency at which the model for the solution definition must be rebuilt. Possible values: • do_not_update • every_1_day • every_1_hour • every_6_hours • every_12_hours • every_1_minute • every_15_minutes • every_30_minutes Default: do_not_update Data type: String
<Object>.versionNumber	Version number of the *ClusteringSolution* object.

The following example gets properties of the active object version in the store.

```
// Get properties
var mlSolution =
 sn_ml.ClusteringSolutionStore.get('ml_x_snc_global_global_clust
ering_solution');
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getProperties()), null, 2));
```

Output:

```
*** Script: {
  "algorithmConfig": {
    "algorithm": "kmeans",
    "targetCoverage": "90"
  },
  "datasetProperties": {
    "tableName": "incident",
    "fieldNames": [
      "category",
      "short_description",
      "state",
      "description"
    ],
    "encodedQuery": "activeANYTHING"
  },
  "domainName": "global",
  "groupByFieldName": "category",
  "inputFieldNames": [
    "short_description"
  ],
  "isActive": "true",
  "label": "clustering solution",
  "minRecordsPerCluster": 2,
  "name": "ml_x_snc_global_global_clustering_solution",
  "processingLanguage": "en",
  "stopwords": [
    "Default English Stopwords"
  ],
  "updateFrequency": "do_not_update",
  "versionNumber": "1"
}
```

ClusteringSolutionVersion - getStatus(Boolean includeDetails)

Gets training completion status.

Parameters

Name	Type	Description
includeDetails	Boolean	Flag that indicates whether to return status *details*. Valid values: • true: Return additional details. • false: Don't return additional details. Default: False

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	JavaScript object containing training status information for a ClusteringSolution object. `{ "state": "String", "percentComplete": "Number as a String", "hasJobEnded": "Boolean value as a String", "details": {Object} }`
<Object>.state	Training completion state. If the training job reaches a terminal state, the job does not leave that state. If the state is terminal, the *hasJobEnded* property is set to `true`. Possible values: • `fetching_files_for_training` • `preparing_data` • `retry` • `solution_cancelled` (terminal) • `solution_complete` (terminal) • `solution_error` (terminal) • `solution_incomplete` • `training_request_received` • `training_request_timed_out` (terminal) • `training_solution` • `uploading_solution` • `waiting_for_training` Data type: String
<Object>.hasJobEnded	Flag that indicates whether training is complete. Valid values: • true: Training is complete. • false: Training is incomplete. Data type: Boolean value as a String
<Object>.percentComplete	Training percent complete. If the completion percentage is less than 100, the job might be in a terminal state. For example, if training times out. Data type: Number as a String Range: 0 thru 100
<Object>.details	Object containing a list of additional training details.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Object

The following example shows a successful result with training complete.

```
// Get status
var mlSolution =
 sn_ml.ClusteringSolutionStore.get('ml_x_snc_global_global_clust
er_solution');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getStatus(true), null, 2)));
```

Output:

```
{
 "state":"solution_complete",
 "percentComplete":"100",
 "hasJobEnded":"true",
 "details":{"stepLabel":"Solution Complete"} // This information
 is only returned if getStatus(true);
}
```

The following example shows an unsuccessful result with training complete.

```
// Get status
var solutionName = 'ml_x_snc_global_global_cluster_solution';
var mlSolution =
 sn_ml.ClusteringSolutionStore.get(solutionName);
var trainingStatus = mlSolution.getLatestVersion().getStatus();

gs.print(JSON.stringify(JSON.parse(trainingStatus), null, 2));
```

Output:

```
{
 "state":"solution_error",
 "percentComplete":"100",
 "hasJobEnded":"true"
}
```

ClusteringSolutionVersion - getTopNPurityInfo(Object options)

Gets the top purity results for a clustering solution. The purity measurement provides insights as a percentage for the clustering fields on which the purity is based.

Parameters

Name	Type	Description
options	Object	Options that determine the number and format of the top cluster purity results. `{ "clusterIds": [Array],`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>{
		  "groupBy": [Array],
		  "purityFields": [Array],
		  "topN": Number,
		  "topNFields": Number
		}</pre>

options.clusterIds	Array	Optional. List of cluster IDs provided as strings. A cluster ID is provided in the Cluster Summary [ml_cluster_summary] table. If provided, this method returns purity cluster information for each specified cluster. Default: This method returns purity information for all clusters.
options.groupBy	Array	Optional. List of group_by field strings from your table to help the system identify the class which is most frequent in the cluster. If provided, returns purity information for cluster solutions using group_by fields. The Cluster Summary [ml_cluster_summary] table lists clusters and any associated Group by values. This field only applies to clusters that use group by in the clustering definition. Eligible fields are listed in the **Table** field. For details on the group by feature, refer to Create and train a clustering solution.
options.purityFields	Array	Optional. List of purity field strings. If provided, this method only returns information for these purity fields. You can view purity values for a cluster in the Cluster Summary [ml_cluster_summary] table lists. **Note:** If both *purity_fields* and *top_n_fields* are provided, this method returns *top_n_fields* first, then selects fields from *purity_fields*. Default: Return purity information for all purity fields saved for the cluster.
options.topN	Number	Optional. Restricts the number of predictions to return to the highest values for each purity field. Maximum value: 10 Default: Return all purity information for each purity field.
options.topNFields	Number	Optional. Restricts the number of purity fields returned to fields with the highest purity for each cluster. Maximum value: 10 Default: Return all fields in the cluster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	JSON-formatted string containing a list of clusters with purity fields and details. **Note:** Results vary based on settings made in the *options* input parameter. The following information illustrates how cluster purity results are sorted and categorized. Refer to the example for actual output. `{ "<clusterID>":[ // List sorted by purity per field { "<fieldName>":[ // List sorted by purity per field value {"<field_val1_1>":"<purity>"}, // Additional field values ]}, // Additional fields ], // Additional clusters }`
String.<clusterID>	List of clusters arranged in descending order by purity value per cluster. Data type: Array
String.<clusterID>.<field>	List of objects representing purity fields arranged in descending order by purity value per field. The *options.top_n_fields* input object parameter property determines the number of fields returned. `"<field>":[{"<field_val>":"<purity>"}]}` Data type: Array
String.<clusterID>.<field>.<field_val>	List of objects containing field value and purity. For example, `{"priority":[{"5":"100"}]}` is a priority field with a score of 5 and a purity value of 100 percent. Results list in descending order by purity percentage. The *options.top_n* input object parameter property determines the number of results returned. Data type: Array

The following example shows how to get the top two purity results for the category field in specific cluster solutions.

```
var solution = new GlideRecord('ml_solution');
solution.addQuery('sys_id', '<clustering_solution_sys_id>');
solution.addQuery('active', 'true');
solution.query();

while (solution.next()) {

  var options = {};
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  options.clusterIds = ['1', '3', '5'];
  options.purityFields = ['category'];
  options.topN = '2';
  options.topNFields = '2';

  var clustering = new
 sn_ml.ClusteringSolutionVersion(solution);
  var results = clustering.getTopNPurityInfo(options);

  gs.info(results);
}
```

Output displays purity insights based on the settings provided in the options parameter.

```
{"1":[{"category":[{"network":"99.96"},{"inquiry":"0.04"}]}],"
3":[{"category":[{"Systems Engineering":"100"}]}],
"5":[{"category":[{"Security":"100"}]}]}
```

ClusteringSolutionVersion - getUpdateStatus()

Gets the status of the most recent clustering solution update job.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	State of the clustering solution update. States: • Configuration or network error • Error while updating solution • Fetching files for updating • Preparing data • Unauthorized • Update complete • Updating is cancelled • Updating request received • Updating request timed out • Updating solution • Uploading • Waiting

The following example shows how to get the update status of a clustering solution.

```
var myCluster = new
 sn_ml.ClusteringSolutionStore.get("ml_x_snc_global_global_clust
ering_solution");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.print(JSON.stringify(myCluster.getActiveVersion().getUpdateSt
atus()));
```

Output:

```
"Update Complete"
```

ClusteringSolutionVersion - getVersionNumber()

Gets the version number of a solution object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Version number.

The following example shows how to get a version number.

```
// Get version number
var mlSolution =
 sn_ml.ClusteringSolutionStore.get('ml_x_snc_global_global_clust
ering_solution');

gs.print("Version number:
 "+JSON.stringify(JSON.parse(mlSolution.getActiveVersion().getVe
rsionNumber()), null, 2));
```

Output:

```
Version number: 1
```

ClusteringSolutionVersion - submitUpdateJob(Object options)

Submits clustering update jobs with options to narrow results to a specific table and filter for matching records.

Parameters

Name	Type	Description
options	Object	JavaScript object containing options on which to base a clustering solution update. `{ "filter" : "String", "table" : "String" }`
options.filter	String	Encoded query string in standard Glide format. See Encoded query strings. Enables running an update job based on the filter provided.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
options.table	String	Name of the table on which to run an update job.

Returns

Type	Description
None	

The following example shows how to submit an update job.

```
var myCluster = new
 sn_ml.ClusteringSolutionStore.get("ml_x_snc_global_global_clust
ering_solution");

var options = {"filter" : "precision", "table" : "incident"};

myCluster.getActiveVersion().submitUpdateJob(options);
```

CMDBDuplicateTaskUtils - Global

The *CMDBDuplicateTaskUtils* script include provides methods to create a de-duplication task that contains duplicate configuration items (CIs) that are of independent type.

A de-duplication task can only contain Configuration Management Database (CMDB) CIs that are not in another de-duplication task.

CMDBDuplicateTaskUtils - CMDBDuplicateTaskUtils()

Creates an instance of the *CMDBDuplicateTaskUtils* class.

Parameters

Name	Type	Description
None		

```
/**
 * CMDBDeduplicateTaskUtil().createDeduplicateTask() example
 *
 * OVERVIEW
 *
 * This script will allow you to search the CMDB
 * for records that may be duplicates based on the field
 * and filter definitions of your chosing
 *
 */

try {

    //SET INITIAL VARIABLES

    //Set the table that you would like to check for duplicates
 - note this MUST be a CMDB table
    var cmdbTable = 'cmdb_ci';
```

Dedupe Task Script: >>>Created de-duplication task DUP0001002
 for MacBook Pro 15"
```

CMDBDuplicateTaskUtils - createDuplicateTask(String sysIDs)

Create a de-duplication task in which the sys_ids of duplicate CIs are specified.

Parameters

Name	Type	Description
sysIDs	String	A comma-separated list of sys_ids for which to create a de-duplication task.

Returns

Type	Description
String	The sys_id of the created de-duplication task. Returns null if: • The input string is empty. • The input parameter contains a sys_id that is not in the cmdb_ci table. • The input parameter contains a sys_id that is in an open de-duplication task

```
// where <sys-id1> and <sys-id2> are sys_IDs of CIs in the
 cmdb_ci table
```

```
var sysIDs = '<sys-id1>,<sys-id2>';
var dupTaskUtil = new CMDBDuplicateTaskUtils();
var deDupTaskID = dupTaskUtil.createDuplicateTask(sysIDs);
gs.info(deDupTaskID);
```

Output (unique sys_id):

```
04c53e2c1bac411079e52131604bcba9
```

CMDBDuplicateTemplateUtil - Global

The *CMDBDuplicateTemplateUtil* script include provides methods to add and remove de-duplication tasks to/from a de-duplication template.

For more information on de-duplication of CIs, de-duplication tasks, and de-duplication templates, see Duplicate CIs remediation.

CMDBDuplicateTemplateUtils - CMDBDuplicateTemplateUtils()

Creates an instance of the *CMDBDuplicateTemplateUtils* class.

Parameters

Name	Type	Description
None		

The following code example shows how to call this method to create a CMDBDuplicateTemplateUtils object.

```
var dupTemp = new CMDBDuplicateTemplateUtils();
```

CMDBDuplicateTemplateUtils - addTasksToTemplate(String templateId, Array taskIds)

Adds one or more de-duplication tasks to a specified de-duplication template.

This method overwrites any existing template values, but logs the previous values for each template in the system logs.

The following list describes scenarios where a task isn't added to a template and is then marked as either skipped or failed:

- The specified template isn't in the published state. All tasks are marked as skipped.
- The specified template is running. All tasks are marked as skipped.
- The task isn't in the open state. The task is marked as skipped.
- The task isn't compatible with the specified template. For example, the specified template might be created for Application Server Tomcat, but the specified de-duplication task is created for Linux Server. The task is marked as skipped.
- The specified template doesn't exist. All tasks are marked as failed.
- The GlideRecord update for the template column on the task fails. The task is marked as failed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
templateId	String	Sys_id of the de-duplication template to associate with the de-duplication task.
taskIds	Array	List of sys_ids of the de-duplication tasks to associate with the specified template.

Returns

Type	Description
Object	Result object containing the status of all the tasks that were attempted to be associated with the specified template. Data type: Object `{ "failed": [Array], "skipped": [Array], "success": [Array], "summary": "String" }`
failed	List of tasks that failed to be associated with the template. Data type: Array of Objects `"failed": [ { "message": "String", "messageType: "String", "taskId": "String" } ]`
failed.message	Message that describes why the task failed to be associated with the template. Data type: String
failed.messageType	Reason for the failure. Data type: String
failed.taskId	Sys_id of a task that failed to be associated with the template. Data type: String
skipped	List of tasks that didn't fail, but weren't associated with the template (skipped). Data type: Array of Objects `"skipped": [ { "message": "String",`

Returns (continued)

Type	Description

	<pre>"messageType: "String",
	"taskId": "String"
	}
	]</pre>

skipped.message	Message that describes why the task was skipped. Data type: String
skipped.messageType	Reason for the task being skipped. Data type: String
skipped.taskId	Sys_id of a task that the method skipped associated with the template. Data type: String

success	List of tasks that were successfully associated with the template.
	
	Data type: Array of Objects
	<pre>"success": [
	{
	"message": "String",
	"messageType: "String",
	"taskId": "String"
	}
	]</pre>

success.message	Not currently in use. Data type: String
success.messageType	Not currently in use. Data type: String
success.taskId	Sys_id of a task that was associated with the template. Data type: String
summary	Brief description of any overall processing errors that occurred, such as if the specified template doesn't exist. Data type: String

The following code example shows how to call this method to add de-duplication tasks to a de-duplication template.

```
// Add tasks to template
var taskIds = [];
taskIds.push("96d2d25113152200eef2dd828144b0a4");
taskIds.push("f785a2c3d7012201de92a5f75e610398");
taskIds.push("635dd3dbc128ce0100655f1ec66ed41d");
```

      "message": "Cannot add de-duplication task(s) to template
 6b43105c37301000deeabfc8bcbe5db2 because the template is not
 published. Publish the template before adding tasks.",
      "messageType": "unpublished_template"
    }
  ]
Summary:
```

CMDBDuplicateTemplateUtils - removeTemplateFromTask(Array taskIds)

Clears the de-duplication template value in the specified de-duplication task records. By clearing this value, the association between a template and the task is removed.

The following list describes scenarios where the template value isn't removed from the task record and is marked as either skipped or failed:

- The de-duplication template associated with the task is running. The task is marked as skipped.
- The task state is "work in progress" or the task isn't found. The task is marked as skipped.
- The GlideRecord update for the template column on the task fails. The task is marked as failed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
taskIds	Array	List of sys_ids of the de-duplication task records from which to clear the de-duplication template value.

Returns

Type	Description
Object	Result object containing the count of tasks for which the template value removal was successful, skipped, or failed. `{ "failed": Number, "success": Number, "skipped": Number }`
failed	Number of tasks that failed to remove the de-duplication template value. Data type: Number
success	Number of tasks that successfully removed the de-duplication template value. Data type: Number
skipped	Number of tasks that the method skipped removing the de-duplication template value. Data type: Number

The following code example shows how to call this method to remove de-duplication template values from de-duplication task records.

```
// Remove tasks from template
var taskIds = [];
taskIds.push("96d2d25113152200eef2dd828144b0a4");
taskIds.push("f785a2c3d7012201de92a5f75e610398");
taskIds.push("635dd3dbc128ce0100655f1ec66ed41d");

var result = new
 CMDBDuplicateTemplateUtils().removeTemplateFromTasks(taskIds);
);
gs.info('Success: ' + result.success);
gs.info('Failed: ' + result.failed);
gs.info('Skipped: ' + result.skipped);
```

Output:

```
Success: 2
Failed: 0
Skipped: 1
```

CMDBGroupAPI - Scoped

The *CMDBGroupAPI* provides methods for performing actions on Configuration Management Database (CMDB) groups.

This API is a scoped static class. To use this class you must include the `sn_cmdbgroup` namespace identifier before the CMDBGroupAPI object. For example:

```
var response =
 sn_cmdbgroup.CMDBGroupAPI.getManualCIList(groupSysId, false);
```

To access this API you must have the itil or asset role.

CMDBGroupAPI - getAllCI(String groupId, Boolean requireCompleteSet, Boolean requireAllQueryNodesCis)

Returns all configuration items (CIs) for the specified group. The results include all manual CIs and the list of CIs from the query builder's saved query.

Parameters

Name	Type	Description
groupId	String	Sys_id of the Configuration Management Database (CMDB) group.
requireCompleteSet	Boolean	Optional, but must be passed if *requireAllQueryNodesCis* is passed. Flag that indicates whether an empty string is returned if any CIs are filtered out by access control list (ACL) restrictions. Valid values: • true: Return empty string. • false: Don't return value. Default: false
requireAllQueryNodesCis	Boolean	Optional. Flag that indicates whether to return CIs from all CMDB classes of the query. Valid values: • true: Return CIs from all columns. • false: Only return CIs from the starting node of the query builder query. Default: false

Returns

Type	Description
errors	List of errors for a failed operation. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.

Returns (continued)

Type	Description

	<pre>"errors": [
	  {
	  "message": "String",
	  "error": "String"
	  }
	]</pre>

errors.error	Error name. Possible values: • GROUP_SYS_ID_IS_NOT_FOUND • GROUP_SYS_ID_IS_EMPTY • FAIL_TO_INSERT_GROUP_CI_PAIR • FAIL_TO_INSERT_GROUP_QUERY_ID_PAIR • CI_CAN_NOT_FOUND • SAVED_QUERY_ID_NOT_FOUND • ERROR_DURING_QUERY_BUILDER_PROCESS_QUERY • TIMEOUT_DURING_QUERY_BUILDER_PROCESS_QUERY • NOT_COMPLETE_DURING_QUERY_BUILDER_PROCESS_QUERY • MAX_LIMIT_DURING_QUERY_BUILDER_PROCESS_QUERY • GROUP_API_TIMEOUT • EXCEPTION_FROM_EXECUTE_QUERY • SOME_CI_NOT_VISIBLE_DUE_TO_SECURITY_CONSTRAINT Data type: String
errors.message	Brief description of the error message. Data type: String
idList	List of CMDB CI sys_ids. Data type: Array
partialCIListDueToACLFlag	Flag that indicates if the list of returned CIs is incomplete due to ACL restrictions. **Note:** This is not considered an error condition, and no corresponding error information is returned. Data type: Boolean Valid values: • true: *idList* is incomplete. • false: *idList* is complete.
result	Flag that indicates whether the method completed successfully.

CMDBGroupAPI - getAllCIFromQueryBuilder(String groupId, Boolean requireCompleteSet, Boolean requireAllQueryNodesCis)

Returns all configuration items (CIs) returned from all saved query builders' query IDs for the specified group.

Parameters

Name	Type	Description
groupId	String	Sys_id of the Configuration Management Database (CMDB) group.
requireCompleteSet	Boolean	Optional, but must be passed if *`requireAllQueryNodesCis`* is passed. Flag that indicates whether an empty string is returned if any CIs are filtered out by access control list (ACL) restrictions. Valid values: • true: Return empty string. • false: Don't return value. Default: false
requireAllQueryNodesCis	Boolean	Optional. Flag that indicates whether to return CIs from all CMDB classes of the query. Valid values: • true: Return CIs from all columns. • false: Only return CIs from the starting node of the query builder query. Default: false

Returns

Type	Description
errors	List of errors for a failed operation. Data type: Array `"errors": [ { "message": "String", "error": "String" } ]`
errors.error	Error name. Possible values:

  'idList':[]
}
```

CMDBGroupAPI - getManualCIList(String groupId, Boolean requireCompleteSet)

Returns the CMDB group's manual CI list.

Parameters

Name	Type	Description
groupId	String	The sysId of the CMDB group.
requireCompleteSet	Boolean	When true, returns an error string if any CIs are filtered out by ACL restrictions.

Returns

Type	Description
String	A JSON formated string in the format

CMDBGroupAPI - getSavedQueryIdList(String groupId, Boolean requireCompleteSet)

Returns the query builder's query IDs for the specified CMDB group.

Parameters

Name	Type	Description
groupId	String	The sysId of the CMDB group.
requireCompleteSet	Boolean	When true, returns an empty string if any CIs are filtered out by ACL restrictions.

Returns

Type	Description

String	A JSON formated string in the format
	`{ 'result':false,`
	`'errors':[ {'message':'Group does not exist',`
	`'error':'GROUP_SYS_ID_IS_NOT_FOUND'},`
	`{ } // another error if it exists`

CMDBGroupAPI - setManualCIList(String groupId, String ciSysIds)

Sets the manual CI list for the specified group. The existing manual CI list is overwritten. CI sysIds not found in the cmdb_ci table are ignored.

Parameters

Name	Type	Description
groupId	String	The sysId of the CMDB group.
ciSysIds	String	Comma separated list of CI sysIds.

Returns

Type	Description
String	A JSON formated string in the format `{ 'result':false, 'errors':[ {'message':'Group does not exist', 'error':'GROUP_SYS_ID_IS_NOT_FOUND'}, { } // another error if it exists ], 'partialCIListDueToACLFlag':false, 'idList':['sys_id_1', 'sys_id2'] }` Where • result - a boolean flag. When true the method was successful. • errors - a list of errors with a message and error code. • partialCIListDueToACLFlag - a Boolean flag. When true, the idList is incomplete due to an ACL restriction. When false, the idList is complete. • idList - an array of cmdb_ci sys_ids When not successful, returns one of the errors GROUP_SYS_ID_IS_NOT_FOUND, GROUP_SYS_ID_IS_EMPTY, FAIL_TO_INSERT_GROUP_CI_PAIR, FAIL_TO_INSERT_GROUP_QUERY_ID_PAIR, CI_CAN_NOT_FOUND, SAVED_QUERY_ID_NOT_FOUND, ERROR_DURING_QUERY_BUILDER_PROCESS_QUERY, TIMEOUT_DURING_QUERY_BUILDER_PROCESS_QUERY, NOT_COMPLETE_DURING_QUERY_BUILDER_PROCESS_QUERY, MAX_LIMIT_DURING_QUERY_BUILDER_PROCESS_QUERY, GROUP_API_TIMEOUT, EXCEPTION_FROM_EXECUTE_QUERY, SOME_CI_NOT_VISIBLE_DUE_TO_SECURITY_CONSTRAINT

```
// Script example:
var setManualCIListFunc = function(groupSysId, manualCIList) {
    var parser = new JSONParser();
    var response =
 sn_cmdbgroup.CMDBGroupAPI.setManualCIList(groupSysId,
 manualCIList);
    var parsed = parser.parse(response);
    if (parsed.result) {
        gs.info("succeed to set manual ci list");
    } else {
```

```
        gs.info("fail to set manual ci list, errors: " +
 JSON.stringify(parsed.errors));
    }
}
var group = "d0d2d25113152200eef2dd828144b0e4";
var groupDoesNotExist = "1234";
var manualCIList = "b4fd7c8437201000deeabfc8bcbe5dc1,
 affd3c8437201000deeabfc8bcbe5dc3";
setManualCIListFunc(group, manualCIList);
setManualCIListFunc(groupDoesNotExist, manualCIList);
```

Output: (Line breaks added for formatting.)

```
succeed to set manual ci list
fail to set manual ci list, errors: [{"message":"Group does not
 exist","error":
"GROUP_SYS_ID_IS_NOT_FOUND"}]
```

CMDBGroupAPI - setSavedQueryIdList(String groupId, String queryIds)

Sets the saved query ID list for the specified group. The existing query ID list is overwritten. Query sysIds not found in the qb_saved_query table are ignored.

Parameters

Name	Type	Description
groupId	String	The sysId of the CMDB group.
queryIds	String	Comma separated list of saved query sysIds.

Returns

Type	Description
String	A JSON formated string in the format `{ 'result':false, 'errors':[ {'message':'Group does not exist', 'error':'GROUP_SYS_ID_IS_NOT_FOUND'}, { } // another error if it exists ], 'partialCIListDueToACLFlag':false, 'idList':['sys_id_1', 'sys_id2'] }` Where • result - a boolean flag. When true the method was successful. • errors - a list of errors with a message and error code. • partialCIListDueToACLFlag - a Boolean flag. When true, the idList is incomplete due to an ACL restriction. When false, the idList is complete. • idList - an array of cmdb_ci sys_ids When not successful, returns one of the errors GROUP_SYS_ID_IS_NOT_FOUND, GROUP_SYS_ID_IS_EMPTY, FAIL_TO_INSERT_GROUP_CI_PAIR, FAIL_TO_INSERT_GROUP_QUERY_ID_PAIR, CI_CAN_NOT_FOUND, SAVED_QUERY_ID_NOT_FOUND, ERROR_DURING_QUERY_BUILDER_PROCESS_QUERY,

```

CMDBQBScopedScriptableAPI - Scoped

Provides methods to execute Configuration Management Database (CMDB) Query Builder operations in server-side scripts.

This API is the scoped equivalent of CMDBQueryBuilderAPI - Global.

This API requires the Configuration Management for Scoped Apps plugin (com.snc.cmdb.scoped) and is provided within the `sn_cmdb` namespace.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about CMDB Query Builder, see CMDB Query Builder.

CMDBQBScopedScriptableAPI - createReport(String savedQueryId, String savedQueryName)

Creates a report that shows the results of a Configuration Management Database (CMDB) Query Builder query and returns the URL of the report.

Parameters

Name	Type	Description
savedQueryId	String	Sys_id of the query to use for the report. This parameter is not required if a query name is provided. Table: Saved Queries [qb_saved_query]
savedQueryName	String	Name of the query to use for the report. This parameter is not required if a query sys_id is provided. Table: Saved in the **Name** field of the Saved Queries [qb_saved_query] table.

Returns

Type	Description
Object	Details about the created report and any errors. `{ "error": "String", "message": "String", "status": "String" }`
<Object>.error	Error code. Returned when the report creation fails or invalid input parameters are provided. Possible errors: • `USER_NOT_AUTHORIZED_EXCEPTION` • `INVALID_PARAM` • `QUERY_SYS_ID_INVALID` • `REPORT_INELIGIBLE` Data type: String
<Object>.message	Message containing details about the success or failure of the report creation. Possible messages: • `<report-url>` • `User is unauthorized to create a CMDBQueryBuilder query report`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `Invalid Parameters. Please provide either a valid sysId or a valid name of a saved query` • `Invalid queryId. Please provide a valid saved query ID` • `Query must have a schedule with at least one run to create a report.` See also Schedule a CMDB query. Data type: String
<Object>.status	Status code. Returned when the update is successful. Value: `success` Data type: String

This example shows how to create a report by passing a saved query name.

```
var queryReport =
 sn_cmdb.CMDBQBScopedScriptableAPI.createReport('','CMDBQueryTes
t1');

gs.info(JSON.stringify(queryReport, null, 2));
```

Output:

```
{

 "message":"\/sys_report_template.do?sysparm_report_source_id=6d
299cf81bbd4210bccf42a3b24bcb7a&sysparm_type=list&sysparm_title=C
MDBQueryTest1&sysparm_source_type=source&sysparm_from_list=true&
sysparm_chart_size=large&sysparm_manual_labor=true",
   "status":"success"
}
```

This example shows an error when the query sys_id and name are both missing from the method call.

```
var queryReport =
 sn_cmdb.CMDBQBScopedScriptableAPI.createReport('', '');

gs.info(JSON.stringify(queryReport, null, 2));
```

Output:

```
{
   "error":"INVALID_PARAM",
   "message":"Invalid Parameters. Please provide either a valid
 sysId or a valid name of a saved query"
}
```

CMDBQBScopedScriptableAPI - deleteQuery(String savedQueryId, String savedQueryName)

Deletes a Configuration Management Database (CMDB) Query Builder query.

Parameters

Name	Type	Description
savedQueryId	String	Sys_id of the query to delete. This parameter can be provided as an empty string if a query name is provided. Table: Saved Queries [qb_saved_query]
savedQueryName	String	Name of the query to delete. This parameter is not required if a query sys_id is provided. Table: Saved in the *Name* field of the Saved Queries [qb_saved_query] table.

Returns

Type	Description
Object	Details about the deleted query and any errors. `{ "error": "String", "message": "String", "status": "String" }`
<Object>.error	Error code. Returned when the delete operation fails or invalid input parameters are provided. Possible errors: • `USER_NOT_AUTHORIZED_EXCEPTION` • `INVALID_PARAM` • `QUERY_DELETE_FAILED` Data type: String
<Object>.message	Message containing details about the success or failure of the delete operation. Possible messages: • `Successfully deleted the saved query` • `User is unauthorized to delete a CMDBQueryBuilder query` • `Invalid Parameters. Please provide either a valid sysId or a valid name of a saved query` • `Failed to delete the given saved query`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.status	Status code. Returned when the update is successful. Value: `success` Data type: String

This example shows how to delete a saved query by passing the query name.

```
gs.info(JSON.stringify(sn_cmdb.CMDBQBScopedScriptableAPI.deleteQ
uery('', 'CMDBQueryTest1')));
```

Output:

```
{
   "message":"Successfully deleted the saved query",
   "status":"success"
}
```

This example shows an error when the query sys_id and name are both missing from the method call.

```
gs.info(JSON.stringify(sn_cmdb.CMDBQBScopedScriptableAPI.deleteQ
uery('', '')));
```

Output:

```
{
   "error":"INVALID_PARAM",
   "message":"Invalid Parameters. Please provide either a valid
 sysId or a valid name of a saved query"
}
```

CMDBQBScopedScriptableAPI - getSavedQueryExecutionDetails(String savedQueryName, Boolean executeQuery, Number timeout)

Returns the execution details for a Configuration Management Database (CMDB) Query Builder query.

Optionally, you can execute the query in order to return current execution details.

If a timeout or memory issue occurs while executing the query, you can fine tune the query batch size to help alleviate these problems. For more information, see Batch size for Query Builder saved queries.

Parameters

Name	Type	Description
savedQueryName	String	Name of the query to retrieve execution details for. Table: *Name* field in the Saved Queries [qb_saved_query] table.
executeQuery	Boolean	Optional. Flag that indicates whether to execute the specified query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • true: Execute the specified query and return its execution details. • false: Don't execute the specified query. Return the most recent execution details for the query. Default: False
timeout	Number	Optional. Integer value that overrides the default query execution timeout limit of five minutes. Unit: Seconds Default: Five minutes

Returns

Type	Description
Object	Details about the query execution and any errors. `{ "error": "String", "execution_batch_size": Number, "message": "String", "query_id": "String", "status": "String", "table_name": "String" }`
<Object>.error	Error code. Returned when the query execution fails or the specified query is not found. Possible errors: • `QUERY_EXECUTION_NOT_FOUND` • `QUERY_NOT_FOUND` • `QUERY_EXECUTION_FAILED` • `USER_NOT_AUTHORIZED_EXCEPTION` Data type: String
<Object>.message	Message containing details about the error code. Returned when the query execution fails or the specified query is not found. Possible messages:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `Query execution details not found. Please execute the query.` • `Given saved query not found. Please make sure you are passing the name of a saved query.` • `Query execution failed. Please use a valid query.` • `User is unauthorized to execute a CMDBQueryBuilder query.` Data type: String
<Object>.query_id	Sys_id of the query execution. Data type: String Table: Query Status [qb_query_status]
<Object>.status	Status of the query execution. • COMPLETE: Execution is complete. • FAILED: Error occurred while executing query. • TIME_OUT: Query execution timed out. • MAX_LIMIT: Maximum number of return results reached. Data type: String
<Object>.table_name	Name of the table that contains the query execution details. Data type: String

This example shows how to execute a saved query and set the query execution timeout value to 10 minutes.

```
var savedQuery =
 sn_cmdb.CMDBQBScopedScriptableAPI.getSavedQueryExecutionDetails
('CMDBQueryTest1', true, 600);

gs.info(JSON.stringify(savedQuery, null, 2));
```

Output:

```
{
   "execution_batch_size": 100,
   "query_id":"024fd53a7773330033b5270bba106141",

 "table_name":"u_cmdb_qb_result_598918aacb4dbf3f1a8dcf03fce6a5d5
7151a4e2",
   "status":COMPLETE
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CMDBQBScopedScriptableAPI - saveQuery(String savedQueryName, String queryJson)

Saves a Configuration Management Database (CMDB) Query Builder query and returns the sys_id of the saved query.

Parameters

Name	Type	Description
savedQueryName	String	Name to save the query under. Table: Saved in the **Name** field of the Saved Queries [qb_saved_query] table.
queryJson	String	JSON that defines the query. Table: Saved in the **Query** field of the Saved Queries [qb_saved_query] table.

Returns

Type	Description
Object	Object containing details about the saved query and any errors. `{ "error": "String", "message": "String", "status": "String" }`
<Object>.error	Error code. Returned when the save operation fails or invalid input parameters are provided. Possible errors: • `USER_NOT_AUTHORIZED_EXCEPTION` • `QUERY_NAME_INVALID` • `QUERY_INVALID` • `QUERY_EXISTS_ALREADY` • `QUERY_SAVE_FAILED` Data type: String
<Object>.message	Message containing details about the success or failure of the save operation. Possible messages: • `Successfully saved the query with sysId <sy_id>` • `User is unauthorized to save a CMDBQueryBuilder query` • `Query name is empty. Please provide a name`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `QueryJson is invalid. Please provide a valid queryJson` • `Query name is already used, please use a different name` • `Unexpected exception while saving the query` Data type: String
<Object>.status	Status code. Returned when the save operation is successful. Value: `success` Data type: String

This example shows how to add a query to the Saved Queries [qb_saved_query] table.

```
var queryJson =

   "message":"QueryJson is invalid. Please provide a valid
 queryJson"
}
```

CMDBQBScopedScriptableAPI - updateQuery(String savedQueryId, String savedQueryName, String queryJson)

Updates the JSON for a Configuration Management Database (CMDB) Query Builder query.

Parameters

Name	Type	Description
savedQueryId	String	Sys_id of the query to update. This parameter is not required if a query name is provided. Table: Saved Queries [qb_saved_query]
savedQueryName	String	Name of the query to update. This parameter is not required if a query sys_id is provided. Table: Saved in the *Name* field in the Saved Queries [qb_saved_query] table.
queryJson	String	JSON to update the query with.

Parameters (continued)

Name	Type	Description
		Table: Saved in the *Query* field in the Saved Queries [qb_saved_query] table.

Returns

Type	Description
Object	Details about the updated query and any errors. `{ "error": "String", "message": "String", "status": "String" }`
<Object>.error	Error code. Returned when the update fails or invalid input parameters are provided. Possible errors: • `USER_NOT_AUTHORIZED_EXCEPTION` • `INVALID_PARAM` • `QUERY_INVALID` • `QUERY_UPDATE_FAILED` • `UNAUTHORIZED_REPORT_SOURCE_USER` Data type: String
<Object>.message	Message containing details about the success or failure of the update. Possible messages: • `Successfully updated the saved query` • `User is unauthorized to update a CMDBQueryBuilder query` • `Invalid Parameters. Please provide either a valid sysId or a valid name of a saved query` • `QueryJson is invalid. Please provide a valid queryJson` • `Failed to update the given saved query` • `User is unauthorized to update report source of a saved query` Data type: String
<Object>.status	Status code. Returned when the update is successful. Value: `success`

CMDBQueryBuilderAPI - Global

Provides methods to execute Configuration Management Database (CMDB) Query Builder operations in server-side scripts.

This API requires the Configuration Management Database (CMDB) application (com.snc.cmdb).

Note:

This API is only available in Global scope. To use these methods in a scoped application, see CMDBQBScopedScriptableAPI - Scoped.

For more information about CMDB Query Builder, see CMDB Query Builder.

CMDBQueryBuilderAPI - createReport(String savedQueryId, String savedQueryName)

Creates a report that shows the results of a Configuration Management Database (CMDB) Query Builder query and returns the URL of the report.

For scoped applications, use CMDBQBScopedScriptableAPI - createReport(String savedQueryId, String savedQueryName).

Parameters

Name	Type	Description
savedQueryId	String	Sys_id of the query to use for the report. This parameter is not required if a query name is provided. Table: Saved Queries [qb_saved_query]
savedQueryName	String	Name of the query to use for the report. This parameter is not required if a query sys_id is provided. Table: Saved in the **Name** field of the Saved Queries [qb_saved_query] table.

Returns

Type	Description
Object	Details about the created report and any errors. `{ "error": "String", "message": "String", "status": "String" }`
<Object>.error	Error code. Returned when the report creation fails or invalid input parameters are provided.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Possible errors: • `USER_NOT_AUTHORIZED_EXCEPTION` • `INVALID_PARAM` • `QUERY_SYS_ID_INVALID` • `REPORT_INELIGIBLE` Data type: String
<Object>.message	Message containing details about the success or failure of the report creation. Possible messages: • `<report-url>` • `User is unauthorized to create a CMDBQueryBuilder query report` • `Invalid Parameters. Please provide either a valid sysId or a valid name of a saved query` • `Invalid queryId. Please provide a valid saved query ID` • `Query must have a schedule with at least one run to create a report.` See also Schedule a CMDB query. Data type: String
<Object>.status	Status code. Returned when the update is successful. Value: `success` Data type: String

This example shows how to create a report by passing a saved query name.

```
var queryReport = SNC.CMDBQueryBuilderAPI.createReport('',
 'CMDBQueryTest1');

gs.info(JSON.stringify(JSON.parse(queryReport), null, 2));
```

Output:

```
{

 "message":"\/sys_report_template.do?sysparm_report_source_id=6d
299cf81bbd4210bccf42a3b24bcb7a&sysparm_type=list&sysparm_title=C
MDBQueryTest1&sysparm_source_type=source&sysparm_from_list=true&
sysparm_chart_size=large&sysparm_manual_labor=true",
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   "status":"success"
}
```

This example shows an error when the provided query name is invalid.

```
var queryReport = SNC.CMDBQueryBuilderAPI.createReport('',
 'Test');

gs.info(JSON.stringify(JSON.parse(queryReport), null, 2));
```

Output:

```
{
   "error":"INVALID_PARAM",
   "message":"Invalid Parameters. Please provide either a valid
 sysId or a valid name of a saved query"
}
```

CMDBQueryBuilderAPI - deleteQuery(String savedQueryId, String savedQueryName)

Deletes a Configuration Management Database (CMDB) Query Builder query.

For scoped applications, use CMDBQBScopedScriptableAPI - deleteQuery(String savedQueryId, String savedQueryName).

Parameters

Name	Type	Description
savedQueryId	String	Sys_id of the query to delete. This parameter can be provided as an empty string if a query name is provided. Table: Saved Queries [qb_saved_query]
savedQueryName	String	Name of the query to delete. This parameter is not required if a query sys_id is provided. Table: Saved in the *Name* field of the Saved Queries [qb_saved_query] table.

Returns

Type	Description
Object	Details about the deleted query and any errors. `{ "error": "String", "message": "String", "status": "String" }`
<Object>.error	Error code. Returned when the delete operation fails or invalid input parameters are provided. Possible errors:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `USER_NOT_AUTHORIZED_EXCEPTION` • `INVALID_PARAM` • `QUERY_DELETE_FAILED` Data type: String
<Object>.message	Message containing details about the success or failure of the delete operation. Possible messages: • `Successfully deleted the saved query` • `User is unauthorized to delete a CMDBQueryBuilder query` • `Invalid Parameters. Please provide either a valid sysId or a valid name of a saved query` • `Failed to delete the given saved query` Data type: String
<Object>.status	Status code. Returned when the update is successful. Value: `success` Data type: String

This example shows how to delete a saved query by passing the query name.

```
var delQuery = SNC.CMDBQueryBuilderAPI.deleteQuery('',
 'CMDBQueryTest1');

gs.info(JSON.stringify(JSON.parse(delQuery), null, 2));
```

Output:

```
{
   "message":"Successfully deleted the saved query",
   "status":"success"
}
```

CMDBQueryBuilderAPI - getSavedQueryExecutionDetails(String savedQueryName, Boolean executeQuery, Number timeout)

Returns the execution details for a Configuration Management Database (CMDB) Query Builder query.

Optionally, you can execute the query in order to return current execution details.

If a timeout or memory issue occurs while executing the query, you can fine tune the query batch size to help alleviate these problems. For more information, see Batch size for Query Builder saved queries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For scoped applications, use CMDBQBScopedScriptableAPI - getSavedQueryExecutionDetails(String savedQueryName, Boolean executeQuery, Number timeout).

Parameters

Name	Type	Description
savedQueryName	String	Name of the query to retrieve execution details for. Table: *Name* field in the Saved Queries [qb_saved_query] table.
executeQuery	Boolean	Optional. Flag that indicates whether to execute the specified query. Valid values: • true: Execute the specified query and return its execution details. • false: Don't execute the specified query. Return the most recent execution details for the query. Default: False
timeout	Number	Optional. Integer value that overrides the default query execution timeout limit of five minutes. Unit: Seconds Default: Five minutes

Returns

Type	Description
Object	Details about the query execution and any errors. `{ "error": "String", "execution_batch_size": Number, "message": "String", "query_id": "String", "status": "String", "table_name": "String" }`
<Object>.error	Error code. Returned when the query execution fails or the specified query is not found. Possible errors: • `QUERY_EXECUTION_NOT_FOUND` • `QUERY_NOT_FOUND` • `QUERY_EXECUTION_FAILED` • `USER_NOT_AUTHORIZED_EXCEPTION`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.message	Message containing details about the error code. Returned when the query execution fails or the specified query is not found. Possible messages: • `Query execution details not found. Please execute the query.` • `Given saved query not found. Please make sure you are passing the name of a saved query.` • `Query execution failed. Please use a valid query.` • `User is unauthorized to execute a CMDBQueryBuilder query.` Data type: String
<Object>.query_id	Sys_id of the query execution. Data type: String Table: Query Status [qb_query_status]
<Object>.status	Status of the query execution. • COMPLETE: Execution is complete. • FAILED: Error occurred while executing query. • TIME_OUT: Query execution timed out. • MAX_LIMIT: Maximum number of return results reached. Data type: String
<Object>.table_name	Name of the table that contains the query execution details. Data type: String

This example shows how to get the execution status of a saved query.

```
var savedQuery =
 SNC.CMDBQueryBuilderAPI.getSavedQueryExecutionDetails('CMDBQuer
yTest1');

gs.info(JSON.stringify(JSON.parse(savedQuery), null, 2));
```

Output:

```
{
   "query_id":"024fd53a7773330033b5270bba106141",

 "table_name":"u_cmdb_qb_result_598918aacb4dbf3f1a8dcf03fce6a5d5
7151a4e2",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   "status":COMPLETE
}
```

This example shows how to execute a saved query and set the query execution timeout value to 10 minutes.

```
var savedQuery =
 SNC.CMDBQueryBuilderAPI.getSavedQueryExecutionDetails('CMDBQuer
yTest2', true, 600);

gs.info(JSON.stringify(JSON.parse(savedQuery), null, 2));
```

Output:

```
{
  "execution_batch_size": 100,
  "query_id": "e73428b4939baa50779bfdfb5cba1047",
  "table_name":
 "u_cmdb_qb_result_f0eed95be923bf3d439c87c028ae3c3af53aa739",
  "status": "COMPLETE"
}
```

The following example shows how to access information in the result table for the saved query CMDBQueryTest2 in the previous example. You can also use the result table name followed by `.list` in the filter for results.

```
var resultTableName =
 'u_cmdb_qb_result_f7593958e298869427726be96f88155cce269806';
var queryId = '76bd283c931bee502285f4cc5cba10da'; // insert the
 query ID here
var gr = new GlideRecord(resultTableName);
gr.addQuery('query', queryId);
gr.query();
if (gr.next()) {
     gs.info(gr.getDisplayValue('u_server_1')); // field name in
 the result table
}
```

Output:

```
PS LoadBal01
```

CMDBQueryBuilderAPI - saveQuery(String savedQueryName, String queryJson)

Saves a Configuration Management Database (CMDB) Query Builder query and returns the sys_id of the saved query.

For scoped applications, use CMDBQBScopedScriptableAPI - saveQuery(String savedQueryName, String queryJson).

Parameters

Name	Type	Description
savedQueryName	String	Name to save the query under. Table: Saved in the **Name** field of the Saved Queries [qb_saved_query] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
queryJson	String	JSON that defines the query. Table: Saved in the **Query** field of the Saved Queries [qb_saved_query] table.

Returns

Type	Description
Object	Object containing details about the saved query and any errors. `{ "error": "String", "message": "String", "status": "String" }`
<Object>.error	Error code. Returned when the save operation fails or invalid input parameters are provided. Possible errors: • `USER_NOT_AUTHORIZED_EXCEPTION` • `QUERY_NAME_INVALID` • `QUERY_INVALID` • `QUERY_EXISTS_ALREADY` • `QUERY_SAVE_FAILED` Data type: String
<Object>.message	Message containing details about the success or failure of the save operation. Possible messages: • `Successfully saved the query with sysId <sy_id>` • `User is unauthorized to save a CMDBQueryBuilder query` • `Query name is empty. Please provide a name` • `QueryJson is invalid. Please provide a valid queryJson` • `Query name is already used, please use a different name` • `Unexpected exception while saving the query` Data type: String
<Object>.status	Status code. Returned when the save operation is successful.

```

CMDBQueryBuilderAPI - updateQuery(String savedQueryId, String savedQueryName, String queryJson)

Updates the JSON for a Configuration Management Database (CMDB) Query Builder query.

For scoped applications, use CMDBQBScopedScriptableAPI - updateQuery(String savedQueryId, String savedQueryName, String queryJson).

Parameters

Name	Type	Description
savedQueryId	String	Sys_id of the query to update. This parameter is not required if a query name is provided. Table: Saved Queries [qb_saved_query]
savedQueryName	String	Name of the query to update. This parameter is not required if a query sys_id is provided. Table: Saved in the *Name* field in the Saved Queries [qb_saved_query] table.
queryJson	String	JSON to update the query with. Table: Saved in the *Query* field in the Saved Queries [qb_saved_query] table.

Returns

Type	Description
Object	Details about the updated query and any errors. `{ "error": "String", "message": "String", "status": "String" }`
<Object>.error	Error code. Returned when the update fails or invalid input parameters are provided. Possible errors: • `USER_NOT_AUTHORIZED_EXCEPTION` • `INVALID_PARAM` • `QUERY_INVALID`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `QUERY_UPDATE_FAILED` • `UNAUTHORIZED_REPORT_SOURCE_USER` Data type: String
<Object>.message	Message containing details about the success or failure of the update. Possible messages: • `Successfully updated the saved query` • `User is unauthorized to update a CMDBQueryBuilder query` • `Invalid Parameters. Please provide either a valid sysId or a valid name of a saved query` • `QueryJson is invalid. Please provide a valid queryJson` • `Failed to update the given saved query` • `User is unauthorized to update report source of a saved query` Data type: String
<Object>.status	Status code. Returned when the update is successful. Value: `success` Data type: String

This example shows how to update a saved query by passing the query name.

```
var queryJson =

CMDBTransformUtil - Global

The *CMDBTransformUtil* script include uses the Identification and Reconciliation (IRE) framework to minimize the creation of duplicate configuration items (CI).

The IRE framework also reconciles CI attributes by only accepting information from authorized sources when updating the CMDB in `onBefore` transform map scripts. You can't use this class in other scripts. For additional information on how the IRE framework operates, see CMDB Identification and Reconciliation.

CMDBTransformUtil - CMDBTransformUtil()

Creates a CMDBTransformUtil object.

Parameters

Name	Type	Description
None		

```
var cmdbUtil = new CMDBTransformUtil();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CMDBTransformUtil - getError()

Returns any errors generated by the previous *identifyAndReconcile()* or *identifyAndReconcileEnhanced()* method call.

Use this method in onBefore transform map scripts to obtain errors. Use the hasError() method to first detect any errors from the *identifyAndReconcile()* or *identifyAndReconcileEnhanced()* method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Error message from *identifyAndReconcile()* or *identifyAndReconcileEnhanced()*.

```
// Add this code to the onBefore transform map script
// Call CMDB API to do Identification and Reconciliation of the
 current row
var cmdbUtil = new CMDBTransformUtil();
cmdbUtil.setDataSource('ImportSet');
cmdbUtil.identifyAndReconcileEnhanced(source, map, log);
ignore = true;

if (cmdbUtil.hasError()) {
  var errorMessage = cmdbUtil.getError();
  log.error(errorMessage);
} else {
  log.info('IE Output Payload: ' + cmdbUtil.getOutputPayload());
  log.info('Imported CI: ' + cmdbUtil.getOutputRecordSysId());
}
```

Scoped equivalent

There is no scoped equivalent for this method.

CMDBTransformUtil - getOutputPayload()

Returns the JSON payload from the previous *identifyAndReconcile()* or *identifyAndReconcileEnhanced()* method call.

Use this method in onBefore transform map scripts.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
<String>	JSON formatted string that is a list of results for the configuration items in the input string. Each result string is in the format 'items: [{}], relations:[{}]', where each item within the items and relations lists contains name-value pairs. Data type: String
<String>.additionalCommittedItems	No values are currently returned.
<String>.additionalCommittedRelations	No values are currently returned.

<String>.items	Description of the created or updated CIs.
	
	Data type: Object
	
	`"items": {`
	
	`"additionalRelatedItems": [Array],`
	`"className": "String",`
	`"duplicateIndices": [Array],`
	`"errorCount": Number,`
	`"errors": [Array],`
	
	`"identificationAttempts": [Array],`
	
	`"identifierEntrySysId": "String",`
	`"info": [Array],`
	`"inputIndices": [Array],`
	`"maskedAttributes": [Array],`
	`"operation": "String",`
	`"relatedItems": [Array],`
	`"relatedSysIds": [Array],`
	`"sysId": "String"`
	`}`

<String>.items.additionalRelatedItems	List of information about additional lookup and related items that were processed but

Returns (continued)

Type	Description
	not provided as part of the input payload. These items are from partial payloads. This information is not currently returned. Data type: Array of Objects `"additionalRelatedItems": [ { "className": "String", "inputIndices": [Array], "operation": "String", "sysId": "String" } ]`
<String>.items.additionalRelatedItems.className	Class/table name (sys_class_name) of the CI that was created or updated. Data type: String
<String>.items.additionalRelatedItems.inputIndices	Index of the corresponding input item. For top-level items, it is a list of integers. For related or lookup items, it is list of JSON objects. Data type: Array of Numbers or Array of Objects `"inputIndices": [ { "mainIndex": Number, "subIndex": Number } ]`
<String>.items.additionalRelatedItems.inputIndices.mainIndex	Index value from the request body *items* array that corresponds to the CI parent of the additional related item. Data type: Number
<String>.items.additionalRelatedItems.inputIndices.subIndex	Index value from the request body *items.lookup* array that

Returns (continued)

Type	Description
	corresponds to the additional related item. Data type: Number
<String>.items.additionalRelatedItems.operation	Type of operation. Possible values: • INSERT: New CI was inserted into the database. • NO_CHANGE: No CI changes were made. • UPDATE: Existing CI was updated. Data type: String
<String>.items.additionalRelatedItems.sysId	Sys_id of the additional related items. Data type: String
<String>.items.className	Class/table name (sys_class_name) of the CI that was created or updated. Data type: String
<String>.items.duplicateIndices	List of indexes of CIs that are duplicates of the current item. Data type: Array
<String>.items.errorCount	Number of errors. Data type: Number
<String>.items.errors	List of errors encountered while processing this CI. Data type: Array of Objects `"errors": [ { "error": "String", "message": "String" } ]`
<String>.items.errors.error	Type of error encountered while processing the CI.

Returns (continued)

Type	Description
	Data type: String
<String>.items.errors.message	Error message associated with the error. Data type: String
<String>.items.identificationAttempts	List of attempts that were made to identify the CIs. Data type: Array of Objects `"identificationAttempts": [ { "attemptResult": "String", "attributes": [Array], "hybridEntryCiAttributes": [Array], "identifierName": "String", "searchOnTable": "String" } ]`
<String>.items.identificationAttempts.attemptResult	Results of the attempt to identify the CI. Possible values: • MATCHED: Identification succeeded. A unique CI was found in the identifier rule table which exactly matched the specified attributes. • MULTI_MATCH: Identification failed with an error. Duplicate CIs were found in the identifier rule table when matching against the specified attributes. • NO_MATCH: Identification failed. No CI was found in the identifier rule table which matched the specified attributes. • SKIPPED: Identification not attempted. The attributes

Returns (continued)

Type	Description
	required for this identifier rule table search were not provided, so the rule was not applied. Data type: String
<String>.items.identificationAttempts.attributes	List of CI identifier entry attributes that were used during the identification process. Data type: Array Attribute names and types depend on the request body data and the identifier in use, such as: `"attributes": [ "serial_number": "String", "serial_number_type": "String", ]`
<String>.items.identificationAttempts.hybridEntryCiAttributes	No values are currently returned.
<String>.items.identificationAttempts.identifierName	Identifier rule used for this CI identification attempt. Data type: String
<String>.items.identificationAttempts.searchOnTable	Name of the table searched during the identification process. Data type: String
<String>.items.identifierEntrySysId	Sys_id for the identifier rule used to identify the CI. Located in the Identifier Entry [cmdb_identifier_entry] table. Data type: String
<String>.items.info	List that contain additional information about the processing of the item. Data type: Array of Objects `"info": [ { "code": "String", "message": "String",`

Returns (continued)

Type	Description
	<pre>"ruleSysId": "String" }]</pre>
<String>.items.info.code	Reclassification type that was skipped. Possible values: • SKIPPED_CLASS_SWITCH • SKIPPED_CLASS_DOWNGRADE • SKIPPED_CLASS_UPGRADE Data type: String
<String>.items.info.message	Message that provides additional insights into the reason for skipping the reclassification. Data type: String
<String>.items.info.ruleSysId	Sys_id of the reclassification restriction rule that was matched. Applicable only when IRE skips reclassification due to reclassification restriction rule. This value is empty if the reclassification is skipped due to a payload or global flag. Data type: String
<String>.items.inputIndices	Index values for CIs from the request body *items* array that correspond to this CI. Data type: Array
<String>.items.maskedAttributes	List of attributes whose update by a non-authoritative data source was skipped as defined by the Reconciliation Rules. Data type: Array
<String>.items.relatedItems	List that provides information about the processed related items. Data type: Array of Objects <pre>"relatedItems": [{</pre>

© 2026 ServiceNow, Inc. All rights reserved.

Returns (continued)

Type	Description
	<pre>"className": "String", "errors": [Array], "errorCount": Number, "inputIndices": [Array], "operation": "String", "sysId": "String" }]</pre>
<String>.items.relatedItems.className	Class/table name (sys_class_name) of the related item. Data type: String
<String>.items.relatedItems.errors	List of errors that occurred during processing. Data type: Array of Objects <pre>"errors": [{ "error": "String", "message": "String" }]</pre>
<String>.items.relatedItems.errorCount	Number of errors detected during processing. Data type: Number
<String>.items.relatedItems.inputIndices	Indexes of the corresponding related items. Data type: Array or Numbers <pre>"inputIndices": [{ "mainIndex": Number, "subIndex": Number }]</pre>
<String>.items.relatedItems.inputIndices.mainIndex	Integer value from the request body *items* array that corresponds to the CI parent of the related item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Number
<String>.items.relatedItems.inputIndices.subIndex	Integer value from the request body *items.lookup* array that corresponds to the related item. Data type: Number
<String>.items.relatedItems.operation	Type of operation. Possible values: • INSERT: New CI was inserted into the database. • NO_CHANGE: No CI changes were made. • UPDATE: Existing CI was updated. Data type: String
<String>.items.relatedSysIds	List of the sys_id values for related items (table lookup items) from the request body *items.lookup* array. Notable values - null: No sys_id was identified for this related item. Data type: Array
<String>.items.sys_id	Sys_id of the CI that was updated or created. Data type: String
<String>.relations	Information about the processed relations. Data type: Array of Objects `"relations":[ { "className": "String", "errorCount": Number, "inputIndices": [Array], "operation": "String", "sysId": "String"`

Scoped equivalent

There is no scoped equivalent for this method.

CMDBTransformUtil - getOutputRecordSysId()

Returns the sys_id of the configuration item (CI) that was inserted or updated.

Use this method in onBefore transform map scripts.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the CI that was inserted or updated.

```
// Add this code to the onBefore transform map script
// Call CMDB API to do Identification and Reconciliation of
 current row
var cmdbUtil = new CMDBTransformUtil();
cmdbUtil.setDataSource('ImportSet');
cmdbUtil.identifyAndReconcileEnhanced(source, map, log);
ignore = true;

if (cmdbUtil.hasError()) {
  var errorMessage = cmdbUtil.getError();
  log.error(errorMessage);
} else {
  log.info('IE Output Payload: ' + cmdbUtil.getOutputPayload());
  log.info('Imported CI: ' + cmdbUtil.getOutputRecordSysId());
}
```

Scoped equivalent

There is no scoped equivalent for this method.

CMDBTransformUtil - getPayload(Object source, Object map, Object log)

Returns the JSON payload generated from the specified input.

You can then modify the payload and use the *`setPayload()`* method to store the updated payload. Once the payload is modified and stored, use *`identifyAndReconcile()`* or *`identifyAndReconcileEnhanced()`* to process the payload.

Parameters

Name	Type	Description
source	Object	Global object available in transform map scripts that holds the incoming record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
map	Object	Map object available in transform map scripts that holds the current transform map record.
log	Object	Log object available in transform map scripts.

Returns

Parameter	Description
<String>	JSON formatted string that is list of results for the configu items in the input string. Data type: String `{ "additionalCommit tems": [Array], "additionalCommit elations": [Array] "hasError": Bool "hasWarning": Boolean, "items": [Array] "relations": [Array], "summary": {Obje }`
<String>.additionalCommittedItems	List of CIs that were commit during the IRE processing o the current payload, but wer not present in the current in payload. Data type: Array of Objects `"additionalCommitt ems": [ { "className": "String", "errorCount": Number, "operation": "String", "identificationAt ts": [Array], "inputIndices" [Array],`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Description
<String>.additionalCommittedRelations.className	The sys_class_name of this additional dependent relatio CI. Data type: String Only supported value: cmdb_rel_ci: The CI Relation table.
<String>.additionalCommittedRelations.errorCount	Number of errors encountere while processing this additio dependent relationship CI. Data type: Number
<String>.additionalCommittedRelations.errors	Description of the errors encountered while processi additional dependent relatio CI. Data type: Array of Objects `"errors": [ { "error": "Stri "message": "String" } ]`
<String>.additionalCommittedRelations.errors.error	Type of error encountered while processing the additio dependent relationship CI. Data type: String
<String>.additionalCommittedRelations.errors.message	Error message encountered while processing this additio dependent relationship CI. Data type: String
<String>.additionalCommittedRelations.inputIndices	Index values for dependent relationship CI objects in the request body *relations* that correspond to this addit dependent relationship CI. Data type: Array `"inputIndices": [ Number ]`

Returns (continued)

Parameter	Description
<String>.additionalCommittedRelations.markers	Marker values for internal us Data type: Array `"markers": []`
<String>.additionalCommittedRelations.mergedPayloadIds	Sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] that were merged for this CI. were merged during process of this additional dependent relationship CI. Data type: Array `"mergedPayloadIds" "String" ]`
<String>.additionalCommittedRelations.operation	Operation that was performe for the additional dependen relationship CI. Possible values: • INSERT: The dependent relationship CI is inserted the target table as a new r • INSERT_AS_INCOMPLETE dependent relationship C errors and is inserted into CMDB IRE Incomplete Pay [cmdb_ire_incomplete_pa table. • INSERT_AS_PARTIAL: The dependent relationship C errors and is inserted into CMDB IRE Partial Payload [cmdb_ire_partial_payloa table. • NO_CHANGE: No operatio performed for the depend relationship CI. • UPDATE: An existing depe relationship CI in the targe is updated. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Description
<String>.hasError	Flag that indicates whether a item or relation has errors. Data type: Boolean
<String>.hasWarning	Flag that indicates whether a item or relation has warnings Data type: Boolean
<String>.items	Description of the created o updated CIs. Data type: Array of Objects `"items": [{ "additionalRelate ms": [Array], "className": "String", "duplicateIndices [Array], "errorCount": Number, "errors": [Arr "identificationAt ts": [Array], "identifierEntryS d": "String", "incompleteSysIds "String", "info": [Array "inputIndices" [Array], "maskedAttributes [Array], "operation": "String", "partialSysIds "String", "relatedItems" [Array], "relatedSysIds [Array], "sysId": "Stri`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Description
	<pre> }]</pre>

<String>.items.additionalRelatedItems	Information about additiona lookup and related items tha processed but not provided of the input payload. These i are from partial payloads.
	
	Data type: Array of Objects
	<pre>"additionalRelated
	s": [
	  {
	  "className":
	"String",
	  "inputIndices"
	[Array],
	
	"mergedPayloadIds
	[Array],
	  "operation":
	"String",
	  "sysId": "Stri
	  }
	]</pre>

<String>.items.additionalRelatedItems.className	Class/table name (sys_class_name) of the CI t was created or updated. Data type: String
<String>.items.additionalRelatedItems.inputIndices	Index values for CIs from the request body *items* array t correspond to this related ite Data type: Array of Numbers
<String>.items.additionalRelatedItems.mergedPayloadIds	List of sys_ids of the partial payloads that were merged into the related item. Locate the CMDB IRE Partial Payloa [cmdb_ire_partial_payloads] Data type: Array
<String>.items.additionalRelatedItems.operation	Type of operation. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Description
	• INSERT: New CI was inserted into the database. • NO_CHANGE: No CI changes were made. • UPDATE: Existing CI was updated. Data type: String
<String>.items.additionalRelatedItems.sysId	Sys_id of the CI that was updated or created. Data type: String
<String>.items.className	Class/table name (sys_class_name) of the CI that was created or updated. Data type: String
<String>.items.duplicateIndices	List of indexes of CIs that are duplicates of the current item Data type: Array
<String>.items.errorCount	Number of errors encountered while processing the item. Data type: Number
<String>.items.errors	List of errors encountered while processing this CI. Data type: Array of Objects `"errors": [ { "error": "Stri "message": "String" } ]`
<String>.items.errors.error	Type of error encountered while processing the CI. Data type: String
<String>.items.errors.message	Error message associated with error. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Description
<String>.items.identificationAttempts	List of attempts that were ma identify the CIs. Data type: Array of Objects `"identificationAtt s": [ { "attemptResult "String", "attributes": [Array], "hybridEntryCiAtt tes": [Array], "identifierNam "String", "searchOnTable "String" } ]`
<String>.items.identificationAttempts.attemptResult	Results of the attempt to ide the CI. Possible values: • MATCHED: Identification succeeded. A unique CI w found in the identifier rule which exactly matched the specified attributes. • MULTI_MATCH: Identificat failed with an error. Duplic were found in the identifie table when matching agai specified attributes. • NO_MATCH: Identification No CI was found in the ide rule table which matched specified attributes. • SKIPPED: Identification no attempted. The attributes required for this identifier table search were not prov so the rule was not applie Data type: String
<String>.items.identificationAttempts.attributes	List of CI identifier entry attri that were used during the identification process.

Returns (continued)

Parameter	Description
	Data type: Array Attribute names and types c on the request body data an identifier in use, such as: `"attributes": [ "serial_number": "String", "serial_number_ty "String", ]`
<String>items.identificationAttempts.hybridEntryCiAttributes	List of CI identifier entry attri that were used during the identification process. Data type: Array Attribute names and types c on the request body data an identifier in use, such as: `"hybridEntryCiAttr es": [ "name": "String" "serial_number": "String" ]`
<String>.items.identificationAttempts.identifierName	Identifier rule used for this C identification attempt. Data type: String
<String>.items.identificationAttempts.searchOnTable	Name of the table searched the identification process. Data type: String
<String>.items.identifierEntrySysId	Sys_id for the identifier rule used to identify the CI. Located in the Identifier Entr [cmdb_identifier_entry] table Data type: String
<String>.items.incompleteSysIds	If the item had errors and wa saved as an incomplete pay this parameter contains the sys_id of the record in the CMDB IRE Incomplete Paylo

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Description
	[cmdb_ire_incomplete_payl table. Data type: String
<String>.items.info	Additional information abou processing of the item. Data type: Array of Objects `"info": [ { "code": "Strin "message": "String", "ruleSysId": "String" } ]`
<String>.items.info.code	Reclassification type that wa skipped. Possible values: • SKIPPED_CLASS_SWITCH • SKIPPED_CLASS_DOWNG • SKIPPED_CLASS_UPGRAD Data type: String
<String>.items.info.message	Message that provides addi insights into the reason for skipping the reclassification Data type: String
<String>.items.info.ruleSysId	Sys_id of the reclassification restriction rule that was mat Applicable only when IRE skips reclassification due to reclassification restriction rule. This value is empty if th reclassification is skipped d payload or global flag. Data type: String
<String>.items.inputIndices	Indexes of the correspondin CI. For top-level items, it is a integers. For related or looku it is list of JSON objects.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Description
	Data type: Array of Numbers
<String>.items.maskedAttributes	List of attributes whose upda a non-authoritative data sou was skipped as defined by t Reconciliation Rules. Data type: Array
<String>.items.operation	Operation that took place. Possible values: • INSERT: New CI was inser the database. • INSERT_AS_INCOMPLETE Item was saved in cmdb_ire_incomplete_pay table. • INSERT_AS_PARTIAL: Item was saved in cmdb_ire_partial_payload • UPDATE: Existing CI was updated. • UPDATE_WITH_DOWNGR CI was updated and the cl changed to a more generi (ancestor class). • UPDATE_WITH_SWITCH: updated and the class cha to a class that is not ances descendent. • UPDATE_WITH_UPDRADE was updated and the clas changed to a more specia class (descendent class). Data type: String
<String>.items.partialSysIds	If the item had errors and wa saved as a partial payload, t parameter contains the sys_ the partial payload record. Data type: String
<String>.items.relatedItems	List of JSON objects that de a related CI (table lookup CI the request body *items.1* array.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Description
	Data type: String
<String>.items.relatedItems.errorCount	Number of errors detected w processing the related items Data type: Number
<String>.items.relatedItems.incompleteSysIds	If the relation had errors and was saved as an incomplete payload, this value is the sys of the record in the CMDB IRE Incomplete Payloads [cmdb_ire_incomplete_payl table. Data type: String
<String>.items.relatedItems.inputIndices	Index of the corresponding i item. For top-level items, it is of integers. For related or loo items, it is list of JSON objec Data type: Array of Numbers Array of Objects `"inputIndices": [ { "mainIndex": Number, "subIndex": Num } ]`
<String>.items.relatedItems.inputIndices.mainIndex	Index value from the reques *items* array that correspon the CI parent of the related i Data type: Number
<String>.items.relatedItems.inputIndices.subIndex	Index value from the reques body *items.lookup* array corresponds to the related it Data type: Number
<String>.items.relatedItems.mergedPayloadIds	List of sys_ids of the partial payloads that were merged i CI during processing. Data type: Array
<String>.items.relatedItems.operation	Operation that took place. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Description
	• INSERT: New related CI wa inserted into the database • INSERT_AS_INCOMPLETE Item was saved in cmdb_ire_incomplete_pay table. • INSERT_AS_PARTIAL: Item was saved in cmdb_ire_partial_payload • NO_CHANGE: No related C changes were made. • UPDATE: Existing related C updated. • UPDATE_WITH_DOWNGR Related CI was updated a class changed to a more g class (ancestor class). • UPDATE_WITH_SWITCH: F CI was updated and the cl changed to a class that is ancestor or descendent. • UPDATE_WITH_UPDRADE Related CI was updated a the class changed to a mo specialized class (descen class). Data type: String
<String>.items.relatedItems.partialSysIds	If the related item had errors was saved as a partial paylo this contains a list of the sys of the associated records in the CMDB IRE Partial Payloa [cmdb_ire_partial_payloads] Data type: Array
<String>.items.relatedItems.sysId	Sys_id of the related item. Data type: String
<String>.items.relatedItems.warningCount	Number of warnings encoun when processing the related Data type: Number
<String>.items.relatedItems.warnings	Description of warnings encountered while processi related items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Description
	Data type: Array of Objects `"warnings": [ { "error": "Stri "message": "String" } ]`
<String>.items.relatedItems.warnings.error	Type of warning encountere processing the related item. Data type: String
<String>.items.relatedItems.warnings.message	Message associated with th warning. Data type: String
<String>.items.relatedSysIds	List of the sys_id values of th CIs used during lookup-bas identification of related item Data type: String
<String>.items.sys_id	Sys_id of the CI that was up or created. Data type: String
<String>.relations	Description of a dependent relationship CI from the requ body *relations* array. Data type: Array of Objects `"relations": [ { "className": "String", "errorCount": Number, "errors": [Arr "incompleteSysIds "String", "inputIndices" [Array], "operation": "String", "partialSysIds "String", "sysId": "Stri`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Description
	<pre> }]</pre>
<String>.relations.className	Sys_class_name of this dep relationship CI. Only supported value: cmdb_rel_ci: CI Relationshi Data type: String
<String>.relations.errorCount	Number of errors encounte when processing the depen relationship CI. Data type: Number

<String>.relations.errors	List that describes errors tha encountered while processi dependent relationship CI.
	
	Data type: Array of Objects
	<pre>"errors": [
	  {
	  "error": "Stri
	  "message":
	"String"
	  }
	]</pre>

<String>.relations.errors.error	Type of error encountered w processing the dependent relationship CI. Data type: String
<String>.relations.errors.message	Error message encountered while processing this depen relationship CI. Data type: String
<String>.relations.incompleteSysIds	If the relation had errors and was saved as an incomplete payload, this value is the sys of the record in the CMDB IRE Incomplete Payloads [cmdb_ire_incomplete_payl table. Data type: String

Returns (continued)

Parameter	Description
<String>.relations.inputIndices	Indexes for the dependent relationship CI objects in the request body *relations* that correspond to this depe relationship CI. Data type: Array
<String>.relations.operation	Type of operation performed Possible values: • INSERT: The dependent relationship CI was inserte the target table as a new r • INSERT_AS_INCOMPLETE dependent relationship C errors and was inserted in CMDB IRE Incomplete Pay [cmdb_ire_incomplete_pa table. • INSERT_AS_PARTIAL: The dependent relationship C errors and was inserted in the CMDB IRE Partial Payl [cmdb_ire_partial_payloa table. • NO_CHANGE: No operatio performed. • UPDATE: An existing depe relationship CI in the targe was updated. Data type: String
<String>.relations.partialSysIds	If the relation had errors and saved as a partial payload, t value is the sys_id of the rec in the CMDB IRE Partial Payl [cmdb_ire_partial_payloads] Data type: String
<String>.relations.sysId	Sys_id of the dependent relationship CI. Data type: String
<String>.summary	List of JSON properties that provide statistics on how ma items were inserted, update such, per class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Description
	Data type: Array
<String>.summary.<class_name>	Statistics for a specific class Data type: Object <class_name>: { "additionalInsertemCount": Number, "errorCount": Num "incompleteItemCot": Number, "insertedItemCoun Number, "partialItemCount Number, "skippedItemCount Number, "unchangedItemCou Number, "updatedItemCount Number, "warningCount": Number }
<String>.summary.<class_name>.additionalInsertedItemCount	Number of items inserted du processing of partial payloa Data type: Number
<String>.summary.<class_name>.errorCount	Number of errors encounter processing items. Data type: Number
<String>.summary.<class_name>.incompleteItemCount	Number of items inserted in CMDB IRE Incomplete Paylo [cmdb_ire_incomplete_payl table. Data type: Number
<String>.summary.<class_name>.insertedItemCount	Number of items created. Data type: Number
<String>.summary.<class_name>.partialItemCount	Number of items saved in the Partial Payload table [cmdb_ire_partial_payloads Data type: Number
<String>.summary.<class_name>.skippedItemCount	Number of items that were s

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Description
	Data type: Number
<String>.summary.<class_name>.unchangedItemCount	Number of items that had er but were not modified. Data type: Number
<String>.summary.<class_name>.updatedItemCount	Number of items updated. Data type: Number
<String>.summary.<class_name>.warningCount	Number of items that genera warning when processed. Data type: Number

This code example shows how to obtain the payload of an ImportSet, where you can then update the payload, and then set the new payload before calling the *cmdbUtil.identifyAndReconcileEnhanced()* method to process the payload.

```
// Add this code to the onBefore transform map script
// Ability to modify the payload using get and set APIs
// Call cmdbUtil API to do Identification and Reconciliation of
 current row
var cmdbUtil = new CMDBTransformUtil();
cmdbUtil.setDataSource('ImportSet');
var payload = cmdbUtil.getPayload(source, map, log);
// Modify the payload here
cmdbUtil.setPayload(payload);
cmdbUtil.identifyAndReconcileEnhanced(source, map, log);
ignore = true;

if (cmdbUtil.hasError()) {
  var errorMessage = cmdbUtil.getError();
  log.error(errorMessage);
} else {
  log.info('IE Output Payload: ' + cmdbUtil.getOutputPayload());
  log.info('Imported CI: ' + cmdbUtil.getOutputRecordSysId());
}
```

CMDBTransformUtil - hasError()

Determines if an error occurred in the previous *identifyAndReconcile()* or *identifyAndReconcileEnhanced()* method call.

Use this method in onBefore transform map scripts.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether there was an error occurred in the previously called *identifyAndReconcile()* or *identifyAndReconcileEnhanced()* method. Possible values: • true: An error occurred • false: No error occurred

```
// Add this code to the onBefore transform map script
// Call CMDB API to do Identification and Reconciliation of
 current row
var cmdbUtil = new CMDBTransformUtil();
cmdbUtil.setDataSource('ImportSet');
cmdbUtil.identifyAndReconcileEnhanced(source, map, log);
ignore = true;

if (cmdbUtil.hasError()) {
  var errorMessage = cmdbUtil.getError();
  log.error(errorMessage);
} else {
  log.info('IE Output Payload: ' + cmdbUtil.getOutputPayload());
  log.info('Imported CI: ' + cmdbUtil.getOutputRecordSysId());
}
```

Scoped equivalent

There is no scoped equivalent for this method.

CMDBTransformUtil - identifyAndReconcile(Object source, Object map, Object log)

Inserts or updates a configuration item (CI) in the Configuration Management Database (CMDB).

Use this method in onBefore transform map scripts. Using this method instead of relying on the transform to insert or update the configuration item record reduces duplicate entries in the CMDB. For additional information, see Apply CI Identification and Reconciliation to Import Sets.

To prevent the transform from adding or updating the record a second time, set `ignore = true`.

Parameters

Name	Type	Description
source	Object	Global object available in transform map scripts that holds the incoming record.
map	Object	Map object available in transform map scripts that holds the current transform map record.
log	Object	Log object available in transform map scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

This code example shows how to call the *identifyAndReconcile()* method to process the current row of the input payload.

```
// Add this code to the onBefore transform map script
// Call CMDBTransformUtil API to do Identification and
 Reconciliation of the current row
var cmdbUtil = new CMDBTransformUtil();
cmdbUtil.identifyAndReconcile(source, map, log);
ignore = true;
```

CMDBTransformUtil - identifyAndReconcileEnhanced(Object source, Object map, Object log)

Inserts or updates a configuration item (CI) in the Configuration Management Database (CMDB).

In addition to providing the functionality of the *CMDBTransformUtil.identifyAndReconcile()* method, this method also supports:

- Handling partial payloads
- Handling partial commits
- Removing duplicate items within a payload
- Generating output summaries

For additional information on Identification and Reconciliation and more detailed explanations of the data used by this method, see Identification and Reconciliation (IRE).

Parameters

Name	Type	Description
source	Object	Global object available in transform map scripts that holds the incoming record.
map	Object	Map object available in transform map scripts that holds the current transform map record.
log	Object	Log object available in transform map scripts.

Returns

Type	Description
None	

This code example shows how to call the *identifyAndReconcileEnhanced()* method to process the passed in payload.

```
// Add this code to the onBefore transform map script
// Call CMDBTransformUtil API to do Identification and
 Reconciliation
var cmdbUtil = new CMDBTransformUtil();
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
cmdbUtil.identifyAndReconcileEnhanced(source, map, log);
ignore = true;
```

CMDBTransformUtil - logTransformStats(Object log)

Logs the number of configuration items (CI) inserted, updated, skipped, or that had errors.

Use this method in onComplete transform map scripts.

Parameters

Name	Type	Description
log	Object	Log object available in transform map scripts.

Returns

Type	Description
void	

```
var cmdbUtil = new CMDBTransformUtil();
cmdbUtil.logTransformStats(log);
```

Scoped equivalent

There is no scoped equivalent for this method.

CMDBTransformUtil - setDataSource(String source)

Sets the data source to use when the *`identifyAndReconcile()`* or *`identifyAndReconcileEnhanced()`* method is called.

Use this method in `onBefore` transform map scripts. If this method is not called, the default value *`ImportSet`*.

Parameters

Name	Type	Description
source	String	Data source for the source configuration item record.

Returns

Type	Description
void	

```
// Add this code to the onBefore transform map script
// Call CMDB API to do Identification and Reconciliation of
 current row
var cmdbUtil = new CMDBTransformUtil();
cmdbUtil.setDataSource('ImportSet');
cmdbUtil.identifyAndReconcileEnhanced(source, map, log);
ignore = true;

if (cmdbUtil.hasError()) {
```

```
  var errorMessage = cmdbUtil.getError();
  log.error(errorMessage);
} else {
  log.info('IE Output Payload: ' + cmdbUtil.getOutputPayload());
  log.info('Imported CI: ' + cmdbUtil.getOutputRecordSysId());
}
```

Scoped equivalent

There is no scoped equivalent for this method.

CMDBUtil - Global

The *CMDBUtil* API provides utility methods for creating and managing table relationships in the Configuration Management Database (CMDB) and managing CMDB baselines.

CMDBUtil is a JavaScript-accessible ScriptableObject. The *CMDBUtil* API has dynamic and static methods. You access dynamic methods by creating a SNC.CMDBUtil object. You access static methods by using SNC.CMDBUtil global object to call the methods.

This example creates a CMDBUtil object.

```
var cu = new SNC.CMDBUtil();
cu.baselineProposedChangesGenDIFF(current,
 action.get('sysparm_changeset'));
```

This example calls a static method.

```
var output =
 SNC.CMDBUtil.getAllChildrenOfAsCommaList('cmdb_ci_computer');
```

Use these methods to manage CMDB table relationships and baselines.

CMDBUtil - baselineProposedChangesApplyChanges(GlideRecord proposedChanges)

Applies proposed changes in a task_ci record that represent an update set for all CIs associated with the task.

This is a dynamic method.

Parameters

Name	Type	Description
proposedChanges	GlideRecord	The collection of proposed changes in the change request (CHG).

Returns

Type	Description
void	

```
//Where current is a GlideRecord and action is the current UI
 action
var base = new SNC.CMDBUtil();
base.baselineProposedChangesApplyChanges(current);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CMDBUtil - baselineProposedChangesGenDiff(GlideRecord current, String changeSet)

Generates the XML for proposed changes diff, and adds it to the corresponding task_ci record.

This is a dynamic method.

Parameters

Name	Type	Description
current	GlideRecord	The GlideRecord that contains the collection of proposed changes.
changeSet	String	The sysid of the task_ci record that represents the change set to use.

Returns

Type	Description
void	

```
//Where current is a GlideRecord and action is the current UI
 action
var base = new SNC.CMDBUtil();
base.baselineProposedChangesGenDIFF(current,
 action.get('sysparm_changeset'));
```

CMDBUtil - bootstrap(String dictFile)

Bootstraps the environment by creating the database, creating the system dictionary table, and having the system dictionary table describe itself.

This is a static method.

Parameters

Name	Type	Description
dictFile	String	The file name including path, of the dictionary to load.

Returns

Type	Description
void	

CMDBUtil - createCIRelationship(String tableName, String parent, String child, String parentField, String childField)

Creates a CI relationship between fields.

Parameters

Name	Type	Description
tableName	String	Optional. The name of the relationship target table. Default: CI Relationship [cmdb_rel_ci] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
parent	String	Sys_id of the parent CI record in the Configuration Items [cmdb_ci] table.
child	String	Sys_id of the child CI record in the Configuration Items [cmdb_ci] table.
parentField	String	The parent relationship label listed in the CI Relationship Type [cmdb_rel_type] table.
childField	String	The child relationship label listed in the CI Relationship Type [cmdb_rel_type] table.

Returns

Type	Description
String	Sys_id of the new record listed in the CI Relationship [cmdb_rel_ci] table.

The following example shows how to create a CI relationship between the parent CI contains field and the child CI contained_by field. The relationship is listed in the CI Relationship [cmdb_rel_ci] table.

```
var base = new SNC.CMDBUtil();
base.createCIRelationship('<parent_ci_sys_id>',
 '<child_ci_sys_id>, 'Contains', 'Contained by');
```

CMDBUtil - getAllChildrenOfAsCommaList(String baseTable)

Gets all the child tables of the specified table as a comma-separated list.

This is a static method.

Parameters

Name	Type	Description
baseTable	String	The base table name.

Returns

Type	Description
String	A comma-separated list of sys_ids of tables extending the base table.

```
//Where cmdv_ci_computer is a table.
var output =
 SNC.CMDBUtil.getAllChildrenOfAsCommaList('cmdb_ci_computer');
gs.print(output);
```

CMDBUtil - getCMDBViews()

Gets all the records in the CMDB View [cmdb_view] table.

This method is dynamic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	List of the records in the CMDB View [cmdb_view] table.

The following example shows how to list the CMDB views.

```
var util = new SNC.CMDBUtil();
var cmdbViews = util.getCMDBViews();
gs.info(cmdbViews);

// Note that the output in the example is type:
 java.util.ArrayList
// To convert to JS Array, use ArrayUtils (add these lines
 preceding gs.info):
// var arrUtil = new global.ArrayUtil();
// var arrViews = arrUtil.convertArray(cmdbViews);
```

Output:

```
[View 3, View 1, View 2, Another view]
```

CMDBUtil - getTables0(String tableName)

Gets a list of all the parents of a table.

This method is a static method.

Parameters

Name	Type	Description
tableName	String	The table name.

Returns

Type	Description
Array	List of tables that are parents of the specified table.

The following example shows how to list the parent tables of the Server [cmdb_ci_server] table.

```
var gr = new GlideRecord('incident');

// Querying the incident table
gr.addQuery('number','INC0000005');
gr.query();

if(gr.next()){
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  // Find the list of parent tables for Configuration item field
 of this Incident
  var ciParent =
 SNC.CMDBUtil.getTablesO(gr.cmdb_ci.sys_class_name);
  gs.print("Parent Tables for the Configuration Item '"
 + gr.cmdb_ci.name + "' belonging to the CMDB Class '"+
 gr.cmdb_ci.sys_class_name+ "' are: \n" + ciParent);
}
```

Output:

```
Parent Tables for the Configuration Item
 'ApplicationServerPeopleSoft' belonging to the CMDB Class
 'cmdb_ci_server' are:
[cmdb_ci_server, cmdb_ci_computer, cmdb_ci_hardware, cmdb_ci,
 cmdb]
```

CMDBUtil - isExcludedFromBR(String className)

Determines whether a CI class is defined in the Business Rule Exclusion Lists [cmdb_business_rule_exclusions] table. Use this method in an advanced condition to prevent a business rule from executing on excluded CI classes.

For example, the Create Asset on insert business rule uses this method in the advanced condition to prevent the rule from creating assets for CI classes such as cmdb_ci_qualifier, cmdb_ci_endpoint, cmdb_ci_storage_volume, and cmdb_ci_vcenter_datastore_disk. Define classes for exclusion in the Business Rule Exclusion Lists [cmdb_business_rule_exclusions] table.

Parameters

Name	Type	Description
className	String	Name of the class to check for exclusion.

Returns

Type	Description
Boolean	True if the class is defined in the Business Rule Exclusion Lists [cmdb_business_rule_exclusions] table; otherwise, false.

```
//Returns true if the cmdb_ci_endpoint class is defined
//in the Business Rule Exclusion Lists table
var exclusion =
 SNC.CMDBUtil.isExcludedFromBR("cmdb_ci_endpoint");

//Advanced condition that prevents business rules from executing
 on
//classes in the Business Rule Exclusion Lists table
(!SNC.CMDBUtil.isExcludedFromBR(current.getTableName()))
```

CMDBUtil - processCIChange(GlideRecord event, GlideRecord target)

Wraps the call to *RelationshipEventProcessor()*, which processes any changes to CI relationships.

This is a dynamic method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
event	GlideRecord	The event record.
target	GlideRecord	The target record.

Returns

Type	Description
void	

CMDBUtil - processRelChange(GlideRecord event, GlideRecord current, String relType, String triplet)

Wraps the call to `RelationshipEventProcessor()`, which processes any changes to CI relationships, with the specified type and triplet.

This is a dynamic method.

Parameters

Name	Type	Description
event	GlideRecord	The event record
current	GlideRecord	The current record, which is either the relation record or a user record if the current process is a deletion.
relType	String	The type of relation that changed.
triplet	String	The child, parent, and class name from the relation that changed.

Returns

Type	Description
void	

CMDBUtil - removeCIRelationship(String tableName, String parentField, String childField, String parentDesc, Object childDesc)

Deletes the specified CI relationship.

This is a dynamic method.

Parameters

Name	Type	Description
tableName	String	Optional. Table name Default: CI Relationship [cmdb_rel_ci] table
parentField	String	Parent field
childField	String	Child field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
parentDesc	String	Parent relationship descriptor
childDesc	Object	Child relationship descriptor

Returns

Type	Description
void	

This code example shows how to remove every relation type 'Depends on::Used by' for the specified parent.

```
var cu = new SNC.CMDBUtil();
var parentSysID = '27d18f6fc0a8000b00ad14d4929d1b45';
var parentDesc = 'Depends on';
var childDesc = 'Used by'

// Get records with parent equal parentSysID
var relation = new GlideRecord('cmdb_rel_ci');
relation.addQuery('parent', parentSysID);
relation.query();
while(relation.next()){
    // Remove every relation of type: 'Depends on::Used by' for
 the parent
    // If the relation type does not exist, it inserts this
 relation type into [cmdb_rel_type].
    cu.removeCIRelationship('cmdb_rel_ci', parentSysID,
 relation.child.getValue('sys_id'), parentDesc, childDesc)
}
```

CMDBUtil - reParentTable(String table, String oldParent, String newParent)

Changes the parent of the given table to the new parent.

Parameters

Name	Type	Description
table	String	The table to re-parent.
oldParent	String	The old parent.
newParent	String	The new parent.

Returns

Type	Description
Boolean	Flag that indicates if the parent change is successful. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: Parent change was successful. • false: Parent change wasn't successful.

To recreate the following example, use the code provided to create a custom table. Next create a record and check it in the task table. The custom table created extends from the Task table, which means it has successfully re-parented. The code isn't intended to be directly used via copy and paste. To show output, the custom table was created before running the code.

```
/*
  Before running the code in the background Script Make Sure
 'Record For Rollback' is unchecked.

  This API CMDBUtil.reParentTable changes the parent of the
 table but will not allow the OOB tables to change the parent it
 works only in the custom table. Hence this script contains the
 creation of the custom table.
  API CMDBUtil.reParentTable has 3 parameters (Table, Old
 Parent , New Parent);
  We can make the Parent as Null as well by using this (Table,
 Old Parent, '');

  The code in this example shows how to create a custom table
 without any extension.
  Then creating a record and then again creating a record and
 checking in the task table after it gets extended to the task
 table.

  If the code returns false means the record is not present
 in the task table as it is not extended. It returns true only
 when the record is found in the task table after the table is
 extended.

*/

/* Run the following code to create the custom table without an
 extension
createCustomTable('u_custom_table','Custom Table'); // Creating
 a custom Table (don't create if you have one)
var CreatedRecord = CreateCustomRecord('u_custom_table'); //
 Creating a record in the custom table
gs.print(CheckRecord('u_custom_table'));  // Checking of the
 record in the task table by passing the Class Name (A.K.A your
 custom Table)

var getParentTables = new
 SNC.CMDBUtil.reParentTable('u_custom_table','','task'); //
 Extending the custom table to task table . This Works only when
 the table is extendable
var CreatedRecordAfter =
 CreateCustomRecord('u_custom_table'); // Creating a record in
 the custom table
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.print(CheckRecord('u_custom_table'));  // Checking of the
 record in the task table by passing the Class Name (A.K.A your
 custom Table)
*/

// If the custom Table is already created, run this. (Do not run
 these 4 lines when creating the table)
gs.print(CheckRecord('u_custom_table')); //Checking of the
 record in the task table by passing the Class Name (A.K.A your
 custom Table)
var getParentTables = new
 SNC.CMDBUtil.reParentTable('u_custom_table','','task'); //
Extending the custom table to task table . This Works only when
 the table is extendable
var CreatedRecordAfter =
 CreateCustomRecord('u_custom_table'); //Creating a record in
 the custom table
gs.print(CheckRecord('u_custom_table'));  //Checking of the
 record in the task table by passing the Class Name (A.K.A your
 custom Table)

function createCustomTable(Name, Label)
{
  var customTable = new GlideRecord('sys_db_object');
  customTable.initialize();
  customTable.name=  Name ;
  customTable.label= Label ;
  customTable.is_extendable= true;
  customTable.insert();
}

function CreateCustomRecord(customTableName)
{
  var customTable = new GlideRecord(customTableName);
  customTable.initialize();
  return customTable.insert();
}

function CheckRecord(customTableName)
{
  var task =new GlideRecord('task');
  task.addQuery('sys_class_name', customTableName);
  task.query();

  if(task.next())
  {
    return true;
  }

  return false;
}
```

Output:

```
*** Script: true
*** Script: true
```

Color - Scoped, Global

Creates a Color object used to define color attributes that you can apply to elements in a PDF; such as cells, tables, and lines.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the `sn_pdfgeneratorutils` namespace. The plugin is activated by default.

This API is a component used with the Document API to generate a PDF.

Color - Color(Array colors)

Instantiates a new *`Color`* object with RGB values.

Color can be applied to the following scenarios:

Parameters

Name	Type	Description
colors	Array	Three numbers indicating RGB values using a decimal value from 0 through 1. For example, in `[0.1, 0.9, 0.5]`, the value of the first position is red, second is green, and third is blue. Also, `[0, 0, 0]` is solid black, `[0.5, 0.5, 0.5]` is solid gray, and `[1, 1, 1]` is solid white.

The following example shows how to create a *`Color`* object.

```
var color = new sn_pdfgeneratorutils.Color([0.1, 0.9,
 0.5]); //given as object containing RGB values
```

Color – equals(Color color)

Indicates whether the values of two different color objects match.

Parameters

Name	Type	Description
color	Color	Color object to check for a match.

Returns

Type	Description
Boolean	Flag that indicates whether the values of two color objects match. Valid values: • true: The colors match. • false: The colors do not match.

The following example shows how to create two color objects and determine if the colors match.

```
var color1 = new sn_pdfgeneratorutils.Color([1,0.5,0.5]);  //
 given as an array of RGB values
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var color2 = new sn_pdfgeneratorutils.Color([0.8,0.5,0.5]);
    // given as an array of RGB values
var isequal = color1.equals(color2);
```

Color – getGrayColor(Number grayScale)

Returns a black, gray, or white color object.

Parameters

Name	Type	Description
grayScale	Number	Decimal value in the range 0 through 1, in which 0 is black and 1 is white.

Returns

Type	Description
Object	Color object reflecting the provided grayscale value.

The following example shows how to create a color object that is 50% grayscale.

```
var grayColor = new
 sn_pdfgeneratorutils.Color.getGrayColor(0.5);
```

Color – setColorValue(Array colors)

Creates color with given values and enables you to change the values of an existing color. Each of the values must be from 0 through 1.

Parameters

Name	Type	Description
colors	Array	Three numbers indicating RGB values using a decimal value from 0 through 1. For example, in `[0.1, 0.9, 0.5]`, the value of the first position is red, second is green, and third is blue. Also, `[0, 0, 0]` is solid black, `[0.5, 0.5, 0.5]` is solid gray, and `[1, 1, 1]` is solid white.

Returns

Type	Description
None	

The following example shows how to change the values of an existing color.

```
var color = new sn_pdfgeneratorutils.Color([1,0.5,0.5]);
  //given as array of RGB values;
color.setColorValue(color);
```

Color – setOpacity(Number opacity)

Sets the level of color opacity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
color	Color	Floating decimal value from 0 through 1, in which 0 is fully transparent and 1 is fully opaque.

Returns

Type	Description
None	

The following example shows how to create a color object and set its opacity to 50 percent.

```
var color = new Color([1,0.5,0.5]);
color.setOpacity(0.5);
```

ConnectActionResponse - Global

The *ConnectActionResponse* API provides a method to create a glide record.

The *ConnectActionResponse* methods are accessed through a global object (response) that is available only in Connect action scripts.

ConnectActionResponse - newRecord(String table, Object values, String view)

Create a GlideRecord in the specified table with the specified values.

Opens a form in the UI based upon the table, which replaces the **Table** and **Document** fields in the Live Group Profile record for the associated conversation.

Parameters

Name	Type	Description
table	String	Name of the table where the record is to be added.
values	Object	An object of name value pairs where the names are field names in the table and the values are the field values.
view	String	The form view to load. This parameter is optional.

Returns

Type	Description
void	

```
response.newRecord("incident", {
 short_description: conversation.document.short_description ||
 "",
 caller_id: conversation.document.opened_by
});
```

ConnectionInfo - Scoped, Global

The *ConnectionInfo* API enables you to get connection attribute information through the connection and credential alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use this API in scoped applications or within the global scope. In scoped scripts, use the `sn_cc` namespace identifier.

For more information on connections and credentials, see Credentials and connection information.

This function retrieves connection attribute information identified by the given connection and credential alias.

```
var provider = new sn_cc.ConnectionInfoProvider();

// get a jdbc connection in the current domain with the alias ID
//     "6219afbf9f03320021dd7501942e70fc"
var connectionInfo =
 provider.getConnectionInfo("6219afbf9f03320021dd7501942e70fc");
if (connectionInfo != null) {
  // get data map
  var datamap = connectionInfo.getDataMap();
  gs.info(datamap["name"]);
  gs.info(datamap["connection_url"]);

  // get the same values using getAttribute
  gs.info(connectionInfo.getAttribute("name"));
  gs.info(connectionInfo.getAttribute("connection_url"));

  // get credential attributes
  gs.info(connectionInfo.getCredentialAttribute("user_name"));
  gs.info(connectionInfo.getCredentialAttribute("password"));

  // get extended attributes
  var extendedAttributes =
 connectionInfo.getExtendedAttributes();
  gs.info(extendedAttributes["name1"]);
 }

 // get a jdbc connection in the ACME domain with the alias ID
 //      "cd5923ff9f03320021dd7501942e70bb"
 connectionInfo =
 provider.getConnectionInfoByDomain("cd5923ff9f03320021dd7501942
e70bb",
        "c90d4b084a362312013398f051272c0d");
 if (connectionInfo != null) {
   // get data map
   var datamap = connectionInfo.getDataMap();
   gs.info(datamap["name"]);
 }
```

Scoped ConnectionInfo - getAttribute(String name)

Returns the value of a *ConnectionInfo* attribute with the specified property name.

Parameters

Name	Type	Description
name	String	Name of a *ConnectionInfo* object property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Value of a specified *ConnectionInfo* property.

```
// get the same values using getAttribute
gs.info(connectionInfo.getAttribute("name"));
gs.info(connectionInfo.getAttribute("connection_url"));
```

Scoped ConnectionInfo - getCredentialAttribute()

Returns the value of credential attributes for a specified connection.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Key-value pair map of credential attributes.

```
// get credential attributes
gs.info(connectionInfo.getCredentialAttribute("user_name"));
gs.info(connectionInfo.getCredentialAttribute("password"));
```

Scoped ConnectionInfo - getDataMap()

Returns the connection attributes as a collection of key-value pairs.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Key-value pair map of connection attributes.

```
// get data map
var datamap = connectionInfo.getDataMap();
gs.info(datamap["name"]);
gs.info(datamap["connection_url"]);
```

Scoped ConnectionInfo - getExtendedAttributes()

Returns the extended attributes as a collection of key-value pairs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Key-value pair map of extended attributes.

```
// get extended attributes
  var extendedAttributes =
 connectionInfo.getExtendedAttributes();
  gs.info(extendedAttributes["name1"]);
 }
```

ConnectionInfoProvider - Scoped, Global

The *ConnectionInfoProvider* API provides methods to select connection information through the connection alias.

You can use this API in scoped applications or within the global scope. In scoped scripts, use the `sn_cc` namespace identifier.

This function retrieves connection information identified by the given connection alias.

```
var provider = new sn_cc.ConnectionInfoProvider();

// get a jdbc connection in the current domain with the alias ID
//     "6219afbf9f03320021dd7501942e70fc"
var connectionInfo =
 provider.getConnectionInfo("6219afbf9f03320021dd7501942e70fc");
if (connectionInfo != null) {
  // get data map
  var datamap = connectionInfo.getDataMap();
  gs.info(datamap["name"]);
  gs.info(datamap["connection_url"]);

  // get the same values using getAttribute
  gs.info(connectionInfo.getAttribute("name"));
  gs.info(connectionInfo.getAttribute("connection_url"));

  // get credential attributes
  gs.info(connectionInfo.getCredentialAttribute("user_name"));
  gs.info(connectionInfo.getCredentialAttribute("password"));

  // get extended attributes
  var extendedAttributes =
 connectionInfo.getExtendedAttributes();
  gs.info(extendedAttributes["name1"]);
 }

 // get a jdbc connection in the ACME domain with the alias ID
 //      "cd5923ff9f03320021dd7501942e70bb"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 connectionInfo =
 provider.getConnectionInfoByDomain("cd5923ff9f03320021dd7501942
e70bb",
        "c90d4b084a362312013398f051272c0d");
 if (connectionInfo != null) {
   // get data map
   var datamap = connectionInfo.getDataMap();
   gs.info(datamap["name"]);
 }
```

ConnectionInfoProvider - ConnectionInfoProvider()

Selects connection information through the connection alias.

Parameters

Name	Type	Description
None		

ConnectionInfoProvider - getConnectionInfo(String aliasID)

Retrieves a ConnectionInfo object identified by the given aliasID in the current domain.

Parameters

Name	Type	Description
aliasID	String	Sys_id of a connection alias.

Returns

Type	Description
ConnectionInfo	Information about the connection.

```
var provider = new sn_cc.ConnectionInfoProvider();

// get a jdbc connection in the current domain with the alias ID
//     "6219afbf9f03320021dd7501942e70fc"
var connectionInfo =
 provider.getConnectionInfo("6219afbf9f03320021dd7501942e70fc");
```

ConnectionInfoProvider - getConnectionInfoByDomain(String aliasID, String domainID)

Retrieves a ConnectionInfo object identified by the given aliasID for a specific domain.

Parameters

Name	Type	Description
aliasID	String	Sys_id of a connection alias.
domainID	String	Sys_id of a domain or `global`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
ConnectionInfo	Connection information.

```
var provider = new sn_cc.ConnectionInfoProvider();

// get a jdbc connection in the ACME domain with the alias ID
 //      "cd5923ff9f03320021dd7501942e70bb"
 connectionInfo =
 provider.getConnectionInfoByDomain("cd5923ff9f03320021dd7501942
e70bb",
        "c90d4b084a362312013398f051272c0d");
```

Conversation - Scoped

The *Conversation* API enables you to create or modify Connect conversations.

To use this class in a scoped application, use the `sn_connect` namespace identifier. The Connect Scriptable APIs plugin (ID: com.glide.connect.scriptable) should be enabled to access the *Conversation* API.

Conversation - addSubscriber(String sysID)

Adds a user to a conversation.

Parameters

Name	Type	Description
sysID	String	Sys_ID of the user you want to add to a conversation.

Returns

Type	Description
void	

```
var conversation =
 sn_connect.Conversation.get("7caf49111309030034bb58a12244b06c
");
conversation.addSubscriber("a8f98bb0eb32010045e1a5115206fe3a");
```

Conversation - create(String name)

Creates a Connect conversation.

Parameters

Name	Type	Description
name	String	Create a conversation with a specific name.
type	String	Include a specific conversation type. The type is determined by the type choice list. The base system includes the following type options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• connect • support • group • peer • qanda • team

Returns

Type	Description
Object	Scriptable Conversation

```
var conversation = sn_connect.Conversation.create({
    name: "Hello world",
    type: "connect"
});
```

Conversation - get(String sysID)

Returns an existing Connect conversation by sys_id.

Parameters

Name	Type	Description
sysID	String	The sys_id of the conversation record.

Returns

Type	Description
Object	Conversation object

```
var conversation =
 sn_connect.Conversation.get("27b9844c1385030034bb58a12244b037
");
```

Conversation - removeSubscriber(String sysID)

Removes a user from a conversation.

Parameters

Name	Type	Description
SysID	String	The sys_id of the user you want to remove from a conversation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var conversation =
 sn_connect.Conversation.get("7caf49111309030034bb58a12244b06c
");
conversation.removeSubscriber("a8f98bb0eb32010045e1a5115206fe3a
");
```

Conversation - sendMessage(String body, String field)

Sends a message to a conversation.

Parameters

Name	Type	Description
Body	String	The main text of the message.
Field	String	The field you want the message to appear as. Only use this option if adding a message to a record conversation. Choose from work_notes, comments, or system. Using the field system treats the message as a system message.

Returns

Type	Description
void	

```
var conversation =
 sn_connect.Conversation.get("2064fa39190103009 64f5270e9840fbb
");
conversation.sendMessage({body: "Hello world", field:
 "work_notes"});
```

CostPlanBatchOperations - Global

The *CostPlanBatchOperations* script include provides methods that enable the creation of a large number of cost plan records for demands and projects using batch processing. Use this script include instead of *GlideRecord* to more efficiently create multiple cost plan records.

Use the *CostPlanBatchOperations.add()* method to add any number of cost plans to a batch queue. Once you have added all the required cost plans, use the *CostPlanBatchOperations.process()* method to create/insert the cost plans in your instance. Until you call the *CostPlanBatchOperations.process()* method, the add requests remain in the batch queue (they are not yet added to your instance). If for some reason you need to remove all of the cost plans in the batch queue, use the *CostPlanBatchOperations.clear()* method.

To use this script include you must activate the PPM Standard (com.snc.financial_planning_pmo) plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CostPlanBatchOperations - add(Object costPlan)

Adds one or more cost plans to a specified task (project or demand). Use this method when you want to create multiple cost plans.

Once processed, the cost plans are inserted into the specified project or demand. You can then view and modify them within your instance. For additional information, see Create a project cost plan and Create a demand cost plan.

Note: This method only defines the cost plans to add to your instance. The cost plans are not inserted into your instance until the `costPlanBatchOperations.process()` is called.

Parameters

Name	Type	Description
costPlan	Object	One or more objects or an array of objects that describe each of the cost plans to add to an existing task.
costPlan.name	String	Name of the cost plan. Maximum length: 130 characters
costPlan.task	String	Sys_id of the project or demand to associate with this cost plan. You can locate this value in one of the following tables: • Project [pm_project] • Project Task [pm_project_task] • Demand [dmn_demand]
costPlan.unit_cost	Number	Cost of a single unit of the specified resource.
costPlan.resource_type	String	Sys_id of the record that defines the cost type associated with this cost plan. The available values for this parameter are defined in the Cost Type Definition [resource_type_definition] table.
costPlan.start_fiscal_period	String	Sys_id of the record that defines the starting fiscal period to associate with this cost plan. The available values for this parameter are defined in the Fiscal period [fiscal_period] table.
costPlan.end_fiscal_period	String	Sys_id of the record that defines the ending fiscal period to associate with this cost plan. The available values for this parameter are defined in the Fiscal period [fiscal_period] table.
costPlan.<optional>	Varied	Optional. You can pass in additional parameters to add to a cost plan. The available parameters depend on the type of cost plan that you are creating. Refer to the Cost Plan [cost_plan] table for the list of additional parameters that you can pass.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

This example shows how to add a simple batched cost plan.

```
//Define Array of Cost Plan records in JSON format
var costPlanRecords= [];
costPlanRecords.push({
   name:'Capital Expense',
   task:'f7a36d1bdb58001025c85a35dc96193a', // sys_id of the
 task
   unit_cost:1000.00, //decimal
   resource_type:'a546eaf79330120064f572edb67ffb70', // sys_id
 of the cost type definition
   start_fiscal_period:'091b6e60cb111200f2de77a4634c9c2e', //
 sys_id of the start fiscal period record
   end_fiscal_period:'0d1b6e60cb111200f2de77a4634c9c2f',//
 sys_id of the end fiscal period record
   quantity:1 // Optional cost plan record attributes
});

var costPlanBatchOperations = new CostPlanBatchOperations();
costPlanBatchOperations.add(costPlanRecords);
var costPlanSysIds = costPlanBatchOperations.process();
```

CostPlanBatchOperations - clear()

Removes all cost plan objects that were added using the *`CostPlanBatchOperations.add()`* method.

Note: This method only works for cost plans that have been added. Once a cost plan is processed, this method cannot remove it. Processed cost plans must be removed manually through the UI.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example shows how to clear the batch queue after adding cost plans.

```
//Define Array of Cost Plan records in JSON format
var costPlanRecords= [];
costPlanRecords.push({
   name:'Capital Expense',
   task:'f7a36d1bdb58001025c85a35dc96193a', // sys_id of the
 task
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  unit_cost:1000.00, //decimal
  resource_type:'a546eaf79330120064f572edb67ffb70', // sys_id
 of the cost type definition
  start_fiscal_period:'091b6e60cb111200f2de77a4634c9c2e', //
 sys_id of the start fiscal period record
  end_fiscal_period:'0d1b6e60cb111200f2de77a4634c9c2f',//
 sys_id of the end fiscal period record
  quantity:1 // Optional cost plan record attributes
});

var costPlanBatchOperations = new CostPlanBatchOperations();
costPlanBatchOperations.add(costPlanRecords);
var costPlanSysIds = costPlanBatchOperations.process();
costPlanBatchOperations.clear();
```

CostPlanBatchOperations - process()

Processes all of the cost plans that were added using the *`CostPlanBatchOperations.add()`* method and creates corresponding cost plans and relevant rollups.

Once the cost plans are successfully processed, the cost plan queue is cleared.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	Sys ID for each generated cost plan.

This example shows how to process a simple batched cost plan.

```
//Define Array of Cost Plan records in JSON format
var costPlanRecords= [];
costPlanRecords.push({
  name:'Capital Expense',
  task:'f7a36d1bdb58001025c85a35dc96193a', // sys_id of the
 task
  unit_cost:1000.00, //decimal
  resource_type:'a546eaf79330120064f572edb67ffb70', // sys_id
 of the cost type definition
  start_fiscal_period:'091b6e60cb111200f2de77a4634c9c2e', //
 sys_id of the start fiscal period record
  end_fiscal_period:'0d1b6e60cb111200f2de77a4634c9c2f',//
 sys_id of the end fiscal period record
  quantity:1 // Optional cost plan record attributes
});

var costPlanBatchOperations = new CostPlanBatchOperations();
costPlanBatchOperations.add(costPlanRecords);
var costPlanSysIds = costPlanBatchOperations.process();
```

CriteriaEvaluator - Global

The `CriteriaEvaluator` script include provides methods to implement a general-purpose criteria evaluator.

The general use pattern is to construct the class, add as many criteria as needed, then evaluate.

CriteriaEvaluator - addCriterion(String lhComparand, String operator, String rhComparand)

Adds the criteria to be evaluated.

Parameters

Name	Type	Description
lhComparand	String	The left hand comparand. Must be a named value in the left hand values input into `evaluate()`.
operator	String	The operator. Must be one of: equals, starts with, contains, does not contain, ends with, or regex matches.
rhComparand	String	The right hand comparand. Can be evaluated either as one of the right hand values input to `evaluate()` or as a literal string.

Returns

Type	Description
void	

CriteriaEvaluator - evaluate(Object lhValues, String rhValues, Boolean any)

Evaluates the criteria.

Parameters

Name	Type	Description
lhValues	Object	A hashmap of name-value pairs to evaluate the left hand comparands of the criteria.
rhValues	String	Optional right hand values to use instead of the literal value in evaluating the right hand comparands.
any	Boolean	If true, any criterion matching suffices for a true result. If false, all criteria must match for a true result.

Returns

Type	Description
Boolean	True if the supplied values satisfy the criteria, false otherwise.

CSBScratchpadUtil - Scoped

The `CSBScratchpadUtil` API allows consumers to share "extra" information that is outside of any other Service Exchange service, with their providers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This information is stored as name-value pairs in the Scratchpad [sn_sb_scratchpad] table. The shared information must be associated with tasks that are of one of two types: provider tasks or remote tasks.

If the associated task is active, the updated scratchpad information syncs to the consumer instance. If a task is deactivated or deleted, the information in the scratchpad is also deleted after a specified number of days; by default three. This default is defined in the sn_sb.scratchpad.autodelete.days property.

Both providers and consumers can add, update, and remove information to and from the Scratchpad table. Producers update this information using the PSBScratchpadUtil - Scoped API.

To access this API, the Service Exchange for Consumers application must be installed. This API runs in the `sn_sb_con` namespace.

CSBScratchpadUtil - get(GlideRecord taskGR, String name)

Returns the value of a specified scratchpad property.

Parameters

Name	Type	Description
taskGR	GlideRecord	GlideRecord of the active remote task or provider task associated with the specified scratchpad property. These records are located in the Remote task [sn_sb_con_remote_task] and Provider task [sn_sb_con_provider_task] tables.
name	String	Name of the scratchpad property whose value to retrieve. Located in the Scratchpad [sn_sb_scratchpad] table.

Returns

Type	Description
String or null	Value of the requested scratchpad property. Null if the property isn't found.

The following code example shows how to call this method.

```
var rtGR = new GlideRecord("sn_sb_con_remote_task");
rtGR.setLimit(1);
rtGR.query();
rtGR.next()
if (rtGR.isValidRecord()) {
  var util = new sn_sb_con.CSBScratchpadUtil();
  util.update(rtGR, "name1", "value1");
  gs.info(util.get(rtGR, "name1"));
}
```

Output:

```
"value1"
```

CSBScratchpadUtil - getAll(GlideRecord taskGR)

Returns the property names and values (name-value pairs) of all scratchpad properties associated with the specified task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
taskGR	GlideRecord	GlideRecord of the active remote task or provider task whose associated scratchpad properties to return. These records are located in the Remote task [sn_sb_con_remote_task] and Provider task [sn_sb_con_provider_task] tables.

Returns

Type	Description
Object	All property names and values contained in the specified task. In the form: `{ name1: value1, name2: value2, … }`

The following code example shows how to call this method.

```
var rtGR = new GlideRecord("sn_sb_con_remote_task");
rtGR.setLimit(1);
rtGR.query();
rtGR.next()
if (rtGR.isValidRecord()) {
  var util = new sn_sb_con.CSBScratchpadUtil();
  util.update(rtGR, "name1", "value1");
  gs.info(JSON.stringify(util.getAll(rtGR)));
}
```

Output:

```
{ "name1": "value1" }
```

CSBScratchpadUtil - getNames(GlideRecord taskGR)

Returns the list of names of all scratchpad properties associated with the specified task record.

Parameters

Name	Type	Description
taskGR	GlideRecord	GlideRecord of the active remote task or provider task for which to return the list of names of all associated scratchpad properties. These records are located in the Remote task [sn_sb_con_remote_task] and Provider task [sn_sb_con_provider_task] tables.

Returns

Type	Description
String Array	List of names of the scratchpad properties associated with the specified task record.

The following code example shows how to call this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var rtGR = new GlideRecord("sn_sb_con_remote_task");
rtGR.setLimit(1);
rtGR.query();
rtGR.next()
if (rtGR.isValidRecord()) {
  var util = new sn_sb_con.CSBScratchpadUtil();
  util.update(rtGR, "name1", "value1");
  gs.info(JSON.stringify(util.getNames(rtGR)));
}
```

Output:

```
[ "name1" ]
```

CSBScratchpadUtil - populateClientScratchpadBR(GlideRecord taskGR)

Places the scratchpad properties associated with the specified remote task or provider task in the client g_scratchpad.

You can call this method from a UI display business rule.

Parameters

Name	Type	Description
taskGR	GlideRecord	GlideRecord of the active remote task or provider task whose associated scratchpad entries should be placed in the client g_scratchpad. These records are located in the Remote task [sn_sb_con_remote_task] and Provider task [sn_sb_con_provider_task] tables.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
new
 sn_sb_con.CSBScratchpadUtil().populateClientScratchpadBR(curren
t);
```

CSBScratchpadUtil - remove(GlideRecord taskGR, String name)

Deletes the specified scratchpad property from the Scratchpad [sn_sb_scratchpad] table.

Note: Deletes are not synced to other ServiceNow instances. Scratchpad properties are automatically deleted in a specified number of days after the associated task record is deactivated or deleted.

Parameters

Name	Type	Description
taskGR	GlideRecord	GlideRecord of the active remote task or provider task associated with the specified scratchpad property. These records are located in the Remote

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		task [sn_sb_con_remote_task] and Provider task [sn_sb_con_provider_task] tables.
name	String	Name of the scratchpad property to remove from the Scratchpad [sn_sb_scratchpad] table.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
var rtGR = new GlideRecord("sn_sb_con_remote_task");
rtGR.setLimit(1);
rtGR.query();
rtGR.next()
if (rtGR.isValidRecord()) {
  var util = new sn_sb_con.CSBScratchpadUtil();
  util.update(rtGR, "name1", "value1");
  util.remove(rtGR, “name1”);
  gs.info(util.get(rtGR, "name1"));
}
```

Output:

```
undefined
```

CSBScratchpadUtil - update(GlideRecord taskGR, String name, String value, Boolean client_side_accessible)

Inserts a property or updates the value of a property in the Scratchpad [sn_sb_scratchpad] table.

Note: The maximum number of properties that you can update in one call is 50.

Parameters

Name	Type	Description
taskGR	GlideRecord	GlideRecord of the active remote task or provider task associated with the specified scratchpad property. These records are located in the Remote task [sn_sb_con_remote_task] and Provider task [sn_sb_con_provider_task] tables.
name	String	Name of a new or existing scratchpad property. This name must be unique across all scratchpad properties.
value	String	Value of the scratchpad property. Maximum: 4000 characters.
client_side_accessible	Boolean	Optional. Flag that indicates whether this property is available to the client-side *g_scratchpad* when

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		populateClientScratchpadBR is called from a display business rule. Valid values: • true: Property is available. • false: Property isn't available. Default: false

Returns

Type	Description
None	

The following code example shows how to call this method.

```
var rtGR = new GlideRecord("sn_sb_con_remote_task");
rtGR.setLimit(1);
rtGR.query();
rtGR.next()
if (rtGR.isValidRecord()) {
  var util = new sn_sb_con.CSBScratchpadUtil();
  util.update(rtGR, "name1", "value2");
  gs.info(util.get(rtGR, "name1"));
}
```

Output:

```
"value2"
```

CSVParser - Scoped

The *CSVParser* API provides methods for parsing comma-separated value (CSV) formatted records into an object or an array.

This API runs in the `sn_impex` namespace.

CSVParser - parseLineToArray(String cvsLine, String delimiter, String quoteCharacter)

Parses passed in CSV formatted content into an array.

Parameters

Name	Type	Description
csvLine	String	CSV content to parse.
delimiter	String	Optional. Character used to delineate the fields in the source CSV content. Default: Comma ','

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
quoteCharacter	String	Optional. Character used as the quote character in the source CSV content. Default: Double quote ""

Returns

Type	Description

Array	Array containing the parsed values for each element in the passed-in CSV content.
	
	For example:
	`{`
	`Joe,`
	`Smith,`
	`470 W Carmen, Chicago IL, 60640`
	`}`

This example shows simple CSV formatted content parsed into a returned array.

```
var csvLine = '\"Joe\",\"Smith\",\"1470 W Carmen, Chicago IL,
 60640\"';
var delimiter = ',';
var quoteCharacter = '"';

var x = new sn_impex.CSVParser().parseLineToArray(csvLine,
 delimiter, quoteCharacter);

gs.log(x[0]);
gs.log(x[1]);
gs.log(x[2]);
```

Output:

```
Joe
Smith
1470 W Carmen, Chicago IL, 60640
```

CSVParser - parseLineToObject(String cvsLine, Array headers, String delimiter, String quoteCharacter)

Parses passed in CSV formatted content into an object.

Parameters

Name	Type	Description
csvLine	String	CSV content to parse.
headers	Array of Strings	Headers associated with the CSV content. These headers must be specified in the same order as the corresponding content in *csvLine*. For example, `var headers = ['first_name', 'last_name', 'address'];`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
delimiter	String	Optional. Character used to delineate the fields in the source CSV content. Default: Comma ','
quoteCharacter	String	Optional. Character used as the quote character in the source CSV content. Default: Double quote '"'

Returns

Type	Description
Object	Object containing the header and corresponding value for each element in the passed-in CSV content. For example: `{ first_name: Joe, last_name: Smith, address: 1470 W Carmen, Chicago IL, 60640 }`

This example shows CSV formatted content parsed into a returned object.

```
var csvLine = '\"Joe\",\"Smith\",\"1470 W Carmen, Chicago IL,
 60640\"';
var headers = ['first_name', 'last_name', 'address'];
var delimiter = ',';
var quoteCharacter = '"';

var x = new sn_impex.CSVParser().parseLineToObject(csvLine,
 headers, delimiter, quoteCharacter);

gs.log(x.first_name);
gs.log(x.last_name);
gs.log(x.address);
```

Output:

```
Joe
Smith
1470 W Carmen, Chicago IL, 60640
```

This example shows an exception response because of an invalid pass of the header parameter.

```
var csvLine = '\"Joe\",\"Smith\",\"1470 W Carmen, Chicago IL,
 60640\"';
var headers = null;
var delimiter = ',';
var quoteCharacter = '"';
try {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var x = new sn_impex.CSVParser().parseLineToObject(csvLine,
 headers, delimiter, quoteCharacter);

gs.log(x.first_name);
gs.log(x.last_name);
gs.log(x.address);
}
catch(ex) {
      gs.info(ex.message);
}
```

Output:

```
CSVParser: Header list is empty: no thrown error
*** Script: CSVParser: Header list is empty
```

CTIOperationRequest - Scoped, Global

The *CTIOperationRequest* script include provides methods to set and get data on the current CTIOperationRequest object.

You use CTIOperationRequest objects to pass information between a message transformer and an operation handler within the ServiceNow Voice framework.

Typically, a message transformer is responsible for parsing an incoming CTI-specific payload and setting the payload data on an associated CTIOperationRequest object. An operation handler is then responsible for getting the information from the CTIOperationRequest object and using the data to process the requested operation.

The ServiceNow base system provides working operation handlers and message transformers that enable connection to Amazon Connect. When building contact flows within Amazon Connect, there are two integration points between Amazon services and a ServiceNow instance:

- Amazon Web Services (AWS) Lambda Proxy (Invoke AWS Lambda function)
- AWS Lex Bot (Get Customer Input)

You can find the available operation handlers and message transformers for these integration points in the Operation Handlers [sn_cti_operation_handler] and Provider Message Transformer [sn_cti_provider_msg_transormer] tables.

A payload is passed into a ServiceNow instance from an external source, such as from a computer telephony integration (CTI) provider that is making an operation request. When a request is received, a message transformer parses the payload and uses the CTIOperationRequest set methods to set payload values, such as the operation handler name, onto an operation and contact-specific CTIOperationRequest object.

For example, the following message transformer script parses the passed in JSON payload and sets the values required by the associated operation handler on the CTIOperationRequest object.

```
{
  try {
    var jsonPayload = httpRequest.body.data;
    if (jsonPayload) {
 var event = jsonPayload.event;
 if (event) {
   var details = event.Details;
   if (details) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 operationRequest.setOperationName(details.Parameters['sn_operat
ion']);
     var contactData = details.ContactData;
     if(contactData) {
  // Call id should be surfaced in openframe call log so it can
 be tied to transcription later
  operationRequest.setParameter('contact.call_id',
 contactData.ContactId);
  for(var ck in contactData.CustomerEndpoint) {
    operationRequest.setParameter('contact.' + ck,
 contactData.CustomerEndpoint[ck]);
       }
       operationRequest.setParameter('contact.id',
 contactData.ContactId);
       operationRequest.setParameter('contact.phone',
 contactData.CustomerEndpoint.Address);
     }
     var parameters = details.Parameters;
     if (parameters) {
  for (var pk in parameters) {
    switch(pk) {
      case 'interactionId':
   operationRequest.setInteractionSysId(parameters[pk]);
   break;
      case 'authToken':
   operationRequest.setAuthToken(parameters[pk]);
   break;
      case 'language':
   operationRequest.setLanguage(parameters[pk]);
   break;

      default:
   operationRequest.setParameter(pk, parameters[pk]);
   }
          }
        }
      }
     }
  } catch(e) {
  ctx.setError(e);
  }
})(httpRequest, operationRequest, ctx);
```

After the message transformer finishes parsing the passed in payload, the ServiceNow Voice framework instantiates the specified operation handler. The operating handler uses the *CTIOperationResponse* script include get methods to obtain the information that it needs from the associated CTIOperationRequest object to process the requested operation.

For example, the following operation handler script stores values that were set on the CTIOperationRequest object in the interaction record associated with the call.

```
(function(/*CTIOperationRequest*/
 request, /*CTIOperationResponse*/ response, ctx) {
  // Returns the sys_id of the interaction record.
  var interactionSysId = request.getInteractionSysId();
```

© 2026 ServiceNow, Inc. All rights reserved.

```
  var number = request.getParameter('number');
  var addComment = request.getParameter('add_comment');
  addComment = addComment ? addComment.toLowerCase() :
 addComment;
  addComment = 'yes' === addComment || 'true' === addComment ||
 '1' === addComment;
  var workNotes = request.getParameter('work_notes');
  var message = gs.getMessage('Thankyou');
  var interactionGr = request.getInteractionRecord();
  var openedFor = interactionGr ?
 interactionGr.getValue('opened_for') : null;
  if (openedFor && number && addComment && workNotes) {
    var now_GR = new GlideRecordSecure('incident');
    now_GR.addQuery('caller_id', openedFor);
    now_GR.addQuery('number', number);
    now_GR.query();
    if (now_GR.next()) {
      now_GR.work_notes += workNotes;
      now_GR.update();
      message = now_GR.getMessage('Your comment was added');
    }
  }
  response.setStatusCode(200);
  response.setMessage(message);
})(request, response, ctx);
```

For additional information on creating operation handlers, see Configure a contact flow for an automated caller interaction.

This script include runs in the `sn_cti_core` namespace. Before you are able to access the *`CTIOperationRequest`* script include, the ServiceNow Voice (sn_cti_core) plugin must be activated. For information on activating ServiceNow Voice, see Install ServiceNow Voice applications.

For additional information on the ServiceNow Voice, see ServiceNow Voice.

CTIOperationRequest - CTIOperationRequest(String origin)

Instantiates a CTIOperationRequest object.

Parameters

Name	Type	Description
origin	String	Optional. Origin of the request. Usually the name of the computer telephony integrator provider. Default: null

```
var request = new sn_cti_core.CTIOperationRequest('AWS
 Connect');
request.setSessionAttribute('contact.phone', '+15552222345');
request.setSessionAttribute('contact.okToCall', true);
request.setSessionAttribute('contact.address', {
    street: '1234 Main St'
    city: 'API City',
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    zip: 91335
});
```

CTIOperationRequest - getAuthToken()

Returns the authentication token set on the associated CTIOperationRequest object.

This token is used by the ServiceNow Voice framework to authenticate the current ServiceNow Voice user before executing the requested operation handler if the handler's *auth_required* flag is set to true. The *auth_required* flag is a field in the Operation Handler [sn_cti_operation_handler] table. The life of an authentication token should be for the life of the call session, but is determined by the CTI provider.

You can define whatever authentication/authorization handling required by your implementation by creating your own authentication operation handler. Regardless of how the authentication token is generated, the message translator must pass the token back in the CTI payload. Additionally, the CTI provider must store this authentication token locally and pass it in each operation request that requires authentication.

If using the instance provided authenticate operation handler, the handler initiates the creation of the authentication token based on a four-digit user-entered pin. It then sets the authentication token in the sessionAttributes object of the CTIOperationResponse object. The associated message transformer translates the sessionAttributes object into the CTI-specific payload and then sends it to the CTI provider.

Note: If the authentication token is not passed, all requests to execute operation handlers with the *auth_required* flag set will fail. If you do not use authentication, you do not need to maintain authentication tokens.

The ServiceNow base system provides working operation handlers and message transformers that enable connection to Amazon Connect. When building contact flows within Amazon Connect, there are two integration points between Amazon services and a ServiceNow instance:

- Amazon Web Services (AWS) Lambda Proxy (Invoke AWS Lambda function)
- AWS Lex Bot (Get Customer Input)

You can find the available operation handlers and message transformers for these integration points in the Operation Handlers [sn_cti_operation_handler] and Provider Message Transformer [sn_cti_provider_msg_transormer] tables.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The authentication token associated with the current ServiceNow Voice user.

```
(function( /*CTIProviderResponseExecutionContext*/
 ctx, /*CTIOperationRequest*/
 operationRequest, /*CTIOperationResponse*/
 operationResponse, /*HTTPResponse*/ httpResponse) {
  var sessionAttributes = {},
      intentResponse;
```

```
  var statusCode = -1;
  var message = 'Unprocessed';
  if (operationResponse) {
    statusCode = operationResponse.getStatusCode();
    sessionAttributes =
 operationResponse.getSessionAttributes();
    message = operationResponse.getMessage();
    var error = operationResponse.getError();
    if (error) {
      sessionAttributes.error = error;
    }
  }
  if
 (sn_cti_core.CTIRequestDispatcher.Constants.HTTP.Status.AUTH_RE
QUIRED.code === statusCode) {
    //first call for a secure action without authentication
 token
    sessionAttributes.statusCode = 401;
    sessionAttributes.message = message;
    intentResponse = {
      sessionAttributes: sessionAttributes,
      dialogAction: {
        type: 'Close',
        fulfillmentState: 'Fulfilled',
        message: {
          contentType: 'PlainText',
          content: 'This operation requires authentication. Say
 authenticate for authentication.'
        }
      }
    };
  } else if ('DialogCodeHook' ===
 operationRequest.getParameter('$$invocationSource')) {
      //pass back authToken and interactionId
      sessionAttributes.authToken =
 operationRequest.getAuthToken();
      sessionAttributes.interactionId =
 operationRequest.getInteractionSysId();
      var originalSlots =
 operationRequest.getParameter('$$slots');
      var responseParameters = operationResponse ?
 operationResponse.getParameters() : {};
      responseParameters = responseParameters ?
 responseParameters : {};
      // See if processing happened and we got a dialogAction
      var responseDialogAction =
 responseParameters['dialogAction'];
      // Default dialog action
      var dialogAction = {
        type: 'Delegate',
        slots: originalSlots
      };
      // If the response doesn't contain an override replay the
 inputs
      if (responseDialogAction) {
        // We bypassed dialoghook so delegate and pass through
 inputs
```

```
        dialogAction = responseDialogAction;
      }
      intentResponse = {
        sessionAttributes: sessionAttributes,
        dialogAction: dialogAction
      };
  } else {
    // Override required session attributes
    sessionAttributes.statusCode = statusCode;
    sessionAttributes.message = message;
    // Build response template
    intentResponse = {
      sessionAttributes: sessionAttributes,
      dialogAction: {
        type: 'Close',
        fulfillmentState: 'Fulfilled',
        message: {
          contentType: 'PlainText',
          content: message
        }
      }
    };
  }
  httpResponse.setBody(intentResponse);
})(ctx, operationRequest, operationResponse, httpResponse);
```

CTIOperationRequest - getInteractionRecord()

Returns the interaction GlideRecord associated with the operation request.

An interaction represents a customer request for assistance made through a chat, phone call, or in-person. Interactions can be routed to queues for assignment or assigned to agents directly. Interaction records are stored in the Interaction [interaction] table and can contain any type of data that describes service account interactions with a customer for a specific session.

Interaction records are associated with a CTIOperationRequest object through the CTIOperationRequest - setInteractionSysId(String Id) method. This method is typically called by the message transformer and must be called prior to calling the *`getInteractionRecord()`* method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideRecord	Interaction GlideRecord object associated with the current CTIOperationRequest object. If the interaction record sys_id has not been set on the CTIOperationRequest object, returns null.

```
(function(/*CTIOperationRequest*/
 request, /*CTIOperationResponse*/ response, /*Context*/ ctx) {
  var notes = '', lang = request.getLanguage();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 try {
   // Returns the interaction record (GlideRecord) set on the
passed in CTIOperationRequest object
   var interactionGr = request.getInteractionRecord();

   var now_GR = new GlideRecord('sys_user');
   if(interactionGr &&
now_GR.get(interactionGr.opened_for.toString())) {
   if(now_GR.locked_out == true) {
       notes += gs.getMessageLang("User record found locked.
Unlocking the account.\n", lang);
       now_GR.locked_out=false;
       now_GR.update();
       response.setStatusCode(200);
       response.setMessage(gs.getMessageLang("Your account has
been unlocked.", lang));
     } else {
       notes += gs.getMessageLang("User record not locked.\n",
lang);
       response.setStatusCode(200);
       response.setMessage(gs.getMessageLang("Your account
doesn't seem to be locked.", lang));
     }
   } else {
     notes += gs.getMessageLang("User record not found.
Transfer to agent\n", lang);
     response.setStatusCode(302);
     response.setMessage(gs.getMessageLang("I am unable to find
your record. Let me transfer to someone who can help.", lang));
   }
   if(interactionGr) {
     interactionGr.work_notes = notes;
     interactionGr.update();
   }
 } catch(e) {
   ctx.setError(e);
 }
})(request, response, ctx);
```

CTIOperationRequest - getInteractionSysId()

Returns the sys_id of the interaction record associated with the current CTIOperationRequest object.

The CTIOperationRequest - setInteractionSysId(String Id) method must have been called prior to calling this method.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The sys_id of the interaction record set on the current CTIOperationRequest object. If the sys_id was not set on the associated CTIOperationRequest object, the method returns null.

```
(function( /*CTIOperationRequest*/
 request, /*CTIOperationResponse*/ response, ctx) {
  // Returns the sys_id of the interaction record associated
 with the CTIOperationRequest object.
  var interactionSysId = request.getInteractionSysId();
  var number = request.getParameter('number');
  var addComment = request.getParameter('add_comment');
  addComment = addComment ? addComment.toLowerCase() :
 addComment;
  addComment = 'yes' === addComment || 'true' === addComment ||
 '1' === addComment;
  var workNotes = request.getParameter('work_notes');
  var message = gs.getMessage('Thankyou');
  var interactionGr = request.getInteractionRecord();
  var openedFor = interactionGr ?
 interactionGr.getValue('opened_for') : null;
  if (openedFor && number && addComment && workNotes) {
    var now_GR = new GlideRecordSecure('incident');
    now_GR.addQuery('caller_id', openedFor);
    now_GR.addQuery('number', number);
    now_GR.query();
    if (now_GR.next()) {
    now_GR.work_notes += workNotes;
    now_GR.update();
      message = gs.getMessage('Your comment was added');
    }
  }
  response.setStatusCode(200);
  response.setMessage(message);
})(request, response, ctx);
```

CTIOperationRequest - getLanguage()

Returns the ISO 639.1 language code that was set on the current CTIOperationRequest object.

Using the customer preferred language enables you to use platform-provided internationalization and localization capabilities to customize messages and other communications with the associated caller.

Typically an operation handler calls the getLanguage() method and the message transformer sets the language on the CTIOperationRequest object by calling the CTIOperationRequest - setLanguage(String languageCode) method.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The ISO 639.1 language code set on the current CTIOperationRequest object. If the language code is not set, returns en.

The following example shows an operation handler calling *getLanguage()* to obtain the caller's preferred language.

```
(function(/*CTIOperationRequest*/
 request, /*CTIOperationResponse*/ response) {
  // Obtain the contact's preferred language
  var notes = "", announcement, lang = request.getLanguage();
  try {

    var interactionGr = request.getInteractionRecord();

    announcement = gs.getMessageLang("We are currently
 experiencing issues with VPN. If you are calling about VPN
 issues, you may hang up the call.", lang);
    // Use the contact's language to customize the response
 messages and notes
    if(announcement) {
      notes = gs.getMessageLang("Listened to announcement: {0}",
 lang, [announcement]);
      response.setStatusCode(200);
    } else {
      announcement = gs.getMessageLang("There are currently no
 known outage announcements", lang);
      //use the status case as the flag to check for
 announcements in contact flow
      response.setStatusCode(404);
    }
    response.setMessage(announcement);

    if(interactionGr && notes) {
      interactionGr.work_notes = notes;
      interactionGr.update();
    }

  } catch(e) {
    ctx.setError(e);
  }

})(request, response);
```

CTIOperationRequest - getMajorVersion()

Returns the major version of the computer telephony integrator (CTI) software set on the current CTIOperationRequest object.

Use this method if the CTI providers connected to your ServiceNow instance are running multiple versions of their software, as different software versions may require different processing behavior. If the processing behavior is only slightly different between the software versions, it may make sense to have only a single operation handler. You can then handle the processing differences by just checking the version of software making the request and process the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

request/data within your operation handler. If the required processing is significantly different between versions, it may be more effective to use multiple operation handlers.

Typically the message transformer sets the software version on the CTIOperationRequest object by calling the CTIOperationRequest - setMajorVersion(Number majorVersion) method and an operation handler then consumes the set value using this method. You can also get/set the minor version value of a provider's software using the CTIOperationRequest - getMinorVersion() and CTIOperationRequest - setMinorVersion(Number minorVersion) methods.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Major version number of the CTI software. If the major version was never set, returns 1.

```
var request = new sn_cti_core.CTIOperationRequest('origin');
var majorVersion = request.getMajorVersion();
```

CTIOperationRequest - getMinorVersion()

Returns the minor version of the computer telephony integrator (CTI) software associated with a CTIOperationRequest object.

Use this method if the CTI providers connected to your ServiceNow instance are running multiple versions of their software, as different software versions may require different processing behavior. If the processing behavior is only slightly different between the software versions, it may make sense to have only a single operation handler. You can then handle the processing differences by just checking the version of software making the request and process the request/data within your operation handler. If the required processing is significantly different between versions, it may be more effective to use multiple operation handlers.

Typically the message transformer sets the software version on the CTIOperationRequest object by calling the CTIOperationRequest - setMinorVersion(Number minorVersion) CTIOperationRequest - setMinorVersion(Number minorVersion) method and an operation handler then consumes the set value using this method. You can also get/set the major version value of a provider's software using the CTIOperationRequest - getMajorVersion() CTIOperationRequest - getMajorVersion() and CTIOperationRequest - setMajorVersion(Number majorVersion) CTIOperationRequest - setMajorVersion(Number majorVersion) methods.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Minor version number of the CTI software. If the minor version was never set, returns 0.

```
var request = new sn_cti_core.CTIOperationRequest('origin');
var minorVersion = request.getMinorVersion();
```

CTIOperationRequest - getOperationName()

Returns the name of the operation that the computer telephony integration (CTI) provider is requesting to execute.

The operation name determines the operation handler that is used to process a request. Typically the message transformer sets the operation name on the CTIOperationRequest object using the CTIOperationRequest - setOperationName(String name) method.

Note: The *`getOperationName()`* method does not instantiate the associated operation handler. This is done by the ServiceNow Voiceframework. This method simply returns the associated operation handler name.

Note: For Amazon Connect Lex Bot implementations, intent names are appended with a five letter suffix as different Amazon intents cannot have the same intent name. In the ServiceNow Voice framework, the intent name equals the operation handler name. An operation handler can either be specific for an intent, having an operation handler name that includes this suffix (myOperation_SUFFX), or it can be generic and used by multiple CTI providers or different use cases, such as using the same handler for processing an HR request and a helpdesk request (myOperation).

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The name of the operation that the CTI provider is requesting to execute. If the operation name is not set, returns null.

```
var request = new sn_cti_core.CTIOperationRequest('origin');
var name = request.getOperationName();
```

CTIOperationRequest - getOperationSubStepName()

Returns the substep operation handler name set on the current CTIOperationRequest object.

Use substeps to perform actions such as initialization and validation before processing an operation. Unlike operation handlers that are meant to be generic and used by all CTI providers, substeps are CTI provider specific and use terminology and naming conventions that are specific to the CTI provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ServiceNow Voice framework performs the following steps to locate the required operation handler and any associated substep operation handlers.

> **Note:** For Amazon Connect Lex Bot implementations, intent names are appended with a five letter suffix as different Amazon intents cannot have the same intent name. In the ServiceNow Voice framework, the intent name equals the operation handler name. An operation handler can either be specific for an intent, having an operation handler name that includes this suffix (myOperation_SUFFX), or it can be generic and used by multiple CTI providers or different use cases, such as using the same handler for processing an HR request and a helpdesk request (myOperation).

1. Tries to locate the operation handler associated with the request.
   - First checks for an operation handler called `myOperation_SUFFX`.
   - If not found, checks for the operation handler `myOperation`. If not found, errors out.
2. If the handler is found, checks the *`auth_required`* flag on the operation handler. If set, it checks that a valid authentication token (obtained through the *`getAuthToken()`* method) is present on the request. If present and valid, continue processing, else throw an error.
3. Looks up the operation handler for the passed in substep. For this example let's assume `subStepName=SubStep`.
   - First checks for an operation handler named `myOperation_SUFFX.SubStep`. If found, executes the handler.
   - If not found, checks for the handler `myOperation.SubStep`. If found executes the handler.
   - If not found, checks if a `subStepNotFoundBehavior` was set on the request object.
   - If set, executes the behavior, otherwise, errors out.
4. Executes the primary operation handler (`myOpersation_SUFFX` or `myOperation`.)

Typically the message transformer sets the substep name on the CTIOperationRequest object using the CTIOperationRequest - setOperationSubStepName(String name) method. You can override this behavior if you are creating your own transformer by calling the CTIOperationRequest - setSubStepNotFoundBehaviour(Object behaviour) method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The name of the substep operation handler set on the CTIOperationRequest object. If it does not exist, returns null.

```
var request = new sn_cti_core.CTIOperationRequest('origin');
var name = request.getOperationSubStepName();
```

CTIOperationRequest - getParameter(String key)

Returns the value of a specified key previously set on the current CTIOperationRequest object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the get/set parameter methods enables the passing of virtually any string or number value between a message transformer and an operation handler. The parameter object can contain zero or more key/value pairs of data that directly correlate to the current operation request. The operation handler determines what key/value pairs are required as it consumes these values. Typically the message transformer sets these parameters on the CTIOperationRequest object by calling the CTIOperationRequest - setParameter(String key, Object value) method and the operation handler consumes them using this method.

Parameters

Name	Type	Description
key	String	The name of the key value to return.

Returns

Type	Description
String or Number	Value of the specified key. If no such key exists, returns null.

```
(function( /*CTIOperationRequest*/
 request, /*CTIOperationResponse*/ response, ctx) {
  var interactionSysId = request.getInteractionSysId();
  // Returns the number and add_comment parameters from the
 CTIOperationRequest object
  var number = request.getParameter('number');
  var addComment = request.getParameter('add_comment');
  addComment = addComment ? addComment.toLowerCase() :
 addComment;
  addComment = 'yes' === addComment || 'true' === addComment ||
 '1' === addComment;
  var workNotes = request.getParameter('work_notes');
  var message = gs.getMessage('Thankyou');
  var interactionGr = request.getInteractionRecord();
  var openedFor = interactionGr ?
 interactionGr.getValue('opened_for') : null;
  if (openedFor && number && addComment && workNotes) {
    var now_GR = new GlideRecordSecure('incident');
    now_GR.addQuery('caller_id', openedFor);
    now_GR.addQuery('number', number);
    now_GR.query();
    if (now_GR.next()) {
    now_GR.work_notes += workNotes;
    now_GR.update();
      message = gs.getMessage('Your comment was added');
    }
  }
  response.setStatusCode(200);
  response.setMessage(message);
})(request, response, ctx);
```

CTIOperationRequest - getParameters()

Returns the key-value pairs for all parameters that were previously set on the current CTIOperationRequest object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the get/set parameter methods enables the passing of virtually any string or number value between a message transformer and an operation handler. The parameter object can contain zero or more key/value pairs of data that directly correlate to the current operation request. The operation handler determines what key/value pairs are required as it consumes these values. Typically the message transformer sets these parameters on the CTIOperationRequest object by calling the CTIOperationRequest - setParameter(String key, Object value) method and the operation handler consumes them using this method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	A map of key-value pairs that were previously set on the CTIOperationRequest object. This key-value pairs are free-form and defined by the needs of the operation handler. The returned values are either Strings or Numbers.

```
var request = new sn_cti_core.CTIOperationRequest('origin');
var parms = request.getParameters();
for(var key in parms) {
    gs.info(key + '=' + parms[key]);
}
```

CTIOperationRequest - getSessionAttribute(String key)

Returns the value of a specified session attribute key set on the current CTIOperationRequest object.

Using the get/set session attribute methods enables the passing of virtually any string or number value between a message transformer and an operation handler. The sessionAttribute object can contain zero or more key/value pairs of data that are valid for the duration of a computer telephony integration provider defined session, such as the contact's phone number. Session attributes can also be accessed within a contact flow. The operation handler determines what session attribute key/value pairs are needed as it consumes these values. Typically the message transformer sets these attributes on the CTIOperationRequest object by calling the CTIOperationRequest - setSessionAttribute(String key, Object value) method. Session attributes are different than parameters in that they persist for the life of the session (such as the entire call) and should be passed back by the CTI provider with each operation request within that call session.

Parameters

Name	Type	Description
key	String	The name of the key value to return.

Returns

Type	Description
String or Number	Value of the specified key. If no such key exists, returns null.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var request = new sn_cti_core.CTIOperationRequest('origin');
var phoneAttribute =
 request.getSessionAttribute('contact.phone');
```

CTIOperationRequest - getSessionAttributes()

Returns a key-value pair map of all session attributes set on the current CTIOperationRequest object.

Using the get/set session attribute methods enables the passing of virtually any string or number value between a message transformer and an operation handler. The sessionAttribute object can contain zero or more key/value pairs of data that are valid for the duration of a computer telephony integration provider defined session, such as the contact's phone number. Session attributes can also be accessed within a contact flow. The operation handler determines what session attribute key/value pairs are needed as it consumes these values. Typically the message transformer sets these attributes on the CTIOperationRequest object by calling the CTIOperationRequest - setSessionAttribute(String key, Object value) method. Session attributes are different than parameters in that they persist for the life of the session (such as the entire call) and should be passed back by the CTI provider with each operation request within that call session.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	A map of session attribute key-value pairs that were set on the associated CTIOperationResponse object. This map is free-form and defined by the needs of the operation handler.

```
var request = new sn_cti_core.CTIOperationRequest('origin');
var parms = request.getSessionAttributes();
for(var key in parms) {
    gs.info(key + '=' + parms[key]);
}
```

CTIOperationRequest - getSubStepNotFoundBehaviour

Returns the handling behavior for a subsep when a substep's operation handler is not found.

Use substeps to perform actions such as initialization and validation before processing an operation. Unlike operation handlers that are meant to be generic and used by all CTI providers, substeps are CTI provider specific and use terminology and naming conventions that are specific to the CTI provider.

If the requested substep operation handler cannot be found by the ServiceNow Voice framework, it attempts to use the "step not found behavior". This behavior is typically set by the message transformer when an operation is initially requested.

Parameters

Name	Type	Description
None		

Returns

Type	Description
OperationNotFoundBehaviours	The behavior/handling to perform when an operation handler cannot be found for the operation/substep combination (*<operation_name>*.SubStep>). If not defined, returns null. Possible values: • OperationNotFoundBehaviours.ThrowError: Throw an error. • OperationNotFoundBehaviours.PassThrough: Do not perform any further processing on the request, just return. • OperationNotFoundBehaviours.RouteToOperation: Use the parent operation handler *<operation_name>*.

```
var request = new sn_cti_core.CTIOperationRequest('origin');
var behavior = request.getSubStepNotFoundBehaviour();
```

CTIOperationRequest - setAuthToken(String id)

Sets an authentication token on the current CTIOperationRequest object.

This token is used by the ServiceNow Voice framework to authenticate the current ServiceNow Voice user before executing the requested operation handler if the handler's *auth_required* flag is set to true. The *auth_required* flag is a field in the Operation Handler [sn_cti_operation_handler] table. The life of an authentication token should be for the life of the call session, but is determined by the CTI provider.

You can define whatever authentication/authorization handling required by your implementation by creating your own authentication operation handler. Regardless of how the authentication token is generated, the message translator must pass the token back in the CTI payload. Additionally, the CTI provider must store this authentication token locally and pass it in each operation request that requires authentication.

If using the instance provided authenticate operation handler, the handler initiates the creation of the authentication token based on a four-digit user-entered pin. It then sets the authentication token in the sessionAttributes object of the CTIOperationResponse object. The associated message transformer translates the sessionAttributes object into the CTI-specific payload and then sends it to the CTI provider.

Note: If the authentication token is not passed, all requests to execute operation handlers with the *auth_required* flag set will fail. If you do not use authentication, you do not need to maintain authentication tokens.

The ServiceNow base system provides working operation handlers and message transformers that enable connection to Amazon Connect. When building contact flows within Amazon Connect, there are two integration points between Amazon services and a ServiceNow instance:

- Amazon Web Services (AWS) Lambda Proxy (Invoke AWS Lambda function)
- AWS Lex Bot (Get Customer Input)

You can find the available operation handlers and message transformers for these integration points in the Operation Handlers [sn_cti_operation_handler] and Provider Message Transformer [sn_cti_provider_msg_transormer] tables.

Parameters

Name	Type	Description
id	String	The authentication token for the associated ServiceNow Voice user.

Returns

Type	Description
void	

Example of message transformer script that saves the passed in authentication token.

```
{
  try {
    var jsonPayload = httpRequest.body.data;
    if (jsonPayload) {
 var event = jsonPayload.event;
 if (event) {
   var details = event.Details;
   if (details) {

 operationRequest.setOperationName(details.Parameters['sn_operat
ion']);
     var contactData = details.ContactData;
     if(contactData) {
  // Call id should be surfaced in openframe call log so it can
 be tied to transcription later
  operationRequest.setParameter('contact.call_id',
 contactData.ContactId);
  for(var ck in contactData.CustomerEndpoint) {
    operationRequest.setParameter('contact.' + ck,
 contactData.CustomerEndpoint[ck]);
        }
        operationRequest.setParameter('contact.id',
 contactData.ContactId);
        operationRequest.setParameter('contact.phone',
 contactData.CustomerEndpoint.Address);
     }
     var parameters = details.Parameters;
     if (parameters) {
  for (var pk in parameters) {
    switch(pk) {
      case 'interactionId':
   operationRequest.setInteractionSysId(parameters[pk]);
   break;
      case 'authToken':
   operationRequest.setAuthToken(parameters[pk]);
```

```
   break;
      case 'language':
   operationRequest.setLanguage(parameters[pk]);
   break;
      case 'statusCode':
      case 'message':
   break;

      default:
   operationRequest.setParameter(pk, parameters[pk]);
   }
            }
          }
        }
      }
    }
  } catch(e) {
  ctx.setError(e);
  }
})(httpRequest, operationRequest, ctx);
```

CTIOperationRequest - setInteractionSysId(String Id)

Sets the sys_id of the interaction record associated with the operation request on the current CTIOperationRequest object.

