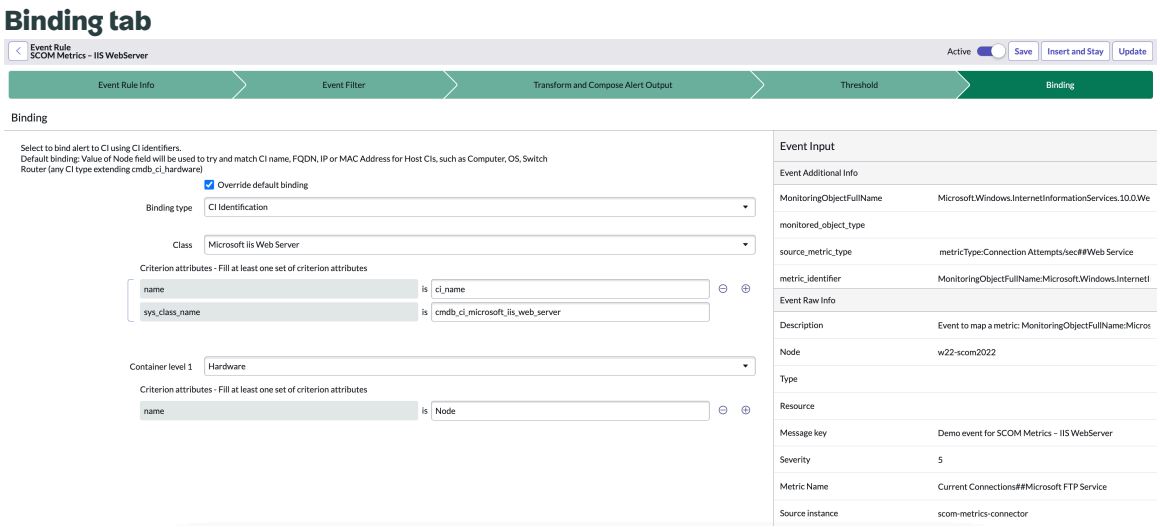
Role required: evt_mgmt_admin

About this task

Before going through the procedure, let's first understand how this binding works with an example. Suppose an out-of-the-box event rule, SCOM Metrics – IIS WebServer, generates an alert for a Microsoft IIS Web Server running on a host. Instead of binding the alert to just the host machine, you want it to be associated with the specific application (IIS Web Server) where the issue occurred. Here's how the system ensures accurate binding.

Let's say in the **Binding** tab, the **Class** and **Container Level 1** are defined along with their respective attributes, as shown in the image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The binding procedure follows these steps:

1. Identifying the Host (Container Level 1)

   Since the Microsoft IIS Web Server runs on a host (in this case Hardware), the system first locates the host, which is defined as **Container Level 1**. The name field is used to identify the host, and its value is taken from the **Node** field of the event. Using this name, the system searches the CMDB to find a matching host CI.

2. Identifying the Microsoft IIS Web Server CI on the Host

   Once the host is identified, the system looks for a Microsoft IIS Web Server CI under that host with the following attributes:

   - name = ci_name
   - sys_class_name = cmdb_ci_microsoft_iis_web_server

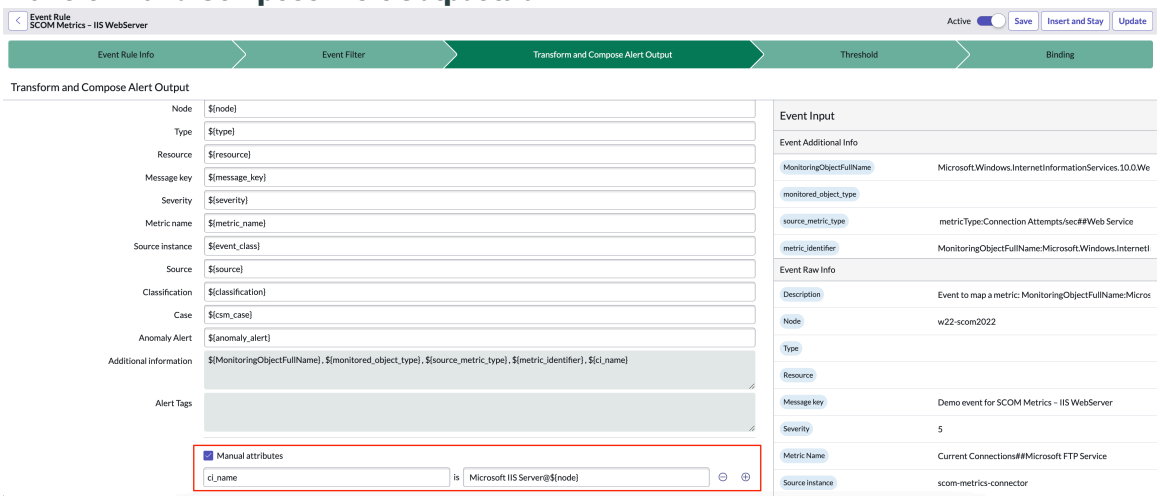
   Here, ci_name is derived from the key-value pair defined in the **Transform and Compose Alert Output** tab of the event rule. Assume that in the **Transform and Compose Alert Output** tab of the event rule, the **Manual attributes** check box is selected and the following key-value pair is already added:

   - **Field Name**: `ci_name`
   - **Field Value**: `Microsoft IIS Server@${node}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This ensures that `ci_name` appears in the **Additional information** field of the alert and is used when configuring the attribute field of the CI class.

Transform and Compose Alert Output tab



If a matching Microsoft IIS Web Server CI is found on the identified host, the alert is bound to the correct application CI rather than just the host. This ensures more precise incident tracking and resolution, linking the alert to the actual service affected instead of only the machine it runs on.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields of the event rule.
3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI Identification**.
6. In the **Class** field, select a CI class.
7. In the **Select an identifier** field, select an identifier for the class.

   An identifier for a class is a set of rules that helps the system recognize and match CIs correctly. Think of it like a fingerprint for each type of CI (such as a server, router, or application). The identifier uses key attributes—like a serial number, hostname, or IP address—to make sure that when new data comes in, it gets linked to the right CI instead of creating duplicates. For more information on CI identification rule, see Create a CI identification rule.
8. In the **Add value** field, add the exact value or specify the source field from which the value for the field must be populated.

   Add or remove fields using the add (⊕) and the delete (⊖) icons.

   Note: While filling in the CI Class attributes, if you do not find the attribute you need, you can use the **Transform and Compose Alert Output** tab of the event rule to add the necessary key-value pair. For more information, see Configure an event rule to customize alert content.

   The event rule transformation and composition is useful when relevant information exists in a different field but needs to be extracted or reassigned for proper alert processing. This is especially important when the required attribute is not directly available and must be manually defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, suppose the **Additional information** field of an alert contains the alert name under the **Node** field. However, for correct processing, we need this value to appear under the **Name** field instead. Since there is no existing name attribute in the event, we can manually create one using the **Transform and Compose Alert Output** tab in the event rule. Here's how:

a. Select the **Transform and Compose Alert Output** tab.

b. Select the **Manual attributes** check box.

c. Add the following key-value pair:

- **Field**: Name
- **Field Value**: Node

This configuration ensures that the system extracts the **Node** value and maps it to the name field, making it available for CI binding and alert correlation.

9. In the *Container level 1* area, specify the host.
10. In the **Select an identifier** field, select an identifier for the container.
11. In the **Add value** field, add the exact value or the field that is the source for the **Select an identifier** field of the container.

    Add or remove fields using the add (⊕) and the delete (⊖) icons.
12. Select **Save**.

Example: Binding alerts to non-host CIs

Bind alerts to an application service (a non-host CI) using event rules and event field mapping. This example demonstrates how to achieve this by leveraging the IP address associated with the service.

Before you begin

Role required: evt_mgmt_admin

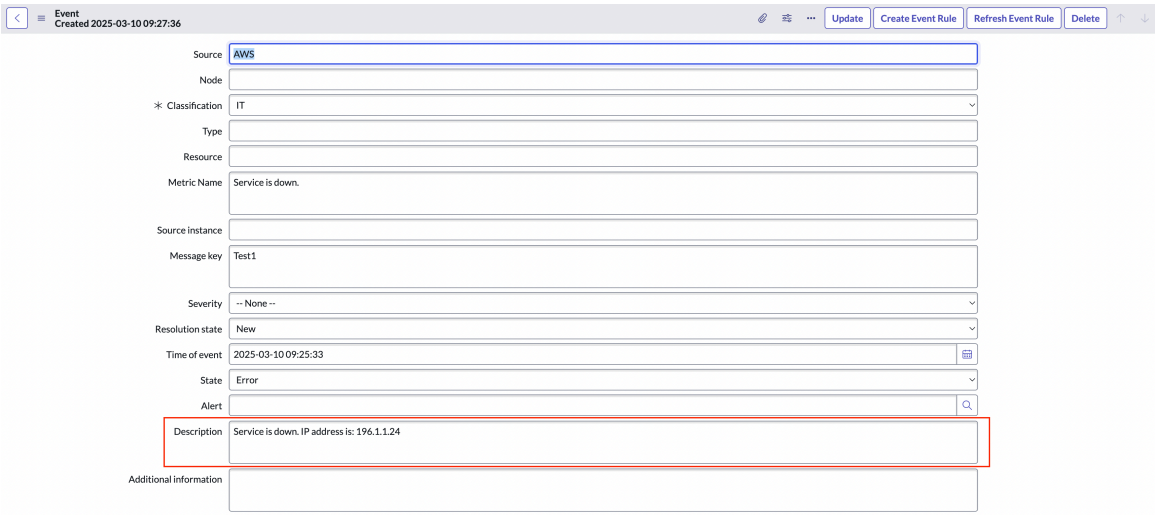
About this task

When an event is generated, it may not always include the exact name of the Application Service it affects. Instead, it might provide details such as an IP address. In this example, suppose application services are identified by IP addresses. Since the goal is to bind the alert to an Application Service, you need to determine which service name corresponds to the given IP address.

To achieve this, follow these steps:

1. Match the correct Application Service: Override the default binding and select **Binding Type** as **CI field matching**. The binding process needs to associate the alert with an Application Service, not a host. In the event rule, set the **CI Type** to **Application Service** so that the system searches for the service in the Application Service table (cmdb_ci_service_auto).
2. Extract the IP address from the event description: The event might contain a message like `Service is down. IP address is: 196.1.1.24`. You need to extract the IP address from this description for further processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

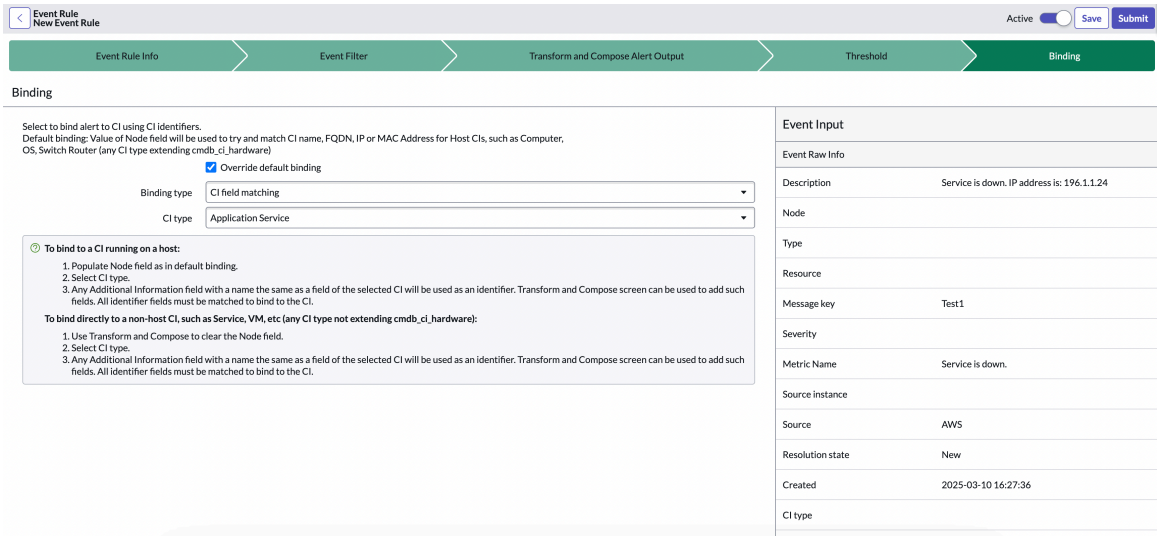


3. Translate the IP address into a service name using Event Field Mapping: Use Event Field Mapping to look up the extracted IP address in the CMDB and find the associated application service. Once a matching service is found, its name is stored in the **Name** field of the event.
4. Bind the alert to the correct Application Service: If the service name is identified, the alert's CI is populated with that service.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Open the specific event for which you want to create an event rule.
3. Select **Create Event Rule**.
   The new event rule page opens. Some fields in the event rule are populated based on the event record data, such as the Source field value.
4. In the **Event Rule Info** tab, in the **Name** field, enter `application service binding`.
5. Select the **Binding** tab.
   In this tab, you select the CI type as a service (non-host) instead of a host because the goal is to bind alerts to an Application Service, not to a physical or virtual machine.
6. Perform the following steps:
   a. Select the **Override default binding** check box.
   b. In the **Binding type** field, select **CI field matching**.
   c. From the **CI type** list, select **Application Service**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select the **Transform and Compose Alert Output** tab.

   In this tab, you extract the IP address of the application service into a manually created field. Extracting the IP allows the system to look up the corresponding service in the Application Service table (cmdb_ci_service_auto). Without extracting the IP, the system wouldn't be able to determine which Application Service the event belongs to, making it difficult to bind the alert correctly.

8. Perform the following steps:

   a. Clear the **Node** field.

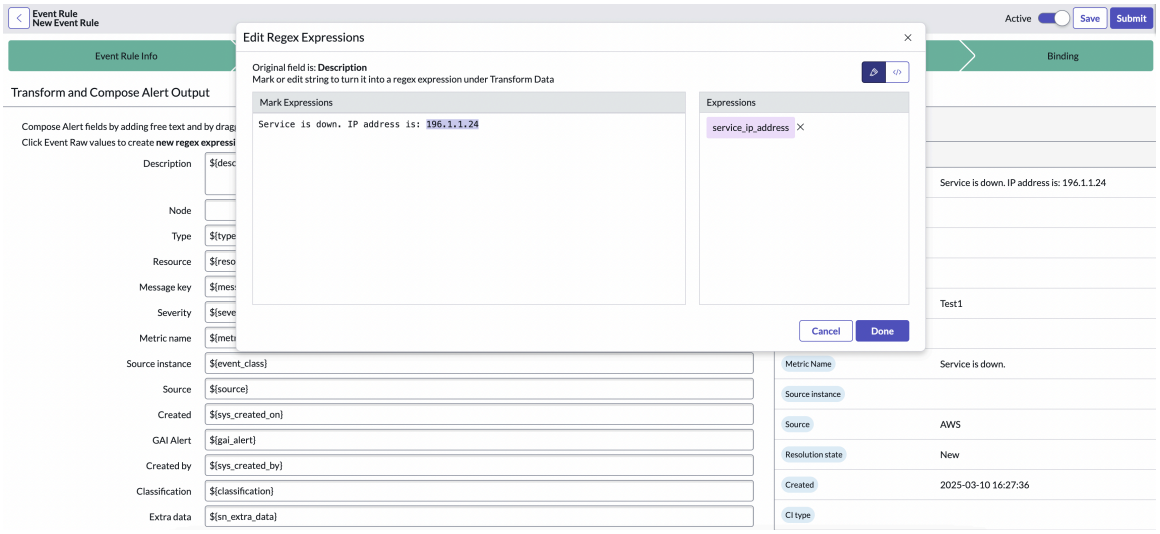
      When an event is processed, it often comes with multiple fields of information. The **Node** field typically contains the host or device name. However, since the goal is to bind the alert to an Application Service rather than a host, clearing the **Node** field ensures that the system focuses on identifying the correct service instead of mistakenly associating the alert with a host CI.

   b. Under **Event Input** > **Event Raw Info**, select **Description**.

      The Edit Regex Expressions window opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the Mark Expressions section, select the IP address, manually enter a field name (e.g., service_ip_address), and press Enter to save it.



d. Select **Done**.

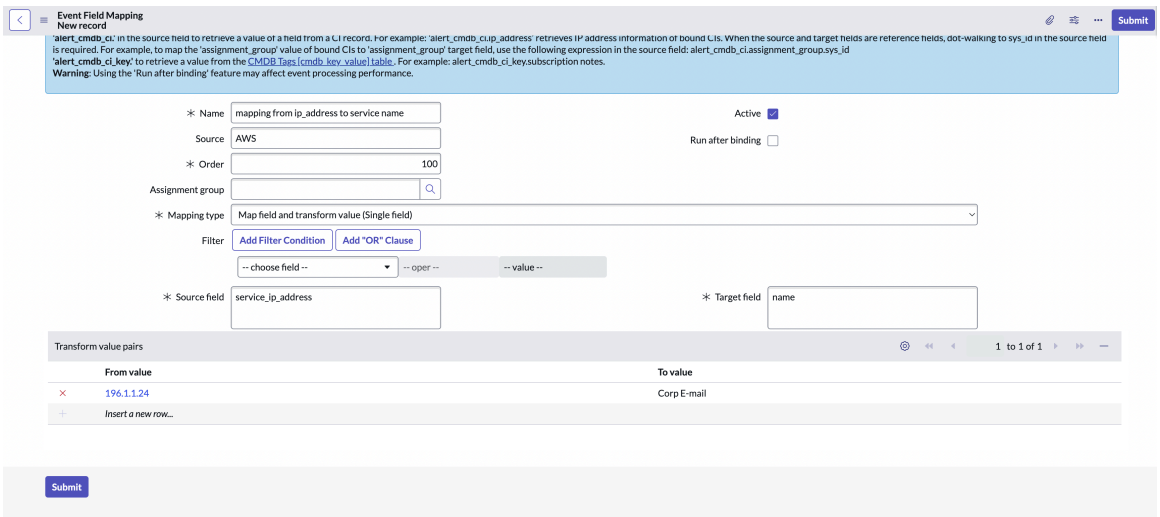
The IP address is extracted into the newly created **service_ip_address** field, which is added to the **Additional info** field of the alert. This allows it to be used later to identify the corresponding Application Service.

9. Select **Submit** in the event rule to save your changes.

10. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
In Event Field Mapping, configure the extracted IP address to map it to the corresponding service name. The event provides only an IP address, but alerts need to be associated with a service name (not just an IP). The system needs to map this IP to its corresponding Application Service so that teams can easily identify the impacted service.

11. Select **New**.
The Event Field Mapping window opens.

12. Perform the following:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

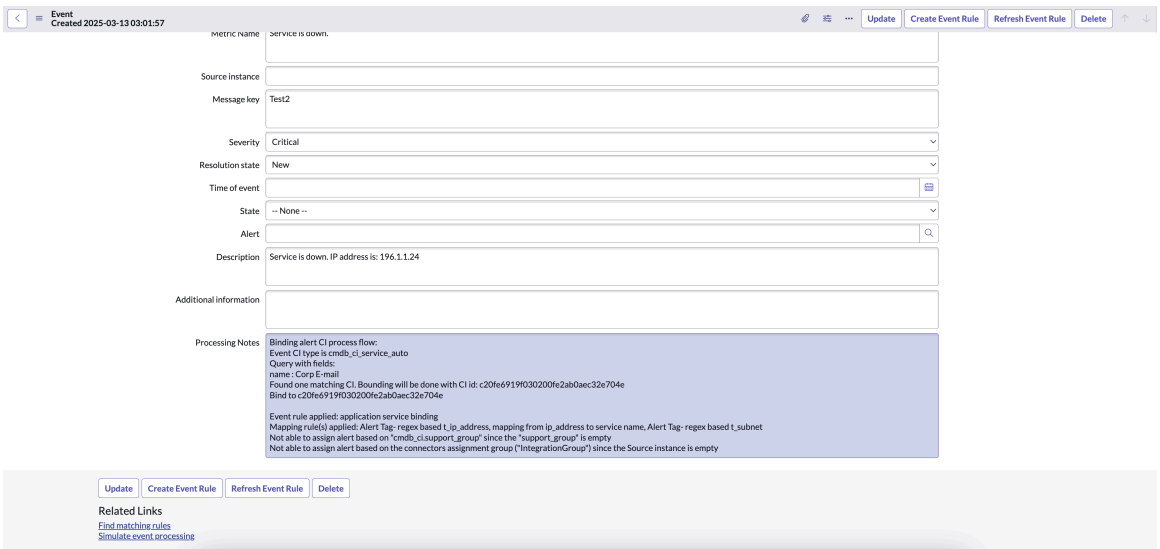
Field	Action
Name	Enter the name of the mapping. Example: mapping from ip_address to service name.
Source	Enter `AWS`. **Note:** The source is the same as the one in the Events record.
Mapping type	Select **Map field and transform value (Single field)**
Source field	Enter `service_ip_address`.
Target field	Enter `name`. The target field value is the column name in the Application Service table (cmdb_ci_service_auto) where the source field value is searched.
Transform value pairs	
From value	196.1.1.24
To value	Corp E-mail

13. Select **Submit**.

The system extracts the IP address of the service from the event and stores it in the **service_ip_address** field. Since the Application Service table (cmdb_ci_service_auto) does not have a column for searching by IP address, the Transform value pairs feature is used to map the IP address to a name—in this case, Corp E-mail and and saves it in the **name** field within the **Additional info** field of the alert. The **Target field** specifies where to search for the Corp E-mail in the Application Service table. The system looks for Corp E-mail in the **name** column of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the Application Service table (cmdb_ci_service_auto). If a match is found, the alert is bound to the corresponding Application Service.



Example: Bind alerts to CIs using dynamic CI types

Use event field mapping to dynamically bind alerts to the appropriate CIs based on event attributes, eliminating the need for separate event rules for each CI. This approach simplifies configuration, improves accuracy, and enhances alert binding.

Before you begin

Role required: evt_mgmt_admin

About this task

In general, for an event generated from a specific source mentioned in the **Source** field, the system applies the corresponding event rule. The override default binding option in an event rule specifies a specific CI class for binding. However, in a more dynamic use case, the CI class is not predefined and can change based on event attributes. For example, suppose a customer has multiple CIs with the same name, but each CI belongs to a different CI class. In the traditional event rule method, as the CI class (or the CMDB table) is defined for a CI, the mapping is incorrect because the system searches in the same CI class for all CIs with the same name and attributes, instead of looking in the specific CMDB table defined for each CI class.

To resolve this—in other words, to determine the correct CI class to search—the system uses the **CI type** field from the event to identify the CI class. By using an event field mapping that maps from event attributes to CI type, it becomes possible to know which CMDB table to search, ensuring that the CI is correctly mapped to the event.

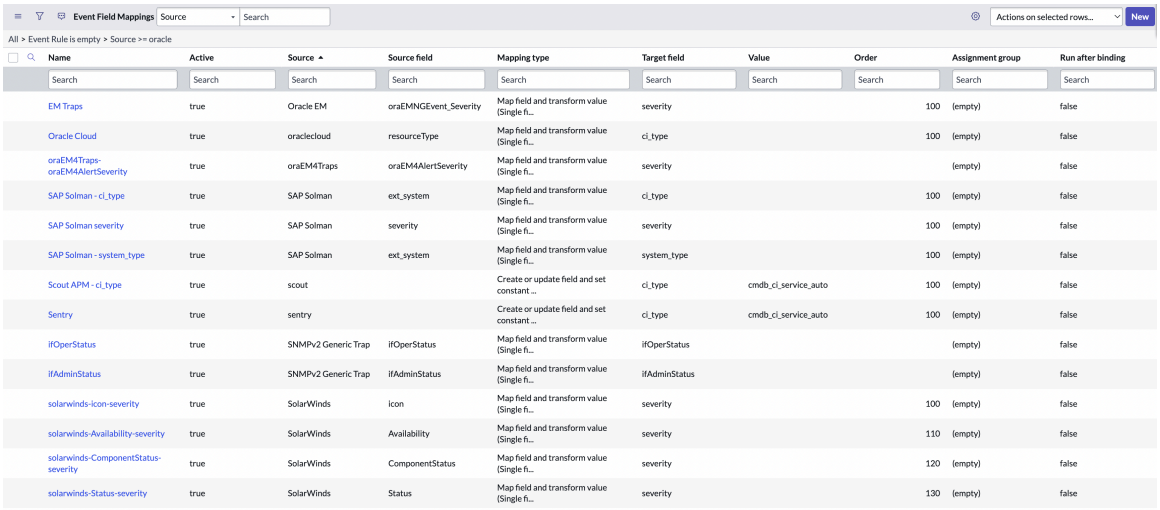
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

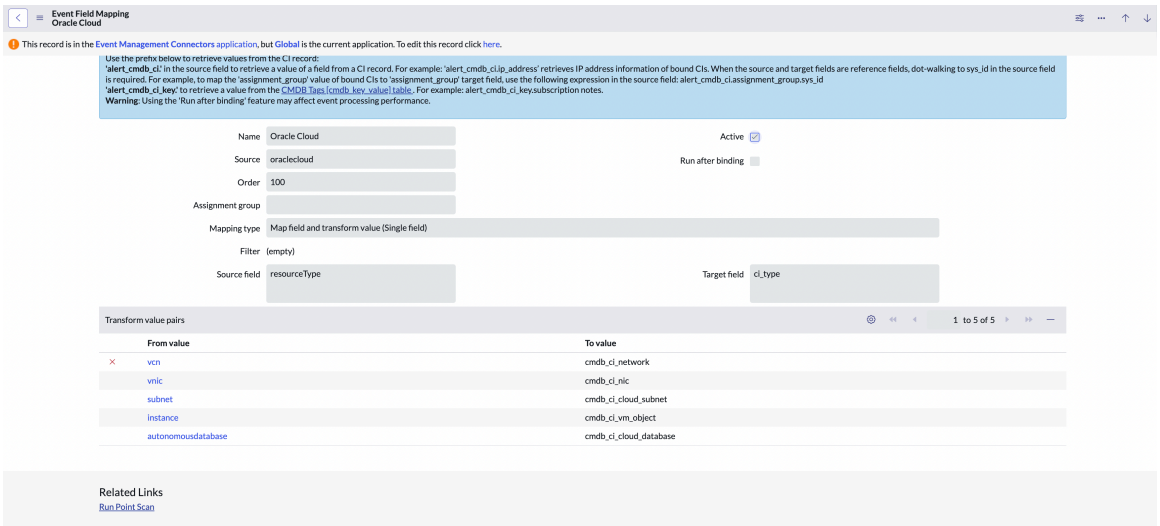
Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.



2. Select **Oracle Cloud**.

   This is an existing event field map used as an example. The event field map details page opens.



3. Review the event field mapping details page and understand the relevant fields and their corresponding values.

Event Field Mapping fields

Field	Description
Name	Event field map name.
Source	Event monitoring software that generated the event. In this case, oraclecloud.
Order	Number to define the order in which this action should be processed. Actions with lower numbers are processed first.
Mapping type	Select **Map field and transform value (Single field)**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Source field	**resourceType** is a field that is defined in the **Additional Information** field of the event defined by the Oracle Cloud system. The possible values of **resourceType** are listed in the **From value** column, while the corresponding CMDB tables for those values are specified in the **To value** column in the Transform value pairs section. If **resourceType** is **instance**, the system searches in the [cmdb_ci_vm_object] table for CI binding.
Target field	The **CI type** field (**ci_type**) in an event is a special field that provides the CI class name, indicating which CMDB table to search. The **CI type** field values are listed in the **To value** column in the Transform value pairs section.
Transform value pairs	
From value	Lists the possible values of the event field (e.g., `resourceType`) that are derived from the event data.
To value	Specifies the corresponding CMDB table associated with each value listed in the **From value** column. Indicates the CI type to bind the alert to.

View patterns for event group creation

Event groups are sets of events that do not have a matching event rule. You can view the patterns in a group of events to learn the impact of creating a rule based on the event source and description patterns.

Before you begin

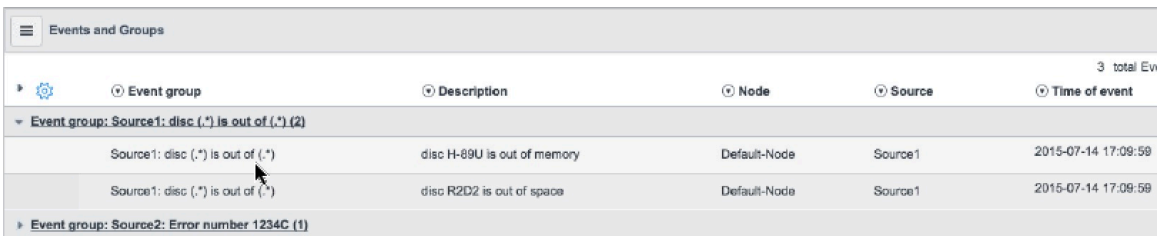
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Events are grouped according to their source and description.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Wait for the group calculation to complete and then click the created link.
   If there are not enough events, the calculation will not create groups.
3. In the list of events, select an event.
4. To change the pattern of an event, double-click the pattern, make your changes, and then click **Update**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Refresh event rules

Manually update event rules to reflect current event information because once an event rule is created, the **Event Additional info** and **Event Raw info** fields are not automatically updated.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Select the event.
3. Select **Refresh Event Rule**.
4. Select the event rules to refresh.
5. Select **Refresh Selected**.

   If you selected multiple event rules, then the last selected item in the list opens in the Event Rule Designer.

   Note: If the current event rule regex expressions do not match the selected event after the refresh, the update fails and an error message appears specifying the problematic fields. This safeguard ensures that your previously defined event rule regex expressions are not broken due to the refresh.

Find rules that will be applied to an event

View the rules that will be applied on an event to determine how this event will be processed.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Navigate to **Event Management** > **All Events**, and then click an event number.
2. Under **Related Links**, click **Find matching rules**.
3. Review the information that appears in the blue box at the top of the page, and review all **Processing Notes** to find rules that apply to an event.

Related topics

View events

Simulate event processing

You can simulate event processing logic on events and display the resulting alert to better understand which rules are executed on a given event and how the event fields change after the rule is executed.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Open the event you want to simulate.
3. In the **Related Links** section, select **Simulate event processing.**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the info message that appears at the top of the screen, select the link to the created simulated alert.
5. **Optional:** View which event rules and event field mapping rules were applied and the event field values by selecting the **Activities** tab.

Event field mapping configuration

Use Event field mappings rules to map values from specific fields to values in other fields.

Event Management stores event field mappings in the Event Field Mapping [em_mapping_rule] table. The mappings apply after event rule processing and prior to alert generation. The mapping values from the Event Mapping Pair [em_mapping_pair] table apply to the alert. The original event severity remains unchanged.

For example, if events come with the field "**org_severity**" with the values "*Low*, *Medium*, *High*" and you want the alert **Severity** to hold this value, create an event field mapping rule that maps the field **org_severity** to **Severity**, with these values:

Example showing org_severity mapped to Severity

Original org_severity value	Map to alert Severity value
Low	Warning
Medium	Major
High	Critical

Default event field mappings

Event Management provides default event field mappings for commonly used system monitoring tools. The Transform Value Pairs from event field mappings format the incoming event data for Event Management.

You can view the default event field mappings and mapping pairs by navigating to **Event Management** > **Rules** > **Event Field Mappings** and double-clicking **Name**.

Create event field mappings

Use event field mappings to map values from specific event fields to values in other fields to provide more comprehensive information in an alert. Use team-based integrations in event rules to make sure that connector ownership and execution of rules give precedence to global rules. Teams can maintain consistency and hierarchy while offering flexibility and customization options.

Before you begin

Role required: evt_mgmt_admin

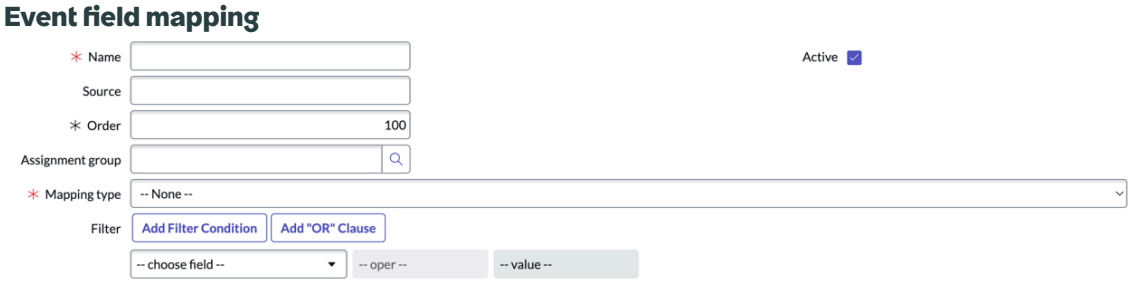
About this task

Create the rule to match the event by its class and original values. Also, specify the new values to replace the original values in the event.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
2. Select **New** or open an existing rule to edit and fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Event Field Mapping form

Field	Description
Name	Event field mapping name.
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Order	Number to define the order in which this action should be processed. Actions with lower numbers are processed first.
Assignment group	For Team-based integrations, select an assignment group. If no assignment group is defined in the event field-mapping rule, then this rule is considered global. When the rules are running – first the global rules run and then the rules that belong to the assignment group that the event's source instance belongs to.
Mapping type	Mapping mechanism that is used to change an event field value. ○ **Map field and transform value (Single field)**: Maps the **Source field** value to the matching value in the Transform value pairs [em_mapping_pair] table and populates the **Target field**. Source and Target fields may be event fields, additional info fields, or alert tags. ○ **Create or update field and set constant value (Constant)**: Sets a constant value to a **Target field**. The **Target field** may be an event field, additional info field, or alert tag. ○ **Map field (Copy field)**: Copies the exact value of a Source field to the specified Target field. The Source and Target fields may be Event field, Additional info field, or alert tags. ○ **Map field and transform value using regex**: Generically maps the value from the Source field to the matching value in the Transform value pairs table and populate the **Target field**. Source and Target fields may be event, additional info, or alert tags fields. ○ **Map field using regex**: Copies the value from a generically defined **Source field** to the **Target field**. The Source field must be a field from the event additional info field. The Target field may be the field of event, additional info, or alert tag. With this type, you can generically find the name of the Source field by using a regular expression (regex).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Map field and copy value from regex group**: Copies part of the Source field value to the Target field. Source and Target fields may be event fields, additional info fields, or alert tags. Define a regex to specify what part of the **Source field** should be copied. ○ **Advanced mapping using script**: Implements your own logic for event values transformation by using a script. When the 'Run after binding' check box is selected, the rule is executed after the CI binding phase and uses the dedicated script that also has the sys_id of the CI in the input parameters. **Warning:** Complex scripts may affect event processing performance. ○ **Map field from reference table** Use this rule type to extract a **Source field** value from the selected **Reference table** by matching the **Field to match**value to the **Matching alert field** value and then mapping the **Source field** value to the **Target field**. The **Matching alert field** and the **Target field** may be event fields, additional info fields, or alert tags.
Filter	A condition for event field mapping. Select **Add Filter Condition** or **Add "OR" Clause** to configure multiple conditions.
Active	Activates or deactivates the event field mapping. If possible, find and apply another event field mapping rule.
Run after binding	○ When selected, the rule is executed after the CI binding phase. ○ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example: Use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance. **Note:** This check box is displayed only for the following Mapping types: **Map field and transform value (Single field)**, **Map field (Copy field)**, **Map field and transform value using regex**, **Map field and copy value from regex group**, and **Map field from reference table**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you selected **Map field and transform value (Single field)**, fill in the fields as appropriate.

Map field and transform value (Single field) fields

Field	Description
Source field	Event field to map - includes all event and additional info fields. Note: For Additional info fields use: "additional_info.<field name>". When the 'Run after binding' check box is selected, you can use the **alert_cmdb_ci** and the **alert_cmdb_ci_key** prefixes to receive CI related data.
Target field	Event field where the mapping rule inserts or updates the value. When this field is identical to the **Source field**, the mapping rule updates the value in memory of the event field. Alert tags can also be defined by using the *<t_>* prefix.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the following prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Key fields (Transform Value Pairs section)

Field	Description
Key	Value that the mapping rule searches for. Whenever the event field has this value, the mapping rule adds the value listed in the **Source field** field to the field listed in the **Target field**. This field is displayed when the **Mapping type** is **Map field and transform value (Single field)**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Select **+** to add more **Key** fields, as required.

Typical use case: To map the 'event_severity' field in the additional info field with possible values [such as WARNING, MINOR, CRITICAL, CLEAR, MAJOR] to the severity field, configure the following:

- Source field: 'event_severity'
- Target field: 'severity'
- Transform value pairs:
  - From value: 'WARNING', to value: '4'
  - From value: 'MINOR', to value: '3'
  - and so forth...

- If you selected **Create or update field and set constant value (Constant)**, fill in the fields as appropriate.

Create or update field and set constant value (Constant) fields

Field	Description
Target field	The **Target field** may be an an event field, additional info field, or alert tag. Typical use case: Set alert severity to 1 for all events that match the filter.
Value	Value you want to use for the **To field**. This field is displayed when the **Mapping type** is **Constant**.

Typical use case: Set alert severity to 1 for all events that match the filter.

- If you selected **Map field (Copy field)**, fill in the fields as appropriate.

Map field (Copy field) fields

Field	Description
Source field	**Source field** value to be copied to the **Target field** field. The **Source field** may be an event field, additional info field, or alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.

© 2026 ServiceNow, Inc. All rights reserved.

Field	Description
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: To copy the IP field from the event additional info field to the alert field node, use the following:

- 'Source field': ip
- 'Target field': node

○ If you selected **Map field and transform value using regex**, fill in the fields as appropriate.

Map field and transform value using regex

Field	Description
Source field	Source field value to be copied to the **Target field** field. The **Source field** may be an event field, additional info field, or alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: To map severity from the field color in the Additional info field to the Severity field, use:

- Source field: 'color'
- Target field: 'severity'
- Transform value pairs:
  - From value: !*red', To value: '1'. This covers both 'dark red', 'light red', and other values containing 'red' and maps them all to '1'.
  - and so forth...

Key fields (Transform Value Pairs section)

Field	Description
Key	Value that the mapping rule searches for. Whenever the event field has this value, the mapping rule adds the value listed in the **Source field** field to the field listed in the **Target field**. This field is displayed when the **Mapping type** is **Map field and transform value (Single field)**. Select **+** to add more **Key** fields, as required.

- If you selected **Map field using regex**, fill in the fields as appropriate.

Map field using regex fields

Field	Description
Source field	Generically defined Source field value to be copied to the **Target field** field. The **Source field** must be a field from the event additional info field. With this type, you can generically find the name of the

Field	Description
	Source field by using a regular expression (regex).
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.

Typical use case: To map the 'region' field from the additional_info field that appears as 'tags.region' or 'tags|region' or 'cloud.region' to an alert tag *t_region*, use:

- 'Source field': *region
- 'Target field': t_region

- If you selected **Map field and copy value from regex group**, fill in the fields, as appropriate.

Map field and copy value from regex group fields

Field	Description
Source field	Generically defined Source field value to be copied to the **Target field** field. The Source field must be a field from the event additional info field. With this type, you can generically find the name of the Source field by using a regular expression (regex).
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record

Field	Description
	is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.
Regex group expression	.*_.*_(.*)_.*

Typical use case: To extract the third octet from the IP and save it in the additional info *third_octet* field, use:

- 'Source field': ip
- 'Target field': third_octet
- 'Regex group expression': .*_.*_(.*)_.*

- If you selected **Advanced mapping using script**, fill in the fields as appropriate.

Advanced mapping using script fields

Field	Description
Script	The code editor gives text editor support for inline scripts. The code editor has these features for the supported language services and Inline scripts: Syntax coloring, indentation, line numbers, and automatic creation of closing braces and quotes, Auto-suggestions, and auto-completions. Editing tips: ▪ To insert a fixed space anywhere in your code, press the Tab key. ▪ To indent a single line of code, select in the leading white space of the line and then press Tab. ▪ To indent one or more lines of code, select the code and then press Tab. ▪ To decrease the indentation, press Shift +Tab. ▪ To remove one tab from the start of a line of code, select in the line and press Shift +Tab. ▪ To declare variables, use the var keyword so that they remain within the proper JavaScript scope.
Run after binding	When the 'Run after binding' check box is selected, the rule is executed after the CI binding phase and uses the dedicated

Field	Description
	script that also has the sys_id of the CI in the input parameters. **Warning:** Complex scripts may affect event processing performance.

- If you selected **Map field from reference table**, fill in the fields as appropriate.

Map field from reference table fields

Field	Description
Reference table	The reference table. Select the table from where the field is to be mapped to the Target field in the event.
Field to match	The field from the Reference table to be matched with the Matching alert field from the event. It's used to filter out the Reference table records.
Source field	**Source field** value to be copied to the **Target field** field. The **Source field** is the field of the table that was selected as the Reference table.
Matching alert field	Event field to find matching Reference table records. The **Matching alert field** is matched with the **Field to match** field. The Matching alert field may be the Event field, Additional info field, or the Alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** In the **Matching alert field**, to retrieve a value of a field from a CI record. For example: 'alert_cmdb_ci.ip_address' retrieves IP address information of bound CIs. When the **Matching alert field** and the **Field to match** fields are reference fields, dot-walking to sys_id in the **Matching alert field** is required. For example, to use the 'assignment_group'

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	value of bound CIs to match with the **Field to match** field, use the following expression in the **Matching alert field**: alert_cmdb_ci.assignment_group.sys_id ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: Extract 'short_description' from the 'pc_vendor_cat_item' records matching its 'name' field with the 'cat_item_name' field in the Additional info field of the event and map it to the 'description' field on the event in the following fields:

- 'Reference table': pc_vendor_cat_item
- 'Field to match': name
- 'Source field': short_description
- 'Matching alert field': cat_item_name
- 'Target field': description

3. Right-click the form header and select **Save**.
4. Select **Submit**.

Example:
The following values comprise a predefined rule that is applied to events in the *`Trap From Enterprise 9`* class. If the events contain the `snmpTrapOID` element with a value of `iso.org.dod.internet.private.enterprises.cisco.0.0`, the mapping rule changes the value to `reload` in the alerts. If the events contain the `snmpTrapOID` element, a value of `iso.org.dod.internet.private.enterprises.cisco.0.1`, the mapping rule changes the value to `tcpConnectionClose` in the alerts.

Field	Values
Name	cisco.snmpTrapOID
Source	Trap From Enterprise 9
Mapping type	Map field and transform value (Single field).
Source field	snmpTrapOID
Target field	snmpTrapOID
Transform Value Pairs	• Pair 1 ○ **Key**: iso.org.dod.internet.private.enterprises.cisco.0 ○ **Value**: reload • Pair 2

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Values
	○ **Key**: iso.org.dod.internet.private.enterprises.cisco.0 ○ **Value**: tcpConnectionClose

What to do next

Test an event field mapping by sending an event that includes a field that is present in the event field mapping.

Event identifiers

Event identifiers uniquely distinguish one event from another. Event Management uses these identifiers to determine whether to create a new alert or update an existing one.

By default, an event is uniquely identified by the following fields:

- **Message Key**
- **Domain**
- **Category**

Changing the **Category** field (for example, through a Background Script or Business Rule) may lead to unexpected system behavior.

If the **Message Key** is not provided, the system automatically generates one by concatenating the following fields:

- **Source**
- **Type**
- **Node**
- **Resource**
- **Metric Name**

If the above fields are not defined in the incoming event, you can define them using event rules.

Alert tags

Alert tags allow consolidation for all normalized fields and improve the admin experience to transform and normalize alert fields (key/value) enabling reuse of normalized fields across different sources. This improves alert quality for correlation and provides more out-of-the-box TBAC (Tag Based Automatic Correlation) definitions.

Example: Field normalization in alert management

In some cases, the same information may exist under different field names across data sources. For instance, an incoming event from one source has the location stored under the field **region**, but in other source, the same information is captured under **impacted_region**. To avoid confusion and enable consistent grouping, filtering, or automation, we normalize these fields by creating a unified field — for example,**t_region**. This field pulls the value from **region** or from **impacted_region** depending what field is present in the event. This way, the normalized field **t_region** always holds the location value in a consistent manner, regardless of the original source field.

Alert tags field appears in the Alerts form. These tags are created by Event Rules and in Event mapping and are saved in the alert tags' table [em_alert_tags]. The naming convention used to

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

create key/value pairs is t_<tag name>. This enables reusing tags in the event rules by allowing users to select tags that were previously defined. When new alert tags are defined, TBAC (Tag Based Alert Clustering) tags are automatically created. Using these TBAC tags, you can create new TBAC alert clustering definitions from the new source of tags.

Event field format for event collection

Event Management requires all events to use a standard form, regardless of how they arrive at the instance.

In the application navigation filter, enter `em_event.list`.

Event form

Name	Description
em_event.source [Source]	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
em_event.node [Node]	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
em_event.type [Type]	Optional. The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
em_event.resource [Resource]	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.
metric_name [Metric Name]	The name of the metric that has been measured, such as DB `Disk Free Space (MB)`, `Disk Writes/sec`, or `Disk Write Bytes/sec`.
em_event.event_class [Source instance]	If the em_event.node field is not specified, it is mandatory for alerts to be created automatically. Values for the em_event.event_class field originate from either the source generating the events or by event rule. Name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44. Corresponding field display name is **Source Instance**.
em_event.message_key [Message key]	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
em_event.ci_type [CI type]	String containing information about CI type. Maximum length: 100 characters.
em_event.severity [Severity]	Event severity options are: • **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. • **Major**: Major functionality is severely impaired or performance has degraded. • **Minor**: Partial, non-critical loss of functionality or performance degradation occurred.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event form (continued)

Name	Description
	• **Warning**: Attention is required, even though the resource is still functional. • **OK**: An alert is created. The resource is still functional. • **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.
em_event.resolution_state [Resolution state]	Optional. If the field is empty, the resolution on corresponding alerts is still pending. Event state from the event source is either **New** or **Closing**. • **New**, the resolution on corresponding alerts is open. • **Closing** event state closes corresponding alerts.
em_event.time_of_event [Time of event]	Time that the event occurred in the source system. This field is a GlideDateTime field in UTC or GMT format. Maximum length: 40 characters.
em_event.state [State]	Current processing state of the event: • **Ready**: Event has been received and is waiting to be processed. • **Processed**: Event was successfully processed. • **Ignored**: Value is not in use. • **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank.
em_event.alert [Alert]	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.
em_event.description [Description]	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.
em_event.additional_info [Additional information]	Optional. A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field "Connection instance is successful". When the event is processed, all this plain text becomes one JSON string and might not be useful

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event form (continued)

Name	Description
	within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {“additional_content”: “Connection instance is successful"}.
processing_notes [Processing Notes]	Display of the events processing log.

Custom alert fields

You can populate custom alert fields with data contained in **Additional information** field of the event.

Valuable data contained in **Additional information** fields of events can be useful, for example, for reporting. Alert fields are automatically populated from fields that have the same name in the event. This behavior holds true for **Additional information** event fields and for **Additional information** fields that Event Rule adds. Therefore, to populate a custom alert field with the value in **Additional information** fields, use the custom field name in the **Additional information** field. You can also use Event Rules for this purpose. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON format when the event is processed. For more information, see Configure an event rule to customize alert content.

The short description field of an alert is automatically written using the type, node, and description of the alert. To prevent the short description field from being over-written, open the *sys_properties* table, locate the *evt_mgmt.override_alert_short_description* property, change the value to `false`, and then click **Update**.

Depending on permissions, you may only be able to create fields with the **user_** prefix. If so, use Event Rules to create an **Additional information** field with the same name. To prevent some fields to be copied to the alert field, use the *evt_mgmt.alert_black_list_fields* property and add the field names that must be excluded. By default, the fields that are not copied are:

- message_key
- category
- additional_info
- sys_updated_on
- sys_updated_by
- sys_created_by
- sys_created_on
- sys_mod_count
- sys_id

Testing and sending events

You can manually test and send events to confirm that Event Management properly manages events and generates alerts.

Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

For example, you can manually send events to:

- Confirm that the MID Server is using an event connector definition and instance to send events.
- Confirm that event rules, event field mapping, and other configurations do generate alerts.
- Track an operation or action that did not generate an event.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Click **New** and then fill in the fields.

Event form

Name	Description
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
Resource	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Metric Name	The name of the metric that has been measured, such as `DB Disk Free Space (MB)`, `Disk Writes/sec`, or `Disk Write Bytes/sec`.
Source instance	Name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44. Corresponding field display name is **Source Instance**.
Message key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Severity	The severity of the event. The options are typically interpreted as follows: ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed. ○ **OK**: An alert is created. The resource is still functional.
Resolution state	Optional. If the field is empty, the resolution on corresponding alerts is still pending. Event state from the event source is either **New** or **Closing**.

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	○ **New**, the resolution on corresponding alerts is open. ○ **Closing** event state closes corresponding alerts.
Time of event	Time that the event occurred in the source system. This field is a GlideDateTime field in UTC or GMT format. Maximum length: 40 characters.
State	The current processing state of the event: ○ **Ready**: Event has been received and is waiting to be processed. ○ **Processed**: Event was successfully processed. ○ **Ignored**: Value is not in use. ○ **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank.
Alert	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.
Description	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.
Additional information	A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field “Connection instance is successful”. When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {“additional_content”: “Connection instance is successful"}.

3. Click **Submit**.

View event processing statistics

Extract statistics from your instance to ensure that performance is not affected and extract metrics related to event processes to monitor event processing status.

Before you begin

Ensure that the *Event Management - Collect xmlstats* job is active. Configure this scheduled job by navigating to **System Definition** > **Scheduled Jobs**.

You can control the processing of event statistics using the *evt_mgmt.event_processing_stats_period* property. For information about configuring this property, see Configure statistics processing period.

Role required: evt_mgmt_operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can view key metrics from the instance to ensure that performance is not affected and monitor the status of the processing of events. For more information about viewing self-health monitoring statistics, see View self-health monitoring statistics for Metric Intelligence.

Procedure

1. In a browser where the instance is running, run the XML Stats script by appending the following text to the instance URL: `xmlstats.do?include=XMLStatsEm`
2. Press **Enter**.
3. Monitor the event processing metrics that are reported to ensure that events are processed according to accepted benchmark values.

Result

Example: Sample output after running the XML Stats script

```
<xmlstats created="Tue Oct 23 04:01:25 PDT 2018"
 includes="XMLStatsEm" version="2">
<itom_event_management>
<event_processing>
<processed count="47" max_process_time="10"
 mean_process_time="5" record_time="2018-10-23 11:00:41"/>
<ready count="7" oldest_ready_event="37" record_time="2018-10-23
 11:00:41"/>
<error count="5" record_time="2018-10-23 11:00:41"/>
<total_created count="5" record_time="2018-10-23 11:00:41"/>
</event_processing>
</itom_event_management>
</xmlstats>
```

The event processing metrics in the report are described in the following table.

Note: The default processing cycle is events created in the last hour and updated in the last minute.

Event processing statistics

Metric	Description
Event processing statistics	
processed count=n	Number of events processed by the instance.
max_process_time=n	Longest time taken by the instance to process an event.
mean_process_time=n	Average time taken by the instance to process the events in this cycle.
Event ready statistics	
ready count=n	Number of events that are in Ready state and are available to be processed. Default processing cycle: events created in the last hour and updated in the last minute.
oldest_ready_event=n	Longest time taken by an event to remain in Ready state. If this metric has a value that is bigger than your benchmark figure, investigate the event further to determine what is impeding the processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event processing statistics (continued)

Metric	Description
	Default processing cycle: events created in the last hour.
Other processing statistics	
error count=n	Number of events for which errors were reported. Default processing cycle: events created in the last hour and updated in the last minute.
total_created count=n	Overall number of events that were processed during this event processing cycle. Default processing cycle: events created in the last hour.

Enable processing of event process statistics

Enable the system property that switches on statistics processing for events to let the platform collect and analyze metrics such as event volume, processing flow, and handling time. This helps you monitor system performance, identify bottlenecks, and optimize event handling for faster and more efficient operations.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New** and fill in the form.

System property fields

Field	Description
Name	Name of the property you are creating.
Description	Narrative that describes the property and its function.
Choices	Comma-separated values for a choice list. If you need a different choice list label and value, use an equal sign (=) to separate the label from the value. For example, Blue=0000FF, Red=FF0000,Green=00FF00 displays Blue, Red, and Green in the list, and saves the corresponding hex value in the property value field.
Type	Data type, that is selected from a list (for example, integer, string, or true|false).
Value	Desired value for the property. When retrieving properties using the `gs.getProperty()` method, treat the results as strings. For example, a true|false property returns 'true' or 'false' (strings), not the Boolean equivalent.
Read roles	Roles that have read access to this property.
Write roles	Roles that have write access to this property.

3. Select **Submit**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Add a system property

Configure statistics processing period

Set the time period, in seconds, for collecting event processing statistics. For example, you can set a time period twice as long as the default 60 seconds to collect more statistics.

Before you begin

Role required: evt_mgmt_admin

About this task

Use the *evt_mgmt.enable_event_processing_stats* property to configure the XMLStatsEm script time to collect event processing statistics. The default value of this property is 60 and the unit is second. Set the property values to run the script over a longer or shorter period. For example, set a shorter period of statistics collection so fewer CPU resources are used.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the *evt_mgmt.enable_event_processing_stats* property.
3. Either configure the value of an existing *evt_mgmt.enable_event_processing_stats* property to run the XMLStatsEm script over a shorter or longer time period or create a new property if it does not exist already.
   - If the property exists, set the property to the required time period to enable the XMLStatsEm script time to collect event processing statistics and click **Update**.
   - If the property does not exist, click **New**, fill in the form, and click **Update**.

System property fields

Field	Description
Name	Name of the property you are creating.

For example, Blue=0000FF, Red=FF0000,Green=00FF00 displays Blue, Red, and Green in the list, and saves the corresponding hex value in the property value field.
Type	Data type, that is selected from a list (for example, integer, string, or true|false).
Value	Desired value for the property. When retrieving properties using the *gs.getProperty()* method, treat the results as strings. For example, a true|false property returns 'true' or 'false' (strings), not the Boolean equivalent.
Read roles	Roles that have read access to this property.
Write roles	Roles that have write access to this property.

Manage and monitor alerts

An alert is a notification for selected events that are considered to be important and require attention. Event Management generates alerts based on event rules.

You can monitor and resolve alerts in ways that are based on alert impact calculations and alert configuration and property settings.

Alert management rules for resolving alerts

You can configure Event Management to respond to alerts automatically. An alert management rule determines the required alert response, such as to open an incident, knowledge base article, open a task, launch remediation action.

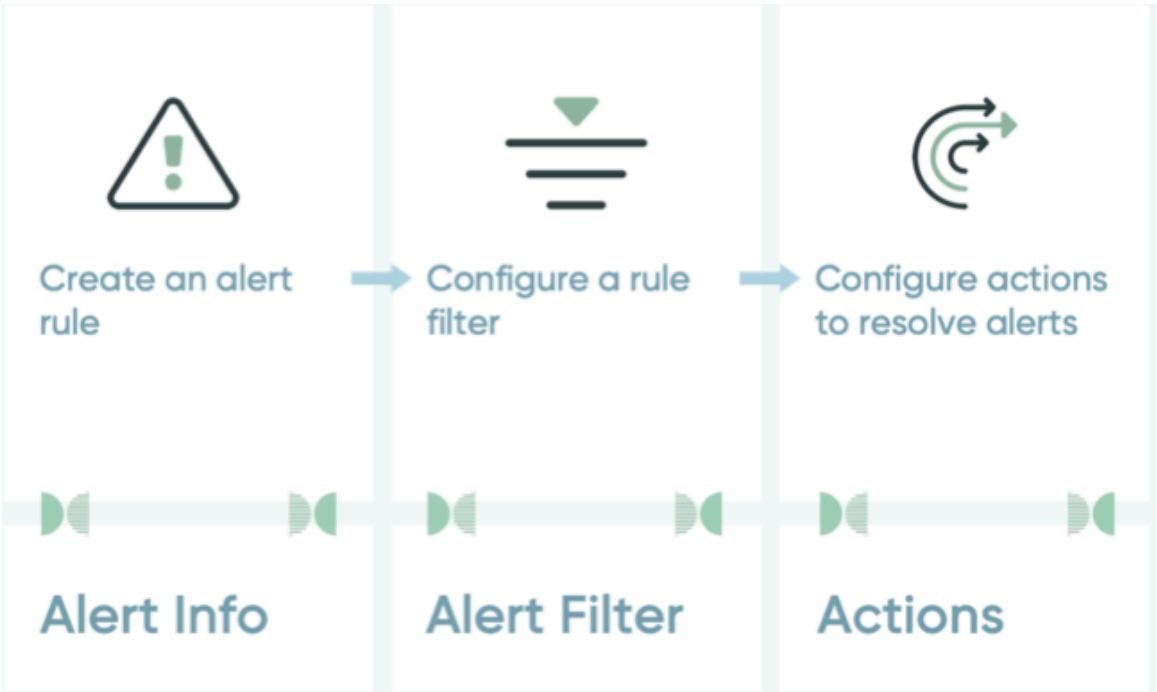
Alert management rules provided with the base system as a store application (Alert Rules Management [sn_em_arm]) to help you respond to alerts. You can create filters to specify conditions for the rule so that the remedial action specified in the rule takes effect only when the conditions are met. For example, launch the required subflow or open an incident based on an alert. The alert's execution history is automatically updated to indicate the actions that were invoked.

Users with the evt_mgmt_admin role can use the alert management rule designer to create and customize alert management rules to act on specified alerts. Define rules with filters to determine which alerts the rule applies to. You can create rules to launch applications, URLs, subflows, remediation actions, or take other actions, such as to open an incident. For more information, see Create an alert management rule.

Users with the evt_mgmt_operator role can manually run alert management rules.

Alert management rule flow

The flow to create and run an alert management rule is:



Alert management rule components

Component	Description
Alert Info	Configure a name and general information for the rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert management rule components (continued)

Component	Description
Alert Filter	Specify a filter to determine to which alerts the rule applies. You can specify the related list conditions. **Note:** The fields that are not supported for alert filtering are: Overall Event Count, Priority, Priority Group, Priority Breakdown, Tags, and Impacted Services.
Actions	Specify the response to the alert, such as to run a subflow, perform remediation action, launch an application, or launch a URL in a browser.

How rules are applied to updated alerts

Alert management rules run on all updated open alerts. Rules don't run on closed alerts, even if they've been updated. The filters determine whether the rule's actions apply to the alert. For example, if a rule's condition indicates that an email message is sent when the alert severity changes to Major, the rule applies to an alert updated by a severity change from Warning to Major.

Use of filters and other actions

Filters ensure that the rule is invoked only when the configured condition occurs, and not for every update of the alert. For example, you can configure a rule so that updates that aren't relevant (such as a **Work notes** field update) don't cause the rule to run. As another example, a filter condition can specify that the alert management rule runs only when the alert severity is critical.

You can perform the following actions:

- Specify a filter that determines which alerts the rule applies to.
- In the Related List Conditions section of the form, configure additional conditions, for example, with an *`Alert > Parent`* relationship, to filter for any alerts that were received today.
- Respond to alerts. For example, by using subflows and workflows, create incidents for primary alerts with critical severity, or open a search engine in a browser to search for data according to the description field of the alert.
- Apply remediation. Remediation is based on Orchestration workflows that can be scripted to perform remediation tasks such as gathering system information or rebooting a server.

Note: For enhanced performance of *`Event Management - Evaluate Scoped Alert Rules Management`* scheduled jobs, use subflows instead of workflows.

Scheduled jobs that check alert management rules

Alert management rules are checked every 11 seconds by the default *`Event Management - Evaluate Scoped Alert Rules Management0`* scheduled job. The job then executes the required actions. For large-scale environments, you can add more than one job. Please contact Customer Service and Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Only new users from Vancouver and up get two scheduled jobs: *Event Management - Evaluate Scoped Alert Rules Management0* and *Event Management - Evaluate Scoped Alert Rules Management1*. Users upgrading from previous family releases remain with a single scheduled job *Event Management - Evaluate Scoped Alert Rules Management0*.

Don't modify the *sn_em_arm.alert_management.num_of_jobs* property.

By default, the alert grouping job (**Service Analytics group alerts using RCA/Alert Aggregation**) and the alert management (**Event Management - Evaluate Scoped Alert Rules Management0**) jobs run independently of each other. For more information about coordinating the alert response and the automated alert grouping, see Synchronizing alert response with automated alert grouping.

Migrate existing alert action rules

Existing alert action rules from an earlier release can be migrated to become alert management rules. You can modify an alert action rule only after migrating it to an alert management rule. For more information, see Migrate an alert action rule to an alert management rule.

Create an alert management rule

Create an alert management rule to track alerts and resolve them by determining the required response, for example, to open an incident or launch remediation action.

Before you begin

To enable remediation with a subflow, you can use a subflow that is available with the base system, or you can create your own subflow. For details, see Create a custom subflow for alerts.

Role required: evt_mgmt_admin, flow_designer

About this task

Use alert management rules to track and resolve alerts.
While working in the alert management rule designer, you can work in multiple sections without losing information in any section.

Note:

- Alert management rules that are not configured to perform any action are skipped and the rule is automatically set to inactive.
- If an alert is bound to a CI by a user action (such as an alert management rule) and the CI is in the Maintenance state, you must manually bind the CI to the alert and mark it with the **In Maintenance** status.

Create alert management rules that:

- Locate other alert management rules that have relevance to the selected alert.
- Determine when the execution of the rule takes place.

Alert management rules do not necessarily complete in the order in which they are invoked.

You can configure alert management rules to:

- Automatically generate and link incidents, tasks, or knowledge articles to alerts.
- Automatically apply a remediation workflow or enable users to manually run remediation.
- Automatically construct a URL according to the value of specified fields in the alert.

To assist you, several alert management rules are provided with the base system. You can use them as presented or you can use them as examples to build custom alert management rules.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert management rules provided with the base system

Rule	Description	Active
Open sensor dashboard in PRTG	The sensor dashboard in the Paessler PRTG Network Monitor (PRTG) application opens.	Yes
Oracle EM Launch Target Status and View Events	Launch Oracle Enterprise Manager to view: • Target Status • Event for alerts from source Oracle EM	Yes
Drilldown to OMI	Drill down to the HP Operations Manager i (OMi) application.	Yes
Create Incident on Primary Critical Alert	Create an incident for primary critical alerts. The incident can be created automatically or manually.	No
Search Google for "description"	Open Google Search in a browser to search for data according to the description that appears in the alert.	Yes
Create Incident	Create an incident for all alerts that are not in maintenance state. The rule runs automatically on selective update.	No
Create Incident Manually	Manually create an incident for alerts that are not in maintenance state.	Yes
Create Major Incident Candidate	Create a major incident candidate for all alerts that are not in maintenance state and are not secondary alerts. A major incident candidate can be promoted to become a major incident.	No
Create Major Incident	Create a major incident for all alerts that are not in maintenance state and are not secondary alerts.	No

If your instance was upgraded from Kingston, the alert action rules that were provided with the Kingston base system are available to you. However, if you modified any of the rules, the changes made are not carried over.

Alert management rules run 5 seconds after an alert is updated, resetting the timer if updates occur within that window. This delay ensures remediation actions, such as incident creation, are triggered only when the issue is clear and stable, reducing duplicates and unnecessary noise. To change the default 5-second delay, create the `evt_mgmt.alert_rule_delay` property on the **All** > **System Properties** > **All Properties** and change the value. To know how to create a property, see Add a system property.

Procedure

1. Navigate to **Event Management** > **Rules** > **Alert Management Rules**.
2. Click **New** and then fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Alert Management Rule form

Field	Description
Name	Unique name for the rule.
Active	Check box for enabling the rule. If this check box is selected, you must specify: ○ in the **Alert Filter** section, an alert filter ○ in the **Actions** section, at least one of any of these actions: ▪ active subflow ▪ workflow ▪ quick response
Order	Order in which rules are evaluated when multiple rules are defined for the same alert. Alert management rules are evaluated in ascending order. The default value is `100`.
Multiple alert rules	Instruction about whether to search for additional rules: ○ **Search for additional rules**: Execute the current rule then continue and execute other matching rules in the order of rule priority, where the lower number has the higher priority. ○ **Stop search for additional rules**: Execute only the current rule for the alert that matches the filter. When selecting this option, a rule configured second in a rule hierarchy may run before the results of the first rule take effect.
Description	Descriptive text for the rule.
Assignment group	Assignment group that works on the alert. If no assignment group is defined in the alert rule, then this alert rule is considered as a global rule. When the rules are running – first the global rules run and then the rules that belong to the assignment group of the alert.

3. Click **Alert Filter** and specify conditions for alerts that this rule is applied to.

Alert Filter stage

Field	Description
Rule is activated when	Rule execution takes place when: ○ **Alert changes to filter**–content changes to the alert cause the alert to match the filter. If the filter is matched on following update of the alert, the rule is not applied. If the alert was closed and then reopens, at the next update of the alert and the filter is matched, the rule is applied. Thereafter, when there is an update of the alert, the rule is no longer applied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Alert matches filter**–the content of the alert matches the filter. On following update of the alert and if the filter is matched, the rule runs and is applied to the alert. The rule remains applied for every matching update.
Alert filter	
Preview	Function to preview alerts that match the specified condition. A hyperlink shows how many alerts match the filter.  If you click the hyperlink, the browser opens another tab that lists alerts in the Alerts [em_alert_list] table. The list shows which alerts match the rule, including closed alerts. Alerts that have already been run by the rule are not marked in any way. You can click any alert to view further details.
Conditions	Conditions that, if fulfilled, cause the filter to be applied. For more information about building conditions, see Using the condition builder. To add another condition, click **New Criteria**. **Note:** The **Created on** condition is not invoked when running the **Event Management - Evaluate Alert Management Rules** job. Instead, use the **Updated on** condition, as the job detects alerts based on the time they were updated and not on the time they were created.
Related List Conditions	Conditions to include a relationship with another table in the filter. **a.** Click **Table** and select the required table. **b.** Specify the conditions for this filter. For more information about creating related lists, see Add related list conditions.

4. Click **Actions**.
   In this section, you can configure the following action types as a response to alerts or to remediate alerts:
   - Remediation Subflows: Execute a subflow provided with the base system.
   - Launch Applications: Open applications and browsers that you configure.

   Note: The Remediation Workflows option is deprecated. To enable flows to be triggered by alerts, use the Flow Designer.

5. **Optional:** In the Remediation Subflows section, follow these instructions to add subflows:

   a. Under **Subflow**, double-click the cell.

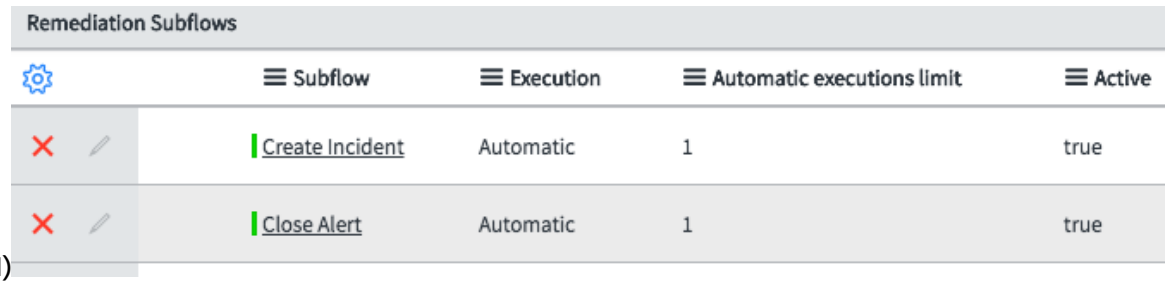
   b. Click the search icon.
   The list of subflows provided with the base system appears. For more information, see Event Management subflows in the base system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. From the subflow list, select a subflow.

d. Repeat, adding as many subflows as required.

(Optional)



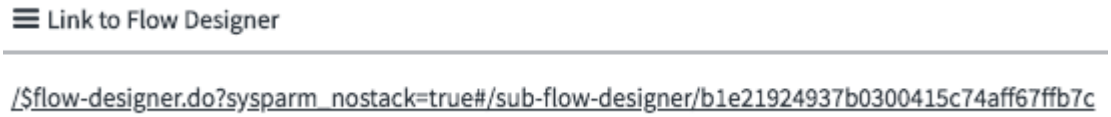
e. To specify when the subflow must be executed, double-click the cell under **Execution**.

Subflow execution options

Name	Description
Automatic	The subflow is executed automatically when the rule is matched.
Manual	Execute the subflow if required when the rule is matched.
Both	When the rule is matched, the subflow is executed automatically and you can optionally execute the subflow again manually.

f. Under **Automatic executions limit**, double-click the cell and enter the integer number of times to execute the subflow.
After the subflow has been executed the indicated number of times, it does not run anymore.

g. To enable the subflow to be executed, double-click the cell under **Active** and select `true`.
A link in the cell under **Link to Flow Designer** appears only after a subflow has been selected and the rule has been saved.



6. To add instructions to launch applications or to open browser windows, in the Launch Applications area:

a. Under **Display Name**, double-click the cell.
Specify a name for the link.

b. In the **URL** field, compose the URL using data from the alert in the format:`http://${source}.com:${port}/${cmdb_ci.name}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Active** field is automatically updated.

Any URL-based action can utilize the alert parameters and the URLs can refer to wikis, messaging services, REST APIs, and so on.

7. Click **Submit**.

Result

The alert management rule is added to the list of available rules that can be used to resolve alerts.

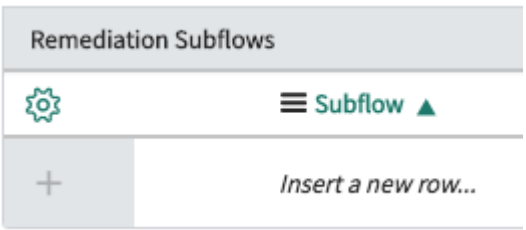
Apply a quick response in an alert

Event Management subflows in the base system

The subflows provided with the base system appear in the Remediation Subflows area of alert management rules.

Accessing the subflows

Navigate to **Event Management** > **Rules** > **Alert Management Rules** and click **New**. Click the **Actions** tab. In the Remediation Subflows area, double-click the **Insert a new row** field.



Click the search icon to add subflows. The list of subflows that are provided with the base system appears.

Subflows in the base system

Name	Description
Acknowledge Alert	Subflow to mark the alert as being Acknowledged. Acknowledge an alert to show that further attention is required.
Attach Knowledge Article (legacy)	Subflow to attach a knowledge article to the alert. This subflow is provided for instances that are migrated from legacy releases (prior to the London release). **Note:** Add the **Knowledge article** column to the Alert Management Rules [em_alert_management_rule] table, and select an article to attach to an alert when the rule executes.
Change Alert to Maintenance Mode	Subflow to mark the alert as being in Maintenance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflows in the base system (continued)

Name	Description
Close Alert	Subflow to mark the alert as being Closed.
Create Incident	Subflow to create an incident. Fields from the alert are used to populate the matching fields in the incident that is created. **Note:** • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, an incident is not created. • The alert management job runs even if the alert grouping job is not complete, if a specified time frame has passed. When this occurs, you can enable the *Avoid INTs on secondary alerts* rule to prevent incidents from being created for secondary alerts (when the *evt_mgmt.avoid_int_enabled* property is enabled), since an incident already exists for the primary alert.
Create Major Incident Candidate	Subflow to create a major incident candidate. Fields from the alert populate the matching fields in the major incident candidate that is created. A major incident candidate can be upgraded to become a major incident. **Note:** • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, a major incident candidate is not created. • If the **Role in group** is **Secondary**, the major incident candidate is not created.
Create Major Incident from Alert	Subflow to create a major incident from alert. Fields from the alert are used to populate the matching fields in the major incident that is created.

Subflows in the base system (continued)

Name	Description
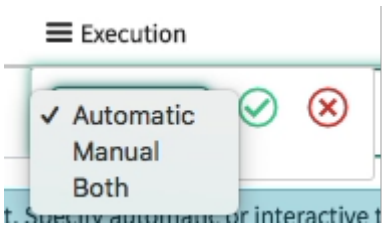
	script for instances migrated from legacy releases (prior to the London release). If configured, apply the task template. **Note:** Add the **Task template** column to the Alert Management Rules [em_alert_management_rule] table, and select a task template and task to apply when the rule executes.
Overwrite Alert Template (legacy)	This subflow applies the alert template. This subflow is provided for instances that are migrated from legacy releases (prior to the London release). **Note:** Add the **Task type** column to the Alert Management Rules [em_alert_management_rule] table, and select an alert template to apply when the rule executes.

1. Select the subflow that you need.
2. To customize a subflow, see Create a custom subflow for alerts. This topic also describes the input parameters in a subflow.
3. To specify when the workflow must be executed, double-click the cell under **Execution**.



.

Create a custom subflow for alerts

You can create a subflow according to your requirements. For example, you can resolve alerts, notify teams, or run remediation actions.

Before you begin

Role required: evt_mgmt_admin, flow_designer

About this task

Copy an existing subflow, and then customize it. Publish the custom subflow so that it is available to be used to resolve any alert. For more information, see Create a subflow.

Note: If your ServiceNow instance uses domain separation, you must ensure that the new custom subflow that you created operates only on the data of the designated domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

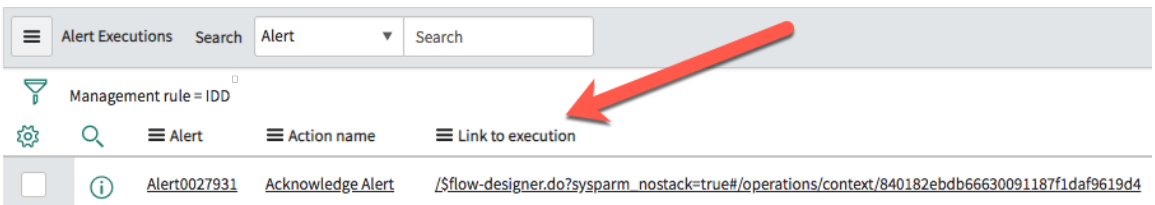
Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. In the Flow Designer window, click **Subflows**.
3. Click **Create Incident**.
   The Create Incident subflow opens in Flow Designer in read-only format. The inputs in the Create Incident subflow are described in the following table.

Create Incident input parameters

Value	Description
alertRuleName	The name of the alert management rule that specifies this subflow, for example `IDD`.
alertRuleId	The sys_id of the alert management rule, for example, `1ae122e84f5f1300b28392918110c71e`.
alertGR	The alert record that matches the filter that is defined in the alert management rule, for example, `Alert0027931`
executionId	The ID of the execution to be retrieved, for example, `000182ebdb66630091187f1daf9619d4`
userName	The current user's name, for example, `admin`.
userDisplayName	The name that the current user specified to be displayed, for example, `System Administrator`.

For example, in an alert management rule that has processed alerts, in the Alert Executions area, click the **Link to execution** of the required alert.



The Flow Designer opens. Click **Subflow Inputs and Outputs**. The input variable names of the subflow are displayed with their respective values.

4. In the subflow header, click more actions and select **Copy subflow**.
5. In the **New Subflow Name** field, enter the name of the new subflow.
6. To limit the application scope of the subflow, in the **Application** field, select the required application, otherwise select `Global`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Click **Copy**.
   The new subflow is created and is opened as a tab in the subflow designer editor. The inputs provided by the template appear.

   Inputs are fixed and cannot be added to.

   In the editor, you can delete subflow inputs or outputs, as required.

8. To delete an input, click .
   Inputs are fixed and cannot be added to.
9. Create subflow outputs by defining the names and data types.
   a. Click to add output.
   b. Define the name and the data type.
10. To save the subflow in draft status, click **Save**.
11. To save and publish the subflow so that it can be used in the alert management rule designer, click **Publish**.

Result

Include the modified subflow in an alert management rule to resolve alerts according to your customized requirements.

Subflows

Alert executions information

Alert executions information provides a reference to the alert management rule actions that are performed. This information appears in the Alert Management Rule record only if an alert matches the filter in the rule and an action was performed. You can click any link in the Alert Executions list to open the referenced item.

Alert Executions

In the Alert Management Rule record, the Alert Executions list shows key related records for the rule.

Note: The Alert Executions list in the Alert Management Rules record shows alert execution information and lists the alert management rules that the selected alert matched.

Alert Executions list

Alert Executions Go to Alert Search 1 to 2 of 2

Management rule = Rule for execution

Alert	Action name	Link to execution	Related Task	Log	Automatic run	Created
Alert0010009	Create Incident	/$flow-designer.do?sysparm_nostack=true#/operations/context/d35096efdbe2130091187f1daf96190e	INC0010002	Automatic execution #1 out of 1.	true	2018-06-13 05:31:26
Alert0010008	Create Incident	/$flow-designer.do?sysparm_nostack=true#/operations/context/fddc86ab4fa21300b28392918110c731	INC0010001	Automatic execution #1 out of 1.	true	2018-06-13 05:16:03

Information in the Alert Executions list

The columns in the Alert Executions list are populated with details of the alerts that matched the alert management rule and the actions that ran. The listed alerts match the filter in the rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View alert execution information

You can click any link in the Alert Executions list to view the alert execution information of the referenced item. This information appears in the Alert Management Rule record only after an alert matched the filter in the rule and an action was performed.

Before you begin

Role required: evt_mgmt_admin

About this task

Among the information shown in the Alert Executions list is:

- The list of alerts that matched the filter of the rule.
- The tasks, including incidents, that were opened.
- Which remediation workflows ran and which subflows ran.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Management Rules**.
2. In the Alert Management Rules list, click the rule.
   If an alert matched the filter in the rule and an action was performed, the Alert Executions list appears in the Alert Management Rules record. The list appears irrespective of the stage of the selected alert management rule.

Alert Executions list

Column	Description
Alert	Alert number of the alerts that matched the alert management rule.
Action name	Name of the action that was taken to resolve the alert (subflow or workflow).
Link to execution	Link to the action execution log that was created when the action was performed.
Related task	Link to the task that was created when the alert was resolved. For example, if the action for a rule is to create an incident, this field provides the incident number with a link to open the incident. A link is provided to the workflow remediation task that is created to monitor the remediation.
Log	Notice or information showing the result of the execution action, for example, how executions took place, "`1 out of 2 executions`". When the alert closes, the execution count number (the first number) resets to 0. This information does not indicate that the subflow was executed successfully, rather that the call to that subflow was successful and that the subflow is correctly configured.
Automatic run	Indication of how the action ran: automatically (true) or manually (false).
Created	Date and time that the entry was created.

Migrate an alert action rule to an alert management rule

Existing alert action rules from an earlier release can be executed, but cannot be modified. Alert action rules that have been migrated become alert management rules and all the definitions of the alert action rules are migrated to the alert management rule format. Migrated rules can be modified.

Before you begin

Role required: evt_mgmt_admin

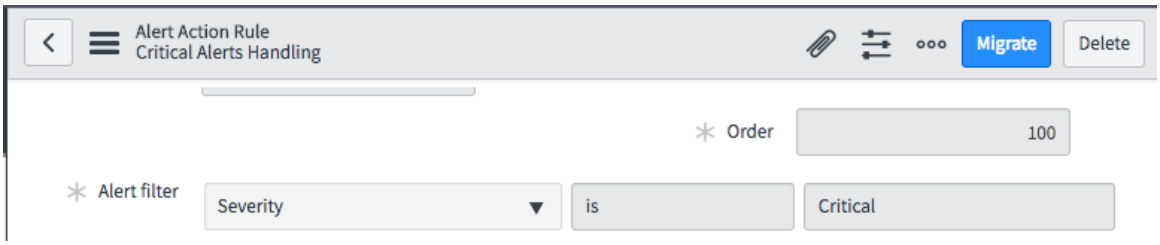
About this task

Existing alert action rules are active, read-only rules. An alert action rule can be modified only after it is migrated to an alert management rule.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Action Rules**.
2. Select an alert action rule to migrate or delete.

Alert Action Rule record



3. Click **Migrate**.
   If you clicked **Migrate**, the list of migrated rules can be found, together with new alert management rules, by navigating to **Event Management** > **Rules** > **Alert Management**.

   After a successful migration, all the definitions of the alert action rules are migrated to the alert management rule format.

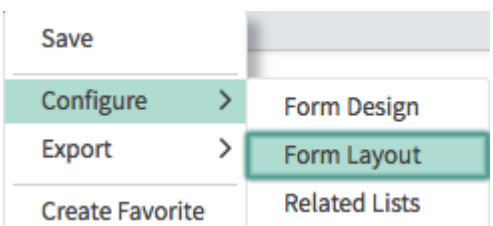
Result

When an alert action rule has been migrated successfully, the alert action rule can no longer be modified. However, the new alert management rule can be modified.

What to do next

If the alert action rule that was migrated had a task template, you can customize the alert management rule designer to display the task template name.

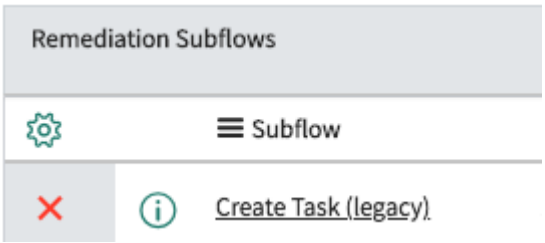
1. In the header of the alert management rule, click **Additional actions** .
2. Select **Configure** > **Form Layout**.



3. In the **Available** pane, select **Task template** and move it to the **Selected** pane. Position it as required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Task template** field, select the required template.
5. In the Actions tab, in the Remediation Subflows area, select the Create Task (legacy) subflow to run the task template.



Related topics

Apply a quick response in an alert

Synchronizing alert response with automated alert grouping

Synchronize alert response with grouping by ensuring alert management jobs runs after alert grouping jobs—this prevents duplicate actions like incident creation on secondary alerts.

Before you begin
Role required: admin

About this task
By default, the alert grouping job (**Service Analytics group alerts using RCA/Alert Aggregation**) and the alert management job (**Event Management - Evaluate Scoped Alert Rules Management0**) run independently of each other. To synchronize the alert response with automated alert grouping (for example, to avoid creating an incident on a secondary alert), you must enable the property *evt_mgmt.avoid_int_enabled* to ensure that the Alert Management job is executed after the Alert Grouping job is completed. This property is accessible from the Event Management Properties page (**All** > **Event Management** > **Administration** > **Event Management Properties**). In addition, you must configure the relevant alert management rule (for example, for incident creation), to filter out all secondary alerts.

Note: If only one alert exists when the Alert Management job runs, an incident is created. When a second alert arrives later, the next Alert Grouping job forms a group, makes the new alert as secondary, and creates a new incident.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. If you want to avoid incidents on secondary alerts, select the **Enable Avoid Incidents on Secondary alerts and wait for Grouping job to be executed** check box.
3. Select **Save**.
4. To filter out secondary alerts, navigate to **All** > **Event Management** > **Rules** > **Alert Management Rules**.
5. Select the relevant rule.
6. In the Alert Management Rule form, select the **Alert Filter** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. In the Condition area, select **And**.
8. Add a condition:
   - **Role in Group**
   - **is not**
   - **Secondary**
9. Select **Update**.

Configure alert remediation actions

Run commands to perform alert remediation on remote Linux and Windows CIs.

Before you begin

Install the following plugins:

- IntegrationHub Enterprise spokes plugin
- ServiceNow IntegrationHub Action Step - PowerShell
- ServiceNow IntegrationHub Action Step - SSH

For Linux: Ensure that the remote Linux host is reachable using the MID Server IP address that runs action scripts.

For Windows:

- Ensure that Powershell v3.0 - 5.0 are supported and installed on the Windows target server.
- Enable Powershell remoting on the remote Windows target server.
- Ensure that the remote Windows target server is reachable using the FQDN from the MID Server that runs action scripts.

Add credentials to the credential aliases that come with the base system:

- linuxAdmin
- windowsAdmin

Role required: evt_mgmt_admin or flow_designer

Procedure

1. Access remediation actions in one of the following ways:
   - Quick actions in an alert, as described in Apply a quick response in an alert.
   - The Playbook tab in Service Operations Workspace, as described in Run actions to resolve alert issues .
2. Configure additional input in the alert's **Additional Information** field, using this format:

   ```
   {"remediation_action_resource":"<mandatory input>"}
   ```

   The mandatory input per action is described in the following table.

Action name	Mandatory input in Additional information field
Stop Windows Process	Process ID
Restart Linux Service	Service Name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action name	Mandatory input in Additional information field
Kill Linux Process	Process ID
Get Windows Processes	N/A
Stop Windows Service	Service Display Name
Restart Windows Service	Service Display Name
Get Windows Services	N/A
Stop Linux Service	Service Name
Start Windows Service	Service Display Name
Suspend Windows Service	Service Display Name
Get Linux Services	N/A
Run Linux Top for Memory	N/A
Show Disk Space Used	N/A
Run Linux Top	N/A
Start Linux Service	Service Name
Show Disk Space Used	N/A

Result

After executing an alert action, the results are noted in the *Work Notes* field of the alert.

CI Remediation

Alert and configuration item (CI) remediations help troubleshoot and resolve underlying problems that generate alerts. Remediation is based on Orchestration workflows that can be scripted to perform remediation tasks such as gathering system information or rebooting a server.

Event Management provides a framework for configuring and implementing a system-wide remediation plan to resolve, minimize, or prevent problems that generate events and alerts. Configure alert management rules to remediate alerts and CI remediation rules to remediate a set of CIs.

Alert remediation

Use alert management rules to associate specific alerts with a remediation workflow. You can apply a workflow to alerts manually. Alternatively, you can configure the alert management rule that executes a workflow automatically for alerts that match the rule criteria. The workflow can also be scripted to request user approval before executing subsequent workflow tasks. The workflow is paused for user approval, even if it was automatically triggered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI remediation

Configure remediation more comprehensively by creating CI remediation rules to manually apply remediation to specific CIs.

Remediation tasks

When a remediation workflow is executed, a remediation task is created to capture details such as the time that the workflow started to run, the alert that triggered the remediation workflow (if relevant), and the CI that was remediated. View these tasks to track remediation activities in the organization.

Related topics

Migrate an alert action rule to an alert management rule

Create or edit CI remediation

Create a CI remediation rule that lets users manually apply an Orchestration workflow for resolving issues with specific CIs associated with alerts. Define these CIs in the CI filter conditions of the rule.

Before you begin

Create the workflow to remediate CIs. In the workflow settings, select **Remediation Task [em_remediation_task]** in the **Table** field.

Then submit the workflow definition, and add the following conditions to the workflow properties:

- **[Run Remediation][is][true]**
- **[Workflow][is][<name of the new workflow that you just created>]**

  For example, if the name of the workflow is `CI remediation`, add this condition:

  [Workflow][is][CI remediation]

After you finish configuring the workflow, make sure that you publish it. For more details, see Create a workflow.

Role required: evt_mgmt_admin

About this task

A CI remediation rule associates a set of CIs that might experience problems with a remediation workflow. The remediation workflow can either resolve the underlying problem or help troubleshoot the problem that generated the alert. For example, you can proactively configure a workflow with the appropriate response actions for predictable alerts. For more details, see the Event Management Remediation short video.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **CI Remediations**.
2. Click **New**, or select a CI remediation to edit.
3. Fill in the fields, and click **Submit** or **Update**.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI remediation form

Control	Description
CI filter	Conditions to match the CIs that you want to apply this remediation to.
Orchestration workflow	The remediation workflow to apply to CIs that match the filter conditions.

Result
In service maps that are opened from the Event Management dashboard, this remediation can be applied to any CIs that match the filter conditions.

View remediation tasks

Event Management automatically creates a remediation task to capture every remediation that was applied to a CI or to an alert. It gives you an overall view of remediation activities in the organization.

Before you begin
Role required: evt_mgmt_user

Procedure

Navigate to **All** > **Event Management** > **Remediation Tasks**.

Column	Description
Number	Number assigned to this task.
Configuration item	Item or service affected by this task.
Priority	Priority that was assigned to this task, based on impact and urgency.
State	State of the task, which can be open or closed.
Assigned to	Person that this task was assigned to.
Short description	Description for the task.
Task type	This task type is a remediation task.

How alerts work with CIs in maintenance

When a CI is in maintenance, the impact tree, the service map, and Alerts tab are updated based on various factors.

Watch this brief video to learn about how alerts work with CIs.

A CI is in maintenance when:

- A change request is scheduled for the CI.
- The **Install Status** field on the CI record is set to **In Maintenance**.

Note: To customize how alerts work with CIs in maintenance, see Create maintenance rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How CIs in Maintenance appear in Event Management	Description and the optimal time to resolve the alert
CI with an active change request  If an active change request is scheduled for the CI or if the **Install Status** of the CI is **In Maintenance**, all alerts on the affected CI are excluded from impact calculation. The Alerts tab also temporarily hides all corresponding alerts. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green. For a service, all alerts on CIs in the service are also hidden from the Alerts tab. The entire service is shown in green on the impact tree. For a host with an active change request, the host applications are considered as one unit. All child applications are treated in the same manner as the host until the change request is no longer active.	An active change request has the following values: • The **State** is **Scheduled** or **Implement**. • The current time is between the Planned start date and Planned end date on the change request. OR • The current time is between the Actual start date and Actual end date on the change request. You can monitor the progress of the change request. Wait until the change request moves to the **Review** or **Closed** state. Then you can address all alerts for the affected CI and any alerts that generated between start and end dates. Use the impact tree, topology, and Alerts tab to show the calculated impact severity. **Note:** The **Maintenance** check box for an alert is selected when the **Install Status** field on the CI record is **In Maintenance**. This **Maintenance** check box indicates that the alert must be hidden from the **Alerts** tab. When the maintenance job updates this field, the **Updated** field (sys_updated_on) changes for open alerts, but not for closed alerts.
CI with no active change request and not in maintenance When there is no active change request for a CI and when the CI is not in maintenance, impact calculation resumes. The impact tree, the service map, and Alerts tab show the calculated impact severity for alerts.	An inactive change request has the following values: • The **State** is **New**, **Assess**, **Authorize**, **Review**, **Close**, or has no changes at all. • The **State** is **Scheduled** or **Implement**. However, the current time is before or after the planned or actual date ranges on the change request. You can monitor the progress of the change request. When a CI has an inactive change request, you can address the corresponding alerts as appropriate.

SLAs for application services and CIs

Event Management supports the creation of SLAs for application services and for CIs.

You can monitor and manage the quality of the application services offered by your organization. For example, you might want to set up an SLA that is triggered when the max alert severity of an application service or CI is **Critical**, and measure the time it takes to bring the application service or CI back to the **OK** state, when the conditions that caused the alert have been resolved.

SLAs and the Task table

You can create SLA definitions only for tables that extend the Task table. The Event Management application provides a table named Event Management SLA [em_ci_severity_task], which extends the Task table. Use this table in your SLA definitions to specify the severity level that should trigger and stop the SLA. During alert impact calculation, changes in the severity level of application services and CIs are automatically updated in the Event Management SLA table. Scheduled jobs keep the information in this table up to date.

How the Event Management SLA table is populated

The Event Management SLA table is populated differently for application services and CIs:

- For application services, the system automatically populates the Event Management SLA table when an application service is created or when its max severity is changed.
- For CIs, you must first identify which CIs can be made available for SLAs by creating an SLA configuration record. The system then automatically populates the Event Management SLA table with the CI max severity is changed.

Note: Duplicate CIs are not added to the Event Management SLA table even if the same CI matches more than one SLA configuration filter.

Create an SLA configuration for CIs

Create an SLA configuration from the Event Management application to determine which CIs are available for SLAs.

Before you begin
Role required: evt_mgmt_admin

About this task
The SLA configuration record is a filter on a table in the system. Select a table that has the CIs for which you want to create an SLA.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **SLA Configuration**.
2. Click **New**.
3. Fill in the form fields (see table).

SLA Configuration form fields

Field	Description
Name	Provide a descriptive name.
Table	Select a table with the CIs for which you want to create the SLA. You can also use the Configuration Item to Host View [query_based_service_basic_view] table, which is used by Dynamic CI Groups.
Filter	Configure the filter for the records.

4. Right-click the header and select **Save**.

Example:
The following is an example.

If you want to run an SLA on all Linux servers for major and critical alerts, first create an SLA configuration on the Linux Server [cmdb_ci_linux_server] table. Then create the SLA definition with this filter:

- `CI.class` is `Linux Server`
- `Severity` is `Major` or `Critical`

What to do next
Create an SLA definition on the CIs that match this SLA configuration.

Limit the records for the SLA configuration filter

If too many records are returned by the SLA configuration filter, you can add a property to set the maximum number of records.

Before you begin
Role required: evt_mgmt_admin

About this task
By default, the size of dynamic CI group records is limited to 10,000 elements. Exceeding this limit can affect system stability. If the filter configuration for a specified dynamic CI group returns too many records, you can limit the number of records that are returned by setting the value of the sa.qbs.max_num_of_cis property. For more information, see Create a Dynamic CI Group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enter `sys_properties.list` in the application navigator.
2. Add the following property:
   sa.qbs.max_num_of_cis
3. Set the value to an integer that represents the maximum number of records to return.

Create an SLA definition for a CI or application service

You can create SLA definitions for CIs and application services just as you can for other task records in the instance.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Service Level Management** > **SLA** > **SLA Definitions**.
2. Click **New**.
3. Fill out the fields on the SLA Definition form.
   For a description of each field, see Create an SLA definition for a CI or application service.
4. For the **Table** field, select **Event Management SLA [em_ci_severity_task]**.
5. Configure the **Start condition** filter by adding conditions, such as:

SLA filter conditions

For all CIs where the **Severity** is **Critical**		
Type	**is**	**CI** **Note:** Event Management SLAs work only on CI classes from Service Instance [cmdb_ci_service_auto].
Severity	**is**	**Critical**
For a specific service, such as Email, when the **Severity** is **Critical**		
Application Service	**is**	**Email**
Severity	**is**	**Critical**

6. Configure pause, stop and reset conditions.
7. Click **Submit**.

Alert lifecycle configuration

Event Management provides various modules, templates, and properties for configuring alerts and the actions that execute for these alerts.

Configure the alert active interval

The active interval property (**evt_mgmt.active_interval**) determines how Event Management handles a new event that is similar to events that appear on an existing closed alert. Based on the active interval, event, and existing closed alert information, the alert is reopened and the event information is added to the existing alert or a new alert is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
When the new event is received and the alert is already closed, Event Management compares the time since the last alert update (**sys_updated_on**) and the active interval property value. Then, the system either updates the existing alert or creates a new alert (if the original alert is closed), as explained in the following table. If the alert is open, Event Management automatically updates it without checking the active interval property value.

Scenario	Result
The new event occurs before the active interval elapses for the existing closed alert.	The event is identified as a recurrence of an existing issue. The alert is updated with the event information and the alert is reopened.
The new event occurs after the active interval elapses for the existing closed alert.	A new alert is created because the event is identified as a new issue. The event information is added to the new alert.

Change the active interval by editing the **Active interval (in seconds), within which a new event reopens a closed alert** property value.

Procedure
1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. Change the number of seconds for the **Active interval (in seconds), within which a new event reopens a closed alert** property.
3. Click **Save**.

Configure alert flapping

Set flapping properties to determine when an alert enters and exits the flapping state. Flapping can indicate configuration problems (that is, thresholds set too low), troublesome services, or real network problems.

Before you begin
Role required: evt_mgmt_admin

About this task
Flapping occurs when the event source continues to generate events even after its associated alert has been closed. Flapping causes the resource's status to repeatedly fluctuate between the *`OK`* severity and a severity requiring attention, for example, *`Critical`*.

Procedure
1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. Edit the following properties, as appropriate.

Property	Description
evt_mgmt.update_alert_restricted_fields_elapsed_time	When the system receives events that do not update alerts—because the event data is not new and is identical to the existing alert—system fields are not updated by default. This helps reduce noise. For example, a "keep

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	alive" event might be sent every few minutes from a server to confirm that a device is still connected, even if no new data is being ex changed. This property defines the minimum time in terval (in seconds) that must pass before an alert can be updated based on identical events. If an identical event is received within this in terval, the update is suppressed to avoid gen erating frequent, redundant notifications. By default, the interval is set to 86,400 seconds (24 hours).
evt_mgmt.flap_interval	Flap interval, in seconds, which is the time pe riod within which an alert enters the flapping state. An alert enters the flapping state when its cur rent **Flap Count** value reaches or exceeds the given *evt_mgmt.flap_frequency* property value within the time period speci fied by the *evt_mgmt.flap_interval* property.
evt_mgmt.flap_frequency	Flap frequency, frequency an alert must reoc cur to enter the flapping state.
evt_mgmt.flap_quiet_interval	Flap quiet interval (in seconds), quiet time that must pass for an alert to exit the flapping state. An alert exits the flapping state when the time interval between the latest occur rence of the event and the **Flap last update time** of the alert reaches or exceeds the *evt_mgmt.flap_quiet_interval* property value. An alert can also exit flapping in these conditions: ○ When an incoming event arrives after the *flap_quiet_interval* time has elapsed. The new alert generates and its state value depends on the incoming event severity. ○ After a background job, which runs every five minutes, verifies that no alert updates occurred and the *flap_quiet_interval* time has

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	elapsed. If there are no updates, the alert shows the previous state value that it had before the background job ran.

3. Click **Save**.

What to do next

You can monitor the **Event Management** > **All Alerts** list for alerts that are in the flapping state. For details, see View alerts in the flapping state.

Related topics

Work with flapping alerts

View alerts in the flapping state

Alert priority

Determine the order in which to handle alerts according to the alert priority score. Multiple factors determine the alert priority score and this value changes with changes to the underlying factors.

Multi-factor decisions

The value of the alert priority score is a composite of the value of the category and its relative weight. You can configure the factors that make up the score, as described in the following sections, according to *`Category order`*, *`Category value mapping`*, and *`CI type weight factor mapping`*. The categories are:

- *`Accumulated categories`* - These categories accumulate items with different sub-types that may have a different status or weighing factor. For example, services that are factored according to different criticality or services that are factored according to cost.
- *`Choice-list categories`* - A list of items. You can map any of the items to a different value, thereby changing the priority for that item. For example, critical severity, which has the value of 1 by default, can be mapped to 4 to give it a higher weight in the calculated alert priority score.

List of categories

Category	Description
Accumulated categories	
Number of impacted business-services	This category is factored by the business-criticality of the service. An alert that has an impact on one service has a lower priority score than an alert that has an impact on many services. For example, if a router is down, then it might affect many services and a higher priority ensures that this alert is handled before handling another alert that has an impact on fewer services. An alert that has an impact on many non-critical services must be handled with priority. However, if an alert has an impact on only a few services, but they are critical services, then this alert has a higher priority.
CI type	This category distinguishes between various CI types. For example, an alert on a CI type that is a router or switch may have a higher priority than an alert on another CI type, like a server or application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of categories (continued)

Category	Description
Number of Secondary alerts	Alerts that have characteristics similar to other alerts are usually grouped together, such as alerts with the same message key. A parent alert which has many secondary alerts has a higher priority than a parent alert that has only a few secondary alerts. All secondary alerts of a parent alert are counted. If a secondary alert is closed, it is no longer correlated to the parent alert. If a parent alert is closed, all secondary alerts are no longer correlated and their priority value is calculated accordingly.
Choice-list categories	
Alert state	Priority score is not calculated for an alert that is in *Closed* state. The available states with their default values are: • Open = mapping value 1 • Reopen = mapping value 2 • Flapping = mapping value 3
Alert severity	The priority score reflects the level of seriousness of the underlying alert, for example, an alert that has severity of *Critical* has a higher weighted value than an alert with a severity of *Minor*. Priority is not calculated for an alert that has a severity of *OK*. The available levels are: • Critical • Major • Minor • Warning
Role	The priority score reflects the role of the alert. The priority score is higher for an alert that has a role of *Parent*, next is the role of *None*, and the least weight is given to an alert with a role of *Secondary*. A parent alert that has many secondary alerts has a higher value than a parent alert that has less secondary alerts. The available roles are: • Parent • None • Secondary

Structure of the alert priority score

Weighted value for each category

Each category has its own placement in the alert priority score, according to its order and limit. You can configure the order and limit, as described in Modify the alert priority score, below. There are only positive numbers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All category values are mapped from the *em_alert_priority_category_mapping* table, except for the following:

- CI Type: Mapped from the *em_alert_priority_ci_type* table.
- Secondary: Value is the number of secondary alerts and is not mapped from any table.

Note: To ensure optimal memory protection, alert groups with more than 1000 alerts may not have an accurate priority score.

Example constituents of alert priority score of 7302020.003

Category	Score
Services	(7.0, 1000000.0) For example, if there are 2 impacted services whose business criticality priority score is as follows: • Service1: Business criticality priority score = **3** • Service2: Business criticality priority score = **4** The sum of the business criticality priority scores is **7**, so the computed priority value is 7,000,000 (7 * 1,000,000) **Note:** The business criticality priority score is the mapped value (**Value after mapping**) in the application services entries of the Alert Priority Category Mappings table (em_alert_priority_category_mapping).
Severity	(3.0, 100000.0)
CI type	(20.0, 100.0)
Role	(2.0, 10.0)
Secondary	(0, 0.01)
State	(3.0, 0.001)

Using the scores from the preceding table, the alert priority score is computed as follows:

```
(Services value * 1,000,000) + (Severity value * 100,000) +
(CI type value * 100) + (Role value * 10) + (Secondary value) +
(State value * 0.001)
```

Replacing the values of the categories from the preceding table into the formula:

```
(7 * 1,000,000) + (3 * 100,000) + (20 * 100) + (2 * 10) + (0 *
0.001) + (3 * 0.001) = 7,302,020.003
```

In the **Priority Breakdown** area of the **More Information** tab, the alert priority value is displayed as 7302020.003. In the Alerts list, this value is displayed as 7302 (number of thousands).

Note: If you have customized business criticality values that differ from the out-of-box values, add an entry to the Alert Priority Category Mappings table [em_alert_priority_category_mapping].

Effect of category limits

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Limits placed on categories enable overflow values to affect the next category that is ranked higher in priority order. Each accumulated category has a predefined limit. If the count goes above that limit, 1 is added to the next higher-order category. For example, if the number of CI types goes over the limit, then 1 is added to the next category (Severity) which is higher in priority: `yyy-zzz becomes yy(y+1) -000`

Display in All Alerts list

In the **All Alerts** list, the alert priority score value is displayed in the **Priority** column. For display purposes only, the actual calculated alert priority score is divided by 1000, while in the database, for calculation and sorting purposes, the full computed value is used.

The detailed computation of the alert priority of the selected alert is displayed in the **Priority Breakdown** area **More Information** tab.

Calculating the alert priority score

Calculating alert priority is based on all of a group's alerts, and not only the group's primary alert. Priority is calculated for alerts that match these conditions:

- State not-equal to **Closed**
- Severity not-equal to **OK**

Alerts that are queued for priority calculation are listed in the `em_alert_trigger_queue` table. In the Scheduled Jobs table, there are two `Event Management - Alert Priority Queue` jobs. These two jobs can run in parallel. You can use *`Insert and Stay`* to create another job. The `Event Management - Alert Priority Queue` job runs once every minute and calculates priorities in batches of 1000 open alerts. There are multiple factors that determine the value of the priority of an alert. A change in severity triggers an immediate update of the alert priority score. In this case, only the severity-part of the priority is changed, together with severity information in the **Priority Breakdown** area of the **More Information** tab.

Triggers that cause recalculation

Triggers that can cause the alert priority score to be recalculated are:

List of recalculation triggers

Trigger	Effect on the alert priority score
New alert	The generation of a new alert is a trigger to calculate the alert priority score.
Existing alert that changes from closed to any other state	Priority is not calculated for a closed alert, so if the alert state is changed from its current state of closed to open, reopen, or flapping, that change is a trigger to recalculate the alert priority score.
Role change, between primary, secondary, or none	Changes in role are a trigger for the alert priority score to be recalculated. For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of recalculation triggers (continued)

Trigger	Effect on the alert priority score
	• An alert whose type has changed to `Primary`, triggers the alert priority score to be recalculated. • An alert whose type has changed to `None`, triggers the alert priority score to be recalculated. • An alert whose type has changed to `Secondary`, triggers the alert priority score to be recalculated.
CI type	When a CI becomes bound to alert, that change is a trigger to recalculate the alert priority score. This trigger to recalculate the priority occurs once only, when the CI is bound to the alert.
Change of number of secondary alerts	A change in the number of secondary alerts triggers the alert priority score to be recalculated.
Severity	A change in severity is a trigger to recalculate the alert priority score. For example, changing from `OK` to `Major` triggers the score to be recalculated. Unlike the other triggers listed above, a change in severity triggers an immediate update of the severity part of the alert priority score calculation.

Modify the alert priority score

You can change the importance of some categories of the alert priority, by modifying their order and/or their weight, as described below. For example, if the CI type is higher in importance than the number of impacted services, you can change their respective order. As a result, the number of services is now multiplied by 100, while CI type is now multiplied by 1000000.

Note: The changes that you make, using this advanced procedure, change the default method of calculating the alert priority score. Alerts that might otherwise not have a high score, by changing these configurable values, change the way you determine the order in which to handle alerts.

Changing category order

Navigate to the *em_alert_priority_category_order* table. In the **Order** column, you can change the order of the required category.

Category value mapping

The *em_alert_priority_category_mapping* table shows the configuration value for each category choice. Each value in a drop-down list of categories can be remapped to a different value by configuring this table.

CI type weight factor mapping

Navigate to the *em_alert_priority_ci_type* table. You can add a new CI, for example, `DualCoreCPU` and in the **Priority** column, you can change the priority of the required category. In addition, you can edit existing Type and also change its priority value. This table is used to map the value of each CI type, for example, a mainframe that is CI_type: cmdb_ci_mainframe might have a priority of 80, while a server with CI type: cmdb_ci_server might have a priority of 60. The mapping enables you to customize the priority of the various Ci types.

Alert assignment groups for teams

Alert assignment groups assign alerts to the right teams promptly and automatically, improving overall incident management capabilities.

Admins determine the alert assignment group priority, making sure that alerts are routed to the appropriate team members.

The Alert assignment group is determined by the *evt_mgmt.alert_auto_assignment_field* property value. As an admin, you can choose to set the assignment group based on the alert fields using the property value and the order of the comma-separated fields by editing the property value.

- Create event field mappings

Assigning alert assignment group precedence

Assign alert assignment group precedence to make sure that alerts are routed to the appropriate team members.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** and search for `sys_properties.list`.
2. In the **Search** field, enter `evt_mgmt.alert_auto_assignment_field` and select the property record.
   For more information on the property, see Team-based integration properties.
3. In the **Value** field, enter the assignment group precedence.
   Set the assignment group precedence according to the order of the comma-separated fields such as cmdb_ci.support_group, IntegrationGroup.
4. Select **Update**.

Configuring Express List views for users and user groups

Centrally control what users monitor by predefining views in Express List and assigning them to users and user groups.

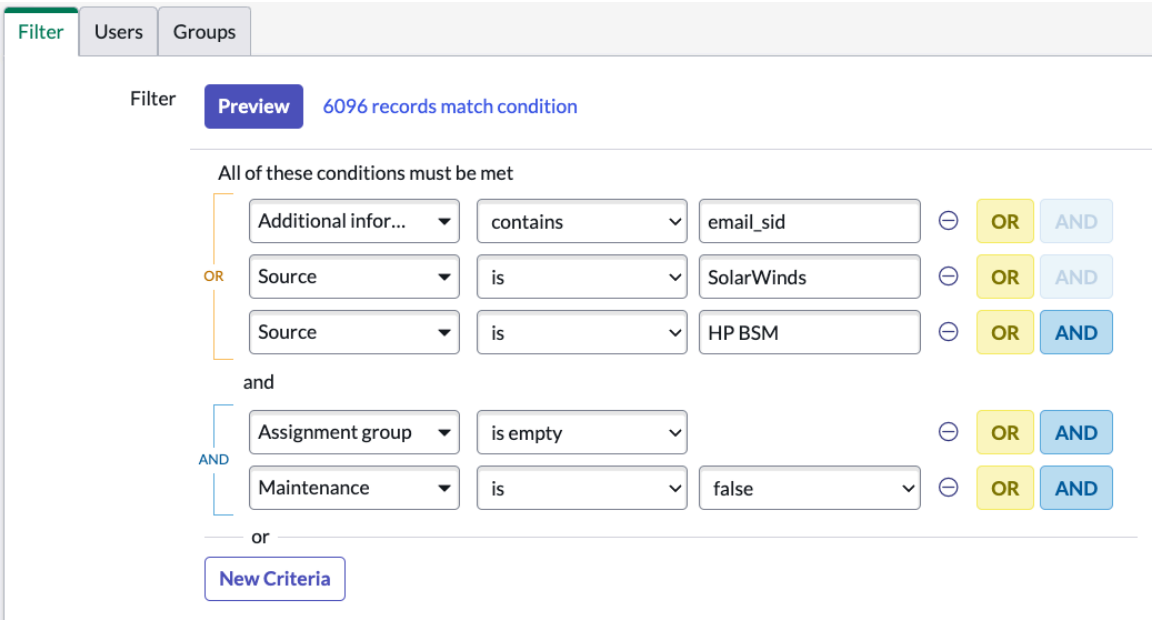
As an Event Management admin, you can create Express List views to ensure that users focus on specific services, priorities, or alerts. Event Management enables you to define the filters, column order, and filter attributes for an Express List view and then assign the view to individual users and user groups.

Users belonging to a group can only see the predefined views you assigned to that group and their own saved views. If a user belongs to multiple groups, they can see the views you assigned to all of these groups. Users can switch between views and modify and save all views except their assigned default view. However, they can't override settings in any of their assigned views and modify or share their default view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The filter conditions builder enables you to configure AND and OR conditions between attributes.

Express List view filter conditions



For example, the admin can configure conditions that allow the user to see only alerts that are not assigned to an assignment group or in maintenance. In the example, the alerts must also contain a value of email_sid and must be from one of the specified sources.

Related topics

Create a predefined Express List view for users

Identify an assigned Express List view

Create a predefined Express List view for users

Configure an Express List view for users to make sure that they focus on specific services, priorities, or alerts. You can set the filters, column order, and filter attributes for this view and assign it to individual users or user groups.

Before you begin

For more information about predefined Express List views, see Configuring Express List views for users and user groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Express List Views**.
2. Select **New**.
3. On the **Express List View** form, fill in the fields.

Express List View table

Field	Description
Name	Unique name of the Express List view.
Primary Sort By Field	The field by which to sort the Express List.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Default: Initial event generation time.
Secondary Sort By Field	Optional field by which to sort the results of the primary sort-by field.
Order	The order of this Express List view, if multiple views exist.
Order of Primary Sort By Field	The sorting order of the Primary Sort By Field: Ascending or Descending.
Order of Secondary Sort By Field	The sorting order of the Secondary Sort By Field, if set: Ascending or Descending.
Default	Option to set this Express List view as the default view for the assigned user or group. If multiple default views exist, the value set in the Order field determines their order.

4. Set filter conditions for the Express List view.

   a. In the **Filter** tab, select a field, an operator, and one or more values for a condition.

   > **Note:** The default field is State. When selecting fields for filter conditions, use only direct reference fields or single-level references and not nested references. Nested references in filter conditions aren't supported. For example, **Configuration#item.Class** #uses a reference field, **Configuration item**, that#contains #another reference field, **Class**.

   b. **Optional:** Add a filter condition or alert tag filter condition.

Task	Actions
Add a filter condition	i. Select either the AND or the OR operator. ii. Select a field, an operator, and one or more values for the condition.
Add an alert tag filter condition	i. In the Alert Tags Filter section, select **Insert a new row**. ii. Select the required tag, operator, and value for each tag filter. iii. Optionally add additional filter conditions by selecting **New criteria** and adding the tag filter condition.

   c. View the number of results a query with the configured conditions would return by selecting **Preview**.

5. Assign users and groups to the Express List view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Procedure
Assign a user to the selected Express List view	**a.** In the **Users** tab, select **Insert a new row**. **b.** Select the search icon and search for the relevant user in the **Users** table. **c.** Select the user. **d.** Select the save icon.
Assign a user group to the selected Express List view	**a.** In the **Groups** tab, select **Insert a new row**. **b.** Select the search icon and search for the relevant group in the **Groups** table. **c.** Select the group. **d.** Select the save icon. **Note:** Users who belong to a group can only see the views that you assigned to that group. If a user belongs to multiple groups, they can see the views you con figured for all of these groups.

6. From the form menu, select **Save**.
   The following tabs display:
   - The **Express List Table Fields** tab shows the fields to be displayed as table columns in Express List.
   - The **Express List View Field Attributes** tab shows the filter attributes for the open alerts in Express List.
7. **Optional:** Add columns to the Express List.
   a. In the **Express List Table Fields** tab, select **New**.
   b. On the form, fill in the fields.

Field	Description
Field	The column to add.
Express List View	Name of the view to which to add the column.
Minimum width	Minimum width of the column in pixels.
Order	Position of the column in the table.
Active	Option to display the column.

   c. Select **Submit**.
8. **Optional:** Add filter attributes to customize this view for assigned users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These filters are automatically applied to the Filters pane in Express List when users select this view.

a. In the **Express List View Field Attributes** tab, select **New**.

b. On the form, fill in the fields.

Field	Description
Field	Attribute to add to the Filter pane.
Express List View	Name of the view to which to add the attribute.
Order	Position of the attribute in the pane.
Active	Option to activate the attribute.

9. **Optional:** Exclude fields from the Express List view by deactivating them.
   a. In the **Express List Table Fields** tab, select the information icon for the relevant field record.
   b. Select **Open Record**.
   c. On the field form, clear the **Active** check box.
   d. Select **Update**
10. **Optional:** Exclude field attributes from the Express List view by deactivating them.
    a. In the **Express List View Field Attributes** tab, select the information icon for the relevant field attribute record.
    b. Select **Open Record**.
    c. On the field form, clear the **Active** check box.
    d. Select **Update**.

    Note: You can view the updated state of a field or a field attribute in the table by selecting the list controls icon and then selecting **Refresh List**.

11. When you're satisfied with the Express List view, select **Update**.

Assign users and groups to predefined Express List views

Assign individual users and user groups to preconfigured Express List views to make sure that they focus on specific services, priorities, or alerts.

Before you begin

For more information about predefined Express List views, see Configuring Express List views for users and user groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Express List Views**.
2. Select the predefined Express List view that you want to assign to a user or group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Assign users or groups to the selected Express List view.

Task	Procedure
Assign a user to the selected Express List view	**a.** In the **Users** tab, select **Insert a new row...**. **b.** Select the search icon ( ) and search for the relevant user in the **Users** table. **c.** Select the user and then select the save icon ( ).
Assign a user group to the selected Express List view	**a.** In the **Groups** tab, select **Insert a new row...**. **b.** Select the search icon ( ) and search for the relevant group in the **Groups** table. **c.** Select the group and then select the save icon ( ). **Note:** Users belonging to a group can only see the predefined views you assigned to that group and their own saved views. If users belong to multiple groups, they can see the views you as signed to all of these groups.

4. Select **Update**.

Alert impact calculation

Impact calculation shows the magnitude of an outage on CIs, services, alerts, and alert groups. The system uses factors such as impact rules and CI relationships to calculate the severity of a generated alert. The severity appears on the impact tree, application services maps, and dashboards.

Impact calculations are available for application services alert groups. The following factors are used to calculate the overall impact of an outage.

- Impact rules.
- Number of related active alerts.
- Past history of the affected CI.
- Relationships between CIs for a particular application service or application services.
- If the CI element includes a network or storage devices.
- Alerts on CIs in the maintenance state are excluded from impact calculation.

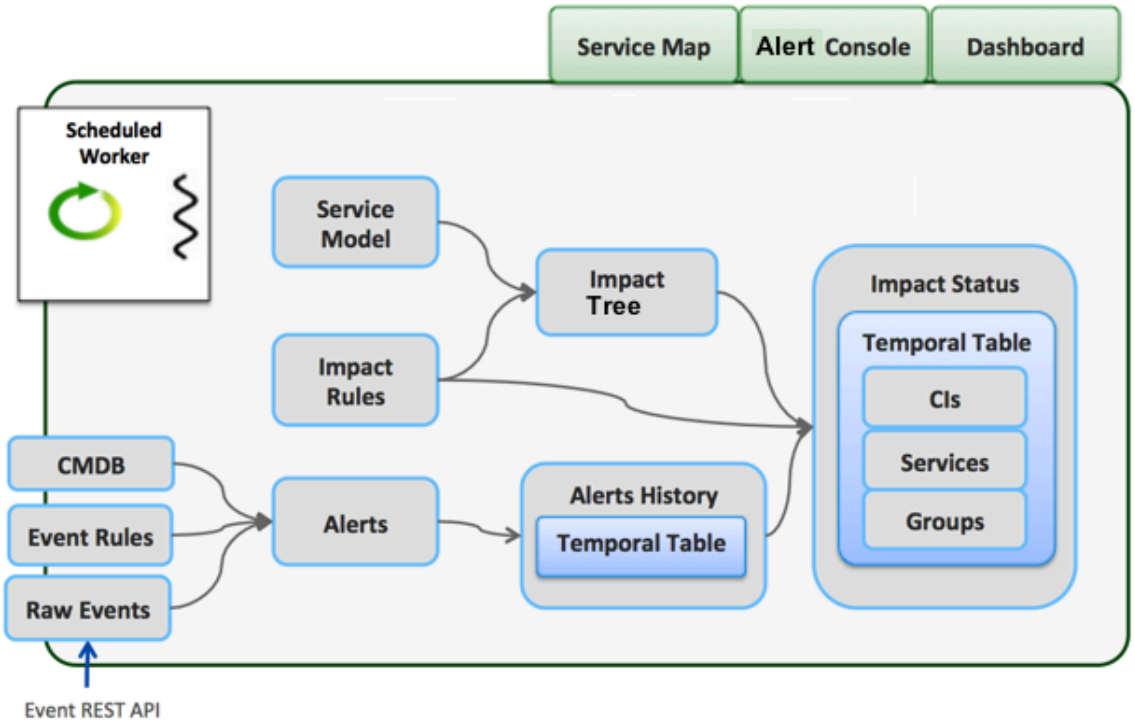
Note:

- CIs are considered to be in maintenance not only when an active change request is scheduled, but also when the **Status** field of the CI is set to **In Maintenance**.
- When a child CI is put in maintenance, it also places the parent CI in maintenance.

If there is a connection between services, the impact of one service on the other is also calculated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact calculations use information from various sources to set the alert severity



How impact is calculated

Impact calculation varies depending on the CI relationships for a application service or application services. Additional factors, such as change requests, network paths, storage paths, and related CIs all affect impact calculation.

Services

The following impact calculation flow operates for alerts where the outage does not affect a network or network storage. Event Management performs the following steps:

1. Create a service map. Use the Service Configuration Item Associations [svc_ci_assoc] and CI Relationships [cmdb_rel_ci] tables to create child-parent relationships in the application service or application services.
2. If there is no CMDB path from the service to the CI but an association appears in the svc_ci_assoc table, show a Depends-on relationship between the application service and the CI. Otherwise, show no connection.
3. For an application services, if the CIs assigned to the service are also connected to the service in the CMDB, the map keeps the hierarchy between CIs as they appear in CMDB. The CI service assignments appear in the Service Configuration Item Associations section of the Application service form. If there is no connection to the service in the CMDB, the CIs appear directly under the application services in the map.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Change requests and the In Maintenance status

If an active change request is scheduled for the CI or if the **Install Status** of the CI is **In Maintenance**, all alerts on the affected CI are excluded from impact calculation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Alerts tab also temporarily hides all corresponding alerts. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green.

Note:

- CIs are considered to be in maintenance not only when an active change request is scheduled, but also when the **Status** field of the CI is set to **In Maintenance**.
- When a child CI is put in maintenance, it also places the parent CI in maintenance.

For a service, all alerts on CIs in the service are also hidden from the Alerts tab. The entire service is shown in green on the impact tree. For a host with an active change request, the host applications are considered as one unit. All child applications are treated in the same manner as the host until the change request is no longer active. For additional information, see How alerts work with CIs in maintenance.

Network paths

To account for network redundancy, Event Management uses a separate impact calculation. You can see network topology or path changes in the application service. The following impact calculation flow operates for alerts where a network path is affected. Event Management performs the following steps:

1. Create a application service map for the affected network.
   - Use the host ID and target IP information from the alert and the network path from the Network Paths [sa_network_paths] table.
   - Use the elements in the network path that derive from the Configuration Item [cmdb_ci] table. Also, use the elements that are associated to the path, from the Infra Path To Elements [sa_infra_path_assoc] table.
   - Set the relationships. The application CI has a Depends on::Used by relationship on an element in the path that is defined in the CI Relationship [cmdb_rel_ci] table. In the relationship, the application CI is the parent and the element in the network path is the child.
2. Calculate a separate severity for each regular element in the path. Each regular element in the path contributes its own severity to its ancestors up to the application CI where the path originated from.
3. Calculate all redundant elements in the path with the redundancy rule by reducing the severity on the impacted CIs by one level. For example, if the severity is *`Critical`*, the redundancy rule decreases severity by one level to *`Major`*.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Storage paths

To account for storage device redundancy, Event Management uses a separate impact calculation. You can see impact tree updates when the network storage topology changes from the application service. Event Management performs the following steps for alerts that contain storage CIs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Create a application service map for the affected storage device:
   - Use the storage device in the sa_fs_to_storage_path table. The storage device definition uses the file system information in the path.
   - Use the elements in the storage path that derive from the Configuration Item [cmdb_ci] table. Also, use the elements that are associated to the path from the Infra Path To Elements [sa_infra_path_assoc] table.
   - Set the relationships. The application CI has a Depends on::Used by relationship on an element in the path that is defined in the CI Relationship [cmdb_rel_ci] table. In the relationship, the application CI is the parent and the element in the storage path is the child.
2. Calculate a separate severity for each regular element in the path. Each regular element in the path contributes its own severity to its ancestors up to the original application CI the path.
3. Use the redundancy rule to calculate redundant elements in the path by reducing the severity on the impacted CIs by one level. For example, if the severity is *`Critical`*, the redundancy rule decreases by one level to *`Major`*.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Related CIs

As alerts generate for a CI, additional impact calculations run for related CIs. For example additional impact calculations run for a application service dependency to a CI that is not actually part of the application service. These related CIs are not discovered as part of the service. Instead, the related CIs are specified by an infrastructure relationship definition.

The following impact calculation flow operates for alerts with CIs that have a dependency to related CIs which are considered outside the application service. Event Management performs the following steps:

1. Derive relationships between the application service CIs and related CIs. Use the relationships, impact rules, and other data from the Infrastructure Relations [em_impact_infra_rel_def] table.
2. Add related CIs to the impact tree and alert list on the Event Management dashboard.
   - Use data from the Infrastructure Relationship [em_impact_infra_rel_def] table to show containment links to the host.
   - Use the Impact Status [em_impact_status] and Alert History [em_alert_history] tables to determine the status.

Impact rules

Impact rules, which are used for impact calculation, estimate the magnitude or severity of an outage based on affected CIs.

The Impact Rule [em_impact_rule] table contains impact rules that show the applicable CIs, application services, and settings for impact. The following default impact rules are available.

Application Cluster Member

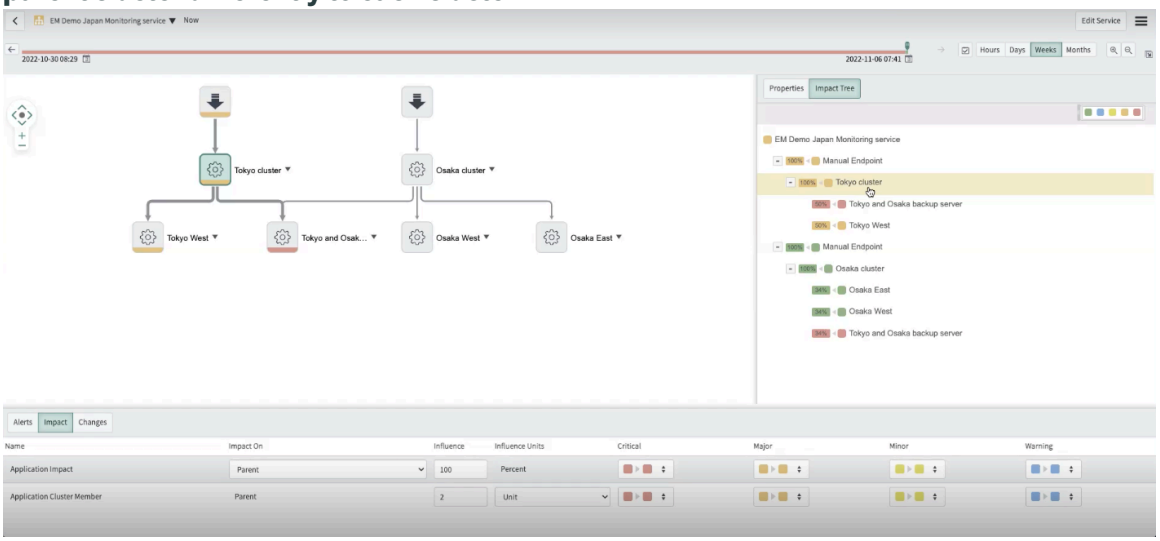
Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**.

You can configure different impact rules per cluster and thus the child CI impact propagation to the parent (for the same child CI) will be different. Therefore, you can manually create groups of Cis (aka manual clusters) and configure the impact rule at the cluster level for downstream towards the cluster children.

Example where the same child CI will propagate its impact to its parent cluster differently to each cluster



In the above example, there are two entry points. The Osaka cluster on the right-hand side has three CIs. The Tokyo cluster on the left-hand side has two CIs. The Tokyo and Osaka backup server has shared parents - Tokyo cluster and Osaka cluster. On the right-hand panel you can see the Impact Tree where the Tokyo cluster has two Application Cluster Members with 50% influence each and the Osaka cluster has three with 34% influence each.

For manual cluster configuration there are two rows: Application Impact and Application Cluster Member. The children are displayed since the Impact On field was selected as Parent and not Application Service. In the Application Cluster Member row the Influence field is configured to two. This implies that the minimum amount of children who fail (and that they propagate the failure upwards to their parents) are two. The Osaka cluster is configured to three. The percentage is different for the Tokyo and Osaka backup server for each cluster (50% and 34%). As you can see, even though the Tokyo and Osaka backup server failure is Red Critical, it influences the parents differently. The Osaka cluster remains green even though the Tokyo cluster failure is Orange Major.

Click a service or CI to see the alerts that are associated with it. For example, if you click the high-level application service, the alerts that are associated with it are displayed in the alert area under the Map View when you select **Alerts**. The alerts listed are those of the selected service. Alerts of child-services are listed when those services are selected.

The following impact fields are displayed when you select **Impact**.

Inclusion

Determines the impact on entities with a Contains relationship. This rule is read-only.

Infrastructure Dependencies

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Determines the definition of impact propagation for CIs in infrastructure relationships.

CI application service

Determines how impact applies to parent or child entities that are part of an application service.

CI Impact

Applies to application services. Determines the relationship between service members. The impact from child to parent CIs is always 100%. For example, the parent impact severity is derived from the child CI with the highest severity.

CI Parent in Application

Sets impact only on the parent entity.

Network Path

Determines how impact applies to parent or child entities that are part of a traditional network.

OS Cluster Member

Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down.

Storage Path

Determines how impact applies to parent or child entities that are part of a storage network.

Properties

In addition to configuring impact rules, you can configure properties for impact calculation.

Configure these properties, as appropriate:

Impact Calculation Properties

Property Name	Description
`evt_mgmt.impact_calculation.alert_grouping_support`	Enable alert grouping support.
`evt_mgmt.impact_maintenance.sleep_time_sec`	Minimum time in seconds for checking CI maintenance: checks both the Status field on the CI and any change request schedule for the CI.
`evt_mgmt.impact_calculation.alert_processing_delay`	The delay after creating or updating an alert, before it is used for impact calculation and grouping. Used to compensate for the late arrivals or slow business rules defined on the em_alert table. Default = 2000 msec. Used when alerts and events are processed one at a time (when the `evt_mgmt.max_objs_in_alert_query` property is not defined or is set to **1**).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact Calculation Properties (continued)

Property Name	Description
`evt_mgmt.impact_calculation.alert_holding_delay`	The delay during creating or updating an alert before it is used for impact calculation and grouping. Used to compensate the late arrivals or slow business rules defined on em_alert table. Default = 30000 msec. Used in large customer environments with high traffic, when alerts and events are processed in batches (when the `evt_mgmt.max_objs_in_alert_query` property is set to a value greater than **1**).

For more information, see Event Management - Impact calculation [KB1157218].

Understand Service Maps

Service maps show active alerts for CIs and the relationships between CIs. By viewing this information, you can better understand the source of alerts and take remediation steps. The service map is available for all application services.

About Service Maps

A service map shows alerts with impacted CIs and CI interdependencies. For example, changes to a connection between a host and hypervisor appear on the service map. As service map definitions change, the service map, alert, and impact information updates accordingly. From the Quebec release, there is enhanced visibility. When the alert is bound to the entry point, the service map identifies an entry point problem.

Note: Alerts will not be displayed for the entry points on the service map.

You can open a service map from these places:

- From the Application services list, you can view service maps for application services.
- From the Monitored services list, you can view service maps for monitored services.

The following icons are used in service maps. The icon shapes are slightly different for application services.

Service map icons

Icon	Description
	Represents applications such as Microsoft IIS or SQL servers.
	Represents physical and VM computers and servers.
	Represents the network starting point. For example, Layer 3 devices appear toward the top of the map, and connected software and services appear near the end of the map.
	Shows the number of redundant CIs.
	Shows the workload between machines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service map icons (continued)

Icon	Description
	The gray connector shows a relationship between CIs.
	Each CI with no active alerts box represents a network CI. A gray box represents a CI with no active alerts. Information about the CI is hidden.
	Hides multiple CIs that are designated as redundant.
	An impacted CI displays the color that represents the severity of the alert associated with the CI. • **Critical (red)**: Immediate action is required. The resource is either not functional or critical problems are imminent. • **Major (orange)**: Major functionality is severely impaired or performance has degraded. • **Minor (yellow)**: Partial, non-critical loss of functionality or performance degradation occurred. • **Warning (blue)**: Attention is required, even though the resource is still functional. • **OK (green)**: An alert is created. The resource is still functional. • **No color**: No active alerts.
	Represents a fiber channel, hard drives, or other data storage devices.
	Represents related web services for the network such as NGINX or JBoss web server.

Note: Session timeout settings don't apply to this screen. The session remains connected, even when there is no human interaction. If this setting is a concern, either log out or close the active tab in the browser.

Related topics

Alert impact calculation

View an alert impact on CIs in a service map

View the impact tree

The impact tree shows the relationships between CIs and the relative percentage impact for each child CI. This information is available for both discovered services and application services.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

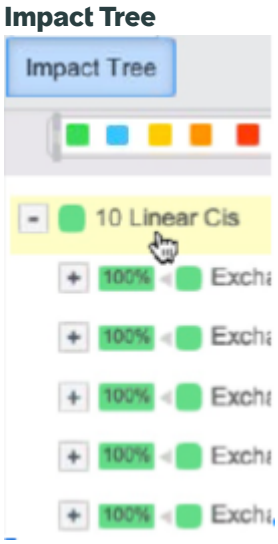
About this task

The impact tree shows the result of impact rules on CI parent and child relationships. The tree represents a service map with CIs from the Service Configuration Item Associations [svc_ci_assoc] table. When related CIs are connected but not part of the service map, the impact for the related CIs can also appear in the impact tree.

The numbers or percentages on a parent CI summarize overall severity based on alerts from child CIs. The parent severity is based on impact rule computations.

You can also learn about the impact tree from the following video tutorial.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Open the service map for the service from the Application service list.
   a. Navigate to **Event Management** > **Services** > **Application Services**.
   b. Click **View service** next to the service.
2. On the service map, click a CI that has a severity color.
3. Click the **Impact** tab.
4. From the **Impact Tree** tab in the side pane, expand the parent CI and click the CI that generated alerts.
5. Use the severity color to locate CIs that contain alerts:
   - **Critical (red)**: Immediate action is required. The resource is either not functional or critical problems are imminent.
   - **Major (orange)**: Major functionality is severely impaired or performance has degraded.
   - **Minor (yellow)**: Partial, non-critical loss of functionality or performance degradation occurred.
   - **Warning (blue)**: Attention is required, even though the resource is still functional.
   - **OK (green)**: An alert is created. The resource is still functional.
6. Do one or more of the following.

Option	Description
Adjust impact rules	**a.** Click the **Impact** tab. **b.** Review and adjust the impact rules as nec essary.
Remediate an alert	**a.** Click the **Alerts**. **b.** Right-click the alert and select **Run remedia tion**.

Network paths appearing in the impact tree can use a large amount of resources, which degrades system performance. To disable network paths from appearing

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

in the impact tree, navigate to **System Properties** > **All Properties** and set the *evt_mgmt.network_path_excluded* property to **true**.

To view impact tree using Service Operations Workspace, see View impact tree using Service Operations Workspace.

Adjust impact rules for a CI

Configure impact rules to customize the impact calculation for discovery services and manual services. The impact rules update the overall alert and show the impact on related CIs. When you change impact rules, the updates apply to alert severity in places such as the Event Management dashboard and Operator Workspace.

Before you begin

Role required: evt_mgmt_admin

About this task

You can view and adjust the impact rules of CIs from the application service map of a service.

Note: Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

Procedure

1. Open the application service map from either the Event Management dashboard or the Application service list.

Option	Description
From the Event Management dashboard	**a.** Navigate to **Event Management** > **Dash board**. **b.** Double-click the tile of the application ser vices.
From the Application Service list	**a.** Navigate to **Event Management** > **Services** > **Application Services**. **b.** Click **View Map** next to the application ser vices.

2. On the application service map, click a CI.
3. Below the map, click the **Impact** tab and then adjust the impact rules accordingly.

Impact Rules

Field	Description
Name	The name of the impact rule. ○ **Application Cluster Member**: Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3). The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**. **Note:** To configure a manual cluster, see Configure a manual cluster

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Application Impact**: Determines how impact is applied to a specific CI, the overall application service, or parent/child entities within an application service. For the Application Impact rule, you can choose from the following Impact options: **Application Service** or **Parent**. ▪ If no CI is selected, the alert rule applies to the entire application service. ▪ If you select a specific CI, you can define whether the rule applies to the service or its parent. ○ **Inclusion**: Determines the impact on entities with a Contains relationship. This rule is read-only. ○ **Infrastructure Dependencies**: Determines the definition of impact propagation for CIs in infrastructure relationships. ○ **Network Path**: Determines how impact applies to parent or child entities that are part of a traditional network. ○ **OS Cluster Member**: Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down. ○ **Storage Path**: Determines how impact applies to parent or child entities that are part of a storage network.
Impact On	The valid type of service for this impact rule. ○ **Application Service**: The impact rule applies to a application service. ○ **Parent**: The impact rule applies to the parent CI.
Influence	The value to allow the impact rule to set on the parent. Set a value on the parent. This field works with the **Influence Units** field.
Influence Units	The unit of measurement to show impact on the parent. Set the highest value on the parent CI. Set lower values on each child CI. When alerts occur for several child CIs, Event Management calculates the sum of the **Influence Units** of each affected child. If the sum exceeds the parent **Influence Units** value, the parent receives the highest severity in the set. This field works with the **Influence** field. ○ **Percent**: When the percentage exceeds the **Influence** value, apply the impact on the parent. ○ **Number**: When the number exceeds the **Influence** value, apply the impact on the parent. For example, you can set the parent **Influence Units** to **100%** and the child CIs to these values: ▪ Child 1: 34% ▪ Child 2: 34% ▪ Child 3: 34% ▪ Child 4: 70% When alerts for Child 3 and Child 5 have the Critical severity, the severity of the parent is set to Critical because the sum is greater than 100% (34% + 70% = 104%).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Impact when Critical	The alternative impact to use when the calculated severity is Critical. If the column to the right of **Impact when Critical** has a higher severity, update all right-most columns with the same or a lower severity as **Impact when Critical**. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Major	The alternative impact to use when the calculated severity is **Major**. If the column to the right of **Impact when Major** has a higher severity, update all right-most columns the same or a lower severity as **Impact when Major**. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Minor	The alternative impact to use when the calculated severity is **Minor**. Controls the field values to the right of this field. If the **Impact when Warning** column has a higher severity, use the **Impact when Minor** value for both fields. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Warning	The alternative impact to use when the calculated severity is **Warning**. To make sure the topology and impact tree accurately show impact, make sure that the columns to the left have higher severities. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).

What to do next

Review the changes on the impact tree. For example, if you changed a number or percentage influence for child CIs, review the impact tree updates accordingly.

View an alert impact on CIs in a service map

You can view service maps to see active alerts for CIs and the relationship between CIs. By viewing this information, you can better understand the source of alerts and take remediation steps. The service map is available for all application services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
You can open a service map from these places:

- From the Application services list, you can view service maps for application services.
- From the Monitored services list, you can view service maps for monitored services.

Procedure
1. Open an application service map:
   a. Navigate to **Event Management** > **Services** > **Application Services**.
   b. Next to the service, click **View Map**.
2. Do one or more of the following.

Option	action
View alerts for a CI by type and severity	In the service map: **a.** Click a CI tile. **b.** Below the map, click the **Alerts** tab and re view the listed alerts.
View changes to a CI in a discovered ser vice	In the service map: **a.** Click a CI tile. **b.** Below the map, click the **Changes** tab.
Show alert bindings to CIs	In the service map: **a.** Click a CI tile. **b.** Click the additional actions menu icon to view the **Affected CIs** indicator. **c.** Below the map, click the **Affected CIs** tab.
View CI properties	In the service map: **a.** Click a CI tile. **b.** In the side pane, click the **Properties** tab and review information about the CI. **c.** If you want to view more detailed informa tion, scroll to the end of the pane and click **Detailed Properties**.
Show the impact rules for a CI	In the service map: **a.** Click a CI that has a severity. **b.** Below the service map, click the **Impact** tab and review the listed impact rules.
Show alert details for networks or storage for a service	In the service map: **a.** Right-click a path between CIs. **b.** Select **Show network path**or **Show stor age path**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	action
Display additional information for CIs	In the service map header: **a.** Click the additional actions menu icon **b.** You can select the **Map Indicators** for addi tional information that you want to view.
Remediate a CI	In the topology, right-click the CI, and then se lect **Remediation options**.

Create an infrastructure relationship for related CIs

Infrastructure relationships show CIs that are connected to a application service but are not necessary parts of the service. Infrastructure relationships are only available for application services.

Before you begin

Role required: evt_mgmt_admin

About this task

When you create a CI infrastructure relationship, the information is stored in the Infrastructure Relations [em_impact_infra_rel_def] table. When alerts generate, the related CI accompanies the application service information on the Event Management dashboard and in the impact tree. Additional information for the related CIs only appears on a related dependency view map for the application service. The following default infrastructure relationships are available.

Default infrastructure relationships

Infrastructure relationship	Impact rule	Description
cmdb_ci_appl	OS Cluster Member	Shows alert impact between hardware and software applications.
cmdb_ci_esx_server	Infrastructure Dependencies	Shows alert impact between VCenter and ESX clusters.
cmdb_ci_kvm	Infrastructure Dependencies	Shows that alert impact on Linux Kernel-based Virtual Machine (KVM) connectivity.
cmdb_ci_vm_zones	Infrastructure Dependencies	Shows alert impact on the Solaris VM zones.

For example, based on of the cmdb_ci_vm_zones Infrastructure relationship definition, Event Management adds ZoneServer@mmp1 to the application service. The Containment rule manages impact severity on alerts.

© 2026 ServiceNow, Inc. All rights reserved.

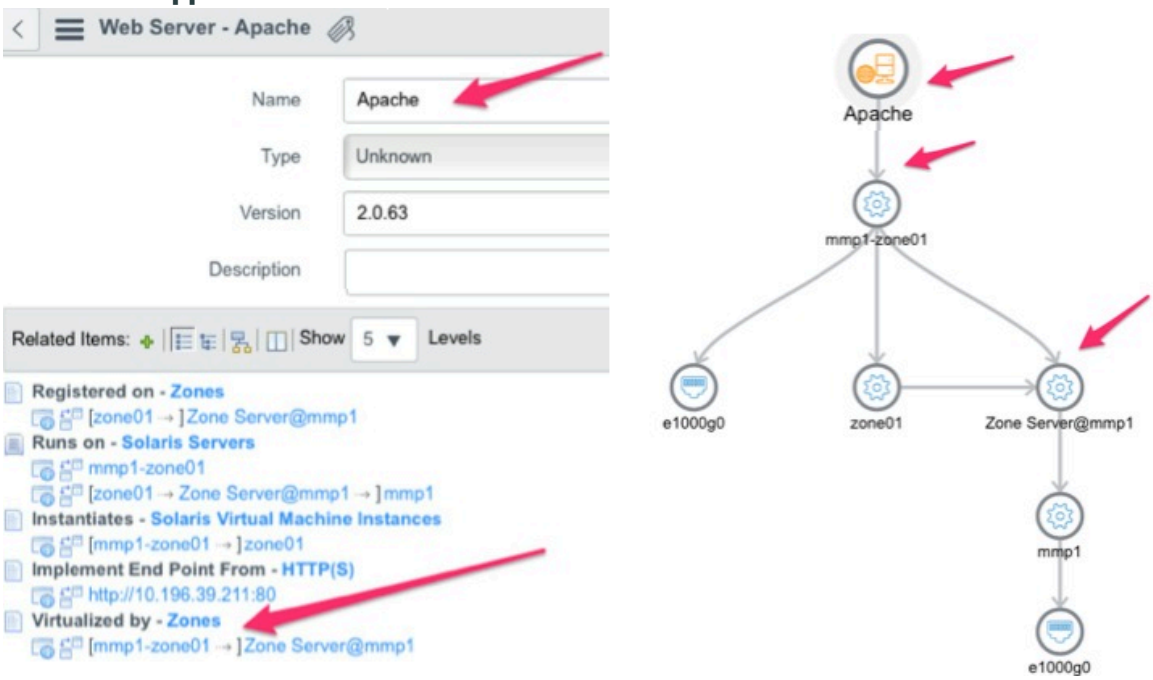
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related CIs appear on the BSM



Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Infrastructure Relations**.
2. Click **New**.
3. Fill in the fields, as appropriate.