If you want to maintain contact interaction information within a contact-specific interaction record, the interaction record sys_id must be maintained for the entire ServiceNow Voice call session.

Typically, an operation handler creates an interaction record when a new contact call is initiated. It then sets the interaction record sys_id and table name on the associated CTIOperationResponse object as session attributes using the CTIOperationRequest - setSessionAttribute(String key, Object value) method. The associated method transformer then translates this information into the computer telephony integration (CTI) provider payload and sends it back to the CTI provider.

The CTI provider must store the interaction record sys_id for the contact session locally. Each time the CTI provider interacts with the ServiceNow Voice for this contact session, it must pass back the corresponding interaction record sys_id in its payload. The receiving message transformer then parses the payload and uses the CTIOperationRequest - setInteractionSysId() method to set the interaction record sys_id on the associated CTIOperationtRequest object.

The CTIOperationRequest - getInteractionRecord() method uses this sys_id to obtain the correct interaction record for the contact session. Interaction records are located in the Interaction [interaction] table. For additional information on interaction records, see

Parameters

Name	Type	Description
sys_id	String	The sys_id of the interaction record to associate with the request.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of a message transformer script that extracts the interaction record sys_id from the incoming payload (passed as a parameter) and sets it on the associated CTIOperationRequest object.

```
{
  try {
    var jsonPayload = httpRequest.body.data;
    if (jsonPayload) {
 var event = jsonPayload.event;
 if (event) {
   var details = event.Details;
   if (details) {

 operationRequest.setOperationName(details.Parameters['sn_operat
ion']);
     var contactData = details.ContactData;
     if(contactData) {
  // Call id should be surfaced in openframe call log so it can
 be tied to transcription later
  operationRequest.setParameter('contact.call_id',
 contactData.ContactId);
  for(var ck in contactData.CustomerEndpoint) {
    operationRequest.setParameter('contact.' + ck,
 contactData.CustomerEndpoint[ck]);
        }
        operationRequest.setParameter('contact.id',
 contactData.ContactId);
        operationRequest.setParameter('contact.phone',
 contactData.CustomerEndpoint.Address);
     }
     var parameters = details.Parameters;
     if (parameters) {
  for (var pk in parameters) {
    switch(pk) {
                // Associate the existing customer interaction
 record with the request
      case 'interactionId':
   operationRequest.setInteractionSysId(parameters[pk]);
   break;
      case 'authToken':
   operationRequest.setAuthToken(parameters[pk]);
   break;
      case 'language':
   operationRequest.setLanguage(parameters[pk]);
   break;
      case 'statusCode':
      case 'message':
   break;

      default:
   operationRequest.setParameter(pk, parameters[pk]);
   }
          }
        }
      }
    }
```

```
  } catch(e) {
  ctx.setError(e);
  }
})(httpRequest, operationRequest, ctx);
```

CTIOperationRequest - setLanguage(String languageCode)

Sets the ISO 639.1 language code to use when processing the associated operation on a CTIOperationRequest object.

Using the customer preferred language enables you to use platform-provided internationalization and localization capabilities to customize messages and other communications with the associated caller. Typically the message transformer sets the language on the CTIOperationRequest object.

Parameters

Name	Type	Description
languageCode	String	The ISO 639.1 language code to use when processing the associated operation.

Returns

Type	Description
void	

```
{
  try {
    var jsonPayload = httpRequest.body.data;
    if (jsonPayload) {
 var event = jsonPayload.event;
 if (event) {
   var details = event.Details;
   if (details) {

 operationRequest.setOperationName(details.Parameters['sn_operat
ion']);
     var contactData = details.ContactData;
     if(contactData) {
  // Call id should be surfaced in openframe call log so it can
 be tied to transcription later
  operationRequest.setParameter('contact.call_id',
 contactData.ContactId);
  for(var ck in contactData.CustomerEndpoint) {
    operationRequest.setParameter('contact.' + ck,
 contactData.CustomerEndpoint[ck]);
        }
        operationRequest.setParameter('contact.id',
 contactData.ContactId);
        operationRequest.setParameter('contact.phone',
 contactData.CustomerEndpoint.Address);
     }
     var parameters = details.Parameters;
     if (parameters) {
  for (var pk in parameters) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    switch(pk) {
      case 'interactionId':
   operationRequest.setInteractionSysId(parameters[pk]);
   break;
      case 'authToken':
   operationRequest.setAuthToken(parameters[pk]);
   break;
      case 'language':
   operationRequest.setLanguage(parameters[pk]);
   break;
      case 'statusCode':
      case 'message':
   break;

      default:
   operationRequest.setParameter(pk, parameters[pk]);
   }
            }
          }
        }
      }
    }
  } catch(e) {
  ctx.setError(e);
  }
})(httpRequest, operationRequest, ctx);
```

CTIOperationRequest - setMajorVersion(Number majorVersion)

Sets the major version of the computer telephony integrator (CTI) provider software making the request on the associated CTIOperationRequest object.

Use this method if the CTI providers connected to your ServiceNow instance are running multiple versions of their software, as different software versions may require different processing behavior. If the processing behavior is only slightly different between the software versions, it may make sense to have only a single operation handler. You can then handle the processing differences by just checking the version of software making the request and process the request/data within your operation handler. If the required processing is significantly different between versions, it may be more effective to use multiple operation handlers.

Typically the message transformer sets the software version on the CTIOperationRequest object by calling this method and an operation handler then consumes the set value using the CTIOperationRequest - getMajorVersion() method. You can also get/set the minor version value of a provider's software using the CTIOperationRequest - getMinorVersion() and CTIOperationRequest - setMinorVersion(Number minorVersion) methods.

Parameters

Name	Type	Description
majorVersion	Number	Major version of the CTI provider software making the operation request. If this value was not previously set, returns 1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var request = new sn_cti_core.CTIOperationRequest('origin');
request.setMajorVersion(2);
```

CTIOperationRequest - setMinorVersion(Number minorVersion)

Sets the minor version of the computer telephony integrator (CTI) provider software making the request on the associated CTIOperationRequest object.

Use this method if the CTI providers connected to your ServiceNow instance are running multiple versions of their software, as different software versions may require different processing behavior. If the processing behavior is only slightly different between the software versions, it may make sense to have only a single operation handler. You can then handle the processing differences by just checking the version of software making the request and process the request/data within your operation handler. If the required processing is significantly different between versions, it may be more effective to use multiple operation handlers.

Typically the message transformer sets the software version on the CTIOperationRequest object by calling this method and an operation handler then consumes the set value using the CTIOperationRequest - getMinorVersion() method. You can also get/set the major version value of a provider's software using the CTIOperationRequest - getMajorVersion() and CTIOperationRequest - setMajorVersion(Number majorVersion) methods.

Parameters

Name	Type	Description
minorVersion	Number	Minor version of the CTI provider software making the operation request. If this value was not previously set, returns 0.

Returns

Type	Description
void	

```
var request = new sn_cti_core.CTIOperationRequest('origin');
...
request.setMinorVersion(3);
```

CTIOperationRequest - setOperationName(String name)

Sets the name of the operation that the computer telephony integration (CTI) provider is attempting to execute on the current CTIOperationRequest object.

The operation name determines the operation handler that is used to process the request. Call this method from the associated message transformer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For Amazon Connect Lex Bot implementations, intent names are appended with a five letter suffix as different Amazon intents cannot have the same intent name. In the ServiceNow Voice framework, the intent name equals the operation handler name. An operation handler can either be specific for an intent, having an operation handler name that includes this suffix (myOperation_SUFFX), or it can be generic and used by multiple CTI providers or different use cases, such as using the same handler for processing an HR request and a helpdesk request (myOperation).

Parameters

Name	Type	Description
name	String	The name of the operation that the CTI provider is currently attempting to execute. This name must be the same as the name of the operation handler to use to process the request. If it is not, an error is thrown. You can locate the available operation handlers in the Operation Handler [sn_cti_operation_handler] table.

Returns

Type	Description
void	

```
{
  try {
    var jsonPayload = httpRequest.body.data;
    if (jsonPayload) {
 var event = jsonPayload.event;
 if (event) {
   var details = event.Details;
   if (details) {
          // Set the operation handler to use to process the
 request

 operationRequest.setOperationName(details.Parameters['sn_operat
ion']);
     var contactData = details.ContactData;
     if(contactData) {
  // Call id should be surfaced in openframe call log so it can
 be tied to transcription later
  operationRequest.setParameter('contact.call_id',
 contactData.ContactId);
  for(var ck in contactData.CustomerEndpoint) {
    operationRequest.setParameter('contact.' + ck,
 contactData.CustomerEndpoint[ck]);
        }
        operationRequest.setParameter('contact.id',
 contactData.ContactId);
        operationRequest.setParameter('contact.phone',
 contactData.CustomerEndpoint.Address);
     }
     var parameters = details.Parameters;
     if (parameters) {
  for (var pk in parameters) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    switch(pk) {
      case 'interactionId':
   operationRequest.setInteractionSysId(parameters[pk]);
   break;
      case 'authToken':
   operationRequest.setAuthToken(parameters[pk]);
   break;
      case 'language':
   operationRequest.setLanguage(parameters[pk]);
   break;
      case 'statusCode':
      case 'message':
   break;

      default:
   operationRequest.setParameter(pk, parameters[pk]);
   }
            }
          }
        }
      }
    }
  } catch(e) {
  ctx.setError(e);
  }
})(httpRequest, operationRequest, ctx);
```

CTIOperationRequest - setOperationSubStepName(String name)

Sets the operation substep name on the current CTIOperationRequest object.

Use substeps to perform actions such as initialization and validation before processing an operation. Unlike operation handlers that are meant to be generic and used by all CTI providers, substeps are CTI provider specific and use terminology and naming conventions that are specific to the CTI provider.

The ServiceNow Voice framework performs the following steps to locate the required operation handler and any associated substep operation handlers.

> **Note:** For Amazon Connect Lex Bot implementations, intent names are appended with a five letter suffix as different Amazon intents cannot have the same intent name. In the ServiceNow Voice framework, the intent name equals the operation handler name. An operation handler can either be specific for an intent, having an operation handler name that includes this suffix (myOperation_SUFFX), or it can be generic and used by multiple CTI providers or different use cases, such as using the same handler for processing an HR request and a helpdesk request (myOperation).

1. Tries to locate the operation handler associated with the request.
   - First checks for an operation handler called `myOperation_SUFFX`.
   - If not found, checks for the operation handler `myOperation`. If not found, errors out.
2. If the handler is found, checks the *`auth_required`* flag on the operation handler. If set, it checks that a valid authentication token (obtained through the *`getAuthToken()`* method) is present on the request. If present and valid, continue processing, else throw an error.
3. Looks up the operation handler for the passed in substep. For this example let's assume `subStepName=SubStep`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- First checks for an operation handler named `myOperation_SUFFX.SubStep`. If found, executes the handler.
- If not found, checks for the handler `myOperation.SubStep`. If found executes the handler.
- If not found, checks if a `subStepNotFoundBehavior` was set on the request object.
- If set, executes the behavior, otherwise, errors out.

4. Executes the primary operation handler (`myOpersation_SUFFX` or `myOperation`.)

You can set the default behavior of a substep by calling the CTIOperationRequest - setSubStepNotFoundBehaviour(Object behaviour) method.

Parameters

Name	Type	Description
name	String	The name of the substep that the CTI provider is trying to execute.

Returns

Type	Description
void	

```
(function( /*HTTPRequest*/ httpRequest, /*CTIOperationRequest*/
 operationRequest, /*Context*/ ctx) {
  try {
    var jsonPayload = httpRequest.body.data;
    if (jsonPayload) {
      var event = jsonPayload.event;
      if (event) {
        var intent = event.currentIntent;
  var inputTranscript = event.inputTranscript;
  if(inputTranscript) {
    operationRequest.setParameter('$utterance',
 inputTranscript);
  }
        if (intent) {
          operationRequest.setOperationName(intent.name);
    // Add this because intent name gets changed through the
 pipeline
    operationRequest.setParameter('$original_intent',
 intent.name);
          var sessionAttributes = event.sessionAttributes;
          if (sessionAttributes) {
            for (var sk in sessionAttributes) {
              switch (sk) {
                case 'interactionId':

 operationRequest.setInteractionSysId(sessionAttributes[sk]);
                  break;
                case 'authToken':

 operationRequest.setAuthToken(sessionAttributes[sk]);
                  break;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    case 'language':
      operationRequest.setLanguage(sessionAttributes[sk]);
      break;
                case 'statusCode':
                case 'message':
                  break;
                default:
                  operationRequest.setSessionAttribute(sk,
 sessionAttributes[sk]);
              }
            }
          }
          var slots = intent.slots;
    // Always copy in slots they are the parameters for the
 operation
          if (slots) {
            for (var pk in slots) {
              operationRequest.setParameter(pk, slots[pk]);
            }
          }
          var invocationSource = event.invocationSource;
    operationRequest.setParameter('$$invocationSource',
 invocationSource);
          // Specific handling for dialog hooks with a way to
 override for Amazon specific provider
          if (invocationSource === 'DialogCodeHook') {
      // Set substep to trigger forwarding to another handler IF
 it s present

 operationRequest.setOperationSubStepName(invocationSource);
      // Allow pass through behavior
      var behaviourToUse =
 sn_cti_core.CTIOperationRequest.OperationNotFoundBehaviours.Pas
sThrough;

 operationRequest.setSubStepNotFoundBehaviour(behaviourToUse);
      // Reserved - copy slots in so we can just use delegate as
 default if the call isn't handled
      operationRequest.setParameter('$$slots', slots);
          }
        }
      }
    }
  } catch (e) {
      ctx.setError(e);
  }
  return operationRequest;
})(httpRequest, operationRequest, ctx);
```

CTIOperationRequest - setParameter(String key, Object value)

Sets the specified key-value pair on the parameter object of the current CTIOperationRequest object.

Using the get/set parameter methods enables the passing of virtually any string or number value between a message transformer and an operation handler. The parameter object can contain zero or more key/value pairs of data that directly correlate to the current operation request. The

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

operation handler determines what key/value pairs are required as it consumes these values. Typically the message transformer sets these parameters on the CTIOperationRequest object by calling this method and the operation handler consumes them using the CTIOperationRequest - getParameter(String key) or CTIOperationRequest - getParameters() method.

Note: You should only store objects that can survive a `JSON.parse(JSON.stringify(object))` operation. Objects not meeting this criteria may not propagate correctly through the entire operation processing chain.

For example:

```
var x = {
  "string": 'abc',
  "int": 123,
  "float": 1.234,
  "number": new Number(3),
  "boolean": true,
  "date": new Date(2006, 0, 2, 15, 4, 5),
  "object": {
    "string": 'abc',
    "int": 123,
    "float": 1.234,
    "number": new Number(3),
    "boolean": true,
    "date": new Date(2006, 0, 2, 15, 4, 5)
  },
  "function": function(abc) {

  }
}
var stringify = JSON.stringify(x);
gs.info(stringify);
var hydrate = JSON.parse(stringify);
var stringify2 = JSON.stringify(hydrate);
gs.info(stringify2);
```

Produces:

```
{"string":"abc","int":123,"float":1.234,"number":3,"boolean":tru
e,"date":"2006-01-02T23:04:05.000Z","object":{"string":"abc","in
t":123,"float":1.234,"number":3,"boolean":true,"date":"2006-01-0
2T23:04:05.000Z"}}
{"string":"abc","int":123,"float":1.234,"number":3,"boolean":tru
e,"date":"2006-01-02T23:04:05.000Z","object":{"string":"abc","in
t":123,"float":1.234,"number":3,"boolean":true,"date":"2006-01-0
2T23:04:05.000Z"}}
```

Parameters

Name	Type	Description
key	String	Name of the key under which to store the associated value.
value	Object	Value to store. Valid data types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• string • int • float • number • boolean • date • object

Returns

Type	Description
void	

```
{
  try {
    var jsonPayload = httpRequest.body.data;
    if (jsonPayload) {
 var event = jsonPayload.event;
 if (event) {
   var details = event.Details;
   if (details) {

CTIOperationRequest - setSessionAttribute(String key, Object value)

Sets the specified session attribute key-value pair on the current CTIOperationRequest object.

Using the get/set session attribute methods enables the passing of virtually any string or number value between a message transformer and an operation handler. The sessionAttribute object can contain zero or more key/value pairs of data that are valid for the duration of a computer telephony integration provider defined session. Session attributes can also be accessed within a contact flow. The operation handler determines what session attribute key/value pairs are needed as it consumes these values. Typically the message transformer sets these attributes on the CTIOperationRequest object by calling this method and the operation handler gets the attributes using the CTIOperationRequest - getSessionAttribute(String key) or CTIOperationRequest - getSessionAttribute() method.

Note: You should only store objects that can survive a `JSON.parse(JSON.stringify(object))` operation. Objects not meeting this criteria may not propagate correctly through the entire operation processing chain.

For example:

```
var x = {
  "string": 'abc',
  "int": 123,
  "float": 1.234,
  "number": new Number(3),
  "boolean": true,
  "date": new Date(2006, 0, 2, 15, 4, 5),
  "object": {
    "string": 'abc',
    "int": 123,
    "float": 1.234,
    "number": new Number(3),
    "boolean": true,
    "date": new Date(2006, 0, 2, 15, 4, 5)
  },
  "function": function(abc) {
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }
}
var stringify = JSON.stringify(x);
gs.info(stringify);
var hydrate = JSON.parse(stringify);
var stringify2 = JSON.stringify(hydrate);
gs.info(stringify2);
```

Produces:

```
{"string":"abc","int":123,"float":1.234,"number":3,"boolean":tru
e,"date":"2006-01-02T23:04:05.000Z","object":{"string":"abc","in
t":123,"float":1.234,"number":3,"boolean":true,"date":"2006-01-0
2T23:04:05.000Z"}}
{"string":"abc","int":123,"float":1.234,"number":3,"boolean":tru
e,"date":"2006-01-02T23:04:05.000Z","object":{"string":"abc","in
t":123,"float":1.234,"number":3,"boolean":true,"date":"2006-01-0
2T23:04:05.000Z"}}
```

Parameters

Name	Type	Description
key	String	Name of the key under which to store the associated value.
value	Object	Value to store. Valid data types: • string • int • float • number • boolean • date • object

Returns

Type	Description
void	

```
var request = new sn_cti_core.CTIOperationRequest('origin');
request.setSessionAttribute('contact.phone', '+15552222345');
request.setSessionAttribute('contact.okToCall', true);
request.setSessionAttribute('contact.address', {
    street: '1234 Main St'
    city: 'API City',
    zip: 91335
});
```

CTIOperationRequest - setSubStepNotFoundBehaviour(Object behaviour)

Sets the behavior to perform if the current substep's operation handler is not found.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method should be called by the input message transformer.

Parameters

Name	Type	Description
behaviour	OperationNotFoundBehaviours	Behavior to use if a handling behavior is not specified for the substep. This must be a behavior defined on the CTIOperationRequest.OperationNotFoundBehaviours object. Possible values: • ThrowError: Throw an error. • PassThrough: Do not perform any further processing on the request, just return. • RouteToOperation: Use the parent operation handler *<operation_name>*.

Returns

Type	Description
void	

```
(function( /*HTTPRequest*/ httpRequest, /*CTIOperationRequest*/
 operationRequest, /*Context*/ ctx) {
  try {
    var jsonPayload = httpRequest.body.data;
    if (jsonPayload) {
      var event = jsonPayload.event;
      if (event) {
        var intent = event.currentIntent;
  var inputTranscript = event.inputTranscript;
  if(inputTranscript) {
    operationRequest.setParameter('$utterance',
inputTranscript);
  }
        if (intent) {
          operationRequest.setOperationName(intent.name);
    // Add this because intent name gets changed through the
pipeline
    operationRequest.setParameter('$original_intent',
intent.name);
          var sessionAttributes = event.sessionAttributes;
          if (sessionAttributes) {
            for (var sk in sessionAttributes) {
              switch (sk) {
                case 'interactionId':

operationRequest.setInteractionSysId(sessionAttributes[sk]);
                  break;
                case 'authToken':

operationRequest.setAuthToken(sessionAttributes[sk]);
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                  break;
    case 'language':
      operationRequest.setLanguage(sessionAttributes[sk]);
      break;
                case 'statusCode':
                case 'message':
                  break;
                default:
                  operationRequest.setSessionAttribute(sk,
 sessionAttributes[sk]);
              }
            }
          }
          var slots = intent.slots;
    // Always copy in slots they are the parameters for the
 operation
          if (slots) {
            for (var pk in slots) {
              operationRequest.setParameter(pk, slots[pk]);
            }
          }
          var invocationSource = event.invocationSource;
    operationRequest.setParameter('$$invocationSource',
 invocationSource);
          // Specific handling for dialog hooks with a way to
 overide for Amazon specific provider
          if (invocationSource === 'DialogCodeHook') {
      // Set substep to trigger forwarding to another handler IF
 it s present

 operationRequest.setOperationSubStepName(invocationSource);
      // Allow pass through behavior
      var behaviourToUse =
 sn_cti_core.CTIOperationRequest.OperationNotFoundBehaviours.Pas
sThrough;

 operationRequest.setSubStepNotFoundBehaviour(behaviourToUse);
      // Reserved - copy slots in so we can just use delegate as
 default if the call isn't handled
      operationRequest.setParameter('$$slots', slots);
          }
        }
      }
    }
  } catch (e) {
      ctx.setError(e);
  }
  return operationRequest;
})(httpRequest, operationRequest, ctx);
```

CTIOperationResponse - Scoped, Global

The *CTIOperationResponse* script include provides methods to set and get data on the current CTIOperationResponse object.

You use CTIOperationResponse objects to pass information between an operation handler and a message transformer within the ServiceNow Voice framework.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Typically, an operation handler is responsible for setting values on the CTIOperationResponse object as it processes the associated request. A message transformer is then responsible for getting the values from the CTIOperationRequest object and building the CTI-specific payload that is sent back to the computer telephony integrator (CTI) provider.

The ServiceNow base system provides working operation handlers and message transformers that enable connection to Amazon Connect. When building contact flows within Amazon Connect, there are two integration points between Amazon services and a ServiceNow instance:

- Amazon Web Services (AWS) Lambda Proxy (Invoke AWS Lambda function)
- AWS Lex Bot (Get Customer Input)

You can find the available operation handlers and message transformers for these integration points in the Operation Handlers [sn_cti_operation_handler] and Provider Message Transformer [sn_cti_provider_msg_transormer] tables.

The following operation handler script shows how to use various *`CTIOperationResponse`* methods to set values on the CTIOperationResponse object.

```
(function(/*CTIOperationRequest*/
 request, /*CTIOperationResponse*/ response) {

  try {
    var state = request.getParameter('$state');
    if(!state) {
      state = 'new';
    }
    var phone = request.getParameter('contact.phone');
    var username = request.getParameter('contact.username');
    var someDataPresent = phone || username;
    if(!someDataPresent) {
      throw 'phone or username must be supplied';
    }
    if('new' === state) {
      var userGr = null;
      if(phone || username) {
        userGr = new GlideRecordSecure('sys_user');
        var qc = null;
        if(phone) {
          qc = userGr.addQuery('phone', phone);
          qc.addOrCondition('mobile_phone', phone);
          qc.addOrCondition("home_phone", phone);
        }
        if(username) {
          if(qc) {
            qc.addOrCondition('user_name', username);
          } else {
            qc = userGr.addQuery('user_name', username);
          }
        }
        // If there was criteria then run the query
        if(qc) {
          userGr.query();
        } else {
          userGr = null;
        }
      }
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      var foundUser = userGr && userGr.next();

      var phonelogGr = new
 GlideRecord('sn_openframe_phone_log');
      phonelogGr.initialize();
      phonelogGr.setValue('call_id',
 request.getParameter('contact.id'));
      phonelogGr.setValue('phone_number', phone);
      if(foundUser) {
        phonelogGr.setValue('contact', userGr.getUniqueValue());
      }
      phonelogGr.insert();

      var interactionGr = new GlideRecordSecure('interaction');
      interactionGr.initialize();
      interactionGr.setValue('type', 'phone');
      interactionGr.setValue('short_description', 'User Contact
 via Phone: ' + phone);
      interactionGr.setValue('channel_metadata_table',
 'sn_openframe_phone_log');

 interactionGr.setValue('channel_metadata_document',phonelogGr.g
etUniqueValue());

      if(foundUser) {
        interactionGr.setValue('opened_for',
 userGr.getUniqueValue());
        response.setSessionAttribute('snc_user_first_name',
 userGr.getValue('first_name'));
        response.setSessionAttribute('snc_user_last_name',
 userGr.getValue('last_name'));
        response.setSessionAttribute('snc_user_sys_id',
 userGr.getUniqueValue());
      } else {
        response.setSessionAttribute('snc_user_sys_id',
 "USER_NOT_FOUND");
      }
      interactionGr.setValue('state', 'new');

      var interactionId = interactionGr.insert();

      response.setStatusCode(200);
      response.setMessage('success');
      response.setSessionAttribute('interactionTable',
 'interaction');
      response.setSessionAttribute('interactionId',
 interactionId);

    }
  } catch(e) {
    ctx.setError(e);
  }

})(request, response);
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For additional information on creating operation handlers, see Configure a contact flow for an automated caller interaction.

The following message transformer script gets the values set on the CTIOperationResponse object and stores them in the CTI-specific payload that is then sent back to the CTI provider.

```
(function
 (/*CTIOperationResponse*/operationResponse, /*HTTPResponse*/
 httpResponse) {
 // AWS Connect Lambda expects name value pairs only
 var out = {};
 for(var k in operationResponse.getSessionAttributes()) {
  out[k] = operationResponse.getSessionAttributes()[k];
 }
 out.statusCode = operationResponse.getStatusCode();
 out.message = operationResponse.getMessage();
 httpResponse.setBody(out);
})(operationResponse, httpResponse);
```

This script include runs in the `sn_cti_core` namespace. Before you are able to access the *`CTIOperationRequest`* script include, the ServiceNow Voice Core (sn_cti_core) plugin must be installed. For information on this installation, see Install ServiceNow Voice applications.

For additional information on the ServiceNow Voice, see ServiceNow Voice.

CTIOperationResponse - CTIOperationResponse(String origin)

Instantiates a CTIOperationResponse object.

Parameters

Name	Type	Description
None		

```
var response = new sn_cti_core.CTIOperationResponse();
response.setMinorVersion(3);
```

CTIOperationResponse - getAuthToken()

Returns the authentication token that was set on the CTIOperationResponse object.

This token is used by the ServiceNow Voice framework to authenticate the current ServiceNow Voice user before executing the requested operation handler if the handler's *`auth_required`* flag is set to true. The *`auth_required`* flag is a field in the Operation Handler [sn_cti_operation_handler] table. The life of an authentication token should be for the life of the call session, but is determined by the CTI provider.

You can define whatever authentication/authorization handling required by your implementation by creating your own authentication operation handler. Regardless of how the authentication token is generated, the message translator must pass the token back in the CTI payload. Additionally, the CTI provider must store this authentication token locally and pass it in each operation request that requires authentication.

If using the instance provided authenticate operation handler, the handler initiates the creation of the authentication token based on a four-digit user-entered pin. It then sets the authentication token in the sessionAttributes object of the CTIOperationResponse object. The associated message transformer translates the sessionAttributes object into the CTI-specific payload and then sends it to the CTI provider.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the authentication token is not passed, all requests to execute operation handlers with the *auth_required* flag set will fail. If you do not use authentication, you do not need to maintain authentication tokens.

The ServiceNow base system provides working operation handlers and message transformers that enable connection to Amazon Connect. When building contact flows within Amazon Connect, there are two integration points between Amazon services and a ServiceNow instance:

- Amazon Web Services (AWS) Lambda Proxy (Invoke AWS Lambda function)
- AWS Lex Bot (Get Customer Input)

You can find the available operation handlers and message transformers for these integration points in the Operation Handlers [sn_cti_operation_handler] and Provider Message Transformer [sn_cti_provider_msg_transormer] tables.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The authentication token previously set on the CTIOperationRequest object. If not set, returns null.

```
var response = new sn_cti_core.CTIOperationResponse();
var token = response.getAuthToken();
```

CTIOperationResponse - getError()

Returns the error object associated with the current CTIOperationResponse object.

You might use this information to formulate the payload returned to the computer telephony integration (CTI) provider.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Operation error information. The format of this object is determined by the CTI provider. If an error does not exist, returns null.

```
(function( /*CTIProviderResponseExecutionContext*/
 ctx, /*CTIOperationRequest*/
 operationRequest, /*CTIOperationResponse*/
 operationResponse, /*HTTPResponse*/ httpResponse) {
    var sessionAttributes = {},
        intentResponse;
```

```
    var statusCode = -1;
    var message = 'Unprocessed';
    if (operationResponse) {
        statusCode = operationResponse.getStatusCode();
        sessionAttributes =
 operationResponse.getSessionAttributes();
        message = operationResponse.getMessage();
        var error = operationResponse.getError();
        if (error) {
            sessionAttributes.error = error;
        }
    }
    if
 (sn_cti_core.CTIRequestDispatcher.Constants.HTTP.Status.AUTH_RE
QUIRED.code === statusCode) {
        //first call for a secure action without authentication
 token
        sessionAttributes.statusCode = 401;
        sessionAttributes.message = message;
        intentResponse = {
            sessionAttributes: sessionAttributes,
            dialogAction: {
                type: 'Close',
                fulfillmentState: 'Fulfilled',
                message: {
                    contentType: 'PlainText',
                    content: 'This operation requires
 authentication. Say authenticate for authentication.'
                }
            }
        };
    } else if ('DialogCodeHook' ===
 operationRequest.getParameter('$$invocationSource')) {
        //pass back authToken and interactionId
        sessionAttributes.authToken =
 operationRequest.getAuthToken();
        sessionAttributes.interactionId =
 operationRequest.getInteractionSysId();
  var originalSlots = operationRequest.getParameter('$$slots');
        var responseParameters = operationResponse ?
 operationResponse.getParameters() : {};
        responseParameters = responseParameters ?
 responseParameters : {};
        // See if we processing happened and we got a
 dialogAction
  var responseDialogAction = responseParameters['dialogAction'];
  // Default dialog action
        var dialogAction = {
            type: 'Delegate',
            slots: originalSlots
        };
  // If the response doesn't contain an override replay the
 inputs
        if (responseDialogAction) {
            // We bypassed dialoghook so delegate and pass
 through inputs
            dialogAction = responseDialogAction;
```

```
        }
        intentResponse = {
            sessionAttributes: sessionAttributes,
            dialogAction: dialogAction
        };
    } else {
        // Override required session attributes
        sessionAttributes.statusCode = statusCode;
        sessionAttributes.message = message;
        // Build response template
        intentResponse = {
            sessionAttributes: sessionAttributes,
            dialogAction: {
                type: 'Close',
                fulfillmentState: 'Fulfilled',
                message: {
                    contentType: 'PlainText',
                    content: message
                }
            }
        };
    }
    httpResponse.setBody(intentResponse);
})(ctx, operationRequest, operationResponse, httpResponse);
```

CTIOperationResponse - getInteractionSysId()

Returns the sys_id of the interaction record associated with the call session that was set on the CTIOperationResponse object.

The CTIOperationResponse - setInteractionSysId(String Id) method must have been called prior to calling this method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The sys_id of the interaction record set on the CTIOperationResponse object. Interaction records are located in the Interaction [interaction] table. If the interaction record sys_id is not set, the method returns null.

```
var request = new sn_cti_core.CTIOperationResponse();
var interactionId = request.getInteractionSysId();
```

CTIOperationResponse - getMajorVersion()

Returns the major version of the computer telephony integrator (CTI) software set on the current CTIOperationResponse object.

Use this method if the CTI providers connected to your ServiceNow instance are running multiple versions of their software, as different software versions may require different payloads. If the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

payload is only slightly different between the software versions, it may make sense to have only a single message transformer. You can then handle the payload differences by just checking the version of software making the request within your message transformer. If the required payload is significantly different between versions, it may be more effective to use multiple message transformers.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Major version number of the CTI software. If the major version was never set, returns 1.

```
var request = new sn_cti_core.CTIOperationResponse();
var majorVersion = response.getMajorVersion();
```

CTIOperationResponse - getMessage()

Returns the message string set on the current CTIOperationResponse object.

Typically this is a message that is spoken back to the user once an operation is complete. You can set this value using the CTIOperationResponse - setMessage(String message) method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Message text. If no message exists, returns null.

```
(function
 (/*CTIOperationResponse*/operationResponse, /*HTTPResponse*/
 httpResponse) {
  // AWS Connect Lambda expects name value pairs only
  var out = {};
  for(var k in operationResponse.getSessionAttributes()) {
    out[k] = operationResponse.getSessionAttributes()[k];
  }
  out.statusCode = operationResponse.getStatusCode();
  out.message = operationResponse.getMessage();
  httpResponse.setBody(out);
})(operationResponse, httpResponse);
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CTIOperationResponse - getMinorVersion()

Returns the minor version of the computer telephony integrator (CTI) software set on the current CTIOperationResponse object.

Use this method if the CTI providers connected to your ServiceNow instance are running multiple versions of their software, as different software versions may require different payloads. If the payload is only slightly different between the software versions, it may make sense to have only a single message transformer. You can then handle the payload differences by just checking the version of software making the request within your message transformer. If the required payload is significantly different between versions, it may be more effective to use multiple message transformers.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Minor version number of the payload associated with this interaction. If the minor version was never set, returns 0.

```
var request = new sn_cti_core.CTIOperationResponse();
var minorVersion = request.getMinorVersion();
```

CTIOperationResponse - getParameter(String key)

Returns the value of a specified key previously set on the current CTIOperationResponse object.

Using the get/set parameter methods enables the passing of virtually any string or number value between an operation handler and a message transformer. The parameter object can contain zero or more key/value pairs of data that directly correlate to the current operation response. The operation handler determines what key/value pairs are required as it produces these values. Use the CTIOperationResponse - setParameter(String key, Object value) method to set parameters on the current CTIOperationResponse object.

Parameters

Name	Type	Description
key	String	The name of the key value to return.

Returns

Type	Description
String	The value of the passed in key. If no such key exists, returns null.

```
var request = new sn_cti_core.CTIOperationResponse();
var parm = request.getParameter('contact.phone');
```

CTIOperationResponse - getParameters()

Returns the key-value pairs for all parameters that were previously set on the current CTIOperationResponse object.

Using the get/set parameter methods enables the passing of virtually any string or number value between an operation handler and a message transformer. The parameter object can contain zero or more key/value pairs of data that directly correlate to the current operation response. The operation handler determines what key/value pairs are required as it produces these values. Use the CTIOperationResponse - setParameter(String key, Object value) method to set parameters on the current CTIOperationResponse object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	A map of key-value pairs that were previously set on the CTIOperationResponse object. This key-value pairs are free-form and defined by the needs of the operation handler. The returned values are either Strings or Numbers.

```
(function( /*CTIProviderResponseExecutionContext*/
 ctx, /*CTIOperationRequest*/
 operationRequest, /*CTIOperationResponse*/
 operationResponse, /*HTTPResponse*/ httpResponse) {
  var sessionAttributes = {},
      intentResponse;
  var statusCode = -1;
  var message = 'Unprocessed';
  if (operationResponse) {
    statusCode = operationResponse.getStatusCode();
    sessionAttributes =
 operationResponse.getSessionAttributes();
    message = operationResponse.getMessage();
    var error = operationResponse.getError();
    if (error) {
      sessionAttributes.error = error;
    }
  }
  if
 (sn_cti_core.CTIRequestDispatcher.Constants.HTTP.Status.AUTH_RE
QUIRED.code === statusCode) {
    //first call for a secure action without authentication
 token
    sessionAttributes.statusCode = 401;
    sessionAttributes.message = message;
    intentResponse = {
      sessionAttributes: sessionAttributes,
      dialogAction: {
        type: 'Close',
        fulfillmentState: 'Fulfilled',
        message: {
```

```
          contentType: 'PlainText',
          content: 'This operation requires authentication. Say
authenticate for authentication.'
        }
      }
    };
  } else if ('DialogCodeHook' ===
operationRequest.getParameter('$$invocationSource')) {
      //pass back authToken and interactionId
      sessionAttributes.authToken =
operationRequest.getAuthToken();
      sessionAttributes.interactionId =
operationRequest.getInteractionSysId();
      var originalSlots =
operationRequest.getParameter('$$slots');
      var responseParameters = operationResponse ?
operationResponse.getParameters() : {};
      responseParameters = responseParameters ?
responseParameters : {};
      // See if processing happened and we got a dialogAction
      var responseDialogAction =
responseParameters['dialogAction'];
      // Default dialog action
      var dialogAction = {
        type: 'Delegate',
        slots: originalSlots
      };
      // If the response doesn't contain an override replay the
inputs
      if (responseDialogAction) {
        // We bypassed dialoghook so delegate and pass through
inputs
        dialogAction = responseDialogAction;
      }
        intentResponse = {
            sessionAttributes: sessionAttributes,
            dialogAction: dialogAction
        };
    } else {
      // Override required session attributes
      sessionAttributes.statusCode = statusCode;
      sessionAttributes.message = message;
      // Build response template
      intentResponse = {
        sessionAttributes: sessionAttributes,
        dialogAction: {
          type: 'Close',
          fulfillmentState: 'Fulfilled',
          message: {
            contentType: 'PlainText',
            content: message
          }
        }
      };
  }
```

```
  httpResponse.setBody(intentResponse);
})(ctx, operationRequest, operationResponse, httpResponse);
```

CTIOperationResponse - getSessionAttribute(String key)

Returns the value for a specified session attribute key set on the current CTIOperationResponse object.

Using the get/set session attribute methods enables the passing of virtually any string or number value between an operation handler and a message transformer. Session attributes can also be accessed within a contact flow. The sessionAttribute object can contain zero or more key/value pairs of data, such as the contact's phone number, that are valid for the duration of a computer telephony integration provider defined session. The operation handler determines what session attribute key/value pairs are needed as it utilizes these values during processing. Typically the operation handler sets these attributes on the CTIOperationResponse object by calling the CTIOperationResponse - setSessionAttribute(String key, Object value) method and the message transformer consumes the attributes using this method.

Parameters

Name	Type	Description
key	String	The name of the key value to return.

Returns

Type	Description
String	Value of the passed in key. If no such key exists, returns null.

```
var response = new sn_cti_core.CTIOperationResponse();
var phoneAttribute =
 response.getSessionAttribute('contact.phone');
```

CTIOperationResponse - getSessionAttributes()

Returns the key-value pairs for all session attributes that were previously set on the current CTIOperationResponse object.

Using the get/set session attribute methods enables the passing of virtually any string or number value between an operation handler and a message transformer. Session attributes can also be accessed within a contact flow. The sessionAttribute object can contain zero or more key/value pairs of data, such as the contact's phone number, that are valid for the duration of a computer telephony integration provider defined session. The operation handler determines what session attribute key/value pairs are needed as it utilizes these values during processing. Typically the operation handler sets these attributes on the CTIOperationResponse object by calling the CTIOperationResponse - setSessionAttribute(String key, Object value) method and the message transformer consumes the attributes using this method.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	A map of key-value pairs that were previously set on the CTIOperationResponse object. This key-value pairs are free-form and defined by the needs of the operation handler. The returned values are either Strings or Numbers.

```
(function
 (/*CTIOperationResponse*/operationResponse, /*HTTPResponse*/
 httpResponse) {
  // AWS Connect Lambda expects name value pairs only
  var out = {};
  for(var k in operationResponse.getSessionAttributes()) {
    out[k] = operationResponse.getSessionAttributes()[k];
  }
  out.statusCode = operationResponse.getStatusCode();
  out.message = operationResponse.getMessage();
  httpResponse.setBody(out);
})(operationResponse, httpResponse);
```

CTIOperationResponse - getStatusCode()

Returns the status code set on the current CTIOperationResponse object.

These status codes should correspond with standard HTTP status codes, such as 200 for success, 401 for authorization required. Typically, the resultant status codes are determined by the operation handler and are set on the CTIOperationResponse object using the CTIOperationResponse - setStatusCode(String statusCode) method. The message transformer then uses this method to include the status code in the payload returned to the computer telephony integrator provider.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Status code of the current operation. If a status code has not been set, returns -1.

```
(function
 (/*CTIOperationResponse*/operationResponse, /*HTTPResponse*/
 httpResponse) {
  // AWS Connect Lambda expects name value pairs only
  var out = {};
  for(var k in operationResponse.getSessionAttributes()) {
    out[k] = operationResponse.getSessionAttributes()[k];
  }
  out.statusCode = operationResponse.getStatusCode();
  out.message = operationResponse.getMessage();
  httpResponse.setBody(out);
})(operationResponse, httpResponse);
```

CTIOperationResponse - setAuthToken(String token)

Sets an authentication token on the current CTIOperationResponse object.

This token is used by the ServiceNow Voice framework to authenticate the current ServiceNow Voice user before executing the requested operation handler if the handler's *auth_required* flag is set to true. The *auth_required* flag is a field in the Operation Handler [sn_cti_operation_handler] table. The life of an authentication token should be for the life of the call session, but is determined by the CTI provider.

You can define whatever authentication/authorization handling required by your implementation by creating your own authentication operation handler. Regardless of how the authentication token is generated, the message translator must pass the token back in the CTI payload. Additionally, the CTI provider must store this authentication token locally and pass it in each operation request that requires authentication.

If using the instance provided authenticate operation handler, the handler initiates the creation of the authentication token based on a four-digit user-entered pin. It then sets the authentication token in the sessionAttributes object of the CTIOperationResponse object. The associated message transformer translates the sessionAttributes object into the CTI-specific payload and then sends it to the CTI provider.

Note: If the authentication token is not passed, all requests to execute operation handlers with the *auth_required* flag set will fail. If you do not use authentication, you do not need to maintain authentication tokens.

The ServiceNow base system provides working operation handlers and message transformers that enable connection to Amazon Connect. When building contact flows within Amazon Connect, there are two integration points between Amazon services and a ServiceNow instance:

- Amazon Web Services (AWS) Lambda Proxy (Invoke AWS Lambda function)
- AWS Lex Bot (Get Customer Input)

You can find the available operation handlers and message transformers for these integration points in the Operation Handlers [sn_cti_operation_handler] and Provider Message Transformer [sn_cti_provider_msg_transormer] tables.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The authentication token to use to authenticate operations that have the *auth_required* flag set.

```
var response = new sn_cti_core.CTIOperationResponse();
var authenticate = <Your authentication code here>; //
 Authenticate the user
if (authenticated) {
 var claims = {
  "interactionId":interactionGr.sys_id.toString()
 };
 var jwt = new sn_cti_core.AuthHelpers().generateJWT(claims);
```

```
 response.setAuthToken(jwt);
}
```

CTIOperationResponse - setError(Object error)

Sets the error object in the current CTIOperationResponse object.

You can use the error object in the component to formulate the payload to send to the computer telephony integrator (CTI) provider.

Parameters

Name	Type	Description
error	Object	Information about the error that was detected while processing the requested operation. The format of this object is determined by the CTI provider.

Returns

Type	Description
void	

```
var response = new sn_cti_core.CTIOperationResponse();
response.setError(new Error("You did not supply a field"));
```

CTIOperationResponse - setInteractionSysId(String id)

Sets the sys_id of the interaction record associated with the operation request on the current CTIOperationResponse object.

Parameters

Name	Type	Description
sys_id	String	The sys_id to set for the current interaction.

Returns

Type	Description
void	

```
var response = new sn_cti_core.CTIOperationResponse();
response.setInteractionSysId('98529cc55380001048e5ddeeff7b120b
');
```

CTIOperationResponse - setMajorVersion(Number majorVersion)

Sets the major version of the computer telephony integrator (CTI) provider software making the request on the associated CTIOperationResponse object.

Use this method if the CTI providers connected to your ServiceNow instance are running multiple versions of their software, as different software versions may require different payloads. If the payload is only slightly different between the software versions, it may make sense to have only a single message transformer. You can then handle the payload differences by just checking the version of software making the request within your message transformer. If the required payload

is significantly different between versions, it may be more effective to use multiple message transformers.

Parameters

Name	Type	Description
majorVersion	Number	Major version of the CTI provider software making the operation request. If this value was not previously set, returns 1.

Returns

Type	Description
void	

```
var request = new sn_cti_core.CTIOperationResponse();
request.setMajorVersion(2);
```

CTIOperationResponse - setMessage(String message)

Sets a text message on the current CTIOperationResponse object.

Typically this is a message that is spoken back to the user once an operation is complete and is set by the associated operation handler. The message transformer then uses the CTIOperationResponse - getMessage() method to obtain the message and pass it back to the computer telephony integration provider.

Parameters

Name	Type	Description
message	String	Message text

Returns

Type	Description
void	

```
(function(/*CTIOperationRequest*/
 request, /*CTIOperationResponse*/ response, /*Context*/ ctx) {
  var notes = '', lang = request.getLanguage();
  try {

    var interactionGr = request.getInteractionRecord();

    var now_GR = new GlideRecord('sys_user');
    if(interactionGr &&
 now_GR.get(interactionGr.opened_for.toString())) {
    if(now_GR.locked_out == true) {
        notes += gs.getMessageLang("User record found locked.
 Unlocking the account.\n", lang);
        now_GR.locked_out=false;
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        now_GR.update();
        response.setStatusCode(200);
        response.setMessage(gs.getMessageLang("Your account has
 been unlocked.", lang));
      } else {
        notes += gs.getMessageLang("User record not locked.\n",
 lang);
        response.setStatusCode(200);
        response.setMessage(gs.getMessageLang("Your account
 doesn't seem to be locked.", lang));
      }
    } else {
      notes += gs.getMessageLang("User record not found.
 Transfer to agent\n", lang);
      response.setStatusCode(302);
      response.setMessage(gs.getMessageLang("I am unable to find
 your record. Let me transfer to someone who can help.", lang));
    }
    if(interactionGr) {
      interactionGr.work_notes = notes;
      interactionGr.update();
    }
  } catch(e) {
    ctx.setError(e);
  }
})(request, response, ctx);
```

CTIOperationResponse - setMinorVersion(Number minorVersion)

Sets the minor version of the computer telephony integrator (CTI) provider software making the request on the associated CTIOperationResponse object.

Use this method if the CTI providers connected to your ServiceNow instance are running multiple versions of their software, as different software versions may require different payloads. If the payload is only slightly different between the software versions, it may make sense to have only a single message transformer. You can then handle the payload differences by just checking the version of software making the request within your message transformer. If the required payload is significantly different between versions, it may be more effective to use multiple message transformers.

Parameters

Name	Type	Description
minorVersion	Number	Minor version of the CTI provider software making the operation request. If this value was not previously set, returns 0.

Returns

Type	Description
void	

```
var response = new sn_cti_core.CTIOperationResponse();
response.setMinorVersion(3);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CTIOperationResponse - setParameter(String key, Object value)

Sets the specified key-value pair on the associated CTIOperationResponse object.

Using the get/set parameter methods enables the passing of virtually any string or number value between an operation handler and a message transformer. The parameter object can contain zero or more key/value pairs of data that directly correlate to the current operation request. The operation handler determines what key/value pairs are required as it consumes these values. Typically the operation handler sets these parameters on the CTIOperationResponse object by calling this method and the message transformer consumes them using the CTIOperationResponse - getParmeter(String key) or CTIOperationResponse - getSParameters() method.

Note: You should only store objects that can survive a `JSON.parse(JSON.stringify(object))` operation. Objects not meeting this criteria may not propagate correctly through the entire operation processing chain.

For example:

```
var x = {
  "string": 'abc',
  "int": 123,
  "float": 1.234,
  "number": new Number(3),
  "boolean": true,
  "date": new Date(2006, 0, 2, 15, 4, 5),
  "object": {
    "string": 'abc',
    "int": 123,
    "float": 1.234,
    "number": new Number(3),
    "boolean": true,
    "date": new Date(2006, 0, 2, 15, 4, 5)
  },
  "function": function(abc) {

  }
}
var stringify = JSON.stringify(x);
gs.info(stringify);
var hydrate = JSON.parse(stringify);
var stringify2 = JSON.stringify(hydrate);
gs.info(stringify2);
```

Produces:

```
{"string":"abc","int":123,"float":1.234,"number":3,"boolean":tru
e,"date":"2006-01-02T23:04:05.000Z","object":{"string":"abc","in
t":123,"float":1.234,"number":3,"boolean":true,"date":"2006-01-0
2T23:04:05.000Z"}}
{"string":"abc","int":123,"float":1.234,"number":3,"boolean":tru
e,"date":"2006-01-02T23:04:05.000Z","object":{"string":"abc","in
t":123,"float":1.234,"number":3,"boolean":true,"date":"2006-01-0
2T23:04:05.000Z"}}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
key	String	Name of the key under which to store the associated value.
value	Object	Value to store for the key. Valid data types: • string • int • float • number • boolean • date • object

Returns

Type	Description
void	

```
var response = new sn_cti_core.CTIOperationResponse();
response.setParameter('contact.phone', '+15552222345');
response.setParameter('contact.okToCall', true);
response.setParameter('contact.address', {
    street: '1234 Main St'
    city: 'API City',
    zip: 91335
});
```

CTIOperationResponse - setSessionAttribute(String key, Object value)

Sets the specified session attribute key-value pair on the associated CTIOperationResponse object.

Using the get/set session attribute methods enables the passing of virtually any string or number value between an operation handler and a message transformer. The sessionAttribute object can contain zero or more key/value pairs of data that are valid for the duration of a computer telephony integration provider defined session. Session attributes can also be accessed within a contact flow. The operation handler determines what session attribute key/value pairs are needed as it consumes these values. Typically the operation handler sets these attributes on the CTIOperationResponse object by calling this method and the message transformer gets the attributes using the CTIOperationResponse - getSessionAttribute(String key) or CTIOperationResponse - getSessionAttribute() method.

Note: You should only store objects that can survive a `JSON.parse(JSON.stringify(object))` operation. Objects not meeting this criteria may not propagate correctly through the entire operation processing chain.

For example:

```
var x = {
  "string": 'abc',
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "int": 123,
  "float": 1.234,
  "number": new Number(3),
  "boolean": true,
  "date": new Date(2006, 0, 2, 15, 4, 5),
  "object": {
    "string": 'abc',
    "int": 123,
    "float": 1.234,
    "number": new Number(3),
    "boolean": true,
    "date": new Date(2006, 0, 2, 15, 4, 5)
  },
  "function": function(abc) {

  }
}
var stringify = JSON.stringify(x);
gs.info(stringify);
var hydrate = JSON.parse(stringify);
var stringify2 = JSON.stringify(hydrate);
gs.info(stringify2);
```

Produces:

```
{"string":"abc","int":123,"float":1.234,"number":3,"boolean":tru
e,"date":"2006-01-02T23:04:05.000Z","object":{"string":"abc","in
t":123,"float":1.234,"number":3,"boolean":true,"date":"2006-01-0
2T23:04:05.000Z"}}
{"string":"abc","int":123,"float":1.234,"number":3,"boolean":tru
e,"date":"2006-01-02T23:04:05.000Z","object":{"string":"abc","in
t":123,"float":1.234,"number":3,"boolean":true,"date":"2006-01-0
2T23:04:05.000Z"}}
```

Parameters

Name	Type	Description
key	String	Name of the session attribute key under which to set the associated value.
value	Object	Value to set. Valid data types: • string • int • float • number • boolean • date • object

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var response = new sn_cti_core.CTIOperationResponse();
response.setSessionAttribute('contact.phone', '+15552222345');
response.setSessionAttribute('contact.okToCall', true);
response.setSessionAttribute('contact.address', {
    street: '1234 Main St'
    city: 'API City',
    zip: 91335
});
```

CTIOperationResponse - setStatusCode(Number statusCode)

Sets the status code of the current operation request on the CTIOperationResponse object.

You can use any integer values to define the status, but it is recommended that you emulate the HTTP status codes, such as 200 = Ok/Success, 400 = Bad Request, 401 = Unauthorized.

Parameters

Name	Type	Description
statusCode	Number	Integer that uniquely identifies the status of the requested operation.

Returns

Type	Description
void	

```
(function(/*CTIOperationRequest*/
 request, /*CTIOperationResponse*/ response, /*Context*/ ctx) {
  var notes = '', lang = request.getLanguage();
  try {

    var interactionGr = request.getInteractionRecord();

    var now_GR = new GlideRecord('sys_user');
    if(interactionGr &&
 now_GR.get(interactionGr.opened_for.toString())) {
    if(now_GR.locked_out == true) {
        notes += gs.getMessageLang("User record found locked.
 Unlocking the account.\n", lang);
        now_GR.locked_out=false;
        now_GR.update();
        response.setStatusCode(200);
        response.setMessage(gs.getMessageLang("Your account has
 been unlocked.", lang));
      } else {
        notes += gs.getMessageLang("User record not locked.\n",
 lang);
        response.setStatusCode(200);
```

```
        response.setMessage(gs.getMessageLang("Your account
 doesn't seem to be locked.", lang));
      }
    } else {
      notes += gs.getMessageLang("User record not found.
 Transfer to agent\n", lang);
      response.setStatusCode(302);
      response.setMessage(gs.getMessageLang("I am unable to find
 your record. Let me transfer to someone who can help.", lang));
    }
    if(interactionGr) {
      interactionGr.work_notes = notes;
      interactionGr.update();
    }
  } catch(e) {
    ctx.setError(e);
  }
})(request, response, ctx);
```

Data - Scoped, Global

The *Data* API provides a data object that contains the results of transform performed by a *sn_clotho.Client.transform()* method.

Do not use a constructor to create an instance of this class, instead use the object returned by the *sn_clotho.Client.transform()* method.

You can call this class in scoped and global server scripts. This class runs in the `sn_clotho` namespace identifier.

This class is part of the MetricBase application.

Scoped Data - getEnd()

Returns the end time for data in the Data object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideDateTime	The end of the time period.

Scoped Data - getLabel()

Returns the label assigned by the *sn_clotho.ClothoTransform.label()* method.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The label assigned to the data.

Scoped Data - getMetricName()

Returns the name of the metric of the data series. Returns null when the data object is associated with multiple data series.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the metric field. Returns null when the data object is associated with multiple data series.

Scoped Data - getPeriod()

Returns the time period in milliseconds.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The elapsed time in seconds.

Scoped Data - getStart()

Returns the start time for data in the Data object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideDateTime	The time for the first data point.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped Data - getSubject()

Returns the subject of the data series. Returns null when the data object is associated with multiple data series.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The subject field value of the subject GlideRecord. This is generally the sys_id of the subject GlideRecord.

Scoped Data - getTableName()

Returns the name of the table assigned in the DataSelector class constructor. Returns null when the data object is associated with multiple data series.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Table name. Returns null when the data object is associated with multiple data series.

Scoped Data - getValues()

Returns an array of values.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	An array of numbers.

Scoped Data - size()

Returns the number of values in the Data object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of values in the object.

DataBuilder - Scoped, Global

The *DataBuilder* API provides methods to create a series of data points for a metric. Use the *sn_clotho.Client.put()* method to save the values.

You can call this class in scoped and global server scripts. When using the *DataBuilder* class, use the `sn_clotho` namespace identifier.

This class is part of the MetricBase application.

DataBuilder - DataBuilder(Object glideRecord, String subject, String metric)

Creates an instance of the DataBuilder class.

Parameters

Name	Type	Description
glideRecord	Object	GlideRecord from which to obtain the domain.
subject	String	The sys_id of the GlideRecord associated with this series.
metric	String	The field name of the metric.

The following example initializes a new instance of `DataBuilder` from the `sn_clotho` namespace using the `now_GR` parameter, which represents the current time or a specific time range, and the string parameter `'cpu_percentage'`, which is the name of the metric being tracked.

```
// Where cpu_percentage is the name of the metric
        var dataBuilder = new sn_clotho.DataBuilder(now_GR,
 'cpu_percentage');
```

DataBuilder - add(GlideDateTime start, Array value)

Adds a series of data points to the DataBuilder object. Each data point is a time stamp and a value.

Uses the start parameter and the retention policy collection period to calculate the time stamp for each value in the array. The first value has the start parameter as the time stamp. This method does not save the data in the MetricBase database. Use the *sn_clotho.Client.put()* method to save the values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
start	GlideDateTime	The time stamp for the first data point. Subsequent time stamps are calculated using the retention policy collection period.
value	Array	An array of numbers.

Returns

Type	Description
DataBuilder	The same DataBuilder object.

The following example first initializes an array (points) containing three numerical values: 7, 0.5, and 273, which represent different data points related to CPU usage at a given timestamp. Then, the code initializes a new `sn_clotho.DataBuilder` object using `now_GR` (a GlideRecord object) represents the target database record where this data is being stored. `'cpu_percentage'` is the metric name used to track CPU usage.

A new time variable is created using GlideDateTime, which sets the object to the current date and time. Finally, the code uses `dataBuilder.add(time, points)` to store multiple data points in the Data Builder object.

```
var points = [7,0.5,273];
var dataBuilder = new sn_clotho.DataBuilder(now_GR,
 'cpu_percentage');
// this creates a GlideDateTime object set to the current date
 and time
var time = new GlideDateTime();
dataBuilder.add(time, points);
```

DataBuilder - add(GlideDateTime start, Number value)

Adds a data point to the DataBuilder object. Each data point is a time stamp and a value. This method does not save the data point in the metric. Use the *`sn_clotho.Client.put()`* method to save the values.

Parameters

Name	Type	Description
start	GlideDateTime	The time stamp for the data point.
value	Number	The value of the data point.

Returns

Type	Description
DataBuilder	The DataBuilder object.

The following example first initializes a new instance of `DataBuilder` from the `sn_clotho` namespace using the parameters `now_GR` (the target record) and `'cpu_percentage'` (the metric to track). `GlideDateTime` initializes time to the current date and time. Finally,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`dataBuilder.add()` stores the value `0.6` (representing a value of 60% CPU usage) at the current timestamp.

```
var dataBuilder = new sn_clotho.DataBuilder(now_GR,
 'cpu_percentage');
// this creates a GlideDateTime object set to the current date
 and time
var time = new GlideDateTime();
dataBuilder.add(time, 0.6);
```

DCManager - Global

The *DCManager* API enables you to group data by type.

Using this API you can:

- Assign data classifications to existing dictionary entries.
- Look up the data classifications for specific dictionary entries.
- Remove all data classifications associated with specific dictionary entries.
- Retrieve a list of all data classifications available in the current domain.

This API requires the Data Classification [com.glide.data_classification] plugin.

For more information, see Data Classification.

DCManager - classify(String dictEntries, String dataClasses)

Assigns pre-defined or user-defined data classifications to existing dictionary entries.

Requires the admin or data_classification_admin role.

Parameters

Name	Type	Description
dictEntries	String	The sys_ids of the records you want to classify. The sys_ids are from the Dictionary [sys_dictionary] table. Entered as a comma-separated list enclosed in a string.
dataClasses	String	The sys_ids of the data classifications you want to assign. The sys_ids are from the Data Classification [data_classification] table. Entered as a comma-separated list enclosed in a string.

Returns

Type	Description
String	Message describing the result of the operation.

This example finds records containing social security numbers and classifies the records as confidential.

```
var dcm = new SNC.DCManager();
var confidentialClass = {};
var ssnFields = [];
var dataClasses = JSON.parse(dcm.getAllDataClasses());

// Get the Confidential data class record
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
dataClasses.forEach(function (dataClass) {
  if (dataClass.name == "Confidential")
    confidentialClass = dataClass;
});

// Find fields that seem to be strong social security numbers
var dictionaryGR = new GlideRecord("sys_dictionary");
dictionaryGR.addQuery("element",
 "ssn").addOrCondition("element", "social_security_number");
dictionaryGR.query();
while (dictionaryGR.next())
  ssnFields.push(dictionaryGR.getUniqueValue());

// Classify any found entries as Confidential
if (ssnFields.length > 0)
  dcm.classify(ssnFields.join(), confidentialClass.sys_id);
```

Output:

```
"Successfully stored the data classification configurations"
```

DCManager - clearClassification(String dictEntries)

Removes all data classifications for the specified dictionary entries.

Requires the admin or data_classification_admin role.

Parameters

Name	Type	Description
dictEntries	String	The sys_ids of the records you want to remove classifications from. The sys_ids are from the Dictionary [sys_dictionary] table. Entered as a comma-separated list enclosed in a string.

Returns

Type	Description
String	Message describing the result of the operation.

This example removes the data classification for a dictionary entry.

```
var dcm = new SNC.DCManager();
gs.info(dcm.clearClassification("445de0a6dba30300efc57416bf9619b
0"));
```

Output:

```
"Classifications removed for the specified dictionary entries"
```

DCManager - getAllDataClasses()

Returns a list of all data classifications available in the current domain.

Requires the admin, data_classification_admin, or data_classification_auditor role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
<Array>	Result of the request. Returns the sys_id and name for each available data classification. If there are no data classifications, it returns an empty array. Data classifications can be organized into parent-child relationships. If there are parent data classifications, they are identified in the result. Data type: Array `[ { "parent": {Object}, "sys_id": "String", "name": "String" } ]`
<Array>.parent	Entry for a parent data classification. Data type: Object `"parent": { "sys_id": "String", "name": "String" }`
<Array>.parent.sys_id	Sys_id of the parent data classification from the Data Classification [data_classification] table. Data type: String
<Array>.parent.name	Name of the parent data classification. Data type: String
<Array>.sys_id	Sys_id of the data classification from the Data Classification [data_classification] table. Data type: String
<Array>.name	Name of the data classification. Data type: String

This example retrieves a list of all available data classifications.

  }
]
```

DCManager - getClassification(String dictEntries)

Retrieves all data classifications for the specified dictionary entries.

Parameters

Name	Type	Description
dictEntries	String	The sys_ids of the records you want to retrieve classifications for. The sys_ids are from the Dictionary [sys_dictionary] table. Entered as a comma-separated list enclosed in a string.

Returns

Type	Description
<Object>	JSON object containing each dictionary entry's sys_id with an array of its associated data classes. If there are no associated data classifications, it returns a message describing the result of the operation. Data classifications can be organized into parent-child relationships. If there are parent data classifications, they are identified in the result. Data type: Object

Returns (continued)

Type	Description

	<pre>{
	  <sys_dictionary_sys_id>: [
	  {
	  "parent": {Object},
	  "sys_id": "String",
	  "name": "String"
	  }
	  ]
	}</pre>

<Object>.parent	Entry for a parent data classification.
	
	Data type: Object
	<pre>"parent": {
	  "sys_id": "String",
	  "name": "String"
	}</pre>

<Object>.parent.sys_id	Sys_id of the parent data classification from the Data Classification [data_classification] table. Data type: String
<Object>.parent.name	Name of the parent data classification. Data type: String
<Object>.sys_id	Sys_id of the data classification from the Data Classification [data_classification] table. Data type: String
<Object>.name	Name of the data classification. Data type: String

This example retrieves the data classifications for a dictionary entry.

```
var dcm = new SNC.DCManager();
gs.info(dcm.getClassification("445de0a6dba30300efc57416bf9619b0"
));
```

Output:

```
{
  "445de0a6dba30300efc57416bf9619b0": [
    {

}
```

ScopedDCManager - Scoped

The *ScopedDCManager* API enables you to group data by type.

Using this API you can:

- Assign data classifications to existing dictionary entries.
- Look up the data classifications for specific dictionary entries.
- Remove all data classifications associated with specific dictionary entries.
- Retrieve a list of all data classifications available in the current domain.

This API requires the Data Classification [com.glide.data_classification] plugin.

For more information, see Data Classification.

ScopedDCManager - classify(String dictEntries, String dataClasses)

Assigns pre-defined or user-defined data classifications to existing dictionary entries.

Requires the admin or data_classification_admin role.

Parameters

Name	Type	Description
dictEntries	String	The sys_ids of the records you want to classify. The sys_ids are from the Dictionary [sys_dictionary] table. Entered as a comma-separated list enclosed in a string.
dataClasses	String	The sys_ids of the data classifications you want to assign. The sys_ids are from the Data Classification [data_classification] table. Entered as a comma-separated list enclosed in a string.

Returns

Type	Description
String	Message describing the result of the operation.

This example finds records containing social security numbers and classifies the records as confidential.

```
var dcm = new global.ScopedDCManager();
var confidentialClass = {};
var ssnFields = [];
var dataClasses = JSON.parse(dcm.getAllDataClasses());

// Get the Confidential data class record
dataClasses.forEach(function (dataClass) {
  if (dataClass.name == "Confidential")
    confidentialClass = dataClass;
});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Find the fields that seem to be strong social security
 numbers
var dictionaryGR = new GlideRecord("sys_dictionary");
dictionaryGR.addQuery("element",
 "ssn").addOrCondition("element", "social_security_number");
dictionaryGR.query();
while (dictionaryGR.next())
  ssnFields.push(dictionaryGR.getUniqueValue());

// Classify any found entries as confidential
if (ssnFields.length > 0)
  dcm.classify(ssnFields.join(), confidentialClass.sys_id);
```

Output:

```
"Successfully stored the data classification configurations"
```

ScopedDCManager - clearClassification(String dictEntries)

Removes all data classifications for the specified dictionary entries.

Requires the admin or data_classification_admin role.

Parameters

Name	Type	Description
dictEntries	String	The sys_ids of the records you want to remove classifications from. The sys_ids are from the Dictionary [sys_dictionary] table. Entered as a comma-separated list enclosed in a string.

Returns

Type	Description
String	Message describing the result of the operation.

This example removes the data classification for a dictionary entry.

```
var dcm = new global.ScopedDCManager();
gs.info(dcm.clearClassification("445de0a6dba30300efc57416bf9619b
0"));
```

Output:

```
"Classifications removed for the specified dictionary entries"
```

ScopedDCManager - getAllDataClasses()

Returns a list of all data classifications available in the current domain.

Requires the admin, data_classification_admin, or data_classification_auditor role.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
<Array>	Result of the request. Returns the sys_id and name for each available data classification. If there are no data classifications, it returns an empty array. Data classifications can be organized into parent-child relationships. If there are parent data classifications, they are identified in the result. Data type: Array `[ { "parent": {Object}, "sys_id": "String", "name": "String" } ]`
<Array>.parent	Entry for a parent data classification. Data type: Object `"parent": { "sys_id": "String", "name": "String" }`
<Array>.parent.sys_id	Sys_id of the parent data classification from the Data Classification [data_classification] table. Data type: String
<Array>.parent.name	Name of the parent data classification. Data type: String
<Array>.sys_id	Sys_id of the data classification from the Data Classification [data_classification] table. Data type: String
<Array>.name	Name of the data classification. Data type: String

This example retrieves a list of all available data classifications.

```
var dcm = new global.ScopedDCManager();
gs.info(dcm.getAllDataClasses());
```

Output:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DatasetDefinition - Global

The *DatasetDefinition* API provides methods to identify a set of records including a table name, columns, and row selection criteria to use as input for ML training algorithms. Datasets don't contain the actual data.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace. For information, see Predictive Intelligence.

Use the dataset to estimate mutual information *PredictabilityEstimate* or train data specified by an *Encoder*. You can also use the dataset to train data specified by one of the following solution types:

- *ClassificationSolution*
- *ClusteringSolution*
- *RegressionSolution*
- *SimilaritySolution*

For usage guidelines, refer to Using ML APIs.

DatasetDefinition - DatasetDefinition(Object)

Creates an instance of the *DatasetDefinition* class, enabling you to define a dataset by table name, fields, and query.

Create your dataset definition by passing a table and a list of fields. You can also pass a query to restrict datasets to include rows with specific characteristics.

Once created, a DatasetDefinition object cannot be modified.

Parameters

Name	Type	Description
config	Object	JavaScript object containing the dataset definition properties. `{ "encodedQuery": "String", "fieldDetails": [Array], "fieldNames": [Array], "tableName": "String" }`
config.tableName	String	Name of the table for the dataset. For example, `"tableName" : "Incident"`.
config.fieldNames	Array	Optional. List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Default: All fields
config.fieldDetails	Array	Optional. List of JavaScript objects that specify field properties. Use this property to force machine learning algorithms to interpret fields as being a specific type. You do not need to get field details for every field listed in the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		fieldNames property. All details must correspond with a field listed in the *fieldNames* array. `[ { "name": "String", "type": "String" } ]`
config.fieldDetails.name	String	Name of the field defining the type of information to restrict this dataset to. If used, this field name must match the corresponding name listed in the *fieldNames* property.
config.fieldDetails.type	String	Machine-learning field type. Specifying the data type forces the ML trainer to interpret a field as having that type. If no data type is specified, the system determines the type. Supported types: • *nominal*: ML interprets this field as containing classes or categories. • *numeric*: ML interprets this field as containing numbers. • *text*: ML interprets this field as containing text. These types identify data types from a machine learning perspective. The ML type might differ from the type listed in the source table. A field can be a string type, but its purpose can be to encode a nominal value. For example, t-shirt sizes such as "XL", "L", or "M" are string types in the table, but each value represents a categorgy of a nominal attribute from an ML perspective.
config.encodedQuery	String	Optional. Encoded query string in standard Glide format. See Encoded query strings. You can construct the query to be absolute or relative. For example, your query can return rows for the previous 3 months (relative), or for the May through July period (absolute). Whether using an absolute or relative pattern, the data a definition identifies can change if the rows in the underlying table change.

The following example shows how to create a dataset definition.

```
var myData = new sn_ml.DatasetDefinition(
  {
     'tableName' : 'incident',
     'fieldNames' : ['category', 'short_description',
 'priority', 'assignment_group.name'],
```

ast2Quarters()@javascript:gs.endOfLast2Quarters()^state=3'
  });
```

DatasetDefinition - getEligibleFields(String capability)

Returns a list of fields that are eligible as either input fields (features) or predicted fields regarding a solution of a given capability, for example, a classification solution. Eligibility is determined based on the fields having the appropriate glide data types.

Parameters

Name	Type	Description
capability	String	Capability for which to retrieve fields eligible for training. This method currently only supports classification solutions, any other value for the capability throws a "capability not supported" exception. Valid values: `"classification"`

Returns

Type	Description
Object	Object containing eligible input field names and eligible output field names. `{ "eligibleInputFieldNames" : [Array], "eligibleOutputFieldNames" : [Array] }`
<Object>.eligibleInputFieldNames	List of strings indicating input fields eligible for training. Data type: Array
<Object>.eligibleOutputFieldNames	List of strings indicating output fields eligible for training. Data type: Array

The following example shows how to display eligible fields for a classification solution.

```
var myIncidentData = new sn_ml.DatasetDefinition({
  'tableName' : 'incident',
  'encodedQuery' : 'activeANYTHING'
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
});

var eligibleFields =
 JSON.parse(myIncidentData.getEligibleFields('classification'));

gs.print(JSON.stringify(eligibleFields, null, 2));
```

Output:

```
{
  "eligibleInputFieldNames": [
    "resolved_by",
    "short_description",
    "description",
    "notify"
  ],
  "eligibleOutputFieldNames": [
    "parent",
    "caused_by",
    "location",
    "category"
  ]
}
```

DateTimeUtils - Global

The *DateTimeUtils* script include is a collection of date/time functions.

You can use this script include in any server-side script, and is available through GlideAjax.

DateTimeUtils - int8ToGlideDateTime(Number int64)

Converts Microsoft AD integer8 DateTime format into GlideDateTime format.

Integer8 is also known as Microsoft Filetime format. This method is commonly used when importing AD user's date fields, such as Expiration Date.

Parameters

Name	Type	Description
int64	Number	A 64-bit value representing the number of 100-nanosecond intervals since January 1, 1601 (UTC).

Returns

Type	Description
GlideDateTime	A GlideDateTime object set to the Integer8 date and time.

```
//convert and set account expiration date from AD
//this is an example that could be used in an LDAP import
 transform map to import the LDAP account
//expires attribute to a customer created u_account_expires
 GlideDateTime field
var dtUtil = new DateTimeUtils();
target.u_account_expires =
 dtUtil.int8ToGlideDateTime(source.u_accountexpires);
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DateTimeUtils - msToGlideDateTime(Number milliseconds)

Convert milliseconds to a GlideDateTime object

Parameters

Name	Type	Description
milliseconds	Number	The number of milliseconds

Returns

Type	Description
GlideDateTime	A GlideDateTime object

```
//example script to call the method from a client
Replace MILLISECONDSVALUE with your variable
var ga = new GlideAjax('DateTimeUtils');
ga.addParam('sysparm_name','msToGlideDateTime');
ga.addParam('sysparm_value', MILLISECONDSVALUE);
ga.getXMLWait();
var newGDT = ga.getAnswer();
```

DecisionTableAPI - Scoped, Global

The *DecisionTableAPI* class enables you to access Decision Tables data in scoped and global server-side scripts.

To access *DecisionTableAPI* methods, use the `sn_dt` namespace. You must have the decision_table_crud_api role to use this API. To learn more about Decision Tables, see Decision Tables.

DecisionTableAPI - DecisionTableAPI()

Instantiates a DecisionTableAPI object.

Parameters

Name	Type	Description
None		

```
var dt = new sn_dt.DecisionTableAPI();
```

DecisionTableAPI - createAnswerElementChoices(String decisionID, Array questions)

Creates multiple records in the Choices [sys_choice] table that are linked to answer elements.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the decision table record. Located in the Decision Tables [sys_decision] table.
choices	Array	Array of objects used to create records in the Choices [sys_choice] table. Each object creates one choice record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>[
		  {
		  answerElementID: "String",
		  label: "String",
		  order: Number,
		  value: "String"
		  }
		]</pre>

choices.answerElementID	String	Sys_id of the answer element to associate with the choice. Located in the Result [sys_decision_multi_result_element] table.
choices.label	String	Label of the choice.
choices.order	Number	Optional. Order of the choice.
choices.value	String	Value of the choice.

Returns

Type	Description

Object	Object with information about the status of the API request.
	<pre>{
	  "errors": [Array],
	  "results": [Array],
	  "status": "String"
	}</pre>

<Object>.errors	Error information.
	
	Data type: Array
	<pre>"errors": [
	  {
	  "message": "String",
	  "type": "String
	  }
	]</pre>

<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.results	Array with information about the status of each choice. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"results": [
	  {
	  "errors": [Array],
	  "record": GlideRecord,
	  "status": "String"
	  }
	]</pre>

<Object>.results.errors	Error information for the choice.
	
	Data type: Array
	<pre>"errors": [
	  {
	  "message": "String",
	  "type": "String
	  }
	]</pre>

<Object>.results.errors.message	Error message. Data type: String
<Object>.results.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.results.record	GlideRecord reference to the choice created in the Choices [sys_choice] table. Data type: GlideRecord
<Object>.results.status	Status that indicates whether the choice record was successfully created. Possible values: • Success • Failure Data type: String
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example creates two choices for an answer element.

```
var decisionID = 'a45be18c3d839910f8776a598af91269';
var answerElementID = '99d197c83d0b9910f8776a598af912df';
var choices = [
   {
      label: 'Hyderabad',
      value: 'hyd',
      answerElementId: answerElementID,
      order: 20
   },
   {
      label: 'Mumbai',
      value: 'mum',
      answerElementId: answerElementID,
      order: 40
   }
];

var dt = new sn_dt.DecisionTableAPI();
var response = dt.createAnswerElementChoices(decisionID,
 choices);
gs.info('Status - ' + response.status);
gs.info('First choice sys id - ' +
 response.results[0].record.getValue('sys_id'));
gs.info('Second choice sys id - ' +
 response.results[1].record.getValue('sys_id'));
```

Output:

```
Status - Success
First choice sys id - 6bc0d3c03d0b9910f8776a598af912c6
Second choice sys id - 6fc0d3c03d0b9910f8776a598af912c9
```

DecisionTableAPI - createAnswerElements(String decisionID, Array answerElements)

Creates multiple records in the Result [sys_decision_multi_result_element] table that are related to the specified decision table.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the decision table record. Located in the Decision Tables [sys_decision] table.
answerElements	Array	Array of objects used to create records in the Result Elements [sys_decision_multi_result_element] table. Each object creates one answer element record. `[ { label: "String", maxsize: Number, order: Number, reference: "String", type: "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
answerElements.label	String	Label of the answer element record.
answerElements.maxsize	Number	Optional. Maximum number of characters allowed in the answer element field. Use this property only if *`answerElements.type`* is `String`. Default value: 250
answerElements.order	Number	Optional. Order of the answer element.
answerElements.reference	String	Required if the value of *`answerElements.type`* is `Reference`. Name of the reference table used by the answer element.
answerElements.type	String	Answer element input type. Valid values: • Boolean • Choice • Currency • Decimal • Due_date • Glide_date • Glide_date_time • Glide_duration • Integer • Longint • Reference • String

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "results": [Array], "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ {`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"message": "String",
	"type": "String
	}
	]</pre>

<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String

<Object>.results	Array with information about the status of each answer element.
	
	Data type: Array
	<pre>"results": [
	{
	"errors": [Array],
	"record": GlideRecord,
	"status": "String"
	}
	]</pre>

<Object>.results.errors	Error information for the answer element.
	
	Data type: Array
	<pre>"errors": [
	{
	"message": "String",
	"type": "String
	}
	]</pre>

<Object>.results.errors.message	Error message. Data type: String
<Object>.results.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.results.record	GlideRecord reference to the answer element created in the Result Elements [sys_decision_multi_result_element] table. Data type: GlideRecord
<Object>.results.status	Status that indicates whether the answer element record was successfully created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Possible values: • Success • Failure Data type: String
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example creates two answer elements for a decision table.

```
var decisionID = 'a45be18c3d839910f8776a598af91269';
var answerElements = [
   {
      label: 'City name',
      name: 'city',
      type: 'choice',
      comments: 'City name',
   },
   {
      label: 'Assigned To',
      name: 'assigned_to',
      type: 'reference',
      reference: 'sys_user'
   }
];

var dt = new sn_dt.DecisionTableAPI();
var response = dt.createAnswerElements(decisionID,
 answerElements);
gs.info('Status - ' + response.status);
gs.info('First answer element sys id - ' +
 response.results[0].record.getValue('sys_id'));
gs.info('Second answer element sys id - ' +
 response.results[1].record.getValue('sys_id'));
```

Output:

```
Status - Success
First answer element sys id - 41c707803d0b9910f8776a598af91201
Second answer element sys id - 51c707803d0b9910f8776a598af91217
```

DecisionTableAPI - createConditions(String decisionID, Array conditions)

Creates multiple records in the Decision Conditions [sn_decision_table_decision_condition] table that are related to the specified decision table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the decision table record. Located in the Decision Tables [sys_decision] table.
conditions	Array	Array of objects used to create records in the Decision Conditions [sn_decision_table_decision_condition] table. Each object creates one decision condition record. `[ { decisionInput: "String", defaultOperator: "String", label: "String" } ]`
conditions.decisionInput	String	Sys_id of the decision input to associate with the condition. Located in the Decision Inputs [sys_decision_input] table.
conditions.defaultOperator	String	Optional. Default operator for the condition. For a list of valid operators, see Operators available for filters and queries.
conditions.label	String	Label of the decision condition record.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "results": [Array], "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.results	Array with information about the status of each decision condition. Data type: Array `"results": [ { "errors": [Array], "record": GlideRecord, "status": "String" } ]`
<Object>.results.errors	Error information for the decision condition. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.results.errors.message	Error message. Data type: String
<Object>.results.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.results.record	GlideRecord reference to the decision condition created in the Decision Conditions [sn_decision_table_decision_condition] table. Data type: GlideRecord
<Object>.results.status	Status that indicates whether the decision condition record was successfully created. Possible values: • Success • Failure Data type: String
<Object>.status	Status of the API request. Possible values: • Success • Failure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String

This example creates two decision conditions for a decision table.

```
var decisionID = 'a45be18c3d839910f8776a598af91269';
var conditions = [
    {
        label: 'Total count',
        decisionInput: '22bde5003dc39910f8776a598af91292',
        defaultOperator: '!='
    },
    {
        label: 'Is Incident Active',
        decisionInput: '6abde5003dc39910f8776a598af9127e',
        default_operator: 'ISEMPTY',
        order: 10,
        field: 'u_incident.active'
    }
];

var dt = new sn_dt.DecisionTableAPI();
var response = dt.createConditions(decisionID, conditions);
gs.info('Status - ' + response.status);
gs.info('First condition sys id - ' +
 response.results[0].record.getValue('sys_id'));
gs.info('Second condition sys id - ' +
 response.results[1].record.getValue('sys_id'));
```

Output:

```
Status - Success
First condition sys id - c1530f4c3dc79910f8776a598af912ef
Second condition sys id - c9530f4c3dc79910f8776a598af912f1
```

DecisionTableAPI - createDecisionTable(Object decisionTable)

Creates a decision table record in the Decision Tables [sys_decision] table.

Parameters

Name	Type	Description
decisionTable	Object	Key-value pairs of the field names and values to use to create a decision table record. `{ "accessibleFrom": "String", "name": "String", "scope": "String }`
decisionTable.accessibleFrom	String	Optional. Scopes that have access to the decision table record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • package_private • public
decisionTable.name	String	Name of the decision table.
decisionTable.scope	String	Scope of the decision table record.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "record": GlideRecord, "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.record	GlideRecord reference to the decision table created in the Decision Tables [sys_decision] table. Data type: GlideRecord
<Object>.status	Status of the API request. Possible values: • Success • Failure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String

This example creates an Emergency Change Policy decision table.

```
var decisionTable = {
    name: 'Emergency Change Policy',
    scope: 'global',
    accessibleFrom: 'public'
};

var dt = new sn_dt.DecisionTableAPI();
var response = dt.createDecisionTable(decisionTable);
gs.info('Status -' + response.status);
gs.info('Decision Table sys id - ' +
 response.record.getValue('sys_id'));
```

Output:

```
Status - Success
Decision Table sys id - 665569083d839910f8776a598af91223
```

DecisionTableAPI - createInputChoices(String decisionID, Array choices)

Creates multiple records in the Choices [sys_choice] table that are linked to decision inputs.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the decision table record. Located in the Decision Tables [sys_decision] table.
choices	Array	Array of objects used to create records in the Choices [sys_choice] table. Each object creates one choice record. `[ { inputID: "String", label: "String", order: Number, value: "String" } ]`
choices.inputID	String	Sys_id of the decision input to associate with the choice. Located in the Decision Inputs [sys_decision_input] table.
choices.label	String	Label of the choice.
choices.order	Number	Optional. Order of the choice.
choices.value	String	Value of the choice.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "results": [Array], "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.results	Array with information about the status of each choice. Data type: Array `"results": [ { "errors": [Array], "record": GlideRecord, "status": "String" } ]`
<Object>.results.errors	Error information for the choice. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.results.errors.message	Error message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.results.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.results.record	GlideRecord reference to the choice created in the Choices [sys_choice] table. Data type: GlideRecord
<Object>.results.status	Status that indicates whether the choice record was successfully created. Possible values: • Success • Failure Data type: String
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example creates two choices for a decision input.

```
var decisionID = 'a45be18c3d839910f8776a598af91269';
var inputID = '4d1f8f083d0b9910f8776a598af91274';
var choices = [
   {
      label: 'Hyderabad',
      value: 'hyd',
      inputId: inputID,
      order: 20
   },
   {
      label: 'Mumbai',
      value: 'mum',
      inputId: inputID,
      order: 40
   }
];

var dt = new sn_dt.DecisionTableAPI();
var response = dt.createInputChoices(decisionID, choices);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info(JSON.stringify(response));
gs.info('Status - ' + response.status);
gs.info('First choice sys id - ' +
 response.results[0].record.getValue('sys_id'));
gs.info('Second choice sys id - ' +
 response.results[1].record.getValue('sys_id'));
```

Output:

```
Status - Success
First choice sys id - 6bc0d3c03d0b9910f8776a598af912c6
Second choice sys id - 6fc0d3c03d0b9910f8776a598af912c9
```

DecisionTableAPI - createInputs(String decisionID, Array inputs)

Creates multiple records in the Decision Inputs [sys_decision_input] table that are related to the specified decision table.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the decision table record. Located in the Decision Tables [sys_decision] table.
inputs	Array	Array of objects used to create records in the Decision Input [sys_decision_input] table. Each object creates one decision input record. `[ { label: "String", maxsize: Number, order: Number, reference: "String", type: "String" } ]`
inputs.label	String	Label of the decision input record.
inputs.maxsize	Number	Optional. Maximum number of characters allowed in the input field. Use this property only if *inputs.type* is `String`. Default value: 250
inputs.order	Number	Optional. Order of the input.
inputs.reference	String	Required if the value of *inputs.type* is `Reference`. Name of the reference table used by the decision input.
inputs.type	String	Decision input type. Valid values: • String • Integer • True/False

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• Choice • Reference • Date • Date/Time

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "results": [Array], "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.results	Array with information about the status of each decision input. Data type: Array `"results": [ { "errors": [Array], "record": GlideRecord, "status": "String" } ]`
<Object>.results.errors	Error information for the decision input. Data type: Array

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"errors": [
	  {
	  "message": "String",
	  "type": "String
	  }
	]</pre>

<Object>.results.errors.message	Error message. Data type: String
<Object>.results.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.results.record	GlideRecord reference to the decision input created in the Decision Inputs [sys_decision_input] table. Data type: GlideRecord
<Object>.results.status	Status that indicates whether the decision input record was successfully created. Possible values: • Success • Failure Data type: String
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example creates two inputs for a decision table.

```
var decisionID = 'a45be18c3d839910f8776a598af91269';
var inputs = [
   {
      label: 'Incident',
      type: 'reference',
      reference: 'incident',
      ref_qual: 'active=true^EQ'
   },
   {
      label: 'Total count',
      type: 'integer'
```

```
    }
];

var dt = new sn_dt.DecisionTableAPI();
var response = dt.createInputs(decisionID,inputs);
gs.info('Status - ' + response.status);
gs.info('First input id -' +
 response.results[0].record.getValue('sys_id'));
gs.info('Second input id -' +
 response.results[1].record.getValue('sys_id'));
```

Output:

```
Status - Success
First input id - 5dbfa58c3d839910f8776a598af91219
Second input id - 95bfe1803dc39910f8776a598af912fa
```

DecisionTableAPI - createQuestions(String decisionID, Array questions)

Creates multiple records in the Decisions [sys_decision_question] table that are related to the specified decision table.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the decision table record. Located in the Decision Tables [sys_decision] table.
questions	Array	Array of objects used to create records in the Decisions [sys_decision_question] table. Each object creates one question record. `[ { active: Boolean, answer: [Array], condition: "String", defaultAnswer: Boolean, order: Number } ]`
questions.active	Boolean	Flag that indicates whether the question record is active. Valid values: • true: The question record is active. • false: The question record is not active.
questions.answer	Array	Array of possible answers to the question. For a single result table, the array can only have one object. For a multi-result table, the array can have multiple objects. `[ { name: "String", value: "String"`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		}]
questions.answer.name	String	Name of the answer element. Located in the Result [sys_decision_multi_result_element] table.
questions.answer.value	String	Value of the answer element. Located in the Result [sys_decision_multi_result_element] table.
questions.condition	String	Conditions required to reach this question. The fields available for the conditions are the decision inputs that are associated with the decision table. For more information about creating conditions, see Operators available for filters and queries.
questions.default.answer	Boolean	Flag that indicates whether this question is the default question for the decision table. Valid values: • true: The question is the default question. • false: The question is not the default question.
questions.order	Number	Order of the question.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "results": [Array], "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Possible value: INTERNAL_ERROR Data type: String
<Object>.results	Array with information about the status of each question. Data type: Array `"results": [ { "errors": [Array], "record": GlideRecord, "status": "String" } ]`
<Object>.results.errors	Error information for the question. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.results.errors.message	Error message. Data type: String
<Object>.results.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.results.record	GlideRecord reference to the question created in the Decisions [sys_decision_question] table. Data type: GlideRecord
<Object>.results.status	Status that indicates whether the question record was successfully created. Possible values: • Success • Failure Data type: String
<Object>.status	Status of the API request. Possible values:

Returns (continued)

Type	Description
	• Success • Failure Data type: String

This example creates two questions for a decision table.

```
var decisionID = 'a45be18c3d839910f8776a598af91269';
var questions = [
   {
      condition: 'u_item=Phone^u_price=500^EQ',
      answer:[
         {
            name: 'u_seller',
            value: '02826bf03710200044e0bfc8bcbe5d64'
         },
         {
            name: 'u_discount',
            value: '5'
         }
      ],
      active: true,
      defaultAnswer: true,
      order: 300
   },
   {
      condition: 'u_item=Laptop^u_price>800^EQ',
      answer:[
         {
            name: 'u_discount',
            value: '20'
         }
      ],
      active: true,
      defaultAnswer: false,
      order: 150
   }
];

var dt = new sn_dt.DecisionTableAPI();
var response = dt.createQuestions(decisionID, questions);
gs.info(JSON.stringify(response));
gs.info('Status - ' + response.status);
gs.info('First decision sys id - ' +
 response.results[0].record.getValue('sys_id'));
gs.info('Second decision sys id - ' +
 response.results[1].record.getValue('sys_id'));
```

Output:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Status - Success
First decision sys id - 21c8d3003d4b9910f8776a598af91213
Second decision sys id - e9c8d3003d4b9910f8776a598af91218
```

DecisionTableAPI - deleteAnswerElement(String answerElementID)

Deletes a record in the Result [sys_decision_multi_result_element] table.

Parameters

Name	Type	Description
answerElementID	String	Sys_id of the answer element record. Located in the Result Elements [sys_decision_multi_result_element] table.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example deletes an answer element.

```
var answerElementID = '51c707803d0b9910f8776a598af91217';

var dt = new sn_dt.DecisionTableAPI();
var response = dt.deleteAnswerElement(answerElementID);
gs.info('Status - ' + response.status);
```

Output:

```
Status - Success
```

DecisionTableAPI - deleteChoice(String choiceID)

Deletes a record in the Choices [sys_choice] table.

Parameters

Name	Type	Description
choiceID	String	Sys_id of the choice record. Located in the Choices [sys_choice] table.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.status	Status of the API request. Possible values: • Success • Failure

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String

This example deletes a choice.

```
var choiceID = '4532db883d0b9910f8776a598af912e7';

var dt = new sn_dt.DecisionTableAPI();
var response = dt.deleteChoice(choiceID);
gs.info('Status - ' + response.status);
```

Output:

```
Status - Success
```

DecisionTableAPI - deleteCondition(String conditionID)

Deletes a record in the Decision Conditions [sn_decision_table_decision_condition] table.

Parameters

Name	Type	Description
conditionID	String	Sys_id of the decision condition record. Located in the Decision Conditions [sn_decision_table_decision_condition] table.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR

Returns (continued)

Type	Description
	Data type: String
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example deletes a decision condition.

```
var conditionID = 'c9530f4c3dc79910f8776a598af912f1';

var dt = new sn_dt.DecisionTableAPI();
var response = dt.deleteCondition(conditionID);
gs.info('Status - ' + response.status);
```

Output:

```
Status - Success
```

DecisionTableAPI - deleteDecisionTable(String decisionID)

Deletes a record in the Decision Tables [sys_decision] table.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the decision table record. Located in the Decision Tables [sys_decision] table.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String`

Returns (continued)

Type	Description
	<pre> }]</pre>
<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example deletes a decision table.

```
var decisionID = 'a1f6e14c3d039910f8776a598af9129d';

var dt = new sn_dt.DecisionTableAPI();
var response = dt.deleteDecisionTable(decisionID);
gs.info('Status -' + response.status);
```

Output:

```
Status - Success
```

DecisionTableAPI - deleteInput(String inputID)

Deletes a record in the Decision Inputs [sys_decision_input] table.

Parameters

Name	Type	Description
inputID	String	Sys_id of the decision input record. Located in the Decision Inputs [sys_decision_input] table.

Returns

Type	Description

Object	Object with information about the status of the API request.
	<pre>{
	  "errors": [Array],</pre>

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	<pre> "status": "String" }</pre>

<Object>.errors	Error information.
	
	Data type: Array
	<pre>"errors": [
	   {
	      "message": "String",
	      "type": "String
	   }
	]</pre>

<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example deletes a decision input.

```
var inputID = 'a1f6e14c3d039910f8776a598af9129d';

var dt = new sn_dt.DecisionTableAPI();
var response = dt.deleteInput(inputID);
gs.info('Status -' + response.status);
```

Output:

```
Status - Success
```

DecisionTableAPI - deleteQuestion(String questionID)

Deletes a record in the Decisions [sys_decision_question] table.

Parameters

Name	Type	Description
questionID	String	Sys_id of the question record. Located in the Decisions [sys_decision_question] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example deletes a question.

```
var questionId = '700602fe81d21110f87735acbca2c610';

var dt = new sn_dt.DecisionTableAPI();
var response = dt.deleteQuestion(questionId);
gs.info('Status - ' + response.status);
```

Output:

```
Status - Success
```

DecisionTableAPI - getAll()

Returns all decision tables from the Decision Tables [sys_decision] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	All decision tables and their fields from the Decision Tables [sys_decision] table. Each decision table contains these key-value pairs: • distinctAnswers: Array. Answer records associated with the decision table. Each record contains these key-value pairs. ◦ answerElementValues: Array. Answer element values associated with the answer record. Each record contains these key-value pairs: ▪ answerElementName: String. Name of the answer element. ▪ label: String. Answer record label. ▪ table: String. Table of the answer element if the answer element is a Reference type. ▪ type: String. Type of the answer element. ▪ valid: Boolean. True if the record exists in the system; otherwise false. ▪ value: String. Value of the answer element. ◦ label: String. Answer record label. ◦ multipleAnswerRecord: Boolean. True if this is a multiple answer record; otherwise false. ◦ valid: Boolean. True if the record exists in the system; otherwise false. ◦ value: String. Sys_id of the answer record. ◦ table: String. Table containing the answer record. • referenceQualifier: String. Used for internal purposes. • inputs: Array. Decision inputs from the Decision Inputs [sys_decision_input] table associated with the decision table. Each record contains these key-value pairs. ◦ searchField: String. Used for internal purposes. ◦ defaultValue: String. Default value for the input. ◦ show_ref_finder: Boolean. Used for internal purposes. ◦ use_dependent: Boolean. Used for internal purposes. ◦ type: String. Input data type. ◦ mandatory: Boolean. True if the input is mandatory; otherwise false. ◦ extended: Boolean. True if the input extends another field; otherwise false. ◦ local: Boolean. Used for internal purposes. ◦ sys_class_name: String. Used for internal purposes. ◦ reference: String. Reference table used if the input type is reference. ◦ dependent_on: String. Field that document ID and choice inputs depend on. ◦ data_structure: String. Used for internal purposes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ readonly: Boolean. True if the input is read-only; otherwise false. ○ id: String. Sys_id of the input from the Decision Inputs [sys_decision_input] table. ○ type_label: String. Input data type label. ○ table: String. Reference field table if the input type is reference. ○ order: Number. Order in which the system evaluates inputs. ○ ref_qual: String. Condition applied to the reference table. ○ reference_display: String. Used for internal purposes. ○ choiceOption: String. Method for users to see a list of suggested values. ○ label: String. Label of the input record. ○ hint: String. Hint text used to help users understand the input required. ○ name: String. Internal name of the input record. ○ attributes: Array. Field attributes that apply to the input record. ○ maxsize: Number. Maximum number of characters allowed in the field. ○ columnName: String. Name of the input. • answerElements: Array. Answer elements from the Answer elements [sys_decision_multi_result_element] table associated with the decision table. Each record contains these key-value pairs. ○ searchField: String. Used for internal purposes. ○ defaultValue: String. Default value for the answer element. ○ show_ref_finder: Boolean. Used for internal purposes. ○ use_dependent: Boolean. Used for internal purposes. ○ type: String. Answer element data type. ○ mandatory: Boolean. True if the answer element is mandatory; otherwise false. ○ extended: Boolean. True if the answer element extends another field; otherwise false. ○ local: Boolean. Used for internal purposes. ○ sys_class_name: String. Used for internal purposes. ○ reference: String. Reference table used if the answer element type is reference. ○ dependent_on: String. Field that document ID and choice answer elements depend on. ○ data_structure: String. Used for internal purposes. ○ readonly: Boolean. True if the input is read-only; otherwise false. ○ id: String. Sys_id of the input from the Answer elements [sys_decision_multi_result_element] table. ○ type_label: String. Answer element data type label. ○ table: String. Reference field table if the answer element type is reference. ○ order: Number. Order of the answer elements. ○ ref_qual: String. Condition applied to the reference table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ reference_display: String. Used for internal purposes. ○ comments: Description of the answer element. ○ choiceOption: String. Method for users to see a list of suggested values. ○ label: String. Label of the answer element record. ○ hint: String. Hint text used to help users understand the answer element required. ○ name: String. Internal name of the answer element record. ○ attributes: Array. Field attributes that apply to the answer element record. ○ maxsize: Number. Maximum number of characters allowed in the field. ○ columnName: String. Name of the answer element. • domain: String. Domain in which the decision table is visible. • answerType: String. Used for internal purposes. • questions: Array. Decision records from the Decision [sys_decision_question] table associated with the decision table. Decision records contain these key-value pairs. ○ defaultAnswer: Boolean. True if this decision is the default for the decision table; otherwise false. ○ condition: String. Conditions required to reach this decision. The fields available for the condition are the decision inputs that are associated with this decision table. ○ answer: Object. Answer record associated with the decision. Answer objects contain these key-value pairs. ▪ answerElementValues: Array. Answer element values associated with the answer record. Each record contains these key-value pairs: ▪ answerElementName: String. Name of the answer element. ▪ label: String. Answer record label. ▪ table: String. Table of the answer element if the answer element is a Reference type. ▪ type: String. Type of the answer element. ▪ valid: Boolean. True if the record exists in the system; otherwise false. ▪ value: String. Value of the answer element. ▪ label: String. Answer record label. ▪ multipleAnswerRecord: Boolean. True if this is a multiple answer record; otherwise false. ▪ valid: Boolean. True if the record exists in the system; otherwise false. ▪ value: String. Sys_id of the answer record. ▪ table: String. Table containing the answer record. ○ decisionTable: String. Sys_id of the decision table from the Decision Tables [sys_decision] table associated with the decision. ○ domain: String. Domain in which the decision is visible. ○ active: Boolean. True if the decision record is active; otherwise false.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ id: String. Sys_id of the decision record from the Decision [sys_decision_question] table. ○ label: String. Label for the decision record. ○ order: Number. Order in which the system evaluates decisions. • accessibleFrom: String. Scopes that have access to the record. • name: String. Internal name of the decision table record. • active: Boolean. True if the decision table record is active; otherwise false. • multipleAnswerSupported: Boolean. True if the decision table support multiple answers; otherwise false. • id: String. Sys_id of the decision table record. • label: String. Label of the decision table record. • answerTable: Object. Answer table associated with the decision table. ○ displayValue: String. Display name of the table that contains answer records. ○ value: String. Internal name of the table that contains answer records. • conditions: Array. Conditions in the Decision [sys_decision_question_list] table. Applicable only for decision tables created or edited in Decision Builder. Each entry contains the following key value pairs. ○ decisionInput: String. Sys_id of the corresponding decision input. Listed in the Decision Inputs [sys_decision_input] table. ○ sysId: String. Sys_id of the condition record. ○ defaultOperator: String. Default operator for the condition. ○ typeName: String. Name of the condition type. ○ description: String. Description of the condition. ○ label: String. Label of the condition. ○ type: String. Sys_id of the condition type. ○ reference: String. Reference table used if the condition type is reference. ○ field: String. Field of the condition if the condition is dot-walked from an input of type reference. ○ decisionTable: String. Sys_id of the decision table from the Decision Tables [sys_decision] table. ○ fieldLabel: String. Field label of the condition if the condition is dot-walked from an input of type reference. ○ scope: String. Scope of the condition. ○ domain: String. Domain in which the condition is visible. ○ typeLabel: String. Label of the condition type. ○ fieldParentTable: Table name of the condition field. Value returns if the condition is dot-walked to a non-reference field from a reference input. ○ order: Number. Order of the condition.

DecisionTableAPI - getAnswers(String decisionID)

Returns the answers associated with the specified decision table. An answer is a record on any table associated with a Decision [sys_decision_question] record.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the Decision Table record from the Decision Tables [sys_decision] table.

Returns

Type	Description
Object	Answer records associated with the decision table. Each record contains these key-value pairs:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• answerElementValues: Array. Answer element values associated with the answer record. Each record contains these key-value pairs:
	  ○ answerElementName: String. Name of the answer element.
	  ○ label: String. Answer record label.
	  ○ table: String. Table of the answer element if the answer element is a Reference type.
	  ○ type: String. Type of the answer element.
	  ○ valid: Boolean. True if the record exists in the system; otherwise false.
	  ○ value: String. Value of the answer element.
	• label: String. Answer record label.
	• multipleAnswerRecord: Boolean. True if this is a multiple answer record; otherwise false.
	• valid: Boolean. True if the record exists in the system; otherwise false.
	• value: String. Sys_id of the answer record.
	• table: String. Table containing the answer record.
	
	Format: JSON

```
var dt = new sn_dt.DecisionTableAPI();
var response =
 dt.getAnswers("3c4464a7b701230034d1da23ee11a993");
gs.info(JSON.stringify(response));
```

Output:

```
{
 "result": [
  {
   "answerElementValues": [
    {
     "valid": true,
     "answerElementName": "u_user",
     "label": "Abel Tuter",
     "value": "62826bf03710200044e0bfc8bcbe5df1",
     "table": "sys_user"
   }],
  "valid": true,
  "multipleAnswerRecord": true,
  "label": "User: Abel Tuter",
  "value": "76e19cd953d7011097a3ddeeff7b122c",
  "table": "sys_decision_multi_result"
  },
 ]
}
```

DecisionTableAPI - getDecision(String decisionID, Map inputs)

Evaluates a decision table based on the provided inputs and returns an answer. If no inputs are provided, returns the first default answer found.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the Decision Table record from the Decision Tables [sys_decision] table.
inputs	Map	Optional. Input values for the Decision Inputs [sys_decision_input] table associated with the provided decision table. Use the value of the **Column name** field as the key. The data type of the value must match the Decision Input **Type** field. If no inputs are provided, returns the first default answer found. **Note:** All inputs and column names must follow the following format: • be all lower case and prefixed with a `u_` • blank spaces are replaced with `_` For example, • Input name: Incident • Input technical name: u_incident • Result column name: Assignment Group • Result column technical name: u_assignment_group For more information, see Make Decisions from JavaScript with the DecisionTableAPI - Workflow Automation CoE

Returns

Type	Description
GlideRecord	The correctly evaluated Answer record associated with the decision table. An answer record is a record from the table defined in the Decision [sys_decision_question] record **Answer table** field. • If no inputs are provided, returns the first default answer found. If no default or correctly evaluated answers are found, returns an error. • If the decision table supports multiple answers, each answer is listed in the *`result_elements`* field.

```
var dt = new sn_dt.DecisionTableAPI();
var inputs = new Object();
inputs['u_age'] = 25;
var response =
 dt.getDecision('26eea7a9dba07300efc65404ce961961', inputs);
var user = response.result_elements.u_user;
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DecisionTableAPI - getDecisions(String decisionID, Map inputs)

Evaluates a decision table based on the provided inputs and returns all correctly evaluated answers. If no inputs are provided, returns all default answers.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the Decision Table record from the Decision Tables [sys_decision] table.
inputs	Map	Optional. Input values for the Decision Inputs [sys_decision_input] table associated with the provided decision table. If no inputs are provided, returns all default answers. **Note:** All inputs and column names must follow the following format: • be all lower case and prefixed with a `u_` • blank spaces are replaced with `_` For example, • Input name: Incident • Input technical name: u_incident • Result column name: Assignment Group • Result column technical name: u_assignment_group For more information, see Make Decisions from JavaScript with the DecisionTableAPI - Workflow Automation CoE

Returns

Type	Description
Array	List of answer records in GlideRecord format. An answer record is a record on any table associated with a Decision [sys_decision_question] record. • If no inputs are provided, returns all default answers. • If no default or correctly evaluated answers are found, returns an error. • If the decision table supports multiple answers, each answer is listed in the *result_elements* field.

```
var dt = new sn_dt.DecisionTableAPI();
var input = new Object();
input['u_age'] = 25;
var response =
 dt.getDecisions('5b06ce5db701230034d1da23ee11a965', input);
var firstRecord = response[0];
var user = firstRecord.result_elements.u_user;
```

DecisionTableAPI - getDecisionTable(String decisionID)

Returns a single decision table from the Decision Tables [sys_decision] table.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the Decision Table record from the Decision Tables [sys_decision] table.

Returns

Type	Description

Object	Decision table from the Decision Tables [sys_decision] table. Each decision table contains these key-value pairs.
	• distinctAnswers: Array. Answer records associated with the decision table. Each record contains these key-value pairs.
	  ○ answerElementValues: Array. Answer element values associated with the answer record. Each record contains these key-value pairs:
	  ▪ answerElementName: String. Name of the answer element.
	  ▪ label: String. Answer record label.
	  ▪ table: String. Table of the answer element if the answer element is a Reference type.
	  ▪ type: String. Type of the answer element.
	  ▪ valid: Boolean. True if the record exists in the system; otherwise false.
	  ▪ value: String. Value of the answer element.
	  ○ label: String. Answer record label.
	  ○ multipleAnswerRecord: Boolean. True if this is a multiple answer record; otherwise false.
	  ○ valid: Boolean. True if the record exists in the system; otherwise false.
	  ○ value: String. Sys_id of the answer record.
	  ○ table: String. Table containing the answer record.
	• referenceQualifier: String. Used for internal purposes.
	• inputs: Array. Decision inputs from the Decision Inputs [sys_decision_input] table associated with the decision table. Each record contains these key-value pairs.
	  ○ searchField: String. Used for internal purposes.
	  ○ defaultValue: String. Default value for the input.
	  ○ show_ref_finder: Boolean. Used for internal purposes.
	  ○ use_dependent: Boolean. Used for internal purposes.
	  ○ type: String. Input data type.
	  ○ mandatory: Boolean. True if the input is mandatory; otherwise false.
	  ○ extended: Boolean. True if the input extends another field; otherwise false.
	  ○ local: Boolean. Used for internal purposes.
	  ○ sys_class_name: String. Used for internal purposes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ reference: String. Reference table used if the input type is reference. ○ dependent_on: String. Field that document ID and choice inputs depend on. ○ data_structure: String. Used for internal purposes. ○ readonly: Boolean. True if the input is read-only; otherwise false. ○ id: String. Sys_id of the input from the Decision Inputs [sys_decision_input] table. ○ type_label: String. Input data type label. ○ table: String. Reference field table if the input type is reference. ○ order: Number. Order in which the system evaluates inputs. ○ ref_qual: String. Condition applied to the reference table. ○ reference_display: String. Used for internal purposes. ○ choiceOption: String. Method for users to see a list of suggested values. ○ label: String. Label of the input record. ○ hint: String. Hint text used to help users understand the input required. ○ name: String. Internal name of the input record. ○ attributes: Array. Field attributes that apply to the input record. ○ maxsize: Number. Maximum number of characters allowed in the field. ○ columnName: String. Name of the input. • answerElements: Array. Answer elements from the Answer elements [sys_decision_multi_result_element] table associated with the decision table. Each record contains these key-value pairs. ○ searchField: String. Used for internal purposes. ○ defaultValue: String. Default value for the answer element. ○ show_ref_finder: Boolean. Used for internal purposes. ○ use_dependent: Boolean. Used for internal purposes. ○ type: String. Answer element data type. ○ mandatory: Boolean. True if the answer element is mandatory; otherwise false. ○ extended: Boolean. True if the answer element extends another field; otherwise false. ○ local: Boolean. Used for internal purposes. ○ sys_class_name: String. Used for internal purposes. ○ reference: String. Reference table used if the answer element type is reference. ○ dependent_on: String. Field that document ID and choice answer elements depend on. ○ data_structure: String. Used for internal purposes. ○ readonly: Boolean. True if the input is read-only; otherwise false. ○ id: String. Sys_id of the input from the Answer elements [sys_decision_multi_result_element] table. ○ type_label: String. Answer element data type label.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ table: String. Reference field table if the answer element type is reference. ○ order: Number. Order of the answer elements. ○ ref_qual: String. Condition applied to the reference table. ○ reference_display: String. Used for internal purposes. ○ comments: Description of the answer element. ○ choiceOption: String. Method for users to see a list of suggested values. ○ label: String. Label of the answer element record. ○ hint: String. Hint text used to help users understand the answer element required. ○ name: String. Internal name of the answer element record. ○ attributes: Array. Field attributes that apply to the answer element record. ○ maxsize: Number. Maximum number of characters allowed in the field. ○ columnName: String. Name of the answer element. • domain: String. Domain in which the decision table is visible. • answerType: String. Used for internal purposes. • questions: Array. Decision records from the Decision [sys_decision_question] table associated with the decision table. Decision records contain these key-value pairs. ○ defaultAnswer: Boolean. True if this decision is the default for the decision table; otherwise false. ○ condition: String. Conditions required to reach this decision. The fields available for the condition are the decision inputs that are associated with this decision table. ○ answer: Object. Answer record associated with the decision. Answer objects contain these key-value pairs. ▪ answerElementValues: Array. Answer element values associated with the answer record. Each record contains these key-value pairs: ▪ answerElementName: String. Name of the answer element. ▪ label: String. Answer record label. ▪ table: String. Table of the answer element if the answer element is a Reference type. ▪ type: String. Type of the answer element. ▪ valid: Boolean. True if the record exists in the system; otherwise false. ▪ value: String. Value of the answer element. ▪ label: String. Answer record label. ▪ multipleAnswerRecord: Boolean. True if this is a multiple answer record; otherwise false. ▪ valid: Boolean. True if the record exists in the system; otherwise false. ▪ value: String. Sys_id of the answer record. ▪ table: String. Table containing the answer record.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ decisionTable: String. Sys_id of the decision table from the Decision Tables [sys_decision] table associated with the decision. ○ domain: String. Domain in which the decision is visible. ○ active: Boolean. True if the decision record is active; otherwise false. ○ id: String. Sys_id of the decision record from the Decision [sys_decision_question] table. ○ label: String. Label for the decision record. ○ order: Number. Order in which the system evaluates decisions. • accessibleFrom: String. Scopes that have access to the record. • name: String. Internal name of the decision table record. • active: Boolean. True if the decision table record is active; otherwise false. • multipleAnswerSupported: Boolean. True if the decision table support multiple answers; otherwise false. • id: String. Sys_id of the decision table record. • label: String. Label of the decision table record. • answerTable: Object. Answer table associated with the decision table. ○ displayValue: String. Display name of the table that contains answer records. ○ value: String. Internal name of the table that contains answer records. • conditions: Array. Conditions in the Decision [sys_decision_question_list] table. Applicable only for decision tables created or edited in Decision Builder. Each entry contains the following key value pairs. ○ decisionInput: String. Sys_id of the corresponding decision input. Listed in the Decision Inputs [sys_decision_input] table. ○ sysId: String. Sys_id of the condition record. ○ defaultOperator: String. Default operator for the condition. ○ typeName: String. Name of the condition type. ○ description: String. Description of the condition. ○ label: String. Label of the condition. ○ type: String. Sys_id of the condition type. ○ reference: String. Reference table used if the condition type is reference. ○ field: String. Field of the condition if the condition is dot-walked from an input of type reference. ○ decisionTable: String. Sys_id of the decision table from the Decision Tables [sys_decision] table. ○ fieldLabel: String. Field label of the condition if the condition is dot-walked from an input of type reference. ○ scope: String. Scope of the condition. ○ domain: String. Domain in which the condition is visible. ○ typeLabel: String. Label of the condition type.

DecisionTableAPI - getInputs(String decisionID)

Returns the decision inputs from the Decision Inputs [sys_decision_input] table associated with the passed in decision table.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the Decision Table record from the Decision Tables [sys_decision] table.

Returns

Type	Description
Object	Decision inputs from the Decision Inputs [sys_decision_input] table associated with the decision table. You can find the inputs associated with a decision table using the Decision Inputs related list in the Decision Tables [sys_decision] table. Inputs contain these key-value pairs. • searchField: String. Used for internal purposes. • defaultValue: String. Default value for the input. • show_ref_finder: Boolean. Used for internal purposes. • use_dependent: Boolean. Used for internal purposes. • type: String. Input data type. • mandatory: Boolean. True if the input is mandatory; otherwise false. • extended: Boolean. True if the input extends another field; otherwise false.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• local: Boolean. Used for internal purposes. • sys_class_name: String. Used for internal purposes. • reference: String. Reference table used if the input type is reference. • dependent_on: String. Field that document ID and choice inputs depend on. • data_structure: String. Used for internal purposes. • readonly: Boolean. True if the input is read-only; otherwise false. • id: String. Sys_id of the input from the Decision Inputs [sys_decision_input] table. • type_label: String. Input data type label. • table: String. Reference field table if the input type is reference. • order: Number. Order in which the system evaluates inputs. • ref_qual: String. Condition applied to the reference table. • reference_display: String. Used for internal purposes. • choiceOption: String. Method for users to see a list of suggested values. • label: String. Label of the input record. • hint: String. Hint text used to help users understand the input required. • name: String. Internal name of the input record. • attributes: Array. Field attributes that apply to the input record. • maxsize: Number. Maximum number of characters allowed in the field. • columnName: String. Name of the input. Format: JSON

```
var dt = new sn_dt.DecisionTableAPI();
var response = dt.getInputs("3c4464a7b701230034d1da23ee11a993");
gs.info(JSON.stringify(response));
```

Output:

```
{"result": [{
  "searchField": "number",
  "defaultValue": "",
  "show_ref_finder": false,
  "use_dependent": false,
  "type": "reference",
  "mandatory": false,

```

DecisionTableAPI - getQuestions(String decisionID)

Returns the decisions from the Decision [sys_decision_question] table associated with the passed in decision table.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the Decision Table record from the Decision Tables [sys_decision] table.

Returns

Type	Description

Object	Decisions from the Decision [sys_decision_question] table associated with the decision table. You can find the decisions associated with a decision table using the Decisions related list in the Decision Tables [sys_decision] table. Decision records contain these key-value pairs.
	• defaultAnswer: Boolean. True if this decision is the default for the decision table; otherwise false.
	• condition: String. Conditions required to reach this decision. The fields available for the condition are the decision inputs that are associated with this decision table.
	• answer: Object. Answer record associated with the decision. Answer objects contain these key-value pairs.
	  ○ answerElementValues: Array. Answer element values associated with the answer record. Each record contains these key-value pairs:
	  ▪ answerElementName: String. Name of the answer element.
	  ▪ label: String. Answer record label.
	  ▪ table: String. Table of the answer element if the answer element is a Reference type.
	  ▪ type: String. Type of the answer element.
	  ▪ valid: Boolean. True if the record exists in the system; otherwise false.
	  ▪ value: String. Value of the answer element.
	  ○ label: String. Answer record label.
	  ○ multipleAnswerRecord: Boolean. True if this is a multiple answer record; otherwise false.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ valid: Boolean. True if the record exists in the system; otherwise false. ○ value: String. Sys_id of the answer record. ○ table: String. Table containing the answer record. • decisionTable: String. Sys_id of the decision table from the Decision Tables [sys_decision] table associated with the decision. • domain: String. Domain in which the decision is visible. • active: Boolean. True if the decision record is active; otherwise false. • id: String. Sys_id of the decision record from the Decision [sys_decision_question] table. • label: String. Label for the decision record. • order: Number. Order in which the system evaluates decisions. Format: JSON

```
var dt = new sn_dt.DecisionTableAPI();
var response =
 dt.getQuestions("3c4464a7b701230034d1da23ee11a993");
gs.info(JSON.stringify(response));
```

Output:

```
{"result": [{
  "defaultAnswer": true,
  "condition": "change_request.state=-3^EQ",
  "answer": {
    "valid": true,
    "label": "CAB Approval",
    "value": "45358a5db701230034d1da23ee11a938",
    "table": "chg_approval_def"
  },
  "decisionTable": "3c4464a7b701230034d1da23ee11a993",
  "domain": "global",
  "active": true,
  "state": null,
  "id": "2764a4a7b701230034d1da23ee11a989",
  "label": "Requires CAB Approval",
  "order": 0
}]}
```

DecisionTableAPI - updateAnswerElement(String answerElementID, Object answerElement)

Updates a record in the Result [sys_decision_multi_result_element] table.

Parameters

Name	Type	Description
answerElementID	String	Sys_id of the answer element record. Located in the Result Elements [sys_decision_multi_result_element] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
answerElement	Object	Key-value pairs to update the answer element record. `{ comments: "String", label: "String", maxsize: Number }`
answerElement.comments	String	Optional. Description of the answer element.
answerElement.label	String	Optional. Label of the answer element record.
answerElement.maxsize	Number	Optional. Maximum number of characters allowed in the answer element field. Use this property only if *answerElement.type* is `String`.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "record": GlideRecord, "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.record	GlideRecord reference to the answer element updated in the Result Elements [sys_decision_multi_result_element] table. Data type: GlideRecord

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example updates the label and comments for an answer element.

```
var answerElementID = '51c707803d0b9910f8776a598af91217';
var answerElement = {
   label: 'Product',
   comments: 'hello'
};

var dt = new sn_dt.DecisionTableAPI();
var response = dt.updateAnswerElement(answerElementID,
 answerElement);
gs.info('Status - ' + response.status);
gs.info('Result Element label changed to - ' +
 response.record.getValue('label'));
```

Output:

```
Status - Success
Result Element label changed to - Product
```

DecisionTableAPI - updateChoice (String choiceID, Object choice)

Updates a record in the Choices [sys_choice] table.

Parameters

Name	Type	Description
choiceID	String	Sys_id of the choice record. Located in the Choices [sys_choice] table.
choice	Object	Key-value pairs to update the choice record. `{ label: "String", order: Number, value: "String" }`
choice.label	String	Optional. Label of the choice.
choice.order	Number	Optional. Order of the choice.
choice.value	String	Optional. Value of the choice.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "record": GlideRecord, "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.record	GlideRecord reference to the choice updated in the Choices [sys_choice] table. Data type: GlideRecord
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example updates the label, value, and order for a choice.

```
var choiceID = '4532db883d0b9910f8776a598af912e7';
var choices = {
   label: 'Delhi',
   value: 'del',
   order: 50
};

var dt = new sn_dt.DecisionTableAPI();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var response = dt.updateChoice(choiceID, choices);
gs.info('Status - ' + response.status);
```

Output:

```
Status - Success
```

DecisionTableAPI - updateCondition(String conditionID, Object condition)

Updates a record in the Decision Conditions [sn_decision_table_decision_condition] table.

Parameters

Name	Type	Description
conditionID	String	Sys_id of the decision condition record. Located in the Decision Conditions [sn_decision_table_decision_condition] table.
condition	Object	Key-value pairs to update the decision condition record. `{ defaultOperator: "String", description: "String", label: "String" }`
condition.defaultOperator	String	Optional. Default operator for the condition. For a list of valid operators, see Operators available for filters and queries.
condition.description	String	Optional. Description of the condition.
condition.label	String	Optional. Label of the decision condition record.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "record": GlideRecord, "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.record	GlideRecord reference to the decision condition updated in the Decision Conditions [sn_decision_table_decision_condition] table. Data type: GlideRecord
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example updates a decision condition.

```
var conditionID = 'c9530f4c3dc79910f8776a598af912f1';
var condition = {
   defaultOperator: '!=',
   label: 'Active Incident',
   description: 'Check if the incident is active'
};

var dt = new sn_dt.DecisionTableAPI();
var response = dt.updateCondition(conditionID, condition);
gs.info('Status - ' + response.status);
gs.info('Condition label changed to - ' +
 response.record.getValue('label'));
```

Output:

```
Status - Success
Condition label changed to - Active Incident
```

DecisionTableAPI - updateDecisionTable(String decisionID, Object decisionTable)

Updates a record in the Decision Tables [sys_decision] table.

Parameters

Name	Type	Description
decisionID	String	Sys_id of the decision table record. Located in the Decision Tables [sys_decision] table.
decisionTable	Object	Key-value pairs to update the decision table record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>{
		  "accessibleFrom": "String",
		  "name": "String"
		}</pre>

decisionTable.accessibleFrom	String	Optional. Scopes that have access to the decision table record. Valid values: • package_private • public
decisionTable.name	String	Optional. Name of the decision table.

Returns

Type	Description

Object	Object with information about the status of the API request.
	<pre>{
	  "errors": [Array],
	  "record": GlideRecord,
	  "status": "String"
	}</pre>

<Object>.errors	Error information.
	
	Data type: Array
	<pre>"errors": [
	  {
	  "message": "String",
	  "type": "String
	  }
	]</pre>

<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.record	GlideRecord reference to the decision table updated in the Decision Tables [sys_decision] table. Data type: GlideRecord
<Object>.status	Status of the API request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Possible values: • Success • Failure Data type: String

This example updates a decision table.

```
var decisionID = 'a1f6e14c3d039910f8776a598af9129d';
var decisionTable = {
   name: 'Emergency Change Request',
   accessibleFrom: 'public',
};

var dt = new sn_dt.DecisionTableAPI();
var response = dt.updateDecisionTable(decisionID,
 decisionTable);
gs.info('Status -' + response.status);
gs.info('Decision Table sys id - ' +
 response.record.getValue('sys_id'));
```

Output:

```
Status - Success
Decision Table sys id - a1f6e14c3d039910f8776a598af9129d
```

DecisionTableAPI - updateInput(String inputID, Object input)

Updates a record in the Decision Inputs [sys_decision_input] table.

Parameters

Name	Type	Description
inputID	String	Sys_id of the decision input record. Located in the Decision Inputs [sys_decision_input] table.
input	Object	Key-value pairs to update a decision input record. `{ active: Boolean, defaultValue: "String", label: "String", mandatory: Boolean, maxsize: Number, order: Number, readonly: Boolean }`
input.active	Boolean	Optional. Flag that indicates whether the decision input record is active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • true: The decision input record is active. • false: The decision input record is not active.
input.defaultValue	String	Optional. Default value for the input.
input.label	String	Optional. Label of the decision input record.
input.mandatory	Boolean	Optional. Flag that indicates whether the input is mandatory. Valid values: • true: The input is mandatory. • false: The input is not mandatory.
input.maxsize	Number	Optional. Maximum number of characters allowed in the input field. Use this property only if *input.type* is `String`.
input.order	Number	Optional. Order of the input.
input.readonly	Boolean	Optional. Flag that indicates whether the input is read-only. Valid values: • true: The input is read-only. • false: The input is not read-only.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "record": GlideRecord, "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.record	GlideRecord reference to the decision input updated in the Decision Inputs [sys_decision_input] table. Data type: GlideRecord
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example updates a decision input.

```
var inputID = 'e862f1803dc39910f8776a598af912da';
var input = {
   label: 'Item name',
   defaultValue: 'Apple',
   maxsize: 100,
};

var dt = new sn_dt.DecisionTableAPI();
var response = dt.updateInput(inputID, input);
gs.info(JSON.stringify(response));
gs.info('Status - ' + response.status);
gs.info('Input label changed to - ' +
 response.record.getValue('label'));
```

Output:

```
Status - Success
Input label changed to - Item name
```

DecisionTableAPI - updateQuestion(String questionID, Object question)

Updates a record in the Decisions [sys_decision_question] table.

Parameters

Name	Type	Description
questionID	String	Sys_id of the question record. Located in the Decisions [sys_decision_question] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
question	Object	Key-value pairs to update the question record. `{ active: Boolean, answer: [Array], condition: "String", defaultAnswer: Boolean, label: "String", order: Number }`
question.active	Boolean	Optional. Flag that indicates whether the question record is active. Valid values: • true: The question record is active. • false: The question record is not active.
question.answer	Array	Optional. Array of possible answers to the question. For a single result table, the array can only have one object. For a multi-result table, the array can have multiple objects. `[ { name: "String", value: "String" } ]`
question.answer.name	String	Optional. Name of the answer element. Located in the Result Elements [sys_decision_multi_result_element] table.
question.answer.value	String	Optional. Value of the answer element. Located in the Result Elements [sys_decision_multi_result_element] table.
question.condition	String	Optional. Conditions required to reach this question. The fields available for the conditions are the decision inputs that are associated with the decision table. For more information about creating conditions, see Operators available for filters and queries.
question.defaultAnswer	Boolean	Optional. Flag that indicates whether this question is the default question for the decision table. Valid values: • true: The question is the default question. • false: The question is not the default question.
question.label	String	Optional. Label of the question record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
question.order	Number	Optional. Order of the question.

Returns

Type	Description
Object	Object with information about the status of the API request. `{ "errors": [Array], "record": GlideRecord, "status": "String" }`
<Object>.errors	Error information. Data type: Array `"errors": [ { "message": "String", "type": "String } ]`
<Object>.errors.message	Error message. Data type: String
<Object>.errors.type	Type of error. Possible value: INTERNAL_ERROR Data type: String
<Object>.record	GlideRecord reference to the question updated in the Decisions [sys_decision_question] table. Data type: GlideRecord
<Object>.status	Status of the API request. Possible values: • Success • Failure Data type: String

This example updates a question record.

```
var questionId = '70381fcc3d0b9910f8776a598af91219';
var questions = {
   condition: 'u_item=Laptop^u_price>1800^EQ',
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   answer:[
      {
         name: 'u_discount',
         value: '40',
      },
      {
         name: 'u_seller',
         value: '02826bf03710200044e0bfc8bcbe5d64',
      },
   ],
   active: true,
   order: 3000
};

var dt = new sn_dt.DecisionTableAPI();
var response = dt.updateQuestion(questionId, questions);
gs.info('Status - ' + response.status);
```

Output:

```
Status - Success
```

DevOpsOrchestrationToolIntegrationHandler - Scoped

The *DevOpsOrchestrationToolIntegrationHandler* API enables processing of payloads from custom DevOps tools.

A custom DevOps tool is any tool that doesn't have an integration with DevOps. For a list of tools that have DevOps integrations, see DevOps Change Velocity integrations.

This API enables the processing of payloads that are used by the REST endpoint DevOps - POST /devops/tool/{capability}. You must implement the methods of this API in a script include before calling the *POST /devops/tool/{capability}* endpoint.

This API executes in the `sn_devops` namespace. For more information about DevOps, see DevOps Config.

DevOpsOrchestrationToolIntegrationHandler - getNativeIdForOrchestrationTask(Object payload)

Returns the value of the *orchestrationTaskName* parameter from the payload for the *POST /devops/tool/{capability}* endpoint.

You must implement this method in a script include before calling the REST endpoint DevOps - POST /devops/tool/{capability}.

Parameters

Name	Type	Description
payload	Object	Payload containing data from the custom tool which is accepted by the REST endpoint *POST /devops/tool/{capability}*, where *capability* is `orchestration`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Value of the *orchestrationTaskName* parameter from the payload.

In this example, a script include named `DevOpsOrchestrationCustomToolIntegrationHandler` implements the methods *handleTool* and *getNativeIdForOrchestrationTask*. The *getNativeIdForOrchestrationTask* method is implemented to return the value of the *orchestrationTaskName* parameter from the payload for POST /devops/tool/{capability}.

```
var DevOpsOrchestrationCustomToolIntegrationHandler =
 Class.create();

DevOpsOrchestrationCustomToolIntegrationHandler.prototype = {

    handleTool: function(toolName) {
        if (!gs.nil(toolName) && toolName ==
 'sn_devops_custom_tool')
            return true;
        return false;
    },

    getNativeIdForOrchestrationTask: function(payload) {
        return payload.orchestrationTaskName;
    },

    type: 'DevOpsOrchestrationCustomToolIntegrationHandler'

};
```

DevOpsOrchestrationToolIntegrationHandler - handleTool(String toolName)

Checks if this handler is valid for the specified tool.

You must implement this method in a script include before calling DevOps - POST /devops/tool/{capability}.

Parameters

Name	Type	Description
toolName	String	Name of the tool. Located in the **Tool Name** field in the DevOps Tool Integration [sn_devops_tool_integration] table.

Returns

Type	Description
Boolean	Flag that indicates whether this handler is valid for the specified tool. Possible values: • true: This handler can be used for the specified tool. • false: This handler can't be used for the specified tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this example, a script include named `DevOpsOrchestrationCustomToolIntegrationHandler` implements the methods *`handleTool`* and *`getNativeIdForOrchestrationTask`*. The *`handleTool`* method is implemented to check that the passed in name is for the correct tool. Replace `'sn_devops_custom_tool'` with the name of the tool that you're using.

```
var DevOpsOrchestrationCustomToolIntegrationHandler =
 Class.create();

DevOpsOrchestrationCustomToolIntegrationHandler.prototype = {

    handleTool: function(toolName) {
        if (!gs.nil(toolName) && toolName ==
 'sn_devops_custom_tool')
            return true;
        return false;
    },

    getNativeIdForOrchestrationTask: function(payload) {
        return payload.orchestrationTaskName;
    },

    type: 'DevOpsOrchestrationCustomToolIntegrationHandler'

};
```

DiscoveryAPI - Scoped

The *`DiscoveryAPI`* class provides methods that launch a quick discovery of a single IPv4 address and return summaries of previously launched discovery statuses for a single configuration item (CI) or for all scanned CIs.

This class runs is in the `sn_discovery` namespace.

DiscoveryAPI - discoverIpAddress(String ipAddress, String application, String source)

Discovers a specified IPv4 address.

A MID Server is selected automatically, based on the IP address provided or the application specified.

Parameters

Name	Type	Description
application	String	Optional. Application configured for the MID Server. To define a *`source`* parameter but not an *`application`* parameter, use "NULL" as the place holder. Default: Discovery
ipAddress	String	IP address to discover.
source	String	Optional. Source of the Discovery. This same value appears in the optional **Source** field in the Discovery Status record, which indicates how the Discovery was triggered. Default: Discovery_API

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Discovery status record sys_id. The following exceptions can be thrown during MID Server selection: • *NoSuitableMidServerFoundException*: `No appropriate MID Server available for this Discovery` • *BadArgumentException*: `Invalid argument detected during MID Server selection`

```
var sysid =
 sn_discovery.DiscoveryAPI.discoverIpAddress("11.23.125.39");
```

DiscoveryAPI - reportCiIpAddressStatus(Object ipAddress, Object discoveryStatusSysId)

Used to return a summary of a configuration item's Discovery status given the specific status sys_id and IPv4 address.

The following exceptions can be thrown:

- *DiscoveryStatusNotFoundException*: `Displays this message: Discovery Status with sys id '`<invalid value>`' does not exist`
- *DiscoveryDeviceHistoryNotFoundException*: `Device History with Discovery Status sys id '`<invalid value>`' and ipAddress '`<invalid value>`' does not exist`
- *IllegalArgumentException* (invalid input arguments): This argument exception prevents input values from being null.
  - `Discovery Status sys id can not be null`
  - `ipAddress can not be null`
- *IllegalArgumentException* (values stored in database): This argument exception prevents erroneous data from being returned to the caller in the case of bad attribute values.
  - `Discovery Status 'state' property can not be null`
  - `Device history 'source' property can not be null`
  - `Device history 'issues' property is not an integer: `<invalid value>
  - `Device history 'issues' property can not be less than 0: `<invalid value>

Parameters

Name	Type	Description
ipAddress	string	The IPv4 address that was scanned.
discoveryStatusSysId	string	The sys_id of the Discovery status record for the IP address that was scanned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
array	JavaScript array of immutable ReportCiStatusOutputJS objects.

```
var ipResultObj =
 sn_discovery.DiscoveryAPI.reportCiIpAddressStatus(ipAddress,
 discoveryStatus);
```

DiscoveryAPI - reportCiStatus(Object discoveryStatusSysId)

Used to return a summary of a CI Discovery status given a specific Discovery Status sys_id.

The following exceptions can be thrown:

- *DiscoveryStatusNotFoundException*: `Discovery Status with sys id '<invalid value>' does not exist`
- *DiscoveryDeviceHistoryNotFoundException*: `Device History with Discovery Status sys id '<invalid value>' and ipAddress '<invalid value>' does not exist`
- *IllegalArgumentException* (invalid input arguments): This argument exception prevents input values from being null.
  - `Discovery Status sys id can not be null`
  - `ipAddress can not be null`
- *IllegalArgumentException* (values stored in database): This argument exception imposes post conditions on database access values.
  - `Discovery Status 'state' property can not be null`
  - `Device history 'source' property can not be null`
  - `Device history 'issues' property is not an integer: <invalid value>`
  - `Device history 'issues' property can not be less than 0: <invalid value>`

Parameters

Name	Type	Description
sys_id	string	The sys_id of a Discovery status record.

Returns

Type	Description
array	JavaScript array of immutable ReportCiStatusOutputJS objects.

```
var ipResultObjArray =
 sn_discovery.DiscoveryAPI.reportCiStatus(discoveryStatus);
for(var idx=0; idx < ipResultObjArray.length; idx++) {
var ipResultObj = ipResultObjArray[idx];
```

Document - Scoped, Global

The *Document* API provides methods to initialize a PDF, add content, and close the PDF. After adding content, the document can be attached to a target record.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the `sn_pdfgeneratorutils` namespace. The plugin is activated by default.

This API depends on the a suite of classes to build various elements comprising a PDF.

- Cell – Creates a Cell object as a cell in a table. You can use this API to format the cell and include additional blocks, such as paragraphs and images.
- Color – Creates a Color object used to define color attributes that you can apply to elements in a PDF; such as cells, tables, and lines.
- Image – Creates an Image object representing an image and its layout insert in a PDF. Enables defining attributes such as scale, alignment, and border color.
- Line – Creates a Line object using methods to draw a line in a PDF.
- Paragraph – Creates a Paragraph object representing a block of text in a PDF.
- PdfPage – Creates a PdfPage object representing a PDF page and its attributes; such as size, width, and color.
- Style – Creates a style for defining properties such font size, border, and alignment. You can apply the same style to multiple objects simultaneously.
- Table – Creates a Table object to add to a PDF document. Defines the data to use in each cell and sets styles, margins, and alignment.

The following example shows how to create a basic PDF using the *Document* API and several components, such as a table, cell, and paragraph. The result is a list of Incidents from the Incident [incident] table listed in a PDF. You can test this example in your instance if you replace `<sys_id>` with the sys_id of an incident record.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var whiteColor =  sn_pdfgeneratorutils.Color([1,1,1]);
var greyColor =  sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
var headerBgColor = new
 sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

// Query the Incident table
var gr = new GlideRecord("incident");
gr.query();

// declare table by providing width array and Boolean for large
 table
var table = new sn_pdfgeneratorutils.Table(true, [70,200],
 false);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
table.setHeaderStyle(headerStyle);

var nParagraph = new sn_pdfgeneratorutils.Paragraph("Number");
var sParagraph = new sn_pdfgeneratorutils.Paragraph("Short
 Description");

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;

hdrCell1.addParagraph(nParagraph);
hdrCell2.addParagraph(sParagraph);

table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);

var row = 0;

while(gr.next()) {
var numCell = new sn_pdfgeneratorutils.Cell;
var sdCell = new sn_pdfgeneratorutils.Cell;

var numberParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.number);
var sdParagraph = new
 sn_pdfgeneratorutils.Paragraph(gr.short_description);

numCell.addParagraph(numberParagraph);
sdCell.addParagraph(sdParagraph);

if (row % 2 == 1) {
     table.setDefaultbackGroundColor(greyColor);
} else {
     table.setDefaultbackGroundColor(whiteColor);
}

table.addCell(numCell);
table.addCell(sdCell);

row = row + 1;
}

document.addTable(table);
document.saveAsAttachment("incident", "<sys_id>",
 "SampleGenerationTest.pdf");
```

The PDF attachment is listed in the Attachments [sys_attachment] table.

Number	Short Description
INC0000060	Unable to connect to email
INC0009002	My computer is not detecting the headphone device
INC0000009	Reset my password
INC0000010	Need Oracle 10GR2 installed
INC0000011	Need new Blackberry set up
INC0000012	Customer didn't receive eFax
INC0000013	EMAIL is slow when an attachment is involved
INC0000014	Missing my home directory
INC0000021	New employee hire
INC0000024	Issue with a web page on wiki
INC0000026	Seem to have an issue with my hard drive...
INC0000028	My disk is still having issues. Can't delete a file
INC0000030	Lost connection to the wireless network
INC0000032	EMAIL Server Down Again
INC0000033	File Server is 80% full - Needs upgrade
INC0000034	Does not look like a backup occurred last night
INC0000035	Reset my password
INC0000036	Issue with networking

Document - Document(PdfPage pageSize)

Instantiates a *Document* object and generates a PDF document.

Parameters

Name	Type	Description
pageSize	PdfPage	PDF page size.

Returns

Type	Description
Object	PDF document.

The following example shows how to create a *Document* object and return a PDF.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document(pageSize);
```

Document – addAndStartNewPage()

Adds a page to the document by terminating the current page and creating a new one.

Additional methods for adding a new page in a document:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- addNewPage() – Adds a new blank page to the document. Use to force a page break to start a new chapter or section in your document.
- addNewPageAtIndex() – Adds a new page at the specified index of the document. For example, setting the index to 6 inserts a page six or inserts the page at the position of the existing page six in a document. The original page six becomes page seven.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to add a new page to a document. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var para1 = new sn_pdfgeneratorutils.Paragraph("This text lands
 on the first page.");
var para2 = new sn_pdfgeneratorutils.Paragraph("This text lands
 on the new page.");

document.addParagraph(para1);

document.addAndStartNewPage();

document.addParagraph(para2);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>",
 "newPage.pdf");
```

Document – addAuthor(String author)

Adds a name to the author field in PDF document properties.

Parameters

Name	Type	Description
author	String	Name of the document's author.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to add a name to the author field in PDF document properties. For a document usage example, see Document API.

```
var author = "John Do";

document.addAuthor(author);
```

Document – addImage(Image image)

Adds an image to a document.

Parameters

Name	Type	Description
image	Image	Image to add to a document.

Returns

Type	Description
None	

The following example shows how to add an image to a document. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare image using sys attachment
var image = new
 sn_pdfgeneratorutils.Image("<imgAttachment_sys_id>");

// add the image to the doc
document.addImage(image);

document.saveAsAttachment("incident", "<record_sys_id>",
 "docWithImage.pdf");
```

Document – addNewLine()

Adds a new empty line to the document.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to add a new line to a document. For a document usage example, see Document API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");

var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

document.addNewLine();
```

Document – addNewPage()

Adds a new blank page to the document. Use to force a page break to start a new chapter or section in your document.

Additional methods for adding a new page in a document:

- addAndStartNewPage()– Adds a page to the document by terminating the current page and creating a new one.
- addNewPageAtIndex() – Adds a new page at the specified index of the document. For example, setting the index to 6 inserts a page six or inserts the page at the position of the existing page six in a document. The original page six becomes page seven.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to add a new blank page to a document. For a document usage example, see Document API.

```
Usage:
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

document.addNewPage();
```

Document – addNewPageAtIndex(Number index)

Adds a new page at the specified index of the document. For example, setting the index to 6 inserts a page six or inserts the page at the position of the existing page six in a document. The original page six becomes page seven.

Additional methods for adding a new page in a document:

- addAndStartNewPage()– Adds a page to the document by terminating the current page and creating a new one.
- addNewPage() – Adds a new blank page to the document. Use to force a page break to start a new chapter or section in your document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
index	Number	Position at which to insert a new page.

Returns

Type	Description
None	

The following example shows how to add a new PDF page to position 6 of a document. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");

var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var index = 6;

document.addNewPageAtIndex(index);
```

Document – addParagraph(Paragraph paragraph)

Adds a paragraph to a document.

Parameters

Name	Type	Description
paragraph	Paragraph	Block of text provided as a paragraph object.

Returns

Type	Description
None	

The following example shows how to add a paragraph to a document. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var para = "Lorem ipsum dolor sit amet.";

document.addParagraph(para);
```

Document – addTable(Table table)

Adds a table to a document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
table	Table	Table to be inserted into the document.

Returns

Type	Description
None	

The following example shows how to add a table to a document. See the Table API for more details on how to define a table. For a document usage example, see Document API.

```
var table = new sn_pdfgeneratorutils.Table([70,200], false);

document.addTable(table);
```

Document – close()

Closes a document.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to close a document. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

document.close();
```

Document – createDocument(PdfPage pageSize)

Creates a document with the specified page size.

Parameters

Name	Type	Description
pageSize	PdfPage	Document page size.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	PDF document.

The following example shows how to create a document. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");

var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);
```

Document – getPageCount()

Gets the number of pages in the document.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Number of pages in the document.

The following example shows how to get the page count of a nine-page document. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var count = document.getPageCount();

gs.info("The number of pages is " + count);
```

Output:

```
The number of pages is 9
```

Document – getPageSize()

Gets the default page size of the document.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Value of the default page size set using the PdfPage API. Possible values: • A4 – 595 x 842 points • EXECUTIVE – 522 x 756 points • LETTER – 612 x 792 points • LEDGER – 792 x 1224 points

The following example shows how to get the page size of a document. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");

var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var pagesize = document.getPageSize();
```

Document – isClosed()

Indicates whether a document is closed or open.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	Flag that indicates whether a document is open or closed. Valid values: • true: Document is closed. • false: Document is open. Default: true

The following example shows how to get the page size of a document. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");

var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var closed = document.isClosed();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Document – saveAsAttachment(String tableName, String tableSysId, String fileName)

Attaches the document file to the specified target table.

Parameters

Name	Type	Description
tableName	String	Name of the table on which to attach the document.
tableSysId	String	Sys_id of the record on which to attach the document.
fileName	String	Name of the document to attach.

Returns

Type	Description
String	Sys_id of the attached document in the Attachments [sys_attachment] table.

The following example shows how to attach a document to an incident record. For a document usage example, see Document API.

```
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// Additional document properties

document.saveAsAttachment("incident", "<record_sys_id>",
 "SampleDocGeneration.pdf");
```

Document – setBaseDirection(String direction)

Sets the base text flow direction to reorder from based on character recognition

Parameters

Name	Type	Description
direction	String	Text flow direction. Valid values: • LEFT_TO_RIGHT: Order text flow left to right. The text direction is only reordered if left-to-right language characters are detected. • RIGHT_TO_LEFT: Order text flow right to left. The text direction is only reordered if right-to-left language characters are detected. Default: LEFT_TO_RIGHT

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to set text flow left to right. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");

var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

document.setBaseDirection("RIGHT_TO_LEFT");
```

Document – setMargins(Number topMargin, Number rightMargin, Number bottomMargin, Number leftMargin)

Sets the page margin sizes in the document.

Parameters

Name	Type	Description
topMargin	Number	Height of the top margin in points.
rightMargin	Number	Width of the right margin in points.
bottomMargin	Number	Height of the bottom margin in points.
leftMargin	Number	Width of the left margin in points.

Returns

Type	Description
None	

The following example shows how to set page margins in a document. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

document.setMargins(72,36,36,36);
```

DocumentListEntryService - Scoped, Global

The *DocumentListEntryService* API provides methods for maintaining document templates in a document list.

This API requires the Document Management plugin (com.snc.platform_document_management) and is provided within the `sn_doc_services` namespace. For information, see Document Services.

Before using the methods in this API, add a document template with its version and create a document list. Use the SystemDocumentListEntry API to add or remove documents from a document list.

Before using the methods in this API, you must add a document with its default version and create a document list.

- SystemDocument – Define a document object.
- DocumentService – Add, update, or delete a document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- SystemDocumentVersion – Define a document version.
- DocumentVersionService – Add, update, or delete a document version.
- SystemDocumentList – Define a document list.
- DocumentListService – Add, update, or delete a document list.

To define a document as a template:

- Define the document object setting the SystemDocument – template() method to true. Create or update the document record with the methods in the DocumentService API.
- Select the Template check box of a document in the Documents [ds_document] table.

DocumentListEntryService - DocumentListEntryService()

Instantiates a *DocumentListEntryService* object.

Parameters

Name	Type	Description
None		

The following example shows how to instantiate a *DocumentListEntryService* object.

```
var s = new sn_doc_services.DocumentListEntryService();
```

DocumentListEntryService - createDocumentListEntry(SystemDocumentListEntry entry)

Adds a document template entry to a document list.

Parameters

Name	Type	Description
entry	SystemDocumentListEntry	One or more properties representing fields of a document list entry object.

Returns

Type	Description
Object	Sys_id of the new record in the Document List Entries [ds_document_list_entry] table with a success message. Error message otherwise. `{ "message": "String", "request_id": "String", "status": "String" }`
<Object>.message	Message confirming success or error. Data type: String
<Object>.request_id	Sys_id of the record in the Document List Entries [ds_document_list_entry] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - The operation was successful. • failure – The operation was not successful. The *message* provides details. Data type: String

The following example shows how to define a document entry and add it to a document list. See also SystemDocumentListEntry.

```
var docListEntry = new
 sn_doc_services.SystemDocumentListEntry('21afddea2460fc10f877a6
fed1c2b0dd');
docListEntry.document("9acd7fea24587410f877a6fed1c2b060");
docListEntry.description('birth certificate');

var dlEntrySvc = new sn_doc_services.DocumentListEntryService();
gs.info(JSON.stringify(dlEntrySvc.createDocumentListEntry(docLis
tEntry), null, 2));
```

Output:

```
{
  "message": "Create List Entry , List Entry sysId :
 d3f0b13624e8fc10f877a6fed1c2b0d9is successful.",
  "request_id": "d3f0b13624e8fc10f877a6fed1c2b0d9",
  "status": "success"
}
```

DocumentListEntryService - deleteDocumentListEntry(String listEntryId)

Removes a document list entry from the Document List Entries [ds_document_list_entry] table.

Parameters

Name	Type	Description
listEntryId	String	Sys_id of a document list record in the Document List Entries [ds_document_list_entry] table.

Returns

Type	Description

Object	Success or error message.
	`{`
	`  "message": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"status": "String"
	}</pre>

<Object>.message	Message confirming success or error. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - The operation was successful. • failure – The operation was not successful. The *message* provides details. Data type: String

The following example shows how to delete a document list record. See also SystemDocumentList.

```
var listEntryId = 'd3f0b13624e8fc10f877a6fed1c2b0d9';

var dlEntrySvc = new sn_doc_services.DocumentListEntryService();
gs.info(JSON.stringify(dlEntrySvc.deleteDocumentListEntry(listEn
tryId), null, 2));
```

Output:

```
{
  "message": "Deleting an entry for the given
 documentListEntrySysId : d3f0b13624e8fc10f877a6fed1c2b0d9 is
 successful.",
  "status": "success"
}
```

DocumentListEntryService - updateDocumentListEntry(String listEntryId, SystemDocumentListEntry entry)

Updates the field values of an existing document list entry.

Parameters

Name	Type	Description
listEntryId	String	Sys_id of a document list record in the Document List Entries [ds_document_list_entry] table.
entry	SystemDocumentListEntry	One or more properties representing fields of a document list entry object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Success or error message. `{ "message": "String", "request_id": "String", "status": "String" }`
<Object>.message	Message confirming success or error. Data type: String
<Object>.request_id	Sys_id of the record in the Document List Entries [ds_document_list_entry] table. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - The operation was successful. • failure – The operation was not successful. The *message* provides details. Data type: String

The following example shows how to update a document list entry description. See also SystemDocumentListEntry.

```
var listEntryId = 'd3f0b13624e8fc10f877a6fed1c2b0d9';

var entry = new sn_doc_services.SystemDocumentListEntry();
entry.description('description update');

var dlEntrySvc = new sn_doc_services.DocumentListEntryService();
gs.info(JSON.stringify(dlEntrySvc.updateDocumentListEntry(listEntryId, entry), null, 2));
```

Output:

```
{
  "message": "Updating an entry for the given
 documentListEntrySysId : d3f0b13624e8fc10f877a6fed1c2b0d9 is
 successful.",
  "request_id": "d3f0b13624e8fc10f877a6fed1c2b0d9",
  "status": "success"
}
```

DocumentListService - Scoped, Global

The *DocumentListService* API provides methods for creating, deleting, and updating a document list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API requires the Document Management plugin (com.snc.platform_document_management) and is provided within the `sn_doc_services` namespace. For information, see Document Services.

The Document Management plugin also supports creating lists of document templates to associate with your document. For example, a job application requiring multiple documents such as a diploma, ID, or passport. After you add your document list, you can add document templates:

- SystemDocumentListEntry – Define a document template list entry.
- DocumentListEntryService – Add or remove a document template list entry.

To define a document as a template:

- Define the document object setting the SystemDocument – template() method to true. Create or update the document record with the methods in the DocumentService API.
- Select the Template check box of a document in the Documents [ds_document] table.

The following APIs enable you to define and manage documents:

- SystemDocument – Define a document object.
- DocumentService – Add, update, or delete a document.

To define a document as a template:

- Define the document object setting the SystemDocument – template() method to true. Create or update the document record with the methods in the DocumentService API.
- Select the Template check box of a document in the Documents [ds_document] table.

See also SystemDocumentList.

DocumentListService - DocumentListService()

Instantiates a *`DocumentListService`* object.

Parameters

Name	Type	Description
None		

The following example shows how to instantiate a *`DocumentListService`* object. See also SystemDocumentList.

```
var s = new sn_doc_services.DocumentListService();
```

DocumentListService - createDocumentList(SystemDocumentList doc)

Creates a document list in the Document Lists [ds_document_lists] table.

The Document Management plugin also supports creating lists of document templates to associate with your document. For example, a job application requiring multiple documents such as a diploma, ID, or passport. After you add your document list, you can add document templates:

- SystemDocumentListEntry – Define a document template list entry.
- DocumentListEntryService – Add or remove a document template list entry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the createDocumentsFromList() method to create documents from the document template list.

Parameters

Name	Type	Description
doc	SystemDocumentList	One or more properties representing fields of a new record. The name property is required and can be set using the *SystemDocumentList* constructor or *name()* method.

Returns

Type	Description
Object	Sys_id of the new record in the Document Lists [ds_document_lists] table with a success message. Error message otherwise. `{ "message": "String", "request_id": "String", "status": "String" }`
<Object>.message	Message confirming success or error. Data type: String
<Object>.request_id	Sys_id of the record in the Document Lists [ds_document_lists] table. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - The operation was successful. • failure – The operation was not successful. The *message* provides details. Data type: String

The following example shows how to create a document list. See also SystemDocumentList.

```
var dL = new sn_doc_services.SystemDocumentList('My document
 list');

// Define the document list field
dL.description('description');

var docList = new sn_doc_services.DocumentListService();
gs.info(JSON.stringify(docList.createDocumentList(dL), null,
 2));
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "message": "Create List for the given name : My document list,
 List sysId : b2c021a924683c10f877a6fed1c2b0b1 is successful.",
  "request_id": "b2c021a924683c10f877a6fed1c2b0b1",
  "status": "success"
}
```

DocumentListService - createDocumentsFromList(String listSysId, String tableName, String tableSysId)

Creates documents from a list of document templates.

Note: Before using this method, create a document template list using the createDocumentList() method.

Parameters

Name	Type	Description
listSysId	String	Sys_id of a document list record in the Document Lists [ds_document_lists] table.
tableName	String	Name of the table containing the record on which add a list of document template references.
tableSysId	String	Sys_id of the record containing the content from which to add a list of document template references.

Returns

Type	Description
Object	Success or error message. `{ "message": "String", "request_id": "String", "status": "String" }`
<Object>.message	Message containing the number of document templates in the document list. Data type: String
<Object>.request_id	Sys_id of the record in the Document Lists [ds_document_lists] table. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - The operation was successful. • failure – The operation was not successful. The *message* provides details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String

The following example shows how add a list of document template references to a record. The documentation is added to a record in the Incidents [incident] table.

```
var result = new
 sn_doc_services.DocumentListService().createDocumentsFromList('
21afddea2460fc10f877a6fed1c2b0dd', 'incident',
 'd7158da0c0a8016700eef46c8d1f3661');
gs.info(JSON.stringify(result, null, 2));
```

Output:

```
{
  "message": "Created 1 document references for the given table
 name: incident, table sysId : d7158da0c0a8016700eef46c8d1f3661
 with list SysId 21afddea2460fc10f877a6fed1c2b0dd",
  "request_id": "21afddea2460fc10f877a6fed1c2b0dd",
  "status": "success"
}
```

DocumentListService - deleteDocumentList(String listSysId)

Removes a document record from the Document Lists [ds_document_lists] table.

Parameters

Name	Type	Description
listSysId	String	Sys_id of a document list record in the Document Lists [ds_document_lists] table.

Returns

Type	Description
Object	Success or error message. `{ "message": "String", "request_id": "String", "status": "String" }`
<Object>.message	Message confirming success or error. Data type: String
<Object>.request_id	Sys_id of the record in the Document Lists [ds_document_lists] table. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• success - The operation was successful. • failure – The operation was not successful. The *message* provides details. Data type: String

The following example shows how to delete a document list record. See also SystemDocumentList.

```
var docListID = 'b2c021a924683c10f877a6fed1c2b0b1';

var docListSvc = new sn_doc_services.DocumentListService();
gs.info(JSON.stringify(docListSvc.deleteDocumentList(docListID),
 null, 2));
```

Output:

```
{
  "message": "Delete List for the given sysId :
 b2c021a924683c10f877a6fed1c2b0b1 is successful.",
  "request_id": "b2c021a924683c10f877a6fed1c2b0b1",
  "status": "success"
}
```

DocumentListService - updateDocumentList(String docSysId, SystemDocumentList doc)

Updates the field values of an existing document list.

Parameters

Name	Type	Description
listSysId	String	Sys_id of a document list record in the Document Lists [ds_document_lists] table.
doc	SystemDocumentL	One or more properties representing document list fields to be updated.

Returns

Type	Description
Object	Success or error message. `{ "message": "String", "request_id": "String", "status": "String" }`
<Object>.message	Message confirming success or error. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.request_id	Sys_id of the record in the Document Lists [ds_document_lists] table. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - The operation was successful. • failure – The operation was not successful. The *`message`* provides details. Data type: String

The following example shows how to update a document list name and description. See also SystemDocumentList.

```
var docListID = 'b2c021a924683c10f877a6fed1c2b0b1';

var docListUpdate = new sn_doc_services.SystemDocumentList();
docListUpdate.name('name change');
docListUpdate.description('description update');

var docListSvc = new sn_doc_services.DocumentListService();
gs.info(JSON.stringify(docListSvc.updateDocumentList(docListID ,
 docListUpdate), null, 2));
```

Output:

```
{
  "message": "Update List for the given sysId :
 b2c021a924683c10f877a6fed1c2b0b1 is successful.",
  "request_id": "b2c021a924683c10f877a6fed1c2b0b1",
  "status": "success"
}
```

DocumentReferenceService - Scoped, Global

The *`DocumentReferenceService`* API provides methods for managing document references within a target table, such as the Incidents [incident] or Knowledge [kb_knowledge] table. You can use document references to associate information with a record.

This API requires the Document Management plugin (com.snc.platform_document_management) and is provided within the `sn_doc_services` namespace. For information, see Document Services.

The following APIs enable you to define and manage documents:

- SystemDocument – Define a document object.
- DocumentService – Add, update, or delete a document.

DocumentReferenceService - DocumentReferenceService()

Instantiates a *`DocumentReferenceService`* object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

The following example shows how to instantiate a *DocumentReferenceService* object.

```
var result = new sn_doc_services.DocumentReferenceService();
```

DocumentReferenceService - addDocumentReference(String docSysId, String targetTable, String tableSysId)

Adds a document reference to a target table record.

Parameters

Name	Type	Description
docSysId	String	Sys_id of a document record in the Documents [ds_document] table.
targetTable	String	Name of the target table on which to provide a document reference.
tableSysId	String	Sys_id of the target table record to which the document reference is to be added.

Returns

Type	Description
Object	Sys_id of the new record in the Document References [ds_document_reference] table with a success message. Error message otherwise. `{ "message": "String", "status": "String" }`
<Object>.message	Message confirming success or error. If successful, includes the sys_id of the record the document reference was added to. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - The operation was successful. • failure – The operation was not successful. The *message* provides details. Data type: String

The following example shows how to add a document reference to a record in the Incidents [incident] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var docReference = new
 sn_doc_services.DocumentReferenceService();

var result = docReference.addDocumentReference("<docSysId>",
 "incident", "<tableSysId>");

gs.info(JSON.stringify(result, null, 2));
```

Output:

```
{
  "message": "Adding an entry to DocumentReference for the given
 docId to target table : incident, sysId : <tableSysId> is
 successful.",
  "status": "success"
}
```

DocumentReferenceService - removeDocumentReference(String docSysId, String targetTable, String tableSysId)

Removes a document reference from the Document References [ds_document_reference] table.

Parameters

Name	Type	Description
docSysId	String	Sys_id of a document record in the Documents [ds_document] table.
targetTable	String	Name of the table containing the document reference. This information is listed with the document in the Document References [ds_document_reference] table.
tableSysId	String	Sys_id of the record from which the document is referenced. You can find related information listed with the document in the Document References [ds_document_reference] table.

Returns

Type	Description
Object	Success message. Error message otherwise. `{ "message": "String", "status": "String" }`
<Object>.message	Message confirming success or error. If successful, includes the sys_id of the record the document reference was removed from. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• success - The operation was successful. • failure – The operation was not successful. The *message* provides details. Data type: String

The following example shows how to remove a document reference from a record in the Incidents [incident] table.

```
var docReference = new
 sn_doc_services.DocumentReferenceService();

var result = docReference.removeDocumentReference("<docSysId>",
 "incident", "<tableSysId>");

gs.info(JSON.stringify(result, null, 2));
```

Output:

```
{
  "message": "Deleting an entry to DocumentReference for the
 given docId to target table : incident, sysId : <tableSysId> is
 successful.",
  "status": "success"
}
```

DocumentService - Scoped, Global

The *DocumentService* API provides methods for creating, deleting, and updating a document.

This API requires the Document Management plugin (com.snc.platform_document_management) and is provided within the `sn_doc_services` namespace. For information, see Document Services.

A document is a collection of information about a document record. The methods used to create or update a record modify fields using the SystemDocument object.

Document content is managed using versions. The following APIs enable you to define and manage document versions:

- SystemDocumentVersion – Define a document version as the source of the document content. Each version is an element containing the document content and is provided using a single URL or attachment. An attachment can only be added in the Document Versions [ds_document_version] table UI and not with the API.
- DocumentVersionService – Document content is managed using versions.

Use the DocumentReferenceService API to manage documents referenced in a target table, such as the Incidents [incident] or Knowledge [kb_knowledge] table.

The Document Management plugin also supports creating lists of document templates to associate with your document. For example, a job application requiring multiple documents such as a diploma, ID, or passport.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- SystemDocumentList – Define a list of document templates.
- DocumentListService – Add or remove a document template list.
- SystemDocumentListEntry – Define a document template list entry.
- DocumentListEntryService – Add or remove a document template list entry.

DocumentService - DocumentService()

Instantiates a *DocumentService* object.

Parameters

Name	Type	Description
None		

The following example shows how to instantiate a *DocumentService* object.

```
var s = new sn_doc_services.DocumentService();
```

DocumentService - createDocument(SystemDocument doc)

Creates a document record in the Documents [ds_document] table.

Parameters

Name	Type	Description
doc	SystemDocument	One or more properties representing fields of a new record. The name property is required and can be set using the *SystemDocument* constructor or *name()* method.

Returns

Type	Description
Object	Sys_id of the new record in the Documents [ds_document] table with a success message. Error message otherwise. `{ "message": "String", "request_id": "String", "status": "String" }`
<Object>.message	Message confirming success or error. Possible values: • Create document sysId : <sys_id> is successful. • Document Name is mandatory and should be valid. • Document Name is mandatory and it should not be null or empty. • <SystemDocument property requiring sys_id input> with SysId: "<sys_id>" does not exist Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.request_id	Sys_id of the record in the Documents [ds_document] table. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - The operation was successful. • failure – The operation was not successful. The *message* provides details. Data type: String

The following example shows how to populate *SystemDocument* object properties and create a new document record.

```
var d = new sn_doc_services.SystemDocument('My document');

// Define the document fields
var reviewers =
 '62826bf03710200044e0bfc8bcbe5df1,a8f98bb0eb32010045e1a5115206f
e3a';
d.description('description');
d.classification('restricted');
d.state('review');
d.department('93b25282c0a8000b0b55c8ab34e2f1e6');
d.template(false);
d.type('policy');
d.reviewers(reviewers);
d.audience('external');

var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId :
 10404202245034l0f877a6fed1c2b031 is successful.",
  "request_id": "10404202245034l0f877a6fed1c2b031",
  "status": "success"
}
```

DocumentService - deleteDocument(String docSysId)

Removes a document record from the Documents [ds_document] table.

Parameters

Name	Type	Description
docSysId	String	Sys_id of a document record in the Documents [ds_document] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Success or error message. `{ "message": "String", "request_id": "String", "status": "String" }`
<Object>.message	Message confirming success or error. Data type: String
<Object>.request_id	Sys_id of the record in the Documents [ds_document] table. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - The operation was successful. • failure – The operation was not successful. The *message* provides details. Data type: String

The following example shows how to delete an existing document record.

```
var docid = "<sys_id>";
var svc = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(svc.deleteDocument(docid), null, 2));
```

Output:

```
{
  "message": "Delete document sysId : <sys_id> is successful.",
  "request_id": "<sys_id>",
  "status": "success"
}
```

DocumentService - updateDocument(String docSysId, SystemDocument doc)

Updates the field values of an existing document record.

Parameters

Name	Type	Description
docSysId	String	Sys_id of a document record in the Documents [ds_document] table.
doc	SystemDocument	One or more properties representing document fields to be updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Success or error message. `{ "message": "String", "request_id": "String", "status": "String" }`
<Object>.message	Message confirming success or error. Data type: String
<Object>.request_id	Sys_id of the record in the Documents [ds_document] table. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - The operation was successful. • failure – The operation was not successful. The *message* provides details. Data type: String

The following example shows how to change a document name. See also SystemDocument.

```
var dId = "19aab54e24103410f877a6fed1c2b03d";
var d = new sn_doc_services.SystemDocument();
d.name("c22.txt");

var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.updateDocument(dId, d), null, 2));
```

Output:

```
{
  "message": "Update document sysId :
 19aab54e24103410f877a6fed1c2b03d is successful.",
  "request_id": "19aab54e24103410f877a6fed1c2b03d",
  "status": "success"
}
```

DocumentVersionService - Scoped, Global

The *DocumentVersionService* API provides a service for creating and deleting document versions. Each version is an element containing the document content and is provided using a single URL or attachment. An attachment can only be added in the Document Versions [ds_document_version] table UI and not with the API.

This API requires the Document Management plugin (com.snc.platform_document_management) and is provided within the `sn_doc_services` namespace. For information, see Document Services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before creating a document version, you must first define and add a document record.

- SystemDocument – Define a document object.
- DocumentService – Add, update, or delete a document.

DocumentVersionService - DocumentVersionService()

Instantiates a *DocumentVersionService* object.

Parameters

Name	Type	Description
None		

The following example shows how to instantiate a *DocumentVersionService* object.

```
var versionSvc = new sn_doc_services.DocumentVersionService();
```

DocumentVersionService - createDocumentVersion(SystemDocumentVersion docVersion)

Creates a document version record in the Versions [ds_document_version] table.

Parameters

Name	Type	Description
docVersion	SystemDocumentVersion	One or more properties representing fields of a document version.

Returns

Type	Description
Object	Sys_id of the new record in the Versions [ds_document_version] table with a success message. Error message otherwise. `{ "message": "String", "request_id": "String", "status": "String" }`
<Object>.message	Message confirming success or error. If successful, includes the sys_id of the document record and the sys_id of its new document version. Data type: String
<Object>.request_id	Sys_id of the new record in the Versions [ds_document_version] table. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - The operation was successful. • failure – The operation was not successful. The *message* provides details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String

The following example shows how to populate *SystemDocumentVersion* object properties and create a new document version. See also SystemDocumentVersion.

```
var versionDefinition = new
 sn_doc_services.SystemDocumentVersion('491efbee24187410f877a6fe
d1c2b0a9');

versionDefinition.type('url');
versionDefinition.url('http://one/1.0');

var versionSvc = new sn_doc_services.DocumentVersionService();
gs.info(JSON.stringify(versionSvc.createDocumentVersion(versionD
efinition), null, 2));
```

Output:

```
{
  "message": "Adding an entry to DocumentVersion for the
 given docId : 491efbee24187410f877a6fed1c2b0a9, sysId :
 d5a340d9242cf810f877a6fed1c2b069 is successful.",
  "request_id": "d5a340d9242cf810f877a6fed1c2b069",
  "status": "success"
}
```

DocumentVersionService - deleteDocumentVersion(String docVersionSysId)

Deletes a document version.

Parameters

Name	Type	Description
docVersionSysId	String	Sys_id of a document version in the Versions [ds_document_version] table.

Returns

Type	Description
Object	Success message. Error message otherwise. `{ "message": "String", "status": "String" }`
<Object>.message	Message confirming success or error. If successful, includes the sys_id of the deleted document version. Data type: String
<Object>.status	Status indicating whether the operation is successful.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Possible values: • success - The operation was successful. • failure – The operation was not successful. The *message* provides details. Data type: String

The following example shows how to delete an existing document version.

```
var vId = "<versionSysId>";
var versionSvc = new sn_doc_services.DocumentVersionService();

gs.info(JSON.stringify(versionSvc.deleteDocumentVersion(vId),
 null, 2));
```

Output:

```
{
  "message": "Deleting an entry to DocumentVersion for the
 given documentVersionSysId : , sysId : <versionSysId> is
 successful.",
  "status": "success"
}
```

DSCScriptableAPI - Global

The *DSCScriptableAPI* provides methods for checking the health of your domain configuration for an instance.

This API is part of the Domain Separation Center dashboard and is available in the SNC global namespace.

The com.glide.domain.msp_extensions.installer plugin must be activated for Domain Separation Center dashboard availability.

DSCScriptableAPI - DSCScriptableAPI()

Instantiates a new DSCScriptable object.

Parameters

Name	Type	Description
None		

DSCScriptableAPI - chkDataInvalidDomainForTables(String tableNames)

Checks a list of comma-separated tables for invalid domains.

View records that reference invalid domains in the Domain Log [syslog_domain] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
tableNames	String	Comma-separated list of table names.

Returns

Type	Description
String	GUID of any invalid references; OK otherwise

```
var dsc = new SNC.DSCScriptableAPI();
dsc.chkDataInvalidDomainForTables('task, sys_user');
```

DSCScriptableAPI - chkDataInvalidPathForTables(String tableNames)

Checks a list of comma-separated tables for invalid domain paths.

Records that have an invalid domain path are logged in the syslog_domain table.

Parameters

Name	Type	Description
tableNames	String	Comma-separated list of table names.

Returns

Type	Description
String	GUID if there are invalid paths; OK otherwise

```
var dsc = new SNC.DSCScriptableAPI();
dsc.chkDataInvalidPathForTables('task, sys_user');
```

DuplicateTemplate - Scoped

The *DuplicateTemplate* API provides methods for users to interact with de-duplication templates by enforcing a set of validations for each method.

De-duplication task remediation can be more time consuming than desirable when handled individually. Duplication templates enable grouping a set of duplicate tasks and running them together. Use the *DuplicateTemplate* API to create and consume de-duplication templates. This API runs in the `sn_cmdb` namespace and requires the cmdb_dedup_admin role to access.

When an instance detects duplicate configuration items (CIs) during identification and reconciliation, it groups each set of duplicate CIs into a de-duplication task for review and remediation. De-duplication tasks provide details about the duplication, including a list of all duplicate CIs. For information, see Duplicate CIs remediation.

See also: IdentificationEngine - Scoped

Template life cycle

1. Use the CreateTemplate() method to create a template in the draft state.

   You can use the following methods to retrieve or update the template:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- getTemplate()
- canAddTasksToTemplate()
- updateTemplate()

2. Use the publishTemplate() method to move the template from draft to published state.

   Note: Use the unPublishTemplate() method to return a published template to draft state and update the template.

3. Optional. Use the CMDBDuplicateTemplateUtil script include to add or remove tasks.
4. Use the runTemplate() method to run the template.

   To cancel a running task, use the requestCancellation() method.

5. If the template is no longer needed, you can retire the template using the retireTemplate() method.

Remediating a single task using a template

To remediate a single task without running the template, you can preview and remediate de-duplication tasks.

1. Use the previewTemplate() method to preview the remediation of a single-task with a template.
2. Use the remediateTask() method to remediate the de-duplication task with a template.

DuplicateTemplate - canAddTasksToTemplate(Array taskIds, String templatId)

Checks if the provided list of tasks can be added to a template.

Use this method to determine whether tasks are suitable for adding to the template. For example, the specified template might be created for Application Server Tomcat, but the specified de-duplication tasks are created for Linux Server. These tasks don't have a matching template class, so they can't be added to the template.

Parameters

Name	Type	Description
taskIds	Array	Array of sys_ids of the de-duplication tasks to add to the template.
templateId	String	Sys_id of the template listed in the Reconcile Duplicate Template [reconcile_duplicate_template] table.

Returns

Type	Description
Object	Result object containing what tasks can be added, skipped, or failed. `{ "success": [ "<task_id_1>",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"<task_id_2>",
	"<task_id_3>"
	],
	"failed": [
	"<task_id_4>"
	],
	"skipped": [
	"<task_id_5>"
	]
	}</pre>

failed	Error occurred while checking if the task is compatible with the template. See also Detecting duplicate CIs.
skipped	The tasks are incompatible because they don't have a matching template class, so the task was skipped.
success	The task matches the template class and can be added to the template.

The following example shows how to check for tasks that can be added to the template.

```
var taskIds = [];
taskIds.push(<task_id_1>);
taskIds.push(<task_id_2>);
taskIds.push(<task_id_3>);

var result =
 sn_cmdb.DuplicateTemplate.canAddTasksToTemplate(taskIds,
 <template_id>);

gs.info('Success:' + result.success);
gs.info('Failed:' + result.failed);
gs.info('Skipped:' + result.skipped);
```

Output:

```
Success: <task_id_1>
Failed: <task_id_2>
Skipped: <task_id_3>
```

DuplicateTemplate - createTemplate(Object template)

Creates a de-duplication template in draft state.

Parameters

Name	Type	Description

template	Object	The template object with different options for creating the template.
		<pre>{
		"allow_master_ci_null_update": Boolean,
		"allow_null_attribute_update": Boolean,</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		"description": "String", "duplicate_ci_action": "String", "duplicate_ci_updates": [Array], "master_ci_condition": "String", "master_ci_option": "String", "merge_related_items": "String", "merge_related_items_condition": [Array], "merge_relations_condition": "String", "merge_relations": "String", "most_related_items_merge_attributes": "String", "most_relations_merge_attributes": "String", "name": "String", "newest_updated_merge_attributes": "String", "oldest_created_merge_attributes": "String", "table": "String", "task_conditions": "String" }
template.allow_null_attribute_update	Boolean	Optional. Flag that indicates if main CI attributes are updated with null values from duplicate CIs when resolving attribute conflicts for CIs within a de-duplication task. Valid values: • true: The main CI attributes are updated with null values from duplicate CIs. • false: The main CI attributes aren't updated with null values from duplicate CIs. Default: False
template.allow_master_ci_null_update	Boolean	Optional. Only includes updates from duplicate CIs if the main CI value is null. Flag that indicates whether to include only updates from duplicate CIs if the main CI value is null. Valid values: • true: Only include updates from duplicate CIs if the main CI value is null. • false: Include updates from all duplicate CIs. Default: False
template.description	String	Optional. Description to store more information about the template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
template.duplicate_ci_action	String	Optional. Specifies if the duplicate CI is to be deleted or updated with unique custom values. Possible options: • delete • update (requires specifying *duplicate_ci_updates*)
template.duplicate_ci_updates	Array	Optional, unless the setting for *duplicate_ci_action* is `update`. Array of objects specifying how the duplicate CI values are updated. `[ { "element": "String", "element_label": "String", "value": "String", "display": "String" } ]`
template.duplicate_ci_updates.element	String	The system dictionary name of a reference field.
template.duplicate_ci_updates.element_label	String	The label that the reference field displays.
template.duplicate_ci_updates.value	String	Value for a reference field, that is, the contents of the reference field.
template.duplicate_ci_updates.display	String	Display value for a reference field.
template.master_ci_option	String	Optional. Specifies how the main CI is selected for a de-duplication task when applying this template. Possible options: • conditional (must specify *master_ci_condition*) • most_related_items – Attributes to be merged from the CI with the most related items to the main CI. • most_relations – Attributes to be merged from the CI with the most relationships to the main CI. • newest_created – separated attributes to be merged from the most recently updated CI to the main CI. • oldest_created – Comma-separated attributes to be merged from the oldest-created CI to the main CI.
template.master_ci_condition	String	Optional (required if the value of *master_ci_option* is `conditional`). Encoded query to specify how the main CI is selected. If multiple CIs or no CIs match the query, the method selects the most recently updated CI as the main CI. The encoded query is evaluated for the template table. This table is identified in the *table* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For details, see Encoded query strings .
template.merge_relations	String	Optional. Specifies how the relationships for duplicate CIs within a de-duplication task are merged when applying this template. Possible options: • all • conditional • none
template.merge_relations	String	Optional. Specifies how the relationships for duplicate CIs within a de-duplication task are merged when applying this template. Possible options: • all • conditional • none
template.merge_relations_condition	String	Optional (required if the value of *merge_relations* is `conditional`). Encoded query to specify if all or none of the relationships from duplicate CIs are merged. The query is evaluated on the main CI that is selected for the de-duplication task. If the query returns true, all relationships are merged. If false, no relationships are merged. The encoded query is evaluated for the template table. This table is identified in the *table* property. For details, see Encoded query strings .
template.merge_related_items	String	Optional. Specifies which related tables for duplicate CIs within a de-duplication task are merged to the main CI when applying this template. See also Remediate a de-duplication task (legacy). Possible options: • all_available – Includes the default-related tables and any related tables that reference duplicate CIs for the de-duplication task remediated via the template. • conditional • default – Includes related entries provided by the Duplicate CI Remediator Default Related Items module. • none
template.merge_related_items_condition	Array	Optional. List of related entries with an encoded query for each related entry. Each query is evaluated on the main CI that is selected for the task. If the query returns true, the related

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		entries are merged during the remediation of a de-duplication task. If false, related entries aren't merged. `"merge_related_items_condition": [ { "related_entry": "String", "condition": "String" } ]` For details, see Encoded query strings .
template.most_relationships_merge_attributes	String	Optional. Comma-separated attributes to be merged from the CI with the most relationships to the main CI.
template.most_related_items_merge_attributes	String	Optional. Comma-separated attributes to be merged from the CI with the most related items to the main CI.
template.name	String	Name of the template.
template.newest_updated_merge_attributes	String	Optional. Comma-separated attributes to be merged from the most recently updated CI to the main CI.
template.oldest_created_merge_attributes	String	Optional. Comma-separated attributes to be merged from the oldest-created CI to the main CI.
template.table	String	Table for which the template is created.
template.task_conditions	String	Optional. Encoded query to be evaluated when the template runs. This query is evaluated on the Reconcile Duplicate Task Data [reconcile_duplicate_task_data] table. All tasks returned from this query are considered during the template evaluation. **Note:** Even if a task is returned as a part of the query, it doesn't guarantee that the template run processes the task. Other factors might cause the task to be skipped during template processing. For details, see Encoded query strings .

Returns

Type	Description
String	Sys_id of the template created in the Reconcile Duplicate Templates [reconcile_duplicate_template] table.

The following example shows how to create a de-duplication template.

```
var template = {
  "name": "Test Windows Template",
  "table": "cmdb_ci_win_server",
  "description": "This is a Windows server template",
  "master_ci_option": "oldest_created",
  "master_ci_condition": "",
  "allow_null_attribute_update": false,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "allow_master_ci_null_update": false,
  "oldest_created_merge_attributes": "serial_number,os_version",
  "merge_relations": "all",
  "merge_relations_condition": "",
  "merge_related_items": "conditional",
  "merge_related_items_condition": [
    {
      "related_entry": "change_request.cmdb_ci",
      "condition": "ramCONTAINS1024"
    },
    {
      "related_entry": "incident.cmdb_ci",
      "condition": "os_versionCONTAINSWindows"
    }
  ],
  "duplicate_ci_action": "delete",
  "duplicate_ci_updates":   [{
    "element": "ram",
    "element_label": "RAM (MB)",
    "value": "1024",
    "display": "1024"
  }],
  "task_conditions":
 "category=attribute^key=serial_number^value=E2BX1^EQ"
};

var templateId =
 sn_cmdb.DuplicateTemplate.createTemplate(template);

gs.info(templateId);
```

Output:

```
8dfcd36e042b2510f877c1665753a485
```

DuplicateTemplate - getTemplate(String templateId)

Gets the template object.

Parameters

Name	Type	Description
templateId	String	Sys_id of the template listed in the Reconcile Duplicate Template [reconcile_duplicate_template] table.

Returns

Type	Description
Object	The template object with different options for creating the template. `{ "allow_master_ci_null_update": Boolean, "allow_null_attribute_update": Boolean, "description": "String", "duplicate_ci_action": "String", "duplicate_ci_updates": [Array],`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	"master_ci_condition": "String", "master_ci_option": "String", "merge_related_items": "String", "merge_related_items_condition": [Array], "merge_relations_condition": "String", "merge_relations": "String", "most_related_items_merge_attributes": "String", "most_relations_merge_attributes": "String", "name": "String", "newest_updated_merge_attributes": "String", "oldest_created_merge_attributes": "String", "table": "String", "task_conditions": "String" }
<Object>.allow_null_attribute_update	Flag that indicates if main CI attributes are updated with null values from duplicate CIs when resolving attribute conflicts for CIs within a de-duplication task. Valid values: • true: The main CI attributes are updated with null values from duplicate CIs. • false: The main CI attributes aren't updated with null values from duplicate CIs. Data type: Boolean
<Object>.allow_master_ci_null_update	Only includes updates from duplicate CIs if the main CI value is null. Valid values: • true: Only include updates from duplicate CIs if the main CI value is null. • false: Include updates from all duplicate CIs. Data type: Boolean
<Object>.description	Description to store more information about the template. Data type: String
<Object>.duplicate_ci_action	Specifies if the duplicate CI is to be deleted or updated with unique custom values. Possible options: • delete • update (requires specifying *duplicate_ci_updates*) Data type: String
	Array of objects specifying how the duplicate CI values are updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

<Object>.duplicate_ci_updates	<pre>[
	  {
	  "element": "String",
	  "element_label": "String",
	  "value": "String",
	  "display": "String"
	  }
	]</pre>
	Data type: Object

<Object>.duplicateCIUpdates.element	The system dictionary name of a reference field. Data type: String
<Object>.duplicateCIUpdates.element_label	The label that the reference field displays. Data type: String
<Object>.duplicateCIUpdates.value	Value for a reference field, that is, the contents of the reference field. Data type: String
<Object>.duplicateCIUpdates.display	Display value for a reference field. Data type: String
<Object>.master_ci_option	Specifies how the main CI is selected for a de-duplication task when applying this template. Possible options: • conditional (must specify *master_ci_condition*) • most_related_items – Attributes to be merged from the CI with the most related items to the main CI. • most_relations – Attributes to be merged from the CI with the most relationships to the main CI. • newest_created – separated attributes to be merged from the most recently updated CI to the main CI. • oldest_created – Comma-separated attributes to be merged from the oldest-created CI to the main CI. Data type: String
<Object>.merge_relations	Specifies how the relationships for duplicate CIs within a de-duplication task are merged when applying this template. Possible options: • all • conditional • none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.merge_related_items	Specifies which related tables for duplicate CIs within a de-duplication task are merged to the main CI when applying this template. See also Remediate a de-duplication task (legacy). Possible options: • all_available – Includes the default-related tables and any related tables that reference duplicate CIs for the de-duplication task remediated via the template. • conditional • default – Includes related entries provided by the Duplicate CI Remediator Default Related Items module. • none Data type: String
<Object>.merge_related_items_condition	List of related entries with an encoded query for each related entry. Each query is evaluated on the main CI that is selected for the task. If the query returns true, the related entries are merged during the remediation of a de-duplication task. If false, related entries aren't merged. For details, see Encoded query strings. Data type: Array
<Object>.most_relations_merge_attributes	Comma-separated attributes to be merged from the CI with the most relationships to the main CI. Data type: String
<Object>.most_related_items_merge_attributes	Comma-separated attributes to be merged from the CI with the most related items to the main CI. Data type: String
<Object>.name	Name of the template. Data type: String
<Object>.newest_updated_merge_attributes	Comma-separated attributes to be merged from the most recently updated CI to the main CI. Data type: String
<Object>.oldest_created_merge_attributes	Comma-separated attributes to be merged from the oldest-created CI to the main CI. Data type: String
<Object>.table	Table for which the template is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.task_condition_table	Location of the table task conditions, that is, the Reconcile Duplicate Task Data [reconcile_duplicate_task_data] table. The value never changes and the table is intended for internal use only. Data type: String
<Object>.task_conditions	Encoded query to be evaluated when the template runs. This query is evaluated on the Reconcile Duplicate Task Data [reconcile_duplicate_task_data] table. All tasks returned from this query are considered during the template evaluation. **Note:** Even if a task is returned as a part of the query, it doesn't guarantee that the template run processes the task. Other factors might cause the task to be skipped during template processing. For details, see Encoded query strings . Data type: String

The following example shows how to retrieve a template.

```
var template =
 sn_cmdb.DuplicateTemplate.getTemplate('<template_id>');
gs.info(JSON.stringify(template));
```

Output:

```
{
  "most_relations_merge_attributes": "",
  "task_conditions":
 "category=attribute^key=serial_number^value=E2BX1^EQ",
  "duplicate_ci_updates":
 "org.mozilla.javascript.NativeArray@5d3b19ef",
  "description": "This is a Windows server template",
  "master_ci_option": "oldest_created",
  "merge_related_items": "conditional",
  "duplicate_ci_action": "delete",
  "newest_updated_merge_attributes": "",
  "merge_related_items_condition": [
    {
      "condition": "os_versionCONTAINSWindows",
      "related_entry": "incident.cmdb_ci"
    },
    {
      "condition": "ramCONTAINS1024",
      "related_entry": "change_request.cmdb_ci"
    }
  ],
  "most_related_items_merge_attributes": "",
  "merge_relations": "all",
  "task_condition_table": "reconcile_duplicate_task_data",
  "name": "Test Windows Template",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "allow_null_attribute_update": false,
  "table": "cmdb_ci_win_server",
  "allow_master_ci_null_update": false,
  "oldest_created_merge_attributes": "serial_number,os_version"
}
```

DuplicateTemplate - previewTemplate(String templateId, String taskId)

Generates a preview of how different template options were applied to the de-duplication task and how it's to be remediated.

This method validates all the required attributes before generating the preview for the task using the template. Templates can be created or updated without specifying the required attributes. The required attributes must be provided to preview any de-duplication task.

The following attributes are required:

- duplicate_ci_action
- master_ci_option
- merge_related_items
- merge_relations
- name
- table

Note: Although this method validates all of the attributes, there's no requirement for the template to be in the published state for a preview.

Use the remediateTask() method to remediate de-duplication tasks.

Parameters

Name	Type	Description
templateId	String	Sys_id of the template listed in the Reconcile Duplicate Template [reconcile_duplicate_template] table.
taskId	String	Sys_id of the de-duplication task listed in the Remediate Duplicate Task [reconcile_duplicate_task] table.

Returns

Type	Description
Object	Preview object with values showing how the de-duplication tasks can be remediated using the template. `{ "allClassCIMap": {Object}, "duplicateCIAction": "String", "duplicateCIUpdates": [Array], "masterCI": "String", "mergeRelations": Boolean, "relatedTablesMerged": [Array], "resolvedFieldCIMap": [Array], "taskId": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"tooManyDuplicates": Boolean
	}</pre>

<Object>.allClassCIMap	List of sys_ids of the CIs within a de-duplication task, grouped by CI class. For example, *cmdb_ci_computer*.
	<pre>"allClassCIMap": {
	"<ci_class_name>": [
	"<ci_sys_id_1>",
	"<ci_sys_id_2>"
	]
	}</pre>
	Data type: Object

<Object>.duplicateCIAction	Specifies if the duplicate CI is to be deleted or updated with unique custom values. Possible options: • delete • update (requires specifying *duplicate_ci_updates*) Data type: String

<Object>.duplicateCIUpdates	Array of objects specifying how the duplicate CI values are updated.
	<pre>[
	{
	"element": "String",
	"element_label": "String",
	"value": "String",
	"display": "String"
	}
	]</pre>
	Data type: Array

<Object>.duplicateCIUpdates.element	The system dictionary name of a reference field. Data type: String
<Object>.duplicateCIUpdates.element_label	The label that the reference field displays. Data type: String
<Object>.duplicateCIUpdates.value	Value for a reference field, that is, the contents of the reference field. Data type: String
<Object>.duplicateCIUpdates.display	Display value for a reference field. Data type: String
<Object>.masterCI	Sys_id of the CI that was selected as the main CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.mergeRelations	Specifies how the relationships for duplicate CIs within a de-duplication task are merged when applying this template. Possible options: • all • conditional • none Data type: String
<Object>.relatedTablesMergeId	Specifies which related tables for duplicate CIs within a de-duplication task are merged to the main CI when applying this template. See also Remediate a de-duplication task (legacy). Possible options: • all_available – Includes the default-related tables and any related tables that reference duplicate CIs for the de-duplication task remediated via the template. • conditional • default – Includes related entries provided by the Duplicate CI Remediator Default Related Items module. • none Data type: Array
<Object>.resolvedFieldCIMap	Array of elements to be merged from duplicate CIs to the main CI. `"resolvedFieldCIMap": [ { "element": "String", "sys_id": "String" } ]` Data type: Array
<Object>.resolvedFieldCIMap.element	Name of the element to be merged from a duplicate CI to the main CI. Data type: String
<Object>.resolvedFieldCIMap.sys_id	Sys_id of the element to be merged from a duplicate CI to the main CI. Data type: String
<Object>.taskId	Sys_id of the de-duplication task listed in the Remediate Duplicate Task [reconcile_duplicate_task] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.tooManyDuplicates	Flag that indicates whether the task has more than the maximum number of CIs. The threshold is determined by comparing the value of the system property glide.duplicate_ci_ remediator.max.cis (default value 1000 CIs). Valid values: • true: Task number of CIs exceeds the maximum number of CIs. • false: Task number of CIs don't exceed the maximum number of CIs. Data type: Boolean

The following example shows how to get a preview of de-duplication remediation for a specified template.

```
var preview =
 sn_cmdb.DuplicateTemplate.previewTemplate("<template_id>",
 "<task_id>");
gs.info(JSON.stringify(preview));
```

Output:

```
{
  "taskId": "<task_id>",
  "masterCI": "<ci_sys_id_1>",
  "allClassCIMap": {
    "cmdb_ci_computer": [
      "<ci_sys_id_1>",
      "<ci_sys_id_2>"
    ]
  },
  "resolvedFieldCIMap": [
    {
      "element": "ram",
      "sys_id": "<ci_sys_id_2>"
    },
    {
      "element": "os_version",
      "sys_id": "<ci_sys_id_2>"
    }
  ],
  "mergeRelations": true,
  "relatedTablesMerged": [
    "incident.cmdb_ci",
    "change_request.cmdb_ci"
  ],
  "duplicateCIAction": "delete",
  "duplicateCIUpdates": [],
  "tooManyDuplicates": false
}
```

DuplicateTemplate - publishTemplate(String templateId)

Publishes a template. When successful, the template moves from draft to published state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method validates all the required attributes before publishing the template. You can create or update templates without specifying the required attributes, but the attributes must be provided before publishing a template.

The following attributes are required:

- duplicate_ci_action
- master_ci_option
- merge_related_items
- merge_relations
- name
- table

In published state, you can run the template using the runTemplate() method.

See also:

- previewTemplate()
- unPublishTemplate()
- updateTemplate()

Parameters

Name	Type	Description
templateId	String	Sys_id of the template listed in the Reconcile Duplicate Template [reconcile_duplicate_template] table.

Returns

Type	Description
Boolean	Flag that indicates whether the template was published. Valid values: • true: The template was published. • false: The template wasn't published.

The following example shows how to publish a template and display results.

```
var isPublished =
 sn_cmdb.DuplicateTemplate.publishTemplate('<template_id>');
gs.info(isPublished);
```

Output:

```
true
```

DuplicateTemplate - remediateTask(String templateId, String taskId)

Remediates a de-duplication task using the template.

If the template isn't in the published state, the template can't be run and the method throws an exception.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the previewTemplate() method to preview how de-duplication tasks are to be remediated.

See also.

- Duplicate CIs remediation
- publishTemplate()
- Remediate a de-duplication task (legacy)

Parameters

Name	Type	Description
templateId	String	Sys_id of the template listed in the Reconcile Duplicate Template [reconcile_duplicate_template] table.
taskId	String	Sys_id of the de-duplication task listed in the Remediate Duplicate Task [reconcile_duplicate_task] table.

Returns

Type	Description
String	If successful, the merge resolution ID for the de-duplication task remediation. This merge resolution ID the sys_id of a record in the Duplicate CI Remediation [cmdb_duplicate_ci_remediation] table. If unsuccessful, the template might not be in the published state.

The following example shows how to remediate a de-duplication task.

```
var mergeResolutionId =
 sn_cmdb.DuplicateTemplate.remediateTask("<template_id>",
 "<task_id>");
gs.info(mergeResolutionId);
```

Output:

```
<merge_resolution_id>
```

DuplicateTemplate - requestCancellation(String templateRunId)

Cancels an existing template run.

A cancel request can only be made for a template run if it's in draft, ready, or running state.

After a template run cancel request, the template run state changes to the intermediate stage Cancel Requested.

Running this method doesn't automatically cancel template runs in Ready or Draft state. The template run state doesn't change to Cancelled until any tasks running are complete. At that point any remaining tasks staged for remediation change from cancel requested to canceled.

- publishTemplate()
- runTemplate()
- retireTemplate()

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
templateRunId	String	Sys_id of the template run listed in the De-Duplication Template Run [reconcile_duplicate_template_run] table.

Returns

Type	Description
String	Flag that indicates whether the cancel request was successful. Valid values: • true: The cancel request was successful. • false: The cancel request wasn't successful.

The following example shows how to cancel a template run and display whether the operation is successful.

```
var isCancelled =
 sn_cmdb.DuplicateTemplate.requestCancellation("487c67e2046b2510
f877c1665753a4cc");
gs.info(isCancelled);
```

Output:

```
true
```

DuplicateTemplate - retireTemplate(String templateId)

Retires a template.

Use this method to move a template to the retire state if it's no longer needed.

The template can't be retired and the method throws an exception under the following conditions:

- The template is in the published state.
- The template is running or scheduled to run.

See also:

- publishTemplate()
- runTemplate()
- requestCancellation()
- DuplicateTemplate - unPublishTemplate(String templateId)

Parameters

Name	Type	Description
templateId	String	Sys_id of the template listed in the Reconcile Duplicate Template [reconcile_duplicate_template] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the template is retired. Valid values: • true: The template is retired. • false: The template couldn't be retired because it was running, scheduled to be run, or in published state

The following example shows how to retire a template and display results.

```
var isRetired =
 sn_cmdb.DuplicateTemplate.retireTemplate(<template_id>);
gs.info(isRetired);
```

Output:

```
true
```

DuplicateTemplate - runTemplate(String templateId)

Schedules a remediation run for a de-duplication template in the published state. A template can be run multiple times but you can only schedule one run at a time.

If the template isn't in published state, it can't be run and the method throws an exception. Use the publishTemplate() method to move the template from draft to published state.

To cancel a running task, use the requestCancellation() method.

Parameters

Name	Type	Description
templateId	String	Sys_id of the template listed in the Reconcile Duplicate Template [reconcile_duplicate_template] table.

Returns

Type	Description
String	Sys_id of the template that was run listed in the De-Duplication Template Run [reconcile_duplicate_template_run] table. If unsuccessful, the template might not be in published state.

The following example shows how to schedule a run for a published de-duplication template.

```
var template =
 sn_cmdb.DuplicateTemplate.runTemplate('<template_id>');
gs.info(JSON.stringify(template));
```

Output:

```
487c67e2046b2510f877c1665753a4cc
```

DuplicateTemplate - unPublishTemplate(String templateId)

Unpublishes a template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method moves the template from the published state to the draft state, which enables updating the template. The template can't be unpublished if it is running or scheduled to be run.

See also:

- publishTemplate()
- requestCancellation()
- updateTemplate()

Parameters

Name	Type	Description
templateId	String	Sys_id of the template listed in the Reconcile Duplicate Template [reconcile_duplicate_template] table.

Returns

Type	Description
Boolean	Flag that indicates whether the template was successfully unpublished. Valid values: • true: The template was successfully unpublished. • false: The template wasn't successfully unpublished. The template might be running or scheduled to be run.

The following example shows how to unpublish a template and display results.

```
var isUnPublished =
 sn_cmdb.DuplicateTemplate.unPublishTemplate(<template_id>);
gs.info(isUnPublished);
```

Output:

```
true
```

DuplicateTemplate - updateTemplate(String templateId, Object template)

Updates a de-duplication template in draft state.

See also:

- unPublishTemplate()
- canAddTasksToTemplate()

Parameters

Name	Type	Description
templateId	String	Sys_id of the template listed in the Reconcile Duplicate Template [reconcile_duplicate_template] table.
template	Object	The template object with different options for creating the template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		{
		"allow_master_ci_null_update": Boolean,
		"allow_null_attribute_update": Boolean,
		"description": "String",
		"duplicate_ci_action": "String",
		"duplicate_ci_updates": [Array],
		"master_ci_condition": "String",
		"master_ci_option": "String",
		"merge_related_items": "String",
		"merge_related_items_condition":
		[Array],
		"merge_relations_condition": "String",
		"merge_relations": "String",
		"most_related_items_merge_attributes":
		"String",
		"most_relations_merge_attributes":
		"String",
		"name": "String",
		"newest_updated_merge_attributes":
		"String",
		"oldest_created_merge_attributes":
		"String",
		"table": "String",
		"task_conditions": "String"
		}

template.allow_null_attribute_update	Boolean	Optional. Flag that indicates if main CI attributes are updated with null values from duplicate CIs when resolving attribute conflicts for CIs within a de-duplication task. Valid values: • true: The main CI attributes are updated with null values from duplicate CIs. • false: The main CI attributes aren't updated with null values from duplicate CIs. Default: False
template.allow_master_ci_null_update	Boolean	Optional. Only includes updates from duplicate CIs if the main CI value is null. Flag that indicates whether to include only updates from duplicate CIs if the main CI value is null. Valid values: • true: Only include updates from duplicate CIs if the main CI value is null. • false: Include updates from all duplicate CIs. Default: False

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
template.description	String	Optional. Description to store more information about the template.
template.duplicate_ci_action	String	Optional. Specifies if the duplicate CI is to be deleted or updated with unique custom values. Possible options: • delete • update (requires specifying *duplicate_ci_updates*)
template.duplicate_ci_updates	Array	Optional, unless the setting for *duplicate_ci_action* is `update`. Array of objects specifying how the duplicate CI values are updated. `[ { "element": "String", "element_label": "String", "value": "String", "display": "String" } ]`
template.duplicate_ci_updates.element	String	The system dictionary name of a reference field.
template.duplicate_ci_updates.element_label	String	The label that the reference field displays.
template.duplicate_ci_updates.value	String	Value for a reference field, that is, the contents of the reference field.
template.duplicate_ci_updates.display	String	Display value for a reference field.
template.master_ci_option	String	Optional. Specifies how the main CI is selected for a de-duplication task when applying this template. Possible options: • conditional (must specify *master_ci_condition*) • most_related_items – Attributes to be merged from the CI with the most related items to the main CI. • most_relations – Attributes to be merged from the CI with the most relationships to the main CI. • newest_created – separated attributes to be merged from the most recently updated CI to the main CI. • oldest_created – Comma-separated attributes to be merged from the oldest-created CI to the main CI.
template.master_ci_condition	String	Optional (required if the value of *master_ci_option* is `conditional`). Encoded query to specify how the main CI is selected. If multiple CIs or no CIs match the query, the method selects the most recently updated CI as the main CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		The encoded query is evaluated for the template table. This table is identified in the *table* property. For details, see Encoded query strings .
template.merge_relations	String	Optional. Specifies how the relationships for duplicate CIs within a de-duplication task are merged when applying this template. Possible options: • all • conditional • none
template.merge_relations	String	Optional. Specifies how the relationships for duplicate CIs within a de-duplication task are merged when applying this template. Possible options: • all • conditional • none
template.merge_relations_condition	String	Optional (required if the value of *merge_relations* is `conditional`). Encoded query to specify if all or none of the relationships from duplicate CIs are merged. The query is evaluated on the main CI that is selected for the de-duplication task. If the query returns true, all relationships are merged. If false, no relationships are merged. The encoded query is evaluated for the template table. This table is identified in the *table* property. For details, see Encoded query strings .
template.merge_related_items	String	Optional. Specifies which related tables for duplicate CIs within a de-duplication task are merged to the main CI when applying this template. See also Remediate a de-duplication task (legacy). Possible options: • all_available – Includes the default-related tables and any related tables that reference duplicate CIs for the de-duplication task remediated via the template. • conditional • default – Includes related entries provided by the Duplicate CI Remediator Default Related Items module. • none
template.merge_related_items_condition	Array	Optional. List of related entries with an encoded query for each related entry. Each query is evaluated on the main CI that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		is selected for the task. If the query returns true, the related entries are merged during the remediation of a de-duplication task. If false, related entries aren't merged. `"merge_related_items_condition": [ { "related_entry": "String", "condition": "String" } ]` For details, see Encoded query strings .
template.most_relationships_merge_attributes	String	Optional. Comma-separated attributes to be merged from the CI with the most relationships to the main CI.
template.most_related_items_merge_attributes	String	Optional. Comma-separated attributes to be merged from the CI with the most related items to the main CI.
template.name	String	Name of the template.
template.newest_updated_merge_attributes	String	Optional. Comma-separated attributes to be merged from the most recently updated CI to the main CI.
template.oldest_created_merge_attributes	String	Optional. Comma-separated attributes to be merged from the oldest-created CI to the main CI.
template.table	String	Table for which the template is created.
template.task_conditions	String	Optional. Encoded query to be evaluated when the template runs. This query is evaluated on the Reconcile Duplicate Task Data [reconcile_duplicate_task_data] table. All tasks returned from this query are considered during the template evaluation. **Note:** Even if a task is returned as a part of the query, it doesn't guarantee that the template run processes the task. Other factors might cause the task to be skipped during template processing. For details, see Encoded query strings .

Returns

Type	Description
Boolean	Flag that indicates whether the template was updated. Valid values: • true: The template was updated. • false: The template was updated. The template might not be in draft (unpublished) state.

The following example shows how to update several properties of an existing de-duplication template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var template = {
  "name": "Test Windows Template",
  "table": "cmdb_ci_win_server",
  "description": "This is a windows server template",
  "master_ci_option": "newest_updated",
  "master_ci_condition": "",
  "allow_null_attribute_update": false,
  "allow_master_ci_null_update": false,
  "oldest_created_merge_attributes": "",
  "newest_updated_merge_attributes": "ram,cpu_count",
  "most_relations_merge_attributes": "",
  "most_related_items_merge_attributes": "",
  "merge_relations": "all",
  "merge_relations_condition": "",
  "merge_related_items": "conditional",
  "merge_related_items_condition": [
    {
      "related_entry": "change_request.cmdb_ci",
      "condition": "ramCONTAINS1024"
    },
    {
      "related_entry": "incident.cmdb_ci",
      "condition": "os_versionCONTAINSWindows"
    }
  ],
  "duplicate_ci_action": "delete",
  "duplicate_ci_updates": "",
  "task_conditions":
 "category=attribute^key=serial_number^value=E2BX1^EQ"
};

sn_cmdb.DuplicateTemplate.updateTemplate(<template_id>,
 template);
```

Output:

```
true
```

DurationCalculator - Global

The *DurationCalculator* script include provides methods for calculating durations and due dates.

DurationCalculator - DurationCalculator( )

Constructor for *DurationCalculator* class.

Parameters

Name	Type	Description
None		

```
var dc = new DurationCalculator();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DurationCalculator - calcDuration(Number seconds)

Calculates an end date and time based on current start date and time and passed in duration (seconds).

This method also sets the *this.endDateTime*, *this.seconds*, and *this.totalSeconds* properties with the updated values. The *seconds* property represents the total number of seconds of work to be performed in the duration based on the work schedule. The *totalSeconds* property represents the total number of seconds between the start and end times of the duration, which includes both work and non-work.

Prior to calling this method, you must call *setStartDateTime()* with the start time to use for the duration.

Parameters

Name	Type	Description
seconds	Number	Number of seconds to add to the start date and time to compute the end date and time, seconds, and total seconds values.

Returns

Type	Description
Boolean	False if the input value is not a number.

```
var gdt = new GlideDateTime("2020-05-01 00:00:00");

var dc = new DurationCalculator();
dc.setStartDateTime(gdt);

if(!dc.calcDuration(2*24*3600)){ // 2 days
  gs.log("*** Error calculating duration");
  return;
}
var secs = dc.getSeconds();
var totalSecs = dc.getTotalSeconds();

gs.print("***SCHEDULE DURATION: SECS=" + secs + " TOTALSECS=" +
 totalSecs + " ENDTIME = " + endDateTime);
```

Output

```
***SCHEDULE DURATION: SECS=172800 TOTALSECS=970534 ENDTIME =
 2020-05-03 00:00:00
```

DurationCalculator - calcRelativeDueDate(GlideDateTime start, Number days, String endTime)

Calculates the due date starting at the passed in start time and adding the number of days using the current schedule and time zone.

Called from relative duration definitions, initiated by *calcRelativeDuration()*, as `calculator.calcRelativeDueDate(calculator.startDateTime, days)`. Once the day that the work is due is determined, the method sets the time to the passed in *endTime* of that day. If there are not enough days left in the schedule, uses the last day in the schedule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
start	GlideDateTime	GlideDateTime object that contains the start date for the computation.
days	Number	Number of days to add to the start date.
endTime	String	Time of day that the work is due on the computed due date. If blank, defaults to the end of the work day. Format: HH:mm:ss

Returns

Type	Description
Boolean	Flag that indicates if the completion date is within the schedule. Possible values: • true: Completion date is within the schedule. • false: Completion date falls outside the schedule. Undefined if no schedule was set prior to calling this method.

```
var dc = new DurationCalculator();
var startTime = new GlideDateTime();

// Settings for calculations
// Optional: Specify the schedule to use for the following
 calculations
dc.setSchedule('08fcd0830a0a0b2600079f56b1adb9ae');
// Optional: Specify a different timezone to use
dc.setTimeZone("Los Angeles");
// Optional: Set a start date and time, otherwise the current
 time is assumed
dc.setStartDateTime("2020-04-10 08:00:00")
// Calculate end time, from number of seconds required in the
 schedule
dc.calcDuration(3*24*3600); // 3 days
dc.calcRelativeDueDate(startTime, "3", "07:00:00");
```

DurationCalculator - calcRelativeDuration(String relativeDurationID)

Calculates the duration using the specified relative duration script.

Upon completion, the *this.endDateTime* and *this.seconds* properties are set to indicate the results of the calculation.

Parameters

Name	Type	Description
relativeDurationID	String	sys_id of relative duration schedule (table cmn_relative_duration).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	The result of the duration script.

```
var dc = new DurationCalculator();
dc.calcRelativeDuration('08fcd0830a0a1b2600074f56b1ad7cb');
```

DurationCalculator - calcScheduleDuration(String startTime, String endTime)

Returns the duration between the *startTime* and the *endTime* within the already-specified schedule and optionally overridden timezone.

This method also sets *this.endDateTime*, *this.seconds*, and *this.totalSeconds* in the current schedule object.

Parameters

Name	Type	Description
startTime	String	Optional. Display value for the end time. Default: Uses the current date and time (set using *setStartDateTime()*). You must pass a placeholder if this parameter it not passed, such as `dur.calcScheduleDuration("", endDateTime);`.
endTime	String	Optional. Display value for the start time. Default: Uses the current date and time (set using *setEndDateTime()*).

Returns

Type	Description
Number	Schedule duration. Returns 0 if *endTime* is before *startTime*. Unit: Seconds

```
var dur = new DurationCalculator();

// Set 9-5 weekday schedule. This is the schedule in which
 endDateTime, seconds, and totalseconds is set
dur.setSchedule('08fcd0830a0a0b2600079f56b1adb9ae');
dur.calcScheduleDuration("2019-01-02 11:00:00", "2019-01-06
 09:00:00");
var secs = dur.getSeconds();
var totalSecs = dur.getTotalSeconds();
var endDateTime = dur.getEndDateTime() + "";

gs.print("***SCHEDULE DURATION: SECS=" + secs + " TOTALSECS=" +
 totalSecs + " ENDTIME = " + endDateTime);
```

 2019-01-06 09:00:00
```

DurationCalculator - calcScheduleDuration(GlideDateTime startTime, GlideDateTime endTime)

Returns the duration between the *startTime* and the *endTime* within the already-specified schedule and optionally overridden timezone.

This method also sets *this.endDateTime*, *this.seconds*, and *this.totalSeconds* in the current schedule object.

Parameters

Name	Type	Description
startTime	GlideDateTime	Optional. GlideDateTime object that contains the start time to use. Default: Uses the current date and time (set using *setStartDateTime()*). You must pass a placeholder if this parameter it not passed, such as `dur.calcScheduleDuration("", endDateTime);`.
endTime	GlideDateTime	Optional. GlideDateTime object that contains the end time to use. Default: Uses the current date and time (set using *setEndDateTime()*).

Returns

Type	Description
Number	Schedule duration. Returns 0 if *endTime* is before *startTime*. Unit: Seconds

```
var startDateTime = new GlideDateTime("2020-11-02 11:00:00");
// Instantiate a new GlideDateTime object which has the end date
 as the current date and time
var endDateTime = new GlideDateTime();
var dur = new DurationCalculator();

// Set 9-5 weekday schedule. This is the schedule in which
 endDateTime, seconds, and totalseconds is set
dur.setSchedule('08fcd0830a0a0b2600079f56b1adb9ae');
dur.calcScheduleDuration(startDateTime, endDateTime);
var secs = dur.getSeconds();
var totalSecs = dur.getTotalSeconds();

gs.print("***SCHEDULE DURATION: SECS=" + secs + " TOTALSECS=" +
 totalSecs + " ENDTIME = " + endDateTime);
```

Output

```
***SCHEDULE DURATION: SECS=293734.24 TOTALSECS=970534 ENDTIME =
 2020-11-13 16:35:34
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DurationCalculator - getEndDateTime( )

Gets the *endDateTime* property that was set by *calcDuration*/*calcRelativeDuration*, indicating the end date and time for the duration.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideDateTime	The end datetime.

```
var dc = new DurationCalculator();
dc.calcDuration(52);
gs.print(dc.getEndDateTime());
```

2012-04-17 20:57:27

DurationCalculator - getSeconds( )

Returns the *this.seconds* property that was set by *calcDuration*/*calcRelativeDuration*, indicating the total number of seconds of work to be performed for the duration.

This is the total work time, not the total time between start and end times and may be used to determine percentages of the work time.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The total work time, in seconds.

```
var startDateTime = new GlideDateTime("2020-11-02 11:00:00");
// Instantiate a new GlideDateTime object which has the end date
 as the current date and time
var endDateTime = new GlideDateTime();
var dur = new DurationCalculator();

// Set 9-5 weekday schedule. This is the schedule in which
 endDateTime, seconds, and totalseconds is set
dur.setSchedule('08fcd0830a0a0b2600079f56b1adb9ae');
dur.calcScheduleDuration(startDateTime, endDateTime);
var secs = dur.getSeconds();
var totalSecs = dur.getTotalSeconds();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.print("***SCHEDULE DURATION: SECS=" + secs + " TOTALSECS=" +
 totalSecs + " ENDTIME = " + endDateTime);
```

Output

```
***SCHEDULE DURATION: SECS=293734.24 TOTALSECS=970534 ENDTIME =
 2020-11-13 16:35:34
```

DurationCalculator - getTotalSeconds( )

Returns the *totalSeconds* value that was set by a call to *calculate(record)*.

The *totalSeconds* property represents the total number of seconds between the start and end times of the duration, which includes both work and non-work.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The total number of seconds.

```
var startDateTime = new GlideDateTime("2020-11-02 11:00:00");
// Instantiate a new GlideDateTime object which has the end date
 as the current date and time
var endDateTime = new GlideDateTime();
var dur = new DurationCalculator();

// Set 9-5 weekday schedule. This is the schedule in which
 endDateTime, seconds, and totalseconds is set
dur.setSchedule('08fcd0830a0a0b2600079f56b1adb9ae');
dur.calcScheduleDuration(startDateTime, endDateTime);
var secs = dur.getSeconds();
var totalSecs = dur.getTotalSeconds();

gs.print("***SCHEDULE DURATION: SECS=" + secs + " TOTALSECS=" +
 totalSecs + " ENDTIME = " + endDateTime);
```

Output

```
***SCHEDULE DURATION: SECS=293734.24 TOTALSECS=970534 ENDTIME =
 2020-11-13 16:35:34
```

DurationCalculator - isAfter(GlideDateTime dt, String tm)

Compares the passed in time to the time value in the passed in GlideDateTime object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
dt	GlideDateTime or String	Either a GlideDateTime object or a display value date and time to compare to the passed in *tm* value. If you pass a display value date and time, the method converts it to a GlideDateTime object.
tm	String	Display value for the time to compare against the time value in the GlideDateTime object. Assumes same date. Format: HH:mm:ss

Returns

Type	Description
Boolean	Flag that indicates if the passed in time value (*tm*) is after the time in the GlideDateTime object (*dt*). Possible values: • true: *tm* is after *dt*. • false *tm* is not after *dt*.

```
var dc = new DurationCalculator();
gs.print(dc.isAfter("2020-04-10 08:00:00", "09:00:00"));
```

*** Script: true

DurationCalculator - setSchedule(String schedId, String timezone)

Sets the schedule and time zone to use for calculating the due date.

Parameters

Name	Type	Description
schedId	String	Sys_id of the schedule to set. Located in the Schedule [cmn_schedule] table.
timezone	String	Optional. Time zone to set. Default: User's time zone.

Returns

Type	Description
void	

```
var startDateTime = new GlideDateTime("2020-11-02 11:00:00");
// Instantiate a new GlideDateTime object which has the end date
 as the current date and time
var endDateTime = new GlideDateTime();
var dur = new DurationCalculator();
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Set 9-5 weekday schedule. This is the schedule in which
 endDateTime, seconds, and totalseconds is set
dur.setSchedule('08fcd0830a0a0b2600079f56b1adb9ae');
dur.calcScheduleDuration(startDateTime, endDateTime);
var secs = dur.getSeconds();
var totalSecs = dur.getTotalSeconds();

gs.print("***SCHEDULE DURATION: SECS=" + secs + " TOTALSECS=" +
 totalSecs + " ENDTIME = " + endDateTime);
```

Output

```
***SCHEDULE DURATION: SECS=293734.24 TOTALSECS=970534 ENDTIME =
 2020-11-13 16:35:34
```

DurationCalculator - setStartDateTime(String start)

Sets the start date and time for the duration calculations.

Parameters

Name	Type	Description
start	String	Display value for the start time in GMT for subsequent calculations.

Returns

Type	Description
void	

```
var dc = new DurationCalculator();
dc.setStartDateTime("2020-04-10 08:00:00")
```

DurationCalculator - setStartDateTime(GlideDateTime description)

Sets the start date and time for the duration calculations.

Parameters

Name	Type	Description
description	GlideDateTime	GlideDateTime object that contains the start time in GMT for subsequent calculations.

Returns

Type	Description
void	

```
var startDateTime = new GlideDateTime("2020-11-02 11:00:00");
var dur = new DurationCalculator();

// Set 9-5 weekday schedule.
dur.setSchedule('08fcd0830a0a0b2600079f56b1adb9ae');
dur.setStartDateTime(startDateTime);
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DurationCalculator - setTimeZone(String timezone)

Sets the time zone to use for calculating the due date.

Parameters

Name	Type	Description
timezone	String	Value of the time zone.

Returns

Type	Description
void	

```
var dc = new DurationCalculator();
dc.setTimeZone("Los Angeles");
```

DynamicSchemaAPI - Global

The *DynamicSchemaAPI* provides methods to clear the various caches used by the dynamic schema implementation.

You must have the dynamic_schema_writer role to execute any of the *clear()* methods.

Note: You shouldn't need to call the *clear()* methods in a production environment. Use these methods when you are troubleshooting your implementation if you think there is a possible caching problem causing stale data.

For more information on dynamic attributes, see Dynamic Schema.

DynamicSchemaAPI - clearDynamicCategoryCache()

Clears the entire dynamic category cache (DynamicCategoryCache).

DynamicCategoryCache is the internal in-memory cache of all dynamic categories. If you observe issues with stale category data, use this method to clear the cache.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this method.

```
var api = DynamicSchemaAPI.get();
api.clearDynamicCategoryCache();
```

DynamicSchemaAPI - clearDynamicChoiceSetCache()

Clears the entire dynamic choice set cache (DynamicChoiceSets).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DynamicChoiceSets is the internal in-memory cache of all dynamic choice sets. If you observe issues with stale choice sets data, use this method to clear the cache.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this method.

```
var api = DynamicSchemaAPI.get();
api.clearDynamicChoiceSetCache();
```

DynamicSchemaAPI - clearDynamicAttributeGroupCache()

Clears the DynamicAttributeGroups and DynamicAttributes caches.

These are internal in-memory caches that contain the attribute and attribute group data. If you observe issues with stale attribute or group data, use this method to clear the cache.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this method.

```
var api = DynamicSchemaAPI.get();
api.clearDynamicAttributeGroupCache();
```

DynamicSchemaAPI - clearDynamicAttributeGroupCacheItem(String sysId)

Clears the specified dynamic attribute group from the DynamicAttributeGroup cache.

If you observe issues with stale data for a specific attribute group, use this method to clear the group's cache.

Parameters

Name	Type	Description
sysId	String	Sys_id of the attribute group to clear from the cache. Located in the Dynamic Attribute Group [dynamic_attribute_group] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
var api = DynamicSchemaAPI.get();
api.clearDynamicAttributeGroupCacheItem(sysId);
```

DynamicSchemaAPI - clearDynamicCategoryCacheItem(String sysId)

Clears a specified dynamic schema category from the DynamicCategoryCache.

DynamicCategoryCache is the internal in-memory cache of all dynamic categories. If you observe issues with stale category data for a specific category, use this method to clear that category's cache.

Parameters

Name	Type	Description
sysId	String	Sys_id of the category to clear from the cache. Located in the Dynamic Category [dynamic_category] table.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
var api = DynamicSchemaAPI.get();
api.clearDynamicCategoryCacheItem(sysId);
```

DynamicSchemaAPI - clearDynamicChoiceSetItem(String sysId)

Clears a specified dynamic schema choice set from the DynamicChoiceSets cache.

DynamicChoiceSets is the internal in-memory cache for all dynamic choice sets. If you observe an issue with stale data for a specific choice set, use this method to clear that choice set's cache.

Parameters

Name	Type	Description
sysId	String	Sys_id of the choice set to clear from the cache. Located in the Dynamic Choice Set [dynamic_choice_set] table.

Returns

Type	Description
None	

The following code example shows how to call this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var api = DynamicSchemaAPI.get();
api.clearDynamicChoiceSetItem(sysId);
```

DynamicSchemaAPI - get()

Returns the DynamicSchemaAPI singleton.

You must call this method prior to calling any other *DynamicSchemaAPI* method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this method.

```
var api = DynamicSchemaAPI.get();
```

DynamicTranslation - Scoped

The *DynamicTranslation* API provides methods that translate text, in real time, into multiple languages using translation service providers.

In addition, you can use this API to detect the language of a specific string and check whether the *DynamicTranslation* methods are enabled for a translation service. Use this API to create a seamless localization experience for your user interface, enabling one interface to service multiple countries.

Currently this API supports two translation service providers: Microsoft Azure Translator Service and Google Cloud Translator Service. You can also configure other translation services within your instance and then use the *DynamicTranslation* API to translate your text.

When using these methods in a server-side script, use the `sn_dt_api` namespace identifier. Before you are able to use this API, you must activate the DynamicTranslation (com.glide.dynamic_translation) plugin. For information on this plugin and additional information on Dynamic Translation, refer to Dynamic translation overview.

DynamicTranslation - getDetectedLanguage(String text, Object parms)

Detects the language of the passed in text.

If you pass in a translator, the method uses that translation service to detect the source language. Otherwise, the detection is performed by the default translation service. Ensure that the text strings that you provide contain enough verbiage to enable proper language detection.

In addition to the detected language, the response contains a confidence level of the detection, along with other possible language alternatives. If a translator is not passed in, the method also returns the default translation service used to detect the language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
text	String	Text to use to detect the language.
parms	Object	Optional. JSON object that contains additional translation parameters.
parms.translator	String	Optional. Translation service to use to translate the text (not case-sensitive). Valid values: • Google • Microsoft • IBM • <custom> **Note:** To use custom translation services you must first configure the translation service in your instance. For details, see Integrate with a translation service provider. Default: Translation service configured in the Translator Configuration [sn_dt_translator_configuration] table.

Returns

Type	Description
alternatives	Array of objects that describe other languages that also may be a match. Data type: Array `"alternatives": [ { "code": "String", "confidence": "String", "name": "String" } ]`
alternatives.code	Language code of the alternative language. Data type: String
alternatives.confidence	Float value indicating the confidence level of the alternative language. Value is between zero and one. The lower the value, the lower the confidence level. Data type: String
alternatives.name	Language code of the alternative language. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

detectedLanguage	Description of the detected language.
	
	Data type: Object
	
	`"detectedLanguage": {`
	`  "code": "String",`
	`  "confidence": "String",`
	`  "name": "String"`
	`}`

detectedLanguage.code	Language code of the detected language. Data type: String
detectedLanguage.confidence	Float value indicating the confidence level of the alternative language. Value is between zero and one. The lower the value, the lower the confidence level. Data type: String
detectedLanguage.name	Language code of the detected language. Data type: String
translator	Translation service used to detect the language. Data type: String
Error messages	The following are error messages that the method may return and indications as to the error's root cause. • Text ("text" field) is missing or invalid. (40000): The text to translate is either missing or not a string. • Dynamic Translation plugin is not installed. (40001): The *`Dynamic Translation`* API was invoked without activating the com.glide.dynamic_translation plugin. For information on activating this plugin, see Dynamic translation overview. • Translator ("translator" field) is invalid. (40003): The passed in *`translator`* parameter is not a string. • <translator> translator is not configured. (40004): The specified translation service is not configured in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • <translator> translator is inactive. (40005): The specified translation service is not set to **Active** in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • Additional parameters are invalid. (40006): The additional parameters that were passed are not an object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• Maximum time limit has been exceeded. (40009): The operation took longer than the defined timeout value specified in the Translation Configuration. Default: 40 seconds • Default translator is not configured for detection. (40011): The default translation service has not been specified for language detection in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • <translator> translator is not configured for detection. (40013): The specified translation service is not configured for language detection in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • Unknown error occurred. (40051): Default error thrown when the error doesn't fall in to any other category. • Text ("text" field) has exceeded its maximum length. (40052): The text that was passed in to translate exceeds the maximum length supported by the corresponding translation service. • Request is not authorized because credentials are missing or invalid (40055): The credentials configured for the translation service in Connections & Credentials are not valid. For information on connections and credentials, see Dynamic translation overview.

This example shows code in a server-side script that detects a string in English using IBM's translation service.

```
var detectedResponse =
 sn_dt_api.DynamicTranslation.getDetectedLanguage('Please detect
 the language of this text', {"translator":'IBM'});
 gs.info(JSON.stringify(detectedResponse));
```

Output:

```
{
  detectedLanguage:
    { "code": "en", "confidence": "1", "name": "en" }
  alternatives:
    [
      { "code": "vi", "confidence": "0.86", "name": "vi" },
      { "code": "id", "confidence": "0.86", "name": "id" }
    ]
 }
```

This example shows a server script that throws an error when an invalid translation service is passed in.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var detectedResponse =
 sn_dt_api.DynamicTranslation.getDetectedLanguage('Please detect
 the language of this text', {"translator":123});
 gs.info(JSON.stringify(detectedResponse));
```

Output:

```
{"code":"40003","message":"Translator (\"translator\" field) is
 invalid"}
```

DynamicTranslation - getDetectedLanguages(Array texts, Object parms)

Detects the languages of the passed in text strings.

If you pass in a translator, the method uses that translation service to detect the source language. Otherwise, the detection is performed by the default translation service. Ensure that the text strings that you provide contain enough verbiage to enable proper language detection.

In addition to the detected language, the response contains a confidence level of the detection, along with other possible language alternatives. If a translator is not passed in, the method also returns the default translation service used to detect the language.

Parameters

Name	Type	Description
texts	Array	List of text strings to use to detect the language(s).
parms	Object	Optional. JSON object that contains additional translation parameters. `"parms": { "translator": "String" }`
parms.translator	String	Translation service to use to detect the language of a string. Translation services are configured under the **Translator Configuration** menu and located in the Translator Configuration [sn_dt_translator_configuration] table. Possible values - not case-sensitive: • Google • Microsoft • IBM • <custom> **Note:** To use custom translation services you must first configure the translation service in your instance. For details, see Integrate with a translation service provider. Default: Translation service configured in the Translator Configuration [sn_dt_translator_configuration] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
detections	Language detection of text strings. Data type: Object `"detections": { "alternatives": [Array], "detectedLanguage": {Object}, "isError": Boolean ]`
detections.alternatives	Array of objects that describe other languages that might also be a match. Data type: Array `"alternatives": [ { "code": "String", "confidence": "String", "name": "String" } ]`
detections.alternatives.code	Language code of the alternative language. Data type: String
detections.alternatives.confidence	Float value indicating the confidence level of the alternative language. Value is between zero and one. The lower the value, the lower the confidence level. Data type: String
detections.alternatives.name	Language code of the alternative language. Data type: String
detections.detectedLanguage	Description of the detected language. Data type: Object `"detectedLanguage": { "code": "String", "confidence": "String", "name": "String" }`
detections.detectedLanguage.code	Language code of the detected language. Data type: String
detections.detectedLanguage.confidence	Float value indicating the confidence level of the alternative language. Value is between zero and one. The lower the value, the lower the confidence level.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
detections.detectedLanguage	language code of the detected language. Data type: String
detections.isError	Flag that indicates whether the detection of language for the text resulted in an error. Valid values: • true: Error encountered. • false: Language detection was successful. Data type: Boolean
status	Status of the response to the method call. Possible values: • Error • Partial • Success Data type: String
translator	Translation service used to detect the language. Data type: String
Error messages	The following are error messages that the method may return and indications as to the error's root cause. • Text ("text" field) is missing or invalid. (40000): The text to translate is either missing or not a string. • Dynamic Translation plugin is not installed. (40001): The *`Dynamic Translation`* API was invoked without activating the com.glide.dynamic_translation plugin. For information on activating this plugin, see Dynamic translation overview. • Translator ("translator" field) is invalid. (40003): The passed in *`translator`* parameter is not a string. • <translator> translator is not configured. (40004): The specified translation service is not configured in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • <translator> translator is inactive. (40005): The specified translation service is not set to **Active** in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • Additional parameters are invalid. (40006): The additional parameters that were passed are not an object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• Maximum time limit has been exceeded. (40009): The operation took longer than the defined timeout value specified in the Translation Configuration. Default: 40 seconds • Request failed with multiple errors. (40010): Multiple errors occurred in the language detection call. For more information, refer to the response for each individual text string. • Default translator is not configured for detection. (40011): The default translation service has not been specified for language detection in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • <translator> translator is not configured for detection. (40013): The specified translation service is not configured for language detection in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • Translator configuration version is invalid. Migrate to v3. (40014): The associated version of the Translator Configuration for the specified translation service does not support the specified text translation method. For more information, see Migrate to version v3 of a translator configuration. • Unknown error occurred. (40051): Default error thrown when the error doesn't fall in to any other category. • Text ("text" field) has exceeded its maximum length. (40052): The text that was passed in to translate exceeds the maximum length supported by the corresponding translation service. • Request is not authorized because credentials are missing or invalid (40055): The credentials configured for the translation service in Connections & Credentials are not valid. For information on connections and credentials, see Dynamic translation overview.

This example shows code in a server script that detects English as the language of the passed-in strings using the Microsoft translation service.

```
var detectedResponse =
 sn_dt_api.DynamicTranslation.getDetectedLanguages(["First text
 string language to detect", "Second text string language to
 detect"], {"translator": "Microsoft"});
gs.info(JSON.stringify(detectedResponse));
```

Output

```
{
  "translator":"Microsoft",
  "status":"Success",
  "detections":[
    {
      "isError":false,
      "detectedLanguage":{"name":"en", "code":"en",
 "confidence":"1"},
```

```
      "alternatives":[
        {"name":"id", "code":"id", "confidence":"0.83"},
        {"name":"ms", "code":"ms", "confidence":"0.83"}
      ]
    },
    {
      "isError":false,
      "detectedLanguage":{"name":"en", "code":"en",
 "confidence":"1"},
      "alternatives":[
        {"name":"fr", "code":"fr", "confidence":"0.83"},
        {"name":"id", "code":"id", "confidence":"0.83"}
      ]
    }
  ]
}
```

This example shows code in a server script that returns a Partial status when two text strings are passed in and one of them is invalid.

```
var detectedResponse =
 sn_dt_api.DynamicTranslation.getDetectedLanguages(["First text
 string language to detect", ""], {"translator": "Microsoft"});
gs.info(JSON.stringify(detectedResponse));
```

Output

```
{
  "translator":"Microsoft",
  "status":"Partial",
  "detections":[
    {
      "isError":false,
      "detectedLanguage":{"name":"en", "code":"en",
 "confidence":"1"},
      "alternatives":[
        {"name":"id", "code":"id", "confidence":"0.83"},
        {"name":"ms", "code":"ms", "confidence":"0.83"}
      ]
    },
    {
      "isError":true,
      "code":"40000",
      "message":"Text is missing or invalid"
    }
  ]
}
```

This example shows code in a server script that throws an error when an invalid translation service is passed in.

```
var detectedResponse =
 sn_dt_api.DynamicTranslation.getDetectedLanguages(["First text
 string language to detect", "Second text string language to
 detect"], {"translator": "123"});
gs.info(JSON.stringify(detectedResponse));
```

Output

```
{"code":"40003","message":"Translator (\"translator\" field) is
 invalid","status":"Error"}
```

DynamicTranslation - getTranslation(String textToTranslate, Object parms)

Translates the passed in text to one or more languages.

The method uses translation services, such as Microsoft Azure Translator Service and Google Cloud Translator Service, to perform the translation. If you do not pass in translation parameters, the method uses the system default.

Parameters

Name	Type	Description
textToTranslate	String	Text to translate.
parms	Object	Optional. JSON object that contains additional translation parameters. `"parms": { "additionalParameters": {Object}, "sourceLanguage": "String", "targetLanguages": [Array], "translator": "String" }`
parms.additionalParameters	Array	Optional. Array of JSON objects. Each object contains key-value pairs that provide additional information for performing the translation. `"additionalParameters": { "parameterName": "String", "parameterValue": "String" }`
parms.additionalParameters.parameterName	String	Optional. Key name. Valid values: textype: Type of text to translate. For Microsoft Azure Translator Service only.
parms.additionalParameters.parameterValue	String	Optional. Value of the associated key. Valid values: • plain: Standard text string • html: HTML text string Default: plain

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
parms.sourceLanguage	String	Optional. Language code of the source text. Default: Translation service detects the source language.
parms.targetLanguages	Array	Optional. List of language codes to use to translate the text. The method returns translated text for each language code. Default: User preferred language.
parms.translator	String	Optional. Translation service to use to translate the text (not case-sensitive). Valid values: • Google • Microsoft • IBM • <custom> **Note:** To use custom translation services you must first configure the translation service in your instance. For details, see Integrate with a translation service provider. Default: Translation service configured in the Translator Configuration [sn_dt_translator_configuration] table.

Returns

Type	Description
detectedLanguage	Description of the detected language. Data type: Object `"detectedLanguage": { "code": "String", "name": "String" }`
detectedLanguage.code	Language code of the detected language. Data type: String
detectedLanguage.name	Language code of the detected language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
translations	Array of objects that describe the language translations. Data type: Array `translations": [ { "targetLanguage": "String", "translatedText": "String" } ]`
translations.targetLanguage	Language code to which the source text was translated. Data type: String
translations.translatedText	Translated text. Data type: String
translator	Translation service used to detect the language. Data type: String
Error messages	The following are error messages that the method may return and indications as to their root cause. • Text ("text" field) is missing or invalid. (40000): The text to translate is either missing or not a string. • Dynamic Translation plugin is not installed. (40001): The *`Dynamic Translation`* API was invoked without activating the com.glide.dynamic_translation plugin. For information on activating this plugin, see Dynamic translation overview. • Default translator is not configured for translation. (40002): No translation service is selected as the default translation service in the Translator Configurations. For information on creating/modifying a translator configuration, see Create a translator configuration. • Translator ("translator" field) is invalid. (40003): The passed in *`translator`* parameter is not a string. • <translator> translator is not configured. (40004): The specified translation service is not configured in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • <translator> translator is inactive. (40005): The specified translation service is not set to **Active** in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration. • Additional parameters are invalid. (40006): The additional parameters that were passed are not an object.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• Target languages ("targetLanguages" field) are invalid. (40007): The *targetLanguages* parameter is passed in the call but is not valid for one of the following reasons:
	  ○ Value is not an array
	  ○ Array is empty
	  ○ One or multiple of the entries is not a string
	• Source language ("sourceLanguage" field) is invalid. (40008): The *sourceLanguage* parameter is passed in the call but the value is not a String.
	• Maximum time limit has been exceeded. (40009): The operation took longer than the defined timeout value specified in the Translation Configuration. Default: 40 seconds
	• <translator> translator is not configured for translation. (40012): The specified translation service is not configured for text translation in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration.
	• Unknown error occurred. (40051): Default error thrown when the error doesn't fall in to any other category.
	• Text ("text" field) has exceeded its maximum length. (40052): The text that was passed in to translate exceeds the maximum length supported by the corresponding translation service.
	• Source language is invalid. (40053): The passed in *sourceLanguage* parameter contains a language code that is not supported by the corresponding translation service.
	• Target language is invalid. (40054): One or more of the language codes passed in the *targetLanguages* parameter is not supported by the corresponding translation service.
	• Request is not authorized because credentials are missing or invalid (40055): The credentials configured for the translation service in Connections & Credentials are not valid. For information on connections and credentials, see Dynamic translation overview.
	• Text cannot be translated to target languages. (40056): The specified translation service is not able to translate the passed in text into the specified target languages.

This example shows a server script translating plain text from English (detected) into French and Italian using Microsoft's translation service.

```
try {

 gs.info(JSON.stringify(sn_dt_api.DynamicTranslation.getTranslat
ion("Translate this text using platform from server", {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "targetLanguages": ["fr", "it"],
    "additionalParameters": [{
      "parameterName": "texttype",
      "parameterValue": "plain"
    }],
    "translator": "Microsoft"
  }));
} catch (error) {
    gs.info(error.message);
}
```

Response:

```
{"translations":[
    {
      "targetLanguage":"it",
      "translatedText":"Tradurre questo testo utilizzando la
 piattaforma dal server"
    },
    {
      "targetLanguage":"fr",
      "translatedText":"Traduire ce texte en utilisant la
 plate-forme à partir du serveur"
    }
  ],
  "translator":"Microsoft",
  "detectedLanguage":{"code":"en","name":"en"}
}
```

This example shows a server script that throws an error when an invalid target language is passed in.

```
try {

 gs.info(JSON.stringify(sn_dt_api.DynamicTranslation.getTranslat
ion("Translate this text using platform from server", {
        "targetLanguages": ["123"],
        "additionalParameters": [{
            "parameterName": "texttype",
            "parameterValue": "plain"
        }],
        "translator": "Microsoft"
    })));
} catch (error) {
    gs.info(error.message);
}
```

Response:

```
{"code":"40054","message":"Target language is invalid"}
```

DynamicTranslation - getTranslations(Array texts, Object parms)

Translates the passed in text strings to one or more languages.

The method uses translation services, such as Microsoft Azure Translator Service and Google Cloud Translator Service, to perform the translation. If you do not pass in translation parameters, the method uses the system default.

Parameters

Name	Type	Description
texts	Array	List of text stings to translate.
parms	Object	Optional. JSON object that contains additional translation parameters. `"parms": { "additionalParameters": {Object}, "sourceLanguage": "String", "targetLanguages": [Array], "translator": "String" }`
parms.additionalParameters	Object	Optional. Array of JSON objects. Each object contains key-value pairs that provide additional information for performing the translation. `"additionalParameters": { "parameterName": "String", "parameterValue": "String" }`
parms.additionalParameters.parameterName	String	Optional. Key name. Valid values: textype: Type of text to translate. For Microsoft Azure Translator Service only.
parms.additionalParameters.parameterValue	String	Optional. Value of the associated key. Valid values: • plain: Standard text string • html: HTML text string Default: plain
parms.sourceLanguage	String	Optional. Language code of the source text. Default: Translation service detects the source language.
parms.targetLanguages	Array	Optional. List of language codes to use to translate the text. The method returns translated text for each language code. Default: User preferred language.

Parameters (continued)

Name	Type	Description
parms.translator	String	Optional. Translation service to use to translate the text (not case-sensitive). Valid values: • Google • Microsoft • IBM • <custom> **Note:** To use custom translation services you must first configure the translation service in your instance. For details, see Integrate with a translation service provider. Default: Translation service configured in the Translator Configuration [sn_dt_translator_configuration] table.

Returns

Type	Description
status	Status of the response to the method call. Possible values: • Error • Partial • Success Data type: String
translations	Array of objects that describe the language translations. Data type: Array `translations": [ { "isError": Boolean; "detectedLanguage": {Object}, "textTranslations": [Array] } ]`
translations.isError	Flag that indicates whether the translation of the text resulted in an error. Valid values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: Error encountered. • false: Text translation was successful. Data type: Boolean
translations.detectedLanguage	Description of the detected language. Data type: Object `"detectedLanguage": { "code": "String", "name": "String" }`
translations.detectedLanguage.code	Language code of the detected language. Data type: String
translations.detectedLanguage.name	Language code of the detected language. Data type: String
textTranlations	Array of objects. Description of the language used to translate the text string. `"textTranslation": { "targetLanguage": "String", "translatedText": "String" }`
textTranslations.targetLanguage	Language code to which the source text was translated. Data type: String
textTranslations.translatedText	Translated text. Data type: String
translator	Translation service used to translate the text. Data type: String
Error messages	The following are error messages that the method may return and indications as to their root cause. • Text ("text" field) is missing or invalid. (40000): The text to translate is either missing or not a string. • Dynamic Translation plugin is not installed. (40001): The *Dynamic Translation* API was invoked without activating the com.glide.dynamic_translation plugin. For information on activating this plugin, see Dynamic translation overview.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• Default translator is not configured for translation. (40002): No translation service is selected as the default translation service in the Translator Configurations. For information on creating/modifying a translator configuration, see Create a translator configuration.
	• Translator ("translator" field) is invalid. (40003): The passed in *translator* parameter is not a string.
	• <translator> translator is not configured. (40004): The specified translation service is not configured in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration.
	• <translator> translator is inactive. (40005): The specified translation service is not set to **Active** in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration.
	• Additional parameters are invalid. (40006): The additional parameters that were passed are not an object.
	• Target languages ("targetLanguages" field) are invalid. (40007): The *targetLanguages* parameter is passed in the call but is not valid for one of the following reasons:
	  ○ Value is not an array
	  ○ Array is empty
	  ○ One or multiple of the entries is not a string
	• Source language ("sourceLanguage" field) is invalid. (40008): The *sourceLanguage* parameter is passed in the call but the value is not a String.
	• Maximum time limit has been exceeded. (40009): The operation took longer than the defined timeout value specified in the Translation Configuration. Default: 40 seconds
	• Request failed with multiple errors. (40010): Multiple errors occurred in the language detection call. For more information, refer to the response for each individual text string.
	• <translator> translator is not configured for translation. (40012): The specified translation service is not configured for text translation in the Translator Configuration. For information on creating/modifying a translator configuration, see Create a translator configuration.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• Translator configuration version is invalid. Migrate to v3. (40014): The associated version of the Translator Configuration for the specified translation service does not support the specified text translation method. For more information, see Migrate to version v3 of a translator configuration. • Unknown error occurred. (40051): Default error thrown when the error doesn't fall in to any other category. • Text ("text" field) has exceeded its maximum length. (40052): The text that was passed in to translate exceeds the maximum length supported by the corresponding translation service. • Source language is invalid. (40053): The passed in *sourceLanguage* parameter contains a language code that is not supported by the corresponding translation service. • Target language is invalid. (40054): One or more of the language codes passed in the *targetLanguages* parameter is not supported by the corresponding translation service. • Request is not authorized because credentials are missing or invalid (40055): The credentials configured for the translation service in Connections & Credentials are not valid. For information on connections and credentials, see Dynamic translation overview. • Text cannot be translated to target languages. (40056): The specified translation service is not able to translate the passed in text into the specified target languages.

This example shows code in a server-side script that translates a list of text strings into French and Italian using the Microsoft translation service.

```
try {

 gs.info(JSON.stringify(sn_dt_api.DynamicTranslation.getTranslat
ions(["Translate first text using platform from server",
 "Translate second text using platform from server"], {
    "targetLanguages": ["fr", "it"],
    "additionalParameters": [{"parameterName": "texttype",
 "parameterValue": "plain"}],
    "translator": "Microsoft"
  })));
} catch (error) {
    gs.error(error.message);
}
```

Response:

```
{
  "translations":[
    {
      "isError":false,
      "textTranslations":[
        {
          "targetLanguage":"it",
          "translatedText":"Traduci il primo testo utilizzando
 la piattaforma dal server"
        },
        {
          "targetLanguage":"fr",
          "translatedText":"Traduire le premier texte à l'aide
 de la plate-forme à partir du serveur"
        }
      ],
      "detectedLanguage": {"name":"en", "code":"en"}
    },
    {
      "isError":false,
      "textTranslations":[
        {
          "targetLanguage":"it",
          "translatedText":"Traduci il secondo testo utilizzando
 la piattaforma dal server"
        },
        {
          "targetLanguage":"fr",
          "translatedText":"Traduire le deuxième texte à l'aide
 de la plate-forme à partir du serveur"
        }
      ],
      "detectedLanguage": {"name":"en", "code":"en"}
    }
  ],
  "translator":"Microsoft",
  "status":"Success"
}
```

This example shows a server script that returns a Partial status when one of the two passed in text strings is invalid.

```
try {

 gs.info(JSON.stringify(sn_dt_api.DynamicTranslation.getTranslat
ions(["Translate first text using platform from server", ""], {
    "targetLanguages": ["fr", "it"],
    "additionalParameters": [{"parameterName": "texttype",
 "parameterValue": "plain"}],
    "translator": "Microsoft"
  })));
} catch (error) {
    gs.error(error.message);
}
```

```
{
  "translations":[
    {
      "isError":false,
      "textTranslations":[
        {
          "targetLanguage":"it",
          "translatedText":"Traduci il primo testo utilizzando
 la piattaforma dal server"
        },
        {
          "targetLanguage":"fr",
          "translatedText":"Traduire le premier texte à l'aide
 de la plate-forme à partir du serveur"
        }
      ],
      "detectedLanguage":{"name":"en", "code":"en"}
    },
    {
      "isError":true,
      "code":"40000",
      "message":"Text is missing or invalid"
    }
  ],
  "translator":"Microsoft",
  "status":"Partial"
}
```

This example shows a server script that throws an error when an invalid translation service is passed in.

```
try {

 gs.info(JSON.stringify(sn_dt_api.DynamicTranslation.getTranslat
ions(["Translate first text using platform from server",
 "Translate second text using platform from server"], {
    "targetLanguages": ["fr", "it"],
    "additionalParameters": [{"parameterName": "texttype",
 "parameterValue": "plain"}],
    "translator": 123
  })));
} catch (error) {
    gs.error(error.message);
}
```

Response:

```
{"code":"40003","message":"Translator (\"translator\" field) is
 invalid","status":"Error"}
```

DynamicTranslation - isEnabled(String translator)

Determines whether the various methods in the *DynamicTranslation* API are enabled for a translation service.

If you pass in a specific translation service, the method checks the method activation for that translation service; otherwise the method checks the default translation service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
translator	String	Optional. Translation service to use to verify whether the methods are active. Translation services are configured under the Translator Configuration menu. Possible values - not case-sensitive: • Google • Microsoft • IBM • <custom> **Note:** To use custom translation services you must first configure the translation service in your instance. For details, see Integrate with a translation service provider. Default: Default translation service.

Returns

Type	Description
batchDetection	Flag that indicates whether the `getDetectedLanguages()` method is enabled. Possible values: • true: Enabled • false: Disabled Data type: Boolean
batchTranslation	Flag that indicates whether the `getTranslations()` method is enabled. Possible values: • true: Enabled • false: Disabled Data type: Boolean
detection	Flag that indicates whether the `getDetectedLanguage()` method is enabled. Possible values: • true: Enabled • false: Disabled Data type: Boolean
translation	Flag that indicates whether the `getTranslation()` method is enabled. Possible values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: Enabled • false: Disabled Data type: Boolean
Error messages	The following are error messages that the API may return and indications as to their root cause. • Translator ("translator" field) is invalid. (40003): The passed in *translator* parameter is not a string.

This example shows a server script that checks whether the *DynamicTranslation* methods are active for the Microsoft translator.

```
try {
  var response =
 sn_dt_api.DynamicTranslation.isEnabled('Microsoft');
  gs.info(JSON.stringify(response));
} catch(error) {
    gs.info(error.message);
}
```

Output:

```
{"detection":true,"batchTranslation":true,"batchDetection":true,
"translation":true}
```

This example shows a server script that throws an error when an invalid translation service is passed in.

```
try {
  var response = sn_dt_api.DynamicTranslation.isEnabled(123);
  gs.info(JSON.stringify(response));
} catch(error) {
    gs.info(error.message);
}
```

Output:

```
{"code":"40003","message":"Translator (\"translator\" field) is
 invalid"}
```

Encoder - Global

The *Encoder* API provides a scriptable object used in Predictive Intelligence stores. This object converts input data into vectors of numbers, based on encoder-specific goals and configurations. Encoders can be used independently to run encodings or can be configured as part of solutions to encode text columns.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Encoders are text processing objects that are either pre-trained or trained based on the language datasets you provide. You can train encoders that determine how the system interprets and processes text fields. For ML solutions that include text, you can train an encoder to specify how to process text and use the trained encoder in a solution.

Encoders have configuration and versions, and can be trained independently with their own retraining frequency. API-defined encoders are different from UI-defined encoders, because the retraining of UI-defined encoders is controlled by the solutions using them.

The encoder setup-to-training flow is as follows:

1. Create one or more datasets using the *DatasetDefinition* API.
2. Use the constructor to create an encoder object.
3. Add the encoder object to the encoder store using the *EncoderStore - add()* method.
4. Train the encoder using the *submitTrainingJob()* method. This creates a version of the object that you can manage using the *EncoderVersion* API.

Once you have trained an encoder, you can use it in a solution object:

- *ClassificationSolution*
- *ClusteringSolution* (required unless using the Levenshtein distance algorithm)
- *RegressionSolution*
- *SimilaritySolution* (required)

Note: This API runs with full privileges before the Vancouver Patch 7 Hotfix 2b and Washington DC Patch 7 releases. With later releases, grant access using ACLs. For more information see Query ACLs.

For usage guidelines, refer to Using ML APIs.

Encoder - Encoder(Object config)

Creates an encoder.

To get an encoder for one or more datasets, use this constructor to create a new encoder object with a unique name.

Parameters

Name	Type	Description
config	Object	JavaScript object containing configuration properties of the encoder. `{ "algorithmConfig": {Object}, "datasets": [Array], "domainName": "String", "label": "String", "minRowCount": "String", "processingLanguage": "String", "stopwords": [Array],`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>"trainingFrequency": "String"
		}</pre>

config.algorithmConfig	Object	Optional. JavaScript object containing algorithm configuration properties.
		<pre>'algorithmConfig' : {
		"algorithm": "String"
		}</pre>

config.algorithmConfig.algorithm	String	Name of the algorithm for training this encoder. Possible values: • *paravec*: Paragraph vector word embedding. • *tf-idf*: Term Frequency–Inverse Document Frequency (TF-IDF)-based text.
config.datasets	Array	List of *DatasetDefinition* object names.
config.domainName	String	Optional. Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Default: Current domain, for example, `"global"`.
config.label	String	Identifies the prediction task.
config.minRowCount	String	Optional. Minimum number of records required in the dataset for training. Default: 10000
config.processingLanguage	String	Optional. Processing language in two-letter ISO 639-1 language code format. Default: "en"
config.stopwords	Array	Optional. Preset list of strings that the system automatically generates based on the *language* property setting. For details, see Create a custom stopwords list. Default: English Stopwords

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
config.trainingFrequency	String	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once

The following example shows how to create an encoder job and add it to the encoder store.

```
var myPrbData = new sn_ml.DatasetDefinition({
    'tableName' : 'problem',
    'fieldNames' : ['short_description'],
    'encodedQuery' : 'activeANYTHING'
});

var myIncidentData = new sn_ml.DatasetDefinition({
    'tableName' : 'incident',
    'fieldNames' : ['short_description', 'description'],
    'encodedQuery' : 'activeANYTHING'
});

var myEncoder = new sn_ml.Encoder({
    'label': "encoder",
    'datasets' : [myPrbData, myIncidentData],
    'algorithmConfig' : {
        'algorithm' : 'tf-idf'
    }
});
var myEncoderName = sn_ml.EncoderStore.add(myEncoder);
```

Encoder - cancelTrainingJob()

Cancels a job for a encoder object that has been submitted for training.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to cancel an existing training job.

```
var myEncoder =
 sn_ml.EncoderStore.get('ml_sn_global_global_encoder');

myEncoder.cancelTrainingJob();
```

Encoder - getActiveVersion()

Gets the active EncoderVersion object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Active *EncoderVersion* object.

The following example shows how to get an active *Encoder* version from the store and return its training status.

```
var mlEncoder =
 sn_ml.EncoderStore.get('ml_x_snc_global_global_encoder');

gs.print(JSON.stringify(JSON.parse(mlEncoder.getActiveVersion().
getStatus()), null, 2));
```

Output:

```
{
  "state": "encoder_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

Encoder - getAllVersions()

Gets all versions of an encoder.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	Existing versions of an encoder object. See also *EncoderVersion* API.

The following example shows how to get all *Encoder* version objects and call the *getVersionNumber()* and *getStatus()* encoder version methods on them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var mlEncoder =
 sn_ml.EncoderStore.get('ml_x_snc_global_global_encoder');

var mlEncoderVersions = mlEncoder.getAllVersions();

for (i = 0; i < mlEncoderVersions.length; i++) {
gs.print("Version " + mlEncoderVersions[i].getVersionNumber() +
 " Status: " + mlEncoderVersions[i].getStatus() +"\n");
};
```

Output:

```
Version 3 Status:
 {"state":"encoder_complete","percentComplete":"100","hasJobEnde
d":"true"}

Version 2 Status:
 {"state":"encoder_complete","percentComplete":"100","hasJobEnde
d":"true"}

Version 1 Status:
 {"state":"encoder_cancelled","percentComplete":"0","hasJobEnded
":"true"}
```

Encoder - getLatestVersion()

Gets the latest version of an encoder.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	*EncoderVersion* object corresponding to the latest version of an *Encoder()*.

The following example shows how to get the latest version of an encoder and return its training status.

```
var mlEncoder =
 sn_ml.EncoderStore.get('ml_x_snc_global_global_encoder');

gs.print(JSON.stringify(JSON.parse(mlEncoder.getLatestVersion().
getStatus()), null, 2));
```

Output:

```
{
  "state": "encoder_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Encoder - getName()

Gets the name of the object to use for interaction with the store.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the encoder object.

The following example shows how to update *Encoder* dataset information and print the name of the object.

```
// Update encoder
var myIncidentData = new sn_ml.DatasetDefinition({
   'tableName' : 'incident',
   'fieldNames' : ['category', 'short_description', 'priority'],
   'encodedQuery' : 'activeANYTHING'
});

var eligibleFields =
 JSON.parse(myIncidentData.getEligibleFields(encoder));

var myEncoder = new sn_ml.Encoder({
   'label': "my encoder",
   'datasets' : [myIncidentData],
   'inputFieldNames': eligibleFields['eligibleInputFieldNames'],
   'predictedFieldName': 'category'
});

// update encoder
sn_ml.EncoderStore.update('ml_x_snc_global_global_my_definition_
4', myEncoder);

// print encoder name
gs.print('Encoder Name: '+myEncoder.getName());
```

Output:

```
Encoder Name: ml_x_snc_global_global_my_definition_4
```

Encoder - getProperties()

Gets solution object properties.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description

Object	Contents of the Dataset and *Encoder()* object details in the *EncoderStore*.
	
	`{`
	`"algorithmConfig" : {Object},`
	`"datasetsProperties": [Array],`
	`"domainName": "String",`
	`"label": "String",`
	`"name": "String",`
	`"processingLanguage": "String",`
	`"scope": "String",`
	`"stopwords": [Array],`
	`"trainingFrequency": "String"`
	`}`

<Object>.algorithmConfig.algorithm	Name of the algorithm for training this encoder. Possible values: • *paravec*: Paragraph vector word embedding. • *tf-idf*: Term Frequency–Inverse Document Frequency (TF-IDF)-based text. Data type: String.

<Object>.algorithmConfig	Optional. JavaScript object containing algorithm configuration properties.
	
	`'algorithmConfig' : {`
	`"algorithm": "String"`
	`}`
	
	Data type: Object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.datasetsProperties	List of *DatasetDefinition()* properties associated with the encoder. `{ "encodedQuery": "String", "fieldDetails": [Array], "fieldNames": [Array], "tableName": "String" }` Data type: Array.
<Object>.datasetsProperties.tableName	Name of the table for the dataset. For example, `"tableName" : "Incident"`. Data type: String.
<Object>.datasetsProperties.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Data type: Array.
<Object>.datasetsProperties.fieldNames.fieldDetails	List of JavaScript objects that specify field properties. `[ { "name": "String", "type": "String" } ]` Data type: Array.
<Object>.datasetsProperties.fieldNames.fieldDetails.<object>.name	Name of the field defining the type of information to restrict this dataset to. Data type: String.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.datasetsProperties.fieldDetails.<object>.type	Machine-learning field type. Data type: String.
<Object>.datasetsProperties.fieldDetails.encodedQuery	Encoded query string in standard Glide format. See Encoded query strings. Data type: String.
<Object>.domainName	Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String.
<Object>.label	Identifies the prediction task. `{ "label": "my first prediction" }` Data type: String.
<Object>.name	System-assigned name. Data type: String.
<Object>.predictedFieldName	Identifies a field to be trained for predictability. Data type: String.
<Object>.processingLanguage	Processing language in two-letter ISO 639-1 language code format. Data type: String.
<Object>.scope	Object scope. Currently the only valid value is `global`. Data type: String
<Object>.stopwords	Optional. Preset list of strings that the system automatically generates based on the *`language`* property setting. For details, see Create a custom stopwords list. Data type: Array.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.trainingFrequency	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once Data type: String.

The following example gets properties of an encoder object in the store.

```
var myEncoder =
 sn_ml.EncoderStore.get('ml_sn_global_global_encoder');

gs.print(JSON.stringify(JSON.parse(myEncoder.getProperties()),
 null, 2));
```

Output:

```
*** Script: {
  "datasetsProperties": [
    {
      "tableName": "incident",
      "fieldNames": [
        "assignment_group",
        "short_description",
        "description"
      ],
      "encodedQuery": "activeANYTHING"
    }
  ],
  "domainName": "global",
  "label": "my encoder definition",
  "name": "ml_x_snc_global_global_my_encoder_definition",
  "processingLanguage": "en",
  "scope": "global",
  "stopwords": [
    "Default English Stopwords"
  ],
  "trainingFrequency": "run_once"
}
```

Encoder - getVersion(String version)

Gets an encoder by provided version number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
version	String	Existing version number of an encoder.

Returns

Type	Description
Object	Specified version of the *Encoder()* object on which you can call *EncoderVersion* API methods.

The following example shows how to get the training status of an encoder by version number.

```
var mlEncoder =
 sn_ml.EncoderStore.get('ml_x_snc_global_global_encoder');

gs.print(JSON.stringify(JSON.parse(mlEncoder.getVersion('1').get
Status()), null, 2));
```

Output:

```
{
  "state": "encoder_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

Encoder - setActiveVersion(String version)

Activates a specified version of an encoder in the store.

Parameters

Name	Type	Description
version	String	Name of the *Encoder()* object version to activate. Activating this version deactivates any other version.

Returns

Type	Description
None	

The following example shows how to activate an encoder version in the store.

```
sn_ml.Encoder.setActiveVersion("ml_incident_categorization");
```

Encoder - submitTrainingJob()

Submits a training job.

Note: Before running this method, you must first add an encoder to the store using the *EncoderStore - add()* method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	*EncoderVersion* object corresponding to the *Encoder* being trained.

The following example shows how to create a dataset, apply it to an encoder, add it to a store, and submit the training job.

```
// Create a dataset
var myData = new sn_ml.DatasetDefinition({

  'tableName' : 'incident',
  'fieldNames' : ['assignment_group', 'short_description',
 'description'],
  'encodedQuery' : 'activeANYTHING'

});

// Create an encoder
var myEncoder = new sn_ml.Encoder({

  'label': "my encoder definition",
  'datasets' : [myData],
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames':['short_description']

});

// Add the encoder to the store to later be able to retrieve it.
var my_unique_name = sn_ml.EncoderStore.add(myEncoder);

// Train the encoder - this is a long running job
var myEncoderVersion = myEncoder.submitTrainingJob();
```

EncoderStore - Global

The *EncoderStore* API provides methods to store and retrieve encoders.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

EncoderStore - add(Object mlEncoder)

Adds a new encoder object to the store and returns a unique name.

Note: Label values do not need to be unique. For example, if you run this method with the same label 10 times, this method adds 10 different uniquely-named objects to the store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
mlEncoder	Encoder	*Encoder()* object to add to the store.

Returns

Type	Description
String	System-generated solution name.

The following example shows how to add an encoder to the store. Use *Encoder - submitTrainingJob()* to run the training job after adding it to the store.

```
// Create a dataset
var myData = new sn_ml.DatasetDefinition({

  'tableName' : 'incident',
  'fieldNames' : ['assignment_group', 'short_description',
 'description'],
  'encodedQuery' : 'activeANYTHING'

});

// Create a solution
var myEncoder = new sn_ml.Encoder({

  'label': "my encoder definition",
  'datasets' : [myData],
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames':['short_description']

});

// Add the encoder to the store to later be able to retrieve it.
var my_unique_name = sn_ml.EncoderStore.add(myEncoder);
```

EncoderStore - deleteObject(String name)

Removes a specified encoder object from the store.

Parameters

Name	Type	Description
name	String	Name of the *Encoder()* object to be deleted.

Returns

Type	Description
None	

The following example shows how to delete an encoder from the store.

```
sn_ml.EncoderStore.deleteObject("ml_sn_global_global_encoder");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

EncoderStore - get(String name)

Gets an encoder object from a store.

Parameters

Name	Type	Description
name	String	Name of an encoder in a store.

Returns

Type	Description
Object	*Encoder* object. Returns an error if the object does not exist.

The following example shows how to get an encoder object from the store using the *get()* method and view its training status using the Encoder - getActiveVersion() and EncoderVersion - getStatus() methods.

```
// Get status
var myEncoder =
 sn_ml.EncoderStore.get('ml_incident_categorization');

gs.print(JSON.stringify(JSON.parse(myEncoder.getActiveVersion().
getStatus(), null, 2)));
```

Output:

```
{
 "state":"solution_complete",
 "percentComplete":"100",
 "hasJobEnded":"true"
}
```

EncoderStore - getAllNames(Object options)

Gets the names of all encoder definition records in the store.

Parameters

Name	Type	Description
options	Object	Options for restricting results within the specified properties. `{ "label": "String", "domainName": "String", "scope": "String" };`
options.label	String	Optional. Label of your solution object.
options.domainName	String	Optional. Name of the domain for your solution object. Refer to Domain separation and Predictive Intelligence.
options.scope	String	Optional. Name of an application scope for your solution object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Array	List of strings representing encoder object names in the store.

In the following example, the *getAllNames()* method returns a list of all names in the store.

```
gs.print(JSON.stringify(JSON.parse(sn_ml.EncoderStore.getAllName
s()), null, 2));
```

Output:

```
[
  "ml_x_snc_global_global_classification_word_corpus",
  "ml_x_snc_global_global_predictability_estimate",
  "GloVe",
  "ml_x_snc_global_global_encoder",
  "ml_x_snc_global_global_predictability_estimate_1"
]
```

In the following example, the *getAllNames()* method returns only names associated with values set in the *options* parameter.

```
var options = {
  'label' : 'my encoder definition',
  'domainName' : 'global',
  'scope' : 'global'
};
var solNames = sn_ml.EncoderStore.getAllNames(options);
gs.print(JSON.stringify(JSON.parse(solNames), null, 2));
```

Output:

```
[
  "ml_x_snc_global_global_my_encoder_definition"
]
```

EncoderStore - update(String name, Object mlEncoder)

Updates an encoder object in a store.

Parameters

Name	Type	Description
name	String	Name of the encoder to update.
mlEncoder	*Encoder*	*Encoder()* object properties to update.

Returns

Type	Description
None	

The following example shows how to update an encoder object in the store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var encoderUpdate = new sn_ml.Encoder({
  'label': 'my encoder definition',
  'dataset' : myData,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames': ['short_description']
});

sn_ml.EncoderStore.update('ml_sn_global_global_incident_servic
e', encoderUpdate);
```

EncoderVersion - Global

The *EncoderVersion* API provides a scriptable object used in Predictive Intelligence stores.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

This API is used for working with encoder versions based on Encoder API objects in the Encoder store.

The system activates the most recent version of the encoder when it completes training, and only allows one version to be active at a time. However, you can activate any previously trained version you want to use to make predictions.

Methods in this API are accessible using the following *Encoder* methods:

- *getActiveVersion()*
- *getAllVersions()*
- *getLatestVersion()*
- *getVersion()*

EncoderVersion - getProperties()

Gets encoder object properties and version number.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Contents of the Dataset and Encoder details. Results vary by object property setup. `{ "algorithmConfig" : {Object}, "datasetsProperties": [Array], "domainName": "String", "isActive": "String", "label": "String", "name": "String", "predictedFieldName": "String", "processingLanguage": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>{
	  "scope": "String",
	  "stopwords": [Array],
	  "trainingFrequency": "String",
	  "versionNumber": "Number"
	}</pre>

<Object>.algorithmConfig	Optional. JavaScript object containing algorithm configuration properties.
	<pre>'algorithmConfig' : {
	  "algorithm": "String"
	}</pre>
	Data type: Object.

<Object>.algorithmConfig.algorithm	Name of the algorithm for training this encoder. Possible values: • *paravec*: Paragraph vector word embedding. • *tf-idf*: Term Frequency–Inverse Document Frequency (TF-IDF)-based text. Data type: String.

<Object>.datasetsProperties	List of *DatasetDefinition()* properties associated with the encoder.
	<pre>{
	  "encodedQuery": "String",
	  "fieldDetails": [Array],
	  "fieldNames": [Array],
	  "tableName": "String"
	}</pre>
	Data type: Array.

<Object>.datasetsProperties.tableName	Name of the table for the dataset. For example, `"tableName" : "Incident"`. Data type: String.
<Object>.datasetsProperties.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Data type: Array.

<Object>.datasetsProperties.fieldDetails	List of JavaScript objects that specify field properties.
	<pre>[
	  {
	  "name": "String",
	  "type": "String"</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	}] Data type: Array.
<Object>.datasetsProperties.fieldDetails	Name of the field that contains type of information to restrict this dataset to. Data type: String.
<Object>.datasetsProperties.fieldDetails.fieldType	Machine Details of field type. Data type: String.
<Object>.datasetsProperties.filterQuery	Encoded query string in Canary Glide format. See Encoded query strings. Data type: String.
<Object>.domainName	Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String.
<Object>.isActive	Flag that indicates whether this version is active. Valid values: • true: Version is active. • false: Version is not active. Data type: String

<Object>.label	Identifies the prediction task.
	
	{
	"label": "my first prediction"
	}
	
	Data type: String.

<Object>.name	System-assigned name. Data type: String.
<Object>.predictedFieldName	Identifies a field to be trained for predictability. Data type: String.
<Object>.processingLanguage	Processing language in two-letter ISO 639-1 language code format. Data type: String.
<Object>.scope	Object scope. Currently the only valid value is `global`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.stopwords	Optional. Preset list of strings that the system automatically generates based on the *language* property setting. For details, see Create a custom stopwords list. Data type: Array.
<Object>.trainingFrequency	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once Data type: String.
<Object>.versionNumber	Version number of the *Encoder* object. Data type: String.

The following example gets properties of the active object version in the store.

```
// Get properties
var mlEncoder =
 sn_ml.EncoderStore.get('ml_incident_categorization');

gs.print(JSON.stringify(JSON.parse(mlEncoder.getActiveVersion().
getProperties()), null, 2));
```

Output:

```
*** Script: {
  "datasetsProperties": [
    {
      "tableName": "incident",
      "fieldNames": [
        "assignment_group",
        "short_description",
        "description"
      ],
      "encodedQuery": "activeANYTHING"
    }
  ],
  "domainName": "global",
  "isActive": "true",
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "label": "my encoder definition",
  "name": "ml_x_snc_global_global_my_encoder_definition",
  "processingLanguage": "en",
  "stopwords": [
    "Default English Stopwords"
  ],
  "versionNumber": "1"
}
```

EncoderVersion - getSentenceVectors(Array input)

Returns vectors for each input sentence.

Parameters

Name	Type	Description
input	Array	Array of strings as sentences from which to receive vectors.

Returns

Type	Description
String	Array of sentence vectors.

The following example shows how to return a vector for a single sentence.

```
var myEncoderName = 'GloVe';

var myEncoder = sn_ml.EncoderStore.get(myEncoderName);

var input = ["I like to code."];

var vectors =
 myEncoder.getActiveVersion().getSentenceVectors(input);

gs.print(vectors);
```

Output:

```
*** Script:

```

EncoderVersion - getSimilarWords(Array input, Object options)

Returns words similar to each input word in the descending rank order of similarity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
input	Array	Array of words for which to find similar words.
options	Object	Map to refine results. `{ "topN":"String" }`
options.topN	String	If provided, returns the top results up to the specified number of words. For example, use `"10"` to return the top 10 most similar words.

Returns

Type	Description
Array	List of elements containing the similar words for the input word in the corresponding position. These similar words are represented by an of array of pairs in the format `[word, similarity score]`.

The following example shows how to get similar words using the `GloVe` encoder.

```
var myEncoderName = 'GloVe';
var myEncoder = sn_ml.EncoderStore.get(myEncoderName);
var input =  ["apple"];
var options = {"topN":"5"};
gs.print(myEncoder.getActiveVersion().getSimilarWords(input,
 options));
```

Output:

```
*** Script:
 [[["iphone",0.5987],["macintosh",0.5836],["ipod",0.5761],["micr
osoft",0.5664],["ipad",0.5628]]]
```

EncoderVersion - getStatus(Boolean includeDetails)

Gets training completion status.

Parameters

Name	Type	Description
includeDetails	Boolean	Flag that indicates whether to return status *details*. Valid values: • true: Return additional details. • false: Don't return additional details. Default: False

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	JavaScript object containing training status information for an Encoder object. `{ "state": "String", "percentComplete": "Number as a String", "hasJobEnded": "Boolean value as a String", "details": {Object} }`
<Object>.state	Training completion state. If the training job reaches a terminal state, the job does not leave that state. If the state is terminal, the *hasJobEnded* property is set to `true`. Possible values: • `fetching_files_for_training` • `preparing_data` • `retry` • `solution_cancelled` (terminal) • `solution_complete` (terminal) • `solution_error` (terminal) • `solution_incomplete` • `training_request_received` • `training_request_timed_out` (terminal) • `training_solution` • `uploading_solution` • `waiting_for_training` Data type: String
<Object>.hasJobEnded	Flag that indicates whether training is complete. Valid values: • true: Training is complete. • false: Training is incomplete. Data type: Boolean value as a String
<Object>.percentComplete	Training percent complete. If the completion percentage is less than 100, the job might be in a terminal state. For example, if training times out. Data type: Number as a String Range: 0 thru 100
<Object>.details	Object containing a list of additional training details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Object

The following example shows a successful result with training complete.

```
// Get status
var mlEncoder =
 sn_ml.EncoderStore.get('ml_incident_categorization');

gs.print(JSON.stringify(JSON.parse(mlEncoder.getActiveVersion().
getStatus(true), null, 2)));
```

Output:

```
{
 "state":"solution_complete",
 "percentComplete":"100",
 "hasJobEnded":"true",
 "details":{"stepLabel":"Encoder Complete"} // This information
 is only returned if getStatus(true);
}
```

The following example shows an unsuccessful result with training complete.

```
// Get status
var encoderName = 'ml_x_snc_global_global_encoder';
var mlEncoder = sn_ml.EncoderStore.get(encoderName);
var trainingStatus = mlEncoder.getLatestVersion().getStatus();

gs.print(JSON.stringify(JSON.parse(trainingStatus), null, 2));
```

Output:

```
{
 "state":"solution_error",
 "percentComplete":"100",
 "hasJobEnded":"true"
}
```

EncoderVersion - getVersionNumber()

Gets the version number of a solution object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Version number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to get a version number.

```
// Get version number
var mlEncoder =
 sn_ml.EncoderStore.get('ml_incident_categorization');

gs.print("Version number:
 "+JSON.stringify(JSON.parse(mlEncoder.getActiveVersion().getVer
sionNumber()), null, 2));
```

Output:

```
Version number: 1
```

EncoderVersion - getWordVectors(Array input)

Returns vectors for each input word.

Parameters

Name	Type	Description
input	Array	List of strings as words from which to receive vectors.

Returns

Type	Description
Array	List of vectors for each word provided.

The following example shows how to get a vector from the word `hello`.

```
var myEncoderName = 'GloVe';
var myEncoder = sn_ml.EncoderStore.get(myEncoderName);
var input =  ["hello"];

gs.print(myEncoder.getActiveVersion().getWordVectors(input));
```

Output:

```
*** Script:
 [[-0.337119996547699,-0.2169100046157837,-0.006636499892920256,

```

Event - Global

The *Event* API provides methods that enable the setting and getting of values within an event.

These events are sent from a MID Server to a ServiceNow instance. Before you are able to successfully send events, the connection between the MID Server and the ServiceNow instance must be defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the *Event* API to add/update fields within an event. Use the *SNEventSenderProvider* API to instantiate an event sender object. Then use the *IEventSender* API to send the event to a ServiceNow instance.

You must activate the Event Management (com.glideapp.itom.snac) plugin before attempting to access this API. The Event Management plugin requires a separate subscription and must be activated. This plugin includes demo data and activates related plugins if they are not already active.

For additional information on event management, see Event Management.

Event - Event()

Instantiates an Event constructor.

Parameters

Name	Type	Description
None		

```
var event = new Event();
var esource = event.getField("source");
var eseverity = event.getField("severity");
```

Event - getField(String field)

Returns the current value of the passed in event management field.

Parameters

Name	Type	Description
field	String	Name of the event management field value to return.

Returns

Type	Description
String	Value of the requested event management field.

```
var event = new Event();
var eventSource = event.getField("source");
var eventSeverity = event.getField("severity");
```

Event - setAdditionalInfo(String additionalInfo)

Replaces the existing *additional_info* field in the associated event with the passed in JSON string.

Note: You can use the setField() method to update a specific field within the *additional_info* field.

Parameters

Name	Type	Description
additionalInfo	String	JSON String (key/value pairs) to save in the *additional_info* field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Note: This parameter replaces the existing information. It does not update the existing fields.

Returns

Type	Description
void	

```
event.setAdditionalInfo("{\"evtComponent\":\"Microsoft-Windows-
 WindowsUpdateClient\",\"evtMessage\":\"Installation Failure:
 Windows failed. Error 0x80070490\"}");
```

Event - setField(String key, String value)

Sets the specified field in the associated event.

If the passed in *key* matches a predefined event field, the method updates the corresponding event field. Otherwise, the method adds the *key* parameter to the *additional_info* section of the event before applying the passed in *value*.

The following are the predefined event fields that you can modify using this method:

Field	Description
additional_info	Key-value pair to add to the *additional_info* field of the associated event. If the passed in key already exists, its value is overwritten. Maximum length: 4,000 characters Associated UI field: Additional information
ci_identifier	JSON string that uniquely identifies a configuration item. For example, `{"name":"SAP ORA01","type":"Oracle"}`. Maximum length: 1,000 characters
cmdb_ci	Sys_id of the Configuration Item [cmdb_ci] record to bind the event to. Default: Null
description	Free-form description of the event. Maximum length: 4,000 characters Associated UI field: Description Default: Null
event_class	Enterprise Message Service (EMS) that generated the event. For example, "Solarwinds" or "SCOM". Maximum length: 100

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Associated UI field: Source instance Default: Null
message_key	Unique event identifier. To override an existing event severity, use the same *message_key* value. Maximum length: 1024 characters Associated UI field: Message key Default: Combination of *source*, *node*, *type*, *resource*, and *metric name*.
resolution_state	Event resolution state. Valid values: • New: Resolution state for the corresponding event is open. • Closing: Resolution state for corresponding event is closing/closed. Associated UI field: Resolution state Default: New
resource	Node resource to associate with the event. For example, "Disk C:", "CPI-1", or the name of a process or service. Maximum length: 100 characters Associated UI field: Resource
severity	Event severity. Valid values: • 0: Clear - No action is required. An alert is not created from this event. Existing alerts are closed. • 1: Ok - An alert is created. The resource is still functional. • 2: Warning - Attention is required, even though the resource is still functional. • 3: Minor - Partial, non-critical loss of functionality or performance degradation occurred. • 4: Major - Major functionality is severely impaired or performance has degraded. • 5: Critical - Immediate action is required. The resource is either not functional or critical problems are imminent. Associated UI field: Severity Default: Null
source	Instance of the EMS that triggered the event. Typically the connector instance name. Maximum length: 200 characters

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Associated UI field: Source Default: Null
time_of_event	UTC time that the event occurred in the source system. Format: "yyyy-MM-dd HH:mm:ss" Maximum length: 40 characters Associated UI field: Time of event Default: Current date/time
type	Metric type to which the event is related, such as Disk or CPU. This value is used to identify an event record from which alerts are created. Maximum length: 100 characters Associated UI field: Type Default: Null

Note: You can also use the setText() method to update the *description* field and the setTimeOfEvent() method to update the event time.

For additional information on events, see Event Management.

Parameters

Name	Type	Description
key	String	Name of the key to add or update in the event. For additional information on the predefined event fields, see Event field format for event collection.
value	String	Information to store in the associated event field. **Note:** The *value* string is trimmed before it is stored, whereby multiple spaces are replaced with a single space.

Returns

Type	Description
void	

```
var event = new Event();
event.setField("source","SAP Solman");
event.setField("severity","3");
event.setField("time_of_event", "2019-18-05 13:12:05");
event.setField("type", "SAP object");
event.setField("user", "admin"); // parameter will be added to
 additional_info section
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event - setText(String text)

Sets the *description* field of the associated event to the passed in value.

Note: You can also use the Event - setField(String key, String value) method to set the *text* field in the current event. Unlike the *setField()* method, this method does not trim the passed in text.

Parameters

Name	Type	Description
text	String	Text to store in the *description* field of the associated event. Max length: 4000 characters

Returns

Type	Description
void	

```
var event = new Event();
event.setText("SAP Solman");
```

Event - setTimeOfEvent(String timeOfEvent)

Sets the *time_of_event* field in the associated event to the passed in UTC time value.

Note: You can also use the Event - setField(String key, String value) method to set the *time_of_event* field.

Parameters

Name	Type	Description
timeOfEvent	String	UTC time value to set in the *time_of_event* field. Format: "yyyy-MM-dd HH:mm:ss" Max length: 40 characters

Returns

Type	Description
void	

```
var event = new Event();
event.setTimeOfEvent("2019-18-05 13:12:05");
```

EventProcessorUtilOOB - Scoped

The *EventProcessorUtilOOB* script include provides methods to construct and publish events on the configured message broker.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to change the default functionality of this script include, you need to override these methods in the `EventProcessorUtil` script include. You must have the admin role to modify this script include.

This script include runs in the `sn_api_notif_mgmt` namespace.

EventProcessorUtilOOB - constructandPublishEvent(Object inboundEventPayloadRecord, String eventId)

Constructs a TMF688 compliant payload based on the passed information and publishes the event to the configured publishing platform.

The default publishing platform is defined in the sn_api_notif_mgmt.publisher_message_bus_config system property.

Note: This method is a core utility method of queue management. You should not need to override this method unless you plan on redesigning the underlying notification framework.

Parameters

Name	Type	Description
inboundEventPayloadRecord	Object	Information associated with the event. The format of this payload is dependent on the event type. In the base implementation, this is the glide record data of the associated event in JSON format.
eventId	String	Unique ID of the event to publish such as a GUID.

Returns

Type	Description
tmfEventPayload	TMF688-compliant event payload created for the event. For a description of the default format of this event payload, refer to the TMF688 Event Management API User Guide.

The following code example shows how to call this method.

```
processIndividualEventRecord: function(inboundQueueGr, node_id)
 {
  var isError = false;
  var errorMessage;
  try {
    new
 EventProcessorUtil().constructandPublishEvent(JSON.parse(inboun
dQueueGr.getValue('payload')),
 inboundQueueGr.getValue('record_id'));
  } catch (ex) {
    this._logger.logErr("Event processing failed " + ex);
    isError = true;
    errorMessage = JSON.stringify(ex);
  }

  // Update the inbound queue record based on processing
  var inboundQueueObj = new sn_tmt_core.BaseObject();
  if (isError == true) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    inboundQueueObj.setValue('state',
 sn_tmt_core.Constants.INBOUND_QUEUE_STATE.ERROR);
    inboundQueueObj.setValue('error_message', errorMessage);
  } else {
    inboundQueueObj.setValue('state',
 sn_tmt_core.Constants.INBOUND_QUEUE_STATE.COMPLETED);
  }
    var inboundQueue = new
 sn_tmt_core.InboundQueue(inboundQueueGr, false);
    inboundQueue.updateInboundQueueRecord(inboundQueueObj);
},
```

EventProcessorUtilOOB - fetchEventHandlerAndCreateTMFEvent(Object eventSnapshot, String eventType, String eventId)

Converts the passed raw event object into a TMF-compliant event object by invoking a payload generator based on the event type.

You will need to override this method if your implementation does any of the following:

- Modifies the existing event handling.
- Adds a new event type. You must add the event type and its associated payload generator.
- Adds a new object in the Producer Event Notification Framework.

You may also need to override the methods within the `TroubleTicketNotificationUtil` script include to add attributes to the returned TMF-compliant payload or modify the default handling of the payload.

For additional information, see Configure trouble ticket notifications using the Producer Event Notification Framework.

Parameters

Name	Type	Description
eventSnapshot	Object	Raw data to transform into a TMF-compliant object. You can obtain this object from the payload field of the Inbound Queue [sn_tmt_core_inbound_queue] table. Inbound queue records are created by business rules, such as Trouble Ticket Attribute Change Event, which is associated with the Incident [incident] table. The format of the event snapshot is defined by the business rule that originally pushed the event into the inbound queue.

eventType	String	Event type. This value specifies the type of event data that is passed in the *eventSnapshot* payload. The passed payload is processed based on this event type. The event type is stamped on the inbound queue record by the associated business rule on the associated table. Each event type has its own event payload structure. For example:
		`{`
		`"eventId":"dc2003c2c3bb3550054e20bdc0013136",`
		`"@type":"Troubleticket",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>{
		  "eventType":"TroubleTicketCreateEvent",
		  "event":{
		  "troubleTicket":{
		  "short_description":"Test payload",
		  "severity":3,
		  "ticketType":"incident"
		  }
		  }
		}</pre>
		Default values for trouble ticket event types are defined in the *EVENT_TYPES* parameter in the `sn_api_notif_mgmt.Constants` script include.

eventId	String	Unique identifier of the event to convert.

Returns

Type	Description
tmfEventPayload	Event payload in TMF-compliant format. To see the transformation process of the passed *eventSnapshot* object to the TMF-compliant payload, review the code in the `TroubleTicketNotificationUtilOOB` script include.

The following code example shows how to call this method.

```
constructandPublishEvent: function(inboundEventPayloadRecord,
 eventId) {
  if (gs.nil(inboundEventPayloadRecord)) return;
  var tmfEventPayload =
 this.fetchEventHandlerAndCreateTMFEvent(inboundEventPayloadReco
rd.eventSnapshot, inboundEventPayloadRecord.eventType, eventId);

  this._logger.debug("Event payload generated for the event id "
 + eventId + " is " + JSON.stringify(tmfEventPayload));

  if
 (gs.getProperty(Constants.EVENT_PUBLISH_MESSAGE_BUS_CONFIGURATI
ON) ==
 Constants.EVENT_PUBLISH_MESSAGE_BUS_CONFIGURATION_VALUES.OPEN_M
ESSAGE_BUS) {
    // Publish event in custom message bus
      this.publishEventToOpenMessageBus(tmfEventPayload);

  } else if
 (gs.getProperty(Constants.EVENT_PUBLISH_MESSAGE_BUS_CONFIGURATI
ON) ==
 Constants.EVENT_PUBLISH_MESSAGE_BUS_CONFIGURATION_VALUES.HERM
ES) {
    // Publish event in hermes kafka
    try {
      this.publishMessageToHermesKafka(tmfEventPayload);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    } catch (ex) {
      this._logger.logErr("Publishing message to Hermes Kafka
 Failed, error is: " + ex);
    }
  } else if
 (gs.getProperty(Constants.EVENT_PUBLISH_MESSAGE_BUS_CONFIGURATI
ON) ==
 Constants.EVENT_PUBLISH_MESSAGE_BUS_CONFIGURATION_VALUES.BOTH_M
ESSAGE_BUS_CONFIGURATIONS) {
    // Publish event in both custom message bus and hermes kafka
    this.publishEventToOpenMessageBus(tmfEventPayload);
    try {
      this.publishMessageToHermesKafka(tmfEventPayload);
    } catch (ex) {
      this._logger.logErr("Publishing message to Hermes Kafka
 Failed, error is: " + ex);
    }
  }
  return tmfEventPayload;
},
```

The following code example shows the switch case statements used by this method to determine how to transform the passed event payload based on the *eventType* parameter. If you add other event types to your implementation, you must override this method and include the processing for the new event type.

```
fetchEventHandlerAndCreateTMFEvent: function(eventSnapshot,
 eventType, eventId) {
var eventPayload;
switch (eventType) {
  case Constants.EVENT_TYPES.TROUBLE_TICKET_STATUS_CHANGE:
    eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateTroubl
eTicketStatusChangePayload(eventSnapshot, eventType, eventId);
    break;

  // New event type in trouble ticket
  case 'troubleTicketPriorityChange'
    eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateTroubl
eTicketAttributeChangePayload(eventSnapshot, eventType,
 eventId);
    break;

  // New event type of object other than trouble ticket
  case 'domainOrderStatusChange'
    eventPayload = new
 sn_ind_tmt_orm().domainOrderNotification().generatedomainOrderS
tatusChangePayoad(eventSnapshot, eventType, eventId);
    break;

  default:
    this._logger.debug("Event with id " + eventId + " could not
 find the matching payload generator");
    eventPayload = null;
  }
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
return eventPayload;
},
```

EventProcessorUtilOOB - publishMessageToHermesKafka(Object tmfEventPayload)

Instantiates the *HermesEventPublisher* class and publishes the passed event payload to the Hermes Kafka message broker.

Parameters

Name	Type	Description
tmfEventPayload	Object	TMF688-compliant event payload created for the event. For a description of the default format of this event payload, refer to the TMF688 Event Management API User Guide.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
constructandPublishEvent: function(inboundEventPayloadRecord,
 eventId) {
  if (gs.nil(inboundEventPayloadRecord)) return;
  var tmfEventPayload =
 this.fetchEventHandlerAndCreateTMFEvent(inboundEventPayloadReco
rd.eventSnapshot, inboundEventPayloadRecord.eventType, eventId);

  this._logger.debug("Event payload generated for the event id "
 + eventId + " is " + JSON.stringify(tmfEventPayload));

  if
 (gs.getProperty(Constants.EVENT_PUBLISH_MESSAGE_BUS_CONFIGURATI
ON) ==
 Constants.EVENT_PUBLISH_MESSAGE_BUS_CONFIGURATION_VALUES.OPEN_M
ESSAGE_BUS) {
    // Publish event in open message bus
    this.publishEventToOpenMessageBus(tmfEventPayload);

  } else if
 (gs.getProperty(Constants.EVENT_PUBLISH_MESSAGE_BUS_CONFIGURATI
ON) ==
 Constants.EVENT_PUBLISH_MESSAGE_BUS_CONFIGURATION_VALUES.HERM
ES) {
    // Publish event in Hermes Kafka
    try {
      this.publishMessageToHermesKafka(tmfEventPayload);
    } catch (ex) {
       this._logger.logErr("Publishing message to Hermes Kafka
 Failed, error is: " + ex);
    }
  } else if
 (gs.getProperty(Constants.EVENT_PUBLISH_MESSAGE_BUS_CONFIGURATI
ON) ==
```

    }
  }
  return tmfEventPayload;
},
```

EventQueueProcessorOOB - Scoped

The *EventQueueProcessorOOB* script include provides methods to manage event requests on the inbound event queue (located in the Inbound Queue [sn_tmt_core_inbound_queue] table).

If you want to change the default functionality of this script include, you need to override these methods in the `EventQueueProcessor` script include. You must have the admin role to modify this script include.

This script include runs in the `sn_api_notif_mgmt` namespace.

EventQueueProcessorOOB - transformEventObject(Object eventSnapshot, Object eventJson, String queueType)

Adds attributes to the passed event snapshot.

This method is not implemented in the base instance. If you need to add attributes to the event snapshot before processing the event and sending it out on the proper message-bus, you should override this method in the `EventQueueProcessor` script include.

Parameters

Name	Type	Description
eventSnapshot	Object	Raw event data in which to add attributes. This object is from the payload field of the Inbound Queue [sn_tmt_core_inbound_queue] table. Inbound queue records are created by business rules, such as Trouble Ticket Attribute Change Event, that are associated with the Incident [incident] table. The format of the event snapshot is defined by the business rule that originally pushed the event into the inbound queue.
eventJson	Object	JSON formatted glide record that caused the event to be triggered. This is the object that was stored in the Inbound Queue table. The format of this object is dependent on the table from which it was generated, such as incident or case.
queueType	String	Queue in which the event was pushed. For the default implementation, this is always `sn_tmt_core_inbound_queue`. If you modify the event

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		queuing implementation in your instance, pass the name of the queue that contains the event record.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
pushEventsToEventQueue: function(eventSnapshot, queueType) {
  if (queueType == Constants.QUEUE_TYPE.INBOUND_QUEUE) {
    var inboundQueueEventJson =
 this.generateInboundQueueObj(eventSnapshot);
    this.transformEventObject(eventSnapshot,
 inboundQueueEventJson, queueType);
    // Passing isSecure as false
    new sn_tmt_core.InboundQueue(null,
 false).createInboundQueueRecord(inboundQueueEventJson);
  }
},
```

ExpenseAllocation - Global

The *ExpenseAllocation* script include is used by various cost management processes and can also be used for generating custom expense allocation records (*fm_expense_allocation*) from scripted expense allocation rules.

This script include requires the Cost Management (com.snc.cost_management) plugin.

ExpenseAllocation - ExpenseAllocation(GlideRecord expense, GlideRecord rule)

Called when you create a new *ExpenseAllocation* object.

This is not needed if scripting advanced allocation rules. This object is already available as the *allocation* variable.

Parameters

Name	Type	Description
expense	GlideRecord	*GlideRecord* identifying the source of the expense.
rule	GlideRecord	*GlideRecord* identifying the rule to use in allocating the expense line.

Returns

Type	Description
ExpenseAllocation object	The ExpenseAllocation object just created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var allocation=new ExpenseAllocation(expenseGlideRecord,
 ruleGlideRecord);
```

ExpenseAllocation - createAllocation(GlideRecord target, Number amount)

Creates an expense allocation (*fm_expense_allocation*) record referencing the parameters provided during instantiation and this method.

Parameters

Name	Type	Description
target	GlideRecord	*GlideRecord* target of the allocation, for example a cost center record to allocate an expense to Decimal amount - the amount of the allocation.
amount	Number	The amount of the allocation.

Returns

Type	Description
Boolean	True if the expense allocation was successfully created.

```
var allocation=new ExpenseAllocation(expenseGlideRecord,
 ruleGlideRecord);
allocation.createAllocation(costCenterGlideRecord, 2345.67);
```

ExpenseLine - Global

The *ExpenseLine* script include is used by various cost management processes and can also be used for generating expense line (*fm_expense_line*) records from your own server-side scripts.

This script include requires the Cost Management (com.snc.cost_management) plugin.

ExpenseLine - ExpenseLine (GlideRecord source, Number amount, String description)

Constructor for *ExpenseLine* object.

Parameters

Name	Type	Description
source	GlideRecord	*GlideRecord* identifying the source of the expense
amount	Number	Decimal number identifying the amount of the expense
description	String	(Optional) Description of the expense.

Returns

Type	Description
ExpenseLine object	The ExpenseLine object just instantiated.

```
//get some random CI to be used as an expense source
        var ci = new GlideRecord("cmdb_ci_server");
        ci.query();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        ci.next();

        //create expense line
        var exp = new ExpenseLine(ci, 234.56, "Test expense
 line");
```

ExpenseLine - createExpense()

Creates a new expense line record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the expense line was successfully created.

```
//get some random CI to be used as an expense sourcevar ci =new
 GlideRecord("cmdb_ci_server");
ci.query();
ci.next();

//create expense line
var exp =new ExpenseLine(ci,234.56,"Test expense line");
exp.setSummaryType("run_business");
var success = exp.createExpense();
```

ExpenseLine - processCIParents()

Used internally by the *createExpense* method to process CI relationships when the expense source is a cmdb_ci record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

ExpenseLine - setCostSource(GlideRecord costSource)

Identifies the source rate card or distribution cost that was the source of expense line generation.

This is not the source (CI, task) of the expense.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
costSource	GlideRecord	*GlideRecord* of CI rate card cost, distribution cost, or task rate card. This is generally only used for system-generated expense lines.

Returns

Type	Description
void	

ExpenseLine - setDescription(String description)

Defines the description of an expense.

Parameters

Name	Type	Description
description	String	Description of expense.

Returns

Type	Description
void	

ExpenseLine - setParent(GlideRecord expense)

Sets the parent field on the expense line.

This is generally only used by the system when generating indirect expenses such as business service aggregated expenses.

Parameters

Name	Type	Description
expense	GlideRecord	Parent expense line record.

Returns

Type	Description
void	

ExpenseLine - setRecurring(Boolean recurring)

Flags the expense as recurring by setting the recurring field to true.

Expense lines are set to false by default so there is no need to call *setRecurring(false)*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
recurring	Boolean	Set to true to identify expense line as a recurring expense.

Returns

Type	Description
void	

ExpenseLine - setSummaryType(String summaryType)

Sets a value for the expense line summary_type field.

Parameters

Name	Type	Description
summaryType	String	Typically you would set this to a value already specified in the expense line summary type field choice list.

Returns

Type	Description
void	

```
//get some random CI to be used as an expense sourcevar ci =new
 GlideRecord("cmdb_ci_server");
ci.query();
ci.next();

//create expense line
var exp =new ExpenseLine(ci,234.56,"Test expense line");
exp.setSummaryType("run_business");
```

ExtractTermsFromAttachment - Global

The *ExtractTermsFromAttachment* script include provides methods to extract terms from an attachment.

This script include is called with the ScriptedExtractor object, SysAttachmentInputStream, the sys_id for the attachment, and the extension for the attachment. The *getTerms()* method is called to extract the terms from the attachment that should be indexed. The *getTerms()* method should just return a string that contains the terms. If you prefer to input a file rather than an inputStream, call *extractor.getFile()* to get the File object containing the attachment.

FinancialsWidgetUtil - Scoped

The *FinancialsWidgetUtil* script include provides methods to customize widgets in the **Financials** section of Project Workspace and Strategic Planning Workspace.

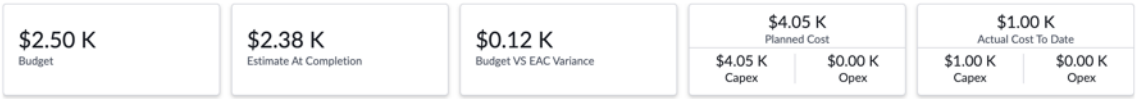
The following widgets are available in Project Workspace and Strategic Planning Workspace by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Budget
- Estimate at Completion
- Planned Cost
- Actual Cost to Date

You can use the *FinancialsWidgetUtil* script include to add child widgets that show values for a specified time period or expense type.

Financials section in Project Workspace



In this example from Project Workspace, the Planned Cost widget has child widgets that show CapEx and OpEx values, while the Budget widget doesn't have any child widgets.

To use this script include, create a child widget with one of the available financials widgets as the parent. Use the methods from this script include in the **Script** field of the child widget record.

The *FinancialsWidgetUtil* script include requires the Financials Core application (sn_invst_pln), as well as the Strategic Planning application (sn_apw_advanced) or Project Workspace application (sn_pw). This script include is provided within the `sn_invst_pln` namespace.

FinancialsWidgetUtil - FinancialsWidgetUtil(GlideRecord investmentGr, Object timeScope, String expenseType)

Instantiates a *FinancialsWidgetUtil* object.

This object is used to get aggregate values such as budget and planned cost for an investment.

Parameters

Name	Type	Description
investmentGr	GlideRecord	Investment to get aggregate values for. Located in the Investment [sn_invst_pln_invst_investment] table.
timeScope	Object	Object containing the fiscal periods to use as the start and end dates for the aggregation. `{ "startFiscalPeriodSysId": "String", "endFiscalPeriodSysId": "String" }`
timeScope.startFiscalPeriodSysId	String	Sys_id of the fiscal period to use as the start date for the aggregation. Located in the Fiscal Period [fiscal_period] table.
timeScope.endFiscalPeriodSysId	String	Sys_id of the fiscal period to use as the end date for the aggregation. Located in the Fiscal Period [fiscal_period] table.
expenseType	String	Optional. Type of expense to include in the aggregation, such as capital expenditure (CapEx) or operating expense (OpEx). Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• capex • opex

This example instantiates a *FinancialsWidgetUtil* object that can be used to return aggregate values for an investment where the expense type is CapEx and the time period is `context.timeScope`.

```
var context = JSON.parse(context);
var investment = context.investment;
(function initializeFWU() {
   var invGr = new GlideRecord('sn_invst_pln_invst_investment');
   if (invGr.get(investment.sys_id)) {
      var capexCost = new
 sn_invst_pln.FinancialsWidgetUtil(invGr, context.timeScope,
 'capex');
   }
})();
```

FinancialsWidgetUtil - getActuals()

Returns the actual cost for any planning items and work items linked to an investment.

To use this method, create a child widget with the Actual Cost to Date widget as the parent. Use this method in the **Script** field of the child widget record.

The actual cost returned by this method is for the time period and expense type specified when instantiating the *FinancialsWidgetUtil* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Object containing the display value and value for the actual cost. `{ "displayValue": "String", "value": Number }`
<Object>.displayValue	Display value of the actual cost, such as `$1.00 K`. Data type: String
<Object>.value	Value of the actual cost, such as `1000`. Data type: Number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example adds a child widget to the Actual Cost to Date widget that shows the actual cost for OpEx only.

```
var context = JSON.parse(context);
var investment = context.investment;
(function getCost() {
   var invGr = new GlideRecord('sn_invst_pln_invst_investment');
   if (invGr.get(investment.sys_id)) {
      var opexCost = new
 sn_invst_pln.FinancialsWidgetUtil(invGr, context.timeScope,
 'opex').getActuals();
      return {
         displayValue:
 PPMCurrencyHelper.getFormattedAmountWithCurrency(opexCost.valu
e),
         value: opexCost.value
      };
   }
})();
```

FinancialsWidgetUtil - getBudget()

Returns the budget for any planning items and work items linked to an investment.

To use this method, create a child widget with the Budget widget as the parent. Use this method in the **Script** field of the child widget record.