Infrastructure Relations form

Field	Description
Child Type	The table that contains data about the child entity.
Parent Type	The table that contains data about the parent entity.
Relation Type	The relationship between the child and parent entities.
Impact Direction	The impacts direction to show on the application service map. ○ **From Child to Parent**: When an alert is regarding a child, show the impact on the parent. ○ **From Parent to Child**: When an alert is regarding a parent, show the impact on the child entity.
Impact Rule	The impact rule to calculate infrastructure relationships: ○ **OS Cluster Member** : Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down. ○ **Application Cluster Member** : Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3). The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**. ○ **Infrastructure Dependencies** : Determines the definition of impact propagation for CIs in infrastructure relationships. ○ **CI Application Service**: Determines how impact applies to parent or child entities that are part of an application service. ○ **CI Parent in Application**: Sets impact only on the parent entity. ○ **Inclusion**: Determines the impact on entities with a Contains relationship. This rule is read-only. ○ **Network Path**: Determines how impact applies to parent or child entities that are part of a traditional network. ○ **Storage Path**: Determines how impact applies to parent or child entities that are part of a storage network. ○ **CI Impact** : Applies to application services. Determines the relationship between service members. The impact from child to parent CIs is always 100%. For example, the parent impact severity is derived from the child CI with the highest severity.

4. Click **Submit**.

View impact of child service on parent service

In the map view of an application service, the severity of a child service is propagated to its parent service.

Before you begin

Role required:

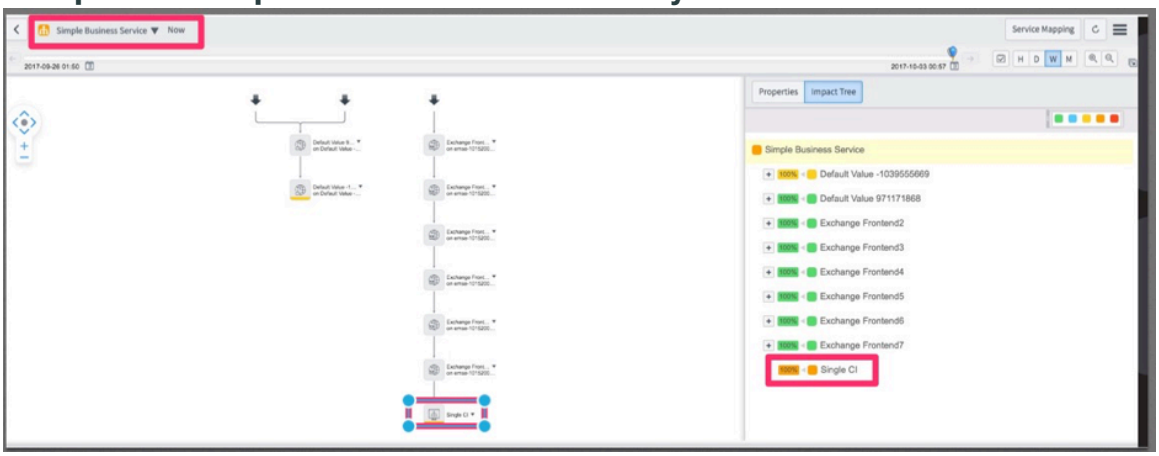
- for application services, evt_mgmt_admin
- for discovered services, service_mapping_admin

About this task

In the map view of a discovered application service, you can see that the severity of a child service is propagated to the parent service.
An application service is affected by the severity of alerts that are directly associated with it and alerts on the CIs that are in the service. If the severity of a child service is higher than that of its parent service, on the map view the parent service shows the severity of the child service. In the map view, the **Impact Tree** list shows the CIs. The color of the CIs indicates the alert severity. The child service is also affected by application services that are under it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example where the parent service shows the severity of the child service



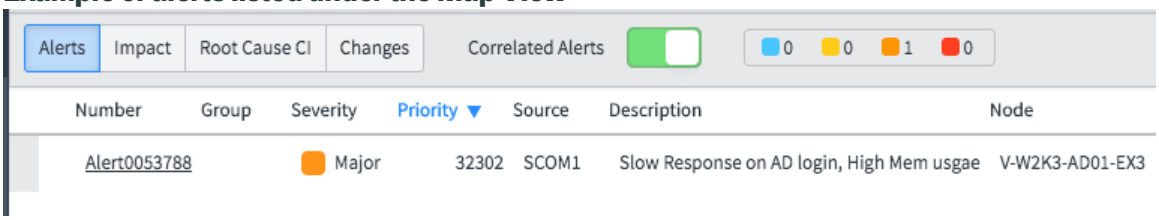
If a loop is created, for example, by connecting a parent service to a sub-service, this relationship can be viewed in the map view. The impact of this loop is not calculated and the Impact Tree does not display this relationship. For example, assume that there are three CIs, A, B, and C, where C is a sub-service to B and B is a sub-service to A. The relationship of the A connected service to C is displayed in the map view. However, this relationship is not shown in the Impact Tree.

Note: A message appears in the system error log in the following format, where the sys_id of the service and the node changes accordingly: `Found loop in ServiceId: [sysId], and node:[sysId]. Removing this relation to avoid impact loops`

For example, `Found loop in ServiceId:409d4fd59f030200fe2ab0aec32e705c, and node:df5cf6159f030200fe2ab0aec32e70a2. Removing this relation to avoid impact loops`

Click a service or CI to see the alerts that are associated with it. For example, if you click the high-level application service, the alerts that are associated with it are displayed in the alert area under the Map View. The alerts listed are those of the selected service. Alerts of child-services are listed when those services are selected.

Example of alerts listed under the Map View



Procedure

Open an application service map:

a. Navigate to **Event Management** > **Services** > **Application Services**.

b. Select **View Service** next to the service.

c. On the right-hand panel, select **Impact tree**.

d. On the lower panel, select **Impact**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

In the service map, you can visually verify that the service health of the sub-service is rolled-up to the parent service. At the bottom of each icon of an impacted CI is a colored bar that represents the severity of the alert. This color bar also displays in the bottom bar of its parent service. For manual cluster configuration, you can modify the Application Impact and Application Cluster Member.

Probable Root Cause Analysis (RCA)

Shorten the mean time to repair (MTTR) by discovering the root cause of an alert.

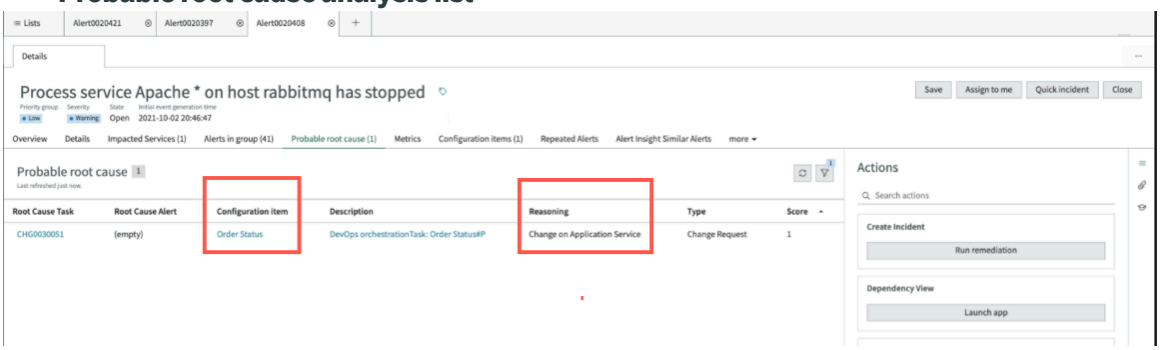
Probable root cause analysis (RCA) provides a list of probable root causes for alerts. This capability uses existing data in IT Service Management to help you determine the root cause of an issue.

RCA takes three factors into consideration: Alerts, configuration item (CI) topology, and change requests on the CIs. It extracts CIs from alerts or alert groups and analyzes the CI relationships in the CMDB. It then uses a set of configurable filters to consider relevant change requests on the CIs as possible root causes.

Change requests can be related to a time frame or to a CI, the application service it belongs to, or the software installed on it. For example, a CI must be upgraded or a security patch installed on it. A change request on one CI can affect other CIs.

RCA maps the alerts and change requests to the CIs. It proceeds to calculate the root cause score, a logical score used for sorting probable root causes. The calculation of this score is based on change requests on CIs, and on alerts on a crucial CI called the Topology Origin CI. The root cause score determines how RCA populates the probable root causes list.

Probable root cause analysis list



By default, the list shows the five probable root causes with the highest score. It lists the CIs related to each alert, and the reason RCA identified them as probable root causes.

Scoring for probable root causes is determined by the following criteria, in the indicated order (lower number = higher priority):

1. Change on a CI that originates from topology.
2. Change on a related CI originates from topology.
3. Change on a CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Change on a related CI/change on an application service/change on software.
5. Alert on the CI that originates from topology.

To disable the Probable Root Cause Analysis feature, you must create the property *sa_analytics.disable_prc* and set the value to `true`. For more information on how to create a property, see Add a system property.

Customize RCA settings

Modify default settings that determine RCA behavior.

Before you begin

Role required: evt_mgmt_admin

About this task

Default filter settings control which change requests RCA considers as possible root causes. You may want to change certain default settings, for example to make RCA ignore standard change requests.

You can also change the number of probable root causes shown in the list. By default, the list shows the five probable root causes with the highest root cause score.

By default the RCA calculation is enabled. You can disable it by changing the default *sa_analytics.disable_prc* value to True.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Do one or both of the following, as needed.
   - Change default filter settings:
     a. Select **New**.
     b. In the **Name** field, specify the name of the property for which you want to change the default setting.

     The new property must have the same name as the related property in the table.

Property	Description	Type	Default value
sa_analytics.rca.filter_category	The categories of change requests that RCA considers as possible root cause.	string	" "
sa_analytics.rca.filter_type	The types of change requests that RCA considers as possible root cause.	string	"standard,normal,emergency"
sa_analytics.rca.filter_state	The state of change requests that RCA considers as possible root cause.	string	"-1,0,3,7,8,157" ▪ Implement: -1 ▪ Review: 0 ▪ Closed: 3,7,8,157

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description	Type	Default value
sa_analytics.rca.filter_interval_hour	The time frame, in hours, during which change requests occurred that RCA considers as possible root cause.	int	168
sa_analytics.rca_use_legacy_query	Use legacy queries for RCA calculation.	Boolean	True
sa_analytics.rca.get_tasks_for_impacted_cis	Include change requests for impacted services in the RCA list.	Boolean	True
sa_analytics.rca_scoring_by_selected_proximity	Enable selecting proximity of RCAs by time proximity to the alert.	Boolean	True
sa_analytics.rca_cmdb_relation_levels	Number of levels to search related configuration items.	int	1
sa_analytics.rca_time_filtering_planned_time	Enables filtering of change requests by planned time.	Boolean	True
sa_analytics.rca_time_filtering_actual_start_time	Enables filtering of change requests by implementation time.	Boolean	True
sa_analytics.rca.upper_filter_interval_hour	Determines the time upper bound for change requests filtering.	int	1
sa_analytics.rca.order_by_scoring_for_virtual_alerts	When calculating RCAs for virtual alert – order the records by scoring of PRCs of the corresponding secondaries.	Boolean	True
sa_analytics.rca_same_reason_prioritize_recent	When 2 PRCs have the same reasoning, prioritize the one with the most recent change request during scoring calculations.	Boolean	True
sa_analytics.rca.prefer_ci_case_app_service	In case the service is the same change request on application service and on CI, prefer the	Boolean	False

Property	Description	Type	Default value
	one from application service.		

c. Enter a valid value for the property.

Note: The value you set for the new property overrides the default value for the related property.

- Change the maximum number of probable root causes shown in the list:

  a. Find the property *sa_analytics.rca_task_table_max_records*.

Property name	Description	Type	Default value
sa_analytics.rca_task_table_max_records	The maximum number of probable root causes shown in the Probable root causes list.	integer	5

  b. Replace the default value with a new valid value.

- Disable RCA by creating the *sa_analytics.disable_prc* property.

  a. Select **New**.

  b. Fill in the form with the following values.

Property name	Description	Type	Value
sa_analytics.disable_prc	Disabling the Probable root cause.	Boolean	True

3. Click **Submit**.

Alert similarity

Finding alerts that are similar to the alert that you are currently investigating can help save troubleshooting time by seeing how similar alerts were resolved.

Finding similar alerts

Alert similarity applies natural language processing (NLP) based on ServiceNow AI Platform machine learning (ML) as implemented in Predictive Intelligence.

ML logic filters out irrelevant information and provides further information to help you understand the cause of alerts. You can view solutions used to resolve similar alerts and the probable root cause.

ML helps find similar alerts based on text found in these alert record fields:

- Configuration item.Class
- Metric name
- Description

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional alert information

In the Alert Workspace, select the required alert and click **Insight** to view additional information about the alert.

In the Alerts list, select the required alert and use the Alert Insight tabs on the right side of the alert record to view additional information about the alert. For example, you can view the top recent alerts for the current CI and similar CIs to find the most suitable solution towards resolving the alert.

The alert insight tabs are:

- Impacted Services
- Flapping
- History
- Activities
- More Information
- Repeated Alerts
- Similar Alerts
- CI Incidents
- CI Change Requests
- CI Problems
- Related Incidents
- Related Change Requests
- Related Problems

For more information about the alert insight tabs, see Alert insight information.

Find similar alerts

You can find alerts similar to the alert currently being investigated. Save troubleshooting time by reviewing similar alerts to see how they were resolved.

Before you begin

Ensure that the Predictive Intelligence plugin is activated. To activate this plugin, see Activate a plugin.

Ensure that the `evt_mgmt.similarity_use_ml` property is set to `true`.

Role required: evt_mgmt_admin

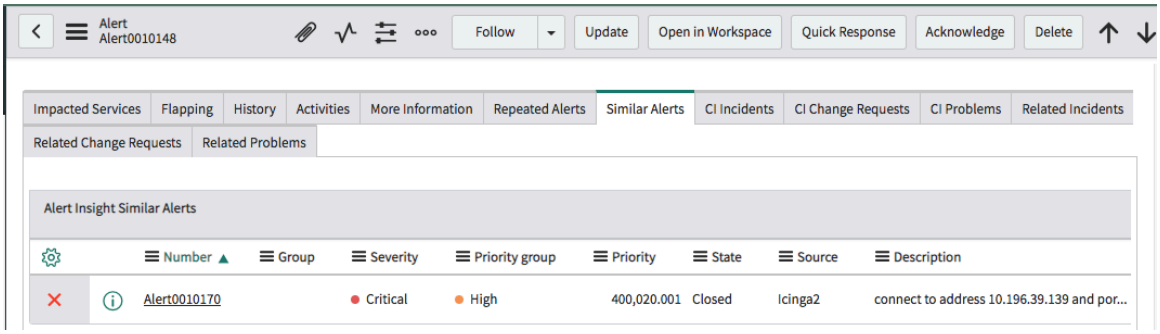
About this task

Save time in resolving the current alert by reviewing how similar alerts were resolved. Provide resolution consistency by resolving similar alerts in the same way.

Procedure

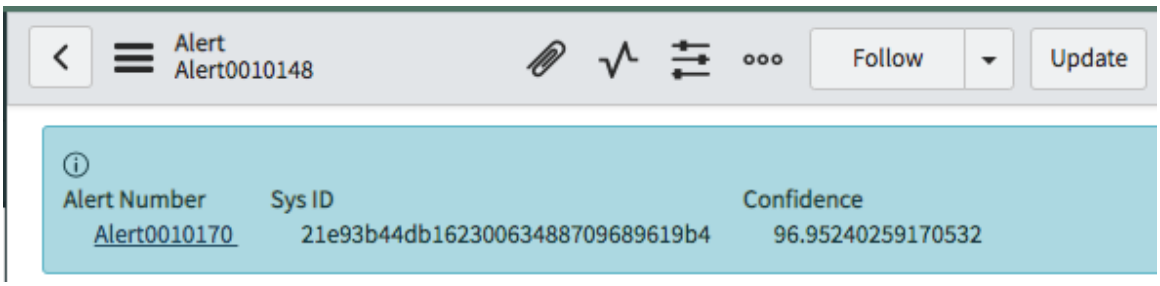
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. In the list of alerts, click the alert record that you want to investigate.
3. In the alert record, click the **Similar Alerts** tab.
   Alerts that are similar to the alert that is being investigated are listed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



By default, up to 10 similar alerts are listed. You can modify this value by setting the `evt_mgmt.similarity_max_similar_alerts_shown` property.

4. If you configured a threshold, in the Related links area, click **Show Similarities Details**. The Sys ID and confidence level of each similar alert is displayed. The Confidence level is an indication of how the similar alert matches the parameters that you set. As an example, a high confidence percentage value indicates a higher likelihood of similarity of the alerts to the values that you set.



You can modify the value of the threshold by setting the `evt_mgmt.similarity_use_threshold` property.

Similarity solutions

Similarity solutions enable you to use Machine Learning (ML) to compare the text in a resolved alert record to an open alert record to reuse its resolution approach.

Training a similarity solution

To train a similarity solution, you collect words to compile a collection that Machine Learning (ML) can use to compare text in the **Short Description**, **Description**, **Source**, **Type**, **Resource**, and **Metric Name** fields in a resolved alert to see whether the words in the set match words in an open alert. The resolved alert, which is similar to an open alert, provides an example to show how the open alert can be resolved.

To train a solution, the filter must return at least one record. If your filter returns no records, update it.

Note: The preferred number of records for training a solution is between 30,000 records and 300,000. If you submit more than 300,000 records, the most recent 300,000 records are used to train the solution. Use only authentic records from the database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Ensure that the records you train are not too old and that they are relevant to your business needs. Keep the words in the collection current.
- Do not use hard-coded dates as filters because these filters are not updated when you retrain solutions unless you update them manually before every retraining. Instead, use relative date filters, for example, the last 3 months, last 6 months, or last 12 months.
- Perform training as needed until it provides an acceptable similarity solution. This practice provides you time to review and update your solution definition.

Fields to include in the solution

Record the fields that are likely to contain words and phrases that help the system identify similar records for your solution.

The similarity fields that you select should be a subset of your input field selections. For example, if you select fields from incident records that are in Open state, do not select **Close note** as a similarity field. Because open records do not include **Close note** fields, the text cannot be similar.

The similarity fields are available to users when they create records.

About the similarity score

The similarity score is a measure from 0-100 of the degree of similarity between two alert records. Alert records that have a similarity score higher than the threshold that you specify is returned by the solution.

Review similarity examples and their scores using the **Show training progress** feature to determine whether to either increase or decrease the solution threshold. You can change the threshold value in the **Threshold for Similarity Score** field.

View training solution progress

Training times vary based on the number of records and classes within the training set. The more records and classes you use, the longer the training can take. For example, a data set containing 100,000 records and several hundred classes can take around five hours to complete.

To show the training solution progress, the ML solution automatically performs the following activities when you select **Show training progress** on the Solutions page. For more information, see View solution training progress.

Solution training activities

Activity	Description
Fetching files for training.	The system downloads the training records and sends them to the nearest training service.
Preparing the data.	The system removes duplicate records from the training set.
Training the solution.	The training service trains the solution.
Uploading the trained solution.	The training service uploads the solution as attachment records.

Create an Event Management similarity solution

Create and train a solution that applies machine learning to a collection of words to target and suggest similar alerts in your instance dataset. For example, you can compare the text in a resolved alert record to an open alert record to reuse its resolution approach.

Before you begin

Role required: evt_mgmt_admin

About this task

The encryption scheme that you use can affect whether you can train solutions.

- If your data is encrypted by Full Disc Encryption (FDE), you can train solutions.
- If the field you are using for training is encrypted using Field Encryption, ensure that the shared service worker user has the correct encryption module role that has been used for encryption.
- If you are using Edge Encryption, training is not supported.

Note: This feature supports only English language processing.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. Click **New**.
3. On the form, fill in the fields.

ML Solution Definition form

Field	Description
Solution Template	Use to define a word collection.
Label	Unique name for the similarity solution.
Name	Field that is auto-populated with a system-assigned name that is similar to the label name when the solution is created.
Table	Table that contains the records to use for the word collection, for example, the Incident table or the Asset table. When you assign a table value, a link appears that shows the number of records that match your current conditions.
Filter	Conditions that you want to apply to the training records. To train a solution, the filter must return at least one record. If your filter returns no records, update it.
Input Fields	Record the fields that contain the text and context that you want to include in your word collection. The field data type can be a string, reference, choice, or HTML, such as **Short description** and **Description**. **Note:** **Journal type** is not a supported data type. Good candidates for your input fields have text that is relevant to the solution. For example, if you are configuring a solution to find similar incident records, you can select the **Short Description**, **Description**, **Resolution notes**, and **Close notes** fields.
Training Frequency	Training is performed once by the system, by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Because your data can age over time and degrade the accuracy of recommendations, consider invoking scheduled trainings once your solution definition is fairly stable.
Domain	On instances where domain separation is active, select the domain whose target records you want to use for your word collection. Create a separate similarity solution definition record for each domain whose field values you want to use for your word collection.
Similarity Fields	Record fields that are likely to contain words and phrases that help the system identify similar records for your solution. To change your **Similarity Field** choices, click the Lock icon ( ) to open the field and make your updates. Click the icon again to close the field and save your updates.
Similarity Window	The period in which you want to look for similar records. If you have a smaller number of total incoming records, a larger window might be best. However, if the window is too large, you may retrieve records that are not as useful. If the window is too small, you might not retrieve enough similar records. For example, if you are looking for similar incident records that are open, you can select **Last 1 day**. This selection targets the most recent records, many of which could still be open.
Similarity Window Filters	Filter conditions for your similarity window. These filters define the dataset conditions under which your similarity results are determined. For example, if you are looking for similar incident records that are open, you can filter your search by creating conditions such as: **[Incident state] [is] [In progress]** These filters are applied in addition to the **Input Field** filters.
Window Refresh Frequency	Frequency to refresh the similarity window. For example, if your window contains incident records that are open, you can select a refresh frequency value of **Every 15 minutes**. New incidents typically occur frequently throughout the day so this frequency increases the likelihood that newly opened records are included in the refresh. **Note:** If your similarity window is composed of records such as Knowledge article records, which are typically not created often, you can choose a larger refresh frequency such as **Every 1 day**.

4. Click **Save** to save the solution definition record so you can return to it later, or click **Submit & Train** to create the solution definition record and train it.
5. If you submitted the solution for training, click **OK** on the **Training Activation** window to confirm.

Result

The system schedules the solution for training with the nearest training service. You and other users subscribed to the Predictive Intelligence Notifications category receive a notification when the training completes, including any errors that might have occurred in the training. When training is complete, the system uploads the solution as an Attachment record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Review the trained similarity solution examples in the **Similarity Examples** related link on your ML Solution Definition form.

View Event Management solution training progress

View solution training progress or statistics to determine whether a solution is available or how long the next training cycle might take to complete.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, select the solution whose progress or statistics you want to view.
3. Click the **Show training progress** related link.
   The ML solution automatically performs activities that appear in the Training Progress pop-up window.

   The system shows a Training Progress pop-up window. In the following example, the progress failed.

   If the training is a success, all bars would be fully blue and the progress for each step would show 100%.

What to do next

See Review Event Management similarity examples.

Review Event Management similarity examples

Review the similarity examples and scores that the system provides during solution training to see how the selected alert record compares to existing alert records. For example, you can modify the similarity score threshold to increase the accuracy of your similarity recommendations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Train a similarity solution in a ServiceNow datacenter. For more information, see Create an Event Management similarity solution.

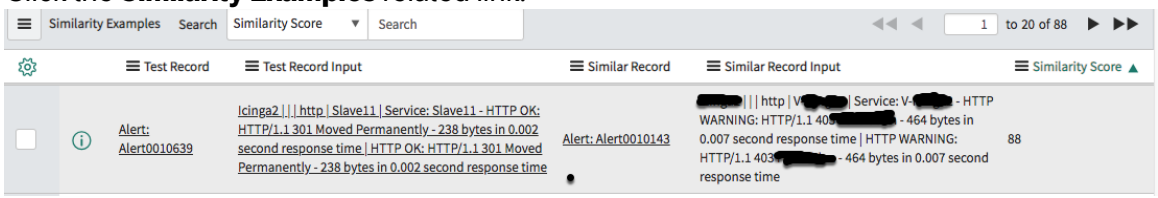
Role required: evt_mgmt_admin

About this task

Adjust the current threshold to provide useful results. For example, a low similarity score has more coverage but less precision.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, locate your solution and click the Information icon ( ).
3. Click **Open Record**.
4. Click the **Similarity Examples** related link.



5. Review the similarity examples and their threshold scores to determine the accuracy and coverage levels you want applied to your solution similarity results.
   The higher the similarity score, the more precise it is and the less coverage it offers. The lower the similarity score, the more coverage it has and the less precision it offers.
6. Based on your review, determine whether to increase or decrease the similarity score threshold value for your similarity solution

   The solution returns only similarity results that have a score that is higher than the threshold. If the current threshold is not providing useful results, adjust the threshold value.

7. Navigate to **Predictive Intelligence** > **Similarity** > **Solutions**.
8. In the ML Solutions list, locate your solution and click the Reference icon ( ).
9. Click **Open Record**.
10. In the Solution Statistics tab, enter a new value in the **Similarity Score Threshold** field.
    For example, suppose that the current score is 80. Based on your similarity example review, you might want to update the field by entering a higher score of 90, which will return fewer results but ones that are more similar to the alert record under review. A lower similarity score has more coverage but less precision.
11. Right-click in the form header and click **Save**.
    Your solution uses the new similarity threshold value. In the example, the solution returns similar results that have a score higher than 90.

Activate Event Management solution version

The system activates the most recent version of the solution, but you can activate any previously trained Event Management solution version if it is more appropriate.

Before you begin

Because you might have created more than one solution, you can choose to activate the solution that is most appropriate.
Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, click the Reference icon (ⓘ) for the trained solution that you want to activate.
3. Click **Open Record**.
   You can assign a title to the solution using the `evt_mgmt_similarity_solution_title` property. The default value is `ml_x_global_alert_similarity`. This property changes the value in the **Solution Name** field.
4. In the solution record, click **Activate**.
   The system activates this solution version and deactivates any other solution version.

Self-health monitors for Event Management

Use the Event Management self-health monitors to track Event Management features and resolve issues.

Monitor Event Management to detect and resolve issues

Enable the self-health feature to help detect and troubleshoot Event Management health issues. Some configuration is required before the self-health feature can display meaningful data. Once configured and the related scheduled jobs are enabled, the Service Operations Workspace displays data that is automatically collected and calculated on a recurring schedule.

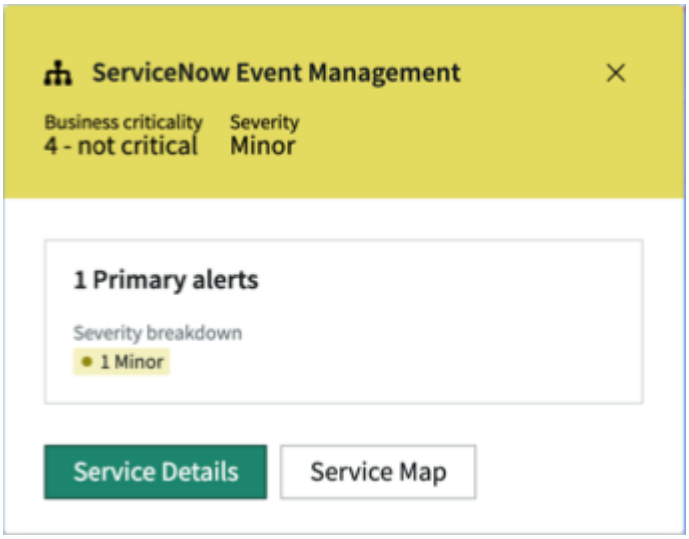
Note: Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

The self-health feature creates CIs in the CMDB to represent the components of the self-health service. Use the provided monitors to monitor and track the health of services and Event Management features.

Event Management self-health can:

- Trigger alerts when there is an issue with Event Management.
- Display the **ServiceNow Event Management** application services in Service Operations Workspace. Use Service Operations Workspace to view alerts by application service, technical service, and alert groups. You can double-click a tile to view general information about the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Click **Service Details** to view details of the service.
- Click **Service Map** to view a map representation of the **ServiceNow Event Management** application services to see the relationships between CIs in the **ServiceNow Event Management** application services.

Self-health monitoring process workflow

After the *Event Management – self-health monitoring* property is enabled:

1. The **ServiceNow Event Management** application services is automatically created.
2. Jobs are automatically scheduled to run scripts that configure what must be monitored.
3. The Monitoring States [em_monitor_state] table is updated after each event run that the configuration scripts trigger.
4. The alerts that are generated are monitored.

   The service displays the status of the monitored entity. For example, alerts are displayed in the Event Management dashboard, Service Operations Workspace or All Alerts list.

You can resolve the alerts according to the underlying issue by using **Quick Response** on the standard platform interface. For details, see Apply a quick response in an alert.

Jobs scheduled to process scripts

The jobs scheduled to run by default after the *Event Management – self-health monitoring* property is enabled are:

- The `Event Management - Insert Health Monitor` scheduled job which runs the scripts.
- The `Event Management - Update Health Monitor` scheduled job which runs the update scripts. This job runs once every minute.

Start or stop self-health monitoring

You can control the starting or stopping of the self-health monitor feature by configuring the self-health monitoring property. The first time that the self-health monitoring property is enabled, it automatically creates the ServiceNow Event Management application services.

Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Configure the self-health monitoring property to monitor and track application services and Event Management.

Procedure
1. Navigate to **All** > **Event Management** > **Event Management Properties**.
2. Locate the *Enable Event Management self-health monitoring* (*evt_mgmt.self_health_active*) property.
   Select one of these values:

Enable Event Management self-health monitoring property

Field	Description
Enabled	The ServiceNow Event Management application services is created and set to monitor self-health. Events are received and alerts are generated.
Alerts Only	The ServiceNow Event Management application services and the CIs related to it are not created. Alerts are created but are not bound to a CI.
Disabled	The ServiceNow Event Management application services is not operational. Events are not received, and alerts are not generated.

3. Click **Save**.

Result
The ServiceNow Event Management application services is set according to the value selected for the *evt_mgmt.self_health_active* property.

Configure the Event Management - Insert Health Monitor scheduled job

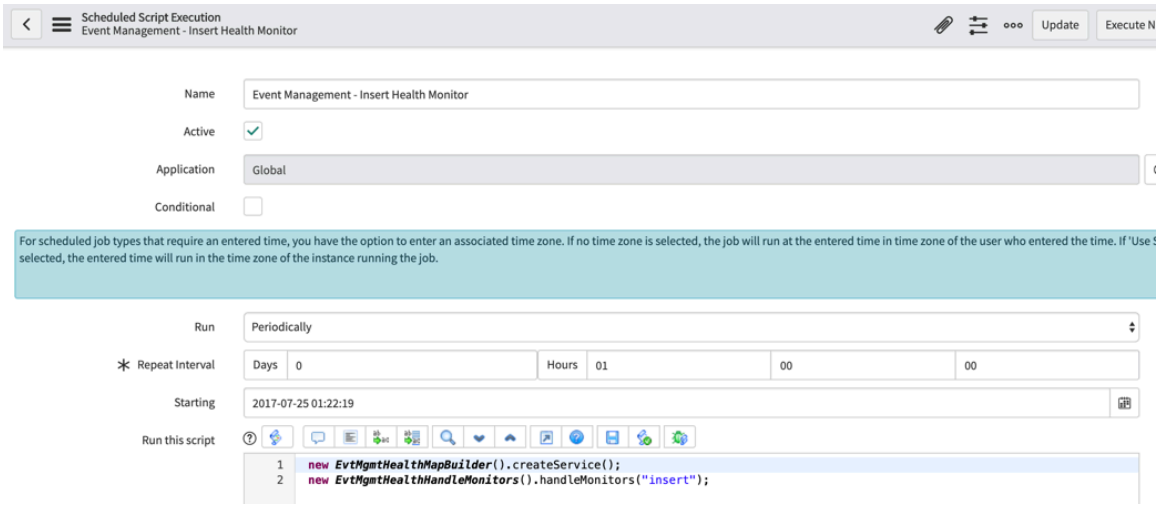
Determine what the Event Management - Insert Health Monitor scheduled job is to monitor. After the job runs, you can view the **ServiceNow Event Management** application services.

Before you begin
Ensure that the *Enable Event Management — self-health monitoring* property is enabled on the Event Management Properties page (**Event Management** > **Event Management Properties**).

Role required: evt_mgmt_admin

Procedure
1. Navigate to **System Definition** > **Scheduled Jobs**.
2. Locate and select the **Event Management - Insert Health Monitor** job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Modify the scripts indicated in the **Run this script** field to determine what the scripts are to monitor.

Monitor self-health with domain separation

Use domain separation to enable self-health to display Event Management health issues that are based on data, rules, and settings from the logged in user domain. The selected domain must not contain any child domains.

Before you begin

Ensure that the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin is activated and that the MID Server you're connecting to is configured for Event Management.

Role required: evt_mgmt_admin

About this task

Self-health monitoring is domain aware. If the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin has been activated, then self-health displays health issues based on data, rules, and settings from the logged in user domain. If rules and settings aren't defined for a child domain, then the settings of the parent are applied, recursively.

Note: To generate self-health monitoring events in the domain-separated instance, you must specify the domain of these generated events. This is done by specifying the `sys_id` of the required domain in the *`evt_mgmt.domain_self_monitoring`* property.

When the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin isn't activated, adding, or removing a connector or MID Server is immediately reflected in the map.

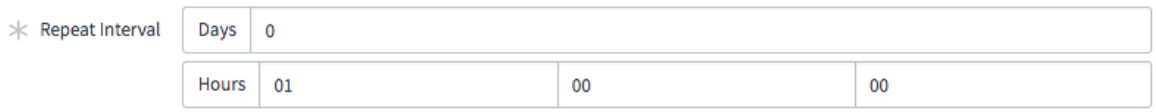
When the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin is activated, updates are done periodically according to the interval specifications of the Event Management — Insert Health Monitor scheduled job.

Procedure

1. Navigate to **All** > **System Scheduler** > **Scheduled Jobs**.
2. In the **Schedule** list, locate and select the Event Management — Insert Health Monitor job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Event Management — Insert Health Monitor job, under Related Links, select **Configure Job Definition**.
4. Set the required periodic update time in the **Repeat Interval** field by specifying the required values.
   The default interval is one hour.

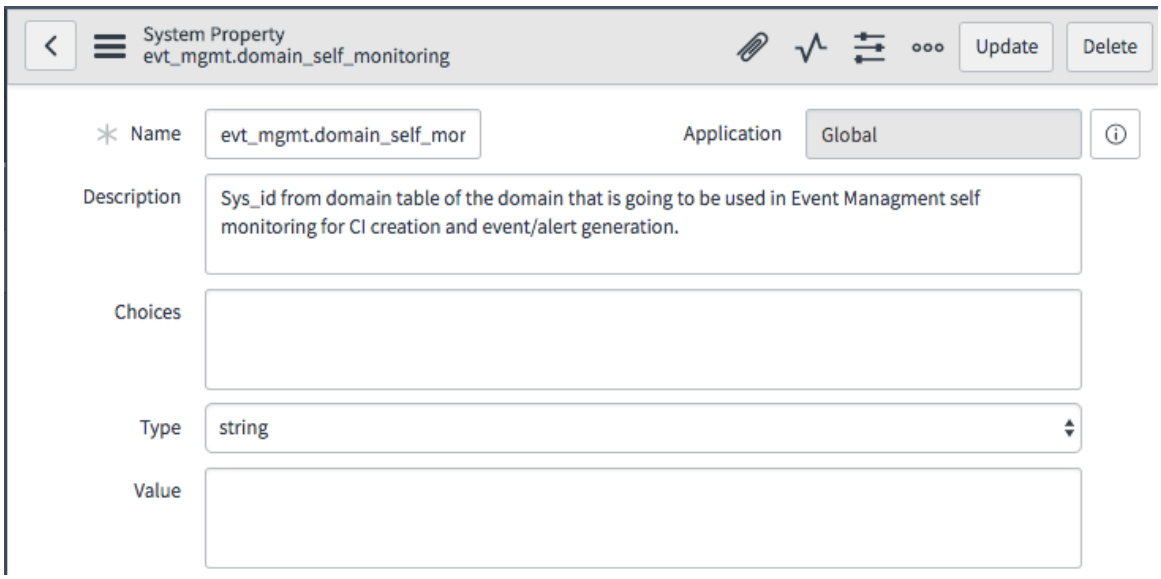


5. Select **Update**.

Result

Further configuration is required for CI creation, receipt of events, and alert generation. The `sys_id` of the domain must be specified in the **Value** field of the *`evt_mgmt.domain_self_monitoring`* property.

1. Navigate to **System Properties All Properties**.
2. Locate and select the *`evt_mgmt.domain_self_monitoring`* property.



3. In the **Value** field, specify the `sys_id` of the domain.
4. Select **Update**.

Domain separation setup and basic administration

Configure a self-health monitor

You can configure a self-health monitor to track Event Management components and see that they do not exceed the specified threshold.

Before you begin

Role required: evt_mgmt_admin

About this task

The Monitoring Configurations [em_monitor_conf] table lists the records that determine which Event Management components are being monitored. Each record contains the health

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

monitor script that is relevant to what you are monitoring. If you intend to create a new health monitor script, you must configure a monitor to match the purpose of the custom script. You can configure the monitoring configuration records to track the items that are important to you. For example, you can modify the threshold aspect in the *Connector's Idle state monitoring* record, by specifying that the monitoring job frequency is 90 seconds instead of 120 seconds.

Note: Each of the monitoring configuration records can be disabled.

If a monitoring configuration specifies a threshold, the configuration value determines what alert severity to display. Threshold values specify the delay time values in units of minutes.

After the *Event Management - self-health monitoring* property is enabled, these jobs are automatically scheduled to run scripts that configure what must be monitored:

- The Event Management - Insert Health Monitor scheduled job runs the scripts. Determine what must be monitored by adding or modifying the script in this job, which runs once every hour.
- The Event Management - Update Health Monitor scheduled job runs the update scripts. This job runs once every minute.

Use the following procedure to configure whether a monitoring configuration can run and set the frequency of the monitoring job. You can specify the threshold values that, if exceeded, trigger an alert.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Self-Health Monitoring**.
2. From the Monitoring Configurations list, select a monitoring configuration record and modify the required field.
   On the form, fill in the fields.

Monitoring Configuration form

Field	Description
Active	Check box for enabling the monitoring configuration to be active.
Monitoring job frequency [seconds]	Frequency that the monitoring job is run.
Critical Threshold	Any point above the value is considered a critical consequence.
Major Threshold	Any point above the value, but below the value of the **Critical Threshold**, is considered a major consequence.
Minor Threshold	If exceeded, the value is considered a minor consequence.
Warning Threshold	If the value is exceeded, a warning is issued.

3. Click **Update**.

Result

The values in the modified monitoring configuration record are compared to the actual values as they occur in events that are received. Alerts are created according to the configuration settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example:

Example 1: Use the following procedure to modify the **Critical Threshold** field of the **Connector's Idle state monitoring** monitor from 30 seconds to 35 seconds. This field determines the number of seconds that pass before an alert is generated when the **Critical Threshold** idle state value of a connector is exceeded. In this example, the **Critical Threshold** field is modified from 30 seconds to 35 seconds.

1. Navigate to **Event Management** > **Settings** > **Self-Health configuration**.
2. From the Monitoring Configurations list, select **Connector's Idle state monitoring**.
3. In the **Critical Threshold** field, modify the value to `35`.
4. Click **Update**.

Result The threshold value of the **Critical Threshold** field is increased from `30` to `35`, thereby increasing the number of seconds that pass before an alert is generated for this threshold.

Example 2: This example describes the configuration of the severity threshold when using the **Connectors Status** monitor. The **Connector Status** monitor has a true (= value 1) or false (= value 0) configuration for the severity threshold. For this monitor, where a threshold has the value `1`, then that severity is displayed. Only one severity threshold can have the value`1`. This example assumes that the required severity displayed is `Minor`.

1. Navigate to **Event Management** > **Settings** > **Self-Health configuration**.
2. From the Monitoring Configurations list, select **Connectors Status**.
3. In the **Minor Threshold** field, specify the value `1`.
4. Click **Update**.

Result The monitor issues an alert if the threshold value of the **Minor Threshold** field is exceeded.

What to do next

Create a customized monitor. A template is provided to assist you to create script that can monitor the specified components. For more information, see Create a self-health monitor to use custom health monitor script.

Create a self-health monitor to use custom health monitor script

You can create a self-health monitor to use custom health monitor script to monitor specified Event Management components.

Before you begin

Role required: evt_mgmt_admin

About this task

To augment the self-health monitors that are provided with the base system, you can create a self-health monitor to monitor the components that you specify. The health monitor scripts that are provided with the base system are listed in the following table.

Health monitor scripts provided with the base system

Health monitor script	Used by a monitor to:
Check delay in event processing	Monitor the duration of events [in minutes] that remain in Ready state and are not processed.
Connectors Monitor	Monitor:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health monitor scripts provided with the base system (continued)

Health monitor script	Used by a monitor to:
	• Whether the time that a connector in idle state surpassed the threshold [in minutes] configured. • The active status of connectors.
Get Event Processing state	Monitor the time that events are in Ready state. Alerts are sent when this time exceeds the threshold.
MID Server Threshold Alerts	Monitor MID Server health. Events are sent when changes in MID Server state are detected.

You can create alert management rules to respond to and remediate the issues detected by self-health. Alerts are generated based on the specified severity and threshold. Navigate to **Event Management** > **Administration** > **Self-Health Monitoring** for the monitors that are provided with the base instance to monitor the issues detected by self-health, which are:

Monitor	Description
Connector's idle state monitoring	Monitor to verify whether any of the connectors were in idle state that surpassed the threshold [in minutes] that was configured. Health Monitor script selected: `Connectors Monitor`.
Connectors Status	Monitor to track the active status of the connectors. Select only one threshold to configure which severity to invoke using 1 to select the threshold field or 0 to ignore the threshold field. For more information, see Connector status example. Health Monitor script selected: `Connectors Monitor`.
Delay in event processing	Monitor to track the duration of events [in minutes] that remain in Ready state and were not processed. This duration period initiates an alert for the event processing CI with severity according to the configured thresholds [minutes]. Health Monitor script selected: `Check delay in event processing`.
Event Processing job	Monitor the state of the event processing jobs. An alert is generated when the idle time of a job exceeds the configured threshold. Health Monitor script selected: `Get Event Processing state`.
MID Server MID Server Threshold Alerts	Monitor MID Server MID Server health. Events are sent when issues with MID Server availability and resource thresholds are detected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitor	Description
	Health Monitor script selected: `MID Server Threshold Alerts`.

Note: To prevent a self-health monitor from detecting the connector status, at any time you can clear the **Active** check box of the monitor and then click **Update**.

Procedure

1. Navigate to **Event Management** > **Administration** > **Self-Health Monitoring**, and click **New**.
2. On the form, fill in the fields.

Monitoring Configuration form

Field	Description
Name	Descriptive and meaningful name for the monitor.
Description	Text narrative that describes the monitor.
Active	Check box to enable the monitor.
Monitoring job frequency [seconds]	Frequency that the monitoring job should run. Default: `120` seconds.
Last Run	Last run date and time. These values are automatically updated.
Script	Monitoring script. Click the search icon. The existing scripts are listed in the Health Monitor Scripts screen, or click **New** to create a custom health monitor script. For more information about creating a custom health monitor script, see step 3.
Note: Regarding all the following threshold configuration fields: All monitored values are compared against the thresholds. If a monitored value exceeds a threshold, an alert with the appropriate severity is issued.	
Critical Threshold	Any point above the value is considered a critical consequence.
Major Threshold	Any point above the value, but below the value of the Critical Threshold, is considered a major consequence.
Minor Threshold	If exceeded, the value is considered a minor consequence.
Warning Threshold	If the value is exceeded, a warning is issued.
Additional information	Further information about the monitor.

3. To create a custom health monitor script, on the Monitoring Configuration form, next to the **Script** field, click the search icon to open the Health Monitor Scripts form, and click **New**.
4. On the form, fill in the fields.

Health Monitor Script form

Field	Description
Active	Check box to enable the monitor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Text narrative that describes the custom script.
Name	Descriptive and meaningful name for the custom script.
Script	Custom script to run when called from a monitor. A script template is provided as a guide. You can use the Health monitor scripts provided with the base system as examples of how to author the script, and use the script editor tools. Ensure that the custom script includes: Run the monitor function, which is called according to the "monitoring job frequency" setting *runUpdateHealthMonitorScripts(scriptId)*. Add this function to run the monitoring logic. Specify the configuration function that is called every hour *runInsertHealthMonitorScripts(scriptId)*. Add the configuration logic and add a CI if needed. In the navigation pane search field, enter `em_monitor_state.list`. In the Monitoring States [em_monitor_state] table, specify the initialization of the monitor record in the required record. Use the helper functions defined in *EvtMgmtHealthMonitorCommon* and *EvtMgmtEventAlertGenerator* script includes: ○ EvtMgmtHealthMonitorCommon ○ healthMonitorCommon.shouldRun ○ healthMonitorCommon.calculateSeverity ○ EvtMgmtEventAlertGenerato ○ openAlert ○ closeAlert

You can use the Monitoring Configurations [em_monitor_conf] table for self-health monitoring configuration, the Health Monitor Scripts [em_monitor_scripts] table for scripts, and Monitoring States [em_monitor_state] table for displaying the results of the monitor, as initialized inside *runInsertHealthMonitorScripts*.

For more information about script includes and APIs, see:Script includes that are installed with Event Management

5. Click **Submit**.

Result

To monitor the Event Management components that you specify, you can configure a self-health monitor that uses the custom health monitor script that you created.

View the Event Management self-health application services map

You can view Event Management application services maps to have a visualization of the data on configuration items (CIs) that comprise this service, and the relations and connections between these CIs.

Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Event Management application services topology map only displays MID Servers that have passed validation and connectors that are active.

About this task

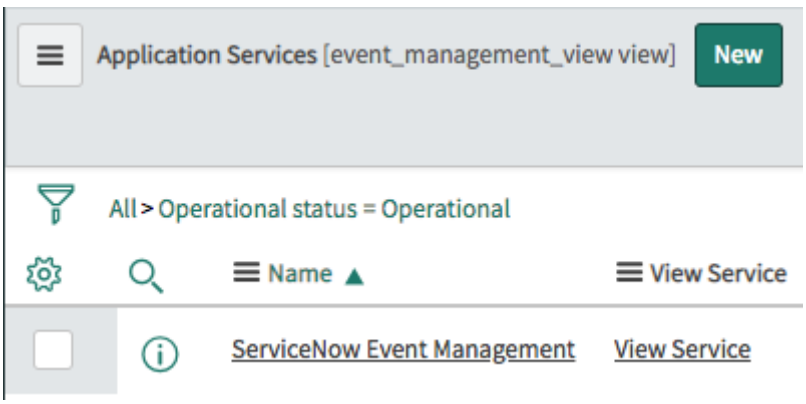
The Event Management components that are monitored by the self-health application services are listed in the following table:

Components monitored by the self-health application service

Component	What is monitored
Event connectors	For each connector: • Status: Success or Error • Delay: Elapsed time from 'last run time' (above threshold)
Event processing jobs	For each event processing job: • Number of actual jobs executed compared to the number of jobs configured to run. • Delay of any of the event processing jobs above the time set as threshold. • Duration of events in Ready state compared to the specified threshold. • Delay of event rule processing above the set threshold. If there is a delay, an alert is generated and the event rule is disabled.
MID Servers	MID Servers that have been validated are displayed. The MID Server status and the `Ecc_agent_issue` table are monitored. An event is triggered whenever this table is updated. The MID Server status is displayed, either **Up** or **Down**. For information about MID Server health, see MID Server heartbeat

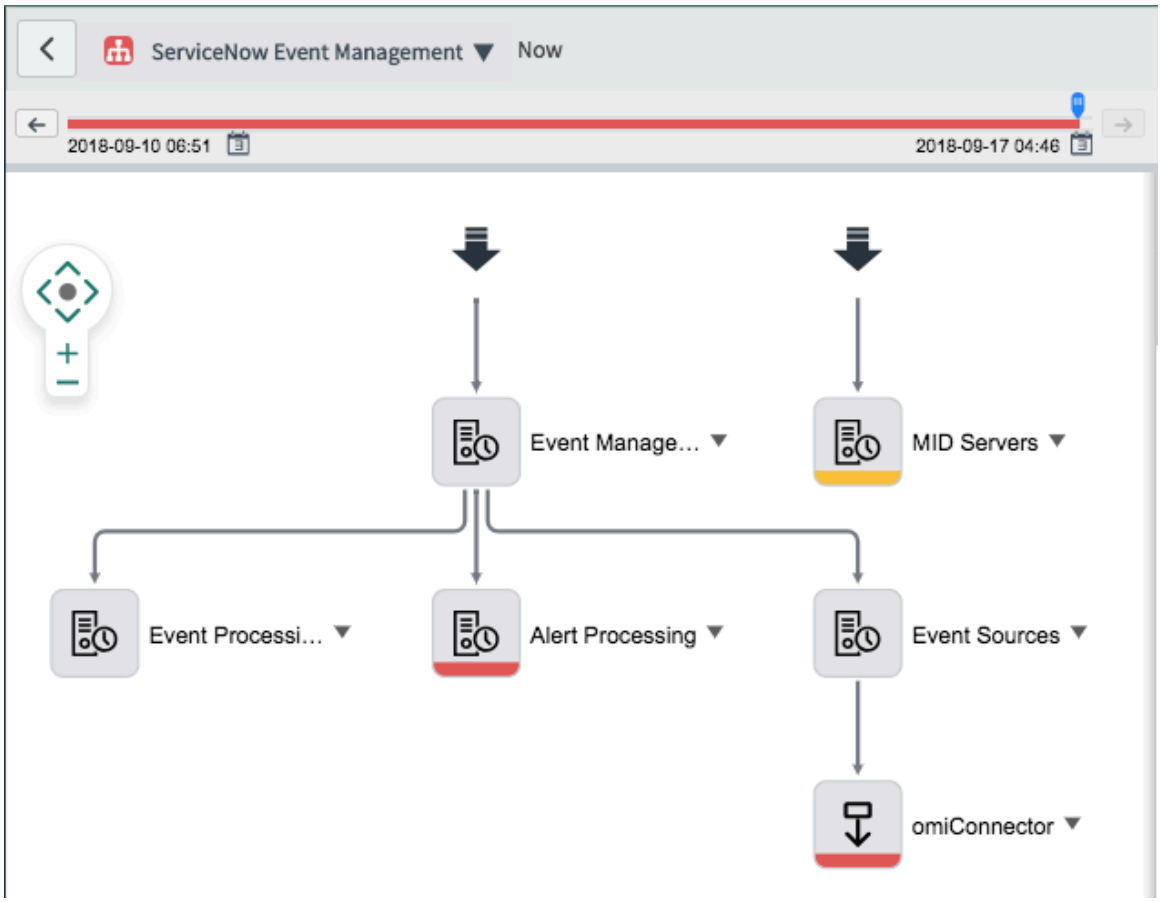
Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.
2. Click the **ServiceNow Event Management** application services.
3. On the **Application Services** page, locate **ServiceNow Event Management** and click **View Service**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Displayed on the map are the related MID Servers and the Event Management object, as depicted in the following image; these MID Servers have an **UP** status. MID Servers are updated when they are created or deactivated.



Under the Event Management object is Event Processing, Alert Processing, and Event Sources (for example, connectors). Only **Active** connectors are shown; when a connector is created, the connector is displayed only after it has been activated. The status of active connectors is updated and the status of non-active connectors is not displayed.

In the preceding image, the health of Event Management components is displayed. The omniConnector component has a red bar, indicating that a critical alert has occurred that affects this connector. In addition, this critical alert impacts the parent Alert Processing object, which as a result, has a red bar.

Result

You can select the configuration item that has a critical alert and change the impact from parent to application service.

Create maintenance rules

Use maintenance rules to mark CIs in maintenance status. When in maintenance status, these CIs are excluded from impact calculation.

Before you begin

Role required: evt_mgmt_admin

About this task

You can define rules to mark CIs that match the specified criteria as being in maintenance status. The marked CIs populate the Impact Maintenance CIs [em_impact_maint_ci] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When running maintenance rules, the cmdb_ci status of matching CIs is not changed. However, matching CIs are flagged in the em_impact_maint_ci table by these rules and this status is considered for impact and alert calculations.

The field flagged by this rule as being in maintenance status is the CMDB status field.

Note: To activate a maintenance rule, select the **Active** field in the maintenance rule. To deactivate a maintenance rule, clear the **Active** field.

The maintenance rules provided with the base instance are:

Default maintenance rule	Description
CI in Change Window	Where the CI has an active change window, the matching CIs are marked as being in maintenance status. The rule runs a query against the change request [change_request] table to determine whether the rule is applied. All these conditions in the change_request table must be met: • **State** is one of these options: Scheduled, Implement, Work in Progress, or Open/New (state in (-2, -1, 1, 2)). • **Approval** is Approved (approval = 'approved'). • The change request window is active, that is, the current time is between **Planned start date** and **Planned end date**, or the current time is between **Actual start date** and **Actual end date**. • The change request record is not an on-hold record (on_hold='false'). **Note:** All these conditions must be present for the CI to be placed in maintenance status by this rule. For example, if the **State** of the change request approval status is `Change is waiting for approval`, then the change is not added to the em_impact_maint_ci table.
Maintenance status of CI	CIs whose CMDB status field is **In Maintenance** are flagged by this rule as being in maintenance status. By default, retired CIs are not included in CIs that are **In Maintenance**. To include retired CIs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default maintenance rule	Description
	1. Navigate to **All Properties**. 2. Select **New**. 3. Configure the *evt_mgmt.maintenance_rule_include_retired* property with **Value = true**. **Note:** Including thousands of retired CIs may decrease system performance.

Procedure

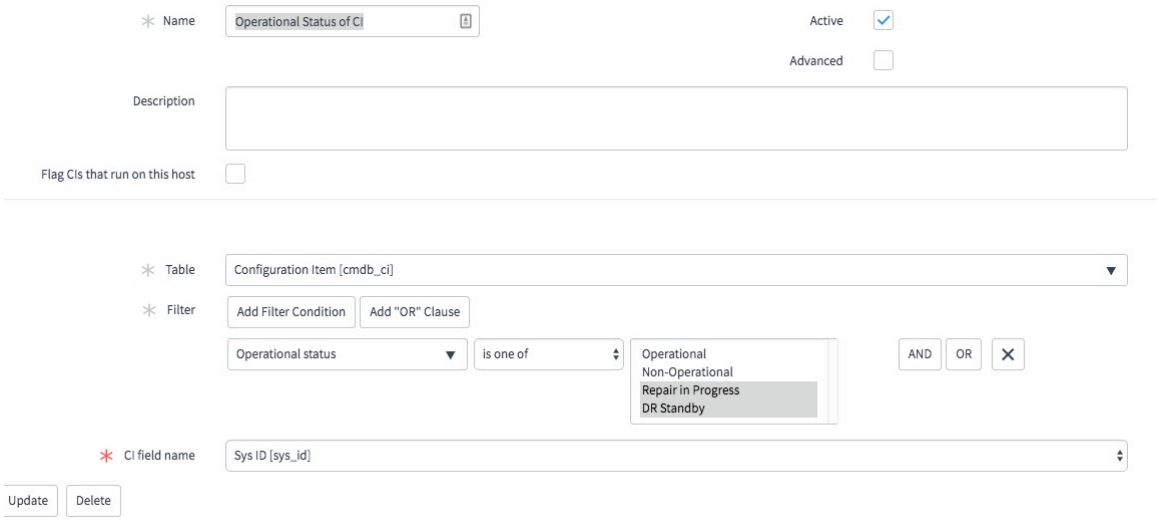
1. Navigate to **All** > **Event Management** > **Rules** > **Maintenance Rules**.
2. Click **New**.
3. Fill in the fields, as appropriate.

Column heading	Description
Name	The maintenance rule name.
Active	Select to activate the maintenance rule.
Advanced	Select to enable the optional script section to display.
Description	Information that describes this maintenance rule.
Flag CIs that run on this host	Select to flag all applications running on the recognized host as being in maintenance.
Table	Select the table that contains the CI that you require.
Filter	Specify how to select the data.
CI field name	Select the CI from the list. The list is populated according to your selection in the **Table** field. If a CMDB table, or a table derived from CMDB, was selected, specify `sys_id` for the **CI field name**. Otherwise, specify the required CI field that you want to use. See the examples.

4. Click **Submit**.

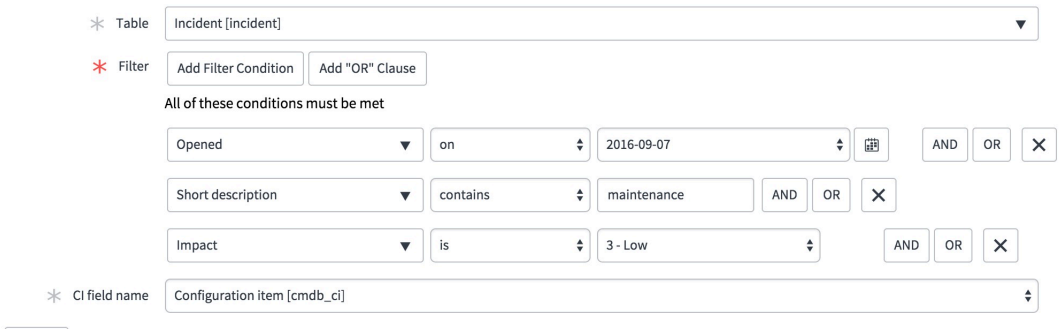
Example:
Example of a maintenance rule using a CMDB table.
Assume that a company defines a CI as being in maintenance when the Operational Status of the CI is either **Repair in Progress** or **DR Standby**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Example of a maintenance rule using a table other than CMDB.

Assume that a company uses Incident records to track maintenance. Any maintenance request is translated to an incident when it has a description that starts with “Performing maintenance on CI”. As long as the status of such an incident is open, this status indicates that the maintenance is in progress. For the **CI field name** field, specify a CI name from the table that was chosen, in this case **Incident**.



Example of a maintenance rule that uses the advanced script feature.

In the Maintenance Rule page, select the **Advanced** option. Customize the provided example script:

```
var now_GR = new GlideRecord('cmdb_ci');
gr.addQuery('name', 'your_name_here');
gr.query();
while (gr.next()){
 result.push(gr.sys_id +'');}
```

The return value for this example script is a text string that represents an array of CI IDs, for example, ['sys_id1','sys_id2','sys_id3'].

You can use this script as an example to prepare your own customized script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
(function findCisInMaint(){
var result = [];

//Your code goes here, this is an example of setting CIs in maintenance
var gr = new GlideRecord('cmdb_ci');
gr.addQuery('name', 'your_name_here');
gr.query();
while (gr.next()){
 result.push(gr.sys_id +''); //The array should be a string array, make sure to add strings
}

//Make sure to create a string representation of the array
return JSON.stringify(result);