The budget returned by this method is for the time period and expense type specified when instantiating the *`FinancialsWidgetUtil`* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Object containing the display value and value for the budget. `{ "displayValue": "String", "value": Number }`
<Object>.displayValue	Display value of the budget, such as `$2.50 K`. Data type: String
<Object>.value	Value of the budget, such as `2500`. Data type: Number

This example adds a child widget to the Budget widget that shows the budget for OpEx only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var context = JSON.parse(context);
var investment = context.investment;
(function getCost() {
   var invGr = new GlideRecord('sn_invst_pln_invst_investment');
   if (invGr.get(investment.sys_id)) {
      var opexCost = new
 sn_invst_pln.FinancialsWidgetUtil(invGr, context.timeScope,
 'opex').getBudget();
      return {
         displayValue:
 PPMCurrencyHelper.getFormattedAmountWithCurrency(opexCost.valu
e),
         value: opexCost.value
      };
   }
})();
```

FinancialsWidgetUtil - getEAC()

Returns the estimate at completion (EAC) value for any planning items and work items linked to an investment.

To use this method, create a child widget with the Estimate at Completion widget as the parent. Use this method in the **Script** field of the child widget record.

The EAC value returned by this method is for the time period and expense type specified when instantiating the *`FinancialsWidgetUtil`* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Object containing the display value and value for the EAC. `{ "displayValue": "String", "value": Number }`
<Object>.displayValue	Display value of the EAC, such as `$2.38 K`. Data type: String
<Object>.value	Value of the EAC, such as `2380`. Data type: Number

This example adds a child widget to the Estimate at Completion widget that shows the EAC for OpEx only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var context = JSON.parse(context);
var investment = context.investment;
(function getCost() {
   var invGr = new GlideRecord('sn_invst_pln_invst_investment');
   if (invGr.get(investment.sys_id)) {
      var opexCost = new
 sn_invst_pln.FinancialsWidgetUtil(invGr, context.timeScope,
 'opex').getEAC();
      return {
         displayValue:
 PPMCurrencyHelper.getFormattedAmountWithCurrency(opexCost.valu
e),
         value: opexCost.value
      };
   }
})();
```

FinancialsWidgetUtil - getPlannedCost()

Returns the planned cost for any planning items and work items linked to an investment.

To use this method, create a child widget with the Planned Cost widget as the parent. Use this method in the **Script** field of the child widget record.

The planned cost returned by this method is for the time period and expense type specified when instantiating the *`FinancialsWidgetUtil`* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Object containing the display value and value for the planned cost. `{ "displayValue": "String", "value": Number }`
<Object>.displayValue	Display value of the planned cost, such as `$4.05 K`. Data type: String
<Object>.value	Value of the planned cost, such as `4050`. Data type: Number

This example adds a child widget to the Planned Cost widget that shows the planned cost for OpEx only.

```
var context = JSON.parse(context);
var investment = context.investment;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
(function getCost() {
   var invGr = new GlideRecord('sn_invst_pln_invst_investment');
   if (invGr.get(investment.sys_id)) {
      var opexCost = new
 sn_invst_pln.FinancialsWidgetUtil(invGr, context.timeScope,
 'opex').getPlannedCost();
      return {
         displayValue:
 PPMCurrencyHelper.getFormattedAmountWithCurrency(opexCost.valu
e),
         value: opexCost.value
      };
   }
})();
```

Findings - Scoped, Global

The *Findings* API provides methods for handling how an Instance Scan check produces findings.

This API is included with the Instance Scan (com.glide.instance_scan) plugin and runs in the `sn_instance_scan` namespace. For more information, see Instance Scan.

In Instance Scan, checks run on each record in the scope of a scan on the instance to generate findings. Each finding holds information about an issue record and which check it violated. *Findings* methods are used in Instance Scan checks as part of the engine object passed to the user. Add the code to the **Script** field in the check form.

See also:

- Getting started with checks
- Findings

Findings - increment()

Increases the count of the current finding.

The finding count starts at zero for each record that a check analyzes in a scan. When called, this method increments the finding count. The count indicates that a finding is to be generated for the current record.

This method can be called multiple times to signify that this finding has multiple occurrences of a check violation in the current record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to count the number of records with a failed state in a table type check. For more information, see Create a table type check.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
(function(engine) {
  if (current.getValue("state") == "failed") {
    engine.finding.increment();
  }
})(engine);
```

Findings - incrementWithNode(Object node)

If the current finding is from a linter check, this method increments the current finding count and simultaneously passes the linter node object to the finding.

Use this method in the Script field in the Linter Check form. This method saves information about the given node, such as a line number in a current finding's details column.

See also:

- Advanced linter check scripts
- LinterCheckAstNode API

Parameters

Name	Type	Description
node	Object	Node object from the linter check.

Returns

Type	Description
None	

The following example shows how to increment linter type nodes in a linter check. For information on using linter check methods, see LinterCheckAstNode API.

```
(function(engine) {
  engine.rootNode.visit(function(node) {
    if (node.getTypeName() === "NAME" &&
        node.getNameIdentifier() === "soughtFunction" &&
        node.getParent().getTypeName() === "CALL") {
      engine.finding.incrementWithNode(node);
    }
  });
})(engine);
```

Findings - setCurrentSource(GlideRecord source)

Sets the source of the current finding based on the provided GlideRecord.

Use this method in the **Script** field of a Script Only check. This method is not used for any other checks because they automatically set the source as the current record during the scan. For more information, see Create a script only check.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
source	GlideRecord	The record to set as the source record for the current finding. This value is added as a reference in the Source field of the Scan Findings [scan_finding] table.

Returns

Type	Description
None	

The following example shows how to set the current source to an incident record in a script only check. For more information, see Create a script only check.

```
(function(engine) {
  var gr = new GlideRecord('incident');
  gr.get('2f99f330730210100a5310c92bf6a798');
  engine.finding.setCurrentSource(gr);
  engine.finding.increment();
})(engine);
```

FormInfoHeader - Global

The *FormInfoHeader* script include provides methods to add an HTML message as a form info message.

The *addMessage()* method is commonly used in record producers.

FormInfoHeader - addMessage(String message)

Adds an HTML message to the form header, where form info messages are displayed.

Parameters

Name	Type	Description
message	String	A message that may include HTML tags.

Returns

Type	Description
void	

```
gs.include("FormInfoHeader");
  var fi = new FormInfoHeader();
  fi.addMessage('This incident was opened on your behalf<br/>
     The IT department will contact you for further information
 or when the incident is resolved');
```

FlowAPI - Scoped, Global

The *FlowAPI* provides methods to execute actions, flows, or subflows in server-side scripts using either blocking or non-blocking methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access *FlowAPI* methods in global and scoped scripts using the `sn_fd` namespace. Create calls to your flows using the **Code Snippet** action in Workflow Studio or use the methods detailed here to update scripts manually.

Note: In domain separated instances, flows, subflows, and actions triggered by this API run in the domain of the user who started the script. For example, if a user in the Acme domain starts a script that triggers a flow, the flow runs in the Acme domain and can only access Acme data, even if the flow runs as the System User.

Note: To optimize instance performance, avoid calling these methods from an asynchronous business rule script. Instead, create a scheduled job record within the Workflow Studio UI.

FlowAPI - cancel(String contextId, String reason)

Cancels a paused or running flow, subflow, or action.

Parameters

Name	Type	Description
contextId	String	Sys_id of the execution details record for the flow, subflow, or action. Access the execution details by navigating to the Flow Executions tab in Workflow Studio, or pass the sys_id of the context record returned by the *startFlow()*, *startSubflow()*, or *startAction()* methods. **Note:** There might be a small delay in cancellation if the target context is running on a different node of the instance. Contexts running on the same node are cancelled immediately. Contexts running on another node must first wait for the cancellation to be forwarded to the appropriate node.
reason	String	Optional. Reason for canceling the flow, subflow, or action. Appears in the **Message** field of the Flow engine log entries [sys_flow_log] table.

Returns

Type	Description
void	

This example uses the return value of the *startFlow()* method to cancel any long-running flows.

```
(function() {

var now_GR = new GlideRecord('incident');
now_GR.addQuery('number', 'INC0000050');
now_GR.query();
now_GR.next();

      try {
          var inputs = {};
          inputs['current'] = now_GR; // GlideRecord of table:
          inputs['table_name'] = 'incident';

          // Starts the flow asynchronously.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        var result = sn_fd.FlowAPI.getRunner()
        .flow('global.myFlow')
        .inBackground()
        .withInputs(inputs)
        .run();

        var contextId = result.getContextId();
        var dateRun = result.getDate();
        var domainUsed = result.getDomainId();
        var flowName = result.getFlowObjectName();
        var flowObjectType = result.getFlowObjectType();

    } catch (ex) {
        var message = ex.getMessage();
        gs.error(message);
    }
})();

// Call the cancel() method using the context Id returned from
 the startFlow() method
sn_fd.FlowAPI.cancel(contextId, 'Flow took too long to
 execute.');
```

This example cancels any flows named Test Flow.

```
var now_GR = new GlideRecord("sys_flow_context");
now_GR.addQuery("name", "Test Flow");
now_GR.query();

while (now_GR.next()) {
sn_fd.FlowAPI.cancel(now_GR.getUniqueValue(), 'Canceling Test
 Flows');
}
```

FlowAPI - executeAction(String name, Map inputs, Number timeout)

Runs an action from a server-side script synchronously.

Execute an action from within a business rule, script include, or any other server-side script. Actions run using this method run synchronously, so the method has access to outputs created by the action. Use **startAction** to run an action asynchronously.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *`getRunner()`* method in the *`FlowAPI`* class to return a ScriptableFlowRunner object and use the associated methods. Use the *`ScriptableFlowRunner`* methods if you need to support domain separation.

Note: This method runs the action as the user who initiates the session.

Parameters

Name	Type	Description
name	String	The scope and name of the action to be executed, for example `global.action_name`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
inputs	Map	Name-value pairs that define action inputs. Use the input name, not the input label.
timeout	Number	Optional. Timeout in milliseconds. This value overrides the 30 second default timeout specified by the *com.glide.hub.flow_api.default_execution_time* system property. After the timeout expires, an exception is thrown.

Returns

Type	Description
Object	The action outputs.

In this example, the script uses *sn_fd.FlowAPI.executeAction* to execute an action called actionforpassword2test in the global scope. A variable called inputs contains the inputs for the action. In this case, a name and password. The outputs for the action are stored in the outputs variable, which in this case, is an encrypted password object. The code is wrapped in a try/catch statement to capture any errors that might occur when the flow executes.

```
(function() {

  try {
    var inputs = {};
    inputs['name'] = ; // String
    inputs['password2'] = ; // Password (2 Way Encrypted)

    // Execute Synchronously: Run in foreground. Code snippet
 has access to outputs.
    // var timeout = ; //timeout in ms

 //sn_fd.FlowAPI.executeAction('global.actionforpassword2test',
 inputs, timeout)
    var outputs =
 sn_fd.FlowAPI.executeAction('global.actionforpassword2test',
 inputs);

    // Get Outputs:
    // Note: outputs can only be retrieved when executing
 synchronously.
    var output = outputs['output']; // Password (2 Way
 Encrypted)

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }
})();
```

FlowAPI - executeActionQuick(String name, Map inputs, Number timeout)

Run an action from a server-side script synchronously from the current user session without creating execution details or other related records. Improve performance by eliminating record-

keeping overhead. Use this API to increase the speed of high-volume processing, for example multiple executions per second, in a production environment.

Reporting & records generated

This method does not create execution details and context records, regardless of Workflow Studio settings.

Wait support

This method does not support pausing the action to wait for conditions. Steps that pause for wait conditions such as Ask for Approval or Wait for Condition are not supported.

MID Server support

This method does not support pausing an action to run from a MID Server.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *`getRunner()`* method in the *`FlowAPI`* class to return a ScriptableFlowRunner object and use the associated methods. Use the *`ScriptableFlowRunner`* methods if you need to support domain separation.

Parameters

Name	Type	Description
name	String	Scope and internal name of the action to execute. For example, `global.action_name`. Locate the **Internal name** field in the list of Workflow Studio actions.
inputs	Map	Name-value pairs that define action inputs. You can find the available action inputs and required data types under Inputs in the action outline. Use the input name, not the input label. For example, `{'table':'incident','sys_id':'a39d8e3cf0212300964feeefe80ff0ed'`
timeout	Number	Optional. Timeout in milliseconds. This value overrides the 30 second default timeout specified by the *`com.glide.hub.flow_api.default_execution_time`* system property. After the timeout expires, an exception is thrown.

Returns

Type	Description
Object	Object containing outputs defined by the action. You can find the outputs for the action under **Outputs** in the action outline.

```
(function() {
  try {

    var grIncident = new GlideRecord('incident');
    grIncident.get('57af7aec73d423002728660c4cf6a71c');

    var inputs = {};
    inputs['variable'] = grIncident;

    var outputs =
 sn_fd.FlowAPI.executeActionQuick('global.update_record_test',
 inputs);
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    // Get Outputs:
    // Note: outputs can only be retrieved when executing
 synchronously.
    var output1 = outputs['output1'];

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
    }

})();
```

FlowAPI - executeDataStreamAction(String name, Map inputs, Number timeout)

Runs a Data Stream action synchronously from a server-side script and returns a ScriptableDataStream object.

For more information about Data Stream actions, see Data Stream actions and pagination.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *getRunner()* method in the *FlowAPI* class to return a ScriptableFlowRunner object and use the associated methods. Use the *ScriptableFlowRunner* methods if you need to support domain separation.

Note: Always wrap data stream logic in a `try/catch` block to catch errors. Always include a `finally` statement that ends with the *close()* method from the *ScriptableDataStream* class to close the data stream and prevent performance issues.

Parameters

Name	Type	Description
name	String	The scope and name of the Data Stream action to execute. For example, `global.data_stream_action_name`.
inputs	Map	Name-value pairs that define action inputs. Use the input name, not the input label. If the action does not have any inputs, do not include this parameter.
timeout	Number	Optional. Amount of time before the action times out. After the timeout expires, an exception is thrown. The timeout only applies to the *executeDataStreamAction* method, not to methods in the *ScriptableDataStream* class. Default: 30000, specified by the *com.glide.hub.flow_api.default_execution_time* system property Unit: Milliseconds

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
ScriptableDataStream	An object used to iterate through items in the data stream. Use the methods in the *ScriptableDataStream* class to interact with this object. See ScriptableDataStream API.

This example creates an incident record for each item returned in the data stream.

```
(function() {

  try {

    // Execute Data Stream Action.
    var stream =
 sn_fd.FlowAPI.executeDataStreamAction('x_my_scope.data_stream_n
ame');

    // Process each item in the data stream
    while (stream.hasNext()) {

      // Get a single item from the data stream.
      var item = stream.next();

      // Use the item.
      var now_GR = new GlideRecord('incident');
      now_GR.setValue('number',item.id);
      now_GR.setValue('short_description',item.name);
      now_GR.insert();

      // By default, this code snippet will terminate after 10
 items.
      // Remove or modify this limit after testing your code.
      if (stream.getItemIndex() >= 9) {
        break;
      }
    }
  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  } finally {
    stream.close();
  }

})();
```

FlowAPI - executeFlow(String name, Map inputs, Number timeout)

Runs a flow from a server-side script synchronously.

Execute a flow from within a business rule, script include, or any other server-side script. Flows run using this method run synchronously. Use **startFlow** to run a flow asynchronously.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *getRunner()* method in the *FlowAPI* class to return a ScriptableFlowRunner object and use the associated methods. Use the *ScriptableFlowRunner* methods if you need to support domain separation.

Note: This method runs the flow as the user specified in flow properties.

Parameters

Name	Type	Description
name	String	The scope and name of the flow to be executed, for example `global.flow_name`.
inputs	Map	Name-value pairs that define trigger inputs. Use the input name, not the input label.
timeout	Number	Optional. Timeout in milliseconds. This value overrides the 30 second default timeout specified by the *com.glide.hub.flow_api.default_execution_time* system property. After the timeout expires, an exception is thrown.

Returns

Type	Description
None	Normal operation produces no return value.
Exception	The API throws an exception when a flow called synchronously pauses. `The current execution is in the waiting state`. In most cases, the exception is removed when the flow resumes. However, the API cannot resume a flow that has been sent to a MID Server.

This example uses sn_fd.FlowAPI.executeFlow to execute a global flow called test_flow. This flow is normally triggered when a record on the incident table is updated. Because you are activating the flow from a script, you must provide this information. The code creates an inputs variable that contains the current record, and the table for the record. The code is wrapped in a try/catch statement to capture any errors that might occur when the flow executes.

```
(function() {
  try {
    var inputs = {};
    inputs['current'] = ; // GlideRecord of table:
    inputs['table_name'] = 'incident';

    // Execute Synchronously: Run in foreground.
    // var timeout = ; //timeout in ms
    //sn_fd.FlowAPI.executeFlow('global.test_flow', inputs,
 timeout)
    sn_fd.FlowAPI.executeFlow('global.test_flow', inputs);
  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }
})();
```

FlowAPI - executeFlowQuick(String name, Map inputs, Number timeout)

Runs a flow, subflow, action, or Data Stream action from a server-side script synchronously or asynchronously without creating execution details or other related records. Improves performance by eliminating record-keeping overhead. Use this API to increase the speed of high-volume processing, for example multiple executions per second, in a production environment.

Reporting & records generated

This method does not create execution details and context records, regardless of Workflow Studio settings.

Run as user

This method runs the flow as the user who initiates the session. Setting the flow to run as the system user, or impersonating a user, is not supported.

Wait support

This method does not support pausing the flow to wait for conditions. Actions or flow logic that pause for wait conditions such as Ask for Approval, Wait for Condition, or Wait for a duration are not supported.

MID Server support

This method does not support pausing a flow to run from a MID Server.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *`getRunner()`* method in the *`FlowAPI`* class to return a ScriptableFlowRunner object and use the associated methods. Use the *`ScriptableFlowRunner`* methods if you need to support domain separation.

Parameters

Name	Type	Description
name	String	Scope and internal name of the flow to execute. For example, `global.flow_name`. Locate the **Internal name** field in the list of Workflow Studio flows.
inputs	Map	Name-value pairs that define trigger inputs. You can find the available trigger inputs and required data types in the Trigger section of the flow. Use the input name, not the input label. For example, `{'table':'incident','sys_id':'a39d8e3cf0212300964feeefe80ff0ed'`
timeout	Number	Optional. Timeout in milliseconds. This value overrides the 30 second default timeout specified by the *`com.glide.hub.flow_api.default_execution_time`* system property. After the timeout expires, an exception is thrown.

Returns

Type	Description
void	

```
(function() {

  try {
    var grIncident = new GlideRecord('incident');
    grIncident.get('ed92e8d173d023002728660c4cf6a7bc');

    var inputs = {};
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    inputs['current'] = grIncident;
    inputs['table_name'] = 'incident';

    sn_fd.FlowAPI.executeFlowQuick('global.test_quick_flow',
 inputs);

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
 }

})();
```

FlowAPI - executeSubflow(String name, Map inputs, Number timeout)

Runs an subflow from a server-side script synchronously.

Execute a subflow from within a business rule, script include, or any other server-side script. Subflows run using this method run synchronously. Use **startSubflow** to run an subflow asynchronously.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *getRunner()* method in the *FlowAPI* class to return a ScriptableFlowRunner object and use the associated methods. Use the *ScriptableFlowRunner* methods if you need to support domain separation.

Note: This method runs the flow as the user specified in flow properties.

Parameters

Name	Type	Description
name	String	The scope and name of the subflow to be executed, for example `global.subflow_name`.
inputs	Map	Name-value pairs that define subflow inputs. Use the input name, not the input label.
timeout	Number	Optional. Timeout in milliseconds. This value overrides the 30 second default timeout specified by the *com.glide.hub.flow_api.default_execution_time* system property. After the timeout expires, an exception is thrown.

Returns

Type	Description
Object	Object containing the subflow outputs.
Exception	The API throws an exception when a flow called synchronously pauses. `The current execution is in the waiting state`. In most cases, the exception is removed when the flow resumes. However, the API cannot resume a flow that has been sent to a MID Server.

In this example, the script uses sn_fd.FlowAPI.executeSubflow to execute an subflow called subflowTest in the global scope. A variable called inputs contains the inputs for the subflow. In this case, a name and password. The code is wrapped in a try/catch statement to capture any errors that might occur when the flow executes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
(function() {

 try {
  var inputs = {};
  inputs['name'] = ; // String
  inputs['password2'] = ; // Password (2 Way Encrypted)

  // Execute Synchronously: Run in foreground.
  // var timeout = ; //timeout in ms

 //sn_fd.FlowAPI.executeSubflow('global.subflowTest', inputs,
 timeout)
              var outputs =
 sn_fd.FlowAPI.executeSubflow('global.subflowTest', inputs);

 } catch (ex) {
  var message = ex.getMessage();
  gs.error(message);
 }
})();
```

FlowAPI - executeSubflowQuick(String name, Map inputs, Number timeout)

Run a subflow from a server-side script synchronously from the current user session without creating execution details or other related records. Improve performance by eliminating record-keeping overhead. Use this API to increase the speed of high-volume processing, for example multiple executions per second, in a production environment.

Reporting & records generated

This method does not create execution details and context records, regardless of Workflow Studio settings.

Run as user

This method runs the flow as the user who initiates the session. Setting the flow to run as the system user, or impersonating a user, is not supported.

Wait support

This method does not support pausing the flow to wait for conditions. Actions or flow logic that pause for wait conditions such as Ask for Approval, Wait for Condition, or Wait for a duration are not supported.

MID Server support

This method does not support pausing a flow to run from a MID Server.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *`getRunner()`* method in the *`FlowAPI`* class to return a ScriptableFlowRunner object and use the associated methods. Use the *`ScriptableFlowRunner`* methods if you need to support domain separation.

Parameters

Name	Type	Description
name	String	Scope and internal name of the subflow to execute. For example, `global.subflow_name` Locate the **Internal name** field in the list of Workflow Studio subflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
inputs	Map	Name-value pairs that define subflow inputs. You can find the available subflow inputs and required data types under Inputs in the subflow. Use the input name, not the input label. For example, `{'table':'incident','sys_id':'a39d8e3cf0212300964feeefe80ff0ed'`
timeout	Number	Optional. Timeout in milliseconds. This value overrides the 30 second default timeout specified by the *com.glide.hub.flow_api.default_execution_time* system property. After the timeout expires, an exception is thrown.

Returns

Type	Description
Object	Object containing outputs defined by the subflow. You can find the outputs for the subflow under **Subflow Inputs & Outputs** in the subflow outline.

```
(function() {

  try {
    var grIncident = new GlideRecord('incident');
    grIncident.get('57af7aec73d423002728660c4cf6a71c');

    var inputs = {};
    inputs['variable'] = grIncident;

    var outputs =
 sn_fd.FlowAPI.executeSubflowQuick('global.test_quick_run_subflo
w', inputs);

    // Get Outputs:
    // Note: outputs can only be retrieved when executing
 synchronously.
    var output1 = outputs['output1'];

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
    }

})();
```

FlowAPI - getErrorMessage(String contextId)

Returns the error messages produced by a flow, subflow, or action. This method cannot return messages from flows, subflows, or actions run with the quick() API.

Parameters

Name	Type	Description
contextId	String	The sys_id of the flow, subflow, or action whose error messages you want to get.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The last operation run and the error message it produced.

This example starts a global subflow called test_error_subflow and returns any error messages it produces. Normally, a single script does not both run a flow and then get its error messages. Typically, either another script or Workflow Studio would have already run the flow. The code is wrapped in a try/catch statement to capture any errors that might occur when the flow executes.

```
(function() {

  try {
    // Gather inputs to call flow
    var inputs = {};
    inputs['ah_task'] = myTaskRecord; // GlideRecord of table:
 task
    inputs['ah_comment'] ='Test Comment' ; // String

    // Call flow with known errors
    var contextId =
 sn_fd.FlowAPI.startSubflow('global.test_error_subflow',
 inputs);

    // Get flow error message
    var errormsg = sn_fd.FlowAPI.getErrorMessage(contextId);
    return errormsg;

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }
})();
```

Output:

```
Operation
 (test_error_flow.574033f6db6811102166e2291396199f.274073f6db681

FlowAPI - getFlowStages(String scopedFlowName)

Return a JSON string containing the list of flow stages.

Parameters

Name	Type	Description
scopedFlowName	String	The application scope and name of the flow whose stages you want to get.

Returns

Type	Description
String	JSON formatted string that lists the stages of the flow by their stage record values.

This example shows getting the stages for the Service Catalog Item Request flow.

```
(function() {

  try {
    // Name of flow with stages
    var flowName = "service_catalog_item_request";

    // Get flow stages
    var flowStages = sn_fd.FlowAPI.getFlowStages(flowName);
    //Print JSON as info message
    gs.info(flowStages);
    return flowStages;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }
})();
```

Output:

The JSON string contains name-value pairs for a stage field. See for more information.

```

FlowAPI - getOutputs(String contextId)

Returns the outputs of a completed action or subflow.

You can use the return values from either the *`startAction()`* or *`startSubflow()`* methods as the contextId parameter.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *`getRunner()`* method in the *`FlowAPI`* class to return a ScriptableFlowRunner object and use the associated methods. Use the *`ScriptableFlowRunner`* methods if you need to support domain separation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
contextId	String	The sys_id of the action or subflow whose outputs you want to get.

Returns

Type	Description
Object	Object containing the action or subflow outputs.

This example starts a global subflow called test_subflow, waits for the flow to finish, and then gets its output values. Normally, a single script does not both run a flow and then get its output values. Since a flow may not complete before the *`getOutputs()`* call, this example uses a wait time. Typically, either another script or Workflow Studio would have already run the flow. The code is wrapped in a try/catch statement to capture any errors that might occur when the flow executes.

```
(function() {

  try {
    // Gather inputs to call flow
    var inputs = {};
    inputs['ah_task'] = myTaskRecord; // GlideRecord of table:
 task
    inputs['ah_comment'] ='Test Comment' ; // String

    // Call flow
    var contextId =
 sn_fd.FlowAPI.startSubflow('global.test_subflow', inputs);

    // Wait for the flow to finish running

    // Get flow outputs
    var outputs = sn_fd.FlowAPI.getOutputs(contextId);
    var output1 = outputs['output1'];
    return output1;

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }
})();
```

FlowAPI - getRunner()

Returns a *`ScriptableFlowRunner`* builder object for a flow or action that you want to run.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
ScriptableFlowRunner	Builder object used to run a Workflow Studio action, flow, or subflow.

This example runs a flow synchronously.

```
(function() {
  try {

    var inputs = {};

    inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c';  //
 Pass the record's sys_id in as input.

    var result = sn_fd.FlowAPI.getRunner()  // Create a
 ScriptableFlowRunner builder object.
      .action('global.markapproved')        // Run the global
 scope action named markapproved.
      .inForeground()
      .inDomain('TOP/ACME')                 // Run the action
 from the TOP/ACME domain.
      .withInputs(inputs)
      .run();                               // Run the action
 and return a FlowRunnerResult object.

    var contextId = result.getContextId();  // Retrieve the
 context ID from the result
    var dateRun = result.getDate();
    var domainUsed = result.getDomainId();  // Retrieve the
 Domain ID from the result.
    var flowName = result.getFlowObjectName();
    var flowObjectType = result.getFlowObjectType();

    var outputs = result.getOutputs();            // Retrieve
 any outputs from the action execution.
    var newApprovalStatus = outputs['approval'];  // Echo back
 the approval status for verification.

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

FlowAPI - getStatus(String contextId)

Returns the status of a flow, subflow, or action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
contextId	String	The sys_id of the flow, subflow, or action whose status you want to get.

Returns

Parameter	Type	Description
<String>	String	JSON formatted string containing the current state of the flow, subflow, or action as name-value pairs. `{ "hasLookupError": Boolean, "errorMessage": "String", "contextStatus": {Object} }`
<String>.hasLookupError	Boolean	Flag that indicates whether there was an issue looking up the context status of the flow, subflow, or action. `{ "hasLookupError": false, "errorMessage": "", "contextStatus": {Object} }`
<String>.errorMessage	String	Error message returned by context lookup operation. This parameter is void when *`hasLookupError`* is false. `{ "hasLookupError": false, "errorMessage": "", "contextStatus": {Object} }`
<String>.contextStatus	Object	JSON formatted string containing state details about the queried flow, subflow, or action. `{ "hasLookupError": false, "errorMessage": "", "contextStatus": { "state": "COMPLETE", "errorState": "NONE" } }`
<String>.contextStatus.state	String	State of the flow, subflow, or action context. Some state values provide additional information in related parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Type	Description
		• COMPLETE provides additional information in the *errorState* parameter • ERROR provides additional information in the *message* parameter • CANCELLED provides additional information in the *canceledReason* parameter • IN_PROGRESS provides additional information in the *isRunOnMid* parameter • WAITING provides additional information in the *waitingOn* parameter `{ "hasLookupError": false, "errorMessage": "", "contextStatus": { "state": "COMPLETE", "errorState": "NONE" } }`
<String>.contextStatus.errorState	String	Flow complete state produced by flow error handling. The API only generates this parameter when the flow, subflow, or action is in the COMPLETE state. • ERROR_CAUGHT • ERROR_SKIPPED `{ "hasLookupError": false, "errorMessage": "", "contextStatus": { "state": "COMPLETE", "errorState": "ERROR_CAUGHT" } }`
<String>.contextStatus.message	String	Error message returned by the flow, subflow, or action. The API only generates this parameter when the flow, subflow, or action is in the ERROR state. `{ "hasLookupError": false, "errorMessage": "", "contextStatus": { "state": "ERROR", "message": "Error: Error Message! (Process Automation.LOG; line 1)"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Type	Description

		<pre>}
		}</pre>

<String>.contextStatus.canceledReason	String	Cancel message returned by the flow, subflow, or action. The API only generates this parameter when the flow, subflow, or action is in the CANCELLED state.
		<pre>{
		"hasLookupError": false,
		"errorMessage": "",
		"contextStatus": {
		"state": "CANCELLED",
		"canceledReason": "User has requested to stop executing the flow"
		}
		}</pre>

<String>.contextStatus.isRunOnMid	Boolean	Flag that indicates whether the flow, subflow, or action is run on a MID Server environment. The API only generates this parameter when the flow, subflow, or action is in the IN_PROGRESS state.
		<pre>{
		"hasLookupError": false,
		"errorMessage": "",
		"contextStatus": {
		"state": "IN_PROGRESS",
		"isRunOnMid": true
		}
		}
		}</pre>

<String>.contextStatus.waitingOn	Array	List of items that the current flow, subflow, or action is waiting on. The API only generates this parameter when the flow, subflow, or action is in the WAITING state.
		<pre>{
		"hasLookupError": false,
		"errorMessage": "",
		"contextStatus": {
		"state": "WAITING",
		"waitingOn": [
		{
		"stepType": "TIMER",
		"endTime": 1713627497643
		},
		{
		"stepType": "WAIT_FOR_CONDITION_WITH_TIMEOUT",
		"table": "incident",
		"condition": "sys_id=10e8b43243200210338774d6ebb8f22d^short_description=112",</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Type	Description
		"endTime": 1713645497800 }] } }
<String>.contextStatus.waitingOn.stepType	String	List of reasons why a flow, subflow, or action is waiting. The API only generates this parameter when the flow, subflow, or action is in the WAITING state. • WAIT_FOR_CONDITION • WAIT_FOR_CONDITION_WITH_TIMEOUT • ASK_FOR_APPROVAL • CREATE_TASK_WITH_WAIT • TIMER • SLA_TIMER • SUBFLOW

<String>.contextStatus.waitingOn.table	String	Table name containing the record that the flow, subflow, or action is waiting on. The API only generates this parameter when the flow, subflow, or action is in the WAITING state and the stepType is WAIT_FOR_CONDITION, WAIT_FOR_CONDITION_WITH_TIMEOUT, ASK_FOR_APPROVAL, or CREATE_TASK_WITH_WAIT.
		{
		"hasLookupError": false,
		"errorMessage": "",
		"contextStatus": {
		"state": "WAITING",
		"waitingOn": [
		{
		"stepType":
		"WAIT_FOR_CONDITION",
		"table": "incident",
		"condition":
		"sys_id=1347723243200210338774d6ebb8f285^short_description=1238"
		}
		]
		}
		}

<String>.contextStatus.waitingOn.condition	String	Query condition of the record that the flow, subflow, or action is waiting on. The API only generates this parameter when the flow, subflow, or action is in the WAITING state and the stepType is WAIT_FOR_CONDITION,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Type	Description

		WAIT_FOR_CONDITION_WITH_TIMEOUT, ASK_FOR_APPROVAL, or CREATE_TASK_WITH_WAIT.
		{
		"hasLookupError": false,
		"errorMessage": "",
		"contextStatus": {
		"state": "WAITING",
		"waitingOn": [
		{
		"stepType":
		"WAIT_FOR_CONDITION",
		"table": "incident",
		"condition":
		"sys_id=13477232432002103387 74d6ebb8f285^short_description=1238"
		}
		]
		}
		}

<String>.contextStatus.waitingOn.endTime	Integer	End time that the flow, subflow, or action is waiting on. The API only generates this parameter when the flow, subflow, or action is in the WAITING state and the stepType is WAIT_FOR_CONDITION_WITH_TIMEOUT, TIMER, or SLA_TIMER.
		{
		"hasLookupError": false,
		"errorMessage": "",
		"contextStatus": {
		"state": "WAITING",
		"waitingOn": [
		{
		"stepType": "SLA_TIMER",
		"endTime": 1713574610000
		}
		]
		}
		}

<String>.contextStatus.waitingOn.approvalRole	String	Approval rule that the flow, subflow, or action is waiting on. The API only generates this parameter when the flow, subflow, or action is in the WAITING state and the stepType is ASK_FOR_APPROVAL.
		{
		"hasLookupError": false,
		"errorMessage": "",
		"contextStatus": {
		"state": "WAITING",
		"waitingOn": [
		{

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Parameter	Type	Description
		<pre>"stepType": "ASK_FOR_APPROVAL", "table": "incident", "condition": "sys_id=3bd897033720021033879631749 24b20^approvalINapproved,rejected,canc elled", "approvalRule": "ApprovesAnyU[a8f98bb0eb32010045e1a5 115206fe3a,71826bf03710200044e0bfc8bc be5d3b]" }] } } </pre>
<String>.contextStatus.waitingOn.contextId	String	The sys_id of the subflow that the flow or subflow is waiting on. The API only generates this parameter when the flow, or subflow is in the WAITING state and the stepType is SUBFLOW. <pre>{ "hasLookupError": false, "errorMessage": "", "contextStatus": { "state": "WAITING", "waitingOn": [{ "stepType": "SUBFLOW", "contextId": "0f724aabd921021020291a665e07e44a" }] } } </pre>

This example runs a flow containing Do the following in parallel flow logic. Normally, a single script does not both run a flow and then get its error messages. Typically, either another script or Workflow Studio would have already run the flow.

```
(function() {
  try {
    var result = sn_fd.FlowAPI.getRunner()  // Create a
 ScriptableFlowRunner builder object.
      .flow('global.test_do_in_parallel')   // Run the global
 scope flow named do_in_parallel.
      .run();                               // Run the action
 and return a FlowRunnerResult object.

    var contextId = result.getContextId();  // Retrieve the
 context ID from the result

    var flowStatus = sn_fd.FlowAPI
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      .getStatus(contextId);                // Retrieve any
 outputs from the action execution.

    return flowStatus;

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

Output:

```
{
    "hasLookupError": false,
    "errorMessage": "",
    "contextStatus": {
      "state": "WAITING",
      "waitingOn": [
        {
          "stepType": "TIMER",
          "endTime": 1713627497643
        },
        {
          "stepType": "WAIT_FOR_CONDITION_WITH_TIMEOUT",
          "table": "incident",
          "condition":
 "sys_id=10e8b43243200210338774d6ebb8f22d^short_description=11
2",
          "endTime": 1713645497800
        }
      ]
    }
  }
```

FlowAPI - hasApprovals(String scopedFlowName)

Checks if a flow within a give scope contains any Ask for Approval actions.

The *`hasApprovals()`* method determines if a flow within a given scope contains any Ask for Approval actions. This method also checks if any Ask for Approval actions within the flow are nested under If flow logic blocks. For more information, see Ask for Approval actions.

Parameters

Name	Type	Description
scopedFlowName	String	Scope and internal name of the flow to execute. For example, `global.flow_name`. Locate the **Internal name** field in the list of Workflow Studio flows.

Returns

Type	Description
String	Returns one of the following string values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• ALWAYS: The flow contains an Ask for Approval action that isn't nested within a conditional `If` flow logic block. • CONDITIONALLY: The flow contains an Ask for Approval action that is nested within a conditional `If` flow logic block. • NO: The flow doesn't contain any Ask for Approval actions. • UNKNOWN: There was a compiler error, and the system can't determine whether the flow contains any Ask for Approval actions.

The following example checks if the *`example_flow`* flow within the *`global`* scope contains any Ask for Approval actions and logs the result.

```
(function() {

  try {
    var result =
 sn_fd.FlowAPI.hasApprovals('global.example_flow');
    gs.log('Result: ' + result);
  }

  catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }
})();
```

FlowAPI - restartFlowFromContext(String ContextId, Map providedInputs)

Restarts a flow, subflow, or action that was run in the background. You can provide new inputs or omit them to reuse the previously provided inputs.

Parameters

Name	Type	Description
contextId	String	The sys_id of the flow, subflow, or action you want to restart. This flow, subflow, or action must have run in background and have an associated sysevent record.
providedInputs	Object	Optional. Map object containing the name-value pairs that define replacement inputs for the flow, subflow, or action. If you omit or provide a null value for this parameter, the flow, subflow, or action runs using the previously provided inputs.

Returns

Type	Description
ScriptableFlowRunnerResponse	Object containing the execution details of a Workflow Studio action, flow, or subflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Restarts a sample flow that has a record-based trigger on the Incident table. The original flow used sample incident INC0008112 as an input. When the flow restarts it instead uses sample incident INC0008111 as an input.

```
(function() {
  try {

    var flowContextID = '4216396ffd7d11107edcf07204c30fd5';
  // sys_id of sys_flow_context record
    var oldIncidentRecord =
'552c48888c033300964f4932b03eb092'; // sys_id of INC0008112
    var newIncidentRecord =
'a83820b58f723300e7e16c7827bdeed2'; // sys_id of INC0008111
    var inputs = {};
    var gr = new GlideRecord('incident'); // Create new incident
object

    gr.get(newIncidentRecord);            // Get GlideRecord
object for INC0008111

    inputs['current'] = gr;               // Set new Incident
record as input
    inputs['table_name'] = 'incident';    // Set table name to
Incident

    var result = sn_fd.FlowAPI.getRunner()            // Create
a ScriptableFlowRunner builder object.
      .restartFlowFromContext(flowContextID, inputs); // Restart
flow with new inputs.

    var contextId = result.getContextId();  // Retrieve the
context ID from the result
    var dateRun = result.getDate();

    gs.info(contextId + ' ' + dateRun);

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

FlowAPI - scheduleCancel(String contextId, String reason, Integer delaySeconds)

Schedule a system event in the Flow Engine Queue to cancel a flow that is in the in progress, presumed interrupted, or waiting state after a delay.

Parameters

Name	Type	Description
contextId	String	Sys_id of the execution details record for the flow, subflow, or action. The target flow, subflow, or action must be in the in progress, presumed interrupted, or waiting state. Access the execution details by navigating to the Flow Executions tab in Workflow Studio, or pass the sys_id of the context record returned by the method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Note: There might be a small delay in cancellation if the target context is running on a different node of the instance. Contexts running on the same node are cancelled immediately. Contexts running on another node must first wait for the cancellation to be forwarded to the appropriate node.
reason	String	Reason for canceling the flow, subflow, or action. Appears in the **Message** field of the Flow engine log entries [sys_flow_log] table.
delaySeconds	Integer	Optional. Number of seconds to wait before processing a cancellation event in the Flow Engine Queue. If you omit this parameter, the method uses the default value of 1 second. You can use this parameter to avoid the performance impact of scheduling the cancellation of thousands of flow contexts at the same time. Rather than run all cancellations simultaneously, schedule a batch of flow cancellations with a delay. Alternatively, you could use the delay as a time out value for an asynchronous flow.

Returns

Type	Description
None	

This example uses the return value of the *`startFlow()`* method to schedule the cancellation of any long-running flows.

```
(function() {

var now_GR = new GlideRecord('incident');
now_GR.addQuery('number', 'INC0000050');
now_GR.query();
now_GR.next();

      try {
          var inputs = {};
          inputs['current'] = now_GR; // GlideRecord of table:
          inputs['table_name'] = 'incident';

          // Starts the flow asynchronously.
          var contextId =
 sn_fd.FlowAPI.startFlow('global.myFlow', inputs);

      } catch (ex) {
          var message = ex.getMessage();
          gs.error(message);
      }
})();
```

© 2026 ServiceNow, Inc. All rights reserved.

```
// Call the scheduleCancel() method using the context Id
 returned from the startFlow() method
sn_fd.FlowAPI.scheduleCancel(contextId, 'Flow took too long to
 execute.', 60);
```

This example schedules the cancellation of any flows named Test Flow.

```
var now_GR = new GlideRecord("sys_flow_context");
now_GR.addQuery("name", "Test Flow");
now_GR.query();

while (now_GR.next()) {
sn_fd.FlowAPI.scheduleCancel(now_GR.getUniqueValue(), 'Canceling
 Test Flows', 60);
}
```

This example uses the delaySeconds parameter to run flow cancellation jobs in batches. Use batches to cancel thousands of flow contexts.

```
var delaySeconds = 1;

for (var i; i < sys_flow_context.length; ++i) {
  if (i % 100 === 0) {
    delaySeconds = delaySeconds + 60;
  }
  var contextId = sys_flow_context[i];
  var reason = "Example reason";
  sn_fd.FlowAPI.scheduleCancel(contextId, reason, delaySeconds);
}
```

FlowAPI - setEncryptedOutput(String password)

Builds password2 values inside a script step.

Identify an encrypted password2 value returned from a GlideRecord, enabling the system to display the value as a masked password rather than an encrypted string.

Parameters

Name	Type	Description
password	String	Encrypted password2 value.

Returns

Type	Description
String	Encrypted password2 value, recognised by the engine as a password value.

This example returns value of a password2 field from a user record and stores in in a variable. This variable is passed into the setEncryptedOutput method, which is called using sn_fd.GlideActionUtil.setEncryptedOutput. The instance recognises the returned value as a password.

```
(function execute(inputs, outputs) {
  // ...code...
  var now_GR = new GlideRecord('sys_user');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  now_GR.addQuery('first_name' , 'Abel');
  now_GR.query();
  now_GR.next();
  var pwVal = now_GR.getValue('pw2');
  outputs['usedSetEncrypted'] =
 sn_fd.GlideActionUtil.setEncryptedOutput(pwVal);
  outputs['justSetDirectly'] = pwVal;
})(inputs, outputs);
```

FlowAPI - startAction(String name, Map inputs)

Runs an action from a server-side script asynchronously.

Execute an action from within a business rule, script include, or any other server-side script. Actions run using this method run asynchronously, so scripts using this method do not have access to any outputs created by the action. Use **executeAction** to run an action synchronously and access the outputs it generates.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *`getRunner()`* method in the *`FlowAPI`* class to return a ScriptableFlowRunner object and use the associated methods. Use the *`ScriptableFlowRunner`* methods if you need to support domain separation.

Note: This method runs the action as the user who initiates the session.

Parameters

Name	Type	Description
name	String	The scope and name of the action to be executed, for example `global.action_name`.
inputs	Map	Name-value pairs that define action inputs. Use the input name, not the input label.

Returns

Type	Description
String	Sys Id of the context record for the action. Access the context record by navigating to the Flow Executions tab in Workflow Studio, selecting a flow execution, and clicking **Open Context Record**.

This example uses sn_fd.FlowAPI.startAction to execute an action called add_comment in the sn_itsm_spoke scope. The inputs object contains a target record and a comment to add to that record. The code is wrapped in a try/catch statement to capture any errors that might occur when the flow executes.

```
(function() {
  try {
    var inputs = {};
    inputs['ah_task'] = myTaskRecord; // GlideRecord of table:
 task
    inputs['ah_comment'] ='Test Comment' ; // String

    var contextId =
 sn_fd.FlowAPI.startAction('sn_itsm_spoke.add_comment', inputs);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }
})();
```

FlowAPI - startActionQuick(String name, Map inputs)

Runs an action from a server-side script asynchronously without creating execution details or other related records. Improve performance by eliminating record-keeping overhead. Use this API to increase the speed of high-volume processing, for example multiple executions per second, in a production environment.

Reporting & records generated

This method does not create execution details and context records, regardless of Workflow Studio settings.

Wait support

This method does not support pausing the action to wait for conditions. Steps that pause for wait conditions such as Ask for Approval or Wait for Condition are not supported.

MID Server support

This method does not support pausing an action to run from a MID Server.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *`getRunner()`* method in the *`FlowAPI`* class to return a ScriptableFlowRunner object and use the associated methods. Use the *`ScriptableFlowRunner`* methods if you need to support domain separation.

Parameters

Name	Type	Description
name	String	Scope and internal name of the action to execute. For example, `global.action_name`. Locate the **Internal name** field in the list of Workflow Studio actions.
inputs	Map	Name-value pairs that define action inputs. You can find the available action inputs and required data types under Inputs in the action outline. Use the input name, not the input label. For example, `{'table':'incident','sys_id':'a39d8e3cf0212300964feeefe80ff0ed'}`.

Returns

Type	Description
void	

```
(function() {

  try {
    var grIncident = new GlideRecord('incident');
    grIncident.get('57af7aec73d423002728660c4cf6a71c');

    var inputs = {};
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    inputs['variable'] = grIncident;

    sn_fd.FlowAPI.startActionQuick('global.update_record_test',
 inputs);

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
    }

})();
```

FlowAPI - startFlow(String name, Map inputs)

Runs a flow from a server-side script.

Execute a flow from within a business rule, script include, or any other server-side script. Flows executed with this method run asynchronously.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *`getRunner()`* method in the *`FlowAPI`* class to return a ScriptableFlowRunner object and use the associated methods. Use the *`ScriptableFlowRunner`* methods if you need to support domain separation.

Note: This method runs the flow as the user specified in flow properties.

Parameters

Name	Type	Description
name	String	The scope and name of the flow to be executed, for example `global.flow_name`.
inputs	Map	Name-value pairs that define trigger inputs. Use the input name, not the input label.

Returns

Type	Description
String	Sys Id of the context record for the flow. Access the context record by navigating to the Flow Executions tab in Workflow Studio, selecting a flow execution, and clicking **Open Context Record**.

This example uses sn_fd.FlowAPI.startFlow to execute a global flow called test_flow. The code creates an inputs variable that contains inputs required by the flow. In this case, the current record and the table for the record. The code is wrapped in a try/catch statement to capture any errors that might occur when the flow executes.

```
(function() {

  var now_GR = new GlideRecord('incident');
  now_GR.addQuery('number', 'INC0009009');
  now_GR.query();
  now_GR.next();

  try {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    var inputs = {};
    inputs['current'] = now_GR; // GlideRecord of table:
 Incident
    inputs['table_name'] = 'incident';

    var contextId = sn_fd.FlowAPI.startFlow('global.test_flow',
 inputs);

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }
})();
```

FlowAPI - startFlowQuick(String name, Map inputs)

Runs a flow from a server-side script asynchronously without creating execution details or other related records. Improve performance by eliminating record-keeping overhead. Use this API to increase the speed of high-volume processing, for example multiple executions per second, in a production environment.

Reporting & records generated

This method does not create execution details and context records, regardless of Workflow Studio settings.

Run as System user

This method runs the flow as the System user. Setting the flow to run as the user who initiates the session, or impersonating a user, is not supported.

Wait support

This method does not support pausing the flow to wait for conditions. Actions or flow logic that pause for wait conditions such as Ask for Approval, Wait for Condition, or Wait for a duration are not supported.

MID Server support

This method does not support pausing a flow to run from a MID Server.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *`getRunner()`* method in the *`FlowAPI`* class to return a ScriptableFlowRunner object and use the associated methods. Use the *`ScriptableFlowRunner`* methods if you need to support domain separation.

Parameters

Name	Type	Description
name	String	Scope and internal name of the flow to execute. For example, `global.flow_name`. Locate the **Internal name** field in the list of Workflow Studio flows.
inputs	Map	Name-value pairs that define trigger inputs. You can find the available trigger inputs and required data types in the Trigger section of the flow. Use the input name, not the input label. For example, `{'table':'incident','sys_id':'a39d8e3cf0212300964feeefe80ff0ed'}`.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
(function() {

  try {
    var grIncident = new GlideRecord('incident');
    grIncident.get('ed92e8d173d023002728660c4cf6a7bc');

    var inputs = {};
    inputs['current'] = grIncident;
    inputs['table_name'] = 'incident';

    sn_fd.FlowAPI.startFlowQuick('global.test_quick_flow',
 inputs);

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
 }

})();
```

FlowAPI - startSubflow(String name, Map input)

Runs a subflow from a server-side script.

Execute a subflow from within a business rule, script include, or any other server-side script. Subflows run using this method run asynchronously Scripts that include this method do not have access to outputs created by the flow. Use **executeSubflow** to run a subflow synchronously and access the outputs it generates.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *`getRunner()`* method in the *`FlowAPI`* class to return a ScriptableFlowRunner object and use the associated methods. Use the *`ScriptableFlowRunner`* methods if you need to support domain separation.

Note: This method runs the flow as the user specified in flow properties.

Parameters

Name	Type	Description
name	String	The scope and name of the subflow to be executed, for example `global.subflow_name`.
inputs	Map	Name-value pairs that define subflow inputs. Use the input name, not the input label.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Sys Id of the context record for the subflow. Access the context record by navigating to the Flow Executions tab in Workflow Studio, selecting a flow execution, and clicking **Open Context Record**.

This example uses *sn_fd.FlowAPI.startSubflow* to execute a global flow called test_subflow. The code is wrapped in a try/catch statement to capture any errors that might occur when the flow executes.

```
(function() {
  try {
    var inputs = {};
    inputs['ah_task'] = myTaskRecord; // GlideRecord of table:
 task
    inputs['ah_comment'] ='Test Comment' ; // String

    var contextId =
 sn_fd.FlowAPI.startSubflow('global.test_subflow', inputs);

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

FlowAPI - startSubflowQuick(String name, Map inputs)

Runs a subflow from a server-side script asynchronously without creating execution details or other related records. Improve performance by eliminating record-keeping overhead. Use this API to increase the speed of high-volume processing, for example multiple executions per second, in a production environment.

Reporting & records generated

This method does not create execution details and context records, regardless of Workflow Studio settings.

Run as System user

This method runs the flow as the System user. Setting the flow to run as the user who initiates the session, or impersonating a user, is not supported.

Wait support

This method does not support pausing the flow to wait for conditions. Actions or flow logic that pause for wait conditions such as Ask for Approval, Wait for Condition, or Wait for a duration are not supported.

MID Server support

This method does not support pausing a flow to run from a MID Server.

Note: This API is replaced by ScriptableFlowRunner - Scoped, which deprecates the existing methods used to build objects and execute Workflow Studio flows and actions. Use the *getRunner()* method in the *FlowAPI* class to return a ScriptableFlowRunner object and use the associated methods. Use the *ScriptableFlowRunner* methods if you need to support domain separation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Scope and internal name of the subflow to execute. For example, `global.subflow_name`. Locate the **Internal name** field in the list of Workflow Studio subflows.
inputs	Map	Name-value pairs that define subflow inputs. You can find the available subflow inputs and required data types under Inputs in the subflow. Use the input name, not the input label. For example, `{'table':'incident','sys_id':'a39d8e3cf0212300964feeefe80ff0ed'}`.

Returns

Type	Description
void	

```
(function() {

  try {
    var grIncident = new GlideRecord('incident');
    grIncident.get('57af7aec73d423002728660c4cf6a71c');

    var inputs = {};
    inputs['variable'] = grIncident;

 sn_fd.FlowAPI.startSubflowQuick('global.test_quick_run_subflo
w', inputs);

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
    }

})();
```

FlowScriptAPI - Scoped

The *FlowScriptAPI* API provides a method to return the context ID of the running flow.

You cannot instantiate objects of this type. Objects of this type are created automatically and are accessible only in script steps and inline scripts.

FlowScriptAPI - getContextID()

Returns the context ID of the running flow.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The sys_id of the running flow.

This example assumes you have created a flow containing a **Log** action. This inline script generates the content of the Log message.

```
var contextId = FlowScriptAPI.getContextID();
return contextId;
```

Output:

```
4ecead85c4da0010598d0c7c6bf73554
```

Flow - Scoped (deprecated)

The *Flow* API provides methods to run activated Workflow Studio flows.

This API is deprecated and replaced by the ScriptableFlowRunner - Scoped and ScriptableFlowRunnerResult - ScopedAPIs.

The *Flow* API can only be used in server scripts.

Use the `sn_fd` namespace to access the *Flow* API.

Before interacting with a flow using the *Flow* API, you must first create and activate the flow in the Workflow Studio interface. Because the *Flow* API only interacts with pre-built flows, there is no constructor for the class.

Note: To optimize instance performance, avoid calling these methods from an asynchronous business rule script. Instead, create a scheduled job record within the Workflow Studio UI.

Flow - startAsync(String scopeName.flowName, Map flowInputs)

Ignores the trigger and runs an activated flow asynchronously.

Asynchronous calls are non-blocking, allowing the client to execute other code in the script without having to wait for the flow to complete.

Parameters

Name	Type	Description
scopeName.flowName	String	The application scope for the flow and the internal name of the flow to run. If scopeName is not included, the scope of the user currently logged in is used. Retrieve the internal name of the flow using the **Internal name** column on the Workflow Studio landing page.

flowInputs	Map	Name-value pairs in `<String, Object>` format that define record-based flow inputs.
		
		To call a flow with a record-based trigger, use the format:
		`var flowInputs = {};`
		`flowInputs['current'] = glideRecord;`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		`flowInputs['table_name'] = glideRecord.getTableName();`
		
		The GlideRecord object must be named 'current'.
		
		To call a flow with a Service Catalog trigger, use the format:
		
		`var flowInputs = {};`
		`flowInputs['request_item'] = glideRecord;`
		`flowInputs['table_name'] = glideRecord.getTableName();`
		
		The GlideRecord object must be named 'request_item'.

Returns

Type	Description
Object	PlanResponse object containing the following properties: • contextId: sys_id of the execution details record for the executed flow. Access the execution details by navigating to the Flow Executions tab in Workflow Studio and filtering by sys_id. An exception occurs when the flow: • Does not exist within the specified application scope, or the flow or scope name has been misspelled. • Is not activated. • Exceeds the recursion limit set by the *com.glide.hub.flow_engine.indirect_recursion_limit* system property. The default value is three.

```
//Example 1: Run a flow with a record-based trigger
(function startFlowAsync() {

 try {
  // You MUST fetch the GlideRecord that will be passed to the
 flow
  var glideRecordInput = new GlideRecord('sys_user');
  glideRecordInput.get('62826bf03710200044e0bfc8bcbe5df1');

  var flowInputs = {};
  flowInputs['current'] = glideRecordInput;
  flowInputs['table_name'] = glideRecordInput.getTableName();

  var result =
 sn_fd.Flow.startAsync('global.recordtriggeredflow',
 flowInputs);

  //The Sys ID of a flow execution (contextId)
  var contextId = result.contextId;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 } catch (ex) {
  var message = ex.getMessage();
  gs.error(message);
 }

})();

//Example 2: Run a flow with a schedule-based trigger
(function startFlowAsync() {

 try {
  var result =
 sn_fd.Flow.startAsync('global.scheduletriggeredflow');

  //The Sys ID of a flow execution (contextId)
  var contextId = result.contextId;

 } catch (ex) {
  var message = ex.getMessage();
  gs.error(message);
 }

})();

//Example 3: Run a flow with a Service Catalog trigger
(function startFlowAsync() {

 try {
  // You MUST fetch the GlideRecord that will be passed to the
 flow
  var glideRecordInput = new GlideRecord('sc_req_item');
  glideRecordInput.get(aeed229047801200e0ef563dbb9a71c2);

  var flowInputs = {};
  flowInputs['request_item'] = glideRecordInput;
  flowInputs['table_name'] = glideRecordInput.getTableName();

  var result =
 sn_fd.Flow.startAsync('global.catalogtriggeredflow',
 flowInputs);

  //The Sys ID of a flow execution (contextId)
  var contextId = result.contextId;

 } catch (ex) {
  var message = ex.getMessage();
  gs.error(message);
 }

})();

//Example 4: Run a flow with a MetricBase trigger
(function startMetricBaseFlowAsync() {

 try {

  var oilLevelTriggerRecord = new GlideRecord('oil_levels');
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  oilLevelTriggerRecord.get('a4b3622bc72113007b237f48cb97635f');

  var metricTriggerDefinition = new
 GlideRecord('sys_metric_trigger_definition');

 metricTriggerDefinition.get('21f2eae7c72113007b237f48cb976352
');

  var event_time =
 oilLevelTriggerRecord.getValue('sys_created_on');
  var level = 4;

  var metricBaseFlowInputs = {};
  //The record that triggered the metric event
  metricBaseFlowInputs['current'] = oilLevelTriggerRecord;
  //The MetricBase Trigger Definition record
  metricBaseFlowInputs['metric'] = metricTriggerDefinition;
  //The time that the 'record' reached a specific metric event
 level and triggered this flow
  metricBaseFlowInputs['event_time'] = event_time;
  //The target event level to reach in order for a metric flow
 to trigger
  metricBaseFlowInputs['level'] = level;

  var result =
 sn_fd.Flow.startAsync('global.metricbasedtriggeredflow',
 metricBaseFlowInputs);

  //The Sys ID of a flow execution (contextId)
  var contextId = result.contextId;

 } catch (ex) {
  var message = ex.getMessage();
  gs.error(message);
 }

})();
```

GenericUPSAlarmsReconciler - Global

The *GenericUPSAlarmsReconciler* script include provides methods to obtain reconciler information for generic uninterruptible power supply (UPS) alarms.

Use this API for SNMP-related discovery.

GenericUPSAlarmsReconciler - getReconcilationField()

Returns the reconciliation field.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The reconciliation field

GenericUPSAlarmsReconciler - getReconcilationKey()

Returns the reconciliation key.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The reconciliation key

GenericUPSAlarmsReconciler - hasChanged()

Determines if the generic UPS bypass information has changed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the information has changed; otherwise, false.

GenericUPSAlarmsReconciler - readDatabaseFields()

Reads the database fields.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GenericUPSAlarmsReconciler - readDiscovered()

Reads the discovered information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GenericUPSAlarmsReconciler - setDatabaseFields()

Sets the database fields.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GenericUPSBypassReconciler - Global

The `GenericUPSBypassReconciler` script include provides methods to obtain reconciler information for generic uninterruptible power supply (UPS) bypasses.

Use this API for SNMP-related discovery.

GenericUPSBypassReconciler - getReconcilationField()

Returns the reconciliation field.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The reconciliation field

GenericUPSBypassReconciler - getReconcilationKey()

Returns the reconciliation key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The reconciliation key

GenericUPSBypassReconciler - hasChanged()

Determines if the generic UPS Bypass information has changed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the information has changed; otherwise, false.

GenericUPSBypassReconciler - readDatabaseFields()

Reads the database fields.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GenericUPSBypassReconciler - readDiscovered()

Reads the discovered information.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

GenericUPSBypassReconciler - setDatabaseFields()

Sets the database fields.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GenericUPSInputsReconciler - Global

The `GenericUPSInputsReconciler` script include provides methods to obtain reconciler information for generic uninterruptible power supply (UPS) inputs.

Use this API for SNMP-related discovery.

GenericUPSInputsReconciler - getReconcilationField()

Returns the reconciliation field.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The reconciliation field

GenericUPSInputsReconciler - getReconcilationKey()

Returns the reconciliation key.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The reconciliation key

GenericUPSInputsReconciler - hasChanged()

Determines if the generic UPS Bypass information has changed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the information has changed; otherwise, false.

GenericUPSInputsReconciler - readDatabaseFields()

Reads the database fields.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GenericUPSInputsReconciler - readDiscovered()

Reads the discovered information.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GenericUPSInputsReconciler - setDatabaseFields()

Sets the database fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GenericUPSOutputsReconciler - Global

The `GenericUPSOutputsReconciler` script include provides methods to obtain reconciler information for generic uninterruptible power supply (UPS) outputs.

Use this API for SNMP-related discovery.

GenericUPSOutputsReconciler - getReconcilationField()

Returns the reconciliation field.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The reconciliation field

GenericUPSOutputsReconciler - getReconcilationKey()

Returns the reconciliation key.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GenericUPSOutputsReconciler - hasChanged()

Determines if the generic UPS bypass information has changed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the information has changed; otherwise, false.

GenericUPSOutputsReconciler - readDatabaseFields()

Reads the database fields.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GenericUPSOutputsReconciler - readDiscovered()

Reads the discovered information.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

GenericUPSOutputsReconciler - setDatabaseFields()

Sets the database fields.

Parameters

Name	Type	Description
None

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

GeniusResultAnswer - Scoped

The *GeniusResultAnswer* API provides methods for creating an answer object in a Genius Result configuration's processor scripts. Answers created with this API define search requests or key-value pair maps that can populate Genius Result answer cards.

You can populate the answer object with query details retrieved from the context of the Genius Result configuration using the *GeniusResultContext* API.

The *GeniusResultAnswer* API methods you need to invoke to create your answer object depend on which AI Search Genius Result Configuration form field you're using for your script:

- If you're scripting in a Genius Result configuration's *AI Search request processor* field, you need to invoke the *setTable()* method and one of the *setSearchPhrase()*, *addSearchPhrases()*, or *setEncodedQuery()* methods. All other methods are optional except for *addDataMap()*, which is not relevant for this use case.
- If you're scripting in a Genius Result configuration's *AI Search response processor* field, you need to invoke the *addDataMap()* method. No other methods are relevant for this use case.

Use this API in Genius Result server-side scripts with the `sn_ais` namespace identifier. For more information on scripting logic for Genius Results, see Create a new Genius Result configuration.

GeniusResultAnswer – addDataMap(Object map)

Defines a Genius Result answer with arbitrary key-value pair fields in your Genius Result configuration's *AI Search response processor* script. You can utilize any public ServiceNow AI Platform API to generate these fields.

Note: When scripting in a Genius Result configuration's *AI Search response processor* field, you need to invoke this method. If you don't invoke this method, the Genius Result returns no answers when triggered.

You can add multiple field maps to a single *AI Search response processor* script by invoking this method more than once. Each field map populates a separate Genius Result answer card.

Parameters

Name	Type	Description
map	Object	Defines an arbitrary set of key-value pair fields for addition to the search query response from AI Search. All field values must be Strings. `{ "fieldName1": String, "fieldName2": String }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether invocation of the method succeeded. Valid values: • true: Invocation of the method succeeded. • false: Invocation of the method failed.

This *AI Search response processor* script adds custom title and URL key-value pair fields to the answer object for display on a Genius Result answer card.

```
function process(context) {
  var answer = new sn_ais.GeniusResultAnswer();

  var customFieldMap = {
    "title": "My custom Genius Result answer",
    "url": "https://example.com/myGeniusResultLink"
  }

  answer.addDataMap(customFieldMap);

  return answer;
}
```

GeniusResultAnswer – addSearchPhrases(Array searchPhrases)

Adds terms to the search query defined in your Genius Result configuration's *AI Search request processor* script.

Note: When scripting in a Genius Result configuration's *AI Search request processor* field, you must invoke the `setTable()` method and one of the `setSearchPhrase()`, `addSearchPhrases()`, or `setEncodedQuery()` methods. If you don't invoke both of the required methods, your Genius Result returns no answers when triggered.

Parameters

Name	Type	Description
searchPhrases	Array	Array of arbitrary Strings to add as search terms for the search query defined in your Genius Result configuration's *AI Search request processor* script. AI Search treats these search terms as if separated by the OR operator. Example: `[ "Term": String, "Quoted phrase": String ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether invocation of the method succeeded. Valid values: • true: Invocation of the method succeeded. • false: Invocation of the method failed.

This *AI Search request processor* script constructs a search query for records on the User [sys_user] table that contain the terms `Beth` or `Anglin`.

```
function process(context) {
  var answer = new sn_ais.GeniusResultAnswer();

  answer.setTable('sys_user');
  answer.addSearchPhrases(['Beth','Anglin']);

  return answer;
}
```

GeniusResultAnswer – setEncodedQuery(String query)

Specifies an encoded search query in your Genius Result configuration's *AI Search request processor* script. Results from this encoded search query are displayed as Genius Result answer cards.

Note: When scripting in a Genius Result configuration's *AI Search request processor* field, you need to invoke the *setTable()* method and one of the *setSearchPhrase()*, *addSearchPhrases()*, or *setEncodedQuery()* methods. If you don't invoke both of the required methods, your Genius Result returns no answers when triggered.

Parameters

Name	Type	Description
query	String	Encoded search query to send to AI Search from your Genius Result configuration's *AI Search request processor* script.

Returns

Type	Description
Boolean	Flag that indicates whether invocation of the method succeeded. Valid values: • true: Invocation of the method succeeded. • false: Invocation of the method failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This *AI Search request processor* script constructs an encoded search query against the User [sys_user] table. The final query joins together multiple subqueries generated from entities detected in the user's original search query.

```
function process(context) {
  var answer = new sn_ais.GeniusResultAnswer();

  answer.setTable('sys_user');
  answer.setSearchLimit(2);
  answer.spellCheck(false);
  var queries = [];
  var matchingSegments;
  var predictionResult = context.getPredictionResult();
  if (predictionResult && predictionResult.length == 1) {
    var detail = predictionResult[0];
    if (detail['result'] && detail['result']['entities']) {
      var entities = detail['result']['entities'];
      for (var i = 0; i < entities.length; i++) {
        if (entities[i]['name'].endsWith('personName')) {
          matchingSegments = entities[i]['matchingSegments'];
          for (var j = 0; j < matchingSegments.length; j++)

 answer.addSearchPhrases([matchingSegments[j]['value']]);
        } else if (entities[i]['name'].endsWith('cityLocation'))
 {
          matchingSegments = entities[i]['matchingSegments'];
          if (matchingSegments && matchingSegments.length > 0)
            queries.push('location.nameLIKE' +
 matchingSegments[0]['value']);
        } else if
 (entities[i]['name'].endsWith('departmentName')) {
          matchingSegments = entities[i]['matchingSegments'];
          if (matchingSegments && matchingSegments.length > 0)
            queries.push('department.nameLIKE' +
 matchingSegments[0]['value']);
        } else if (entities[i]['name'].endsWith('jobTitle')) {
          matchingSegments = entities[i]['matchingSegments'];
          if (matchingSegments && matchingSegments.length > 0)
            queries.push('titleLIKE' +
 matchingSegments[0]['value']);
        }
      }
    }
  }

  if (queries.length > 0)
    answer.setEncodedQuery(queries.join('^'));

  return answer;
}
```

GeniusResultAnswer – setSearchLimit(Number searchLimit)

Limits the maximum number of results returned for the search query defined in your Genius Result configuration's *AI Search request processor* script. By default, the search query returns up to three results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
searchLimit	Number	Positive integer value for the maximum number of search results to return for the search query defined in your Genius Result configuration's *AI Search request processor* script. Values above 3 have no effect. Default: 3

Returns

Type	Description
Boolean	Flag that indicates whether invocation of the method succeeded. Valid values: • true: Invocation of the method succeeded. • false: Invocation of the method failed.

This *AI Search request processor* script searches for records from the Catalog Item [sc_cat_item] table that contain the term `laptop` and returns a maximum of two results.

```
function process(context) {
  var answer = new sn_ais.GeniusResultAnswer();

  answer.setTable('sc_cat_item');
  answer.setSearchPhrase('laptop');
  answer.setSearchLimit(2);

  return answer;
}
```

GeniusResultAnswer – setSearchPhrase(String searchPhrase)

Specifies terms for the search query defined in your Genius Result configuration's *AI Search request processor* script.

Note: When scripting in a Genius Result configuration's *AI Search request processor* field, you need to invoke the *setTable()* method and one of the *setSearchPhrase()*, *addSearchPhrases()*, or *setEncodedQuery()* methods. If you don't invoke both of the required methods, your Genius Result returns no answers when triggered.

Parameters

Name	Type	Description
searchPhrase	String	Terms to use for the search query defined in your Genius Result configuration's *AI Search request processor* script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		If you want to retain the search terms from the query that triggered the Genius Result configuration, set this parameter to the String value returned by the *GeniusResultContext.getOriginalSearchPhrase()* method.

Returns

Type	Description
Boolean	Flag that indicates whether invocation of the method succeeded. Valid values: • true: Invocation of the method succeeded. • false: Invocation of the method failed.

This *AI Search request processor* script constructs a search query for records from the User [sys_user] table that contain the term `Anglin`.

```
function process(context) {
  var answer = new sn_ais.GeniusResultAnswer();

  answer.setTable('sys_user');
  answer.setSearchPhrase('Anglin');

  return answer;
}
```

GeniusResultAnswer – setTable(String table)

Limits the search query defined in a Genius Result configuration's *AI Search request processor* script to a specific table. The query only returns search results from the specified table as Genius Result answer cards.

Note: When scripting in a Genius Result configuration's *AI Search request processor* field, you need to invoke this method and one of the *setSearchPhrase()*, *addSearchPhrases()*, or *setEncodedQuery()* methods. If you don't invoke both of the required methods, your Genius Result returns no answers when triggered.

Parameters

Name	Type	Description
table	String	ServiceNow AI Platform table name. Only indexed records on this table are returned as results for the search query defined in your Genius Result configuration's *AI Search request processor* script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether invocation of the method succeeded. Valid values: • true: Invocation of the method succeeded. • false: Invocation of the method failed.

This *AI Search request processor* script constructs a search query for records from the User [sys_user] table that contain the term `Anglin`.

```
function process(context) {
  var answer = new sn_ais.GeniusResultAnswer();

  answer.setTable('sys_user');
  answer.setSearchPhrase('Anglin');

  return answer;
}
```

GeniusResultAnswer – spellCheck(Boolean spellCheck)

Specifies whether to perform typo handling auto-correction (spell checking) for the search query defined in a Genius Result configuration's *AI Search request processor* script.

If you don't invoke this method in your Genius Result configuration's *AI Search request processor* script, the defined search query inherits the typo handling flag from the search query that triggers the Genius Result configuration.

Parameters

Name	Type	Description
spellCheck	Boolean	Flag that indicates whether to perform typo handling auto-correction for the search query defined in your Genius Result configuration's *AI Search request processor* script. Valid values: • true: Perform typo handling auto-correction for the search query. • false: Bypass typo handling auto-correction for the search query. Default: true

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This *AI Search request processor* script disables typo handling auto-correction for its search query against the User [sys_user] table.

```
function process(context) {
  var answer = new sn_ais.GeniusResultAnswer();

  answer.setTable('sys_user');
  answer.setSearchLimit(2);
  answer.spellCheck(false);
  var queries = [];
  var matchingSegments;
  var predictionResult = context.getPredictionResult();
  if (predictionResult && predictionResult.length == 1) {
    var detail = predictionResult[0];
    if (detail['result'] && detail['result']['entities']) {
      var entities = detail['result']['entities'];
      for (var i = 0; i < entities.length; i++) {
        if (entities[i]['name'].endsWith('personName')) {
          matchingSegments = entities[i]['matchingSegments'];
          for (var j = 0; j < matchingSegments.length; j++)

 answer.addSearchPhrases([matchingSegments[j]['value']]);
        } else if (entities[i]['name'].endsWith('cityLocation'))
 {
          matchingSegments = entities[i]['matchingSegments'];
          if (matchingSegments && matchingSegments.length > 0)
            queries.push('location.nameLIKE' +
 matchingSegments[0]['value']);
        } else if
 (entities[i]['name'].endsWith('departmentName')) {
          matchingSegments = entities[i]['matchingSegments'];
          if (matchingSegments && matchingSegments.length > 0)
            queries.push('department.nameLIKE' +
 matchingSegments[0]['value']);
        } else if (entities[i]['name'].endsWith('jobTitle')) {
          matchingSegments = entities[i]['matchingSegments'];
          if (matchingSegments && matchingSegments.length > 0)
            queries.push('titleLIKE' +
 matchingSegments[0]['value']);
        }
      }
    }
  }

  if (queries.length > 0)
    answer.setEncodedQuery(queries.join('^'));

  return answer;
}
```

GeniusResultContext - Scoped

The *GeniusResultContext* API provides methods for retrieving search query information from the context of a Genius Result configuration.

You can use search query details retrieved with this API to populate Genius Result answer objects created with the *GeniusResultAnswer* API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use this API in Genius Result server-side scripts with the `sn_ais` namespace identifier. For more information on scripting logic for Genius Results, see Create a new Genius Result configuration.

GeniusResultContext - getMatchingDocuments()

Retrieves search result documents from the search query that triggers your Genius Result configuration.

Use this method in a Genius Result configuration's response processor script to retrieve field values from search result documents returned by the search query that triggers your Genius Result. You can populate Genius Result answers with fields from the search result documents using *`GeniusResultAnswer`* API methods.

Note: This method returns no results when invoked in an *`AI Search request processor`* script, since the script is executed before AI Search computes results for the triggering search query. Don't use this method in your request processor scripts.

Parameters

Name	Type	Description
None		

Returns

Type	Description
[Array]	Array of objects in which each object represents a search result document that matched the search query. Data type: Array `[ { ".score": Number, ".table": "String", ".text": "String", ".title": "String", ".url": "String", "class_name": "String", "sys_id": "String", "<field_name>": <field_value> } ]` **Note:** Depending on the search query, some of the search result document's AI Search index fields may appear in the object in addition to the listed name-value pairs.
[Array]..score	Relevancy score computed for the search result document in the context of the search query. Data type: Number **Note:** The name for this name-value pair begins with a period to distinguish it from the AI Search index's **score** common field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
[Array]..table	Name of the ServiceNow AI Platform table that the search result document was indexed from. Data type: String **Note:** The name for this name-value pair begins with a period to distinguish it from the AI Search index's **table** common field.
[Array]..text	Indexed text from the search result document. Data type: String **Note:** The name for this name-value pair begins with a period to distinguish it from the AI Search index's **text** common field.
[Array]..title	Indexed title for the search result document. Data type: String **Note:** The name for this name-value pair begins with a period to distinguish it from the AI Search index's **title** common field.
[Array]..url	URL for the search result document. Data type: String **Note:** The name for this name-value pair begins with a period to distinguish it from the AI Search index's **url** common field.
[Array].class_name	The child class that the search result document belongs to. For more information on table child classes, see Table extension and classes. Data type: String
[Array].sys_id	Sys_id for the search result document. Data type: String
[Array].<field_name>	AI Search index field from the search result document. Data type: The data type of the AI Search index field.

This *AI Search response processor* script retrieves up to three search result documents matched by the search query and checks whether any of them is from the Knowledge [kb_knowledge] table. If it finds a search result document from the Knowledge table, the function adds that document's fields to the *GeniusResultAnswer* object so the UI can display them to the user.

```
function process(context) {
  var answer = new sn_ais.GeniusResultAnswer();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  var matchingDocuments = context.getMatchingDocuments();
  if (matchingDocuments.length > 1) {
    for (var i = 0; i < 3; i++) {
      var currentDocument = matchingDocuments[i];
      if (currentDocument['.table'] == 'kb_knowledge') {
        var gr = new GlideRecord("kb_knowledge");
        if (gr.get(currentDocument['sys_id'])) {
          answer.addDataMap({
            "number": currentDocument['number'],
            "url": currentDocument['.url'],
            "title": currentDocument['.title']
          });
        }
      }
      break;
    }
  }
  return answer;
}
```

GeniusResultContext – getOriginalSearchPhrase()

Retrieves the original search terms from the search query that triggers your Genius Result configuration.

You can use retrieved search terms to populate Genius Result answers using *`GeniusResultAnswer`* API methods.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Original terms from the search query. Data type: String

This *`AI Search request processor`* script gets the search query's original terms and uses them as the query terms for a new snippet search.

```
function process(context) {
  var answer = new sn_ais.GeniusResultAnswer();

  var searchPhrase = context.getOriginalSearchPhrase();
  answer.setSearchPhrase(searchPhrase);
  answer.snippetSearch(true);

  return answer;
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GeniusResultContext – getPredictionResult()

Retrieves NLU model prediction results for the search query that triggers your Genius Result configuration.

Use this method in a Genius Result configuration's request or response processor script to retrieve the intent detected for the triggering search query. You can populate Genius Result answers with details from the detected intent using `GeniusResultAnswer` API methods.

Parameters

Name	Type	Description
None		

Returns

Type	Description
[Array]	Array of objects in which each object represents an NLU model intent prediction result for the search query. Data type: Array `[ { "intentName": "String", "result": {Object}, "solutionName": "String" } ]`
[Array].intentName	Name of the NLU model intent detected in the search query. Data type: String
[Array].result	Object representing the NLU model intent prediction result for the search query. Data type: Object `"result": { "application": {Object}, "result": {Object}, "solutionLabel": "String", "solutionName": "String", "solutionType": "String", "type": "String", "version": Number }`
[Array].result.application	Object containing metadata for the search application that produced the prediction result. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"application": {
	  "language": "String",
	  "type": "String"
	}</pre>

[Array].result.application.language	Language context for the ServiceNow AI Platform application that produced the prediction result. Data type: String
[Array].result.application.type	Type of the ServiceNow AI Platform application that produced the prediction result. Data type: String

[Array].result.result	Object including details for the NLU model intent prediction result.
	
	Data type: Object
	<pre>"result": {
	  "entities": [Array],
	  "intentName": "String",
	  "intents": [Array],
	  "nluModelName": "String",
	  "score": Number
	}</pre>

[Array].result.result.entities	Array of objects in which each object represents an NLU model intent entity detected in the search query.
	
	Data type: Array
	<pre>"entities": [
	  {
	  "matchingSegments": [Array],
	  "name": "String",
	  "parts": [Array],
	  "score": Number,
	  "startingPosition": Number,
	  "value": "String"
	  }
	]</pre>

[Array].result.result.entities.matchingSegments	Array of objects in which each object represents a matching segment of the detected NLU entity.
	
	Data type: Array
	<pre>"matchingSegments": [
	  {</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"directMatch": Boolean
	"meta": {Object},
	"value": "String"
	}
	]</pre>

[Array].result.result.entities.matchingSegments.directMatch	Flag that indicates whether the NLU entity matching segment represents an exact match for the entity value.

[Array].result.result.entities.matchingSegments.meta	Object containing key-value pair fields representing metadata for the NLU entity matching segment.
	
	Data type: Object
	<pre>"meta": {
	"augmentedBy": "String",
	"colMeta:first_name": "String",
	"colMeta:last_name": "String",
	"compositionStrategy": "String",
	"fieldName": "String",
	"searchPreProcessors": "String",
	"SUB_PHRASE.penalty": "String",
	"tableName": "String"
	}</pre>

[Array].result.result.entities.matchingSegments.value	String value of the NLU entity matching segment. Data type: String
[Array].result.result.entities.name	Name for the detected NLU entity, in `entity:[NLU_model].[intent].[entity_type]` format. Data type: String

[Array].result.result.entities.parts	Array of objects in which each object represents an NLU entity part found in the prediction result.
	
	Data type: Array
	<pre>"parts": [
	{
	"meta": {Object},
	"value": "String"
	}
	]</pre>

[Array].result.result.entities.parts.meta	Object containing key-value pair fields representing metadata for the NLU entity part.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Object `"meta": { "augmentedBy": "String", "colMeta:name": "String", "compositionStrategy": "String", "fieldName": "String", "searchPreProcessors": "String", "SUB_PHRASE.penalty": "String", "tableName": "String" }`
[Array].result.result.entities.parts.value	String value of the NLU entity part. Data type: String
[Array].result.result.entities.score	Numeric score from 0 through 1 indicating confidence for the detected NLU entity. Data type: Number
[Array].result.result.entities.startingPosition	Numeric index for the character position in the search query at which the detected NLU entity begins. Data type: Number
[Array].result.result.entities.value	String value of the NLU detected in the search query. Data type: String
[Array].result.result.intentName	Name of the NLU model intent detected in the search query. Data type: String
[Array].result.result.intents	Array of objects in which each object represents a nested NLU model intent detected in the search query. Nested intent objects include the same parameter names and data types as the parent NLU model intent object. Data type: Array `"intents": [ { "entities": [Array], "intentName": "String", "intents": [Array], "nluModelName": "String", "score": Number`

Returns (continued)

Type	Description
	<pre> }]</pre>
[Array].result.result.nluModelName	Name of the NLU model that produced the prediction result. Data type: String
[Array].result.result.score	Numeric score from 0 through 1 indicating confidence for the NLU model prediction result. Data type: Number
[Array].result.solutionLabel	Label for the NLU model that produced the prediction result. Data type: String
[Array].result.solutionName	Name for the NLU model that produced the prediction result. Data type: String
[Array].result.solutionType	Type for the NLU model that produced the prediction result. Data type: String
[Array].result.type	Type of the prediction result. Data type: String
[Array].result.version	Version of the NLU model that produced the prediction result. Data type: Number
[Array].solutionName	Name of the NLU model that produced the prediction result. Data type: String

This *AI Search request processor* script checks whether the search query includes an NLU model prediction result. When it finds a prediction result, it adds the matching segments from all detected catalogItem entities as search terms.

```
function process(context) {
  var answer = new sn_ais.GeniusResultAnswer();

  answer.setTable('sc_cat_item');
  answer.setSearchLimit(2);
  var predictionResult = context.getPredictionResult();
  if (predictionResult && predictionResult.length == 1) {
    var detail = predictionResult[0];
```

```
    if (detail['result'] && detail['result']['entities']) {
      var entities = detail['result']['entities'];
      for (var i = 0; i < entities.length; i++) {
        if (entities[i]['name'].endsWith('catalogItem')) {
          var matchingSegments =
 entities[i]['matchingSegments'];
          for (var j = 0; j < matchingSegments.length; j++)

 answer.addSearchPhrases([matchingSegments[j]['value']]);
        }
      }
    }
  }

  return answer;
}
```

GlideAggregate - Global

The *GlideAggregate* API enables creating database aggregation queries.

The *GlideAggregate* class is an extension of the *GlideRecord* class and provides database aggregation (AVG, COUNT, GROUP_CONCAT, GROUP_CONCAT_DISTINCT, MAX, MIN, STDDEV, SUM) queries. This functionality can be helpful when creating customized reports or in calculations for calculated fields.

When you use *GlideAggregate* methods on currency or price fields, you are working with the reference currency value. Be sure to convert the aggregate values to the user's session currency for display. Because the conversion rate between the currency or price value (displayed value) and its reference currency value (aggregation value) might change, the result may not be what the user expects.

To use this API to create dynamic attributes you must have the dynamic_schema_writer role. To read dynamic data using this API you must have the dynamic_schema_reader role.

For more information on dynamic attributes, see Dynamic Schema.

Note: When using an on-premise system, the database server time zone must be set to GMT/UTC for this class to work properly.

GlideAggregate - addAggregate(String agg, String name)

Adds an aggregate to a database query.

Parameters

Name	Type	Description
agg	String	Name of an aggregate to use. Valid values: • AVG: Average value of the expression. • COUNT: Count of the number of non-null values. • GROUP_CONCAT: Concatenates all non-null values of the group in ascending order, joins them with a comma (','), and returns the result as a string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• GROUP_CONCAT_DISTINCT: Concatenates all non-null values of the group in ascending order, removes duplicates, joins them with a comma (','), and returns the result as a string. • MAX: Largest, or maximum, value. • MIN: Minimum value. • STDDEV: Population standard deviation. • SUM: Sum of all values.
name	String	Optional for field name. Name of the field, or path to an attribute within a dynamic attribute store, to group the results of the aggregation by. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table. For more information on dynamic attributes, see Dynamic Schema. Default: Null

Returns

Type	Description
None	

The following example shows how to use *`GlideAggregate`* functions on the Incident [incident] table.

```
var incidentGA = new GlideAggregate('incident');
incidentGA.groupBy('category');
incidentGA.orderByAggregate('COUNT', 'sys_mod_count');

incidentGA.addAggregate('AVG', 'sys_mod_count');
incidentGA.addAggregate('COUNT', 'sys_mod_count');
incidentGA.addAggregate('GROUP_CONCAT', 'sys_mod_count');
incidentGA.addAggregate('GROUP_CONCAT_DISTINCT',
 'sys_mod_count');
incidentGA.addAggregate('MAX', 'sys_mod_count');
incidentGA.addAggregate('MIN', 'sys_mod_count');
incidentGA.addAggregate('STDDEV', 'sys_mod_count');
incidentGA.addAggregate('SUM', 'sys_mod_count');

incidentGA.query();

while (incidentGA.next()) {
```

Scoped equivalent

To use the *addAggregate()* method in a scoped application, use the corresponding scoped method: addAggregate().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideAggregate - addBizCalendarTrend(String fieldName, String bizCalendarSysId)

Adds trending by a business calendar to the aggregate query. This method allows you to pick a date and time field in the corresponding GlideRecord and group records based on a specified business calendar time span.

Note: This method does not use the JOIN operator on the SQL queries.

Parameters

Name	Type	Description
fieldName	String	Date and time field in the associated GlideRecord to use to determine in which group or calendar time span that the record will be included.
bizCalendarSysId	String	Sys_id of the calendar record to use. This is the calendar that contains the desired time spans.

Returns

Type	Description
None	

The following code example shows the count of incident records grouped by the "Month" business calendar time spans.

```
var monthCal = "4d7ddda353f3001076bcddeeff7b12b1"
var ga = new GlideAggregate('incident');
ga.addAggregate('COUNT');
ga.addBizCalendarTrend('opened_at', monthCal);
ga.setGroup(false);
ga.query();
gs.print(ga.getRowCount());
while (ga.next()) {
  gs.info(ga.getValue('bizcalref') + ', ' +
 ga.getValue('bizcalrefend') + ', ' + ga.getAggregate('COUNT'));
}
```

Output:

```
13
2015-08-01 00:00:00, 2015-09-01 00:00:00, 2
2015-11-01 00:00:00, 2015-12-01 00:00:00, 2

GlideAggregate - addEncodedQuery(String query)

Adds an encoded query to the other queries that may have been set for this aggregate.

Parameters

Name	Type	Description
query	String	Encoded query string to add to the aggregate.

Returns

Type	Description
None	

```
var agg = new GlideAggregate('incident');
agg.addAggregate('count','category');
agg.orderByAggregate('count', 'category');
agg.orderBy('category');
agg.addQuery('opened_at', '>=',
 'javascript:gs.monthsAgoStart(2)');
agg.addQuery('opened_at', '<=',
 'javascript:gs.monthsAgoEnd(2)');
agg.query();
while (agg.next()) {
  var category = agg.category;
  var count = agg.getAggregate('count','category');
  var query = agg.getQuery();
  var agg2 = new GlideAggregate('incident');
  agg2.addAggregate('count','category');
  agg2.orderByAggregate('count', 'category');
  agg2.orderBy('category');
  agg2.addQuery('opened_at', '>=',
 'javascript:gs.monthsAgoStart(3)');
  agg2.addQuery('opened_at', '<=',
 'javascript:gs.monthsAgoEnd(3)');
  agg2.addEncodedQuery(query);
  agg2.query();
  var last = "";
  while (agg2.next()) {
     last = agg2.getAggregate('count','category');
  }
  gs.log(category + ": Last month:" + count + " Previous Month:"
 + last);

}
```

Scoped equivalent

To use the *addEncodedQuery()* method in a scoped application, use the corresponding scoped method: addEncodedQuery().

GlideAggregate - addHaving(String name, String operator, String value)

Adds a "having" element to the aggregate, such as select category, count(*) from incident group by category HAVING count(*) > 5.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Aggregate to filter on. For example, COUNT.
operator	String	Operator symbol. For example <, >, =, !=.
value	String	Value to query on. For example, '5'.

Returns

Type	Description
None	

```
var trend = new GlideAggregate('incident');
trend.addTrend ('opened_at','Month');
trend.addAggregate('COUNT');

//addHaving limits the results returned to those in which the
 aggregate COUNT is greater than 2
trend.addHaving('COUNT', '>', '2');
trend.setGroup(false);
trend.query();
while(trend.next()) {
  gs.print(('Incidents by month ' + trend.getValue('timeref')
 + ' where count is more than 2 count is: ' +
 trend.getAggregate('COUNT'));
}
```

Output:

```
Incidents by month 9/2018 where count is more than 2 count is: 3
Incidents by month 10/2018 where count is more than 2 count is:
 8
Incidents by month 11/2018 where count is more than 2 count is:
 14
```

GlideAggregate - addHaving(String aggName, String fieldName, String operator, String value)

Adds a "having" element to the aggregate, such as select category, count(*) from incident group by category HAVING count(*) > 5. This implementation of the method enables you to specify a specific field within a table or a dynamic attribute to act upon.

Parameters

Name	Type	Description
aggName	String	Aggregate to filter on. For example, COUNT.
fieldName	String	Field name or path to an attribute within a dynamic attribute store. Format of the dynamic path: `dyn_att_field->group_name->attribute_name`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table. For more information on dynamic attributes, see Dynamic Schema.
operator	String	Operator symbol. For example <, >, =, !=.
value	String	Value to query on. For example, '5'.

Returns

Type	Description
None	

The following code example shows how to identify the duplicate serial numbers within the cmdb table using a field name in the *`addHaving()`* method call.

```
function getDupes(tableName, dpField) {
    var ga = new GlideAggregate(tableName);
    ga.addAggregate('COUNT', dpField); // Aggregate to count
 values in whatever field is passed as dpField
    ga.addHaving('COUNT', dpField, '>', '1'); // Returns only
 records having more than one active instance of dpField
    ga.query();
    var arDupes = new Array(); // Build array to push the
 results into
    while (ga.next()) {
      arDupes.push(ga.getValue(dpField)); // Push the value of
 the dupe field to the array
    }
    return arDupes;
}

var tableName = "cmdb";
var dpField = "serial_number";

gs.print(getDupes(tableName, dpField));
```

Output:

```
Incidents by month 9/2018 where count is more than 2 count is: 3
Incidents by month 10/2018 where count is more than 2 count is:
 8
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Incidents by month 11/2018 where count is more than 2 count is:
 14
```

The following example shows to identify duplicates, but uses a dynamic attribute instead of a field in the *addHaving()* method call.

```
function getDupes(tableName, dpField) {
    var ga = new GlideAggregate(tablename);
    ga.addAggregate('COUNT', dpField); // Aggregate to count
 values in whatever dynamic attribute is passed as dpField
    ga.addHaving('COUNT', dpField, '>', '1'); // Returns only
 records having more than one active instance of dpField
    ga.query();
    var arDupes = new Array(); // Build array to push the
 results into
    while (ga.next()) {
      arDupes.push(ga.getValue(dpField)); // Push the value of
 the dupe field to the array
    }
    return arDupes;
}

var tableName = "cmdb";
var dpField = "dyn_att_field->group->attr";

gs.print(getDupes(tableName, dpField));
```

Output:

```
Incidents by month 9/2018 where count is more than 2 count is: 3
Incidents by month 10/2018 where count is more than 2 count is:
 8
Incidents by month 11/2018 where count is more than 2 count is:
 14
```

GlideAggregate - addTrend(String fieldName, String timeInterval, Number numUnits)

Adds a trend for a field. Use a trend to show patterns over a period of time.

Note: To control whether to group *dayofweek* results by year, use GlideAggregate - setIntervalYearIncluded(Boolean b).

Parameters

Name	Type	Description
fieldName	String	Name of the field for which trending should occur.
timeInterval	String	Time interval for the trend. Valid values: • date • dayofweek • hour • minute • quarter

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• value • week • year
numUnits	Number	Optional. Only valid when *timeInterval* = *minute*. Number of minutes to include in the trend. Default: 1

Returns

Type	Description
None	

```
var trend = new GlideAggregate('incident');
trend.addTrend ('opened_at','month');
trend.addAggregate('COUNT');
trend.setGroup(false);
trend.query();
while(trend.next()) {
   gs.print(trend.getValue('timeref') + ': ' +
 trend.getAggregate('COUNT'));
}
```

Output:

```
9/2018: 3
10/2018: 8
11/2018: 14
```

Scoped equivalent

To use the *addTrend()* method in a scoped application, use the corresponding scoped method: addTrend().

GlideAggregate - getAggregate(String agg, String name)

Gets the value of an aggregate from the current record.

Parameters

Name	Type	Description
agg	String	Type of the aggregate. Valid values: • AVG: Average value of the expression. • COUNT: Count of the number of non-null values. • GROUP_CONCAT: Concatenates all non-null values of the group in ascending order, joins them with a comma (','), and returns the result as a string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• GROUP_CONCAT_DISTINCT: Concatenates all non-null values of the group in ascending order, removes duplicates, joins them with a comma (','), and returns the result as a string. • MAX: Largest, or maximum, value. • MIN: Minimum value. • STDDEV: Population standard deviation. • SUM: Sum of all values.
name	String	Name of the field, or path to an attribute within a dynamic schema, to get the aggregate from. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table. For more information on dynamic attributes, see Dynamic Schema.

Returns

Type	Description
String	Value of the aggregation. If the values being aggregated are FX Currency values, the returned value is in the format `<currency_code;currency_value>`, such as: USD;134.980000. **Note:** If the specified field contains FX Currency values of mixed currency types, the method is not able to aggregate the values and returns a semicolon (;).

This example shows how to obtain the COUNT aggregate.

```
function doMyBusinessRule(assigned_to, number) {
  var agg = new GlideAggregate('incident');
  agg.addQuery('assigned_to', assigned_to);
  agg.addQuery('category', number);
  agg.addAggregate("COUNT");
  agg.query();
  var answer = 'false';
  if (agg.next()) {
    answer = agg.getAggregate("COUNT");
    if (answer > 0)
      answer = 'true';
    else
      answer = 'false';
  }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  return answer;
}
```

This example shows the aggregation of an FX Currency field.

```
var ga = new GlideAggregate('laptop_tracker');
ga.addAggregate('SUM', 'cost');
ga.groupBy('name');
ga.query();
while (ga.next()) {
  gs.info('Aggregate results ' + ga.getValue('name') + ' => ' +
 ga.getAggregate('SUM', 'cost'));
}
```

Output:

```
*** Script: Aggregate results Apple MacBook Air =>
 USD;1651.784280000000
*** Script: Aggregate results Apple MacBook Pro =>
 USD;1651.784280000000
*** Script: Aggregate results Dell XPS => USD;470.852672000000
*** Script: Aggregate results LG =>
*** Script: Aggregate results Samsung Galaxy =>
 USD;225.320000000000
*** Script: Aggregate results Surface3 => USD;2895.560369520000
*** Script: Aggregate results Toshiba => USD;9385.202875800000
```

The following example shows how to call this method using an attribute in a dynamic attribute store.

```
var ga_Inc = new GlideAggregate('incident');
ga_Inc.groupBy('inc_dynamic_schema->cars->make');
ga_Inc.addAggregate('AVG', 'inc_dynamic_schema->cars->cost');
ga_Inc.addAggregate('MIN', 'inc_dynamic_schema->cars->cost');
ga_Inc.addAggregate('MAX', 'inc_dynamic_schema->cars->cost');
ga_Inc.addAggregate('SUM', 'inc_dynamic_schema->cars->cost');
ga_Inc.addAggregate('COUNT', 'inc_dynamic_schema->cars->cost');
ga_Inc.addAggregate('STDDEV', 'inc_dynamic_schema->cars->cost');
ga_Inc.addAggregate('GROUP_CONCAT',
 'inc_dynamic_schema->cars->cost');
ga_Inc.addAggregate('GROUP_CONCAT_DISTINCT',
 'inc_dynamic_schema->cars->cost');
ga_Inc.addAggregate('COUNT(DISTINCT',
 'inc_dynamic_schema->cars->cost');
ga_Inc.query();
while (ga_Inc.next()) {
    gs.info(gr_Inc.getValue('inc_dynamic_schema->cars->make'));
    gs.info('AVG: ' + ga_Inc.getAggregate('AVG',
 'inc_dynamic_schema->cars->cost'));
    gs.info('MAX: ' + ga_Inc.getAggregate('MAX',
 'inc_dynamic_schema->cars->cost'));
    gs.info('MIN: ' + ga_Inc.getAggregate('MIN',
 'inc_dynamic_schema->cars->cost'));
    gs.info('SUM: ' + ga_Inc.getAggregate('SUM',
 'inc_dynamic_schema->cars->cost'));
    gs.info('COUNT: ' + ga_Inc.getAggregate('COUNT',
 'inc_dynamic_schema->cars->cost'));
```

Scoped equivalent

To use the *`getAggregate()`* method in a scoped application, use the corresponding scoped method: getAggregate().

GlideAggregate - getDynamicAttributeValue(String fullPath)

Returns the value of the dynamic attribute located at a specified path.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
fullPath	String	Path to use to locate the desired dynamic attribute. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table.

Returns

Type	Description
Object	Value of the dynamic attribute located at the specified path. If the *fullPath* parameter contains invalid data or the specified attribute value isn't one of the supported data types, returns null.

The following code example shows how to call this method.

```
var ga_Tab = new GlideAggregate('u_mytable');
ga_Tab.groupBy('u_dyn_attr_store->paint->color');
ga_Tab.addAggregate('AVG', 'u_dyn_attr_store->paint->number');
ga_Tab.query();

while(ga_Tab.next()) {
    gs.info(
        "color: " +
 ga_Tab.getDynamicAttributeValue('u_dyn_attr_store->paint->colo
r')
        + "  avg: " + ga_Tab.getAggregate('AVG',
 'u_dyn_attr_store->paint->number'));
}
```

Output:

```
*** Script: color: blue  avg: 5.0000
*** Script: color: red  avg: 8.0000
*** Script: color: yellow  avg: 7.0000
```

GlideAggregate - getDynamicAttributeValue(String dynamicAttributeField, String groupAttrPath)

Returns the value of the dynamic attribute located at a specified field in the current table and a specified attribute path.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
dynamicAttributeField	String	Name of the field in the table that contains the dynamic attribute.
groupAttrPath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`

Returns

Type	Description
Object	Value of the dynamic attribute located at the specified path. If either the *dynamicAttributeField* or *groupAttrPath* parameters are invalid, returns null.

The following code example shows how to call this method.

```
var ga_Tab = new GlideAggregate('u_mytable');
ga_Tab.groupBy('u_dyn_attr_store->paint->color');
ga_Tab.addAggregate('AVG', 'u_dyn_attr_store->paint->number');
ga_Tab.query();

while(ga_Tab.next()) {
    gs.info(
        "color: " +
 ga_Tab.getDynamicAttributeValue('u_dyn_attr_store',
 'paint->color')
        + "  avg: " + ga_Tab.getAggregate('AVG',
 'u_dyn_attr_store->paint->number'));
}
```

Output:

```
*** Script: color: blue  avg: 5.0000
*** Script: color: red  avg: 8.0000
*** Script: color: yellow  avg: 7.0000
```

GlideAggregate - getDynamicAttributeDisplayValue(String fullPath)

Returns the display value of the dynamic attribute located at the specified path.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
fullPath	String	Path to use to locate the desired dynamic attribute. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table.

Returns

Type	Description
String	Display value of the dynamic attribute located at the specified path. If the *fullPath* parameter is invalid, returns null.

The following code example shows how to call this method.

```
var ga_Tab = new GlideAggregate('u_mytable');
ga_Tab.groupBy('u_dyn_attr_store->paint->color');
ga_Tab.addAggregate('AVG', 'u_dyn_attr_store->paint->number');
ga_Tab.query();

while(ga_Tab.next()) {
    gs.info(
        "color: " +
 ga_Tab.getDynamicAttributeDisplayValue('u_dyn_attr_store->pai
nt->color')
        + "  avg: " + ga_Tab.getAggregate('AVG',
 'u_dyn_attr_store->paint->number'));
}
```

Output:

```
*** Script: color: blue  avg: 5.0000
*** Script: color: red  avg: 8.0000
*** Script: color: yellow  avg: 7.0000
```

GlideAggregate - getDynamicAttributeDisplayValue(String dynamicAttributeField, String groupAttrPath)

Returns the display value of the dynamic attribute located in a specified table field and attribute path.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
dynamicAttributeField	String	Name of the field in the table that contains the dynamic attribute.
groupAttrPath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`

Returns

Type	Description
String	Display value of the dynamic attribute located at the specified path. If either the *dynamicAttributeField* or *groupAttrPath* parameters are invalid, returns null.

The following code example shows how to call this method.

```
var ga_Tab = new GlideAggregate('u_mytable');
ga_Tab.groupBy('u_dyn_attr_store->paint->color');
ga_Tab.addAggregate('AVG', 'u_dyn_attr_store->paint->number');
ga_Tab.query();

while(ga_Tab.next()) {
    gs.info(
        "color: " +
 ga_Tab.getDynamicAttributeDisplayValue('u_dyn_attr_store',
 'paint->color')
        + "  avg: " + ga_Tab.getAggregate('AVG',
 'u_dyn_attr_store->paint->number'));
}
```

Output:

```
*** Script: color: blue  avg: 5.0000
*** Script: color: red  avg: 8.0000
*** Script: color: yellow  avg: 7.0000
```

GlideAggregate - getQuery()

Retrieves the query necessary to return the current aggregate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The query.

```
var agg = new GlideAggregate('incident');
agg.addAggregate('count','category');
agg.orderByAggregate('count', 'category');
agg.orderBy('category');
agg.addQuery('opened_at', '>=',
 'javascript:gs.monthsAgoStart(2)');
agg.addQuery('opened_at', '<=',
 'javascript:gs.monthsAgoEnd(2)');
agg.query();
while (agg.next()) {
  var category = agg.category;
  var count = agg.getAggregate('count','category');
  var query = agg.getQuery();
  var agg2 = new GlideAggregate('incident');
  agg2.addAggregate('count','category');
  agg2.orderByAggregate('count', 'category');
  agg2.orderBy('category');
  agg2.addQuery('opened_at', '>=',
 'javascript:gs.monthsAgoStart(3)');
  agg2.addQuery('opened_at', '<=',
 'javascript:gs.monthsAgoEnd(3)');
  agg2.addEncodedQuery(query);
  agg2.query();
  var last = "";
  while (agg2.next()) {
     last = agg2.getAggregate('count','category');
  }
  gs.log(category + ": Last month:" + count + " Previous Month:"
 + last);

}
```

GlideAggregate - getRowCount()

Retrieves the number of rows in the GlideAggregate object.

Parameters

Name	Type	Description
None

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Number of rows in the GlideAggregate object.

```
var count = new GlideAggregate('incident');
  count.addAggregate('MIN', 'sys_mod_count');
  count.addAggregate('MAX', 'sys_mod_count');
  count.addAggregate('AVG', 'sys_mod_count');
  count.groupBy('category');
  count.query();
  gs.info(count.getRowCount());
  while (count.next()) {
     var min = count.getAggregate('MIN', 'sys_mod_count');
     var max = count.getAggregate('MAX', 'sys_mod_count');
     var avg = count.getAggregate('AVG', 'sys_mod_count');
     var category = count.category.getDisplayValue();
     gs.info(category + " Update counts: MIN = " + min + " MAX =
 " + max + " AVG = " + avg);
  }
```

Output:

```
6
Database Update counts: MIN = 8 MAX = 48 AVG = 28.0000
Hardware Update counts: MIN = 4 MAX = 14 AVG = 6.6250
Inquiry / Help Update counts: MIN = 0 MAX = 34 AVG = 6.5714
Network Update counts: MIN = 3 MAX = 37 AVG = 18.6000
Request Update counts: MIN = 5 MAX = 39 AVG = 13.4000
Software Update counts: MIN = 4 MAX = 98 AVG = 24.0000
```

Scoped equivalent

To use the *getRowCount()* method in a scoped application, use the corresponding scoped method: Scoped GlideAggregate - getRowCount().

GlideAggregate - getTotal(String agg, String name)

Returns the number of records by summing an aggregate.

Parameters

Name	Type	Description
agg	String	Name of an aggregate to use. Valid values: • AVG: Average value of the expression. • COUNT: Count of the number of non-null values. • GROUP_CONCAT: Concatenates all non-null values of the group in ascending order, joins them with a comma (','), and returns the result as a string. • GROUP_CONCAT_DISTINCT: Concatenates all non-null values of the group in ascending order, removes duplicates, joins them with a comma (','), and returns the result as a string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• MAX: Largest, or maximum, value. • MIN: Minimum value. • STDDEV: Population standard deviation. • SUM: Sum of all values.
name	String	Name of the field to aggregate.

Returns

Type	Description
Number	Number of records.

```
var incidentGA = new GlideAggregate('incident');
incidentGA.addQuery('category', 'software');
incidentGA.addAggregate('COUNT');
incidentGA.addTrend('opened_at','year'); // Counting number of
 incidents for software category per year
incidentGA.setGroup(false);
incidentGA.query();
while(incidentGA.next()){
  gs.info('Incidents opened on year -
 '+incidentGA.getValue('timeref')+' -
 '+incidentGA.getAggregate('COUNT'));
}
gs.info('Total Aggregate Value >> '+
 incidentGA.getTotal('COUNT'));
```

Output:

```
Incidents opened on year - 2015 - 1
Incidents opened on year - 2018 - 5
Incidents opened on year - 2020 - 10
Total Aggregate Value >> 16
```

GlideAggregate - getValue(String name)

Returns the value of a field or a dynamic attribute.

Parameters

Name	Type	Description
name	String	Field name or path to an attribute within a dynamic attribute store. Format of the dynamic path: `dyn_att_field->group_name->attribute_name`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table.

Returns

Type	Description
String	Value of the specified field. Returns null if invalid (not part of result set).

```
var trend = new GlideAggregate('incident');
trend.addTrend ('opened_at','Month');
trend.addAggregate('COUNT');

//addHaving limits the results returned to those in which the
 aggregate COUNT is greater than 2
trend.addHaving('COUNT', '>', '2');
trend.setGroup(false);
trend.query();
while(trend.next()) {
  gs.print(('Incidents by month ' + trend.getValue('timeref')
 + ' where count is more than 2 count is: ' +
 trend.getAggregate('COUNT'));
}
```

Output:

```
Incidents by month 9/2018 where count is more than 2 count is: 3
Incidents by month 10/2018 where count is more than 2 count is:
 8
Incidents by month 11/2018 where count is more than 2 count is:
 14
```

Scoped equivalent

To use the *`getValue()`* method in a scoped application, use the corresponding scoped method: getValue().

GlideAggregate - groupBy(String name)

Provides the name of a field, or an attribute within a dynamic attribute store, to use when grouping the aggregates.

May be called numerous times to set multiple group fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Field name or path to an attribute within a dynamic attribute store. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table. For more information on dynamic attributes, see Dynamic Schema.

Returns

Type	Description
None	

The following example shows how to call this method.

```
var count = new GlideAggregate('incident');
count.addAggregate('MIN', 'sys_mod_count');
count.addAggregate('MAX', 'sys_mod_count');
count.addAggregate('AVG', 'sys_mod_count');
count.groupBy('category');
count.query();
while (count.next()) {
  var min = count.getAggregate('MIN', 'sys_mod_count');
  var max = count.getAggregate('MAX', 'sys_mod_count');
  var avg = count.getAggregate('AVG', 'sys_mod_count');
  var category = count.category.getDisplayValue();
  gs.log(category + " Update counts: MIN = " + min + " MAX = " +
 max + " AVG = " + avg);
}
```

The following example shows how to call this method using an attribute in a dynamic attribute store.

```
var ga_AppTab = new GlideAggregate('application_table');
ga_AppTab.addGroupBy('dyn_att_field->group->attr');
ga_AppTab.addAggregate('AVG', 'dyn_att_field->group->attr1');
ga_AppTab.addHaving('SUM', 'dyn_att_field->group->attr2', '>=',
 420);
ga.query();
```

Scoped equivalent

To use the *groupBy()* method in a scoped application, use the corresponding scoped method: groupBy().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideAggregate - orderBy(String name)

Orders the aggregates using the value of the specified field, dynamic attribute path, or glidefunction. The field is also added to the group-by list.

Parameters

Name	Type	Description
name	String	Field name, path to an attribute within a dynamic attribute store, or glidefunction to use to order the aggregates. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table. For more information on dynamic attributes, see Dynamic Schema. glidefunction format: `glidefunction:length(short_description)`. For more information about glidefunctions, see glidefunction operations.

Returns

Type	Description
None	

```
var agg = new GlideAggregate('incident');
agg.addAggregate('count','category');
agg.orderByAggregate('count', 'category');
agg.orderBy('category');
agg.addQuery('opened_at', '>=',
 'javascript:gs.monthsAgoStart(2)');
agg.addQuery('opened_at', '<=',
 'javascript:gs.monthsAgoEnd(2)');
agg.query();
while (agg.next()) {
  var category = agg.category;
  var count = agg.getAggregate('count','category');
  var query = agg.getQuery();
  var agg2 = new GlideAggregate('incident');
  agg2.addAggregate('count','category');
  agg2.orderByAggregate('count', 'category');
  agg2.orderBy('category');
  agg2.addQuery('opened_at', '>=',
 'javascript:gs.monthsAgoStart(3)');
  agg2.addQuery('opened_at', '<=',
 'javascript:gs.monthsAgoEnd(3)');
  agg2.addEncodedQuery(query);
  agg2.query();
```

```
  var last = "";
  while (agg2.next()) {
     last = agg2.getAggregate('count','category');
  }
  gs.log(category + ": Last month:" + count + " Previous Month:"
 + last);
}
```

Scoped equivalent

To use the *orderBy()* method in a scoped application, use the corresponding scoped method: orderBy().

GlideAggregate - orderByAggregate(String agg, String fieldName)

Orders the aggregates based on the specified aggregate and field or dynamic attribute.

Parameters

Name	Type	Description
agg	String	Type of aggregation. Valid values: • AVG: Average value of the expression. • COUNT: Count of the number of non-null values. • GROUP_CONCAT: Concatenates all non-null values of the group in ascending order, joins them with a comma (','), and returns the result as a string. • GROUP_CONCAT_DISTINCT: Concatenates all non-null values of the group in ascending order, removes duplicates, joins them with a comma (','), and returns the result as a string. • MAX: Largest, or maximum, value. • MIN: Minimum value. • STDDEV: Population standard deviation. • SUM: Sum of all values.
fieldName	String	Name of the field or path to an attribute within a dynamic attribute store to aggregate. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table. For more information on dynamic attributes, see Dynamic Schema.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
var agg = new GlideAggregate('incident');
agg.addAggregate('count','category');
agg.orderByAggregate('count', 'category');
agg.orderBy('category');
agg.addQuery('opened_at', '>=',
 'javascript:gs.monthsAgoStart(2)');
agg.addQuery('opened_at', '<=',
 'javascript:gs.monthsAgoEnd(2)');
agg.query();
while (agg.next()) {
  var category = agg.category;
  var count = agg.getAggregate('count','category');
  var query = agg.getQuery();
  var agg2 = new GlideAggregate('incident');
  agg2.addAggregate('count','category');
  agg2.orderByAggregate('count', 'category');
  agg2.orderBy('category');
  agg2.addQuery('opened_at', '>=',
 'javascript:gs.monthsAgoStart(3)');
  agg2.addQuery('opened_at', '<=',
 'javascript:gs.monthsAgoEnd(3)');
  agg2.addEncodedQuery(query);
  agg2.query();
  var last = "";
  while (agg2.next()) {
     last = agg2.getAggregate('count','category');
  }
  gs.log(category + ": Last month:" + count + " Previous Month:"
 + last);

}
```

Scoped equivalent

To use the *orderByAggregate()* method in a scoped application, use the corresponding scoped method: orderByAggregate().

GlideAggregate - query()

Issues the query and gets the results.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
var agg = new GlideAggregate('incident');
agg.addAggregate('count','category');
agg.orderByAggregate('count', 'category');
agg.orderBy('category');
agg.addQuery('opened_at', '>=',
 'javascript:gs.monthsAgoStart(2)');
agg.addQuery('opened_at', '<=',
 'javascript:gs.monthsAgoEnd(2)');
agg.query();
while (agg.next()) {
  var category = agg.category;
  var count = agg.getAggregate('count','category');
  var query = agg.getQuery();
  var agg2 = new GlideAggregate('incident');
  agg2.addAggregate('count','category');
  agg2.orderByAggregate('count', 'category');
  agg2.orderBy('category');
  agg2.addQuery('opened_at', '>=',
 'javascript:gs.monthsAgoStart(3)');
  agg2.addQuery('opened_at', '<=',
 'javascript:gs.monthsAgoEnd(3)');
  agg2.addEncodedQuery(query);
  agg2.query();
  var last = "";
  while (agg2.next()) {
     last = agg2.getAggregate('count','category');
  }
  gs.log(category + ": Last month:" + count + " Previous Month:"
 + last);
```

Scoped equivalent

To use the *query()* method in a scoped application, use the corresponding scoped method: query().

GlideAggregate - setAggregateWindow(Number firstRow, Number lastRow)

Limits the number of rows from the table to include in the aggregate query.

Parameters

Name	Type	Description
firstRow	Number	Zero-based index of the first row to include in the aggregate query, inclusive.
lastRow	Number	Zero-based index of the last row to include in the aggregate query, exclusive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

Prints the count of each category for the first ten records in the Incident [incident] table.

```
var incidentGroup = new GlideAggregate('incident');
incidentGroup.addAggregate('COUNT', 'category');
incidentGroup.setAggregateWindow(0, 10);
incidentGroup.query();
while (incidentGroup.next()) {
   var incidentCount = incidentGroup.getAggregate('COUNT',
 'category');
   gs.info('{0} count: {1}',
 [incidentGroup.getValue('category'), incidentCount]);
}
```

Output:

```
database count: 1
Hardware count: 1
inquiry count: 7
software count: 1
```

Scoped equivalent

To use the *`setAggregateWindow()`* method in a scoped application, use the corresponding scoped method: setAggregateWindow().

GlideAggregate - setGroup(Boolean b)

Sets whether to group the results.

Parameters

Name	Type	Description
b	Boolean	Flag that indicates whether to group the results. Valid values: • true: Group the results. • false: Do not group the results.

Returns

Type	Description
None	

```
var ga = new GlideAggregate('incident');
ga.addAggregate('COUNT', 'category');

ga.setGroup(true);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the *setGroup()* method in a scoped application, use the corresponding scoped method: setGroup().

GlideAggregate - setIntervalYearIncluded(Boolean b)

Sets whether to group results by year for day-of-week trends. These trends are created using the *addTrend()* method with the *dayofweek* time interval.

Dependency: GlideAggregate - addTrend('<fieldName>', 'dayofweek').

Parameters

Name	Type	Description
b	Boolean	Flag that indicates whether to include a year for a trend with a day-of-week time interval. Valid values: • true: Group day-of-week results by year. • false: Exclude the year from time interval results. Default: true

Returns

Type	Description
None	

The following example shows how to count incidents created in the last six months. The incidents are separated by the day of the week, but not including the year. For example, the default results for Thursday would include the year, such as `Thursday/2023: 16`.

```
var incidentGroup = new GlideAggregate('incident');
incidentGroup.addEncodedQuery("sys_created_onRELATIVEGT@month@ago@6");
incidentGroup.addTrend('sys_created_on', 'dayofweek');
incidentGroup.addAggregate('COUNT');
incidentGroup.setIntervalYearIncluded(false);
incidentGroup.query();
while (incidentGroup.next()) {
    gs.info(incidentGroup.getValue('timeref') + ': ' +
 incidentGroup.getAggregate('COUNT'))};
```

Output:

```
Sunday: 1
Monday: 15
Tuesday: 1
Wednesday: 7
Thursday: 16
Saturday: 1
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the *setIntervalYearIncluded()* method in a scoped application, use the corresponding scoped method: setIntervalYearIncluded().

GlideAggregate - Scoped

The *GlideAggregate* API enables creating database aggregation queries.

The *GlideAggregate* class is an extension of the *GlideRecord* class and provides database aggregation (AVG, COUNT, GROUP_CONCAT, GROUP_CONCAT_DISTINCT, MAX, MIN, STDDEV, SUM) queries. This functionality can be helpful when creating customized reports or in calculations for calculated fields.

When you use *GlideAggregate* methods on currency or price fields, you are working with the reference currency value. Be sure to convert the aggregate values to the user's session currency for display. Because the conversion rate between the currency or price value (displayed value) and its reference currency value (aggregation value) might change, the result may not be what the user expects.

Note: When using an on-premise system, the database server time zone must be set to GMT/UTC for this class to work properly.

Scoped GlideAggregate - GlideAggregate(String tableName)

Creates a GlideAggregate object on the specified table.

Parameters

Name	Type	Description
tableName	String	Name of the table.

```
var count = new GlideAggregate('incident');
```

Scoped GlideAggregate - addAggregate(String agg, String name)

Adds an aggregate to a database query.

Parameters

Name	Type	Description
agg	String	Name of an aggregate to use. Valid values: • AVG: Average value of the expression. • COUNT: Count of the number of non-null values. • GROUP_CONCAT: Concatenates all non-null values of the group in ascending order, joins them with a comma (','), and returns the result as a string. • GROUP_CONCAT_DISTINCT: Concatenates all non-null values of the group in ascending order, removes duplicates, joins them with a comma (','), and returns the result as a string. • MAX: Largest, or maximum, value. • MIN: Minimum value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• STDDEV: Population standard deviation. • SUM: Sum of all values.
name	String	Optional. Name of the field to group the results of the aggregation by. Default: Null

Returns

Type	Description
None	

The following example shows how to use *GlideAggregate* functions on the Incident [incident] table.

```
var incidentGA = new GlideAggregate('incident');
incidentGA.groupBy('category');
incidentGA.orderByAggregate('COUNT', 'sys_mod_count');

incidentGA.addAggregate('AVG', 'sys_mod_count');
incidentGA.addAggregate('COUNT', 'sys_mod_count');
incidentGA.addAggregate('GROUP_CONCAT', 'sys_mod_count');
incidentGA.addAggregate('GROUP_CONCAT_DISTINCT',
 'sys_mod_count');
incidentGA.addAggregate('MAX', 'sys_mod_count');
incidentGA.addAggregate('MIN', 'sys_mod_count');
incidentGA.addAggregate('STDDEV', 'sys_mod_count');
incidentGA.addAggregate('SUM', 'sys_mod_count');

incidentGA.query();

while (incidentGA.next()) {
gs.info('CATEGORY: ' + incidentGA.getValue('category'));
gs.info('AVG: ' + incidentGA.getAggregate('AVG',
 'sys_mod_count'));
gs.info('COUNT: ' + incidentGA.getAggregate('COUNT',
 'sys_mod_count'));
gs.info('GROUP_CONCAT: ' +
 incidentGA.getAggregate('GROUP_CONCAT', 'sys_mod_count'));
gs.info('GROUP_CONCAT_DISTINCT: ' +
 incidentGA.getAggregate('GROUP_CONCAT_DISTINCT',
 'sys_mod_count'));
gs.info('MAX: ' + incidentGA.getAggregate('MAX',
 'sys_mod_count'));
gs.info('MIN: ' + incidentGA.getAggregate('MIN',
 'sys_mod_count'));
gs.info('STDDEV: ' + incidentGA.getAggregate('STDDEV',
 'sys_mod_count'));
gs.info('SUM: ' + incidentGA.getAggregate('SUM',
 'sys_mod_count'));
```

Scoped GlideAggregate - addEncodedQuery(String query)

Adds an encoded query to the other queries that may have been set for this aggregate.

Parameters

Name	Type	Description
query	String	An encoded query to add to the aggregate.

Returns

Type	Description
None	

```
//Number of incidents varies depending on the current state
//of the incident table
var count = new GlideAggregate('incident');
count.addEncodedQuery('active=true');
count.addAggregate('COUNT');
count.query();
var incidents = 0;
if (count.next())
   incidents = count.getAggregate('COUNT');
gs.info(incidents);
```

Scoped GlideAggregate - addQuery(String name, String operator, String value)

Adds a query to the aggregate.

Parameters

Name	Type	Description
name	String	Query to add.
operator	String	Operator for the query.
value	String	List of values to include in the query.

Returns

Type	Description
GlideQueryCondition	Query condition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//Number of incidents varies depending on the current state
//of the incident table
var count = new GlideAggregate('incident');
count.addQuery('active', '=','true');
count.addAggregate('COUNT', 'category');
count.query();
while (count.next()) {
   var category = count.category;
   var categoryCount = count.getAggregate('COUNT', 'category');
   gs.info("There are currently " + categoryCount + " incidents
 with a category of " + category);
}
```

Output:

```
There are currently 1 incidents with a category of database
There are currently 5 incidents with a category of hardware
There are currently 42 incidents with a category of inquiry
There are currently 4 incidents with a category of network
There are currently 4 incidents with a category of request
There are currently 7 incidents with a category of software
```

Scoped GlideAggregate - addNotNullQuery(String fieldName)

Adds a not null query to the aggregate.

Parameters

Name	Type	Description
fieldname	String	Name of the field.

Returns

Type	Description
GlideQueryCondition	Scoped query condition.

```
var count = new GlideAggregate('incident');
  count.addNotNullQuery('short_description');
  count.query();   // Issue the query to the database to get all
 records
  while (count.next()) {
     // add code here to process the aggregate
  }
```

Scoped GlideAggregate - addNullQuery(String fieldName)

Adds a null query to the aggregate.

Parameters

Name	Type	Description
fieldName	String	Name of the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideQueryCondition	The scoped query condition.

```
var count = new GlideAggregate('incident');
  count.addNullQuery('short_description');
  count.query();   // Issue the query to the database to get all
 records
  while (count.next()) {
     // add code here to process the aggregate
  }
```

Scoped GlideAggregate - addTrend(String fieldName, String timeInterval, Number numUnits)

Adds a trend for a specified field. Use a trend to show patterns over a period of time.

Note: To control whether to group *dayofweek* results by year, use Scoped GlideAggregate - setIntervalYearIncluded(Boolean b).

Parameters

Name	Type	Description
fieldName	String	Name of the field for which trending should occur.
timeInterval	String	Time interval for the trend. Valid values: • date • dayofweek • hour • minute • quarter • value • week • year
numUnits	Number	Optional. Only valid when *timeInterval* = *minute*. Number of minutes to include in the trend. Default: 1

Returns

Type	Description
void	

```
var ga = new GlideAggregate('incident');
ga.addAggregate('COUNT'); // Count all incidents opened each
 quarter
ga.addTrend('opened_at', 'quarter');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
ga.query();
while(ga.next()) {
 gs.info([ga.getValue('timeref'), ga.getAggregate('COUNT')]);
}
```

Output:

```
3/2018, 9
4/2018, 2
1/2019, 38
2/2019, 310
```

Scoped GlideAggregate - getAggregate(String agg, String name)

Returns the value of an aggregate from the current record.

Parameters

Name	Type	Description
agg	String	Type of the aggregate. Valid values: • AVG: Average value of the expression. • COUNT: Count of the number of non-null values. • GROUP_CONCAT: Concatenates all non-null values of the group in ascending order, joins them with a comma (','), and returns the result as a string. • GROUP_CONCAT_DISTINCT: Concatenates all non-null values of the group in ascending order, removes duplicates, joins them with a comma (','), and returns the result as a string. • MAX: Largest, or maximum, value. • MIN: Minimum value. • STDDEV: Population standard deviation. • SUM: Sum of all values.
name	String	Name of the field on which to perform the aggregation.

Returns

Type	Description
String	The value of the aggregation. If the values being aggregated are FX Currency values, the returned value is in the format `<currency_code;currency_value>`, such as: USD;134.980000. **Note:** If the specified field contains FX Currency values of mixed currency types, the method is not able to aggregate the values and returns a semicolon (;).

Shows an aggregation that returns the number of records in the Incident table.

```
var count = new GlideAggregate('incident');
count.addAggregate('COUNT');
count.query();
var incidents = 0;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
if (count.next()) {
  incidents = count.getAggregate('COUNT');
}
//Number of incidents varies depending on the current state
//of the incident table
gs.info('Number of incidents: ' + incidents);
```

Output: Number of incidents: 63.

Shows the aggregation of an FX Currency field.

```
var ga = new GlideAggregate('laptop_tracker');
ga.addAggregate('SUM', 'cost');
ga.groupBy('name');
ga.query();
while (ga.next()) {
  gs.info('Aggregate results ' + ga.getValue('name') + ' => ' +
 ga.getAggregate('SUM', 'cost'));
}
```

Output:

```
*** Script: Aggregate results Apple MacBook Air =>
 USD;1651.784280000000
*** Script: Aggregate results Apple MacBook Pro =>
 USD;1651.784280000000
*** Script: Aggregate results Dell XPS => USD;470.852672000000
*** Script: Aggregate results LG =>
*** Script: Aggregate results Samsung Galaxy =>
 USD;225.320000000000
*** Script: Aggregate results Surface3 => USD;2895.560369520000
*** Script: Aggregate results Toshiba => USD;9385.202875800000
```

Scoped GlideAggregate - getAggregateEncodedQuery()

Gets the query necessary to return the current aggregate.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Encoded query to get the aggregate.

```
var count = new GlideAggregate('incident');
count.addAggregate('MIN', 'sys_mod_count');
count.groupBy('category');
count.query();
while (count.next()) {
    gs.info(count.getAggregateEncodedQuery());
}
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
category=database
category=hardware
category=inquiry
category=network
category=request
category=software
```

Scoped GlideAggregate - getEncodedQuery()

Retrieves the encoded query.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	Encoded query.

```
var count = new GlideAggregate('incident');
count.addAggregate('MIN', 'sys_mod_count');
count.addAggregate('MAX', 'sys_mod_count');
count.addAggregate('AVG', 'sys_mod_count');
count.groupBy('category');
count.query();
gs.info(count.getEncodedQuery());
```

Output:

```
ORDERBYcategory^GROUPBYcategory
```

Scoped GlideAggregate - getRowCount()

Retrieves the number of rows in the GlideAggregate object.

Parameters

Name	Type	Description
none		

Returns

Type	Description
Number	Number of rows in the GlideAggregate object.

```
var count = new GlideAggregate('incident');
  count.addAggregate('MIN', 'sys_mod_count');
  count.addAggregate('MAX', 'sys_mod_count');
  count.addAggregate('AVG', 'sys_mod_count');
  count.groupBy('category');
  count.query();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 gs.info(count.getRowCount());
 while (count.next()) {
    var min = count.getAggregate('MIN', 'sys_mod_count');
    var max = count.getAggregate('MAX', 'sys_mod_count');
    var avg = count.getAggregate('AVG', 'sys_mod_count');
    var category = count.category.getDisplayValue();
    gs.info(category + " Update counts: MIN = " + min + " MAX =
" + max + " AVG = " + avg);
 }
```

Output:

```
6
Database Update counts: MIN = 8 MAX = 48 AVG = 28.0000
Hardware Update counts: MIN = 4 MAX = 14 AVG = 6.6250
Inquiry / Help Update counts: MIN = 0 MAX = 34 AVG = 6.5714
Network Update counts: MIN = 3 MAX = 37 AVG = 18.6000
Request Update counts: MIN = 5 MAX = 39 AVG = 13.4000
Software Update counts: MIN = 4 MAX = 98 AVG = 24.0000
```

Scoped GlideAggregate - getTableName()

Retrieves the table name associated with this GlideAggregate object.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	Table name.

```
var count = new GlideAggregate('incident');
count.addAggregate('MIN', 'sys_mod_count');
count.addAggregate('MAX', 'sys_mod_count');
count.addAggregate('AVG', 'sys_mod_count');
count.groupBy('category');
count.query();
gs.info(count.getTableName());
```

Scoped GlideAggregate - getValue(String name)

Returns the value of the specified field.

Parameters

Name	Type	Description
name	String	Name of the field within the current table to return.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Value of the specified field. Returns null if invalid (not part of result set).

```
var count = new GlideAggregate('incident');
count.addAggregate('MAX', 'sys_mod_count');
count.groupBy('category');
count.query();
while (count.next()) {
  gs.info(count.getValue('category') + " category had " +
 count.getAggregate('MAX', 'sys_mod_count') + " updates");
}
```

Output:

```
category had 12 updates
hardware category had 15 updates
inquiry category had 36 updates
network category had 37 updates
software category had 95 updates
```

Scoped GlideAggregate - groupBy(String name)

Provides the name of a field to use in grouping the aggregates.

May be called numerous times to set multiple group fields.

Parameters

Name	Type	Description
name	String	Name of the field.

Returns

Type	Description
None	

```
var count = new GlideAggregate('incident');
count.addAggregate('MIN', 'sys_mod_count');
count.addAggregate('MAX', 'sys_mod_count');
count.addAggregate('AVG', 'sys_mod_count');
count.groupBy('category');
count.query();
while (count.next()) {
     var min = count.getAggregate('MIN', 'sys_mod_count');
     var max = count.getAggregate('MAX', 'sys_mod_count');
     var avg = count.getAggregate('AVG', 'sys_mod_count');
     var category = count.category.getDisplayValue();
     gs.info(category + " Update counts: MIN = " + min + " MAX =
 " + max + " AVG = " + avg);
}
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Database Update counts: MIN = 8 MAX = 48 AVG = 28.0000
Hardware Update counts: MIN = 4 MAX = 14 AVG = 6.6250
Inquiry / Help Update counts: MIN = 0 MAX = 34 AVG = 6.5714
Network Update counts: MIN = 3 MAX = 37 AVG = 18.6000
Request Update counts: MIN = 5 MAX = 39 AVG = 13.4000
Software Update counts: MIN = 4 MAX = 98 AVG = 24.0000
```

Scoped GlideAggregate - hasNext()

Determines if there are any more records in the GlideAggregate object.

Parameters

Name	Type	Description
none		

Returns

Type	Description
Boolean	Flag that indicates whether there are more results in the query set. Possible values: • true: More results are in the query set. • false: No more results in the query set.

```
var agg = new GlideAggregate('incident');
agg.addAggregate('AVG', 'sys_mod_count');
agg.groupBy('category');
agg.query();
while (agg.hasNext()) {
    agg.next();
    var avg = agg.getAggregate('AVG', 'sys_mod_count');
    var category = agg.category.getDisplayValue();
    gs.info(category + ': AVG = ' + avg);
}
```

Output:

```
Database: AVG = 32.5000
Hardware: AVG = 12.0000
Inquiry / Help: AVG = 7.6667
Network: AVG = 24.0000
Request: AVG = 16.4000
Software: AVG = 27.0833
```

Scoped GlideAggregate - next()

Moves to the next record in the GlideAggregate.

Parameters

Name	Type	Description
none		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether there are more results in the query set. Possible values: • true: More results are in the query set. • false: No more results in the query set.

```
var count = new GlideAggregate('incident');
count.addAggregate('COUNT');
count.query();
var incidents = 0;
if (count.next()) {
   incidents = count.getAggregate('COUNT');
   gs.info(incidents);
}
```

Scoped GlideAggregate - orderBy(String name)

Orders the aggregates using the value of the specified field. The field is also added to the group-by list.

Parameters

Name	Type	Description
name	String	Name of the field to order the aggregates by. Alternatively, you can provide a glidefunction to order the aggregates, such as `glidefunction:length(short_description)`. For more information about glidefunctions, see glidefunction operations.

Returns

Type	Description
None	

```
var agg = new GlideAggregate('incident');
agg.addAggregate('count', 'category');
agg.orderBy('category');
agg.query();
while (agg.next()) {
  var category = agg.category;
  var count = agg.getAggregate('count', 'category');
  var agg2 = new GlideAggregate('incident');
  agg2.addAggregate('count', 'category');
  agg2.orderBy('category');
  gs.info(category + ": Current number of incidents:" + count);
}
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
database: Current number of incidents:2
hardware: Current number of incidents:8
inquiry: Current number of incidents:28
network: Current number of incidents:5
request: Current number of incidents:5
software: Current number of incidents:11
```

Scoped GlideAggregate - orderByAggregate(String agg, String fieldName)

Orders the aggregates based on the specified aggregate and field.

Parameters

Name	Type	Description
agg	String	Type of aggregation.
fieldName	String	Name of the field to aggregate.

Returns

Type	Description
void	

```
ga.addAggregate('COUNT', 'category');
ga.orderByAggregate('count', 'category');
ga.query();
while(ga.next()) {
  gs.info('Category: ' + ga.category + ' ' +
 ga.getAggregate('COUNT', 'category'));
}
```

Output:

```
Category: inquiry 18
Category: software 11
Category: hardware 7
Category: network 5
Category: request 5
Category:  4
Category: database 2
```

Scoped GlideAggregate - orderByDesc(String name)

Sorts the aggregates in descending order based on the specified field. The field will also be added to the group-by list.

Parameters

Name	Type	Description
name	String	Name of the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
var agg = new GlideAggregate('incident');
agg.addAggregate('count', 'category');
agg.orderByDesc('category');
agg.query();
while (agg.next()) {
  var category = agg.category;
  var count = agg.getAggregate('count', 'category');
  var agg2 = new GlideAggregate('incident');
  agg2.addAggregate('count', 'category');
  agg2.orderBy('category');
  gs.info(category + ": Current number of incidents:" + count);
}
```

Output:

```
software: Current number of incidents:11
request: Current number of incidents:5
network: Current number of incidents:5
inquiry: Current number of incidents:28
hardware: Current number of incidents:8
database: Current number of incidents:2
```

Scoped GlideAggregate - query()

Issues the query and gets the results.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

```
var count = new GlideAggregate('incident');
count.addAggregate('COUNT');
count.query();
var incidents = 0;
if (count.next()) {
   incidents = count.getAggregate('COUNT');
}
gs.info('Number of incidents: ' + incidents);
```

Scoped GlideAggregate - setAggregateWindow(Number firstRow, Number lastRow)

Limits the number of rows from the table to include in the aggregate query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
firstRow	Number	Zero-based index of the first row to include in the aggregate query, inclusive.
lastRow	Number	Zero-based index of the last row to include in the aggregate query, exclusive.

Returns

Type	Description
None	

Prints the count of each category for the first ten records in the Incident [incident] table.

```
var incidentGroup = new GlideAggregate('incident');
incidentGroup.addAggregate('COUNT', 'category');
incidentGroup.setAggregateWindow(0, 10);
incidentGroup.query();
while (incidentGroup.next()) {
   var incidentCount = incidentGroup.getAggregate('COUNT',
 'category');
   gs.info('{0} count: {1}',
 [incidentGroup.getValue('category'), incidentCount]);
}
```

Output:

```
database count: 1
Hardware count: 1
inquiry count: 7
software count: 1
```

Scoped GlideAggregate - setGroup(Boolean b)

Sets whether to group the return results.

Parameters

Name	Type	Description
b	Boolean	Flag that indicates whether to group the results. Valid values: • true: Group the results. • false: Do not group the results.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var ga = new GlideAggregate('incident');
ga.addAggregate('COUNT', 'category');

ga.setGroup(true);
ga.groupBy("category");

ga.query();

while(ga.next()) {
  gs.info('Category ' + ga.category + ' ' +
 ga.getAggregate('COUNT', 'category'));
  }
```

Output:

```
Category database 2
Category hardware 7
Category inquiry 18
Category network 5
Category request 5
Category software 11
```

Scoped GlideAggregate - setIntervalYearIncluded(Boolean b)

Sets whether to group results by year for day-of-week trends. These trends are created using the *addTrend()* method with the *dayofweek* time interval.

Dependency: Scoped GlideAggregate - addTrend('<fieldName>', 'dayofweek').

Parameters

Name	Type	Description
b	Boolean	Flag that indicates whether to include a year for a trend with a day-of-week time interval. Valid values: • true: Group day-of-week results by year. • false: Exclude the year from time interval results. Default: true

Returns

Type	Description
None	

The following example shows how to count incidents created in the last six months. The incidents are separated by the day of the week, but not including the year. For example, the default results for Thursday would include the year, such as `Thursday/2023: 16`.

```
var incidentGroup = new GlideAggregate('incident');
incidentGroup.addEncodedQuery("sys_created_onRELATIVEGT@month@ag
o@6");
incidentGroup.addTrend('sys_created_on', 'dayofweek');
incidentGroup.addAggregate('COUNT');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
incidentGroup.setIntervalYearIncluded(false);
incidentGroup.query();
while (incidentGroup.next()) {
    gs.info(incidentGroup.getValue('timeref') + ': ' +
 incidentGroup.getAggregate('COUNT'))};
```

Output:

```
Sunday: 1
Monday: 15
Tuesday: 1
Wednesday: 7
Thursday: 16
Saturday: 1
```

GlideApplicationProperty - Scoped, Global

The *GlideApplicationProperty* API provides methods to get and set application property values for a specific domain.

Application properties enable service providers to customize application functionality based on the domain. Instead of only having a single system property (System Property [sys_properties] table) that defines the functionality for all domains and users, application properties can be implemented to define functionality for specific domains.

To access this API you must activate the Domain Support - Domain Extensions Installer (com.glide.domain.msp_extensions.installer) plugin.

For additional information on domain-specific application properties, see Domain-separated application properties.

GlideApplicationProperty - getValue(String name, String domainSysId)

Returns the value for the specified application property and domain sys_id.

The list of available application properties is located in the Application Properties [sys_application_property] and Application Property Values [sys_application_property_value] tables.

Note: If the specified domain is a child domain, and there is not an application property for the child domain, the method returns the parent domain application property, if available.

Parameters

Name	Type	Description
name	String	Name of the application property to return. **Note:** If the application is not global, you must prefix the name of the sys_application_property with the application's scope.
domainSysId	String	Optional. Sys_id of the domain associated with the application property. Default: Session domain

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Value of the specified application property for the specified domain. If *domainSysId* is not passed in the call, then returns the session domain. If the specified application property doesn't exist, returns the same-name system property value. If the user does not have access rights to the specified domain, throws an exception and no value is returned.

This example shows how to create a new application property and override its value for ACME and Cisco domains.

```
var MY_APP_PROP_NAME = 'my-app-prop';
var ACME_DOMAIN_ID = 'c90d4b084a362312013398f051272c0d';
var CISCO_DOMAIN_ID = 'c90f91924a362312001bdefae0f35d68';

// create a new app_config entry:
var now_GR = new GlideRecord('sys_application_property');
now_GR.name = MY_APP_PROP_NAME;
now_GR.default_value = 'my-app-prop-default_value';
now_GR.insert();

// Override the value for ACME domain, catch exception if user
 can't access the specified domain
try {
  GlideApplicationProperty.setValue(MY_APP_PROP_NAME,
 'prop-value-ACME', ACME_DOMAIN_ID);
  gs.info('Value for ACME domain: ' +
 GlideApplicationProperty.getValue(MY_APP_PROP_NAME,
 ACME_DOMAIN_ID));
} catch (ex) {
  gs.info('Exception: ' + ex);
}

// Override the value for Cisco domain -- assuming that the
 current session domain is Cisco. Notice that we don't pass
 domain-id explicitly
session.setDomainID(CISCO_DOMAIN_ID); // NOTE: this API is not
 available from non-global scope (use domain-picker to switch to
 Cisco)
gs.info('Domain: ' + session.getCurrentDomainID());
GlideApplicationProperty.setValue(MY_APP_PROP_NAME,
 'prop-value-Cisco');
gs.info('Value for current session (Cisco) domain: ' +
 GlideApplicationProperty.getValue(MY_APP_PROP_NAME));
```

Output:

```
*** Script: Value for ACME domain: prop-value-ACME
*** Script: Domain: c90f91924a362312001bdefae0f35d68
*** Script: Value for current session (Cisco) domain:
 prop-value-Cisco
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideApplicationProperty - setValue(String name, String value, String domainSysId)

Stores the specified value in the specified application property for the specified domain, or the current session domain if not specified.

The following are guidelines for using this method:

- The application property is not created if its name contains one of the following strings:
  - glide.properties.blacklist
  - glide.properties.no_db_override
  - glide.properties.safe_overrides
  - glide.properties.maint_write_roles
- The application property is not created if there is an existing system property with the same name, and the system property is marked as private.
- The application property is not created if there is an existing system property and the application property does not reference it.
- The name of the application property in the sys_application_property table is prefixed with the application's scope if it is not global.
- This method cannot be called from a different scope.

Parameters

Name	Type	Description
name	String	Name of the application property to save. **Note:** If the application is not global, you must prefix the name of the sys_application_property with the application's scope.
value	String	Value to store in the specified application property.
domainSysId	String	Optional. Sys_id of the domain associated with the application property. Default: Current session domain

Returns

Type	Description
Boolean	Flag that indicates whether the save operation was successful. Valid values: • true: Value was successfully saved. • false: An error occurred and the application property was not created/updated. If the user does not have access rights to the specified domain, throws an exception and no value is returned.

This example shows how to create a new application property and override its value for ACME and Cisco domains.

```
var MY_APP_PROP_NAME = 'my-app-prop';
var ACME_DOMAIN_ID = 'c90d4b084a362312013398f051272c0d';
```

```
var CISCO_DOMAIN_ID = 'c90f91924a362312001bdefae0f35d68';

// create a new app_config entry:
var now_GR = new GlideRecord('sys_application_property');
now_GR.name = MY_APP_PROP_NAME;
now_GR.default_value = 'my-app-prop-default_value';
now_GR.insert();

// Override the value for ACME domain, catch exception if user
 can't access the specified domain
try {
  GlideApplicationProperty.setValue(MY_APP_PROP_NAME,
 'prop-value-ACME', ACME_DOMAIN_ID);
  gs.info('Value for ACME domain: ' +
 GlideApplicationProperty.getValue(MY_APP_PROP_NAME,
 ACME_DOMAIN_ID));
} catch (ex) {
  gs.info('Exception: ' + ex);
}

// Override the value for Cisco domain -- assuming that the
 current session domain is Cisco. Notice that we don't pass
 domain-id explicitly
session.setDomainID(CISCO_DOMAIN_ID); // NOTE: this API is not
 available from non-global scope (use domain-picker to switch to
 Cisco)
gs.info('Domain: ' + session.getCurrentDomainID());
GlideApplicationProperty.setValue(MY_APP_PROP_NAME,
 'prop-value-Cisco');
gs.info('Value for current session (Cisco) domain: ' +
 GlideApplicationProperty.getValue(MY_APP_PROP_NAME));
```

Output:

```
*** Script: Value for ACME domain: prop-value-ACME
*** Script: Domain: c90f91924a362312001bdefae0f35d68
*** Script: Value for current session (Cisco) domain:
 prop-value-Cisco
```

GlideappCalculationHelper - Global

The *GlideappCalculationHelper* API is a scriptable object that provides methods that add items to an existing request or request the recalculation of the price of a request.

The methods for this API are used in global server-side scripts (script includes, business rules, etc.). There is currently no support for scoped applications.

GlideappCalculationHelper - addItemToExistingRequest(String requestID, String catalogID, String quantity)

Adds a specific catalog item to an existing request. This API should be used only before a request (REQ) is approved. After the REQ is approved, the RITM process is not initiated.

Parameters

Name	Type	Description
requestID	String	Sys_id of the request to which to add the catalog item(s)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
catalogID	String	Sys_id of the catalog item to add to the request
quantity	String	Number (quantity) of the specified catalog item to be add to the request.

Returns

Type	Description
void	

```
var catItemId = "04b7e94b4f7b4200086eeed18110c7fd";
var requestId = "6eed229047801200e0ef563dbb9a71c2";
var helper = new GlideappCalculationHelper();
helper.addItemToExistingRequest(requestId, catItemId, "1");
```

GlideappCalculationHelper - rebalanceRequest(String requestID)

Recalculates the price of all of the items in a specified request.

Parameters

Name	Type	Description
requestID	String	Sys_id of the request for which to recalculate the price

Returns

Type	Description
void	

```
var catItemId = "04b7e94b4f7b4200086eeed18110c7fd";
var requestId = "6eed229047801200e0ef563dbb9a71c2";
var helper = new GlideappCalculationHelper();
//Add an item to the request
helper.addItemToExistingRequest(requestId, catItemId, "1");
//Re-calculate the price of the request after adding the item
helper.rebalanceRequest(requestId);
```

GlideCalendarDateTime - Scoped (deprecated)

The `GlideCalendarDateTime` class provides methods for performing operations on GlideCalendarDateTime objects, such as instantiating GlideCalendarDateTime objects or working with glide_date_time fields.

This API has been deprecated. Please use the GlideDateTime API instead.

GlideCertificateEncryption - Global

The `GlideCertificateEncryption` API provides methods for encrypting certificates.

Use these methods to generate a hash for the certificate, sign data using a private key, and generate a message authentication code.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideCertificateEncryption - GlideCertificateEncryption()

Instantiates a GlideCertificateEncryption object.

Parameters

Name	Type	Description
None		

Scoped equivalent

To use the `GlideCertificateEncryption()` constructor in a scoped application, use the corresponding scoped constructor: CertificateEncryption().

GlideCertificateEncryption - generateMac(String key, String algorithm, String data)

Generates the Message Authentication Code (MAC), which is used to authenticate a message.

Parameters

Name	Type	Description
key	String	Key to use to sign the message. Must be Base64 encoded.
algorithm	String	Algorithm to use to generate the MAC: HmacSHA256, HmacSHA1, HmacMD5, and so on.
data	String	Data to process.

Returns

Type	Description
String	MAC in base64 format.

```
var mac = new GlideCertificateEncryption;
var key = "sample_key";
key = GlideStringUtil.base64Encode(key);
mac.generateMac(key, "HmacSHA256", "sample_data");
```

Scoped equivalent

To use the `generateMac()` method in a scoped application, use the corresponding scoped method: generateMac().

GlideCertificateEncryption - getThumbPrint(String certificateID, String algorithm)

Generates a hash (SHA-1, SHA-256, and so on) for the certificate from Trust Store Cert.

Parameters

Name	Type	Description
certificateID	String	sys_id of the certificate record in the X.509 Certificate [sys_certificate] table.
algorithm	String	SHA-1, SHA-256, and so on

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Thumbprint in base64 format.

Scoped equivalent

To use the `getThumbPrint()` method in a scoped application, use the corresponding scoped method: getThumbPrint().

GlideCertificateEncryption - getThumbPrintFromKeystore(String certificateID, String alias, String algorithm)

Generates a hash (SHA-1, SHA-256, and so on) for the certificate from the key store entry.

Parameters

Name	Type	Description
certificateID	String	sys_id of the certificate record in the X.509 Certificate [sys_certificate] table.
alias	String	Alias name for the certificate.
algorithm	String	SHA-1, SHA-256, and so on.

Returns

Type	Description
String	Thumbprint in base64 format.

Scoped equivalent

To use the `getThumbPrintFromKeystore()` method in a scoped application, use the corresponding scoped method: getThumbPrintFromKeystore().

GlideCertificateEncryption - sign(String certificateID, String alias, String aliaspassword, String algorithm, String datatosign)

Signs the data using the private key and the given algorithm.

Parameters

Name	Type	Description
certificateID	String	sys_id of the certificate record in the X.509 Certificate [sys_certificate] table.
alias	String	Private key name.
aliaspassword	String	Password for the private key.
datatosign	String	Data to sign.
algorithm	String	SHA-1, SHA-256, and so on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Signed data in base64 format.

```
var gce = new GlideCertificateEncryption;
gce.sign("recordID", "alias", "password", "SHA-1", "sign this
 data");
```

Scoped equivalent

To use the *sign()* method in a scoped application, use the corresponding scoped method: sign().

GlideConversation - Global

The *GlideConversation* API provides methods to access information in a Connect message.

Important:

Starting with the Paris release, Connect Support no longer receives enhancements or non-priority bug fixes. Consider moving to ServiceNow® Advanced Work Assignment and Agent Chat in workspace to automatically assign chat requests and other work items to agents. For details, see Move from Connect Support to Advanced Work Assignment and Agent Chat.

Access GlideConversation properties through a global object (conversation) that is available only in Connect action conditions and scripts.

Connect conversations are stored on the Live Group Profile [live_group_profile] table.

GlideConversation - description

The conversation's description.

Field

Name	Type	Description
description	String	The conversation's description.

```
var c= conversation.description;
```

GlideConversation - document

The sysID of the document associated with the conversation.

This field is set for feed conversations, and contains the sysID of the record being discussed.

Field

Name	Type	Description
document	GlideRecord	The document associated with the conversation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideConversation - name

The name of the conversation.

Field

Name	Type	Description
name	String	The name of the conversation.

```
var c= conversation.name;
```

GlideConversation - queueEntry

The queue entry associated with the conversation.

The queue entry is a reference field pointing to the chat_queue_entry table. This field is only available on support conversations. The queue chat entry is used to track the state of the conversation. This property is not changed if an incident record is created from the support conversation using the *`newRecord()`* method.

Field

Name	Type	Description
queueEntry	GlideRecord	The queue entry associated with the conversation.

```
var c= conversation.queueEntry;
```

GlideConversation - sys_id

The sys_id of the conversation.

Field

Name	Type	Description
sys_id	String	The sys_id of the conversation.

```
var c= conversation.sys_id;
```

GlideConversation - table

The name of the table containing the record being discussed.

This field is set for feed conversations, and is set to the table holding the record.

Field

Name	Type	Description
table	String	The name of the table holding the record being discussed.

```
var c= conversation.table;
```

GlideConversation - type

The conversation type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This is not the message type.

Connect supports the following types.

- peer - direct conversations, which consist of messages between two users.
- connect - group conversations, which consist of messages between more than two users.
- support - Connect Support conversations.
- feed - record conversations, which consist of messages that correspond to comments and work notes on a specific record.

Field

Name	Type	Description
type	String	The conversation type.

```
var c= conversation.type;
```

GlideCurrencyConfig - Scoped

The `GlideCurrencyConfig` API provides methods to retrieve various configuration information for FX Currency fields.

You can acquire information for a specific FX Currency field by calling the GlideCurrencyConfig(Object ed) constructor, which associates a specific FX Currency field to the instantiated object. When calling the various `GlideCurrencyConfig()` methods, if a record exists in the FX Currency Configuration [fx_configuration] table for the FX Currency field, the requested value is passed back. If a record or field is not available, the default value is passed back. You can also acquire the default FX Currency configuration values by calling the GlideCurrencyConfig() constructor.

For additional information on FX Currency configuration, see Setting up and operating FX Currency fields.

This class runs is in the `sn_currency` namespace.

GlideCurrencyConfig - GlideCurrencyConfig()

Instantiates a GlideCurrencyConfig object that enables the retrieval of global default FX Currency configuration information.

When calling the available methods on this type of GlideCurrencyConfig object, the return values are the FX Currency global defaults from system properties. If a global default is not defined in system properties, a hard-coded default is returned (this can also be an empty value if not configured).

This object does not provide configuration information for a specific FX Currency field. To retrieve specific FX Currency field information, use the GlideCurrencyConfig(Object ed) constructor.

For more information, see Configuring FX Currency global settings.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var cur_config = new sn_currency.GlideCurrencyConfig();
```

GlideCurrencyConfig - GlideCurrencyConfig(Object ed)

Instantiates a GlideCurrencyConfig object that enables the retrieval of the configuration information for a specific FX Currency field.

When calling the available methods on this type of GlideCurrencyConfig object, the return values are from the FX Currency Configuration [fx_configuration] record associated with the FX Currency field, if a record exists. If a record does not exist, default values are returned.

For more information, see Configuring FX Currency global settings.

Parameters

Name	Type	Description
ed	GlideElementDescriptor	GlideElementDescriptor object of the FX Currency field to associate with the GlideCurrencyConfig object.

```
var grCurr = new GlideRecord('my_FXCurrency_table');
var curr_field = grCurr.getElement('currency');
var ed = curr_field.getED();
var cur_config = new sn_currency.GlideCurrencyConfig(ed);
```

GlideCurrencyConfig - getAggregationSource()

Returns the aggregation source value for an FX Currency field.

If called on an existing FX Currency field that has a corresponding FX Currency Configuration [fx_configuration] record, returns the value of the Aggregation Source (aggregation_source) field. Otherwise, if a new record, returns a default value.

For more information on aggregation source, see Specify the table field and its currency display parameters.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Source of values for aggregations. The returned value depends on the constructor used to instantiate the object. • *`GlideCurrencyConfig(Object ed)`*: If an fx_configuration record exists, returns the aggregation_source field from the fx_configuration record that is associated with the FX Currency field specified by the GlideElementDescriptor passed in the constructor. If no fx_configuration record, follows the *`GlideCurrencyConfig()`* rules. • *`GlideCurrencyConfig()`*: If set, returns the value in the glide.currency2.aggregation_source field in system properties. Otherwise, returns a hard-coded default of `reference`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Possible values: • default • as_entered • reference

This code example returns the default aggregation source.

```
var cur_config = new sn_currency.GlideCurrencyConfig();
var curr_agg_source = cur_config.getAggregationSource();
```

This code example returns the aggregation source for a specific FX Currency field.

```
var grCurr = new GlideRecord('my_FXCurrency_table');
var curr_field = grCurr.getElement('currency');
var ed = curr_field.getED();
var cur_config = new sn_currency.GlideCurrencyConfig(ed);
var curr_agg_source = cur_config.getAggregationSource();
```

GlideCurrencyConfig - getConversionDateSource()

Returns the field used as the source of the date and time for the currency conversion.

If called on an existing FX Currency field that has a corresponding FX Currency Configuration [fx_configuration] record, returns the value of the Conversion Date Source (conversion_date_source) field. Otherwise, if a new record, returns "null".

For more information on the Conversion Date Source field, see Identify the rate table and date source for currency conversions.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Field in the record used as the conversion date source. The returned value depends on the constructor used to instantiate the object. • *`GlideCurrencyConfig(Object ed)`*: If an fx_configuration record exists, returns the conversion_date_source field from the fx_configuration record that is associated with the FX Currency field specified by the GlideElementDescriptor passed in the constructor. If no fx_configuration record, follows the *`GlideCurrencyConfig()`* rules. • *`GlideCurrencyConfig()`*: Returns `null`.

This code example returns the conversion date source for a specific FX Currency field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var grCurr = new GlideRecord('my_FXCurrency_table');
var curr_field = grCurr.getElement('currency');
var ed = curr_field.getED();
var cur_config = new sn_currency.GlideCurrencyConfig(ed);
var curr_conv_date_src = cur_config.getConversionDateSource();
```

GlideCurrencyConfig - getDisplayDigits()

Returns the number of digits to display for an FX Currency field.

If called on an existing FX Currency field that has a corresponding FX Currency Configuration [fx_configuration] record, returns the value of the Display Digits (display_digits) field. Otherwise, if a new record, returns a default value.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Number of digits to display for the FX Currency field. The returned value depends on the constructor used to instantiate the object. • *`GlideCurrencyConfig(Object ed)`*: If an fx_configuration record exists, returns the value of the display_digits field in the FX Currency Configuration [fx_configuration] record that is associated with the FX Currency field specified by the GlideElementDescriptor passed in the constructor. If no fx_configuration record, follows the *`GlideCurrencyConfig()`* rules. • *`GlideCurrencyConfig()`*: If set, returns the value of the glide.currency2.display_digits property in system properties. Otherwise, returns `-1`.

This code example returns the default number of display digits.

```
var cur_config = new sn_currency.GlideCurrencyConfig();
var curr_display_digits = cur_config.getDisplayDigits();
```

This code example returns the display digits for a specific FX Currency field.

```
var grCurr = new GlideRecord('my_FXCurrency_table');
var curr_field = grCurr.getElement('currency');
var ed = curr_field.getED();
var cur_config = new sn_currency.GlideCurrencyConfig(ed);
var curr_display_digits = cur_config.getDisplayDigits();
```

GlideCurrencyConfig - getDisplayValue()

Returns the currency code used to convert the FX Currency value when it appears in lists and reports.

If called on an existing FX Currency field that has a corresponding FX Currency Configuration [fx_configuration] record, returns the value of the Display Value Currency (display_value) field. Otherwise, if a new record, returns a default value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Currency code to use to display the FX Currency field. The returned value depends on the constructor used to instantiate the object. • *`GlideCurrencyConfig(Object ed)`*: If an fx_configuration record exists, returns the display_value field, which contains the currency code, from the fx_configuration record that is associated with the FX Currency field specified by the GlideElementDescriptor passed in the constructor. If no fx_configuration record, follows the *`GlideCurrencyConfig()`* rules. • *`GlideCurrencyConfig()`*: If set, returns the value of the glide.currency2.display_value property in system properties. Otherwise, returns `as_entered`. Possible values: • default: Global default. This is the value in the glide.currency2.display_digits property. • as_entered: Currency value as entered by the user. • in_session_currency: Currency value converted to the session currency. Session currency is based on the user's locale. • in_reference_currency: Reference value if computed and stored. Otherwise, the currency value converted to the reference currency.

This code example returns the default currency code.

```
var cur_config = new sn_currency.GlideCurrencyConfig();
var curr_display_value = cur_config.getDisplayValue();
```

This code example returns the display currency code for a specific FX Currency field.

```
var grCurr = new GlideRecord('my_FXCurrency_table');
var curr_field = grCurr.getElement('currency');
var ed = curr_field.getED();
var cur_config = new sn_currency.GlideCurrencyConfig(ed);
var curr_display_value = cur_config.getDisplayValue();
```

GlideCurrencyConfig - getRateFilterRateTableField()

Returns the rate table field used as a rate table filter for an FX Currency field.

If called on an existing FX Currency field that has a corresponding FX Currency Configuration [fx_configuration] record, returns the value of the Rate Table Field (rate_filter_rate_table_field). Otherwise, if a new record, returns a default value.

For more information on rate table filters, see Select the rate and target table fields used for filtering.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Field in the rate table used to filter the rate table records. The returned value depends on the constructor used to instantiate the object. • *`GlideCurrencyConfig(Object ed)`*: If an fx_configuration record exists, returns the rate_filter_rate_table_field from the fx_configuration record that is associated with the FX Currency field specified by the GlideElementDescriptor passed in the constructor. If no fx_configuration record, follows the *`GlideCurrencyConfig()`* rules. • *`GlideCurrencyConfig()`*: Returns `null`.

This code example returns the rate table field used to filter rate table records for a specific FX Currency field.

```
var grCurr = new GlideRecord('my_FXurrency_table');
var curr_field = grCurr.getElement('currency');
var ed = curr_field.getED();
var cur_config = new sn_currency.GlideCurrencyConfig(ed);
var curr_reference_currency =
 cur_config.getRateFilterRateTableField();
```

GlideCurrencyConfig - getRateFilterTargetTableField()

Returns the target table field used to filter the rate table records for an FX Currency field.

If called on an existing FX Currency field that has a corresponding FX Currency Configuration [fx_configuration] record, returns the value of the Target Table Field (rate_filter_target_table_field). Otherwise, if a new record, returns a default value.

For more information on rate table filters, see Select the rate and target table fields used for filtering.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Field in the target table used/to use to filter the rate table. The returned value depends on the constructor used to instantiate the object. • *`GlideCurrencyConfig(Object ed)`*: If an fx_configuration record exists, returns the rate_filter_target_table_field from the fx_configuration record that is associated with the FX Currency field specified by the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	GlideElementDescriptor passed in the constructor. If no fx_configuration record, follows the *GlideCurrencyConfig()* rules. • *GlideCurrencyConfig()*: Returns `null`.

This code example returns the default rate filter, target table field.

```
var cur_config = new sn_currency.GlideCurrencyConfig();
var curr_rate_filter =
 cur_config.getRateFilterTargetTableField();
```

This code example returns the rate filter, target table field for a specific FX Currency field.

```
var grCurr = new GlideRecord('my_FXCurrency_table');
var curr_field = grCurr.getElement('currency');
var ed = curr_field.getED();
var cur_config = new sn_currency.GlideCurrencyConfig(ed);
var curr_rate_filter =
 cur_config.getRateFilterTargetTableField();
```

GlideCurrencyConfig - getRateTable()

Returns the rate table used to convert currency for an FX Currency field.

If called on an existing FX Currency field that has a corresponding FX Currency Configuration [fx_configuration] record, returns the value of the Rate Table Field (rate_filter_rate_table_field). Otherwise, if a new record, returns a default value.

For more information on FX Currency rate tables, see Identify the rate table and date source for currency conversions.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the rate table used to perform the currency conversion. The returned value depends on the constructor used to instantiate the object. • *GlideCurrencyConfig(Object ed)*: If an fx_configuration record exists, returns the rate_table_field field from the fx_configuration record that is associated with the FX Currency field specified by the GlideElementDescriptor passed in the constructor. If no fx_configuration record, follows the *GlideCurrencyConfig()* rules. • *GlideCurrencyConfig()*: If set, returns the value of the glide.currency2.system_rate_table property from system properties. Otherwise, returns `fx_system_rate`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns the default rate table.

```
var cur_config = new sn_currency.GlideCurrencyConfig();
var curr_rate_table = cur_config.getRateTable();
```

Returns the rate table used for a specific FX Currency field.

```
var grCurr = new GlideRecord('my_FXCurrency_table');
var curr_field = grCurr.getElement('currency');
var ed = curr_field.getED();
var cur_config = new sn_currency.GlideCurrencyConfig(ed);
var curr_rate_table = cur_config.getRateTable();
```

GlideCurrencyConfig - getReferenceCurrency()

Returns the reference currency for an FX Currency field.

If called on an existing FX Currency field that has a corresponding FX Currency Configuration [fx_configuration] record, returns the value of the Reference Currency (reference_currency) field. Otherwise, if a new record, returns a default value.

For more information on reference currency, see Set the reference currency.

Parameters

Name	Type	Description
None		

Returns

Type	Description

String	Reference currency as an ISO currency code. The returned value depends on the constructor used to instantiate the object.
	• *`GlideCurrencyConfig(Object ed)`*: If an fx_configuration record exists, returns the reference_currency field from the fx_configuration record that is associated with the FX Currency field specified by the GlideElementDescriptor passed in the constructor. If no fx_configuration record, follows the *`GlideCurrencyConfig()`* rules.
	• *`GlideCurrencyConfig()`*: If set, returns the value of the glide.currency2.default_reference_currency system property. Otherwise the method applies the following rules, in the specified order, to determine the reference currency code:
	  ○ If the glide.system.reference_currency system property is set to true, uses the value in the glide.system.reference_currency.code system property.
	  ○ The value in the glide.system.locale system property (which implies a currency).
	  ○ Default locale of the Java Virtual Machine on which the instance is running.

This code example returns the default reference currency.

```
var cur_config = new sn_currency.GlideCurrencyConfig();
var curr_reference_currency = cur_config.getReferenceCurrency();
```

This code example returns the reference currency for a specific FX Currency field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var grCurr = new GlideRecord('my_FXCurrency_table');
var curr_field = grCurr.getElement('currency');
var ed = curr_field.getED();
var cur_config = new sn_currency.GlideCurrencyConfig(ed);
var curr_reference_currency = cur_config.getReferenceCurrency();
```

GlideCurrencyConfig - getReferenceCurrencySource()

Returns the reference currency source for an FX Currency field.

If called on an existing FX Currency field that has a corresponding FX Currency Configuration [fx_configuration] record, returns the value (dot-walk path) of the Reference Currency Source (reference_currency_source) field. Otherwise, if a new record, returns a default value.

For more information on reference currency source, see Set the reference currency.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Dot-walk path of the field used/to use as the reference currency. The returned value depends on the constructor used to instantiate the object. • *`GlideCurrencyConfig(Object ed)`*: If an fx_configuration record exists, returns the reference_currency_source field from the fx_configuration record that is associated with the FX Currency field specified by the GlideElementDescriptor passed in the constructor. If no fx_configuration record, follows the *`GlideCurrencyConfig()`* rules. • *`GlideCurrencyConfig()`*: Returns `null`.

This code example returns the default reference currency source.

```
var cur_config = new sn_currency.GlideCurrencyConfig();
var curr_reference_currency =
 cur_config.getReferenceCurrencySource();
```

This code example returns the reference currency source for a specific FX Currency field.

```
var grCurr = new GlideRecord('my_FXCurrency_table');
var curr_field = grCurr.getElement('currency');
var ed = curr_field.getED();
var cur_config = new sn_currency.GlideCurrencyConfig(ed);
var curr_reference_currency =
 cur_config.getReferenceCurrencySource();
```

GlideCurrencyConverter - Scoped

The *`GlideCurrencyConverter`* API provides methods to convert one currency value to another, such as converting US dollars into European euros.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can instantiate the GlideCurrencyConverter object and define the source and destination currencies during instantiation using `GlideCurrencyConverter(from, to)`.
You can also instantiate the object without these values and define them later using the `setFromCurrency()` and `setToCurrency()` methods. These values and the amount to convert must be set before calling the `convert()` method to perform the currency conversion. To set the amount to convert, use the `setAmount()` method.

The `GlideCurrencyConverter()` API also provides optional methods that enable you to:

- Set the date and time for which to perform the conversion, `setDateTime()`. By setting the date and time, the rate that is used in the conversion calculation is that for the specified date and time, instead of the default of the current date and time.
- Set the rate table to use in the conversion, `setRateTable()`. By default the conversion uses the fx_system_rate table however, you can define custom rate tables for your instance. For additional information on creating rate tables, see Add conversion rates using a custom rate table.

This class runs is in the `sn_currency` namespace.

GlideCurrencyConverter - GlideCurrencyConverter()

Instantiates a `GlideCurrencyConverter` object.

Parameters

Name	Type	Description
None		

This example shows how to call the method.

```
var conv = new sn_currency.GlideCurrencyConverter();
```

GlideCurrencyConverter - GlideCurrencyConverter(String from, String to)

Instantiates a `GlideCurrencyConverter` object and sets the source and destination country codes to use in the currency conversion.

Parameters

Name	Type	Description
from	String	Three-letter ISO 3166 country code of the source currency.
to	String	Three-letter ISO 3166 country code of the converted currency.

This example shows how to call the method.

```
var conv = new sn_currency.GlideCurrencyConverter('EUR', 'USD');
```

GlideCurrencyConverter - convert()

Executes the currency converter.

Call this method after calling other `GlideCurrencyConverter` methods that construct the currency conversion, such as `setAmount()`, `setRateTable()`, and `setDate()`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description

Object	If the conversion is successful, returns CurrencyExchangeValue object. If unsuccessful, returns "null".
	`CurrencyExchangeValue {`
	`Rate: Number,`
	`OriginalAmount: Number,`
	`Amount: Number,`
	`fromCurrency: String,`
	`toCurrency: String,`
	`rateSysId: String`
	`}`
	Rate: Number. Exchange rate used in the conversion.
	OriginalAmount: Number. Source currency amount.
	Amount: Number. Converted amount (*OriginalAmount* * *Rate*).
	fromCurrency: String. Three-letter ISO 3166 country code of the source currency.
	toCurrency: String. Three-letter ISO 3166 country code of the converted currency.
	rateSysId: String. Sys_id of the rate table record used to calculate the conversion.

This example shows how to call the method.

```
var conv = new sn_currency.GlideCurrencyConverter('EUR', 'USD');
conv.setAmount(100);
gs.info(conv.convert());
```

Output:

```
CurrencyExchangeValue{Rate = 1.0777, OriginalAmount = 100,
 Amount = 107.7700, fromCurrency = 'EUR', toCurrency = 'USD',
 rateSysId = '2ed537fcb271937adb'}
```

GlideCurrencyConverter - setAmount(String amount)

Sets the amount of currency to convert.

Parameters

Name	Type	Description
amount	String	Currency amount to convert. This value must be unformatted except for a decimal point to denote fractional currency. For example, 1234.56 is valid, 1,234.56 is invalid.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

This example shows how to call the method.

```
var conv = new sn_currency.GlideCurrencyConverter('EUR', 'USD');
conv.setAmount(100);
```

GlideCurrencyConverter - setDateTime(Object date)

Sets the currency conversion date and time.

This date and time determines the conversion rate that is used to convert the currency. If this method is not called before the *`GlideCurrencyConverter.convert()`* method, the conversion is performed using the rate for the current date/time.

Parameters

Name	Type	Description
date	GlideDateTime	Date/time for which to calculate the currency conversion. This value determines the rate that is used in the conversion.

Returns

Type	Description
void	

The following example shows how to call this method.

```
var conv = new sn_currency.GlideCurrencyConverter('EUR', 'USD');
conv.setAmount(100);
var gd = new GlideDateTime("2019-01-03 11:00:00");
conv.setDateTime(gd);
gs.info(conv.convert());
```

Output:

```
CurrencyExchangeValue{fOriginalAmount=100,
 fOriginalCurrency='EUR', fRate=1.061, fAmount=106.1,
 fCurrency='USD', fRateSysId='4555525f5553445f3130303030313031'}
```

GlideCurrencyConverter - setFromCurrency(String from)

Sets the country code of the source currency.

Parameters

Name	Type	Description
from	String	Three-letter ISO 3166 country code of the source currency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

This example shows how to call the method.

```
var conv = new
 sn_currency.GlideCurrencyConverter().setFromCurrency('FRA');
```

GlideCurrencyConverter - setRateTable(String rateTable)

Defines the rate table to use in the currency conversion.

If this method is not called before the *`GlideCurrencyConverter.convert()`* method is called, the conversion is performed using the fx_system_rate table. All custom rate tables must extend the fx_conversion_rate table. For additional information on creating rate tables, see Add conversion rates using a custom rate table.

Parameters

Name	Type	Description
rateTable	String	Name of the rate table to use in the currency conversion.

Returns

Type	Description
void	

This example shows how to call the method.

```
var conv = new sn_currency.GlideCurrencyConverter('EUR', 'USD');
conv.setRateTable(custom_rate_table);
```

GlideCurrencyConverter - setToCurrency(String to)

Sets the country code of the destination currency.

Parameters

Name	Type	Description
to	String	Three-letter ISO 3166 country code of the source currency.

Returns

Type	Description
void	

This example shows how to call the method.

```
var conv = new
 sn_currency.GlideCurrencyConverter().setToCurrency('USA');
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideCurrencyExchangeValue - Scoped

The *GlideCurrencyExchangeValue* API provides methods to access information related to FX Currency conversions.

Refer to the *GlideCurrencyConverter()* API for methods that return a GlideCurrencyExchangeValue object.

This class runs is in the `sn_currency` namespace.

Note: There is no constructor for this class.

GlideCurrencyExchangeValue - getAmount()

Returns the currency amount after the conversion.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Currency amount after the conversion.

This example assumes a conversion rate of 1 Euro = .92 US dollars.

```
var conv = new sn_currency.GlideCurrencyConverter('EUR', 'USD');
conv.setAmount(100);
var convertValues = conv.convert();
gs.info('Exchanged Amount: ' + convertValues.getAmount());
```

Output:

```
Exchanged Amount: $92.00
```

GlideCurrencyExchangeValue - getCurrency()

Returns the converted to currency type.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Three-letter ISO currency code of the converted to currency.

This example shows how to call the method.

```
var convertValues = new
 sn_currency.GlideCurrencyConverter('USD', 'JPY');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
convertValues.setAmount(100);
gs.info('Exchanged Currency (To): ' +
 convertValues.convert().getCurrency());
```

Output:

```
Exchanged Currency (To): JPY
```

GlideCurrancyExchangeValue - getOriginalCurrency()

Returns the original, pre-conversion currency type.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Three-letter ISO currency code of the currency converted from.

This example shows how to call the method.

```
var converter = new sn_currency.GlideCurrencyConverter('USD',
 'JPY');
converter.setAmount(999.999)
var convertValues = converter.convert();
gs.info('Original Amount: ' +
 convertValues.getOriginalCurrency());
```

Output:

```
Original Amount: USD
```

GlideCurrencyExchangeValue - getOriginalValue()

Returns the original, pre-conversion amount.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Original amount before conversion.

This example shows how to call the method.

```
var converter = new sn_currency.GlideCurrencyConverter('USD',
 'JPY');
converter.setAmount(999.999)
var convertValues = converter.convert();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info('Original Amount: ' +
 'convertValues.getOriginalAmount());
```

Output:

```
Original Amount: 999.999
```

GlideCurrencyExchangeValue - getRate()

Returns the exchange rate used during the conversion.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Exchange rate used in the currency conversion.

This example shows how to call the method.

```
var converter = new sn_currency.GlideCurrencyConverter('EUR',
 'USD');
converter.setAmount(999.999)
var convertValues = converter.convert();
gs.info('Original Amount: ' + convertValues.getRate());
```

Output:

```
Exchange rate: 1.0559
```

GlideCurrencyExchangeValue - getRateSysId()

Returns the sys_id of the record in the rate table used in the currency conversion.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the rate table used in the currency conversion.

This example shows how to call the method.

```
var converter = new sn_currency.GlideCurrencyConverter('USD',
 'JPY');
converter.setAmount(999.999)
var convertValues = converter.convert();
gs.info('Rate table sys_id: ' + convertValues.getRateSysId());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
Original Amount: 99ebb4156fa831005be8883e6b3ee4b9
```

GlideCurrencyFormatter - Scoped

The `GlideCurrencyFormatter` API provides methods to format FX Currency strings.

When instantiating the GlideCurrencyFormatter object, you define the format of the output results for this object. Once set, the same format is used each time you call the `GlideCurrencyFormatter.format()` method of that object. The `GlideCurrencyFormatter()` and `format()` methods are the only two methods that you must call to format FX Currency.

The `GlideCurrencyFormatter()` API also provides optional methods that enable you to:

- Set the locale of the currency using `setLocale()`. By setting the locale, the formatter takes into consideration any formatting that is specific to that locale, such as whether a decimal point or decimal comma is used to denote fractions of currency amount. Default: System locale
- Set the minimum number of fractional digits to display using `setMinFractionDigits()`. Defines the minimum number of digits to the right of the decimal point/decimal comma to include. By default, all digits passed in are displayed. If the passed in amount has fewer digits than the specified minimum, the result is padded with "0".
- Set the maximum number of fractional digits to display using `setMaxFractionDigits()`. Defines the maximum number of digits to the right of the decimal point/decimal comma to include. By default, all digits passed in are displayed. If the passed in amount has a greater number of digits than the specified maximum, the additional digits are truncated during the process of rounding to the number of maximum fraction digits. Rounding is performed to the closest right-most digit. For example, if the maximum fraction digit is set to 2 and the passed in currency value is 123.456, the formatted value is 123.46. If the currency value is 23.122, the formatted value is 23.12. If the maximum is set to less than the minimum, the minimum value is used.

This class runs is in the `sn_currency` namespace.

GlideCurrencyFormatter - GlideCurrencyFormatter(String formatString)

Instantiates a GlideCurrencyFormatter object and defines the format string to use to format FX Currency.

This method does not perform the actual string format. You must call the `GlideCurrencyFormatter.format()` method to format the currency.

Parameters

Name	Type	Description
formatString	String	Optional. Format string to use to format any currency passed into the formatter. Valid values: • %s: Replaced by the currency symbol associated with the country code specified in the `format()` call. • %v: Replaced by the currency amount, such as 123.45. • %c: Replaced by the ISO currency code specified in the `format()` call, such as USD or EUR.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• %l: Replaced with the passed in value, no formatting performed. • %p: Replaced by the percent sign (%). For example, if the format string is '%s%v%c' and the value to format is 123.45 in US dollars, the returned formatted string is $123.45 USD. If the format string is '%s%l%c' and the value string to format is '56M' in Euros, the returned formatted string is €56M EUR. **Note:** The same format string is used each time the *format()* method is called on this object.

This example shows how to call the method.

```
var formatString = '%s%v%c';
var exchangeValue = new
 sn_currency.GlideCurrencyFormatter(formatString);
```

GlideCurrencyFormatter - format(String value, String currencyCode)

Formats a specified currency value using the specified currency code.

The resulting format of the currency is also dependent on the values passed in when the GlideCurrencyFormatter object was initially instantiated.

Parameters

Name	Type	Description
value	String	Currency amount to format. The amount can only contain a decimal point to denote the fractional amount, commas are not supported. Valid values: 123.45 or 2436.23 Invalid values 123,45 or 2,134.56
currencyCode	String	Three-letter ISO currency code to use when formatting the currency.

Returns

Type	Description
String	Formatted currency value.

This example shows how to call the method.

```
var amount = '123456.123456789';
var currencyCode = 'USD';
var formatString = '%s%v%c';
var exchangeValue = new
 sn_currency.GlideCurrencyFormatter(formatString);
gs.info('Formatted currency: ' +
 exchangeValue.setMaxFractionDigits(2).format(amount,
 currencyCode));
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
Formatted currency: $123,456.12USD
```

GlideCurrencyFormatter - setLocale(String language, String country)

Sets the default language and country, which constitutes the locale, for the currency formatter.

If you do not call this method before calling the *GlideCurrencyFormatter.format()* method, the locale defaults to the current session locale.

Parameters

Name	Type	Description
language	String	Two-letter ISO 639 language code, such as en, sp, and fr.
country	String	Two-letter ISO 3166 country code, such as US, ES, and FR.

Returns

Type	Description
void	

This example shows setting the currency formatter to France.

```
var amount = '123456.123456789';
var currencyCode = 'EUR';
var formatString = '%s%v%c';
var exchangeValue = new
 sn_currency.GlideCurrencyFormatter(formatString);
exchangeValue.setLocale("fr", "FR"); // Language = fr Country =
 FR
gs.info('Formatted currency: ' +
 exchangeValue.setMaxFractionDigits(2).format(amount,
 currencyCode));
```

Output:

```
Formatted currency: €123 456,12EUR
```

GlideCurrencyFormatter - setMaxFractionDigits(Number maxFractionDigits)

Sets the maximum number of digits to the right of the decimal point/decimal comma to return.

Parameters

Name	Type	Description
maxFractionDigits	Number	Maximum number of fraction digits to return. If this value is set to something less than the *minFractionDigits* value, it is overridden by *minFractionDigits*.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example shows how to call the method.

```
var amount = '123456.123456789';
var currencyCode = 'USD';
var formatString = '%s%v%c';
var exchangeValue = new
 sn_currency.GlideCurrencyFormatter(formatString);
gs.info('Formatted currency: ' +
 exchangeValue.setMaxFractionDigits(2).format(amount,
 currencyCode));
```

Output:

```
Formatted currency: $123,456.12USD
```

GlideCurrencyFormatter - setMinFractionDigits(Number minFractionDigits)

Sets the minimum number of fraction digits (right of the decimal point/decimal comma) to return.

Parameters

Name	Type	Description
minFractionDigits	Number	Minimum number of fraction digits to return.

Returns

Type	Description
void	

```
var amount = '123456.12';
var currencyCode = 'USD';
var formatString = '%s%v%c';
var exchangeValue = new
 sn_currency.GlideCurrencyFormatter(formatString);
gs.info('Formatted currency: ' +
 exchangeValue.setMinFractionDigits(3).format(amount,
 currencyCode));
```

Output:

```
Formatted currency: $123,456.120USD
```

GlideCurrencyParser - Scoped

The *GlideCurrencyParser* API provides methods to parse FX Currency values to detect locale-based formatting.

The methods in this class parse a specified string into a GlideCurrencyValue object enabling you to obtain locale-based currency formatting. Before calling the *GlideCurrencyParser.parse()* method, which actually performs the parse, you must set the currency code to use during the parse. You can set the currency code by either passing it in the *GlideCurrencyParser.parse()* method call or by calling *GlideCurrencyParser.setDefaultCurrencyCode()*.

Setting the locale is optional. If you do not set it through the *GlideCurrencyParser.setLocale()* method, the currency amount passed into *GlideCurrencyParser.parse()* must be unformatted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This class runs is in the `sn_currency` namespace.

GlideCurrencyParser - GlideCurrencyParser()

Instantiates a GlideCurrencyParser object that provides methods to parse a string into a GlideCurrencyValue object.

Parameters

Name	Type	Description
None		

This example shows how to call the method.

```
var parser = new sn_currency.GlideCurrencyParser();
```

GlideCurrencyParser - parse(String value)

Parses a specified string into a GlideCurrencyValue object to obtain locale-based currency formatting.

Parameters

Name	Type	Description
value	String	String to parse. You can prepend this string with the ISO currency code to use when parsing the string (semicolon separated). If the currency code is not set prior to calling the *`parse()`* method, it defaults to the current session currency code. This method supports both decimal point and decimal comma notation. For example: "123.45", "USD;123.45", "123,45", "EUR;123,45"

Returns

Type	Description
GlideCurrencyValue	Parsed value information. Data type: Object

This example sets the locale to France and then parses the passed currency value to US dollars.

```
var gp = new sn_currency.GlideCurrencyParser();
gp.setLocale("fr", "FR");
var cv = gp.parse("USD;1234,56");
gs.info(cv);
```

Output:

```
USD;1234.56
```

This example sets the default currency code to US dollars and then parses the currency value.

```
var amount = "1234.56"
var gp = new sn_currency.GlideCurrencyParser();
gp.setDefaultCurrencyCode("USD");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var cv = gp.parse(amount);
gs.info(cv);
```

Output:

```
USD;1234.56
```

GlideCurrencyParser - setDefaultCurrencyCode(String currencyCode)

Sets the currency code for the associated GlideCurrencyParser object.

Parameters

Name	Type	Description
currencyCode	String	Three-letter ISO currency code to use as the default in the associated GlideCurrencyParser object.

Returns

Type	Description
void	

The following example sets the default currency code to US dollars.

```
var amount = "123.45"
var gp = new sn_currency.GlideCurrencyParser();
gp.setDefaultCurrencyCode("USD");
var cv = gp.parse(amount);
gs.info(cv);
```

Output:

```
USD;123.45
```

GlideCurrencyParser - setLocale(String language, String country)

Sets the default language and country codes, which constitute the locale, on the associated GlideCurrencyParser object.

If you do not call this method before calling the *`GlideCurrencyParser.parse()`* method, the locale defaults to the current session locale.

Parameters

Name	Type	Description
language	String	Two-letter ISO 639 language code, such as en, es, and fr.
country	String	Two-letter ISO 3166 country code, such as US, ES, and FR.

Returns

Type	Description
void	

The following example shows how to set the locale to Spain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var amount = "USD;1.234,56"
var gp = new sn_currency.GlideCurrencyParser();
gp.setLocale("es", "ES");
var cv = gp.parse(amount);
gs.info(cv);
```

Output:

```
USD;1234.56
```

GlideCurrencyValue - Scoped

The *GlideCurrencyValue* API provides methods that return the currency code and original currency from an associated *GlideCurrencyParser.parse()* call.

This class runs is in the `sn_currency` namespace.

Note: There is no constructor for this class.

GlideCurrencyValue - getAmount()

Returns the currency amount originally passed into the associated *GlideCurrencyParser.parse()* call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Original currency passed into the *parse()* method.

This example shows how to call the method.

```
var gp = new sn_currency.GlideCurrencyParser();
gp.setLocale("eng", "USA");
var cv = gp.parse("USD;1234.56");
gs.info('Original currency amount: ' + cv.getAmount());
```

Output:

```
Original currency amount: 1234.56
```

GlideCurrencyValue - getCurrencyCode()

Returns the currency code used to parse the currency in the associated *GlideCurrencyParser.parse()* call.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Three-letter ISO currency code used to parse the currency.

This example shows how to call the method.

```
var gp = new sn_currency.GlideCurrencyParser();
gp.setLocale(eng, USA);
var cv = gp.parse("USD";"1234.56");
gs.info('Parsed currency code: ' + cv.getCurrencyCode());
```

Output:

```
Parsed currency code: USD
```

GlideDate - Global

The *GlideDate* class provides methods for performing operations on GlideDate objects, such as instantiating GlideDate objects or working with GlideDate fields.

For guidance on date time input strings with a list of common format conflicts, refer to Date and time format guidelines.

See also GlideDateTime - Global.

GlideDate - GlideDate()

Creates a GlideDate object with the current date time.

Parameters

Name	Type	Description
None		

```
//Today's date is April 21, 2021
var gd = new GlideDate();
gs.info(gd.getValue());
```

Output:

```
2021-04-21
```

GlideDate - getByFormat(String format)

Gets the date in the specified date format.

Parameters

Name	Type	Description
format	String	Desired date format using Java SimpleDateFormat. For example, `"dd-MM-yyyy"` to get the day, month, and year, or `"EEEE"` to get the day of the week.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Date value for the GlideDate object in the specified format.

```
var gd = new GlideDate();
gd.setValue('2021-04-21');
gs.info(gd.getByFormat("dd-MM-yyyy"));
```

Output:

```
21-04-2021
```

Scoped equivalent

To use this method in a scoped application, use the corresponding scoped method: Scoped GlideDate - getByFormat(String format).

GlideDate - getDayOfMonthNoTZ()

Gets the day of the month stored by the GlideDate object, expressed in the UTC time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The day of the month in the UTC time zone, from 1 to 31.

```
//Today's date is 2016-05-13
var gd =new GlideDate();
gs.info(gd.getDayOfMonthNoTZ());
```

Output:

```
13
```

Scoped equivalent

To use this method in a scoped application, use the corresponding scoped method: Scoped GlideDate - getMonthNoTZ().

GlideDate - getDisplayValue()

Gets the date and time field value in the UTC time zone.

See also: getDisplayValueInternal()

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	Date value for the GlideDate object in the UTC time zone.

```
var gd = new GlideDate();
gd.setValue('2025-04-21');
gs.info(gd.getDisplayValue());
```

Output:

```
2025-04-21
```

Scoped equivalent

To use this method in a scoped application, use the corresponding scoped method: Scoped GlideDate - getDisplayValue().

GlideDate - getDisplayValueInternal()

Gets the date in the internal format (yyyy-MM-dd) and current user's timezone.

See also getDisplayValue()

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	Date value for the GlideDate object in the current user's time zone. Format: yyyy-MM-dd

```
var gd = new GlideDate();
gs.info(gd.getDisplayValueInternal());
```

Output:

```
2021-04-21
```

Scoped equivalent

To use this method in a scoped application, use the corresponding scoped method: Scoped GlideDate - getDisplayValueInternal().

GlideDate - getDisplayValueLang(String style)

Returns the date value in the user's locale according to a specified date style.

Parameters

Name	Type	Description
style	String	Date format. Valid values: • *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022). • *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022). If any other value is passed the API defaults to `medium`. Accepted values are not case sensitive.

Returns

Type	Description
String	A string representation of the date in the style specified and in the appropriate format for the locale of the current user.

The following example returns the date of the user's locale in all styles.

```
var gd = new GlideDate(); // This will fetch the current date

gs.info('date: ' + gd.getDisplayValue());

gs.info('date: ' + gd.getDisplayValueLang("full"));
gs.info('date: ' + gd.getDisplayValueLang("long"));
gs.info('date: ' + gd.getDisplayValueLang("medium"));
gs.info('date: ' + gd.getDisplayValueLang("short"));
```

Output:

```
date: 2023-01-18
Wednesday, January 18, 2023
date: January 18, 2023
date: Jan 18, 2023
date: 1/18/23
```

GlideDate - getDisplayValueLang(String style, String language)

Returns the date value in the user's locale and language according to a specified date style.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
style	String	Date format. Valid values: • *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022). • *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022). If any other value is passed the API defaults to `medium`. Accepted values are not case sensitive.
language	String	Returns the date according to a specified language value. Accepts language tags that conform with the BCP-47 standard. For example, `fr` for French or `en-UK` for British English. For a full list of accepted values, see BCP 47 Language Code List.

Returns

Type	Description
String	Date in the style and language specified according to the locale of the current user.

The following example returns the date of the user's locale in various languages and styles.

```
var gd = new GlideDate(); // This will fetch the current date

gs.info('date: ' + gd.getDisplayValue());

gs.info('date: ' + gd.getDisplayValueLang("full", "fr"));
gs.info('date: ' + gd.getDisplayValueLang("long", "en-GB"));
gs.info('date: ' + gd.getDisplayValueLang("medium", "de"));
gs.info('date: ' + gd.getDisplayValueLang("short", "es-MX"));
```

Output:

```

date: 2023-01-18
date: mercredi 18 janvier 2023
date: 18 January 2023
date: 18.01.2023
date: 18/01/23
```

GlideDate - getMonthNoTZ()

Gets the month stored by the GlideDate object, expressed in the UTC time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The numerical value of the month from 1 to 12.

```
//Today's date is 2016-05-13
var gd =new GlideDate();
gs.info(gd.getMonthNoTZ());
```

Output:

```
5
```

Scoped equivalent

To use this method in a scoped application, use the corresponding scoped method: Scoped GlideDate - getMonthNoTZ().

GlideDate - getYearNoTZ()

Gets the year stored by the GlideDate object, expressed in the UTC time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The numerical value of the year.

```
//Today's date is 2016-05-13
var gd =new GlideDate();
gs.info(gd.getYearNoTZ());
```

Output:

```
2016
```

Scoped equivalent

To use this method in a scoped application, use the corresponding scoped method: Scoped GlideDate - getYearNoTZ().

GlideDate - parseDate(String date, String language, String country)

Parses a date to the locale associated with the passed language and country codes.

Note: This method fails and throws an exception if the regional date format isn't followed.

Parameters

Name	Type	Description
date	String	Date formatted in regional syntax. Formats: • Alphanumeric dates: You can specify months as either three characters such as Jan, Feb, or Mar, or fully spell out the month's name. Years must be four digits and days must be two digits. For example: `"31 Jan 2020"` or `"31 January 2020"` • Numeric dates: Days and months must be two digits. Four digits are highly preferred for years, though the method does support a two-digit year with less accuracy and a higher chance of parse failure. You must also use the regional date separator. These separators affect the parse based on the passed in *`language`* and *`country`* values. For example: "12/31/2020" for US locale and "31.12.20" for Estonia locale.
language	String	ISO-639 two-character language code.
country	String	ISO-3166 two-character country code.

Returns

Type	Description
Object	Parsed GlideDate object that you can use in calculations or insert in a record. This method throws an exception if the date failed to parse. An exception happens when the date format doesn't match the specified locale format (passed *`language`* and *`country`* parameters).

The following code example parses a date and adds four weeks to that date.

```
var date = GlideDate.parseDate("31 Dec 2020", "en", "GB");
date.addWeeksLocalTime(4);
gs.info("Project is due 4 weeks after start date, on " +
 date.getDisplayValue());
```

Output:

```
Project is due 4 weeks after start date, on 2021-01-28
```

GlideDate - setDisplayValue(String asDisplayed)

Sets a date value using the current user's display format and time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
asDisplayed	String	Date in the current user's display format and time zone. Format: Must be formatted using the current user's preferred display format, such as yyyy-MM-dd.

Returns

Type	Description
None	

```
var gd = new GlideDate();
gd.setDisplayValue("2011-01-01");
gs.info(gd.getValue());
```

Output:

```
2011-01-01
```

Scoped equivalent

To use this method in a scoped application, use the corresponding scoped method: Scoped GlideDate - setDisplayValue(String asDisplayed).

GlideDate - setDisplayValueLang(String date, String style)

Sets a date using a specified style and format according to the current user's locale.

Parameters

Name	Type	Description
date	String	Date value for the GlideDate object in the current user's time zone. Valid values are any date and time output from the `getDisplayValueLang()` function. For instance, using output from the `getDisplayValueLang(String style, String language)` example earlier in this topic, **October 25, 2022** or **25.10.2022** are accepted values.
style	String	Date format. Valid values: • *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022). If any other value is passed the API defaults to `medium`. Accepted values are not case sensitive.

Returns

Type	Description
void	

The following example shows how you can set the current date of the user's locale to 'full' style using *`setDisplayValueLang()`*.

```
glideDate.setDisplayValueLang("2/3/2023", "short");

gs.info('date: ' + glideDate.getDisplayValue());
gs.info('date: ' + glideDate.getDisplayValueLang("full"));
```

Output:

```
date: 2023-02-03
date: Friday, February 3, 2023
```

GlideDate - setDisplayValueLang(String date, String style, String language)

Sets a date using a specified style, language, and format according to the current user's locale.

Parameters

Name	Type	Description
date	String	Date value for the GlideDate object in the current user's time zone. Valid values are any date and time output from the *`getDisplayValueLang()`* function. For instance, using output from the *`getDisplayValueLang(String style, String language)`* example earlier in this topic, **October 25, 2022** or **25.10.2022** are accepted values.
style	String	Date format. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022). • *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022). If any other value is passed the API defaults to `medium`. Accepted values are not case sensitive.
language	String	Sets the language using a language tag that conforms with the BCP-47 standard. For example, `fr` for French or `en-UK` for British English. For a full list of accepted values, see BCP 47 Language Code List.

Returns

Type	Description
Void	

The following example returns the date and time in short and full styles for English and French.

```
var glideDateFR = new GlideDate();

glideDateUS.setDisplayValueLang("2/3/202", "short", "en-US" );
glideDateFR.setDisplayValueLang("2/3/2023", "short", "fr-FR" );

gs.info('en-US date: ' + glideDateUS.getDisplayValue());
gs.info('en-US date: ' +
 glideDateUS.getDisplayValueLang("full"));

gs.info('fr-FR date: ' + glideDateFR.getDisplayValue());
gs.info('fr-FR date: ' +
 glideDateFR.getDisplayValueLang("full"));
```

Output:

```
en-US date: 2023-02-03
en-US date: Friday, February 3, 2023
fr-FR date: 2023-03-02
fr-FR date: Thursday, March 2, 2023
```

GlideDate - setValue(String o)

Sets the date of the current GlideDate object in internal format (yyyy-MM-dd) and the system time zone (UTC by default).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
o	String	Date and time to set in the current GlideDate object. Format: yyyy-MM-dd

Returns

Type	Description
None	

```
var gd = new GlideDate();
gd.setValue('2015-01-01');
gs.info(gd.getValue());
```

Output:

```
2015-01-01
```

Scoped equivalent

To use this method in a scoped application, use the corresponding scoped method: Scoped GlideDate - setValue(String o).

GlideDate - Scoped

The scoped *GlideDate* class provides methods for performing operations on GlideDate objects, such as instantiating GlideDate objects or working with GlideDate fields.

For guidance on date time input strings with a list of common format conflicts, refer to Date and time format guidelines.

See also GlideDateTime - Scoped.

Scoped GlideDate - GlideDate()

Creates a GlideDate object with the current date time.

Parameters

Name	Type	Description
None		

```
//Today's date is April 21, 2021
var gd = new GlideDate();
gs.info(gd.getValue());
```

Output:

```
2021-04-21
```

Scoped GlideDate - getByFormat(String format)

Gets the date in the specified date format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
format	String	Desired date format using Java SimpleDateFormat. For example, `"dd-MM-yyyy"` to get the day, month, and year, or `"EEEE"` to get the day of the week.

Returns

Type	Description
String	Date value for the GlideDate object in the specified format.

```
var gd = new GlideDate();
gd.setValue('2021-04-21');
gs.info(gd.getByFormat("dd-MM-yyyy"));
```

Output:

```
21-04-2021
```

Scoped GlideDate - getDayOfMonthNoTZ()

Gets the day of the month stored by the GlideDate object, expressed in the UTC time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The day of the month in the UTC time zone, from 1 to 31.

```
//Today's date is 2016-05-13
var gd =new GlideDate();
gs.info(gd.getDayOfMonthNoTZ());
```

Output:

```
13
```

Scoped GlideDate - getDisplayValue()

Gets the date and time field value in the UTC time zone.

See also: getDisplayValueInternal()

Parameters

Name	Type	Description
none		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Date value for the GlideDate object in the UTC time zone.

```
var gd = new GlideDate();
gd.setValue('2025-04-21');
gs.info(gd.getDisplayValue());
```

Output:

```
2025-04-21
```

Scoped GlideDate - getDisplayValueInternal()

Gets the date in the internal format (yyyy-MM-dd) and current user's timezone.

See also getDisplayValue()

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	Date value for the GlideDate object in the current user's time zone. Format: yyyy-MM-dd

```
var gd = new GlideDate();
gs.info(gd.getDisplayValueInternal());
```

Output:

```
2021-04-21
```

Scoped GlideDate - getDisplayValueLang(String style, String language)

Returns the date value in the user's locale according to a specified language and date style.

Parameters

Name	Type	Description
style	String	Date format. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022). • *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022). If any other value is passed the API defaults to `medium`. Accepted values are not case sensitive.
language	String	Returns the date according to a specified language value. Accepts language tags that conform with the BCP-47 standard. For example, `fr` for French or `en-UK` for British English. For a full list of accepted values, see BCP 47 Language Code List.

Returns

Type	Description
String	Date in the style and language specified according to the locale of the current user.

The following example returns the date of the user's locale in various languages and styles.

```
var gd = new GlideDate(); // This will fetch the current date

gs.info('date: ' + gd.getDisplayValue());

gs.info('date: ' + gd.getDisplayValueLang("full", "fr"));
gs.info('date: ' + gd.getDisplayValueLang("long", "en-GB"));
gs.info('date: ' + gd.getDisplayValueLang("medium", "de"));
gs.info('date: ' + gd.getDisplayValueLang("short", "es-MX"));
```

Output:

```

date: 2023-01-18
date: mercredi 18 janvier 2023
date: 18 January 2023
date: 18.01.2023
date: 18/01/23
```

Scoped GlideDate - getMonthNoTZ()

Gets the month stored by the GlideDate object, expressed in the UTC time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The numerical value of the month from 1 to 12.

```
//Today's date is 2016-05-13
var gd =new GlideDate();
gs.info(gd.getMonthNoTZ());
```

Output:

```
5
```

Scoped GlideDate - getValue()

Gets the date in the internal format (yyyy-MM-dd) and the system time zone (UTC by default).

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The date value for the GlideDate object in the system time zone. Format: yyyy-MM-dd

```
var gd = new GlideDate();
gd.setValue('2021-04-21');
gs.info(gd.getValue());
```

Output:

```
2021-04-21
```

Scoped GlideDate - getYearNoTZ()

Gets the year stored by the GlideDate object, expressed in the UTC time zone.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	The numerical value of the year.

```
//Today's date is 2016-05-13
var gd =new GlideDate();
gs.info(gd.getYearNoTZ());
```

Output:

```
2016
```

Scoped GlideDate - setDisplayValue(String asDisplayed)

Sets a date value using the current user's display format and time zone.

Parameters

Name	Type	Description
asDisplayed	String	Date in the current user's display format and time zone. Format: Must be formatted using the current user's preferred display format, such as yyyy-MM-dd.

Returns

Type	Description
None	

```
var gd = new GlideDate();
gd.setDisplayValue("2011-01-01");
gs.info(gd.getValue());
```

Output:

```
2011-01-01
```

Scoped GlideDate - setDisplayValueLang(String date, String style)

Sets a date using a specified style and format according to the current user's locale.

Parameters

Name	Type	Description
date	String	Date value for the GlideDate object in the current user's time zone. Valid values are any date and time output from the `getDisplayValueLang()` function. For instance, using output from the `getDisplayValueLang(String style, String language)` example earlier in this topic, **October 25, 2022** or **25.10.2022** are accepted values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
style	String	Date format. Valid values: • *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022). • *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022). If any other value is passed the API defaults to `medium`. Accepted values are not case sensitive.

Returns

Type	Description
void	

The following example shows how you can set the current date of the user's locale to 'full' style using *`setDisplayValueLang()`*.

```
glideDate.setDisplayValueLang("2/3/2023", "short");

gs.info('date: ' + glideDate.getDisplayValue());
gs.info('date: ' + glideDate.getDisplayValueLang("full"));
```

Output:

```
date: 2023-02-03
date: Friday, February 3, 2023
```

Scoped GlideDate - setDisplayValueLang(String date, String style, String language)

Sets a date using a specified style, language, and format according to the current user's locale.

Parameters

Name	Type	Description
date	String	Date value for the GlideDate object in the current user's time zone. Valid values are any date and time output from the *`getDisplayValueLang()`* function. For instance, using output from the *`getDisplayValueLang(String style, String`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		language) example earlier in this topic, **October 25, 2022** or **25.10.2022** are accepted values.
style	String	Date format. Valid values: • *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022). • *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022). If any other value is passed the API defaults to `medium`. Accepted values are not case sensitive.
language	String	Sets the language using a language tag that conforms with the BCP-47 standard. For example, `fr` for French or `en-UK` for British English. For a full list of accepted values, see BCP 47 Language Code List.

Returns

Type	Description
Void	

The following example returns the date and time in short and full styles for English and French.

```
var glideDateFR = new GlideDate();

glideDateUS.setDisplayValueLang("2/3/202", "short", "en-US" );
glideDateFR.setDisplayValueLang("2/3/2023", "short", "fr-FR" );

gs.info('en-US date: ' + glideDateUS.getDisplayValue());
gs.info('en-US date: ' +
 glideDateUS.getDisplayValueLang("full"));

gs.info('fr-FR date: ' + glideDateFR.getDisplayValue());
gs.info('fr-FR date: ' +
 glideDateFR.getDisplayValueLang("full"));
```

Output:

```
en-US date: 2023-02-03
en-US date: Friday, February 3, 2023
```

```
fr-FR date: 2023-03-02
fr-FR date: Thursday, March 2, 2023
```

Scoped GlideDate - setValue(String o)

Sets the date of the current GlideDate object in internal format (yyyy-MM-dd) and the system time zone (UTC by default).

Parameters

Name	Type	Description
o	String	Date and time to set in the current GlideDate object. Format: yyyy-MM-dd

Returns

Type	Description
None	

```
var gd = new GlideDate();
gd.setValue('2015-01-01');
gs.info(gd.getValue());
```

Output:

```
2015-01-01
```

Scoped GlideDate - subtract(GlideDate start, GlideDate end)

Gets the duration difference between two GlideDate values.

Parameters

Name	Type	Description
start	GlideDate	The start value.
end	GlideDate	The end value.

Returns

Type	Description
GlideDuration	The duration between the two values.

```
var sgd1 = new GlideDate();
sgd1.setDisplayValue('2014-07-18');
var sgd2 = new GlideDate();
sgd2.setDisplayValue('2014-07-19');

var duration = GlideDate.subtract(sgd1, sgd2);
gs.info(duration.getDisplayValue());
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
1 Day
```

GlideDateTime - Global

The *GlideDateTime* class provides methods for performing operations on GlideDateTime objects.

Use the *GlideDateTime* methods to perform date-time operations, such as instantiating a GlideDateTime object, performing date-time calculations, formatting a date-time, or converting between date-time formats.

For guidance on date time input strings with a list of common format conflicts, refer to Date and time format guidelines.

GlideDateTime - GlideDateTime()

Instantiates a new *GlideDateTime* object with the current date and time.

Parameters

Name	Type	Description
None		

This example instantiates a *GlideDateTime* object.

```
var gdt = new GlideDateTime();
gs.info(gdt);
```

Output:

```
2022-08-08 16:51:44
```

GlideDateTime - GlideDateTime(String dateTime)

Instantiates a new *GlideDateTime* object using the passed-in date and time value.

The system attempts to match the passed-in value with the specified internal system format. If the argument does not match the system format, the system attempts to match it to one of the following formats in this order:

- yyyy-MM-dd HH:mm:ss
- MM/dd/yyyy HH:mm:ss
- MM-dd-yyyy HH:mm:ss
- MM-dd-yyyy HH:mm
- MM-dd-yyyy
- MM/dd/yyyy
- dd-MM-yyyy HH:mm:ss
- dd-MM-yyyy HH.mm.ss
- dd-MM-yyyy HH.mm
- dd-MM-yy HH.mm.ss
- dd/MM/yyyy
- dd-MM-yyyy
- yyyy-MM-dd HH:mm

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- yyyy-MM-dd
- dd.MM.yyyy HH:mm:ss
- dd.MM.yyyy HH.mm.ss
- dd.MM.yyyy hh:mm:ss a
- dd.MM.yyyy hh.mm.ss a
- dd.MM.yyyy

Note: The following format is not supported:

- yyyy-MM-dd'T'HH:mm:ss.SSSZ

Parameters

Name	Type	Description
dateTime	String	UTC date and time to set in the *GlideDateTime* object.

This example shows how to instantiate a *GlideDateTime* object using a string.

```
var gdt = new GlideDateTime("2023-01-01 12:00:00");
gs.info(gdt);
```

Output:

```
2023-01-01 12:00:00
```

GlideDateTime - GlideDateTime(GlideDateTime gdt)

Instantiates a new *GlideDateTime* object set to the time of a specified *GlideDateTime* object.

Parameters

Name	Type	Description
gdt	GlideDateTime	Object used to set the time of the new object.

This example shows how to instantiate a *GlideDateTime* object (gdt1) using a string in the format `yyyy-MM-dd HH:mm:ss`, and a second *GlideDateTime* object (gdt2) using gdt1.

```
var gdt1 = new GlideDateTime("2025-01-28 12:00:00"); //
 GlideDateTime(String g)
var gdt2 = new GlideDateTime(gdt1); //
 GlideDateTime(GlideDateTime g)
gs.info(gdt1);
gs.info(gdt2);
```

Output:

```
2025-01-28 12:00:00
2025-01-28 12:00:00
```

GlideDateTime - add(Number milliseconds)

Adds a specified number of milliseconds to the GlideDateTime object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
milliseconds	Number	The number of milliseconds to add

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.print(gdt.getNumericValue());
gdt.add(10);
gs.print(gdt.getNumericValue());
```

Output:

```
1314777600000
1314777600010
```

Scoped equivalent

To use the *add()* method in a scoped application, use the corresponding scoped method: add().

GlideDateTime - add(GlideTime time)

Adds a GlideTime object to the current GlideDateTime object.

Parameters

Name	Type	Description
time	GlideTime	GlideTime object whose time value to add to the specified GlideDateTime object.

Returns

Type	Description
void	

This example shows how to add 20 seconds to the time set in the gdt GlideDateTime object.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
var gtime1 = new GlideTime();
gtime1.setValue("00:00:20");
gdt.add(gtime1);
gs.print(gdt.toString());
```

Output:

```
2011-08-31 08:00:20
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the *add()* method in a scoped application, use the corresponding scoped method: add().

GlideDateTime - addDays(Number days)

Adds a specified number of days to the current GlideDateTime object. A negative parameter subtracts days.

This method isn't available in scoped applications. You can alternatively use *addDaysLocalTime()* or *addDaysUTC()* in scoped applications.

Parameters

Name	Type	Description
days	Number	The number of days to add. Use a negative number to subtract.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addDays(-1);
gs.print(gdt.getDate());
```

Output:

```
2011-08-30
```

GlideDateTime - addDaysLocalTime(Number days)

Adds a specified number of days to the current GlideDateTime object. A negative parameter subtracts days.

The method determines the local date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts days using the local date and time values.

Parameters

Name	Type	Description
days	Number	The number of days to add. Use a negative value to subtract.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addDaysLocalTime(-1);
gs.print(gdt.getLocalDate());
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
2011-08-30
```

Scoped equivalent

To use the *addDaysLocalTime()* method in a scoped application, use the corresponding scoped method: addDaysLocalTime().

GlideDateTime - addDaysUTC(Number days)

Adds a specified number of days to the current GlideDateTime object. A negative parameter subtracts days.

The method determines the UTC date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts days using the UTC date and time values.

Parameters

Name	Type	Description
days	Number	The number of days to add. Use a negative value to subtract.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addDaysUTC(-1);
gs.print(gdt.getDate());
```

Output:

```
2011-08-30
```

Scoped equivalent

To use the *addDaysUTC()* method in a scoped application, use the corresponding scoped method: addDaysUTC().

GlideDateTime - addSeconds(Number seconds)

Adds a specified number of seconds to the GlideDateTime object.

Parameters

Name	Type	Description
seconds	Number	The number of seconds to add

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gdt = new GlideDateTime("2011-12-07 08:00:00");
gdt.addSeconds(1000);
gs.print(gdt.getValue());
```

Output:

```
2011-12-07 08:16:40
```

Scoped equivalent

To use the *addSeconds()* method in a scoped application, use the corresponding scoped method: addSeconds().

GlideDateTime - addWeeks(Number weeks)

Adds a specified number of weeks to the current GlideDateTime object. A negative parameter subtracts weeks.

Use *addWeeksLocalTime()* and *addWeeksUTC()* instead of this method.

Parameters

Name	Type	Description
weeks	Number	The number of weeks to add. Use a negative number to subtract.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addWeeks(-1);
gs.print(gdt.getDate());
```

Output:

```
2011-08-24
```

GlideDateTime - addWeeksLocalTime(Number weeks)

Adds a specified number of weeks to the current GlideDateTime object. A negative parameter subtracts weeks.

The method determines the local date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts weeks using the local date and time values.

Parameters

Name	Type	Description
weeks	Number	The number of weeks to add. Use a negative number to subtract.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addWeeksLocalTime(-1);
gs.print(gdt.getDate());
```

Output:

```
2011-08-24
```

Scoped equivalent

To use the *addWeeksLocalTime()* method in a scoped application, use the corresponding scoped method: addWeeksLocalTime().

GlideDateTime - addWeeksUTC(Number weeks)

Adds a specified number of weeks to the current GlideDateTime object. A negative parameter subtracts weeks.

The method determines the UTC date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts weeks using the UTC date and time values.

Parameters

Name	Type	Description
weeks	Number	The number of weeks to add. Use a negative number to subtract.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addWeeksUTC(-1);
gs.print(gdt.getDate());
```

Output:

```
2011-08-24
```

Scoped equivalent

To use the *addWeeksUTC()* method in a scoped application, use the corresponding scoped method: addWeeksUTC().

GlideDateTime - addMonths(Number months)

Adds a specified number of months to the current GlideDateTime object. A negative parameter subtracts months.

Use *addMonthsLocalTime()* or *addMonthsUTC()* instead of this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
months	Number	The number of months to add. Use a negative number to subtract.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addMonths(2);
gs.print(gdt.getDate());
```

Output:

```
2011-10-31
```

GlideDateTime - addMonthsLocalTime(Number months)

Adds a specified number of months to the current GlideDateTime object. A negative parameter subtracts months.

The method determines the local date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts months using the local date and time values.

Parameters

Name	Type	Description
months	Number	The number of months to add. Use a negative value to subtract.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addMonthsLocalTime(2);
gs.print(gdt.getDate());
```

Output:

```
2011-10-31
```

Scoped equivalent

To use the *addMonthsLocalTime()* method in a scoped application, use the corresponding scoped method: addMonthsLocalTime().

GlideDateTime - addMonthsUTC(Number months)

Adds a specified number of months to the current GlideDateTime object. A negative parameter subtracts months.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The method determines the UTC date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts months using the UTC date and time values.

Parameters

Name	Type	Description
months	Number	The number of months to add. Use a negative number to subtract.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addMonthsUTC(2);
gs.print(gdt.getDate());
```

Output:

```
2011-10-31
```

Scoped equivalent

To use the *addMonthsUTC()* method in a scoped application, use the corresponding scoped method: addMonthsUTC().

GlideDateTime - addYears(Number years)

Adds a specified number of years to the current GlideDateTime object. A negative parameter subtracts years.

Use *addYearsLocalTime()* or *addYearsUTC()* instead of this method.

Parameters

Name	Type	Description
years	Number	The number of years to add. Use a negative value to subtract.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2010-08-31 08:00:00");
gdt.addYears(1);
gs.print(gdt.getDate());
```

Output:

```
2011-08-31
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideDateTime - addYearsLocalTime(Number years)

Adds a specified number of years to the current GlideDateTime object. A negative parameter subtracts years.

The method determines the local date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts years using the local date and time values.

Parameters

Name	Type	Description
years	Number	The number of years to add. To subtract use a negative value.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2010-08-31 08:00:00");
gdt.addYearsLocalTime(1);
gs.print(gdt.getDate());
```

Output:

```
2011-08-31
```

Scoped equivalent

To use the *AddYearsLocalTime()* method in a scoped application, use the corresponding scoped method: AddYearsLocalTime().

GlideDateTime - addYearsUTC(Number years)

Adds a specified number of years to the current GlideDateTime object. A negative parameter subtracts years.

The date and time value stored by GlideDateTime object is interpreted as being in the UTC time zone.

Parameters

Name	Type	Description
years	Number	The number of years to add. Use a negative value to subtract.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2010-08-31 08:00:00");
gdt.addYearsUTC(1);
gs.print(gdt.getDate());
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
2011-08-31
```

Scoped equivalent

To use the *addYearsUTC()* method in a scoped application, use the corresponding scoped method: addYearsUTC().

GlideDateTime - compareTo(Object dateTime)

Compares two date and time objects to determine whether one occurs before the other or if they are equivalent.

Parameters

Name	Type	Description
dateTime	Object	Date time in a GlideDateTime object

Returns

Type	Description
Number	• 0 = Dates are equal • 1 = The object's date is after the date specified in the parameter • -1 = The object's date is before the date specified in the parameter

```
var initDate = new GlideDateTime("2011-08-01 12:00:00");
var compDate1 = new GlideDateTime("2011-08-01 12:00:00");
var compDate2 = new GlideDateTime("2011-07-31 12:00:00");
var compDate3 = new GlideDateTime("2011-08-04 16:00:00");

gs.info(initDate.compareTo(compDate1)); // Equals (0)
gs.info(initDate.compareTo(compDate2)); // initDate is after
 compDate2 (1)
gs.info(initDate.compareTo(compDate3)); // initDate is before
 compDate3 (-1)
```

Output:

```
0
1
-1
```

Scoped equivalent

To use the *compareTo()* method in a scoped application, use the corresponding scoped method: compareTo().

GlideDateTime - equals(Object GDT)

Compares an object with an existing value for equality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
GDT	Object	The object to compare. Can be a GlideDateTIme object or a valid date time string.

Returns

Type	Description
Boolean	True if they are equal, false otherwise.

```
var gdt = new GlideDateTime("2011-08-31 00:00:00");
gs.print(gdt.equals("2011-09-30 00:12:01"));
```

Output:

```
false
```

Scoped equivalent

To use the *equals()* method in a scoped application, use the corresponding scoped method: equals().

GlideDateTime - getDate()

Returns the date stored by the GlideDateTime object. Expressed in the format yyyy-MM-dd and in the system time zone, UTC by default.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Date in the system time zone. Format: yyyy-MM-dd, and in the system time zone, UTC by default.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.info(gdt.getDate());
```

Output:

```
2011-08-31
```

Scoped equivalent

To use the *getDate()* method in a scoped application, use the corresponding scoped method: getDate().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideDateTime - getDayOfMonth()

Gets the current day of the month in the UTC time zone.

Deprecated. Use *getDayOfMonthLocalTime()* and *getDayOfMonthUTC()* instead of this method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The day of the month in the UTC time zone, from 1 to 31.

```
var gdt = new GlideDateTime("2011-12-02 12:00:00");
gs.print(gdt.getDayOfMonth());
```

Output:

```
2
```

GlideDateTime - getDayOfMonthLocalTime()

Gets the day of the month stored by the GlideDateTime object, expressed in the current user's time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The day of the month in the user's time zone, from 1 to 31.

```
var gdt = new GlideDateTime("2011-12-02 12:00:00");
gs.print(gdt.getDayOfMonthLocalTime());
```

Output:

```
2
```

Scoped equivalent

To use the *getDayOfMonthLocalTime()* method in a scoped application, use the corresponding scoped method: getDayOfMonthLocalTime().

GlideDateTime - getDayOfMonthUTC()

Gets the day of the month stored by the GlideDateTime object, expressed in the UTC time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The day of the month in the UTC time zone, from 1 to 31.

```
var gdt = new GlideDateTime("2011-12-02 12:00:00");
gs.print(gdt.getDayOfMonthUTC());
```

Output:

```
2
```

Scoped equivalent

To use the *getDayOfMonthUTC()* method in a scoped application, use the corresponding scoped method: getDayOfMonthUTC().

GlideDateTime - getDayOfWeek()

Retrieves the day of the week stored by the GlideDateTime object, expressed in the user's time zone.

Use *getDayOfWeekLocalTime()* and *getDayOfWeekUTC()* instead of this method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The day of the week value - Monday = 1, ... Sunday = 7.

```
var gdt = new GlideDateTime("2011-12-01 12:00:00");
gs.print(gdt.getDayOfWeek());
```

Output:

```
4
```

GlideDateTime - getDayOfWeekLocalTime()

Gets the day of the week stored by the GlideDateTime object, expressed in the user's time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The day of the week value - Monday = 1, ... Sunday = 7

```
var gdt = new GlideDateTime("2011-12-01 12:00:00");
gs.print(gdt.getDayOfWeekLocalTime());
```

Output:

```
4
```

Scoped equivalent

To use the *getDayOfWeekLocalTime()* method in a scoped application, use the corresponding scoped method: getDayOfWeekLocalTime().

GlideDateTime - getDayOfWeekUTC()

Gets the day of the week stored by the GlideDateTime object, expressed in the UTC time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The day of the week value - Monday = 1, ... Sunday = 7

```
var gdt = new GlideDateTime("2011-12-01 12:00:00");
gs.print(gdt.getDayOfWeekUTC());
```

Output:

```
4
```

Scoped equivalent

To use the *getDayOfWeekUTC()* method in a scoped application, use the corresponding scoped method: getDayOfWeekUTC().

GlideDateTime - getDaysInMonth()

Gets the number of days in the month stored by the GlideDateTime object, expressed in the Java Virtual Machine time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use *getDaysInMonthLocalTime()* and *getDaysInMonthUTC()* instead of this method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of days in the current month in the Java Virtual Machine time zone.

```
var gdt = new GlideDateTime(); //December
gs.print(gdt.getDaysInMonth());
```

Output:

```
31
```

GlideDateTime - getDaysInMonthLocalTime()

Gets the number of days in the month stored by the GlideDateTime object, expressed in the current user's time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of days in the current month in the user's time zone.

```
var gdt = new GlideDateTime(); //December
gs.print(gdt.getDaysInMonthLocalTime());
```

Output:

```
31
```

Scoped equivalent

To use the *getDaysInMonthLocalTime()* method in a scoped application, use the corresponding scoped method: getDaysInMonthLocalTime().

GlideDateTime - getDaysInMonthUTC()

Gets the number of days in the month stored by the GlideDateTime object, expressed in the UTC time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of days in the month stored by the GlideDateTime object, expressed in the UTC time zone.

```
var gdt = new GlideDateTime(); //December
gs.print(gdt.getDaysInMonthUTC());
```

Output:

```
31
```

Scoped equivalent

To use the *getDaysInMonthUTC()* method in a scoped application, use the corresponding scoped method: getDaysInMonthUTC().

GlideDateTime - getDisplayValue()

Gets the date and time value in the current user's display format and time zone.

Note: Referring to the GlideDateTime object directly returns the date and time value in the GMT time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Date and time in the user's format and time zone. Keep in mind when designing business rules or script includes that this method may return values in different formats for different users.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.info(gdt.getDisplayValue());
```

Output:

```
2011-08-31 01:00:00
```

Scoped equivalent

To use the *getDisplayValue()* method in a scoped application, use the corresponding scoped method: getDisplayValue().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideDateTime - getDisplayValueInternal()

Returns the display value in the internal format, yyyy-MM-dd HH:mm:ss. This method is useful for date/time fields, but not for date fields.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	The date and time values for the GlideDateTime object. Format: yyyy-MM-dd HH:mm:ss in the caller's time zone.

```
// The passed in date and time is converted to the caller's time
 zone.
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.info(gdt.getDisplayValueInternal());
```

Output:

```
2011-08-31 01:00:00
```

Scoped equivalent

To use the *`getDisplayValueInternal()`* method in a scoped application, use the corresponding scoped method: getDisplayValueInternal().

GlideDateTime - getDisplayValueLang(String style)

Returns a date and time value in the current user's locale according to the specified date style.

Parameters

Name	Type	Description
style	String	Specifies the date and time format. Valid values: • *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022). • *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		If any other value is passed the API will default to use *medium*. Accepted values are not case sensitive.

Returns

Type	Description
String	A string representation of the date in the style specified and in the appropriate format for the locale of the current user.

The following example returns the date and time of the user's locale in all date styles.

```
var gdt = new GlideDateTime(); // This will fetch the current
 date

gs.info('date: ' + gdt.getDisplayValue());

gs.info('date: ' + gdt.getDisplayValueLang("full"));
gs.info('date: ' + gdt.getDisplayValueLang("long"));
gs.info('date: ' + gdt.getDisplayValueLang("medium"));
gs.info('date: ' + gdt.getDisplayValueLang("short"));
```

Output:

```
date: 2023-01-18 06:49:02
date: Wednesday, January 18, 2023 06:49:02
date: January 18, 2023 06:49:02
date: Jan 18, 2023 06:49:02
date: 1/18/23 06:49:02
```

GlideDateTime - getDisplayValueLang(String style, String language)

Returns a date and time value in the current user's locale according to a specified language and date style.

Parameters

Name	Type	Description
style	String	Specifies the date and time format. Valid values: • *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022). If any other value is passed the API will default to use *medium*. Accepted values are not case sensitive.
language	String	Returns the date according to a specified language value. Accepts language tags that conform with the BCP-47 standard. For example, `fr` for French or `en-UK` for British English. For a full list of accepted values, see BCP 47 Language Code List.

Returns

Type	Description
String	A string representation of the date in the style specified and in the appropriate format for the locale of the current user.

The following example returns the date and time of the user's locale in all language and date styles.

```
var gdt = new GlideDateTime(); // This will fetch the current
 date

gs.info('date: ' + gdt.getDisplayValue());

gs.info('date: ' + gdt.getDisplayValueLang("full", "fr"));
gs.info('date: ' + gdt.getDisplayValueLang("long", "en-GB"));
gs.info('date: ' + gdt.getDisplayValueLang("medium", "de"));
gs.info('date: ' + gdt.getDisplayValueLang("short",
 "es-MX"));```
```

Output:

```
date: 2023-01-18 06:49:02
mercredi 18 janvier 2023 06:49:02
18 January 2023 06:49:02
18.01.2023 06:49:02
18/01/23 06:49:02
```

GlideDateTime - getDSTOffset()

Gets the amount of time that daylight saving time is offset.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Amount of time, in milliseconds, that daylight saving is offset. Returns 0 if there is no offset or if the time is not during daylight saving time.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.print(gdt.getDSTOffset());
```

Output:

```
3600000
```

Scoped equivalent

To use the *getDSTOffset()* method in a scoped application, use the corresponding scoped method: getDSTOffset().

GlideDateTime - getErrorMsg()

Gets the current error message.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	The error message

```
var gdt = new GlideDateTime("2011-aa-31 aa:00:00"); //bad
gs.print(gdt.isValid()); //false
gs.print(gdt.getErrorMsg()); //reason
```

Output:

```
false
Could not parse DateTime: 2011-aa-31 aa:00:00
```

Scoped equivalent

To use the *getErrorMsg()* method in a scoped application, use the corresponding scoped method: getErrorMsg().

GlideDateTime - getInternalFormattedLocalTime()

Returns the object's time in the local time zone and in the internal format.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	The object's time in the local time zone and the internal format.

This example displays the time in the system time format of the user's timezone.

```
var gdt = new GlideDateTime('2022-10-08 01:00:00');
gs.info(gdt.getDisplayValue());
gs.info(gdt.getInternalFormattedLocalTime());
```

Output:

```
2022-10-07 06:00:00 PM
18:00:00
```

Scoped equivalent

To use the *`getInternalFormattedLocalTime()`* method in a scoped application, use the corresponding scoped method: getInternalFormattedLocalTime().

GlideDateTime - getInternalMidnight(Number dayOfTheWeek)

Returns a date and time object set to midnight of a specified day using UTC.

Parameters

Name	Type	Description
dayOfTheWeek	Number	The day of the week for which to return the date/time object.

Returns

Type	Description
GlideDateTime	A GlideDateTime object set to midnight.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.print(gdt.getInternalMidnight(2));
```

Output:

```
2011-08-30 00:00:01
```

GlideDateTime - getLocalDate()

Gets the date stored by the GlideDateTime object, expressed in the standard format, yyyy-MM-dd, and the current user's time zone.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideDate	The date in the user's time zone.

This example displays the time in the user's time format in the user's timezone.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.print(gdt.getLocalDate());
```

Output:

```
2011-08-31
```

Scoped equivalent

To use the *getLocalDate()* method in a scoped application, use the corresponding scoped method: getLocalDate().

GlideDateTime - getLocalTime()

Gets the time in the user's time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideTime	The time in the user's time zone.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.print(gdt.getLocalTime());
```

Output:

```
1970-01-01 01:00:00
```

Scoped equivalent

To use the *getLocalTime()* method in a scoped application, use the corresponding scoped method: getLocalTime().

GlideDateTime - getMonth()

Retrieves the month stored by the GlideDateTime object, expressed in Java Virtual Machine time zone.

Use *getMonthLocalTime()* and *getMonthUTC()* instead of this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The numerical value of the month, Jan=1, Dec=12.

```
var gdt = new GlideDateTime(); //December
gs.print(gdt.getMonth());
```

Output:

```
12
```

GlideDateTime - getMonthLocalTime()

Gets the month stored by the GlideDateTime object, expressed in the current user's time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The numerical value of the month, Jan=1, Dec=12.

```
var gdt = new GlideDateTime(); //December
gs.print(gdt.getMonthLocalTime());
```

Output:

```
12
```

Scoped equivalent

To use the *`getMonthLocalTime()`* method in a scoped application, use the corresponding scoped method: getMonthLocalTime().

GlideDateTime - getMonthUTC()

Gets the month stored by the GlideDateTime object, expressed in the UTC time zone.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	The numerical value of the month, Jan=1, Dec=12.

```
var gdt = new GlideDateTime(); //December
gs.print(gdt.getMonthUTC());
```

Output:

```
12
```

Scoped equivalent

To use the *getMonthUTC()* method in a scoped application, use the corresponding scoped method: getMonthUTC().

GlideDateTime - getNumericValue()

Gets the number of milliseconds since January 1, 1970, 00:00:00 GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of milliseconds since January 1, 1970, 00:00:00 GMT.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.print(gdt.getNumericValue());
```

Output:

```
1314777600000
```

GlideDateTime - getSpanTime(Number dayOfWeek)

Retrieves the amount of time elapsed since the midnight of a specified day to the current time.

Parameters

Name	Type	Description
dayOfWeek	Number	Day of week value from 1 to 7. 1 = Monday, 7=Sunday.

Returns

Type	Description
GlideTime	The amount of time elapsed since midnight of the specified day. To display the result in user-friendly terms, set the value to GlideDuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00"); //Wednesday
var dur = new GlideDuration();

var span = gdt.getSpanTime(1); //how much time since Monday
 00:00:00
dur.setValue(span);
gs.print(dur.getDisplayValue());
```

Output:

```
2 Days 8 Hours
```

GlideDateTime - getTime()

Gets the Unix duration stamp.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideTime	The Unix duration stamp in system format based on GMT time.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.print(gdt.getTime());
```

Output:

```
1970-01-01 08:00:00
```

Scoped equivalent

To use the *getTime()* method in a scoped application, use the corresponding scoped method: getTime().

GlideDateTime - getTZOffset()

Gets the time zone offset in milliseconds.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of milliseconds of the time zone offset

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gdt = new GlideDateTime();
gdt.getLocalTime(); // PST local time
gs.print(gdt.getTZOffset());
```

Output:

```
-28800000
```

Scoped equivalent

To use the `getTZOffset()` method in a scoped application, use the corresponding scoped method: getTZOffset().

GlideDateTime - getUserFormattedLocalTime()

Returns the object's time in local time zone in the user's format.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	The object's time in local time and the user's format.

The following code example shows how to call this method.

```
var gdt = new GlideDateTime('2022-10-08 01:00:00');
gs.info(gdt.getDisplayValue());
gs.info(gdt.getUserFormattedLocalTime());
```

Output:

```
2022-10-07 06:00:00 PM
06:00:00 PM
```

Scoped equivalent

To use the `getUserFormattedLocalTime()` method in a scoped application, use the corresponding scoped method: getUserFormattedLocalTime().

GlideDateTime - getUserTimeZone()

Retrieves the time zone for the current user session.

This method is equivalent to `gs.getSession().getTimeZone()`.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
TimeZone	TimeZone object for the current user.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.print(gdt.getUserTimeZone());
```

Output:

```
sun.util.calendar.ZoneInfo[id="America/Los_Angeles",offset=-2880
0000,dstSavings=3600000,useDaylight=true,transitions=185,
lastRule=java.util.SimpleTimeZone[id=America/Los_Angeles,offset=
-28800000,dstSavings=3600000,useDaylight=true,startYear=0,startM
ode=3,
startMonth=2,startDay=8,startDayOfWeek=1,startTime=7200000,start
TimeMode=0,endMode=3,endMonth=10,endDay=1,endDayOfWeek=1,
endTime=7200000,endTimeMode=0]]
```

GlideDateTime - getUTCMidnight(Number dayOfTheWeek)

Retrieves a GlideDateTime object with the time set to midnight using the UTC time zone.

This method sets the date of the new GlideDateTime object as the specified day of the week within the week of the original GlideDateTime object.

Parameters

Name	Type	Description
dayOfTheWeek	Number	The day of the week, from 1 to 7. Monday=1, Sunday=7. Do not enter 0 in this parameter.

Returns

Type	Description
GlideDateTime	A new GlideDateTime object, set to midnight.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00"); //
 Wednesday, 3rd day of the week.
gs.print(gdt.getUTCMidnight(5)); //Friday, 5th day of the week.
```

Output:

```
2011-09-02 00:00:00
```

GlideDateTime - getValue()

Returns the date and time value stored by the GlideDateTime object in the internal format, yyyy-MM-dd HH:mm:ss, in the UTC time zone.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Date and time in the internal format and system time zone. Format: yyyy-MM-dd HH:mm:ss in the UTC time zone.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.info(gdt.getValue());
```

Output:

```
2011-08-31 08:00:00
```

Scoped equivalent

To use the *getValue()* method in a scoped application, use the corresponding scoped method: getValue().

GlideDateTime - getWeekOfYearLocalTime()

Gets the number of the week stored by the GlideDateTime object, expressed in the current user's time zone.

All weeks begin on Sunday. The first week of the year is the week that contains at least one day of the new year. The week beginning Sunday 2015-12-27 is considered the first week of 2016 as that week contains January 1 and 2.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of the current week. The highest week number in a year is either 52 or 53.

```
var gdt = new GlideDateTime("2011-12-01 12:00:00");
gs.print(gdt.getWeekOfYearUTC());
```

Output:

```
49
```

Scoped equivalent

To use the *getWeekOfYearLocalTime()* method in a scoped application, use the corresponding scoped method: getWeekOfYearLocalTime().

GlideDateTime - getWeekOfYearUTC()

Gets the number of the week stored by the GlideDateTime object, expressed in the UTC time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All weeks begin on Sunday. The first week of the year is the week that contains at least one day of the new year. The week beginning Sunday 2015-12-27 is considered the first week of 2016 as that week contains January 1 and 2.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of the current week in UTC time. The highest week number in a year is either 52 or 53.

```
var gdt = new GlideDateTime("2011-12-01 12:00:00");
gs.print(gdt.getWeekOfYearUTC());
```

Output:

```
49
```

Scoped equivalent

To use the *getWeekOfYearUTC()* method in a scoped application, use the corresponding scoped method: getWeekOfYearUTC().

GlideDateTime - getYear()

Retrieves the year stored by the GlideDateTime object, expressed in the Java Virtual Machine time zone.

Use *getYearLocalTime()* and *getYearUTC()* instead of this method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The 4-digit year value in the Java Virtual Machine time zone.

```
var gdt = new GlideDateTime(); //2011
gs.print(gdt.getYear());
```

Output:

```
2011
```

GlideDateTime - getYearLocalTime()

Gets the year stored by the GlideDateTime object, expressed in the current user's time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The 4-digit year value in the user's time zone.

```
var gdt = new GlideDateTime(); //2011
gs.print(gdt.getYearLocalTime());
```

Output:

```
2011
```

Scoped equivalent

To use the *getYearLocalTime()* method in a scoped application, use the corresponding scoped method: getYearLocalTime().

GlideDateTime - getYearUTC()

Returns the year stored by the GlideDateTime object, expressed in the UTC time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
number	Four-digit year value in the UTC time zone.

```
var gdt = new GlideDateTime(); //2011
gs.info(gdt.getYearUTC());
```

Output:

```
2011
```

Scoped equivalent

To use the *getYearUTC()* method in a scoped application, use the corresponding scoped method: getYearUTC().

GlideDateTime - hasDate()

Determines if an object's date is set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the object's date is set, false otherwise.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.print(gdt.hasDate());
```

Output:

```
true
```

Scoped equivalent

To use the *hasDate()* method in a scoped application, use the corresponding scoped method: hasDate().

GlideDateTime - isDST()

Determines if the object's time uses a daylight saving offset

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the time is daylight saving time, false otherwise.

```
var gdt = new GlideDateTime("2011-08-31 00:00:00");
gs.print(gdt.isDST()); //true
```

Output:

```
true
```

Scoped equivalent

To use the *isDST()* method in a scoped application, use the corresponding scoped method: isDST().

GlideDateTime - isValid()

Determines if a value is a valid date and time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if value is valid, false otherwise.

```
var gdt = new GlideDateTime("2011-aa-31 aa:00:00");
gs.print(gdt.isValid()); //true
gs.print(gdt.getErrorMsg()); //reason
```

Output

```
Invalid date time: '2011-aa-31 aa:00:00', ignored
```

Scoped equivalent

To use the `isValid()` method in a scoped application, use the corresponding scoped method: isValid().

GlideDateTime - setDayOfMonth(Number day)

Sets the day of the month to a specified value.

Use `setDayOfMonthLocalTime(day)` and `setDayOfMonthUTC(day)` instead of this method.

Parameters

Name	Type	Description
day	Number	Day of the month, from 1 to 31.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime();
gdt.setDayOfMonth(9);
gs.print(gdt.getDayOfMonth());
```

Output:

```
9
```

GlideDateTime - setDayOfMonthLocalTime(Number day)

Sets the day of the month to a specified value in the current user's time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
day	Number	The day of month to change to, from 1 to 31. If this value is greater than the maximum number of days in the month, the value is set to the last day of the month.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime();
gdt.setDayOfMonthLocalTime(9);
gs.print(gdt.getDayOfMonthLocalTime());
```

Output:

```
9
```

Scoped equivalent

To use the *setDayOfMonthLocalTime()* method in a scoped application, use the corresponding scoped method: setDayOfMonthLocalTime().

GlideDateTime - setDayOfMonthUTC(Number day)

Sets the day of the month to a specified value in the UTC time zone.

Parameters

Name	Type	Description
day	Number	The day of month to change to, from 1 to 31. If this value is greater than the maximum number of days in the month, the value is set to the last day of the month.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime();
gdt.setDayOfMonthUTC(9);
gs.print(gdt.getDayOfMonthUTC());
```

Output:

```
9
```

Scoped equivalent

To use the *setDayOfMonthUTC()* method in a scoped application, use the corresponding scoped method: setDayOfMonthUTC().

GlideDateTime - setDisplayValue(String asDisplayed)

Sets a date and time value using the current user's display format and time zone.

Parameters

Name	Type	Description
asDisplayed	String	The date and time in the current user's display format and time zone. The parameter must be formatted using the current user's preferred display format, such as MM-dd-yyyy HH:mm:ss. To assign the current date and time to a variable in a workflow script, use `<variable>.setDisplayValue(gs.nowDateTime);`.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-02-02 12:00:00");
gdt.setDisplayValue("2011-01-01 12:00:00");
gs.print(gdt.getValue());
```

Output:

```
2011-01-01 20:00:00
```

Scoped equivalent

To use the *`setDisplayValue()`* method in a scoped application, use the corresponding scoped method: setDisplayValue().

GlideDateTime - setDisplayValue(String dateTime, String format)

Sets a date and time value using the current user's time zone and the specified date and time format.

This method throws a runtime exception if the date and time format used in the dateTime parameter does not match the format parameter. You can retrieve the error message by calling *`getErrorMsg()`* on the GlideDateTime object after the exception is caught.

Parameters

Name	Type	Description
dateTime	String	The date and time in the current user's time zone.
format	String	The format to use to parse the dateTime parameter.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gdt = new GlideDateTime("2011-02-02 12:00:00");
gdt.setDisplayValue("20-5-2011 12:00:00", "dd-MM-yyyy
 HH:mm:ss");
gs.print(gdt.getValue());
```

Output:

```
2011-05-20 19:00:00
```

Scoped equivalent

To use the *setDisplayValue()* method in a scoped application, use the corresponding scoped method: setDisplayValue().

GlideDateTime - setDisplayValueInternal(String dateTime)

Sets a date and time value using the internal format (yyyy-MM-dd HH:mm:ss) and the current user's time zone.

Parameters

Name	Type	Description
dateTime	String	The date and time in internal format

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-02-02 12:00:00");
gdt.setDisplayValueInternal("2011-01-01 12:00:00");
gs.print(gdt.getValue());
```

Output:

```
2011-01-01 20:00:00
```

Scoped equivalent

To use the *setDisplayValueInternal()* method in a scoped application, use the corresponding scoped method: setDisplayValueInternal().

GlideDateTime - setDisplayValueInternalWithAlternates(String dateTime)

Sets a date and time value using the internal format (yyyy-MM-dd HH:mm:ss) and the current user's time zone.

This method attempts to parse incomplete date and time values.

Parameters

Name	Type	Description
dateTime	String	The date and time in internal format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

GlideDateTime - setDisplayValueLang(String dateTime, String style)

Sets a date using a specified style and format according to the current user's locale.

Parameters

Name	Type	Description
dateTime	String	Date and time value for the GlideDate object in the current user's time zone. Valid values are any date and time output from the `getDisplayValueLang()` function. For instance, using output from the `getDisplayValueLang(String style, String language)` example earlier in this topic, **November 28, 2022 07:03:41** or **28.11.2022 07:03:41** are accepted values.
style	String	Specifies the date format. Valid values: • *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022). • *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022). If any other value is passed the API will default to use *medium*. Accepted values are not case sensitive.

Returns

Type	Description
Void	

The following example returns the date and time in short and full styles.

```
var glideDateFR = new GlideDateTime();
glideDateFR.setDisplayValueLang("2/3/2023 17:27:56", "short");

gs.info('date: ' + glideDateFR.getDisplayValue());
gs.info('date: ' + glideDateFR.getDisplayValueLang("full"));
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
date: 2023-02-03 17:27:56
date: Friday, February 3, 2023 17:27:56
```

GlideDateTime - setDisplayValueLang(String dateTime, String style, String language)

Sets a date and time using a specified style, language, and format according to the current user's locale.

Parameters

Name	Type	Description
dateTime	String	Date and time value for the GlideDate object in the current user's time zone. Valid values are any date and time output from the *`getDisplayValueLang()`* function. For instance, using output from the *`getDisplayValueLang(String style, String language)`* example earlier in this topic, **November 28, 2022 07:03:41** or **28.11.2022 07:03:41** are accepted values.
style	String	Specifies the date format. Valid values: • *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022). • *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022). If any other value is passed the API will default to use *`medium`*. Accepted values are not case sensitive.
language	String	Sets the language using a language tag that conforms with the BCP-47 standard. For example, `fr` for French or `en-UK` for British English. For a full list of accepted values, see BCP 47 Language Code List.

Returns

Type	Description
Void	

The following example returns the date and time in short and full styles for English and French.

```
var glideDateFR = new GlideDateTime();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
glideDateUS.setDisplayValueLang("2/3/2023 18:00:00", "short",
 "en-US" );
glideDateFR.setDisplayValueLang("2/3/2023 18:00:00", "short",
 "fr-FR" );

gs.info('en-US date: ' + glideDateUS.getDisplayValue());
gs.info('en-US date: ' +
 glideDateUS.getDisplayValueLang("full"));

gs.info('fr-FR date: ' + glideDateFR.getDisplayValue());
gs.info('fr-FR date: ' +
 glideDateFR.getDisplayValueLang("full"));
```

Output:

```
en-US date: 2023-02-03 18:00:00
en-US date: Friday, February 3, 2023 18:00:00
fr-FR date: 2023-03-02 18:00:00
fr-FR date: Thursday, March 2, 2023 18:00:00
```

GlideDateTime - setGlideDateTime(GlideDateTime gDT)

Sets the date and time of the current object using an existing GlideDateTime object.

This method is equivalent to instantiating a new object with a GlideDateTime parameter.

Parameters

Name	Type	Description
gDT	GlideDateTime	A GlideDateTime object

Returns

Type	Description
void	

```
var dt1 = new GlideDateTime("2011-01-01 12:00:00");
var dt2 = new GlideDateTime("2011-02-02 08:00:00");
dt1.setGlideDateTime(dt2);
gs.print(dt1.getValue());
```

Output:

```
2011-02-02 08:00:00
```

Scoped equivalent

To use the *`setGlideDateTime()`* method in a scoped application, use the corresponding scoped method: setGlideDateTime().

GlideDateTime - setInitialValue(String dateTime)

Sets the date and time.

This method is equivalent to *`setValue(Object)`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
dateTime	String	The date and time to use. Accepts either a string in the GMT time zone in the internal format, or a GlideDateTime object.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime();
gdt.setInitialValue("2011-01-01 12:00:00");
gs.print(gdt.getValue());
```

Output:

```
2011-01-01 12:00:00
```

GlideDateTime - setMonth(Number month)

Sets the month stored by the GlideDateTime object to a specified value using the Java Virtual Machine time zone.

Use *`setMonthLocalTime()`* or *`setMonthUTC()`* instead of this method.

Parameters

Name	Type	Description
month	Number	The month to change to.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime();
gdt.setMonth(1);
gs.print(gdt.getMonth());
```

Output:

```
1
```

GlideDateTime - setMonthLocalTime(Number month)

Sets the month stored by the GlideDateTime object to a specified value using the current user's time zone.

Parameters

Name	Type	Description
month	Number	The month to change to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime();
gdt.setMonthLocalTime(1);
gs.print(gdt.getMonthLocalTime());
```

Output:

```
1
```

Scoped equivalent

To use the *setMonthLocalTime()* method in a scoped application, use the corresponding scoped method: setMonthLocalTime().

GlideDateTime - setMonthUTC(Number month)

Sets the month stored by the GlideDateTime object to a specified value using the UTC time zone.

Parameters

Name	Type	Description
month	Number	The month to change to.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime();
gdt.setMonthUTC(1);
gs.print(gdt.getMonthUTC());
```

Output:

```
1
```

Scoped equivalent

To use the *setMonthUTC()* method in a scoped application, use the corresponding scoped method: setMonthUTC().

GlideDateTime - setNumericValue(Number milliseconds)

Sets the date and time to the number of milliseconds since January 1, 1970 00:00:00 GMT.

Parameters

Name	Type	Description
milliseconds	Number	Number of milliseconds

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime();
gdt.setNumericValue(1314777600000);
gs.print(gdt.getValue());
```

Output:

```
2011-08-31 08:00:00
```

GlideDateTime - setTZ(TimeZone timeZone)

Sets the time zone of the GlideDateTime object to be the specified time zone.

Parameters

Name	Type	Description
timeZone	TimeZone	A time zone object

Returns

Type	Description
void	

```
var tz = gs.getSession().getTimeZone();
var gdt = new GlideDateTime();
gdt.setTZ(tz);
```

GlideDateTime - setValue(Object dateTime)

Sets the date and time of the GlideDateTime object.

This method is equivalent to `setInitialValue()`.

Parameters

Name	Type	Description
dateTime	Object	The date and time to use. This parameter may be one of several types. • A string in the UTC time zone and the internal format of yyyy-MM-dd HH:mm:ss: Sets the value of the object to the specified date and time. Using the method this way is equivalent to instantiating a new GlideDateTime object using the `GlideDateTime(value)` constructor. If the date and time format used does not match the internal format, the method attempts to set the date and time using other available formats. Resolving the date and time this way can lead to inaccurate data due to ambiguity in the day and month values. When using a non-standard date and time format, use `setValueUTC(dateTime, format)` instead. • A GlideDateTime object: Sets the value of the object to the date and time stored by the GlideDateTime passed in the parameter. Using the method

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		this way is equivalent to instantiating a new GlideDateTime object using the `GlideDateTime(g)` constructor. • A Java Date object: Sets the value of the object using the value stored by the Java Date object. Using the method this way is equivalent to passing the value returned by the Java Date object `getTime()` to the GlideDateTime `setNumericValue()` method. This method does not accept JavaScript Date objects. • A JavaScript Number: Sets the value of the object using the Number value as milliseconds past January 1, 1970 00:00:00 UTC. Using the method this way is equivalent to the `setNumericValue(milliseconds)` method. • A Java Integer or Long: Sets the value of the object using the Integer or Long value as milliseconds past January 1, 1970 00:00:00 UTC. Using the method this way is equivalent to the `setNumericValue(milliseconds)` method.

Returns

Type	Description
void	

Set the date and time using a string in yyyy-MM-dd HH:mm:ss format.

```
var gdt = new GlideDateTime("2011-01-01 12:00:00");
gdt.setValue("2011-02-02 08:00:00");
gs.print(gdt.getValue());
```

Output:

```
2011-02-02 08:00:00
```

Set the date and time using an existing GlideDateTime object.

```
var gdtSource = new GlideDateTime("2017-05-23 11:37:41");
var gdtDest = new GlideDateTime();
gdtDest.setValue(gdtSource);
gs.print(gdtDest.getValue());
```

Output:

```
2017-05-23 11:37:41
```

Set the date and time using a number indicating milliseconds past January 1, 1970 00:00:00 UTC.

```
var gdt = new GlideDateTime("2011-01-01 12:00:00");
gdt.setValue(1617634522375);
gs.print(gdt.getValue());
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
2021-04-05 14:55:22
```

Scoped equivalent

To use the *setValue()* method in a scoped application, use the corresponding scoped method: setValue().

GlideDateTime - setValueUTC(String dateTime, String format)

Sets a date and time value using the UTC time zone and the specified date and time format.

This method throws a runtime exception if the date and time format used in the dateTime parameter does not match the format parameter. You can retrieve the error message by calling *getErrorMsg()* on the GlideDateTime object after the exception is caught.

Parameters

Name	Type	Description
dateTime	String	The date and time to use.
format	String	The format to use.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-01-01 12:00:00");
gdt.setValueUTC("15-02-2011 08:00:00", "dd-MM-yyyy HH:mm:ss");
gs.print(gdt.getValue());
```

Output:

```
2011-02-15 08:00:00
```

Scoped equivalent

To use the *setValueUTC()* method in a scoped application, use the corresponding scoped method: setValueUTC().

GlideDateTime - setYear(Number year)

Sets the year stored by the GlideDateTime object to a specified value using the Java Virtual Machine time zone.

Use *setYearLocalTime()* or *setYearUTC()* instead of this method.

Parameters

Name	Type	Description
year	Number	The year to change to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime();
gdt.setYear(2013);
gs.print(gdt.getYear());
```

Output:

```
2013
```

GlideDateTime - setYearLocalTime(Number year)

Sets the year stored by the GlideDateTime object to a specified value using the current user's time zone.

Parameters

Name	Type	Description
year	Number	The year to change to.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime();
gdt.setYearLocalTime(2013);
gs.print(gdt.getYearLocalTime());
```

Output:

```
2013
```

Scoped equivalent

To use the `setYearLocalTime()` method in a scoped application, use the corresponding scoped method: setYearLocalTime().

GlideDateTime - setYearUTC(Number year)

Sets the year stored by the GlideDateTime object to a specified value using the UTC time zone.

Parameters

Name	Type	Description
year	Number	The year to change to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var gdt = new GlideDateTime();
gdt.setYearUTC(2013);
gs.print(gdt.getYearUTC());
```

Output:

```
2013
```

Scoped equivalent

To use the *setYearUTC()* method in a scoped application, use the corresponding scoped method: setYearUTC().

GlideDateTime - subtract(GlideTime time)

Subtracts a specified amount of time.

Parameters

Name	Type	Description
time	GlideTime	The time to subtract

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
var gtime1 = new GlideTime();
gtime1.setValue("00:00:20");
gdt.subtract(gtime1);
gs.print(gdt.getTime());
```

Output:

```
1970-01-01 07:59:40
```

Scoped equivalent

To use the *subtract()* method in a scoped application, use the corresponding scoped method: subtract().

GlideDateTime - subtract(Number milliseconds)

Subtracts a specified number of milliseconds from the GlideDateTime object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
milliseconds	Number	The number of milliseconds to subtract

Returns

Type	Description
void	

```
var gdt = new GlideDateTime("2011-12-07 08:00:00");
gdt.subtract(1000);
gs.print(gdt.getValue());
```

Output:

```
2011-12-07 07:59:59
```

Scoped equivalent

To use the *`subtract()`* method in a scoped application, use the corresponding scoped method: subtract().

GlideDateTime - subtract(GlideDateTime start, GlideDateTime end)

Returns the duration difference between two specified GlideDateTime objects.

Parameters

Name	Type	Description
start	GlideDateTime	Start date object.
end	GlideDateTime	End date object.

Returns

Type	Description
GlideDuration	Duration difference between the two specified dates.

```
var gdt1 = new GlideDateTime("2011-08-28 09:00:00");
var gdt2 = new GlideDateTime("2011-08-31 08:00:00");

var dur = GlideDateTime.subtract(gdt1, gdt2); // Difference
 between gdt1 and gdt2
gs.info(dur.getDisplayValue());
```

Output:

```
2 Days 23 Hours
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the *subtract()* method in a scoped application, use the corresponding scoped method: subtract().

GlideDateTime - toString()

Returns the date and time value stored by the GlideDateTime object in the internal format, yyyy-MM-dd HH:mm:ss, and the system time zone, UTC by default.

This method is equivalent to *getValue()*.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	The date and time stored by the GlideDateTime object in the system time zone and format.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.print(gdt.toString());
```

Output:

```
2011-08-31 08:00:00
```

Scoped equivalent

To use the *toString()* method in a scoped application, use the corresponding scoped method: toString().

GlideDateTime - Scoped

The scoped *GlideDateTime* class provides methods for performing operations on GlideDateTime objects.

Use the *GlideDateTime* methods to perform date-time operations, such as instantiating a GlideDateTime object, performing date-time calculations, formatting a date-time, or converting between date-time formats.

For guidance on date time input strings with a list of common format conflicts, refer to Date and time format guidelines.

Scoped GlideDateTime - GlideDateTime()

Instantiates a new *GlideDateTime* object with the current date and time.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example instantiates a *GlideDateTime* object.

```
var gdt = new GlideDateTime();
gs.info(gdt);
```

Output:

```
2022-08-08 16:51:44
```

Scoped GlideDateTime - GlideDateTime(String value)

Instantiates a new *GlideDateTime* object using the passed-in date and time value.

The system attempts to match the passed-in value with the specified internal system format. If the argument does not match the system format, the system attempts to match it to one of the following formats in this order:

- yyyy-MM-dd HH:mm:ss
- MM/dd/yyyy HH:mm:ss
- MM-dd-yyyy HH:mm:ss
- MM-dd-yyyy HH:mm
- MM-dd-yyyy
- MM/dd/yyyy
- dd-MM-yyyy HH:mm:ss
- dd-MM-yyyy HH.mm.ss
- dd-MM-yyyy HH.mm
- dd-MM-yy HH.mm.ss
- dd/MM/yyyy
- dd-MM-yyyy
- yyyy-MM-dd HH:mm
- yyyy-MM-dd
- dd.MM.yyyy HH:mm:ss
- dd.MM.yyyy HH.mm.ss
- dd.MM.yyyy hh:mm:ss a
- dd.MM.yyyy hh.mm.ss a
- dd.MM.yyyy

Note: The following format is not supported:

- yyyy-MM-dd'T'HH:mm:ss.SSSZ

Parameters

Name	Type	Description
value	String	UTC date and time to set in the *GlideDateTime* object.

This example shows how to instantiate a *GlideDateTime* object using a string.

```
var gdt = new GlideDateTime("2023-01-01 12:00:00");
gs.info(gdt);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
2023-01-01 12:00:00
```

Scoped GlideDateTime - GlideDateTime(GlideDateTime g)

Instantiates a new *GlideDateTime* object set to the time of a specified *GlideDateTime* object.

Parameters

Name	Type	Description
g	GlideDateTime	Object used to set the time of the new object.

This example shows how to instantiate a *GlideDateTime* object (gdt1) using a string in the format `yyyy-MM-dd HH:mm:ss`, and a second *GlideDateTime* object (gdt2) using gdt1.

```
var gdt1 = new GlideDateTime("2025-01-28 12:00:00"); //
 GlideDateTime(String g)
var gdt2 = new GlideDateTime(gdt1); //
 GlideDateTime(GlideDateTime g)
gs.info(gdt1);
gs.info(gdt2);
```

Output:

```
2025-01-28 12:00:00
2025-01-28 12:00:00
```

Scoped GlideDateTime - add(GlideTime gd)

Adds a GlideTime object to the current GlideDateTime object.

Parameters

Name	Type	Description
gd	GlideTime	GlideTime object whose time value to add to the specified GlideDateTime object.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
var gtime1 = new GlideTime();
gtime1.setValue("00:00:20");
gdt.add(gtime1);
var gtime2 = gdt.getTime();
gs.info(gtime2.getByFormat('hh:mm:ss'));
```

Output:

```
08:00:20
```

Scoped GlideDateTime - add(Number milliseconds)

Adds the specified number of milliseconds to the current GlideDateTime object.

Parameters

Name	Type	Description
milliseconds	Number	The number of milliseconds to add.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.info(gdt.getNumericValue());
gdt.add(10);
gs.info(gdt.getNumericValue());
```

Output:

```
1314777600000 1314777600010
```

Scoped GlideDateTime - addDaysLocalTime(Number days)

Adds a specified number of days to the current GlideDateTime object. A negative parameter subtracts days. The method determines the local date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts days using the local date and time values.

Parameters

Name	Type	Description
days	Number	The number of days to add. Use a negative value to subtract.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addDaysLocalTime(-1);
gs.info(gdt.getLocalDate());
```

Output:

```
2011-08-30
```

Scoped GlideDateTime - addDaysUTC(Number days)

Adds a specified number of days to the current GlideDateTime object. A negative parameter subtracts days. The method determines the UTC date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts days using the UTC date and time values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
days	Number	The number of days to add. Use a negative number to subtract.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addDaysUTC(-1);
gs.info(gdt.getDate());
```

Output:

```
2011-08-30
```

Scoped GlideDateTime - addMonthsLocalTime(Number months)

Adds a specified number of months to the current GlideDateTime object. A negative parameter subtracts months. The method determines the local date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts months using the local date and time values.

Parameters

Name	Type	Description
months	Number	The number of months to add. use a negative value to subtract.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addMonthsLocalTime(2);
gs.info(gdt.getDate());
```

Output:

```
2011-10-31
```

Scoped GlideDateTime - addMonthsUTC(Number months)

Adds a specified number of months to the current GlideDateTime object. A negative parameter subtracts months. The method determines the UTC date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts months using the UTC date and time values.

Parameters

Name	Type	Description
months	Number	The number of months to add. Use a negative value to subtract.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addMonthsUTC(2);
gs.info(gdt.getDate());
```

Output:

```
2011-10-31
```

Scoped GlideDateTime - addSeconds(Number seconds)

Adds the specified number of seconds to the current GlideDateTime object.

Parameters

Name	Type	Description
seconds	Number	The number of seconds to add.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-12-07 08:00:00");
gdt.addSeconds(1000);
gs.info(gdt.getValue());
```

Output:

```
2011-12-07 08:16:40
```

Scoped GlideDateTime - addWeeksLocalTime(Number weeks)

Adds a specified number of weeks to the current GlideDateTime object. A negative parameter subtracts weeks. The method determines the local date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts weeks using the local date and time values.

Parameters

Name	Type	Description
weeks	Number	The number of weeks to add. Use a negative value to subtract.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addWeeksLocalTime(-1);
gs.info(gdt.getDate());
```

Output:

```
2011-08-24
```

Scoped GlideDateTime - addWeeksUTC(Number weeks)

Adds a specified number of weeks to the current GlideDateTime object. A negative parameter subtracts weeks. The method determines the UTC date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts weeks using the UTC date and time values.

Parameters

Name	Type	Description
weeks	Number	The number of weeks to add. Use a negative value to subtract.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gdt.addWeeksUTC(-1);
gs.info(gdt.getDate());
```

Output:

```
2011-08-24
```

Scoped GlideDateTime - addYearsLocalTime(Number years)

Adds a specified number of years to the current GlideDateTime object. A negative parameter subtracts years. The method determines the local date and time equivalent to the value stored by the GlideDateTime object, then adds or subtracts years using the local date and time values.

Parameters

Name	Type	Description
years	Number	The number of years to add. Use a negative value to subtract.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gdt = new GlideDateTime("2010-08-31 08:00:00");
gdt.addYearsLocalTime(1);
gs.info(gdt.getDate());
```

Output:

```
2011-08-31
```

Scoped GlideDateTime - addYearsUTC(Number years)

Adds a specified number of years to the current GlideDateTime object. A negative parameter subtracts years. The date and time value stored by GlideDateTime object is interpreted as being in the UTC time zone.

Parameters

Name	Type	Description
years	Number	The number of years to add. Use a negative value to subtract.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2010-08-31 08:00:00");
gdt.addYearsUTC(1);
gs.info(gdt.getDate());
```

Output:

```
2011-08-31
```

Scoped GlideDateTime - after(GlideDateTime gdt)

Determines if the GlideDateTime object's date and time occurs after the specified object's date and time.

Parameters

Name	Type	Description
gdt	GlideDateTime	Date and time to check against.

Returns

Type	Description
Boolean	Flag that indicates whether the GlideDateTime object's date and time is after the date and time specified by the parameter. Possible values: • true: GlideDateTime object date and time is after the specified object's date and time. • false: GlideDateTime object date and time is before or equal to the specified object's date and time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gdt1 = new GlideDateTime("2016-05-09 10:11:12");
var gdt2 = new GlideDateTime("2017-06-12 15:11:12");
gs.info(gdt1.after(gdt2));
```

Output:

```
False
```

Scoped GlideDateTime - before(GlideDateTime gdt)

Determines if the GlideDateTime object's date and time occurs before the specified GlideDateTime object's date and time.

Parameters

Name	Type	Description
gdt	GlideDateTime	Date and time to check against.

Returns

Type	Description
Boolean	Flag that indicates whether the GlideDateTime object's date and time is before the date and time specified by the parameter. Possible values: • true: GlideDateTime object date and time is before the specified date and time. • false: GlideDateTime object date and time is after or equal to the specified date and time.

```
var gdt1 = new GlideDateTime("2016-05-09 10:11:12");
var gdt2 = new GlideDateTime("2017-06-12 15:11:12");
gs.info(gdt1.before(gdt2));
```

Output

```
true
```

Scoped GlideDateTime - compareTo(Object o)

Compares two date and time objects to determine whether they are equivalent or one occurs before or after the other.

Parameters

Name	Type	Description
o	Object	Date and time object in GlideDateTime format

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	• 0 = Dates are equal • 1 = The object's date is after the date specified in the parameter • -1 = The object's date is before the date specified in the parameter

```
var initDate = new GlideDateTime("2011-08-01 12:00:00");
var compDate1 = new GlideDateTime("2011-08-01 12:00:00");
var compDate2 = new GlideDateTime("2011-07-31 12:00:00");
var compDate3 = new GlideDateTime("2011-08-04 16:00:00");

gs.info(initDate.compareTo(compDate1)); // Equals (0)
gs.info(initDate.compareTo(compDate2)); // initDate is after
 compDate2 (1)
gs.info(initDate.compareTo(compDate3)); // initDate is before
 compDate3 (-1)
```

Output:

```
0
1
-1
```

Scoped GlideDateTime - equals(Object dateTime)

Compares a datetime with an existing value for equality.

Parameters

Name	Type	Description
dateTime	GlideDateTime object or String	The datetime to compare.

Returns

Type	Description
Boolean	Returns true if they are equal; otherwise, false.

```
var gdt = new GlideDateTime("2011-08-31 00:00:00");
gs.info(gdt.equals("2011-09-30 00:12:01"));
```

Output:

```
false
```

Scoped GlideDateTime - getDate()

Returns the date stored by the GlideDateTime object. Expressed in the standard format, yyyy-MM-dd, and in the system time zone, GMT by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Date in the system time zone.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.info(gdt.getDate());
```

Output:

```
2011-08-31
```

Scoped GlideDateTime - getDayOfMonthLocalTime()

Gets the day of the month stored by the GlideDateTime object, expressed in the current user's time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The day of the month in the user's time zone, from 1 to 31.

```
var gdt = new GlideDateTime("2011-12-02 12:00:00");
gs.info(gdt.getDayOfMonthLocalTime());
```

Output:

```
2
```

Scoped GlideDateTime - getDayOfMonthUTC()

Gets the day of the month stored by the GlideDateTime object, expressed in the UTC time zone.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	The day of the month in the UTC time zone, from 1 to 31.

```
var gdt = new GlideDateTime("2011-12-02 12:00:00");
gs.info(gdt.getDayOfMonthUTC());
```

Output:

```
02
```

Scoped GlideDateTime - getDayOfWeekLocalTime()

Gets the day of the week stored by the GlideDateTime object, expressed in the user's time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The day of week value, in the user's time zone, from 1 to 7. Monday equals 1, Sunday equals 7.

```
var gdt = new GlideDateTime("2011-12-01 12:00:00");//Thursday
gs.info(gdt.getDayOfWeekLocalTime());
```

Output:

```
4
```

Scoped GlideDateTime - getDayOfWeekUTC()

Returns the day of the week stored by the GlideDateTime object, expressed in the UTC time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Day of week value from 1 to 7. Monday equals 1, Sunday equals 7.

```
var gdt = new GlideDateTime("2011-12-01 12:00:00"); //Thursday
gs.info(gdt.getDayOfWeekUTC());
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
4
```

Scoped GlideDateTime - getDaysInMonthLocalTime()

Gets the number of days in the month stored by the GlideDateTime object, expressed in the current user's time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of days in the current month in the user's time zone.

```
var gdt = new GlideDateTime("2011-12-02 12:00:00"); //December
gs.info(gdt.getDaysInMonthLocalTime());
```

Output:

```
30
```

Scoped GlideDateTime - getDaysInMonthUTC()

Gets the number of days in the month stored by the GlideDateTime object, expressed in the UTC time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of days in the month stored by the GlideDateTime object, expressed in the UTC time zone.

```
var gdt = new GlideDateTime("2011-11-02 12:00:00"); //November
gs.info(gdt.getDaysInMonthUTC());
```

Output:

```
30
```

Scoped GlideDateTime - getDisplayValue()

Gets the date and time value in the current user's display format and time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Date and time in the user's format and time zone. Keep in mind when designing business rules or script includes that this method may return values in different formats for different users.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.info(gdt.getDisplayValue()); //uses current user session time
 zone (US/Pacific)
```

Output:

```
2011-08-31 01:00:00
```

Scoped GlideDateTime - getDisplayValueInternal()

Gets the display value in the internal format (yyyy-MM-dd HH:mm:ss).

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The date and time values for the GlideDateTime object in the current user's time zone and the internal date and time format of `yyyy-MM-dd HH:mm:ss`.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.info(gdt.getDisplayValueInternal()); //uses current user
 session time zone (US/Pacific)
```

Output:

```
2011-08-31 01:00:00
```

Scoped GlideDateTime - getDisplayValueLang(String style, String language)

Returns a date and time value in the current users' locale according to a specified language and date style.

Parameters

Name	Type	Description
style	String	Specifies the date and time format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022). • *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022). If any other value is passed the API will default to use *`medium`*. Accepted values are not case sensitive.
language	String	Returns the date according to a specified language value. Accepts language tags that conform with the BCP-47 standard. For example, `fr` for French or `en-UK` for British English. For a full list of accepted values, see BCP 47 Language Code List.

Returns

Type	Description
String	A string representation of the date in the style specified and in the appropriate format for the locale of the current user.

The following example returns the date and time of the user's locale in all language and date styles.

```
var gdt = new GlideDateTime(); // This will fetch the current
 date

gs.info('date: ' + gdt.getDisplayValue());

gs.info('date: ' + gdt.getDisplayValueLang("full", "fr"));
gs.info('date: ' + gdt.getDisplayValueLang("long", "en-GB"));
gs.info('date: ' + gdt.getDisplayValueLang("medium", "de"));
gs.info('date: ' + gdt.getDisplayValueLang("short",
 "es-MX"));```
```

Output:

```
date: 2023-01-18 06:49:02
mercredi 18 janvier 2023 06:49:02
18 January 2023 06:49:02
18.01.2023 06:49:02
18/01/23 06:49:02
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideDateTime - getDSTOffset()

Gets the amount of time that daylight saving time is offset.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Amount of time, in milliseconds, that daylight saving is offset. Returns 0 if there is no offset or if the time is not during daylight saving time.

```
var gdt = new GlideDateTime("2014-08-31 08:00:00");
gs.info(gdt.getDSTOffset()); //uses current user session time
 zone (US/Pacific)
```

Output:

```
3600000
```

Scoped GlideDateTime - getErrorMsg()

Gets the current error message.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	The error message.

```
var gdt = new GlideDateTime();
gdt.setDisplayValue("2011-aa-01 00:00:00");
gs.info(gdt.getErrorMsg());
```

Output:

```
Could not parse DateTime: 2011-aa-01 00:00:00
```

Scoped GlideDateTime - getInternalFormattedLocalTime()

Returns the object's time in the local time zone and in the internal format.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The object's time in the local time zone and the internal format.

This example displays the time in the system time format of the user's timezone.

```
var gdt = new GlideDateTime('2022-10-08 01:00:00');
gs.info(gdt.getDisplayValue());
gs.info(gdt.getInternalFormattedLocalTime());
```

Output

```
2022-10-07 06:00:00 PM
18:00:00
```

Scoped GlideDateTime - getLocalDate()

Gets the date stored by the GlideDateTime object, expressed in the standard format, yyyy-MM-dd, and the current user's time zone.

Parameters

Name	Type	Description
None		

Returns

Type	
GlideDate	The date in the user's time zone.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.info(gdt.getLocalDate());
```

Output:

```
2011-08-31
```

Scoped GlideDateTime - getLocalTime()

Returns a GlideTime object that represents the time portion of the GlideDateTime object in the user's time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideTime	The time in the user's time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gdt = new GlideDateTime("2014-08-31 08:00:00");
gt = gdt.getLocalTime();
gs.info("local time is " + gt.getByFormat('hh:mm:ss'));
```

Output:

```
local time is 01:00:00
```

Scoped GlideDateTime - getMonthLocalTime()

Gets the month stored by the GlideDateTime object, expressed in the current user's time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The numerical value of the month.

```
var gdt = new GlideDateTime("2011-11-02 12:00:00"); //November
gs.info(gdt.getMonthLocalTime());
```

Output:

```
11
```

Scoped GlideDateTime - getMonthUTC()

Gets the month stored by the GlideDateTime object, expressed in the UTC time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The numerical value of the month.

```
var gdt = new GlideDateTime("2011-11-02 12:00:00"); //November
gs.info(gdt.getMonthUTC());
```

Output:

```
11
```

Scoped GlideDateTime - getNumericValue()

Gets the number of milliseconds since January 1, 1970, 00:00:00 GMT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of milliseconds since January 1, 1970, 00:00:00 GMT.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.info(gdt.getNumericValue());
```

Output:

```
1314777600000
```

Scoped GlideDateTime - getTime()

Returns a GlideTime object that represents the time portion of the GlideDateTime object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideTime	The Unix duration stamp in system format based on GMT time.

```
var gdt = new GlideDateTime("2014-08-31 08:00:00");
gt = gdt.getTime();
gs.info(gt.getByFormat('hh:mm:ss'));
```

Output:

```
08:00:00
```

Scoped GlideDateTime - getTZOffset()

Gets the time zone offset in milliseconds.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	The number of milliseconds of time zone offset.

```
var gdt = new GlideDateTime();
gdt.getLocalTime(); // PST local time
gs.info(gdt.getTZOffset());
```

Output:

```
-25200000
```

Scoped GlideDateTime - getUserFormattedLocalTime()

Returns the object's time in the local time zone and in the user's format.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The object's time in the local time zone and in the user's format.

This example shows the object's time in the local time zone.

```
var gdt = new GlideDateTime('2022-10-08 01:00:00');
gs.info(gdt.getDisplayValue());
gs.info(gdt.getUserFormattedLocalTime());
```

Output:

```
2022-10-07 06:00:00 PM
06:00:00 PM
```

Scoped GlideDateTime - getValue()

Returns the date and time value stored by the GlideDateTime object in the internal format, yyyy-MM-dd HH:mm:ss, in the UTC time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Date and time in the internal format and system time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Format: yyyy-MM-dd HH:mm:ss in the UTC time zone.

```
var gdt = new GlideDateTime("2014-08-31 08:00:00");
gs.info(gdt.getValue());
```

Output:

```
2014-08-31 08:00:00
```

Scoped GlideDateTime - getWeekOfYearLocalTime()

Gets the number of the week stored by the GlideDateTime object, expressed in the current user's time zone.

All weeks begin on Sunday. The first week of the year is the week that contains at least one day of the new year. The week beginning Sunday 2015-12-27 is considered the first week of 2016 as that week contains January 1 and 2.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of the current week. The highest week number in a year is either 52 or 53.

```
var gdt = new GlideDateTime("2011-12-01 12:00:00");//49th week,
 1st week in december
gs.info(gdt.getWeekOfYearLocalTime());
```

Output:

```
49
```

Scoped GlideDateTime - getWeekOfYearUTC()

Gets the number of the week stored by the GlideDateTime object, expressed in the UTC time zone.

All weeks begin on Sunday. The first week of the year is the week that contains at least one day of the new year. The week beginning Sunday 2015-12-27 is considered the first week of 2016 as that week contains January 1 and 2.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	The number of the current week in UTC time. The highest week number in a year is either 52 or 53.

```
var gdt = new GlideDateTime("2011-12-01 12:00:00");//49th week,
 1st week in December
gs.info(gdt.getWeekOfYearUTC());
```

Output:

```
49
```

Scoped GlideDateTime - getYearLocalTime()

Gets the year stored by the GlideDateTime object, expressed in the current user's time zone.

Parameters

Name	Type	Description
none		

Returns

Type	Description
Number	Four-digit year value in the user's time zone.

```
var gdt = new GlideDateTime("2011-11-02 12:00:00");
gs.info(gdt.getYearLocalTime());
```

Output:

```
2011
```

Scoped GlideDateTime - getYearUTC()

Gets the year stored by the GlideDateTime object, expressed in the UTC time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	4-digit year value in the UTC time zone.

```
var gdt = new GlideDateTime("2011-11-02 12:00:00");
gs.info(gdt.getYearUTC());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
2011
```

Scoped GlideDateTime - hasDate()

Determines if an object's date is set.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the object date is set; otherwise, returns false.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.info(gdt.hasDate());
```

Output:

```
true
```

Scoped GlideDateTime - isDST()

Determines if an object's time uses a daylight saving offset.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the time is daylight saving; otherwise, returns false.

```
var gdt = new GlideDateTime("2014-08-31 00:00:00");
gs.info(gdt.isDST()); //true
```

Output:

```
var gdt = new GlideDateTime("2014-08-31 00:00:00");
gs.info(gdt.isDST()); //true
```

Scoped GlideDateTime - isValid()

Determines if a value is a valid date and time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if value is valid; otherwise, returns false.

```
var gdt = new GlideDateTime("2011-aa-31 aa:00:00");
gs.info(gdt.isValid()); //true
gs.info(gdt.getErrorMsg()); //reason
```

Output:

```
false
Invalid date time: '2011-aa-31 aa:00:00', ignored
```

Scoped GlideDateTime - onOrAfter(GlideDateTime gdt)

Determines if the GlideDateTime object's data and time occurs on or after the specified GlideDateTime object's date and time.

Parameters

Name	Type	Description
gdt	GlideDateTime	Date and time to check against.

Returns

Type	Description
Boolean	Flag that indicates whether the GlideDateTime object's date and time is on or after the date and time specified by the parameter. Possible values: • true: GlideDateTime object date and time is on or after the specified object's date and time. • false: GlideDateTime object date and time is before the specified object's date and time.

```
var gdt1 = new GlideDateTime("2016-05-09 10:11:12");
var gdt2 = new GlideDateTime("2017-06-12 15:11:12");
gs.info(gdt1.onOrAfter(gdt2));
```

Output

```
false
```

Scoped GlideDateTime - onOrBefore(GlideDateTime gdt)

Determines if the GlideDateTime object's data and time occurs on or before the specified GlideDateTime object's date and time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
gdt	GlideDateTime	Date and time to check against.

Returns

Type	Description
Boolean	Flag that indicates whether the GlideDateTime object's date and time is on or before the date and time specified by the parameter. Possible values: • true: GlideDateTime object date and time is on or before the specified object's date and time. • false: GlideDateTime object date and time is after the specified object's date and time.

```
var gdt1 = new GlideDateTime("2016-05-09 10:11:12");
var gdt2 = new GlideDateTime("2017-06-12 15:11:12");
gs.info(gdt1.onOrBefore(gdt2));
```

Output

```
true
```

Scoped GlideDateTime - setDayOfMonthLocalTime(Number day)

Sets the day of the month to a specified value in the current user's time zone.

Parameters

Name	Type	Description
day	Number	The day of month to change to, from 1 to 31. If this value is greater than the maximum number of days in the month, the value is set to the last day of the month.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime();
gdt.setDayOfMonthLocalTime(9);
gs.info(gdt.getDayOfMonthLocalTime());
```

Output:

```
9
```

Scoped GlideDateTime - setDayOfMonthUTC(Number day)

Sets the day of the month to a specified value in the UTC time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
day	Number	The day of month to change to, from 1 to 31. If this value is greater than the maximum number of days in the month, the value is set to the last day of the month.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime();
gdt.setDayOfMonthUTC(9);
gs.info(gdt.getDayOfMonthUTC());
```

Output:

```
9
```

Scoped GlideDateTime - setDisplayValue(String asDisplayed)

Sets a date and time value using the current user's display format and time zone.

Parameters

Name	Type	Description
asDisplayed	String	The date and time in the current user's display format and time zone. The parameter must be formatted using the current user's preferred display format, such as MM-dd-yyyy HH:mm:ss. To assign the current date and time to a variable in a workflow script, use *variable* `.setDisplayValue(gs.nowDateTime);`.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2014-02-02 12:00:00");
gdt.setDisplayValue("2014-01-01 12:00:00");//uses current user
 session time zone (US/Pacific)
gs.info(gdt.getValue());
```

Output:

```
2014-01-01 20:00:00
```

Scoped GlideDateTime - setDisplayValue(String value, String format)

Sets a date and time value using the current user's time zone and the specified date and time format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method throws a runtime exception if the date and time format used in the *value* parameter does not match the *format* parameter. You can retrieve the error message by calling *getErrorMsg()* on the GlideDateTime object after the exception is caught.

Parameters

Name	Type	Description
value	String	Date and time in the current user's time zone.
format	String	Date and time format to use to parse the *value* parameter. Use the following values to describe the *value* parameter: • dd: Day of the month • MM: Month of the year • yyyy: Year • HH: Hour • mm: Minutes • ss: Seconds For example: "dd-MM-yyyy HH:mm:ss" or "MM-dd-yyyy HH:mm".

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-02-02 12:00:00");
gdt.setDisplayValue("20-5-2011 12:00:00", "dd-MM-yyyy
 HH:mm:ss"); //uses current user session time zone
gs.info(gdt.getValue());
```

Output

```
"20-05-2011 12:00:00"
```

Scoped GlideDateTime - setDisplayValueInternal(String value)

Sets a date and time value using the internal format (yyyy-MM-dd HH:mm:ss) and the current user's time zone.

Parameters

Name	Type	Description
value	String	The date and time in internal format.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gdt = new GlideDateTime("2014-02-02 12:00:00");
gdt.setDisplayValueInternal("2014-01-01 12:00:00"); //uses
 current user session time zone (US/Pacific)
gs.info(gdt.getValue());
```

Output:

```
2014-01-01 20:00:00
```

Scoped GlideDateTime - setDisplayValueLang(String dateTime, String style)

Sets a date and time using a specified style and format according to the current user's locale.

Parameters

Name	Type	Description
dateTime	String	Date and time value for the GlideDate object in the current user's time zone. Valid values are any date and time output from the *`getDisplayValueLang()`* function. For instance, using output from the *`getDisplayValueLang(String style, String language)`* example earlier in this topic, **November 28, 2022 07:03:41** or **28.11.2022 07:03:41** are accepted values.
style	String	Specifies the date format. Valid values: • *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022). • *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022). If any other value is passed the API will default to use *`medium`*. Accepted values are not case sensitive.

Returns

Type	Description
Void	

The following example returns the date and time in short and full styles.

```
var glideDateFR = new GlideDateTime();
glideDateFR.setDisplayValueLang("2/3/2023 17:27:56", "short");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info('date: ' + glideDateFR.getDisplayValue());
gs.info('date: ' + glideDateFR.getDisplayValueLang("full"));
```

Output:

```
date: 2023-02-03 17:27:56
date: Friday, February 3, 2023 17:27:56
```

Scoped GlideDateTime - setDisplayValueLang(String dateTime, String style, String language)

Sets a date and time using a specified style, language, and format according to the current user's locale.

Parameters

Name	Type	Description
dateTime	String	Date and time value for the GlideDate object in the current user's time zone. Valid values are any date and time output from the *`getDisplayValueLang()`* function. For instance, using output from the *`getDisplayValueLang(String style, String language)`* example earlier in this topic, **November 28, 2022 07:03:41** or **28.11.2022 07:03:41** are accepted values.
style	String	Specifies the date format. Valid values: • *full*: returns the date in the format of <weekday, month, day, and year> according to the user's locale (for example, Monday, October 24, 2022). • *long*: returns the date in the format of <month, day, and year> according to the user's locale (for example, October 24, 2022). • *medium*: similar to **long** but returns the date with an abbreviated month (for example, Oct 24, 2022). • *short*: returns the date in the format of MM/DD/YY or DD/MM/YY according to the user's locale (for example, 10/24/2022 or 24/10/2022). If any other value is passed the API will default to use *`medium`*. Accepted values are not case sensitive.
language	String	Sets the language using a language tag that conforms with the BCP-47 standard. For example, `fr` for French or `en-UK` for British English. For a full list of accepted values, see BCP 47 Language Code List.

Returns

Type	Description
Void	

The following example returns the date and time in short and full styles for English and French.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var glideDateFR = new GlideDateTime();

glideDateUS.setDisplayValueLang("2/3/2023 18:00:00", "short",
 "en-US" );
glideDateFR.setDisplayValueLang("2/3/2023 18:00:00", "short",
 "fr-FR" );

gs.info('en-US date: ' + glideDateUS.getDisplayValue());
gs.info('en-US date: ' +
 glideDateUS.getDisplayValueLang("full"));

gs.info('fr-FR date: ' + glideDateFR.getDisplayValue());
gs.info('fr-FR date: ' +
 glideDateFR.getDisplayValueLang("full"));
```

Output:

```
en-US date: 2023-02-03 18:00:00
en-US date: Friday, February 3, 2023 18:00:00
fr-FR date: 2023-03-02 18:00:00
fr-FR date: Thursday, March 2, 2023 18:00:00
```

Scoped GlideDateTime - setGlideDateTime(GlideDateTime g)

Sets the date and time of the current object using an existing GlideDateTime object. This method is equivalent to instantiating a new object with a GlideDateTime parameter.

Parameters

Name	Type	Description
g	GlideDateTime	The object to use for setting the datetime value.

Returns

Type	Description
None	

```
var dt1 = new GlideDateTime("2011-01-01 12:00:00");
var dt2 = new GlideDateTime("2011-02-02 08:00:00");
dt1.setGlideDateTime(dt2);
gs.info(dt1.getValue());
```

Output:

```
2011-02-02 08:00:00
```

Scoped GlideDateTime - setMonthLocalTime(Number month)

Sets the month stored by the GlideDateTime object to the specified value using the current user's time zone.

Parameters

Name	Type	Description
month	Number	The month to change to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime();
gdt.setMonthLocalTime(1);
gs.info(gdt.getMonthLocalTime());
```

Output:

```
1
```

Scoped GlideDateTime - setMonthUTC(Number month)

Sets the month stored by the GlideDateTime object to the specified value using the UTC time zone.

Parameters

Name	Type	Description
month	Number	The month to change to.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime();
gdt.setMonthUTC(1);
gs.info(gdt.getMonthUTC());
```

Output:

```
1
```

Scoped GlideDateTime - setValue(String o)

Sets the date and time of the GlideDateTime object.

Parameters

Name	Type	Description
o	String	The date and time to use. This parameter may be one of several types: • A string in the UTC time zone and the internal format of yyyy-MM-dd HH:mm:ss. Sets the value of the object to the specified date and time. Using the method this way is equivalent to instantiating a new GlideDateTime object using the *`GlideDateTime(String value)`* constructor. If the date and time format used does not match the internal format, the method attempts to set the date and time using other available formats. Resolving the date and time this way can lead to inaccurate data due to ambiguity in the day and month values. When using a non-standard date and time format, use *`setValueUTC(String dt, String format)`* instead.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• A GlideDateTime object. Sets the value of the object to the date and time stored by the GlideDateTime passed in the parameter. Using the method this way is equivalent to instantiating a new GlideDateTime object using the *`GlideDateTime(GlideDateTime g)`* constructor. • A JavaScript Number. Sets the value of the object using the Number value as milliseconds past January 1, 1970 00:00:00 UTC.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-01-01 12:00:00");
gdt.setValue("2011-02-02 08:00:00");  // value set =  2011-02-02
 08:00:00
gs.info(gdt.getValue());
```

Output:

```
2011-02-02 08:00:00
```

Scoped GlideDateTime - setValueUTC(String dt, String format)

Sets a date and time value using the UTC time zone and the specified date and time format. This method throws a runtime exception if the date and time format used in the *`dt`* parameter does not match the *`format`* parameter. You can retrieve the error message by calling `getErrorMsg()` on the GlideDateTime object after the exception is caught.

Parameters

Name	Type	Description
dt	String	The date and time to use.
format	String	The date and time format to use.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-01-01 12:00:00");
gdt.setValueUTC("15-02-2011 08:00:00", "dd-MM-yyyy HH:mm:ss");
gs.info(gdt.getValue());
```

Output:

```
2011-02-15 08:00:00
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideDateTime - setYearLocalTime(Number year)

Sets the year stored by the GlideDateTime object to the specified value using the current user's time zone.

Parameters

Name	Type	Description
year	Number	The year to change to.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime();
gdt.setYearLocalTime(2013);
gs.info(gdt.getYearLocalTime());
```

Output:

```
2013
```

Scoped GlideDateTime - setYearUTC(Number year)

Sets the year stored by the GlideDateTime object to the specified value using the UTC time zone.

Parameters

Name	Type	Description
year	Number	The year to change to.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime();
gdt.setYearUTC(2013);
gs.info(gdt.getYearUTC());
```

Output:

```
2013
```

Scoped GlideDateTime - subtract(GlideTime time)

Subtracts a specified amount of time from the current GlideDateTime object.

Parameters

Name	Type	Description
time	GlideTime	The time value to subtract.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
var gtime1 = new GlideTime();
gtime1.setValue("00:00:20");
gdt.subtract(gtime1);
var gtime2 = gdt.getTime();
gs.info(gtime2.getByFormat('hh:mm:ss'));
```

Output:

```
07:59:40
```

Scoped GlideDateTime - subtract(Number milliseconds)

Subtracts the specified number of milliseconds from the GlideDateTime object.

Parameters

Name	Type	Description
milliseconds	Number	Number of milliseconds to subtract.

Returns

Type	Description
None	

```
var gdt = new GlideDateTime("2011-12-07 08:00:00");
gdt.subtract(1000);
gs.info(gdt.getValue());
```

Output:

```
2011-12-07 07:59:59
```

Scoped GlideDateTime - subtract(GlideDateTime start, GlideDateTime end)

Returns the duration difference between two specified GlideDateTime objects.

Parameters

Name	Type	Description
Start	GlideDateTime	Start date object.
End	GlideDateTime	End date object.

Returns

Type	Description
GlideDuration	Duration difference between the two specified dates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gdt1 = new GlideDateTime("2011-08-28 09:00:00");
var gdt2 = new GlideDateTime("2011-08-31 08:00:00");

var dur = GlideDateTime.subtract(gdt1, gdt2); //the difference
 between gdt1 and gdt2
gs.info(dur.getDisplayValue());
```

Output:

```
2 Days 23 Hours
```

Scoped GlideDateTime - toString()

Gets the date and time value stored by the GlideDateTime object in the internal format, yyyy-MM-dd HH:mm:ss, and the system time zone, UTC by default. This method is equivalent to *getValue()*.

Parameters

Name	Type	Description
None		

Returns

Type	
String	The date and time stored by the GlideDateTime object in the system time zone and format.

```
var gdt = new GlideDateTime("2011-08-31 08:00:00");
gs.info(gdt.toString());
```

Output:

```
2011-08-31 08:00:00
```

GlideDBFunctionBuilder - Scoped, Global

The *GlideDBFunctionBuilder* API provides methods to build functions to perform SQL operations in the database.

These methods provide a way to build Relational Database Management System (RDBMS) functions to perform SQL operations on record data. You can use these methods in both scoped and global server scripts.

To use platform functions:

- Construct a function using the GlideDBFunctionBuilder constructor and associated methods.
- After building a function, you apply the function to the current record using the *addFunction()* method of the *GlideRecord* class.
- Add the function to a query using the *addQuery()* method of the *GlideRecord* class.
- Retrieve the results of the function using the existing *GlideRecord* API methods such as *getValue()* and *getElement()*.

For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var functionBuilder = new GlideDBFunctionBuilder();
var dbFunction = functionBuilder.position();
dbFunction = functionBuilder.constant('my'); // search_term:
 Text to search for in the specified table column.
dbFunction = functionBuilder.field('short_description');  //
 column: Name of the table column to search.
dbFunction = functionBuilder.build();

gs.log(dbFunction);

var gr_incident = new GlideRecord('incident'); // Table
 containing the column to search
gr_incident.addFunction(dbFunction);
gr_incident.addQuery("short_description", "CONTAINS", "my");
gr_incident.setLimit(20);
gr_incident.query();
while(gr_incident.next()) {
  gs.info(gr_incident.short_description + "\n position('my',
 short_description): " + gr_incident.getValue(dbFunction));
}
```

For additional information on Function fields, see Function field.

Scoped GlideDBFunctionBuilder - GlideDBFunctionBuilder()

Instantiates a GlideDBFunctionBuilder object.

Parameters

Name	Type	Description
None		

```
var builder = new GlideDBFunctionBuilder();
```

Scoped GlideDBFunctionBuilder - andFunc(expr1, expr2, ...)

Begins a new AND expression, which returns true only if all expressions provided to it as parameters are true. At least one boolean-valued expression must be provided as a parameter.

Parameters

Name	Type	Description
expression	Boolean-valued GlideFunction Expression	At present, glide functions that meet this criteria include `and()`, `or()`, and `compare()`.

Returns

Type	Description
String	The resultant GlideFunction expression.

The following example shows how to define and build a simple case statement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var expr = new GlideDBFunctionBuilder()
    .andFunc()

 .compare().field('first_name').constant('=').constant('John').e
ndfunc()

 .compare().field('active').constant('=').constant(1).endfunc()
    .endfunc()
    .build();
gs.info("Expression: " + expr);
```

Output:

```
Expression:
 glidefunction:and(compare(first_name,'=','John'),compare(active
,'=','1'))
```

Scoped GlideDBFunctionBuilder - add()

Adds the values of two or more integer fields.

Use the *`field(String field)`* method to define fields on which the operation is performed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var functionBuilder = new GlideDBFunctionBuilder();
var myAddingFunction = functionBuilder.add();
myAddingFunction = functionBuilder.field('order');
myAddingFunction = functionBuilder.field('priority');
myAddingFunction = functionBuilder.build();
```

Scoped GlideDBFunctionBuilder - build()

Builds the database function defined by the GlideDBFunctionBuilder object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var functionBuilder = new GlideDBFunctionBuilder();
var myAddingFunction = functionBuilder.add();
myAddingFunction = functionBuilder.field('order');
myAddingFunction = functionBuilder.field('priority');
myAddingFunction = functionBuilder.build();
gs.info(myAddingFunction);
```

Output:

```
*** Script: glidefunction:add(order,priority)
```

Scoped GlideDBFunctionBuilder - coalesce()

Takes any number of comma-separated fields as input and returns the first non-empty value.

Parameters

Name	Type	Description
argument	String	A list containing a constant value (strings, objects, booleans) or a field. Accepted format: `glidefunction:coalesce(<string, string, string, etc.>)`. An argument can have any number of parameters but must have at least one parameter defined.

Returns

Type	Description
String	The first value in the argument list that is non-null. If no values are non-null, null is returned. If no arguments are provided in the creation of the function object, "invalid function" is returned as a string.

The following example request demonstrates how to form the coalesce guide function to return null values according to closed_at, resolved_at, and sys_updated_on fields.

```
var gr = new GlideRecord('incident');
var func = "glidefunction:coalesce(closed_at,
 resolved_at,sys_updated_on)";
gr.addFunction(func);
gr.query();
while(gr.next())
gs.info(gr.getValue(func));
```

The script returns the first non-null value from a field out of this list: [closed_at, resolved_at, sys_updated_on] for each incident record in the incident table and outputs them with `gs.info`.

```
2016-12-14 02:46:44
2018-01-09 22:55:16
2018-01-07 22:54:55
2018-01-13 23:02:54
2018-01-09 23:12:02
```

Scoped GlideDBFunctionBuilder - compare(exp1, op, exp2)

Begins a new COMPARE expression which performs a comparison between two expressions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
exp1	String	Left comparison expression. Can be a constant, reference to a field, or another Glide function.
op	String	A comparison operator, surrounded with quotes. Accepted values: • "'='" • "'<'" • "'>'" • "'<='" • "'>='"
exp2	String	Right comparison expression. Can be a constant, reference to a field, or another Glide function.

Returns

Type	Description
String	The resultant GlideFunction expression.

The following example shows how to build a glidefunction expression using the compare() operation. After calling *`compare()`*, three additional calls must be made to specify each of the three required parameters, which is then completed by a single call to *`endfun()`*. Below, we create two separate *`compare()`* expressions and provide them as parameters to the *`or()`* expression.

```
var expr = new GlideDBFunctionBuilder()
    .orFunc()

 .compare().field('first_name').constant('=').constant('John').e
ndfunc()

 .compare().field('active').constant('=').constant(1).endfunc()
    .endfunc()
    .build();
```

Output:

```
Expression:
 glidefunction:or(compare(first_name,'=','John'),compare(active,
'=','1'))
```

Scoped GlideDBFunctionBuilder - concat()

Concatenates the values of two or more fields.

Use the *`field(String field)`* method to define fields on which the operation is performed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var functionBuilder = new GlideDBFunctionBuilder();
var myConcatFunction = functionBuilder.concat();
myConcatFunction = functionBuilder.field('short_description');
myConcatFunction = functionBuilder.field('caller_id.name');
myConcatFunction = functionBuilder.build();
```

Scoped GlideDBFunctionBuilder - constant(String constant)

Defines a constant value to use in the function. If used with the *dayofweek()* method, the string defines whether to use Sunday or Monday as the first day of the week.

Parameters

Name	Type	Description
constant	String	A constant value used in a function. When used with the *dayofweek()* method, the value defines whether the week starts on a Sunday or Monday. • **1**: Week begins on Sunday. • **2**: Week begins on Monday. This definition enables the *dayofweek()* method to return the correct day of the week from a given date. If a value other than 1 or 2 is provided, the *dayofweek()* method uses Sunday as the first day of the week.

Returns

Type	Description
void	

The following code example shows how to call this method.

```
var functionBuilder = new GlideDBFunctionBuilder();
var dbFunction = functionBuilder.position();
dbFunction = functionBuilder.constant('my');
dbFunction = functionBuilder.field('short_description');
dbFunction = functionBuilder.build();

gs.log(dbFunction);

var g = new GlideRecord('incident');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
g.addFunction(dbFunction);
g.addQuery("short_description", "CONTAINS", "my");
g.setLimit(20);
g.query();
while(g.next()) {
  gs.info(g.short_description + "\n position('my',
 short_description): " + g.getValue(dbFunction));
}
```

Scoped GlideDBFunctionBuilder - datediff()

Determines the duration using a given start date/time and end date/time.

Use the *field(String field)* method to define start and end date/time fields.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var functionBuilder = new GlideDBFunctionBuilder();
var myDateDiffFunction = functionBuilder.datediff();
myDateDiffFunction = functionBuilder.field('sys_updated_on');
myDateDiffFunction = functionBuilder.field('opened_at');
myDateDiffFunction = functionBuilder.build();
```

Scoped GlideDBFunctionBuilder - dayofweek()

Returns an integer representing the day of the week for a given date.

Use the *field(String field)* method to define the given date/time. Use the *constant(String constant)* method to define whether the week starts on a Sunday or Monday.

This method can be used with MySQL, Oracle, and Microsoft SQL Server databases only. If using an Oracle database, the NLS_TERRITORY setting must be set to a territory with Sunday as the first day of the week.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Integer	If the first day of the week is set to Sunday in the *constant(String constant)* method, return values are associated with the following days of the week:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• **1**: Sunday • **2**: Monday • **3**: Tuesday • **4**: Wednesday • **5**: Thursday • **6**: Friday • **7**: Saturday If the first day of the week is set to Monday: • **1**: Monday • **2**: Tuesday • **3**: Wednesday • **4**: Thursday • **5**: Friday • **6**: Saturday • **7**: Sunday If a value other than 1 or 2 is provided in the *`constant(String constant)`* method, the *`dayofweek()`* method uses Sunday as the first day of the week.

```
var functionBuilder = new GlideDBFunctionBuilder();
var dayOfWeekFunction = functionBuilder.dayofweek();
dayOfWeekFunction = functionBuilder.field('opened_at');
dayOfWeekFunction = functionBuilder.constant('2');
dayOfWeekFunction = functionBuilder.build();

var now_GR = new GlideRecord('incident');
now_GR.addFunction(dayOfWeekFunction);
now_GR.query();
while(now_GR.next())
gs.log(now_GR.getValue(dayOfWeekFunction));
```

Scoped GlideDBFunctionBuilder - divide()

Divides the value of one integer field by another.

Use the *`field(String field)`* method to define fields on which the operation is performed.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var functionBuilder = new GlideDBFunctionBuilder();
var myDivideFunction = functionBuilder.divide();
myDivideFunction = functionBuilder.field('order');
myDivideFunction = functionBuilder.field('priority');
myDivideFunction = functionBuilder.build();
```

Scoped GlideDBFunctionBuilder - field(String field)

Defines a field on which a SQL operation is performed.

Parameters

Name	Type	Description
field	String	The field on which you are performing the SQL operation.

Returns

Type	Description
void	

```
var functionBuilder = new GlideDBFunctionBuilder();
var myAddingFunction = functionBuilder.add();
myAddingFunction = functionBuilder.field('order');
myAddingFunction = functionBuilder.field('priority');
myAddingFunction = functionBuilder.build();
```

Scoped GlideDBFunctionBuilder - length()

Determines the number of code units in a field.

Use the *`field(String field)`* method to define fields on which the operation is performed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var functionBuilder = new GlideDBFunctionBuilder();
var myLengthFunction = functionBuilder.length();
myLengthFunction = functionBuilder.field('short_description');
myLengthFunction = functionBuilder.build();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideDBFunctionBuilder - multiply()

Multiplies the values of two integer fields.

Use the *field(String field)* method to define fields on which the operation is performed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var functionBuilder = new GlideDBFunctionBuilder();
var myMultiplyFunction = functionBuilder.multiply();
myMultiplyFunction = functionBuilder.field('order');
myMultiplyFunction = functionBuilder.field('priority');
myMultiplyFunction = functionBuilder.build();
```

Scoped GlideDBFunctionBuilder - orFunc(expression)

Begins a new OR expression which returns true if at least one of the expressions provided to it as a parameter is true.