})();
```

Resolve an incident related to an alert

When you resolve an incident that is associated with an alert, the alert can also close according to the *evt_mgmt.incident_closes_alert* property.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Open an incident.
2. Click **Resolve Incident**.

   The corresponding alert is closed, resolved, or left alone as specified by the *evt_mgmt.incident_closes_alert* system property.

   The alert may not close immediately when the incident is closed. Depending on the value of the *evt_mgmt.alert_rule_close_delay* parameter, the alert may close 5 seconds after the last alert update. This value (in seconds) is defined in the parameter. To use the property, you need to create the property with the same name and assign the required value to it. For more information on how to create a property, see Add a system property.

Close an alert

Close an alert by an event or a user action. Closing an alert also closes any related incident that is not already resolved or closed.

Before you begin

Role required: evt_mgmt_admin or evt_mgmt_operator

About this task

An alert can be closed manually, automatically by a close or clear event, or when a related incident is resolved. Whether the alert is closed when the incident is closed is determined by the *evt_mgmt.incident_closes_alert* property.

When a Clear event is triggered for an open alert, the corresponding alert is set to the "Closed" state. Closing an alert also closes any related incident that is not already resolved or closed. This default behavior can be configured using the *evt_mgmt.alert_closes_incident* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Event Management** > **All Alerts**.
2. Select the alert you want to close.
3. In the Alert Form, select **Close**.
   The alert closes without confirmation. If the alert has any resolved or closed incidents, a work note is added to the incident indicating that the related alert was closed.

   If an alert has an open incident that is not related to any other open alerts, the incident is either closed, resolved, or left unchanged based on the *evt_mgmt.alert_closes_incident* property.

Reopen an alert

Additional events can cause reopening of alerts, or you can reopen an alert by changing its state. When an alert reopens, any associated incidents can also be updated or reopened according to the incident state and the *evt_mgmt.alert_reopens_incident* property.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

When an alert is reopened, the related incident is processed as follows:

- If the incident is not *Resolved* or *Closed*, a work note is added to indicate that the related alert was reopened.
- If the incident is *Resolved* or *Closed*, the incident is reopened, a new incident is created, or nothing is done, depending on the *evt_mgmt.alert_reopens_incident* property value.
  - If the incident is reopened, work notes are added to the incident.
  - If a new incident is created, any matching alert management rule, alert action rule, and task template applies to the incident. If there is no matching alert action rule or template, fields from the existing incident are copied to a new incident.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Search by alert number.
3. In the **State** field, click **Reopen**.
4. Click **Update**.

Alert insight properties

Use these properties to configure alert insight.

The role required: evt_mgmt_admin

The following alert_insight properties are under sys_properties.

Property	Usage
Time Frame	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Usage
evt_mgmt.alert_insight_alert_history_min	Set the time frame (in minutes) to retrieve repeated and similar alert data. Default `43200` (30 days) **Note:** Alerts are retrieved regardless of their state (open / reopen / flapping / closed).
evt_mgmt.alert_insight_closed_alert_window	Set the time frame (in minutes) to retrieve alerts that were already closed. It is the time after the alert last updated date. Default: `4320` (3 days)
Similarity	
evt_mgmt.alert_insight_alert_same_as_filter	This property is a comma-separated string that defines which of the alert fields is used to consider alerts to be similar. Default: `source,type,resource,metric_name`
Related CIs	
evt_mgmt.alert_insight_related_cis_topology_levels The relationship types are: • CMDB based (metadata rules and suggested relations) • Within application services • Within Alert groups	For 'Within application service' relationship type, this property sets the depth or the maximum level of relationship of retrieved CIs. Default: 3
Score	
evt_mgmt.alert_insight_group_mapping	This property sets the score for within alert group relations. Default: 2
evt_mgmt.alert_insight_level_1_mapping	This property sets the score for level 1 relationship. Default: 3
evt_mgmt.alert_insight_level_2_mapping	This property sets the score for level 2 relationship. Default: 2
evt_mgmt.alert_insight_level_3_mapping	This property sets the score for level 3 relationship. Default: 1
Maximum related tasks	
evt_mgmt.alert_insight_max_tasks	Maximum related tasks to retrieve for alert insight. Default: 10

Metadata rules consideration

The parent-child relationship of CIs is considered. Dependent relationship rules consist of hosting and containment rules, each type modeling the data from a different perspective of the CI.

To manage dependent relationship rules:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To access rules at the class level, use the CI Class Manager. Navigate to **All** > **Configuration** > **CI Class Manager**.
- To access grouped rules, use the Metadata Editor. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Metadata Editor**.

Containment rules represent configuration hierarchy of CIs, describing which CI contains which other CIs.

Hosting rules represent placement of CIs in a business definition, describing what CIs run on.

Modify the alert insight properties to configure the way alert information and analysis appears in the Alert Insight pane.

Related CIs configuration

The following properties control which CMDB relationships to consider for related CIs. The CMDB relationships include regular CMDB relation rules, metadata rules (containment rules and hosting rules), and suggested relations.

Property	Usage
evt_mgmt.related_cis_get_all_relation_types	Get all relation types, not including metadata rules. Default: `false`
evt_mgmt.related_cis_use_containment_rules	Use metadata containment rules. Default: `true`
evt_mgmt.related_cis_use_hosting_rules	Use metadata hosting rules. Default: `true`
evt_mgmt.related_cis_use_suggested_relations_rules	Use suggested relations rules. Default: `false`
evt_mgmt.related_cis_validate_relation_rules	This property controls whether to validate relation of CI according to metadata rules. Default: `true`

Score

Scores are configured per relation type or depth. Scores are accumulated. The higher the score, the more relevant is the related CI to the current CI.

Example: For a CI that was found at level `2` in the same application service of the current CI, the score is 2. The same CI is in the same alert group, so there is an extra score of `3`. The accumulated score is therefore `2+3 = 5`.

Affiliation type

The Affiliation Type column in the **Related Incidents**, **Related Change Requests**, and **Related Problems** tabs shows the type of relationship that the CI of the selected alert and the related CI have.

To see affiliation type relationships, navigate to **All** > **Configuration** > **Identification/ Reconciliation** > **Metadata Editor**.

The parent-child relationship between configuration items is considered.

Rotate event tables and alert table cleanup

The growth of data tables impedes performance. Preserve instance performance by event table rotation and alert table cleanup for status and alert history retention.

Containing the growth of event tables

By default, the Event Management event [em_event] table uses table rotation. The table rotation schedule ensures that new data is written to one of the tables in the rotation group. According to the value of **Clean base rotation** setting, the base table is deleted and then a new round of writing the tables in a daily rotation commences. By default, this table deletion occurs after seven rotations.

To back up events to a custom table, see Event Management configuration preferences.

Containing the growth of alert tables

By default, a scheduled job cleans out the alert [em_alert] table. Alert table cleanup is recommended for status and alert history retention.

Related topics

Table rotation

Modify event table rotation

Table rotation is used by Event Management, by default, to contain the growth of event [em_event] tables within the rotation table group.

Before you begin

Role required: evt_mgmt_admin

About this task

Table rotation ensures that event tables grow to a reasonable size.
Each table rotation has a schedule, according to which new data is written to one of the tables in the rotation group. A table rotation group includes the original table plus several additional tables. After the rotation procedure has written the last table in a rotation, the rotation overwrites the first table in the rotation. By default, the table rotation for Event Management is to rotate the em_table to an offload table and the base table cleanup takes place after seven table rotations. For information about backing up events to a custom table, see Event Management configuration preferences.

Procedure

1. Navigate to **All** > **System Definition** > **Table Rotations**.
2. Select the [em_event] table rotation group to modify.
3. Edit the required fields.
4. Select **Update**.

Purge impact status and alert history

Automatically cleans up outdated impact statuses and alert history from the database to free up space, improve system performance, and ensure only relevant data is retained.

Before you begin

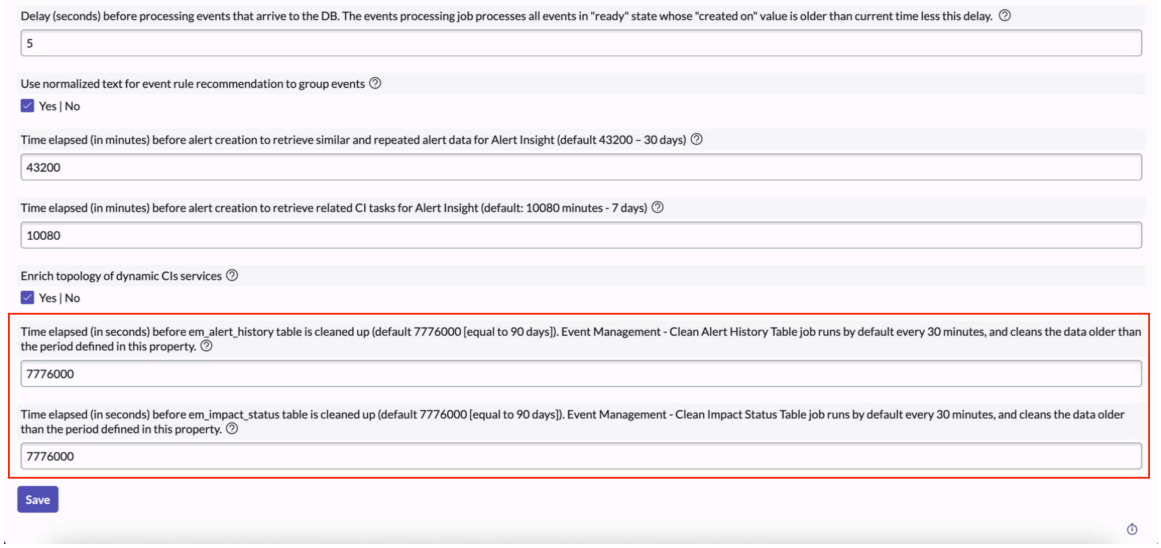
Role required: evt_mgmt_admin

About this task

If records are older than 90 days, by default they are purged. If records are retained for a longer period, larger volumes of data are stored, and performance may be impacted. The data cleanup is done by two jobs: Event Management - Clean Alert History Table and Event Management - Clean Impact Status Table.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. To shorten the retention period, use the highlighted properties.



Related topics

Clean alert history and impact status tables

Schedule jobs to mark and remove old alert records in the Alert History [em_alert_history] and Impact Status [em_impact_status] tables, to prevent the tables from becoming overloaded with data.

Before you begin

Role required: evt_mgmt_admin

About this task

Schedule the following jobs to remove old alert records:

- **Backfill**: Determines when alerts are to be marked for deletion.
- **Clean**: Deletes the alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The records in the [em_alert_history] and [em_impact_status] tables are deleted by default after three months. This is controlled by the properties *evt_mgmt.impact_calculation.cleanup_age_seconds.em_alert_history* and *evt_mgmt.impact_calculation.cleanup_age_seconds.em_impact_status*. The default value is 7,776,000 seconds (equivalent to 90 days).

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
   The **Scheduled Jobs** page appears.
2. To determine how often to mark alerts for deletion on the **Impact Status** table:

   a. Locate and select the **Event Management - Backfill Impact Status Table** job.
   The **Scheduled Script Execution** page appears.

Scheduled Script Execution page

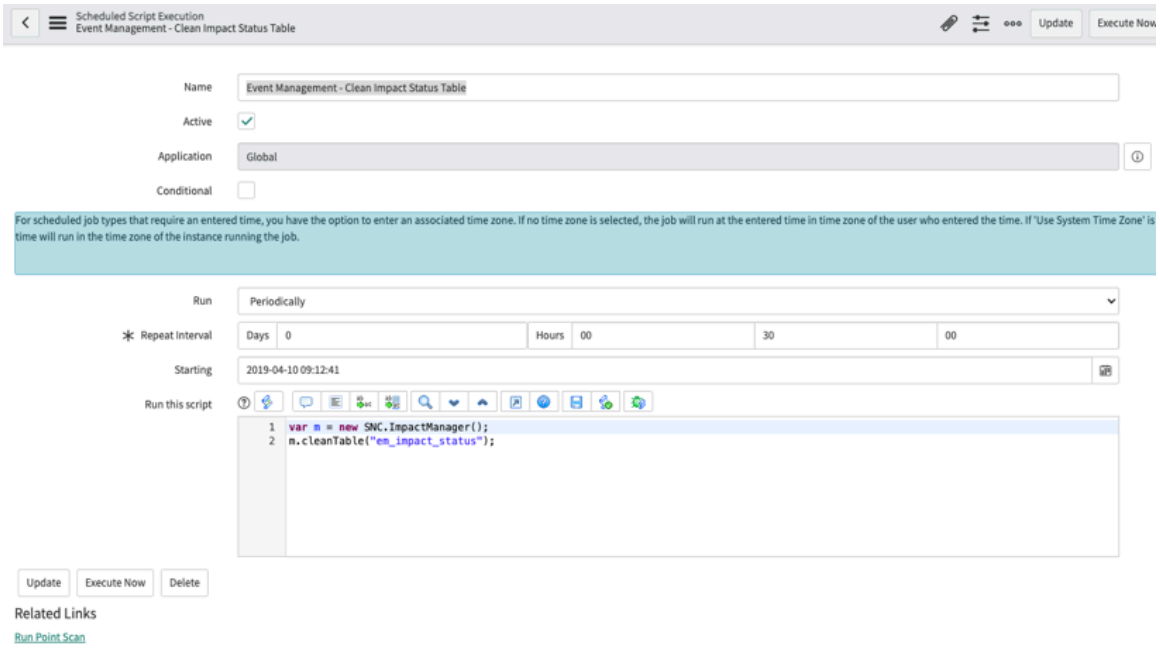
   b. In the **Repeat Interval** field, configure how often you want the job to run.
   To run the job immediately, select **Execute Now**.

   c. Select **Update**.

3. To remove old alerts from the **Impact Status** table:

   a. Locate and select the **Event Management - Clean Impact Status Table** job.
   The **Scheduled Script Execution** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



b. In the **Repeat Interval** field, configure how often you want the job to run.
To run the job immediately, select **Execute Now**.

c. Select **Update**.

4. Repeat steps 2 and 3 to perform the Backfill and Clean jobs on the **Alert History Table**.

Alert table clean up

The Scheduled Jobs feature runs a script to automatically close alerts in the Alerts [em_alert] table that meet specific conditions, helping reduce alert noise and keep the system clean and efficient.

Before you begin

Role required: evt_mgmt_admin

About this task

When the Event Management plugin is activated, by default a job is scheduled to run the `Event Management - auto close alerts` script to automatically close alerts in the alerts table that meet the specified conditions. The default retention policy for closed alerts is that the system deletes closed alerts if it is not updated for 90 days. For more information on the scheduled job, see Table cleaner.

Due to the high level of traffic to the table, you cannot audit the Alert table [em_alert] as a whole. Instead, audit selected fields of interest on the table.

Procedure

1. Set the table to `audit = true`.

2. Set `audit = true` on the relevant fields.
To avoid an excess of audit records, audit only the fields that are necessary for auditing.

Result

The `Event Management - auto close alerts` script runs automatically and repeatedly at the scheduled time and closes alerts that meet the specified conditions.

Alert grouping

Alert grouping is the process of organizing and consolidating related alerts into sets based on common characteristics or criteria. This helps in simplifying alert management by reducing noise, making it easier to prioritize, track, and address issues efficiently. Grouped alerts provide a clearer overview of related incidents, facilitating quicker root cause analysis and remediation.

Understanding alert grouping

Watch this brief video to learn how alert grouping organizes alerts into clusters based on specific criteria.

How alert grouping works

Alert grouping enhances operational efficiency and optimizes alert management by categorizing alerts. Here's how it works:

1. Event consolidation: Event Management collects alerts from multiple sources, providing a centralized view of notifications and alerts. This consolidation enables teams to manage alerts more efficiently and recognize critical issues more easily.
2. Contextual Enrichment: Alerts are enriched with data from the Configuration Management Database (CMDB), which contains detailed information about applications and infrastructure components. This context allows teams to better understand the significance of alerts and prioritize responses based on their impact.
3. Intelligent Correlation: Event Management utilizes different types of machine learning algorithms to automatically group related alerts. This intelligent grouping reduces alert noise by combining similar alerts, allowing teams to concentrate on significant issues rather than being inundated with multiple notifications.

Benefits of alert grouping

- Creating automated alert groups by aggregating alerts based on predefined patterns.
- Correlating alerts using timestamps and CI identification to form automated alert groups.
- Forming CMDB based alert grouping by correlating alerts based on CI relationships in the CMDB.
- Correlating alerts based on text similarity of alerts using NLP (Natural Language Processing).

Related topics

- Synchronizing alert response with automated alert grouping

Alert grouping and use cases

Alert grouping methods range from user-defined approaches, like Manual, Rule-based, and Tag-cluster, to advanced, fine-tunable algorithms, including Automatic, CMDB, Text-based, Log Analytics, and Network Traffic-based grouping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases

Type	Description	Use case
Log Analytics Grouping	Alerts are grouped based on the analysis of log data. This involves correlating log entries to identify related alerts and issues. By leveraging log patterns and sequences, this method can detect complex, multi-step problems across the IT environment.	An online gaming company enhances server stability by implementing proactive log analytics. They monitor logs from game servers in real-time and use analysis tools to detect patterns of errors that occur before crashes. For instance, the analysis reveals that certain error patterns appear about 30 minutes prior to server crashes. By setting up automated alerts for these patterns, the company can initiate remediation actions, such as restarting services or reallocating resources, before a crash occurs. This proactive approach prevents disruptions, minimizes downtime, and improves the gaming experience by addressing issues before they impact players.
Rule-based Grouping	Alerts are grouped according to predefined rules and criteria set by users. These rules might include specific conditions, such as thresholds or event types. This method is effective for consistent and repeatable patterns but requires maintenance of the rules.	In a data center managing an e-commerce website, rule-based alert grouping helps handle high traffic during events like flash sales. Alerts about server issues, such as high CPU usage, are designated as parent alerts. These parent alerts are linked to child alerts that report related problems, like slow database queries. The rules ensure that server-related alerts are grouped with their symptoms, allowing the IT team to quickly identify and address server overload issues. This approach improves issue resolution efficiency and minimizes downtime.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases (continued)

Type	Description	Use case
Automated Grouping	Advanced algorithms automatically identify and group related alerts based on patterns and similarities in the alert data. This method leverages machine learning and AI to adapt to new and unknown issues, providing proactive alert management. Event Management groups alerts that are similar, but not necessarily identical, based on the proximity in time of the last event generation. Alerts with the same CI and the same pattern identifier are grouped together. Automatic alert grouping consists of the following components. • Alert Aggregation Learner (**Service Analytics Alert Aggregation Learner - Daily**): This offline job runs daily to process past alerts and perform statistical analysis to build alert patterns. For details, see Configure pattern based alert grouping. • Real-time Alert Aggregation job (**Service Analytics group alerts using RCA/ Alert Aggregation**): This job runs every minute to generate alert aggregation groups based on alert patterns, CMDB relationships, text similarity, user-defined alert clustering tags, and network traffic connection between processes.	A large financial institution uses machine learning to manage alerts from numerous servers and applications. The system analyzes historical alert data to recognize patterns, such as database server failures frequently being accompanied by client connection errors. It then automatically groups related alerts together. For instance, when a new database server failure alert is detected, it is grouped with previous connection error alerts. This automated grouping helps the IT and security teams quickly identify and address issues, improving response times and reducing downtime.
CMDB-based Grouping	Alerts are grouped based on Configuration Item (CI) relationships and dependencies from the Configuration Management Database (CMDB). This	A telecommunications company uses CMDB data to manage alerts related to their network infrastructure. Alerts related to a specific network router and its connected

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases (continued)

Type	Description	Use case
	approach ensures that alerts related to specific infrastructure components or services are grouped together, providing context-aware alert management.	devices are grouped together based on their CMDB relationships, enabling the network team to see all related issues and address the root cause efficiently.
Network-traffic based Grouping	Network-traffic-based alert grouping analyzes network connections between processes across hosts to identify related alerts. This method leverages service candidates detected through ML Service Mapping, ensuring that alerts related to network traffic issues are grouped together for better context and faster alert resolution.	A cloud-based e-commerce platform experiences transaction slowdowns, causing delays in payment processing. Traditional alerting generates separate alerts for API timeouts, database lags, and network issues, making it difficult to pinpoint the root cause. With Network-Traffic Based Grouping, alerts are automatically grouped based on process-to-process connections identified through ML Service Mapping. The system detects that payment gateway services, fraud detection, and order processing are part of the same service candidate. This reveals that an overloaded fraud detection process is causing transaction bottlenecks. By scaling up the service, the team quickly resolves the issue, minimizing downtime and improving customer experience.
Text-based Grouping	Alerts are grouped by analyzing the text content of alerts to identify similarities and related issues. Natural language processing (NLP) techniques are used to find commonalities in alert description, metric name, and ci class, making this method effective for unstructured data.	In an organization that uses Zoom rooms for virtual meetings, the IT team receives numerous alerts when the Zoom room server experiences an outage. Each alert might indicate a different Zoom room being down, such as Zoom room no 10 is down, Zoom room no 11 is down, and so on, with the only difference being the room number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases (continued)

Type	Description	Use case
		For organizations with a CMDB, these alerts can be grouped using CMDB relations, as the system can correlate the alerts based on the server's impact on all associated Zoom rooms. However, for organizations without a CMDB, text-based grouping can be used. The system applies natural language processing to group alerts with similar descriptions, helping the IT team quickly identify that multiple Zoom rooms are affected by the same underlying server issue. This approach allows the IT team to efficiently address the root cause of the problem, reducing downtime and improving response times.
Tag Cluster Grouping	Alerts are categorized and grouped using tags or labels that represent common attributes, such as application, server type, or geographic location. This method allows for flexible and dynamic grouping based on evolving tagging strategies.	An organization without a CMDB manages a Linux server running various services. The IT team uses a **Node** field in each alert to identify the server, and they group all events related to services on the same server based on this node value. For example, they cluster alerts like Service A down and Service B high CPU usage together if they share the same node value. This approach helps the IT team address server-related issues more efficiently. By clustering alerts for the same node, application, or IP address, the team streamlines their response efforts and resolves issues more effectively, even without a CMDB.
Manual Grouping	Users manually select and group related alerts based	A system administrator receives multiple alerts about

Alert grouping types and use cases (continued)

Type	Description	Use case
	on their expertise and understanding of the system. This approach allows for precise control but can be time-consuming and may miss automated correlations.	different services failing on a single server. The admin manually groups these alerts, recognizing that they are all related to a single hardware failure on that server, and prioritizes fixing the hardware issue to restore all services.

Manual and rule-based alert grouping differs from algorithm-based grouping mainly in how the parent alert is chosen. In manual, rule-based, or log analytics grouping, one of the real alerts is designated as the parent alert. In Automatic, CMDB, Text-based, Tag Cluster modes, and Network Traffic, a virtual alert, representing the oldest and most severe alert in the group, is created as the parent alert.

Note: In domain-separated environments, alert groups are created only for alerts within the same domain.

For information on scheduled jobs and parameters, refer to Scheduled jobs and parameters for alert grouping. For detailed information on different grouping types, see Alert grouping types and creation methods.

Scheduled jobs and parameters for alert grouping

Automate alert organization by configuring jobs to group alerts based on predefined criteria and parameters.

To group alerts in Automated, CMDB, Text-based, Tag Cluster, and Network Traffic Correlation groups, the scheduled job named **Service Analytics group alerts using RCA/Alert Aggregation** is typically run once per minute. This job handles the grouping of alerts based on the specified method. Additionally, you can run multiple scheduled jobs in parallel to manage alert grouping more efficiently. For further details, see Run multiple scheduled jobs for alert grouping.

To define which alerts are grouped, the following parameters are used:

- *sa_analytics.aggregation_enabled*: This parameter enables alert grouping created by the schedule job. Set the property *Enable alert aggregation for Automated, CMDB, and Text-Based groups* to `true` to activate this feature.

  Note: This property also applies to Tag Cluster and Network Traffic Correlation grouping.

- *sa_analytics.agg.query_dynamic_window*: By default, this is set to 10 minutes (600 seconds). It defines the maximum time difference allowed between the last event generation times of two alerts that can be grouped together.
- *sa_analytics.agg.query_max_group_lifetime*: This parameter specifies the maximum time period from the generation of the first alert to the last alert in a group, with a default of 30 minutes (1800 seconds). If events arrive with a delay exceeding this period, the *sa_analytics.agg.group_expiration_time* parameter can be used to extend the grouping time beyond 30 minutes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Some parameters, such as **sa_analytics.agg.query_dynamic_window**, **sa_analytics.agg.query_max_group_lifetime**, and **sa_analytics.agg.group_expiration_time**, are not provided out of the box. To use these properties, you need to create properties with the same names and assign the required values to them. For more information on how to create a property, see Add a system property.

Example: How alerts are grouped

For tag-cluster grouping, alerts are added to a group based on the timeframe parameter defined in the alert tag clustering settings. For automated, CMDB, and text-based, network traffic grouping, alerts are aggregated as follows.

Consider the following alerts with the same CI. (All of them may be added to the same CMDB group).

- Alert1: Initial event generation at 01:00:00 AM
- Alert2: Initial event generation at 01:11:00 AM
- Alert3: Initial event generation at 01:13:00 AM
- Alert4: Initial event generation at 01:16:00 AM
- Alert5: Initial event generation at 01:25:00 AM
- Alert6: Initial event generation at 01:34:00 AM
- Alert7: Initial event generation at 01:43:00 AM

Alert1 and Alert2 are not grouped due to the time gap exceeding 10 minutes. Alert2 and Alert3 create a group at 01:13:00 AM. The 10-minute dynamic window starts at 01:13:00 AM, with the following:

- Alert4 is added to the group at 01:16:00 AM, restarting the 10-minute window.
- Alert5 and Alert6 are added to the group as their event times are within the 10-minute window.
- Alert7 is not added to the group because it arrives 9 minutes after Alert6, exceeding the *sa_analytics.agg.query_max_group_lifetime* limit of 30-minute maximum group lifetime from the initial group creation (01:13:00 AM + 30 minutes = 01:43:00 AM).

Configure scheduled job-based alert grouping

Set up rules and parameters to group related alerts automatically, streamlining alert management and reducing alert noise.

Before you begin

Role required: evt_mgmt_admin

About this task

The scheduled job Service Analytics: Group Alerts Using RCA/Alert Aggregation helps in grouping alerts.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. On the Alert Correlation Properties page, enable the relevant properties.
   - Enable CMDB correlation (*sa_analytics.agg.query_cmdb_correlation_enabled*).
   - Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable ML based Automation correlation (*sa_analytics.specific_patterns_enabled*).
- Enable Text based correlation (*sa_analytics.text_based_group_enabled*).
- "Group by" property, with comma-separated list of field names that need to have matching values across alerts to allow alerts to be grouped together. The property can contain alert field names (such as assignment_group), CI field names (such as alert_cmdb_ci.location), alert additional info field names (such as additional_info.state) or alert tags (such as t_data_center). When the specified field values match each other between alerts, those alerts can be grouped together (*sa_analytics.agg.group_alert_with_same_group_by_fields*).
- Max number of relations between CIs in a topology which form a CMDB group (*sa_analytics.agg.query_cmdb_graph_walk_nodes*).
- Use all CMDB relations for CMDB group correlation (*evt_mgmt.related_cis_get_all_relation_types*).

3. Select **Save**.

   To group alerts without a CI as Text-based or ML based groups, set *sa_analytics.enable_no_ci_grouping* to `true`. Ensure the Feature Identifier includes both the node and metric name. For details on configuring the feature identifier, see Specify and manage pattern identifier attributes for alert grouping.

4. **Optional:** Set *evt_mgmt.alert_groups_reasoning.enable_worknotes* to `none` to prevent group reasoning work note display.

   (Optional) By default, a work note appears in the **Activities** tab when a group is created or updated, showing the grouping reason.

Run multiple scheduled jobs for alert grouping

Run multiple scheduled jobs in parallel to group alerts. This helps prevent overwhelming the system during surges (alert storms).

Before you begin

Role required: admin

About this task

The current scheduled job operates with a single thread. During alert surges (alert storms), processing takes significantly longer. To address this impact, now multiple jobs can process alerts within the scheduled job. This enhances scalability and improves overall performance during high-volume periods.

The number of jobs to be running in the alerts processing is defined in a new property *sa_analytics.agg.alert_grouping.num_of_jobs*. The job number is sent as a parameter to the relevant method.

Note: In this scenario, the procedure for increasing the scale-out from no scale-out (single job) to 2 jobs is shown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can efficiently manage and run multiple scheduled jobs in parallel to group alerts using specific properties. These properties allow you to tailor the grouping criteria to meet your needs, ensuring that alerts are processed based on assignment groups, domain separation, or group-by fields. The available properties are:

- *sa_analytics.agg.group_alert_with_same_assignment_group_only*: Groups alerts that share the same assignment group. By default, the value is set to false. If you want to set this property to true, create a property with the same name and set the value to true.
- *sa_analytics.agg.group_alert_with_same_domain_only*: Groups alerts that belong to the same domain. By default, the value is set to true.
- *sa_analytics.agg.group_alert_with_same_group_by_fields*: "Group by" property, with comma-separated list of field names that need to have matching values across alerts to allow alerts to be grouped together. The property can contain alert field names (such as assignment_group), CI field names (such as alert_cmdb_ci.location), alert additional info field names (such as additional_info.state) or alert tags (such as t_data_center). When the specified field values match each other between alerts, those alerts can be grouped together.

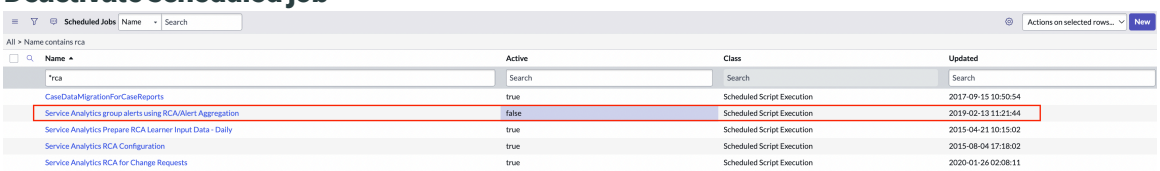
Note: To ensure efficient scale-out, at least one of these properties must be defined to establish some form of separation or grouping logic. This is necessary to ensure that all alerts belonging to the same group are processed correctly by specific jobs, creating a logical division of alerts.

Without setting at least one of these properties to true, the alerts will not be properly segregated. For instance, if you do not define any grouping logic (set any property to true) and both the assignment group and domain separation are set to false, the scale-out will not work, and all alerts will be processed by a single scheduled job.

Procedure

1. Navigate to **All** > **System definition** > **Scheduled jobs**.
2. Locate the scheduled job: Service Analytics group alerts using RCA/Alert Aggregation.
3. For all existing scheduled jobs Service Analytics group alerts using RCA/Alert Aggregation, set the value in the **Active** column to **false**.

Deactivate scheduled job



4. Create a new property *sa_analytics.agg.alert_grouping.num_of_jobs*, or if it already exists, update the property to the desired number of multiple scheduled jobs for alert grouping such as 2 or 4.
5. Clone the scheduled job definition from the Scheduled jobs [sys_auto] table to the desired number of multiple scheduled jobs for alert grouping.
6. In the new jobs, in the Run this script section, call the new JS function queryS0 (instead of old query() function) and transfer to it the job number as input parameter.

Note: Job numbers must start at 0 and follow consecutively: 0, 1, 2, 3, 4...

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Fix hashes in the [sa_analytics_status] and [sa_hash] table by selecting the earliest hash with the same prefix, cloning it, and adding the hash name suffix, for example, "_groupingX", where X is the job number.

   In the case of scaling out from no scale-out (single job) to 2 jobs, and for the hash name `last_alert_process_time`, clone it to maintain the same value as in `last_alert_process_time`:

   - `last_alert_process_time_grouping0`
   - `last_alert_process_time_grouping1`

   In the case of scaling out from no scale-out (single job) to 4 jobs, and for the hash name `last_alert_process_time`, clone it to maintain the same value as in `last_alert_process_time`:

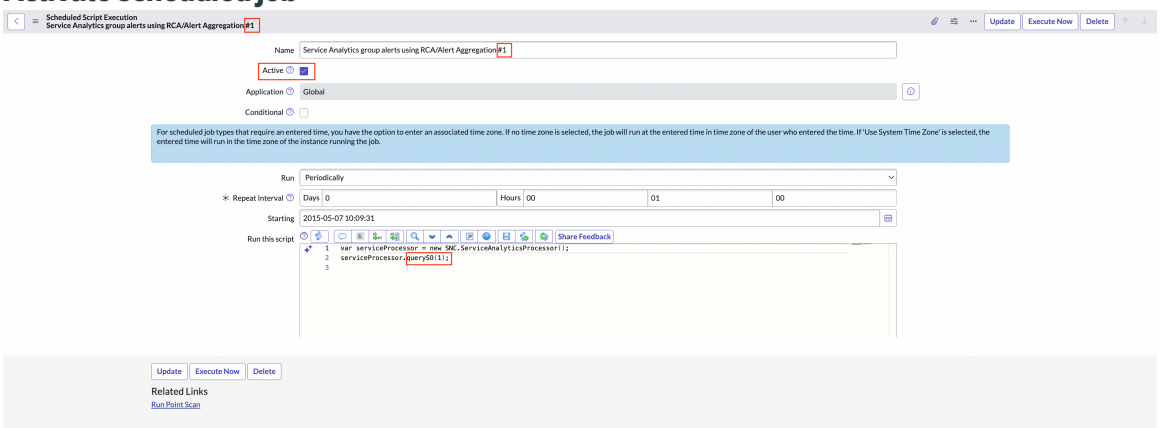
   - `last_alert_process_time_grouping0`
   - `last_alert_process_time_grouping1`
   - `last_alert_process_time_grouping2`
   - `last_alert_process_time_grouping3`

   Hashes to be cloned

Hash name	Table
query_job_last_run	sa_hash
last_alert_process_time	sa_analytics_status
last_staging_table_update_time	sa_analytics_status
last_staging_table_truncate_time	sa_analytics_status
analytics_trigger_g1	sa_hash

8. Activate the new jobs by selecting the **Active** check box for each job.

Activate scheduled job



Result

The scheduled job Service Analytics group alerts using RCA/Alert Aggregation is set up to run multiple jobs simultaneously for alert grouping.

Configure alert correlation logic order

Improve alert management by enabling users to customize correlation logic order. This feature empowers you to fine-tune correlation methods to their specific needs, enhancing alert prioritization and response efficiency.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the property *sa_analytics.agg.query.group_logic_order*.

   Default value is “CMDB,NETWORK_TRAFFIC,TAG_BASED,PATTERN,TEXTBASE". This is a comma separated list of the grouping types in the order of their execution.

   Note: If one of the grouping types is not specified in the property, it needs to be added manually. Alert correlation rules are trigger-based and applied immediately when an alert is created or updated, before other grouping algorithms.

   - CMDB: CMDB grouping
   - NETWORK_TRAFFIC: Network traffic grouping
   - TAG_BASED: Tag cluster grouping
   - PATTERN: Automated CI-based patterns grouping
   - TEXTBASE: Text-based grouping
3. Use the property *sa_analytics.agg.query.group_logic_order* to define or modify the order of correlation methods based on your preferences.

Alert grouping and use cases

Configure filters for automatic alert groups

Filter alerts and alert groups to reduce alert noise. Only alerts that match the filter are included in the group of the selected group type (Automated, CMDB, or Text).

Before you begin
Role required: evt_mgmt_admin

About this task
If your filter specifies alerts whose configuration item class is not Linux, then only alerts with non-Linux configuration items are included in the group of the selected group type.

Note: After the filter is created, it will only apply to new alerts.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Automatic Group Filter**.
2. On the Automatic Group Filters page, either select an existing group filter or create a new filter.
3. If you are creating a new filter:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **New**.

b. Enter a name for the filter in the **Name** field.

c. Select the alert group type:

- Automated
- Test
- CMDB

You can assign more than one group type with a single filter condition.

Each group type can have only one active filter.

4. In the **Alert Filter** section, create conditions for the alert to meet to be included in the group.
5. Save the alert group filter.
   - For an existing alert group filter, select **Submit**.
   - For a new alert group filter, select **Update**.

Result

The filter condition appears on the SA Grouped Alert Filters page in the **Alert filter** column.

Apply alert group filters to aggregated groups

Reduce noise by locating only aggregated alert groups that match a configured filter. Aggregated groups are groups created for alerts with identical CIs and pattern identifiers.

Before you begin

Note: This procedure is relevant for advanced configuration only.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Automatic Group Filters**.
2. On the Automatic Group Filters page, add the **Aggregated** column.
   a. Select the Personalize List icon ( ) in the upper right corner.
   b. Move the **Aggregated** entry from the **Available** list to the **Selected** list.
   c. Select the up/down arrows to determine where the **Aggregated** entry is to appear on the form.
   d. Select **OK**.
3. On the Automatic Group Filters page, double-click the value in the **Aggregated** column.

   Aggregated groups apply only to automated alert groups. When the Aggregated option appears, it is automatically activated for an automated alert group.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the value of the **Automated** field changes, the value of the **Aggregated** field also changes. You can change the value of the **Aggregated** field only if the value of the **Automated** field is true.

4. Select **true** for the specified filter to apply to groups with identical CIs and pattern identifiers or select **false** to ignore the filter and create aggregated groups for all alerts in the system.

Related topics

Specify and manage pattern identifier attributes for alert grouping

Alert grouping types and creation methods

Explore different alert grouping types, understand their descriptions, and learn about their creation methods to enhance problem identification and streamline alert management.

Viewing and managing alert groups

Navigate to **Event Management** > **All Alerts** to view all alert groups. The icon in the **Group** column denotes the alert group type, while alerts not associated with any group have no entry in the **Group** column. Double-click the **Group** column to open the Grouped Alerts dialog, where you can view all alerts in the group and manually add or remove alerts.

Note: An alert can belong to only one alert group at a time.

Types of alert grouping

Alert grouping types

Type	Ico	Description	Creation method	Additional information
Log Analytics	L	Log Analytics groups are formed when the system identifies multiple related Log Analytics alerts, grouping them based on their significant connections.	Created as part of log analytics event processing.	Kinds of Health Log Analytics alerts
Rule-based	R	Rule-based groups consist of related alerts that are organized based on compliance with alert correlation rules, which determine how alerts are grouped according to their relationships.	Created via business rule (Calculate correlation rule) on em_alert table when alert is created or updated.	Create an alert correlation rule
Automated	A	Automated groups are formed by alert aggregation and include a virtual alert as the primary alert of the group. An Aggregated automated group is created when two or more alerts share the same CI type and metric name.	Created via scheduled job.	Automated alert grouping
CMDB	C	CMDB groups are formed based on CI relationships in the CMDB, specifically for CIs that are	Created via scheduled job.	CMDB based alert grouping

Alert grouping types (continued)

Type	Ico	Description	Creation method	Additional information
		not included in rule-based or automated groups.		
Network traffic based	N	Network traffic alert groups are formed by analyzing network traffic connections between processes across hosts. This method leverages service candidates identified through ML Service Mapping to group alerts related to network traffic issues.	Created via scheduled job.	Network traffic based alert grouping
Text	T	Text groups are formed by grouping alerts based on similar text from frequently used words in following fields. • Description • Metric Name • CI Class	Created via scheduled job.	N/A
Tag Cluster	Tag	Tag Cluster groups are formed by grouping alerts according to user-defined tag-based alert clustering definitions.	Created via scheduled job.	Tag cluster alert grouping
Manual	M	Alerts grouped manually by users to organize related issues.	Created manually by the user.	Create alert group manually

For information on scheduled jobs and parameters, refer to Scheduled jobs and parameters for alert grouping. For detailed information on configuring alert correlation logic order, see Configure alert correlation logic order.

Log analytics alert grouping

ServiceNow Health Log Analytics identifies patterns in log data and learns pattern behavior. When its artificial intelligence engine detects anomalous behavior, it sends an event to the ServiceNow Event Management application.

Log analytics alert groups are created by the Health Log Analytics application. For more information, see Types of Health Log Analytics alerts.

Rule-based alert grouping

Rule-based alert grouping is created by alert correlation rules. These rules allow you to manually classify alerts as primary or secondary and establish a relationship between them. Use alert correlation rules to group related alerts. The rule runs only for new alerts or alerts whose status changed from close/flapping to open/reopen.

Example: If rule-based alert grouping is applied, secondary alerts indicating that virtual machines or applications on the offline server are also down and are grouped under the primary alert, which is the root alert for the server that is offline. You can view rule-based alert grouping in

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Express List of Service Operations Workspace (ITOM). For more information, see Viewing links between alerts in rules-based alert groups.

Primary and secondary alerts

- Primary alert: Identifies the root cause of an alert group and represents its secondary alerts.
- Secondary alert: Related to the same issue, they are grouped under the primary alert. The purpose of secondary alerts is to determine which alerts to suppress, reducing alert noise and allowing you to focus on the primary alert.

How primary and secondary alerts interact

In rule-based alert grouping, one of the real alerts is designated as the primary alert. Primary and secondary alert filter conditions specify which alerts are classified as primary and which as secondary. The filter criteria are applied to the Alert [em_alert] table.

In this alert grouping, both primary and secondary alerts are visible but secondary alerts are grouped under the primary alert. The property **Keep the secondary alert open even when primary closed. for manual or rule based** (*evt_mgmt.rule_based_manual_closure*) controls whether secondary alerts remain open or are closed when the primary alert is closed.

If the property is not selected (i.e., set to No), after the primary alert is closed, the parent reference is removed from the secondary alerts (the grouping is dissolved), and the secondary alerts are closed and become stand-alone. If you select the checkbox for the property (i.e., set it to Yes) and the primary alert is closed, the parent reference is removed from the secondary alerts (the grouping is dissolved), causing them to become stand-alone open alerts.

Alert hierarchy

Only one level of secondary alerts is permitted. In situations where a secondary alert has its own secondary alert, the Event Management application flattens the hierarchy to preserve only two levels.

For example, assume alert A is the primary alert and alert B is the secondary alert. If alert C becomes a secondary alert for alert B, the application flattens the hierarchy so that A remains the primary and B and C become sibling secondary alerts, one level below A.

As another example, assume that there are three correlation rules that produce the following results:

- Rule 1 (with an Order value of 1): B becomes a primary alert for A.
- Rule 2 (with an Order value of 2): A becomes a primary alert for C and D.
- Rule 3 (with an Order value of 3): E becomes a primary alert for A.

When alerts B, C, D, and E are triggered, they all appear in the alert list separately because there are no correlations between them.

When alert A is triggered:

1. Rule 1 makes A a secondary alert under alert B.
2. Rule 2 makes both C and D secondary alerts under alert A, and the hierarchy is flattened so that A, C, and D become secondary alerts to the primary alert B.
3. Rule 3 is not applied because multiple parents are not allowed—A already has B as its primary.

Therefore, if all alerts are triggered, only B appears as the primary alert for A, D, and C, while E remains a standalone alert.

Create an alert correlation rule

Create an alert correlation rule to designate primary and secondary alerts. The primary alert is identified as the root cause of the alert group and the secondary alerts are grouped under the primary alert.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Correlation Rules**.
2. Click **New**.
3. On the form, fill in the fields.
   For information on the fields, see Alert correlation rule form.
4. Select **Submit**.

Result
A rule-based alert group is created when a new alert is generated or when the status of an existing alert changes from Closed or Flapping to Open or Reopened, provided the filter criteria are matched.

Automated alert grouping

Automated alert grouping is a process that uses historical data to automatically organize similar alerts into groups. These alerts could be system issues, like server errors or network outages. By grouping related alerts together, it helps teams quickly identify patterns, manage recurring problems, and reduce the noise from too many individual alerts.

Imagine you're monitoring a city's traffic system. You get a lot of alerts—like reports of accidents, traffic jams, and road closures. Automated alert grouping works like a smart assistant that organizes these alerts based on patterns, so you can see related issues together and respond more efficiently. These automated alert groups are displayed in the Express List within the Service Operations Workspace.

How do you enable this grouping

To enable machine learning-based automation for alert correlation, set the property **Enable ML based Automation correlation** (sa_analytics.specific_patterns_enabled) to true.

If the Domain Support - Domain Extensions Installer is activated, alert aggregation patterns are created based on the domain level defined in the sa_analytics.agg.learner_domain_level property. By default, this domain level is set to two, which corresponds to the second level in the domain hierarchy. For example, in a company, Level 1 might represent the company itself, while Level 2 could represent departments or teams within the company. Alerts are grouped based on this second level, like sorting them by department or team. For more details, Domain separation and Event Management.

How does it work

Automated alert grouping uses machine learning (ML) and historical data to identify patterns among alerts. It looks at specific characteristics, called pattern identifiers—such as the type of issue, the affected system, CI or metric that happened multiple times within a similar time period —to determine if alerts are related. The Alert Aggregation Learner uses algorithms to group alerts based on patterns. Specifically, it uses pattern-based algorithms and probabilistic methods to analyze incoming alerts and identify related ones.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Think of it like noticing that accidents often happen at a particular intersection at rush hour. The system groups similar alerts (like recurring traffic jams at the same spot) together based on certain identifiers (like location or type of problem). The system follows these key steps to group alerts effectively:

- Analyze Historical Data: The system studies past alerts to learn patterns and relationships.
- Apply Machine Learning: ML algorithms analyze historical alert data to identify patterns and relationships among alerts. It enables the system to learn from past incidents and improve its ability to group similar alerts together over time.
- Group Similar Alerts: Alerts with matching patterns are automatically grouped together.

Imagine you're managing a city's traffic system, and you receive multiple alerts:

- 8:00 AM: Accident on Main Street
- 8:05 AM: Traffic jam near Main Street
- 8:10 AM: Road closure on Main Street

Automated alert grouping works like a smart assistant by analyzing these alerts and recognizing a pattern. It groups them together because they all relate to Main Street, likely stemming from the same accident. This helps you see the bigger picture quickly and focus on resolving the root cause (the accident), rather than addressing each alert separately.

Benefits

- Find Recurring Issues: Quickly spot patterns (like a server consistently overheating).
- Save Time: Handle groups of related alerts instead of individual ones.
- Improve Response: Focus on fixing the root cause rather than dealing with scattered issues.

Understanding pattern identifiers

A pattern identifier is a set of criteria or attributes (such as alert type, affected system, etc.) used to group similar alerts. It helps to identify recurring issues, making it easier for teams to respond and address ongoing problems.

How pattern identifiers group alerts

Consider a network monitoring system that generates alerts for various issues, such as high CPU usage, memory leaks, or connection timeouts.

Pattern Identifier: Metric Name and CI

- Alert 1: High CPU usage on Server A at 10:00 AM
- Alert 2: High CPU usage on Server A at 10:05 AM
- Alert 3: Memory leak on Server B at 10:10 AM
- Alert 4: High CPU usage on Server A at 10:15 AM

In this case, the pattern identifier could be set to the Metric Name (e.g., high CPU usage) combined with the Configuration Item (CI) (e.g., Server A). Alerts 1, 2, and 4 would be grouped together because they share the same metric (high CPU usage) and the same CI (Server A), indicating a recurring issue that may need further investigation. Alert 3, however, would not be included in this group because it has a different metric (memory leak) and CI (Server B).

Note: The set of alert fields used for the pattern identifier is also referred to as Feature Identifier Attributes or simply attributes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How to configure effective pattern identifiers

To configure effective pattern identifiers for alert grouping, follow these three key steps to ensure accurate and meaningful analysis of alerts.

Step	Action	Description
Create an event rule	Define an event rule. To know how to create an event rule, see Create or edit an event rule.	Set up an event rule to populate the relevant alert fields for the pattern identifier.
Manage pattern identifier	Add relevant alert field to the pattern identifier. To know how to add fields to the pattern identifier, see Specify and manage pattern identifier attributes for alert grouping.	After adding the relevant alert fields, select **Deploy** to activate the pattern identifier.
Choose relevant identifiers	Select alert fields that clearly identify the problem. For example, if the issue is that a service is offline or there's no connection to the database, look for specific values in the alert that indicate this. Add these types of fields to the pattern identifier. By default, we provide the **Metric Name** field as a pattern identifier.	• Avoid overly unique fields (e.g., date) that make pattern identification difficult. • Avoid overly common fields that result in too many alerts being grouped together, making patterns indistinguishable.

Alert grouping and Learned Patterns

Learn how alert patterns are discovered, grouped, and displayed in the system.

Concept	Description
Pattern discovery	When a set of alert fields matches, the alerts are grouped into a "Learned Pattern." For example, alerts with the same Priority Group and Resource are grouped into a pattern.
Pattern reporting	These patterns are displayed on the Learned Patterns report found under **Event Management** > **Administration** > **Learned Patterns**.

Managing Pattern Attributes and Time Frame

Learn the process of managing pattern identifier attributes, deployment of new sets, and how the system identifies issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Concept	Description
Active pattern identifier attributes	Only one set of attributes can be active at a time. **Note:** The new set replaces the current one after deployment.
Purpose and time frame	Pattern grouping identifies issues within the last 30 days, controlled by the **sa_analytics.agg.learner_period_days** property.
Issue identification	To identify an issue, the system utilizes a combination of Configuration Items (CIs) and Pattern Identifiers (sometimes referred to as Feature Identifiers). By default, a Pattern Identifier is defined as the Metric Name, but this can be modified. Two alerts are considered similar if they share the same CI and Pattern Identifier, although fields such as Source, Severity, Description, and others may differ. For more information, see Specify and manage pattern identifier attributes for alert grouping. **Note:** The Alert Aggregation Learner also identifies patterns of alerts within manual alert groups. In some cases, you can create patterns from alerts where the CIs share the same value in a specified field. For example, to build patterns from alerts with the same CI **Location** field, enter `location` in the *`sa_analytics.agg.learner_group_by_property`* property. For more information, Configure scheduled job-based alert grouping. When working with CI-based groups, ensure that the pattern identifier includes both the node and the metric name. For details on configuring the Feature Identifier, see Learned patterns report. **Note:** Alerts that lack a CI can still be grouped together as Text-based or CI-based alert groups, treating a node as a CI. To enable this functionality, set the sa_analytics.enable_no_ci_grouping property to true.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure pattern based alert grouping

Configure the Alert Aggregation Learner (Service Analytics Alert Aggregation Learner - Daily), an offline job that runs daily to process past alerts. It identifies patterns of related alerts using a combination of pattern-based and probabilistic techniques, enabling quicker detection and resolution of recurring issues.

Before you begin

Role required: evt_mgmt_admin

About this task

The Alert Aggregation Learner tracks manual additions and removals of alerts from automated alert groups. If you undo any previous alert additions or removals, the automatic process adjusts accordingly.

You can review user additions and removals from automated alert groups and undo any action to prevent it from being automatically repeated. The Alert Aggregation Learner also identifies patterns in manual alert groups, enabling automatic formation of new alert groups based on these patterns when new streams of alerts arrive.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Corrlelation Properties**.
2. Enable the following properties.
   - Enable alert aggregation for Automated, CMDB, and Text-based groups (*sa_analytics.aggregation_enabled*).

     Note: When disabled, disables all other groups.

   - Enable ML based Automation correlation (*sa_analytics.specific_patterns_enabled*).
3. **Optional:** To configure the time period for the Alert Aggregation Learner to process alerts, perform the following steps:
   a. Navigate to **All** > **System Properties** > **All Properties**.
   b. On the System Properties page, select the *sa_analytics.agg.learner_period_days* property.

      If the property doesn't exist, you need to define it.

   c. Set the property's **Value** to the number of days by which you want alert aggregation learner job to process.

      Note: Values larger than 30 days increase job processing time. For optimal performance, use values of 30 days or less.

Specify and manage pattern identifier attributes for alert grouping

The Alert Aggregation Learner analyzes alerts and identifies patterns using a defined set of alert and configuration item (CI) attributes. By configuring these attributes as pattern identifiers, you can control which characteristics are used to group alerts. This customization creates meaningful alert groups, improving alert management and response times by reducing noise and enabling focus on critical issues.

Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Event Management** > **Administration** > **Manage Pattern Identifier**.
2. On the SA Alert Aggregation Pattern Attributes page, select **New** to create a new pattern identifier, or open an existing pattern identifier.
   The SA Alert Aggregation Pattern Attribute page opens.
3. Select the Unlock Feature Identifier Attributes icon ( ) and move attributes from the **Available** list to the **Selected** list.

   Note: Properties from CMDB CI via dot-walking are not populated.

   The **Configuration Item** attribute is automatically considered as an identifier and should not be added explicitly to the Feature Identifier Attributes section. The pattern is defined as a combination of the configuration item and your selected feature identifier attributes.
4. Selecting the Lock Feature Identifier Attributes icon ( ).
5. Select **Submit** for a new pattern identifier or **Update** for an existing pattern identifier.
6. Navigate back to the SA Alert Aggregation Pattern Attribute page by opening the pattern identifier.
7. Activate the pattern identifier attributes by selecting **Deploy**.

What to do next

- Ensure a corresponding event rule exists: Verify that there is an event rule set up to assign or populate the newly defined pattern identifier attributes to the incoming alerts. Event rules define how attributes are assigned to alerts based on certain conditions.
- Run the Service Analytics Attribute Populator for Historical Alerts job: After the new event rule is in place, this job is used to retroactively populate the pattern identifier attributes for existing alerts that were created before the new attributes were defined. It ensures that even past alerts (historical alerts) have the necessary attributes filled in for grouping them properly.

Learned patterns report

The Learned Patterns report helps assess the efficiency of alert aggregation and identify recurring alert patterns. It enables proactive issue resolution, enhancing overall system performance by providing insights into frequent alerts.

Navigating and sorting the report

To access the Learned Patterns report, navigate to **Event Management** > **Reporting** > **Learned Patterns**.

Sorting Options: You can sort patterns by Pattern Score, Frequency, and Size to prioritize which alerts to address first.

Metrics and data in the report

The report displays key metrics associated with learned patterns, including:

- Frequency: The occurrence count of pattern identifier attributes (CI/MetricName).
- Pattern Identifier Attributes: Describes how alert grouping combines relevant pattern attributes to create a learned pattern. These patterns can reappear across multiple alerts, often indicating the same underlying issue.
- Presentation Format: Metrics are shown in a table format, organized by learned patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This report allows you to:

- Focus on Higher Frequency Alerts: Allocate resources to higher-frequency alerts to expedite the resolution of numerous alerts.
- Target Larger Patterns with Lower Frequency: Allocate resources to larger learned patterns with lower frequency for targeted analysis.

Pattern group details and identifier attributes

- Expand a pattern group to display details about all the identifier attributes that are associated with the pattern.
- Sort the entries within each pattern by Configuration Item and Feature Identifier.

Column	Description
Configuration Item	CI associated with the combined pattern identifier attributes.
Feature Identifier	Feature identifier used for the combined pattern identifier attributes.
Frequency	Number of times the combined pattern identifier attributes appear in the data set.
Size	Number of occurrences of the combined pattern identifier attributes (like Configuration Item and Feature Identifier) within a learned pattern.
Score	Calculated score that combines the frequency and size of the learned pattern. The formula for this score is: `Score = Frequency × (Size + 1)`. This score helps prioritize patterns based on their recurrence and size, making it easier to focus on high-priority patterns.
CI Link	Link in the **Configuration Item** column to view details of the CI information.

Exclude patterns from learned patterns

Exclude CI-based or CI class-based alerts and patterns when you encounter alerts incorrectly added to a learned pattern by the Learned Patterns job. For example, a pattern might include an alert that occurred at the same time as other alerts but is not actually related to them. This maintains accuracy, ensuring better alert groupings and improved management efficiency.

Before you begin

Role required: evt_mgmt_admin

About this task

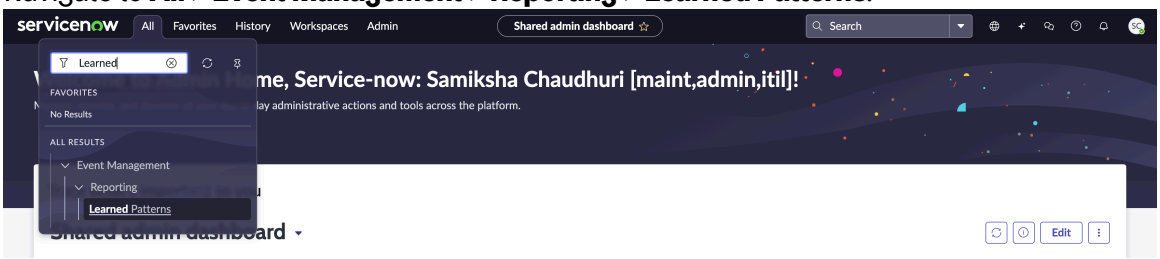
You select the incorrect alert in a pattern to exclude the entire pattern to which it belongs.

Note: When you exclude an incorrect alert, any other patterns containing that alert are also excluded.

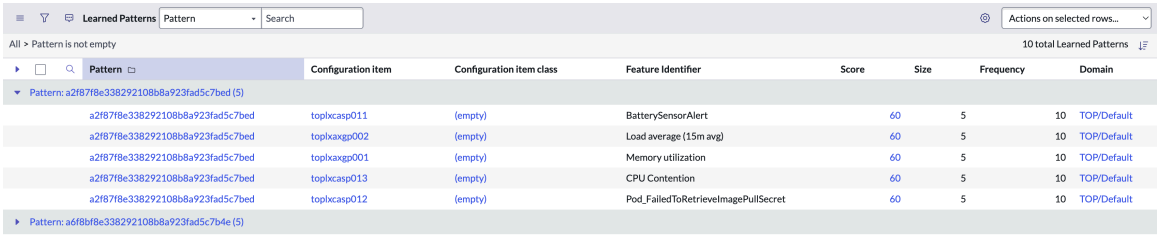
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

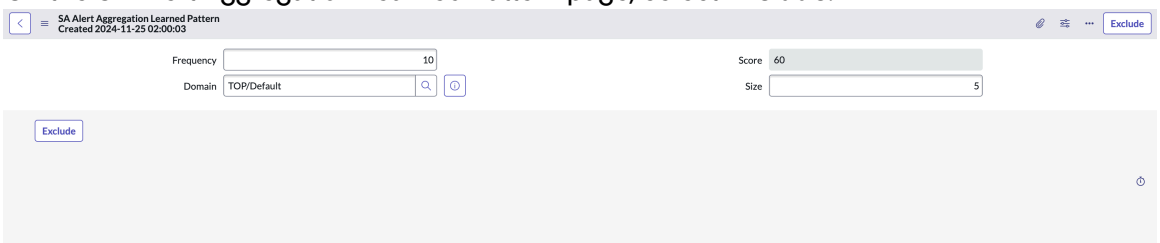
1. Navigate to **All** > **Event Management** > **Reporting** > **Learned Patterns**.



2. On the Learned Patterns page, expand the anomalous pattern.



3. Select the pattern name to open it for exclusion.
4. On the SA Alert Aggregation Learned Pattern page, select **Exclude**.



Result

The entire pattern is removed from the Learned Patterns report and listed on the Excluded Patterns page, located at **Event Management** > **Administration** > **Excluded patterns**.

If the pattern includes other alerts, you can restore it by reclaiming those alerts as a learned pattern. For further details, see Restore excluded patterns.

Restore excluded patterns

Restoring excluded patterns to the learned patterns report lets you reintegrate valuable insights lost due to incorrect alerts. This flexibility maintains accurate alert aggregation and enhances monitoring. For example, if you excluded a pattern due to an incorrect alert, you can restore it without that alert, ensuring relevant data remains accessible for analysis and decision-making.

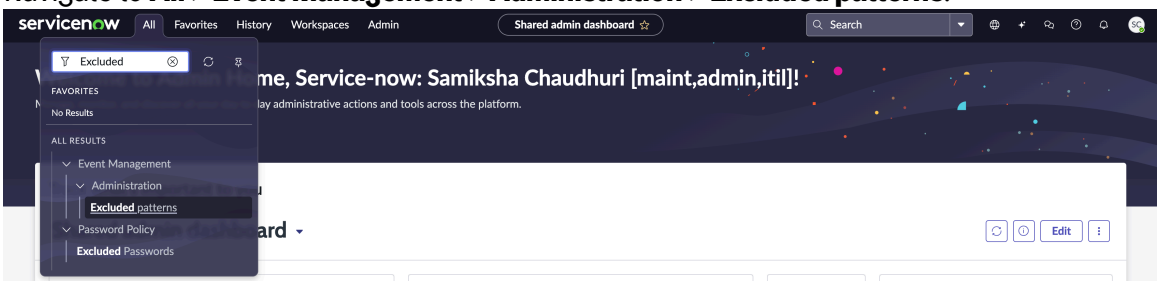
Before you begin

Role required: evt_mgmt_admin

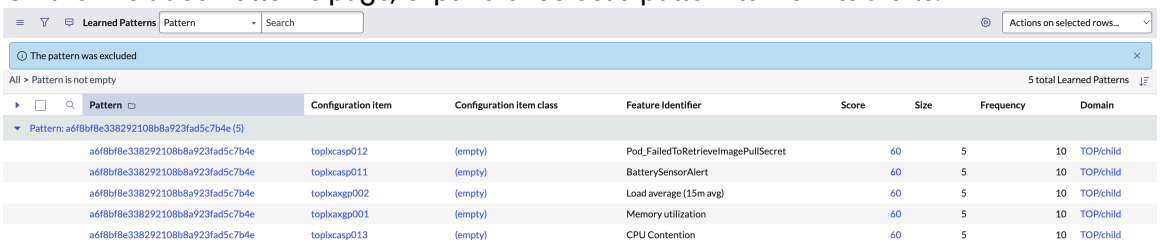
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

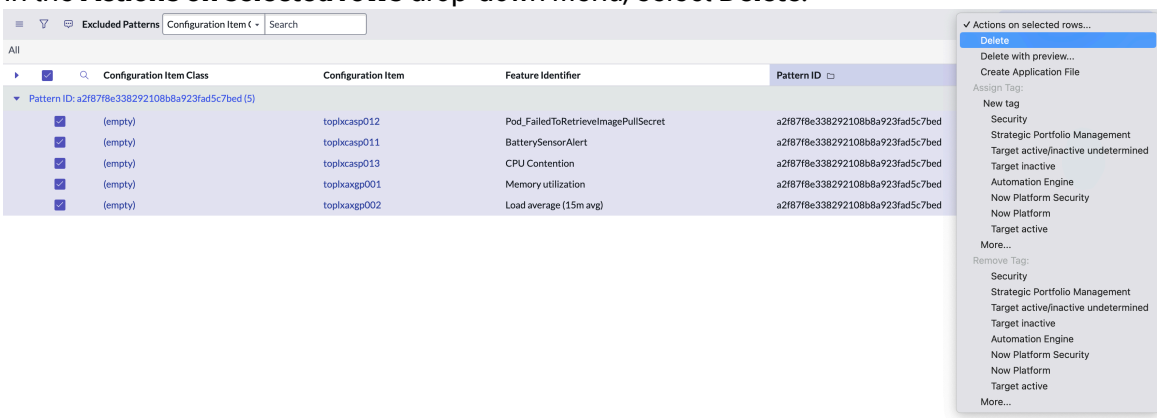
1. Navigate to **All** > **Event Management** > **Administration** > **Excluded patterns**.



2. On the Excluded Patterns page, expand or select a pattern to view its alerts.

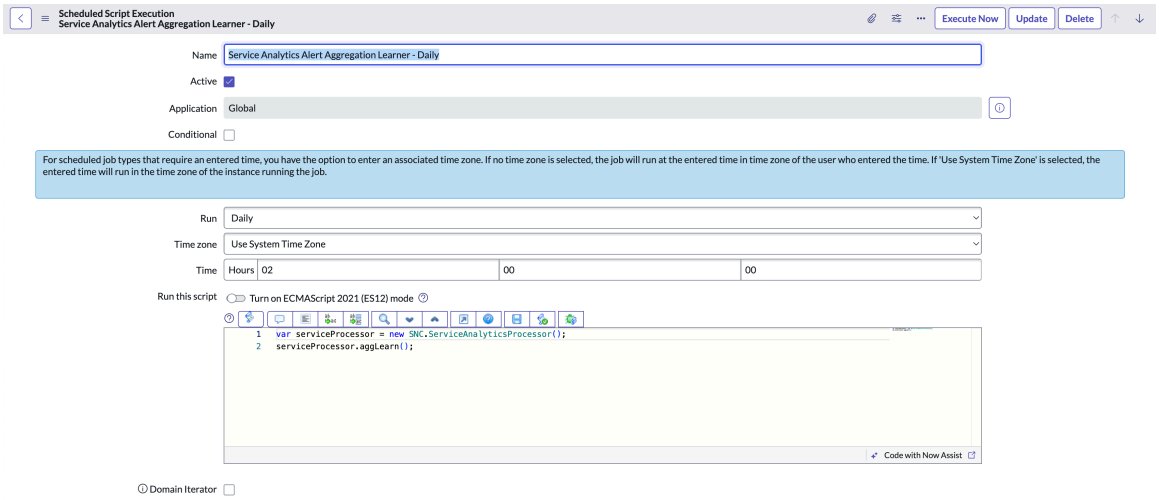


3. Select the patterns you want to restore.
4. In the **Actions on selected rows** drop-down menu, select **Delete**.



5. In the confirmation window, select **Delete**.
6. Run the Learned Patterns scheduled job.
   a. Select **System Definition** > **Scheduled Job**.
   b. On the Scheduled Jobs page, search for the Service Analytics Alert Aggregation Learner - Daily job.
   c. Open the Service Analytics Alert Aggregation Learner - Daily job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. Select **Execute Now**.

Result

The pattern appears with its restored alerts on the Learned Patterns report page. To access this page, navigate to **Event Management** > **Reporting** > **Learned Patterns**.

CMDB based alert grouping

CMDB based alert grouping helps organizations manage alerts by organizing them according to their related configuration items (CIs) within the Configuration Management Database (CMDB). This method group alerts based on CI relations in applications or infrastructure components, allowing teams to better understand the impact of issues, respond more effectively to alerts, and maintain service availability.

CMDB alert groups are created based on the current relationships between CIs in an organization. This means that when several alerts are triggered on different CIs—for example, if a server is experiencing issues — alerts are grouped based on CI relationships.

By default, all the existing connections between CIs are used to group alerts. However, given the complexity of IT systems, there are many types of relationships, and organizations can filter which ones to consider when aggregating alerts. For instance, you can filter relationship types by suggested relationships that appears in the CMDB Group CI Relations [em_suggested_relation_type] table. You can also filter using the hosting and containment rules (dependent relationship rules).

For example, if a server is hosting multiple applications, and there's a problem with that server, all the alerts related to both the server and the applications it hosts can be grouped together. This helps the IT team quickly identify and address the root cause of the issue rather than dealing with each alert in isolation. Similarly, if different processes are running on a server, grouping alerts based on those processes allows teams to see how problems in one area might affect others, leading to a more comprehensive understanding of the situation.

The CMDB alert groups are effectively displayed in the Express List within the Service Operations Workspace, which allows teams to easily monitor and manage related alerts. This feature enhances operational efficiency by providing a clear view of alerts that are interconnected based on the current relationships among configuration items (CIs).

Use cases for CMDB based alert grouping

Use cases for CMDB grouping enhance alert management by correlating alerts based on Configuration Item relationships, improving visibility, and facilitating more efficient troubleshooting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common CMDB grouping use cases

In the context of CMDB grouping, organizations face several challenges when managing alerts related to Configuration Items (CIs).

Common use cases

Use Case	Challenges	Solutions
Shared Configuration Item (CI) Scenario: An organization monitors a database server experiencing multiple issues, resulting in numerous alerts related to different applications using that database.	• Delayed response: Teams may respond to alerts in isolation, potentially overlooking related alerts, leading to delayed resolutions. • Inefficient resource allocation: Time and resources may be wasted on investigating separate alerts that are actually related. • Lack of context: Alerts related to the same CI can be scattered across different alert groups, making it difficult to see the full picture.	• Aggregate alerts related to the same CI into a single group for a unified view. • Facilitate faster alert resolution by addressing all related alerts together.
Hosting/Containment Relations Scenario: A physical server hosts several virtual machines (VMs), and an alert is generated for a hardware failure on the server. Multiple alerts also arise for the VMs due to their reliance on the server.	• Visibility into dependencies: Teams may lack visibility into how CIs are interconnected, leading to inefficient troubleshooting processes. • Complex alert resolution: Understanding which CIs are affected and how they relate can be complicated, resulting in longer resolution times. • Resource drain: Mismanagement of alerts can lead to duplicated efforts across teams, wasting time and resources.	• Group alerts using CMDB hosting/containment rules to aggregate alerts related to the physical server and its hosted VMs into a single alert group. • Provide a comprehensive view of all alerts tied to the physical server's failure. • Focus remediation efforts on the physical server while monitoring the VMs to ensure all aspects are addressed efficiently.
Applicative Relations Scenario: An enterprise application relies on multiple micro-services, and an issue arises with one of these services, generating alerts	• Understanding application dependencies: Teams may find it challenging to trace how application components interact,	• Implement grouping based on applicative flow relations to aggregate alerts related to the affected microservice and its dependent components.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common use cases (continued)

Use Case	Challenges	Solutions
across several components, complicating diagnosis.	making it difficult to pinpoint issues in complex systems. • Slow incident resolution: Without a clear understanding of applicative flow, alert resolution can be slow and labor-intensive. • Inconsistent monitoring: Alerts related to applications may not be consistently monitored or prioritized, leading to potential oversights.	• Utilize dependency maps to visualize how different services interact. • Streamline the resolution process by addressing grouped alerts related to the application, improving response times.

CMDB alert grouping — properties and functionality

Learn about the key properties and functionality of CMDB alert grouping, which facilitate efficient alert organization based on relationships and enhance the overall effectiveness of alert management.

Properties for managing CMDB alert group creation

Use the properties listed in the following tables to control CMDB alert group creation. For more information, see Configure scheduled job-based alert grouping.

Property	Setting
Enable CMDB correlation *sa_analytics.agg.query_cmdb_correlation_enabled*	Enable this property to automatically use CI relationships for alert aggregation, correlating alerts and creating CMDB alert groups.
Max number of relations between CIs in a topology that form a CMDB group *sa_analytics.agg.query_cmdb_graph_walk_nodes*	Set the maximum number of enabled relations between CIs in a topology that form a CMDB group. For example, if you set this property to 3, a CI associated with an alert will automatically be grouped with similar CIs within three hops or less. **Note:** This property setting impacts all types of relations used for alert aggregation. Using a value greater than 4 may negatively affect the performance of the alert aggregation job.
Use all CMDB relations for CMDB group correlation	Set to true if you want to use all relationship types for CMDB grouping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Setting
evt_mgmt.related_cis_get_all_relation_types	The default setting for new users is that the option is set to true, meaning all relationship types are used for grouping. Set the property to false to filter the relations.

Properties for managing automatic creation of CMDB alert groups for advanced use cases

In some use cases, you may need to ignore or exclude certain CI relationships from automatic alert group creation. In this case, the *evt_mgmt.related_cis_get_all_relation_types* property must be set to false, and the properties in the below table must also be configured.

Note: If the *evt_mgmt.related_cis_get_all_relation_types* property is set to false, and the relationship isn't specified in the [em_suggested_relation_type] table, the relationship is not considered for alert aggregation.

Properties for managing automatic creation of CMDB alert groups for advanced use cases

Property	Setting
Enable Suggested Relations for CMDB Correlation *sa_analytics.agg.query_cmdb_suggested_relationship_enabled*	Keep this property enabled to use any suggested relationships defined in the CMDB Group CI Relations [em_suggested_relation_type] table when forming CMDB alert groups. To include a new relationship, add it to this table. This property is enabled by default.
Use CMDB relationship based on host-containment Metadata rules *evt_mgmt.related_cis_use_containment_rules*	Containment rules specify which configuration item classes can be contained within another item through a specific relationship when creating a service template. Keep this property enabled when forming CMDB alert groups to use any host-containment rules defined in the Metadata Editor. For more details, see CMDB dependent relationship rules. This property is enabled by default.
Enable filtering by dependent relationship rules *evt_mgmt.related_cis_use_hosting_rules*	Hosting rules define what classes of configuration items are hosted on other classes of configuration items. Keep this property enabled when forming CMDB alert groups to apply any hosting rules, which define which classes of configuration items are hosted on other classes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for managing automatic creation of CMDB alert groups for advanced use cases (continued)

Property	Setting
	This property is hidden and enabled by default. **Note:** If you need to change the default value, add the property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.
Ignore CMDB alert groups from forming due to CI applicative flow relations *sa_analytics.agg.ignore_cmdb_applicative_flow*	Set this property to true to prevent CMDB groups from forming based on applicative flow relations for CI relations in application services. This property is hidden and enabled by default. **Note:** If you need to change the default value, add the property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.
sa_analytics.applicative_flow_rel_enabled	This property is hidden and enabled by default.

Event Management stores a map of related CIs in the Event Management CI Graph Reuse [em_ci_graph_reuse] table for each processed CI. You can adjust the storage period by modifying the *sa_analytics.agg.query_cmdb_graph_reuse_period* property, with the default set to one day (86,400 seconds). This process enhances the search performance of relations in the CMDB. To disable the storage process during advanced use-case configurations, set the property value to zero.

Note: If you need to change the default value, add the *sa_analytics.agg.query_cmdb_graph_reuse_period* property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.

View the Dependency map for CMDB alerts

The Dependency map illustrates how and why alerts are grouped, simplifying troubleshooting and issue management. It reveals connections between CIs within a CMDB alert group, enhancing visibility into their relationships. Additionally, if a CI is not part of the group but connects to other alert CIs, it remains visible on the map, aiding alert resolution and proactive management.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator

Procedure

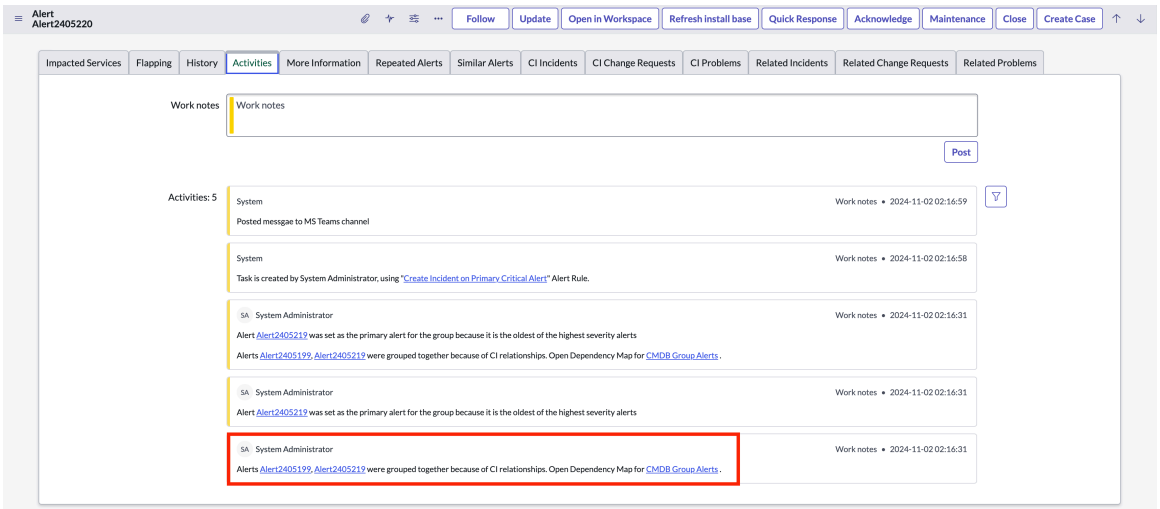
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Search for the CMDB group.
3. Open a CMDB group alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

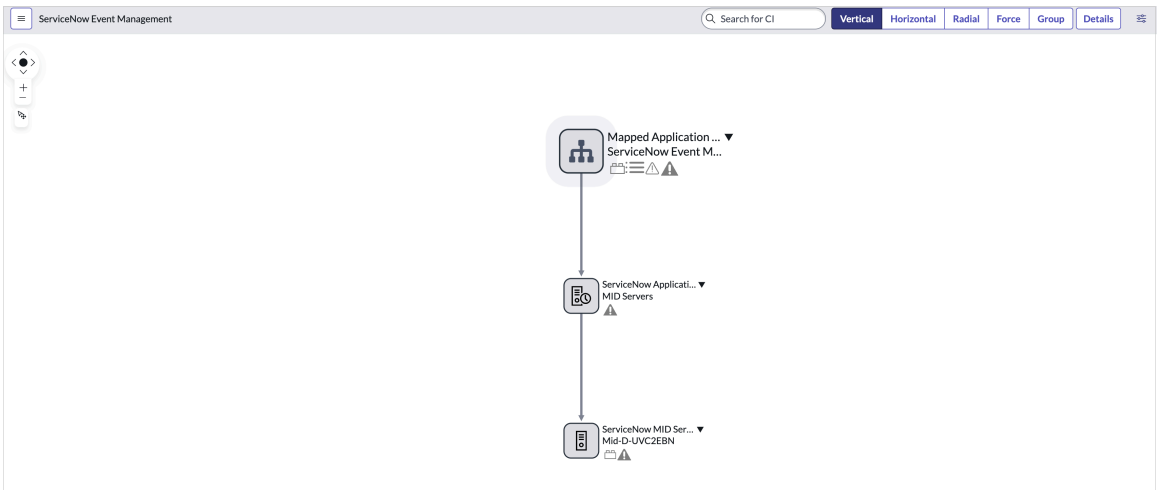
4. Scroll down and select the **Activities** tab.

   You may see a message similar to the following:

   ```
   Alert2405199 and Alert2405219 were grouped together because of
   CI relationships. Open Dependency Map for CMDB Group Alerts.
   Open Dependency Map for CMDB Group Alerts.
   ```



5. Select the link to see the dependency view of the CMDB alerts.



Add a CI relationship to CMDB Group CI Relations

Add a CMDB group CI relationship for a CI class to enable accurate alert group generation.

Before you begin

Role required: evt_mgmt_admin

About this task

Configure the *sa_analytics.agg.query_cmdb_suggested_relationship_enabled* property to further enhance alert grouping by using suggested relationships. For more information on properties, see CMDB alert grouping — properties and functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **CMDB Group CI Relations**.

   a. Click **New**.

   b. Complete the form.

Suggested Relationship fields

Field	Description
Base class	The base class in the relationship serves as either the parent or the child, depending on the type of relationship established.
Relationship	The type of relationship that defines how two or more entities are connected.
Dependent class	The class that relies on another class in the relationship, serving as either the parent or the child depending on the relationship type.

2. Click **Submit**.

Example: CMDB Group CI relation

Base Class	Relationship	Dependent/Target Class
Oracle	Is Hosted On	Linux Server
Oracle	Is Hosted On	Solaris Server

Note: The same parent class and relationship can appear more than once.

Delete a CI relationship from CMDB Group CI Relations

Delete a CMDB group CI relationship to limit available relationships for CMDB alert grouping, helping to reduce noise and improve alert relevance.

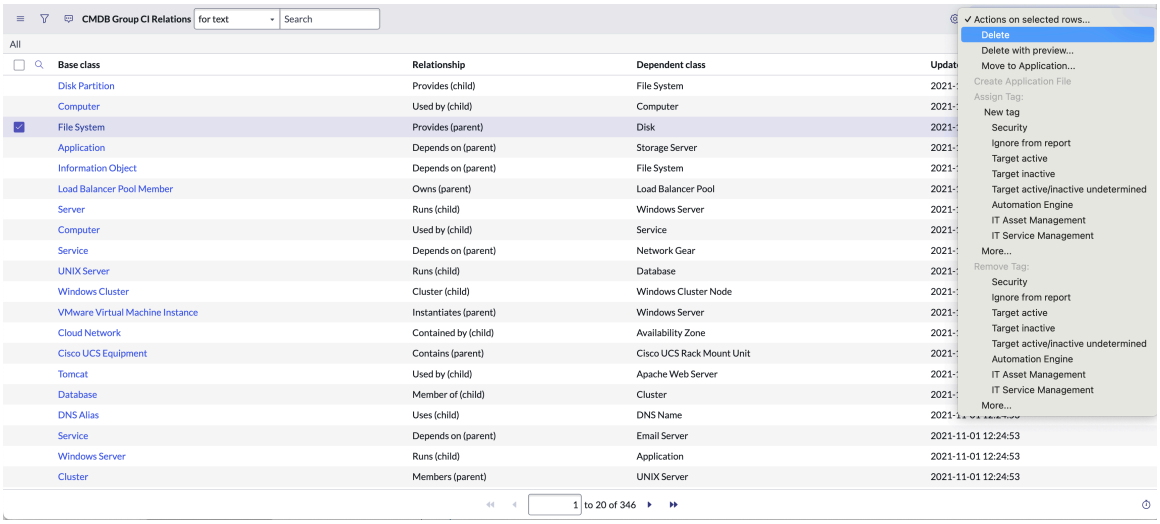
Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **CMDB Group CI Relations**.
2. Select the checkbox next to the CI relationship you want to delete.
3. Select the Actions menu and then select **Delete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. On the confirmation window, select **Delete**.
   The CI relationship is deleted.

Network traffic based alert grouping

The Network traffic based alert grouping method groups alerts by analyzing network traffic connections between processes across hosts. It leverages service candidates identified by ML Service Mapping to group alerts related to network traffic issues. This ensures alerts from directly connected processes within the same service candidate are grouped together, offering a more contextual view of network incidents.

Service candidates are potential collections of processes within your IT environment that are identified based on their network connections and interactions. They represent different services or functions that your IT systems provide, even if they are not fully detailed in your system's configuration database. For example, service candidates might group together all the processes involved in email delivery, even if the configuration details are incomplete.

ML Service Mapping uses machine learning to automatically discover and map out these service candidates. It identifies how different processes and components are connected and grouped together based on their network traffic and interactions. This helps in understanding and organizing the IT services and their components, making it easier to manage and troubleshoot issues. For example, ML Service Mapping might automatically identify and map the connections between email servers and mail clients based on their network interactions.

Note: Network traffic based alert grouping is enabled for new customers starting with the Yokohama release. Existing customers need to enable the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*) manually.

How it works

- Host identification: Alerts related to network issues are generated from various sources.
- Network context identification: The correlation process uses horizontal discovery results and ML Service Mapping to identify the most relevant service candidates and network connections.

  This process uses the results of the scheduled job **Event Management - Populate Service candidate process to process mapping - Daily**, which runs once a day and is used to store

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

process-to-process connections for Host CIs in the format required by the alert grouping algorithm.

- Alert grouping: Alerts are grouped based on direct process-to-process connections within the context of the same service candidate. Grouping is updated in real-time as new alerts are received.

Benefits

- Improved accuracy: By leveraging network traffic connections and service candidates, this method provides high accuracy in grouping alerts, minimizing false positives.
- Enhanced coverage: It effectively groups alerts even in environments with low CMDB maturity, covering a broader range of alerts and issues.
- Streamlined resolution: IT teams can quickly identify and resolve related issues in bulk, reducing the volume of alerts to manage and improving operational efficiency.

Enable network traffic-based alert grouping

Activate network traffic-based alert grouping to automatically correlate and reduce alert noise by grouping related events based on network traffic patterns. This helps improve efficiency in alert response and streamlines alert management.

Before you begin

Ensure the Service Mapping Plus application (sn_sm_scoped_app) is installed.

Role required: evt_mgmt_admin

About this task

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. Ensure that the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*) is selected.

Disable network traffic-based alert grouping

Disable network traffic-based alert grouping to prevent alerts from being grouped solely by network activity, reducing noise during traffic spikes and ensuring critical issues stand out for quicker resolution.

Before you begin

Role required: evt_mgmt_admin

About this task

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. Clear that check box for the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*).
3. Set the property *sa_analytics.enable_process_mapping_calculation* to false.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Follow up on work notes and review service candidate

Track and follow up on work notes while reviewing the service candidate to ensure all actions and updates are captured. This helps maintain clarity and continuity in the review process, reducing the chances of missed details.

Before you begin

Role required: evt_mgmt_admin and sm_admin

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.

   Note: Scroll down to an alert with **Network Traffic** as the group, and in the **Group** column, right-click and select **Show Matching**. This displays all alerts related to **Network Traffic**.

2. For the alert whose work notes you want to see, select the alert number.
3. On the Alert page, scroll down and select the **Activities** tab.
   You can view the work notes for the selected alert.
4. In the work notes, select the service candidate to view details.
   The Application Service Candidate page opens.
5. Select **Preview Map Graph** to view the service candidates mapping in the form of a graph. Service candidates mapping provides a visual representation of how different service candidates are connected, making it easier to understand relationships, identify potential issues, and analyze dependencies more effectively.

Tag cluster alert grouping

Tag cluster alert grouping enables you to easily create groups of alerts. It is a non-code method of alert grouping that correlates alerts without having to use CMDB or model training. This simpler way of grouping similar alerts reduces the overall noise of a large quantity of alerts.

Tag cluster alert grouping is enabled immediately after the activation of the Tag-Based Alert Clustering Engine application, available in the ServiceNow Store. This grouping is applied according to the correlation logic order specified in the Configure alert correlation logic order. Alert grouping tags are attached to definitions on a many-to-many (M2M) basis. Multiple tags can be linked to a single definition, and a tag can be part of multiple definitions. Groups formed from tag cluster alert grouping definitions are classified as the Tag Cluster group type.

Tag cluster alert grouping supports domain separation, allowing different domains to have their own distinct alert grouping configurations and logic.

First, create alert grouping tags to define the criteria for grouping alerts. You can set the tags to require an exact match, an approximate ('fuzzy') match, or a character pattern match.

You can also use preconfigured tags to speed up alert clustering. These predefined tags are mapped from alerts and are based on information from sources such as the Alert field, Alert tags, or Alert additional info. If the required data is missing and the selected tag source is Alert CI or Alert CI key, the tag is populated using the Configuration Item (CI) value from the Configuration Management Database (CMDB). Predefined tags are easily identified by their description, which includes out of the box.

You can attach one or more tags to an alert clustering definition, which specifies the conditions for alert correlation. You can either create your own alert clustering definition or use a predefined one provided by the application. Predefined definitions come with associated tags.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Make sure to activate predefined definitions before use. In new systems, several definitions are active by default. The remaining ones must be activated. For more information, see Activate a predefined alert clustering definition.

Once one or more alert clustering tags are attached to a definition, the system collects alerts and checks if their tags match all the tag values specified in the definition. Alerts with matching or similar tag values are grouped together. New incoming alerts join an existing group if their tags match the tags in the definition used to create the group.

For tag-cluster grouping, alerts are added to a group based on the timeframe defined in the alert clustering settings. The time between the initial alert (virtual alert) and subsequent alerts is evaluated. If two new alerts are received, and their time difference falls within the defined timeframe, they are added to the group. The initial event's generation time is used to determine the relevance of the timeframe.

Create alert clustering tags

Create streamlined alert correlations with alert clustering tags by grouping alerts that share identical or similar tags based on your configured match method. This reduces noise, enhances incident prioritization, and improves operational efficiency, enabling faster issue resolution and response times.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Tags**.
2. Click **New**.
3. Fill in the values on the Event Management tag based alert clustering tag form.
4. Select **Submit**.

Result

The tag appears in the Tag Based Alert Clustering Tags table.

Create an alert clustering definition

Define alert clustering conditions to trigger one or more alert clustering tags, which help create alert groups from fewer alerts. Creating alert groups from fewer alerts reduces noise, making it easier to identify critical incidents, prioritize responses, and manage issues effectively.

Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

To create a tag def users need to use filter to define on which alerts the definition will apply and define a grouping criteria by specifying which field values should be compared to create a group.

Procedure

1. Navigate to **All** > **Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Definitions**.
2. Select **New**.
3. Configure the fields on the Event Management tag based alert clustering definition form.
4. Select **Save**.

Result

The definition appears in the Tag Based Alert Clustering Definitions table and Service Operations Workspace (ITOM) > Grouping automation. Alert groups created by this definition are categorized as Tag Cluster groups.

Activate a predefined alert clustering definition

Activate the predefined alert clustering definitions provided with the Tag-Based Alert Clustering Engine application before use. Utilizing these preconfigured definitions minimizes setup time and ensures a more efficient configuration process, allowing for quicker implementation and streamlined alert management.

Before you begin

Important: If you are already using the Tag-Based Alert Clustering Engine application, all the predefined definitions are inactive and must be activated. In contrast, new customers will find several definitions active by default, allowing for immediate utilization of the alert clustering capabilities without additional setup.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **#Event Management** > **Tag Based Alert Clustering Engine** > **Clustering Definitions**.
2. Select a predefined definition.

   Note: For a complete list of the available predefined definitions, see List of predefined tag-based alert clustering definitions.

3. On the Tag Based Alert Clustering Definition form, select the **Active** check box.
4. Select **Save**.

Result

In the Tag Based Alert Clustering Definitions table, the **Active** field for the activated definition displays the value **true**. You can now associate an alert clustering tag with this definition, enabling effective grouping of alerts based on the defined criteria.

Attach a predefined tag to a tag-based alert clustering definition

Get started faster with alert clustering by attaching a predefined alert clustering tag to a tag-based alert clustering definition in Event Management. By associating a predefined tag, you ensure that alerts meeting the specified criteria are grouped effectively, facilitating quicker identification and response to related incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
The Tag Based Alert Clustering Engine application comes with a set of predefined alert clustering tags. Attach a tag to a tag-based alert clustering definition to specify the conditions that must be met for alert correlation. This enables effective grouping of alerts based on shared characteristics, improving the accuracy and efficiency of incident response and management.

Procedure
1. Navigate to **All** > **#Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Definitions**.
2. Select a definition.
3. Under the Tag Based Alert Clustering Definitions Tags M2M section, select **Insert a new row**.
4. Use the search field to locate a predefined alert clustering tag, and then select the green check mark to confirm your selection.

   Note: Predefined tags are recognizable by their description, which includes "out of the box." For a complete list of the available predefined tags, see List of predefined alert clustering tags.

5. Select **Save**.

Result
The predefined alert clustering tag is now attached to the tag-based alert clustering definition. This association enables the effective grouping of alerts based on the specified criteria, facilitating improved alert management and response efficiency.

Text-based alert grouping

In text-based alert grouping, alerts are organized and correlated based on specific text patterns or keywords within the alert content. This approach dynamically groups alerts that share similar textual characteristics, such as error messages or event descriptions, allowing for more flexible and adaptive management of alerts.

The EM Alert Clustering Solution is a method used to correlate alerts based on similarities in specific fields and form clusters or groups. In ServiceNow Event Management, it creates clusters based on the Description, Metric name, and Configuration item.Class fields. This solution organizes alerts into text-based groups, and when a new alert arrives, the ML Predictor identifies the appropriate cluster, grouping alerts within the same cluster.

Note: The ML Predictor job is asynchronous and assigns real-time alerts to clusters, which may result in slight delays. This delay can cause text-based groups to be created several minutes later, as the alert grouping job runs once per minute. If prediction results are not available during a run, they are rechecked in the next grouping job.

For text-based logic to execute, you must have the Predictive Intelligence plugin (com.glide.platform_ml) installed and the EM Alert Clustering Solution definition activated.

There are specific settings or limits used to control the behavior of text-based alert grouping. These thresholds define the criteria for how alerts are grouped based on text patterns or attributes. The text-based thresholds are:

- Cluster quality threshold: The Cluster quality threshold (*sa_analytics.alert_grouping_tb_cluster_quality_threshold*) determines the minimum quality required for an alert cluster to be considered valid. This

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

threshold ensures that only clusters with a minimum level of similarity and reliability are used. Clusters that meet this threshold are considered valid, improving the precision of the groupings and reducing noise from irrelevant or low-quality clusters. The range of the threshold is from 1 to 100 and the default value is 70.

- Alert rank threshold: The Alert rank threshold (*sa_analytics.alert_grouping_tb_alert_rank_threshold*) defines the minimum rank required for an alert to be included in a group. This threshold ensures that only alerts with a certain level of similarity are grouped together, filtering out lower-ranked alerts to maintain the quality of the alert group. The default value is 0.3, where smaller values indicate better similarity.

Note: To use these properties, you need to create properties with the same names and assign the required values to them. For more information on how to create a property, see Add a system property.

The EM Alert Clustering Solution definition is located in the [ml_capability_definition_clustering] table. To access it, navigate to **Predictive Intelligence** > **Clustering** > **Solution Definitions**.

To verify if the solution definition is active, see Verify text-based clustering solution. To disable the EM Alert Clustering Solution definition, disable text-based alert grouping by setting the property *sa_analytics.text_based_group_enabled* to `false` and clearing the **Active** check box in the EM Alert Clustering Solution definition.

Example of text-based alert grouping

Scenario	Example
Network Connectivity Problems: There are widespread network connectivity issues affecting multiple departments.	Alerts from various network monitoring tools might report issues like Network segment down, High packet loss, or Connectivity issues in subnet. Text-based alert grouping uses the EM Alert Clustering Solution and ML Predictor to streamline alert management. The EM Alert Clustering Solution employs Natural Language Processing (NLP) algorithms to analyze and identify common text patterns in alerts such as Network segment down or High packet loss. It then clusters these alerts based on their text similarity, grouping related issues together. The ML Predictor further enhances this process by evaluating new alerts in real time and assigning them to the appropriate existing clusters based on their text patterns. This dynamic grouping provides a consolidated view of the connectivity problems, allowing network engineers to quickly diagnose and address the root cause of the issues more efficiently.

Verify text-based clustering solution

Event Management uses Natural Language Processing (NLP) algorithms to identify common text patterns in alerts and create alert groups through clustering. This approach not only organizes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

similar alerts efficiently but also reduces noise and helps focus on significant issues, enhancing overall alert management.

Before you begin

Ensure that the Predictive Intelligence plugin (com.glide.platform_ml) is installed.

Ensure the parameter *sa_analytics.text_based_group_enabled* is set to `true`.

Note: If the Predictive Intelligence plugin is not installed, the text-based logic will not execute, even if *sa_analytics.text_based_group_enabled* is set to true. This is because text-based grouping relies on clustering alerts based on the description, metric name, and CI class. Without the plugin, clustering cannot be performed, and as a result, text-based groups will not be created, regardless of the active status.

Ensure that there are at least 100 alerts in the Alerts table [em_alerts].

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Predictive Intelligence** > **Clustering** > **Solution Definitions**.
   The Clustering Definitions page opens.
2. Select EM ALert Clustering Solution.
3. Verify that the **Active** check box is selected.
4. Select **Update & Retrain**.
   For more information on ML solutions, see Reviewing your ML solution training jobs.

Manual alert grouping

Manual alert grouping involves organizing and categorizing alerts based on user-defined criteria and direct intervention.

You can manually select and group alerts to better manage and resolve incidents by tailoring the grouping based on specific needs, relevance, or context. This approach ensures that alerts are categorized effectively, enhancing overall incident management and response efficiency.

Create alert group manually

Manually create an alert group to organize and manage related alerts when not using scheduled jobs. This provides flexibility to group alerts on-demand for effective resolution.

Before you begin

Role required: evt_mgmt_admin

Procedure

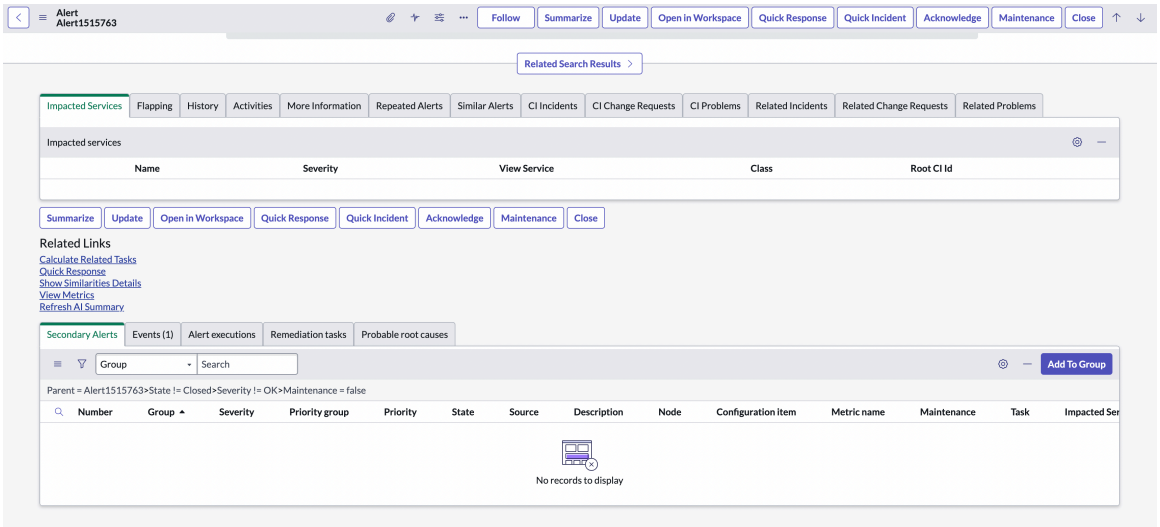
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert.

   The alert will be used to create an alert group, designated as the primary alert, to which you can add secondary alerts.

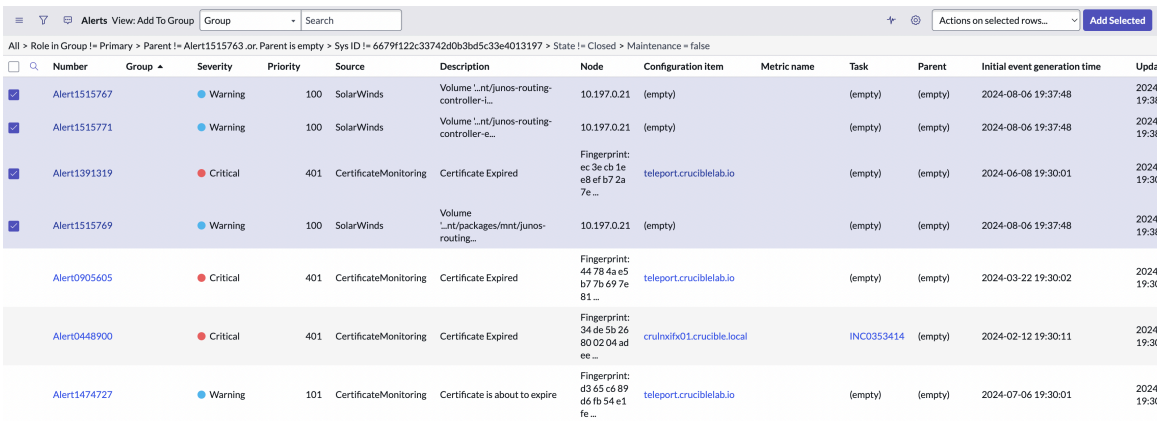
   Note: A closed alert cannot be assigned as a parent alert.

3. Scroll down and in the **Secondary Alerts** tab, select **Add To Group**.

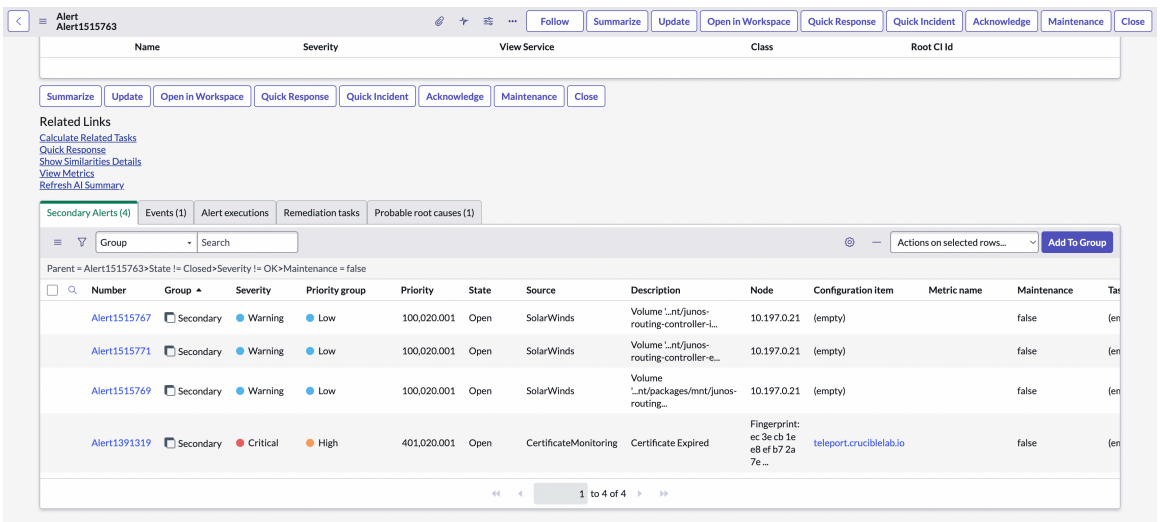
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select the check boxes for all alerts you want to add to the group as secondary alerts and select **Add Selected**.



5. In the **Secondary Alerts** tab, view the alerts that have been added as secondary.



Add secondary alert manually to an existing alert group

Add any relevant alert discovered during the review of an automated alert group as a secondary alert to improve the group's completeness and utility for incident troubleshooting.

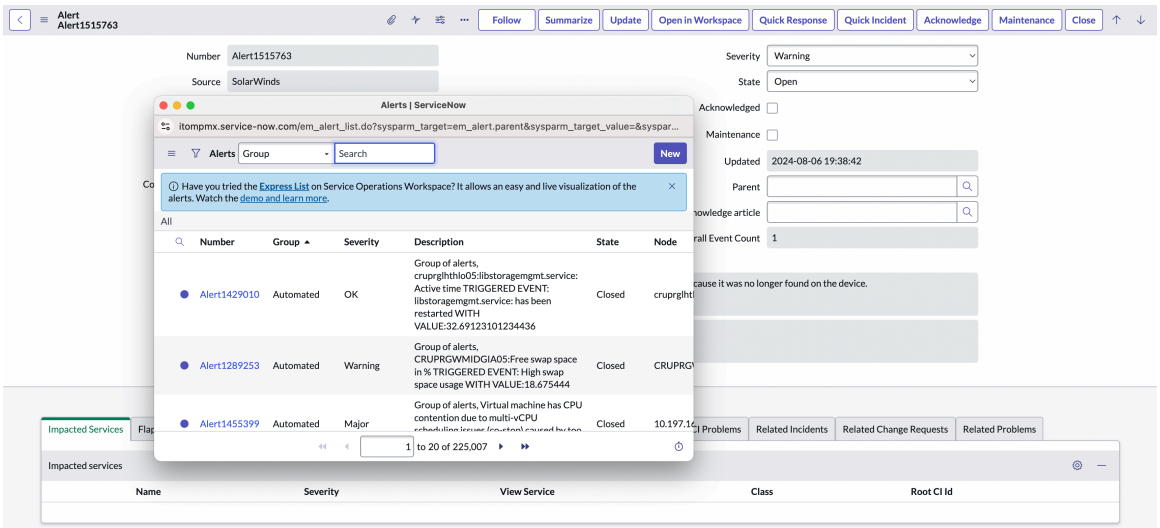
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
The alert you select to add to a new group may already be part of another group. Adding it to the new group will automatically remove it from its current group, changing its group association. Alternatively, you can update the alert's parent to move it to a different group. By specifying a new parent, the alert is transferred to the new parent's group and removed from the previous one. This can be accomplished by updating the **Parent** field on the alert form or by modifying the **Parent** column in the Alerts list.

Note: When you add an alert to a group, this action is logged as feedback for alert grouping as part of the process. Currently, the feedback option is available but does not trigger further actions after being logged. Future enhancements to this feature are being considered.

Procedure
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert.
3. In the **Parent** field, search for the alert you want to assign as the parent for the selected alert.



4. Select the parent alert number.
5. Select **Update**.

Result
The alert is added as a secondary alert to the selected parent alert.

Remove an alert from an alert group

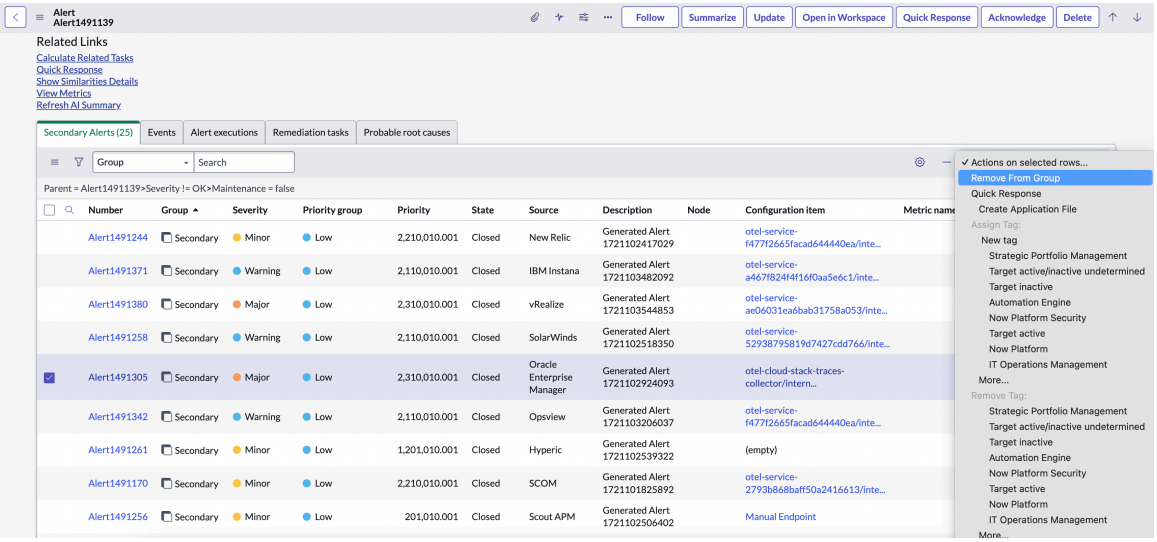
Remove an alert if you want to improve the group's accuracy and usefulness in troubleshooting an incident. If this action leaves the group with one or no alerts, the group is deleted and no longer displays as an alert group.

Before you begin
Role required: evt_mgmt_operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert group.
3. Scroll down to view the **Secondary Alerts** tab.
4. Select the check box next to the alert you want to remove from the group.
5. From the Actions on selected row menu, select **Remove From Group**.



Result

The alert is removed from the group.

Configure work notes to capture alert grouping justifications

As alerts are added to a group, a message is recorded in the alert's Work notes field to explain why the alert was included in the group. Define alert types for creating these worknotes related to alert group reasoning.

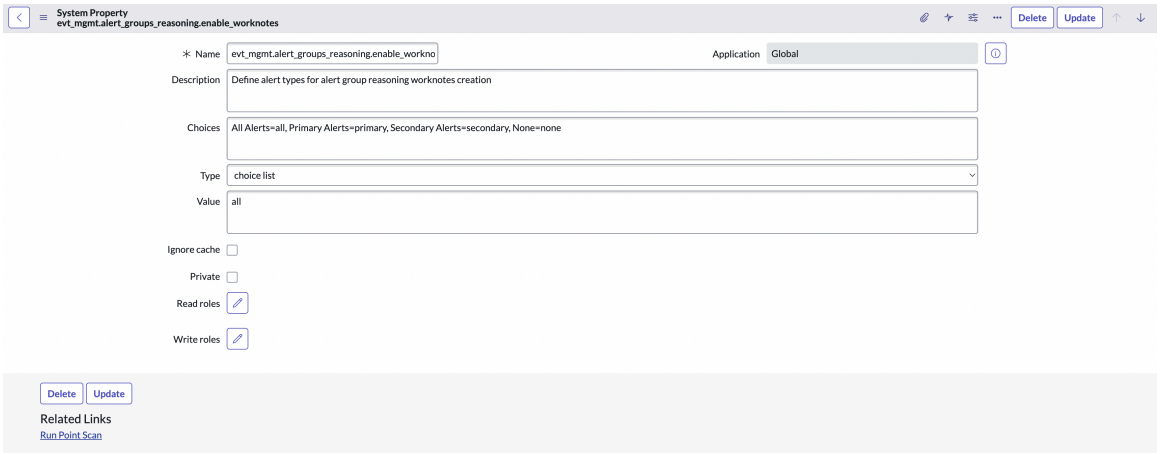
Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the property *`evt_mgmt.alert_groups_reasoning.enable_worknotes`*.
3. Open the property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. In the **Choices** field, define alert types for creating worknotes related to alert group reasoning.

Property values

Value	Description
All Alerts	Work note information is generated for every alert.
Primary Alerts	Work note information is generated only for primary alerts.
Secondary Alerts	Work note information is generated only for secondary alerts.
None	No work note information is generated.

5. Select **Update**.

Alert grouping types and creation methods

Application services in Event Management

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization.

For general information on application services, see Application services.

Manually create an application service in Event Management

You can manually create an application services. Event Management can use application services to monitor service performance and identify health issues.

Before you begin

Role required: evt_mgmt_admin

About this task

An application services is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website. Use application services to organize, maintain, and monitor services in your organization.

Application services do not support these CI types:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.
2. Click **New**.
3. On the form, fill in the fields.

Create a Service form

Field	Description
Name	Enter a unique application service name.
Owned by	Specify an owner who is responsible for this application service in the organization
Add entry points:	
CI Type	Select the CI type (CI class) for the CI you are adding. Every CI belongs to a CI type which contains a set of attributes configured for this kind of CI, for example, cmdb_ci_appl for applications.
CI Name	Select the CI from the list of CIs of the selected CI type.

The CI type list includes only allowed CI types. For example, you cannot add an application cluster.

4. Click **Submit**.

What to do next

For details on grouping application services, see Group application services.

For details on controlling user access to application services, see Control user access to application services.

Convert manual services to application services

You can convert existing manual services to application services. Event Management can use application services to monitor service performance and identify health issues.

Before you begin

Role required: evt_mgmt_admin

About this task

Manual services are no longer supported and this service type, as well as discovered services, have been replaced by application services. Any existing manual services must be converted to application services.
During the conversion process:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The manual service record is moved from the Manual Services [cmdb_ci_service_manual] table to the Mapped Application Service [cmdb_ci_service_discovered] table by changing the record class.
- All the original manual service attributes, such as, name, owner, and operational status, are retained in the application services.
- The configuration items (CIs) of the manual service are retained in the application services after the conversion.
- The system queries the CMDB for the latest CI changes and applies CI impact rules.

Application service does not support these CI types:

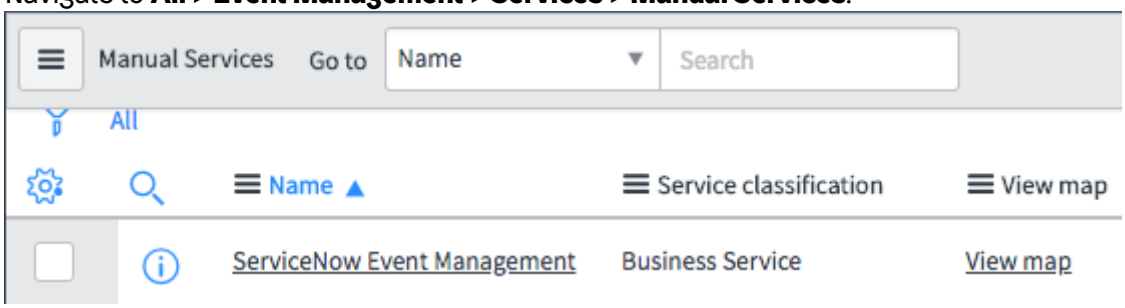
- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If the preceding CI types are used in the manual service that you want to convert, the conversion fails. CIs of this type should be removed before conversion. They can be replaced by adding new CIs to the application services after conversion.

If your ServiceNow instance uses domain separation, the conversion fails if CIs from multiple domains are in the same service. Replace or remove relevant CIs before conversion. The converted application services contains only CIs assigned to the same domain as the application services.

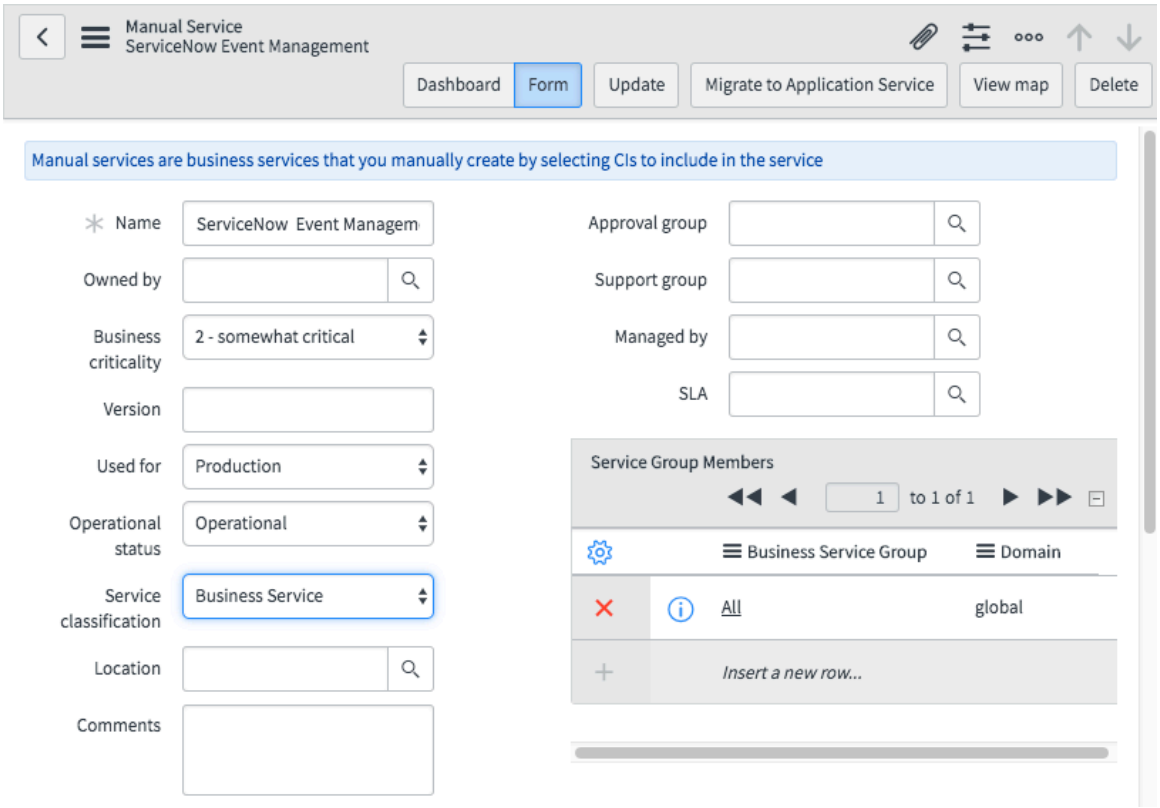
Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Manual Services**.



2. Select the manual service that you want to convert to an application services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Click **Migrate to Application Service**.
4. Click **OK**.

Result

- The CIs from the manual service are added to the converted application services.
- After the conversion process is complete, the application services form opens.

Convert manual services to application services using API

You can use a JavaScript API to convert existing manual services to application services. Event Management can use application services to monitor service performance and identify health issues.

Manual services are no longer supported and this service type, as well as discovered services, have been replaced by application services. Any existing manual services must be converted to application services. Ensure that any automation of manual services (such as business rules or scheduled jobs) have been built and tested before converting to application services.

Note: Manual services are static and retain their original structure after conversion to application services. To update imported manual services with the existing CMDB state, either populate the original manual services to ensure that all CIs are assigned to the correct service, or run the **update with CMDB changes** option after the conversion.

During the conversion process:

- The manual service record is moved from the Manual Services [cmdb_ci_service_manual] table to the Mapped Application Service [cmdb_ci_service_discovered] table by changing the record class.
- All the original manual service attributes, such as, name, owner, and operational status, are retained in the application services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The configuration items (CIs) of the manual service are retained in the application services after the conversion.
- The system queries the CMDB for the latest CI changes and applies CI impact rules.

The maximum number of CI connections added to application services during this operation is controlled by the sa.service.max_ci_service_population property. By default, the value is 1,000 (one thousand connections). Increasing the number of CI connections may cause performance issues. To adjust the maximum number of added CI connections, add the sa.service.max_ci_service_population property, as described in Add a system property.

Attempting to process more CIs than the value specified in the sa.service.max_ci_service_population property causes the operation to fail.

Run the conversion process in small chunks of approximately 10 at a time, to make it easier to pinpoint the problematic service in the event of a conversion problem.

Application services do not support these CI types:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If the preceding CI types are used in the manual service that you want to convert, the conversion fails. CIs of this type should be removed before conversion. They can be replaced by adding new CIs to the application services after conversion.

If your ServiceNow instance uses domain separation, the conversion fails if CIs from multiple domains are in the same service. Replace or remove relevant CIs before conversion. The converted application services contains only CIs assigned to the same domain as the application services.

The JavaScript API is:

```
BusinessServiceManager.migrateManualToApplicationService(String
 service_id)
```

Parameters

Name	Type	Description
service_id	String	sys_id of the manual service to be converted

Returns

Type	Description
Boolean	`true` for a successful conversion, `false` for a conversion that failed

Where the `sys_id` of an existing manual service is `451047c6c0a8016400de0ae6df9b9d76`, run the following API to convert it to an application services:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var bsManager = new SNC.BusinessServiceManager();
var res =
 bsManager.migrateManualToApplicationService("451047c6c0a8016400
de0ae6df9b9d76");
```

Configuring CIs in a manual service as a manual cluster

Configure or modify a CI as a specific CI or a generic CI class in a manual service (that was not discovered automatically) as a manually defined cluster. A manual cluster delivers redundancy capabilities in the cluster and provides continued operations or services of the entire cluster in case of failure of one or more CIs in that cluster.

Manual cluster allows you to group CIs under a logical cluster in a service. In the impact tree you can set the relative impact of a cluster member on the cluster.

Note: Creation of nested manual clusters (cluster inside cluster) is currently not supported.

Once the CI is defined as a manual cluster its impact calculation shows the magnitude of an outage on its children CIs. Impact calculation uses factors such as impact rules and CI relationships to calculate the severity of a generated alert. Impact rules, which are used for impact calculation, estimate the magnitude or severity of an outage based on affected CIs and determines how the impact applies to parent or child entities that are part of an application service.

The magnitude of an outage can be 100% down, 60% affected, 40% impaired, or 20% impaired.

Redundancy is defined in impact rules. For example, you can define that the parent CI is critical if at least two child CIs are critical. The impact from child to parent CIs is not always 100%. If the CIs of all three children are affected, the impact is 100% down.

In a service map, you can configure or modify a specific CI or a generic CI class in a manual service as a manually defined cluster. When configuring as a generic CI class, all the CIs of the selected class in that service are configured the same.

Note: Visual representation of a manual cluster may differ from the visual representation of a cluster that is discovered automatically.

Related topics

Alert impact calculation

Configure a manual cluster

Provide redundancy capabilities of an entire cluster in case of failure of one or more CIs in that cluster. By viewing the relative impact of a cluster member on the cluster information, you can better understand the source of alerts and take remediation steps.

Before you begin

Role required: evt_mgmt_admin

About this task

In a manual service that was not discovered automatically, you can manually group a specific CI or a generic CI class under a logical cluster. The relative impact of a cluster member on the cluster can be configured in the impact tree.

For more information, see Alert impact calculation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Manual Clusters**.
2. Select **New**.
3. In the **Select a Service containing this manual cluster** section, select an application service to contain the new manual cluster based on a specific CI or general CI class.
   The cluster number is automatically generated and appears in the **Number** field.

   a. Select the Lookup using list icon ( ) in the **Service** field.

   b. In the CMDB CI Service [cmdb_ci_service_discovered] table, select a manually created service.
   To define a new application service, see Manually create an application service in Event Management.

   c. **Optional:** Preview the record by selecting the Preview this record icon ( ).

4. In the **Select a Specific CI or generic CI class** section, in the **Defined As** field, select whether to define the manual cluster as a specific CI of a manual cluster or as a generic CI class of a manual cluster that will be applied to all CIs of this class.
   - Specific CI - In the **Configuration item** field, select the Lookup using list icon ( ) and select the configuration item.
   - Generic CI class – In the **Configuration item class** field, select the configuration item class.
5. In the **Provide a Description** section, either provide a description in the **Description** field or leave it blank to contain an automatically generated description when you select **Save** or **Submit**.

   The **Description** field is automatically updated when you select **Save** or **Submit**.
   The automatically generated description consists of the configuration item name and the service name. For example: `CI <Alert Processing> in service <linuxApplService> (*** auto generated ***)`.

   To prevent an automatic update of the Description field and retain your changes, delete the (*** auto generated ***) suffix that appears as part of the description.

6. Activate the cluster by selecting the **Activate** check box.
7. Select **Submit**.

Result
The manual cluster is saved in the EM Impact Manual Cluster [em_impact_manual_cluster] table. The impact calculation is recalculated automatically.

Related topics

Configuring CIs in a manual service as a manual cluster

Create an alert query
An alert query is a set of alerts that meet specific criteria for a particular service.

Before you begin
Navigate to **Event Management** > **Administration** > **Event Management Properties** and ensure that the **Enable alert query support** (*evt_mgmt.impact_calulation.alert_group_support*) property is set to **Yes**.

Role required: evt_mgmt_admin or evt_mgmt_operator

About this task
The main motivation to use alert queries is a modeling solution based on data contained in the alert itself, as an alternative to using either discovered, application, or technical services. Create an alert query to combine similar alerts that meet the specific criteria.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can learn about Event Management basics, including alert queries, from this video:

Procedure

1. Navigate to **Event Management** > **Services** > **Alert Queries**.
2. Select **New**.
3. On the **Alert Query** form, fill in the fields.

   For a description of the field values, see Alert Query form

   Note: In the **Filter** field:

   - When defining an alert query filter, include only fields that appear in the Alert Histories [em_alert_history] table. Impact calculation is based on Alert History data and fields such as Overall Event Count, Priority, and Priority group are not copied to the Alert Histories [em_alert_history] table.
   - Do not specify a dynamic time condition. For example, in the filter, do not specify `Created` condition of `Last 45 minutes` because impact calculation is triggered by a change of alert or alert query. However, for the dynamic time condition, none of these conditions have changed.

   - Some filters may slow down impact calculation. To solve this problem, adjust your alert query by adding an appropriate index, as described in Index suggestions for slow queries.
4. Select **Update**.

Related topics

Create alert group manually

Create a service group

Create service groups to combine similar services. Organize services by groups to perform actions simultaneously on multiple services and to control user access to services.

Before you begin

Role required: evt_mgmt_admin

About this task

Service groups are a way to organize and group services based on the application services or technical services they impact. Instead of looking at individual service from different infrastructure components (like servers, databases, or applications), Service groups help consolidate them under the umbrella of a service group. Application service groups enable faster identification of alert impact. Service groups appear in the **Group by** option on the Service Operations Workspace dashboard.

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Service Groups**.
2. Click **New**.
3. In the **Name** field, enter the name of the new service group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** In the **Parent Group** field, enter the name of another group in which to embed the new group.
   Users with access to a parent service group automatically have access to all its child groups.
5. Click **Submit**.

Related topics

Assign a role to a service group

Group application services

Assign a role to a service group

Assign an Event Management role to the application service group to ensure that group members can manage and act on alerts.

Before you begin

Configure a service group to enable users to manage application services or alert groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Service Group Responsibilities**.
2. Click **New**.
3. In the **Application Service Group** field, select the name of the service group.
4. In the **Role** field, select an Event Management role:
   - evt_mgmt_admin
   - evt_mgmt_integration
   - evt_mgmt_operator
   - evt_mgmt_user
5. Click **Submit**.
6. To find users who are assigned to the role, navigate to **User Administration** > **Users** > **Roles** and search for the role.

Roles installed with Event Management

Activate and configure Service Mapping for top-down discovery

A top-down discovery provides a list of CIs and their interrelationships. This information is useful for managing software services and hardware issues that are associated with alerts.

Before you begin

Role required: evt_mgmt_admin

About this task

In Event Management, Service Mapping relationships appear on alerts. You can view the related CI and other information in the Event Management dashboard. The mapping relationships appear in a service map with the generated alert, any CIs that are bound to the alert, and all related CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

Use Service Mapping to get top-down discovery information.
Service Mapping, which is closely related to Event Management, provides tools to discover the relationships between network, hardware, software, storage, and other devices.

Configure email notification on application service severity change

Configure an email notification to notify users when there is an application service severity change.

Before you begin

Role required: evt_mgmt_admin

About this task

Configure an email notification to notify users when there is an application service severity change. The notification involves specifying when to send it, who receives it, and what it contains.

Procedure

1. Navigate to **All** > **System Properties** > **Email Properties**.
2. In the **Outbound Email Configuration** section, in the **Email sending enabled** option, select **Yes** to enable sending severity information by email.
3. Click **Save**.
4. Navigate to **System Notification** > **Email** > **Notifications**.
5. Click **New**.

   a. In the **Email Notification Actions** form, specify these values.

Field	Value
Name	Type a descriptive name, for example, *Application Service severity change*.
Table	Select the required service type and its corresponding table: Alert Group, Discovered Service, Technical Service, or Application service.
Active	Select the check box to enable email notification.

   b. Click the **Who will receive** tab.
   In the **Users** area, search for and select the required user (the user does not require System Administrator credentials). Repeat this step for as many users that are required to receive this notification.

   c. Click the **When to send** tab and in the **choose field** box, search for and select *Severity*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Click the **What will it contain** tab and in the **Subject** field, type meaningful text that makes it clear to the receiver of the email notification what the content of the email is.

e. In the **Message HTML** message area, using the **Select variables** functions, compose the conditions under which the email notification is to be sent.
For example, configure these variables to change severity:

```
severity changed
```

```
Severity: ${severity}
```

```
on application service
```

```
Name: ${name}
```

6. Click **Submit**.

Configure contextual colors and icons

Use the **Contextual colors and icons** form to configure color, text, and icons to have different default or custom contexts, identified by a context ID.

Before you begin

Role required: evt_mgmt_admin

About this task

You can customize the colors or icons of elements in the **Contextual colors and icons** form to affect the displayed colors or icons of severities in related Event Management screens, either when accessibility mode is off or on. For more information about accessibility, see Accessibility features .

In each color selection field, you have the option of entering the value of the color as any of the following Cascading Style Sheet (CSS) formats that determine how HTML elements should be displayed:

- Name: predefined color names, for example, red, green, olive, blue, darkblue, or lightblue
- RGB decimal: RGB(102, 153, 204)
- RGB hex: #223344

See the following websites for information about CSS color declarations (including hex or RGB notation):

- HTML Colors (W3CSchools) for more information on hex and RGB notation.
- HTML Color Names (W3CSchools) for valid color names.

The context IDs that are provided with the base instance are:

- information_severity
- warning_severity
- minor_severity
- major_severity
- critical_severity
- topology_connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Contextual colors and icons**.
2. Click **New** or modify an existing configuration.
3. Configure the following fields.

Item	Description
Context details	
Context ID	Enter a unique ID for the context, for example, clear_severity.
Context Name	Readable name for the context. This text is available to be read out by screen readers.
Batch	The batch that this context is a member of.
Description	Description of uses for the context.
Colors **Note:** For each entry in the color fields, after you enter a color code, a block appears to the right of the field showing the specified color. Use of invalid color codes triggers an appropriate error notification.	
CSS Color	The corresponding CSS color code for the context color name.
CSS Color on Interaction	CSS color code that appears on hover or focus.
Accessible CSS Color	Accessible CSS color code that appears when accessibility mode is enabled.
Accessible CSS Color on Interaction	Accessible CSS color code that appears on hover or focus.
Icons	
Icon	Icon that is displayed when the context includes an icon.
Accessible Icon	Icon that is displayed when the context includes an icon and when accessibility mode is enabled. To add your own icon, or to see a list of available icons, see Upload one or more images.

4. Click **Submit**.

View Event Management license usage

Event Management is licensed based on the number of CIs bound to alerts during the last year. For alerts that are not bound to CIs, the system calculates the number of nodes (servers) that can send events to the instance directly or through a third-party monitoring tool during the last year.

Before you begin

Role required: evt_mgmt_admin or evt_mgmt_operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The **Event Management - Node Count Store** job calculates the number of unique nodes that send event information, either directly or through third-parties, to Event Management and are eligible for licensing in the last year. The information from this job is stored in the License Usage [em_unique_nodes] table for visibility by all users. CIs bound to alerts are counted towards licensing; if there are no CIs that are bound to alerts, the event node field is used. Node is a reference to a server, not the instances of the software on it. Your node count is based on the amount of infrastructure (servers for example) that will be sending events.

Procedure

Navigate to **All** > **Event Management** > **Reporting** > **License Usage**.

The table is filled automatically based on the alerts in the system. The user has no permission to edit the table. It is used to calculate the usage of the Event Management licensing.

Column	Description
CMDB CI	The CI that is bound to the alert that is gener ated from the event. If there is a value for this field, the **Node** field is empty.
Node	The string value of the **Node** field of the event. If there is a value for this field, the **CMDB CI** field is empty.
Type	One of these values: • Unknown - A CI has not bound to the gener ated alert. • Server - The source of the event was a serv er. • PaaS - The source of the event was Platform as a Service.
Is licensable	One of these values: • True - The event listed is counted towards the license usage. • False - The event listed is not counted to wards the license usage.

Using Event Management

As an Event Management operator, your role is to find alerts, analyze them, and take action to help resolve the underlying issue.

This guide can assist you on a regular basis.

View alert information

View a list of all alerts for application services s, and then manage individual alerts as necessary.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Multiple related events may correlate into a single alert. Event Management only creates alerts when one or more events meet the conditions defined in event rules, alert action rules, and alert configuration settings.

When updating an alert, empty field values do not override values inherited from the alert's event.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.

Note: To stop the message from appearing, set the *show_sow_enhanced_experience_message* property in the [sys_properties] table to false.

2. To view or manage an alert, click the alert number.
3. Review the information on the Alert form.
   You can click tabs on the form for further information.
   - To view flapping information, click the **Flapping** tab.
   - To view alert history, click the **History** tab.

Alert form

Field	Description
Number	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
Resource	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.
Configuration item	JSON string that represents a configuration item. For example, `{"name":"SAP ORA01","type":"Oracle"}`. The CI identifier that generated the event appears in the **Additional information** field. Maximum length: 1000 characters. Note: Reference pop-ups and click-throughs are hidden by default for read-only fields. For **Configuration item** and other read only fields, you can optionally change the read-only setting. For more information, see Configure pop-ups on read-only fields . Click to open the alert in dependency view.
Task	The corresponding task for the alert, such as an incident, change, or problem.
Metric Name	Unique name that describes which metric data is collected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	A description of the alert.
Message key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Severity	The severity of the event. The value for this field is copied from the event unless the event closes the alert, in which case the previous severity is retained for reporting. ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **OK**: An alert is created. The resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.
State	The state of the alert. ○ **Open**: The alert requires user action. ○ **Reopen**: The previously closed alert requires additional user action. ○ **Flapping**: After the alert has been closed, it receives a high frequency of identical events from the same source that causes many alert reopenings. User action is required. ○ **Closed**: The alert is closed and no further user action is required.
Acknowledged	Select **Acknowledged** to indicate that a user has acknowledged the alert.
Maintenance	A check box that shows whether the resource that is affected by the alert is in maintenance.
Updated	The most recent time that the alert information was updated.
Parent	○ If this field is blank, you can specify an alert number. The current alert becomes a secondary alert to this parent alert. ○ If an alert number is displayed, then the current alert is already a secondary alert to this current alert, which is the parent alert.
Feedback	This field appears in alert forms only if the alert being modified is a parent alert. Your response provides feedback about the accuracy and usefulness of the group. Possible values are: ○ None - No value was selected. ○ No Feedback - There is no feedback for this alert. ○ Yes - The alert group is accurate and useful. ○ No - The alert group is not accurate and not useful.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Currently, the feedback option is available but does not trigger further actions after being logged.
Knowledge article	The knowledge article associated with the alert, if any.
Overall Event Count	The counter is increased every time an event is bound to the alert. The count value is kept even after the actual event has been purged. Primary alerts (virtual alerts) are updated based on their secondary alerts. The actual number of events that affected the alert is displayed. **Note:** Do not create an Alert Group based on Event Count. Where an Alert Group is based on Event Count, the impact of the group does not calculate properly because the Event Count field is not copied to the em_alert_history table for impact calculation.
Source instance	The name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44.
User name and role	The user and role of the person who made the most recent alert updates.
Acknowledged	The **Acknowledged** check box value after the most alert recent update. ○ *True*: The **Acknowledged** is selected. ○ *False*: The **Acknowledged** check box is cleared.
Correlated Alerts section	The secondary alerts that are correlated with this alert, where this alert is the primary alert. For more information, see Rule-based alert grouping.
Primary Alerts section	The primary alert that is correlated with this alert, where this alert is a secondary alert. For more information, see Rule-based alert grouping.

Additional tabs.

Field	Description
Impacted Services tab	
Impacted Services	The impacted services that are related to this alert are listed. For more information, see View the impact tree.
Flapping tab	
Flap count	The number of times the alert has flapped—that is, has fluctuated between a closed and a non-closed state—within the flap interval since the start time in the **Flap start window**.
Flap start window	The initial start time to measure the flapping occurrences.
Flap last update time	The last time flapping occurred. This time is the platform processing time, not the source system time.
Flap last state	The state before the alert entered the flapping state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
History tab	
Initial event generation time	The time when the event that generated the alert first occurred. This time is the platform processing time, not the source system time.
Last event generation time	The last time the event that is linked to the alert occurred. This time is the platform processing time, not the source system time.
Created	The time that the alert was created.
Work notes	The additional notes about the alert.
Activities tab	
Activity	A record of the work that was performed. The text has a date and time stamp.
More Information tab	
Priority Breakdown	Displays the computation of the alert priority score.
Additional information	A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field "Connection instance is successful". When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {"additional_content": "Connection instance is successful"}.

What to do next

You can respond to the alert in the following ways:

Alert response options

Option	Description
Submit	Save the modifications that were made to the form and return to the **Alerts** list.
Acknowledge the alert.	Click **Acknowledge**. If the alert is reopened, this button reappears so you can reacknowledge the alert.
Create an incident.	Click **Create incident**. For more information, see Create an incident or security incident from an alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert response options (continued)

Option	Description
If Security Incident Response is activated, create a security incident response.	Click **Create Security Incident**.
Designate that the alert is in maintenance.	Select the **Maintenance** check box. For more information, see View all alerts by the maintenance status.
Close the alert.	Click **Close**. For more information, see Close an alert.

Related topics

Security incidents created from events and alerts

Priority group

For better triage and focus, alerts that have a higher priority are brought to the top of the alert list. This placement brings to your attention those alerts that require you to handle them at a higher priority than other alerts.

The priority group indicates which alerts should be attended to first. Priority is calculated for each open alert and then mapped into one of four priority categories.

Thresholds

Thresholds on the calculated priority are used to determine to which category the alert is mapped to. Alerts with a priority above the value of the *evt_mgmt.top_priority_group_threshold* property are categorized as **Urgent**, which is the highest priority. The default value of this threshold is 1M.

Priority group categories

The priority groups into which alerts fall are listed in the following table.

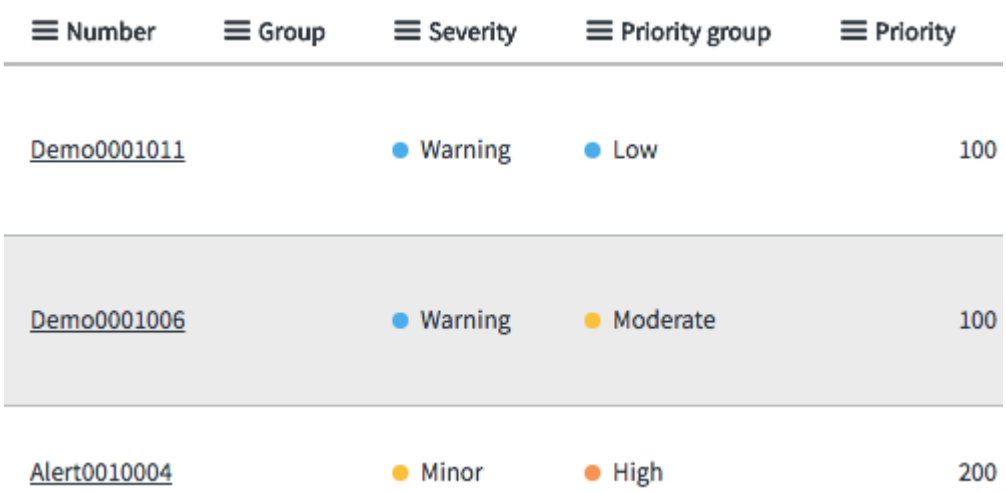
Alert priority groups

Priority group	Icon
Urgent	
High	
Moderate	
Low	

The value of the alert priority group is more meaningful than the alert severity on its own. For example, an alert with a severity of Major, may not be in need of resolution ahead of an alert whose priority is Critical. The combined group priority value takes the weight of each factor into account, giving you a better indication of which alert to attend to first.

The alert priority group is available in alert lists in the Dashboard, Alert Intelligence, and All Alerts page. For example, in the **All Alerts** list, the alert priority group is displayed as depicted in the following image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Triggers that cause recalculation

Changes to open alerts trigger the recalculation of the priority and then the alert is again categorized into the relevant priority group. Closed alerts are not considered for alert priority group calculation.

Related topics

Alert priority

Alert execution information

Alert execution information provides a reference to the actions that have been performed concerning the alert. Among the information presented is which alert management rules ran on the alert, incidents that were opened, and which remediation workflows ran.

Alert Executions

In an alert form, the Alert Execution tab shows key related records for the alert. For example, it shows which actions were performed and which alert management rules were run. If an incident was opened, the related tasks are shown.

Fields in the Alert Executions section

Field	Description
Alert	Reference to the alert that ran under this rule.
Action name	Indicates how the alert was resolved.
Link to execution	Link action that was taken to resolve the alert.
Related task	Link to the incident that was created when the alert was resolved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields in the Alert Executions section (continued)

Field	Description
Log	Link to the log that details the actions taken to resolve the alert
Automatic run	Indicates if the rule was automatic (true) or manual (false).

Action name
This indicates what occurred, for example, if an incident was created.

Log
The log reveals which alert management rule initiated the action. It shows, for example, automatic execution 1 out 3, or manual execution, 2 out of 4.

View alerts in the flapping state

You can view alerts that are specifically in the flapping state.

Before you begin
Before starting this procedure, ask your administrator to configure alert flapping properties.
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
Flapping occurs when the event source continues to generate events even after its associated alert has been closed. Flapping causes the resource's status to repeatedly fluctuate between the *OK* severity and a severity requiring attention, for example, *Critical*.

The frequency of events from an identical source within a given time interval determines whether an alert is in a flapping state or a new issue has occurred. Based on the *evt_mgmt.flap_frequency* and *evt_mgmt.flap_interval* property values:

- If the same issue is recurring, Event Management associates the new event with the existing alert and the state of the alert is set to **Flapping**.
- If the issue occurs after the time interval expires, Event Management creates an alert.

For example, you can respond to an alert by rebooting a problematic server. After no events are generated for several minutes, it is assumed that the issue is fixed and the alert is closed. If the reboot did not actually fix the issue, this server can generate more events later. Then additional alerts are generated for the same issue.

Procedure
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the number of an alert that is in the **Flapping** state.
3. On the alert, click the **Flapping** tab.

Flapping tab on Alert form

Field	Description
Flapping tab	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Flap count	The number of times the alert has flapped—that is, has fluctuated between a closed and a non-closed state—within the flap interval since the start time in the **Flap start window**.
Flap start window	The initial start time to measure the flapping occurrences.
Flap last update time	The last time flapping occurred. This time is the platform processing time, not the source system time.
Flap last state	The state before the alert entered the flapping state.

4. If the **Parent** field is empty, address this alert as a new issue.

Related topics

Configure alert flapping

View all alerts by the maintenance status

The **Maintenance** status indicates that the CI is under maintenance. For example, there is a software upgrade, and the issues can result from that activity, therefore all maintenance alerts are discarded.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

The alert maintenance status can change due to any of these reasons:

- A user selected the **Maintenance** check box on the alert, or selected the alert from the list view, and then clicked the **Maintenance** UI action.
- A new alert that had been bound to a CI whose status is in maintenance status on the CMDB table.
- If all previous events associated with the alert are in maintenance, the alert **Maintenance** field can automatically be set to *`true`* showing maintenance is in progress. However, if an alert **Maintenance** field is *`false`* but the related CI status is changed to *`In Maintenance`* after the alert was created, any subsequent events do not put the alert into maintenance. For example, if an alert is generated for a router and later the router is taken down for maintenance, it is still assumed that there was a problem before maintenance started and the issue must not be ignored.

Note:

- If a maintenance flag was set on an alert in Geneva, after upgrading to Helsinki it affects the impact as a regular alert.
- If an alert is bound to a CI by a user action (such as an alert management rule) and the CI is in the Maintenance state, you must manually bind the CI to the alert and mark it with the **In Maintenance** status.

Procedure

1. Navigate to **All** > **Event Management** > **All alerts**.
2. Review the **Maintenance** column for each alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A value of *true* indicates that the CI is under maintenance.

Note: If the **Maintenance** field is not visible on the Alert form, personalize the list to add the field. For more information, see Personal lists.

Collaborate from within an alert

You can collaborate with colleagues and write work notes while working in an alert.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
You can select to work either in a compact view of Connect that overlays the standard user interface or in a full-screen workspace. The conversations are not copied into the alert.

Procedure
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the required alert.
3. In the alert screen, click **Follow**.
   The label of the button changes to **Following**, showing the current connection to collaboration status.
4. To view the Connect sidebar in a full window, click the down arrow in the **Follow** button and select **Open Connect Full**.
   You can write text in the **Worknote** field. This text is not copied into the alert.
5. To collaborate with colleagues or with support, click the **Add User** icon.
6. To conclude the Connect collaboration session, click **Following**.

Create an incident or security incident from an alert

When an alert must be escalated and assigned to someone who can resolve the underlying issue, you can open an incident.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
If Security Incident Response is activated, a security incident can be created.

You can manually create incidents and security incidents from the Alert form. To prevent duplicate tasks, the system checks the conditions of all task templates before creating an incident.

You can customize the created incident using the *EvtMgmtCustomIncidentPopulator.populateFieldsFromAlert* script include. The customization includes mapping fields from the alert to the incident or aborting the incident creation according to customized conditions. For more information, see Custom alert fields.

You can populate incident fields using custom alert fields values that where populated from additional information fields. Use the *EvtMgmtCustomIncidentPopulator* script include to copy the values to the incident after copying the data to the alert. For more information, see Custom alert fields.

Note: If Security Incident Response is activated, the base system includes an alert action rule called **Create security incidents for critical alerts**. This alert action rule creates security incidents when critical security events are reported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the alert **Number**.
3. To create an incident:
   - To create an incident, click **Quick Incident**.
   - To create a security incident, click **Create Security Incident**. You must install the Security (secops) plugin to enable this option.
4. Click **Update**.

Result

The created incident appears in the **Task** field of the Alert form.

Security incidents created from events and alerts

Place an alert into maintenance

You can manually place any alert into maintenance to hide it from the Alerts list and Agent Workspace.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator

About this task

Placing the alert in maintenance does not place the CI into maintenance. The **Status** field on the CI record remains the same.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Perform one of the following actions.

Option	Description
To put multiple alerts into maintenance	Select the check boxes next to each alert, and then click the **Maintenance** UI action at the top of the list.
To put one alert into maintenance	Open the alert, and either select the **Maintenance** check box and click **Update**, or click the **Maintenance** UI action at the top of the list.

Alert insight information

Alert insight aids faster alert triage, enabling a quicker way to find a solution and expose the probable root cause of the selected alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use alert insight to find a solution and help find the root cause of the alert

Results from data analysis provide further information about the alert, beyond that of the alert form. This aids faster alert triage, enabling a quicker way to find a solution and expose the probable root cause of the alert.

Information shown is from repeated alerts, similar alerts, incidents, problems, and change requests on the same CI, similar CIs, and other CIs that are related by CMDB relations or grouping.

Apply a quick response in an alert

In an alert, use the *Quick Response* feature to apply remediation to the alert or to launch a web application.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

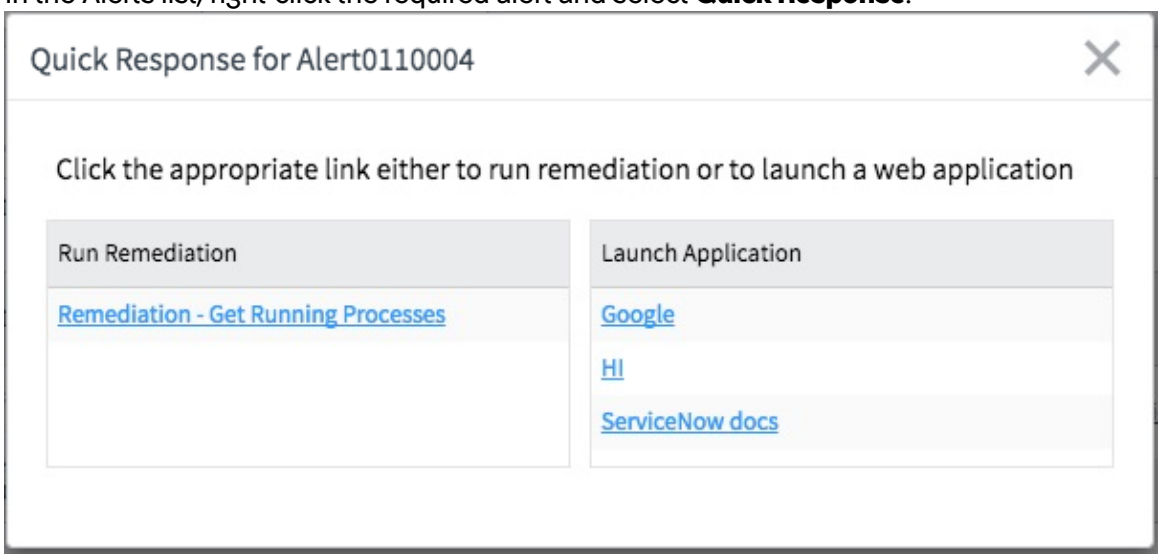
About this task

Quick Response is a feature that enables you to perform a quick action on the selected alert. The action is to apply remediation or to launch an application. If you have upgraded from Istanbul or earlier, this feature is a combination of the **Remediation** and **Launch an application** features.

If you select a remediation link when invoking a Quick Response, a workflow is executed according to the criteria specified in the alert management rule. Click a launch application link to launch the web application that was configured in the alert management rule. For further information, see Migrate an alert action rule to an alert management rule.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. In the Alerts list, right-click the required alert and select **Quick Response**.



3. In the Quick Response page, click the required link to perform the required action.
   If the link that you require is not available, perform one of these actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
For Remediation, define a remediation task using an Alert rule based on the selected alert	**a.** Navigate to **Alert Rules**. **b.** Select the required alert management rule to edit. **c.** Click **Remediation**. **d.** Click **Enable Remediation**. **e.** In the **Execution** field, select either Auto matic or Manual. **f.** In the **Orchestration** workflow field, specify the remediation workflow. ▪ For **Orchestration**, in the workflow set tings, select **Remediation Task [em_re mediation_task]** in the **Table** field. ▪ After you finish configuring the orchestra tion workflow, publish it. **g.** Click **Update**. For further information, see Migrate an alert action rule to an alert management rule.
For Launch Application, create a web appli cation link using an Alert rule based on the selected alert	**a.** Navigate to **Alert Rules**. **b.** Select the required alert management rule to edit. **c.** Click **Launcher**. **d.** Click **Enable**. **e.** In the **Display Name** field, specify a name for the link. **f.** In the **URL** field, compose the URL using data from the alert in the for mat: `${source}.com:${port}/${cmdb_ci.name}` **g.** Click **Update**. For further information, see Migrate an alert action rule to an alert management rule.

What to do next

To create a remediation task or web application link, see Migrate an alert action rule to an alert management rule.

Launch web application from alert

Monitor service health

On the Operator Workspace, you can view alerts by application services, technical service, and alert group. For services, you can also open a service map to view relationships between CIs in the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Ask an administrator to create at least one application services, technical service, or alert group if none of these items exist.

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

The Operator Workspace tiles represent a service, alert group, or CI. The tile color represents the overall alert severity.

Note: Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

These tile icons are available:

Dashboard tile icons

Icon	Meaning
	Represents the status of a mapped application services.
	Represents the status of an Alert group with a set of corresponding open alerts.
	Represents the status of a dynamic CI group.

Each tile represents the highest severity of an alert for the service, alert group, or CI. For example, a tile appears in red if an alert is critical. A green tile indicates either information alerts or no currently active alerts. As the alert severities change, the tile colors update accordingly. The following severities are available:

- **Red**: critical severity (highest severity). Immediate action is required. The resource is either not functional or critical problems are imminent.
- **Orange**: major severity. Major functionality is severely impaired or performance has degraded.
- **Yellow**: minor severity. Partial, non-critical loss of functionality or performance degradation occurred.
- **Blue**: warning severity (lowest severity). Attention is required, even though the resource is still functional.
- **Green**: informational. No severity. An alert is created. The resource is still functional.

Procedure

To integrate with Operational Intelligence, activate the Operational Intelligence (com.snc.sa.metric) plugin.
Follow the steps in the Get started with Metric Intelligence topic. Metrics information appears on the **Metrics** tab in the Service Operations Workspace.

Related topics

View metric values in the Insights Explorer

View discovered service history

The discovered service history shows the frequency of discovered services for a particular time period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
The discovered services history appears only when there are multiple discovered services that occur over a period. A discovered service is a service that is discovered by Service Mapping. The discovered services history is not available for application services. If no discovered services are generated for a particular service, the discovered services history is hidden.

Procedure
1. Navigate to **All** > **Event Management** > **Service Operations Workspace**.
2. Click a service tile and click **Service Map**.
3. Click the **History map** button.

   The history timeline appears, with changes to the service indicated by a clock icon ( ).

4. To view a map showing changes in the service's severity, click the More icon ( ) and select **Advanced map**.

   The displayed color corresponds to the discovered services severity, and the length of the bar in each color corresponds to how long the discovered services stayed at that severity.

   The following table explains the severity colors:

Service severity colors

Severity	Icon color
Critical	Red
Major	Orange
Minor	Yellow
Warning	Blue

5. To change the information that appears on the discovered services history Advanced map, click a history icon.

   - **Calendar icon**: Show information for currently active discovered services.
   - **Hours**: Show information for discovered services that occurred in the past hour.
   - **Days**: Show information for discovered services that occurred in the past 24 hours.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Weeks**: Show information for discovered services that occurred in the past week.
- **Months**: Show information for discovered services that occurred in the past month.

Monitor alerts for an application services

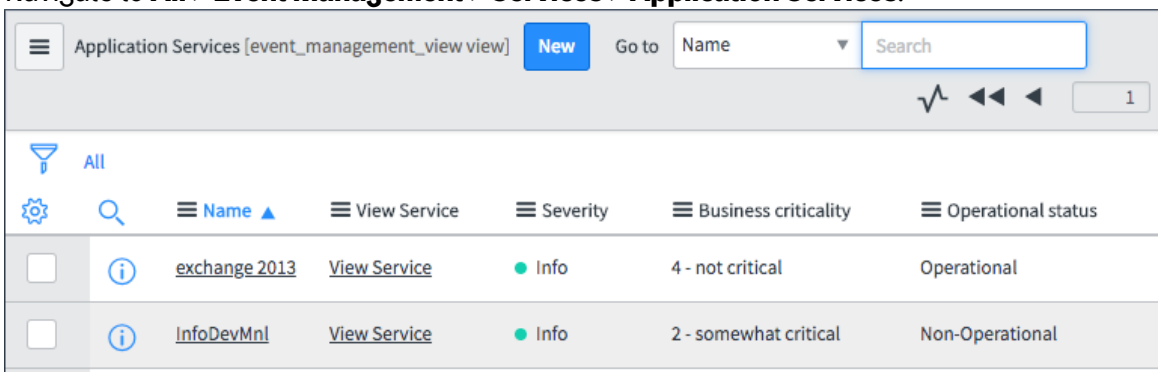
To view information for application services only, navigate to the application services list. From this list, you can open service maps to view and manage alerts for the CIs in each service.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.



2. In the row of the required application services, click **View Map**.
3. Do one or more of the following.

Option	Action
View alert details for a CI	In the service map: **a.** Click a CI tile. **b.** Below the map, click the **Alerts** tab and re view the listed alerts.
View impact on the CI parent	In the service map: **a.** Click a CI tile. **b.** Below the service map, click the **Impact** tab and review the listed impact rules. **c.** Adjust the impact rules as necessary.
Change the map display, map layout, or map indicators	In the service map header: **a.** Click the menu icon. **b.** Configure the appropriate settings.
Navigate to another application services	In the service map header: **a.** Click the down arrow next to the service name or the folder icon for all services. **b.** Search for and select another application services ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
	The icon color represents the highest impact or severity for active alerts on the application services. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
View properties for a CI	In the service map: **a.** Click a CI tile. **b.** In the side pane, click the **Properties** tab and review information about the CI. **c.** If you want to view more detailed informa tion, scroll to the end of the pane and click **Detailed Properties**.

View monitored services

View all services that Event Management supports, such as, alert groups, discovered services, application services, and technical services. According to the type of service, you can view service definition details or drill down into the service.

Before you begin

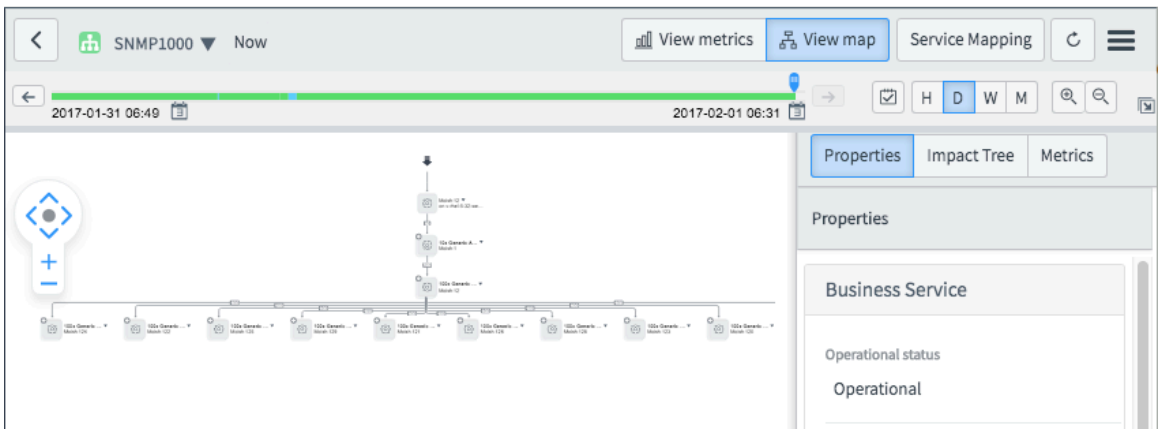
Role required: evt_mgmt_user

Note: Application services that were created before activating the Event Management plugin are not listed in the in the **View Service** column of the Monitored Services list.