At least one boolean-valued expression must be provided as a parameter.

Parameters

Name	Type	Description
expression	Boolean-valued GlideFunction Expression	At Present, glide functions that meet this criteria include and(), or(), and compare().

Returns

Type	Description
String	The resultant GlideFunction expression.

The following example shows how to build a glidefunction expression using the or() operation. The expression returns true if either the *first_name* field is 'John" or the *active* field is true. The resulting expression string may then be used wherever glidefunction expressions are accepted.

```
var expr = new GlideDBFunctionBuilder()
    .orFunc()

 .compare().field('first_name').constant('=').constant('John').e
ndfunc()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 .compare().field('active').constant('=').constant(1).endfunc()
    .endfunc()
    .build();
gs.info("Expression: " + expr);
```

Output:

```
Expression:
 glidefunction:or(compare(first_name,'=','John'),compare(active,
'=','1'))
```

Scoped GlideDBFunctionBuilder - position()

Returns the first occurrence of a specified string within a column of a table.

Optionally you can specify a location within the string to start the search. This method equates to the `LOCATE(substring, str, position)` in MySQL.

You can use this method to find interesting data points or custom reports by data analysts. Typically you will use this method for data warehousing or to extract, transform and load (ETL) data into less flexible systems.

To use this method in Dictionary records, use `glidefunction:position(<serarch_term>,<column>)`.

Note: The parameters specified in the following table are not passed with the method call, but rather are set in the GlideDBFunctionBuilder() object.

Parameters

Name	Type	Description
search_term	String	Text to search for in the specified table column.
column	String	Name of the table column to search. The table is specified in the associated GlideRecord object.
start_position	Number	Optional. Location in the column text to start the search. Default: 1

Returns

Type	Description
None	Position of the first occurrence of the specified search term. Returns 0 if the search term is not found in the associated text. Returns NULL if any required argument is NULL.

The following code example shows how to call this method.

```
var functionBuilder = new GlideDBFunctionBuilder();
var dbFunction = functionBuilder.position();
dbFunction = functionBuilder.constant('my'); // search_term:
 Text to search for in the specified table column.
dbFunction = functionBuilder.field('short_description');  //
 column: Name of the table column to search.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
dbFunction = functionBuilder.build();

gs.log(dbFunction);

var gr_incident = new GlideRecord('incident'); // Table
 containing the column to search
gr_incident.addFunction(dbFunction);
gr_incident.addQuery("short_description", "CONTAINS", "my");
gr_incident.setLimit(20);
gr_incident.query();
while(gr_incident.next()) {
  gs.info(gr_incident.short_description + "\n position('my',
 short_description): " + gr_incident.getValue(dbFunction));
}
```

Output:

```
*** Script: glidefunction:position('my',short_description)
*** Script: Wireless access is down in my area
 position('my', short_description): 28
*** Script: Printer in my office is out of toner
 position('my', short_description): 12
*** Script: Reset my password
 position('my', short_description): 7
*** Script: I can't launch my VPN client since the last software
 update
 position('my', short_description): 16
*** Script: Missing my home directory
 position('my', short_description): 9
*** Script: Seem to have an issue with my hard drive...
 position('my', short_description): 28
*** Script: Please remove the latest hotfix from my PC
 position('my', short_description): 38
*** Script: I can't get my weather report
 position('my', short_description): 13
*** Script: Reset my password
 position('my', short_description): 7
*** Script: my PDF docs are all locked from editing
 position('my', short_description): 1
*** Script: My desk phone does not work
 position('my', short_description): 1
*** Script: Can't log into SAP from my laptop today
 position('my', short_description): 25
*** Script: My computer is not detecting the headphone device
 position('my', short_description): 1
*** Script: My disk is still having issues. Can't delete a file
 position('my', short_description): 1
*** Script: The USB port on my PC stopped working
 position('my', short_description): 17
```

Scoped GlideDBFunctionBuilder - substring()

Returns a substring from a specified column of a table starting at a specified location.

Optionally you can also specify a location within the string where to stop the text extraction. This method equates to the LOCATE(`substring, str, position`) in MySQL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method works similar to that of JavaScript, just at the database level. You can use this method to find interesting data points or custom reports for data analysts. Typically you will use this method for data warehousing or to extract, transform and load (ETL) data into less flexible systems.

To use this method in Dictionary records, use `glidefunction:substring(<field>,<start_position>,<end_position>)`

Note: The parameters specified in the following table are not passed with the method call, but rather are set in the GlideDBFunctionBuilder() object.

Parameters

Name	Type	Description
field	String	Name of the column in the table from which to obtain the text. The table is specified in the associated GlideRecord object.
start_position	Number	Location in the column text to start extracting text.
end_position	Number	Optional. Location in the column text to stop extracting text. Default: End of text in the specified column.

Returns

Type	Description
String	Text extracted from the specified table column.

The following code example shows how to call this method.

```
var functionBuilder = new GlideDBFunctionBuilder();
var dbFunction = functionBuilder.substring();
dbFunction = functionBuilder.field('short_description');  //
 field: Column within the table to obtain the substring
dbFunction = functionBuilder.constant(0); // start_position:
 Location in the column text to start extracting text
dbFunction = functionBuilder.constant(20); // end_position:
 Location in the column text to stop extracting text.
dbFunction = functionBuilder.build();

gs.log(dbFunction);

var gr_incident = new GlideRecord('incident'); // Table
 containing the column from which to extract the text
gr_incident.addFunction(dbFunction);
gr_incident.addQuery("short_description", "CONTAINS", "my");
gr_incident.setLimit(20);
gr_incident.query();
while(gr_incident.next()) {
  gs.info(gr_incident.short_description +
 "\n substring(short_description, 0, 20): " +
 gr_incident.getValue(dbFunction));
}
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
*** Script: glidefunction:substring(short_description,'0','20')
*** Script: Wireless access is down in my area
 substring(short_description, 0, 20): Wireless access is
*** Script: Printer in my office is out of toner
 substring(short_description, 0, 20): Printer in my offic
*** Script: Reset my password

 substring(short_description, 0, 20): My disk is still ha
*** Script: The USB port on my PC stopped working
 substring(short_description, 0, 20): The USB port on my
```

Scoped GlideDBFunctionBuilder - subtract()

Subtracts the value of one integer field from another.

Use the *`field(String field)`* method to define fields on which the operation is performed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var functionBuilder = new GlideDBFunctionBuilder();
var mySubtractFunction = functionBuilder.subtract();
mySubtractFunction = functionBuilder.field('order');
mySubtractFunction = functionBuilder.field('priority');
mySubtractFunction = functionBuilder.build();
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideDBFunctionCaseBuilder - Global

The `GlideDBCaseStatementBuilder` API allows you to build SQL CASE statements and return values based on a series of conditions.

You can use this API as part of the definition of the GlideElement - Global API or when querying a table. To build a CASE statement, start by instantiating the GlideDBFunctionCaseBuilder object using its constructor, `GlideDBFunctionCaseBuilder()`. Then, define one or more cases using a series of `when()` and `then()` calls followed by a single, optional `otherwise()` call. Lastly, call the `build()` method to finalize the builder and produce the completed database function case statement. This statement can then be used directly or as part of other Glide function definitions.

Required roles: Admin, function_field_admin.

GlideDBFunctionCaseBuilder - GlideDBFunctionCaseBuilder()

Instantiates a GlideDBFunctionCaseBuilder object.

Parameters

Name	Type	Description
None		

This example instantiates a GlideDBFunctionCaseBuilder object.

```
var caseBuilder = new GlideDBFunctionCaseBuilder();
```

GlideDBFunctionCaseBuilder - build()

Concludes the list of conditions and builds the final CASE statement.

Parameters

Name	Type	Description
None		

Returns

Type	Description
string	The completed case statement.

The following example shows how to define and build a simple case statement. Depending on the numerical value of the impact field, it will output one of four different strings.

```
const caseStatement = new GlideDBFunctionCaseBuilder()
    .whenCompare("impact", "'='", "'1'").then("'CRITICAL'")
    .whenCompare("impact", "'='", "'2'").then("'URGENT'")
    .whenCompare("impact", "'='", "'3'").then("'IMPORTANT'")
    .otherwise("'NOT IMPORTANT'")
    .build();

const gr_incident = new GlideRecord("incident");
gr_incident.addFunction(caseStatement);
gr_incident.setLimit(10);
gr_incident.query();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
while(gr_incident.next())  {
    gs.info("impact: {0}  case: {1}",
            [gr_incident.impact,
 gr_incident.getValue(caseStatement)]);
}
```

Output:

```
*** Script: impact: 2  case: URGENT
*** Script: impact: 2  case: URGENT
*** Script: impact: 1  case: CRITICAL
*** Script: impact: 2  case: URGENT
*** Script: impact: 2  case: URGENT
*** Script: impact: 3  case: IMPORTANT
*** Script: impact: 1  case: CRITICAL
*** Script: impact: 1  case: CRITICAL
*** Script: impact: 3  case: IMPORTANT
*** Script: impact: 3  case: IMPORTANT
```

GlideDBFunctionCaseBuilder - otherwise(String exp)

Optional. Following at least one pair of calls to when and then, the otherwise() call allows you to specify a value to output if none of the when expressions are satisfied.

Parameters

Name	Type	Description
exp	String	Value to output. Can be a constant, a reference to a field, or another Glide function.

Returns

Type	Description
GlideDBFunctionCaseBuilder	The fluent builder object to continue building the statement.

The following example shows how to define and build a simple case statement.

```
const caseStatement = new GlideDBCaseFunctionBuilder()
    .whenEqual("impact", "'1'").then("'CRITICAL'")
    .whenEqual("impact", "'2'").then("category")
    .whenEqual("impact",
 "'3'").then("length(short_description)")
    .otherwise("'NOT IMPORTANT'")
    .build();

const gr_incident = new GlideRecord("incident");
gr_incident.addFunction(caseStatement);
gr_incident.setLimit(10);
gr_incident.query();
while(gr_incident.next())  {
      gs.info("impact: {0}  case: {1}",
              [gr_incident.impact,
 gr_incident.getValue(caseStatement)]);
}
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
*** Script: impact: 2  case: inquiry
*** Script: impact: 2  case: Hardware
*** Script: impact: 1  case:  CRITICAL
*** Script: impact: 2  case: database
*** Script: impact: 2  case: inquiry
*** Script: impact: 3  case: 28
*** Script: impact: 1  case: CRITICAL
*** Script: impact: 1  case: CRITICAL
*** Script: impact: 3  case: 17
*** Script: impact: 3  case: 29
```

GlideDBFunctionCaseBuilder - then(String exp)

Following any *when()* method, *then()* allows you to specify a value to output if the *when()* expression is satisfied.

Parameters

Name	Type	Description
exp	String	Value to output. Can be a constant, reference to a field, or another Glide function.

Returns

Type	Description
GlideDBFunctionCaseBuilder	The fluent builder object to continue building the statement.

The following example shows how to define and build a simple case statement. In this case, the *then()* expressions show how you can output not only strings, but also the results of other glide functions such as the `length(short_description)`.

```
const caseStatement = new GlideDBCaseFunctionBuilder()
    .whenEqual("impact", "'1'").then("'CRITICAL'")
    .whenEqual("impact", "'2'").then("category")
    .whenEqual("impact",
 "'3'").then("length(short_description)")
    .otherwise("'NOT IMPORTANT'")
    .build();

const gr_incident = new GlideRecord("incident");
gr_incident.addFunction(caseStatement);
gr_incident.setLimit(10);
gr_incident.query();
while(gr_incident.next())  {
      gs.info("impact: {0}  case: {1}",
               [gr_incident.impact,
 gr_incident.getValue(caseStatement)]);
}
```

Output:

```
*** Script: impact: 2  case: inquiry
*** Script: impact: 2  case: Hardware
*** Script: impact: 1  case:  CRITICAL
*** Script: impact: 2  case: database
*** Script: impact: 2  case: inquiry
```

```
*** Script: impact: 3  case: 28
*** Script: impact: 1  case: CRITICAL
*** Script: impact: 1  case: CRITICAL
*** Script: impact: 3  case: 17
*** Script: impact: 3  case: 29
```

GlideDBFunctionCaseBuilder - when(String func)

The most versatile of the supported 'when' expressions, the *when()* method allows you to supply any boolean-valued Glide function as the condition to satisfy.

Parameters

Name	Type	Description
func	String	A Glide function that results in a boolean-valued result when evaluated. Possible values: • glidefunction:compare • glidefunction:and • glidefunction:or

Returns

Type	Description
glideDBFunctionCaseBuilder	The object to continue building the statement.

The following example shows how to define and build a simple case statement. In this case, the *when()* method is used to specify more complex comparison expressions. If the expression evaluates to true, the corresponding string is returned.

```
const caseStatement = new GlideDBFunctionCaseBuilder()
    // if impact == 1 AND category == 'Software' then output
 "CRITICAL SOFTWARE"
    .when("and(compare(impact, '=', '1'), compare(category, '=',
'Software')")
        .then("'CRITICAL SOFTWARE'")
    // if impact == 1 then output "CRITICAL OTHER"
    .when("compare(impact, '=', '1')")
        .then("'CRITICAL OTHER'")
    // if impact == 2 OR category == 'Software' then output
 "URGENT"
    .when("or(compare(impact, '=', '2'), compare(category, '=',
 'Software')")
        .then("'URGENT'")
    // If none of the above expressions are true, output "NOT
 IMPORTANT"
    .otherwise("'NOT IMPORTANT'")
    .build();

const gr_incident = new GlideRecord("incident");
gr_incident.addFunction(caseStatement);
gr_incident.setLimit(20);
gr_incident.query();
while(gr_incident.next())  {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      gs.info("impact: {0}  category: {1}  case: {2}",
            [gr_incident.impact, gr_incident.category,
 gr_incident.getValue(caseStatement)]);
}
```

Output:

```
impact: 2  category: inquiry  case: URGENT
impact: 2  category: Hardware  case: URGENT
impact: 1  category: inquiry  case:  CRITICAL OTHER
impact: 2  category: database  case: URGENT
impact: 2  category: inquiry  case: URGENT
impact: 3  category: software  case: URGENT
impact: 1  category: inquiry  case: CRITICAL OTHER
impact: 1  category: inquiry  case: CRITICAL OTHER
impact: 3  category: inquiry  case: NOT IMPORTANT
impact: 3  category: inquiry  case: NOT IMPORTANT
impact: 3  category: hardware  case: NOT IMPORTANT
impact: 3  category: inquiry  case: NOT IMPORTANT
impact: 3  category: hardware  case: NOT IMPORTANT
impact: 3  category: inquiry  case: NOT IMPORTANT
impact: 1  category: inquiry  case: CRITICAL OTHER
impact: 1  category: software  case: CRITICAL SOFTWARE
impact: 3  category: inquiry  case: NOT IMPORTANT
impact: 3  category: inquiry  case: NOT IMPORTANT
impact: 2  category: software  case: URGENT
impact: 1  category: software  case: CRITICAL SOFTWARE
```

GlideDBFunctionCaseBuilder - whenCompare(String exp1, String op, String exp2)

Begins a comparison case condition.

Parameters

Name	Type	Description
exp1	String	Left comparison expression. Can be a constant, reference to a field, or another Glide function.
op	String	Comparison operator, surrounded with quotes. Valid values: • "'='" • "'<'" • "'>'" • "'<='" • "'>='"
exp2	String	Right comparison expression. Can be a constant, reference to a field, or another Glide function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideDBFunctionCaseBuilder	The function builder object to continue building the statement.

The following example shows how to define and build a simple case statement. In this case, the *whenCompare()* method is used to compare the value of the impact field to a number and output a specified string if they match.

```
const caseStatement = new GlideDBFunctionCaseBuilder()
    .whenCompare("impact", "'='", "'1'").then("'CRITICAL'")
    .whenCompare("impact", "'='", "'2'").then("URGENT")
    .whenCompare("impact", "'='", "'3'").then("IMPORTANT")
    .otherwise("'NOT IMPORTANT'")
    .build();

const gr_incident = new GlideRecord("incident");
gr_incident.addFunction(caseStatement);
gr_incident.setLimit(10);
gr_incident.query();
while(gr_incident.next()) {
    gs.info("impact: {0} case: {1}",
            [gr_incident.impact,
 gr_incident.getValue(caseStatement)]);
}
```

Output:

```
*** Script: impact: 2  case: URGENT
*** Script: impact: 2  case: URGENT
*** Script: impact: 1  case: CRITICAL
*** Script: impact: 2  case: URGENT
*** Script: impact: 2  case: URGENT
*** Script: impact: 3  case: IMPORTANT
*** Script: impact: 1  case: CRITICAL
*** Script: impact: 1  case: CRITICAL
*** Script: impact: 3  case: IMPORTANT
*** Script: impact: 3  case: IMPORTANT
```

GlideDBFunctionCaseBuilder - whenEqual(String exp1, String exp2)

Similar to *whenCompare()*, *whenEqual()* is a convenient method for checking equality. It is equivalent to *whenCompare(leftExpression, '=', rightExpression)*.

Parameters

Name	Type	Description
exp1	String	Left comparison expression. Can be a constant, a reference to a field, or another Glide function.
exp2	String	Right comparison expression. Can be a constant, a reference to a field, or another Glide function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideDBFunctionCaseBuilder	The function builder object to continue building the statement.

The following example shows how to define and build a simple case statement. In this case, the *whenEqual()* method is used to compare the value of the impact field to a number and output a specified string if they match.

```
const caseStatement = new GlideDBFunctionCaseBuilder()
    .whenEqual("impact", "'1'").then("'CRITICAL'")
    .whenEqual("impact", "'2'").then("'URGENT'")
    .whenEqual("impact", "'3'").then("'IMPORTANT'")
    .otherwise("'NOT IMPORTANT'")
    .build();

const gr_incident = new GlideRecord("incident");
gr_incident.addFunction(caseStatement);
gr_incident.setLimit(10);
gr_incident.query();
while(gr_incident.next())  {
    gs.info("impact: {0}  case: {1}",
            [gr_incident.impact,
 gr_incident.getValue(caseStatement)]);
}
```

Output:

```
*** Script: impact: 2  case: URGENT
*** Script: impact: 2  case: URGENT
*** Script: impact: 1  case: CRITICAL
*** Script: impact: 2  case: URGENT
*** Script: impact: 2  case: URGENT
*** Script: impact: 3  case: IMPORTANT
*** Script: impact: 1  case: CRITICAL
*** Script: impact: 1  case: CRITICAL
*** Script: impact: 3  case: IMPORTANT
*** Script: impact: 3  case: IMPORTANT
```

GlideDigest - Scoped

The scoped *GlideDigest* class provides methods for creating a message digest from strings or input streams using MD5, SHA1, or SHA256 hash algorithms.

GlideDigest - GlideDigest()

Creates an instance of scoped GlideDigest.

Parameters

Name	Type	Description
None		

GlideDigest - getMD5Base64(String source)

Creates a message digest from a string using the MD5 algorithm. The output string is in Base64.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
source	String	The source string.

Returns

Type	Description
String	The message digest.

```
var inputString = "Her molasses flowed slowly down the hill.";
var digest = new GlideDigest();
gs.info(digest.getMD5Base64(inputString));
```

GlideDigest - getMD5Base64FromInputStream(GlideScriptableInputStream inputStream)

Creates a message digest from an input stream using the MD5 algorithm. The output string is in Base64.

Parameters

Name	Type	Description
inputStream	GlideScriptableInputStream	The source input stream.

Returns

Type	Description
String	The message digest.

```
var inputStream = new
 GlideSysAttachment().getContentStream(attachmentSysID);
var digest = new GlideDigest();
gs.info(digest.getMD5Base64FromInputStream(inputStream));
```

GlideDigest - getMD5Hex(String source)

Creates a message digest from a string using the MD5 algorithm. The output string is in hexadecimal.

Parameters

Name	Type	Description
source	String	The source string.

Returns

Type	Description
String	The message digest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var inputString = "Her molasses flowed slowly down the hill.";
var digest = new GlideDigest();
gs.info(digest.getMD5Hex(inputString));
```

GlideDigest - getMD5HexFromInputStream(GlideScriptableInputStream inputStream)

Creates a message digest from an input stream using the MD5 algorithm. The output string is in hexadecimal.

Parameters

Name	Type	Description
inputStream	GlideScriptableInputStream	The source input stream.

Returns

Type	Description
String	The message digest.

```
var inputStream = new
 GlideSysAttachment().getContentStream(attachmentSysID);
var digest = new GlideDigest();
gs.info(digest.getMD5HexFromInputStream(inputStream));
```

GlideDigest - getSHA1Base64(String source)

Creates a message digest from a string using the SHA1 algorithm. The output string is in Base64.

Parameters

Name	Type	Description
source	String	The source string.

Returns

Type	Description
String	The message digest.

```
var inputString = "Her molasses flowed slowly down the hill.";
var digest = new GlideDigest();
gs.info(digest.getSHA1Base64(inputString));
```

GlideDigest - getSHA1Base64FromInputStream(GlideScriptableInputStream inputStream)

Creates a message digest from an input stream using the SHA1 algorithm. The output string is in Base64.

Parameters

Name	Type	Description
inputStream	GlideScriptableInputStream	The source input stream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The message digest.

```
var inputStream = new
 GlideSysAttachment().getContentStream(attachmentSysID);
var digest = new GlideDigest();
gs.info(digest.getSHA1Base64FromInputStream(inputStream));
```

GlideDigest - getSHA1Hex(String source)

Creates a message digest from a string using the SHA1 algorithm. The output string is in hexadecimal.

Parameters

Name	Type	Description
source	String	The source string.

Returns

Type	Description
String	The message digest.

```
var inputString = "Her molasses flowed slowly down the hill.";
var digest = new GlideDigest();
gs.info(digest.getSHA1Hex(inputString));
```

GlideDigest - getSHA1HexFromInputStream(GlideScriptableInputStream inputStream)

Creates a message digest from an input stream using the SHA1 algorithm. The output string is in hexadecimal.

Parameters

Name	Type	Description
inputStream	GlideScriptableInputStream	The source input stream.

Returns

Type	Description
String	The message digest.

```
var inputStream = new
 GlideSysAttachment().getContentStream(attachmentSysID);
var digest = new GlideDigest();
gs.info(digest.getSHA1HexFromInputStream(inputStream));
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideDigest - getSHA256Base64(String source)

Creates a message digest from a string using the SHA256 algorithm. The output string is in Base64.

Parameters

Name	Type	Description
source	String	The source string.

Returns

Type	Description
String	The message digest.

```
var inputString = "Her molasses flowed slowly down the hill.";
var digest = new GlideDigest();
gs.info(digest.getSHA256Base64(inputString));
```

GlideDigest - getSHA256Base64FromInputStream(GlideScriptableInputStream inputStream)

Creates a message digest from an input stream using the SHA256 algorithm. The output string is in Base64.

Parameters

Name	Type	Description
inputStream	GlideScriptableInputStream	The source input stream.

Returns

Type	Description
String	The message digest.

```
var inputStream = new
 GlideSysAttachment().getContentStream(attachmentSysID);
var digest = new GlideDigest();
gs.info(digest.getSHA256Base64FromInputStream(inputStream));
```

GlideDigest - getSHA256Hex(String source)

Creates a message digest from a string using the SHA256 algorithm. The output string is in hexadecimal.

Parameters

Name	Type	Description
source	String	The source string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The message digest.

```
var inputString = "Her molasses flowed slowly down the hill.";
var digest = new GlideDigest();
gs.info(digest.getSHA256Hex(inputString));
```

GlideDigest - getSHA256HexFromInputStream(GlideScriptableInputStream inputStream)

Creates a message digest from an input stream using the SHA256 algorithm. The output string is in hexadecimal.

Parameters

Name	Type	Description
inputStream	GlideScriptableInputStream	The source input stream.

Returns

Type	Description
String	The message digest.

```
var inputStream = new
 GlideSysAttachment().getContentStream(attachmentSysID);
var digest = new GlideDigest();
gs.info(digest.getSHA256HexFromInputStream(inputStream));
```

GlideDuration - Scoped

The *GlideDuration* class provides methods for working with spans of time known as durations.

GlideDuration objects store the duration as the number of days and time from January 1, 1970, 00:00:00. As a result, the *setValue()* and *getValue()* methods use the scoped GlideDateTime object for parameters and return values.

GlideDuration - GlideDuration()

Instantiates a GlideDuration object.

Parameters

Name	Type	Description
None		

GlideDuration - GlideDuration(GlideDuration another)

Instantiates a GlideDuration object by cloning the values of the passed in GlideDuration object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
another	GlideDuration	GlideDuration object.

```
var duration = new GlideDuration('3 12:00:00');
var duration2 = new GlideDuration(duration);
gs.info(duration2.getDisplayValue());
```

Output:

```
3 Days 12 Hours
```

GlideDuration - GlideDuration(Number milliseconds)

Instantiates a GlideDuration object with the specified duration in milliseconds.

Parameters

Name	Type	Description
milliseconds	Number	Duration value. Unit: Milliseconds

```
var dur = new GlideDuration(60000);
gs.info(dur.getDurationValue());
```

Output:

```
00:01:00
```

GlideDuration - GlideDuration(String displayValue)

Instantiates a GlideDuration object with the specified duration display value.

Parameters

Name	Type	Description
displayValue	String	Duration value. Format: d HH:mm:ss where "d" is number of days.

```
var duration = new GlideDuration('3 12:00:00');
var duration2 = new GlideDuration('3:00:00');
var answer = duration.add(duration2);
gs.info(answer.getDisplayValue());
```

Output:

```
3 Days 15 Hours
```

GlideDuration - add(GlideDuration duration)

Adds the duration of the specified GlideDuration object to the current GlideDuration object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
duration	GlideDuration	GlideDuration object that contains the duration value to add to the current GlideDuration object.

Returns

Type	Description
GlideDuration	New GlideDuration object whose duration is the sum of the durations of the two GlideDuration objects.

```
var duration = new GlideDuration('3 12:00:00');
var duration2 = new GlideDuration('3:00:00');
var answer = duration.add(duration2);
gs.info(answer.getDisplayValue());
```

Output:

```
3 Days 15 Hours
```

GlideDuration - getByFormat(String format)

Returns the duration value in the specified format.

Parameters

Name	Type	Description
format	String	Duration format. Format: Global date and time field format

Returns

Type	Description
String	Current duration in the specified format.

```
var dur = new GlideDuration('3 22:00:00');
gs.info(dur.getByFormat('HH:mm'));
```

Output

```
22:00
```

GlideDuration - getDayPart()

Returns the number of days.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Number of days in the duration.

```
var dur = new GlideDuration('3 12:00:00');
gs.info(dur.getDayPart());
```

Output:

```
3
```

Scoped GlideDuration - getDisplayValue()

Returns the display value of the duration in number of days, hours, and minutes.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Number of days, hours, and minutes, such as 2 Days 10 Hours 36 Minutes. Format: Display value: "n" Days "n" Hours "n" Minutes

```
var dur = new GlideDuration('3 12:00:00');
gs.info(dur.getDisplayValue());
```

Output:

```
3 Days 12 Hours
```

GlideDuration - getDurationValue()

Returns the duration value in "d HH:mm:ss" format.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Duration value. Format: d HH:mm:ss where "d" is number of days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var dur = new GlideDuration(60000);
gs.info(dur.getDurationValue());
```

Output:

```
00:01:00
```

GlideDuration - getRoundedDayPart()

Returns the rounded number of days. If the time part is more than 12 hours, the return value is rounded up. Otherwise, it is rounded down.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Day value of the display value rounded.

```
var dur = new GlideDuration('3 14:00:00');
gs.info(dur.getRoundedDayPart());
```

Output:

```
4
```

GlideDuration - getValue()

Returns the internal date/time value of the current GlideDuration object.

GlideDuration objects store the duration as a date and time from January 1, 1970, 00:00:00.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Current duration within the GlideDuration object. Format: YYYY-MM-DD HH:mm:ss

```
var dur = new GlideDuration('3 12:00:00');
gs.info(dur.getValue());
```

Output:

```
1970-01-04 12:00:00
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideDuration - setDisplayValue(String asDisplayed)

Sets the duration display value.

Parameters

Name	Type	Description
asDisplayed	String	Display duration value to set. Format: d HH:mm:ss where "d" is number of days

Returns

Type	Description
None	

```
var dur = new GlideDuration();
dur.setDisplayValue('3 08:00:00');
gs.info(dur.getDisplayValue());
```

Output:

```
3 Days 8 Hours
```

GlideDuration - setValue(Object o)

Sets the internal date/time value of the GlideDuration object.

The method sets the duration value to the difference of the passed in date/time the base date/time value of January 1, 1970, 00:00:00. The passed in date/time object (string) is parsed into a GlideDateTime object.

Parameters

Name	Type	Description
o	Object	Date and time to use as the endpoint for the calculated duration time. Format: YYYY-MM-DD HH:mm:ss

Returns

Type	Description
None	

```
var dur = new GlideDuration();
dur.setValue('1970-01-05 08:00:00'); // sets internal DateTime
 value. The String is parsed into a GlideDateTime object.
gs.info(dur.getDisplayValue());
```

Output:

```
4 Days 8 Hours
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideDuration - subtract(GlideDuration duration)

Subtracts the duration of the specified GlideDuration object to the current GlideDuration object.

Parameters

Name	Type	Description
duration	GlideDuration	GlideDuration object that contains the duration value to subtract from the current GlideDuration object.

Returns

Type	Description
GlideDuration	New GlideDuration object whose duration contains the result of the subtraction of the duration of the two GlideDuration objects.

```
var duration = new GlideDuration('3 12:00:00');
var duration2 = new GlideDuration('3:00:00');
var answer = duration.subtract(duration2);
gs.info(answer.getDisplayValue());
```

Output:

```
3 Days 9 Hours
```

GlideDynamicAttributeStore - Global

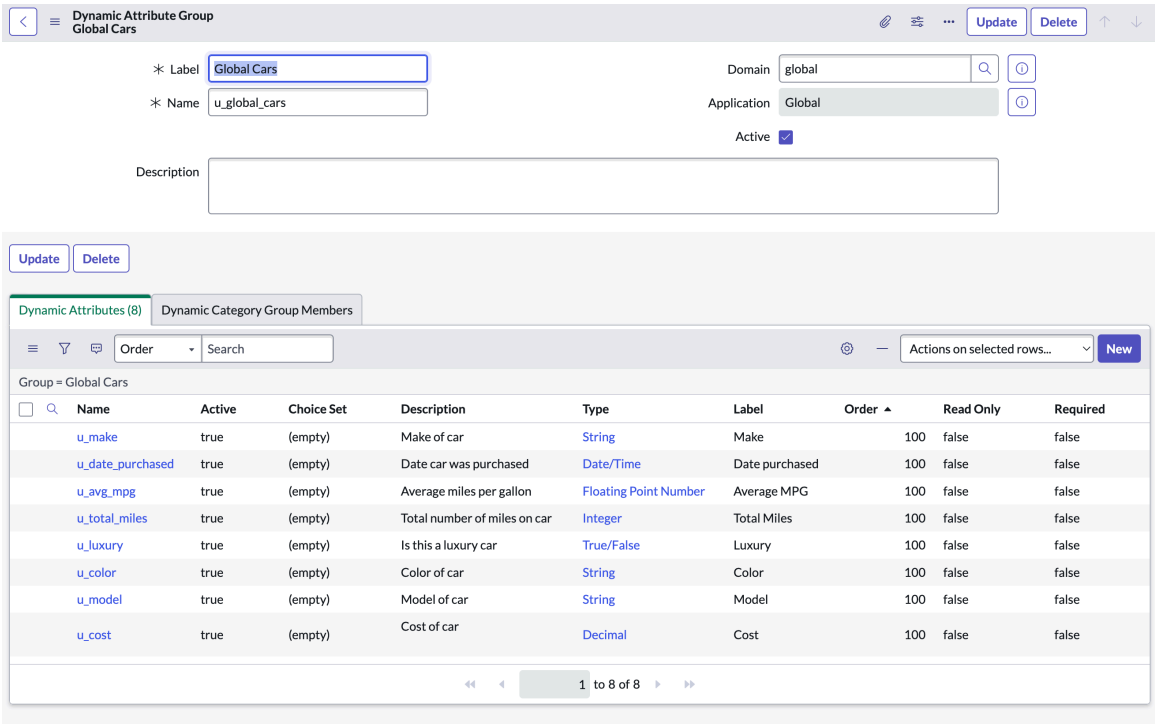
The *GlideDynamicAttributeStore* API provides access to a new built-in dynamic attribute store data type, similar to other data types such as string, date, or date/time.

This API provides methods that enable you to get and set dynamic schema attributes within a GlideDynamicAttribute object. These dynamic attributes enable each row in a table to contain different fields. The fields on which this data type is applied are shown as `dynamic_attribute_store` within the column data type description of the table. For more details on dynamic attributes, see Dynamic schema.

To use this API to create dynamic attributes you must have the dynamic_schema_writer role. To read dynamic data using this API you must have the dynamic_schema_reader role.

The following screenshot shows the dynamic attribute group and associated dynamic attributes that are used in the code examples for this API. The defined attributes provide an example of each of the data types that the dynamic schema implementation supports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



There are methods in this API that have the same functionality as dynamic schema methods in the GlideRecord API. Use this API if you want to set the same group of dynamic attributes on multiple records. Using this API, you can stage a GlideDynamicAttributeStore object with the desired attributes and then copy that object to multiple GlideRecords using the various *`setDynamicAttributeValues()`* methods. Using similar dynamic schema methods in the *`GlideRecord`* API performs the actions on a specified GlideRecord.

GlideDynamicAttributeStore - clear()

Clears all attributes and their values from the GlideDynamicAttributeStore object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this method.

```
var das = new GlideDynamicAttributeStore();
das.setDynamicAttributeValue("cars->color","blue");
das.setDynamicAttributeValue("cars->make","Toyota");
das.setDynamicAttributeValue("cars->model","CRV");
das.setDynamicAttributeValue("cars->luxury",true);
das.setDynamicAttributeValue("cars->cost",12000.5);
das.setDynamicAttributeValue("cars->avg_mpg",24.5234);
das.setDynamicAttributeValue("cars->total_miles",5324);
das.setDynamicAttributeValue("cars->date_purchased",new
 GlideDateTime());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info('das: ' + das.getDisplayValue());
das.clear();
gs.info('das: ' + das.getDisplayValue());
```

Output:

```
*** Script: das: {
  "cars" : {
    "avg_mpg" : "24.5234",
    "color" : "blue",
    "cost" : "12000.5",
    "date_purchased" : "2024-04-19 08:29:52",
    "luxury" : "true",
    "make" : "Toyota",
    "model" : "CRV",
    "total_miles" : "5324"
  }
}
*** Script: das: null
```

GlideDynamicAttributeStore - getDisplayValue()

Returns the JSON map representation of the values stored in the current GlideDynamicAttributeStore object.

This method returns:

- Boolean values as "true" and "false" instead of 1 and 0.
- Date/time values in the user's locale instead of UTC.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Human-readable JSON map of the values stored in the GlideDynamicAttributeStore object. The contents of this string depends on your dynamic schema definition.

The following code example shows how to call this method.

```
var das = new GlideDynamicAttributeStore();
das.setDynamicAttributeValue("cars->color","blue");
das.setDynamicAttributeValue("cars->make","Toyota");
das.setDynamicAttributeValue("cars->model","CRV");
das.setDynamicAttributeValue("cars->luxury",true);
das.setDynamicAttributeValue("cars->cost",12000.5);
das.setDynamicAttributeValue("cars->avg_mpg", 24.5234);
das.setDynamicAttributeValue("cars->total_miles", 5324);
das.setDynamicAttributeValue("cars->date_purchased",new
 GlideDateTime());
gs.info('Value returned by getValue(): ' + das.getValue());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info('Value returned by getDisplayValue(): ' +
 das.getDisplayValue());
```

Output:

```
*** Script: Value returned by getValue():
 {"cars":{"total_miles":5324,"color":"blue","model":"CRV","cost"
:12000.5,"luxury":1,"avg_mpg":24.5234,"make":"Toyota","date_purc
hased":"2024-04-19 15:33:23"}}
*** Script: Value returned by getDisplayValue(): {
  "cars" : {
    "avg_mpg" : "24.5234",
    "color" : "blue",
    "cost" : "12000.5",
    "date_purchased" : "2024-04-19 08:33:23",
    "luxury" : "true",
    "make" : "Toyota",
    "model" : "CRV",
    "total_miles" : "5324"
  }
}
```

GlideDynamicAttributeStore - getDynamicAttributeValue(String groupAttrPath)

Returns the value of the specified attribute within the dynamic attribute store element.

Parameters

Name	Type	Description
groupAttrPath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`

Returns

Type	Description
Object	Value of the dynamic schema attribute referenced by the passed group/attribute path. If the *attributePath* parameter contains invalid information, returns a null.

The following code example shows how to call this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var das = new GlideDynamicAttributeStore();
das.setDynamicAttributeValue("cars->color","blue");
das.setDynamicAttributeValue("cars->make","Toyota");
das.setDynamicAttributeValue("cars->model","CRV");
das.setDynamicAttributeValue("cars->luxury",true);
das.setDynamicAttributeValue("cars->cost",12000.5);
das.setDynamicAttributeValue("cars->avg_mpg", 24.5234);
das.setDynamicAttributeValue("cars->total_miles", 5324);
das.setDynamicAttributeValue("cars->date_purchased",new
 GlideDateTime());
gs.info('Value returned by getDynamicAttributeValue(): ' +
 das.getDynamicAttributeValue("cars->color"));
gs.info('Value returned by getDynamicAttributeValue(): ' +
 das.getDynamicAttributeValue("cars->luxury"));
```

Output:

```
*** Script: Value returned by getDynamicAttributeValue(): blue
*** Script: Value returned by getDynamicAttributeValue(): 1
```

GlideDynamicAttributeStore - getValue()

Returns the compact string representation of the contents of the current GlideDynamicAttributeStore object.

This method returns:

- Boolean values as 1 and 0 instead of "true" and "false".
- Date/time values in UTC instead of the user's locale.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Compact string representation of the values stored in the GlideDynamicAttributeStore object. The contents of this string depends on your dynamic schema definition.

The following code example shows how to call this method.

```
var das = new GlideDynamicAttributeStore();
das.setDynamicAttributeValue("cars->color","blue");
das.setDynamicAttributeValue("cars->make","Toyota");
das.setDynamicAttributeValue("cars->model","CRV");
das.setDynamicAttributeValue("cars->luxury",true);
das.setDynamicAttributeValue("cars->cost",12000.5);
das.setDynamicAttributeValue("cars->avg_mpg", 24.5234);
das.setDynamicAttributeValue("cars->total_miles", 5324);
das.setDynamicAttributeValue("cars->date_purchased",new
 GlideDateTime());
gs.info('Value returned by getValue(): ' + das.getValue());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info('Value returned by getDisplayValue(): ' +
 das.getDisplayValue());
```

Output:

```
*** Script: Value returned by getValue():
 {"cars":{"total_miles":5324,"color":"blue","model":"CRV","cost"
:12000.5,"luxury":1,"avg_mpg":24.5234,"make":"Toyota","date_purc
hased":"2024-04-19 15:33:23"}}
*** Script: Value returned by getDisplayValue(): {
  "cars" : {
    "avg_mpg" : "24.5234",
    "color" : "blue",
    "cost" : "12000.5",
    "date_purchased" : "2024-04-19 08:33:23",
    "luxury" : "true",
    "make" : "Toyota",
    "model" : "CRV",
    "total_miles" : "5324"
  }
}
```

GlideDynamicAttributeStore - setDisplayValue(Object value)

Clears the current GlideDynamicAttributeStore object and then stores the passed JSON map in the GlideDynamicAttributeStore object.

This method is functionally the same as GlideDynamicAttributeStore - setValue(Object value), except that it assumes that all date values are provided in the user's locale.

Parameters

Name	Type	Description
value	Object	Value to set in the current dynamic attribute store object. The passed value must be of one of the following data types: • Boolean (True/False) • Decimal • Floating Point Number • GlideDate • GlideDateTime • Integer • String

Returns

Type	Description
None	

The following example shows how to call this method.

```
var das = new GlideDynamicAttributeStore();
das.setDynamicAttributeValue("cars->color","blue");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
das.setDynamicAttributeValue("cars->make","Toyota");
das.setDynamicAttributeValue("cars->model","CRV");
das.setDynamicAttributeValue("cars->luxury",true);
das.setDynamicAttributeValue("cars->cost",12000.5);
das.setDynamicAttributeValue("cars->avg_mpg", 24.5234);
das.setDynamicAttributeValue("cars->total_miles", 5324);
das.setDynamicAttributeValue("cars->date_purchased",new
 GlideDateTime());
gs.info('das: ' + das.getDisplayValue());
das.setDisplayValue('{"cars":{"luxury":false}}');
gs.info('das: ' + das.getDisplayValue());
```

Output:

```
*** Script: das: {
  "cars" : {
    "avg_mpg" : "24.5",
    "color" : "blue",
    "cost" : "12000.0",
    "date_purchased" : "2024-04-19 14:16:49",
    "luxury" : "true",
    "make" : "Toyota",
    "model" : "CRV",
    "total_miles" : "5324.0"
  }
}
*** Script: das: {
  "cars" : {
    "luxury" : "false"
  }
}
```

GlideDynamicAttributeStore - setDynamicAttributeDisplayValue(String groupAttrPath, Object value)

Sets the value of the dynamic attribute located at a specified path within a dynamic attribute store element.

This method works the same as the GlideDynamicAttributeStore - setDynamicAttributeValue(String groupAttrPath, Object value) method except in its handling of Boolean and date/time values. This method assumes that all date/time values are provided in the user's locale.

Parameters

Name	Type	Description
groupAttrPath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`
value	Object	Value to set in the specified attribute. **Note:** For dynamic attributes, only the following data types are supported: • Boolean (True/False) • Decimal • Floating Point Number • GlideDate • GlideDateTime • Integer • String

Returns

Type	Description
Object	Updated GlideDynamicAttributeStore object. If the *groupAttrPath* parameter isn't valid, the method throws an `IllegalArgumentException`.

The following code example shows how to call this method.

```
var das = new GlideDynamicAttributeStore();
das.setDynamicAttributeDisplayValue("cars->color","blue");
das.setDynamicAttributeDisplayValue("cars->make","Toyota");
das.setDynamicAttributeDisplayValue("cars->model","CRV");
das.setDynamicAttributeDisplayValue("cars->luxury","true");
das.setDynamicAttributeDisplayValue("cars->cost",12000.5);
das.setDynamicAttributeDisplayValue("cars->avg_mpg", 24.5234);
das.setDynamicAttributeDisplayValue("cars->total_miles", 5324);
das.setDynamicAttributeDisplayValue("cars->date_purchased",new
 GlideDateTime());
gs.info('das: ' + das.getDisplayValue());
das.setDisplayValue('{"cars":{"luxury":"false"}}');
gs.info('das: ' + das.getDisplayValue());
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
*** Script: das: {
  "cars" : {
    "avg_mpg" : "24.5234",
    "color" : "blue",
    "cost" : "12000.5",
    "date_purchased" : "2024-04-19 10:40:45",
    "luxury" : "true",
    "make" : "Toyota",
    "model" : "CRV",
    "total_miles" : "5324"
  }
}
*** Script: das: {
  "cars" : {
    "luxury" : "false"
  }
}
```

GlideDynamicAttributeStore - setDynamicAttributeValue(String groupAttrPath, Object value)

Sets the dynamic attribute referenced by a specified group/attribute path to a specified value.

Parameters

Name	Type	Description
groupAttrPath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`
value	Object	Value to set in the specified attribute. **Note:** For dynamic attributes, only the following data types are supported: • Boolean (True/False) • Decimal • Floating Point Number • GlideDate • GlideDateTime • Integer • String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Updated GlideDynamicAttributeStore object. If the *groupAttrPath* parameter isn't valid, the method throws an `IllegalArgumentException`.

The following code example shows how to call this method.

```
var das = new GlideDynamicAttributeStore();
das.setDynamicAttributeValue("cars->color","blue");
das.setDynamicAttributeValue("cars->make","Toyota");
das.setDynamicAttributeValue("cars->model","CRV");
das.setDynamicAttributeValue("cars->luxury",true);
das.setDynamicAttributeValue("cars->cost",12000.5);
das.setDynamicAttributeValue("cars->avg_mpg", 24.5234);
das.setDynamicAttributeValue("cars->total_miles", 5324);
das.setDynamicAttributeValue("cars->date_purchased",new
 GlideDateTime());
gs.info('Value returned by getValue(): ' + das.getValue());
gs.info('Value returned by getDisplayValue(): ' +
 das.getDisplayValue());
```

Output:

```
*** Script: Value returned by getValue():
 {"cars":{"total_miles":5324,"color":"blue","model":"CRV","cost"
:12000.5,"luxury":1,"avg_mpg":24.5234,"make":"Toyota","date_purc
hased":"2024-04-19 15:33:23"}}
*** Script: Value returned by getDisplayValue(): {
  "cars" : {
    "avg_mpg" : "24.5234",
    "color" : "blue",
    "cost" : "12000.5",
    "date_purchased" : "2024-04-19 08:33:23",
    "luxury" : "true",
    "make" : "Toyota",
    "model" : "CRV",
    "total_miles" : "5324"
  }
}
```

GlideDynamicAttributeStore - setDynamicAttributeValues(Object value)

Sets the internal JSON storage for the field to the String representation of the passed value. If the passed value is another instance of a GlideDynamicAttributeStore object, it copies the values from that object to the current object.

Parameters

Name	Type	Description
value	Object	JSON object to store as the value in the associated GlideRecord. The method ignores any invalid JSON values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Updated GlideDynamicAttributeStore object.

The following example shows how to store attribute/value pairs in a GlideDynamicAttributeStore object and then copy those same values from one object to another.

```
var das = new GlideDynamicAttributeStore();
var otherValues = new GlideDynamicAttributeStore();
otherValues.setDynamicAttributeValue("position->x", 5);
otherValues.setDynamicAttributeValue("position->y", 6);

das.setDynamicAttributeValues(otherValues);
gs.info(das);
```

Output:

```
{"_position":{"x":"5.0","y":"6.0"}}
```

GlideDynamicAttributeStore - setValue(Object value)

Clears the current GlideDynamicAttributeStore object and then stores the passed JSON map in that GlideDynamicAttributeStore object.

This method is functionally the same as GlideDynamicAttributeStore - setDisplayValue(Object value) except that it assumes that all date values are in UTC.

Parameters

Name	Type	Description
value	Object	JSON map object to store in the GlideDynamicAttributeStore object. For example: `'{"cars":{"cost":"12500"}}'` This method ignores any invalid JSON values.

Returns

Type	Description
None	

The following example shows how to call this method.

```
var das = new GlideDynamicAttributeStore();
das.setDynamicAttributeValue("cars->color","blue");
das.setDynamicAttributeValue("cars->make","Toyota");
das.setDynamicAttributeValue("cars->model","CRV");
das.setDynamicAttributeValue("cars->luxury",true);
das.setDynamicAttributeValue("cars->cost",12000.5);
das.setDynamicAttributeValue("cars->avg_mpg", 24.5234);
das.setDynamicAttributeValue("cars->total_miles", 5324);
das.setDynamicAttributeValue("cars->date_purchased", new
 GlideDateTime());
gs.info('das: ' + das.getValue());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
das.setValue('{"cars":{"luxury":false}}');
gs.info('das: ' + das.getValue());
```

Output:

```
*** Script: das:
 {"cars":{"total_miles":5324,"color":"blue","model":"CRV","cost"
:12000.5,"luxury":true,"avg_mpg":24.5234,"make":"Toyota","date_p
urchased":"2024-04-19 17:28:47"}}
*** Script: das: {"cars":{"luxury":false}}
```

GlideDynamicAttributeStore - toString()

Returns the content of the GlideDynamicAttributeStore object as a string.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GlideDynamicAttribute object as a string. For example: '{"group":{"attr2":"true","attr1":"42.0"}}'

The following code example shows how to call this method.

```
var das = new GlideDynamicAttributeStore();
das.setDynamicAttributeValue("cars->color","blue");
das.setDynamicAttributeValue("cars->make","Toyota");
das.setDynamicAttributeValue("cars->model","CRV");
das.setDynamicAttributeValue("cars->luxury",true);
das.setDynamicAttributeValue("cars->cost",12000);
das.setDynamicAttributeValue("cars->avg_mpg",24.5);
das.setDynamicAttributeValue("cars->total_miles",5324);
das.setDynamicAttributeValue("cars->date_purchased",new
 GlideDateTime());
gs.info('das: ' + das.toString());
```

Output:

```
*** Script: das:
 {"cars":{"cost":"12000.0","color":"blue","avg_mpg":"24.5","date
_purchased":"2024-04-19
 14:05:00","luxury":"true","model":"CRV","make":"Toyota","total_
miles":"5324.123"}}
```

GlideElement - Global

The *GlideElement* API provides a number of convenient script methods for dealing with fields and their values. *GlideElement* methods are available for the fields of the current glide record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideElement - canCreate()

Determines if the user's role permits the creation of new entries in the associated field.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the current user has permissions to create new entries in the associated field. Possible values: • true: User can create new entries. • false: User cannot create new entries.

The following example shows how to determine if the user has permissions to create entries for the three most recent records in the Problem [problem] table.

```
var gr = new GlideRecord('problem');

// Get records in new state in Problem Table
gr.addQuery('state','101');

// Sort records in order of recent to earlier Created Date
gr.orderByDesc('sys_created_on');

// Limit the query to three records
gr.setLimit(3);
gr.query();

while(gr.next()){
  if(gr.short_description.canCreate()){ ///check to see if the
 current user is allowed to create the record
  gs.info("I can create new records for the field Problem
 statement for - " + gr.number);
  }
}
```

Output:

```
I can create new records for the field Problem statement for -
 PRB0000004
I can create new records for the field Problem statement for -
 PRB0001000
I can create new records for the field Problem statement for -
 PRB0001001
```

Scoped equivalent

To use the *canCreate()* method in a scoped application, use the corresponding scoped method: canCreate().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideElement - canRead()

Determines whether the user's role permits them to read the associated GlideRecord.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the field can be read, false otherwise.

The following example shows how to get a list of active Incident records with a readable Short Description field.

```
var grIncident = new GlideRecord('incident');
grIncident.addEncodedQuery("active=true"); //Query the Incident
 table for active incidents
grIncident.orderByDesc('number');
grIncident.setLimit(3); // limit to three results for example
grIncident.query();

while (grIncident.next()) {
    if (grIncident.short_description.canRead()) { //check to see
 if the current user is allowed to read the record
        gs.info('You have permission to read the
 short description of: ' + grIncident.number + ' ' +
 grIncident.short_description);
    }
}
```

Output:

```
*** Script: You have permission to read the short description
 of: INC0009009 Unable to access the shared folder.
*** Script: You have permission to read the short description
 of: INC0009005 Email server is down.
*** Script: You have permission to read the short description
 of: INC0009001 Unable to post content on a Wiki page
```

Scoped equivalent

To use the *canRead()* method in a scoped application, use the corresponding scoped method: canRead().

GlideElement - canWrite()

Determines whether the user's role permits them to write to the associated GlideRecord.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	True if the user can write to the field, false otherwise.

The following example shows how to get a list of active Incident records with a writeable Short Description field.

```
var grIncident = new GlideRecord('incident');
grIncident.addEncodedQuery("active=true"); //Query the Incident
 table for active incidents
grIncident.orderByDesc('number');
grIncident.setLimit(3); // limit to three results for example
grIncident.query();

while (grIncident.next()) {
    if (grIncident.short_description.canWrite()) { //check to
 see if the current user is allowed to write to the record
        gs.info('You have permission to write to the
 short description of: ' + grIncident.number + ' ' +
 grIncident.short_description);
    }
}
```

Output:

```
*** Script: You have permission to write to the short
 description of: INC0009009 Unable to access the shared folder.
*** Script: You have permission to write to the short
 description of: INC0009005 Email server is down.
*** Script: You have permission to write to the short
 description of: INC0009001 Unable to post content on a Wiki
 page
```

Scoped equivalent

To use the *canWrite()* method in a scoped application, use the corresponding scoped method: canWrite().

GlideElement - changes()

Determines if the current field has been modified. This functionality is available for all available data types, except Journal fields.

Note: The *changes()* method is not supported within ACL scripts.

Note: If the GlideRecord on which you are performing this method has only been initialized and read, and has not been written, the underlying before-and-after values are the same. In this case, the method returns "false", as there has been no change to the data store.

Business rule execution

The ServiceNow AI Platform invokes business rules (*BEFORE* or *AFTER*) before resetting the internal previous values for columns (*GlideElement* objects) to the current values.

This sequence enables the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Triggering an *AFTER* business rule on <column>.changes conditions.
- Accessing the previous *GlideRecord* object in the script section.

Even in *AFTER* business rules, `current.<field>.changes()` returns `true` because the internal previous values haven't been reset yet. The condition `current.<field>.value != previous.<field>.value` also returns `true`.

Previous values are only reset after the following activities:

- The database update is complete.
- All *AFTER* business rules have been processed.

Inside an AFTER business rule, the *changes()* method still returns `true` if the field value was modified, even though the rule executes after the update.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the field has changed, false otherwise.

The following example from a business rule shows how to create an event in the EventQueue if the value of the **assigned_to** field changes. For a comprehensive example, see Sample scripts from the change events business rule.

```
if (!current.assigned_to.nil() && current.assigned_to.changes())
 {
  gs.eventQueue('incident.assigned', current,
 current.assigned_to.getDisplayValue(),
 previous.assigned_to.getDisplayValue());
}
```

Scoped equivalent

To use the *changes()* method in a scoped application, use the corresponding scoped method: changes().

GlideElement - changesFrom(Object value)

Determines if the previous value of the current field matches the specified object.

Note: If the GlideRecord on which you are performing this method has only been initialized and read, and has not been written, the underlying before-and-after values are the same. In this case, the method returns "false", as there has been no change to the data store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
value	Object	An object value to check against the previous value of the current field.

Returns

Type	Description
Boolean	True if the previous value matches the parameter, false if it does not.

```
if (theState.changesTo(resolvedState)) {
  operation = 4; //Resolved
}
else if (theState.changesTo(closedState)) {
  operation = 11; //Resolution Accepted
}
else if (theState.changesFrom(resolvedState) ||
 theState.changesFrom(closedState)) {
  operation = 10; //Re-open
}
else {
  operation = 6; //Update
}
```

Scoped equivalent

To use the *changesFrom()* method in a scoped application, use the corresponding scoped method: changesFrom().

GlideElement - changesTo(Object value)

Determines if the new value of a field, after a change, matches the specified object.

Note: The *changesTo()* method is not supported within ACL scripts.

Note: If the GlideRecord on which you are performing this method has only been initialized and read, and has not been written, the underlying before-and-after values are the same. In this case, the method returns "false", as there has been no change to the data store.

Parameters

Name	Type	Description
value	Object	An object value to check against the new value of the current field.

Returns

Type	Description
Boolean	True if the new value matches the parameter, false if it does not.

```
if (theState.changesTo(resolvedState)) {
  operation = 4; //Resolved
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
}
else if (theState.changesTo(closedState)) {
  operation = 11; //Resolution Accepted
}
else if (theState.changesFrom(resolvedState) ||
 theState.changesFrom(closedState)) {
  operation = 10; //Re-open
}
else {
  operation = 6; //Update
}
```

Scoped equivalent

To use the *changesTo()* method in a scoped application, use the corresponding scoped method: changesTo().

GlideElement - dateNumericValue()

Returns the number of milliseconds since January 1, 1970, 00:00:00 GMT for a duration field. Does not require the creation of a GlideDateTime object because the duration field is already a GlideDateTime object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Number of milliseconds since January 1, 1970, 00:00:00 GMT.

```
var inc = new GlideRecord('incident');
inc.get('17c90efb13418700cc36b1422244b05d');
gs.info(inc.calendar_duration.dateNumericValue());
```

Output: 98000

Scoped equivalent

To use the *dateNumericValue()* method in a scoped application, use the corresponding scoped method: dateNumericValue().

GlideElement - debug(Object o)

Debugs the object and adds debug messages using *setError(String)*.

Parameters

Name	Type	Description
o	Object	An object to debug.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

GlideElement - getAttribute(String attributeName)

Returns the value of the specified attribute from the dictionary.

If the attribute is a boolean attribute, use *`getBooleanAttribute(String)`* to get the value as a boolean rather than as a string.

Parameters

Name	Type	Description
attributeName	String	Attribute name

Returns

Type	Description
String	Attribute value

```
doit();
function doit() {
  var now_GR = new GlideRecord('sys_user');
  now_GR.query("user_name","admin");
  if (now_GR.next()) {
    gs.print("we got one");
    gs.print(now_GR.location.getAttribute("tree_picker"));
  }

}
```

Scoped equivalent

To use the *`getAttribute()`* method in a scoped application, use the corresponding scoped method: getAttribute().

GlideElement - getBaseTableName()

Gets the base table of the field.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the base table. This name might be different from the table that the field is defined on. See Table extension and classes in the product documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to the base table for the Assignment Group field of an Incident record.

```
var gr = new GlideRecord('incident');

//query the Incident Records which have category as Inquiry/Help
gr.addQuery('category','inquiry');

// sort them in the order of earlier to recent created date
gr.orderBy('sys_created_on');
gr.query();

if(gr.next()){ //If at least any one record exists matching this
 query

  //Print the base table for the Assignment Group field
  gs.print("The Base Table for the field Assignment Group is - "
 + gr.assignment_group.getBaseTableName());
};
```

Output:

```
The Base Table for the field Assignment Group is - task
```

GlideElement - getBooleanAttribute(String attributeName)

Returns the Boolean value of the specified attribute from the dictionary.

To get the value as a string, use *`getAttribute(string)`*.

Parameters

Name	Type	Description
attributeName	String	Attribute name

Returns

Type	Description
Boolean	Boolean value of the attribute. Returns false if the attribute does not exist.

The following example shows how to get Boolean values of the *`ignore_filter_on_new`* attribute for two fields.

```
var inc = new GlideRecord('incident');
inc.query();

if (inc.next())
 {
   // opened_by field has attribute "ignore_filter_on_new =
 true"

 gs.info(inc.opened_by.getBooleanAttribute("ignore_filter_on_new
"));

  // short_description field does not have attribute
 ignore_filter_on_new
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 gs.info(inc.short_description.getBooleanAttribute("ignore_filte
r_on_new"));
 }
```

Output:

```
true
false
```

Scoped equivalent

To use the *getBooleanAttribute()* method in a scoped application, use the corresponding scoped method: getBooleanAttribute().

GlideElement - getChoices(String dependent)

Generates a choice list for a field. Returns the choice values from the base table only, not from the extended table.

Parameters

Name	Type	Description
dependent	String	Optional. Field within the associated record on which the choice list field depends.

Returns

Type	Description
array list	The choice values for the field.

```
var glideRecord = new GlideRecord('incident');
glideRecord.query('priority','1');
glideRecord.next();

// urgency has choice list: 1 - High, 2 - Medium, 3 - Low, with
 value: 1, 2, 3
var choices = glideRecord.urgency.getChoices();
```

Scoped equivalent

To use the *getChoices()* method in a scoped application, use the corresponding scoped method: getChoices().

GlideElement - getChoiceValue()

Gets the choice label for the current choice value.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The choice label.

The following example shows how to get the choice label for change request records with the a priority value of Normal.

```
var gr = new GlideRecord('change_request');

//query for the change records with change type as "Normal"
gr.addQuery('type','normal');

// sort them in the order of recent to earlier Created Date
gr.orderByDesc('sys_created_on');

// limit the query to 4 records
gr.setLimit(4);
gr.query();

while(gr.next()){
 //Printing the choice label for those records
 gs.print("The label of the current priority '"+ gr.priority+"'
 for the change request - " + gr.number + " is - "+
 gr.priority.getChoiceValue());
}
```

Output:

```
The label of the current priority '4' for the change request -
 CHG0000014 is - 4 - Low
The label of the current priority '4' for the change request -
 CHG0000013 is - 4 - Low
The label of the current priority '4' for the change request -
 CHG0000012 is - 4 - Low
The label of the current priority '4' for the change request -
 CHG0000011 is - 4 - Low
```

Scoped equivalent

To use the *getChoiceValue()* method in a scoped application, use the corresponding scoped method: getChoiceValue().

GlideElement - getDebugCount()

Gets the number of debug messages logged by *debug()*.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	The number of debug messages.

GlideElement - getDependent()

Returns the field (element) that a specified field is dependent on.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the field on which the current field depends. Null if no dependencies.

The following example shows how to find the parent field of the Configuration Item field using the *getDependent()* method.

```
var inc_gr = new GlideRecord('incident');
inc_gr.get('985f53d82fab301032e8808cf699b6e8'); // Get a
 particular Incident

var field_element = inc_gr.getElement('cmdb_ci'); // Get the
 Configuration Item element
var dependent_field = field_element.getDependent(); // Read the
 dependent field
gs.info("Dependent field: " + dependent_field);
if(dependent_field)
  {
    var dependent_field_value =
 inc_gr.getValue(dependent_field);
    if(!dependent_field_value)
      {
        var base_table = field_element.getRefRecord(); //
 Retrieve the reference record
        var dependent_field_value =
 base_table.getValue(dependent_field); // Read the parent field
 value
      }
    inc_gr.setValue(dependent_field, dependent_field_value); //
 Update the parent field on the Incident
    inc_gr.update();
  }
```

Output:

```
company
```

GlideElement - getDependentTable()

Gets the table that the current table depends on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The name of the table.

GlideElement - getDisplayValue(Number maxChar)

Returns the formatted display value of the field.

Display values are manipulated based on the actual value in the database and user or system settings and preferences.

The display value that is returned is dependent on the field type.

- Choice fields: The database value may be a number, but the display value will be more descriptive.
- Date fields: The database value is in UTC format, while the display value is based on the user's time zone.
- Encrypted text: The database value is encrypted, while the displayed value is unencrypted based on the user's encryption context.
- Reference fields: The database value is sys_id, but the display value is a display field of the referenced record.

Parameters

Name	Type	Description
maxChar	Number	Optional. Maximum number of characters to return.

Returns

Type	Description
String	Display value of the field.

```
var fields = current.getFields();
for (var i = 0; i < fields.size(); i++) {
  var field = fields.get(i);
  var name = field.getName();
  var value = field.getDisplayValue();
  gs.print(i + ". " + name + "=" + value);
}
```

Scoped equivalent

To use the *`getDisplayValue()`* method in a scoped application, use the corresponding scoped method: getDisplayValue().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideElement - getDisplayValueExt(Number maxChar, String nullSub)

Returns the formatted display value of a field, or a specified substitute value if the display value is null or empty.

Display values are manipulated based on the actual value in the database and user or system settings and preferences.

The display value that is returned is dependent on the field type.

- Choice fields: The database value may be a number, but the display value will be more descriptive.
- Date fields: The database value is in UTC format, while the display value is based on the user's time zone.
- Encrypted text: The database value is encrypted, while the displayed value is unencrypted based on the user's encryption context.
- Reference fields: The database value is sys_id, but the display value is a display field of the referenced record.

Parameters

Name	Type	Description
maxChar	Number	Optional. Maximum number of characters to be returned. Default: All
nullSub	String	Value to return if the display value is null or empty.

Returns

Type	Description
String	Formatted display value of the field, or the specified substitute value.

The following example shows how to display the two most recent active records in the Incident [incident] table.

```
var gr = new GlideRecord('incident');
gr.addQuery('active', true);      // get the active records
gr.orderByDesc('sys_updated_on'); // sort the records from most
 recent to oldest updated date
gr.setLimit(2);                   // limit the query to 2
 records
gr.query();

while(gr.next()){ // Printing the Display Value of the
 Configuration Item field.
  // If the Display Value is Null/Empty, then it will be
 substituted with Default value "I with Null/Empty Display
 Value"
  gs.info("The Display Value of the Configuration
 Item for the incident - "+ gr.number+ " is " +
 gr.cmdb_ci.getDisplayValueExt(40, " CI with Null/Empty Display
 Value"));
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
The Display Value of the Configuration Item for the incident -
 INC0007001 is  CI with Null/Empty Display Value
The Display Value of the Configuration Item for the incident -
 INC0000069 is NYC RAC
```

GlideElement - getDisplayValueLang(String language)

Gets the display value of the field in the language passed as a parameter.

The result is only applicable to translatable field types such as **Choice**, **Translated Field**, and **Translated Text**. For other field types, the result defaults to *`getDisplayValue()`*.

You must have the corresponding language plugin to retrieve a translated value. For information, see Activate a language.

See also Scoped GlideElement - getLabelLang(String language).

Parameters

Name	Type	Description
language	String	Language tag conforming with IETF BCP-47.

Returns

Type	Description
String	Display value of the field in the language passed. If a translation isn't available, the method retrieves a value translated in the language of the current user. If a translation isn’t available, the result defaults to English.

The following example shows how to get the original text and German-translated text from the **Accept** (UI View) title field.

```
var uiView = new GlideRecord("sys_ui_view");
uiView.get("fa776f6d97700100f309124eda2975bc");

gs.info("getDisplayValue: " +
 uiView.getElement("title").getDisplayValue());
gs.info("getDisplayValueLang: " +
 uiView.getElement("title").getDisplayValueLang("de"));
```

Output:

```
getDisplayValue: Accept
getDisplayValueLang: Akzeptieren
```

Scoped equivalent

To use the *`getDisplayValueLang()`* method in a scoped application, use the corresponding scoped method: getDisplayValueLang().

GlideElement - getED()

Returns an element descriptor, which provides information about specific fields, rather than the data inside of those fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
ElementDescriptor	The field's element descriptor.

This example gets the fields and field descriptors for the current record.

```
var fields = current.getFields();
for (i=0; i<fields.size(); i++) {
  var field = fields.get(i);
  var descriptor = field.getED();
  gs.print("type=" + descriptor.getType() +
    " internalType=" + descriptor.getInternalType());
}
```

Scoped equivalent

To use the *getED()* method in a scoped application, use the corresponding scoped method: getED().

GlideElement - getElementValue(String value)

Returns the value for the specified element.

Parameters

Name	Type	Description
value	String	Element whose value you want returned.

Returns

Type	Description
String	Value of the element.

```
var fields = current.getFields();
for (var i = 0; i < fields.size(); i++) {
  var field = fields.get(i);
  var name = field.getName();

  // Returns the unformatted value of the element
  var value = field.getElementValue(name);
  var disValue = field.getDisplayValue();
  gs.print(i + ". " + name + " = " + value + ' display value = '
 + disValue);
}
```

Output

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
1. cmdb_ci = 109562a3c611227500a7b7ff98cc0dc7 display value =
 Storage Area Network 001
2. impact = 2 display value = 2 - Medium
```

GlideElement - getError()

Returns any error message associated with the specified element.

Use the setError() method to set an error on a specific field (element).

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Error message currently set for the specified element.

This example shows how to set an error on the short_description element and then read the error back.

```
var incidentGR = new GlideRecord('incident');
incidentGR.setLimit(1);
incidentGR.query();
if (incidentGR.next()) {
    incidentGR.short_description.setError('The description is
 too short.');
    gs.info(incidentGR.short_description.getError()); // 'The
 description is too short.'
}
```

Output:

```
The description is too short.
```

This example shows how to use *getError()* in a function call.

```
// Before query business rule (order = 100)
(function executeRule(current, previous /*null when async*/) {
    var shortDescription =
 current.getValue('short_description');
    if (shortDescription.length < 10) {
        current.short_description.setError('The description is
 too short.');
        current.setAbortAction(true);
    }
})(current, previous);

// Before query business rule (order = 200)
(function executeRule(current, previous /*null when async*/) {
    var shortDescriptionErrMsg =
 current.short_description.getError();
    if (shortDescriptionErrMsg) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        // Some error was set in one of the previous business
 rules.
    }
})(current, previous);
```

GlideElement - getEscapedValue()

Gets the escaped value for the current element.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The escaped value of the current element.

The following example shows how to use the *`getEscapedValue()`* method to display the contents of an Incident short description field with escape characters.

```
/*** Overview - Update incident short description with escape
 characters and printing ***/
var inc = new GlideRecord('incident');
inc.query();
inc.next();
inc.short_description = 'Can\'t log into SAP from my laptop
 today';
inc.update();
gs.info("Short Description:
 "+inc.getElement('short_description').toString()); //without
 escape characters
gs.info("Escaped Short Description:
 "+inc.getElement('short_description').getEscapedValue()); //
 with escape characters
```

Output:

```
Short Description: Can't log into SAP from my laptop today
Escaped Short Description: Can\'t log into SAP from my laptop
 today
```

GlideElement - getFieldStyle()

Gets the CSS style for the field.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The CSS style for the field.

```
var fields = current.getFields();
for (var i = 0; i < fields.size(); i++) {
  var field = fields.get(i);
  var css_style = field.getFieldStyle();
  gs.print("CSS style" + "=" + css_style);
}
```

GlideElement - getGlideObject()

Gets a glide object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	A Glide object.

```
function calcDateDelta(start, end, calendar) {
  var cal = GlideCalendar.getCalendar(calendar);
  if (!cal.isValid())
      return null;
  var realStart = start.getGlideObject();
  var realEnd = end.getGlideObject();
  var duration = cal.subtract(realStart, realEnd);
  return duration;
}
```

GlideElement - getGlideRecord()

Gets a glide record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideRecord	A glide record object.

```
var grInc = new GlideRecord('incident');
grInc.get('sys_id','ef43c6d40a0a0b5700c77f9bf387afe3');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info("Initial grInc - " + grInc.getDisplayValue());

var caller = grInc.getElement("caller_id");
doit(caller);

function doit(caller) {
  var now_GR = caller.getGlideRecord();
  gs.info("doit gr is - " + now_GR.getDisplayValue());
}
```

Output

```
*** Script: Initial grInc - INC0000050
*** Script: doit gr is - INC0000050
```

GlideElement - getHTMLValue(Number maxChars)

Returns the HTML value of a field.

Parameters

Name	Type	Description
maxChars	Number	Optional. Maximum number of characters to return.

Returns

Type	Description
String	HTML value for the field.

The following example shows how to get the HTML content of a meeting note.

```
/*
  getHTMLValueExt() This Function is used to get HTML Value of a
 field. It accepts 2 Parameters

a. maxChar- Number - The maximum number of characters to return.
b. nullSub - String - The value to return if the HTML value is
 null or empty.

*/

// get a cab meeting record by its sys_id
var gr = new GlideRecord('cab_meeting');
gr.addQuery('sys_id','7777777b6d2a20100sys70id534330f6');
gr.query();

if(gr.next()){
  var substituteString = 'Meeting Notes Unavailable';
  var maxLength = 50;
  gs.print(gr.meeting_notes.getHTMLValueExt(maxLength,
 substituteString));
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the `getHTMLValue()` method in a scoped application, use the corresponding scoped method: getHTMLValue().

GlideElement - getHTMLValueExt(Number maxChar, String nullSub)

Returns the HTML value of a field, or a specified substitute value if the HTML value is null or empty.

Parameters

Name	Type	Description
maxChar	Number	The maximum number of characters to return.
nullSub	String	The value to return if the HTML value is null or empty.

Returns

Type	Description
String	The HTML value or the specified substitute value.

The following example shows how to get the HTML content of a meeting note.

```
// get a cab meeting record by its sys_id
var gr = new GlideRecord('cab_meeting');
gr.addQuery('sys_id','7777777b6d2a2010Osys70id534330f6');
gr.query();

if(gr.next()){
  var substituteString = 'Meeting Notes Unavailable';
  var maxLength = 50;
  gs.print(gr.meeting_notes.getHTMLValueExt(maxLength,
 substituteString));
}
```

Output if the meeting note for the record selected is not empty:

```
<p>Meeting note content.</p>
```

GlideElement - getJournalEntry(Number mostRecent)

Returns either the most recent journal entry or all journal entries.

Parameters

Name	Type	Description
mostRecent	Number	If 1, returns the most recent entry. If -1, returns all journal entries.

Returns

Type	Description
String	For the most recent entry, returns a string that contains the field label, timestamp, and user display name of the journal entry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	For all journal entries, returns the same information for all journal entries ever entered as a single string with each entry delimited by "\n\n".

```
//gets all journal entries as a string where each entry is
 delimited by '\n\n'
var notes = current.work_notes.getJournalEntry(-1);
//stores each entry into an array of strings
var na = notes.split("\n\n");

for (var i = 0; i < na.length; i++)
  gs.print(na[i]);
```

Scoped equivalent

To use the *getJournalEntry()* method in a scoped application, use the corresponding scoped method: getJournalEntry().

GlideElement - getLabel()

Returns the object's label.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Object's label

```
var now_GR = new GlideRecord("sc_req_item");
now_GR.addQuery("request", current.sysapproval);
now_GR.query();
while(now_GR.next()) {
    var nicePrice = now_GR.price.toString();
    if (nicePrice != ) {
        nicePrice = parseFloat(nicePrice);
        nicePrice = nicePrice.toFixed(2);
    }
    template.print(now_GR.number + ":  " + now_GR.quantity + " X
 " + now_GR.cat_item.getDisplayValue() + " at $" + nicePrice + "
 each \n");
    template.print("    Options:\n");
    var variables = now_GR.variables.getElements();
    for (var key in variables) {
      var now_V = variables[key];
      if(now_V.getQuestion().getLabel() != ) {
         template.space(4);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        template.print('     ' +
 now_V.getQuestion().getLabel() + " = " +
 now_V.getDisplayValue() + "\n");
      }
    }
}
```

Scoped equivalent

To use the *getLabel()* method in a scoped application, use the corresponding scoped method: getLabel().

GlideElement - getLabelLang(String language)

Gets the label value of the field in the language passed as a parameter.

You must have the corresponding language plugin to retrieve a translated value. For information, see Activate a language.

See also:

- getDisplayValueLang()
- getLabel()

Parameters

Name	Type	Description
language	String	Language tag conforming with IETF BCP-47.

Returns

Type	Description
String	Value of the field label in the language passed. If a translation isn't available, the method retrieves a value translated in the language of the current user. If a translation isn't available, the result defaults to English.

The following example shows how to get the original label text and its German translation of the **Accept** (UI View) title.

```
var uiView = new GlideRecord("sys_ui_view");
uiView.get("fa776f6d97700100f309124eda2975bc");

gs.info("getLabel: " + uiView.getElement("title").getLabel());
gs.info("getLabelLang: " +
 uiView.getElement("title").getLabelLang("de"));
```

Output:

```
getLabel: Title
getLabelLang: Titel
```

Scoped equivalent

To use the *getLabelLang()* method in a scoped application, use the corresponding scoped method: getLabelLang().

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideElement - getName()

Returns the name of the field.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Field name.

The following example shows how to get the name and other values for each field in a sys_user record.

```
var userRec = new GlideRecord("sys_user"); // GlideRecord to
 sys_user table

userRec.get("5137153cc611227c000bbd1bd8cd2005"); // Sys Id of
 user: Fred Luddy

var fields = userRec.getFields();

for (var i = 0; i < fields.size(); i++) {

    var field = fields.get(i);
    var name = field.getName(); // Name of the field
    var label = field.getLabel(); // Label of the field
    var value = field.getDisplayValue(); // Value of the field

    gs.info((Number(i) + 1) + ".\n" + "Field Label: " + label +
 "\n" + "Field Name: " + name + "\n" + "Field Value: " + value);

};
```

Output. Results include 62 fields and have been truncated with ellipsis points (...) to save space.

```
*** Script: 1.
Field Label: Country code
Field Name: country
Field Value:
*** Script: 2.
Field Label: Calendar integration
Field Name: calendar_integration
Field Value: Outlook
...
*** Script: 47.
Field Label: First name
Field Name: first_name
Field Value: Fred
...
*** Script: 54.
Field Label: Last name
Field Name: last_name
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Field Value: Luddy
...
```

Scoped equivalent

To use the *getName()* method in a scoped application, use the corresponding scoped method: getName().

GlideElement - getRefRecord()

Returns a GlideRecord object for a given reference element.

For calculated fields, this method fetches the referenced record and runs a calculation on a scripted default value.

Warning: If the reference element does not contain a value, it returns an empty GlideRecord object, not a NULL object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideRecord	A GlideRecord object

```
var grINC = new GlideRecord('incident');
grINC.notNullQuery('caller_id');
grINC.query();
if (grINC.next()) {

// Get a GlideRecord object for the referenced sys_user record
var grUSER = grINC.caller_id.getRefRecord();
if (grUSER.isValidRecord())
  gs.print( grUSER.getValue('name') );

}
```

Scoped equivalent

To use the *getRefRecord()* method in a scoped application, use the corresponding scoped method: getRefRecord().

GlideElement - getStyle()

Get the CSS style for the value.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The CSS style for the value.

```
// Get string of style field from Field Style record
var cssStyle = now_GR.state.getStyle();
```

GlideElement - getTableName()

Returns the name of the field's table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the table. This may be different from the table Class that the record is in. See Tables and Classes in the product documentation.

```
if (current.approver.getTableName() == "sysapproval_approver") {
  if (current.approver == email.from_sys_id)  {
     current.comments = "reply from: " + email.from + "\n\n" +
 email.body_text;

   // if it's been cancelled, it's cancelled.
  var doit = true;
  if (current.state=='cancelled')
      doit = false;

  if (email.body.state != undefined)
     current.state= email.body.state;

   if (doit)
      current.update();
} else {
   gs.log("Approval for task
 ("+current.sysapproval.getDisplayValue()+") rejected because
 user sending
          email( "+email.from+") does not match the approver
 ("+current.approver.getDisplayValue()+")");
}

}
```

Scoped equivalent

To use the *getTableName()* method in a scoped application, use the corresponding scoped method: getTableName().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideElement - getTextAreaDisplayValue()

Retrieves the display value for the associated field and escapes the HTML.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Escaped display value HTML for the associated field.

The following example retrieves the display value of a KB article.

```
var grh = new GlideRecord('kb_knowledge');
grh.get('c85cd2519f77230088aebde8132e70c2');  // Knowledge
 record sys_id
var t = grh.text.getTextAreaDisplayValue(); // Text is HTML type
 field
var d = GlideXMLUtil.parseHTML(t); // Parse the HTML
var b = d.getDocumentElement().getTextContent().trim();
gs.info(b);
```

Output:

```
This article explains how to use automatic replies in Outlook
 2010 for Exchange accounts.

Setting Up Automatic Replies

Click the
File tab.
Click
Automatic Replies.
Select
Send automatic replies.
If desired, select the
Only send during this time range check box to schedule when your
 out of office replies are active. If you do not specify a start
 and end time, auto-replies will be sent until you select the
 Do not send automatic replies check box.
On the
Inside My Organization tab, type the response that you want to
 send to colleagues while you are out of the office.
On the
Outside My Organization tab, select the
Auto-reply to people outside my organization check box, and then
 type the response that you want to send while you are out of
 the office. Select whether you want replies sent to
My contacts only or to
Anyone outside my organization who sends you messages.

NOTE:
If you select
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
My Contacts only in step 6, replies will be sent
only to contacts that exist in your Contacts folder.

Using Rules With Automatic Replies
It is also possible to use rules to manage your messages while
 you are out of office. For example, you can create rules to
 automatically move or copy messages to other folders, to delete
 messages, to send custom replies, and so on.

Click the
File tab.
Click
Automatic Replies.
Click
Rules, and then click
Add Rule.
Under
When a message arrives that meets the following conditions,
 specify the conditions that the message must meet for the rule
 to be applied. If you want to specify more conditions, click
Advanced, enter or select the options that you want, and then
 click
OK.
If you want to specify that this rule must be applied last,
 select the
Do not process subsequent rules check box.
Under
Perform these actions, select the actions that you want. You can
 select more than one action.
Click
OK three times.

NOTES:

Automatic Replies rules can also be edited by following the
 above procedure.
To turn Automatic Replies rules on or off, in the Automatic
 Reply Rules dialog box, select or clear the check box of the
 rule that you want to turn on or off.
```

GlideElement - getValue()

Returns the value of the field in the database.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The value of the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example retrieves the value of a specified field in the database.

```
var now_GR = new GlideRecord('incident');
now_GR.get('9c573169c611228700193229fff72400'); //INC0000001
gs.info('Display Values');
gs.info('Opened at ' + now_GR.opened_at.getDisplayValue());
gs.info('Opened by ' + now_GR.opened_by.getDisplayValue());
gs.info('Priority ' + now_GR.priority.getDisplayValue());
gs.info('Values');
gs.info('Opened at ' + now_GR.opened_at.getValue());
gs.info('Opened by ' + now_GR.opened_by.getValue());
gs.info('Priority ' + now_GR.priority.getValue());
```

Output:

```
Display Values
Opened at 2022-02-01 15:09:51
Opened by Joe Employee
Priority 1 - Critical
Values
Opened at 2022-02-01 23:09:51
Opened by 681ccaf9c0a8016400b98a06818d57c7
Priority 1
```

Scoped equivalent

To use the *getValue()* method in a scoped application, use the corresponding scoped method: #unique_1903.

GlideElement - getXHTMLValue()

Retrieves the XHTML value of a field.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The XHTML value

GlideElement - getXMLValue()

Gets the XML value of a field as a string.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The XML value

GlideElement - hasAttribute(String attributeName)

Determines whether a field has a particular attribute.

Parameters

Name	Type	Description
attributeName	String	The attribute to check for

Returns

Type	Description
Boolean	True if the field has the attribute, false otherwise.

```
var totalCritical = 0;

var filledCritical = 0; var fields = current.getFields();
 gs.print(fields); for (var num = 0; num &lt; fields.size();
 num++) {

    gs.print("RUNNING ARRAY VALUE " + num);
   var ed = fields.get(num).getED();
   if(ed.hasAttribute("tiaa_critical")) {
       gs.print("CRITICAL FIELD FOUND");
       totalCritical ++;
       if (!fields.get(num).isNil()) {
           filledCritical ++;
       }
   }

} var answer = 0; gs.print("TOTAL - " + totalCritical);
 gs.print("FILLED - " + filledCritical); if (filledCritical &gt;
 0 &amp;&amp; totalCritical &gt; 0){

    var pcnt = (filledCritical/totalCritical)*100;
   answer = pcnt.toFixed(2);;

} answer;
```

GlideElement - hasRightsTo(String operationName)

Determines if the user has the right to perform a particular operation.

Parameters

Name	Type	Description
operationName	String	Name of the operation to check for

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	True if the user has permission to perform the operation, false otherwise. Flag that indicates whether a user has permission to perform an operation. Valid values: • true: User has permissions. • false: User does not have permissions.

The following example shows how to determine if a user has rights to read a specific table.

```
// Pass table name and userId to check if user has read access
 against given table name
checkAccess('incident', 'adela.cervantsz');

function checkAccess(tableName, userID) {

    var inc = new GlideRecordSecure(tableName);
    inc.get('$[sys_id]');

    var secureManager = GlideSecurityManager.get();

    //fetch a different user, using user_name field on the
 target user record
    var userObj = gs.getUser().getUserByID(userID);
    secureManager.setUser(userObj);

    var access = 'record/incident/read';

    //check if user has right to access
    var canRead = secureManager.hasRightsTo(access, inc);
    gs.info('canRead: ' + canRead);
}
```

Output:

```
canRead: false
```

GlideElement - hasValue()

Determines if the field has a value.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the field has a value, false otherwise.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideElement - nil()

Determines whether the field is null.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the field is null or an empty string, false otherwise.

```
if (current.start_date.changes() || current.end_date.changes()
 || current.assigned_to.changes()) {
  if (!current.start_date.nil() && !current.end_date.nil()
 && !current.assigned_to.nil()) {
 gs.eventQueue("change.calendar.notify", current,
 current.assigned_to, previous.assigned_to);

}
```

Scoped equivalent

To use the *nil()* method in a scoped application, use the corresponding scoped method: nil().

GlideElement - setDateNumericValue(Number milliseconds)

Sets the duration field to a number of milliseconds since January 1, 1970, 00:00:00 GMT for a duration field. Does not require the creation of a GlideDateTime object because the duration field is already a GlideDateTime object.

Parameters

Name	Type	Description
milliseconds	Number	Number of milliseconds spanned by the duration.

Returns

Type	Description
void	

```
var inc = new GlideRecord('incident');
inc.get('17c90efb13418700cc36b1422244b05d');
var timems = inc.calendar_duration.dateNumericValue();
timems = timems + 11*1000;
inc.calendar_duration.setDateNumericValue(timems)
gs.info(inc.calendar_duration.getValue());
```

Output:

```
1970-01-01 00:01:38
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the *setDateNumericValue()* method in a scoped application, use the corresponding scoped method: setDateNumericValue().

GlideElement - setDisplayValue(Object displayValue)

Sets the display value of the field.

Parameters

Name	Type	Description
displayValue	Object	Value to be displayed.

Returns

Type	Description
void	

Scoped equivalent

To use the *setDisplayValue()* method in a scoped application, use the corresponding scoped method: setDisplayValue().

GlideElement - setError(String message)

Adds an error message to the associated field (element).

You can retrieve the error message using the *getError()* method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

```
if ((!current.u_date1.nil()) && (!current.u_date2.nil())) {
  var start =
 current.u_date1.getGlideObject().getNumericValue();
  var end = current.u_date2.getGlideObject().getNumericValue();
  if (start > end) {
    gs.addInfoMessage('start must be before end');
    current.setAbortAction(true);
    current.u_date1.setError('start must be before end');
  }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the *setError()* method in a scoped application, use the corresponding scoped method: setError().

GlideElement - setInitialValue(Object value)

Sets the initial value of a field.

This method had been deprecated. Use GlideElement - setValue(Object value) for this functionality.

Parameters

Name	Type	Description
value	Object	Initial value for the field.

Returns

Type	Description
void	

GlideElement - setJournalEntry(String entry, String userName)

Adds a journal entry and author as a work note or comment field.

Parameters

Name	Type	Description
entry	String	Content of the journal entry.
userName	String	Optional. The user to attribute the journal entry to.

Returns

Type	Description
None	

The following example shows how to add a work note and its author to a record.

```
var now_GR = new GlideRecord("incident");

now_GR.addQuery("sys_id", "<sys_id_value>");
now_GR.query();

if(now_GR.next()){
  now_GR.work_notes.setJournalEntry("Content of the journal
 entry.", "abel.tuter");
  now_GR.update();
}
```

GlideElement - setValue(Object value)

Sets the value of a field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Before calling this method, the element must already exist by querying an existing record or by using the *now_GR.initialize()* method to initialize a new record.

Not for authentication with password2 fields

The *setValue()* method passes password2 data as clear text, which results in an error about expecting encrypted data. Additionally, using the setValue() method for password2 fields exposes data that should be encrypted.

For password2 authentication, use the *setDisplayValue()* method instead.

See also:

- Deprecate GlideEncrypter usage of 3DES for password2 fields
- Alternatives to GlideEncrypter usage in knowledge base article KB1320986
- Password2 encryption with the Key Management Framework (KMF)

Parameters

Name	Type	Description
value	Object	The value the field is to be set to.

Returns

Type	Description
void	

Set the value passing a string.

```
var glideRecord = new GlideRecord('incident');
glideRecord.query('priority','1');
glideRecord.next();
glideRecord.short_description.setValue('Network failure');
```

Set the value passing an object.

```
var now_GR  = new GlideRecord('student');
now_GR.initialize();
now_GR.setValue('first_name', 'Joe');
now_GR.setValue('last_name', 'Smith');
now_GR.insert();
```

Scoped equivalent

To use the *setValue()* method in a scoped application, use the corresponding scoped method: setValue().

GlideElement - toString()

Converts the field's value to a string.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The field's value as a string.

```
doit();

function doit() {

  var now_GR = new GlideRecord('sys_user');
  now_GR.query();
  while (now_GR.next()) {
  if ((now_GR().length !=
 now_GR.first_name.toString().trim().length) ||
 (now_GR.last_name.toString().length
        != now_GR.last_name.toString().trim().length)) {
      now_GR.first_name = now_GR.first_name.toString().trim();
      now_GR.last_name = now_GR.last_name.toString().trim();
      now_GR.autoSysFields(false);
      now_GR.update();
    }
  }

}
```

Scoped equivalent

To use the *toString()* method in a scoped application, use the corresponding scoped method: toString().

GlideElement - Scoped

The scoped *GlideElement* API provides a number of convenient script methods for dealing with fields and their values. Scoped *GlideElement* methods are available for the fields of the current glide record.

Scoped GlideElement - canCreate()

Determines if the user's role permits the creation of new entries in the associated field.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the current user has permissions to create new entries in the associated field. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: User can create new entries. • false: User cannot create new entries.

The following example shows how to determine if the user has permissions to create entries for the three most recent records in the Problem [problem] table.

```
var gr = new GlideRecord('problem');

// Get records in new state in Problem Table
gr.addQuery('state','101');

// Sort records in order of recent to earlier Created Date
gr.orderByDesc('sys_created_on');

// Limit the query to three records
gr.setLimit(3);
gr.query();

while(gr.next()){
  if(gr.short_description.canCreate()){ ///check to see if the
 current user is allowed to create the record
  gs.info("I can create new records for the field Problem
 statement for - " + gr.number);
  }
}
```

Output:

```
I can create new records for the field Problem statement for -
 PRB0000004
I can create new records for the field Problem statement for -
 PRB0001000
I can create new records for the field Problem statement for -
 PRB0001001
```

Scoped equivalent

To use the *canCreate()* method in a scoped application, use the corresponding scoped method: canCreate().

Scoped GlideElement - canRead()

Indicates whether the user's role permits them to read the associated GlideRecord.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	True if the field can be read, false otherwise.

The following example shows how to get a list of active Incident records with a readable Short Description field.

```
var grIncident = new GlideRecord('incident');
grIncident.addEncodedQuery("active=true"); //Query the Incident
 table for active incidents
grIncident.orderByDesc('number');
grIncident.setLimit(3); // limit to three results for example
grIncident.query();

while (grIncident.next()) {
    if (grIncident.short_description.canRead()) { //check to see
 if the current user is allowed to read the record
        gs.info('You have permission to read the
 short description of: ' + grIncident.number + ' ' +
 grIncident.short_description);
    }
}
```

Output:

```
*** Script: You have permission to read the short description
 of: INC0009009 Unable to access the shared folder.
*** Script: You have permission to read the short description
 of: INC0009005 Email server is down.
*** Script: You have permission to read the short description
 of: INC0009001 Unable to post content on a Wiki page
```

Scoped GlideElement - canWrite()

Determines whether the user's role permits them to write to the associated GlideRecord.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the user can write to the field, false otherwise.

The following example shows how to get a list of active Incident records with a writeable Short Description field.

```
var grIncident = new GlideRecord('incident');
grIncident.addEncodedQuery("active=true"); //Query the Incident
 table for active incidents
grIncident.orderByDesc('number');
grIncident.setLimit(3); // limit to three results for example
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
grIncident.query();

while (grIncident.next()) {
    if (grIncident.short_description.canWrite()) { //check to
 see if the current user is allowed to write to the record
       gs.info('You have permission to write to the
 short description of: ' + grIncident.number + ' ' +
 grIncident.short_description);
    }
}
```

Output:

```
*** Script: You have permission to write to the short
 description of: INC0009009 Unable to access the shared folder.
*** Script: You have permission to write to the short
 description of: INC0009005 Email server is down.
*** Script: You have permission to write to the short
 description of: INC0009001 Unable to post content on a Wiki
 page
```

Scoped GlideElement - changes()

Determines if the current field has been modified. This functionality is available for all available data types, except Journal fields.

Note: The *changes()* method is not supported within ACL scripts.

Note: If the GlideRecord on which you are performing this method has only been initialized and read, and has not been written, the underlying before-and-after values are the same. In this case, the method returns "false", as there has been no change to the data store.

Business rule execution

The ServiceNow AI Platform invokes business rules (*BEFORE* or *AFTER*) before resetting the internal previous values for columns (*GlideElement* objects) to the current values.

This sequence enables the following actions:

- Triggering an *AFTER* business rule on <column>.changes conditions.
- Accessing the previous *GlideRecord* object in the script section.

Even in *AFTER* business rules, `current.<field>.changes()` returns `true` because the internal previous values haven't been reset yet. The condition `current.<field>.value != previous.<field>.value` also returns `true`.

Previous values are only reset after the following activities:

- The database update is complete.
- All *AFTER* business rules have been processed.

Inside an AFTER business rule, the *changes()* method still returns `true` if the field value was modified, even though the rule executes after the update.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the fields have been changed, false if the field has not.

The following example from a business rule shows how to create an event in the EventQueue if the value of the **assigned_to** field changes. For a comprehensive example, see Sample scripts from the change events business rule.

```
if (!current.assigned_to.nil() && current.assigned_to.changes())
 {
  gs.eventQueue('incident.assigned', current,
 current.assigned_to.getDisplayValue(),
 previous.assigned_to.getDisplayValue());
}
```

Scoped GlideElement - changesFrom(Object o)

Determines if the previous value of the current field matches the specified object.

Note: If the GlideRecord on which you are performing this method has only been initialized and read, and has not been written, the underlying before-and-after values are the same. In this case, the method returns "false", as there has been no change to the data store.

Parameters

Name	Type	Description
o	Object	An object value to check against the previous value of the current field.

Returns

Type	Description
Boolean	True if the previous value matches, false if it does not.

```
// The following example shows that in a business rule, if
 "active" field is changed from true,
// insert a event in the EventQueue.
if (current.active.changesFrom(true)) {
  gs.eventQueue("incident.inactive", current,
 current.incident_state, previous.incident_state);
}
```

Scoped GlideElement - changesTo(Object o)

Determines if the new value of a field, after a change, matches the specified object.

Note: The *changesTo()* method is not supported within ACL scripts.

Note: If the GlideRecord on which you are performing this method has only been initialized and read, and has not been written, the underlying before-and-after values are the same. In this case, the method returns "false", as there has been no change to the data store.

Parameters

Name	Type	Description
o	Object	An object value to check against the new value of the current field.

Returns

Type	Description
Boolean	True if the previous value matches, false if it does not.

```
// The following example shows that in a business rule, if
 "active" field is changed to false,
// insert a event in the EventQueue.
if (current.active.changesTo(false)) {
  gs.eventQueue("incident.inactive", current,
 current.incident_state, previous.incident_state);
}
```

Scoped GlideElement - dateNumericValue()

Returns the number of milliseconds since January 1, 1970, 00:00:00 GMT for a duration field. Does not require the creation of a GlideDateTime object because the duration field is already a GlideDateTime object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Number of milliseconds since January 1, 1970, 00:00:00 GMT.

```
var inc = new GlideRecord('incident');
inc.get('17c90efb13418700cc36b1422244b05d');
gs.info(inc.calendar_duration.dateNumericValue());
```

Output:

```
98000
```

Scoped GlideElement - getAttribute(String attributeName)

Returns the value of the specified attribute from the dictionary.

If the attribute is a boolean attribute, use *`getBooleanAttribute(String)`* to get the value as a boolean rather than as a string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
attributeName	String	Attribute name

Returns

Type	Description
String	Attribute value

```
doit();
function doit() {
  var now_GR = new GlideRecord('sys_user');
  now_GR.query("user_name","admin");
  if (now_GR.next()) {
    gs.info("we got one");
    gs.info(now_GR.location.getAttribute("tree_picker"));
  }
}
```

Scoped GlideElement - getBooleanAttribute(String attributeName)

Returns the Boolean value of the specified attribute from the dictionary.

To get the value as a string, use *`getAttribute(string)`*.

Parameters

Name	Type	Description
attributeName	String	Attribute name

Returns

Type	Description
Boolean	Boolean value of the attribute. Returns false if the attribute does not exist.

The following example shows how to get Boolean values of the *`ignore_filter_on_new`* attribute for two fields.

```
var inc = new GlideRecord('incident');
inc.query();

if (inc.next())
 {
   // opened_by field has attribute "ignore_filter_on_new =
 true"

 gs.info(inc.opened_by.getBooleanAttribute("ignore_filter_on_new
"));

  // short_description field does not have attribute
 ignore_filter_on_new
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 gs.info(inc.short_description.getBooleanAttribute("ignore_filte
r_on_new"));
 }
```

Output:

```
true
false
```

Scoped GlideElement - getChoices(String dependent)

Returns the choice list for a specified field.

The field for which to return the choice list is specified in the method call. For example: `var choices = glideRecord.urgency.getChoices();`. For information on choice list field types and their associated capabilities, see Choice list field type.

Parameters

Name	Type	Description
dependent	String	Optional. Field within the associated record on which the choice list field depends.

Returns

Type	Description
Array	List of possible values for the choice list, which are the values in the Choice [sys_choice] table. If the *dependent* parameter is passed, the return results reflect only those choices available for the specified dependent field.

```
var glideRecord = new GlideRecord('incident');
glideRecord.query('priority','1');
glideRecord.next();

// urgency has choice list: 1 - High, 2 - Medium, 3 - Low, with
 value: 1, 2, 3
var choices = glideRecord.urgency.getChoices();
```

Scoped GlideElement - getChoiceValue()

Returns the choice label for the current choice.

A choice has a value (number) and a label (string). This method returns the label.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The selected choice's label.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var glideRecord = new GlideRecord('incident');
glideRecord.query('priority','1');
glideRecord.next();

// urgency has choice list: 1 - High, 2 - Medium, 3 - Low, with
 value: 1, 2, 3
var choiceLabel = glideRecord.urgency.getChoiceValue();
gs.info(choiceLabel);
```

Output:

```
1 - High
```

Scoped GlideElement - getDecryptedValue()

Returns the clear text value for Password (2 way encrypted) fields in scoped applications.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The clear text password.

```
var tablename = 'x_scoped_app_table'
var CI = new GlideRecord(tablename);
CI.addQuery('number', '0001002');
CI.query();
CI.next();

var password = CI.password_field
var decrypted = password.getDecryptedValue();
gs.info(decrypted);
```

Output:

```
x_scoped_app: cleartextpassword
```

Scoped GlideElement - getDisplayValue(Number maxCharacters)

Returns the formatted display value of a specified field from an associated GlideRecord object.

Display values are manipulated based on the actual value in the database and user or system settings and preferences.

The display value that is returned is dependent on the field type.

- Choice fields: The database value may be a number, but the display value will be more descriptive.
- Date fields: The database value is in UTC format, while the display value is based on the user's time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Encrypted text: The database value is encrypted, while the displayed value is unencrypted based on the user's encryption context.
- Reference fields: The database value is sys_id, but the display value is a display field of the referenced record.

For more information on display values, see Display values.

Parameters

Name	Type	Description
maxCharacters	Number	Optional. Maximum characters desired. Default: All

Returns

Type	Description
String	Display value of the specified field.

The following example shows how to retrieve the display value of the priority field in an incident record.

```
var glideRecord = new GlideRecord('incident');
glideRecord.query('priority','1');
glideRecord.next();
gs.info(glideRecord.priority.getDisplayValue());
```

Output:

```
1 - Critical
```

The following example shows how to retrieve both the display value and internal value of specified fields in the incident database.

```
var now_GR = new GlideRecord('incident');
now_GR.get('9c573169c611228700193229fff72400'); //INC0000001
gs.info('Display Values:');
gs.info('Opened at ' + now_GR.opened_at.getDisplayValue());
gs.info('Opened by ' + now_GR.opened_by.getDisplayValue());
gs.info('Priority ' + now_GR.priority.getDisplayValue());
gs.info('Values:');
gs.info('Opened at ' + now_GR.opened_at.getValue());
gs.info('Opened by ' + now_GR.opened_by.getValue());
gs.info('Priority ' + now_GR.priority.getValue());
```

Output:

```
Display Values:
Opened at 2022-02-01 15:09:51
Opened by Joe Employee
Priority 1 - Critical
Values:
Opened at 2022-02-01 23:09:51
Opened by 681ccaf9c0a8016400b98a06818d57c7
Priority 1
```

Scoped GlideElement - getDisplayValueLang(String language)

Gets the display value of the field in the language passed as a parameter.

The result is only applicable to translatable field types such as **Choice**, **Translated Field**, and **Translated Text**. For other field types, the result defaults to `getDisplayValue()`.

You must have the corresponding language plugin to retrieve a translated value. For information, see Activate a language.

See also Scoped GlideElement - getLabelLang(String language).

Parameters

Name	Type	Description
language	String	Language tag conforming with IETF BCP-47.

Returns

Type	Description
String	Display value of the field in the language passed. If a translation isn't available, the method retrieves a value translated in the language of the current user. If a translation isn’t available, the result defaults to English.

The following example shows how to get the original text and German-translated text from the **Accept** (UI View) title field.

```
var uiView = new GlideRecord("sys_ui_view");
uiView.get("fa776f6d97700100f309124eda2975bc");

gs.info("getDisplayValue: " +
 uiView.getElement("title").getDisplayValue());
gs.info("getDisplayValueLang: " +
 uiView.getElement("title").getDisplayValueLang("de"));
```

Output:

```
getDisplayValue: Accept
getDisplayValueLang: Akzeptieren
```

Scoped GlideElement - getED()

Returns the field's element descriptor.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideElementDescriptor	The field's element descriptor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var grInc = new GlideRecord('incident');
grInc.query('priority', '1');

var field = grInc.getElement('priority');
var ed = field.getED();
```

Scoped GlideElement - getGlobalDisplayValue()

Returns the phone number in international format.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Phone number in international format.

The following example shows how to get the phone number of a walk-up location. This example requires the Walk-up Experience plugin.

```
// Passing walkup location name and closed phone number in
 parameters
setWalkupLocPhone('Santa Clara Tech Lounge','phone_number');

function setWalkupLocPhone(locName, field) {
  var walkupLoc = new GlideRecord('wu_location_queue');
  walkupLoc.addQuery('name',locName);
  walkupLoc.query();
  walkupLoc.next();

  // Returns the phone number of walk-up location queue in
 international format
  gs.info(walkupLoc[field].getGlobalDisplayValue());
}
```

Output:

```
+91 98124 56789
```

Scoped GlideElement - getHTMLValue(Number maxChars)

Returns the HTML value of a field.

Parameters

Name	Type	Description
maxChars	Number	Optional. Maximum number of characters to return.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	HTML value for the field.

```
var inccause = new GlideRecord("incident");
inccause.short_description = current.short_description;
inccause.comments = current.comments.getHTMLValue();
inccause.insert();
```

Scoped GlideElement - getJournalEntry(Number mostRecent)

Returns either the most recent journal entry or all journal entries.

Parameters

Name	Type	Description
mostRecent	Number	If 1, returns the most recent entry. If -1, returns all journal entries.

Returns

Type	Description
String	For the most recent entry, returns a string that contains the field label, timestamp, and user display name of the journal entry. For all journal entries, returns the same information for all journal entries ever entered as a single string with each entry delimited by "\n\n".

```
//gets all journal entries as a string where each entry is
 delimited by '\n\n'
var notes = current.work_notes.getJournalEntry(-1);
//stores each entry into an array of strings
var na = notes.split("\n\n");

for (var i = 0; i < na.length; i++)
  gs.info(na[i]);
```

Scoped GlideElement - getLabel()

Returns the object label.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Object label

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var now_GR = new GlideRecord("sc_req_item");
now_GR.addQuery("request", current.sysapproval);
now_GR.query();
while(now_GR.next()) {
var nicePrice = now_GR.price.toString();
    if (nicePrice != ) {
        nicePrice = parseFloat(nicePrice);
        nicePrice = nicePrice.toFixed(2);
    }
    template.print(now_GR.number + ":  " + now_GR.quantity + " X
 " + now_GR.cat_item.getDisplayValue() + " at $" + nicePrice + "
 each \n");
    template.print("    Options:\n");
    var variables = now_GR.variables.getElements();
    for (var key in variables) {
      var now_V = variables[key];
      if(now_V.getQuestion().getLabel() != ) {
         template.space(4);
         template.print('     ' +
 now_V.getQuestion().getLabel() + " = " +
 now_V.getDisplayValue() + "\n");
      }
    }
}
```

Scoped GlideElement - getLabelLang(String language)

Gets the label value of the field in the language passed as a parameter.

You must have the corresponding language plugin to retrieve a translated value. For information, see Activate a language.

See also:

- getDisplayValueLang()
- getLabel()

Parameters

Name	Type	Description
language	String	Language tag conforming with IETF BCP-47.

Returns

Type	Description
String	Value of the field label in the language passed. If a translation isn't available, the method retrieves a value translated in the language of the current user. If a translation isn’t available, the result defaults to English.

The following example shows how to get the original label text and its German translation of the **Accept** (UI View) title.

```
var uiView = new GlideRecord("sys_ui_view");
uiView.get("fa776f6d97700100f309124eda2975bc");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info("getLabel: " + uiView.getElement("title").getLabel());
gs.info("getLabelLang: " +
 uiView.getElement("title").getLabelLang("de"));
```

Output:

```
getLabel: Title
getLabelLang: Titel
```

Scoped GlideElement - getName()

Returns the name of the field.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Field name.

The following example shows how to get the name and other values for each field in a sys_user record.

```
var userRec = new GlideRecord("sys_user"); // GlideRecord to
 sys_user table

userRec.get("5137153cc611227c000bbd1bd8cd2005"); // Sys Id of
 user: Fred Luddy

var fields = userRec.getFields();

for (var i = 0; i < fields.size(); i++) {

    var field = fields.get(i);
    var name = field.getName(); // Name of the field
    var label = field.getLabel(); // Label of the field
    var value = field.getDisplayValue(); // Value of the field

    gs.info((Number(i) + 1) + ".\n" + "Field Label: " + label +
 "\n" + "Field Name: " + name + "\n" + "Field Value: " + value);

};
```

Output. Results include 62 fields and have been truncated with ellipsis points (...) to save space.

```
*** Script: 1.
Field Label: Country code
Field Name: country
Field Value:
*** Script: 2.
Field Label: Calendar integration
Field Name: calendar_integration
Field Value: Outlook

```

Scoped GlideElement - getReferenceTable()

Gets the table name for a reference element.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Table name of the reference.

```
var grINC = new GlideRecord('incident');
grINC.query('number','INC0010041'); // record assignment group
 assigned to "CAB Approval"
if (grINC.next()) {
  // Get the table name
  var tableName = grINC.assignment_group.getReferenceTable();
  gs.info( tableName );
}
```

Scoped GlideElement - getRefRecord()

Returns a GlideRecord object for a given reference element.

For calculated fields, this method fetches the referenced record and runs a calculation on a scripted default value.

Warning: If the reference element does not contain a value, it returns an empty GlideRecord object, not a NULL object.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideRecord	A GlideRecord object

```
var grINC = new GlideRecord('incident');
grINC.addNotNullQuery('caller_id');
grINC.query();
if (grINC.next()) {

// Get a GlideRecord object for the referenced sys_user record
var grUSER = grINC.caller_id.getRefRecord();
if (grUSER.isValidRecord())
  gs.info(grUSER.getValue('name'));

}
```

Scoped GlideElement - getTableName()

Returns the name of the table on which the field resides.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the table. The returned value may be different from the table Class that the record is in. See Tables and Classes in the product documentation.

```
if (current.approver.getTableName() == "sysapproval_approver") {
  if (current.approver == email.from_sys_id)  {
     current.comments = "reply from: " + email.from + "\n\n" +
 email.body_text;

   // if it's been cancelled, it's cancelled.
  var doit = true;
  if (current.state=='cancelled')
      doit = false;

  if (email.body.state != undefined)
     current.state= email.body.state;

   if (doit)
      current.update();
} else {
   gs.log("Approval for task
 ("+current.sysapproval.getDisplayValue()+") rejected because

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            email( "+email.from+") does not match the approver
 ("+current.approver.getDisplayValue()+")");
}

}
```

Scoped GlideElement - nil()

Determines if a field is null.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the field is null. Possible values: • true: Field is null. • false: Field is not null.

```
var glideRecord = new GlideRecord('incident');
glideRecord.query('priority','1');
glideRecord.next();
gs.info(glideRecord.state.nil());
```

Output:

```
false
```

Scoped GlideElement - setDateNumericValue(Number milliseconds)

Sets the value of a date/time element to the specified number of milliseconds since January 1, 1970 00:00:00 GMT.

When called, *`setDateNumericValue()`* automatically creates the necessary GlideDateTime/GlideDate/GlideDuration object, and then sets the element to the specified value.

Note: Before calling this method, the element must already exist by querying an existing record or by using the *`now_GR.initialize()`* method to initialize a new record.

Parameters

Name	Type	Description
milliseconds	Number	Number of milliseconds since 1/1/1970

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var now_GR = new GlideRecord("incident");
now_GR.initialize();
now_GR.opened_at.setDateNumericValue(10000);
```

Scoped GlideElement - setDisplayValue(Object value)

Sets the display value of the field.

Parameters

Name	Type	Description
value	Object	The value to set for the field.

Returns

Type	Description
void	

```
var glideRecord = new GlideRecord('incident');
glideRecord.query('priority','1');
glideRecord.next();

//change the urgency to 3
glideRecord.urgency.setDisplayValue('3 - Low');
gs.info(glideRecord.urgency);
```

Scoped GlideElement - setError(String errorMessage)

Adds an error message. Available in Fuji patch 3.

Parameters

Name	Type	Description
errorMessage	String	The error message.

Returns

Type	Description
void	

```
var glideRecord = new GlideRecord('incident');
glideRecord.query('priority','1');
glideRecord.next();

glideRecord.short_description.setError('Error text');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideElement - setPhoneNumber(Object phoneNumber, Boolean strict)

Sets the field to the specified phone number.

This method is only available on a phone number GlideElement.

Parameters

Name	Type	Description
phoneNumber	Object	The phone number to set. This can be in either the international or local format.
strict	Boolean	When true, specifies that the number specified must match the correct format. When false, the system attempts to correct an improperly formatted phone number.

Returns

Type	Description
Boolean	Flag that indicates whether the phone number value was set. Possible values: • true: Value was set. • false: Value was not set.

The following example shows how to set the phone number of a walk-up location. This example requires the Walk-up Experience plugin.

```
setWalkupLocPhone('Santa Clara Tech Lounge','+91 9812456789');

function setWalkupLocPhone(locName, phoneNumber) {
  var walkupLoc = new GlideRecord('wu_location_queue');
  walkupLoc.addQuery('name', locName);
  walkupLoc.query();
  walkupLoc.next();

  // Set phone number of walk-up location
  var isPhoneNumberSet =
 walkupLoc.phone_number.setPhoneNumber(phoneNumber, true);
  walkupLoc.update();
  gs.info('Phone Number: ' + walkupLoc.phone_number);
  gs.info('Is phone number specified match the correct format: '
 + isPhoneNumberSet);
}
```

Output:

```
Phone Number: +919812456789
Is phone number specified match the correct format: true
```

Scoped GlideElement - setValue(Object value)

Sets the value of a field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Before calling this method, the element must already exist by querying an existing record or by using the *now_GR.initialize()* method to initialize a new record.

Not for authentication with password2 fields

The *setValue()* method passes password2 data as clear text, which results in an error about expecting encrypted data. Additionally, using the setValue() method for password2 fields exposes data that should be encrypted.

For password2 authentication, use the *setDisplayValue()* method instead.

See also:

- Deprecate GlideEncrypter usage of 3DES for password2 fields
- Alternatives to GlideEncrypter usage in knowledge base article KB1320986
- Password2 encryption with the Key Management Framework (KMF)

Parameters

Name	Type	Description
value	Object	Object value to set the field to.

Returns

Type	Description
None	

Set the value passing a string.

```
var glideRecord = new GlideRecord('incident');
glideRecord.query('priority','1');
glideRecord.next();
glideRecord.short_description.setValue('Network failure');
```

Set the value passing an object.

```
var now_GR  = new GlideRecord('student');
now_GR.initialize();
now_GR.setValue('first_name', 'Joe');
now_GR.setValue('last_name', 'Smith');
now_GR.insert();
```

Scoped GlideElement - toString()

Converts the value of a GlideRecord field to a string.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Value as a string.

```
var glideRecord = new GlideRecord('incident');
glideRecord.query('priority','1');
glideRecord.next();
gs.info(glideRecord.opened_at.toString());
```

Output:

```
2019-08-31 23:09:51
```

GlideElementCurrency2 - Scoped

The *GlideElementCurrency2* API provides methods to perform operations on Foreign Exchange (FX) Currency fields (also known as Currency2) within the current GlideRecord.

This API provides methods that enable you to perform the following:

- Obtain the FX Currency field display string, as entered by the user.
- Obtain the display value of an FX Currency field.
- Obtain the reference currency value of an FX Currency field.
- Obtain the session currency value of an FX Currency field.
- Set the display value of an FX Currency field.

The *GlideElementCurrency2* class has no constructor.

GlideElementCurrency2 - getAsEnteredDisplayValue()

Returns an FX Currency field display string, as entered by the user, from the associated GlideRecord.

For additional information on FX Currency fields, see Setting up and operating FX Currency fields.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Display currency string as entered by the user.

This example shows how to call the method.

```
var tablename = 'my_currency2_table';
var setcur2 = new GlideRecord(tablename);
setcur2.initialize();
setcur2.currency_2_field.setDisplayValue('JPY;999999.1234');
setcur2.insert();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info('As entered display value: ' +
 setcur2.currency_2_field.getAsEnteredDisplayValue());
```

Output:

```
As entered display value: ¥999,999.12
```

GlideElementCurrency2 - getDisplayValue()

Returns the display value of an FX Currency field within the associated GlideRecord.

Depending on how the display_value is set in the FX Currency Configuration [fx_configuration] table, the returned value may be the:

- Currency value as entered by the user
- Currency value converted to the session currency (based on the user's locale)
- Currency value converted to the reference currency

For additional information on FX Currency and the configuration table, see Configure FX Currency global settings.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Display currency value

This example shows how to call the method.

```
var tablename = 'my_FXcurrency_table';
var setcur2 = new GlideRecord(tablename);
setcur2.initialize();
setcur2.currency_2_field.setDisplayValue('JPY;999999.1234');
setcur2.insert();
gs.info('Display Value: ' +
 setcur2.currency_2_field.getDisplayValue());
```

Output:

```
Display Value: ¥999,999.12
```

GlideElementCurrency2 - getReferenceDisplayValue()

Returns the reference currency value of an FX Currency field within the associated GlideRecord.

Reference currency is the common currency into which all currency values in a field are converted. The currency code that the *`getReferenceDisplayValue()`* method uses to derive the reference currency is based on the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If an instance record exists, then the method uses the value in the reference_currency field of the FX Currency [fx_currency2_instance] table.
- If an instance record does not exist, then the method uses the reference currency that would be set on the instance record when the instance record is eventually created (in the following order):
  - If set, the *reference_currency* in the FX Currency Configuration [fx_configuration] table.
  - If set, the *reference_currency_source* in the FX Currency Configuration [fx_configuration] table.
  - System default, system reference currency.

For additional information on the values in the FX Currency Configuration [fx_configuration] table, see Setting up and operating FX Currency fields.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Reference currency amount for the associated FX Currency display value.

This example assumes the reference currency code is USD and uses the default conversion rate specified in the FX Currency Configuration [fx_configuration] table. The output will change based on locale.

```
var tablename = 'my_currency2_table';
var setcur2 = new GlideRecord(tablename);
setcur2.initialize();
setcur2.currency_2_field.setDisplayValue('JPY;999999.1234');
setcur2.insert();
gs.info('Reference display value: ' +
 setcur2.currency_2_field.getReferenceDisplayValue());
```

Output:

```
Reference display value: $8,677.99
```

GlideElementCurrency2 - getSessionDisplayValue()

Returns the session currency value of the associated FX Currency field within the current GlideRecord.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Currency value converted to the session currency, which is based on the current user's locale.

This example assumes the session locale is language code = eng and country code = USA, and uses the default conversion rate specified in the FX Currency Configuration [fx_configuration] table. The output will change based on locale.

```
var tablename = 'my_currency2_table';
var setcur2 = new GlideRecord(tablename);
setcur2.initialize();
setcur2.currency_2_field.setDisplayValue('JPY;999999.1234');
setcur2.insert();
gs.info('Session display value: ' +
 setcur2.currency_2_field.getSessionDisplayValue());
```

Output:

```
Session display value: $8,677.99
```

GlideElementCurrency2 - setDisplayValue(String displayValue)

Sets the display value of an FX Currency field with the specified currency value.

For additional information on FX Currency fields, see Setting up and operating FX Currency fields.

Parameters

Name	Type	Description
displayValue	String	Value to set in the FX Currency field in the format `<currency code>;<currency amount>`. You must format the `<currency amount>` field in the user's locale. For example, if the user's locale is USA/eng, the passed in `<currency amount>` would be 123.45. If the user's local is FRA/fre, the passed in `<currency amount>` would be 123,45.

Returns

Type	Description
void	

This example shows how to call the method.

```
var tablename = 'my_FXcurrency_table';
var setcur2 = new GlideRecord(tablename);
setcur2.initialize();
setcur2.currency_2_field.setDisplayValue('JPY;999,999.1234');
setcur2.insert();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideElementDescriptor - Scoped, Global

The *GlideElementDescriptor* API provides information about individual fields in a glide record.

There is no constructor for this class. Use the *GlideElement* or *GlideRecord* *getED()* method to obtain a GlideElementDescriptor object.

GlideElementDescriptor - getAttachmentEncryptionType()

Returns the encryption type used for attachments on the element's table.

This method is for use with the Edge Encryption plugin.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The encryption type used on attachments. Returns null if attachments on the element's table are not being encrypted.

```
var grInc = new GlideRecord('incident');
grInc.query('priority', '1');

var field = grInc.getElement('priority');
var ed = field.getED();

var isEdge = ed.getAttachmentEncryptionType();
gs.info(isEdge);
```

Output:

```
null
```

GlideElementDescriptor - getEncryptionType()

Returns the element's encryption type.

This method is for use with the Edge Encryption plugin.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The element's encryption type. Returns null if the element is not encrypted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var grInc = new GlideRecord('incident');
grInc.query('priority', '1');

var field = grInc.getElement('priority');
var ed = field.getED();

sEdge = ed.getEncryptionType();
gs.info(isEdge);
```

Output:

```
null
```

GlideElementDescriptor - getInternalType()

Returns the element's internal data type.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The element's internal data type. Possible values: • boolean • char • collection • conditions • date • decimal • documentation_field • domain_id • due_date • email • field_name • file_attachment • float • glide_date • glide_date_time • glide_duration • glide_list • GUID • html

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• image • integer • long • longint • multi_two_lines • journal • journal_input • numeric • order_index • password • ph_number • reference • script • script_plain • string • sys_class_name • table_name • template_value • timer • translated_field • url • user_image • user_input • user_roles • video • workflow

```
var grInc = new GlideRecord('incident');
grInc.query('priority', '1');

var field = grInc.getElement('priority');
var ed = field.getED();

var isEdge = ed.getInternalType();
gs.info(isEdge);
```

Output:

```
integer
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideElementDescriptor - getLabel()

Returns the element's label.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The element's label.

```
var grInc = new GlideRecord('incident');
grInc.query('priority', '1');

var field = grInc.getElement('priority');
var ed = field.getED();

var isEdge = ed.getLabel();
gs.info(isEdge);
```

Output:

```
Priority
```

GlideElementDescriptor - getLength()

Returns the element's length.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The element's size.

```
var grInc = new GlideRecord('incident');
grInc.query('priority', '1');

var field = grInc.getElement('priority');
var ed = field.getED();

var isEdge = ed.getLength();
gs.info(isEdge);
```

Output:

```
40
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideElementDescriptor - getName()

Returns the element's name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The element's name.

```
var grInc = new GlideRecord('incident');
grInc.query('priority', '1');

var field = grInc.getElement('priority');
var ed = field.getED();

var isEdge = ed.getName();
gs.info(isEdge);
```

Output:

```
priority
```

GlideElementDescriptor - getPlural()

Returns the element's plural label.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The element's plural label.

```
var now_GR = new GlideRecord('incident');
now_GR.query();
var ed = now_GR.getED();
gs.info(ed.getPlural());
```

Output:

```
Incidents
```

GlideElementDescriptor - hasAttachmentsEncrypted()

Returns true if an encrypted attachment has been added to the table.

This method is for use with the Edge Encryption plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if an encrypted attachment has been added to the table.

```
var grInc = new GlideRecord('incident');
grInc.query('priority', '1');

var field = grInc.getElement('priority');
var ed = field.getED();

var isEdge = ed.hasAttachmentsEncrypted();
gs.info(isEdge);
```

Output:

```
false
```

GlideElementDescriptor - isAutoOrSysID()

Returns true if the element is an automatically generated or system field.

Automatically generated and system fields cannot be encrypted. This method is for use with the Edge Encryption plugin.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the element is automatically generated or a system field.

```
var grInc = new GlideRecord('incident');
grInc.query('priority', '1');
var field = grInc.getElement('priority');
var ed = field.getED();

isEdge = ed.isAutoOrSysID();
gs.info(isEdge);
```

Output:

```
false
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideElementDescriptor - isChoiceTable()

Returns true if the element is defined as a dropdown choice in its dictionary definition.

Choice fields cannnot be encrypted.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if the element is defined as a dropdown choice. Returns true even if there are no entries defined in the choice table. The last choice type, suggestion, does not return true.

```
var grInc = new GlideRecord('incident');
grInc.query('priority', '1');

var field = grInc.getElement('priority');
var ed = field.getED();

var isChoiceTable = ed.isChoiceTable();
gs.info(isChoiceTable);
```

Output:

```
true
```

GlideElementDescriptor - isEdgeEncrypted()

Returns true if an element is encrypted.

This method is for use with the Edge Encryption plugin.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if the element is encrypted, false otherwise.

```
var grInc = new GlideRecord('incident');
grInc.query('priority', '1');

var field = grInc.getElement('priority');
var ed = field.getED();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var isEdge = ed.isEdgeEncrypted();
gs.info(isEdge)
```

Output:

```
false
```

GlideElementDescriptor - isMandatory()

Determines whether the element is mandatory and must contain a value before the record can be saved.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the associated element is mandatory and must contain a value before the record containing the element can be saved. Possible values: • true: element must contain a value; mandatory field • false: element does not have to contain a value

This example shows how to check whether the name field is mandatory.

```
var isRecordValid;
var now_GR = new GlideRecord('my_table');
var field = now_GR.getElement('name');
var elementDescriptor = field.getED();
now_GR.query();
while (now_GR.next()) {
if (elementDescriptor.isMandatory() && !now_GR.name) {
       isRecordValid = false;
  }
}
```

GlideElementDescriptor - isVirtual()

Returns true if the element is a virtual element.

A virtual element is a calculated field as set by the dictionary definition of the field. Virtual fields cannot be encrypted.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Returns true if the element is a virtual element.

```
var grInc = new GlideRecord('incident');
grInc.query('priority', '1');

var field = grInc.getElement('priority');
var ed = field.getED();

var isVirtual = ed.isVirtual();
gs.info(isVirtual);
```

Output:

```
false
```

GlideElementDynamicAttributeStore - Global

The *GlideElementDynamicAttributeStore* API provides convenient script methods for managing dynamic attributes in the current glide record. Use these methods in conjunction with the *GlideRecord* API to get and set defined dynamic attribute values.

To use this API to create dynamic attributes you must have the dynamic_schema_writer role. To read dynamic data using this API you must have the dynamic_schema_reader role.

This API extends the GlideElement - Global API.

For more information on dynamic attributes, see Dynamic Schema.

GlideElementDynamicAttributeStore - getDynamicAttribute(String attributePath)

Returns a GlideElementDynamicAttribute object representing the dynamic attribute located at the specified dynamic attribute path.

Parameters

Name	Type	Description
attributePath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideElementDynamicAttributeObject	Object that contains the specified dynamic attributes. If the *attributePath* parameter contains invalid information, returns a null.

The following code example shows how to call this method.

```
//Gets all the values of the make attribute from the
 u_inc_dynamic_schema dynamic attribute store column on the
 incident table
var gr_Inc = new GlideRecord('incident');
gr_Inc.query();
while(gr_Inc.next()) {
    var attr =
 gr.getDynamicAttribute('inc_dynamic_schema->cars->make');
    gs.info(attr.getValue());
}

//You can also use if(gr_Inc.next()) if you don't want all the
 values
var gr_Inc = new GlideRecord('incident');
gr_Inc.query();
if(gr_Inc.next()) {
    var attr =
 gr_Inc.getDynamicAttribute('inc_dynamic_schema->cars->make');
    gs.info(attr.getValue());
}
```

GlideElementDynamicAttributeStore - getDynamicAttributeDisplayValue(String attributePath)

Returns the display value of the dynamic attribute located at a specified attribute path within a dynamic attribute store. If a display value is not available, it returns the internal value.

Parameters

Name	Type	Description
attributePath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Value for the associated dynamic attribute in human-readable format. If the *attributePath* parameter contains invalid information, returns a null.

The following code example shows how to call this method.

```
//Gets all the display values of the luxury attribute from
 the inc_dynamic_schema dynamic attribute store column on the
 incident table
var gr_Inc = new GlideRecord('incident');
gr_Inc.query();
while(gr_Inc.next()) {
    var attr =
 gr_Inc.getDynamicAttributeDisplayValue('inc_dynamic_schema->ca
rs->luxury');
    gs.info(attr);
}

//You can also use if(gr.next()) if you don't want all the
 values
var gr_Inc = new GlideRecord('incident');
gr_Inc.query();

if(gr_Inc.next()) {
    var attr =
 gr_Inc.getDynamicAttributeDisplayValue('inc_dynamic_schema->ca
rs->luxury');
    gs.info(attr);
}
```

GlideElementDynamicAttributeStore - getDynamicAttributeValue(String attributePath)

Returns the internal value of the dynamic attribute pointed to by a passed-in attribute path within a dynamic attribute store.

For more information on dynamic attributes, see Dynamic Schema.

Parameters

Name	Type	Description
attributePath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`

Returns

Type	Description
Object	Value of the dynamic attribute pointed to by the passed attribute path. If the *attributePath* parameter contains invalid information, returns a null.

The following code example shows how to call this method.

```
var gr_Inc = new GlideRecord('incident');
gr_Inc.query();

while(gr_Inc.next()) {
    var attr =
 gr_Inc.getDynamicAttributeValue('inc_dynamic_schema->cars->luxu
ry');
    gs.info(attr);
}
```

Output:

```

*** Script: 1
```

GlideElementDynamicAttributeStore - setDynamicAttributeValue(String attributePath, Object value)

Sets the attribute pointed to by a specified attribute path in a dynamic attribute store to a specified value.

For more information on dynamic attributes, see Dynamic Schema.

Parameters

Name	Type	Description
attributePath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`
value	Object	Value to set in the specified attribute. **Note:** For dynamic attributes, only the following data types are supported: • Boolean (True/False) • Decimal • Floating Point Number • GlideDate • GlideDateTime • Integer • String

Returns

Type	Description
GlideElementDynamicAttributeStore	A GlideElementDynamicAttributeStore object containing the specified value. If the *groupAttributePath* parameter contains invalid information, the attribute is not updated.

The following code example shows how to call this method.

```
//This simple example inserts a make attribute on the
 inc_dynamic_schema column where the value of the make attribute
 is Ford.
var gr_Inc = new GlideRecord('incident');
gr_Inc.setDynamicAttributeValue('inc_dynamic_schema->cars->mak
e', 'Ford');
gr_Inc.insert();
```

GlideElementDynamicAttributeStore - setDynamicAttributeValues(GlideDynamicAttributeStore values)

Sets the values specified in the passed GlideElementDynamicAttrbuteStore object in the dynamic attribute store of the current GlideRecord element. The current element's data type must be set to **Dynamic Attribute Store**.

For more information on dynamic attributes, see Dynamic Schema.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
values	GlideDynamicAttributeStore	Object that contains the values to set in the current element's dynamic schema. Values not specified in this object are not updated.

Returns

Type	Description
GlideElementDynamicAttributeStore	Updated GlideElementDynamicAttributeStore object.

The following code example shows how to call this method.

```
var gr_Inc = new GlideRecord('incident');
var das = new GlideDynamicAttributeStore();
das.setDynamicAttributeValue("cars->color", "black");
das.setDynamicAttributeValue("cars->make","Honda");
das.setDynamicAttributeValue("cars->model","CRV");
gr_Inc.setDynamicAttributeValues('inc_dynamic_schema', das);
gr_Inc.insert();
```

This code example inserts the following in the u_inc_dynamic_schema column:

```
{
  "cars" : {
    "color" : "black",
    "make" : "Honda",
    "model" : "CRV"
  }
}
```

GlideElementDynamicAttributeStore - setDynamicAttributeDisplayValue(String attributePath)

Sets the display value of the dynamic attribute located at a specified path within the dynamic attribute store of the current GlideRecord element.

Parameters

Name	Type	Description
attributePath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For example: `"car->color"`
value	Object	Value to set in the current dynamic attribute element. The passed value must be of one of the following data types: • Boolean (True/False) • Decimal • Floating Point Number • GlideDate • GlideDateTime • Integer • String

Returns

Type	Description
GlideElementDynamicAttributeState	Object that contains the updated glide element.

The following code example shows how to call this method.

```
var grFleet = new GlideRecord('u_car_fleet');
grFleet.setDynamicAttributeValue('u_dyn_attr_store',
 'car->color', 'Yellow');
grFleet.setDynamicAttributeValue('u_dyn_attr_store',
 'car->make', 'Ford');
var sysId = grFleet.insert();
gs.info("Inserted: " + grFleet.u_dyn_attr_store);

var daStore = new GlideDynamicAttributeStore();
daStore.setDynamicAttributeValue('car->color', 'Green');
daStore.setDynamicAttributeValue('car->model', 'Bronco');

var geDynAttrStore = grFleet.getElement('u_dyn_attr_store');
geDynAttrStore.setDynamicAttributeDisplayValues(daStore);
grFleet.update();
gs.info("Updated:  " + grFleet.u_dyn_attr_store);
```

Output:

```
*** Script: Inserted: {"car":{"color":"Yellow","make":"Ford"}}
*** Script: Updated:
 {"car":{"color":"Green","make":"Ford","model":"Bronco"}}
```

The following code example shows how a Boolean display value is stored as "1" but is passed back as "true".

```
 var gr_Inc = new GlideRecord('incident');
gr_Inc.setDynamicAttributeDisplayValue('u_inc_dynamic_schema->u_
cars->u_luxury', '1');
gr_Inc.insert()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returned value:

```
{
  "u_cars" : {
    "u_luxury" : "true"
  }
}
```

GlideElementDynamicAttributeStore - setDynamicAttributeDisplayValues(GlideDynamicAttributeStore values)

Sets the display values specified in the passed GlideDynamicAttrbuteStore object in the dynamic attributes of the current GlideRecord element. The current element's data type must be set to **Dynamic Attribute Store** in the associated table.

Parameters

Name	Type	Description
values	GlideDynamicAttributeStore	Object that contains the display values to set in the current element's dynamic attribute store. Display values not specified in this object are not updated. This object must contain both the attribute path and the display value for each attribute to store. For example: `{ "car":{ "color":"Blue", "make":"Ford", "model":"Mustang" } }`

Returns

Type	Description
GlideElementDynamicAttributeStore	Object that contains the updated glide element.

The following code example shows how to call this method.

```
var daStore = new GlideDynamicAttributeStore();
daStore.setDynamicAttributeValue('car->make', 'Ford');
daStore.setDynamicAttributeValue('car->model', 'Mustang');
daStore.setDynamicAttributeValue('car->color', 'Blue');
gs.info("daStore: " + daStore);

var gr_Car = new GlideRecord('u_car_fleet');
gr_Car.query();
while(gr_Car.next()) {
  var glideElement = gr_Car.getElement('u_dyn_attr_store');
  glideElement.setDynamicAttributeValues(daStore);
  gr_Car.update();
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideEmailOutbound - Scoped

The scoped *GlideEmailOutbound* API implements the email object for scoped applications. You can use the *GlideEmailOutbound* methods with the email global object available in mail scripts. The email object behaves identically for global and scoped applications.

GlideEmailOutbound - GlideEmailOutbound()

Instantiates a scoped GlideEmailOutbound object.

Parameters

Name	Type	Description
None		

GlideEmailOutbound - addAddress(String type, String address)

Adds the address to either the cc or bcc list.

Parameters

Name	Type	Description
type	String	Either cc or bcc, determines the list to which the address is added.
address	String	The recipient's email address.

Returns

Type	Description
void	

```
email.addAddress('cc', 'joe.employee@something.com');
```

GlideEmailOutbound - addAddress(String type, String address, String displayName)

Adds the recipient to either the cc or bcc list, but uses the display name instead of the address when showing the recipient.

Parameters

Name	Type	Description
type	String	Either cc or bcc, determines the list to which the address is added.
address	String	The recipient's email address.
displayName	String	The name to be shown instead of the email address.

Returns

Type	Description
void	

```
email.addAddress('bcc', 'joe.employee@something.com', 'dudley
 rocks');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideEmailOutbound - getSubject()

Returns the email's subject line.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The email's subject line.

GlideEmailOutbound - getWatermark()

Returns the email's watermark.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The email's watermark.

```
var watermark = email.getWatermark();
```

GlideEmailOutbound - setBody(String bodyText)

Sets the body of the email.

Parameters

Name	Type	Description
bodyText	String	The body of the email.

Returns

Type	Description
void	

```
email.setBody('Dear Sir, ...');
```

GlideEmailOutbound - setFrom(String address)

Sets the sender's address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
address	String	The sender's email address.

Returns

Type	Description
void	

```
email.setFrom('joe.employee@something.com');
```

GlideEmailOutbound - setReplyTo(String address)

Sets the reply to address.

Parameters

Name	Type	Description
address	String	The reply to email address.

Returns

Type	Description
void	

```
email.setReplyTo('joe.employee@something.com');
```

GlideEmailOutbound - setSubject(String subject)

Sets the email's subject line.

Parameters

Name	Type	Description
subject	String	Text for the subject line.

Returns

Type	Description
void	

```
email.setSubject('Important Issues to discuss');
```

GlideEncrypter - Global (deprecated)

The `GlideEncrypter` API provides methods to encrypt and decrypt strings using the Triple DES algorithm.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The `GlideEncrypter` API uses the three-key Triple DES encryption standard which NIST 800-131A Rev 2 has recommended against using to encrypt data after 2023. Please take a moment to review the information below.

- Starting with the Xanadu family release, the `GlideEncrypter` API is not recommended for use, as this API is deprecated according to NIST guidelines. With the Zurich release, the GlideEncrypter API will be upgraded to automatically use Key Management Framework.
- New instance installations and re-installations using the GlideEncrypter API in the ServiceNow AI Platform will not be permitted in the Zurich release planned for September 2025. Use the Instance Scan to identify where GlideEncrypter is used on your instance. Find this tool on your instance by navigating to **Instance Scan** > **Suites** > **GlideEncrypter**.
- Review the following Knowledge Base article for migration guidance to the applicable replacement solution based on your current use case: Alternatives to deprecated GlideEncrypter APIs.

If the `GlideEncrypter` API is no longer used on your instance, you may deprecate 3DES. For details, see Prepare your instance for GlideEncrypter deprecation.

You can use this API in server scripts in the global scope. The `GlideEncrypter` class has two constructors:

- `GlideEncrypter()`
- `GlideEncrypter(String key)`

GlideEncrypter - GlideEncrypter()

Creates an instance of the GlideEncrypter class using a default (static) encryption key.

Parameters

Name	Type	Description
None		

```
var encr = new GlideEncrypter();
```

GlideEncrypter - GlideEncrypter(String key)

Creates an instance of the GlideEncrypter class using a given encryption key.

Parameters

Name	Type	Description
key	String	Your encryption key must be exactly 24 characters. A key longer than 24 characters will be truncated.

```
var encr = new GlideEncrypter(myKey);
```

GlideEncrypter - decrypt(String encryptedString)

Decrypts a clear string using the Triple DES algorithm.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
encryptedString	String	String to be decrypted.

Returns

Type	Description
String	Clear text string.

```
var encr = new GlideEncrypter();
var clearString = 'abcdefg';
var encrString = encr.encrypt(clearString);
var decrString = encr.decrypt(encrString);
gs.print("Decrypted string = " + decrString);
```

Output:

```
Decrypted string = abcdefg
```

GlideEncrypter - encrypt(String clearString)

Encrypts a clear string using the Triple DES algorithm.

Parameters

Name	Type	Description
clearString	String	String to be encrypted.

Returns

Type	Description
String	Encrypted string.

```
var encr = new GlideEncrypter();
var clearString = 'abcdefg';
var encrString = encr.encrypt(clearString);
gs.print("Encrypted string = " + encrString);
```

Output:

```
Encrypted string = 3wjpvKtUIi4=
```

GlideEventManager - Global

The *GlideEventManager* API provides methods to process events.

For information on creating an event queue, see Creating custom queues to process events.

GlideEventManager - GlideEventManager(String queueName)

Instantiates a *GlideEventManager* object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
queueName	String	Name of a queue for an event listed in the Event Registry [sysevent_register] table. If no queue is provided, *GlideEventManager* processes against the default queue.

The following example shows how to instantiate a *GlideEventManager* object.

```
var eventMgr = new GlideEventManager('my_queue');
```

GlideEventManager - process(Number limit)

Processes the eligible events in a queue.

You can use the *limit* parameter to identify a range of process_on times for events in the queue and it isn't a hard limit. For example, if the limit is 10, the system looks for the 10 oldest pending process_on times. If multiple events have the same process_on time, more than 10 events might be claimed (that is, ready to process).

Parameters

Name	Type	Description
limit	Number	Optional. Limits the number of events claimed. If this value isn't passed, no limit is applied.

Returns

Type	Description
None	

The following example shows how to limit the number of events processed to roughly 200.

```
GlideEventManager('my_event_queue').process(200);
```

GlideScopedEvaluator - Global

The *GlideScopedEvaluator* API allows you to evaluate scripts in a GlideRecord field from both scoped and global server scripts.

This API evaluates scripts within the script field type. The scope of the record defines the scope of the script.

GlideScopedEvaluator - GlideScopedEvaluator()

Instantiates a GlideScopedEvaluator object.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the *GlideScopedEvaluator()* method in a scoped application, use the corresponding scoped method: GlideScopedEvaluator().

GlideScopedEvaluator - evaluateScript(GlideRecord grObj, String scriptField, Object variables)

Evaluates a script from a GlideRecord field.

Parameters

Name	Type	Description
grObj	GlideRecord	The GlideRecord containing a script expression.
scriptField	String	(Optional) The name of the field containing the script expression.
variables	Object	(Optional) A map of variables with name-value pairs. These variables are available to the script during execution of this method.

Returns

Type	Description
Object	The result of the script execution.

```
//For this example, we created a table: "x_app_table" with two
 columns: "short_description", "test_script"
// "test_script" will store the script to be evaluated by
 GlideScopedEvaluator.
var now_GR = new GlideRecord('x_app_table');
now_GR.short_description = 'Testing GlideScopedEvaluator';
now_GR.test_script = "gs.getUser().getName() + ' says ' +
 greeting; ";
now_GR.insert();

//setup variables to be used by the script
var vars = {'greeting' : 'hello'};

//Evaluate the script from the field
var evaluator = new GlideScopedEvaluator();
gs.info(evaluator.evaluateScript(now_GR, 'test_script', vars));

// Now retrieve the result
evaluator.evaluateScript(gr, 'u_test_script', null);
gs.info(evaluator.getVariable('result'));
```

Output:

```
admin says hello
```

Scoped equivalent

To use the *evaluateScript()* method in a scoped application, use the corresponding scoped method: evaluateScript().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideScopedEvaluator - getVariable(String name)

Returns a variable from a GlideScopedEvaluator object.

Parameters

Name	Type	Description
name	String	The name of the variable.

Returns

Type	Description
Object	The value of the specified variable.

```
//setting up a record that contains the script to be executed.
var now_GR = new GlideRecord('global');
now_GR.u_short_description = 'Calculate Addition';
now_GR.u_test_script = "result = x + y";
evaluator.evaluateScript(now_GR, "script")
now_GR.insert();

var evaluator = new GlideScopedEvaluator();
evaluator.putVariable('x', 100);
evaluator.putVariable('y', 200);
evaluator.putVariable('result', null);
evaluator.evaluateScript(now_GR, "script")
now_GR.insert();
```

Output:

```
300
```

Scoped equivalent

To use the *getVariable()* method in a scoped application, use the corresponding scoped method: getVariable().

GlideScopedEvaluator - putVariable(String name, Object value)

Puts a variable into the *GlideScopedEvaluator* object. These variables are available to the script that this GlideScopedEvaluator object runs.

Parameters

Name	Type	Description
name	String	The name of the variable.
value	Object	The value of the variable.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//setting up a record that contains the script to be executed.
var now_GR = new GlideRecord('u_global_table');
now_GR.u_short_description = 'Calculate Addition';
now_GR.u_test_script = "result = x + y";
evaluator.evaluateScript(now_GR, "script")
now_GR.insert();

var evaluator = new GlideScopedEvaluator();
evaluator.putVariable('x', 100);
evaluator.putVariable('y', 200);
evaluator.putVariable('result', null);
evaluator.evaluateScript(now_GR, "script")
now_GR.insert();
```

Output:

```
300
```

Scoped equivalent

To use the *putVariable()* method in a scoped application, use the corresponding scoped method: putVariable().

GlideScopedEvaluator - Scoped

The *GlideScopedEvaluator* API allows you to evaluate scripts in a GlideRecord field from both scoped and global server scripts.

This API evaluates records with script fields defined. The scope of the script is defined by the scope of the record.

GlideScopedEvaluator - GlideScopedEvaluator()

Instantiates a GlideScopedEvaluator object.

Parameters

Name	Type	Description
None		

GlideScopedEvaluator - evaluateScript(GlideRecord grObj, String scriptField, Object variables)

Evaluates a script that resides in a GlideRecord field.

Parameters

Name	Type	Description
grObj	GlideRecord	GlideRecord containing a script expression.
scriptField	String	Optional. Name of the field containing the script expression.
variables	Object	Optional. Map of variables with name-value pairs. These variables are available to the script during execution of this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Result of the script execution.

```
// Setting up a record that contains the script to be executed.
var now_GR = new GlideRecord('u_global_table');
now_GR.u_short_description = 'Calculate Addition';
now_GR.u_test_script = "result = x + y";
now_GR.insert();

var evaluator = new GlideScopedEvaluator();
evaluator.putVariable('x', 100);
evaluator.putVariable('y', 200);
gs.info(evaluator.evaluateScript(now_GR, 'u_test_script'));
```

Output:

```
300
```

GlideScopedEvaluator - getVariable(String name)

Returns a specified variable from a GlideScopedEvaluator object.

Parameters

Name	Type	Description
name	String	Name of the variable to return.

Returns

Type	Description
Object	Value of the specified variable.

The following example shows how to call the *getVariable()* method to check the value of the *answer* variable.

```
(function executeRule(current, previous /*null when async*/) {
  var grAG = current.assignment_group.getRefRecord(); // Get the
 GlideRecord of the assignment group
  if (grAG.isValidRecord()) {
    var ge = new GlideScopedEvaluator();
    ge.putVariable("current", current); // Pass through the
 "current" variable as "current"
    ge.putVariable("group", grAG); // Pass through the "grAG"
 variable as "group"
    ge.putVariable("answer", true); // default "answer" to TRUE
    ge.evaluateScript(grAG, "u_assignment_condition"); // Run
 the script

    // Abort the transaction if the "answer" variable was set to
 FALSE explicitly (undefined doesn't count)
    if (ge.getVariable("answer") === false) {
      gs.addErrorMessage("Assignment rule did not pass");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      current.setAbortAction(true);
    }
  }
})(current, previous);
```

GlideScopedEvaluator - putVariable(String name, Object value)

Sets a variable into the GlideScopedEvaluator object. These variables are available to the script that this GlideScopedEvaluator object runs.

Parameters

Name	Type	Description
name	String	Name of the variable.
value	Object	Value of the variable.

Returns

Type	Description
None	

The following example shows how to call the *putVariable()* method to set the *answer* variable to true.

```
(function executeRule(current, previous /*null when async*/) {
  var grAG = current.assignment_group.getRefRecord(); // Get the
 GlideRecord of the assignment group
  if (grAG.isValidRecord()) {
    var ge = new GlideScopedEvaluator();
    ge.putVariable("current", current); // Pass through the
 "current" variable as "current"
    ge.putVariable("group", grAG); // Pass through the "grAG"
 variable as "group"
    ge.putVariable("answer", true); // Set default "answer" to
 TRUE
    ge.evaluateScript(grAG, "u_assignment_condition"); // Run
 the script

    // Abort the transaction if the "answer" variable was set to
 FALSE explicitly (undefined doesn't count)
    if (ge.getVariable("answer") === false) {
      gs.addErrorMessage("Assignment rule did not pass");
      current.setAbortAction(true);
    }
  }
})(current, previous);
```

GlideExcelParser - Scoped, Global

The *GlideExcelParser* API parses .xlsx formatted Excel files and access file data in scripts.

You can use the *GlideExcelParser* methods in global and scoped scripts. Use the `sn_impex` namespace identifier to create a GlideExcelParser object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideExcelParser - GlideExcelParser()

Creates an instance of GlideExcelParser.

The API name space identifier "sn_impex" must be used when creating a GlideExcelParser object.

Parameters

Name	Type	Description
None		

```
var parser = new sn_impex.GlideExcelParser();
var attachment = new GlideSysAttachment();
// use attachment sys id of an excel file
var attachmentStream = attachment.getContentStream(<attachment
 sys id>);

parser.parse(attachmentStream);

//retrieve the column headers
var headers = parser.getColumnHeaders();
var header1 = headers[0];
var header2 = headers[1];

//print headers
gs.info(header1 + " " + header2);

while(parser.next()) {
  var row = parser.getRow();
  //print row value for both columns
  gs.info(row[header1] + ' ' + row[header2])
}
```

GlideExcelParser - close()

Close the connection to the input stream and release the document.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example shows how to close the parser once all document management is complete.

```
// iterate over each row in the excel sheet
var attachment = new GlideSysAttachment();
var attachmentStream = attachment.getContentStream(<attachment
 sys id>);
var parser = new sn_impex.GlideExcelParser();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
parser.parse(attachmentStream);
while (parser.next()) {
  // do something on each row
  var row = parser.getRow();
  gs.info(JSON.stringify(row));
}
parser.close(); // close the stream and release the document
```

GlideExcelParser - getColumnHeaders()

Returns a list of column headers from the parsed document.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	An array of strings of column headers from the parsed document.