Procedure

1. Navigate to **All** > **Event Management** > **Monitored services**.
2. Click **View Service** to open the view that is relevant to that service.
   When you drill down to the contents of the service, either a map, alert list, or CI list appears according to the type of service.

   For example, if you click **View Service** for SNMP1000, you can drill down to the contents of the service and the related topology map appears.



3. To view service definition details of a service, click the name of the service on the **Monitored services** page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, in the **Name** column, click SNMP1000 (SNMP1000).

Use the Event Management overview dashboard

The Event Management overview module uses Performance Analytics to present data from your instance for you to better visualize and understand your processes and drive continual improvement.

About this task

From the Xanadu release onward, the Event Management overview module has been deprecated and replaced with the AIOps dashboards. The dashboards deprecated include the following:

- Event Management insights
- Event Management scorecards
- Event Management overview

The AIOps dashboards offer comprehensive visualizations of critical operational data. You can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment. For more information, see AIOps Dashboards in Service Operations Workspace for ITOM.

Performance Analytics and Reporting

Launch web application from alert

You can launch a web application from an alert that matches the conditions set in an alert action rule.

Before you begin

Create an alert action rule that is configured to prepare a URL when the conditions that you stipulate are met. For example, based on the results when the alert parameters are resolved, this feature can open a Knowledge Base article or construct a URL.

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Right-click an alert in All Alerts or the Alert list in the Event Management Dashboard (for instances upgraded from a release before Orlando), and choose **Quick Response**. Click the required link to launch the web application that was configured in the alert action rule. For further information, see Migrate an alert action rule to an alert management rule.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Right-click the required alert and select **Quick Response**.
   A window appears with a list of available web applications that were configured in the alert action rule and the filter that matches the alert. To see the target URL, point to the cursor over the application name.

   Note: If one or more of the alert action rule parameters cannot be resolved, the related application name appears in black. When the alert parameters are resolved, then the application name becomes a link.

3. Click the name of an application to open the URL in another tab or window in your browser.

Example:

A common use case is launch in context to the source management system.
Other examples include to search in knowledge bases, not only within ServiceNow, but externally as well. Any URL-based action can utilize the alert parameters and the URLs can refer to wikis, messaging services, REST APIs, and so on.

Event Management Operator Tutorial

As an Event Management operator, your role is to find alerts, analyze them, and take action to help resolve the underlying issue.

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Take the tutorial

Before you can work as an operator, you should take a tutorial to become familiar with several Event Management concepts and understand what operators typically do on a regular basis.

Start the tutorial by clicking the first lesson:

Lesson 1	An overview of events and alerts
Lesson 2	An overview of application services
Lesson 3	Event Management operator workspaces

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lesson 4	What operators do

An overview of alerts for Event Management operators

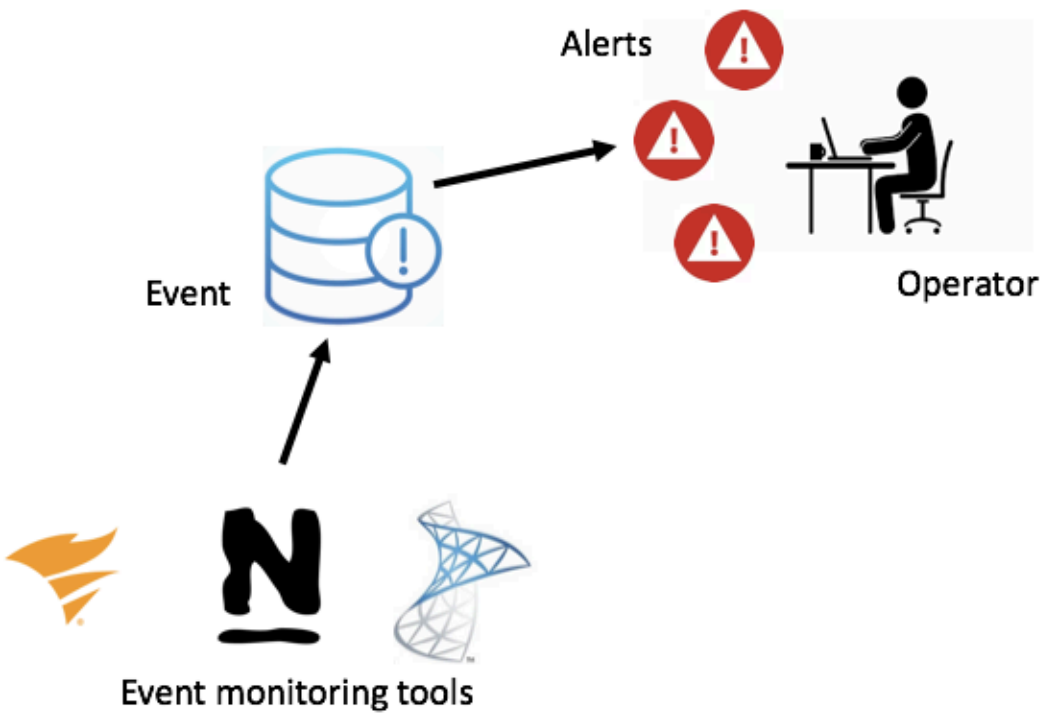
As an Event Management operator, you need to understand how an alert is generated from an event, what to look for in an alert, and how alerts can be grouped together.

This is the first lesson in the Event Management tutorial.

Lesson 1	○	**An overview of events and alerts**
Lesson 2	○	An overview of application services
Lesson 3	○	Event Management operator workspaces
Lesson 4	○	What operators do

Your organization already has an event monitoring tool in place, such as Microsoft System Center Operations Manager (SCOM), Nagios, SolarWinds, and so on. When an issue occurs on your network, such as a computer going down or a database failure, the event monitoring tools send events to your ServiceNow instance. The Event Management application processes the events according to the settings that your administrator configured, and then generates alerts. An alert is an indicator that the issue requires some type of action.

Alert generation



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an Event Management operator, your role is to view alerts and, depending on how Event Management is implemented in your organization, take an action to help resolve the underlying issue or notify someone who can. Later in this tutorial, you will see the phases of a typical alert management process.

Alert priority and severity

The two most common characteristics of an alert are the priority and the severity.

- The priority of an alert is a score that helps you determine how important the impact is to application services. Multiple factors determine the alert priority score. Your Event Management administrator can configure the algorithm that the Event Management application uses to calculate priority.
- The severity of an alert is an indicator of how serious the underlying issue is. The event monitoring tool in your organization usually sends severity values with the event, which then gets carried over in the alert. These are the default severity types that you will see in this tutorial:

Severity	Description
Critical	The resource is either not functional or critical problems are imminent.
Major	Major functionality is severely impaired or performance has degraded.
Minor	Partial, non-critical loss of functionality or performance degradation occurred.
Warning	Attention is required, even though the resource is still functional.
OK	No severity. An alert is created. The resource is still functional.
Clear	The alert no longer needs action.

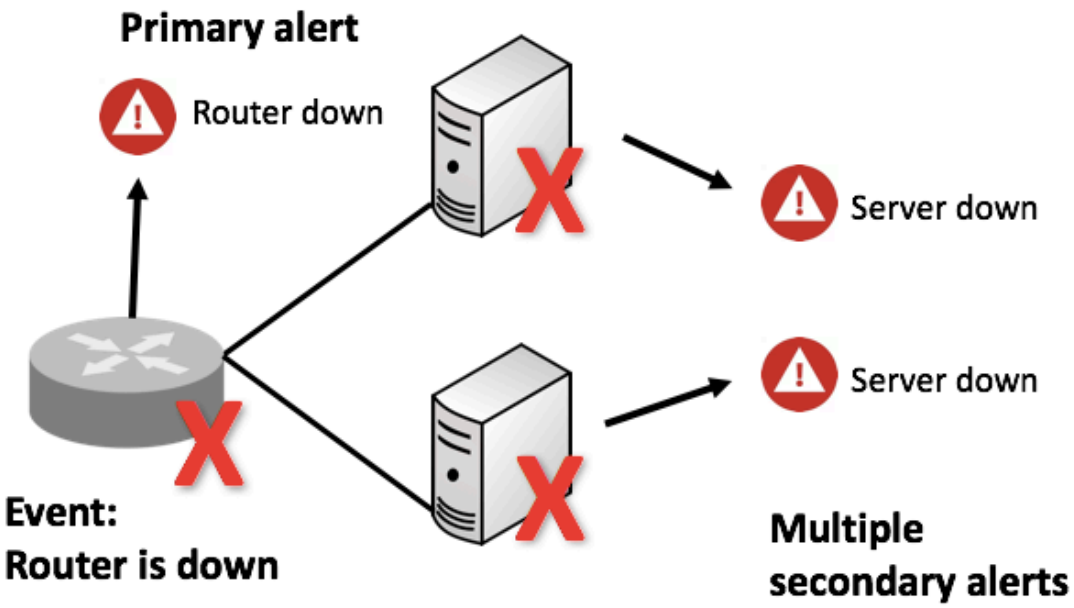
Correlated alerts

Some alerts are related to each other. For example, if a router goes down, several separate alerts could be generated, one for each server connected to the router. All of these alerts are related, or correlated. To help you manage correlated alerts, Event Management can automatically group them and establish a two-level hierarchy with one root alert, called the primary alert, at the top, and other related alerts, called secondary alerts, under the primary alert. When you view alerts, primary alerts stand out by default so you know which alert to focus on without being distracted by the secondary alerts.

In our example, if a router goes down on your network, network communication is also affected for connected servers, assuming they cannot reach any other routers. The router outage becomes the primary alert and the alerts generated on the server are secondary alerts that are correlated under the router alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Secondary alert generation



Depending on your organization's Event Management implementation, alerts might be grouped automatically based on correlation rules that your administrator sets up. Your instance can also learn how to improve the way it correlates alerts based on these rules. As an operator, you should still verify the accuracy of the correlation and, if necessary, manually correlate additional alerts with the primary alert. Later in the tutorial, you will learn how to do this.

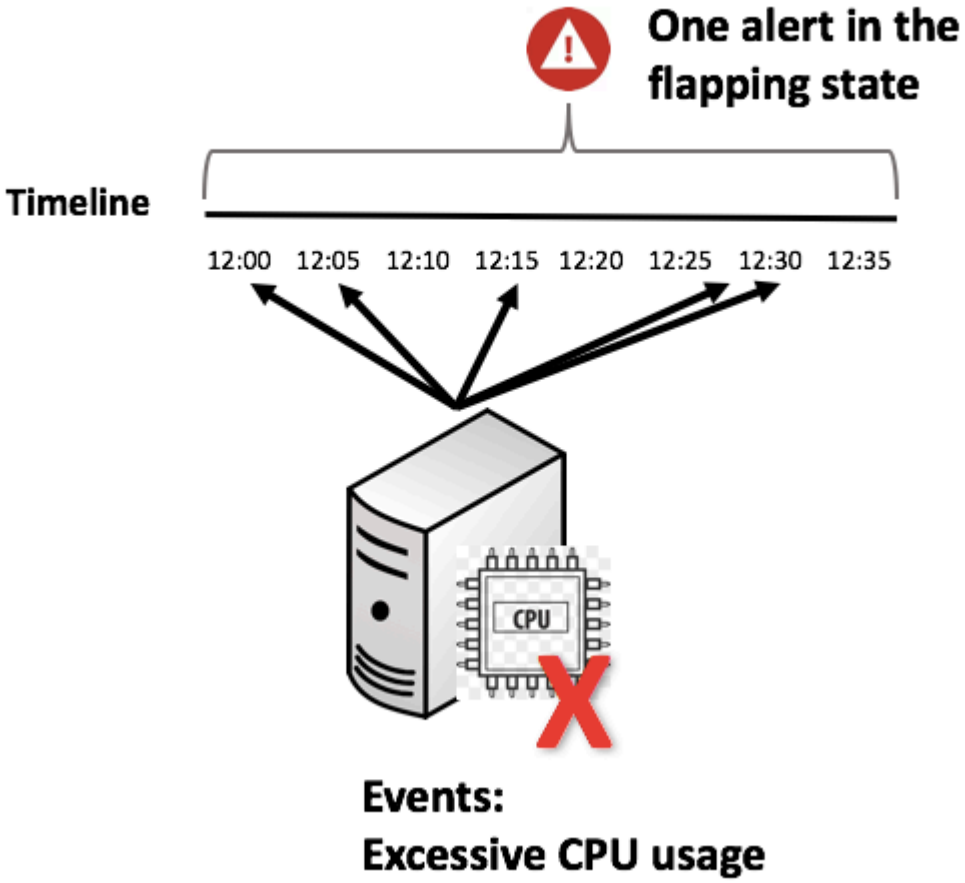
In this tutorial, you will learn how to manually correlate alerts.

Alert flapping

An alert can flap, meaning that it gets multiple open-close events in rapid succession. Flapping indicates that Event Management does not know whether the underlying events are genuine or not. The events could indicate small issues with the way CIs are configured, or larger issues, like network outages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert flapping



For example, if a server that hosts a web service has too many active processes, it might trigger an event about excessive CPU usage. Since CPU usage can fluctuate rapidly depending on web service requests, several events might be triggered, leading to the alert being put in the flapping state. As an operator, you might need to create an incident to have the server restarted, or someone might have to reconfigure the CPU, or possibly make a hardware change on the device.

As another example, consider a loose network cable that causes momentary, repeated network outages. The thresholds that your administrator configures might not be optimal for this kind of alert and Event Management considers it a flapping alert.

Continue the tutorial

Proceed to the next lesson: Application services for Event Management operators.

Application services for Event Management operators

As an Event Management operator, you need to understand what application services are.

This is the second lesson in the Event Management tutorial.

Lesson 1	✓	An overview of events and alerts

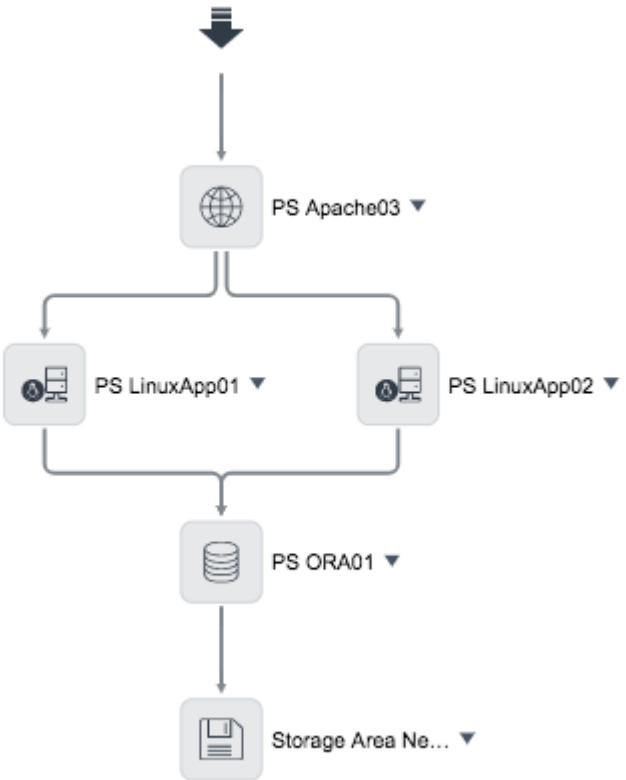
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lesson 2	○	**An overview of application services**
Lesson 3	○	Event Management operator workspaces
Lesson 4	○	What operators do

An application service is a collection of components, such as network devices, computers, and applications that offer a service to your organization. The services can be something like an email system or a website that tracks orders or requests in a database. Your administrator should have already specified the application services in your ServiceNow instance.

Each component that makes up an application service is referred to as a configuration item or CI. This service map provides a visual representation of an application service:

Service map



In this example, you can see a Web Portal application service with these CIs:

- **PS Apache03**: An Apache web server that hosts a company website.
- **PS LinuxApp01** and **PS LinuxApp02**: Two Linux servers that share the workload from the web server.
- **PS ORA01**: A database server that both Linux servers need to access.
- **Storage Area Network 001**: A mass storage device on which the other CIs depend.

You can see service maps like this on the Service Operations Workspace dashboard. Later in this tutorial, you will learn about the dashboard and what an application service looks like when an alert is associated with a CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Types of application services

Event Management classifies application services into the following types:

Technical services

A technical service is a dynamic grouping of CIs based on some common criteria. For example, a technical service could be comprised of all web servers or all Oracle databases for a specific location, like North America.

Application services

An application service can consist of discovered services, manual services, or both. A discovered service is an application service that the Service Mapping application finds (if your organization uses Service Mapping). A manual service is an application service that your administrator configures by selecting and adding each CI and specifying the relationships between CIs.

Alert groups

Alerts that are grouped together, either manually or automatically.

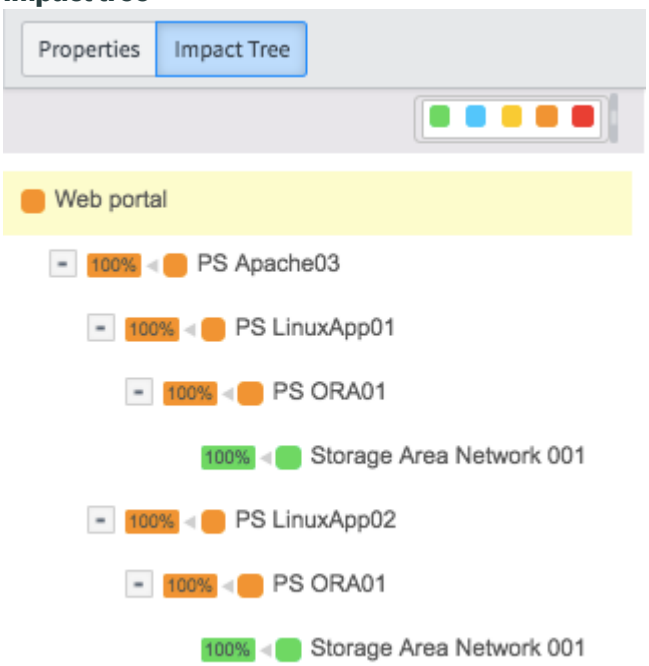
Alert impact

Application services are critical to the operations of your organization. If an issue occurs on one CI, the entire application service can be affected. Part of your role as an operator is to analyze alerts on CIs and see how they impact the application service as a whole, and then take an action to help remediate or solve the underlying issue. Your administrator can configure impact rules that go into calculations for the severity of an alert.

Later, when you learn how to use the Service Operations Workspace dashboard, you will learn how to view an impact tree for an application service so you can understand the relationship between the severity of an alert and the overall application service.

In this example, you can see how a **Major** alert on an Oracle database (**PS ORA01**) also causes a major alert on its parent CIs and on the Web portal application service itself.

Impact tree



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Continue the tutorial

Proceed to the next lesson: Event Management operator environment.

Event Management operator environment

As an Event Management operator, your primary work environment is the Service Operations Workspace dashboard.

In this, the third lesson in the Event Management tutorial, you get an overview of your workspaces so you know how to find the information you need.

Tutorial lessons

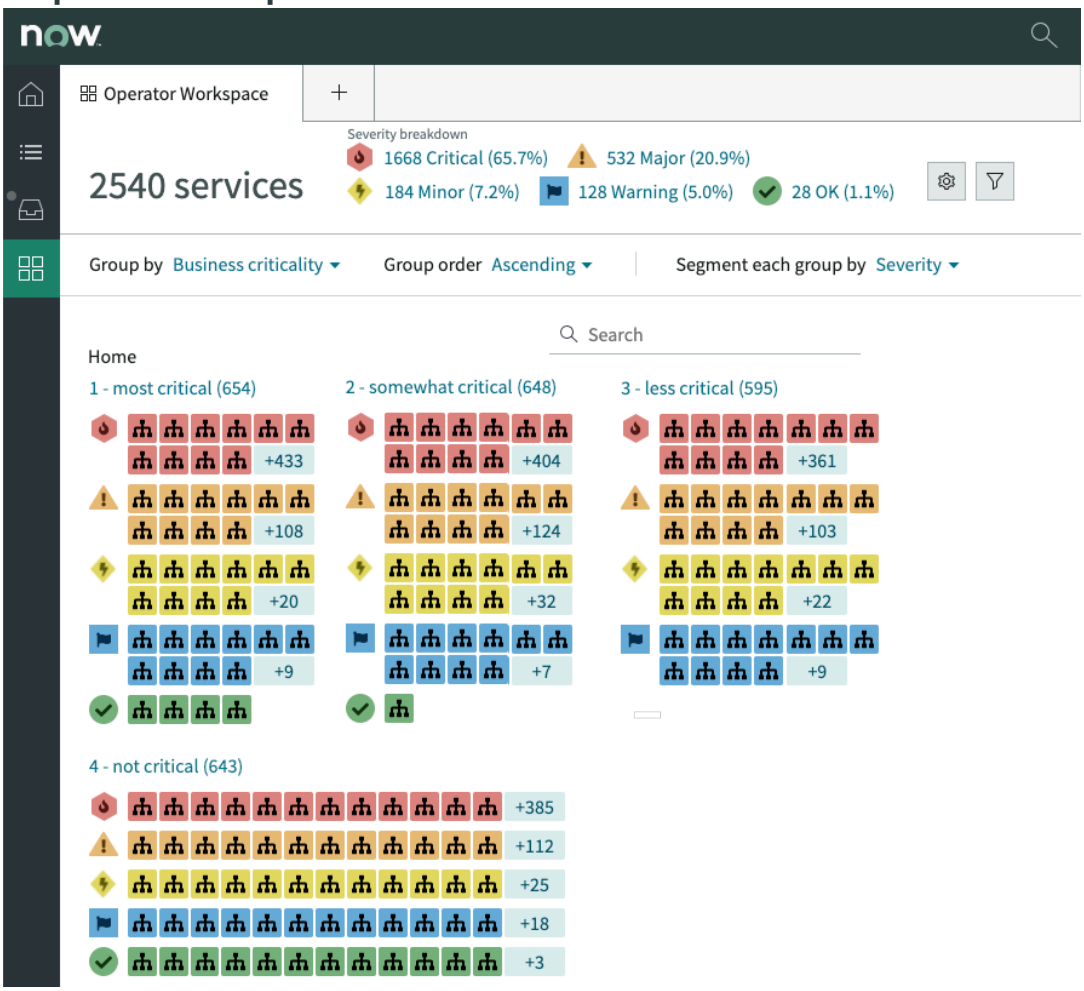
Lesson 1		An overview of events and alerts
Lesson 2		An overview of application services
Lesson 3		Event Management operator environment
Lesson 4		What operators do

The Service Operations Workspace dashboard

Your main area of work is the Service Operations Workspace dashboard, which provides a view that focuses on how alerts relate to application services. From here, you can drill into each application services to see the affected CIs and get an understanding of the overall impact of whatever caused the alert. To open the dashboard, navigate to **Event Management** > **Service Operations Workspace**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Operations Workspace



The main sections of the dashboard are:

Banner

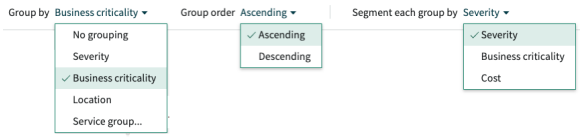
The banner contains controls that show or hide application services based on the criteria you select:

Click a severity level to show or hide application services based on the alerts associated with them.

Use the **Group** and **Segment** controls to organize the view.

Note: Your administrator assigns an application the criticality and cost value to your application services.

Group and Segment filters

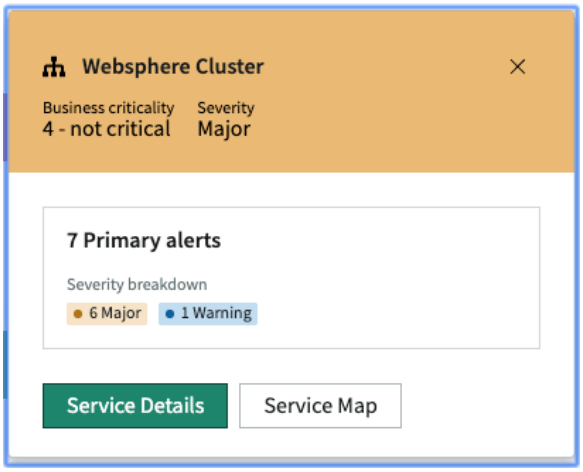


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application services

The Service Operations Workspace dashboard displays tiles that represent application services. The color of a tile represents the severity of the alerts that are associated with the application service.

Click a tile to show a summary of alerts associated with the application service. Click to view details or the service map.



Alerts

Click the List icon (

). On the Lists tab, click the kind of alert to view.

You can filter or sort the list to find an alert. Sort by any alert details, such as the **Priority**, which considers multiple factors for how serious the alert is, or the **Severity**, which is value provided by the event monitoring tool.

Open any alert by clicking the number.

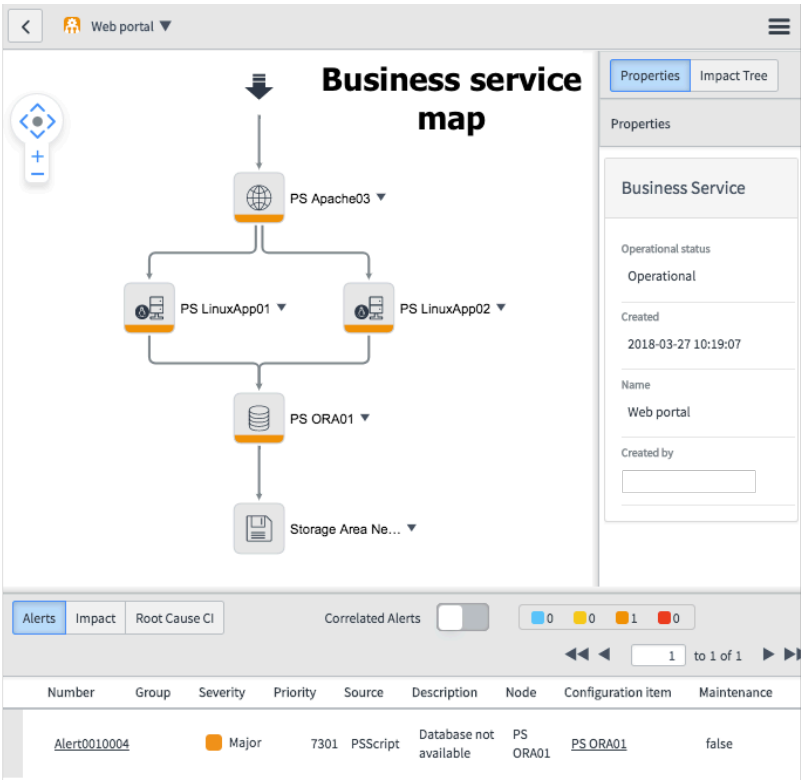
You will learn about what each of the columns means for an alert later on when you analyze an alert.

Application service map views on the Service Operations Workspace dashboard

Double-click the name of an application service tile to open one of the application service map views. The view that you see depends on the type of application service.

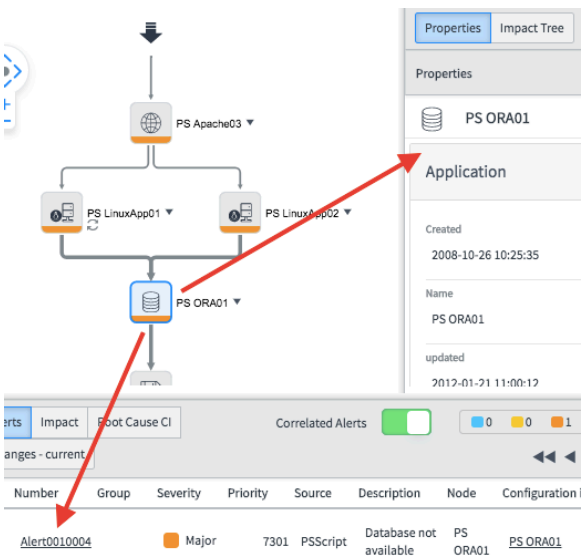
For a manual or standard application service, this view appears:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



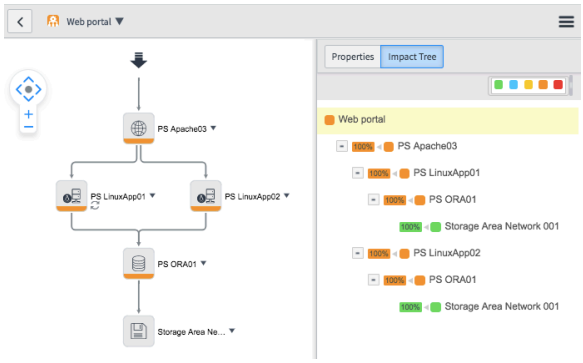
The application service map that you were introduced to in a previous lesson appears in the main panel. This is what you can do from this view:

Click any of the CIs to see the alerts only for that CI and to display the details about that CI in the **Properties** pane.



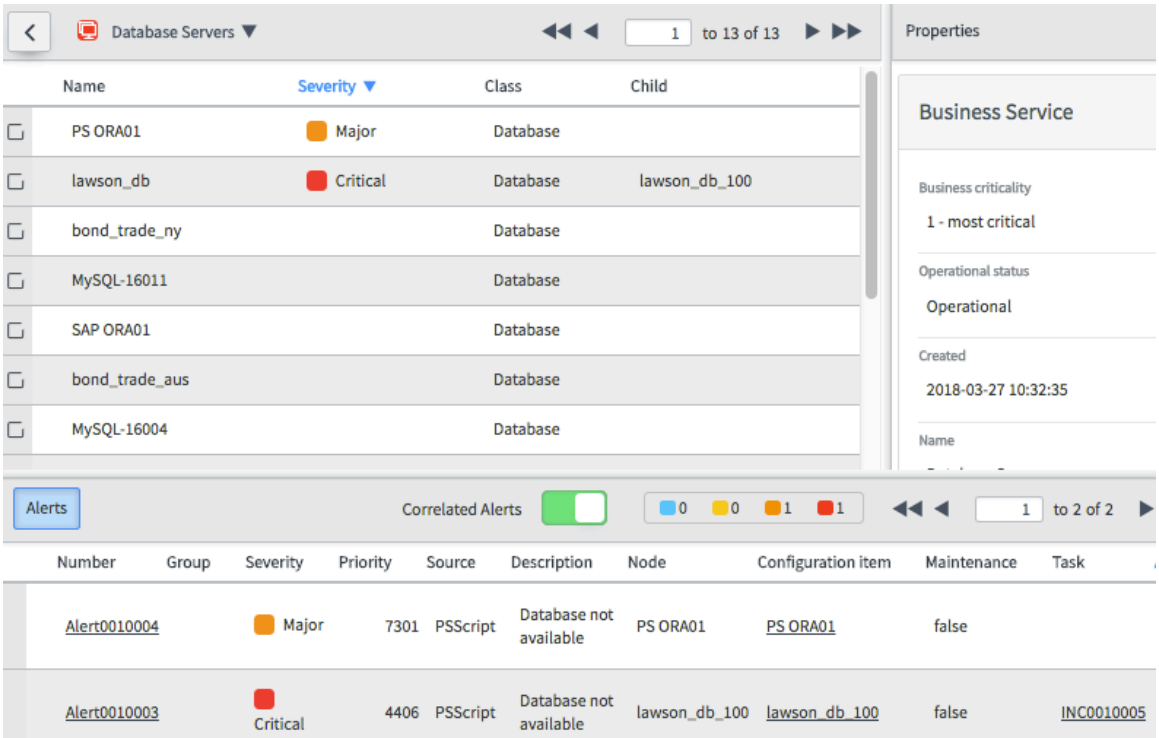
Click **Impact Tree** to see the state of all the CIs and how they affect each other when receiving an alert. You will learn more about the impact tree later on in the tutorial.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



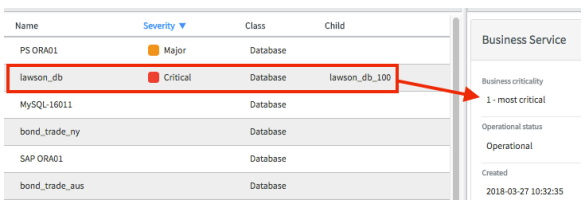
Open any alert from the **Alerts** list at the bottom by clicking the number.

For a technical application service, this view appears:



This is what you can do from this view:

Click any CI to view details about it.



Open any alert from the **Alerts** list at the bottom by clicking the number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Continue the tutorial

Proceed to the next lesson: What Event Management operators do.

What Event Management operators do

As an Event Management operator, your typical workflow involves three phases: analyzing an alert and its effect on application services, taking some type of action, and making sure the alert is finally closed.

This is the last lesson in the Event Management tutorial. In this lesson, you will run through the three phases of a typical operator day-to-day workflow.

Lesson 1	✓	An overview of events and alerts
Lesson 2	✓	An overview of application services
Lesson 3	✓	Event Management Service Operations Workspace
Lesson 4	○	**What operators do**

Your organization will have specific policies and procedures that may differ from the phases outlined in this topic. In addition, your administrator might have customized the Event Management application so that some of these phases are automated and do not actually require any action on your part.

For the purposes of this tutorial, we will walk you through each phase and allow you to perform the tasks manually.

Phase 1	Analyze and acknowledge an alert	In this phase, you will find an alert to work on, analyze the details, and acknowledge it so that other operators know it is a legitimate alert.
Phase 2	Triage an alert	In this phase, you take an action to help remediate the issue that caused the alert. The most common action to take is to create an incident and assign it to someone who can solve the underlying issue.
Phase 3	Close an alert	In this phase, you will verify that the alert is resolved, and then close the alert.

Start here

Start out by learning how to Analyze and acknowledge an alert.

Operator phase 1: Analyze and acknowledge an alert

As an Event Management operator, the first thing you should do is access alerts and then find the ones you want to focus on. You can open the Alert form to analyze the details, and then

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

acknowledge it to let other operators know that the issue causing the alert should be addressed in some way.

Before you begin

Phase 1	◯	**Analyze and acknowledge an alert**
Phase 2	◯	Triage alerts
Phase 3	◯	Close an alert

You must understand both of your operator environments: the Service Operations Workspace dashboard and Service Operations Workspace. Review Event Management operator environment if you have not already done so. This tutorial uses the Service Operations Workspace dashboard.

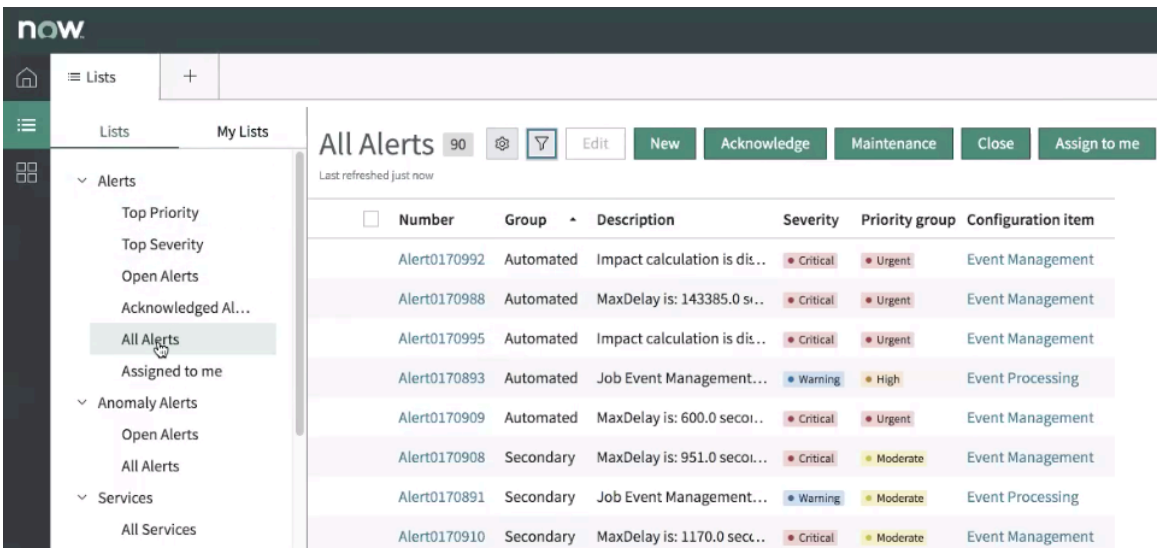
Role required: evt_mgmt_operator

Procedure

1. Navigate to **Event Management** > **Workspaces** > **Service Operations Workspace**.

   In the list, click **Alerts** > **All Alerts**. By default, all alerts appear in the list sorted by **Group**. Click any heading to sort by that value. To view current filter settings, click the filter icon

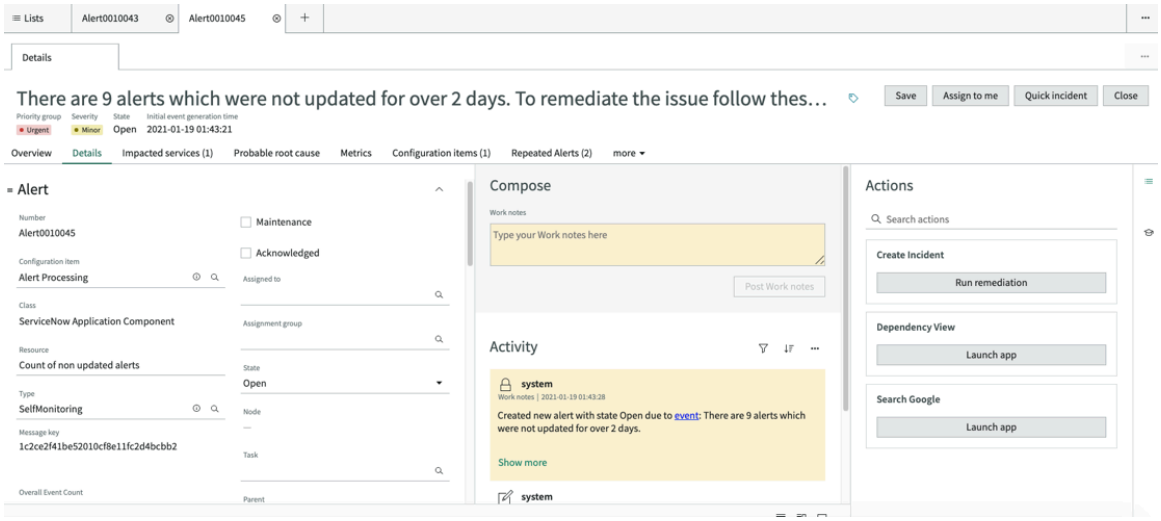
   . To modify filter settings, click **Advanced view**.



2. Find the alerts to focus on by clicking **Application Services** > **Services**, or by using any of the filtering and sorting options.
3. Click an alert name to open the **Details** tab for the alert.

   Example
   The important fields on the form and related items are described after the screenshot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Fields on the Alert Details tab for an alert that is associated with a single CI

Field	Description
Number	The automatically generated alert number that you saw in the list of alerts on the Service Operations Workspace dashboard.
Node	The name of the CI with which the alert is associated. The event that generated the alert occurred on this CI. You might see a computer name, or an IP address or MAC address of a device.
Resource	The object on the node that caused the event. You might see values like the name of a hard disk, a CPU, or the name of a process or a service. You can add information to this field if necessary.
Configuration item	The CI in the CMDB to which this alert applies. If the **Node** field is filled in but this field is empty, and if you know which CI the node represents, you can enter the CI in this field to manually associate the alert with it. **Note:** Your administrator can configure rules that automatically bind CIs to an alert, usually based on what is in the **Node** field. However, it is possible that the system is unable to find the correct CI to bind the alert to. In this case, you might need to manually select a CI. For the purposes of this tutorial, we assume that the correct CI is bound to the alert. When an alert contains a CI, the **Overview** tab opens when selecting the alert.
Task	Any existing task that is associated with the alert, such as an incident, change request, or problem, is shown in this field. When you first look at an alert, this field is blank. You can associate a task when you triage the alert. You associate an incident to an alert and assign the incident to someone at a later stage in this tutorial.
Description	A description of the alert that came from the alert monitoring software in your organization. You can add information if necessary.
Severity	Severity value for the alert:

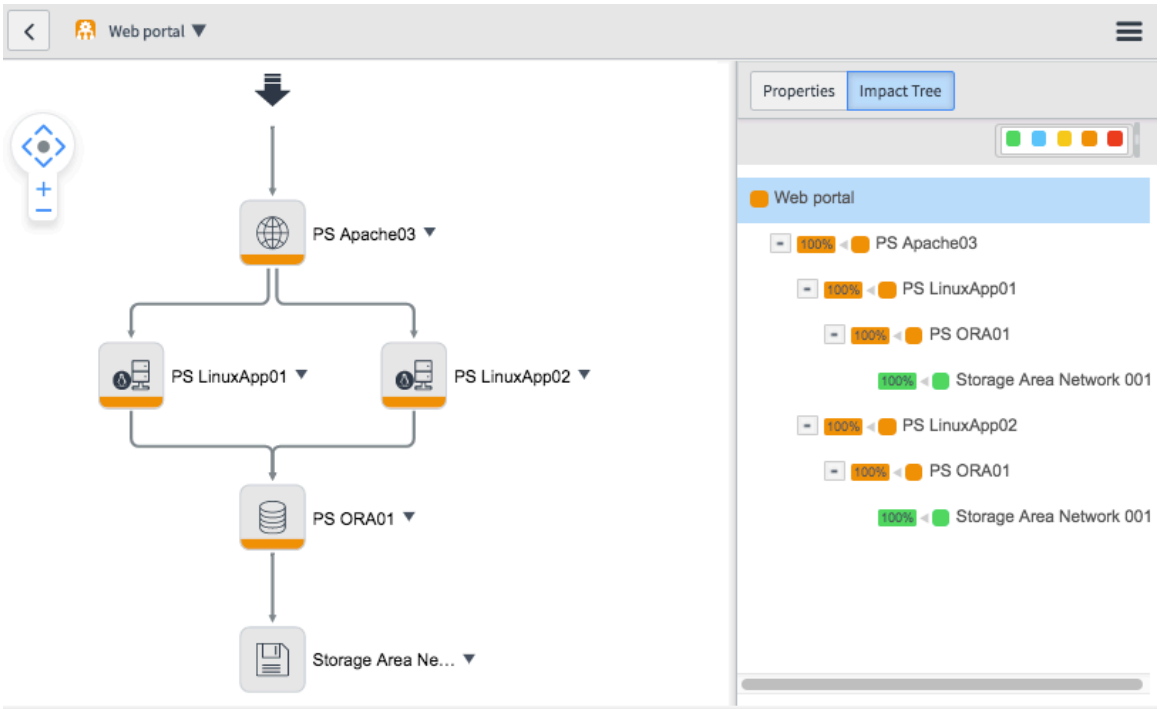
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Critical: Immediate action is required. Either the resource is not functional or critical problems are imminent. ○ Major: Major functionality is severely impaired or performance has degraded. ○ Minor: There is a partial, non-critical loss of functionality, or performance has degraded. ○ Warning: Attention is required even though the resource is still functional. ○ Info: An informational message. An alert is created, but the resource is still functional. ○ Clear or Resolved: No action is required. An alert is not created from this event. Existing alerts are closed.
State	The processing state that the alert is in. A newly generated alert is in the **Open** state. Other states are: ○ **Reopen** indicates that a previously closed alert is open again, and it requires your attention. ○ **Flapping** indicates that the alert is receiving a high frequency of identical events from the same source, which can cause many alerts to re-open even after it is closed. ○ **Closed** indicates that the alert is closed and does not require any further action. You will close an alert as part of the last stage in this tutorial.
Maintenance	Indicates that the alert does not need to be worked on and is hidden from the list of alerts in the Service Operations Workspace dashboard. In this example, we do not want to put the alert in maintenance.
Acknowledged	Indicates that an operator verified that the alert is genuine and is triaging it. You acknowledge the alert at a later stage in this topic. Your Event Management administrator can also have alerts automatically acknowledged immediately after they are generated. If this is the case, the **Acknowledge** check box on the Alert form might already be selected.
Parent	Displays a value only for secondary alerts. The value indicates the alert number of the parent alert. The field is empty for primary alerts (alerts with no parent alert).
Knowledge article	Any existing knowledge base (KB) article that is associated with the alert. When you first open an alert, this field is blank. You can associate a KB article when you triage the alert.

4. Click the **Impacted Services** tab and then click the service name.
   Before you acknowledge the alert, you might want to learn more about the services that are affected due to the service that is the source of the alert.

   The service opens and displays the **Details** tab. Click **Service Map** to view the map of related application services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



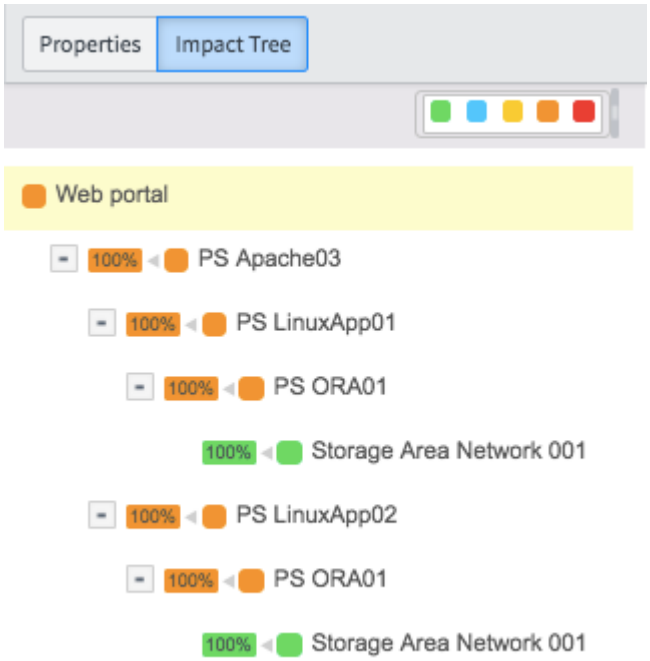
Notice that the major severity indicator in orange is displayed on several CIs. It starts with the Oracle database (**PS ORA01**) and propagates up to all CIs that depend on the database. From this, you can surmise that the alert with the highest level of severity on the Oracle database indicates the root cause of the issue.

This does not necessarily mean that the system generated separate alerts for each CI, but it is possible. When you triage an alert, you can determine whether alerts on other CIs should be correlated under a primary alert.

5. Click the **Impact Tree** tab and review the impacts on each CI.

   The percentages next to each CI in the impact tree show you the effect on each CI. In this example, each CI is impacted 100% by the alert, which means the underlying issue that led to the alert is serious enough to impact the functionality of the application service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Acknowledge the alert.

   Acknowledging an alert does not assign it to you, nor does it create a task like an incident or change request. It simply lets other operators know that you are aware of the issue. After you acknowledge an alert, you will take further action during the triage stage.

Option	Description
Acknowledge a single alert	With this process, you can acknowledge only the alert that you are viewing. **a.** Open the Alert Details form as described earlier. **b.** Select the **Acknowledged** check box.
Acknowledge one or more alerts	With this process, you can acknowledge one alert or multiple related alerts. **a.** Open the list of alerts as described earlier. **b.** Select each alert to acknowledge. **c.** Click **Acknowledge**.

7. Navigate back and look for the alert that you acknowledged.
   You can see that the **Acknowledged** value is **true**.

Number	Group	Severity ▲	Priority	Source	Description	Node	Configuration item	Maintenance	Task	Acknowledged
Alert0010002		Major	3301	SolarWinds	Database issue	PS ORA01	PS ORA01	false		true

What to do next

Go to Operator phase 2: Triage an alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operator phase 2: Triage an alert

After you analyze and acknowledge an alert, you must triage it. The triage phase involves verifying alert correlation and taking an action to help resolve the issue that caused the alert. This topic covers the most common triage task: creating an incident from an alert.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1		Analyze and acknowledge an alert
Phase 2		**Triage alerts**
Phase 3		Close an alert

Role required: evt_mgmt_operator

Procedure

1. Before you start to work on the alert, check whether other alerts should be correlated with the one you just reviewed:

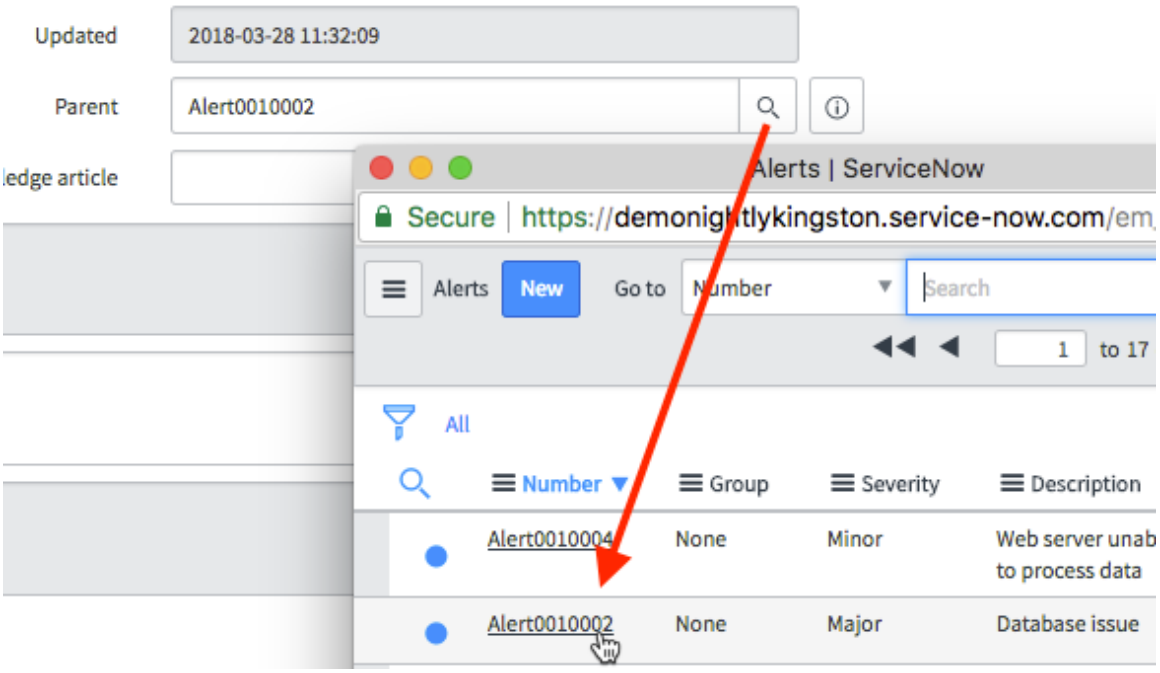
   a. Navigate to **Event Management** > **Service Operations Workspace**.

   b. Click the same application service tile and review the alerts in the **Alerts** list.

   c. If multiple alerts are present, open one to determine if it is related to the other alert, or if the underlying issue is the same in both alerts.
   For example, if an alert is associated with a web server and there is already an alert for the database issue, correlate the web server alert as a secondary alert with the database alert as the primary alert.

   d. Open the secondary alert, click the lookup icon ( ) in the **Parent** field, and then select the primary alert.
   This creates a primary (parent) / secondary (child) relationship between the two alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



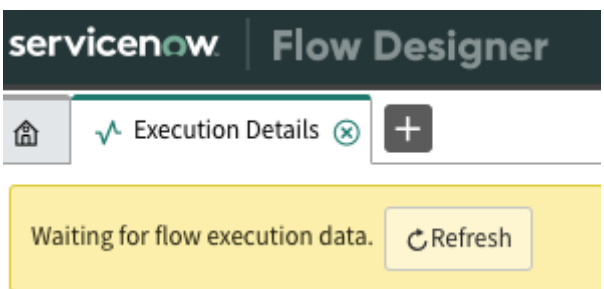
e. Repeat this process to correlate as many secondary alerts as necessary.

f. Navigate back to the Service Operations Workspace dashboard and verify that the primary alert displays an icon in the **Group** column.

Note: Your administrator can set up rules that let the system automatically correlate alerts so that you do not need to do so manually. In that case, a **Feedback** field appears on the Alert form. Select **Yes** if the system correlated the alert correlated correctly, or **No** if not. Currently, the feedback option is available but does not trigger further actions after being logged.

2. Open the primary alert.
3. On the Alert form, click **Actions** > **Create Incident**.
   If your organization uses Security Incident Response, the button is **Create Security incident**.

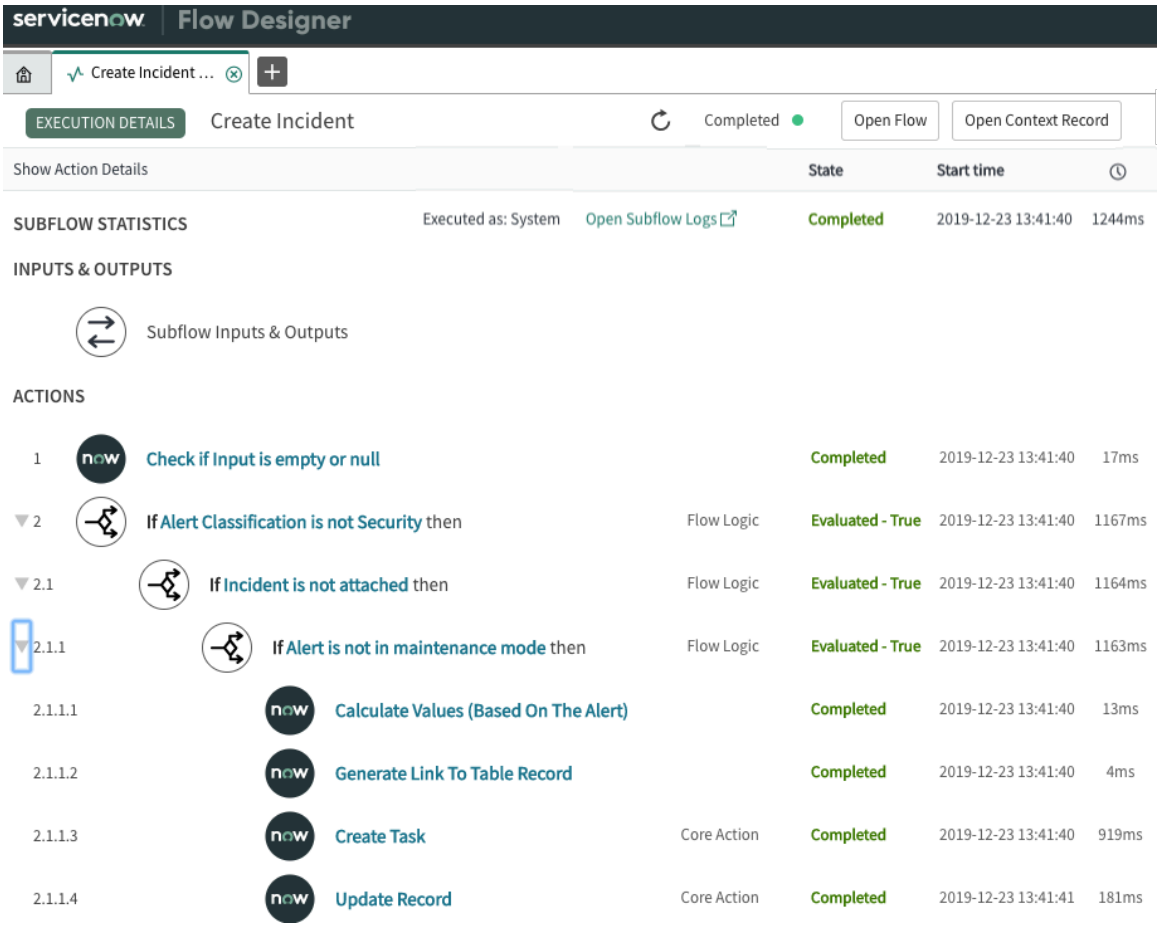
   The Flow Designer opens.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

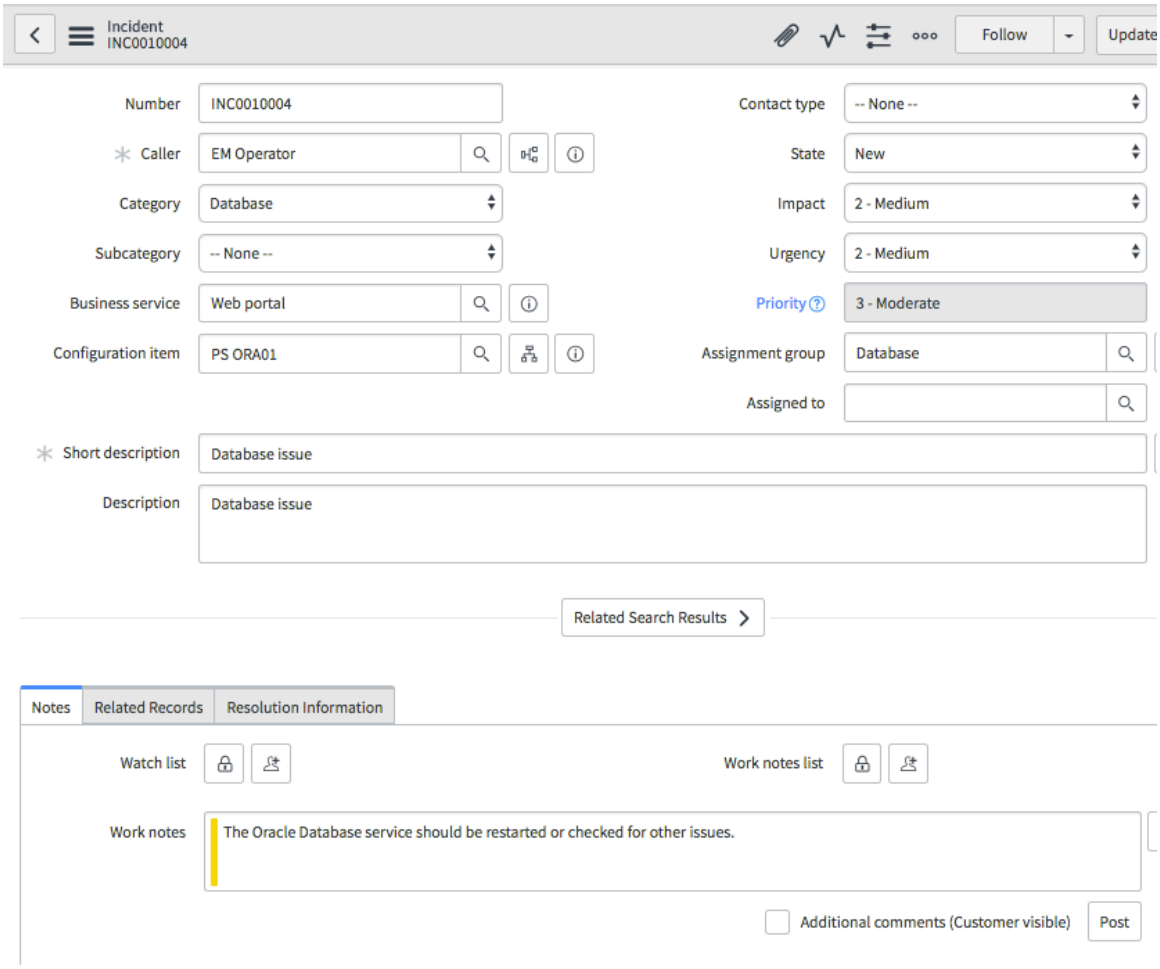
4. Click **Refresh**.

   The **Execution Details** page opens.



5. Click **Open Context Record** and then fill in the Incident form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

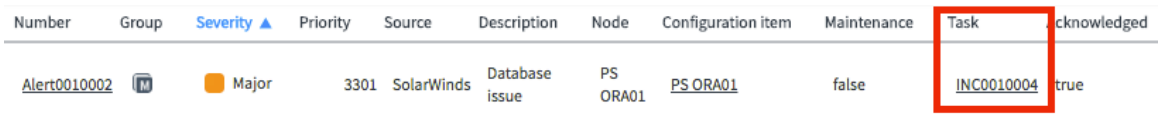


Field	Description
Caller	Click the lookup icon ( ) and then select your name. The caller is the person who discovered the issue that led to the incident.
Category and Subcategory	Select a category that best describes this alert. In this example, **Database** is the best choice.
Application service	Select the application service to which the CI belongs. In this example, the application service is **Web portal**.
Configuration item	If it is not already populated, select the CI. In this example, the Oracle database (**PS ORA01**) is automatically populated into the field.
Impact and Urgency	Select the impact and urgency levels that you think appropriate.
Assignment group Assigned to	Click the lookup icons ( ) for both or either of these fields, and then select the group or the individual that can handle the issue.

6. Click **Submit** to create the incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Alert you are working on reappears. On the Alert form, the incident is populated in the **Task** field. You can also see the incident number in the Task column on the Service Operations Workspace dashboard.



Number	Group	Severity ▲	Priority	Source	Description	Node	Configuration item	Maintenance	Task	cknowledged
Alert0010002		Major	3301	SolarWinds	Database issue	PS ORA01	PS ORA01	false	INC0010004	true

What to do next

There are other tasks you perform as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Run a remediation workflow on an alert

As an Event Management operator, you can also run a workflow on your ServiceNow instance that helps remediate the alert. For example, you might run a workflow that automatically restarts a server on your network, which might resolve an alert about CPU usage.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**
Phase 3	○	Close an alert

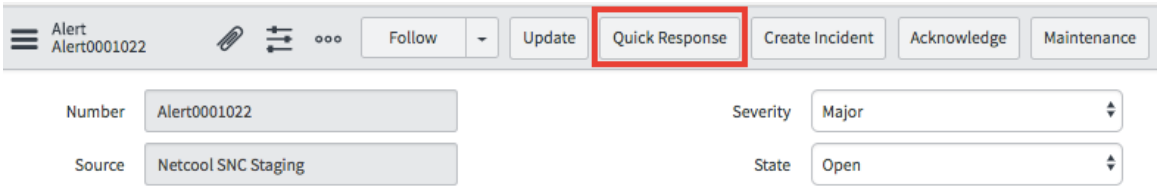
Note: You can run a remediation workflow if your administrator already set up workflows for you to choose from. You should be familiar with your organization's policies regarding triaging of alerts.

Role required: evt_mgmt_operator

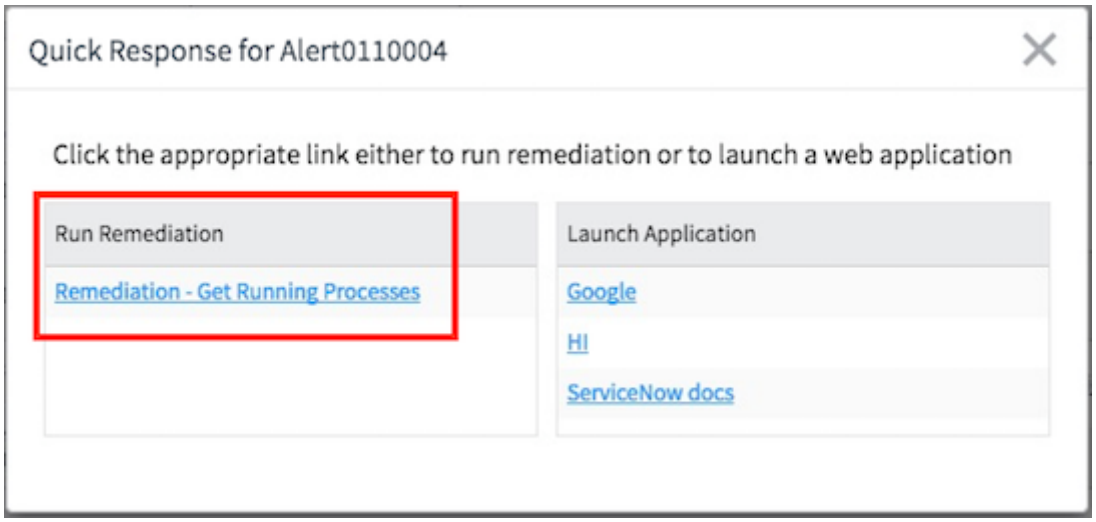
Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click **Quick Response**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. In the Quick Response window, click the name of the remediation under **Run Remediation**.



What to do next

There are also other tasks you can take as part of the triage stage:

- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Launch a web application from an alert

As an Event Management operator, you can also launch a web application from an alert. The web application might be a console for the event monitoring tool that your organization uses, or any external website that provides additional information you might need about the alert.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Phase 3	Close an alert

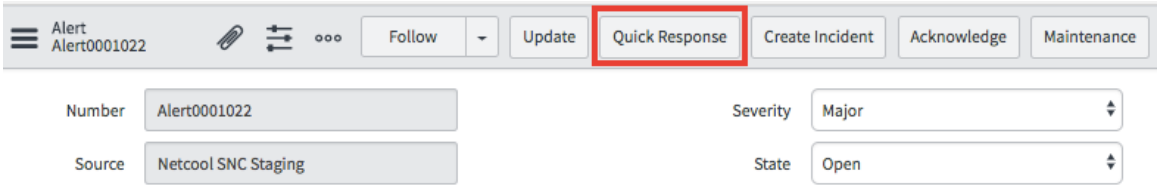
Role required: evt_mgmt_operator

You can launch a web application if your administrator has set up a link to the application. You should be familiar with your organization's policies on triaging alerts.

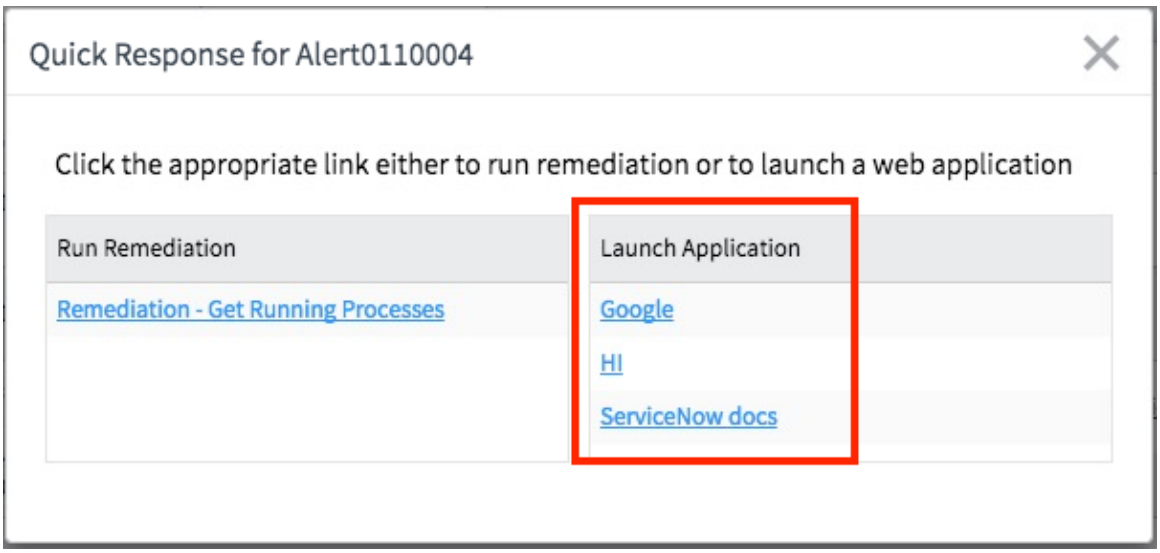
About this task

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click **Quick Response**.



3. In the Quick Response window, click the name of the application under **Launch Application**. Your administrator has specified which applications should appear in the list.



What to do next

There are also other tasks you can take as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Associate a knowledge base article with an alert

As an Event Management operator, you can associate a knowledge base (KB) article with the alert to capture additional information about the alert. This might include a procedure that someone has to follow to resolve the underlying issue on your network, or a best practice to prevent the issue from reoccurring.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

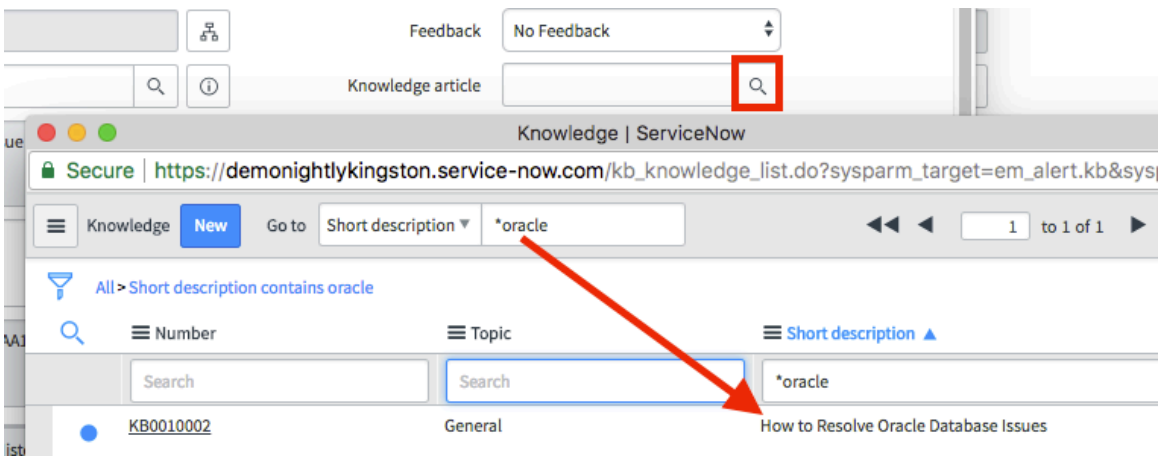
Phase 1		Analyze and acknowledge an alert
Phase 2		**Triage alerts**
Phase 3		Close an alert

This task assumes that your organization uses the Knowledge Base application in your ServiceNow instance.

Role required: evt_mgmt_operator

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click the lookup icon ( ) next to the **Knowledge article** field.
3. Filter the list of existing KB articles by first selecting a field, such as **Short Description**, and then entering related text into the search text field.
   You can use the `contains` (*) operator to search for articles that contain keywords. For example, entering `*oracle` in the short description filters the KB articles that contain the word `oracle` somewhere in the short description.



4. If you cannot find any related KB articles, you can click **New**, create a new one, and then click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The KB article number appears in the **Knowledge article** field on the Alert form.

5. Click **Update** on the Alert form to save the information.

What to do next

There are also other tasks you can take as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Put an alert into maintenance

As an Event Management operator, you can put an alert into maintenance if the alert does not require any further action, but you still want to keep the alert active. Putting the alert into maintenance hides it from the Service Operations Workspace dashboard so that other operators do not need to access it, but it does not close the alert.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**
Phase 3	○	Close an alert

Role required: evt_mgmt_operator

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. Select the **Maintenance** check box and click **Update**, or click the **Maintenance** button at the top of the list.
3. Click **Update**.
4. Navigate to **Event Management** > **Operators Workspace**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notice that alerts in maintenance are not visible in the list by default. The filter excludes alerts where `Maintenance | = | true`.

What to do next

If the issue that led to the alert still needs further attention later, navigate to **Event Management** > **All Alerts**, open the alert, and then clear the **Maintenance** check box and click **Update**. From there you can perform other triage actions.

There are other tasks you can take as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Operator phase 3: Close an alert

After you take action on an alert, you can verify several items on the alert and then close it.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	✓	Triage alerts
Phase 3	○	**Close an alert**

Role required: evt_mgmt_operator

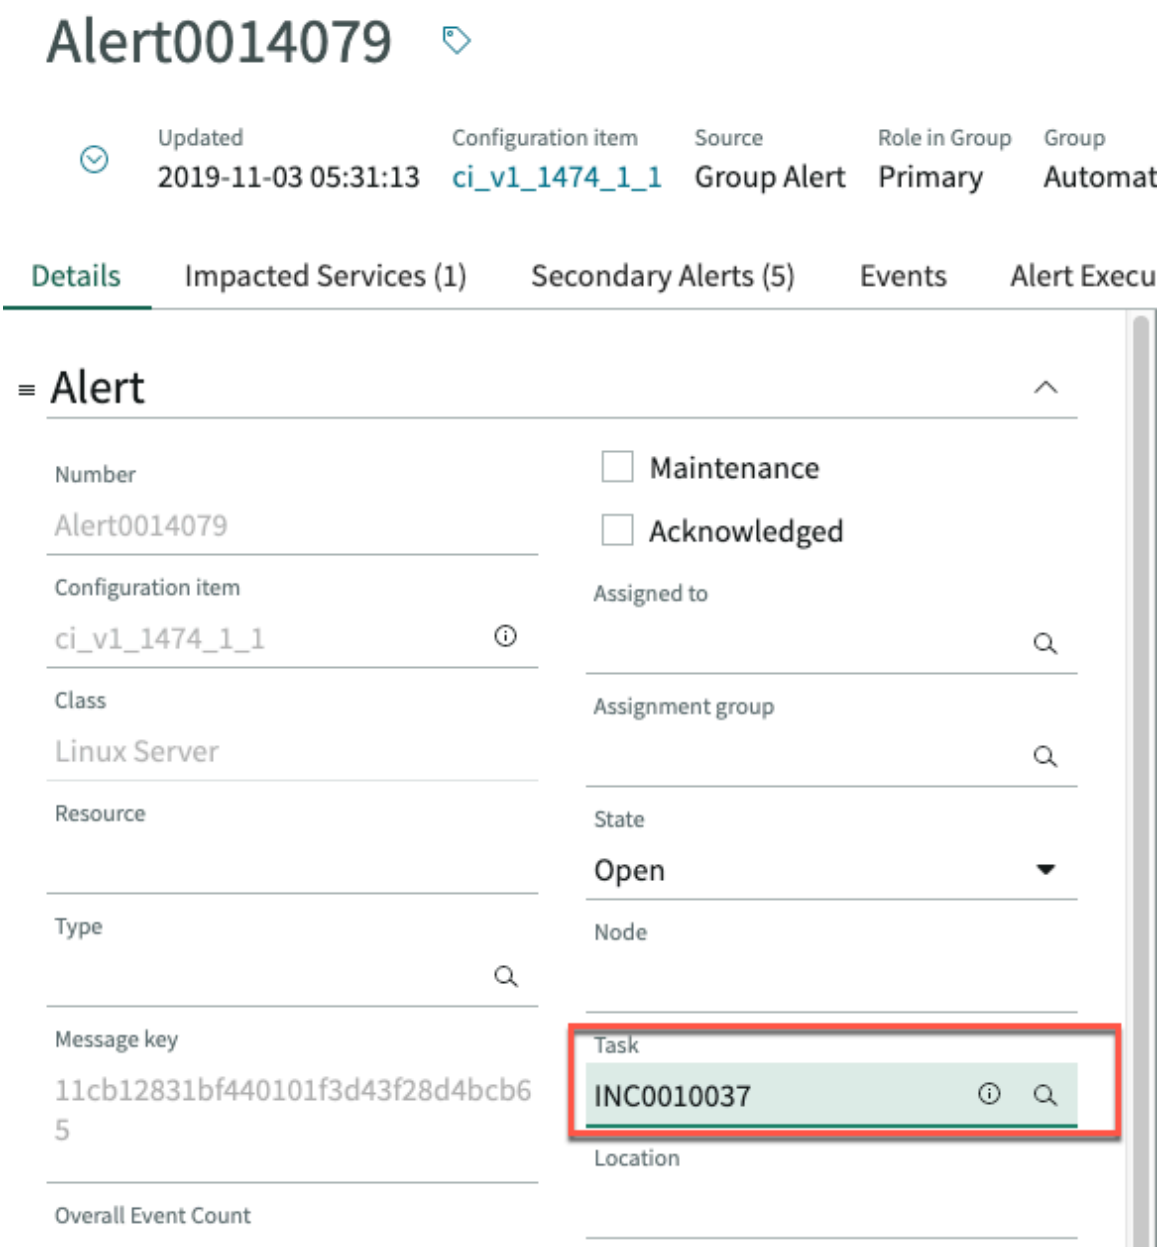
About this task

Procedure

1. Navigate to **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
2. Find the alert you want to close.
   If the alert does not appear in the list, for example because it is in maintenance, change the filter options as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

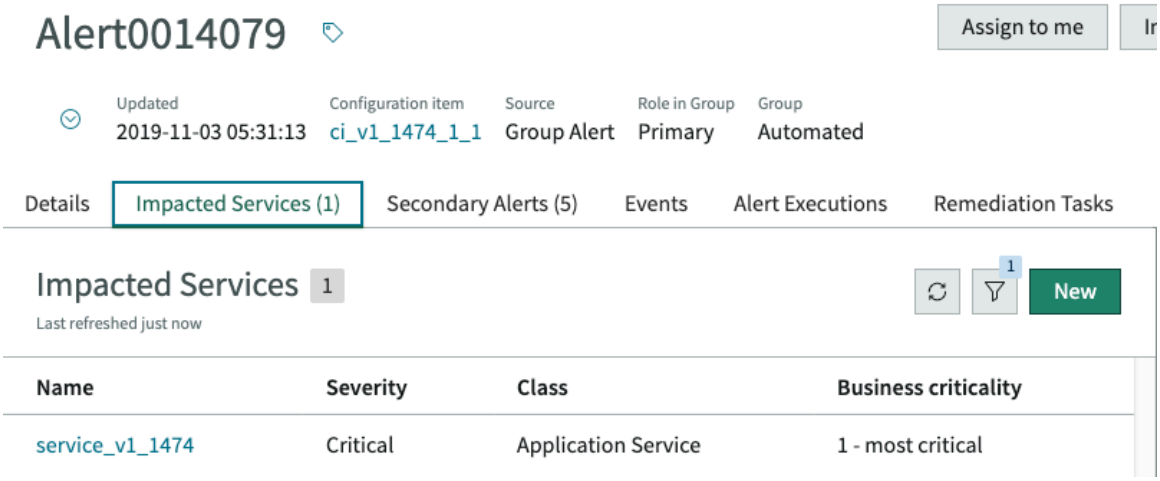
3. Click the alert number to open the Alert Details tab and review key information about the alert.



4. Review information about application services on the **Impacted Services** tab.

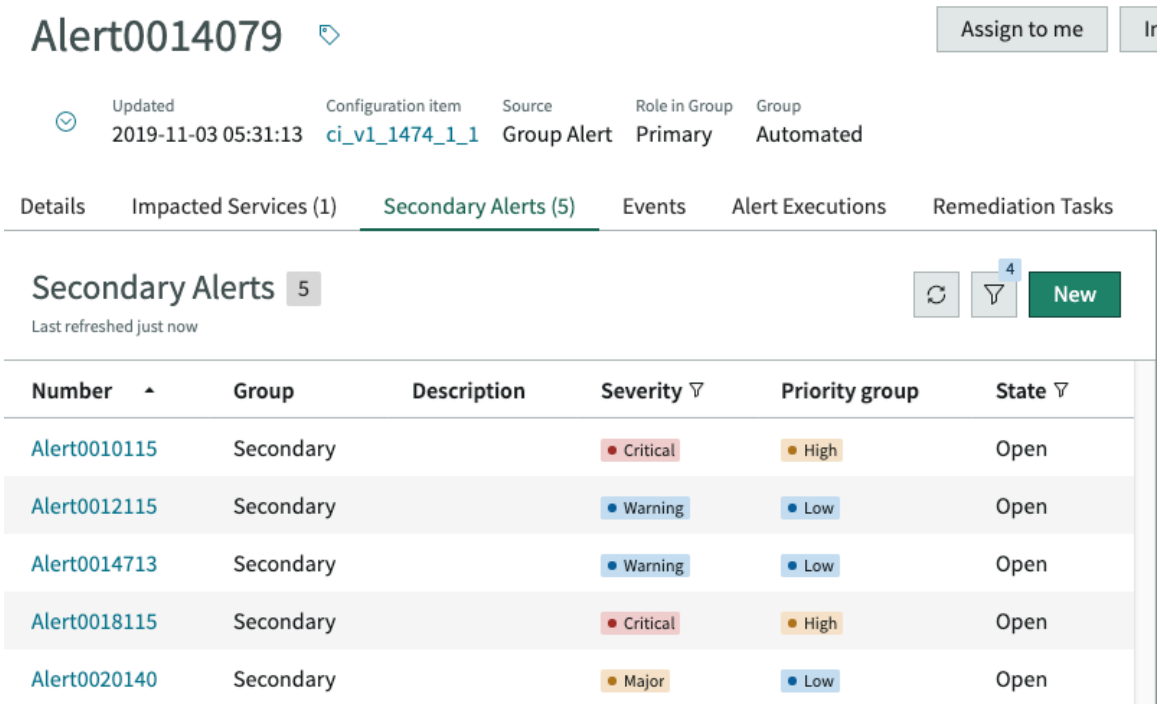
In this example, the service_1474 application service appears in the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you need more information about an application service and want to see the service map, click the service name and then click **Service Map**.

5. Look at the alerts related to this application service, and modify the correlation if necessary. The process for a primary alert differs from the process for a secondary alert.
   - On a primary alert, the secondary alerts that are correlated with the primary appear on the **Secondary Alerts** tab.



Typically, you do not have to do anything with the secondary alerts unless you want to add more secondary alerts or remove the correlation altogether.

Note: When you close a primary alert, the secondary alerts are also closed by default.

   - On a secondary alert:

     The alert number of the primary alert appears in the **Parent** field. You do not have to do anything with the parent alert, unless you want to re-correlate this secondary alert with another primary alert, or remove the correlation altogether by clearing the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When you close a secondary alert, the primary alert is not closed. You must close the primary alert separately.

6. When you are sure the underlying issue causing the event and corresponding alert has been rectified, click **Close**.
   If you think that the alert needs attention, do not close it. Instead, put it into maintenance by selecting the **Maintenance** checkbox.

What to do next

You are finished with the Event Management Operator tutorial, which covers a basic workflow of analyzing alerts, triaging them, and closing them out.

After you close an alert, you might need to follow up on these items:

Reopen an alert

If you think an alert requires further action, you can manually change its state to **Reopen**. When an alert reopens, any associated incidents can also be updated or reopened according to the incident state and the rules that your administrator configured.

Note: Any time you reopen an alert, always go through the triage and close phases again.

Work with alerts in the flapping state

In some cases, the same event that created the alert you just closed could be triggered again, even repeatedly, in a short amount of time. If this occurs, the **State** of the alert that you just closed changes to **Reopen**, and eventually to **Flapping** depending on settings that your administrator configures.

See Handle alerts in the flapping state for more information on what to look for.

For a summary of other tasks that you might need to perform at some time, see Advanced tasks for the Event Management operator.

Advanced tasks for the Event Management operator

As an Event Management operator, you might need to perform additional tasks that are outside of your typical workflow, or tasks that you need to perform only once.

Advanced task	Description
Customize your alert list view	Get to the alerts you need to analyze as soon as possible.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced task	Description
Work with flapping alerts	If an alert is in the flapping state, it means that the underlying issue keep reoccurring. You should triage the alert again and look for another solution.
Handle alerts while CIs are in maintenance	Learn how to handle alerts on a CI that is in the maintenance state, which means it is undergoing some type of change.
Adjust alert impact while triaging an alert	You can change impact rules, which affects how alert impact is calculated and alert severity.

Customize your alert list view

You can create one or more customized alert list views that show only the information pertinent to you. For example, you might want to focus only on the alerts for application services in a specific location, or only the alerts for application services of high criticality.

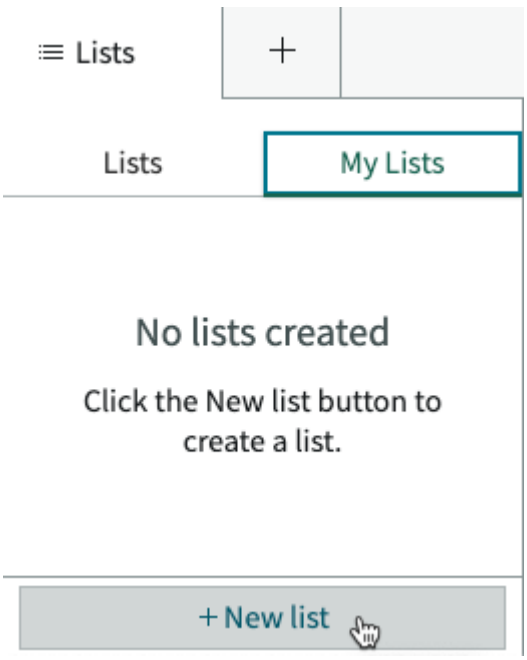
Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

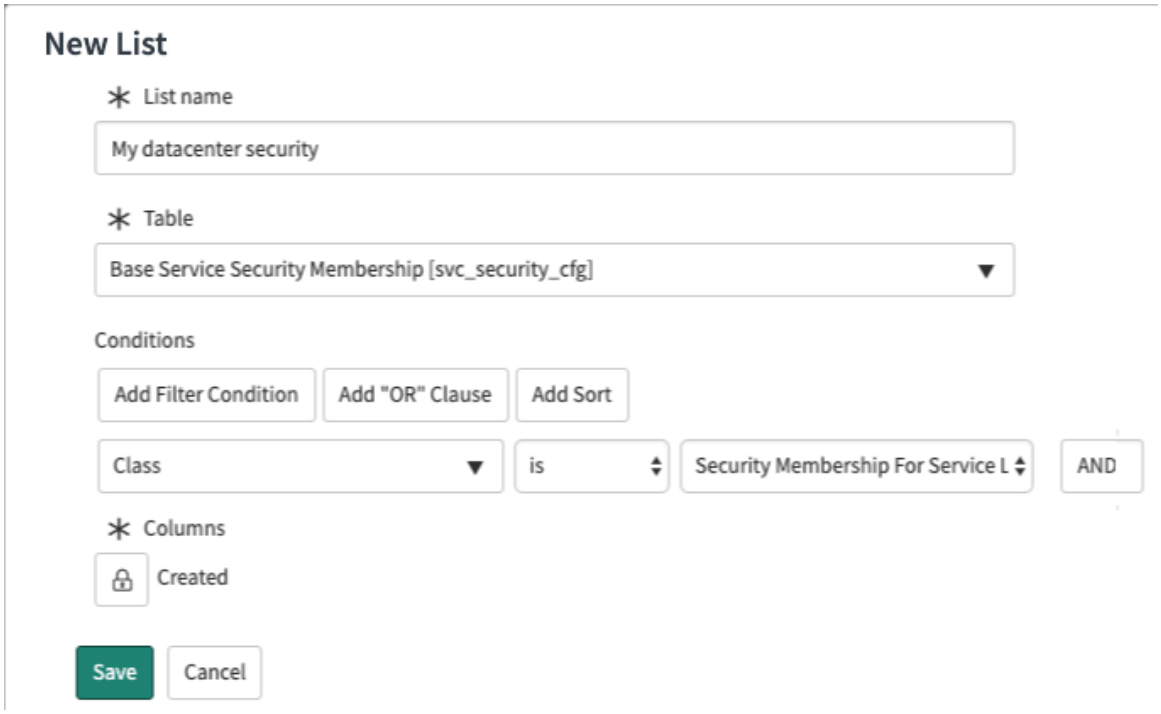
Procedure

1. Navigate to **Event Management** > **Operators Workspace**.
2. On the **Lists** tab, click **My Lists**.



3. Click **+ New list**, fill in the form with name and filter conditions, and then click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The list appears on the **My Lists** tab.

Note: The list applies only to application services, and not to application service groups. The groups appear whether or not they match the filter, and whether or not they contain any services that match the filter.

Work with flapping alerts

If an alert is in the flapping state, you might need to triage the alert again.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

About this task

If an event repeatedly triggers the same alert in a short amount of time, the alert is put into the flapping state, even if an operator closed it previously. The event can also be fluctuating between severity levels, such as Info and Critical. You should triage the alert again, and take action to try to prevent the event from reoccurring.

Note: Your Event Management administrator can configure several settings that determine when to mark an alert as flapping, and other settings that determine what action you can take. This topic covers a generic example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Find alerts in the flapping state:
   a. Navigate to **Event Management** > **Operators Workspace**.
   b. Modify the list of alerts by clicking the filter icon ( ) and specifying criteria to find flapping alerts.
   Click **Advanced view** to modify filter settings. For example, you can specify:
   `State|is|Flapping`.
2. Click the alert number to open it.
3. On the alert, click the **Flapping** tab and review the information:

Field	Description
Flap count	The number of times the alert started flapping since the time in the **Flap start window** field.
Flap start window	The time that flapping started.
Flap last update time	The last time flapping occurred. This time is the instance processing time, not the source system time.
Flap last state	The state of the alert before it entered the flapping state.

4. Decide which action to take based on how often flapping has occurred.
   You can do any of the following, depending on what your organization's standard operating procedures are and what your Event Management administrator configured:
   - Run a remediation workflow that might do something like reboot a server or reset a router.
   - Access a web application, like the application for your event monitoring software on your network.
   - Modify an associated incident or a KB article to include additional information or steps.
5. After you are certain that the underlying issue is addressed, close the alert.

Handle alerts while CIs are in maintenance

When an alert occurs on a CI that is in the maintenance state, the alert state is also changed to maintenance. You should find and monitor the states of these alerts. Later, when changes on the CI are complete, finish triaging the alert and close it.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Before completing this task, familiarize yourself with basic form configuration in an instance. You might need to add fields and related lists to forms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The example in this topic assumes that a network administrator opened a change request to reconfigure a problematic web server.

Role required: evt_mgmt_operator

Procedure

1. Find alerts in maintenance:

   a. Navigate to **Event Management** > **Operators Workspace**.

   b. Click the filter icon ( ) and in the Filter box, click **Advanced view** and specify:

   `State|is|Maintenance`.

2. In the list of alerts, find an alert with a value in the **Configuration Item** column.
   This is the CI on which the alert occurred.
3. Click the CI name to open the form that displays information about the CI.

   In this example, the status of the web server is **In Maintenance** and there is a change request scheduled so that someone can reconfigure it.

4. Click the CI name to open the form that displays information about the CI.

   In this example, the status of the server (on the **Details** tab) is **In Maintenance**. You can view the scheduled change request on the **Change Requests** tab (someone will reconfigure the CI).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. At this point, you should not modify the alert associated with this CI.
   You can open the change request to see if a schedule is attached, or coordinate with your team to find out when the CI will no longer be in maintenance.
6. After you verify that the **Status** field on the CI is not **In Maintenance**, open the alert again and clear the **Maintenance** check box.
7. Continue to triage the alert.

Adjust alert impact while triaging an alert

As an Event Management operator, you might need to modify the impact that an alert has on an application service and on the CIs in a service. Do this when you think that the impact does not accurately represent what you see in your network environment so other operators and administrators see the correct impact information.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

About this task

Before you make any modifications to impact calculations, make sure that you understand how the application services and the CIs actually function. You might need to perform tests on network infrastructure or contact someone who can.

Procedure

1. Navigate to **Event Management** > **Operators Workspace**.
2. Double click the name of the application service that has the alerts you want to modify.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Details tab, click **Service Map**.
4. On the **Service Map** tab, click **Full Map** Tree.
5. On the map, click **Impact Tree**.
6. Analyze the application service to see whether the impact tree accurately reflects the impact of the alerts based on what you know about the CIs involved.

   In this example, a critical alert indicates a serious issue with a Linux server that is part of a Web portal application service.

   Notice that the impact on the Web portal itself is red, meaning critical, even though only one of the Linux servers that it relies upon actually has a critical alert. The other Linux Server does is not impacted by the alert. Assume for this example that the Linux servers perform different roles for the web service, and that even though **PS LinuxApp02** has a critical alert, the **PS LinuxApp01** server can adequately provide all the necessary services to keep the application service operational.

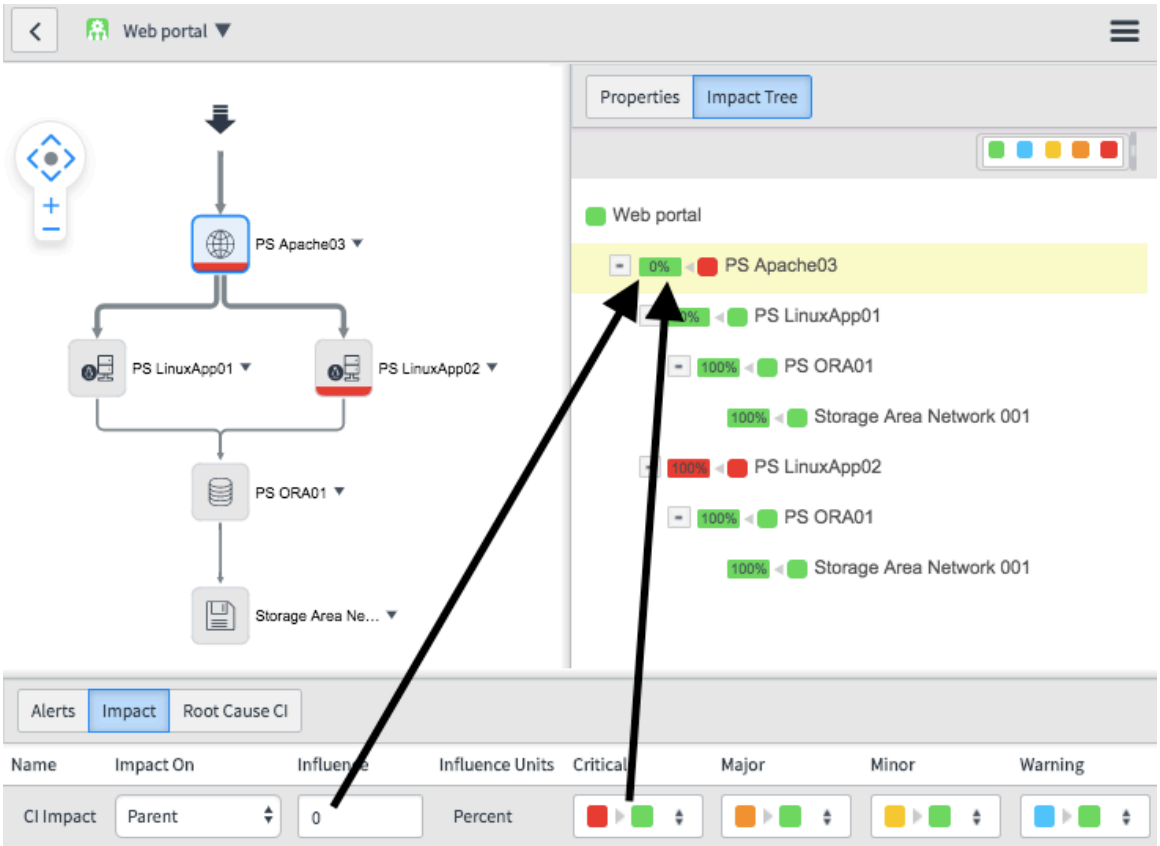
7. Click the **PS Apache03** CI, and then click **Impact** to display the impact rules for the CI. By default, the CI impact rule appears, showing you this information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Impact On** and **Influence** columns show you that the CI (**PS Apache03**) should inherit 100% of the impact of all child CI impacts, which in this case includes the critical impact on the **PS LinuxApp02** server. This setting is why the **PS Apache03** web server, and the application service as a whole, inherits the impact 100%.
- The **Critical** column shows you that a critical alert (red) is inherited as critical alert (red).

8. Change the **Influence** value to 0 since the web server is still operational, and then change the **Critical** column to indicate that a critical impact status (red) should be inherited as a non-impact (green).
9. Wait for the dashboard to update automatically, or click **Event Management** > **Service Operations Workspace** and double-click the same application service to get an updated application service map.

   Notice that the influence on the Apache web server is 0% and the impact status is green. Also notice that the critical alert status (red) remains unchanged, even though the impact changed to green.



10. Navigate back to the Service Operations Workspace dashboard.
    Notice that the application service is now green, indicating that the overall application service is operational. The critical alert still displays at the bottom in the Alerts list, indicating that there is still an issue that you or other operators can address.

What to do next

Your administrator might configure additional impact rules that display when you click a CI in the application service map. You can make adjustments to the **Influence** fields on any impact rule to get the most accurate impact tree.

Event Management reference

Reference topics provide additional information about mapping and fine-tuning application services using Event Management lists and forms.

Components installed with Event Management

Activating the Event Management (com.glideapp.itom.snac) plugin adds several roles, scheduled jobs, and tables.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed with Event Management

Roles used by the Event Management application.

Event Management adds these roles.

Role title [name]	Description	Contains roles
Event Management Administrator [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Event Management. **Note:** Exercise caution with the evt_mgmt_admin role, as it can be elevated to the admin role. A user with the evt_mgmt_admin role has the ability to add and modify scripts that run on a global scope. Ensure proper access control. With this role, the user can create and/or update the following scripts: • Alert correlation rules • Alert management rules • Maintenance rules • Advanced scripts • Event field mapping • Pre- and post-binding scripts	• evt_mgmt_user • template_editor_global
Event Management Operator [evt_mgmt_operator]	In addition to the evt_mgmt_user permissions, can also activate operations on alerts such as acknowledge, close, open incident, and run remediations.	evt_mgmt_user
Event Management User [evt_mgmt_user]	Has read access to all Event Management features. Has the itil role to be able to manage incidents that are created from alerts.	itil
Event Management Integrator	Has create access to the Event [em_event] and Registered Nodes	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
[evt_mgmt_integration]	[em_registered_nodes] tables to integrate with external event sources.	

Scheduled jobs installed with Event Management

List of scheduled jobs that are provided with Event Management.

To review the list of scheduled jobs, navigate to **System Scheduler** > **Scheduled Jobs**. Event Management adds the following scheduled jobs.

Scheduled job	Description
Event Management — Connector execution job	Compares current time with time when active connector instances were last run and sets relevant connectors to execute. Runs every 10 seconds.
Event Management — Handle Impact Stuck Service	Releases stuck services and marks them as requiring rebuilding in the Impact Changes table to rebuild the impact tree. Runs every 2 minutes, 31 seconds.
Event Management — Impact Calculator Trigger	Trigger the impact calculation. The Event Management dashboard and impact tree are refreshed using the calculated figures. Runs every 6 seconds.
Event Management — Impact Topology Consumer	Consumes topology changes and marks the related services as 'require rebuilding' in the Impact Changes table to rebuild their impact trees. Runs every 19 seconds.
Event Management — Update stuck connectors	Release connector instances that are stuck. Runs every 2 minutes.
Event Management — Alert Priority Queue	Calculate alert priority. Two Alert Priority Queue jobs are active and available and can be run multi-thread. Runs every minute.
Event Management — Auto Close Alerts	Alerts that are idle longer than 7 days (default time period) are closed. Modify the default using the `evt_mgmt.alert_auto_close_interval` property. Runs every 10 minutes.
Event Management — Calculate Alert Priority Grouping	Runs and calculates the priority groups: urgent, high, moderate and low for the alerts

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
	according to the highest and lowest priority score in the system. Runs every 30 minutes.
Event Management — Close Flapping Alerts	Close flapping alerts. Runs every 5 minutes.
Event Management — Close Threshold Alerts	Close threshold alerts. Runs every 2 minutes.
Event Management — Evaluate Scoped Alert Rules Management0	Execute alert management rules. Two separate jobs run to ease the load on the system. Runs every 11 seconds.
Event Management — Evaluate Scoped Alert Rules Management1	
Event Management — Filter Services for Impact - Queue Handler	Process changes from em_impact_inclusion_class and em_impact_filter_service. Runs every minute.
Event Management — Impact Tree Builder	Handles all services with changes from the em_impact_changes table and rebuilds their impact trees. Runs every 11 seconds.
Event Management — Insert Health Monitor	Job to produce the **ServiceNow Event Management** application services. Runs once every hour.
Event Management — Maintenance Calculator	Calculate the maintenance for CIs. Runs every minute.
Event Management — Node Count	Calculate license usage. Runs once every hour.
Event Management — Populate Impacted Services Table	Scan cmdb_ci_service_auto and copy all services to em_impacted_service, along with all related classes to em_impact_inclusion_class. Runs once after upgrade.
Event Management — Process Events	Job that runs and processes each Ready event (apply event rule, mapping rule, and create or update alert) Runs every 5 seconds.
Event Management — Process Metric Binding	Process metric binding.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
	Runs every 5 seconds.
Event Management — Process Records in em_extra_data_json	Creates events for log analytics anomalies. Runs every 13 seconds.
Event Management — Queue Connector Processor	Bi-directional functionality. Processes all pending alerts in the Update Queue and sends them to the MID Server. By default, this dequeue process is performed in batches of 1,000 alerts. Runs every 30 seconds.
Event Management — Recalculate Impact for Groups	By default, this job is not active. Can be run on demand to correct the impact on service groups. Runs on demand.
Event Management — Recover Stuck Events	Handle all events that are in queued state and switch back to Ready to handle events from the beginning. Runs at system startup.
Event Management — Update Health Monitor	Update the **ServiceNow Event Management** application services. Runs once every hour.
Event Management — Update SLA Configuration Result	Synchronizes the CIs that match the SLA configuration filter with the Event Management SLA [em_ci_severity_task] table. Runs every 10 minutes.
Event Management — Update SLA Severity	Updates Event Management SLA [em_ci_severity_task] table with the new severity. Runs once every minute.
Event Management — Convert IT Service	Run this property on demand to convert manual services to application services. Runs every 30 minutes.
Event Management — Collect xmlstats	Collect event processing statistics. Runs once every minute.
Event Management — Impact Calculator for Alert Groups and SLA	Calculates the effect of alerts on alert group services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
Event Management — Manual Impact Calculator Trigger	Manually trigger of Impact Calculation on all operational Services.
4x Event Management — Impact Calculator for BS_0	Calculates the impact of alerts on application services, and builds the impact tree on the Event Management dashboard. Four separate jobs run to ease the load on the system.
4x Event Management — Impact Calculator for BS_1	
4x Event Management — Impact Calculator for BS_2	
4x Event Management — Impact Calculator for BS_3	
Event Management — Backfill Alert History table	Locates redundant records in the em_alert_history table and cancels them.
Event Management — Backfill Impact Status table	Locates redundant records in the em_impact_status table and cancels them.
Event Management — Impact for Groups	Calculates the impact of alerts on service groups.
Event Management — Clean Alert History Table	Cleans the Alert History (em_alert_history) table by removing records more than 90 days old. You can customize the amount of time after which alerts are removed by configuring *evt_mgmt.impact_calculation.cleanup_age_sec* in the sys_properties.list table.
Event Management — Clean Impact Status Table	Cleans the Impact Status (em_impact_status) table by removing records more than 90 days old. You can customize the amount of time after which alerts are removed by configuring *evt_mgmt.impact_calculation.cleanup_age_sec* in the sys_properties.list table.

Event Management adds the following scheduled jobs to support alert aggregation and RCA.

Name	Description
Service Analytics Purge Old Observation Data — Daily	Cleans the staging data.
Service Analytics Prepare RCA Learner Input Data — Daily	Prepares RCA input data. Stores and probes MID Server to learn statistical information about alerts.
Service Analytics group alerts using RCA/Alert Aggregation	Applies RCA and alert aggregation to open alerts and prepares automated alert groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Service Analytics Alert Aggregation Learner — Daily	Learns information about existing alerts and groups new open alerts.
Service Analytics RCA Configuration	Configures root cause analysis.
Service Analytics Check File System Space on Analytics MID — Daily	Checks disk usage on the dedicated MID Server, and generates an event if it exceeds the threshold set in the *sa_analytics.rca.mid_max_allowed_space* property.
Service Analytics Gather Value Report Data — Daily	Gathers data for the Value Report.
Service Analytics — Update virtual alerts for aggregation groups	Update the virtual alerts that were created to represent alert aggregation groups, with any changes to alerts belonging to that group. Runs every minute.
Service Analytics Attribute Populator for Historical Alerts	Populate attributes used in feature identifier for historical alert data using event rules. Runs on demand.
Event Management - Analytics Alert Syncer	Gathers alert data that is used by grouping job.

Properties for personalizing domain separation for Event Management connectors

Properties provide the metadata to identify the domain.

You can change the values if you want to use any other table or fields for domain identification but make sure that the table is domain separated.

Note: When personalizing domain separation for event management connectors, all the properties can be overridden at the connector level as well.

There are three caches maintained for personalizing domain separation (main, user_access, missing_domain). You can create a few system properties to control them.

Default System Properties

Property	Description
evt_mgmt. connector_domain_info_table_name	The table where you store domain information for personalizing domain separation. • **Type**: string • **Default value**: core_company
evt_mgmt. connector_domain_info_column_name	The field name in the table to identify the provided domain for personalizing domain separation. • **Type**: string • **Default value**: name
evt_mgmt. connector_domain_id_column_name	The field to get domain ID from for personalizing domain separation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default System Properties (continued)

Property	Description
	• **Type**: string • **Default value**: sys_domain
evt_mgmt. connector_domain_path_column_name	The field to get the domain path from for personalizing domain separation. • **Type**: string • **Default value**: sys_domain_path

Property	Description
evt_mgmt.connector_custom_domain_sep_cache_expire_in_seconds	For personalizing domain separation, if you don't want your main cache to expire every week.
evt_mgmt.connector_custom_domain_sep_user_access_on_domain_cache_size	For personalizing domain separation, if you want to increase the size of the user access cache.
evt_mgmt.connector_custom_domain_sep_missing_domain_cache_expire_in_seconds	For personalizing domain separation, if you want to increase the expire time for cache storing information regarding the missing domain.
evt_mgmt.connector_custom_domain_sep_cache_size	For personalizing domain separation, if you need more main

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	cache size for storing domain information.

Tables installed with Event Management

Tables that are provided when Event Management is activated.

Event Management adds these tables.

Table	Description
Alert [em_alert]	Alerts that Event Management manage.
Alert Correlation Rule [em_alert_correlation_rule]	Rules specifying primary and secondary correlated alerts.
Alert Aggregation Group Alerts [em_agg_group_alert]	Stores alerts associated with aggregated alert groups.
Alert Aggregation Group [em_agg_group]	Relationships between aggregated groups and primary alerts.
Alerts History [em_alert_history]	History of alerts. Used for impact calculation.
Alert Rule [em_alert_rule]	Mappings of alert fields to the Incident [incident] table.
Alert Template [em_alert_template]	Alert templates. This table extends the Template [sys_template] table.
Event Management SLA [em_ci_severity_task]	Event Management SLA tasks for CIs and services.
Connector Definition [em_connector_definition]	Settings for gathering events from external event sources.
Connector Instance [em_connector_instance]	Connection details for external event sources.
MID Server to Connector Instance [em_connector_instance_to_mid]	Mappings of MID Servers to connector instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Event Management License Usage [em_unique_nodes]	When events are received by ITOM AIOps, an entry is added or updated in this table based on the monitored target specified in the received message. The entry links to its corresponding CMDB CI. If none is found, the entry is assigned *Type = Unknown*.
Event [em_event]	Events received by Event Management.
Event Filter [em_event_filter]	Storage for defined event filters.
Event Match Rule [em_match_rule]	Updated events for alert processing. Used by event rules.
Event Match Field [em_match_field]	Mappings of event fields to alert fields. Simple mapping. Used by Event Rules.
Event Compose Field [em_compose_field]	Mappings of event fields to alert fields. Composite mapping. Used by Event Rules.
Event Mapping Rule [em_mapping_rule]	Updated event fields for alert processing.
Event Processing Statistics [em_event_stats]	Statistics on Event Management performance.
Event Type [em_event_type]	Event types.
Task Template [em_incident_template]	Templates that define how to populate new tasks. For example, how fields of an incident that is being created from an alert, must be populated. This table extends the Template [sys_template] table.
Registered Nodes [em_registered_nodes]	Registered nodes data.
Threshold Rule [em_threshold_rule]	Alert threshold rules.
Binding Device Map [Em_binding_device_map]	Event binding to network paths and storage paths.
Process to CI Type Mappings [Em_binding_process_map]	Event binding to specific processes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
CI Remediation [em_ci_remediation]	Remediation rule definitions.
Impact Graph [em_impact_graph]	Impact tree of CIs containing CI hierarchy and impact rules to be used for impact calculation.
Impact Graph History [em_impact_graph_history]	History of changes in impact tree.
Impact Rule Definitions [em_impact_rule_definition]	Definition of rules used for impact calculation.
Impact Rule instance [em_impact_rule]	Rules based on impact rule definitions.
Infrastructure Relations [em_impact_infra_rel_def]	Child-parent pairs or CI types. CIs matching these definitions are added to impact trees.
Impact Maintenance CIs [em_impact_maint_ci]	CIs that are in maintenance and therefore are excluded from impact calculation.
Impact Status [em_impact_status]	Calculated status of CIs and services to be displayed in the dashboard and service maps for dynamic CI groups.
SLA Configuration [em_sla_configuration]	SLA configuration records that identify the CIs that SLAs can run on.
Service Analytics Metric Type Registration [sa_metric_registration]	Source registration details for processing raw data.
Health monitor scripts [em_monitor_scripts]	These scripts determine how to monitor or check, for example, when using the Connectors Monitor script. You can create customized script to monitor a device or an entity. The scripts provided with the base instance are: • Check delay in event processing • Connectors Monitor • Get Event Processing state • MID Server Threshold Alerts
Monitoring configuration [em_monitor_conf]	Use this table to configure what to monitor according to the scripts that are listed. Configure how often to run each script. If a script has a threshold, it determines what alert severity to display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
	Threshold values are in units of minutes and specify the delay time. Navigate to **Event Management** > **Settings** > **Self-Health configuration** to see the list of Monitoring Configurations or to create a new one. Use this script to test Data Center Monitoring. The scripts provided with the base instance are: • Connector's idle state monitoring-monitor to verify whether any of the connectors was in idle state that surpassed the threshold [in minutes] that was configured. • Connectors Status- monitor to track the active status of the connectors. • Delay in event processing-monitor to track the duration [in minutes] of events that remained in 'ready' state and were not processed. • Event Processing job-monitors the state of the event processing jobs. • MID Server Threshold Alert-monitors MID Server health.
Monitoring Event Management Jobs [em_monitor_jobs_state]	Monitor Event Management jobs by adding the relevant jobs to the table. **Note:** The following jobs are not monitored by this table: • Event Management - Process Events • Event Management - Impact Tree Builder • Event Management - Recover Stuck Events • Event Processing
Monitoring state [em_monitor_state]	Use this table to set the threshold for each connector. When there is a value above the threshold, an alert is generated.
EM XMLStats Data [em_xmlstats_data]	Self-health statistics and diagnostic details for Metric Intelligence and Event Management, which are used to produce the XMLStats page.

Event Management adds the following tables to support alert aggregation and RCA.

Table	Description
SA RCA Status [sa_rca_status]	Information (such as IDs) for the latest messages that were sent to the ECC Queue for a service during RCA.
SA RCA Output [sa_rca_output]	RCA learner output data.
SA RCA Group	Automated alert groups for the RCA query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[sa_rca_group]	
SA Analytics Alert Staging [sa_analytics_alert]	Staging table for alerts used for analytics.
SA RCA Input [sa_rca_input]	Input data for the RCA learner.
SA Analytics Status [sa_analytics_status]	Last run information to be used for alert aggregation and RCA.
SA RCA Group Alert [sa_rca_group_alert]	Alerts associated with automated alert groups.
SA RCA Service Configuration Item Association [sa_rca_svc_ci_assoc]	Associations between CIs and services.
SA Alert Aggregation Learned Pattern [sa_agg_pattern]	Learned patterns from alert aggregation.
SA Alert Aggregation Learned Pattern Elements [sa_agg_pattern_element]	CI/Metric Name pairs associated with learned patterns.
SA Alert Aggregation Query Group Patterns [sa_agg_group_pattern]	Relationships between groups discovered in alert aggregation queries and patterns found in learning.
SA Alert Aggregation Query -- Staged (Recent) Alerts [sa_agg_group_alert_staging]	A staging table for alerts that have not yet been associated with any aggregated alert group.
SA Agg Pattern Attribute [sa_agg_pattern_attribute table]	CI/alert attributes to be used for finding patterns for alert aggregation.
SA Alert Attribute Populator Status [sa_alert_attribute_populator_status table]	State and statistics for attribute populator job.
SA Alert Aggregation Learned Pattern Elements Pair wise Mutual Information and Joint Probability [sa_agg_pattern_element_pair]	Pairwise probabilities for pattern elements.
EM Agg Group Prediction	Alert predictions for alert groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[em_agg_group_prediction]	

Event Management Platform Analytics Solutions

Platform Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Platform Analytics Solutions

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

To enable the solution for Event Management, an admin can navigate to **Performance Analytics** > **Guided Setup**. Click **Get Started** then scroll to the section for Event Management. The guided setup takes you through the entire setup and configuration process.

Related topics

Platform Analytics Solutions

Activate your Performance Analytics subscription

Customize Performance Analytics widgets

Customize the appearance of widgets when viewing Performance Analytics visualizations.

Before you begin
Role required: user

Procedure

1. Navigate to **All** > **Performance Analytics** > **Dashboards**.
2. On the **Dashboards** page, select a dashboard to view.
3. Select the Sharing icon ( ) on the top right corner of the page.
4. Move to the top section of the relevant widget and select the Edit Widget icon ( ).
5. In the Edit Widget dialog box, configure the options.
   For details, see Performance Analytics Edit Widget dialog box.
6. Select **Done** in the Edit Widget dialog box.

What to do next
Users with the admin role can customize colors and fonts.

- For more information on customizing colors, see Performance Analytics widgets.
- To customize fonts, navigate to **sys_ux_theme_property.list** and edit the applicable fonts.

Machine learning solutions for Event Management

Build solutions for Event Management with Predictive Intelligence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Solution definition

Solution Definition for Event Management

Solution Definition	Description
Closed alert similarity	Closed alert similarity is a similarity solution definition that is used to recommend similar Alert records based on these fields: Description, Node, Resource, CI Type,Source, and Metric Name from the Alert [em_alert] table. Results are visible to users on the Alert form and on the Similar Alerts tab in Workspace.
EM Alert Clustering Solution	EM Alert Clustering Solution is a clustering solution definition used in Event Management. Allows building clustering models enabling identification of common text patterns in alerts to create alert groups. Text clusters are based on these fields: Description, Metric Name, Configuration Item Class from the Alert [em_alert] table.

Performance Analytics Edit Widget dialog box

Fields in the dialog box for editing a Performance Analytics dashboard widget.

Section	Description
Show real-time updates	Select for updates to appear in the widget in real-time.
Show	Select or clear the boxes to show or hide the following on the widget: • Border • Header • Title
Title alignment	Select the alignment of the widget title: • Left • Center • Right
Title color	Select to configure the color of the widget title.
Header color	Select to configure the color of the widget header.
Interactivity	Select from the displayed options. • Follow interactive filter • Show when following filter

Event Management MID Web Server extension form

Fields in the form for creating or modifying a MID Web Server extension.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Web Server Context form

Field	Description
Name	Unique name for the extension for easy identification.
Short description	Brief, meaningful description of the extension.
Status	This field is auto-populated with the status of the extension. The field is blank until the extension is started. After issuing a command to the extension, one of the following values is displayed: • Started: The extension is running. • Stopped: The extension is not running. • Offline: The MID Server is down. • Error: The extension failed with an error. The error message is displayed in the **Error Message** field. • Warning: A run-time exception has occurred. The extension continues to work.
HTTP/HTTPS Port	Port number the extension listens on for incoming requests.
Authentication Type	The available authentication types are: • **API Key** (default): Any client connecting to the extension must enter an API key into the request's authorization header. For details on viewing existing API keys, see Configure MID Web Server API key authentication. • **Keybased** (deprecated and kept only for compatibility with releases prior to the Yokohama release): The value in the **Secret Key** field is used to generate an authentication token sent in the **Authorization** header of incoming client requests. For details, see Configure key-based MID Web Server authentication. • **Basic**: Define a username and password in the **Basic Auth User** and **Basic Auth User Password** fields, which appear when selecting this option. • **mTLS**: A certificate-based authentication that uses the TLS protocol. For details, see MID Web Server and agent mTLS Authentication.
Secret Key	The value generated when Keybased authentication is selected for the value in the Authentication Type field.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Web Server Context form (continued)

Field	Description
Basic Auth User	Username to be used when selecting Basic authentication.
Basic Auth User Password	Password to be used when selecting Basic authentication.
Secure Connection	Option to indicate that the extension is to use the TLS protocol to encrypt incoming connections. A certificate and private key combination must also be provided to the extension. When selecting this option, the **MID Server Unified Keystore** check box appears.
Use MID Unified Keystore	Option for using the MID Server Unified Keystore option for a secure connection. Clear this option to use **Web Server Keystore**. For details, see Configure a secure MID Web Server extension.
Keystore Certificate Alias	The alias name of the keypair inside the selected keystore that the extension uses to establish a secure connection. Leave this field empty to use the default alias when using the MID Unified Keystore or when using the Web Server Keystore with a single alias.
Keystore Password	The password for the Web Server Keystore when it is used to establish a secure connection.
Keystore Key Password	The password of the private key entry mapped to the specified alias of the Web Server Keystore. This field can be left empty if the password matches the entry in the Keystore Password field.
Truststore Password	The password to the truststore that holds the Certificate Authority (CA) certificates used to validate the signatures of the client certificates. Appears when the **mTLS** authentication type is selected. Leave this field empty if the extension is configured to use the cacerts truststore of the JRE running the MID Server.
Error Message	Message describing any error that causes a command, such as Start or Stop, to fail. This field appears only when the value in the Status field is Error.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Web Server Context form (continued)

Field	Description
Execute on	Location for running this extension. The available options are **Specific MID Server** or **Specific MID Server Cluster**.
MID Server	Depending on your selection in the **Execute on** field, the name of the designated MID Server or MID Server cluster. • If you selected **Specific MID Server**, the name of the designated MID Server. • If you selected **Specific MID Server Cluster**, the name of the designated MID Server cluster.
Executing on	Displays the name of the MID Server on which the extension is running even if the MID Server is down. If the user stops the extension, this field is empty.

Event Management tag based alert clustering tag form

The form for creating or modifying a tag based alert clustering tag displays detailed information about the tag.

Tag based alert clustering tag form

Field	Description
Name	Name of the clustering tag. Defaults to a description of the configured tag (such as, **Exact match on Alert Field "metric name"**). The default name is visible only after saving the tag. Tag names must be unique.
Customized name	Select the check box to customize the value in the **Name** field.
Domain	The domain in which the current record was created. Read-only.
Description	Enter an optional description of the tag.
Source	Select the source from which to choose the field to be matched. • **Alert field** • **Alert additional info** • **Alert CI** • **Alert CI key** • **Alert tags**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering tag form (continued)

Field	Description
	If you select **Alert additional info**, choose an **Additional Info Key** instead of a field. **Alert additional info** is a field on alert containing the key value pair in Jason format and we can use a specific key. **Alert CI key**: Create CMDB key values to cluster alerts based on CMDB Key Values [cmdb_key_value] table. Key values provide an additional method for determining commonalities between alert CIs.
Selected field	Indicate the field that has to match between alerts for the alerts to be included in a group. Appears when you select **Alert Field** or **Alert CI** in the **Source** field. If you select **Alert CI** in the **Source** field, you need to select a CMDB key. A CMDB key is assigned to the CI of the alert.
Key	Indicate the Key that has to match between alerts for the alerts to be included in a group. Appears when you select **Alert additional info** in the **Source** field, or appears when you select **Alert tags** in the **Source** field. When **Alert additional info** is selected, enter the name of one of the fields in the additional info field. When **Alert tags** is selected, enter the name of the relevant alert tag.
CMDB key	Indicate the CMDB key to match for the alerts to be included in a group. Appears when you select **Alert CI Key** in the **Source** field.
Match method	Select the type of match required for the alerts to be included in a group. • **Exact**: Indicates that the field value must be an exact match for the alert to be included in a group. For example, you can configure an alert clustering tag indicating that the alert's **Metric name** field must be an exact match to form a group. When invoking that tag, all

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering tag form (continued)

Field	Description
	alerts with identical values in the **Metric name** field are included in the same group. • **Fuzzy**: Indicates that the field value needs to be an approximate match (depending on the value configured in the **Similarity** field) for the alert to be included in a group. • **Pattern**: Indicates that the field value needs to follow the pattern in the **Pattern** field. For correct syntax and usage examples, see Pattern matching.
Similarity	Specify the similarity percentage that must be met by the alerts to be included in a group. For example, entering 50 indicates that at least 50 percent of the indicated value must appear in the alert for the alert to be included in the group. Appears only when **Fuzzy** is selected as the **Match Method** value. Default value = 90

List of predefined alert clustering tags

A list of the predefined alert clustering tags provided with the Tag Based Alert Clustering Engine # application.

Predefined alert clustering tags

Name	Source	Match method
CI	em_alert.cmdb_ci	Exact match
Description	em_alert.description	Exact match
Metric Name	em_alert.metric_name	Exact match
Node	em_alert.node	Exact match
Resource	em_alert.resource	Exact match
Source	em_alert.source	Exact match
Source instance	em_alert.event_class	Exact match
Type	em_alert.type	Exact match
Assignment group	em_alert.assignment_group	Exact match
CI Class	cmdb_ci.sys_class_name	Exact match
Dns domain	cmdb_ci.dns_domain	Exact match
ip address	cmdb_ci.ip_address	Exact match
Location	cmdb_ci.location	Exact match

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predefined alert clustering tags (continued)

Name	Source	Match method
Environment	cmdb_ci.environment	Exact match
CI name	cmdb_ci.name	Exact match
Namespace	cmdb_ci.namespace	Exact match

Predefined tags extracted from connector payload

Name	Description	Default mapping from CMDB
t_ip_address	IP address	cmdb_ci.ip_address
t_application	Application	-
t_region	Region	-
t_location	Location	cmdb_ci.location
t_environment	Environment	cmdb_ci.environment
t_namespace	Namespace	cmdb_ci.namespace

Event Management tag based alert clustering definition form

The form for creating or modifying a tag based alert clustering definition displays detailed information about the definition.

Tag based alert clustering definition form

Field	Description
Name	Name of the alert clustering definition. Definition names must be unique.
Active	Select to activate the definition. This option is selected by default.
Order	The order by which definitions are tested for incoming alerts. Those with lower Order values are tested first. When an alert matches one of the definitions' filters, it continues searching for more definitions. Default value = 1000
Domain	The domain in which the current record was created. Read-only.
Assignment group	Assignment group that works on the alert. If no assignment group is defined in the alert rule, then this alert rule is considered as a global rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering definition form (continued)

Field	Description
	When the rules are running – first the global rules run and then the rules that belong to the assignment group of the alert.
Description	Enter an optional description of the alert clustering definition.
Filter	Set conditions that incoming alerts must meet to be measured by the alert clustering definition's tags. If the tags correspond to alerts that exist in the system and are within the **Clustering timeframe (minutes)** value, the incoming alerts join with the existing alerts to form an alert group. After configuring the filter, you can click the **Preview** button to view how many existing alerts match the filter's condition. **Note:** • Matching alerts are not automatically included together in an alert group. Alerts are grouped only if they have corresponding alert clustering tags. • Filter parameters are case sensitive by default. To disable case sensitivity, set the *sa_analytics.correlation_case_sensitive* parameter to **false**. • You can also configure alert fields to be excluded from the search, using the *sn_em_tbac.tag_excluded_alert_fields* property. By default, the following are excluded by this property: ○ type ○ event_class
Override group description	Default group descriptions begin with a "Group of alerts" prefix, followed by the description of the primary alert in the group. You may override this group description by selecting the **Override group description** check box. Then, in the **Custom description** field, type a description. This description is used as the description of the groups that are created by this alert clustering definition. **Note:** You cannot save the form if you left the Custom description field blank or with the default 'Group of alerts' text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering definition form (continued)

Field	Description
Clustering timeframe	The maximum time, in minutes, allowed between the first alert and subsequent alerts for them to be grouped together. For example, a value of 60 indicates that any alert generated within 60 minutes of the first alert in the group (the oldest alert) is included in the alert group. Any alert generated after this 60-minute window from the initial alert is not included in the group. Permitted values = 0-1440
Tag Based Alert Clustering Definitions Tags M2M	Select the alert clustering tags to be assigned to the alert clustering definition. Alerts that meet the criteria specified in the selected tags are included in the alert group. The available options are the tags created on the **Tag Based Alert Clustering Tags** page.

List of predefined tag-based alert clustering definitions

A list of the predefined alert clustering definitions provided with the Tag Based Alert Clustering Engine#application.

Predefined alert clustering definitions

Name	Description	Order
Group alerts from the same Application	Group all alerts from the same application, created in the last 10 minutes. In new systems, this definition is activated by default.	9010
Group all alerts from the same IP address	Group all alerts from the same IP address, created in the last 10 minutes.	9020
Group all alerts from the same Namespace	Group all alerts from the same namespace, created in the last 10 minutes. In new systems, this definition is activated by default.	9030
Group all alerts from the same Subnet	Group all alerts from the same subnet, created in the last 10 minutes. In new systems, this definition is activated by default.	9040
Group alerts from the same CI class and Location	Group all alerts from the same CI class and location, created in the last 10 minutes.	9050
Group alerts from the same Application and Environment	Group all alerts from the same application and environment, created in the last 10 minutes.	9060
Group all alerts from a similar Node	Group all alerts from a similar node name, created in the last 10 minutes.	9070
Group alerts from the same Location and Assignment group	Group all alerts from the same location and assignment group, created in the last 10 minutes.	9080

© 2026 ServiceNow, Inc. All rights reserved.

Predefined alert clustering definitions (continued)

Name	Description	Order
Group alerts from the same Region and Metric	Group all alerts from the same region and metric, created in the last 10 minutes.	9090
Group alerts from the same CI class and Metric	Group all alerts from the same CI class and metric, created in the last 10 minutes.	9100
Group alerts from the same Node and Metric	Group all alerts from the same node and metric, created in the last 10 minutes.	9110
Group alerts from the same Assignment group and Class	Group all alerts from the same assignment group and class, created in the last 10 minutes.	9120
Group alerts from the same Type, Metric and Source	Group all alerts from the same type, metric, and source instance, created in the last 10 minutes.	9130
Group alerts from the same CI	Group all alerts from the same CI, created in the last 10 minutes. **Important:** When this rule is active, CMDB grouping must be disabled.	9140
Group alerts from the same Node	Group all alerts from the same node, created in the last 10 minutes. In new systems, this rule is activated by default.	9150

Domain properties installed with Event Management

Use the domain properties installed with Event Management to provide the metadata that points to the appropriate table to identify the domain so that you know which domain to create the event in.

Default domain metadata properties

Property
evt_mgmt. connector_domain_info_table_name
evt_mgmt. connector_domain_info_column_name
evt_mgmt. connector_domain_id_column_name
evt_mgmt. connector_domain_path_column_name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default domain metadata properties (continued)

Property

Connector domain metadata

Override push connector default domain metadata values installed with Event Management with the values in the event HTTP request, including the URL, headers, request body (payload), and connector parameters. Override pull connector domain metadata values with connector parameters only.

Domain metadata parameters

Name	Description	Overrides System Property
connectorDomainInfoTableName	Name of the table containing the records with the domain information. • **Type**: string • **Default value**: core_company	evt_mgmt.connector_domain_info_table_name
connectorDomainInfoColumnName	Name of the column that has a value that should be matched with the domain identifier. For example, you might want to identify a record in the Domain Info table that has a matching value in the **company_name** field. • **Type**: string • **Default value**: name	evt_mgmt.connector_domain_info_column_nar
connectorDomainIdColumnName	Name of the table column that stores the domain ID. • **Type**: string • **Default value**: sys_domain	evt_mgmt.connector_domain_id_column_name
connectorDomainPathColumnName	Name of the table column that stores the domain path. • **Type**: string • **Default value**: sys_domain_path	evt_mgmt.connector_domain_path_column_na

Order of preference for accessing domain metadata

You must provide domain metadata to configure personalized push connector domains. The metadata in preferred accessing order are:

1. Push connector parameters
2. URL query parameters
3. HTTP headers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Request body (payload)
5. Default system properties

URL query parameters

Push connectors have the following URL syntax:

- Instance Type: `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=<connector-source>`
- MID Server type: `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=<connector-transform-script-name>`

You can include domain metadata as additional query parameters in the ServiceNow push connector webhook URL. For example, if the domain information source is the sys_user table, the URL could be `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=<connector-source>&connectorDomainInfoTableName=sys_user`

Request headers

Any of the domain metadata properties can be passed as part of HTTP request headers. Check the documentation from your third-party monitoring tool for information about how request headers are set.

Request body (payload)

You can reference domain metadata from the request body (JSON payload) by setting the metadata parameters as root-level keys in the payload. The following example shows how the *connectorDomainInfoTableName* and *connectorDomainInfoColumnName* parameters might be passed as part of the request body:

```
{
    “source”: “Azure Monitor”,
    “host”: “127.0.0.1”,
    “company”: “ServiceNow”,
    “connectorDomainInfoTableName”: “sys_user”,
    “connectorDomainInfoColumnName”: “first_name”
    }
```

Note: For information on connector parameters, see Personalize domains for push connector events to use in event creation.

Dynatrace connector instance form

The Dynatrace connector instance form displays the fields you must fill in when creating a Dynatrace connector instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page

Field	Description
Name	Unique name for the Dynatrace metric connector instance.
Description	Description for the use of connector instance.
Connector Definition	The connector definition to be used by the connector. Select **Dynatrace Metrics**.
Host IP	Hostname/IP address of the Dynatrace server.
Credential	Select the search icon and select the existing API key credential. If this credential does not exist, create a new credential, as follows: **1.** Ensure that you have an access token with Read Metric (metrics.read) permissions, created on the Dynatrace UI. **2.** Select **New** after selecting the search icon. **3.** Select **API Key Credentials**. **4.** In the **API Key** field, enter the access token from the Dynatrace UI. **5.** In the **Name** field, enter a descriptive name to uniquely identify the credential. **6.** Fill in any other relevant fields, and select **Submit**.
Metric collection	Selected by default. Read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the metric connector pulls metrics from the Dynatrace server. Default: 60.
Active	Select to activate the connector instance.

Dynatrace connector instance value parameters

The following table displays the Dynatrace connector instance value parameters that you can fill in, as needed, when creating a Dynatrace connector instance.

Connector instance value parameters

Parameter	Description
debug	Set to **true** to enable debug logs. Default: false
initialSyncInMins	Number of minutes before the current time that the initial metric collection runs. For example, if the value is 15, the connector fetches metrics from the past 15 minutes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
	Default: 15
logPayload	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default: false
maxMetricsPerQuery	Maximum number of metric ids to query per API call to Dynatrace. The value cannot exceed 32, the maximum limit allowed by Dynatrace. Default: 32
pageSize	Maximum number of records to return in an API response from Dynatrace. Default: 500
port	Port number for the Dynatrace server to connect to. empty
protocol	Protocol to use when connecting to the Dynatrace server. Default: https
throttleApiCalls	Determines whether throttling is enabled. When enabled (**true**), a limit is set on the number of API calls to Dynatrace per minute. Default: false
requestPerMinute	The limit on number of API calls to Dynatrace per minute. Relevant only when *`throttleApiCalls`* = **true**. Default: 1000

Push connector instance form

Push Connector Instance form displays the fields that you must fill when you create or modify a connector.

Field	Description
Name	A unique name for the connector instance record, such as the name of an event source host.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Any optional information that the administrator wants to use to identify this record.
Push Connector definition	Select the definition for the external system from which you want to receive events. You can select any existing definition, for example: • Thousandeyes • Dynatrace • Catchpoints For a list of the connector definitions available in the base system, see Configure Event Management connectors. **Note:** If there are available configuration parameters for the push connector type you select, they appear under Push Connector Instance Configuration Parameters.
MID Server	It shows the list of MID Servers that has at least one MID Server Event Listener context up and running. The MID Server section appears only when the MID type of definition is selected.
URL	This field is auto-populated only after saving the details of the connector instance. Instance: The URL has to be configured in an external system with the ServiceNow credential having a evt_mgmt_integration role to receive the events. MID push connector instance: The URL has to be configured from an external system with Configure the MID Web Server extension credential to receive the events. This field appears only after the form has been saved.
Active	Select this check box to enable receiving the events from this external event source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field appears only after the form has been saved.

Nagios connector instance value parameters

The following table displays the Nagios connector instance value parameters that you can fill in, as needed, when creating a Nagios connector instance.

Connector instance value parameters

Parameter	Description
debug	Set to **true** to enable debug logs. Default: false
max_fetch_interval_min	Limits metric history retrieval to prevent system overload. Default: 180 minutes
offset_min	Adds a small time buffer to ensure no metrics are missed. Default: 5 minutes

Nagios connector instance form

The Nagios connector instance form displays the fields you must fill in when creating a Nagios connector instance.

Connector instance page

Field	Description
Name	Unique name for the Nagios metric connector instance.
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Nagios Metrics**.
Metrics database host	Host IP address of the host where the Nagios server collects metrics.
Metrics database credentials	Credentials required to access the Nagios database.
Metric collection	Option is pre-selected and read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Nagios server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
	Default: 60 seconds.
Active	Option to activate the connector instance.

Zabbix connector instance form

The Zabbix connector instance form displays the fields you must fill in when creating a Zabbix connector instance.

Connector instance page

Field	Description
Name	Unique name for the Zabbix metric connector instance.
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Zabbix Metrics**.
Host IP	Host IP address of the host where the Zabbix server collects metrics.
Credential	Credentials required to access the Zabbix database. Select the search icon and select the Basic Auth credential. • Name: Provide the unique name for Zabbix cred. • UserName: Provide Zabbix server username • Password: Provide Zabbix server password • Select **Submit**.
Metric collection	Option is pre-selected and read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Zabbix server. Default: 60 seconds.
Active	Option to activate the connector instance.

Zabbix connector instance value parameters

The following table displays the Zabbix connector instance value parameters that you can fill in, as needed, when creating a Zabbix connector instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters

Parameter	Description
api_endpoint_suffix	Set this value based on your Zabbix server web interface installation: https://www.zabbix.com/documentation/current/en/manual/installation/frontend#welcome-screen Default value: /zabbix/api_jsonrpc.php [For Apache Server]
debug	Set to **true** to enable debug logs. Default value: false
enable_batch_processing	If batch processing is enabled, metrics details are fetched in batch with 1000 (can be altered by setting appropriate value to - 'max_hosts_per_batch' parameter) hosts per batch. Default value: false
groupids	Provide the host group IDs. These IDs will be used to fetch metrics from the hosts attached to the specified groups. This applies only if `enable_batch_processing` is set to true.
logPayloadForDebug	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default value: false
max_fetch_interval_min	Configured from the 'max_fetch_interval_min' parameter: If the time exceeds 'max_fetch_interval_min', fetching starts from 'max_fetch_interval_min' before the current time; for an INITIAL run without 'lastMetricSignature', the time is set to 'max_fetch_interval_min' before the current time. Default value: 180 minutes
max_hosts_per_batch	If batch processing is enabled, metrics details are fetched in batch with 1000 (can be altered by setting appropriate value to - 'max_hosts_per_batch' parameter) hosts per batch. Default value: 1000
offset_min	Specifies the time offset in minutes for adjusting the fetch start time relative to the current time. Default: 5 minutes
port	Port number for the Zabbix server to connect to. Default value: empty
protocol	Protocol to use when connecting to the Zabbix server. Default value: http

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
with_triggers	It will fetch the trigger information. Default value: false

Note: When monitoring a large number of hosts in Zabbix, fetching massive metric data can impact performance and cause API timeouts; enabling batch processing (enable_batch_processing = true) mitigates this by fetching metrics in batches (default: 1000 hosts, configurable via *max_hosts_per_batch*), though it increases network calls and must be used when monitoring 10,000+ hosts or facing performance issues.

SCOM connector instance form

The SCOM connector instance form displays the fields you must fill in when creating a SCOM connector instance.

Connector instance page

Field	Description
Name	Unique name for the SCOM connector instance.
Description	Description for the use of the SCOM event collection instance.
Active	Select to activate the connector instance. Appears only when selecting a connector instance that has already been created.
Connector definition	The vendor and protocol used to gather events from the external event source. For a regular SCOM connector, select **SCOM**. For a connector instance that you want to monitor metrics, select **SCOM Metrics**. When selecting this option, the fields in the **Connector instance - metrics fields** table appear.
Assignment group	Select the group to whom the connector instance is assigned. For example, this may be a group of administrators or a support group.
Host IP	Specify the SCOM IP address. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Credential	Select Windows credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
	Note: When configuring Windows credentials, if the credential applies to specific MID servers, ensure that the MID Servers you specify on the credential record match the MID Servers specified in the **MID Servers for Connectors** section on the Connector Instance form. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Event collection last run time	The last event collection run time value updates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Last event collection status	The last event collection run time status updates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from SCOM Operations. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Bi-directional	Select to invoke the bi-directional option. This option enables the bi-directional exchange of values to-and-from the external event source. There is default implementation for SCOM. The **Last bi-directional status** option displays only when this option is selected. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Last bi-directional status	The value of this field populates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Last error message	The last error message field is automatically updated. This message is the last error

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
	message received by the connector. If the test connector fails, an error message is displayed in this field. This field does not appear when **SCOM metrics** is selected as the Connector definition.
MID Servers (MID Server for Connectors section)	Specify one or more MID Servers that are up and valid. MID Servers sort according to the order that their details were entered into the MID Server for Connectors section. The port requirement from the MID Server to the SCOM server is `1433`. If the specified MID Server is in a cluster, it may not be selected and another available MID Server is selected in its place. Ensure that the specified MID Servers match the MID Servers specified on the Windows Credentials page, as the connector uses Windows credentials to access MID Servers. If no MID Server is specified, an available MID Server that has a matching IP range is used.

Connector instance - metrics fields (displayed when Connector definition = SCOM Metrics)

Field	Description
Metrics collection	Selected by default. Read-only.
Metrics collection last run time	The last run time of the Metrics Collection scheduled job. This field is read-only.
Last metrics collection status	Status of the Metric Intelligence collection activity. The value of this field populates automatically. This field is read-only.
Metrics collection schedule (seconds)	The time, in seconds, to repeat the Metric Intelligence Collection scheduled job.
Metrics database host	The IP address or the host name of the metrics database host.
Connect using a named instance	When selected, the connection is made using the specified named instance. Otherwise, the connection is made using the specified port.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance - metrics fields (displayed when Connector definition = SCOM Metrics) (continued)

Field	Description
Metrics database port	The port used by the metrics database. The connection is made using JDBC. Default port number is 1433. If **Connect using a named instance** is selected, this option does not appear.
Metrics database named instance	The metrics database instance name.
Database login with Windows authentication	Perform database login with the credentials of the logged-in user defined on the MID Server service.
Metrics database credential	Credentials for the metric database. Use JDBC credentials for the local database user. If **Database login with Windows authentication** is selected, this option does not appear.

Event forwarding properties

Several system properties enable you to customize an event forwarding job.

Note: To access the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Property	Description
evt_mgmt.event_forwarding.sources_to_exclude	List of event sources from which events should not be forwarded. By default, all events are forwarded. Separate multiple sources by commas. • **Type**: string • **Default value**: Empty
evt_mgmt.event_forwarding.event_fields_to_include	List of event fields to include when sending events to the target instance besides the required default fields: resolution_state, event_class, additional_info, node, resource, cmdb_ci,severity, time_of_event, message_key, sys_domain, metric_name, ci_type, ci_identifier, type, source, description, and sys_domain_path. Separate multiple fields by commas. • **Type**: string • **Default value**: Empty

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
evt_mgmt.event_forwarding.event_batch_size	Maximum number of events to batch while sending to the target instance. • **Type**: integer • **Default value**: 500
evt_mgmt.event_forwarding.max_payload_size_in_mb	Maximum size of the event payload, in MB, sent to the target instance at a single time. • **Type**: integer • **Default value**: 5
evt_mgmt.event_forwarding.max_events_to_forward_per_day	Maximum number of events that can be forwarded from the instance per day to minimize the performance impact on the source instance. • **Type**: integer • **Default value**: 100000
evt_mgmt.event_forwarding.log_debug	Enables or disables debug logging for event forwarding. Set this property to true to log debugging information. • **Type**: Boolean • **Default value**: False

Solarwinds connector instance value parameters

The following table displays the Solarwinds connector instance value parameters that you can fill in, as needed, when creating a Solarwinds connector instance.

Connector instance value parameters

Parameter	Description
debug	Set to **true** to enable debug logs. Default value: false
max_fetch_interval_in_min	Number of minutes before the current time when the initial metric collection runs. For example, if the value is 180, the connector fetches metrics from the past 180 minutes. Default value: 180 minutes
logPayloadForDebug	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default value: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
offset	Specifies the time offset in minutes for adjusting the fetch start time relative to the current time. Default: 0 minutes
Port	Port number for the Solarwinds server to connect to. Default value: 17774
protocol	Protocol to use when connecting to the Solarwinds server. Default value: https

Note: When monitoring a large number of hosts in Zabbix, fetching massive metric data can impact performance and cause API timeouts; enabling batch processing (enable_batch_processing = true) mitigates this by fetching metrics in batches (default: 1000 hosts, configurable via *max_hosts_per_batch*), though it increases network calls and must be used when monitoring 10,000+ hosts or facing performance issues.

Solarwinds connector instance form

The Solarwinds connector instance form displays the fields you must fill in when creating a Solarwinds connector instance.

Connector instance page

Field	Description
Name	Unique name for the Solarwinds metric connector instance.
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Solarwinds Metrics**.
Host IP	Hostname/IP address of the Solarwinds server.
Credential	Credentials for a SolarWinds user with Basic Authentication and read access to the SWIS REST API.
Metric collection	Option is pre-selected and read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Solarwinds server. Default: 60 seconds.
Active	Option to activate the connector instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Team-based integration properties

Team-based integration system properties enable you to customize the assignment group functionality for existing and new customers for event rules and event field mapping.

Team-based integration system properties

Property	Description

evt_mgmt.alert_auto_assignment_field	The property determines automatic alert assignm list of comma-separated fields.
	
	The default value of this property is cmdb_ci.sup IntegrationGroup. The assignment group value is **group** field (cmdb_ci.support_group) of the alert the value is taken from the IntegrationGroup valu **group** field in the Connector instances table [em
	
	For upgraded instances from previous family rel to avoid any impact on production instances.
	
	• **Type**: String
	• **Default value**:
	  ○ Empty - for upgraded customers
	  ○ cmdb_ci.support_group, IntegrationGroup -
	
	Note: When you use an alert field in this p alert field in the **Additional Info** field, an ale the value of the **Assignment group** field mu For example, `{"Alert field name":"` `desired sys_user_group record>`

evt_mgmt.enable_group_level_event_rules	Activates team-based functionality for executing field-mapping rules. Global rules take precedenc based rules.
	