The following example shows how to parse an Excel file attachment multiple times to retrieve column headers and print values of each row for each worksheet. Results display column headers and values of three separate sheets in the Excel attachment.

```
var parser = new sn_impex.GlideExcelParser();

var attachment = new GlideSysAttachment();

// Use the attachment sys_id of an Excel file
var attachmentStream =
 attachment.getContentStream("<attachment_sys_id>");

// Set the source to be parsed
parser.setSource(attachmentStream);

// Get the worksheet names to be parsed in the Excel document
var list_sheet_name = parser.getSheetNames();

gs.info(" Sheet Names " + list_sheet_name.join(", "));

// Iterate over each worksheet in the Excel workbook
for (var i = 0; i < list_sheet_name.length; i++) {

 gs.info("**********************************************************
*******************************");
    gs.info("Sheet name:    " + list_sheet_name[i]);

// Set the worksheet name to be parsed
    parser.setSheetName(list_sheet_name[i]);

// Parse each worksheet set using setSheetName()
    if (parser.parse()) {
        //retrieve the column headers
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        var headers = parser.getColumnHeaders();
        var header1 = headers[0];
        var header2 = headers[1];
        var header3 = headers[2];

        //print headers
        gs.info(header1 + "\t||" + header2 + "\t||" + header3);

        // Iterate over each row in the worksheet
        while (parser.next()) {
            var row = parser.getRow();
            //print row value for both columns
            gs.info(row[header1] + '\t|| ' + row[header2] +
 '\t||' + row[header3])
        }
    } else
        gs.info(parser.getErrorMessage());
}
```

Output:

```

GlideExcelParser - getErrorMessage()

Returns the error message when the *parse()* method fails.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The error message.

GlideExcelParser - getRow()

Get the current row values and headers.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	The row headers are property names and the row values are property values.

The following example shows how to parse an Excel file attachment multiple times to retrieve column headers and print values of each row for each worksheet. Results display column headers and values of three separate sheets in the Excel attachment.

```
var parser = new sn_impex.GlideExcelParser();

var attachment = new GlideSysAttachment();

// Use the attachment sys_id of an Excel file
var attachmentStream =
 attachment.getContentStream("<attachment_sys_id>");

// Set the source to be parsed
parser.setSource(attachmentStream);

// Get the worksheet names to be parsed in the Excel document
var list_sheet_name = parser.getSheetNames();

gs.info(" Sheet Names " + list_sheet_name.join(", "));

GlideExcelParser - getSheetNames()

Gets a list of all worksheet names in an Excel workbook.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	Array of strings as worksheet names ordered as positioned from left to right in the workbook. Results include any worksheets marked as hidden.

The following example shows how to parse an Excel file attachment multiple times to retrieve column headers and print values of each row for each worksheet. Results display column headers and values of three separate sheets in the Excel attachment.

```
var parser = new sn_impex.GlideExcelParser();

var attachment = new GlideSysAttachment();

// Use the attachment sys_id of an Excel file
var attachmentStream =
 attachment.getContentStream("<attachment_sys_id>");

// Set the source to be parsed
parser.setSource(attachmentStream);

// Get the worksheet names to be parsed in the Excel document
var list_sheet_name = parser.getSheetNames();

gs.info(" Sheet Names " + list_sheet_name.join(", "));
```

GlideExcelParser - getTableInfo()

Gets table column types and max character length from a spreadsheet or CSV attachment.

Note: This method is restricted to scoped applications.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Returns attachment data as a map in which the key is column name. Values contain column type and maximum length of a character string in the column. Access return values using the *`getType()`* and *`getLength()`* methods.

This example shows how to data from a 7-column spreadsheet attachment including row data such as 1, Meghan, 1/1/85, 1:00 AM, 10.00%, 224-432-8582, ½.

```
var attachmentSysId = "<sys_id>";
var headerRowNumber = 6;

var attachmentStream = new
 GlideSysAttachment().getContentStream(attachmentSysId);
var parser = new sn_impex.GlideExcelParser();
parser.setHeaderRowNumber(headerRowNumber);
if (!parser.parse(attachmentStream)) {
    throw "Attachment could not be parsed as an Excel
 Spreadsheet " + attachmentSysId;
}
var tableInfo = parser.getTableInfo();
for (var name in tableInfo) {
```

```
gs.info('Column Name : ' + name + ', Type : ' +
 tableInfo[name].getType() + ', Max Length : ' +
 tableInfo[name].getLength());
}
```

Output:

```
ProgressWorker: Attempted to get non-existent sys_progress_
worker record, inserted 81b0ca5ddb59730090c9ff9dbf9619c4
sn_appcreator: Column Name : My Number Col, Type : integer,
 Max Length : 1
sn_appcreator: Column Name : My String Col, Type : string,
 Max Length : 650
sn_appcreator: Column Name : My Date Col, Type : glide_date,
 Max Length : 6
sn_appcreator: Column Name : My DateTime Col, Type :
 glide_date_time, Max Length : 7
sn_appcreator: Column Name : My Percent Col, Type : decimal,
 Max Length : 6
sn_appcreator: Column Name : My Phone Col, Type : string,
 Max Length : 12
sn_appcreator: Column Name : My Fraction Col, Type : decimal,
 Max Length : 3
```

GlideExcelParser - next()

Moves to the next row.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if there is a next row, otherwise, returns false.

The following example shows how to parse an Excel file attachment multiple times to retrieve column headers and print values of each row for each worksheet. Results display column headers and values of three separate sheets in the Excel attachment.

```
var parser = new sn_impex.GlideExcelParser();

var attachment = new GlideSysAttachment();

// Use the attachment sys_id of an Excel file
var attachmentStream =
 attachment.getContentStream("<attachment_sys_id>");

// Set the source to be parsed
parser.setSource(attachmentStream);

// Get the worksheet names to be parsed in the Excel document
var list_sheet_name = parser.getSheetNames();
```

```
gs.info(" Sheet Names " + list_sheet_name.join(", "));

// Iterate over each worksheet in the Excel workbook
for (var i = 0; i < list_sheet_name.length; i++) {

 gs.info("************************************************************
*******************************");
    gs.info("Sheet name:    " + list_sheet_name[i]);

// Set the worksheet name to be parsed
    parser.setSheetName(list_sheet_name[i]);

// Parse each worksheet set using setSheetName()
    if (parser.parse()) {
        //retrieve the column headers
        var headers = parser.getColumnHeaders();
        var header1 = headers[0];
        var header2 = headers[1];
        var header3 = headers[2];

        //print headers
        gs.info(header1 + "\t||" + header2 + "\t||" + header3);

        // Iterate over each row in the worksheet
        while (parser.next()) {
            var row = parser.getRow();
            //print row value for both columns
            gs.info(row[header1] + '\t|| ' + row[header2] +
 '\t||' + row[header3])
        }
    } else
        gs.info(parser.getErrorMessage());
}
```

GlideExcelParser - parse(InputStream inputStream)

Parses an XLSX-formatted Excel document.

Parameters

Name	Type	Description
inputStream	GlideScriptableInputStream	Excel document provided as an input stream. **Note:** Do not set this value if using the setSource() method to parse the same source multiple times.

Returns

Type	Description
Boolean	Flag that indicates if the parse was successful. Valid values: • true: Document was successful parsed. • false: Document was not successfully parsed.

Example from a scripted REST API script where the Excel file is sent using an input stream in the request payload.

```
var parser = new sn_impex.GlideExcelParser();
parser.parse(request.body.dataStream);
```

The following example shows how to parse an Excel file attachment multiple times to retrieve column headers and print values of each row for each worksheet. Results display column headers and values of three separate sheets in the Excel attachment.

```
var parser = new sn_impex.GlideExcelParser();

var attachment = new GlideSysAttachment();

// Use the attachment sys_id of an Excel file
var attachmentStream =
 attachment.getContentStream("<attachment_sys_id>");

// Set the source to be parsed
parser.setSource(attachmentStream);

// Get the worksheet names to be parsed in the Excel document
var list_sheet_name = parser.getSheetNames();

gs.info(" Sheet Names " + list_sheet_name.join(", "));

// Iterate over each worksheet in the Excel workbook
for (var i = 0; i < list_sheet_name.length; i++) {

 gs.info("**********************************************************
*******************************");
    gs.info("Sheet name:    " + list_sheet_name[i]);

// Set the worksheet name to be parsed
    parser.setSheetName(list_sheet_name[i]);

// Parse each worksheet set using setSheetName()
    if (parser.parse()) {
        //retrieve the column headers
        var headers = parser.getColumnHeaders();
        var header1 = headers[0];
        var header2 = headers[1];
        var header3 = headers[2];

        //print headers
        gs.info(header1 + "\t||" + header2 + "\t||" + header3);

        // Iterate over each row in the worksheet
        while (parser.next()) {
            var row = parser.getRow();
            //print row value for both columns
            gs.info(row[header1] + '\t|| ' + row[header2] +
 '\t||' + row[header3])
        }
    } else
        gs.info(parser.getErrorMessage());

GlideExcelParser - setHeaderRowNumber(Number headerRowNumber)

Set the number of the header row to be retrieved.

Parameters

Name	Type	Description
headerRowNumber	Number	The header row to be retrieved.

Returns

Type	Description
void	

GlideExcelParser - setNullToEmpty(Boolean empty)

Return an empty value instead of null when an Excel cell is not present.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
empty	Boolean	When true, cells that are not present return an empty value. When false, cells that are not present return null.

Returns

Type	Description
void	

GlideExcelParser - setSheetName(String sheetName)

Set the name of the sheet to be retrieved.

If both *setSheetNumber()* and *setSheetName()* are set, *setSheetName()* is used.

Parameters

Name	Type	Description
sheetName	String	The name of the sheet to be retrieved.

Returns

Type	Description
void	

The following example shows how to parse an Excel file attachment multiple times to retrieve column headers and print values of each row for each worksheet. Results display column headers and values of three separate sheets in the Excel attachment.

```
var parser = new sn_impex.GlideExcelParser();

var attachment = new GlideSysAttachment();

// Use the attachment sys_id of an Excel file
var attachmentStream =
 attachment.getContentStream("<attachment_sys_id>");

// Set the source to be parsed
parser.setSource(attachmentStream);

// Get the worksheet names to be parsed in the Excel document
var list_sheet_name = parser.getSheetNames();

gs.info(" Sheet Names " + list_sheet_name.join(", "));

// Iterate over each worksheet in the Excel workbook
for (var i = 0; i < list_sheet_name.length; i++) {

 gs.info("**********************************************************
**********************************");
    gs.info("Sheet name:    " + list_sheet_name[i]);
```

```
// Set the worksheet name to be parsed
    parser.setSheetName(list_sheet_name[i]);

// Parse each worksheet set using setSheetName()
    if (parser.parse()) {
        //retrieve the column headers
        var headers = parser.getColumnHeaders();
        var header1 = headers[0];
        var header2 = headers[1];
        var header3 = headers[2];

        //print headers
        gs.info(header1 + "\t||" + header2 + "\t||" + header3);

        // Iterate over each row in the worksheet
        while (parser.next()) {
            var row = parser.getRow();
            //print row value for both columns
            gs.info(row[header1] + '\t|| ' + row[header2] +
 '\t||' + row[header3])
        }
    } else
        gs.info(parser.getErrorMessage());
}
```

GlideExcelParser - setSheetNumber(Number sheetNumber)

Set the number of the Excel sheet to be retrieved.

If both *`setSheetNumber()`* and *`setSheetName()`* are set, *`setSheetNumber()`* is ignored.

Parameters

Name	Type	Description
sheetNumber	Number	The Excel sheet number to retrieve.

Returns

Type	Description
void	

The following example shows how to use this method to specify the sheet number of an attached spreadsheet workbook to be read.

```
var parser = new sn_impex.GlideExcelParser();
var attachment = new GlideSysAttachment();

// Use the sys id of an Excel file in the sys_attachment table
 and copy the sys_id of attachment.
var attachmentStream =
 attachment.getContentStream('178e0511138b6300026e32228144b04e
');

// Specify the sheet Number to be read, 0 denotes sheet 1, 1
 denotes sheet 2, etc.
parser.setSheetNumber("0");

parser.parse(attachmentStream);

// retrieve the column headers (tests if on the correct sheet)
var headers = parser.getColumnHeaders();
var header1 = headers[0];
var header2 = headers[1];
var header3 = headers[2];

// print headers
gs.info('Header 1 value = ' +header1);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

```
gs.info('Header 2 value = ' +header2);
gs.info('Header 3 value = ' +header3);
```

Output:

```
Header 1 value = sys_id
Header 2 value = email
Header 3 value = undefined
```

GlideExcelParser - setSource(InputStream inputStream)

Defines an input source for parsing multiple times or parsing each worksheet in an Excel file.

Parameters

Name	Type	Description
inputStream	GlideScriptableInputStream	Excel document provided as an input stream.

Returns

Type	Description
None	

The following example shows how to parse an Excel file attachment multiple times to retrieve column headers and print values of each row for each worksheet. Results display column headers and values of three separate sheets in the Excel attachment.

```
var parser = new sn_impex.GlideExcelParser();

var attachment = new GlideSysAttachment();

// Use the attachment sys_id of an Excel file
var attachmentStream =
 attachment.getContentStream("<attachment_sys_id>");

// Set the source to be parsed
parser.setSource(attachmentStream);

// Get the worksheet names to be parsed in the Excel document
var list_sheet_name = parser.getSheetNames();

gs.info(" Sheet Names " + list_sheet_name.join(", "));

// Iterate over each worksheet in the Excel workbook
for (var i = 0; i < list_sheet_name.length; i++) {

 gs.info("**********************************************************
**********************************");
    gs.info("Sheet name:    " + list_sheet_name[i]);

// Set the worksheet name to be parsed
    parser.setSheetName(list_sheet_name[i]);

// Parse each worksheet set using setSheetName()
    if (parser.parse()) {
        //retrieve the column headers
```

```
        var headers = parser.getColumnHeaders();
        var header1 = headers[0];
        var header2 = headers[1];
        var header3 = headers[2];

        //print headers
        gs.info(header1 + "\t||" + header2 + "\t||" + header3);

        // Iterate over each row in the worksheet
        while (parser.next()) {
            var row = parser.getRow();
            //print row value for both columns
            gs.info(row[header1] + '\t|| ' + row[header2] +
 '\t||' + row[header3])
        }
    } else
        gs.info(parser.getErrorMessage());
}
```

Output:

```

GlideFilter - Scoped, Global

The *GlideFilter* API enables filtering queries to determine if one or more records meet a specified set of requirements.

Methods for this API are accessible using the GlideFilter global object.

Case sensitivity

The *GlideFilter* API is case-sensitive by default. Use the setCaseSensitive() method to enable or disable case sensitivity. *GlideRecord* queries are case-insensitive.

The following example shows how a GlideRecord query is case-insensitive and results in the same user record with upper or lower case.

```
var gr_Query = new GlideRecord('sys_user');
gr_Query.addQuery('first_name', 'Abel');
gr_Query.query();
while (gr_Query.next())
  gs.info("Upper case query: " + gr_Query.getDisplayValue());

var gr_Query = new GlideRecord('sys_user');
gr_Query.addQuery('first_name', 'abel');
gr_Query.query();
while (gr_Query.next())
  gs.info("Lower case query: " + gr_Query.getDisplayValue());
```

GlideRecord.query() output shows the same results display regardless of case.

```
Upper case query: Abel Tuter
Lower case query: Abel Tuter
```

The following example shows how *GlideFilter* only retrieves the matched value of the record for the upper case condition. The lower case condition does not provide a match.

```
// Matches the 'Abel Tuter' user record
var gr_Query = new GlideRecord('sys_user');
gr_Query.query();
var condition = 'first_name=Abel';
var glideFilter = new GlideFilter(condition, 'filterCondition');
while (gr_Query.next()) {
   if (glideFilter.match(gr_Query, true))
        gs.info("Upper case condition: " +
 gr_Query.getDisplayValue());
}

// The following code does not match 'Abel Tuter' user record
var gr_Query = new GlideRecord('sys_user');
gr_Query.query();
var condition = 'first_name=abel';
var glideFilter = new GlideFilter(condition, 'filterCondition');
while (gr_Query.next()) {
   if (glideFilter.match(gr_Query, true))
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        gs.info("Lower case condition: " +
 gr_Query.getDisplayValue());
}
```

The output reveals that the filter only returns upper case results with default case-sensitivity:

```
Upper case condition: Abel Tuter
```

The following example shows how to disable GlideFilter case-sensitivity with the *setCaseSensitive()* method. The filter matches the condition even though the case does not match the field value.

```
// Matches the 'Abel Tuter' user record
var gr_Query = new GlideRecord('sys_user');
gr_Query.query();
var condition = 'first_name=Abel';
var glideFilter = new GlideFilter(condition, 'filterCondition');
while (gr_Query.next()) {
   if (glideFilter.match(gr_Query, true))
     gs.info("Upper case condition: " +
 gr_Query.getDisplayValue());
}

// The following code disables case sensitivity and matches the
 same record
var gr_Query = new GlideRecord('sys_user');
gr_Query.query();

var condition = 'first_name=abel';
var glideFilter = new GlideFilter(condition, 'filterCondition');
glideFilter.setCaseSensitive(false);

while (gr_Query.next()) {
  if (glideFilter.match(gr_Query, true))
    gs.info("Lower case condition: " +
 gr_Query.getDisplayValue());
}
```

The output reveals *GlideFilter* case-insensitive results:

```
Upper case condition: Abel Tuter
Lower case condition: Abel Tuter
```

Filter null values

To exclude null values from *GlideFilter* query results, add `ISNOTEMPTY` to the query condition. The following example shows how using the same encoded query with *GlideRecord* and *GlideFilter* produces different results.

```
var insertRecordsGr = new GlideRecord('u_test_table');
insertRecordsGr.deleteMultiple();
var dates = ['', '2021-01-29', '2021-01-30', '2021-01-31'];
dates.forEach(function(val) {
  insertRecordsGr.initialize();
  insertRecordsGr.u_date_field = val;
  insertRecordsGr.insert();
});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var now_GR = new GlideRecord('u_test_table');
now_GR.addEncodedQuery('u_date_field<javascript:gs.beginningOfToday()');
now_GR.query();

// Encoded query includes null values with GlideFilter, which might cause unexpected results
var condition = 'u_date_field<javascript:gs.beginningOfToday()';

var grWithGlideFilter = new GlideRecord('u_test_table');
grWithGlideFilter.query();
var filter = new GlideFilter(condition, 'filterCondition');

var countWithGlideFilter = 0;
while (grWithGlideFilter.next()) {
  if (GlideFilter.checkRecord(grWithGlideFilter, condition))
     countWithGlideFilter++;
}

gs.info('Record RowCount: ' + now_GR.getRowCount() + ' - Filter Count: ' + countWithGlideFilter);
```

The output shows that *GlideRecord* returns three records, skipping empty date values. The *GlideFilter* query counts the empty date value and returns a count of four records.

```
Record RowCount: 3 - Filter Count: 4
```

To exclude null values from the *GlideFilter* results, add an AND condition ISNOTEMPTY to the queried field.

```
// Encoded query includes null values with GlideFilter
var condition =
 'u_date_field<=javascript:gs.beginningOfToday()^u_date_fieldISNOTEMPTY';
```

Output shows that the *GlideFilter* encoded query skips the null date value and counts three results.

```
Record RowCount: 3 - Filter Count: 3
```

GlideFilter – GlideFilter(String filter, String title)

Instantiates a GlideFilter object.

Parameters

Name	Type	Description
filter	String	Encoded query string in standard Glide format. See Encoded query strings. Results are case-sensitive, unless disabled using the setCaseSensitive() method. To exclude null values from *GlideFilter* query results, add ISNOTEMPTY to the query condition.
title	String	Descriptive title for the filter.

The following example shows how to filter the number of users named Rebekah.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var now_GR = new GlideRecord('sys_user');
now_GR.query();
var condition = 'first_name=rebekah';
var filter = new GlideFilter(condition, 'filterCondition');
filter.setCaseSensitive(false);

var countResults = 0;
while (now_GR.next()) {
  if (filter.match(now_GR, true))
     countResults++;
}

gs.info('Number of users named Rebekah: ' + countResults);
```

Output:

```
Number of users named Rebekah: 2
```

GlideFilter - checkRecord(GlideRecord now_GR, String filter, Boolean match)

Compares a specified filter to the contents of a specified GlideRecord.

If the specified filter contains one condition, the method returns true if the record meets the condition.

Filters support multiple conditions, for example `"active=true^number=abc^category=request"`. You can use the *match* parameter to define whether all conditions must be met to determine a match or just a single condition.

Parameters

Name	Type	Description
now_GR	GlideRecord	*GlideRecord* to evaluate.
filter	String	Encoded query string in standard Glide format. See Encoded query strings. To exclude null values from *GlideFilter* query results, add ISNOTEMPTY to the query condition. **Note:** The *filter* values are case-sensitive. In addition, you cannot use *setCaseSensitive(false)* to change the change the case-sensitive value.
match	Boolean	Optional. Flag that indicates whether all conditions must be met if the *filter* parameter contains multiple conditions. Valid values: • true: All conditions must be met for the method to return true. • false: Only one of the conditions must be met for the method to return true. Default: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Results of the filter comparison. • true: Filter conditions were met. • false: Filter conditions were not met.

The following example shows how to display true for each record in the Incident table that meets the filter condition. False otherwise.

```
var rec = new GlideRecord('incident');
rec.query();

var bool = true;

while(rec.next())
{
   bool = GlideFilter.checkRecord(rec, "active=true");
   gs.info("number "+ rec.number + " is " + bool);
}
```

Output:

```
number INC0000060 is false
number INC0009002 is false
number INC0000009 is false
...
number INC0000015 is true
number INC0000016 is true
number INC0000017 is true
...
```

GlideFilter - match(GlideRecord now_GR, Boolean match)

Evaluates a filter against a specified GlideRecord.

Parameters

Name	Type	Description
now_GR	GlideRecord	*GlideRecord* to evaluate.
match	Boolean	Flag that indicates whether all filter conditions must match. Valid values: • true: All filter conditions must match. • false: Filter condition match is not required. Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Results of the match check. • true: Filter conditions were met. • false: Filter conditions were not met.

The following example shows how to ensure the filter conditions match against the GlideRecord provided.

```
var now_GR = new GlideRecord('sys_user');
now_GR.query();
var condition = 'first_name=rebekah';
var filter = new GlideFilter(condition, 'filterCondition');
filter.setCaseSensitive(false);

var countResults = 0;
while (now_GR.next()) {
  if (filter.match(now_GR, true))
     countResults++;
}

gs.info('Number of users named Rebekah: ' + countResults);
```

Output:

```
Number of users named Rebekah: 2
```

GlideFilter - setCaseSensitive(Boolean caseSensitive)

Enables or disables case-sensitive filter results.

Parameters

Name	Type	Description
caseSensitive	Boolean	Flag that indicates whether the filter is case-sensitive. Valid values: • true: The filter is case-sensitive. • false: The filter is case-insensitive. Default: true

Returns

Type	Description
None	

The following example shows how to disable case-sensitive results.

```
var now_GR = new GlideRecord('sys_user');
now_GR.query();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var condition = 'first_name=rebekah';
var filter = new GlideFilter(condition, 'filterCondition');

// Disable case-sensitive filtering
filter.setCaseSensitive(false);

while (now_GR.next()) {
  if (filter.match(now_GR, true))
     gs.info(now_GR.getDisplayValue());
}
```

Output shows that the filter retrieves upper case results with a lower case condition.

```
Rebekah Padley
Rebekah Lindboe
```

GlideFilter - setEnforceSecurity(Boolean enforceSecurity)

Enables or disables sandboxed evaluation of the filter string.

Parameters

Name	Type	Description
enforceSecurity	Boolean	Flag that indicates whether to evaluate the filter in the sandbox. Valid values: • true: Evaluate the filter in the sandbox. • false: Don't evaluate the filter in the sandbox. Default: false

Returns

Type	Description
None	

The following code example shows how to call this method.

```
var now_GR = new GlideRecord('sys_user');
now_GR.query();
var condition = 'first_name=rebekah';
var filter = new GlideFilter(condition, 'filterCondition');
filter.setEnforceSecurity(true);

var countResults = 0;
while (now_GR.next()) {
  if (filter.match(now_GR, true))
     countResults++;
}

gs.info('Number of users named Rebekah: ' + countResults);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
Number of users named Rebekah: 2
```

GlideGeoPoint - Global

The *GlideGeoPoint* API enables you to get and set geopoint data type values in a table.

This API is available by default. The geopoint data type allows you to store a latitude and longitude values in a single field within a table. Using the *GlideGeoPoint* API, you can instantiate new GlideGeoPoint objects, create new geopoints for a specific table, or retrieve single latitude, longitude or geotype values. For additional information on how to implement specific use cases like inserting new records using a geopoint, computing distances between geopoint locations, or querying for nearby geopoint locations, see GlideGeoPoint Developer Guide.

Key aspects of the geotype data type are:

- It consists of a pair of decimal numbers representing longitude and latitude values.
- The range for longitude is (-180, 180]. Any value outside this range is normalized to the equivalent value inside this range.
- The range for latitude is [-90, 90]. Any value outside this range is normalized to the equivalent value inside this range.
- Geopoint values are always accepted as input and display as a comma-separated pair: “longitude,latitude”. Parentheses may optionally surround the expression.
- Both longitude and latitude values are stored up to 6 decimal places of precision.

Note: *GlideGeoPoint* API values are always listed in longitude, latitude order.

The examples on this page assume that a custom table is pre-populated with fields containing the geopoint field type. For more information about this data type, see Geo point field type and Function field.

GlideGeoPoint - GlideGeoPoint()

Instantiates a *GlideGeoPoint* object. The *GlideGeoPoint* object adds semantic awareness to longitude and latitude values that are otherwise stored as strings.

Parameters

Name	Type	Description
None		

The following example shows how to initialize a new GlideGeoPoint object as a null value.

```
var gp = new GlideGeoPoint();
```

GlideGeoPoint - GlideGeoPoint(String longitude, String latitude)

Instantiates the *GlideGeoPoint* object according to provided longitude and latitude values.

Parameters

Name	Type	Description
longitude	String	The longitude coordinate of the geopoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
latitude	String	The latitude coordinate of the geopoint.

Returns

Type	Description
geopoint	The resultant *GlideGeoPoint* object.

The following example shows how providing longitude and latitude values initializes the object accordingly.

```
// Providing longitude and latitude values initializes the
 object accordingly
var gp = new GlideGeoPoint(10.123, 25.987);
gs.info("geopoint: " + gp);
```

Output:

```
geopoint: 10.123000,25.987000
```

GlideGeoPoint - GlideGeoPoint(Object geoPoint)

Copies longitude and latitude points values to instantiate a new GlideGeoPoint object.

Parameters

Name	Type	Description
geoPoint	Object	The geopoint instance that you want copy.

Returns

Type	Description
geopoint	The resultant *GlideGeoPoint* object.

The following example shows how to copy longitude and latitude values to instantiate a new GlideGeoPoint object.

```
var gp = new GlideGeoPoint(135, -64);
var gpCopy = new GlideGeoPoint(gp);
gs.info("geopoint: " + gpCopy);
```

Output:

```
geopoint: 135,-64
```

GlideGeoPoint - getDisplayValue()

Returns the geopoint of the current user in a user-friendly format.

The *getDisplayValue()* method returns a single geopoint value. For information about how to retrieve all geopoint values from a specific table, see GlideGeoPoint Developer Guide.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The value of the longitude and latitude coordinates set in the object.

```
var gp = new GlideGeoPoint();
gp.setValue(76.25, 49.75);
gs.info("geopoint: " + gp);
gs.info("getDisplayValue(): " + gp.getDisplayValue());
```

Output:

```
geopoint: 76.250000,49.750000
getDisplayValue(): (76.250000, 49.750000)
```

GlideGeoPoint - getGeoPoint(String geo_point_field_name)

Returns a list of geo point coordinate values for a given field name of type geo point.

Parameters

Name	Type	Description
geo_point_field_name	String	The name of the geo point field. Located in the Dictionary Entry `[sys_dictionary]` table. **Note:** You can also locate field names under dictionary elements defined on a table to see associated fields of geo point type.

Returns

Type	Description
Object	The resultant GlideGeoPoint object.

In the following example, 'test_table' is a table which contains the 'geo_point' field of geo point type. The test_table has one record populated in the geo_point column with a value of (-30.560000,-54.330000). The example code returns the latitude and longitude coordinates and display value of the record in geo_point column.

```
var gr_Test = new GlideRecord('test_table');
gr_Test.query();
gr_Test.next();
var gp = gr_Test.getGeoPoint('geo_point');
gs.info("getLatitude(): " + gp.getLatitude());
gs.info("getLongitude(): " + gp.getLongitude());
gs.info("getDisplayValue(): " + gp.getDisplayValue());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
getLatitude(): -54.33
getLongitude(): -30.560000000000002
getDisplayValue(): (-30.560000, -54.330000)
```

GlideGeoPoint - getLatitude()

Returns the latitude value of the *GlideGeoPoint* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The latitude value of the *GlideGeoPoint* object.

```
var gp = new GlideGeoPoint();
gp.setValue(76.25, 49.75);

gs.info("geopoint: " + gp);
gs.info("getLatitude(): " + gp.getLatitude());
```

Output:

```
geopoint: 76.250000,49.750000
getLatitude(): 49.75
```

GlideGeoPoint - getLongitude()

Returns the longitude value of the *GlideGeoPoint* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The longitude value of the *GlideGeoPoint* object.

```
var gp = new GlideGeoPoint();
gp.setValue(76.25, 49.75);
gs.info("geopoint: " + gp);
gs.info("getLongitude(): " + gp.getLongitude());
```

Output:

```
geopoint: 76.250000,49.750000
 getLongitude(): 76.25
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideGeoPoint - getValue()

Returns a string containing the programmatic longitude and latitude value of the current *GlideGeoPoint* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The longitude and latitude value of the current *GlideGeoPoint* object.

```
 var gp = new GlideGeoPoint();
gp.setValue(76.25, 49.75);
gs.info("geopoint: " + gp);
gs.info("getValue(): " + gp.getValue());
```

Output:

```
geopoint: 76.250000,49.750000
getValue(): 76.250000,49.750000
```

GlideGeoPoint - setValue(String longitude, String latitude)

Sets the longitude and latitude values of the geopoint.

Parameters

Name	Type	Description
longitude	String	The longitudinal coordinate of the geopoint.
latitude	String	The latitude coordinate of the geopoint.

Returns

Type	Description
String	The longitude and latitude value set on the *GlideGeoPoint* object.

```
var gp = new GlideGeoPoint();
gp.setValue("-28.48,38.91");
gs.info("geopoint: " + gp);
```

Output:

```
geopoint: -28.480000,38.910000
```

GlideGeoPoint - setValue(String value)

Sets the longitude and latitude values of the geopoint using a single comma-delimited value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
value	String	A comma-delimited value containing longitude and latitude points respectively.

Returns

Type	Description
String	The longitude and latitude value set on the *`GlideGeoPoint`* object.

The following example shows how to set the longitude and latitude values using a single string.

```
var gp = new GlideGeoPoint();
gp.setValue(23.4, 56.7);
```

Output:

```
geopoint: -23.400000,56.700000
```

GlideHTTPRequest - Global

The *`GlideHTTPRequest`* API provides utility methods to perform common functions with Glide HTTP requests.

You can use this API in global server-side scripts. To use this class, instantiate a GlideHTTPRequest object using the constructor. The constructor requires an endpoint URL as an input parameter.

GlideHTTPRequest - addHeader(String name, String value)

Adds a header to your HTTP request.

Parameters

Name	Type	Description
name	String	Header name, such as `Accept` or `Content-Type`.
value	String	Header value, such as `application/json`.

Returns

Type	Description
void	

This example adds the request header "Accept" and returns the number of the incidents from a ServiceNow Instance, parsing the JSON or XML responses.

```
var instance = 'dev12345';
var username = 'admin';
var password = 'yourpassword';

// Instantiate request with ServiceNow API incidents table
 endpoint
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var request = new
 GlideHTTPRequest('https://'+instance+'.service-now.com/api/n
ow/table/incident');

// Add authentication data
request.setBasicAuth(username, password);

// Add the Accept header to get JSON response
request.addHeader('Accept', 'application/json');

// Execute the GET request
var response = request.get();

// Print the results: status code and number of records returned
gs.print(response.getStatusCode());
gs.print('(JSON) Incidents returned: ' +
 JSON.parse(response.getBody()).result.length);

// Replace the Accept header to get XML response
request.addHeader('Accept', 'application/xml');

// Execute the GET request
var response = request.get();

// Print the results: status code and number of records returned
gs.print(response.getStatusCode());
gs.print('(XML) Incidents returned: ' +
 gs.xmlToJSON(response.getBody()).response.result.length);
```

Output

```
200
(JSON) Incidents returned: 66
200
(XML) Incidents returned: 66
```

GlideHTTPRequest - addParameter(String name, String value)

Adds a parameter to your HTTP request.

Parameters

Name	Type	Description
name	String	Parameter to add, such as *sysparm_limit*.
value	String	Value for the parameter.

Returns

Type	Description
void	

This example shows how to add the *sysparm_limit* parameter to the REST endpoint call to limit the number of returned responses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var instance = 'dev12345';
var username = 'admin';
var password = 'yourpassword';

// Instantiate request with ServiceNow API incidents table
 endpoint
var request = new
 GlideHTTPRequest('https://'+instance+'.service-now.com/api/n
ow/table/incident');

// Add authentication data
request.setBasicAuth(username, password);

// Add the 'sysparm_limit' parameter to limit the number of
 records returned
request.addParameter('sysparm_limit', 1);

// Execute the GET request
var response = request.get();

// Print the results: status code and number of records returned
gs.print(response.getStatusCode());
gs.print('Incidents returned: ' +
 JSON.parse(response.getBody()).result.length);
```

Output:

```
200
Incidents returned: 1
```

GlideHTTPRequest - setBasicAuth(String userName, String password)

Sets a user name and password for basic authentication.

Parameters

Name	Type	Description
userName	String	User name to use for authentication.
password	String	User's password to use for authentication.

Returns

Type	Description
void	

This example shows how to use the *`setBasicAuth()`* method to set the user name and password for the associated REST endpoint call.

```
var instance = 'dev12345';
var username = 'admin';
var password = 'yourpassword';

// Instantiate request with ServiceNow API incidents table
 endpoint
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var request = new
 GlideHTTPRequest('https://'+instance+'.service-now.com/api/n
ow/table/incident');

// Add authentication data
request.setBasicAuth(username, password);

// Add the Accept header to get JSON response
request.addHeader('Accept', 'application/json');

// Execute the GET request
var response = request.get();

// Print the results: status code and number of records returned
gs.print(response.getStatusCode());
gs.print('(JSON) Incidents returned: ' +
 JSON.parse(response.getBody()).result.length);

// Replace the Accept header to get XML response
request.addHeader('Accept', 'application/xml');

// Execute the GET request
var response = request.get();

// Print the results: status code and number of records returned
gs.print(response.getStatusCode());
gs.print('(XML) Incidents returned: ' +
 gs.xmlToJSON(response.getBody()).response.result.length);
```

Output

```
200
(JSON) Incidents returned: 66
200
(XML) Incidents returned: 66
```

GlideHTTPRequest - setContentType(String type)

Sets the Content-Type header for your HTTP request to the specified value.

Parameters

Name	Type	Description
type	String	Content type to set, such as `application/json` or `multipart/form-data`. For additional information on Content-Type, see https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Content-Type.

Returns

Type	Description
void	

This example shows how to set the `Content-Type` request header for a REST endpoint call using the *`setContentType()`* method.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var instance = 'dev12345';
var username = 'admin';
var password = 'yourpassword';

// Instantiate request with ServiceNow API incidents table
 endpoint
var request = new
 GlideHTTPRequest('https://'+instance+'.service-now.com/api/n
ow/table/incident');

// Add authentication data
request.setBasicAuth(username, password);

// Set up incident record to post

// Set the Content-Type of the POST
request.setContentType('application/json');

// Execute the POST request
var response = request.post();

// Print the results: status code and number of records returned
gs.print(response.getStatusCode());
```

Output

```
200
```

GlideHTTPRequest - setFollowRedirect(boolean followRedirect)

Enables or disables the follow redirect option for a REST endpoint call.

For additional information on HTTP redirects, see https://developer.mozilla.org/en-US/docs/Web/HTTP/Redirections.

Parameters

Name	Type	Description
followRedirect	Boolean	Flag that indicates whether the endpoint should follow any URL redirect returned by the endpoint. Valid values: • true: Following any returned redirect. • false: Ignore any returned redirect. Default: true

Returns

Type	Description
void	

This example shows how to turn off redirects for an endpoint call using the *`setFollowRedirect()`* method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

```
var instance = 'dev12345';
var username = 'admin';
var password = 'yourpassword';

// Instantiate request with ServiceNow API incidents table
 endpoint
var request = new
 GlideHTTPRequest('https://'+instance+'.service-now.com/api/n
ow/table/incident');

// Add authentication data
request.setBasicAuth(username, password);

// Add the Accept header to get JSON response
request.addHeader('Accept', 'application/json');

// Turn off follow redirect - default is on (true)
request.setFollowRedirect(false);

// Execute the GET request
var response = request.get();

// Print the results: status code and number of records returned
gs.print(response.getStatusCode());
```

Output

```
200
```

GlideHTTPRequest - setHttpTimeout(int timeout)

Sets the HTTP timeout value in milliseconds.

Parameters

Name	Type	Description
timeout	Integer	Timeout value to set. Unit: Milliseconds

Returns

Type	Description
void	

This example shows how to set the time out value for an endpoint call using the *`setTimeout()`* method.

```
var instance = 'dev12345';
var username = 'admin';
var password = 'yourpassword';

// Instantiate request with ServiceNow API incidents table
 endpoint
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var request = new
 GlideHTTPRequest('https://'+instance+'.service-now.com/api/n
ow/table/incident');

// Add authentication data
request.setBasicAuth(username, password);

// Add the Accept header to get JSON response
request.addHeader('Accept', 'application/json');

// Set the time out value
request.setHttpTimeOut(1000);

// Execute the GET request
var response = request.get();

// Print the results: status code and number of records returned
gs.print(response.getStatusCode());
```

Output

```
200
```

GlideHTTPRequest - setLogLevel(String logLevel)

Sets the log level for an HTTP request.

Parameters

Name	Type	Description
logLevel	String	The level of logging available. **Note:** For performance reasons, in production it is advisable to leave HTTP request logging at *basic*. Valid values: • basic: Covers many of the attributes of the HTTP transaction including host, path, response status, and so on. • elevated: Includes all of *basic*, as well as all request headers, the query string, and all response headers. • all: Includes all of *elevated*, as well as the request body and the response body. Default: basic

Returns

Type	Description
void	

This example shows how to set the log level for an endpoint call using the *setLogLevel()* method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var instance = 'dev12345';
var username = 'admin';
var password = 'yourpassword';

// Instantiate request with ServiceNow API incidents table
 endpoint
var request = new
 GlideHTTPRequest('https://'+instance+'.service-now.com/api/n
ow/table/incident');

// Add authentication data
request.setBasicAuth(username, password);

// Add the Accept header to get JSON response
request.addHeader('Accept', 'application/json');

// Set the time out value
request.setLogLevel(elevated);

// Execute the GET request
var response = request.get();

// Print the results: status code and number of records returned
gs.print(response.getStatusCode());
```

Output

```
200
```

GlideHTTPRequest - setupProxy(String host, String port)

Sets the proxy host and port for the associated REST call.

Parameters

Name	Type	Description
host	String	Proxy host
port	String	Proxy port

Returns

Type	Description
void	

GlideHTTPResponse - Global

The *GlideHTTPResponse* API provides utility methods to perform common functions with Glide HTTP responses.

GlideHTTPResponse - getAllHeaders()

Returns a list of all headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	List of all the headers associated with the endpoint call.

This example shows how to delete a specified incident from the Incident table using the *del()* method.

```
var instance = 'dev12345';
var username = 'admin';
var password = 'yourpassword';

// Instantiate request with ServiceNow API incidents table
 endpoint
var request = new
 GlideHTTPRequest('https://'+instance+'.service-now.com/api/n
ow/table/incident');

// Add authentication data
request.setBasicAuth(username, password);

// Add the Accept header to get JSON response
request.addHeader('Accept', 'application/json');

// Execute the GET request
var response = request.get();

// Print all headers associated with the endpoint call
gs.print(response.getAllHeaders());
```

Output

```
[

]
```

GlideHTTPResponse - getBody()

Returns a string containing the body for the HTTP response.

Note: If the stream has already been accessed, it cannot be accessed again. In this case the method will return null.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	HTTP response body.

This example shows how to use the *getBody()* method to display the contents of the return results of an endpoint call.

```
var instance = 'dev12345';
var username = 'admin';
var password = 'yourpassword';

// Instantiate request with ServiceNow API incidents table
 endpoint
var request = new
 GlideHTTPRequest('https://'+instance+'.service-now.com/api/n
ow/table/incident');

// Add authentication data
request.setBasicAuth(username, password);

// Add the Accept header to get JSON response
request.addHeader('Accept', 'application/json');
request.addHeader('Content-Type','application/json');

var response = request.post('{"short_description":"Test me"}');
```

GlideHTTPResponse - getCookies()

Returns the list of cookies associated with an endpoint call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	List containing the name and value of each cookie as a string.

This example shows how to use the *getCookies()* method to display the cookies associated with a endpoint response.

```
var instance = 'dev12345';
var username = 'admin';
var password = 'yourpassword';

// Instantiate request with ServiceNow API incidents table
 endpoint
var request = new
 GlideHTTPRequest('https://'+instance+'.service-now.com/api/n
ow/table/incident');

// Add authentication data
request.setBasicAuth(username, password);

// Add the Accept header to get JSON response
request.addHeader('Accept', 'application/json');

// Execute the GET request
var response = request.get();

// Print the results: status code and number of records returned
gs.print(response.getStatusCode());
gs.print(response.getCookies());
```

Output

```

```

GlideHTTPResponse - getErrorCode()

Returns the current error code returned by an endpoint.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Integer	The error code. 0 is returned if there are no errors.

This example shows how to view the error code of the last error message thrown by the instance for the associated REST call using the *getErrorCode()* method.

```
var instance = 'dev12345'; // Instance name
var username = 'admin';
var password = 'yourpassword';
var sysId = '0123456789abcdef0123456789abcdef';  // Sys_id of
 the incident to get

// Instantiate request with the ServiceNow API incident table
 endpoint for deletion of an incident
var endpoint = 'https://' + instance +
 '.service-now.com/api/now/table/incident/' + sysId;
var request = new GlideHTTPRequest(endpoint);

// Add authentication data
request.setBasicAuth(username, password);

// Delete the incident
response = request.get();

// Print the results: status code and response body
gs.print(response.getStatusCode());

// Get the last error message
gs.print(response.getErrorCode());
```

Output

```
404
1
```

GlideHTTPResponse - getErrorMessage()

Returns the last error encountered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Text string that describes the last error encountered.

This example shows how to view the last error message thrown by the instance for the associated REST call using the *getErrorMessage()* method.

```
var instance = 'dev12345'; // Instance name
var username = 'admin';
var password = 'yourpassword';
var sysId = '0123456789abcdef0123456789abcdef';  // Sys_id of
 the incident to get

// Instantiate request with the ServiceNow API incident table
 endpoint for deletion of an incident
var endpoint = 'https://' + instance +
 '.service-now.com/api/now/table/incident/' + sysId;
var request = new GlideHTTPRequest(endpoint);

// Add authentication data
request.setBasicAuth(username, password);

// Try to get the non-existent incident
response = request.get();

// Print the results: status code and response body
gs.print(response.getStatusCode());

// Get the last error message
gs.print(response.getErrorMessage());
```

Output

```
404
Method failed:
 (/api/now/table/incident/0123456789abcdef0123456789abcdef) with
 code: 404
```

GlideHTTPResponse - getHeader(String name)

Returns the header specified in the passed-in parameter.

Parameters

Name	Type	Description
name	String	Name of the response header to return, such as *Content-Type*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Value of the specified header for the current response.

This example shows how to display the contents of the *Content-Type* header.

```
var instance = 'dev12345'; // Instance name
var username = 'admin';
var password = 'yourpassword';
var sysId = '0123456789abcdef0123456789abcdef';  // Sys_id of
 the incident to get

// Instantiate request with the ServiceNow API incident table
 endpoint for deletion of an incident
var endpoint = 'https://' + instance +
 '.service-now.com/api/now/table/incident/' + sysId;
var request = new GlideHTTPRequest(endpoint);

// Add authentication data
request.setBasicAuth(username, password);

// Execute the GET request
var response = request.get();

// Print the results
gs.print(response.getStatusCode());
gs.print(response.getHeader("Content-Type"));
```

Output

```
200
application/json
```

GlideHTTPResponse - getHeaders()

Returns all headers associated with the endpoint response.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Object containing all associated headers.

This example shows how to display all of the headers associated with an endpoint call using the *getHeaders()* method.

```
var instance = 'dev12345'; // Instance name
var username = 'admin';
var password = 'yourpassword';
```

© 2026 ServiceNow, Inc. All rights reserved.

```
var sysId = '0123456789abcdef0123456789abcdef';  // Sys_id of
 the incident to get

// Instantiate request with the ServiceNow API incident table
 endpoint for deletion of an incident
var endpoint = 'https://' + instance +
 '.service-now.com/api/now/table/incident/' + sysId;
var request = new GlideHTTPRequest(endpoint);

// Add authentication data
request.setBasicAuth(username, password);

// Execute the GET request
var response = request.get();

// Print the results
gs.print(response.getStatusCode());
gs.print(response.getHeaders());
```

Output

```

}
```

GlideHTTPResponse - getHttpMethod()

Returns the HTTP method associated with the specified endpoint call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	HTTP method associated with the endpoint call, such as `org.apache.commons.httpclient.methods.GetMethod@f83e63`. Format: org.apache.commons.httpclient.methods.<Method>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example shows how to display the HTTP method used when calling the associated endpoint using the *getMethod()* method.

```
var instance = 'dev12345'; // Instance name
var username = 'admin';
var password = 'yourpassword';
var sysId = '0123456789abcdef0123456789abcdef';  // Sys_id of
 the incident to get

// Instantiate request with the ServiceNow API incident table
 endpoint for deletion of an incident
var endpoint = 'https://' + instance +
 '.service-now.com/api/now/table/incident/' + sysId;
var request = new GlideHTTPRequest(endpoint);

// Add authentication data
request.setBasicAuth(username, password);

// Execute the GET request
var response = request.get();

// Print the results
gs.print(response.getStatusCode());
gs.print(response.getHttpMethod());
```

Output

```
200
org.apache.commons.httpclient.methods.GetMethod@f83e63
```

GlideHTTPResponse - getStatusCode()

Returns the last status code for an endpoint call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
int	HTTP response status code.

This example shows how to get the status code of a REST call after it executes using the *getStatusCode()* method.

```
var instance = 'dev12345';
var username = 'admin';
var password = 'yourpassword';

// Instantiate request with ServiceNow API incidents table
 endpoint
var request = new
 GlideHTTPRequest('https://'+instance+'.service-now.com/api/n
ow/table/incident');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Add authentication data
request.setBasicAuth(username, password);

// Add the 'sysparm_limit' parameter to limit the number of
 records returned
request.addParameter('sysparm_limit', 1);

// Execute the GET request
var response = request.get();

// Print the results: status code
gs.print(response.getStatusCode());
```

Output:

```
200
```

GlideHTTPResponse - haveError()

Returns a flag that indicates whether there were any errors while processing the endpoint call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether there were any errors when processing the endpoint call. Valid values: • true: Error occurred during the processing of the endpoint. • false: No errors during the processing of the endpoint. Returns true if an error has occurred, or false if there are no errors

This example shows how no error is flagged when the sys_id for an incident is valid using the *`haveError()`* method.

```
var instance = 'dev12345';
var username = 'admin';
var password = 'yourpassword';

// Valid sys_id of an incident record
var sysId = 'a85f82ffdb5f30103dd9c39d13961916';  // Sys_id of
 the incident to get

// Instantiate request with the ServiceNow API incident table
 endpoint for deletion of an incident
var endpoint = 'https://' + instance +
 '.service-now.com/api/now/table/incident/' + sysId;
var request = new GlideHTTPRequest(endpoint);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Add authentication data
request.setBasicAuth(username, password);

// Execute the GET request
var response = request.get();

// Print the results
gs.print(response.getStatusCode());
gs.print(response.haveError());
```

Output

```
200
false
```

This example shows how an error is flagged when the sys_id for an incident is not valid (not found) using the *haveError()* method.

```
var instance = 'dev12345';
var username = 'admin';
var password = 'yourpassword';

// Invalid sys_id
var sysId = 'a85f82ffdb5f30103dd9c39d13961832';  // Sys_id of
 the incident to get

// Instantiate request with the ServiceNow API incident table
 endpoint for deletion of an incident
var endpoint = 'https://' + instance +
 '.service-now.com/api/now/table/incident/' + sysId;
var request = new GlideHTTPRequest(endpoint);

// Add authentication data
request.setBasicAuth(username, password);

// Execute the GET request
var response = request.get();

// Print the results
gs.print(response.getStatusCode());
gs.print(response.haveError());
```

Output

```
404
true
```

GlideImpersonate - Global

The *GlideImpersonate* API enables administrators to pose as another authenticated user for testing purposes.

Use this API when you need to act as another user so to test functionality within your application. When impersonating another user, the administrator has access to exactly what the impersonated user would have access to in the system, including the same menus and modules.

Note: The system records anything the administrator does while impersonating another user as having been done by that user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideImpersonate - canDebug(String userSysId)

Verifies whether the specified user can perform debugging on scripts.

In order for a user to be able to debug scripts, they must be on a developer instance. Debugging is not allowed on production instances.

Parameters

Name	Type	Description
userSysId	String	sys_Id of the user to verify for debugging capability.

Returns

Type	Description
Boolean	True: User is able to debug the application. False: User is not able to debug the application.

```
userDebug: function(userId) {
  var impUser = new GlideImpersonate();
  impUser.canDebug(userId);
 }
```

GlideImpersonate - canImpersonate(String userSysId)

Verifies whether the current user can impersonate the specified user.

If the current user is not assigned the admin role, the user to impersonate is inactive, or there are other issues with impersonating the specified user, the method returns "false" and the user cannot be impersonated.

Parameters

Name	Type	Description
userSysId	String	sys_Id of the user to impersonate

Returns

Type	Description
Boolean	Flag that indicates whether the current user can impersonate the specified user. Possible values: • true: Current user can impersonate the specified user. • false: Current user cannot impersonate the specified user.

```
function onlineImpersonate(userSysId) {
  if (!GlideImpersonate().canImpersonate(userSysId)){
    gs.addInfoMessage("No access to impersonate " + userSysId);
  } else {
    GlideImpersonate().impersonate(userSysId);
  }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  return;
}
```

GlideImpersonate - impersonate(String userSysId)

Sets the user ID for the current administrator to the passed-in user ID, enabling the administrator to act as that user.

When impersonating another user, the administrator has access to exactly what the impersonated user would have access to in the system, including the same menus and modules. Only use this method when testing functionality in an application. Ensure that once you are finished impersonating a user that you call the method again with the administrator sys_Id to stop the impersonation.

Parameters

Name	Type	Description
userSysId	String	Sys_id of the user to impersonate.

Returns

Type	Description
String	Sys_id of the user that was logged in prior to the impersonation request.

The following example shows how to get the current user object.

```
var user = gs.getUserDisplayName();
gs.print ("The current user display name is: " + user);

var impUser = new GlideImpersonate();
impUser.impersonate("62826bf03710200044e0bfc8bcbe5df1");
var user = gs.getUserDisplayName();
gs.print ("The impersonated user display name is: " + user);
```

Output:

```
The current user display name is: System Administrator
The impersonated user display name is: Abel Tuter
```

GlideImpersonate - isImpersonating()

Determines whether the current user is impersonating another user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True: User is currently impersonating another user. False: User is not currently impersonating another user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
function abortOnImpersonate() {
    if (GlideImpersonate().isImpersonating()){
  current.setAbortAction(true);
  gs.addInfoMessage("Transaction canceled due to
 Impersonation");
    }
    return;
}
```

GlideImportLog - Scoped, Global

The *GlideImportLog* API provides methods to write log entries directly to the Import Log [import_log] table.

A GlideImportLog object is consumable by the *GlideImportSetTransformer* API. This object is not required for the *GlideImportSetTransformer* API, it enables you to associate import logs with a specific Import Set transformation.

Related topics

- GlideTransformLog

GlideImportLog - GlideImportLog(GlideImportSetRun importSetRun, String source)

Instantiates a GlideImportLog object.

Parameters

Name	Type	Description
importSetRun	GlideImportSetRun	Optional. Import Set Run record on which all logs are to be associated with.
source	String	Optional. Source field value attached to the Import Log record that defines where in the Import Set process this message was logged from. For example, Loading could represent loading step, Cleanup could represent during the cleanup after the transform, and so on.

Example without optional source parameter.

```
var importSetRun = new GlideImportSetRun();
var importLog = new GlideImportLog(importSetRun);
```

Example using optional source parameter.

```
var importSetRun = new GlideImportSetRun();
var importLog = new GlideImportLog(importSetRun, 'Scripted
 ImportSetTransformer');
```

GlideImportLog - error(String message, String source)

Logs a message of type Error to the Import Log [import_log] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideImportLog

Parameters

Name	Type	Description
message	String	Log message. Maximum length 4000 characters.
source	String	Optional. Source field value attached to the Import Log record that defines where in the Import Set process this message was logged from. For example, Loading could represent loading step, Cleanup could represent during the cleanup after the transform, and so on.

Returns

Type	Description
None	

```
var importLog = new GlideImportLog();
importLog.error('Error executing transform');
```

GlideImportLog - getImportRunHistory()

Returns a sys_id of the Import Run record associated with this Import Log.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of an Import Set Run record from the Transform History [sys_import_set_run] table.

```
var importSet = new GlideRecord('sys_import_set');
importSet.name = 'Scripted Import Set';
importSet.short_description = 'Import set from scripted rest
 api';
importSet.table_name = importSetTableName;
var importSetID = importSet.insert();
var importLog = new GlideImportLog();
var transformer = new GlideImportSetTransformer();
transformer.setLogger(importLog);
transformer.transformAllMaps(importSet);
var importRunSysId = importLog.getImportRunHistory();
```

GlideImportLog - info(String message, String source)

Logs a message of type Info to the Import Log [import_log] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideImportLog

Parameters

Name	Type	Description
message	String	Log message. Maximum length 4000 characters.
source	String	Optional. Source field value attached to the Import Log record that defines where in the Import Set process this message was logged from. For example, Loading could represent loading step, Cleanup could represent during the cleanup after the transform, and so on.

Returns

Type	Description
None	

```
var importLog = new GlideImportLog();
importLog.info('Successfully executed transform');
```

GlideImportLog - setImportRunHistory(String importRunHistory)

Associates the GlideImportLog object with a specific Import Set Run record.

Parameters

Name	Type	Description
importRunHistory	String	The sys_id of a record from the Transform History [sys_import_set_run] table.

Returns

Type	Description
void	

```
var importRunSysId = '4aa3a8d55ba10010953330ad5981c79f';
var importLog = new GlideImportLog();
importLog.setImportRunHistory(importRunSysId);
```

GlideImportLog - warn(String message, String source)

Logs a message of type Warn to the Import Log [import_log] table.

GlideImportLog

Parameters

Name	Type	Description
message	String	Log message. Maximum length 4000 characters.
source	String	Optional. Source field value attached to the Import Log record that defines where in the Import Set process this message was logged from. For example,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Loading could represent loading step, Cleanup could represent during the cleanup after the transform, and so on.

Returns

Type	Description
None	

```
var importLog = new GlideImportLog();
importLog.warn('Transform taking longer than expected.');
```

GlideImportSetRun - Scoped, Global

The *GlideImportSetRun* API provides methods to creates an Import Set Run record which the *GlideImportSetTransformer* API can consume.

GlideImportSetRun - GlideImportSetRun(String importSetID)

Instantiates a GlideImportSetRun object.

Parameters

Name	Type	Description
importSetID	String	Optional. The sys_id of the import set record listed in the Import Sets [sys_import_set] table. If not set, a new [sys_import_set] record is created and the GlideImportSetRun object represents this record.

```
var importSetRun = new GlideImportSetRun();
```

GlideImportSetRun - getImportSetRunSysID()

Gets the sys_id of the Import Set Run associated with the transformation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The sys_id of the Transform Histories [sys_import_set_run] record associated with the transform.

```
var importSetRun = new GlideImportSetRun();
var importSetRunSysId = importSetRun.getImportSetRunSysID();
```

GlideImportSetTable - Scoped, Global

The *GlideImportSetTable* API provides methods to create temporary Import Set tables.

These methods create the Import Set table using a dynamic, standard naming convention. Tables must have at least one defined column. Modification and deletion of existing Import Set tables is not supported.

A scheduled job named Scripted Import Set Deleter runs every seven days by default. Scripted Import Set Deleter deletes all Import Sets, Transform Maps, Transform Entries, and drops the Import Set Tables associated with the tables created by this API.

You can use the *GlideImportSetTable* methods in global and scoped scripts. Use the `sn_impex` namespace identifier to create a GlideImportSetTable object.

GlideImportSetTable - GlideImportSetTable(String tableLabel)

Instantiates a GlideImportSetTable object.

Parameters

Name	Type	Description
tableLabel	String	Label of the Import Set table created upon calling the *create()* method.

```
var importSetTable = new sn_impex.GlideImportSetTable("temp user
 table");
```

GlideImportSetTable - addDateTimeColumn(String columnLabel)

Creates a GlideDateTime column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
columnLabel	String	Label of the GlideDateTime column to create in the Import Set table.

Returns

Type	Description
void	

```
var importSetTable = new sn_impex.GlideImportSetTable("temp user
 table");
importSetTable.addDateTimeColumn('start date');
var tableStructure = importSetTable.create();
```

GlideImportSetTable - addStringColumn(String columnLabel, Number length)

Creates a string column.

Parameters

Name	Type	Description
columnLabel	String	Label of the string column to create in the Import Set table.
length	Number	Optional. Maximum column length. Default: 40 characters

Returns

Type	Description
void	

```
var importSetTable = new sn_impex.GlideImportSetTable("temp user
 table");
importSetTable.addStringColumn('first name', 50);
importSetTable.addStringColumn('last name', 50);
var tableStructure = importSetTable.create();
```

GlideImportSetTable - create()

Creates the Import Set table.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	JSON object in the following format: • tableName: String. Database name of the table. • tableLabel: String. User-friendly label of the table (rewriteable). • columns: Object. Map of table column labels to column names provided by the *addDateTimeColumn()* and *addStringColumn()* methods. ○ column_label: String. Label of the string column in the Import Set table. ○ column_name: String. Name of the string column in the Import Set table. `{"tableName": "<table_name>", "tableLabel": "<table label>", "columns": StringMap(<column_label>: <column_name>)}`

```
// Create Import Set table
var importSetTable = new sn_impex.GlideImportSetTable("temp user table");
importSetTable.addStringColumn('first name', 40);
importSetTable.addStringColumn('last name', 40);
importSetTable.addDateTimeColumn('start date');
var tableStructure = importSetTable.create();

/*
tableStructure = {
"tableName": "imp_staging_table_1417601730000",
"tableLabel": "temp user table",
"columns": {
  "first name": "u_first_name",
  "last name": "u_last_name",
  "start date": "u_start_date"
 }
}
*/

var importSetTableName = tableStructure["tableName"];
var columns = tableStructure["columns"];
```

GlideImportSetTransformer - Scoped, Global

The *GlideImportSetTransformer* API provides methods to create an Import Set Transformer object used to execute an Import Set Transform.

To execute an Import Set transform:

1. Create an Import Set table using the *GlideImportSetTable* API.
2. Create a Transform Map using the *GlideImportSetTransformMap* API.
3. Create or use an existing Import Set using the *GlideRecord* API.
4. Execute an Import Set Transform using the *GlideImportSetTransformer* API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once you have created the Import Set record it must be consumed by the *GlideImportSetTransformer* API in order to trigger the transform.

```
var transformer = new GlideImportSetTransformer();
transformer.transformAllMaps(importSetGr);
```

Related topics

GlideImportLog

GlideImportSetRun

GlideImportSetTable

GlideImportSetTransformMap

GlideRecord

GlideTransformLog

GlideImportSetTransformer - GlideImportSetTransformer()

Instantiates a GlideImportSetTransformer object.

Parameters

Name	Type	Description
None		

```
var transformer = new GlideImportSetTransformer();
```

GlideImportSetTransformer - getImportSetRun()

Gets the Import Set Run object associated with a GlideImportSetTransformer object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideImportSetRun	GlideImportSetRun object created by running a transformation or the argument supplied to the *setImportSetRun()* method.

```
var importSet = new GlideRecord('sys_import_set');
importSet.short_description = 'Import set from scripted rest
 api';
importSet.table_name = importSetTableName;
var importSetID = importSet.insert();
var transformer = new GlideImportSetTransformer();
transformer.transformAllMaps(importSet);
var importSetRun = transformer.getImportSetRun();
```

GlideImportSetTransformer - isError()

Returns a Boolean value specifying whether or not there was an error during a transformation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether there is an error. • true: Error. • false: Success.

```
var importSet = new GlideRecord('sys_import_set');
importSet.short_description = 'Import set from scripted rest
 api';
importSet.table_name = importSetTableName;
var importSetID = importSet.insert();
var transformer = new GlideImportSetTransformer();
transformer.transformAllMaps(importSet);
if(transformer.isError()) {
 gs.error('Error executing the transform');
}
```

GlideImportSetTransformer - setImportSetID(String id)

Associates an Import Set record with a specific GlideImportSetTransformer object.

Parameters

Name	Type	Description
id	String	The sys_id of an Import Set record from the Import Sets [sys_import_set] table.

Returns

Type	Description
void	

```
var importSet = new GlideRecord('sys_import_set');
importSet.short_description = 'Import set from scripted rest
 api';
importSet.table_name = importSetTableName;
var importSetID = importSet.insert();
var transformer = new GlideImportSetTransformer();
transformer.setImportSetID(importSetID);
transformer.transformAllMaps(importSet);
```

GlideImportSetTransformer - setImportSetRun(GlideImportSetRun importSetRun)

Associates an Import Set Run object with a specific GlideImportSetTransformer object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
importSetRun	GlideImportSetRun	GlideImportSetRun object representing the ImportSetRun record to track the transformation history.

Returns

Type	Description
void	

```
var importSet = new GlideRecord('sys_import_set');
importSet.short_description = 'Import set from scripted rest
 api';
importSet.table_name = importSetTableName;
var importSetID = importSet.insert();
var importSetRun = new GlideImportSetRun(importSetID);
var transformer = new GlideImportSetTransformer();
transformer.setImportSetRun(importSetRun);
transformer.transformAllMaps(importSet);
```

GlideImportSetTransformer - setLogger(GlideImportLog log)

Associates a GlideImportLog object with a specific GlideImportSetTransformer object.

If this method is not called prior to calling the *`transformAllMaps()`* method, a GlideImportLog object is created internally on the server side.

Parameters

Name	Type	Description
log	GlideImportLog	GlideImportLog object to link to the Import Set history. Once set, any call from the GlideImportLog object is associated with the Import Set run history for that specific transform.

Returns

Type	Description
void	

```
var importSet = new GlideRecord('sys_import_set');
importSet.short_description = 'Import set from scripted rest
 api';
importSet.table_name = importSetTableName;
var importSetID = importSet.insert();
var importLog = new GlideImportLog();
var transformer = new GlideImportSetTransformer();
transformer.setLogger(importLog);
transformer.transformAllMaps(importSet);
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideImportSetTransformer - setMapID(String mapID)

Associates a Transform Map with a specific GlideImportSetTransformer object.

Parameters

Name	Type	Description
mapID	String	A sys_id from the Table Transform Maps [sys_transform_map] table.

Returns

Type	Description
void	

```
var importSet = new GlideRecord('sys_import_set');
importSet.short_description = 'Import set from scripted rest
 api';
importSet.table_name = importSetTableName;
var importSetID = importSet.insert();
var transformMapId = '<sys id of transform map>';
var transformer = new GlideImportSetTransformer();
transformer.setMapID(transformMapId);
transformer.transformAllMaps(importSet);
```

GlideImportSetTransformer - setSyncImport(Boolean synchronous)

Enables running synchronous transformations.

Parameters

Name	Type	Description
synchronous	Boolean	Sets transformation mode. Valid values: • true: Run transformation synchronously • false: Run transformation asynchronously Default: false

Returns

Type	Description
void	

```
var importSet = new GlideRecord('sys_import_set');
importSet.short_description = 'Import set from scripted rest
 api';
importSet.table_name = importSetTableName;
var importSetID = importSet.insert();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var transformer = new GlideImportSetTransformer();
transformer.setSyncImport(true);
transformer.transformAllMaps(importSet);
```

GlideImportSetTransformer - transformAllMaps(GlideRecord importSet, String rowSysId)

Executes the Import Set transformation.

Parameters

Name	Type	Description
importSet	GlideRecord	GlideRecord of the import set to execute.
rowSysId	String	Optional. Restricts transformation to a single record by passing the sys_id of a record from the Import Sets [sys_import_set] table. Default: Transform all rows

Returns

Type	Description
void	

```
var importSet = new GlideRecord('sys_import_set');
importSet.short_description = 'Import set from scripted rest
 api';
importSet.table_name = importSetTableName;
var importSetID = importSet.insert();
var transformer = new GlideImportSetTransformer();
transformer.transformAllMaps(importSet);
```

GlideImportSetTransformMap - Scoped, Global

The *GlideImportSetTransformMap* API provides methods to create transform maps and transform entries.

You can use the *GlideImportSetTransformMap* methods in global and scoped scripts. Use the `sn_impex` namespace identifier to create a GlideImportSetTransformMap object.

GlideImportSetTransformMap - GlideImportSetTransformMap(String transformMapName, String importSetTableName, String targetTableName)

Instantiates a GlideImportSetTransformMap object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
transformMapName	String	Name of the map.
importSetTableName	String	Name of the Import Set table.
targetTableName	String	Name of the target table.

```
var transformMap = new sn_impex.GlideImportSetTransformMap("temp
 user map name", importSetTableName, targetTableName);
```

GlideImportSetTransformMap - addDateTimeTransformEntry(String sourceColumn, String targetColumn, Boolean coalesce, String dateTimeFormat)

Add a GlideDateTime transform entry to a transform map.

Parameters

Name	Type	Description
targetColumn	String	Target column from target table to transform to.
coalesce	Boolean	Optional. Flag that indicates whether to insert the record into the target table • true: If true and target table contains a record with the same value in this field, the record is updated, that is, not inserted. • false: Default. Record is inserted into the target table.
sourceColumn	String	Source column from Import Set table to transform from.
dateTimeFormat	String	Optional. GlideDateTime format of the transform, for example, yyyy-MM-dd HH:mm:ss. If empty, the default value is the system date time format.

Returns

Type	Description
void	

```
var transformMap = new sn_impex.GlideImportSetTransformMap("temp
 user map name", importSetTableName, targetTableName,);
transformMap.addDateTimeTransformEntry("u_start date", "first
 day", true, "yyyy-MM-dd HH:mm:ss");
var transformMapId = transformMap.create();
```

GlideImportSetTransformMap - addTransformEntry(String sourceColumn, String targetColumn, Boolean coalesce)

Adds a string transform entry to a transform map.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
targetColumn	String	Source column from Import Set table to transform from.
coalesce	String	Target column from target table to transform to.
sourceColumn	Boolean	Optional. Flag that indicates whether to insert the record into the target table • true: If true and target table contains a record with the same value in this field, the record is updated, that is, not inserted. • false: Default. Record is inserted into the target table.

Returns

Type	Description
void	

```
var transformMap = new sn_impex.GlideImportSetTransformMap("temp
 user map name", importSetTableName, targetTableName);
transformMap.addTransformEntry("first_name", "first_name",
 true);
transformMap.addTransformEntry("last_name", "last_name", false);
transformMap.addTransformEntry("age", "age", false);
var transformMapId = transformMap.create();
```

GlideImportSetTransformMap - create()

Creates a new transform map.

Note: To create a transform map you must have defined at least one transform entry using either *addDateTimeTransformEntry()* or *addTransformEntry()*.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The sys_id of the created transform map.

```
var transformMap = new sn_impex.GlideImportSetTransformMap("temp
 user map name", importSetTableName, targetTableName);
transformMap.addTransformEntry("u_first_name", "first_name");
var transformMapId = transformMap.create();
```

GlideJsonPath - Global

The *GlideJsonPath* API retrieves values from a JSON document using a query path string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API is available by default.

GlideJsonPath - GlideJsonPath(String jsonDocument)

Instantiates a GlideJsonPath scriptable object by parsing a JSON document.

Parameters

Name	Type	Description
jsonDocument	String	JSON document to parse.

This example instantiates a GlideJsonPath object by parsing a JSON document.

```
var v = new
 GlideJsonPath('{"lib":{"jsonpath":{"creator":{"name":"DevStudio
","developers":["dev1","dev2","dev3"]}}}}');
```

GlideJsonPath - read(String jsonPath)

Retrieves values from a JSON document using a query path string.

Parameters

Name	Type	Description
jsonPath	String	Path to search for in the JSON document. All valid JSONPath expressions are supported. For more information, see JSONPath.

Returns

Type	Description
Object	JavaScript object(s) that match the specified path.

This example searches a JSON document for all developers listed under the specified path.

```
var v = new
 GlideJsonPath('{"lib":{"jsonpath":{"creator":{"name":"DevStudio
","developers":["dev1","dev2","dev3"]}}}}');
var l =
 v.read("$['lib']['jsonpath']['creator']['developers'][*]");
```

Output:

```
"dev1", "dev2", "dev3"
```

GlideListProperties - Global

The `GlideListProperties` API provides methods to create a list and set list properties. For example, you can define whether a list has a filter, breadcrumbs, and search.

To use this class, you must first instantiate a GlideListProperties object using the constructor.

For an example of this class in the base system, configure a list and select **All**. The tabbed list of options uses the personalize_all UI page and personalize_all_list UI macro to set list properties such as title, context menu, and breadcrumbs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API includes methods that provide information about existing GlideList settings and provides options for setting various GlideList properties. For information on how to modify settings in the UI, see GlideList2 (g_list) - Client or GlideList (Next Experience) - Client.

GlideListProperties - GlideListProperties()

Instantiates a GlideListProperties object.

Parameters

Name	Type	Description
None		

```
var list = new GlideListProperties();
```

GlideListProperties - getListID()

Returns the unique ID for a list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Unique ID for the list

```
var list = new GlideListProperties();
var getID = list.getListID();
gs.print(getID);
```

Output: 3519f77ad95f5700964f387107a8a394

GlideListProperties - getListName()

Returns the name of the list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the list.

```
var list = new GlideListProperties();
var setName = list.setListName("my custom list");
var getName = list.getListName();
gs.print(getName);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output: my custom list

GlideListProperties - getTitle()

Get the title of a list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The title of the list.

Optional example explanation

```
var list = new GlideListProperties();
var title = list.setTitle("My title");
var getTitle = list.getTitle();
gs.print(getTitle);
```

Output: My title

GlideListProperties - hasActions()

Returns whether or not the **Actions on select rows** option is enabled for a list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns **true** if the actions option is enabled for a list.

```
var list = new GlideListProperties();
var actions = list.setHasActions(true);
var hasActions = list.hasActions();
gs.print(hasActions);
```

Output: true

GlideListProperties - hasBottomNav()

Returns whether or not a list has navigation at the bottom.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	If returns **true** the list has bottom navigation.

```
var lp = new GlideListProperties();
var Nav = lp.setHasBottomNav(true);
var hasNav = lp.hasBottomNav();
gs.print(hasNav);
```

Output: true

GlideListProperties - hasBottomVCR()

Returns whether or not the page navigation controls appear in the footer of a list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	If **true** the page navigation controls appear in the footer of a list.

```
var list = new GlideListProperties();
var vcr = list.setHasBottomVCR(true);
var hasVCR = list.hasBottomVCR();
gs.print(hasVCR);
```

Output: true

GlideListProperties - hasFilter()

Returns whether or not a list has a filter.

The filter property is a parent of the breadcrumbs property. If the filter property is listed as false and the breadcrumb is listed as true, `hasFilter()` still returns true because the child property is marked as true.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	If **true** a filter icon appears with the list, or the breadcrumb property is listed as true. If **false** both the filter property and the breadcrumb property are marked as false.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var list = new GlideListProperties();
var filter = list.setHasFilter(true);
var breadcrumbs = list.setHasBreadcrumbs(true);
var hasFilter = list.hasFilter();
gs.print(hasFilter);
```

Output: true

GlideListProperties - hasHeader()

Returns whether or not a list has a header.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns **true** if a list has a header.

```
var list = new GlideListProperties();
var header = list.setHasHeader(true);
var hasHeader = list.hasHeader();
gs.print(hasHeader);
```

Output: true

GlideListProperties - hasHeaderContextMenu()

Returns whether or not a header context menu is enabled for a list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	If **true** a context menu displays next to each column header in a list.

```
var list = new GlideListProperties();
var header = list.setHasHeaderContextMenu(true);
var hasHeader = list.hasHeaderContextMenu();
gs.print(hasHeader);
```

Output: true

GlideListProperties - hasListMechanic()

Returns whether list personalization is enabled for a list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	If **true** the list mechanic is enabled for a list and the Personalize List icon appears on the page.

```
var list = new GlideListProperties();
var mechanic = list.setHasListMechanic(true);
var hasMechanic = list.hasListMechanic();
gs.print(hasMechanic);
```

Output: true

GlideListProperties - hasPopup()

Returns whether or not a list can have popup windows.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns **true** if the list allows popups.

```
var list = new GlideListProperties();
var popup = list.setHasPopup(true);
var hasPopup = list.hasPopup();
gs.print(hasPopup);
```

Output: true

GlideListProperties - hasRowContextMenu()

Returns whether or not rows in a list have a context menu.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	If **true** a list row can have a context menu.

```
var list = new GlideListProperties();
var contextMenu = list.setHasRowContextMenu(true);
var hasContextMenu = list.hasRowContextMenu();
gs.print(hasContextMenu);
```

Output: true

GlideListProperties - hasSearch()

Returns whether or not the search bar is enabled for a list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	If **true** the search bar appears in the header of a list.

```
var list = new GlideListProperties();
var search = list.setHasSearch(true);
var hasSearch = list.hasSearch();
gs.print(hasSearch);
```

Output: true

GlideListProperties - hasTitle()

Returns whether or not the list title appears in the list header.

The title context menu is a child property of title. If `setHasTitleContextMenu` is set to true, `hasTitle` also returns true, even if `setHasTitle` is set to false.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	If **true** the list title appears in the list header.

```
var list = new GlideListProperties();
var title = list.setHasTitle(true);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var contextMenu = list.setHasTitleContextMenu(true);
var hasTitle = list.hasTitle();
gs.print(hasTitle);
```

Output: true

GlideListProperties - hasTitleContextMenu()

Returns whether a context menu appears in a list header.

The title context menu is a child property of title. If `setHasTitleContextMenu` is set to true, `hasTitle` also returns true, even if `setHasTitle` is set to false.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	If **true** the context menu appears in the list header next to the list title.

Optional example explanation

```
var list = new GlideListProperties();
var contextMenu = list.setHasTitleContextMenu(true);
var hasContextMenu = list.hasTitleContextMenu();
gs.print(hasContextMenu);
```

Output: true

GlideListProperties - hasTopVCR()

Returns whether or not the page navigation controls appear in the header of a list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	If **true** the page navigation controls appear in the header of a list.

```
var list = new GlideListProperties();
var vcr = list.setHasTopVCR(true);
var hasVCR = list.hasTopVCR();
gs.print(hasVCR);
```

Output: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideListProperties - isOmitFilter()

Returns whether or not the omit filter option has been selected.

The ListControl omit flags take precedence in that if they are set, they negate the setting of their corresponding flag. For example, if the show filter flag has been set to true, but the ListControl omit filter is true, then checking hasFilter returns `false`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true or false whether the omit filter flag has been selected.

```
var lp = new GlideListProperties();
var omitFilter = lp.isOmitFilter();
gs.print(omitFilter);
```

Output: false

GlideListProperties - isSaveFilterHidden()

Returns whether the Save Filter button is hidden in the condition builder.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	If **true** the Save Filter button is hidden in the condition builder.

```
var list = new GlideListProperties();
var SaveFilter = list.setSaveFilterHidden(true);
var hasSaveFilter = list.isSaveFilterHidden();
gs.print(hasSaveFilter);
```

Output: true

GlideListProperties - isShowLinks()

Returns whether or not a list shows links.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var links = list.setShowLinks(true);
var hasLinks = list.isShowLinks();
gs.print(hasLinks);
```

Output: true

GlideListProperties - isToggleHeader()

Returns whether or not toggling the header columns is available for a list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	If **true** users can show or hide the column headers for a table.

```
var list = new GlideListProperties();
var toggle = list.setToggleHeader(true);
var hasToggle = list.isToggleHeader();
gs.print(hasToggle);
```

Output: true

GlideListProperties - setCanChangeView(Boolean onOff)

Determine whether the user can change the view for the list.

Parameters

Name	Type	Description
onOff	Boolean	If **false** users cannot change the list view. By default, changing views is enabled.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var changeView = list.setCanChangeView(true);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideListProperties - setCanGroup(Boolean onOff)

Determine whether users can group items in a list.

Parameters

Name	Type	Description
onOff	Boolean	If **false**, the group by option does not appear in the column context menu. By default the group by option appears in the list context menu.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var canGroup = list.setCanGroup(true);
```

GlideListProperties - setCanSort(Boolean onOff)

Determine whether the sort option is available in a list.

Parameters

Name	Type	Description
onOff	Boolean	If **false**, the sort option does not appear in column list context menu, and users cannot click the column title to change the order of the list.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var canSort = list.setCanSort(true);
```

GlideListProperties - setContextMenus(Boolean onOff)

Displays or hides all of the available context menus for a list.

Parameters

Name	Type	Description
onOff	Boolean	If set to **true** displays the title context menu, header context menu, and list context menu for a list.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var list = new GlideListProperties();
var context = list.setContextMenus(true);
```

GlideListProperties - setHasActions(Boolean)

Determine whether the **Actions on select rows** options display at the bottom of a list.

Parameters

Name	Type	Description
onOff	Boolean	If **true** displays action options for a list.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var actions = list.setHasActions(true);
```

GlideListProperties - setHasBottomNav(Boolean onOff)

Determine whether the navigation actions at the bottom of a list are hidden or not.

Parameters

Name	Type	Description
onOff	Boolean	When **true** adds navigation to the bottom of a list.

Returns

Type	Description
void	

```
var lp = new GlideListProperties();
var bottom = lp.setHasBottomNav(true);
```

GlideListProperties - setHasBreadcrumbs(Boolean onOff)

Determine whether or not breadcrumbs appear at the top of a list.

Breadcrumbs are a child of filters. To hide breadcrumbs completely, you need to also set the filter to false.

Parameters

Name	Type	Description
onOff	Boolean	If **true** breadcrumbs appear at the top of a list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var breadcrumbs = list.setHasBreadcrumbs(true);
```

GlideListProperties - setHasBottomVCR(Boolean onOff)

Determine whether the first page, last page, next page, and previous page buttons appear at the bottom of the list.

Parameters

Name	Type	Description
onOff	Boolean	If **true**, the first page, last page, next page, and previous page buttons appear at the bottom of the list.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var bottomVCR = list.setHasBottomVCR(true);
```

GlideListProperties - setHasFilter(Boolean onOff)

Determine whether or not the filter displays as part of a list.

The filter is a parent of breadcrumbs. To remove the filter, you need to set both the filter and the breadcrumbs to false.

Parameters

Name	Type	Description
onOff	Boolean	If **true** a filter icon appears at the top of the list. Users can use the filter to narrow search results.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var filter = list.setHasFilter(true);
```

GlideListProperties - setHasHeader(Boolean onOff)

Determine whether or not a list displays a header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
onOff	Boolean	If **true** the list displays a header.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var header = list.setHasHeader(true);
```

GlideListProperties - setHasHeaderContextMenu(Boolean onOff)

Determine whether or not the context menu appears next to each column in a list.

Parameters

Name	Type	Description
onOff	Boolean	If **true** the context menu appears next to each column in a list.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var actions = list.setHasHeaderContextMenu(true);
```

GlideListProperties - setHasListMechanic(Boolean onOff)

Determine whether or not a list has the option for personalization.

Parameters

Name	Type	Description
onOff	Boolean	If **true** the list mechanic is enabled and the Personalize List icon appears on the page.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var mechanic = list.setHasListMechanic(true);
```

GlideListProperties - setHasPopup(Boolean onOff)

Determine whether the list has a popup or modal window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
onOff	Boolean	If **true**the list can have popup windows.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var popup = list.setHasPopup(true);
```

GlideListProperties - setHasRowContextMenu(Boolean onOff)

Determines whether or not list rows have a context menu.

Parameters

Name	Type	Description
onOff	Boolean	When **true** list rows can have a context menu.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var contextMenu = list.setHasRowContextMenu(true);
```

GlideListProperties - setHasSearch(Boolean onOff)

Determine whether search appears for a list.

Parameters

Name	Type	Description
onOff	Boolean	If **true** the search bar appears in the list header.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var search = list.setHasSearch(true);
```

GlideListProperties - setHasTitle(Boolean onOff)

Determine whether the list title appears in the header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
onOff	Boolean	If **true** the title of the list appears in the list header.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var title = list.setHasTitle(true);
```

GlideListProperties - setHasTitleContextMenu(Boolean onOff)

Determine whether or not a list has a context menu in the header.

Parameters

Name	Type	Description
onOff	Boolean	If **true** the context menu appears next to the list title in the header

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var contextMenu = list.setHasTitleContextMenu(true);
```

GlideListProperties - setHasTopVCR(Boolean onOff)

Determine whether or not a list has the page navigation controls in the list header.

Parameters

Name	Type	Description
onOff	Boolean	If **true** the page navigation controls appear in the header of a list.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var vcr = list.setHasTopVCR(true);
```

GlideListProperties - setHideRows(Boolean onOff)

Determine whether rows are visible in a list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
onOff	Boolean	If **true** all of the rows are hidden for a list.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var hideRows = list.setHideRows(true);
```

GlideListProperties - setListID(String ID)

Set the unique ID for a list.

Parameters

Name	Type	Description
Unique ID	String	The unique ID for the list.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var setID = list.setListID("a9dd1483d99f5700964f387107a8a3ec");
var getID = list.getListID();
gs.print(getID);
```

Output: a9dd1483d99f5700964f387107a8a3ec

GlideListProperties - setListName(String name)

Defines a name for the list.

Parameters

Name	Type	Description
name	String	Name of the list.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var name = list.setListName("my custom list");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideListProperties - setSaveFilterHidden(Boolean onOff)

Determine whether the Save Filter button appears in the condition builder.

Parameters

Name	Type	Description
onOff	Boolean	If **true** the Save Filter button is hidden.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var saveFilter = list.setSaveFilterHidden(true);
```

GlideListProperties - setShowLinks(Boolean onOff)

Whether or not a list includes links.

Parameters

Name	Type	Description
onOff	Boolean	If **true** list includes related links.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var links = list.setShowLinks(true);
```

GlideListProperties - setTitle(String title)

Defines the list title.

Parameters

Name	Type	Description
title	String	Title for the list.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var title = list.setTitle("My title");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideListProperties - setToggleHeader(Boolean onOff)

Determine whether users can show or hide column headers for a table.

Parameters

Name	Type	Description
onOff	Boolean	If **true** an icon appears in the header that allows users to show or hide the column headers.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var toggle = list.setToggleHeader(true);
```

GlideListProperties - setVCR(Boolean onOff)

Determine whether the first page, last page, next page, and previous page buttons appear at the top and bottom of the list.

Parameters

Name	Type	Description
onOff	Boolean	If **false**, the list does not have any of the page navigation buttons for a list.

Returns

Type	Description
void	

```
var list = new GlideListProperties();
var VCR = list.setVCR(true);
```

GlideLocale - Scoped

The `GlideLocale` API provides information about display information for the local instance.

There is no constructor for a GlideLocale object. Use the `get()` method to obtain a GlideLocale object.

GlideLocale - get()

Returns the GlideLocale object.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideLocale	The GlideLocale object.

```
var locale = GlideLocale.get();
```

GlideLocale - getDecimalSeparator()

Returns the decimal separator.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The decimal separator.

```
var locale = GlideLocale.get();
var decimalSeparator = locale.getDecimalSeparator();
gs.info( "The decimal separator is " + decimalSeparator);
```

Output:

```
The decimal separator is .
```

GlideLocale - getGroupingSeparator()

Returns the grouping separator.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The grouping separator.

```
var locale = GlideLocale.get();var groupingSeparator =
 locale.getGroupingSeparator();
gs.info( "The grouping separator is " + groupingSeparator);
```

Output:

```
The grouping separator is ,
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideMultiRecurrence - Scoped

The `GlideMultiRecurrence` API provides methods that return GlideDateTime objects that describe the run times for a specified scheduled job.

Use this API when you need to determine when a specific periodic or recurring job needs to run, also known as an occurrence.

This API runs in the `sn_schdl_ns` namespace.

To use this API, the associated scheduling table must contain one or more of the following fields (triggers).

Trigger	Description
effective_end	Scheduled end date and time of the job.
effective_start	Schedule start date and time of the job.
frequency	Number of occurrences to return.
run_dayofmonth	Day of the month to run the job. Valid values: 1-31
run_dayofweek	Day of the week to run the job. Valid values: 1 (Sunday) - 7 (Saturday)
run_month	Month of the year to run the job. Valid values: 1-12
run_time	GMT time of day to run the job.
run_weekinmonth	Week of month to run the job. Valid values: 1-6
time_zone	Time zone of the scheduled job.
trigger_type	• 0: Run once • 1: Repeat • 2: On demand • 3: Day in week • 4: Day in month • 5: Week in month • 6: Day and month in year • 7: Day in week in month and in year • 8: Run at the specified times • 9: Run at system start up • 10: Interval • 11: Daily

When using this API, you must first create a GlideRecord object for the scheduling table on which the API should act. You then retrieve the scheduling record for which to obtain the occurrence records. For example:

```
var table_nameGR = new GlideRecord('<table_name>'); //
 Scheduling table, such as sys_trigger
table_nameGR.addQuery('sys_id', '<sys_id>'); // Sys_id of the
 scheduling record
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
table_nameGR.query();
table_nameGR.next();  // Retrieve the scheduling record
```

GlideMultiRecurrence - getOccurrences()

Returns a GlideDateTime object for each scheduled run time (occurrence) that a specified scheduled job should execute within a specific time period, based on the triggers defined in the associated schedule record (GlideRecord).

This method analyzes the current GlideRecord scheduling object, using the triggers defined within the scheduling object, to determine when the job should run.

Properties that control the return results:

- com.glide.schedule.recurrence.num_occurrences_max: Maximum number of occurrences to return.
- com.glide.schedule.recurrence.num_occurrences_default: Default number of occurrences to return.

The method applies the following rules to determine the occurrences to return for the defined period of time and associated triggers:

- If the *effective_start* field is valid and not null or empty, use it as the date to start returning occurrences. Otherwise use the current date.
- If the *effective_end* date field is valid and not null or empty, return the occurrences between the *effective_start* and the *effective_end* date fields.

  Exception to the above rule: If the *effective_end* date is too far in the future, resulting in the return of more than the number of occurrences specified in the com.glide.schedule.recurrence.num_occurrences_max property, then the result is limited to the value specified in com.glide.schedule.recurrence.num_occurrences_max (default 500).

- If the *effective_end* date field is null or empty, but the *frequency* field is set, then use *frequency* to determine the number of occurrences to return.
- Return historical dates if the *effective_start* date field is in the past.
- If the *frequency* and *effective_end* date fields are both specified, use the *effective_end* date with the maximum number of occurrences limited to the value specified in the com.glide.schedule.recurrence.num_occurrences_max property.

If none of the rules above are true, then the method returns occurrences based on the system properties' default setting.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: *MAX_Drift* is not supported by this API.

Example: Both *frequency* and *effective_end* are specified. *Effective_end* date takes precedence, and *frequency* is ignored.

- *frequency*: 10
- *effective_start*: 1st Aug 2022
- *effective_end*: 10th Oct 2022
- Trigger type: Day in month
- Run day of month: 15

Number of GlideDateTime objects returned = 2.

Occurrences returned: 15th Aug 2022, 15th Sep 2022.

Example: Both *frequency* and *effective_end* are specified. *Effective_end* date takes precedence and *frequency* is ignored, however, the number of returned occurrences is restricted by the value in the com.glide.schedule.recurrence.num_occurrences_max property.

- *frequency*: 20
- *effective_start*: 1st Aug 2022
- *effective_end*: 30th Oct 2070
- Trigger type: Day in month
- Run day of month: 15

Number of GlideDateTime objects returned = 500.

Parameters

Name	Type	Description
grSchedule	GlideRecord	GlideRecord object pointing to the record containing the job for which you want to get the schedule occurrences.

Returns

Type	Description
Array of GlideDateTime objects	GlideDateTime object for each time that the schedule job should run.

The following example shows how to retrieve GlideDateTime objects for all scheduled run date/time for a specific period for a specified job schedule record. The selected job is scheduled to run every hour.

```
var sys_id = 'a9e30c7dc61122760116894de7bcc7bd'; // Sys_id of
 the job schedule record
var table = 'sys_trigger'; // Table that contains the job
 schedule record

var grSchedule = new GlideRecord(table);
if
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 (grSchedule.get(sys_id)) {
  var multiRecurrence = new sn_schdl_ns.GlideMultiRecurrence();
  var dates = multiRecurrence.getOccurrences(grSchedule); //
 Display the list of occurrences
  for(var i=0; i<dates.length; i++) {
    gs.info('occurrence = ' + dates[i]);
  }
}
```

Output:

```
occurrence = 2022-11-21 16:23:23
occurrence = 2022-11-21 17:23:23
occurrence = 2022-11-21 18:23:23
occurrence = 2022-11-21 19:23:23
occurrence = 2022-11-21 20:23:23
occurrence = 2022-11-21 21:23:23
occurrence = 2022-11-21 22:23:23
occurrence = 2022-11-21 23:23:23
occurrence = 2022-11-22 00:23:23
occurrence = 2022-11-22 01:23:23
```

GlideOAuthClient - Scoped, Global

The *GlideOAuthClient* API provides methods for requesting and revoking OAuth refresh and access tokens.

You can use this API in global and scoped scripts. In scoped scripts use the `sn_auth` namespace identifier.

GlideOAuthClient - getToken(String requestID, String oauthProfileID)

Retrieves the access and refresh tokens for the client.

Parameters

Name	Type	Description
requestID	String	Request ID from the OAuth Requestor Profile [oauth_requestor_profile] table, which references the OAuth Entity Profile [oauth_entity_profile] table.
oauthProfileID	String	OAuth profile ID from the OAuth Entity Profile [oauth_entity_profile] table.

Returns

Type	Description
GlideOAuthToken	The access and refresh tokens for the client.

This example code shows how to retrieve access and refresh tokens from the instance database.

```
function dumpToken(token) {
  if(token) {
     gs.info("AccessToken:" + token.getAccessToken());
     gs.info("AccessTokenExpiresIn:" + token.getExpiresIn());
     gs.info("RefreshToken:" + token.getRefreshToken());
  }
```

© 2026 ServiceNow, Inc. All rights reserved.

```
}

var oAuthClient = new  sn_auth.GlideOAuthClient();
var token =
 oAuthClient.getToken('248e3017c302301089a7dd5c2840dda5',
 '9c4e78d3c302301089a7dd5c2840dd76');
dumpToken(token);
```

Output:

```
*** Script:
 AccessToken:6MRxD3TRYYvIaoKr-JCy3KiaOxBPu4C9k8oafo3MYf9q8zDyHQr
8UzMSM3Md2alfaES1rzSYe5ydqgbOwpm7TA

```

GlideOAuthClient - requestToken(String clientName, String jsonString)

Retrieves the token for the client, with the request parameters encoded in JSON format.

Parameters

Name	Type	Description
clientName	String	The client name.
jsonString	String	The JSON string for the client.

Returns

Type	Description
GlideOAuthClientResponse	The token for the client.

This example shows a resource owner password grant type request, with request parameters encoded in JSON format.

```
var oAuthClient = new GlideOAuthClient();
var params ={grant_type:"password", username:"itil",
 password:'itil'};
var json =new JSON();
var text = json.encode(params);
var tokenResponse = oAuthClient.requestToken('TestClient',
 text);
var token = tokenResponse.getToken();

gs.log("AccessToken:"+ token.getAccessToken());
gs.log("AccessTokenExpiresIn:"+ token.getExpiresIn());
gs.log(" RefreshToken:"+ token.getRefreshToken());
```

GlideOAuthClient - requestTokenByRequest(String clientName, GlideOAuthClientRequest request)

Retrieves the token for the client, with the client name and the request set into a GlideOAuthClientResponse object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
clientName	String	The client name.
request	GlideOAuthClientRequest	The request.

Returns

Type	Description
GlideOAuthClientResponse	The token for the client.

GlideOAuthClient - revokeToken(String clientName, String accessToken, String refreshToken, GlideOAuthClientRequest request)

Revokes the access or refresh token for the client, with the request and optional header parameters set into a GlideOAuthClientRequest object.

Parameters

Name	Type	Description
clientName	String	The client name.
accessToken	String	The access token.
refreshToken	String	The refresh token.
request	GlideOAuthClientRequest	The request.

Returns

Type	Description
GlideOAuthClientResponse	The token for the client.

GlideOAuthClientRequest - Scoped, Global

The `GlideOAuthClientRequest` API provides methods for handling OAuth client requests.

You can use this API in global and scoped scripts. In scoped scripts use the `sn_auth` namespace identifier.

GlideOAuthClientRequest - getGrantType()

Retrieves the grant type.

Parameters

Name	Type	Description
none		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The grant type.

GlideOAuthClientRequest - getHeader(String name)

Retrieves the HTTP headers for the string you provide.

Parameters

Name	Type	Description
name	String	The name of the parameter.

Returns

Type	Description
StringMap	The string map with the HTTP headers.

GlideOAuthClientRequest - getHeaders()

Retrieves the HTTP headers.

Parameters

Name	Type	Description
none		

Returns

Type	Description
StringMap	The string map with the HTTP headers.

GlideOAuthClientRequest - getParameter(String name)

Retrieves the parameters for the parameter name you provide.

Parameters

Name	Type	Description
name	String	The parameter name for which you want the parameters.

Returns

Type	Description
String	The parameters.

GlideOAuthClientRequest - getPassword()

Retrieves the password.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The password.

GlideOAuthClientRequest - getRefreshToken()

Retrieves the refresh token.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The refresh token.

GlideOAuthClientRequest - getScope()

Retrieves the scope.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The scope.

GlideOAuthClientRequest - getUserName()

Retrieves the user name.

Parameters

Name	Type	Description
none		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The user name.

GlideOAuthClientRequest - setGrantType(String grantType)

Sets the grant type for the string you provide.

Note: You only need to set the grant type if it is not already defined in the OAuth provider profile.

Parameters

Name	Type	Description
name	String	The grant type.

Returns

Type	Description
void	

GlideOAuthClientRequest - setHead(String name, String value)

Retrieves the HTTP headers for the string you provide.

Parameters

Name	Type	Description
name	String	The name of the parameter.
value	String	The value of the parameter.

Returns

Type	Description
void	

GlideOAuthClientRequest - setParameter(String name, String value)

Sets the parameters for the name:value pair of strings you provide.

Parameters

Name	Type	Description
name	String	The parameter name for which you want the parameters.
value	String	The value of the parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

GlideOAuthClientRequest - setPassword(String password)

Sets the password with the string you provide.

Parameters

Name	Type	Description
password	String	The user name.

Returns

Type	Description
void	

GlideOAuthClientRequest - setRefreshToken(String refreshToken)

Sets the refresh token with the string you provide.

Parameters

Name	Type	Description
refreshToken	String	The refresh token.

Returns

Type	Description
void	

This example shows a resource owner password grant type request.

```
    var tokenRequest =new GlideOAuthClientRequest();
    tokenRequest.setGrantType("password");
    tokenRequest.setUserName("itil");
    tokenRequest.setPassword("itil");
    tokenRequest.setScope(null);

    var oAuthClient =new GlideOAuthClient();var tokenResponse =
oAuthClient.requestToken("TestClient", tokenRequest);
    gs.log("Error:"+ tokenResponse.getErrorMessage());

    var token = tokenResponse.getToken();if(token){
      gs.log("AccessToken:"+ token.getAccessToken());
      gs.log("AccessTokenExpiresIn:"+ token.getExpiresIn());
      gs.log("RefreshToken:"+ token.getRefreshToken());
```

This example shows a refresh token grant type request.

```
    var tokenRequest =new GlideOAuthClientRequest();
    tokenRequest.setGrantType("refresh_token");

 tokenRequest.setRefreshToken("N-GtdSVLkWP_Cr-TysXdmNy59ZYafu5Zz
AS4YaSluXDmOkCkInEnu-hwM5SsGYSFwKJ6xauVmoaq7xJNoalXFQ");
    tokenRequest.setScope(null);

    var oAuthClient =new GlideOAuthClient();
    tokenResponse = oAuthClient.requestToken("TestClient",
 tokenRequest);
    gs.log("Error:"+ tokenResponse.getErrorMessage());
    token = tokenResponse.getToken();if( token){
       gs.log("AccessToken:"+ token.getAccessToken());
       gs.log("AccessTokenExpiresIn:"+ token.getExpiresIn());
       gs.log("AccessTokenSysID:"+
 token.getAccessTokenSysID());
       gs.log("RefreshToken:"+ token.getRefreshToken());
       gs.log("RefreshTokenSysID:"+
 token.getRefreshTokenSysID());
```

GlideOAuthClientRequest - setScope(String scope)

Sets the scope for the string you provide.

Note: You only need to set the scope if it is not already defined in the OAuth provider.

Parameters

Name	Type	Description
scope	String	The scope.

Returns

Type	Description
void	

GlideOAuthClientRequest - setUserName(String userName)

Sets the user name with the string you provide.

Parameters

Name	Type	Description
userName	String	The user name.

Returns

Type	Description
void

GlideOAuthClientResponse - Scoped, Global

The `GlideOAuthClientResponse` API provides methods for handling OAuth client responses.

You can use this API in global and scoped scripts. In scoped scripts use the `sn_auth` namespace identifier.

GlideOAuthClientResponse - getBody()

Retrieves all of the response information, including instance information.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The response information.

GlideOAuthClientResponse - getContentType()

Retrieves the HTTP response content header from an external OAuth provider.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The HTTP response header.

GlideOAuthClientResponse - getErrorMessage()

Retrieves the error message if authentication is not successful.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The error message.

GlideOAuthClientResponse - getResponseCode()

Retrieves the HTTP response code from the external OAuth provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The HTTP response code.

GlideOAuthClientResponse - getResponseParameters()

Retrieves the error message if authentication is not successful.

Parameters

Name	Type	Description
none		

Returns

Type	Description
MapString	The response content.

GlideOAuthClientResponse - getToken()

Retrieves the refresh token.

Parameters

Name	Type	Description
none		

Returns

Type	Description
GlideOAuthToken	The refresh token.

GlideOAuthToken - Scoped, Global

The `GlideOAuthToken` API provides methods for retrieving OAuth access token and information about the access token.

You can use this API in global and scoped scripts. In scoped scripts use the `sn_auth` namespace identifier.

GlideOAuthToken - getAccessToken()

Retrieves the access token associated with the GlideOAuthToken object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Access token.

This example code shows how to retrieve access and refresh tokens from the instance database. See also GlideOAuthClient.

```
function dumpToken(token) {
  if(token) {
     gs.info("AccessToken:" + token.getAccessToken());
     gs.info("AccessTokenExpiresIn:" + token.getExpiresIn());
     gs.info("RefreshToken:" + token.getRefreshToken());
  }
}

var oAuthClient = new  sn_auth.GlideOAuthClient();
var token =
 oAuthClient.getToken('248e3017c302301089a7dd5c2840dda5',
 '9c4e78d3c302301089a7dd5c2840dd76');
dumpToken(token);
```

Output:

```

GlideOAuthToken - getAccessTokenSysID()

Deprecated. Retrieves the sys_id of the token ID associated with the GlideOAuthToken object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the access token.

GlideOAuthToken - getExpiresIn()

Retrieves the lifespan of the access token associated with the GlideOAuthToken object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

```

GlideOAuthToken - getRefreshToken()

Refreshes the token associated with the GlideOAuthToken object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Refreshed token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

GlideOAuthToken - getRefreshTokenSysID()

Deprecated. Retrieves the sys_id of the refresh token.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the refresh token.

GlideOAuthToken - getScope()

Retrieves the token scope, which is the amount of access granted by the access token.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Scope of the access token.

GlidePluginManager - Scoped

The scoped `GlidePluginManager` API provides a method for determining if a plugin has been activated.

GlidePluginManager - isActive(String pluginID)

Determines if the specified plugin has been activated.

Parameters

Name	Type	Description
pluginID	String	Unique plugin identifier.

Returns

Type	Description
Boolean	Flag that indicates if the plugin is active. Valid values: • true: Plugin is active. • false: Plugin is inactive.

```
var now_GR = new GlideRecord('sys_plugins');
var queryString = "active=0^ORactive=1";
now_GR.addEncodedQuery(queryString);
now_GR.query();
var pMgr = new GlidePluginManager();

while (now_GR.next()) {
   var name = now_GR.getValue('name');
   var pID = now_GR.getValue('source');
   var isActive = pMgr.isActive(pID);
   if (isActive)
       gs.info('The plugin ' + name + ' is active');
}
```

Output:

```
The plugin Country Lookup Data is active
The plugin Database Replication is active
The plugin REST API Provider is active
The plugin Ten Cool Things is active
```

GlideQuery - Scoped, Global

The `GlideQuery` script include is an alternative to the `GlideRecord` API for performing CRUD operations on record data from server-side scripts.

The `GlideQuery` script include lets you:

- Use standard JavaScript objects and types for queries and results.
- Quickly diagnose query errors with additional checks and clear error messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Simplify your code by avoiding boiler-plate query patterns.
- Avoid common performance issues without needing deeper knowledge of the GlideRecord.

Use the *GlideQuery* script include in scoped or global server-side scripts. When used within a scoped app, it must be prefixed with the global scope.

```
new global.GlideQuery('sys_user')
// ...
```

This script include requires the GlideQuery [com.sn_glidequery] plugin.

Implementation

This script include works together with the *Stream* and *Optional* APIs in a builder pattern where the method calls chain together, each method building on the returned result of the previous method. Use methods to define the attributes of the query. The methods do not execute until you call a terminal method, a method that returns a query result, allowing you to define the requirements of the query before executing it.

If the query returns a single record, the system wraps the result in an Optional object. If the query returns a stream of records, the system wraps the result in a Stream object. These objects let you manage the result using a set of methods in each API.

For example, this script performs a query on the Task table, groups the records by priority, and returns each priority that has total reassignments greater than four.

```
var query = new global.GlideQuery('task')
    .where('active', true) //Returns new GlideQuery object with
 a "where" clause.
    .groupBy('priority') //Returns new GlideQuery object with a
 "group by" clause.
    .aggregate('sum', 'reassignment_count') //Returns new
 GlideQuery object with a "sum(reassignment_count)" clause.
    .having('sum', 'reassignment_count', '>', 4) //Returns
 new GlideQuery object with a "having reassignment_count > 4"
 clause.
    .select() //Returns a stream of records wrapped in a Stream
 object.
    .forEach(function (priority){ //Terminal method in the
 Stream class that executes the query and returns the result.
      gs.info("Priority " + priority.group.priority + ": " +
 priority.sum.reassignment_count + " reassignments");
    });
```

Output:

```
Priority 1: 11 reassignments
Priority 3: 6 reassignments
Priority 5: 5 reassignments
```

Error handling

The *GlideQuery* script include throws an error when your query has a problem and includes a clear explanation to help guide you. This script include checks for:

- Invalid fields
- Invalid value types for a field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Invalid values for choice fields
- Invalid query operators

For example, the following code sample would throw an error because the queried field does not exist in the table.

```
new global.GlideQuery('task')
    .where('id', '4717dfe5a9fe198100450448b2404c16') // should
 be 'sys_id'
    .select('description', 'severity')
    .toArray(100);
  // Error: Unable to find field 'id' in table 'task'. Known
 fields: active, activity_due, ...
```

This code sample would throw an error because the data type of one of the arguments is incorrect.

```
new global.GlideQuery('task')
    .where('priority', 'one') // priority is an integer (should
 be 1)
    .select('description', 'severity')
    .toArray(100);
  // Error: Unable to match value ['one'] with field 'priority'
 in table 'task'. Expecting type 'integer'
```

Reuse

Because GlideQuery objects are immutable, you can reuse them later in other parts of your code. For example, this script creates a query and then uses the GlideQuery object later to generate a report.

```
var highPriorityTasks = new global.GlideQuery('task')
    .where('active', true)
    .where('priority', 1);

generateReport(highPriorityTasks);
notifyOwners(highPriorityTasks);
var avgReassignmentCount = highPriorityTasks
    .avg('reassignment_count')
    .orElse(0)
```

Limitations

The *GlideQuery* script include does not support:

- Reading or writing to tables that do not allow access from other scopes.
- Reading encoded queries.
- GlideDate or GlideDateTime objects, which are read as JavaScript strings.
- FX currency fields.
- Updating journal field types.
- Queries with ambiguous conditional logic. For example, the following query is unclear because the system does not know whether to execute `(active = true AND name !`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`= null) OR last_name = Luddy` or `active = true AND (name != null OR last_name = Luddy)`.

```
var user = new global.GlideQuery('sys_user')
  .where('active', true)
  .whereNotNull('name')
  .orWhere('last_name', 'Luddy')
  .selectOne()
  .get()
```

See the *where()* method to understand how to nest a child query instead.

Note: Because the *GlideQuery* script include converts GlideRecord objects into standard JavaScript objects, it may take longer to execute queries. To reduce performance issues, avoid creating loops that iterate over large numbers of records.

Intermediate and terminal methods in GlideQuery

The *GlideQuery* script include uses two categories of methods: intermediate and terminal. Intermediate methods are those methods that return a *Stream*, an API used for interacting with a stream of items like records, allowing a fluent style of syntax where calls are chained together. Terminal methods are those methods that do not return a stream and therefore stop the chain of *Stream* method calls.

In the *GlideQuery* script include, methods such as *where()*, *orderBy()*, and *disableWorkflow()* are intermediate methods that return a new GlideQuery object. Similarly, the *GlideQuery* script include's most popular terminal methods, *select()* and *selectOne()*, are terminal methods. These methods are called when *GlideQuery* is done being configured and is ready to start processing records. The differences between these two method types is important to keep in mind when configuring calls to the *GlideQuery* script include according to your specific use cases. For more information about intermediate and terminal methods, see the article *GlideQuery* - Stream Processing Part 1.

The following methods are classified as intermediate:

- *aggregate(String aggregateType, String field)*
- *disableAutoSysFields()*
- *disableWorkflow()*
- *forceUpdate()*
- *groupBy(String fields)*
- *having(String aggregateType, String field, String operator, Number value)*
- *limit(Number limit)*
- *orderBy(String fields)*
- *orderByDesc(String fieldOrAggregate, String field)*
- *orWhere(String fieldOrQuery, String operator, Any value)*
- *orWhereNotNull(String field)*
- *orWhereNull(String field)*
- *where(String fieldOrQuery, String operator, Any value)*
- *whereNotNull(String field)*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `whereNull(String field)`
- `withAcls()`

The following methods are classified as terminal:

- `avg(String field)`
- `count()`
- `deleteMultiple()`
- `get(String key, Array selectedFields)`
- `getBy(Object keyValues, Array selectedFields)`
- `insert(Object keyValues, Object selectedFields)`
- `insertOrUpdate(Object changes, Object selectedFields)`
- `max(String field)`
- `min(String field)`
- `select(String fields)`
- `selectOne(String fields)`
- `sum(String field)`
- `toGlideRecord()`
- `update(Object changes, Object selectedFields)`
- `updateMultiple(Object changes)`

Note: `parse(String table, String encoded_query)` is neither intermediate or terminal, but static.

GlideQuery - GlideQuery(String table)

Instantiates a GlideQuery object used to build and execute record queries.

Parameters

Name	Type	Description
table	String	Table to query.

Returns

Type	Description
None	

This example instantiates a query of the User table.

```
var query = new global.GlideQuery('sys_user');
```

GlideQuery - aggregate(String aggregateType, String field)

Aggregates a field using a specified aggregation function.

Use this method to build queries that aggregate against multiple fields or use multiple aggregate functions, or if you must use the `groupBy()` method. If you only want to aggregate against one

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

field with one function, and you don't need to use *groupBy()*, then use one of these methods instead:

- *avg()*
- *min()*
- *max()*
- *count()*

Parameters

Name	Type	Description
aggregateType	String	The type of aggregation function to perform. Options include: • `min`: Returns the smallest value of all matching records. • `max`: Returns the largest value of all matching records. • `sum`: Returns the sum of all matching records. • `avg`: Returns the average of all matching records. • `count`: Returns the number of number of matching records.
field	String	Field on which to perform the operation.

Returns

Type	Description
GlideQuery	The query object being built.

This script performs a query on the Task table, groups the records by priority, and returns each priority that has total reassignments greater than four.

```
var query = new global.GlideQuery('task')
    .where('active', true) //Returns new GlideQuery object with
 a "where" clause.
    .groupBy('priority') //Returns new GlideQuery object with a
 "group by" clause.
    .aggregate('sum', 'reassignment_count') //Returns new
 GlideQuery object with a "sum(reassignment_count)" clause.
    .having('sum', 'reassignment_count', '>', 4) //Returns
 new GlideQuery object with a "having reassignment_count > 4"
 clause.
    .select() //Returns a stream of records wrapped in a Stream
 object.
    .forEach(function (priority){ //Terminal method in the
 Stream class that executes the query and returns the result.
      gs.info("Priority " + priority.group.priority + ": " +
 priority.sum.reassignment_count + " reassignments");
    });
```

Output:

```
Priority 1: 11 reassignments
Priority 3: 6 reassignments
Priority 5: 5 reassignments
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideQuery - avg(String field)

Returns the aggregate average of a given numeric field.

You can only use this method on fields of the following types:

- Integer
- Long
- Floating point number
- Double
- Currency

Parameters

Name	Type	Description
field	String	Field on which to perform the operation.

Returns

Type	Description
Optional	Object that contains the aggregate average of the given field.

This example shows how to return the average number of faults in the cmdb_ci table.

```
var faults = new global.GlideQuery('cmdb_ci')
    .avg('fault_count')
    .orElse(0);

gs.info(JSON.stringify(faults));
```

Output:

```
0.0037
```

GlideQuery - count()

Returns the number of records that match the query.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Number of records that match the query.

This example returns the number of active records in the User table.

```
var userCount = new global.GlideQuery('sys_user')
    .where('active', true)
    .count();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
612
```

GlideQuery - deleteMultiple()

Deletes all records in the table specified by the preceding Where clauses.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

This example deletes all active records in the User table where the last name is Jeter.

```
var query = new global.GlideQuery('sys_user')
    .where('active', true)
    .where('last_name', 'Jeter')
    .deleteMultiple();
```

GlideQuery - disableAutoSysFields()

Disables updating system fields, or fields with a name that starts with the `sys` prefix, such as sys_created_on, sys_updated_on, and sys_mod_count. Only applies to the specified query.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideQuery	The query object being built.

This example adds a record to the task table, but does not set system fields. Without calling this method, the below example would update sys_updated_on, sys_mod_count, and so on.

```
var query = new global.GlideQuery('task')
    .disableAutoSysFields()
    .insert({ description: 'example', priority: 1 });
```

GlideQuery - disableWorkflow()

Disables any business rules, flows, workflows, or audit records that would run or be created as the result of the query.

Note: This method only works for tables in the GLOBAL scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideQuery	The query object being built.

This example updates multiple records in the Task table without triggering any automatic business processes.

```
var query = new global.GlideQuery('task')
    .disableWorkflow()
    .where('active', true)
    .updateMultiple({ priority: 1 });
```

GlideQuery - forceUpdate()

Forces a database update even when no record changes are made. For example, you can use this method to force a business rule to execute.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideQuery	The query object being built.

This example force updates Task records with a certain sys_id.

```
var forceUpdate = new global.GlideQuery('task')
    .forceUpdate()
    .where('sys_id', taskId)
    .update()
```

GlideQuery - get(String key, Array selectedFields)

Returns a single record from the query.

Parameters

Name	Type	Description
key	String	Sys_id of the record to return.
selectedFields	Array	Optional. Additional fields to return in the result. Default: The system always returns the sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Optional	Object used to interact with a single record.

Example that returns a record based on sys_id.

```
var user = new global.GlideQuery('sys_user')
    .get('5137153cc611227c000bbd1bd8cd2005', ['first_name',
 'last_name']) //Returns an Optional object.
    .orElse({ first_name: 'Default', last_name:
 'User' }); //Method in the Optional class to return a default
 value.

gs.info(JSON.stringify(user, null, 2));
```

Output:

```
{
   "sys_id":"5137153cc611227c000bbd1bd8cd2005",
   "first_name":"Fred",
   "last_name":"Luddy"
}
```

GlideQuery - getBy(Object keyValues, Array selectedFields)

Returns an Optional object containing a single record based on a set of name-value pairs to query by. Assumes the '=' operator for each name-value pair.

Parameters

Name	Type	Description
keyValues	Object	Object where the keys are the name of the fields, and the values are the values to query for.
selectedFields	Array	Optional. Additional fields to return in the result. Default: The system always returns the sys_id.

Returns

Type	Description
Optional	Object used to interact with a single record.

Example that returns a record by querying for a user's name.

```
var user = new global.GlideQuery('sys_user')
    .getBy({
        first_name: 'Fred',
        last_name: 'Luddy'
    }, ['first_name', 'last_name', 'city', 'active']) // select
 first_name, last_name, city, active
    .orElse({
        first_name: 'Nobody',
        last_name: 'Found',
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        city: 'Nowhere',
        active: false
    });

gs.info(JSON.stringify(user, null, 2));
```

Output:

```
{
   "first_name":"Fred",
   "last_name":"Luddy",
   "city":null,
   "active":true,
   "sys_id":"5137153cc611227c000bbd1bd8cd2005"
}
```

GlideQuery - groupBy(String fields)

Groups the query results by a designated field or fields.

You must use this method with the *aggregate()* method.

Parameters

Name	Type	Description
fields	String or Array of Strings	Field or fields to group the results by.

Returns

Type	Description
GlideQuery	The query object being built.

This script performs a query on the Task table, groups the records by priority, and returns each priority that has total reassignments greater than four.

```
var query = new global.GlideQuery('task')
    .where('active', true) //Returns new GlideQuery object with
 a "where" clause.
    .groupBy('priority') //Returns new GlideQuery object with a
 "group by" clause.
    .aggregate('sum', 'reassignment_count') //Returns new
 GlideQuery object with a "sum(reassignment_count)" clause.
    .having('sum', 'reassignment_count', '>', 4) //Returns
 new GlideQuery object with a "having reassignment_count > 4"
 clause.
    .select() //Returns a stream of records wrapped in a Stream
 object.
    .forEach(function (priority){ //Terminal method in the
 Stream class that executes the query and returns the result.
      gs.info("Priority " + priority.group.priority + ": " +
 priority.sum.reassignment_count + " reassignments");
    });
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Priority 1: 11 reassignments
Priority 3: 6 reassignments
Priority 5: 5 reassignments
```

GlideQuery - having(String aggregateType, String field, String operator, Number value)

Filters aggregate groups so that you can display only groups of results that match a specified condition.

Must use this method with the *`aggregate()`* or *`groupBy()`* methods.

Parameters

Name	Type	Description
aggregateType	String	The type of aggregation function to perform. Options include: • `min`: Returns the smallest value of all matching records. • `max`: Returns the largest value of all matching records. • `sum`: Returns the sum of all matching records. • `avg`: Returns the average of all matching records. • `count`: Returns the number of number of matching records.
field	String	Field on which to perform the operation.
operator	String	Numeric operator to use in the operation. Options include: • `>`: Greater than. • `<`: Less than. • `>=`: Greater than or equal to. • `<=`: Less than or equal to. • `=`: Equal to. • `!=`: Not equal to.
value	Number	Number value to use in the operation.

Returns

Type	Description
GlideQuery	The query object being built.

This script performs a query on the Task table, groups the records by priority, and returns each priority that has total reassignments greater than four.

```
var query = new global.GlideQuery('task')
    .where('active', true) //Returns new GlideQuery object with
 a "where" clause.
    .groupBy('priority') //Returns new GlideQuery object with a
 "group by" clause.
    .aggregate('sum', 'reassignment_count') //Returns new
 GlideQuery object with a "sum(reassignment_count)" clause.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    .having('sum', 'reassignment_count', '>', 4) //Returns
new GlideQuery object with a "having reassignment_count > 4"
clause.
    .select() //Returns a stream of records wrapped in a Stream
object.
    .forEach(function (priority){ //Terminal method in the
Stream class that executes the query and returns the result.
      gs.info("Priority " + priority.group.priority + ": " +
priority.sum.reassignment_count + " reassignments");
    });
```

Output:

```
Priority 1: 11 reassignments
Priority 3: 6 reassignments
Priority 5: 5 reassignments
```

GlideQuery - insert(Object keyValues, Object selectedFields)

Inserts a record and returns an Optional object containing the record.

Parameters

Name	Type	Description
keyValues	Object	Object containing name-value pairs to insert into the record. Unspecified fields will be null.
selectedFields	Array	Optional. Additional fields to return in the result. Default: The system always returns the sys_id.

Returns

Type	Description
Optional	Object used to interact with a single record.

This example shows how to insert a record based on a user's first and last name.

```
var fred = new global.GlideQuery('sys_user')
    .insert({ first_name: 'Fred', last_name: 'Luddy' })
    .get();

gs.info(JSON.stringify(fred, null, 2));
```

Output:

```
{
   "sys_id":"cf16eed0e82a9010f8778bda83d255d2",
   "first_name":"Fred",
   "last_name":"Luddy"
}
```

GlideQuery - insertOrUpdate(Object changes, Object selectedFields)

Updates an existing record, or inserts a new record if one does not already exist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
changes	Object	Object containing name-value pairs to update or insert into the record.
selectedFields	Array	Optional. Additional fields to return in the result. Default: The system always returns the sys_id.

Returns

Type	Description
Optional	Object used to interact with a single record.

This example shows how to insert a new record that does not already exist in the system.

```
// insert a new record
var user = new GlideQuery('sys_user')
    .insertOrUpdate({
        first_name: 'George',
        last_name: 'Griffey'
    })
    .orElse(null);
```

This example shows how to update an existing record.

```
// update existing record
var user = new global.GlideQuery('sys_user')
    .insertOrUpdate({
        sys_id: '2d0efd6c73662300bb513198caf6a72e',
        first_name: 'George',
        last_name: 'Griffey' })
    .orElse(null);
```

GlideQuery - limit(Number limit)

Limits the number of records returned in a query.

Parameters

Name	Type	Description
limit	Number	Number of records to return.

Returns

Type	Description
GlideQuery	The query object being built.

This example shows how to limit the results returned to five records.

```
var incidents = new global.GlideQuery('incident')
    .limit(5)
    .select('priority', 'description')
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    .forEach(function (incident){
        gs.info(JSON.stringify(incident, null, 2));
    });
```

Output:

```
*** Script: {
  "priority": 1,
  "description": "User can't get to any of his files on the file
 server.",
  "sys_id": "9d385017c611228701d22104cc95c371"
}
*** Script: {
  "priority": 1,
  "description": "I just moved from floor 2 to floor 3 and my
 laptop cannot connect to any wireless network.",
  "sys_id": "e8caedcbc0a80164017df472f39eaed1"
}
*** Script: {
  "priority": 1,
  "description": "User forgot their email password.",

```

GlideQuery - max(String field)

Returns the aggregate maximum of a given field.

Parameters

Name	Type	Description
field	String	Field on which to perform the operation.

Returns

Type	Description
Optional	Object used to interact with a single record.

This example shows how to return the maximum value, or highest alphanumeric value, of a given field.

```
var name = new global.GlideQuery('sys_user')
    .max('last_name')
    .orElse('');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info(JSON.stringify(name));
```

Output:

```
"Zortman"
```

GlideQuery - min(String field)

Returns the aggregate minimum of a given field.

Parameters

Name	Type	Description
field	String	Field on which to perform the operation.

Returns

Type	Description
Optional	Object used to interact with a single record.

This example shows how to return the minimum value, or lowest alphanumeric value, of a given field.

```
var name = new global.GlideQuery('sys_user')
    .min('last_name')
    .orElse('');

gs.info(JSON.stringify(name));
```

Output:

```
"Abel"
```

GlideQuery - orderBy(String fields)

Orders the returned result in ascending order by a given field.

Parameters

Name	Type	Description
fields	String	Comma-delimited fields to order the result by in ascending order.

Returns

Type	Description
GlideQuery	The query object being built.

This example shows how to order results in ascending order by record number.

```
var query = new global.GlideQuery('incident')
    .orderBy('number')
    .limit(5)
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    .select('number', 'description') //Returns a stream of
 records wrapped in a Stream object.
    .forEach(function (incident){ //Terminal method in the
 Stream class that executes the query and returns the result.
        gs.info(JSON.stringify(incident, null, 2));
    });
```

Output:

```
*** Script: {
  "number": "INC0000001",
  "description": "User can't access email on mail.company.com.",

}
```

GlideQuery - orderByDesc(String fieldOrAggregate, String field)

Orders the returned result in descending order by a given field.

Parameters

Name	Type	Description
fieldOrAggregate	String	If the query does not use the *`aggregate()`* method, pass the field to order the results by. If the query uses the *`aggregate()`* method, pass the type of aggregation function to perform. Options include: • `min`: Returns the smallest value of all matching records. • `max`: Returns the largest value of all matching records. • `sum`: Returns the sum of all matching records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• `avg`: Returns the average of all matching records. • `count`: Returns the number of number of matching records.
field	String	Optional. Field to order the result by in descending order. Required for queries using the *`aggregate()`* method.

Returns

Type	Description
GlideQuery	The query object being built.

This example shows how to order the result in descending order by number.

```
var query = new global.GlideQuery('incident')
    .orderByDesc('number')
    .limit(5)
    .select('number', 'description') //Returns a stream of
 records wrapped in a Stream object.
    .forEach(function (incident){ //Terminal method in the
 Stream class that executes the query and returns the result.
        gs.info(JSON.stringify(incident, null, 2));
    });
```

Output:

```

```

GlideQuery - orWhere(String fieldOrQuery, String operator, Any value)

Adds an OR clause to a query that returns values based on a given condition.

Note: Precede this method with the *where()*, *whereNull()*, or *whereNotNull()* methods.

Parameters

Name	Type	Description
fieldOrQuery	String or GlideQuery	Field or another GlideQuery object used in the where clause. If passing a field, you can dot-walk to a desired value. For example, `'company.name'`.
operator	String	Optional. Operator used in the OR clause. If you do not pass an argument, the system uses the = operator. You do not need to include a placeholder value.
value	Any	Value used in the OR clause.

Returns

Type	Description
GlideQuery	The query object being built.

This example shows how to add a simple OR clause to a query.

```
var query = new global.GlideQuery('sys_user')
   .where('failed_attempts', '>', 0)
   .orWhere('last_login', '<', '2019-04-15')
   .select()
   .forEach(function (user){
      gs.info(JSON.stringify(user, null, 2));
   });
```

Output:

```
*** Script: {
  "sys_id": "005d500b536073005e0addeeff7b12f4"
}
*** Script: {
  "sys_id": "d999e5fc77e72300454792718a10611d"
}
*** Script: {
  "sys_id": "30ad318577ab2300454792718a10619e"
}
*** Script: {
  "sys_id": "4ac73ecd738123002728660c4cf6a72c"
}
*** Script: {
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "sys_id": "3883f4c0730123002728660c4cf6a754"
}
*** Script: {
  "sys_id": "3988a3ca732023002728660c4cf6a757"
}
*** Script: {
  "sys_id": "8ff5b254b33213005e3de13516a8dcf7"
}
```

This example shows how to add an `orWhere` clause that contains a separate query.

```
// active = true OR (title = 'Vice President' AND state = 'CA')
var query = new GlideQuery('sys_user')
   .where('active', true)
   .orWhere(new GlideQuery()
       .where('title', 'Vice President')
       .where('state', 'CA'))
   .select('name')
   .limit(5)
   .forEach(function (user){
      gs.info(JSON.stringify(user, null, 2));
   });
```

Output:

```
*** Script: {
  "name": "ITIL User",
  "sys_id": "681b365ec0a80164000fb0b05854a0cd"
}

*** Script: {
  "name": "Benchmark Scheduler",
  "sys_id": "d3383a875b0132003d1c484c11f91a5b"
}
```

GlideQuery - orWhereNotNull(String field)

Adds an OR clause that returns records that do not contain a null value in a given field.

Note: Precede this method with the *`where()`*, *`whereNull()`*, or *`whereNotNull()`* methods.

Parameters

Name	Type	Description
field	String	Field used in the query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideQuery	The query object being built.

This example shows how to query the User table and return results where the first or last names are not null.

```
var query = new global.GlideQuery('sys_user')
   .whereNotNull('first_name')
   .orWhereNotNull('last_name')
   .select('name')
   .limit(5)
   .forEach(function (user){
      gs.info(JSON.stringify(user, null, 2));
   });
```

Output:

```
*** Script: {
  "name": "ITIL User",
  "sys_id": "681b365ec0a80164000fb0b05854a0cd"
}
*** Script: {
  "name": "System Administrator",
  "sys_id": "6816f79cc0a8016401c5a33be04be441"
}

}
*** Script: {
  "name": "Allyson Gillispie",
  "sys_id": "06826bf03710200044e0bfc8bcbe5d8a"
}
```

GlideQuery - orWhereNull(String field)

Adds an OR clause to a query that returns records that contain a null value in a given field.

Note: Precede this method with the *`where()`*, *`whereNull()`*, or *`whereNotNull()`* methods.

Parameters

Name	Type	Description
field	String	Field used in the query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideQuery	The query object being built.

This example shows how to query the User table and return records where the first or last names are null.

```
var query = new global.GlideQuery('sys_user')
   .whereNull('last_name')
   .orWhereNull('first_name')
   .select('first_name', 'last_name')
   .forEach(function (user){
      gs.info(JSON.stringify(user, null, 2));
   });
```

Output:

```
*** Script: {
  "first_name": "ml.admin",
  "last_name": null,
  "sys_id": "88aad6c5c73003005f1b78d48b9763a5"
}
*** Script: {
  "first_name": "Sitemap Scheduler User",
  "last_name": null,
  "sys_id": "85388c25b71011104eed4643ae11a993"
}
*** Script: {
  "first_name": null,
  "last_name": "Guest",

}
*** Script: {
  "first_name": "ml_report.user",
  "last_name": null,
  "sys_id": "b6bad6c5c73003005f1b78d48b97632a"
}
```

GlideQuery - parse(String table, String encoded_query)

Adds an encoded query to a new *GlideQuery* query.

This method does not support all *GlideRecord* encoded query operators. The following operators are currently supported:

=	ANYTHING	GT_FIELD	NOT IN
!=	BETWEEN	GT_OR_EQUALS_FIELD	NOT LIKE
>	CONTAINS	IN	NSAMEAS
>=	DOES NOT CONTAIN	INSTANCEOF	ON
<	DYNAMIC	LIKE	SAMEAS
<=	EMPTYSTRING	LT_FIELD	STARTSWITH

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	ENDSWITH	LT_OR_EQUALS_FIELD

Parameters

Name	Type	Description
table	String	Table to query, such as task or incident.
encoded_query	String	Encoded query to apply to the records in the specified table.

Returns

Type	Description
GlideQuery	GlideQuery object containing the encoded query.

The following example creates a GlideQuery object that contains all active records in the task table, ordered by the priority field, returned as a Stream object that contains just the description field.

```
GlideQuery.parse('task', 'active=true^ORDERBYpriority') // Pass
 the encoded query to use to parse the Task records
  .select('description') // Return the records that match the
 encoded query
  .forEach(doSomething); // Do some processing on each of the
 returned records
```

GlideQuery - select(String fields)

Returns the results of the query as a Stream object containing the specified fields.

Note: Use a terminal method in the *Stream* class to get the result of the query. For more information, see Stream.

You can append a flag to a field name to return the field's metadata instead of the field's value. For example, using the field name `company$DISPLAY` returns the display value of a company field. Possible flags include:

- `DISPLAY`: Returns the display value of a field.
- `CURRENCY_CODE`: Returns the currency code of a currency field. For example, `USD`.
- `CURRENCY_DISPLAY`: Returns the currency display value of a currency field. For example, `¥123.45`.
- `CURRENCY_STRING`: Returns the currency string of a currency field. For example, `JPY;123.45`.

Parameters

Name	Type	Description
fields	String or Array of Strings	Optional. Fields to display in the result. You can provide any number of fields as arguments, dot-walk to a desired value, or use a flag. For example: `select('first_name', 'location.city', 'company$DISPLAY');`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		or `select(['first_name', 'location.city', 'company$DISPLAY']);` Default: The system always returns the sys_id.

Returns

Type	Description
Stream	Object used to interact with a stream of items such as records.

This example shows how to select fields to display from the query and use `$DISPLAY` to return the display value of a field.

```
var stream = new global.GlideQuery('sys_user')
   .select('first_name', 'last_name', 'company$DISPLAY')
   .limit(5)
   .forEach(function (user){
      gs.info(JSON.stringify(user, null, 2));
   });
```

Output:

```
*** Script: {
  "first_name": "System",
  "last_name": "Administrator",
  "company$DISPLAY": "",
  "sys_id": "6816f79cc0a8016401c5a33be04be441"
}
*** Script: {
  "first_name": "Alva",
  "last_name": "Pennigton",
  "company$DISPLAY": "ACME North America",
  "sys_id": "ca826bf03710200044e0bfc8bcbe5d89"
}
*** Script: {
  "first_name": "Benchmark",
  "last_name": "Scheduler",
  "company$DISPLAY": "",
  "sys_id": "d3383a875b0132003d1c484c11f91a5b"
}
*** Script: {
  "first_name": "Allyson",
  "last_name": "Gillispie",
  "company$DISPLAY": "ACME North America",
  "sys_id": "06826bf03710200044e0bfc8bcbe5d8a"
}
*** Script: {
  "first_name": "SOAP",
  "last_name": "Guest",
  "company$DISPLAY": "",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "sys_id": "155699460a0a0b2b009e27c10b7f68f6"
}
```

GlideQuery - selectOne(String fields)

Returns the result of the query as an Optional object containing specified fields.

Use this method when returning a single record, or to test if a record exists. If returning multiple records, use the *`select()`* method to return a Stream object.

You can append a flag to a field name to return the field's metadata instead of the field's value. For example, using the field name `company$DISPLAY` returns the display value of a company field. Possible flags include:

- `DISPLAY`: Returns the display value of a field.
- `CURRENCY_CODE`: Returns the currency code of a currency field. For example, `USD`.
- `CURRENCY_DISPLAY`: Returns the currency display value of a currency field. For example, `¥123.45`.
- `CURRENCY_STRING`: Returns the currency string of a currency field. For example, `JPY;123.45`.

Parameters

Name	Type	Description

fields	String or Array of Strings	Optional. Fields to display in the result. You can provide any number of fields as arguments, dot-walk to a desired value, or use a flag. For example:
		`selectOne('first_name', 'location.city', 'company$DISPLAY');`
		or
		`selectOne(['first_name', 'location.city', 'company$DISPLAY']);`
		Default: The system always returns the sys_id.

Returns

Type	Description
Optional	Object used to interact with a single record.

This example shows how to return a single record as an Optional object and display specified fields.

```
var user = new global.GlideQuery('sys_user')
    .where('zip', '12345')
    .whereNotNull('last_name')
    .selectOne('first_name', 'last_name', 'company$DISPLAY')
    .get();

gs.info(JSON.stringify(user, null, 2));
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
   "first_name":"Abel",
   "last_name":"Tuter",
   "company$DISPLAY":"ACME South America",
   "sys_id":"62826bf03710200044e0bfc8bcbe5df1"
}
```

GlideQuery - sum(String field)

Returns the aggregate sum of a given numeric field.

You can only use this method on fields of the following types:

- Integer
- Long
- Floating point number
- Double
- Currency

Parameters

Name	Type	Description
field	String	Field on which to perform the operation.

Returns

Type	Description
Optional	Object used to interact with a single record.

This example shows how to return the sum of all faults in the cmdb_ci table.

```
var totalFaults = new global.GlideQuery('cmdb_ci')
    .sum('fault_count')
    .orElse(0);

gs.info(JSON.stringify(totalFaults));
```

Output:

```
10
```

GlideQuery - toGlideRecord()

Returns a GlideRecord object that represents the current query. Returns a GlideAggregate object if the query uses the *`GlideQuery.aggregate()`* method.

After transforming the query, use the *`query()`* method in the GlideRecord or GlideAggregate classes to query the database.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideRecord or GlideAggregate	GlideRecord object that contains the query. If you used the *GlideQuery.aggregate()* method, then the method returns a GlideAggregrate object instead.

This example shows how to transform a GlideQuery object into a GlideRecord.

```
var userGr = new global.GlideQuery('sys_user')
    .where('active', true)
    .whereNotNull('first_name')
    .limit(10)
    .toGlideRecord();
userGr.query();
```

GlideQuery - update(Object changes, Object selectedFields)

Updates an existing record that matches the defined conditions.

Before using this method, call the *where()* method to specify the conditions that a record must meet to be updated.

Parameters

Name	Type	Description
changes	Object	Object containing name-value pairs to update in the record. Names must match fields in the table.
selectedFields	Array	Optional. Additional fields to return in the result. Default: The system always returns the sys_id.

Returns

Type	Description
Optional	Object used to interact with a single record.

This example shows how to update a record with new values.

```
var updateRecord = new global.GlideQuery('sys_user')
    .where('sys_id', '0a826bf03710200044e0bfc8bcbe5d7a')
    .update({ city: 'Los Angeles' });
```

GlideQuery - updateMultiple(Object changes)

Updates all existing records that match the defined conditions. Returns the number of records updated.

Before using this method, call the *where()* method to specify the conditions that the records must meet to be updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
changes	Object	Object containing name-value pairs to update in the record. Names must match fields in the table.

Returns

Type	Description
Object	Object containing the number of records that were updated. Keys include: • `rowCount`: Number of rows updated in the table.

This example shows how to update any records that fit a defined criteria.

```
var update = new global.GlideQuery('sys_user')
    .where('active', false)
    .where('last_name', 'Griffey')
    .updateMultiple({ active: true });

gs.info(JSON.stringify(update));
```

Output:

```
{"rowCount":1}
```

GlideQuery - where(String fieldOrQuery, String operator, Any value)

Adds a Where clause to the query that returns values based on a given condition.

Note: Do not precede this method with the *`orWhere()`*, *`orWhereNull()`*, or *`orWhereNotNull()`* methods.

Parameters

Name	Type	Description
fieldOrQuery	String or GlideQuery	Field or another GlideQuery object used in the where clause. If passing a field, you can dot-walk to a desired value. For example, `'company.name'`.
operator	String	Optional. Operator used in the where clause. If you do not pass an argument, the system uses the = operator.
value	Any	Value used in the where clause.

Returns

Type	Description
GlideQuery	The query object being built.

This example shows how to return records from the User table where active is true and the user's last login is after a specified date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var query = new global.GlideQuery('sys_user')
   .where('active', true)
   .where('last_login', '>', '2018-01-01')
   .limit(5)
   .select()
   .forEach(function (user){
      gs.info(JSON.stringify(user, null, 2));
   });
```

Output:

```
*** Script: {
  "sys_id": "6816f79cc0a8016401c5a33be04be441"
}
*** Script: {
  "sys_id": "005d500b536073005e0addeeff7b12f4"
}
*** Script: {
  "sys_id": "d999e5fc77e72300454792718a10611d"
}

}
*** Script: {
  "sys_id": "3883f4c0730123002728660c4cf6a754"
}
```

This example shows how to return records from the Incident table where active is true and the priority or severity is 1.

```
// active = true AND (priority = 1 OR severity = 1)
var query = new GlideQuery('incident')
    .where('active', true)
    .where(new GlideQuery()
        .where('priority', 1)
        .orWhere('severity', 1))
   .limit(5)
   .select()
   .toArray(5)

gs.info(JSON.stringify(query, null, 2));
```

Output:

```
[
   {
      "sys_id":"b0f31e5673500010c2e7660c4cf6a711"
   },
   {

]
```

GlideQuery - whereNotNull(String field)

Returns records that do not contain a null value in a given field.

Note: Do not precede this method with the *orWhere()*, *orWhereNull()*, or *orWhereNotNull()* methods.

Parameters

Name	Type	Description
field	String	Field used in the query.

Returns

Type	Description
GlideQuery	The query object being built.

This example shows how to query the User table and return results where the first_name field is not null.

```
var query = new global.GlideQuery('sys_user')
   .whereNotNull('first_name')
   .select('name')
   .limit(5)
   .forEach(function (user){
      gs.info(JSON.stringify(user, null, 2));
   });
```

Output:

```
*** Script: {
  "name": "System Administrator",
  "sys_id": "6816f79cc0a8016401c5a33be04be441"
}
*** Script: {
  "name": "Alva Pennigton",
  "sys_id": "ca826bf03710200044e0bfc8bcbe5d89"
}

GlideQuery - whereNull(String field)

Returns records that contain a null value in a given field.

Note: Do not precede this method with the *orWhere()*, *orWhereNull()*, or *orWhereNotNull()* methods.

Parameters

Name	Type	Description
field	String	Field used in the query.

Returns

Type	Description
GlideQuery	The query object being built.

This example shows how to query the User table and return records where the first or last names are null.

```
var query = new global.GlideQuery('sys_user')
   .whereNull('last_name')
   .orWhereNull('first_name')
   .select('first_name', 'last_name')
   .forEach(function (user){
      gs.info(JSON.stringify(user, null, 2));
   });
```

Output:

```
*** Script: {
  "first_name": "ml.admin",
  "last_name": null,
  "sys_id": "88aad6c5c73003005f1b78d48b9763a5"
}
*** Script: {
  "first_name": "Sitemap Scheduler User",
  "last_name": null,
  "sys_id": "85388c25b71011104eed4643ae11a993"
}
*** Script: {
  "first_name": null,
  "last_name": "Guest",

}
```

GlideQuery - withAcls()

Executes the query using the *GlideRecordSecure* API to securely query the database while honoring ACLs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideQuery	The query object being built.

This example shows how to execute a secure query using ACLs.

```
var users = new global.GlideQuery('sys_user')
    .withAcls()
    .limit(5)
    .orderByDesc('first_name')
    .select('first_name')
    .forEach(function (user){
        gs.info(JSON.stringify(user, null, 2));
    });
```

Output:

```
*** Script: {
  "first_name": "Zane",
  "sys_id": "16826bf03710200044e0bfc8bcbe5dbc"
}
*** Script: {
  "first_name": "Zackary",
  "sys_id": "8a826bf03710200044e0bfc8bcbe5d69"

  "first_name": "Wilmer",
  "sys_id": "42826bf03710200044e0bfc8bcbe5d7b"
}
```

GlideQueryCondition - Global

The *GlideQueryCondition* API provides additional AND or OR conditions that can be added to the current condition, allowing you to build complex queries.

Build complex queries such as:

```
category='hardware' OR category='software' AND priority='2' AND
 priority='1'
```

In the case of *addCondition()*, an implied AND is added.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This class has no constructor. A GlideQueryCondition object is returned by the following methods:

- `addActiveQuery()`
- `addInactiveQuery()`
- `addJoinQuery()`
- `addNotNullQuery()`
- `addNullQuery()`
- `addQuery()`

If there is a complicated set of AND and OR queries, a single encoded query containing all conditions simplifies the query creation. To simplify the query creation, create a query in a list view, right-click the query, and select **Copy query**. It creates a single encoded query string to return your result set. Use that string as a parameter in an `addEncodedQuery()` method call.

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an `insert()`, `update()`, `deleteRecord()`, or `deleteMultiple()` method on bad query results can result in data loss.

You can set the `glide.invalid_query.returns_no_rows` system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when `glide.invalid_query.returns_no_rows` is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

GlideQueryCondition - addCondition(String name, String oper, Object value)

Adds an AND condition to the current condition.

Parameters

Name	Type	Description
name	String	The name of a field.
oper	String	(Optional) The operator for the query. If you do not specify an operator, the condition uses an equals operator.
value	Object	The value to query on.

Returns

Type	Description
GlideQueryCondition	A reference to a `GlideQueryConditon` that was added to the GlideRecord.

```
var now_GR = new GlideRecord('incident');
var qc = now_GR.addQuery('category', 'Hardware');
qc.addCondition('category', 'Network');
now_GR.addQuery('number','INC0000003');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
now_GR.next();
now_GR.number;
gs.info(now_GR.getEncodedQuery());
```

Scoped equivalent

To use the *addCondition()* method in a scoped application, use the corresponding scoped method: addCondition().

GlideQueryCondition - addOrCondition(String name, String oper, Object value)

Appends a 2-or-3 parameter OR condition to an existing GlideQueryCondition.

addOrCondition() works in conjunction with any of the addQuery()methods to OR the specified query parameters to the query previously constructed using *addQuery()*.

addOrCondition() is typically called with three parameters; table field, operator, and comparison value. It can be called with only two parameters, table field and comparison value, such as `qc.addOrCondition('category', 'software');`. The operator in this case is assumed to be "equal to".

Parameters

Name	Type	Description
name	String	Field name
oper	String	(Optional) Query operator. The available values are dependent on the data type of the *value* parameter. Numbers: • = • != • > • >= • < • <= Strings (must be in upper case): • = • != • IN • STARTSWITH • ENDSWITH • CONTAINS • DOESNOTCONTAIN
value	Object	Value on which to query (not case-sensitive). **Note:** All passed in arrays must contain a minimum of two elements. Single element arrays are not supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideQueryCondition	A reference to a GlideQueryConditon that was added to the GlideRecord.

```
var now_GR = new GlideRecord('incident');
var qc = now_GR.addQuery('category', 'Hardware');
qc.addOrCondition('category', 'Network');
now_GR.addQuery('number','INC0000003');
now_GR.next();
now_GR.number;
gs.info(now_GR.getEncodedQuery());
```

To group AND/OR statements such as `(state < 3 OR state > 5) AND (priority = 1 OR priority = 5)` use code similar to the following:

```
var myObj = new GlideRecord('incident');
var q1 = myObj.addQuery('state', '<', 3);
q1.addOrCondition('state', '>', 5);
var q2 = myObj.addQuery('priority', 1);
q2.addOrCondition('priority', 5);
myObj.query();
```

Scoped equivalent

To use the *`addOrCondition()`* method in a scoped application, use the corresponding scoped method: addOrCondition().

GlideQueryCondition - Scoped

The scoped *`GlideQueryCondition`* API provides additional AND or OR conditions that can be added to the current condition, allowing you to build complex queries.

Build complex queries such as:

```
category='hardware' OR category='software' AND priority='2' AND
 priority='1'
```

In the case of *`addCondition()`*, an implied AND is added.

This class has no constructor. A GlideQueryCondition object is returned by the following methods:

- *`addActiveQuery()`*
- *`addInactiveQuery()`*
- *`addJoinQuery()`*
- *`addNotNullQuery()`*
- *`addNullQuery()`*
- *`addQuery()`*

If there is a complicated set of AND and OR queries, a single encoded query containing all conditions simplifies the query creation. To simplify the query creation, create a query in a list view, right-click the query, and select **Copy query**. It creates a single encoded query string to return your result set. Use that string as a parameter in an *`addEncodedQuery()`* call.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an `insert()`, `update()`, `deleteRecord()`, or `deleteMultiple()` method on bad query results can result in data loss.

You can set the `glide.invalid_query.returns_no_rows` system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when `glide.invalid_query.returns_no_rows` is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

GlideQueryCondition - addCondition(String name, String oper, Object value)

Adds an AND condition to the current condition.

Parameters

Name	Type	Description
name	String	Name of a field.
oper	String	Optional. The operator for the query. If you do not specify an operator, the condition uses an equals operator.
value	Object	Value to query on.

Returns

Type	Description
GlideQueryCondition	Reference to a GlideQueryConditon that was added to the glide record.

```
var now_GR = new GlideRecord('incident');
var qc = now_GR.addQuery('category', 'Hardware');
qc.addCondition('category', 'Network');
now_GR.addQuery('number','INC0000003');
now_GR.next();
now_GR.number;
gs.info(now_GR.getEncodedQuery());
```

GlideQueryCondition - addOrCondition(String name, String oper, Object value)

Appends a two-or-three parameter OR condition to an existing GlideQueryCondition.

`addOrCondition()` works in conjunction with any of the addQuery() methods to OR the specified query parameters to the query previously constructed using `addQuery()`.

`addOrCondition()` is typically called with three parameters; table field, operator, and comparison value. It can be called with only two parameters, table field and comparison value, such as `qc.addOrCondition('category', 'software');`. The operator in this case is assumed to be "equal to".

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Field name
oper	String	(Optional) Query operator. The available values are dependent on the data type of the *value* parameter. Numbers: • = • != • > • >= • < • <= Strings (must be in upper case): • = • != • IN • STARTSWITH • ENDSWITH • CONTAINS • DOESNOTCONTAIN
value	Object	Value on which to query (not case-sensitive). **Note:** All passed in arrays must contain a minimum of two elements. Single element arrays are not supported.

Returns

Type	Description
GlideQueryCondition	A reference to a GlideQueryConditon that was added to the GlideRecord.

```
var now_GR = new GlideRecord('incident');
var qc = now_GR.addQuery('category', 'Hardware');
qc.addOrCondition('category', 'Network');
now_GR.addQuery('number','INC0000003');
now_GR.next();
now_GR.number;
gs.info(now_GR.getEncodedQuery());
```

To group AND/OR statements to make complex queries, such as "All incidents with a (state less than 3 OR greater than 5) AND (priority is 1 OR priority is 5)

```
var myObj = new GlideRecord('incident');
var q1 = myObj.addQuery('state', '<', 3);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
q1.addOrCondition('state', '>', 5);
var q2 = myObj.addQuery('priority', 1);
q2.addOrCondition('priority', 5);
myObj.query();
```

GlideRecord - Global

The *GlideRecord* API is used for database operations.

The *GlideRecord* API is the primary means of interfacing with the database on the server-side code. A GlideRecord is an object that contains records from a single table. Use the API to instantiate a GlideRecord object and add query parameters, filters, limits, and ordering.

To use this API to create dynamic attributes you must have the dynamic_schema_writer role. To read dynamic data using this API you must have the dynamic_schema_reader role.

For more information on dynamic attributes, see Dynamic Schema.

See the GlideRecord article for details on building and running queries.

For information about *GlideRecordSecure*, which is a class inherited from *GlideRecord* that performs the same functions as *GlideRecord* and also enforces ACLs, see the GlideServer APIs.

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an *insert()*, *update()*, *deleteRecord()*, or *deleteMultiple()* method on bad query results can result in data loss.

You can set the *glide.invalid_query.returns_no_rows* system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when *glide.invalid_query.returns_no_rows* is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

Retrieve values from records

In most cases, don't use dot-walking to get values from a record. Dot-walking retrieves the entire object instead of the field value. Retrieving the object uses more storage and might cause undesirable results when used in arrays or in Service Portal.

Instead of retrieving the entire object, you can use one of the following methods to copy the field values:

- getValue()
- getDisplayValue()

If dot-walking through a GlideElement object is necessary, use the *toString()* method to retrieve values. For example, you might need the current caller's manager sys_id to set another reference field. The following example shows how to get the string value instead of the entire object:

```
var mgr = current.caller_id.manager.toString();
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynamic attributes

There are methods in this API that have the same functionality as dynamic schema methods in the GlideDynamicAttributeStore - Global API. Use the dynamic attribute methods in this API to perform actions on a specified GlideRecord. Use the methods in the *GlideDynamicAttributeStore* API if you want to set the same group of dynamic attributes on multiple records. Using this API, you can stage a GlideDynamicAttributeStore object with the desired attributes and then copy that object to multiple GlideRecords using the various *setDynamicAttributeValues()* methods.

See also:

- GlideAggregate
- GlideElement
- GlideQuery

GlideRecord - GlideRecord(String tableName)

Creates an instance of the GlideRecord class for the specified table.

Parameters

Name	Type	Description
tableName	String	Table to use.

```
var now_GR = new GlideRecord('incident');
```

GlideRecord - addActiveQuery()

Adds a filter to return active records.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideQueryCondition	Filter to return active records.

```
var inc = new GlideRecord('incident');
inc.addActiveQuery();
inc.query();
```

Scoped equivalent

To use the *addActiveQuery()* method in a scoped application, use the corresponding scoped method: addActiveQuery().

GlideRecord - addDomainQuery(Object glideRecord)

Changes the domain used for the query from the user's domain to the domain of the provided GlideRecord.

© 2026 ServiceNow, Inc. All rights reserved.

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an `insert()`, `update()`, `deleteRecord()`, or `deleteMultiple()` method on bad query results can result in data loss.

You can set the `glide.invalid_query.returns_no_rows` system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when `glide.invalid_query.returns_no_rows` is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

This function requires the Domain Support - Domain Extensions Installer (com.glide.domain.msp_extensions.installer) plugin.

Parameters

Name	Type	Description
glideRecord	Object	GlideRecord from which to obtain the domain.

Returns

Type	Description
void	

```
//This example requires the Domain plugin be active, the Group
 table is the specified
//Domain table, and the ITIL user is in the Database Atlanta
 domain
//From any domain (using queryNoDomain()) look up the incidents
 that an ITIL user can only see
//who is in the Database Atlanta domain, should expect all
 incidents with the global or the
//Database Atlanta domain specified.
var domain = new GlideRecord('sys_user');
domain.addQuery('user_name', 'itil');
domain.queryNoDomain();
if (domain.next()) {
    var domainQuery = new GlideRecord('incident');
    domainQuery.addQuery('active', true);
    domainQuery.addDomainQuery(domain);
    domainQuery.query();
    gs.print('Number of Incidents for ITIL user: ' +
 domainQuery.getRowCount());
    while (domainQuery.next())
        gs.print(domainQuery.number);
}
```

Scoped equivalent

This method is not available in scoped applications.

GlideRecord - addEncodedQuery(String query, Boolean enforceFieldACL)

Adds an encoded query to other queries that may have been set.

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an `insert()`, `update()`, `deleteRecord()`, or `deleteMultiple()` method on bad query results can result in data loss.

You can set the `glide.invalid_query.returns_no_rows` system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when `glide.invalid_query.returns_no_rows` is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

Parameters

Name	Type	Description
query	String	An encoded query string.
enforceFieldACL	Boolean	Optional. Flag that indicates whether to enforce field ACL (Access Control List) rules. Valid values: • true: Enforce field ACLs. • false: Don't enforce field ACLs. Default: false

Returns

Type	Description
void	

```
var queryString = "priority=1^ORpriority=2";
 var now_GR = new GlideRecord('incident');

 now_GR.addEncodedQuery(queryString);
 now_GR.query();
 while (now_GR.next()) {
 gs.addInfoMessage(now_GR.number);
 }
```

Scoped equivalent

To use the `addEncodedQuery()` method in a scoped application, use the corresponding scoped method: addEncodedQuery().

GlideRecord - addExtraField(String dotWalkedField)

Queries one or more dot-walked fields from a form or script in a single request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The *addExtraField()* method allows you to query dot-walked fields in a single database request, rather than perform multiple queries per dot-walked element in a form or script (which requires multiple round trips to the database).

Parameters

Name	Type	Description
dotWalkedField	String	The dot-walked field name. Levels of field names are separated by dots (periods). For example, enter the value `Caller.Company` if you want to query the **Company** > **Caller** condition in the Incident [incident] table. The format of *dotWalkedField* follows the left-to-right order of fields in a dotwalked form or script.

Returns

Type	Description
None	**Note:** The *addExtraField()* method does not impact output results; the output is always the same regardless if you use this method in your script.

The following example shows how to query the contact name field of cmn_location (referenced from the "location" reference field in a cmdb_ci field).

Note: The dotWalkedField value in this example, `cmdb_ci.location.contact.name`, looks like "cmdb_ci fields" => "cmn_location fields" => "sys_user fields" in the ServiceNow® UI when selecting fields in a list.

```
var gliderecord = new GlideRecord("incident");
gliderecord.addQuery("number", "INC0041457");
gliderecord.addExtraField("cmdb_ci.location.contact.name");
gliderecord.query();
gliderecord.next();
gs.print(gliderecord.cmdb_ci.location.contact.name);
```

The output is the same as `gs.print(gr.cmdb_ci.location.contact.name)` without using *addExtraField()*. The *addExtraField()* method optimizes the querying of the dot-walked fields. Example output:

```
Abel Tuter
```

GlideRecord - addFunction(Object function)

Applies a pre-defined GlideDBFunctionBuilder object to a record.

Use the GlideDBFunctionBuilder scoped class to define a function. After the function is defined, use the *addFunction(Object function)* method to apply the function to a record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
function	Object	A GlideDBFunctionBuilder or GlideDBCaseStatementBuilder object that defines a SQL operation.

Returns

Type	Description
void	

```
var functionBuilder = new GlideDBFunctionBuilder();
var myAddingFunction = functionBuilder.add();
myAddingFunction = functionBuilder.field('order');
myAddingFunction = functionBuilder.field('priority');
myAddingFunction = functionBuilder.build();

var now_GR = new GlideRecord('incident');
now_GR.addFunction(myAddingFunction);
now_GR.addQuery(myAddingFunction, '<', 5);
now_GR.query();
while(now_GR.next())
gs.log(now_GR.getValue(myAddingFunction));
```

Output:

```
*** Script: 1
*** Script: 4
*** Script: 3
*** Script: 1
*** Script: 1
*** Script: 2
*** Script: 1
*** Script: 1
```

GlideRecord - addInactiveQuery()

Adds a filter to return inactive records. Inactive records have the active flag set to false.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideQueryCondition	Records where the active flag is false.

```
var inc = new GlideRecord('incident');
inc.addInactiveQuery();
inc.query();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

In scoped applications use the scoped method addQuery("active","false").

GlideRecord - addJoinQuery(String table)

Adds a filter to return records based on a relationship in a related table.

For example, find all the users that are in the database group (users via sys_user_grmember table). Another example would be find all problems that have an assigned incident (problems via the incident.problem_id relationship).

This is not a true database join; rather, *addJoinQuery()* adds a subquery. So, while the result set is limited based on the join, the only fields that you have access to are those on the base table (those which are in the table with which the GlideRecord was initialized).

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an *insert()*, *update()*, *deleteRecord()*, or *deleteMultiple()* method on bad query results can result in data loss.

You can set the *glide.invalid_query.returns_no_rows* system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when *glide.invalid_query.returns_no_rows* is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

Parameters

Name	Type	Description
table	String	Table name

Returns

Type	Description
GlideQueryCondition	Records where the relationships match.

Find problems that have an incident attached. This example returns problems that have associated incidents. However, it won't pull values from the incidents that are returned as a part of the query.

```
var prob = new GlideRecord('problem');
prob.addJoinQuery('incident');
prob.query();
```

Find active=false problems with associated incidents.

```
// Look for Problem records
var now_GR = new GlideRecord('problem');

// That have associated Incident records
var grSQ = now_GR.addJoinQuery('incident');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Where the Problem records are "active=false"
now_GR.addQuery('active', 'false');

// And the Incident records are "active=true"
grSQ.addCondition('active', 'true');

// Query
now_GR.query();

// Iterate and print results
while (now_GR.next()) {
    gs.print(now_GR.getValue('number'));
}
```

Scoped equivalent

To use the *addJoinQuery()* method in a scoped application, use the corresponding scoped method: addJoinQuery().

GlideRecord - addJoinQuery(String table, String primaryField)

Adds a filter to return records based on a relationship in a related table.

For example, find all the users that are in the database group (users via sys_user_grmember table). Another example would be find all problems that have an assigned incident (problems via the incident.problem_id relationship).

This is not a true database join; rather, *addJoinQuery()* adds a subquery. So, while the result set is limited based on the join, the only fields that you have access to are those on the base table (those which are in the table with which the GlideRecord was initialized).

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an *insert()*, *update()*, *deleteRecord()*, or *deleteMultiple()* method on bad query results can result in data loss.

You can set the *glide.invalid_query.returns_no_rows* system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when *glide.invalid_query.returns_no_rows* is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

Parameters

Name	Type	Description
table	String	Table name
primaryField	String	If other than sys_id, the primary field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideQueryCondition	Records where the relationships match.

Find problems that have incidents using the open_by field at the join key instead of the sys_id.

```
var now_GR = new GlideRecord('problem');
now_GR.addJoinQuery('incident', 'opened_by');
now_GR.query();
```

Scoped equivalent

To use the *addJoinQuery()* method in a scoped application, use the corresponding scoped method: addJoinQuery().

GlideRecord - addJoinQuery(String table, String primaryField, String joinTableField)

Adds a filter to return records based on a relationship in a related table.

For example, find all the users that are in the database group (users via sys_user_grmember table). Another example would be find all problems that have an assigned incident (problems via the incident.problem_id relationship).

This is not a true database join; rather, *addJoinQuery()* adds a subquery. So, while the result set is limited based on the join, the only fields that you have access to are those on the base table (those which are in the table with which the GlideRecord was initialized).

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an *insert()*, *update()*, *deleteRecord()*, or *deleteMultiple()* method on bad query results can result in data loss.

You can set the *glide.invalid_query.returns_no_rows* system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when *glide.invalid_query.returns_no_rows* is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

Parameters

Name	Type	Description
table	String	Table name
primaryField	String	If other than sys_id, the primary field.
joinTableField	String	If other than sys_id, the field that joins the tables

Returns

Type	Description
GlideQueryCondition	Records where the relationships match.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Find problems that have incidents associated where the incident caller_id field value matches that of the problem opened_by field.

```
var now_GR = new GlideRecord('problem');
now_GR.addJoinQuery('incident', 'opened_by', 'caller_id');
now_GR.query();
```

Scoped equivalent

To use the *addJoinQuery()* method in a scoped application, use the corresponding scoped method: addJoinQuery().

GlideRecord - addNotNullQuery(String fieldName)

Adds a filter to return records where the specified field is not null.

Parameters

Name	Type	Description
fieldName	String	The field name.

Returns

Type	Description
GlideQueryCondition	GlideQueryCondition of records where the parameter field is not null.

```
var target = new GlideRecord('incident');
  target.addNotNullQuery('short_description');
  target.query();   // Issue the query to the database to get
 all records
  while (target.next()) {
     // add code here to process the incident record
  }
```

Scoped equivalent

To use the *addNotNullQuery()* method in a scoped application, use the corresponding scoped method: addNotNullQuery().

GlideRecord - addNullQuery(String fieldName)

Adds a filter to return records where the specified field is null.

Parameters

Name	Type	Description
fieldName	String	The field name.

Returns

Type	Description
GlideQueryCondition	GlideQueryCondition of records where the specified field is null.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var target = new GlideRecord('incident');
  target.addNullQuery('short_description');
  target.query();   // Issue the query to the database to get
 all records
  while (target.next()) {
     // add code here to process the incident record
  }
```

Scoped equivalent

To use the *addNullQuery()* method in a scoped application, use the corresponding scoped method: addNullQuery().

GlideRecord - addQuery(String name, Object operator, Object value)

Provides the ability to build a request, which when executed, returns the rows from the specified table that match the request.

If you're familiar with SQL, this method is similar to the "where" clause. You can make one or more *addQuery()* calls in a single query. For this method the queries are AND'ed. If any of the query statements need to be OR'ed, use the class GlideQueryCondition.

addQuery() is typically called with three parameters; table field, operator, and comparison value. It can be called with only two parameters, table field and comparison value, such as `myObj.addQuery('category','Hardware');`. The operator in this case is assumed to be "equal to".

For additional information on using queries, see Querying tables in script.

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an *insert()*, *update()*, *deleteRecord()*, or *deleteMultiple()* method on bad query results can result in data loss.

You can set the *glide.invalid_query.returns_no_rows* system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when *glide.invalid_query.returns_no_rows* is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

Parameters

Name	Type	Description
name	String	Table field name or path to an attribute within a dynamic attribute store element. Format of the dynamic path: `dyn_att_field->group_name->attribute_name`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table. For more information on dynamic attributes, see Dynamic Schema.
operator	Object	Query operator. The available values are dependent on the data type of the *`value`* parameter. Numbers: • = • != • > • >= • < • <= Strings (must be in upper case): • = • != • IN • NOT IN • STARTSWITH • ENDSWITH • CONTAINS • DOES NOT CONTAIN • INSTANCEOF **Note:** Use CONTAINS instead of the LIKE operator. Dynamic schema operators: • = • != • < • > • <= • >= • BETWEEN

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• CONTAINS • DOES_NOT_CONTAIN • ENDSWITH • GT_FIELD • GT_OR_EQUALS_FIELD • IN • ISEMPTY • ISNOTEMPTY • IS_NOT_NULL • IS_NULL • LIKE • LT_FIELD • LT_OR_EQUALS_FIELD • MATCHES • NOT_IN • NOT_LIKE • NOT_MATCHES • NSAMEAS • SAMEAS • STARTSWITH
value	Object	Value on which to query (not case-sensitive).

Returns

Type	Description
GlideQueryCondition	Reference to the GlideQueryCondition that was added to the GlideRecord.

The following example shows how to call this method.

```
var rec = new GlideRecord('incident');
rec.addQuery('active',true);
rec.addQuery('sys_created_on', ">", "2010-01-19 04:05:00");
rec.query();
while (rec.next()) {
 rec.active = false;
 gs.print('Active incident ' + rec.number + ' closed');
 rec.update();
}
```

The following example shows how to use the `IN` operator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var que = new GlideRecord('incident');
que.addQuery('number','IN','INC00001,INC00002');
que.query();
while(que.next()) {
 //do something....
}
```

The following example shows how to call this method for using attributes in a dynamic attribute store.

```
var gr_Inc = new GlideRecord('incident');
gr_Inc.addQuery('inc_dynamic_schema->cars->avg_mpg', 'GT_FIELD',
 'inc_dynamic_schema2->cars->avg_mpg');
gr_Inc.query();
while(gr_Inc.next()) {
    gs.info(gr_Inc.number + " Gas Mileage 1: " +
 gr_Inc.getDynamicAttributeValue('inc_dynamic_schema->cars->avg_
mpg') +  " GT_FIELD Gas Mileage 2 :" +
 gr_Inc.getDynamicAttributeValue('inc_dynamic_schema2->cars->avg
_mpg'));
}
```

Scoped equivalent

To use the *addQuery()* method in a scoped application, use the corresponding scoped method: addQuery().

GlideRecord - addValue(String field, Number value)

Provides atomic add and subtract operations on a specified number field at the database level for the current GlideRecord object.

Typically, a GlideRecord object is written as one record in a database. Individual field values are stored as defined. For code that adds a value to a GlideRecord field, it simply saves the field to the database with the new value, rather than atomically incrementing it.

For example, when the following code is executed, the value of the u_count field in the database is 2.

```
gs.print(now_now_GR.u_count); // "1"
now_GR.u_count += 1;
now_GR.update();
now_GR.get(now_now_GR.sys_id);
gs.print(now_now_GR.u_count); // "2"
```

If another user concurrently runs identical code, instead of the two operations each adding 1 to u_count, the net effect is that u_count only contains 2, with one operation's update actually being lost.

Conversely, the *addValue()* method performs the addition/subtraction in the database when the record is updated as an atomic operation. Two operations running concurrently each properly update the field.

```
gs.print(now_now_GR.u_count); // "1"
now_GR.addValue("u_count", 1);
now_GR.update();
now_GR.get(now_GR); // The record must be reloaded from the
 database to observe the result
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.print(now_now_GR.u_count); // "3", if executed concurrently
 with another user
```

Note: The new value is not read back from the database unless explicitly done so.

Like *setValue()*, *addValue()* changes only take effect in the database after a subsequent call to *update()* or *insert()*. If *insert()* is called, the specified field is initialized with the *value* parameter passed into *addValue()*.

Note: If *setValue()* is called for the specified field prior to calling *addValue()*, the *addValue()* method is not processed and an error message is logged.

Parameters

Name	Type	Description
field	String	The name of the field in this GlideRecord to modify. If the associated field is not a numeric type, the operation is ignored.
value	Number	The amount to add to the value when the record is saved. To perform a subtraction operation, simply pass a negative value.

Returns

Type	Description
void	

Shows a value being added.

```
gs.print(now_GR.u_count); // "1"
now_GR.addValue("u_count", 1);
now_GR.update();
now_GR.get(now_GR.sys_id); // The record must be reloaded from
 the database to observe the result
gs.print(now_GR.u_count);
```

Output: 2

Shows a value being subtracted.

```
gs.print(now_GR.u_count); // "4"
now_GR.addValue("u_count", -1);
now_GR.update();
now_GR.get(now_GR.sys_id); // The record must be reloaded from
 the database to observe the result
gs.print(now_GR.u_count);
```

Output: 3

GlideRecord - applyEncodedQuery(String queryString)

Sets the values of the specified encoded query terms and applies them to the current GlideRecord.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
queryString	String	Encoded query to apply to the current GlideRecord.

Returns

Type	Description
None	

```
function createAcl(table, role) {
  gs.print("Checking security on table " + table);
  var now_GR = new GlideRecord("sys_security_acl");
  now_GR.addQuery("name", table);
  now_GR.addQuery("operation", "read");
  now_GR.query();
  var encQuery = now_GR.getEncodedQuery();
  if (now_GR.next()) {
    // existing acl found so use it
    createAclRole(now_GR.sys_id.toString(), role);
    return;
  } else {
  now_GR.initialize();
  now_GR.applyEncodedQuery(encQuery);
  var acl = now_GR.insert();
    gs.print("Added read access control on " + table);
    createAclRole(acl, role);
  }
}
```

GlideRecord - applyTemplate(String template)

Apply a template record from the Template table [sys_template] to the current record. If the specified template is not found, no action is taken.

Note: This method automatically instantiates a *now_GR.insert()* method if a template has the **Next Related Child Template** field filled. For information, see Create templates for related task records.

Parameters

Name	Type	Description
template	String	Name of a template from the Templates [sys_template] table.

Returns

Type	Description
void	

```
var rec1 = new GlideRecord("incident");
rec1.initialize();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
rec1.applyTemplate("my_incident_template");
rec1.insert();
```

GlideRecord - autoSysFields(Boolean e)

Enables or disables the update to the fields sys_updated_by, sys_updated_on, sys_mod_count, sys_created_by, and sys_created_on. This is often used for manually updating field values on a record while leaving historical information unchanged.

Warning: Use caution if you use this method. When you use this method the sys_mod_count field will not be incremented, and other sys_ fields will not be updated. This can break functionality including, but not limited to, the Activity Formatter, History Sets, Notifications, and Metrics.

Parameters

Name	Type	Description
e	Boolean	If false disables updates to sys_updated_by, sys_updated_on, sys_mod_count, sys_created_by, and sys_created_on.

Returns

Type	Description
void	

```
var inc = new GlideRecord('incident');

// Change all Open(1) incidents to Active(2)

inc.addQuery('state', 1);
inc.query();

while (inc.next()) {
  inc.autoSysFields(false);  // Do not update sys_updated_by,
 sys_updated_on, sys_mod_count, sys_created_by, and
 sys_created_on
  inc.setWorkflow(false);    // Do not run any other business
 rules
  inc.setValue('state', 2);
  inc.update();
}
```

GlideRecord - canCreate()

Determines if the access control rules (which includes the user's role) permit inserting new records in this table.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the user's roles permit creating of records in this table. Possible values: • true: Creating permitted • false: Creating is not permitted

This example shows whether records can be created on the benefit_plan table.

```
canCreateBenefitPlan : function() {
  var now_GR = new GlideRecord('benefit_plan');
  return now_GR.canCreate();
}
```

Scoped equivalent

To use the `canCreate()` method in a scoped application, use the corresponding scoped method: canCreate().

GlideRecord - canDelete()

Determines if the access control rules (which includes the user's role) permit deletion of records in this table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the user's roles permit deleting of records in this table. Valid values: • true: Deleting permitted • false: Deleting is not permitted

```
var att = new GlideRecord('sys_attachment');
att.get('$[sys_attachment.sys_id]');
var sm = GlideSecurityManager.get();
var checkMe = 'record/sys_attachment/delete';
var canDelete = sm.hasRightsTo(checkMe, att);
gs.log('canDelete: ' + canDelete);
```

Scoped equivalent

To use the `canDelete()` method in a scoped application, use the corresponding scoped method: canDelete().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideRecord - canRead()

Indicates whether the Access Control Rules (ACLs) permit the current user to read the current record within the associated GlideRecord table. This method evaluates all available ACLs for the specific resource.

Note: You shouldn't use this method to check for table-level access. A single call to this method might not be sufficient to get a conclusive table-level access rights check result. To perform a table-level access check, use the *GlideSecurityManager.hasRightsTo()* method.

For additional information on ACLs, see Access Controls Evaluation Order.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the user's roles permit reading of the current record. Valid values: • true: Reading permitted • false: Reading isn't permitted

This example shows how to iterate through the Incident [incident] table and check if the user has read rights to each record.

```
var grTable = new GlideRecord('incident');
grTable.query();
while (grTable.next()) {
  if (grTable.canRead())
  ...
}
```

Scoped equivalent

To use the *canRead()* method in a scoped application, use the corresponding scoped method: canRead().

GlideRecord - canWrite()

Determines if the access control rules (which includes the user's role) permit updates to records in this table.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the user's roles permit writing of records in this table. Valid values: • true: Writing permitted • false: Writing is not permitted

This example shows whether records can be written to the benefit_plan table.

```
canWriteBenefitPlan : function() {
  var now_GR = new GlideRecord('benefit_plan');
  return now_GR.canWrite();
}
```

Scoped equivalent

To use the *canWrite()* method in a scoped application, use the corresponding scoped method: canWrite().

GlideRecord - changes()

Determines whether any of the fields in the record have changed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether there are changes in the specified record. Possible values: • true: Fields in the specified record have changed. • false: No fields have changed.

This example shows how to check if there are changes in an incident record.

```
var now_GR = new GlideRecord("incident");
now_GR.query();
now_GR.next();
if (now_GR.changes()) {
  gs.print("The incident record reported changes right after
 being read");
} else {
  gs.print("The incident record has not changed");
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To implement this functionality in a scoped application, add code similar to the following:

```
var now_GR = new GlideRecord("incident");
   now_GR.get("965c9e5347c12200e0ef563dbb9a7156");
   now_GR.short_description = "test";
   var elements = now_GR.getElements();
   var hasChanged = false;
   for(var i=0; i < elements.length;i++){
     var element = elements[i];
     hasChanged = hasChanged || element.changes();
     gs.info(element.getName() + ":" + element.changes());
   }
   gs.info(hasChanged);
```

GlideRecord - chooseWindow(Number firstRow, Number lastRow, Boolean forceCount)

Sets a range of rows to be returned by subsequent queries.

Using setLimit() with chooseWindow()

The *setLimit()* method implicitly calls the *chooseWindow()* method and might cause unexpected results when used with *chooseWindow()* in a query.

- If the *chooseWindow()* method is called first, its record window is overwritten by the *setLimit()* method.

  Using the following lines in a query returns 100 records starting at row 1:

  ```
  grIncident.chooseWindow(20,30);
  grIncident.setLimit(100);
  ```

- If the *setLimit()* method is called first, the window set by *chooseWindow()* is used and the limit is overwritten.

  Using the following lines in a query returns 10 records starting at row 21:

  ```
  grIncident.setLimit(5);
  grIncident.chooseWindow(20,30);
  ```

> **Note:** Running *query()* with the *chooseWindow()* method triggers a COUNT(*) query, which can result in slow performance on tables with a large number of records. You can use *setLimit()* before *chooseWindow()* to skip running the COUNT(*) query, but the same performance benefit is achievable using *setNoCount()*.

See also:

- query()
- setLimit()
- setNoCount()

Parameters

Name	Type	Description
firstRow	Number	Zero-based index of the starting row for the range, inclusive. (A value of 0 returns the first row.)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
lastRow	Number	Zero-based index of the ending row for the range, exclusive. For example, if *firstRow* = 1 and *lastRow* = 5, four records are returned (2-5).
forceCount	Boolean	Optional. Flag that indicates whether to force a row count query. In most implementations of this call, the row count is performed. There are some outlying cases, such as text searches, were a row count is not performed. Setting this flag ensures that the row count occurs. Valid values: • true: Row count always occurs. • false: Row count occurs if implemented in normal execution of method. Default: false

Returns

Type	Description
void	

This example shows how to return records 3 and 4 from the Incident [incident] table.

```
var now_GR = new GlideRecord('incident');
now_GR.orderBy('number');
now_GR.chooseWindow(2, 4);
now_GR.query();
while (now_GR.next()) {
  gs.info(now_GR.getValue('number') + ' is within window');
}
```

Output:

```
*** Script: INC0000003 is within window
*** Script: INC0000004 is within window
```

GlideRecord - deleteMultiple()

Deletes all records that satisfy the query.

This method does not delete attachments.

Dot-walking is not supported for this method. When using the *deleteMultiple()* function on referenced tables, all the records in the table are deleted. Also, when using *deleteRecord()* to cascade delete, prior calls to *setWorkflow()* on the same GlideRecord object are ignored.

Do not use *deleteMultiple()* on tables with currency fields. Always delete each record individually. Also, do not use this method with the *chooseWindow()* or *setLimit()* methods when working with large tables. The *setLimit()* method does not limit the number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

of records that are deleted with *deleteMultiple()*. All records returned by the query are deleted regardless of *setLimit()*.

The *glide.db.forced.chunk.threshold* system property sets the threshold above which forces chunk record deletions and updates. Chunking helps to prevent non-primary key deletions on huge tables from causing replication problems. For more information, see Available system properties.

Note: When using *deleteMultiple()* to cascade delete, prior calls to *setWorkflow()* on the same GlideRecord object are ignored.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

This example shows how to delete all inactive records from the Incident table.

```
var now_GR = new GlideRecord('incident');
now_GR.addQuery('active','false');
now_GR.query();
now_GR.deleteMultiple();
```

Scoped equivalent

To use the *deleteMultiple()* method in a scoped application, use the corresponding scoped method: deleteMultiple().

GlideRecord - deleteRecord()

Deletes a single record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the record was successfully deleted. Possible values: • true: Record was deleted. • false: No record was found to delete.

This example shows how to delete all inactive records from the Incident table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var rec = new GlideRecord('incident');
rec.addQuery('active',false);
rec.query();
while (rec.next()) {
 gs.info('Inactive incident ' + rec.number + ' deleted');
 rec.deleteRecord();
}
```

Output:

```
Inactive incident INC0010010 deleted
Inactive incident INC0010011 deleted
```

This example shows how to delete a record from the Incident table immediately after it is inserted. The incident *GlideRecord* must be reloaded after the insert before it can be deleted.

```
var grTicket = new GlideRecord('incident');
grTicket.initialize();
grTicket.short_description = 'Example ticket';
grTicket.work_notes = 'An update about the ticket';
var ins_sys_id = grTicket.insert(); // Insert the record
grTicket.get(ins_sys_id); // Reload the inserted record
gs.info(grTicket.deleteRecord()); // Delete the record
```

Output:

```
true
```

Scoped equivalent

To use the *deleteRecord()* method in a scoped application, use the corresponding scoped method: deleteRecord().

GlideRecord - disableSysIdInOptimization()

Disables the default optimization that prevents an extra database query from running when a user passes in a large number of sys_ids, such as `grIncident.addQuery('sys_id', 'IN', listOf200SysIds)`.

This method only effects the GlideRecord on which it's called. To modify the sys_id limit optimization for all GlideRecords, adjust the value in the *glide.db.first_pass_sys_id_list_size.max* system property (default 100).

If you don't either call this method or adjust the *glide.db.first_pass_sys_id_list_size.max* system property and pass a list that contains more sys_id entries than defined in *glide.db.first_pass_sys_id_list_size.max*, the returned value from *GlideRecord.getRowCount()* may be incorrect.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to use the *disableSysIdInOptimiation()* method to disable the sys_id limit optimization when passing an Incident sys_id list that contains 200 entries.

```
var listOf200SysIds = [ ... ]; // 200 comma separated sys_ids
var grIncident = new GlideRecord('incident');
grIncident.addQuery('sys_id', 'IN', listOf200SysIds);
grIncident.disableSysIdInOptimization(); // Rowcount could be
 incorrect without this method call
grIncident.query();
if (grIncident.next())
    gs.info("Rowcount: " + grIncident.getRowCount());
```

Output:

```
Rowcount: 200
```

GlideRecord - find(String columnName, String value)

Returns true if any record has a matching value in the specified column. If found, it also moves to the first record that matches, essentially executing *next()* until the record is returned.

Note: This method creates a record instead of updating the existing record if you apply the *update()* method after modifying the GlideRecord. To avoid creating a record, call the *next()* method before calling *find()*. For example:

```
var existingMaterials = new
 GlideRecord('u_m2m_material_num_service_instance');
existingMaterials.addQuery('u_service_instance',
 serviceInstance.sys_id);
existingMaterials.query();
existingMaterials.next(); // This line added to prevent new
 record creation

existingMaterials.find('u_material_number',
 'ca41b9fd37a84200fdc25ca543990ed8');

existingMaterials.u_material_quantity = 5;
existingMaterials.update("Modify request via catalog");
```

See also:

- next()
- update()

Parameters

Name	Type	Description
columnName	String	Field name to search.
value	String	Value to check for in the specified field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether any record within the current table has a matching value in the specified field. Possible values: • true: Matching field. • false: No matching field.

This example shows how to find a record in the Incident table with "Critical" in the short description field.

```
var now_GR = new GlideRecord("incident");
now_GR.query();
var shortDescription = "Critical";
if (now_GR.find("short_description", shortDescription)) {
  gs.print("An incident with the specified field value was
 found");
  var recordID = now_GR.getValue("sys_id");
  gs.print("Found in the following record: " + recordID);
} else {
  gs.print("An incident with the specified field value was not
 found");
}
```

Output:

```
An incident with the specified field value was found
Found in the following record: 552c48888c033300964f4932b03eb092
```

GlideRecord - get(Object name, Object value)

Returns the specified record in the current GlideRecord object.

This method accepts either one or two parameters. If only a single parameter is passed in, the method assumes that it is the sys_id of the desired record. If not found, it then tries to match the value against the display value. If two parameters are passed in, the first is the name of the column within the GlideRecord to search. The second is the value to search for. If multiple records are found, use *`next()`* to access the additional records.

Parameters

Name	Type	Description
name	Object	Optional. Name of the instantiated GlideRecord column to search for the specified *`value`* parameter. If only a single parameter is passed in, the method assumes that this parameter is sys_id.
value	Object	Value to match. For calculated fields, the value is matched as is rather than running a calculation on a scripted default value for a field in the record.

Returns

Type	Description
Boolean	Indicates whether the requested record was located.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Possible values: • true: Record was found • false: Record was not found

This example gets an incident record by passing in the sys_id.

```
var grIncident = new GlideRecord('incident');
var returnValue =
 grIncident.get('99ebb4156fa831005be8883e6b3ee4b9');
gs.info(returnValue); // logs true or false
gs.info(grIncident.number); // logs Incident Number
```

This example gets an incident record by passing in the column in the record to search and the value to search for.

```
var grIncident = new GlideRecord('incident');
var returnValue = grIncident.get('caller_id.name','Sylivia
 Wayland');
gs.info(returnValue); // logs true or false
gs.info(grIncident.number); // logs Incident Number
```

Scoped equivalent

To use the *get()* method in a scoped application, use the corresponding scoped method: get().

GlideRecord - getAttribute(String fieldName)

Returns the dictionary attributes on the specified field.

Parameters

Name	Type	Description
fieldName	String	Field name for which to return the dictionary attributes

Returns

Type	Description
String	Dictionary attributes

This example shows how to return the dictionary attributes for "tree_picker".

```
function doit() {
  var now_GR = new GlideRecord('sys_user');
  now_GR.query("user_name","admin");
  if (now_GR.next()) {
    gs.print("we got one");
    gs.print(now_GR.location.getAttribute("tree_picker"));
  }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the `getAttribute()` method in a scoped application, use the corresponding scoped method: getAttribute().

GlideRecord - getClassDisplayValue()

Returns the table's label.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Label that identifies the table.

This example prints the label of the passed in table.

```
// Display the incident table label
var now_GR = new GlideRecord("incident");
var value = now_GR.getClassDisplayValue();
gs.info("The table label is " + value + ".");
```

Output:

```
The table label is Incident.
```

Scoped equivalent

To use the `getClassDisplayValue()` method in a scoped application, use the corresponding scoped method: getClassDisplayValue().

GlideRecord - getDisplayValue(String name)

Retrieves the display value for the current record or the display value of an attribute in a dynamic attribute store.

Display values are manipulated based on the actual value in the database and user or system settings and preferences.

The display value that is returned is dependent on the field type.

- Choice fields: The database value may be a number, but the display value is more descriptive.
- Date fields: The database value is in UTC format, while the display value is based on the user's time zone.
- Encrypted text: The database value is encrypted, while the displayed value is unencrypted based on the user's encryption context.
- Reference fields: The database value is sys_id, but the display value is the display field of the referenced record.

For more information on dynamic attributes, see Dynamic Schema.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Optional. Only required when requesting the display value for a dynamic attribute. Path to an attribute within a dynamic schema to retrieve. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table.

Returns

Type	Description
String	Display value for the current record or specified element.

This example writes the display value of a specified incident record into the log.

```
var now_GR = new GlideRecord('incident');
now_GR.get('sys_id','<sys_id>');
gs.info(now_GR.getDisplayValue());
```

Output:

```
INC0000050
```

This example shows how to retrieve the display value of an attribute within a dynamic attribute store element.

```
var gr_AppTab = new GlideRecord('application_table');
gr_AppTab.setValue('dyn_att_field->group->attr', 42);
gr_AppTab.setDisplayValue('dyn_att_field->group->attr2, true);
gr_AppTab.update();
gs.info('Attr value: ' +
gr_AppTab.getDisplayValue('dyn_att_field->group->attr);
gs.info('Attr2 value: ' +
gr_AppTab.getDisplayValue('dyn_att_field->group->attr2);
```

Output:

```
Attr value: System error
Attr2 value: true
```

Scoped equivalent

To use the *`getDisplayValue()`* method in a scoped application, use the corresponding scoped method: getDisplayValue().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideRecord - getDynamicAttribute(String fullPath)

Returns the GlideElementDynamicAttribute object for the specified dynamic attribute store path.

For more information on dynamic attributes, see Dynamic Schema.

Parameters

Name	Type	Description
fullPath	String	Path to use to locate the desired dynamic attribute. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table.

Returns

Type	Description
Object	GlideElementDynamicAttribute object containing the specified dynamic attribute. If the *`fullPath`* parameter is invalid, returns null.

The following code example shows how to call this method.

```
var gr_Inc = new GlideRecord('incident');
gr_Inc.get('number', 'INC0009009');
gr_Inc.getDynamicAttribute('attr_store->car->color').setValue('B
lue');
gr_Inc.update();

gr_Inc = new GlideRecord('incident');
gr_Inc.get('number', 'INC0009009');
gs.info(gr_Inc.getDynamicAttribute('attr_store', 'car->color'));
```

Output:

```
*** Script: Blue
```

GlideRecord - getDynamicAttribute(String dynamicAttributeField, String groupAttrPath)

Returns a GlideElementDynamicAttribute object that contains the dynamic attribute located at the specified table field and attribute path.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
dynamicAttributeField	String	Name of the field in the table that contains the dynamic attribute.
groupAttrPath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`

Returns

Type	Description
Object	GlideElementDynamicAttribute object containing the specified dynamic attribute. If either the *dynamicAttributeField* or *groupAttrPath* parameters are invalid, returns null.

The following code example shows how to call this method.

```
var gr_Inc = new GlideRecord('incident');
gr_Inc.get('number', 'INC0009009');
gr_Inc.getDynamicAttribute('attr_store->car->color').setValue('B
lue');
gr_Inc.update();

gr_Inc = new GlideRecord('incident');
gr_Inc.get('number', 'INC0009009');
gs.info(gr_Inc.getDynamicAttribute('attr_store', 'car->color'));
```

Output:

```
*** Script: Blue
```

GlideRecord - getDynamicAttributeValue(String fullPath)

Returns the value of the dynamic attribute located at a specified path.

Parameters

Name	Type	Description
fullPath	String	Path to use to locate the desired dynamic attribute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table.

Returns

Type	Description
Object	Value of the dynamic attribute located at the specified path. If the *fullPath* parameter contains invalid data or the specified attribute value isn't one of the supported data types, returns null.

The following code example shows how to call this method.

```
// Update the value of the attribute
 'attribute_store->car->time_of_purchase' incident `INC0009009`
 to a timestamp (in UTC)
var gr1 = new GlideRecord('incident');
gr1.get('number', 'INC0009009');
gr1.setDynamicAttributeValue('attribute_store->car->time_of_purc
hase', '2020-05-13 13:52:44');
gr1.update();

// Then retrieve the value of the attribute on the same record
var gr2 = new GlideRecord('incident');
gr2.get('number', 'INC0009009');
gs.info("Time of Purchase Value        (UTC): " +
 gr2.getDynamicAttributeValue('attribute_store->car->time_of_pur
chase'));
gs.info("Time of Purchase DisplayValue (PST): " +
 gr2.getDynamicAttributeDisplayValue('attribute_store->car->time
_of_purchase'));
```

Output:

```
*** Script: Time of Purchase Value        (UTC): 2020-05-13
 13:52:44
*** Script: Time of Purchase DisplayValue (PST): 2020-05-13
 06:52:44
```

GlideRecord - getDynamicAttributeValue(String dynamicAttributeField, String groupAttrPath)

Returns the value of the dynamic attribute located at a specified field in the current table and a specified attribute path.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
dynamicAttributeField	String	Name of the field in the table that contains the dynamic attribute.
groupAttrPath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`

Returns

Type	Description
Object	Value of the dynamic attribute located at the specified path. If either the *dynamicAttributeField* or *groupAttrPath* parameters are invalid, returns null.

The following code example shows how to call this method.

```
// Update the value of the attribute
 'attribute_store->car->time_of_purchase' incident `INC0009009`
 to a timestamp (in UTC)
var gr1 = new GlideRecord('incident');
gr1.get('number', 'INC0009009');
gr1.setDynamicAttributeValue('attribute_store',
 'car->time_of_purchase', '2020-05-13 13:52:44');
gr1.update();

// Then retrieve the value of the attribute on the same record
var gr2 = new GlideRecord('incident');
gr2.get('number', 'INC0009009');
gs.info("Time of Purchase Value        (UTC): " +
 gr2.getDynamicAttributeValue('attribute_store',
 'car->time_of_purchase'));
gs.info("Time of Purchase DisplayValue (PST): " +
 gr2.getDynamicAttributeDisplayValue('attribute_store',
 'car->time_of_purchase'));
```

Output:

```
*** Script: Time of Purchase Value        (UTC): 2020-05-13
 13:52:44
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
*** Script: Time of Purchase DisplayValue (PST): 2020-05-13
 06:52:44
```

GlideRecord - getDynamicAttributeDisplayValue(String fullPath)

Returns the display value of the dynamic attribute located at the specified path.

Parameters

Name	Type	Description
fullPath	String	Path to use to locate the desired dynamic attribute. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table.

Returns

Type	Description
String	Display value of the dynamic attribute located at the specified path. If the *fullPath* parameter is invalid, returns null.

The following code example shows how to call this method.

```
// Update the value of the attribute
 'attribute_store->car->time_of_purchase' incident `INC0009009`
 to a timestamp (in UTC)
var gr1 = new GlideRecord('incident');
gr1.get('number', 'INC0009009');
gr1.setDynamicAttributeValue('attribute_store->car->time_of_purc
hase', '2020-05-13 13:52:44');
gr1.update();

// Then retrieve the value of the attribute on the same record
var gr2 = new GlideRecord('incident');
gr2.get('number', 'INC0009009');
gs.info("Time of Purcahse Value        (UTC): " +
 gr2.getDynamicAttributeValue('attribute_store->car->time_of_pur
chase'));
gs.info("Time of Purcahse DisplayValue (PST): " +
 gr2.getDynamicAttributeDisplayValue('attribute_store->car->time
_of_purchase'));
```

Output:

 06:52:44
```

GlideRecord - getDynamicAttributeDisplayValue(String dynamicAttributeField, String groupAttrPath)

Returns the display value of the dynamic attribute located in a specified table field and attribute path.

Parameters

Name	Type	Description
dynamicAttributeField	String	Name of the field in the table that contains the dynamic attribute.
groupAttrPath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`

Returns

Type	Description
String	Display value of the dynamic attribute located at the specified path. If either the *dynamicAttributeField* or *groupAttrPath* parameters are invalid, returns null.

The following code example shows how to call this method.

```
// Update the value of the attribute
 'attribute_store->car->time_of_purchase' incident `INC0009009`
 to a timestamp (in UTC)
var gr1 = new GlideRecord('incident');
gr1.get('number', 'INC0009009');
gr1.setDynamicAttributeValue('attribute_store',
 'car->time_of_purchase', '2020-05-13 13:52:44');
gr1.update();

// Then retrieve the value of the attribute on the same record
var gr2 = new GlideRecord('incident');
gr2.get('number', 'INC0009009');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info("Time of Purchase Value        (UTC): " +
 gr2.getDynamicAttributeValue('attribute_store',
 'car->time_of_purchase'));
gs.info("Time of Purchase DisplayValue (PST): " +
 gr2.getDynamicAttributeDisplayValue('attribute_store',
 'car->time_of_purchase'));
```

Output:

```
*** Script: Time of Purchase Value        (UTC): 2020-05-13
 13:52:44
*** Script: Time of Purchase DisplayValue (PST): 2020-05-13
 06:52:44
```

GlideRecord - getED()

Returns the element's descriptor.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideElementDescriptor	The element's descriptor.

This example shows how to retrieve the name field for an incident GlideRecord.

```
grInc = new GlideRecord('incident');
grInc.getActiveQuery();
grInc.query();
if (grInc.next())
  gs.info("Table Descriptor is - " + grInc.getED().getName());
```

Output:

```
Table Descriptor is - incident
```

Scoped equivalent

To use the *`getED()`* method in a scoped application, use the corresponding scoped method: getED().

GlideRecord - getElement(String fieldName)

Retrieves the GlideElement for a specified field.

The value returned by this method is a complete GlideElement object.
The results are the equivalent of dot-walking a field value. For example, `now_GR.getElement('short_description')` provides the same result as `nowGR.short_description`.

In most cases, don't use dot-walking to get values from a record. Dot-walking retrieves the entire object instead of the field value. Retrieving the object uses more storage and might cause undesirable results when used in arrays or in Service Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instead of retrieving the entire object, you can use one of the following methods to copy the field values:

- getValue()
- getDisplayValue()

If dot-walking through a GlideElement object is necessary, use the *toString()* method to retrieve values. For example, you might need the current caller's manager sys_id to set another reference field. The following example shows how to get the string value instead of the entire object:

```
var mgr = current.caller_id.manager.toString();
```

See also: GlideElement - toString().

Parameters

Name	Type	Description
fieldName	String	Column name for which to return the GlideElement object.

Returns

Type	Description
GlideElement	The GlideElement for the specified column of the current record. Each object describes a field in the current GlideRecord.

This example shows how to obtain the GlideElement object for a passed in table and compare them with the expected system metadata values.

```
function compareElement(comment, table, element, /*{}*/
 expected) {
  var now_GR = new GlideRecord(table);
  var el = now_GR.getElement(element);
  for (var n in expected) {
    assertEquals(comment + ":" + table + "." + element,
 expected[n], el.sys_meta[n]);
  }
}
```

Scoped equivalent

To use the *getElement()* method in a scoped application, use the corresponding scoped method: getElement().

GlideRecord - getEncodedQuery()

Retrieves the query condition of the current result set as an encoded query string.

For details, see Encoded query strings .

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	

This example shows how to obtain the current encoded query to use later to create a read ACL role.

```
function createAcl(table, role) {
  gs.print("Checking security on table " + table);
  var now_GR = new GlideRecord("sys_security_acl");
  now_GR.addQuery("name", table);
  now_GR.addQuery("operation", "read");
  now_GR.query();
  var encQuery = now_GR.getEncodedQuery();
  if (now_GR.next()) {
    // existing acl found so use it
    createAclRole(now_GR.sys_id.toString(), role);
   return;
  } else {
    now_GR.initialize();
    now_GR.applyEncodedQuery(encQuery);
    var acl = now_GR.insert();
    gs.print("   Added read access control on " + table);
    createAclRole(acl, role);
  }
}
```

Scoped equivalent

To use the *getEncodedQuery()* method in a scoped application, use the corresponding scoped method: getEncodedQuery().

GlideRecord - getEscapedDisplayValue()

Retrieves the field value for the display field of the current record and adds escape characters for use in Jelly scripts.

Note: For this method to work, a display value must have been set on the associated table. For information on how to do this, see Select a field as the table display value.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Escaped value of the current table's display field.

This example shows how to obtain the user_name escaped display value from the User [sys_user] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var userName = "Michael J'ones";
var now_GR = new GlideRecord("sys_user");
if (now_GR.get("user_name", userName)) {
  gs.print("Deleting existing user=" + userName);
  now_GR.deleteRecord();
}
now_GR.initialize();

var name = userName.split(" ", 2);
var firstName = name[0];
var lastName = name[1];
now_GR.setValue("user_name", userName);
gs.print("Name: " + now_GR.getValue("user_name"));
now_GR.setValue("first_name", firstName);
now_GR.setValue("last_name", lastName);
var escapeValue = now_GR.getEscapedDisplayValue();
gs.print("Escaped name: " + escapeValue);
```

Output:

```
Name: Michael J'ones
Escaped name: Michael J\'ones
```

GlideRecord - getFields()

Retrieves a Java ArrayList of fields in the current record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Java ArrayList	Fields in the current record

```
// This can be run in "Scripts - Background" for demonstration
 purposes

// Get a single incident record
var grINC = new GlideRecord('incident');
grINC.query();
grINC.next();
gs.print('Using ' + grINC.getValue('number'));
gs.print('');

// getFields() returns a Java ArrayList
var fields = grINC.getFields();

// Enumerate GlideElements in the GlideRecord object that have
 values
gs.print('Enumerating over all fields with values:');
for (var i = 0; i < fields.size(); i++) {
  var glideElement = fields.get(i);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  if (glideElement.hasValue()) {
    gs.print('  ' + glideElement.getName() + '\t' +
 glideElement);
  }
}
gs.print('');

// Get a specific GlideElement: number
gs.print('Getting the number field:');
for (var i = 0; i < fields.size(); i++) {
  var glideElement = fields.get(i);
  if (glideElement.hasValue() && glideElement.getName() ==
 'number') {
    gs.print('  ' + glideElement.getName() + '\t' +
 glideElement);
  }
}
```

GlideRecord - getLabel()

Retrieves the field's label.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The field's label

This example shows how to retrieve a label of a question field in the Requested Item table and print the label and its display name.

```
template.print("Summary of Requested items:\n");
var now_GR = new GlideRecord("sc_req_item");
now_GR.addQuery("request", current.sysapproval);
now_GR.query();
while(now_GR.next()) {
var nicePrice = now_GR.price.toString();
    if (nicePrice != '') {
        nicePrice = parseFloat(nicePrice);
        nicePrice = nicePrice.toFixed(2);
    }
    template.print(now_GR.number + ":  " + now_GR.quantity + " X
 " + now_GR.cat_item.getDisplayValue()
                    + " at $" + nicePrice + " each \n");
    template.print("    Options:\n");
    for (key in now_GR.variables) {
    var now_V = now_GR.variables[key];
      if(now_V.getGlideObject().getQuestion().getLabel() != '')
 {
        template.space(4);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        template.print('     ' +
 now_V.getGlideObject().getQuestion().getLabel() + " = "
                     + vnow_V.getDisplayValue() + "\n");
      }
    }
}
```

Scoped equivalent

To use the *getLabel()* method in a scoped application, use the corresponding scoped method: getLabel().

GlideRecord - getLink(Boolean noStack)

Retrieves the link for the current record.

Parameters

Name	Type	Description
noStack	Boolean	Flag that indicates whether to append the generated link to the end of the URL. For example: `&sysparm_stack=[tablename]_list.do?sysparm_query=active=true`. Valid values: • true: Append link. • false: Do not append link. Default: false

Returns

Type	Description
String	URL of the current record.

This example checks for attachments and adds the link if any are found.

```
var attachment_link = '';
var rec = new GlideRecord('sc_req_item');
rec.addQuery('sys_id', current.request_item);
rec.query();
if(rec.next()){
  if(rec.hasAttachments()){
    attachment_link = gs.getProperty('glide.servlet.uri') +
 rec.getLink();
  }
}
```

Scoped equivalent

To use the *getLink()* method in a scoped application, use the corresponding scoped method: getLink().

GlideRecord - getLocation()

Retrieves the row number of the current record within the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Zero-based row number of the current record within the table.

This example shows how to check if a record within the Incident table is not retrieved properly by comparing the record count to the record location number.

```
var now_GR = new GlideRecord("incident");
now_GR.addQuery("priority", "4");
now_GR.query();
for (x=0; x <4; x++) {
  now_GR.next();
  gs.print("Location value: " + now_GR.getLocation());
}
```

Output:

```
Location value: 0
Location value: 1
Location value: 2
Location value: 3
```

GlideRecord - getPlural()

Retrieves the plural label of the GlideRecord table.

For example, if the table name is "Change Request," this method returns "Change Requests."

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The plural label of the GlideRecord's table.

This example shows checks the return values for *`getLabel()`* and *`getPlural()`* for the Incident table.

```
var now_GR = new GlideRecord('incident');
gs.print(now_GR.getLabel());
if (now_GR.getLabel() != 'Incident')
throw "GlideRecord.getLabel() returned unexpected value for
 table 'incident': " + now_GR.getLabel();

gs.print(now_GR.getPlural());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
if (now_GR.getPlural() != 'Incidents')
throw "GlideRecord.getPlural() returned unexpected value for
 table 'incident': " + now_GR.getPlural();
"success";
```

Scoped equivalent

To use the *getPlural()* method in a scoped application, use the scoped GlideRecord.getED() method to obtain the field's descriptor, and then use the scoped GlideElementDescriptor.getPlural() method.

GlideRecord - getRecordClassName()

Retrieves the class (table) name for the current record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Class or table name

```
function TaskAssignmentFilter() {
  var classname = current.getRecordClassName();
  var filter = "type=null";
  if (classname == "incident" && current.category == "database")
 {
    filter = GetGroupFilter("database");
  }
  else {
    // append exclusion for 'catalog' to the filter
    var cat = new GlideRecord("sys_user_group_type");
    cat.addQuery("name", "catalog");
    cat.query();
    if (cat.next()) {
      filter += "^ORtype!=" + cat.sys_id;
    }
  }
  gs.log("TaskAssignmentFilter: " + filter);
  return filter;
}
```

Scoped equivalent

To use the *getRecordClassName()* method in a scoped application, use the corresponding scoped method: getRecordClassName().

GlideRecord - getRelatedLists()

Retrieves a list of names and display values of related lists associated with the current GlideRecord.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
HashMap	Hash map with names and display values of related lists.

This example shows how to obtain the list of names and display values of related lists associated with the current GlideRecord, store them in an array, and then print their values.

```
var now_GR = new GlideRecord('incident');
var c = now_GR.getRelatedLists().values().toArray();
var numElements = c.length;
for( var i = 0; i < numElements; ++i){
  gs.print(i+": "+c[i]);
}
```

GlideRecord - getRelatedTables()

Retrieves a list of names and display values of tables that are referred to by the current record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
HashMap	Hash map with names and display values of related tables.

This example shows how to obtain the list of names and display values of tables related to the current GlideRecord, store them in an array, and then print their values.

```
var now_GR = new GlideRecord('incident');
var c = now_GR.getRelatedTables().values().toArray();
var numElements = c.length;
for( var i = 0; i < numElements; ++i){
  gs.print(i+": "+c[i]);
}
```

GlideRecord - getRowCount()

Retrieves the number of rows (records) in the current GlideRecord object.

Note: *GlideRecord* returns matching records, so it might not be as efficient as *GlideAggregate* when you only need the number of records. If you only need a record count and aren't iterating over the matching records, use *GlideAggregate*.

Retrieving the number of records in GlideRecord or GlideAggregate

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The *GlideRecord getRowCount()* and *GlideAggregate getAggregate()* APIs offer similar information. Use the following criteria to determine which option is best for you.

- The *GlideRecord getRowCount()* method tells you how many records have been returned from a query along with the records themselves. If you need the number of records in the result set before or after you iterate over the set to perform actions on the records, use this method.
- The *GlideAggregate getAggregate()* method retrieves only a count of records matching the query, excluding the actual records. The aggregate must be set on the *GlideAggregate* object before issuing the query.

Retrieving the records and count with GlideRecord getRowCount()

The following example shows how to get the total number of active incidents with *GlideRecord getRowCount()*:

```
var incident = new GlideRecord("incident");
incident.addQuery("active", true);
incident.query();

gs.info("*** Total number of active incidents: {0}",
 incident.getRowCount());
```

Retrieving only the number of records with GlideAggregate getAggregate()

The following example shows how to return only the number of records. Because this method doesn't use the matching records, it's much more efficient to use an aggregate query and return just the count.

```
var incident = new GlideAggregate("incident");
incident.addQuery("active", true);
incident.addAggregate("COUNT");
incident.query();

if (incident.next())
    gs.info("*** Total number of active incidents:
 {0}", incident.getAggregate("COUNT"));
```

Deciding which option is best for your solution

If you only want to retrieve the number of records, the *GlideAggregate getAggregate()* method is the best option. To use the individual records and retrieve the number of results, use *GlideRecord getRowCount()*, because a single query provides this functionality.

Note: If you want to use the *getRowCount()* method when using `sys_id IN` with more than 100 sys_id values, such as `grIncident.addQuery('sys_id', 'IN', listOf200SysIds)`, you must either:

- Call the *disableSysIdInOptimization()* method on the GlideRecord.
- Or, adjust the *glide.db.first_pass_sys_id_list_size.max* system property to a value higher than the number of sys_ids in the list.

In addition, ensure that you call the *.next()* method before calling the *getRowCount()* method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Number of rows in the current GlideRecord.

The following example shows how to get the number of incidents from the Incident [incident] table.

```
var numberOfIncidents = new GlideRecord('incident');
numberOfIncidents.query();
gs.info("Records in incident table: " +
 numberOfIncidents.getRowCount());
```

Output:

```
Records in incident table: 6920
```

The following code example shows how to use the *disableSysIdInOptimiation()* method to disable the sys_id limit optimization when passing an Incident sys_id list that contains 200 entries.

```
var listOf200SysIds = [ ... ]; // 200 comma separated sys_ids
var grIncident = new GlideRecord('incident');
grIncident.addQuery('sys_id', 'IN', listOf200SysIds);
grIncident.disableSysIdInOptimization(); // Rowcount could be
 incorrect without this method call
grIncident.query();
if (grIncident.next())
    gs.info("Rowcount: " + grIncident.getRowCount());
```

Output:

```
Rowcount: 200
```

Scoped equivalent

To use the *getRowCount()* method in a scoped application, use the corresponding scoped method: getRowCount().

GlideRecord - getRowNumber()

Retrieves the row number set by *saveLocation()* or *setLocation()*.

To get the current row number, use *getLocation()*.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Saved row number.

This example shows how to save a row location in the Users table and then obtain that row number.

```
var now_GR = new GlideRecord('sys_user');
now_GR.addQuery();
now_GR.query();
now_GR.saveLocation(5);
var savedRow = now_GR.getRowNumber();
gs.print("Saved row: " + savedRow);
```

Output:

```
Saved row: 5
```

GlideRecord - getTableName()

Retrieves the table name associated with this GlideRecord.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	A table name

This example shows how to write the current table name in the system log.

```
gs.log('Table: ' + current.getTableName());
gs.log('Parent: ' + current.parent.sys_id);
var item = new GlideRecord('sc_req_item');
item.addQuery('sys_id', current.parent.sys_id);
item.query();
if(item.next()){
  for(var variable in item.variable_pool) {
    gs.log(variable);
    var answer = eval ("item.variable_pool." + variable +
 ".getDisplayValue()");
    gs.log(answer);
  }
}
```

Scoped equivalent

To use the *getTableName()* method in a scoped application, use the corresponding scoped method: getTableName().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideRecord - getUniqueValue()

Gets the primary key of the record, which is usually the sys_id unless otherwise specified.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The unique primary key as a String, or null if the key is null.

```
var now_GR = new GlideRecord('kb_knowledge');
now_GR.query();
now_GR.next();
var uniqueid = now_GR.getUniqueValue();
gs.info(uniqueid);
```

GlideRecord - getValue(String fieldName)

Retrieves the string value of a specified field or the string value of an attribute in a dynamic attribute store.

Note: If the Column Level Encryption Enterprise plugin is enabled and the instance has access to the key, this method returns clear text values from encrypted fields. If the instance does not have access to the key, this method returns the encrypted value. For more information, see Platform Encryption.

For more information on dynamic attributes, see Dynamic Schema.

Parameters

Name	Type	Description
fieldName	String	The name of the field whose value you want to retrieve or the path to an attribute within a dynamic attribute store to retrieve. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table.

Returns

Type	Description
String	Value of the specified element. Returns null if the field is empty or the field doesn't exist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Note: Boolean values return as `"0"` and `"1"` string values instead of false and true.

This example uses the *`getValue()`* method to obtain field values in two GlideRecords that are being compared.

```
function() {
  var jobExists = true;
  var jobGr;
  while(jobExists){
    jobGr = new GlideRecord("sys_trigger");
    jobExists = jobGr.get("name", "BaselineAPI: Create Baseline
 Job");
  }
  var baselineGr =  new GlideRecord('pm_project_baseline');
  baselineGr.get('baseline_name','Test Project Baseline');
  baselineGr.query();

  Assert.assertEquals(true, baselineGr.next());
  var projectGr =  new GlideRecord('pm_project');
  projectGr.get(this._project);
  Assert.assertEquals(projectGr.getValue('cost'),
 baselineGr.getValue('cost'));
  Assert.assertEquals((projectGr.getValue('capex_cost')),
 baselineGr.getValue('capex_cost'));
  Assert.assertEquals((projectGr.getValue('opex_cost')),
 baselineGr.getValue('opex_cost'));
  Assert.assertEquals((projectGr.getValue('budget_cost')),
 baselineGr.getValue('budget_cost'));
  Assert.assertEquals((projectGr.getValue('value')),
 baselineGr.getValue('value'));
  Assert.assertEquals((projectGr.getValue('npv_value')),
 baselineGr.getValue('npv_value'));
 Assert.assertEquals((projectGr.getValue('score')),
 baselineGr.getValue('score'));
}
```

This example shows how to retrieve the value of a dynamic attribute.

```
// Update the value of the attribute
 'attribute_store->car->color' to 'Red' on incident `INC0009009`
var gr1 = new GlideRecord('incident');
gr1.get('number', 'INC0009009');
gr1.setDynamicAttributeValue('attribute_store->car->color',
 'Red');
gr1.update();

// Then retrieve the value of the attribute on the same record
var gr2 = new GlideRecord('incident');
gr2.get('number', 'INC0009009');
gs.info(gr2.getValue('attribute_store->car->color'));
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
*** Script: Red
```

Scoped equivalent

To use the *getValue()* method in a scoped application, use the corresponding scoped method: getValue().

GlideRecord - hasAttachments()

Determines if the current GlideRecord has any attachments.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the current record has attachments, false otherwise.

This example checks for attachments and creates a link if there are any.

```
var attachment_link = '';
var rec = new GlideRecord('sc_req_item');
rec.addQuery('sys_id', current.request_item);
rec.query();
if(rec.next()){
  if(rec.hasAttachments()){
    attachment_link = gs.getProperty('glide.servlet.uri') +
 rec.getLink();
  }
}
```

GlideRecord - hasNext()

Determines if there are any more records in the GlideRecord.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if there are more records in the query set, otherwise false.

This example shows how to call different functions based on whether there are additional records in the current GlideRecord.

```
if (now_GR.hasNext()) {
  dothis(); // found it, do it
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
} else {
  dothat(); // didn't find it
};
```

Scoped equivalent

To use the *hasNext()* method in a scoped application, use the corresponding scoped method: hasNext().

GlideRecord - initialize()

Creates an empty record within the current GlideRecord that is suitable for population before an insert.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example initializes a new record in the to_do table, creates a record, and then inserts it into the table.

```
var now_GR = new GlideRecord('to_do');
now_GR.initialize();
now_GR.name = 'first to do item';
now_GR.description = 'learn about GlideRecord';
now_GR.insert();
```

Scoped equivalent

To use the *initialize()* method in a scoped application, use the corresponding scoped method: initialize().

GlideRecord - insert()

Inserts a new record with the field values that have been set for the current record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The sys_id of the inserted record, or null if the record is not inserted.

This example creates a new record in the to_do table, sets values for some record fields, and then inserts the record into the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var now_GR = new GlideRecord('to_do');
now_GR.initialize();
now_GR.name = 'first to do item';
now_GR.description = 'learn about GlideRecord';
now_GR.insert();
```

Scoped equivalent

To use the *insert()* method in a scoped application, use the corresponding scoped method: insert().

GlideRecord - insertWithReferences()

Inserts a new record and also inserts or updates any related records with the provided information.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	sys_id of the inserted record or null if the record was not inserted.

If a reference value is not specified (as below), then a new user record is created with the provided first_name and last_name, and the caller_id value is set to this newly created sys_user record. The result is a new sys_user record with the provided first_name and last_name and a new incident record with the provided short_description and caller_id.

```
var inc = new GlideRecord('incident');
inc.initialize();
inc.short_description = 'New incident 1';
inc.caller_id.first_name = 'John';
inc.caller_id.last_name = 'Doe';
inc.insertWithReferences();
```

If a caller_id value is specified, then that caller_id is updated with the provided first_name and last_name. The result is a newly created incident record with values set for short_description and caller_id.

```
var inc = new GlideRecord('incident');
inc.initialize();
inc.short_description = 'New incident 1';
inc.caller_id.setDisplayValue('David Loo');
inc.caller_id.first_name = 'John';
inc.caller_id.last_name = 'Doe';
inc.insertWithReferences();
```

GlideRecord - instanceOf(String className)

Checks a table for the type\class of table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
className	String	Name of a type or class of record.

Returns

Type	Description
Boolean	True if table is an instance of the specified class.

This example checks if the passed in group/user is of the sys_user table/class type.

```
function(groupOrUser, label, grantedBy) {
  var labelCheck;
  var labelRecord;
  if (typeof label === "string") {
    labelRecord = new GlideRecord('label');
    labelRecord.addQuery('name', label);
    labelRecord.query();
    labelRecord.next();
  } else {
    labelRecord = label;
  }
  if (groupOrUser.instanceOf('sys_user')) {
    labelCheck = new GlideRecord('label_user_m2m');
    labelCheck.addQuery('user', groupOrUser.sys_id);
  } else {
    labelCheck = new GlideRecord('label_group_m2m');
    labelCheck.addQuery('group', groupOrUser.sys_id);
  }
  labelCheck.addQuery('label', labelRecord.sys_id);
  if (grantedBy !== "undefined") {
    labelCheck.addQuery('granted_by', grantedBy.sys_id);
  }
  labelCheck.query();
  return labelCheck.hasNext();
}
```

GlideRecord - isNewRecord()

Determines whether the current record has been inserted into the database.

This method returns true only if the *newRecord()* method has been called. This method is useful for scripted ACL, and in the condition of UI actions, but should not be used in background scripts.

Note: This method returns true for any new record during a business rule, or if the *newRecord()* method is used to initialize a record with default values and a unique ID (sys_id). In all other cases, it returns false.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the current record is new (has not been inserted into the database.) Possible values: • true: Record is new. • false: Record is not new.

This example checks if the new record has been inserted into the sys_user table.

```
var now_GR = new GlideRecord("sys_user");
now_GR.newRecord();
now_GR.setValue("user_name", "John Smith");
gs.print("Is this a new record: " + now_GR.isNewRecord());

var now_GR2 = new GlideRecord("sys_user");
now_GR2.addQuery("user_name", "Abel Tutor");
now_GR2.query();
now_GR2.next();
gs.print("Is this a new record: " + now_GR2.isNewRecord());
```

GlideRecord - isValid()

Determines if the current GlideRecord table exists.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the table is exists (valid), otherwise false.

This example checks if the Incident table exists.

```
var testTable = new GlideRecord('incident');
gs.print(testTable.isValid());
```

Scoped equivalent

To use the *isValid()* method in a scoped application, use the corresponding scoped method: isValid().

GlideRecord - isValidField(String columnName)

Determines if the specified field is defined in the current GlideRecord table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
columnName	String	Name of a column to check.

Returns

Type	Description
Boolean	True if the field is defined in the table, otherwise false.

This example checks if the sys_class_name field exists in the cmds_software_instance table.

```
var gobj = new GlideRecord('sys_db_object');
gobj.addQuery('name','cmdb_software_instance');
gobj.query();
if (!gobj.next()) {
  var si = new GlideRecord('cmdb_software_instance');
  si.query();
  var count = 0;
  while (si.next()) {
    if (!si.isValidField('sys_class_name')) {
      var ci = new GlideRecord('cmdb_ci');
      ci.name = si.name;
      ci.setNewGuidValue(si.sys_id);
      ci.sys_class_name = 'cmdb_software_instance';
      ci.insert();
      count++;
    }
  }
}
```

Scoped equivalent

To use the *isValidField()* method in a scoped application, use the corresponding scoped method: isValidField().

GlideRecord - isValidRecord()

Determines if the current record is valid.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag indicating whether the current record is valid. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: Record is valid. • false: Past the end of the record set.

This example checks if the record identifier by the passed in sys_id is a valid record in the idea table.

```
function(sysId) {
  this.log('Inside acceptIdea sysId = ' + sysId);
  var now_GR = new GlideRecord('idea');
  now_GR.get(sysId);
  this.log('now_GR.isValidRecord() = ' +
 now_GR.isValidRecord());
  if(now_GR.isValidRecord()) {
    now_GR.setValue('state', 2);
    this.log('Updating gliderecord');
    this.log('gliderecord table name' + now_GR.getTableName());
    now_GR.update();
  }
}
```

Scoped equivalent

To use the *isValidRecord()* method in a scoped application, use the corresponding scoped method: isValidRecord().

GlideRecord - newRecord()

Creates a GlideRecord, sets the default values for the fields, and assigns a unique ID to the record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example checks if the new record has been inserted into the sys_user table.

```
var now_GR = new GlideRecord("sys_user");
now_GR.newRecord();
now_GR.setValue("user_name", "John Smith");
gs.print("Is this a new record: " + now_GR.isNewRecord());

var now_GR2 = new GlideRecord("sys_user");
now_GR2.addQuery("user_name", "Abel Tutor");
now_GR2.query();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
now_GR2.next();
gs.print("Is this a new record: " + now_GR2.isNewRecord());
```

Scoped equivalent

To use the *newRecord()* method in a scoped application, use the corresponding scoped method: newRecord().

GlideRecord - next()

Moves to the next record in the GlideRecord.

Use this method to iterate through the records returned by a GlideRecord query.

Note: This method fails if there is a field in the table called "next". If that is the case, use the method _next().

Note: The `if(myObj.next())` construct only processes the first record returned.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates if there is a "next" record in the GlideRecord. Valid values: • true: Move to the next record was successful. • false: No more records in the result set.

This example shows how to iterate through the Incident table using the *next()* method.

```
var rec = new GlideRecord('incident');
rec.query();
while (rec.next()) {
  gs.print(rec.number + ' exists');
}
```

Scoped equivalent

To use the *next()* method in a scoped application, use the corresponding scoped method: next().

GlideRecord - _next()

Moves to the next record in the GlideRecord. Provides the same functionality as *next()*, intended to be used in cases where the GlideRecord has a column named next.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if there are more records in the query set.

```
var rec = new GlideRecord('sys_template');
rec.query();
while (rec._next()) {
  gs.print(rec.number + ' exists');
}
```

Scoped equivalent

To use the *_next()* method in a scoped application, use the corresponding scoped method: _next().

GlideRecord - operation()

Determines if an operation is insert, update, or delete.

Knowing the operation enables using *current.operation()* to make a generic business rule which can handle each operation uniquely.

For information on using the global variable *current*, refer to Global variables in business rules.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The current operation. Possible values: • delete • insert • update

The following example shows how to use this method in a business rule. The *operation()* method detects which operation triggered an event and performs a different action depending for update and insert operations.

```
if(current.operation() == "update") {
  current.updates ++; }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
if(current.operation() == "insert") {
  current.updates = 0; }
```

This example shows how to use the *operation()* method to pass the operation value into the *startFlow()* method.

```
function createNewTransferOrder() {
  var toGr = new GlideRecord("alm_transfer_order");
  toGr.initialize();
  // From Stockroom - Southern California Warehouse
  toGr.setValue('from_stockroom', fromStockroomSysId);
  // To Stockroom - San Diego North - Pickup/Dropoff
  toGr.setValue('to_stockroom', toStockroomSysId);
  var transferOrder = toGr.insert();

  if(toGr.get(transferOrder)){
  // Start Transfer Order Workflow
  var wf = new Workflow();
  var context = wf.startFlow(toWorkflowSysId, toGr,
 toGr.operation(),{});
    createNewTransferOrderLine(transferOrder);
  }
}
```

Scoped equivalent

To use the *operation()* method in a scoped application, use the corresponding scoped method: operation().

GlideRecord - orderBy(String fieldName)

Specifies a field name, or path to an attribute within a dynamic attribute store, to use to order the query set. To order by multiple fields, call this method multiple times with different field values.

Parameters

Name	Type	Description
fieldName	String	Table field name, or path to an attribute within a dynamic attribute store, on which to order the query set. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table. For more information on dynamic attributes, see Dynamic Schema.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

This example shows how to order the query set by "order" and then by "number".

```
function UpdateProjectWBS(project) {
  var count = 0;
  var child = new GlideRecord('pm_project_task');
  child.addQuery('parent', project.sys_id);
  child.orderBy('order');
  child.orderBy('number');
  child.query();
  var len = child.getRowCount().toString().length;
  var seq = 0;
  while (child.next()) {
    count += UpdateProjectTaskWBS(child, 1, ++seq, len, '');
  }
  gs.addInfoMessage(count + ' Project Tasks updated');
}
```

This example shows how to order the query set by an attribute within a dynamic attribute store.

```
var gr_Inc = new GlideRecord('incident');
gr_Inc.orderBy('attribute_store->caller_id->first_name');
gr_Inc.query();

while(gr_Inc.next()) {
  gs.info("first_name: " +
 gr_Inc.getValue('attribute_store->caller_id->first_name'));
}
```

Output:

```
*** Script: first_name: Alejandro
*** Script: first_name: Bertie
*** Script: first_name: Beth
*** Script: first_name: Bow
*** Script: first_name: Bud
*** Script: first_name: Carol
*** Script: first_name: Charlie
*** Script: first_name: Christen
*** Script: first_name: David
```

Scoped equivalent

To use the *orderBy()* method in a scoped application, use the corresponding scoped method: orderBy().

GlideRecord - orderByDesc(String fieldName)

Specifies the field, or an attribute in a dynamic attribute store, to use to order the query set in descending order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
fieldName	String	Table field name, or path to an attribute within a dynamic attribute store, on which to order the query set in descending order. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table. For more information on dynamic attributes, see Dynamic Schema.

Returns

Type	Description
void	

This example shows how to order the query set in ascending or descending order.

```
function(fiscalType, orderByDesc) {
  var now_GR = new GlideRecord('fiscal_period');
  now_GR.addQuery('fiscal_type', fiscalType);
  if (orderByDesc) {
    now_GR.orderByDesc('fiscal_start_date_time');
  } else {
    now_GR.orderBy('fiscal_start_date_time');
  }
  now_GR.setLimit(1);
  now_GR.query();
  now_GR.next();
  return now_GR.sys_id;
}
```

This example shows how to order the query set by an attribute within a dynamic attribute store.

```
var gr_Inc = new GlideRecord('incident');
gr_Inc.orderByDesc('attribute_store->caller_id->first_name');
gr_Inc.query();

while(gr_Inc.next()) {
  gs.info("first_name: " +
 gr_Inc.getValue('attribute_store->caller_id->first_name'));
}
```

Output:

```
*** Script: first_name: David
*** Script: first_name: Christen
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
*** Script: first_name: Charlie
*** Script: first_name: Carol
*** Script: first_name: Bud
*** Script: first_name: Bow
*** Script: first_name: Beth
*** Script: first_name: Bertie
*** Script: first_name: Alejandro
```

Scoped equivalent

To use the *orderByDesc()* method in a scoped application, use the corresponding scoped method: orderByDesc().

GlideRecord - query(String field, String value)

Runs a query against the table based on the filters specified in the query methods such as *addQuery()* and *addEncodedQuery()*.

This method queries the GlideRecord table as well as any references of the table. For more information, see Querying tables in script.

Note: This method fails if there is a field in the table called "query". If that is the case, use the method _query(). To run queries in a domain-separated instance, use the method queryNoDomain().

See the GlideRecord article for details on building and running queries.

See also:

- GlideAggregate - Global
- GlideQuery()
- GlideQueryCondition - Global

Parameters

Name	Type	Description
name	String	Optional - must also specify a value parameter. Name of the field to search for the value specified in the value parameter. **Note:** This method is typically run without arguments, but you can specify a name-value pair to filter records containing the specified values. If the parameters are specified, the "name=value" condition is added to the query.
value	String	Optional - must also specify a field parameter. Value to search for in the specified field parameter.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to scan the System Dictionary [sys_dictionary] for tables with a query field.

```
var tableArr = [];

var now_GR = new GlideRecord('sys_dictionary');
now_GR.addQuery('element', 'query');
now_GR.setLimit(6);

now_GR.query();

while(now_GR.next()){
   tableArr.push(now_GR.name.getValue());
};

gs.info('The following tables have a field column called
 "query":');

for (i = 0; i < tableArr.length; i++) {
   gs.info(tableArr[i]);
};
```

Output:

```
The following tables have a field column called "query":
cmdb_convert_bulk_services
cmdb_multisource_query_status
cmdb_qb_result_base
cmdb_qb_table_mapping
discovery_probes_cim_query
kb_feedback
```

Scoped equivalent

To use the *query()* method in a scoped application, use the corresponding scoped method: query().

GlideRecord - _query(String field, String value)

Runs a query against the table based on the filters specified in the query methods such as *addQuery()* and *addEncodedQuery()*. This method is intended to be used on tables in which there's a column named "query", which might cause errors running the query() method.

This method queries the GlideRecord table as well as any references of the table. For more information, see Querying tables in script.

See the GlideRecord article for details on building and running queries.

- GlideAggregate - Global
- GlideQuery()
- GlideQueryCondition - Global

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Optional - must also specify a value parameter. Name of the field to search for the value specified in the value parameter. **Note:** This method is typically run without arguments, but you can specify a name-value pair to filter records containing the specified values. If the parameters are specified, the "name=value" condition is added to the query.
value	String	Optional - must also specify a field parameter. Value to search for in the specified field parameter.

Returns

Type	Description
void	

The following example shows how query the Knowledge Feedback [kb_feedback] table and list KB articles with comments that include Excel.

```
var rec = new GlideRecord('kb_feedback');
rec.addQuery('comments', 'CONTAINS', 'Excel');
rec._query();
while (rec.next()) {
 gs.info(rec.getDisplayValue('article') + " comment: " +
 rec.getValue('comments'));
}
```

Output:

```
KB0000005 comment:
      Can you please add the version of Excel this applies to?
 All?

KB0000005 comment:
      Does this work for all Excel versions? OSX and Windows
 alike?
```

Scoped equivalent

To use the *_query()* method in a scoped application, use the corresponding scoped method: _query().

GlideRecord - queryNoDomain(String field, String value)

Used in domain-separated instances. Similar to *query()*, runs the query against the table based on the filters specified by *addQuery()* and *addEncodedQuery()*, but ignores domains.

This method queries the GlideRecord table as well as any references of the table. For more information, see Querying tables in script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Optional - must also specify a value parameter. Name of the field to search for the value specified in the value parameter. **Note:** This method is typically run without arguments, but you can specify a name-value pair to filter records containing the specified values. If the parameters are specified, the "name=value" condition is added to the query.
value	String	Optional - must also specify a field parameter. Value to search for in the specified field parameter.

Returns

Type	Description
void	

This example shows how to query the incident table for all domains.

```
var rec = new GlideRecord('incident');
rec.queryNoDomain();
while (rec.next()) {
 gs.print(rec.number + ' exists');
}
```

GlideRecord - restoreLocation()

Sets the current record to be the record that was saved with *saveLocation()*. If *saveLocation()* has not been called, the current record is set to the first record of the GlideRecord.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example shows how save the current record location, move to the next record, and then return back to the saved location.

```
function() {
  var now_GR = new GlideRecord("incident");
  now_GR.query();
  now_GR.next();
  var firstID = now_GR.getValue("sys_id");
  now_GR.next();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  var restoreID = now_GR.getValue("sys_id");
  now_GR.saveLocation();
  now_GR.next();
  var lastID = now_GR.getValue("sys_id");
  now_GR.restoreLocation();
  now_GR.next();
  var thisID = now_GR.getValue("sys_id");
  var progress = "first id=" + firstID
    + "\n\t last id=" + lastID
    + "\n\t saved id=" + restoreID
    + "\n\t restored id=" + thisID;
  gs.print("Progress:\n\t" + progress);
}
```

GlideRecord - saveLocation()

Saves the current row number so you can return to this location using the *restoreLocation()* method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example shows how save the current record location, move to the next record, and then return back to the saved location.

```
function() {
  var now_GR = new GlideRecord("incident");
  now_GR.query();
  now_GR.next();
  var firstID = now_GR.getValue("sys_id");
  now_GR.next();
  var restoreID = now_GR.getValue("sys_id");
  now_GR.saveLocation();
  now_GR.next();
  var lastID = now_GR.getValue("sys_id");
  now_GR.restoreLocation();
  now_GR.next();
  var thisID = now_GR.getValue("sys_id");
  var progress = "first id=" + firstID
    + "\n\t last id=" + lastID
    + "\n\t saved id=" + restoreID
    + "\n\t restored id=" + thisID;
  gs.print("Progress:\n\t" + progress);
}
```

GlideRecord - setAbortAction(Boolean b)

Sets a flag to indicate if the next database action (insert, update, delete) is to be aborted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use in an `onBefore` business rule to prevent the database action from being done. The business rule continues to run after *`setAbortAction()`* is called. Calling *`setAbortAction()`* does not stop subsequent business rules from executing. Calling this method only prevents the database action from occurring.

Parameters

Name	Type	Description
b	Boolean	True to abort next action, or false to allow the next action.

Returns

Type	Description
void	

```
if ((!current.u_date1.nil()) && (!current.u_date2.nil())) {
  var start =
 current.u_date1.getGlideObject().getNumericValue();
  var end = current.u_date2.getGlideObject().getNumericValue();
  if (start > end) {
    gs.addInfoMessage('start must be before end');
    current.u_date1.setError('start must be before end');
    current.setAbortAction(true);
  }
}
```

Scoped equivalent

To use the *`setAbortAction()`* method in a scoped application, use the corresponding scoped method: setAbortAction().

GlideRecord - setDisplayValue(String name, Object value)

Sets a specified field, or an attribute in a dynamic attribute store, to a specified display value.

For a reference field, this is the display value for the table. For a date/time, this is the time in the caller's current time zone.

Parameters

Name	Type	Description
name	String	Name of the field whose value you want to set or the path to an attribute within a dynamic attribute store. Format of the dynamic path: `dyn_att_field->group_name->attribute_name` • `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
value	Object	Value to set in the specified attribute. **Note:** For dynamic attributes, only the following data types are supported: • Boolean (True/False) • Decimal • Floating Point Number • GlideDate • GlideDateTime • Integer • String

Returns

Type	Description
void	

The following code example shows how to set a display value in a record and then update the record.

```
var now_GR = new GlideRecord('incident');
now_GR.get('46f09e75a9fe198100f4ffd8d366d17b');
now_GR.setDisplayValue('opened_at','2011-02-13 4:30:00');
now_GR.update();
```

The following code example shows how to set a display value in a dynamic attribute store.

```
var gr_AppTab = new GlideRecord('application_table');
gr_AppTab.setValue('dyn_att_field->group->attr', 42);
gr_AppTab.setDisplayValue('dyn_att_field->group->attr2, true);
gr_AppTab.update();
gs.info('Attr value: ' +
gr_AppTab.getDisplayValue('dyn_att_field->group->attr);
gs.info('Attr2 value: ' +
gr_AppTab.getDisplayValue('dyn_att_field->group->attr2);
```

GlideRecord - setDynamicAttributeValue(String fullPath, Object value)

Sets the value of the dynamic attribute located at a specified path.

Parameters

Name	Type	Description
fullPath	String	Path to use to locate the desired dynamic attribute. Format of the dynamic path: `dyn_att_field->group_name->attribute_name`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table.
value	Object	Value to set the specified dynamic attribute to. The passed value must be of one of the following data types: • Boolean (True/False) • Decimal • Floating Point Number • GlideDate • GlideDateTime • Integer • String

Returns

Type	Description
Boolean	Flag that indicates whether the dynamic attribute was successfully updated. Possible values: • true: Dynamic attribute was successfully updated. • false: Error occurred. Dynamic attribute wasn't updated. Verify that the *fullPath* parameter contains a valid path to the desired attribute.

The following code example shows how to call this method.

```
var gr_Inc = new GlideRecord('incident');
gr_Inc.setValue('inc_dynamic_groups',
 '78db044fc4b44210f8770961513dd7fe'); //Sysid of cars dimensions
 group
gr_Inc.setDynamicAttributeValue("inc_dynamic_schema->cars->color
","black");
gr_Inc.setDynamicAttributeValue("inc_dynamic_schema->cars->make"
,"Honda");
gr_Inc.setDynamicAttributeValue("inc_dynamic_schema->cars->model
","CRV");
gr_Inc.setDynamicAttributeValue("inc_dynamic_schema->cars->luxur
y",false);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gr_Inc.setDynamicAttributeValue("inc_dynamic_schema->cars->cost"
,20000);
gr_Inc.setDynamicAttributeValue("inc_dynamic_schema->cars->avg_m
pg",28.4);
gr_Inc.setDynamicAttributeValue("inc_dynamic_schema->cars->date_
purchased", new GlideDateTime());
gr_Inc.setValue("inc_dynamic_schema->cars->total_miles",
 10000.12345);
gr_Inc.insert();
```

GlideRecord - setDynamicAttributeValue(String dynamicAttributeField, String groupAttrPath, Object value)

Sets the value of the dynamic attribute located in a specified field of the current GlideRecord and a specified attribute path.

Parameters

Name	Type	Description
dynamicAttributeField	String	Name of the field in the table that contains the dynamic attribute.
attributePath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`
value	Object	Value to set the specified dynamic attribute to. The passed value must be of one of the following data types: • Boolean (True/False) • Decimal • Floating Point Number • GlideDate • GlideDateTime • Integer • String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the dynamic attribute was successfully updated. Possible values: • true: Dynamic attribute was successfully updated. • false: Error occurred. Dynamic attribute wasn't updated. Verify that the *dynamicAttributeField* and *groupAttrPath* parameters contain valid data.

The following code example shows how to call this method.

```
// Update the value of the attribute
 'attribute_store->car->time_of_purchase' incident `INC0009009`
 to a timestamp (in UTC)
var gr1 = new GlideRecord('incident');
gr1.get('number', 'INC0009009');
gr1.setDynamicAttributeValue('attribute_store',
 'car->time_of_purchase', '2020-05-13 13:52:44');
gr1.update();

// Then retrieve the value of the attribute on the same record
var gr2 = new GlideRecord('incident');
gr2.get('number', 'INC0009009');
gs.info("Time of Purchase Value        (UTC): " +
 gr2.getDynamicAttributeValue('attribute_store',
 'car->time_of_purchase'));
gs.info("Time of Purchase DisplayValue (PST): " +
 gr2.getDynamicAttributeDisplayValue('attribute_store',
 'car->time_of_purchase'));
```

Output:

```
*** Script: Time of Purchase Value        (UTC): 2020-05-13
 13:52:44
*** Script: Time of Purchase DisplayValue (PST): 2020-05-13
 06:52:44
```

GlideRecord - setDynamicAttributeDisplayValue(String fullPath, Object value)

Sets the display value of the dynamic attribute located at a specified path.

Parameters

Name	Type	Description
fullPath	String	Path to use to locate the dynamic attribute whose display value you want to update. Format of the dynamic path: `dyn_att_field->group_name->attribute_name`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table.
value	Object	Display value to set the specified dynamic attribute to. The passed value must be of one of the following data types: • Boolean (True/False) • Decimal • Floating Point Number • GlideDate • GlideDateTime • Integer • String

Returns

Type	Description
Boolean	Flag that indicates whether the display value of the dynamic attribute was successfully updated. Possible values: • true: Display value of the dynamic attribute was successfully updated. • false: Error occurred. Display value of the dynamic attribute wasn't updated. Verify that the *fullPath* parameter contains a valid path to the desired attribute.

The following code example shows how to call this method.

```
var grProdTab = new GlideRecord('products_table');
grProdTab.query();
grProdTab.next();
var val =
 grProdTab.setDynamicAttributeDisplayValue('product_details->ca
rs->date_purchased', '2023-03-31 08:54:26');
```

GlideRecord - setDynamicAttributeDisplayValue(String dynamicAttributeField, String groupAttrPath, Object value)

Sets the display value of the dynamic attribute located in a specified field of the current GlideRecord and a specified attribute path.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
dynamicAttributeField	String	Name of the field in the table that contains the dynamic attribute.
groupAttrPath	String	Attribute path to use to locate the associated dynamic schema attribute. Format: `"group_name->attr_name"` • `group_name`: Name of the group that the attribute is associated with. Located in the Name field of the Dynamic Attribute Group [dynamic_attribute_group] table or the Group field of the Dynamic Attribute [dynamic_attribute] table. • `attr_name`: Name of the dynamic attribute within the dynamic group. Located in the Name field of the Dynamic Attribute [dynamic_attribute] table. For example: `"car->color"`
value	Object	Display value to set the specified dynamic attribute to. The passed value must be of one of the following data types: • Boolean (True/False) • Decimal • Floating Point Number • GlideDate • GlideDateTime • Integer • String

Returns

Type	Description
Boolean	Flag that indicates whether the display value of the dynamic attribute was successfully updated. Possible values: • true: Display value of the dynamic attribute was successfully updated. • false: Error occurred. Display value of the dynamic attribute wasn't updated. Verify that the *dynamicAttributeField* and *groupAttrPath* parameters contain valid data.

The following code example shows how to call this method.

```
var grProdTab = new GlideRecord('products_table');
grProdTab.query();
grProdTab.next();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var val =
 grProdTab.setDynamicAttributeDisplayValue('product_details',
 'cars->date_purchased', '2023-03-31 08:54:26');
```

GlideRecord - setDynamicAttributeValues(String dynamicAttributeField, GlideDynamicAttributeStore values)

Sets one or more dynamic attribute values with values specified in the passed GlideDynamicAttributeStore object.

This method only updates the attributes and values passed in as arguments. Attributes and values on the GlideRecord that aren't specified are unaffected by this call. Any invalid groups, attributes, or values are ignored. Check the log messages for possible error information.

Parameters

Name	Type	Description
dynamicAttributeField	String	Name of the field in the current table that contains the dynamic schema.
values	GlideDynamicAttributeStore	GlideDynamicAttributeStore object that contains the dynamic attributes to update. The values populated in the object must be of the following data types: • Boolean (True/False) • Decimal • Floating Point Number • GlideDate • GlideDateTime • Integer • String

Returns

Type	Description
None	

The following code example shows how to call this method.

```
var das = new GlideDynamicAttributeStore();
das.setDynamicAttributeValue('group->attribute1', 'Apple');
das.setDynamicAttributeValue('group->attribute2', 1234);

var gr_Inc = new GlideRecord('incident');
gr_Inc.query();
gr_Inc.next();
gr_Inc.setDynamicAttributeValues(das);
```

GlideRecord - setForceUpdate(Boolean force)

Updates the record even if fields have not changed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
force	Boolean	True to update even if fields have not changed, otherwise false.

Returns

Type	Description
void	

This example shows how to force a record in the itfm_cost_model table to update even without changes.

```
function() {
  gs.log("Update Script: Upgrade_cost_model_data.js started");
  var now_GR = new GlideRecord("itfm_cost_model");
  now_GR.initialize();
  now_GR.addNullQuery("source_table");
  now_GR.query();
  while (now_GR.next()) {
    now_GR.setForceUpdate(true);
    var sourceTable =
 getSourceTable(now_GR.getValue('clone_from'));
    if(sourceTable){
      now_GR.setValue("source_table", sourceTable);
      now_GR.setWorkflow(false);
      now_GR.update();
    }
  }
}
```

GlideRecord - setLimit(Number limit)

Sets the maximum number of records to return in the GlideRecord from a query.

Using setLimit() with chooseWindow()

The `setLimit()` method implicitly calls the `chooseWindow()` method and might cause unexpected results when used with `chooseWindow()` in a query.

- If the `chooseWindow()` method is called first, its record window is overwritten by the `setLimit()` method.

  Using the following lines in a query returns 100 records starting at row 1:

  ```
  grIncident.chooseWindow(20,30);
  grIncident.setLimit(100);
  ```

- If the `setLimit()` method is called first, the window set by `chooseWindow()` is used and the limit is overwritten.

  Using the following lines in a query returns 10 records starting at row 21:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
grIncident.setLimit(5);
grIncident.chooseWindow(20,30);
```

Note: Running *query()* with the *chooseWindow()* method triggers a COUNT(*) query, which can result in slow performance on tables with a large number of records. You can use *setLimit()* before *chooseWindow()* to skip running the COUNT(*) query, but the same performance benefit is achievable using *setNoCount()*.

See also:

- chooseWindow()
- query()
- setNoCount()

Parameters

Name	Type	Description
limit	Number	Limit for records to fetch.

Returns

Type	Description
void	

This example sets the number of records returned in the query to a maximum of ten.

```
var now_GR = new GlideRecord('incident');
now_GR.orderByDesc('sys_created_on');
now_GR.setLimit(10);
now_GR.query();
```

Scoped equivalent

To use the *setLimit()* method in a scoped application, use the corresponding scoped method: setLimit().

GlideRecord - setLocation(Number rowNumber)

Sets the current row location to the specified value.

Parameters

Name	Type	Description
rowNumber	Number	Row number to set as the current row.

Returns

Type	Description
void	

This example shows how to set the record position in the Incident table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
verifySetLocation : function() {
  var now_GR = new GlideRecord("incident");
  now_GR.query();
  var recordIDs = new Array();
  while(now_GR.next()) {
  recordIDs.push(now_GR.getValue("sys_id"));
  }
  for (var ix = recordIDs.length - 1; ix >= 0; ix--) {
    now_GR.setLocation(ix);
    Assert.assertEquals(recordIDs[ix],
 now_GR.getValue("sys_id"),
      "The entry retrieved for the index " + ix + " is not
 valid");
  }
}
```

GlideRecord - setNewGuid()

Generates a new GUID and sets it as the unique ID (sys_id) for the current record.

This function applies only to new records. You cannot change the GUID for an existing record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the current record.

This example creates a new task record and stores the ID in the task_rel_task table.

```
var task = new GlideRecord ('task');
var tsk_id = task.setNewGuid();

task.description = "Request: " + current.request.number;
task.description = task.description + "\n" + "Requested by: " +
 current.request.u_requested_by.name;
task.description = task.description + "\n" + "Requested for: " +
 current.request.u_requested_for.name;
task.description = task.description + "\n" + "Item: " +
 current.cat_item.name;

var now_GR = new GlideRecord ('task_rel_task');
//link the incident to the request
now_GR.parent = current.request;
now_GR.child = tsk_id;
now_GR.insert();
```

GlideRecord - setNewGuidValue (String guid)

Generates a new GUID and sets it as the unique ID for the current record, when inserting a new record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
guid	String	Value for the new GUID.

Returns

Type	Description
void	

This example generates a new GUID and sets it as the unique ID for the newly created cmdb_software_instance record.

```
var gobj = new GlideRecord('sys_db_object');
gobj.addQuery('name','cmdb_software_instance');
gobj.query();
if (!gobj.next()) {
  var si = new GlideRecord('cmdb_software_instance');
  si.query();
  var count = 0;
  while (si.next()) {
  if (!si.isValidField('sys_class_name')) {
    var ci = new GlideRecord('cmdb_ci');
    ci.name = si.name;
    ci.setNewGuidValue(si.sys_id);
    ci.sys_class_name = 'cmdb_software_instance';
    ci.insert();
    count++;
  }
}
```

Scoped equivalent

To use the *setNewGuidValue()* method in a scoped application, use the corresponding scoped method: setNewGuidValue().

GlideRecord - setNoCount()

Stops a GlideRecord query from running a COUNT(*) query.

Running *query()* with some methods trigger a COUNT(*) query, such as the *chooseWindow()* and *getRowCount()* methods. The COUNT(*) query might cause slow performance on tables with a million or more records. For more information, see the Performance Improvement - Remove Pagination Count [KB0817996] article in the Now Support Knowledge Base.

Note: The *setLimit()* method also stops a COUNT(*). Using *setNoCount()* is unnecessary if the *setLimit()* method is included in the query.

See also:

- chooseWindow()
- query()

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

The following code example shows how to use *setNoCount()* to skip the COUNT(*) query on a windowed query set using the *chooseWindow()* method.

```
var  grIncident = new GlideRecord('incident');

grIncident.chooseWindow(6915, 6920, true);
grIncident.setNoCount();
grIncident.query();

while (grIncident.next()) { // Iterate through the returned
 records
    gs.info('Incident Number: ' + grIncident.number + ', Short
 Description: ' + grIncident.short_description);
};
```

Output:

```
Incident Number: INC0006811, Short Description: Request an
 account to be created for Fidelity 401(k) Plans
Incident Number: INC0006918, Short Description: Please grant me
 additional roles in Oracle Fin Collections
Incident Number: INC0006812, Short Description: Taxware
 Value-added Tax crashes when I try to launch it
Incident Number: INC0006919, Short Description: Unable to Access
 SuccessFactors Learning
Incident Number: INC0010004, Short Description: Incident for
 assessment not generating
```

Scoped equivalent

To use the *setNoCount()* method in a scoped application, use the corresponding scoped method: setNoCount().

GlideRecord - setQueryReferences(Boolean queryReferences)

Enables or disables using the reference field's display name when querying a reference field.

Parameters

Name	Type	Description
queryReferences	Boolean	Flag indicating what time of data to generate. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• true: Generate a string of display names. • false: Generate a string of sys_ids.

Returns

Type	Description
void	

```
var grByName = new GlideRecord(this.TEST_TABLE);
grByName.addQuery("caller_id", userDisplayName);
grByName.setQueryReferences(true);
grByName.query();
if (grByName.hasNext()) {
  while(grByName.next()) {
    gs.print("Incident caller_id=" + grByName.caller_id);
  }
} else {
  gs.print("NO RESULTS");
}
```

GlideRecord - setUseEngines(Boolean e)

Disables or enables the running of any engines (approval rules / assignment rules).

Warning: Disabling the running of engines can have a significant impact on your ServiceNow® instance and how it operates. Ensure that you thoroughly test this change before deploying it to production.

Parameters

Name	Type	Description
e	Boolean	Flag that indicates whether to enable or disable the running of any engines. Valid values: • true: Enable engines • false: Disable engines

Returns

Type	Description
void	

This example shows how to disable engines and business rules before executing a query.

```
function auditOAuthInboundRequestsUsage(){
  var now_GR = new GlideRecord("oauth_credential");
  var oauthClient = now_GR.addJoinQuery("oauth_entity", "peer",
 "sys_id");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  now_GR.addQuery("type", "access_token");
  now_GR.addQuery("expires", ">", nowDateTime());
  now_GR.addNullQuery("oauth_requestor_profile");
  oauthClient.addCondition("active", "true");
  oauthClient.addCondition("type", "client");
  now_GR.setUseEngines(false);
  now_GR.setWorkflow(false);
  now_GR.query();
  return now_GR.hasNext();
}
```

GlideRecord - setValue(String name, Object value)

Sets the specified field, or an attribute in a dynamic attribute store, to a specified value.

Normally a script would do a direct assignment, for example `now_GR.category = value`. However, if in a script the element name is a variable, then you can use `now_GR.setValue(elementName, value)`. When setting a value, ensure that the data type of the field matches the data type of the value you enter.

If the value parameter is null, the record isn't updated, and an error isn't thrown.

Note: This method can't be used on journal fields. Use GlideElement.setJournalEntry() instead.

Note: If the Column Level Encryption Enterprise plugin is enabled and the instance has access to the key, this method can insert encrypted data into encrypted fields. If the instance does not have access to the key, this method returns an error. For more information, see Platform Encryption.

Not for authentication with password2 fields

The *`setValue()`* method passes password2 data as clear text, which results in an error about expecting encrypted data. Additionally, using the setValue() method for password2 fields exposes data that should be encrypted.

For password2 authentication, use the *`setDisplayValue()`* method instead.

See also:

- Deprecate GlideEncrypter usage of 3DES for password2 fields
- Alternatives to GlideEncrypter usage in knowledge base article KB1320986
- Password2 encryption with the Key Management Framework (KMF)

Parameters

Name	Type	Description
name	String	Name of the field whose value you want to set or the path to an attribute within a dynamic attribute store. Format of the dynamic path: `dyn_att_field->group_name->attribute_name`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• `dyn_att_field`: Name of a dynamic attribute store field on the table. • `group_name`: Name of the group that the attribute is associated with. Located in the group_name field of the Dynamic Attribute Group [dynamic_attribute_group] table. • `attr_name`: Name of the dynamic attribute. Located in the attribute field of the Dynamic Attribute [dynamic_attribute] table. For more information on dynamic attributes, see Dynamic Schema.
value	Object	Value to set in the specified field. **Note:** For a dynamic attribute, only the following data types are supported: • Boolean (True/False) • Decimal • Floating Point Number • GlideDate • GlideDateTime • Integer • String

Returns

Type	Description
None	

This example shows how to set the value of the state field in the planned_task table.

```
function() {
  var topTask = new GlideRecord('planned_task');
  topTask.setValue('state', -5);
  var childTask = new GlideRecord('planned_task');
  childTask.setValue('state', -5);
  var s = new PlannedTaskStateManagement(childTask, topTask);
  var state = s.manageStateChange(false);
  Assert.assertEquals("-5", state);
}
```

This example shows how to set the value of a dynamic attribute.

```
var gr_Inc = new GlideRecord('incident');
gr_Inc.setValue('inc_dynamic_groups',
 '78db044fc4b44210f8770961513dd7fe'); //Sysid of cars dimensions
 group
gr_Inc.setValue("inc_dynamic_schema->cars->color", "black");
gr_Inc.setValue("inc_dynamic_schema->cars->make", "Honda");
gr_Inc.setValue("inc_dynamic_schema->cars->model", "CRV");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gr_Inc.setValue("inc_dynamic_schema->cars->luxury", false);
gr_Inc.setValue("inc_dynamic_schema->cars->cost", 25000);
gr_Inc.setValue("inc_dynamic_schema->cars->avg_mpg", 28.4);
gr_Inc.setValue("inc_dynamic_schema->cars->date_purchased", new
 GlideDateTime());
gr_Inc.setValue("inc_dynamic_schema->cars->total_miles",
 10000.12345);
gr_Inc.insert();
```

Scoped equivalent

To use the *setValue()* method in a scoped application, use the corresponding scoped method: setValue().

GlideRecord - setWorkflow(Boolean e)

Enables or disables the running of business rules that might normally be triggered by subsequent actions. If the *e* parameter is set to false, an insert/update will not be audited. Auditing only happens when the parameter is set to true for a GlideRecord operation.

Note: The *setWorkflow()* method is ignored when subsequently using either the *deleteProblem()* or *deleteMultiple()* methods to cascade delete.

Warning: Disabling the running of business rules can have a significant impact on your ServiceNow® instance and how it operates. Ensure that you thoroughly test this change before deploying it to production.

Parameters

Name	Type	Description
e	Boolean	Flag that indicates whether to enable or disable the running of business rules. Valid values: • true: Enable business rules • false: Disable business rules

Returns

Type	Description
void	

```
doit('name1','name2');

function doit(username1,username2) {

  var usr1 = new GlideRecord('sys_user');
  var usr2 = new GlideRecord('sys_user');
  var num = 0;

  if (usr1.get('user_name',username1) &&
 usr2.get('user_name',username2)) {
    var ref;
    var dict = new GlideRecord('sys_dictionary');
    dict.addQuery('reference','sys_user');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    dict.addQuery('internal_type','reference');
    dict.query();
    while (dict.next()) {
      num = 0;
      ref = new GlideRecord(dict.name.toString());
      ref.addQuery(dict.element,usr1.sys_id);
      ref.query();
      while (ref.next()) {
        ref.setValue(dict.element.toString(),usr2.sys_id);
        ref.setWorkflow(false);
        ref.update();
        num++;
      }
      if (num > 0) {
        gs.print(dict.element + ' changed from ' +
 usr1.user_name +
          ' to ' + usr2.user_name + ' in ' + num + ' ' +
 dict.name + ' records');
      }
    }
  }
}
```

Scoped equivalent

To use the *setWorkflow()* method in a scoped application, use the corresponding scoped method: setWorkflow().

GlideRecord - update(Object reason)

Updates the GlideRecord with any changes that have been made. If the record does not exist, it is inserted.

Parameters

Name	Type	Description
reason	Object	Optional. Reason for the update. The reason appears in the audit record.

Returns

Type	Description
String	The sys_id of the new or update record. Returns null if the update fails.

This example updates a record in the task_ci table.

```
var now_GR = new GlideRecord('task_ci');
now_GR.addQuery();
now_GR.query();
var count = now_GR.getRowCount();
if (count > 0) {
   var allocation = parseInt(10000 / count) / 100;
   while (now_GR.next()) {
      now_GR.u_allocation = allocation;
      now_GR.update();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
}
```

Scoped equivalent

To use the *update()* method in a scoped application, use the corresponding scoped method: update().

GlideRecord - updateMultiple()

Updates each GlideRecord in a stated query with a specified set of changes.

For information on adding journal entries, refer to the setJournalEntry() method.

The *glide.db.forced.chunk.threshold* system property sets the threshold above which forces chunk record deletions and updates. Chunking helps to prevent non-primary key deletions on huge tables from causing replication problems. For more information, see Available system properties.

Note: To ensure expected results, use the *setValue()* method instead of direct assignments. That is, use `gr_Now.setValue('<field_name>', '4'));` instead of `gr_Now.<field_name> = 4`.

Note: Do not use this method with the *chooseWindow()* or *setLimit()* methods when working with large tables.

This method sets new values and does not clear existing values. To clear an existing value, use the *setValue()* method and set the field to 'NULL'. For more information, see Setting a GlideRecord variable to 'NULL'.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

This example shows how to update the state of all active incidents to 4 - "Awaiting User Info".

```
var now_GR = new GlideRecord('incident');
now_GR.addQuery('active', true);
now_GR.setValue('state',  4);
now_GR.updateMultiple();
```

This example shows how to clear existing values of the description field for priority 1 incidents.

```
var test = new GlideRecord('incident');
test.addEncodedQuery('priority=1');
test.query();

test.setValue('description','NULL');
test.updateMultiple();
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the `updateMultiple()` method in a scoped application, use the corresponding scoped method: updateMultiple().

GlideRecord - updateWithReferences(Object reason)

Updates a record and also inserts or updates any related records with the information provided.

Parameters

Name	Type	Description
reason	Object	Reason for the updates. The reason is displayed in the audit record.

Returns

Type	Description
String	The sys_id for the record being updated.

If processing an incident where the Caller ID is set to reference sys_user record 'John Doe,' then the following code would update John Doe's user record. If processing an incident where there's no caller ID specified, then the following code creates a new sys_user record with the provided information (first_name, last_name) and sets the caller ID value to the newly created sys_user record.

```
var inc = new GlideRecord('incident');
inc.get(inc_sys_id);  // Looking up an existing incident record
 where 'inc_sys_id' represents the sys_id of a incident record
inc.caller_id.first_name = 'John';
inc.caller_id.last_name = 'Doe';
inc.updateWithReferences();
}
```

GlideRecord - Scoped

The scoped `GlideRecord` API is used for database operations.

The `GlideRecord` API is the primary means of interfacing with the database on the server-side code. A GlideRecord is an object that contains records from a single table. Use the API to instantiate a GlideRecord object and add query parameters, filters, limits, and ordering.

See the GlideRecord article for details on building and running queries.

For information on a class that performs the same functions as `GlideRecord` and enforces ACLs, see Using GlideRecordSecure.

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an `insert()`, `update()`, `deleteRecord()`, or `deleteMultiple()` method on bad query results can result in data loss.

You can set the `glide.invalid_query.returns_no_rows` system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when `glide.invalid_query.returns_no_rows` is set to true. This happens in queries where an invalid query term is used with a WHERE

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

Retrieve values from records

In most cases, don't use dot-walking to get values from a record. Dot-walking retrieves the entire object instead of the field value. Retrieving the object uses more storage and might cause undesirable results when used in arrays or in Service Portal.

Instead of retrieving the entire object, you can use one of the following methods to copy the field values:

- getValue()
- getDisplayValue()

If dot-walking through a GlideElement object is necessary, use the *toString()* method to retrieve values. For example, you might need the current caller's manager sys_id to set another reference field. The following example shows how to get the string value instead of the entire object:

```
var mgr = current.caller_id.manager.toString();
```

See also:

- GlideAggregate
- GlideElement
- GlideQuery

Scoped GlideRecord - addActiveQuery()

Adds a filter to return active records.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideQueryCondition	Filter to return active records.

```
var inc = new GlideRecord('incident');
inc.addActiveQuery();
inc.query();
```

Scoped GlideRecord - addEncodedQuery(String query, Boolean enforceFieldACL)

Adds an encoded query to other queries that may have been set.

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

return all records from the table. Using an *insert()*, *update()*, *deleteRecord()*, or *deleteMultiple()* method on bad query results can result in data loss.

You can set the *glide.invalid_query.returns_no_rows* system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when *glide.invalid_query.returns_no_rows* is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

Parameters

Name	Type	Description
query	String	An encoded query string.
enforceFieldACL	Boolean	Optional. Flag that indicates whether to enforce field ACL (Access Control List) rules. Valid values: • true: Enforce field ACLs. • false: Don't enforce field ACLs. Default: false

Returns

Type	Description
void	

```
var queryString = "priority=1^ORpriority=2";
var now_GR = new GlideRecord('incident');
now_GR.addEncodedQuery(queryString);
now_GR.query();
while (now_GR.next()) {
  gs.addInfoMessage(now_GR.getValue('number'));
}
```

Scoped GlideRecord - addFunction(Object function)

Applies a pre-defined GlideDBFunctionBuilder object to a record.

Use the *GlideDBFunctionBuilder* scoped class to define a function. After the function is defined, use the *addFunction(Object function)* method to apply the function to a record.

Parameters

Name	Type	Description
function	Object	GlideDBFunctionBuilder object that defines a SQL operation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var functionBuilder = new GlideDBFunctionBuilder();
var myAddingFunction = functionBuilder.add();
myAddingFunction = functionBuilder.field('order');
myAddingFunction = functionBuilder.field('priority');
myAddingFunction = functionBuilder.build();

// Query incidents in which order + priority is less than 5 and
 display that added value
var now_GR = new GlideRecord('incident');
now_GR.addFunction(myAddingFunction);
now_GR.addQuery(myAddingFunction, '<', 5);
now_GR.query();
while(now_GR.next())
  gs.info(now_GR.getValue(myAddingFunction));
```

Output:

```
1
4
3
1
1
2
1
```

Scoped GlideRecord – addJoinQuery(String joinTable, String primaryField, String joinTableField)

Adds a filter to return records based on a relationship in a table related to the current GlideRecord.

You can use this method to find all the users that are in the database group via the Group Member [sys_user_grmember] table, or to find all problems that have an assigned incident via the incident.problem_id relationship.

This is not a true database join; rather, *`addJoinQuery()`* adds a subquery. So, while the result set is limited based on the join, the only fields that you have access to are those on the base table (those which are in the table with which the GlideRecord was initialized.)

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an *`insert()`*, *`update()`*, *`deleteRecord()`*, or *`deleteMultiple()`* method on bad query results can result in data loss.

You can set the *`glide.invalid_query.returns_no_rows`* system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when *`glide.invalid_query.returns_no_rows`* is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

Parameters

Name	Type	Description
joinTable	String	Name of table to use in the join, such as *'incident'*.
primaryField	String	Optional. Name of the field in the GlideRecord to use to join the field specified in the *joinTableField* parameter. Default: sys_id
joinTableField	String	Optional. Name of the field in the table specified in *joinTable* to use to join the tables. Default: First field in the table specified in *joinTable* that is a reference field to the current GlideRecord table.

Returns

Type	Description
GlideQueryCondition	Filter that lists records where the relationships match.

Find problems that have an incident attached. This example returns problems that have associated incidents. However, it won't pull values from the incidents that are returned as a part of the query.

```
var prob = new GlideRecord('problem');
prob.addJoinQuery('incident');
prob.query();
```

Find inactive problems with associated incidents.

```
// Look for Problem records that have associated Incident
 records
var now_GR = new GlideRecord('problem');
var grSQ = now_GR.addJoinQuery('incident');

// Where the Problem records are "active=false"
now_GR.addQuery('active', 'false');

// And the Incident records are "active=true"
grSQ.addCondition('active', 'true');

// Query
now_GR.query();

// Iterate and output results
while (now_GR.next()) {
gs.info(now_GR.getValue('number'));
}
```

Find problems that have incidents associated where the incident *caller_id* field value matches that of the problem *opened_by* field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var now_GR = new GlideRecord('problem');
        now_GR.addJoinQuery('incident', 'opened_by',
 'caller_id');
        now_GR.query();
```

Scoped GlideRecord - addNotNullQuery(String fieldName)

A filter that specifies records where the value of the field passed in the parameter is not null.

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an *insert()*, *update()*, *deleteRecord()*, or *deleteMultiple()* method on bad query results can result in data loss.

You can set the *glide.invalid_query.returns_no_rows* system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when *glide.invalid_query.returns_no_rows* is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

Parameters

Name	Type	Description
fieldName	String	The name of the field to be checked.

Returns

Type	Description
GlideQueryCondition	A filter that specifies records where the value of the field passed in the parameter is not null.

```
var target = new GlideRecord('incident');
target.addNotNullQuery('short_description');
target.query();   // Issue the query to the database to get all
 records where short_description is not null
while (target.next()) {
    // add code here to process the incident record
}
```

Scoped GlideRecord - addNullQuery(String fieldName)

Adds a filter to return records where the value of the specified field is null.

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an *insert()*, *update()*, *deleteRecord()*, or *deleteMultiple()* method on bad query results can result in data loss.

You can set the *glide.invalid_query.returns_no_rows* system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

return records in API results even when *glide.invalid_query.returns_no_rows* is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

Parameters

Name	Type	Description
fieldName	String	The name of the field to be checked.

Returns

Type	Description
GlideQueryCondition	The query condition added to the GlideRecord.

```
var target = new GlideRecord('incident');
target.addNullQuery('short_description');
target.query();   // Issue the query to the database to get all
 records where short_description is null
while (target.next()) {
   // add code here to process the incident record
}
```

Scoped GlideRecord - addQuery(String query)

Adds a filter to return records using an encoded query string.

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an *insert()*, *update()*, *deleteRecord()*, or *deleteMultiple()* method on bad query results can result in data loss.

You can set the *glide.invalid_query.returns_no_rows* system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when *glide.invalid_query.returns_no_rows* is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

Parameters

Name	Type	Description
query	String	An encoded query string.

Returns

Type	Description
GlideQueryCondition	The query condition added to the GlideRecord.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var rec = new GlideRecord('incident');
rec.addQuery('active=true');
rec.query();
while (rec.next()) {
  rec.setValue('active', false);
  gs.info('Active incident ' + rec.getValue('number') + '
 closed');
  rec.update();
}
```

Scoped GlideRecord - addQuery(String name, Object value)

Build a search query and return the rows that match the request.

If you are familiar with SQL, this method is similar to the "where" clause. One or more *addQuery()* calls can be made in a single query; in this case the queries are AND'ed. If any of the query statements need to be OR'ed, use the *GlideQueryCondition* method addOrCondition().

When *addQuery()* is called with only two parameters, table name and comparison value, such as `myObj.addQuery('category','Hardware');`, the operator is assumed to be "equal to".

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an *insert()*, *update()*, *deleteRecord()*, or *deleteMultiple()* method on bad query results can result in data loss.

You can set the *glide.invalid_query.returns_no_rows* system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when *glide.invalid_query.returns_no_rows* is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

Parameters

Name	Type	Description
name	String	Name of the table field to query, or one of the following reserved names: • 123TEXTQUERY321: Adds a string search term to the query. Specify the string you want to match as the value. Use this option to return records with field values containing the search string. This option searches against all fields in the table, which must be configured for indexing and search. For more information about configuring tables for indexing and search, see Configure a single table for indexing and searching. • 123TEXTINDEXGROUP321: Adds a text index group to the query. Specify the name of the text index group from the Text Index Groups [ts_index_group] table you want to query as the value. Use this option to return search results from one of the tables in a text index group, with result relevancy scores normalized using that text index group's settings. For more information about configuring text index groups, see Configure multiple tables for indexing and searching.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Note: For more details on the use of the reserved names, see Querying tables in script.
value	Object	Value on which to query (not case-sensitive).

Returns

Type	Description
GlideQueryCondition	Query condition added to the GlideRecord.

This code example shows how to query the active records in the incident table and then set them all to inactive.

```
var rec = new GlideRecord('incident');
rec.addQuery('active', true);
rec.query();
while (rec.next()) {
  rec.setValue('active', false);
  rec.update();
}
```

This code example adds a query for records that match "email server" in the kb_knowledge table, with search result relevancy values computed using settings from the portal text index group.

```
var now_GR = new GlideRecord("kb_knowledge);
now_GR.addQuery("123TEXTQUERY321", "email server");
now_GR.addQuery("123TEXTINDEXGROUP321", "portal");
now_GR.query();
```

Scoped GlideRecord - addQuery(String name, String operator, Object value)

Provides the ability to build a request, which when executed, returns the rows from the specified table, that match the request.

If you are familiar with SQL, this method is similar to the "where" clause. One or more *addQuery()* calls can be made in a single query; in this case the queries are AND'ed. If any of the query statements need to be OR'ed, use the *GlideQueryCondition* method addOrCondition().

Always test queries on a sub-production instance prior to deploying them on a production instance. An incorrectly constructed encoded query, such as including an invalid field name, produces an invalid query. When the invalid query is run, the invalid part of the query condition is dropped, and the results are based on the valid part of the query, which may return all records from the table. Using an *insert()*, *update()*, *deleteRecord()*, or *deleteMultiple()* method on bad query results can result in data loss.

You can set the *glide.invalid_query.returns_no_rows* system property to true to have queries with invalid encoded queries return no records. In some cases, the query may still return records in API results even when *glide.invalid_query.returns_no_rows* is set to true. This happens in queries where an invalid query term is used with a WHERE operator. In such queries, the WHERE operator ignores the invalid term(s) but still interprets and returns the rest of the query statement. For more information about this system property and its functionality, see Available system properties.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Table field name.
operator	String	Query operator. The available values are dependent on the data type of the *value* parameter. Numbers: • = • != • > • >= • < • <= Strings (must be in upper case): • = • != • IN • NOT IN • STARTSWITH • ENDSWITH • CONTAINS • DOES NOT CONTAIN • INSTANCEOF **Note:** Use CONTAINS instead of the LIKE operator.
value	Object	Value on which to query (not case-sensitive).

Returns

Type	Description
GlideQueryCondition	The query condition that was added to the GlideRecord.

```
var rec = new GlideRecord('incident');
rec.addQuery('active',true);
rec.addQuery('sys_created_on', ">", "2010-01-19 04:05:00");
rec.query();
while (rec.next()) {
  rec.setValue('active', false);
  gs.info('Active incident ' + rec.getValue('number') + '
 closed');
  rec.update();
}
```

Using the IN operator.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var now_GR = new GlideRecord('incident');
now_GR.addQuery('number','IN','INC00001,INC00002');
now_GR.query();
while(now_GR.next()) {
  //do something....
}
```

Scoped GlideRecord - addValue(String field, Number value)

Provides atomic add and subtract operations on a specified number field at the database level for the current GlideRecord object.

Typically, a GlideRecord object is written as one record in a database. Individual field values are stored as defined. For code that adds a value to a GlideRecord field, it simply saves the field to the database with the new value, rather than atomically incrementing it.

For example, when the following code is executed, the value of the *u_count* field in the database is 2.

```
gs.info(now_GR.u_count); // "1"
now_GR.u_count += 1;
now_GR.update();
now_GR.get(now_GR.sys_id);
gs.info(now_GR.u_count); // "2"
```

If another user concurrently runs identical code, instead of the two operations each adding 1 to *u_count*, the net effect is that *u_count* only contains 2, with one operation's update actually being lost.

Conversely, the *addValue()* method performs the addition/subtraction in the database when the record is updated as an atomic operation. Two operations running concurrently each properly update the field.

```
gs.info(now_GR.u_count); // "1"
now_GR.addValue("u_count", 1);
now_GR.update();
now_GR.get(now_GR.sys_id); // The record must be reloaded from
 the database to observe the result
gs.info(now_GR.u_count); // "3", if executed concurrently with
 another user
```

Note: The new value is not read back from the database unless explicitly done so.

Like *setValue()*, *addValue()* changes only take effect in the database after a subsequent call to *update()* or *insert()*. If *insert()* is called, the specified field is initialized with the *value* parameter passed into *addValue()*.

Note: If *setValue()* is called for the specified field prior to calling *addValue()*, the *addValue()* method is not processed and an error message is logged.

Parameters

Name	Type	Description
field	String	Name of the field in this GlideRecord to modify. **Note:** The associated field's data type must be an integer. This method doesn't support other data types such as longs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
value	Integer	Amount to add to the value when the record is saved. To perform a subtraction operation, simply pass a negative value.

Returns

Type	Description
void	

Shows a value being added.

```
gs.info(now_GR.u_count); // "1"
now_GR.addValue("u_count", 1);
now_GR.update();
now_GR.get(now_GR.sys_id); // The record must be reloaded from
 the database to observe the result
gs.info(now_GR.u_count);
```

Output:

```
2
```

Shows a value being subtracted.

```
gs.info(now_GR.u_count); // "4"
now_GR.addValue("u_count", -1);
now_GR.update();
now_GR.get(now_GR.sys_id); // The record must be reloaded from
 the database to observe the result
gs.info(now_GR.u_count);
```

Output:

```
3
```

Scoped GlideRecord - applyEncodedQuery(String queryString)

Sets the values of the specified encoded query terms and applies them to the current GlideRecord.

Parameters

Name	Type	Description
queryString	String	Encoded query to apply to the current GlideRecord.

Returns

Type	Description
None	

```
function createAcl(table, role) {
  gs.info("Checking security on table " + table);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  var now_GR = new GlideRecord("sys_security_acl");
  now_GR.addQuery("name", table);
  now_GR.addQuery("operation", "read");
  now_GR.query();
  var encQuery = now_GR.getEncodedQuery();
  if (now_GR.next()) {
  // existing acl found so use it
    createAclRole(now_GR.getValue('sys_id'), role);
    return;
  } else {
    now_GR.initialize();
    now_GR.applyEncodedQuery(encQuery);
    var acl = now_GR.insert();
    gs.info("Added read access control on " + table);
    createAclRole(acl, role);
  }
}
```

Scoped GlideRecord - canCreate()

Determines if the Access Control Rules, which include the user's roles, permit inserting new records in this table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the user's roles permit creating of records in this table. Valid values: • true: Creating permitted • false: Creating is not permitted

This code example writes whether the current user can create records in the Incident table in the system log.

```
var now_GR = new GlideRecord('incident');
gs.info(now_GR.canCreate());
```

Scoped GlideRecord - canDelete()

Determines if the Access Control Rules, which include the user's roles, permit deleting records in this table.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the user's roles permit deleting of records in this table. Valid values: • true: Deleting permitted • false: Deleting is not permitted

This code example writes whether the current user can delete records in the Incident table in the system log.

```
var att = new GlideRecord('sys_attachment');
gs.info(att.canDelete());
```

Scoped GlideRecord - canRead()

Determines if the Access Control Rules (ACLs) permit reading records in this table. This method evaluates all ACL types, such as user roles, scripted ACLs, ACLs with scripted conditions, and so on.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the user's roles permit reading of records in this table. Valid values: • true: Reading permitted • false: Reading is not permitted

This code example writes whether the current user can read records in the Incident table in the system log.

```
var now_GR = new GlideRecord('incident');
gs.info(now_GR.canRead());
```

Scoped GlideRecord - canWrite()

Determines if the Access Control Rules, which include the user's roles, permit editing records in this table.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the user's roles permit writing of records in this table. Valid values: • true: Writing permitted • false: Writing is not permitted

This code example writes whether the current user can write records in the Incident table in the system log.

```
var now_GR = new GlideRecord('incident');
gs.info(now_GR.canWrite());
```

Scoped GlideRecord - chooseWindow(Number firstRow, Number lastRow, Boolean forceCount)

Sets a range of rows to be returned by subsequent queries.

Using setLimit() with chooseWindow()

The `setLimit()` method implicitly calls the `chooseWindow()` method and might cause unexpected results when used with `chooseWindow()` in a query.

- If the `chooseWindow()` method is called first, its record window is overwritten by the `setLimit()` method.

  Using the following lines in a query returns 100 records starting at row 1:

  ```
  grIncident.chooseWindow(20,30);
  grIncident.setLimit(100);
  ```

- If the `setLimit()` method is called first, the window set by `chooseWindow()` is used and the limit is overwritten.

  Using the following lines in a query returns 10 records starting at row 21:

  ```
  grIncident.setLimit(5);
  grIncident.chooseWindow(20,30);
  ```

Note: Running `query()` with the `chooseWindow()` method triggers a COUNT(*) query, which can result in slow performance on tables with a large number of records. You can use `setLimit()` before `chooseWindow()` to skip running the COUNT(*) query, but the same performance benefit is achievable using `setNoCount()`.

See also:

- query()
- setLimit()
- setNoCount()

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
firstRow	Number	Zero-based index of the starting row for the range, inclusive. (A value of 0 returns the first row.)
lastRow	Number	Zero-based index of the ending row for the range, exclusive. For example, if *firstRow* = 1 and *lastRow* = 5, four records are returned (2-5).
forceCount	Boolean	Optional. Flag that indicates whether to force a row count query. In most implementations of this call, the row count is performed. There are some outlying cases, such as text searches, were a row count is not performed. Setting this flag ensures that the row count occurs. Valid values: • true: Row count always occurs. • false: Row count occurs if implemented in normal execution of method. Default: false

Returns

Type	Description
void	

This example shows how to return records 3 and 4 from the Incident [incident] table.

```
var now_GR = new GlideRecord('incident');
now_GR.orderBy('number');
now_GR.chooseWindow(2, 4);
now_GR.query();
while (now_GR.next()) {
  gs.info(now_GR.getValue('number') + ' is within window');
}
```

Output:

```
*** Script: INC0000003 is within window
*** Script: INC0000004 is within window
```

Scoped GlideRecord - deleteMultiple()

Deletes all records that satisfy the query.

This method does not delete attachments.

Do not use *deleteMultiple()* on tables with currency fields. Always delete each record individually. Also, do not use this method with the *chooseWindow()* or *setLimit()* methods when working with large tables. The *setLimit()* method does not limit the number of records that are deleted with *deleteMultiple()*. All records returned by the query are deleted regardless of *setLimit()*.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The *glide.db.forced.chunk.threshold* system property sets the threshold above which forces chunk record deletions and updates. Chunking helps to prevent non-primary key deletions on huge tables from causing replication problems. For more information, see Available system properties.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

This example shows how to delete all inactive records from the Incident table.

```
var now_GR = new GlideRecord('incident');
now_GR.addQuery('active','false');
now_GR.query();
now_GR.deleteMultiple();
```

Scoped GlideRecord - deleteRecord()

Deletes the current record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the record was successfully deleted. Valid values: • true: Record was deleted. • false: No record was found to delete.

This example shows how to delete a specified record from the Incident table.

```
var now_GR = new GlideRecord('incident');
//to delete one record
if (now_GR.get('99ebb4156fa831005be8883e6b3ee4b9'))
    now_GR.deleteRecord();
```

This example shows how to delete a record from the Incident table immediately after it is inserted. The incident *GlideRecord* must be reloaded after the insert before it can be deleted.

```
var grTicket = new GlideRecord('incident');
grTicket.initialize();
grTicket.short_description = 'Example ticket';
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
grTicket.work_notes = 'An update about the ticket';
var ins_sys_id = grTicket.insert(); // Insert the record
grTicket.get(ins_sys_id); // Reload the inserted record
gs.info(grTicket.deleteRecord()); // Delete the record
```

Output:

```
true
```

Scoped GlideRecord - disableSysIdInOptimization()

Disables the default optimization that prevents an extra database query from running when a user passes in a large number of sys_ids, such as `grIncident.addQuery('sys_id', 'IN', listOf200SysIds)`.

This method only effects the GlideRecord on which it's called. To modify the sys_id limit optimization for all GlideRecords, adjust the value in the *glide.db.first_pass_sys_id_list_size.max* system property (default 100).

If you don't either call this method or adjust the *glide.db.first_pass_sys_id_list_size.max* system property and pass a list that contains more sys_id entries than defined in *glide.db.first_pass_sys_id_list_size.max*, the returned value from *GlideRecord.getRowCount()* may be incorrect.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to use the *disableSysIdInOptimiation()* method to disable the sys_id limit optimization when passing an Incident sys_id list that contains 200 entries.

```
var listOf200SysIds = [ ... ]; // 200 comma separated sys_ids
var grIncident = new GlideRecord('incident');
grIncident.addQuery('sys_id', 'IN', listOf200SysIds);
grIncident.disableSysIdInOptimization(); // Rowcount could be
 incorrect without this method call
grIncident.query();
if (grIncident.next())
    gs.info("Rowcount: " + grIncident.getRowCount());
```

Output:

```
Rowcount: 200
```

Scoped GlideRecord - get(Object name, Object value)

Returns the specified record in the current GlideRecord object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method accepts either one or two parameters. If only a single parameter is passed in, the method assumes that it is the sys_id of the desired record. If not found, it then tries to match the value against the display value. If two parameters are passed in, the first is the name of the column within the GlideRecord to search. The second is the value to search for. If multiple records are found, use `next()` to access the additional records.

Parameters

Name	Type	Description
name	Object	Optional. Name of the instantiated GlideRecord column to search for the specified *value* parameter. If only a single parameter is passed in, the method assumes that this parameter is the sys_id or display value.
value	Object	Value to match. For calculated fields, the value is matched as is rather than running a calculation on a scripted default value for a field in the record.

Returns

Type	Description
Boolean	Indicates whether the requested record was located: • true: record was found • false: record was not found

This example shows how to obtain an incident record by passing in the sys_id.

```
var grIncident = new GlideRecord('incident');
var returnValue =
 grIncident.get('99ebb4156fa831005be8883e6b3ee4b9');
gs.info(returnValue); // logs true or false
gs.info(grIncident.short_description); // logs Incident Short
 description
```

This example shows how to obtain an incident record by passing the field to search (caller_id.name) and the value to match within that field.

```
var grIncident = new GlideRecord('incident');
var returnValue = grIncident.get('caller_id.name','Sylivia
 Wayland');
gs.info(returnValue); // logs true or false
gs.info(grIncident.getValue('number')); // logs Incident Number
```

Scoped GlideRecord - getAttribute(String fieldName)

Returns the dictionary attributes for the specified field.

Parameters

Name	Type	Description
fieldName	String	Field name for which to return the dictionary attributes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Dictionary attributes

```
doit();
function doit() {
  var now_GR = new GlideRecord('sys_user');
  now_GR.query("user_name","admin");
  if (now_GR.next()) {
    gs.info("we got one");
    gs.info(now_GR.location.getAttribute("tree_picker"));
  }
}
```

Scoped GlideRecord - getClassDisplayValue()

Returns the current table's label.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Label that identifies the table.

This example prints the label of the passed in table.

```
// Display the incident table label
var now_GR = new GlideRecord("incident");
var value = now_GR.getClassDisplayValue();
gs.info("The table label is " + value + ".");
```

Output:

```
The table label is Incident.
```

Scoped GlideRecord - getDisplayValue()

Retrieves the display value for the current record.

Display values are manipulated based on the actual value in the database and user or system settings and preferences.

The display value that is returned is dependent on the field type.

- Choice fields: The database value may be a number, but the display value will be more descriptive.
- Date fields: The database value is in UTC format, while the display value is based on the user's time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Encrypted text: The database value is encrypted, while the displayed value is unencrypted based on the user's encryption context.
- Reference fields: The database value is sys_id, but the display value is a display field of the referenced record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Display value for the current record.

This example writes the display value of a specified incident record into the log.

```
var now_GR = new GlideRecord('incident');
now_GR.get('sys_id','<sys_id>');
gs.info(now_GR.getDisplayValue());
```

Output:

```
INC0000050
```

Scoped GlideRecord - getED()

Returns the element's descriptor.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideElementDescriptor	The element's descriptor.

This example shows how to retrieve the name field for an incident GlideRecord.

```
var grInc = new GlideRecord('incident');
grInc.get('sys_id','ef43c6d40a0a0b5700c77f9bf387afe3');

var field = grInc.getElement('priority');
var ed = field.getED();

var isEdge = ed.getLabel();
gs.info("Label is - " + isEdge);
```

Output:

```
Label is - Priority
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideRecord - getElement(String fieldName)

Retrieves the GlideElement object for the specified field.

The value returned by this method is a complete GlideElement object.
The results are the equivalent of dot-walking a field value. For example, `now_GR.getElement('short_description')` provides the same result as `nowGR.short_description`.

In most cases, don't use dot-walking to get values from a record. Dot-walking retrieves the entire object instead of the field value. Retrieving the object uses more storage and might cause undesirable results when used in arrays or in Service Portal.

Instead of retrieving the entire object, you can use one of the following methods to copy the field values:

- getValue()
- getDisplayValue()

If dot-walking through a GlideElement object is necessary, use the *`toString()`* method to retrieve values. For example, you might need the current caller's manager sys_id to set another reference field. The following example shows how to get the string value instead of the entire object:

```
var mgr = current.caller_id.manager.toString();
```

See also:

- GlideElement – toString()
- getElements()

Parameters

Name	Type	Description
fieldName	String	Column name for which to return the GlideElement object.

Returns

Type	Description
GlideElement	The GlideElement for the specified column of the current record. Each object describes a field in the current GlideRecord.

The following example shows how to add a new incident record with details in the **Short Description** field.

```
var elementName = 'short_description';
var now_GR = new GlideRecord('incident');
now_GR.newRecord();
now_GR.setValue(elementName, "My DB is not working");
now_GR.insert();

var sdesc = now_GR.getElement('short_description');
gs.info(sdesc.getValue());
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
My DB is not working
```

Scoped GlideRecord - getElements()

Returns an array of GlideElement objects. Each object describes a field in the current GlideRecord.

If dot-walking through a GlideElement object is necessary, use the *toString()* method to retrieve values. For example, you might need the current caller's manager sys_id to set another reference field. The following example shows how to get the string value instead of the entire object:

```
var mgr = current.caller_id.manager.toString();
```

See also:

- GlideElement – toString()
- getElement()

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	Array of GlideElement objects. Each object describes a field in the current GlideRecord.

The following example displays the value of the name field for the five most recent records created in the Question [question] table.

```
var now_GR = new GlideRecord('question');
var elementArr = now_GR.getElements();
now_GR.orderByDesc('sys_created_on');
now_GR.setLimit(5);
now_GR.query();

while (now_GR.next()){
  var qNames = now_GR.name.toString();
  elementArr.push(qNames);
  gs.info(qNames);
}
```

Output:

```
delivery_time_var
delivery_time
sequence
priority
assigned_group
```

Scoped GlideRecord - getEncodedQuery()

Retrieves the query condition of the current result set as an encoded query string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details, see Encoded query strings .

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	

```
var now_GR = new GlideRecord('incident');
now_GR.addQuery('active', true);
now_GR.addQuery('priority', 1);
now_GR.query();
var encodedQuery = now_GR.getEncodedQuery();
gs.info(encodedQuery);
```

Output:

```
active=true^priority=1
```

Scoped GlideRecord - getLabel()

Returns the field's label.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Field's label

```
template.print("Summary of Requested items:\n");
var now_GR = new GlideRecord("sc_req_item");
now_GR.addQuery("request", current.sysapproval);
now_GR.query();
while(now_GR.next()) {
var nicePrice = now_GR.price.toString();
  if (nicePrice != '') {
    nicePrice = parseFloat(nicePrice);
    nicePrice = nicePrice.toFixed(2);
  }
  template.print(now_GR.number + ":  " + now_GR.quantity + " X "
 + now_GR.cat_item.getDisplayValue()
    + " at $" + nicePrice + " each \n");
  template.print("    Options:\n");
  for (key in now_GR.variables) {
  var now_V = now_GR.variables[key];
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    if(now_V.getGlideObject().getQuestion().getLabel() != '') {
      template.space(4);
      template.print('     ' +
 now_V.getGlideObject().getQuestion().getLabel() + " = "
        + now_V.getDisplayValue() + "\n");
    }
  }
}
```

Scoped GlideRecord - getLastErrorMessage()

Retrieves the last error message. If there is no last error message, null is returned.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The last error message as a string.

```
// Setup a data policy where short_description field in incident
 is mandatory
var now_GR = new GlideRecord('incident');
now_GR.insert(); // insert without data in mandatory field
var errormessage = now_GR.getLastErrorMessage();
gs.info(errormessage);
```

Output:

```
Data Policy Exception: Short description is mandatory
```

Scoped GlideRecord - getLink(Boolean noStack)

Retrieves the link to the current record.

Parameters

Name	Type	Description
noStack	Boolean	Flag indicating whether to append the sysparm_stack parameter to the returned link. This parameter specifies the page to visit after closing the current link. Valid values: • true: Do not attach the sysparm_stack parameter. • false: Attach the sysparm_stack parameter. If true, the sysparm_stack parameter is not appended to the link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Link to the current record.

This example queries all Incident records with a priority of "1" and writes the servlet URI and the current record's link to the system log.

```
var now_GR = new GlideRecord('incident');
now_GR.addActiveQuery();
now_GR.addQuery("priority", 1);
now_GR.query();
now_GR.next();
gs.info(gs.getProperty('glide.servlet.uri') +
 now_GR.getLink(false));
```

Output:

```
https://instance.service-now.com/incident.do?sys_id=46e2fee9a9fe
19810049b49dee0daf58&sysparm_stack=incident_list.do?sysparm_quer
y=active=true
```

Scoped GlideRecord - getRecordClassName()

Retrieves the class name for the current record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The class name.

```
var now_GR = new GlideRecord('incident');
var recordClassName = now_GR.getRecordClassName();
gs.info(recordClassName);
```

Output:

```
incident
```

Scoped GlideRecord - getRowCount()

Retrieves the number of rows (records) in the current GlideRecord object.

Note: `GlideRecord` returns matching records, so it might not be as efficient as `GlideAggregate` when you only need the number of records. If you only need a record count and aren't iterating over the matching records, use `GlideAggregate`.

Retrieving the number of records in GlideRecord or GlideAggregate

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The *GlideRecord getRowCount()* and *GlideAggregate getAggregate()* APIs offer similar information. Use the following criteria to determine which option is best for you.

- The *GlideRecord getRowCount()* method tells you how many records have been returned from a query along with the records themselves. If you need the number of records in the result set before or after you iterate over the set to perform actions on the records, use this method.
- The *GlideAggregate getAggregate()* method retrieves only a count of records matching the query, excluding the actual records. The aggregate must be set on the *GlideAggregate* object before issuing the query.

Retrieving the records and count with GlideRecord getRowCount()

The following example shows how to get the total number of active incidents with *GlideRecord getRowCount()*:

```
var incident = new GlideRecord("incident");
incident.addQuery("active", true);
incident.query();

gs.info("*** Total number of active incidents: {0}",
 incident.getRowCount());
```

Retrieving only the number of records with GlideAggregate getAggregate()

The following example shows how to return only the number of records. Because this method doesn't use the matching records, it's much more efficient to use an aggregate query and return just the count.

```
var incident = new GlideAggregate("incident");
incident.addQuery("active", true);
incident.addAggregate("COUNT");
incident.query();

if (incident.next())
    gs.info("*** Total number of active incidents:
 {0}", incident.getAggregate("COUNT"));
```

Deciding which option is best for your solution

If you only want to retrieve the number of records, the *GlideAggregate getAggregate()* method is the best option. To use the individual records and retrieve the number of results, use *GlideRecord getRowCount()*, because a single query provides this functionality.

Note: If you want to use the *getRowCount()* method when using `sys_id IN` with more than 100 sys_id values, such as `grIncident.addQuery('sys_id', 'IN', listOf200SysIds)`, you must either:

- Call the *disableSysIdInOptimization()* method on the GlideRecord.
- Or, adjust the *glide.db.first_pass_sys_id_list_size.max* system property to a value higher than the number of sys_ids in the list.

In addition, ensure that you call the *.next()* method before calling the *getRowCount()* method.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Number of rows in the current GlideRecord.

The following example shows how to get the number of incidents from the Incident [incident] table.

```
var numberOfIncidents = new GlideRecord('incident');
numberOfIncidents.query();
gs.info("Records in incident table: " +
 numberOfIncidents.getRowCount());
```

Output:

```
Records in incident table: 6920
```

The following code example shows how to use the *disableSysIdInOptimiation()* method to disable the sys_id limit optimization when passing an Incident sys_id list that contains 200 entries.

```
var listOf200SysIds = [ ... ]; // 200 comma separated sys_ids
var grIncident = new GlideRecord('incident');
grIncident.addQuery('sys_id', 'IN', listOf200SysIds);
grIncident.disableSysIdInOptimization(); // Rowcount could be
 incorrect without this method call
grIncident.query();
if (grIncident.next())
    gs.info("Rowcount: " + grIncident.getRowCount());
```

Output:

```
Rowcount: 200
```

Scoped GlideRecord - getTableName()

Retrieves the name of the table associated with the GlideRecord.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The table name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var now_GR = new GlideRecord('incident');
gs.info(now_GR.getTableName());
```

Scoped GlideRecord - getUniqueValue()

Gets the primary key of the record, which is usually the sys_id unless otherwise specified.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The unique primary key as a String, or null if the key is null.

```
var now_GR = new GlideRecord('kb_knowledge');
now_GR.query();
now_GR.next();
var uniqueid = now_GR.getUniqueValue();
gs.info(uniqueid);
```

Scoped GlideRecord - getValue(String name)

Retrieves the string value of an underlying element in a field.

Note: If the Column Level Encryption Enterprise plugin is enabled and the instance has access to the key, this method returns clear text values from encrypted fields. If the instance does not have access to the key, this method returns the encrypted value. For more information, see Platform Encryption.

Parameters

Name	Type	Description
name	String	The name of the field to get the value from.

Returns

Type	Description
String	The string value of the underlying element. Returns null if the field is empty or the field does not exist. Boolean values return as `"0"` and `"1"` string values instead of false and true.

```
var now_GR = new GlideRecord('incident');
now_GR.orderBy('number');
now_GR.query('active','true');
now_GR.next();
gs.info(now_GR.getValue('number'));
```

Output:

```
INC0000002
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideRecord - GlideRecord(String tableName)

Creates an instance of the GlideRecord class for the specified table.

Parameters

Name	Type	Description
tableName	String	The table to be used.

```
var now_GR = new GlideRecord('incident');
```

Scoped GlideRecord - hasNext()

Determines if there are any more records in the GlideRecord object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if there are more records in the query result set.

```
var rec = new GlideRecord('incident');
rec.query();
if (rec.hasNext()) {
  gs.info("Table is not empty");
}
```

Scoped GlideRecord - insert()

Inserts a new record using the field values that have been set for the current record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the inserted record, or null if the record is not inserted.

```
var now_GR = new GlideRecord('incident');
now_GR.initialize();
now_GR.setValue('name', 'New Incident');
now_GR.setValue('description', 'Incident description');
now_GR.insert();
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
138fb4111b4d4d907cf30d03cd4bcb57
```

Scoped GlideRecord - initialize()

Creates an empty record suitable for population before an insert.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var grIncident = new GlideRecord('incident');
grIncident.initialize();
grIncident.setValue('short_description', 'New Incident');
grIncident.setValue('description', 'Incident description');
grIncident.insert();
```

Scoped GlideRecord - isActionAborted()

Checks to see if the current database action is to be aborted.

`isActionAborted()` is initialized (set to false) for new threads and by the `next()` method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates if the current database action is to be aborted. Valid values: • true: The current database action is to be aborted. • false: The current database action is not to be aborted.

```
var now_GR = new GlideRecord('incident');

gs.info(now_GR.isActionAborted());
```

Output:

```
false
```

Scoped GlideRecord - isEncodedQueryValid(String query)

Verifies whether the specified encoded query is valid.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the specified encoded query is valid, then the query is applied, just as if you had called addEncodedQuery(). If the specified encoded query is invalid, then `sys_idNotValidnull` is added as the encoded query.

Note: This method has been deprecated and replaced with the isValidEncodedQuery() method which does not execute the query.

Parameters

Name	Type	Description
query	String	Encoded query to validate. See Encoded query strings.

Returns

Type	Description
Boolean	Flag that indicates whether the specified encoded query is valid. • true: Passed-in encoded query is valid. • false: Passed-in encoded query is not valid.

This code example shows how to validate an encoded query and then execute logic if the query is valid.

```
var now_GR = new GlideRecord('incident_sla');
var isValidQuery =
 now_GR.isEncodedQueryValid('inc_impact=1^taskslatable_active=tr
ue');
if (isValidQuery) {
  now_GR.query();
   .
   .
   .
}
```

Scoped GlideRecord - isNewRecord()

Checks if the current record is a new record that has not yet been inserted into the database.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the record is new and has not been inserted into the database.

```
var now_GR = new GlideRecord("x_app_table");
now_GR.newRecord(); // create a new record and populate it with
 default values
gs.info(now_GR.isNewRecord());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideRecord - isValid()

Determines if the current table is valid or if the record was successfully retrieved.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates if the table is valid or if the record was successfully retrieved. Possible values: • true: Table is valid or the record was successfully retrieved. • false: Table is invalid or the record was not successfully retrieved.

```
var comment_GR = new GlideRecord('cf_comment');
var commentId = '99ebb4156fa831005be8883e6b3ee4b9';
comment_GR.get(commentId);
gs.info(comment_GR.isValid());
```

Scoped GlideRecord - isValidEncodedQuery(String query)

Verifies whether the syntax of the encoded query is correct.

When passing an empty string (`""`) as the provide query:

- The empty string (`""`) represents the absence of a query and returns false.
- Calling `GlideRecord.addEncodedQuery("")` followed by `GlideRecord.query()` returns all rows. The query method is similar to a SQL SELECT statement. In SQL, when using "SELECT * FROM foo WHERE X", the value X represents the query. If no query value is provided, all records are returned (e.g., SELECT * FROM foo).

Parameters

Name	Type	Description
query	String	Encoded query to validate. See Encoded query strings.

Returns

Type	Description
Boolean	Flag that indicates whether the specified encoded query is valid. • true: Passed-in encoded query is valid. • false: Passed-in encoded query is not valid.

This code example shows how to check if the encoded query is valid.

```
var queryString = "priority=1^ORpriority=2";
var now_GR = new GlideRecord('incident');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var isValidQuery = now_GR.isValidEncodedQuery(queryString);
if (isValidQuery) {
  now_GR.addEncodedQuery(queryString);
  now_GR.query();
  .
  .
  .
}
```

Scoped GlideRecord - isValidField(String columnName)

Determines if the specified field is defined in the current table.

Parameters

Name	Type	Description
columnName	String	The name of the field.

Returns

Type	Description
Boolean	True if the field is defined for the current table.

```
var now_GR = new GlideRecord('incident');
now_GR.initialize();
gs.info(now_GR.isValidField("short_description"));
```

Scoped GlideRecord - isValidRecord()

Determines if a record was actually returned by the query/get record operation.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether a record was actually returned by the query/get operation. Valid values: • true: Record returned by query/get operation. • false: End of record set, no record returned.

```
var rec = new GlideRecord('incident');
rec.query();
while (rec.next()) {
  gs.info(rec.number + ' exists');
}
gs.info(rec.isValidRecord());
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideRecord - isView()

Verifies whether the record was created in a view or a table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the record was created in table that is a view. • true: The record was created in a view. • false: The record was created in a table.

This code example shows how to determine if a GlideRecord was created in a view or a table.

```
var mySLA = new GlideRecord('incident_sla');

if (mySLA.isView() == true){
   gs.info('This record was created in a view.');
} else {
   gs.info('This record was created in a table.');
}
```

Output:

```
This record was created in a view.
```

Scoped GlideRecord - newRecord()

Creates a new GlideRecord record, sets the default values for the fields, and assigns a unique ID to the record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var now_GR = new GlideRecord("x_app_table");
now_GR.newRecord();
gs.info(now_GR.isNewRecord());
```

Output:

```
true
```

© 2026 ServiceNow, Inc. All rights reserved.