	• **Type**: Boolean
	• **Default value**:
	  ○ False - for upgraded customers
	  ○ True - for new customers

Alert Query form

You can combine similar alerts that meet specific criteria for a particular service by creating an alert query.

Alert Query form

Field	Description
Name	The alert query name.
Business criticality	The importance of this alert query to the business. This field can determine disaster recovery strategies for this alert query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert Query form (continued)

Field	Description
	• 1: most critical • 2: somewhat critical • 3: less critical • 4: not critical
Used for	The purpose of the alert query. Select from: • Production (Default) • Staging • QA • Test • Development • Demonstration • Training • Disaster recovery
Owned by	The party that is responsible for the alert query.
Email	The email alias for the alert query.
Business phone	The phone number for the business.
Operational status	The status of the alert query. • **Operational**: The alert query is running. Impact calculation runs only on alert queries in the Operational status. Select this option to use this service. If you customized preconfigured options for this category, select the option whose value is set to 1. Event Management calculates impact only on services in use. If you do not want to use this service now, select one of these options: • **Non-Operational**: The alert query is unavailable, disabled, or down. • **Repair in progress**: The alert query is receiving maintenance. • **DR Standby**: The alert query is available as a disaster recovery (DR) standby. • **Ready**: The alert query is prepared for use. • **Retired**: The alert query is withdrawn from active use.
Comments	Any additional notes and information.
Service Group Members	The service group which contains this service.
Filter	The conditions for sending a notification to the alert query. The conditions must meet the alert values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert Query form (continued)

Field	Description
	Note: • When defining an alert query filter, include only fields that appear in the Alert Histories [em_alert_history] table. Impact calculation is based on Alert History data and fields such as Overall Event Count, Priority, and Priority group are not copied to the Alert Histories [em_alert_history] table. • Do not specify a dynamic time condition. For example, in the filter, do not specify `Created` condition of `Last 45 minutes` because impact calculation is triggered by a change of alert or alert query. However, for the dynamic time condition, none of these conditions have changed. • Some filters may slow down impact calculation. To solve this problem, adjust your alert query by adding an appropriate index, as described in Index suggestions for slow queries.

Alert correlation rule form

Manage the fields that define how alerts are correlated and grouped.

Alert correlation rule form

Field	Description
Name	Name of the correlation rule.
Order	The evaluation priority for the rule. Rules with lower numerical values are given higher priority. An alert is evaluated against each alert action rule until a match is found. For example, if you have two alert correlation rules with priorities 10 and 20, respectively, the rule with priority 10 will be evaluated first. If an alert matches the criteria of the rule with priority 10, no further rules will be checked. If it doesn't match, the alert will then be evaluated against the rule with priority 20.
Active	Option to activate or deactivate the rule.
Advanced	Option to switch to advanced mode, which lets you use custom scripts to define your own logic. The sample correlation rule, **Alert correlation rule SAMPLE**, is provided out-of-the-box for reference. You can use the available script as a guide. **Note:** The **Filter** condition specifies which alerts the rule will apply to. Ensure that the same condition is used in the advanced script to identify alerts to be included in the group.
Description	Description of the rule.
Primary Alert	The filter condition to identify the alert that is the primary alert, or most important alert, in a set of related alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert correlation rule form (continued)

Field	Description
	This field does not appear when **Advanced** is selected.
Secondary Alert	The filter condition to identify the alert that is related to the primary alert, however it is of lesser importance. This field does not appear when **Advanced** is selected.
Filter	The filter condition to identify the alert on which the script is run. **Filter** is available only when **Advanced** is selected. Filter parameters are case sensitive by default. To disable case sensitivity, set the *sa_analytics.correlation_case_sensitive* parameter to **false**.
Relationship Type	Specify the type of relationship between the primary and secondary alert: • **No Relationship**: Ignore the relationship when looking for a match. • **Same CI or Node**: Relate both alerts with the same CI. If the CI field is blank, the alerts must have the same Node value. • **Primary is Parent**: Relate the alerts where the primary alert is the parent in a parent-child relationship, as described in the CI Relationship Types table [cmdb_rel_ci]. • **Primary is Child**: Relate the alerts where the primary alert is the child in a child-parent relationship, as described in the CI Relationships table [cmdb_rel_ci]. This field does not appear when the **Advanced** check box is selected.
Time Difference in Minutes	The minutes between which the primary and secondary event must occur to match this rule. The default value is 60 minutes. **Note:** The value for this entry cannot exceed 1440 minutes (one day). This field does not appear when **Advanced** is selected.

Script	Custom script that you can modify to return a JSON string that specifies the primary and secondary alerts.
	
	Select **Advanced** to display the script field.
	
	`(/* The function needs to return a JSON-{correlationType:[correlatedAlerts]} for example: if your filter matches the alert, set the alert as the primary alert and set alerts 1, 2 and 3 each as secondary alerts.`
	
	`You can use both multiple primary alerts and multiple secondary alerts.`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert correlation rule form (continued)

Field	Description

	The correlationType can be PRIMARY or SECONDARY, and the alerts ID must be in an array.
	CurrentAlert is the GlideRecord of the currentAlert on which that rule runs.
	The system supports only one primary per alert, so:
	Do not correlate more than one alert under the PRIMARY array.
	Do not correlate alerts that already have a primary under the SECONDARY array.
	The system supports open alerts only, so do not correlate alerts that have been closed under either one of the arrays.
	*/
	
	(function findCorrelatedAlerts(currentAlert){
	
	var result = {}; //Insert your code here
	result = {'SECONDARY':['alertID1','alertID2','alertID3']};
	return JSON.stringify(result);
	
	})(currentAlert);

Relationship	Description of the CI relationship between primary and secondary, for example, *Allocated from::Allocated to* or *Allocated to::Allocated from*. This field displays only if either **Primary is Parent** or **Primary is Child** is selected for the **Relationship Type**.  This field does not appear when **Advanced** is selected.

Health Log Analytics

The ServiceNow® Health Log Analytics application helps prevent IT issues before your users are affected. It helps you identify the root cause of an issue by enabling you to triage related logs and analyze the raw data.

Health Log Analytics collects raw log data streaming into your instance and structures textual data into key-value pairs. It detects meaningful patterns in the data, and when it discovers an anomaly, it sends an event to the Event Management application.

Health Log Analytics is available in the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.

Get started with ServiceNow Health Log Analytics (HLA)

ServiceNow Health Log Analytics predicts IT issues before they affect your users. The application helps you solve problems faster by collecting, analyzing, and correlating machine-generated log data in real time. It discovers any anomaly, or deviation from normal behavior, as it happens and alerts you of possible issues.

Health Log Analytics overview

Health Log Analytics helps you solve IT issues faster by collecting, analyzing, and correlating machine-generated log data in real time. The application receives and processes logs via the MID Server and sends events to ServiceNow Event Management. Health Log Analytics discovers any anomaly—deviation from normal behavior—as it happens, and alerts you of possible issues. The application helps you identify the root cause of an issue by enabling you to triage related logs and analyze the raw data.

Health Log Analytics can handle any kind of machine-generated textual log data. It can process application, infrastructure, and network logs, as well as other types of textual log data. Although a configuration management database (CMDB) can be helpful to generate high-quality events and alerts, it is not necessary.

Note:

- Health Log Analytics supports only UTF-8 logs. It does not support binary logs.
- If you are sending logs in a language other than English, additional configuration may be required.

Users

Health Log Analytics Users

User	Description	Role
Administrator	Configures the Health Log Analytics application to make it ready for use by Operators. Performs administration tasks to keep the system running efficiently.	evt_mgmt_admin, admin
Operator	Analyzes Log Analytics alerts and takes action to help resolve the underlying issue.	evt_mgmt_operator

Health Log Analytics workflow

Health Log Analytics collects and processes log data automatically. It structures the data logically for operators to analyze, and generates meaningful alerts and suggestions that display in Event Management.

The diagram shows the Health Log Analytics workflow from collecting the data through sending an event or alert to Event Management.

© 2026 ServiceNow, Inc. All rights reserved.

Health Log Analytics workflow

Ingestion

This layer connects your environment to Health Log Analytics. You can stream your logs directly from servers and endpoints or from log repositories. The optional guided setup helps you create data input connectors for the following common data sources:

- Rsyslog
- Beats
- Splunk
- Elasticsearch
- MID Server
- TCP

Structuring

This layer deals with structuring log data and auto-mapping it to logical silos, called Components. Data structuring can be done automatically or manually.

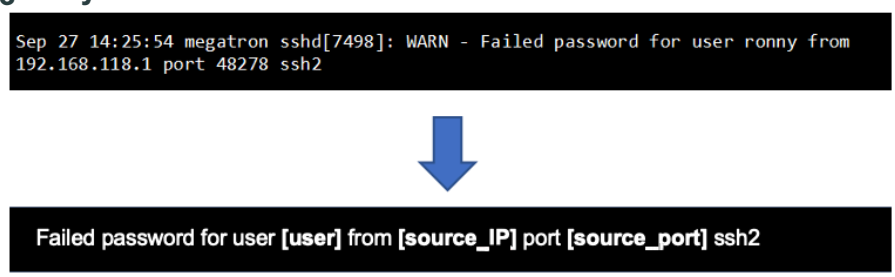
The system auto-structures log data by extracting the following properties from incoming log messages: Message, Timestamp, Host, Severity, and External-IDs. It extracts explicit values, like "property-name" and "value is IP." and semantic ones such as length, number of English words, and variance.

Auto-mapping assigns log samples and metadata to the appropriate tags automatically. The system tries to map log lines by analyzing the source that streams the data. The mapping is based on agent hints and common transport header fields.

Enrichment

This layer handles identifying the variable parts of a log message.

Health Log Analytics workflow - Enrichment



It also identifies keywords and contextual properties. In the image, "WARN" and "Failed" are the keywords to track. "User," "source IP," and "port" are the contextual properties.

Analysis

In this layer, each log line is indexed. Health Log Analytics extracts properties from the inner log message that contribute to models of behavior that the system

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

learns to expect. Anomalous behavior departs from this expected behavior. You can search for an event and its most significant properties for manual triaging.

Machine Learning (ML) and Artificial Intelligence (AI)

Health Log Analytics uses advanced unsupervised machine-learning algorithms to discover patterns within logs and learn their unique data behavior. It then sets dynamic thresholds based on the data signature in real time to detect issues when they first occur. When the system detects a deviation from the typical pattern, it sends an event to Event Management.

Alert in Event Management

Health Log Analytics sends events to Event Management. In Event Management, Health Log Analytics alerts appear in the **All alerts** list. This list enables operators to see alerts from the event and the Health Log Analytics alert type in a single location.

Benefits

Health Log Analytics benefits

Benefit	Feature	User
Simplify data input setup using the guided setup.	Guided setup	Administrator
Set up log data connector integrations quickly and conveniently from the Integrations Launchpad.	Log data connector integrations	Administrator
Shorten onboarding time by installing content packs.	Content packs	Administrator
Save time and reduce errors by migrating data input configurations between instances.	Data input migration	Administrator
Identify the root cause of an alert by analyzing the logs that surround the anomaly.	Surrounding logs	Operator
Visualize anomalous log data on the Log viewer.	Log viewer	Operator
Detect relationships in log data.	Log correlators	Operator
Assign higher or lower significance to alerts.	Mute alert metrics	Operator
Reduce noise by creating log filters.	Log alert filters	Operator
Influence how Health Log Analytics finds anomalies by managing keywords it looks for in the log data.	Lexical keywords	Operator

What to explore next

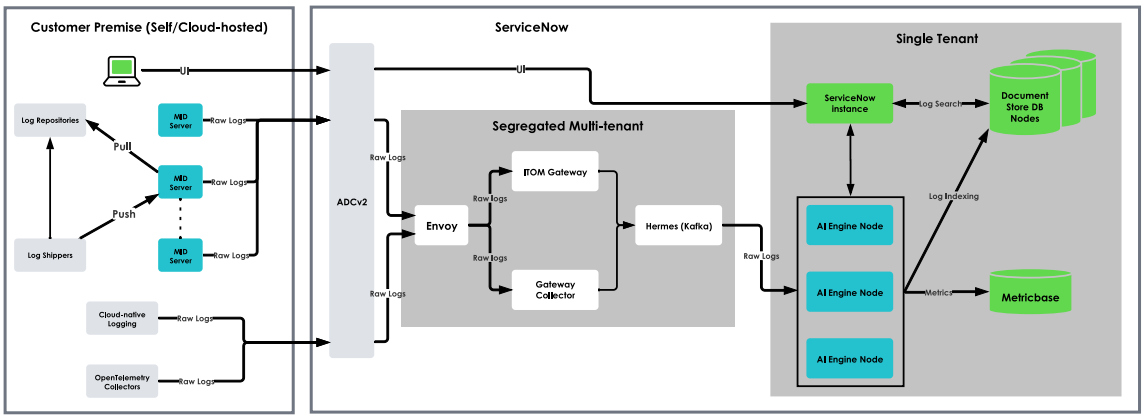
- Health Log Analytics architecture
- How Health Log Analytics generates alerts

Health Log Analytics architecture

Health Log Analytics collects logs streaming into your ServiceNow instance from endpoints or data lakes, such as Splunk and Elasticsearch.

The ServiceNow instance receives the logs either via a MID Server connector instance or via MID-less Ingest, which supports integration with services such as Amazon Data Firehose. Health Log Analytics identifies and triages anomalies in your log data using unsupervised machine-learning (ML) models. It then groups the anomalies together and applies further algorithms to help identify the root cause of the issue.

Health Log Analytics scaled architecture



How Health Log Analytics generates alerts

Health Log Analytics identifies patterns in your log data and learns pattern behavior. When HLA's AI engine detects anomalous behavior, it sends an event to the ServiceNow Event Management application. As an operator, you can use these predictive alerts to handle emerging IT issues before they impact users.

Log anomaly detection

There are many kinds of anomalous (abnormal or unexpected) behavior. In this example, the system tracks the baseline rate—the average number of events per minute—of particular messages. The chart shows the values for the previous day as the lightly peach-shaded area and the values for today as a blue line. The chart shows a dramatic deviation from the expected baseline values at around 10:10. This anomalous behavior generates an alert.

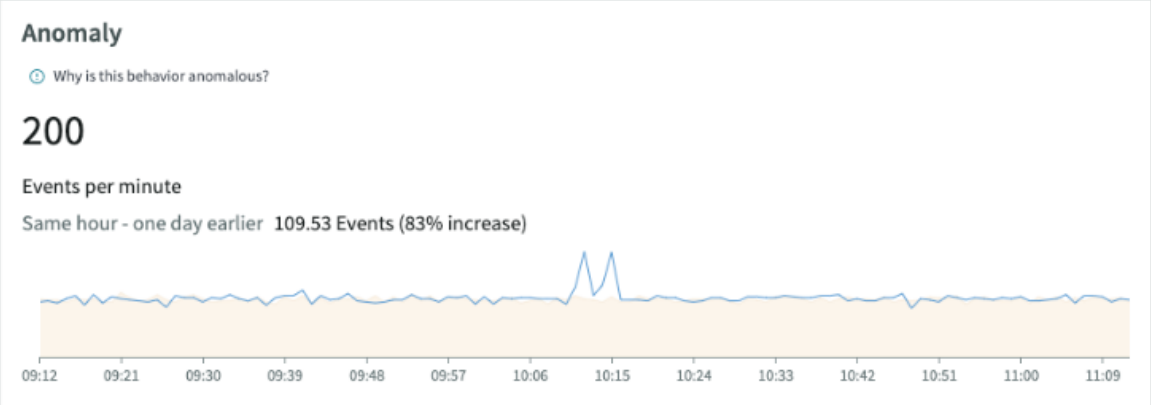
Anomalous behavior



Health Log Analytics uses various methods to detect anomalies and generate alerts.

Alert metrics

Health Log Analytics monitors multiple metrics in the log stream to detect anomalous behavior. Each metric is associated with a unique source: the combination of service instance and component. When the system identifies an anomalous pattern for a metric, it generates an alert.

As an operator, you can provide feedback about the generated alerts. Your feedback "teaches" Health Log Analytics that a specific alert is significant or irrelevant to you. The application then either raises the priority of the alert metric or mutes it to reduce noise.

- A significant alert is more likely to be included in a Log Analytics group when the associated metric behaves anomalously. For more information, see Mark an alert as significant
- Mute an alert for a specified source to eliminate distracting new alerts for unimportant issues. When a metric is muted, Health Log Analytics removes the current alert and any other alerts based on that metric from the feed. It also stops generating new alerts from that metric. For more information, see Mute an unimportant alert.
- When the situation changes, you can return a significant metric to its default significance. You can also reactivate a muted metric to cause the system to start generating alerts again. For more information, see Restore a muted alert or a significant alert.

Lexical keywords

Health Log Analytics scans your logs for words that can indicate important issues. Lexical keywords such as "crashed" or "failed" signal a condition that can merit attention.

The system sets a threshold for each lexical keyword that is based on what it considers the normal occurrence pattern and frequency of that keyword in your logs. When it scans your logs, it finds all occurrences of the keyword. If the number exceeds the threshold, it generates an alert. For more information, see View the lexical keywords that generate alerts.

For information about managing global keywords, see Add, edit, or delete Health Log Analytics lexical keywords. To create or delete keywords for a specific source type, see Configure source type capabilities.

Correlations

Log correlators are keys or values in log data that detect correlations between alerts. For example, a log correlator could detect when the ID of a particular network device occurs simultaneously in multiple warnings across different service instances. For more information, see Identifying relationships in log data by using log correlators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced alert filtering

Add advanced log alert filters to scan alerts for conditions that you specify. The filters reduce noise by dropping alerts that do not indicate a significant issue. While developing a filter, you can test, update, publish, or activate the filter at any time. For more information, see Create advanced log alert filters.

Custom alert rules

Define a Log Analytics alert rule when you encounter log data that should generate an alert. The alert rule generates an alert for a specified metric with a threshold that you specify and sets the properties of the generated alert. For more information, see Add a Log Analytics alert rule.

Configuring Health Log Analytics

As an Administrator, set up and configure Health Log Analytics for Operators to use, and carry out administration tasks to ensure that the system runs efficiently.

Configuration overview

Complete the following tasks for a successful setup and configuration of Health Log Analytics.

Important: Regardless of how you implement Health Log Analytics, you must first configure MID Server system requirements and ensure that the MID Server log ingestion capability is enabled.

For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to HLA.

1. Install Health Log Analytics (HLA).

   Install the Health Log Analytics application.

2. Set up log data inputs or connectors for streaming raw log messages to your ServiceNow instance.

   Use any of the following methods:

   - Set up data inputs using Health Log Analytics guided setup.

     The guided setup provides a sequence of tasks to help you create data inputs on your instance. Using this method ensures that you have the minimum required setup for the data input process.

   - Set up data inputs for Health Log Analytics manually.
   - Set up integrations from Integrations Launchpad.

     The ServiceNow Integrations Launchpad provides a unified interface for convenient integration with log data connectors that feed raw log messages into your instance.

   When the data input configuration process is complete, log data starts streaming to your instance.

3. Identify and resolve log streaming issues.

   Identify and address log streaming issues to ensure that the data inputs you have configured are streaming data properly to your instance.

4. Edit raw log data before processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Modify raw log messages before they are processed in the MID Server, and therefore before Health Log Analytics maps and structures it.

5. Map raw log data.

   Map raw log data that streams into your instance to determine how the data is handled.

   Health Log Analytics tries to auto-map every incoming log line to the correct tag. If properties aren't discovered automatically, you can map the data input sources manually.

6. Refine the source type structure.

   Fine-tune how Health Log Analytics reads your inner log messages and detects anomalies by customizing the extracted properties in the source type structure.

   Health Log Analytics enables you to reclassify auto-classified properties and change auto-mapped labels. These adjustments help the system's machine learning better understand your priorities.

7. Perform additional data input setup tasks.

   After performing the mandatory data input setup and configuration, you can continue with optional setup tasks.

8. Perform advanced data input configuration tasks.

Using guided setup to implement Health Log Analytics

Guided setup provides a sequence of tasks that help you configure Health Log Analytics on your ServiceNow instance. To open guided setup for Health Log Analytics, navigate to **All** > **Guided Setup** > **ITOM Guided Setup** > **Health Log Analytics**.

Install Health Log Analytics (HLA)

Install Health Log Analytics by requesting ServiceNow HLA installation from ServiceNow Customer Support.

Before you begin

The minimum version of the ServiceNow AI Platform required for Health Log Analytics installation is Yokohama.

Important: Health Log Analytics uses the default user sn_occ_occultus for internal communication. Make sure that this user is active and do not deactivate it.

Role required: admin

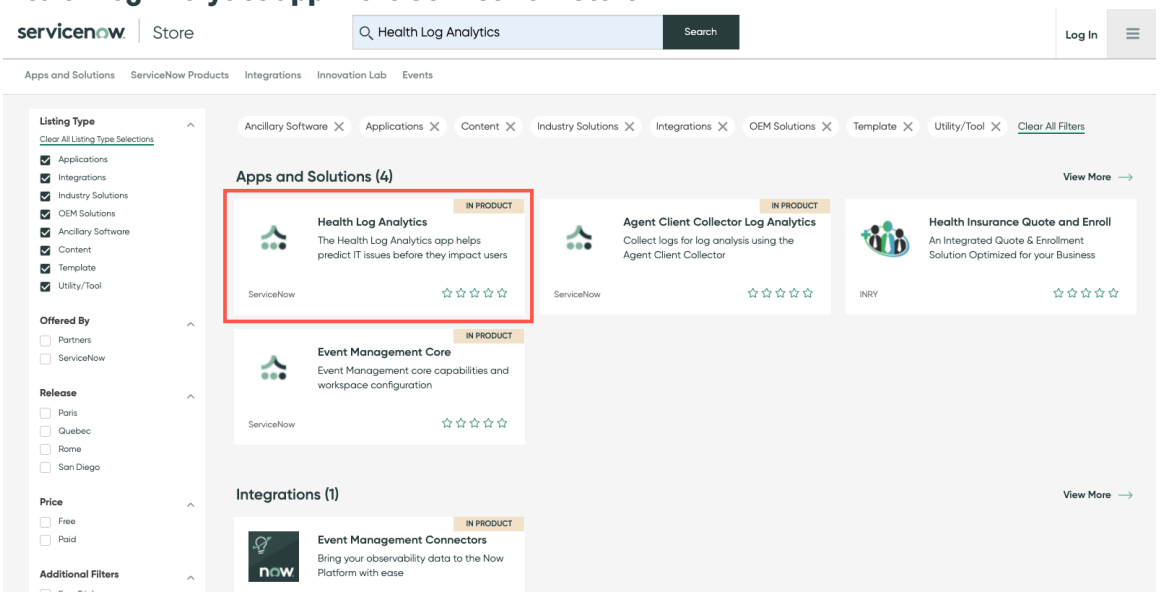
Procedure

1. Ensure that the Health Log Analytics application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements.
   To obtain the entitlements, contact your ServiceNow Solution Consultant.
2. Opt into the ITOM AIOps product.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

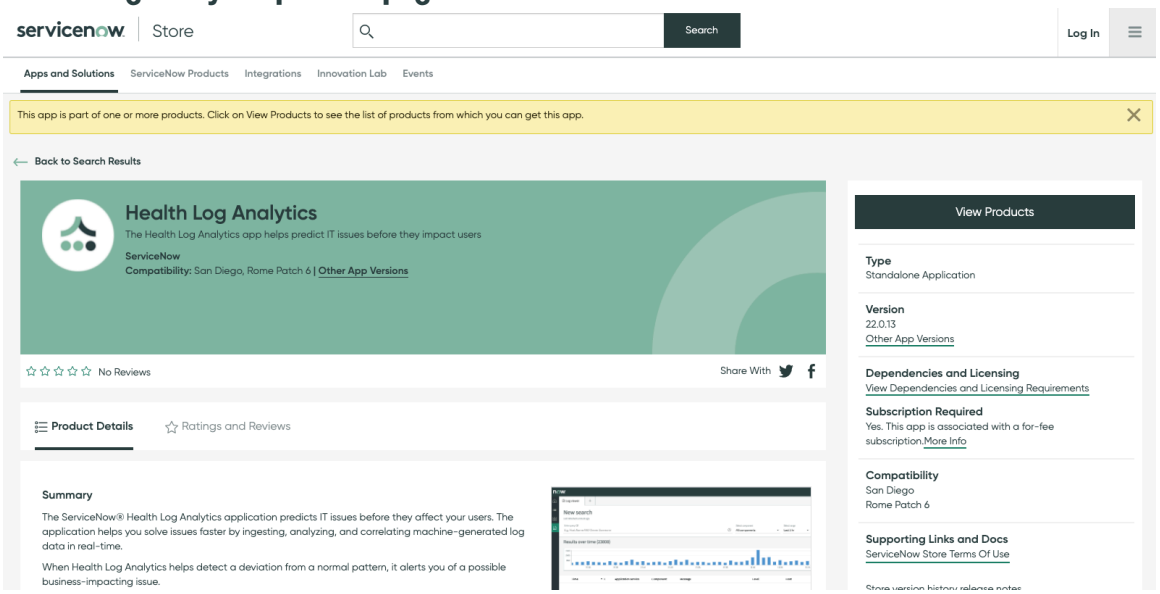
a. Go to the ServiceNow Store website and search for the Health Log Analytics app.

Health Log Analytics app in the ServiceNow Store



b. Select Health Log Analytics.
The Health Log Analytics product page displays.

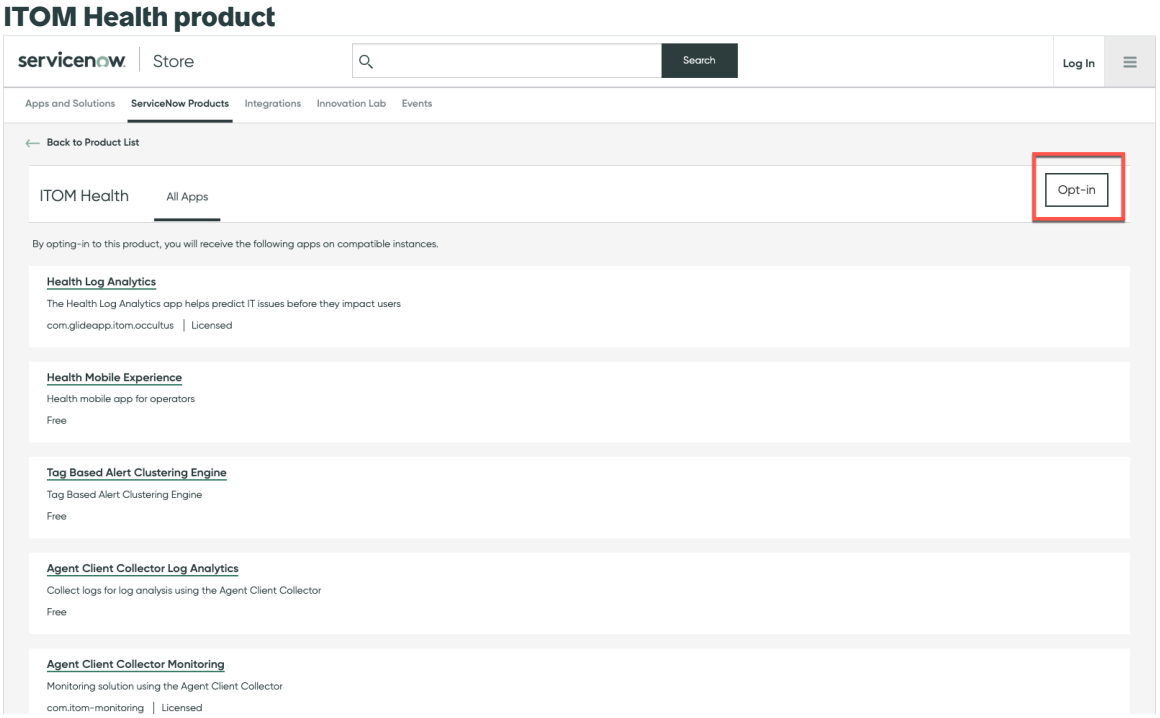
Health Log Analytics product page in the ServiceNow Store



c. Select **View Products**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **Opt-in**.



3. Install the Health Log Analytics application on your instance.

a. Navigate to **System Applications** > **All Available Applications** > **All**.

b. Find the Health Log Analytics application using the search bar.

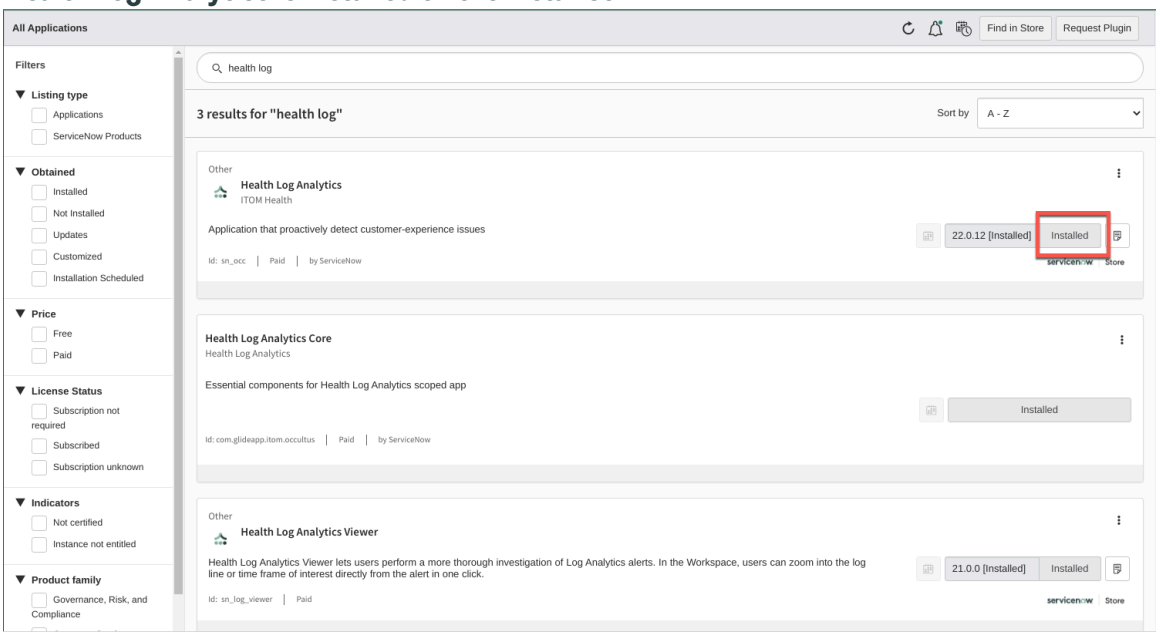
c. On the Health Log Analytics tile, select **Install**.
When the application is successfully installed on the instance, an automatic change request (CHG) is triggered to request provisioning for the necessary endpoints. The instance admin receives the request and any relevant notifications.

Note: Even when the Health Log Analytics application is successfully installed, it will not work until the endpoints have been provisioned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Ensure that the application and its dependencies were installed successfully, as illustrated in the figure.

Health Log Analytics is installed on the instance



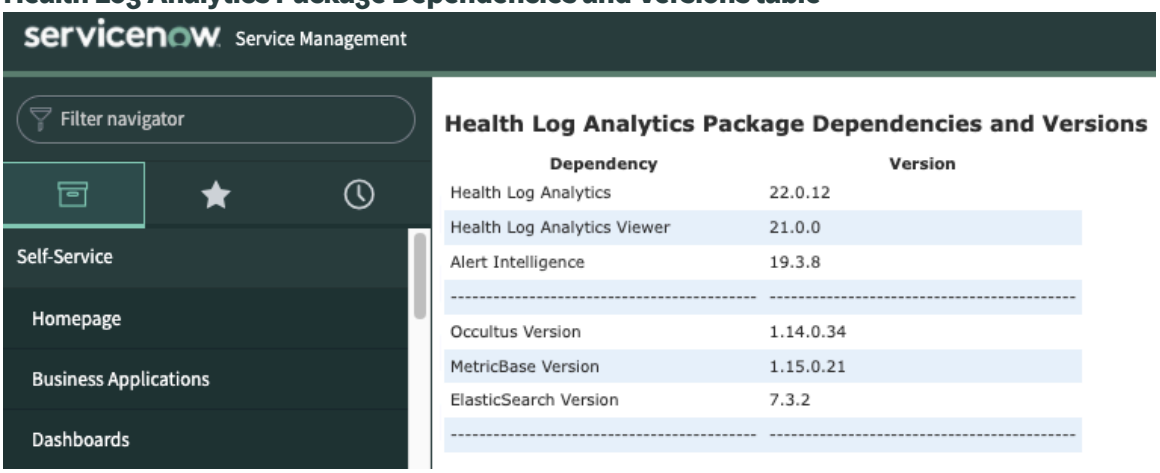
4. Optional: Observe the status of the provisioning process by reviewing the CHG.

Note: Some steps in the provisioning process might require your explicit approval. In such cases, ServiceNow Customer Support will reach out.

5. When provisioning is completed, ensure that the Health Log Analytics application is up and running.

a. In the Filter navigator, enter `sn_occ_stats.do`.
The Health Log Analytics Package Dependencies and Versions table displays.

Health Log Analytics Package Dependencies and Versions table



The provisioned endpoints are listed along with their version number:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Occultus
- MetricBase
- ElasticSearch

Result
The Health Log Analytics application is installed and provisioned on your instance.

What to do next

- Set up the data input process for Health Log Analytics
- (Optional) Install the ServiceNow® Agent Client Collector Log Analytics (ACC-L) plugin.

  Agent Client Collector Log Analytics enables you to stream log data from Linux and Windows hosts to a ServiceNow instance using the Agent Client Collector. For more information, see the Agent Client Collector Log Analytics documentation.

Setting up Health Log Analytics on your ServiceNow instance

Implement Health Log Analytics on your ServiceNow instance by setting up the data input process.

Note: For information about installing the ServiceNow Health Log Analytics application, see Install Health Log Analytics (HLA).

Important: Regardless of how you implement Health Log Analytics, you must first configure MID Server system requirements and ensure that the MID Server log ingestion capability is enabled.

For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to HLA.

Setting up the data input process

You can set up data inputs or integrations for Health Log Analytics in the following ways:

- Using guided setup. The guided setup provides a sequence of tasks to help you configure data inputs on your ServiceNow instance. Using the guided setup ensures that you have the minimum required setup for the data input process. For more information, see Set up data inputs using Health Log Analytics guided setup.
- Manually. For more information, see Set up data inputs for Health Log Analytics manually.
- From the Event Management Integrations Launchpad in Service Operations Workspace for ITOM. The Integrations Launchpad enables you to quickly and conveniently set up integrations and start receiving log data. For more information, see Set up integrations from Integrations Launchpad.

  Note: Currently, integrations are available for Elasticsearch, ServiceNow System Logs Retriever, UDP, TCP, REST API, MID Server, Apache Kafka, Splunk UDP, Splunk TCP, Splunk Poller, Microsoft Azure Log Analytics, and Amazon Data Firehose.

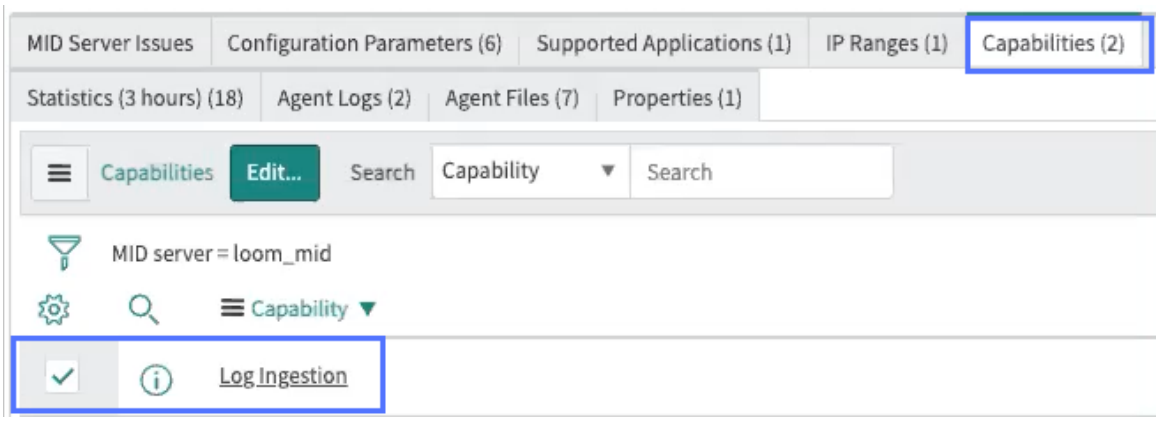
Set up data inputs using Health Log Analytics guided setup

The Health Log Analytics guided setup provides a sequence of tasks to help you create data inputs on your ServiceNow instance. Data input configuration is an essential step in setting up the Health Log Analytics application. Using guided setup ensures that you have the minimum required setup for the data input process.

Before you begin

Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.
- For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to HLA.

Role required: evt_mgmt_admin

About this task

For information about using the guided setup interface, see Using guided setup.

Procedure

1. Navigate to **All** > **Guided Setup** > **ITOM Guided Setup** > **Health Log Analytics**.
2. Follow the instructions to select and set up a data input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Once you've created the data input connector, proceed to map your raw log data.

Related topics

Supported data inputs for Health Log Analytics

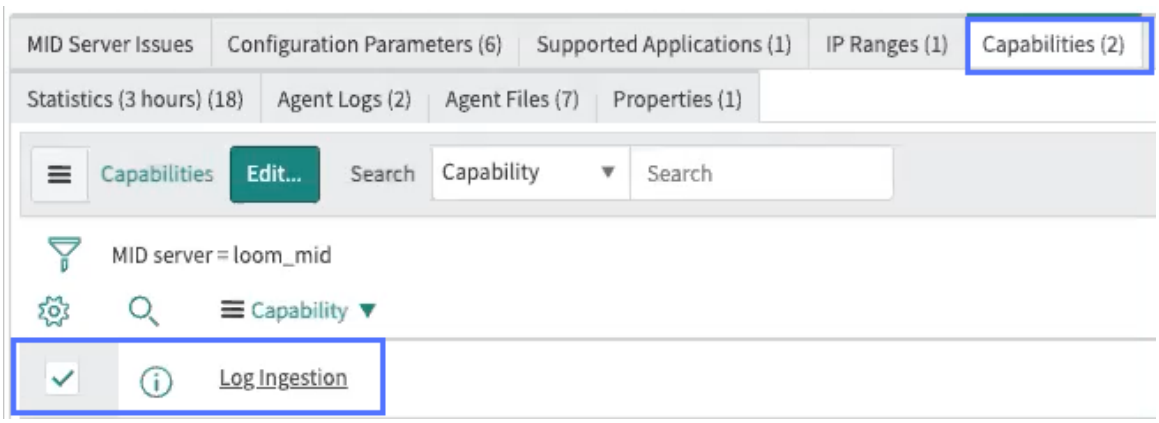
Set up data inputs for Health Log Analytics manually

Set up your Health Log Analytics data inputs for Health Log Analytics manually. Data input configuration is an essential step in setting up the Health Log Analytics application.

Before you begin

Note: Consider using the Health Log Analytics data input guided setup, which ensures that you have the minimum required setup for the data input process. For more information, see Set up data inputs using Health Log Analytics guided setup.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.
- For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to HLA.

Role required: evt_mgmt_admin. For the ServiceNow System Logs data input: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Configure a data input by performing the relevant procedure described in the product documentation.

Data Inputs

Data Input	Description
Rsyslog or Beats	The data input streams log data into your instance using Rsyslog or Beats.
Splunk	The data input streams log data into your instance using Splunk.
Splunk Polling	The data input periodically pulls log data from Splunk by using a query.
Elasticsearch	The data input pulls log data from Elasticsearch indexes into your instance.
TCP	The data input sends raw log messages to your instance directly over a TCP/SSL socket.
UDP	The data input streams raw log messages to your ServiceNow instance directly over a UDP socket.
GCP Pub/Sub	The data input receives log messages that are published to a Google Cloud Pub/Sub topic and streams them to your ServiceNow instance.
MID Server	The data input collects MID Server log files and streams them to your instance.
Amazon CloudWatch	The data input streams log data from Amazon CloudWatch to your ServiceNow instance.
Amazon S3	The data input streams log data from Amazon S3 (Simple Storage Service) buckets to your ServiceNow instance.
Microsoft Azure Log Analytics	The data input streams log data from Microsoft Azure Log Analytics to your ServiceNow instance.
Microsoft Azure Event Hubs	The data input streams events from Microsoft Azure Event Hubs to your ServiceNow instance.
Apache Kafka	The data input streams log data from Apache Kafka to your ServiceNow instance.
REST API	The data input streams log data to your ServiceNow instance in JSON format.
ServiceNow System Logs Retriever	The data input streams log data from the ServiceNow System Log table to the Health Log Analytics AI engine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Input	Description
	Note: Only a single ServiceNow System Logs Retriever data input can exist in the system, and only users with the admin role can create and configure it. This data input doesn't run on a MID Server.
Cribl	The data input to enables Health Log Analytics to process Cribl log messages streaming into your ServiceNow instance.
Edge Delta	The data input enables Health Log Analytics to process Edge Delta log messages streaming into your ServiceNow instance.
Vector Agent	The data input enables Health Log Analytics to process log messages that are streaming into your ServiceNow instance via a Vector Agent.
Agent Client Collector	The data input streams log messages to your ServiceNow instance using the ServiceNow Agent Client Collector. This data input is supported for use with the Agent Client Collector Log Analytics application, available from the ServiceNow Store.

Note: Selecting **Test connection** at the end of the procedure ensures that your data input is configured correctly. You can only publish a data input configuration when the connection between the MID Server and the data repository has been established.

2. Identify and address streaming issues to ensure that the data input is streaming log data to the MID Server from all sources.
   For more information, see Identify and resolve log streaming issues.
3. **Optional:** Edit raw log data before Health Log Analytics maps and structures it.
   For more information, see Edit your raw log data before processing.
4. Determine how Health Log Analytics handles raw log data that is streaming into your instance. By default, every incoming log line is auto-mapped to the correct tag. If properties aren't discovered automatically, map the data input sources manually by defining a JavaScript function. For more information, see Map the raw data.
5. **Optional:** Tweak the source type structure to make sure that Health Log Analytics extracts and classifies all properties correctly.
   For more information, see Refine the source type structure.
6. **Optional:** Perform additional data input setup tasks.
   For more information, see Additional data input setup tasks.

Configuring data inputs for Health Log Analytics manually

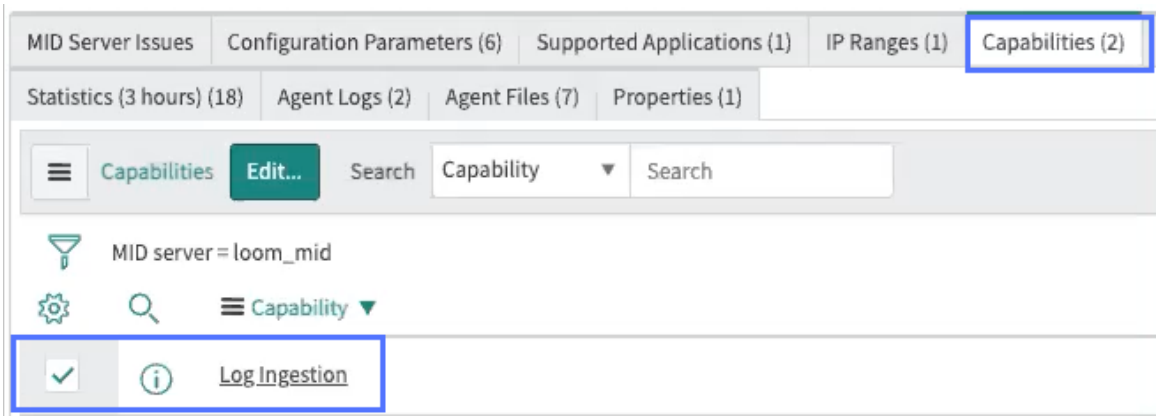
Configure the data input process manually in Health Log Analytics. Data input configuration is an essential step in setting up the Health Log Analytics application.

Configure Rsyslog, Filebeat, or Winlogbeat data inputs

Configure a data input for streaming log messages to your ServiceNow instance using an Rsyslog, Filebeat, or Winlogbeat agent.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the data input type to create from the available data input types described in the table.

Note: The selected data input type complements the passive data input (listener). For more information, see Supported data inputs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data input types

Type	Description
Rsyslog	Streams log messages from UNIX-based servers to the ServiceNow AI engine using the Rsyslog agent.
Linux using Filebeat	Streams system log messages and local files from Linux servers to the instance using the Filebeat agent.
Windows Application Logs using Filebeat	Streams local files from Microsoft Windows devices to the ServiceNow instance using the Filebeat agent.
Windows OS using Winlogbeat	Streams Windows event logs to the ServiceNow instance using the Winlogbeat agent.

4. On the **Getting Started** tab, fill in the form.

   For a description of the fields, see Rsyslog, Filebeat, or Winlogbeat data input configuration fields.

   Note: When creating a data input for Linux using Filebeat, you can select a content pack from the **Content pack** drop-down. The content pack contains default source types and mapping script templates that save you the time it takes to create them from scratch. For more information, see Health Log Analytics content packs for quicker time to value.

5. If the agent has not already been installed, download and install it from the **Installation** tab.

   Note: Make sure that you're running the latest version of the agent. Earlier versions will work, but with limited functionality.

6. On the **Tagging and Binding** tab, assign logs to an service instance in the Configuration Management Database (CMDB) to enable the service to correlate the log data and enable the system to do root cause analysis.

   a. For each source, configure the path and service instance for the logs to be streamed.

      Note: By default, only the required fields **Path** and **Service instance** appear.

      For a description of the fields, see Rsyslog, Filebeat, or Winlogbeat data input configuration fields.

   b. If you want to ship multiline logs using Filebeat, configure the properties that control how Filebeat handles messages that span multiple lines of text.

Field	Description
Match	Specifies how Filebeat combines matching lines into an event.
Negate	Defines whether the pattern identified in the log lines is negated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Regex	Specifies the regular expression to match.

Note: Health Log Analytics currently doesn't support multiline properties for Rsyslog.

c. **Optional:** Define additional log paths to enable the data input to stream log types from multiple paths.
Do the following for each additional log path:

i. Insert a new row.

ii. Configure the log path.

iii. Choose a service instance.

iv. (Optional) Choose a component and a source type.

Note: This option is not available or necessary when using Winlogbeat, because Health Log Analytics streams the Windows event logs.

7. On the **Finish** tab, complete the configuration for your data input type.

- Rsyslog:

a. Download the configuration file and install it on the endpoint device, in the `/etc/rsyslog.d/rsyslog.conf` directory.

Note: If you are using the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store , do the following instead:

i. On the endpoint device, install the configuration file in the `/etc/rsyslog.d/` directory.

ii. Create a spool directory by running the `sudo mkdir -p/var/spool/rsyslog` command.

b. Validate the configuration by running the `rsyslogd -N1` command and verify the output.

c. Restart Rsyslog by running the `sudo systemctl restart rsyslog` command.

d. Verify the output. If it contains errors, check the `/var/log/messages` system log file for error messages and fix the errors.

- Linux using Filebeat:

a. Download the configuration file and install it on the endpoint device, in the `/etc/filebeat/` directory.

b. Start the agent service by running the `sudo service filebeat start` command.

Note: The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration.

c. Restart the agent service by running the appropriate command.

- Windows using Beats (Filebeat or Winlogbeat):

a. Download the configuration file and install it on the endpoint device, in the `C:\Program Files\` directory.

b. Start the agent service by running the appropriate command in PowerShell.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Filebeat: `PS > Start-Service filebeat`
- Winlogbeat: `PS > Start-Service winlogbeat`

Note: The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration.

c. Restart the agent service by running the appropriate command.

8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data to your ServiceNow instance.

Note: The configuration file Health Log Analytics generates for new Filebeat data inputs is compatible with Filebeat version 7.14 and above. The minimum Filebeat version that Elasticsearch currently supports is 7.17, which is nearing its end of life (EOL).

Existing Filebeat data input configuration files in HLA are compatible with Filebeat versions up to 8.x. For Filebeat version 9.0 and above, either migrate from log input to filestream input or generate a new configuration file. For more information on the migration process, refer to the Filebeat documentation.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Configure advanced settings for Rsyslog, Splunk, or TCP data inputs

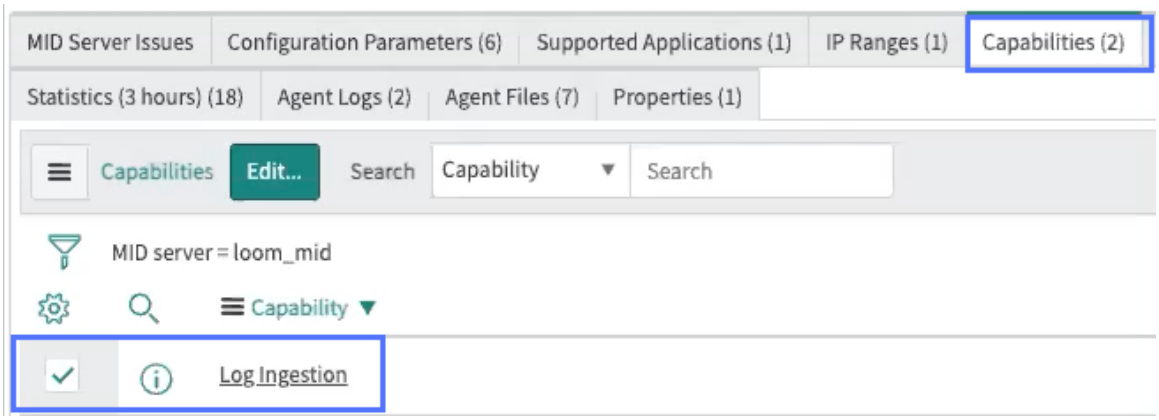
Configure advanced settings for Beats data inputs

Configure Splunk data inputs

Configure a data input for streaming log messages to your ServiceNow instance using a Splunk heavy forwarder.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

- Configure Splunk to forward logs to your ServiceNow instance using Syslog.
- The configuration of this data input assumes the existence of an environment variable named $SPLUNK_HOME. In Unix-like environments, this variable typically points to `/opt/splunk`.

Note: The Windows environment uses the same directory structure, but with backslashes (\).

Role required: evt_mgmt_admin

About this task

This setup procedure is for streaming logs to your instance using a Splunk heavy forwarder. If you can't use a heavy forwarder, you can use a Splunk Universal Forwarder instead. For more

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

information, see the Splunk Universal Forwarder as a Shipping method [KB0961378] article in the Now Support Knowledge Base.

Starting in the Yokohama family release, you can use new Splunk data inputs to ingest data in the preprocessed ("cooked") log-forwarding format that Splunk uses by default. In cooked mode, the Splunk forwarder embeds configuration details, such as host, source type, source, and other settings into the log data. Ingesting the data into HLA in this format ensures that each log line retains all the relevant contextual information. If you are using the cooked data option in HLA, there is no need to edit the `props.conf` and `transforms.conf` files during Splunk data input configuration.

Note: All Splunk configuration files are located in the `$SPLUNK_HOME/etc/system/local/` folder. If a configuration file that you need to modify doesn't exist, create it and save it to this folder.

Note: A MID Server that is down can cause a blockage in your Splunk pipeline. A full processing queue does not affect the pipeline.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Splunk data input for streaming logs via a Splunk heavy forwarder or universal forwarder.
4. On the **Getting Started** tab, fill in the form fields.
   For a description of the fields, see Splunk data input configuration fields.
5. On the **Outputs.conf** tab, add the following stanzas to the `outputs.conf` file to make the shipper forward log data over the selected transport protocol on the selected port, and then select **Next**.

   Note: If you have already configured outputs, merge these lines with your existing configuration.

   - Forwarding over TCP:

     Note: Use the first stanza only if you have not already configured a tcpout stanza. The second stanza is required for forwarding to Health Log Analytics over TCP.

     ```
     [tcpout]
     indexAndForward = 1
     defaultGroup = nothing

     [tcpout:health_log_analytics]
     server = ip-172-31-17-121.us-east-2.compute.internal:5000
     sendCookedData = false
     compressed = false
     ```

   - Forwarding over UDP:

     Note: Use the first stanza only if you have not already configured a syslog stanza. The second stanza is required for forwarding to Health Log Analytics over UDP.

     ```
     [syslog]defaultGroup = nothing
     ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
[syslog:health_log_analytics]
server = ip-172-31-17-121.us-east-2.compute.internal:5000
```

6. On the **Props.conf** tab, edit the `props.conf` file, and then select **Next**.

   Note: If you selected the **Use Cooked Data** option on the **Getting Started** tab, there is no need to edit the `props.conf` file.

   a. Modify existing stanzas or add stanzas to mark source types, service instances, and hosts for forwarding to Health Log Analytics.

      Note: For best results, mark only source types for forwarding.

      When adding stanzas, use the following name formats:

      - Source types: [<source type>]. For example: [syslog]
      - Sources (not recommended): [source::<source>]. For example, [source::myApp]
      - Hosts (not recommended): [host::<host>]. For example, [host::10.9.8.7]

   b. Add the following line to the end of each stanza that you want to forward to Health Log Analytics over either TCP or UDP.

      - Forwarding over TCP:

        ```
        TRANSFORMS-cloned_data = clone_for_hla_store_sourcetype,
         clone_for_hla
        ```

      - Forwarding over UDP:

        ```
        TRANSFORMS-cloned_data = clone_for_hla_store_sourcetype,
         clone_for_hla_udp
        ```

        This line applies the CLONE_SOURCETYPE transform on the data to prevent manipulation needed for Health Log Analytics processing from affecting your existing data pipeline. For example, to send all logs from the source type "syslog" to Health Log Analytics:

        ```
        [syslog]
                                          #existing configuration
         goes here
                                          TRANSFORMS-cloned_data =
         clone_for_hla_store_sourcetype, clone_for_hla_udp
        ```

   c. Add the following stanza to apply all the relevant transforms needed for Health Log Analytics processing.

      Note: Splunk enables you to anonymize sensitive data on the cloned source type for the selected protocol. For more information, see the "Anonymize data" section in the Splunk documentation.

      - Forwarding over TCP:

        ```
        [send_to_hla_tcp]
        TRANSFORMS-health_log_analytics =
         health_log_analytics_add_sourcetype,
         health_log_analytics_add_host,
        ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 health_log_analytics_add_source,
 health_log_analytics_add_syslog5424,
 health_log_analytics_add_index,
 health_log_analytics_add_syslogHost,
 health_log_analytics_add_time
```

- Forwarding over UDP:

```
[send_to_hla_udp]
TRANSFORMS-health_log_analytics =
 health_log_analytics_add_sourcetype,
 health_log_analytics_add_host,
 health_log_analytics_add_source,
 health_log_analytics_add_syslog5424,
 health_log_analytics_add_index,
 health_log_analytics_add_syslogHost,
 health_log_analytics_add_time
```

7. On the **Transforms.conf** tab, add the following stanzas to the `transforms.conf` file, and then select **Next**.

   Note: If you selected the **Use Cooked Data** option on the **Getting Started** tab, there is no need to edit the `transforms.conf` file.

   The third stanza clones the logs for further manipulation without affecting your existing indexing. The remaining stanzas add the information needed to enable correct Health Log Analytics processing.

   Note: You can obfuscate sensitive data by adding a transform here and then modifying the stanza of the cloned source type in the `props.conf` file.

```
[accepted_keys]
#Custom field for preserving sourcetype
hla_sourcetype_preservation=_hla_sourcetype

#Store sourcetype in a custom field, since CLONE_SOURCETYPE
 overwrites it
[clone_for_hla_store_sourcetype]

```

8. On the **Finish.conf** tab, restart Splunk by running the `$SPLUNK_HOME/bin/splunk restart splunkd` command.
9. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
10. Ensure that the data input is configured correctly by selecting **Test connection**.

    Health Log Analytics tries to connect the MID Server to the data repository.

    - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
    - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

Note: You can only publish the data input configuration when the connection is created successfully.

Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

11. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data to your ServiceNow instance using a Splunk shipper.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Related topics

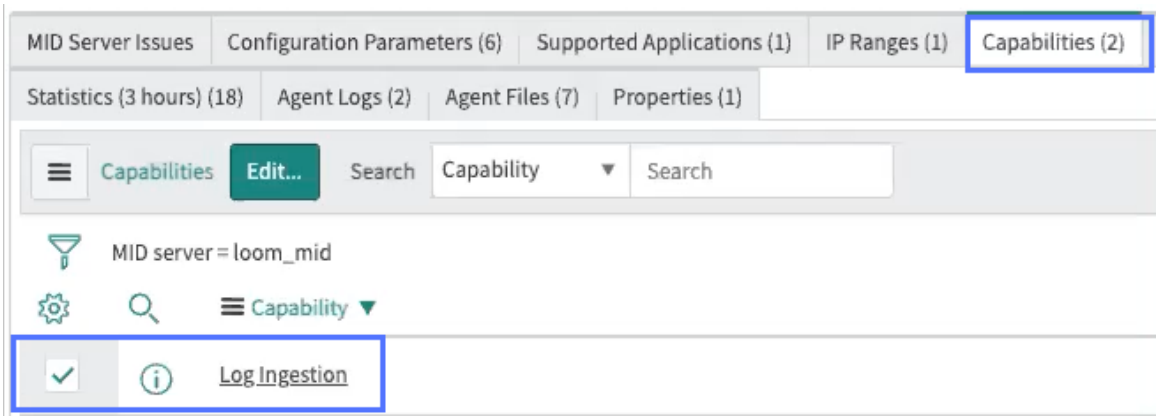
Configure advanced settings for Rsyslog, Splunk, or TCP data inputs

Configure Splunk Polling data inputs

Configure a data input that periodically pulls log data from Splunk by using a query.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Splunk Polling data input.
4. On the form, fill in the fields.
   For a description of the fields, see Splunk Polling data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   On the **Transport tab** and **Advanced tab**, fill in the fields. For a description of the fields, see Splunk Polling data input configuration fields.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Ensure that the data input is configured correctly by selecting **Test connection**.
   Health Log Analytics tries to connect the MID Server to the data repository. If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected.

   Note: You can only publish the data input configuration when the connection is created successfully.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Configure Elasticsearch data inputs

Configure a data input for streaming log data from Elasticsearch indices to your ServiceNow instance.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts to receive log messages from the Google Cloud Pub/Sub topic and streams them to your ServiceNow instance via the MID Server.

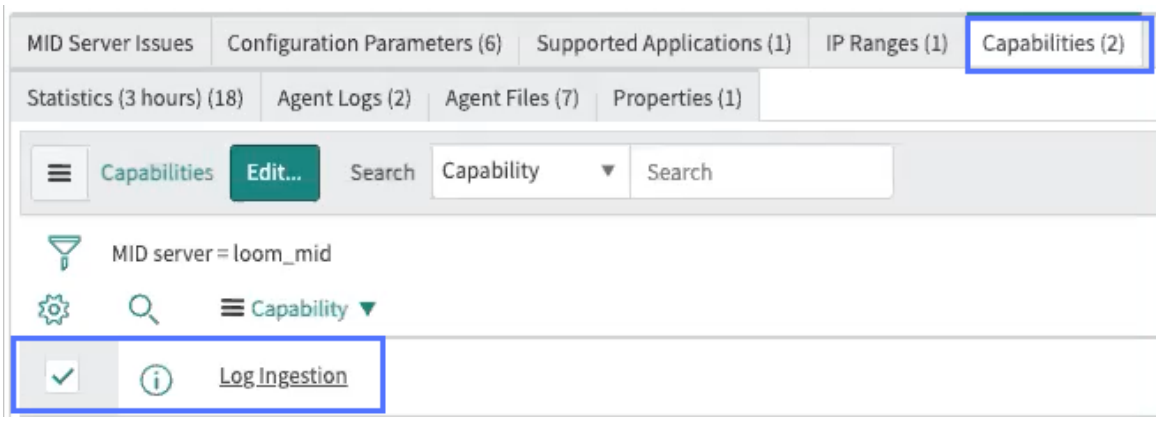
Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

Configure MID Server data inputs

Configure a data input for collecting and streaming MID Server log messages to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

This procedure describes how to create a MID Server data input from the Data Inputs page. To configure the MID Server data input automatically, click the relevant entry in the Related Links section on the MID Server form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- When you create a MID Server data input, all logs are automatically mapped to the predefined mid_server_log source type. This source type includes preconfigured mapping settings to maximize the value of monitoring your MID Server logs. To review the mapping script, navigate directly from the data input configuration form to the mapping form by selecting **Go to Mapping** under Related Links. Review the source type by navigating to Source Type Structures and select the mid_server_log source type.
- For optimal performance, debug MID Server log messages are not processed by default. If you want to send debug messages to Health Log Analytics for processing, add the following to your MID Server properties: mid.hla.mid_data_input.ignore_debug_level_logs = false.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the MID Server data input.
4. On the form, provide a description of the data input and the name of the MID Server from which the logs are streamed.
   For a description of the fields, see MID Server data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   On the form, fill in the fields. For a description of the fields, see MID Server data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for MID Server data inputs.
6. Select **Submit**.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts collecting and streaming MID Server log messages to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Configure Amazon CloudWatch data inputs

Configure a data input for streaming log data from Amazon CloudWatch to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

  Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address

translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Amazon CloudWatch data input.
4. On the form, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for Amazon CloudWatch data inputs.
6. On the **Query settings** tab, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields.
7. On the **Transport** tab, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields. These fields are required.
8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data from Amazon CloudWatch to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Microsoft Azure Log Analytics data input.
4. On the form, fill in the fields.
   For a description of the fields, see Microsoft Azure Log Analytics data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see Microsoft Azure Log Analytics data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for Microsoft Azure Log Analytics data inputs.
6. On the **Query settings** tab, fill in the fields.

   Health Log Analytics uses the values set in these fields to generate the query for receiving log data from Microsoft Azure Log Analytics.

   For example:

   ```
   {"query": "ContainerLog | where TimeGenerated > %s | take 500",
    "project": ["TimeGenerated", "LogEntry", "LogEntrySource"]}
   ```

   where:

   - `ContainerLog`: The data source name.
   - `TimeGenerated`: The event time property name.
   - `500`: The maximum number of rows retrieved in each query.
   - `["TimeGenerated", "LogEntry", "LogEntrySource"]`: The event time and the comma-separated list of column names to return.

   Alternatively, you can configure a custom query in the **Log query** field. The value you set in this field overrides the values in all other fields on the **Query settings** tab except the **From** field. If the **Log query** field is empty, Health Log Analytics generates the query using the values set in the other fields on the tab.

   For a description of the **Query settings** fields, see Microsoft Azure Log Analytics data input configuration fields.

7. On the **Transport** tab, fill in the fields.
   For a description of the fields, see Microsoft Azure Log Analytics data input configuration fields.
8. Select **Save**.

Make sure that the data input is streaming data.

Related topics

Configure advanced settings for Apache Kafka data inputs

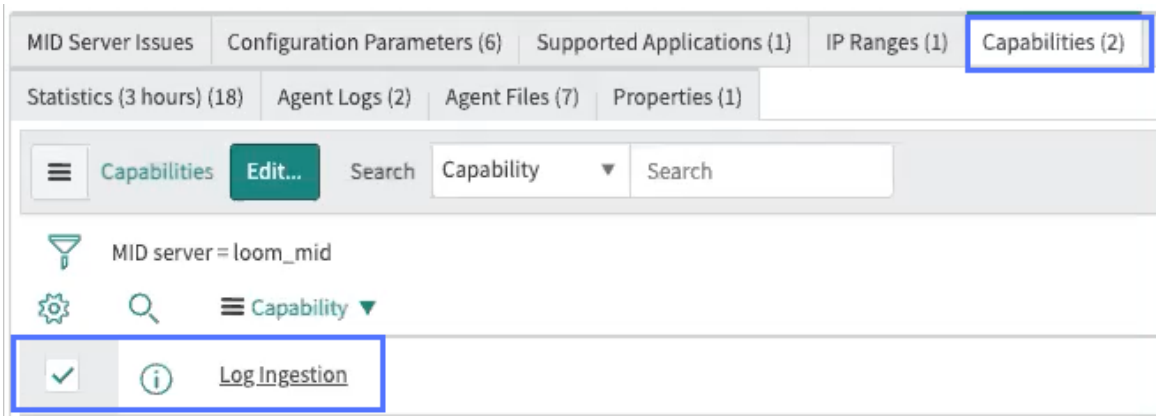
Configure REST API data inputs

Configure a REST API data input for streaming log data to your ServiceNow instance in JSON format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

On the MID Web Server Context form, in the **Execute on** field, select *Specific MID Server* and not the cluster option. In the **MID Server** field, select the specific MID Server to which the log data is pulled.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

The extension handles log messages that are sent to the MID Server by an external log source. The MID Server processes the messages and then passes them to your instance.

To stream log messages to the MID Server, the URL must have the format `http://{MID_SERVER_IP}:{MID_WEB_SERVER_PORT}/api/mid/hla/raw`, where `/api/mid/hla/raw` is the endpoint.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the REST API data input.
4. On the form, fill in the fields.
   For a description of the fields, see REST API data input configuration fields.

   Note: REST API integrations support only UTF-8 encoding for incoming data.

5. Select **Submit**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data in JSON format to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Configure ServiceNow System Logs Retriever data inputs

Configure a data input for streaming log data from the ServiceNow System Log table to the Health Log Analytics AI engine (Occultus).

Before you begin

Note: Only a single ServiceNow System Logs Retriever data input can exist in the system. This data input doesn't run on a MID Server.

Role required: admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the ServiceNow System Logs Retriever data input.
4. On the form, fill in the fields.
   For a description of the fields, see ServiceNow System Logs Retriever data input configuration fields.
5. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record.

The data input starts streaming ServiceNow log data from the System Log table to the Health Log Analytics AI engine, based on the configured filters. Admin users can set filters to query the System Log table. Users with the evt_mgmt_user role can use Event Management to monitor the logs and view the alerts that Health Log Analytics generates from them.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

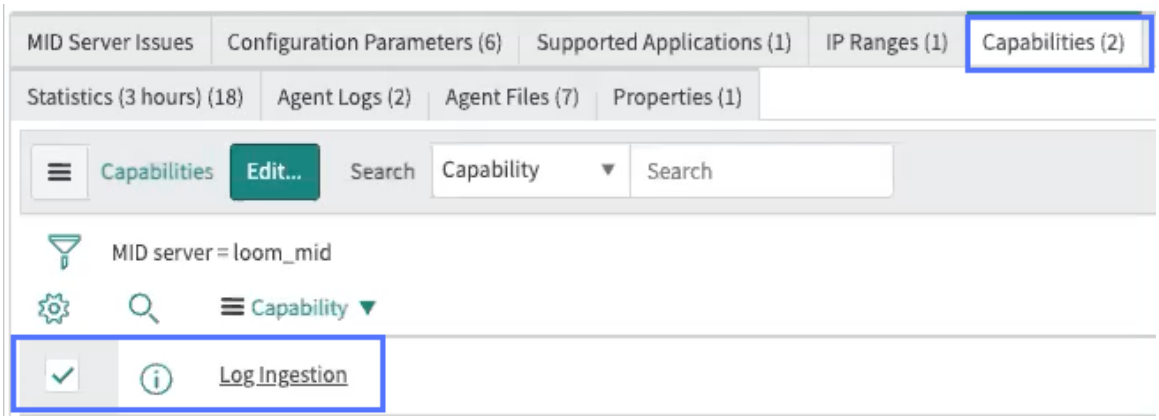
Configure Cribl data inputs

Configure a dedicated Cribl data input to enable Health Log Analytics to process Cribl log messages streaming into your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

If your organization uses Cribl for filtering and routing large volumes of log data from various sources, the log format Health Log Analytics receives is distinct from other types. The Cribl data input enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Cribl data input.
4. On the **Getting Started** tab, fill in the form fields and then select **Next**.
   For a description of the fields, see Cribl data input configuration fields.
5. On the **Config** tab, fill in the form fields and then select **Next**.
   For a description of the fields, see Cribl data input configuration fields.
6. On the **Process** tab, select the required route and then select **Next**.

   For more information, see Cribl data input configuration fields.

Note: For troubleshooting issues related to this step, see the Cribl - Setting up Cribl data input | Troubleshooting setup & data ingestion issues [KB0558611] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Finish** tab opens.

7. On the Cribl instance, verify that the configuration of the data input is correct.
   You can use the Cribl commands displayed on the **Finish** tab as needed.
8. When the configuration is correct, return to the data input configuration **Finish** tab and select **Publish** to publish the data input.

Result

The data input configuration process is complete. The data input starts streaming log data to your ServiceNow instance.

For troubleshooting issues related to the ingestion of log data from Cribl, see the Cribl - Setting up Cribl data input | Troubleshooting setup & data ingestion issues [KB0558611] article in the Now Support Knowledge Base.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

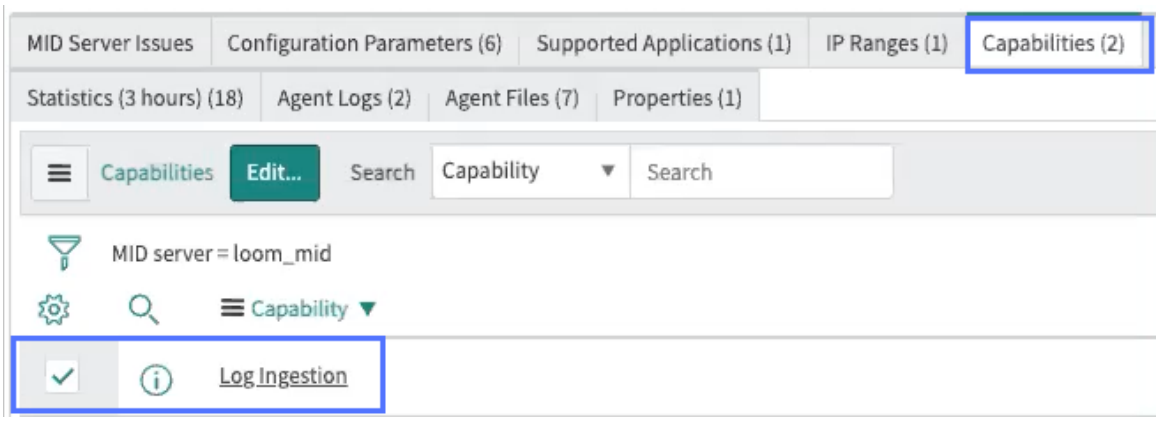
Make sure that the data input is streaming data.

Configure Edge Delta data inputs

Configure an Edge Delta data input to enable Health Log Analytics to process Edge Delta log messages streaming into your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: evt_mgmt_admin

About this task

If your organization uses Edge Delta to handle large volumes of log data from multiple sources before sending it to HLA, the log format HLA receives is distinct from other types. The Edge Delta data input enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Edge Delta data input.
4. On the form, fill in the fields.
   For a detailed description of the fields, see Edge Delta data input configuration fields.
5. Select **Save** to save your configuration.
6. Select **Publish** to publish the data input.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table. The data input starts streaming log data to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

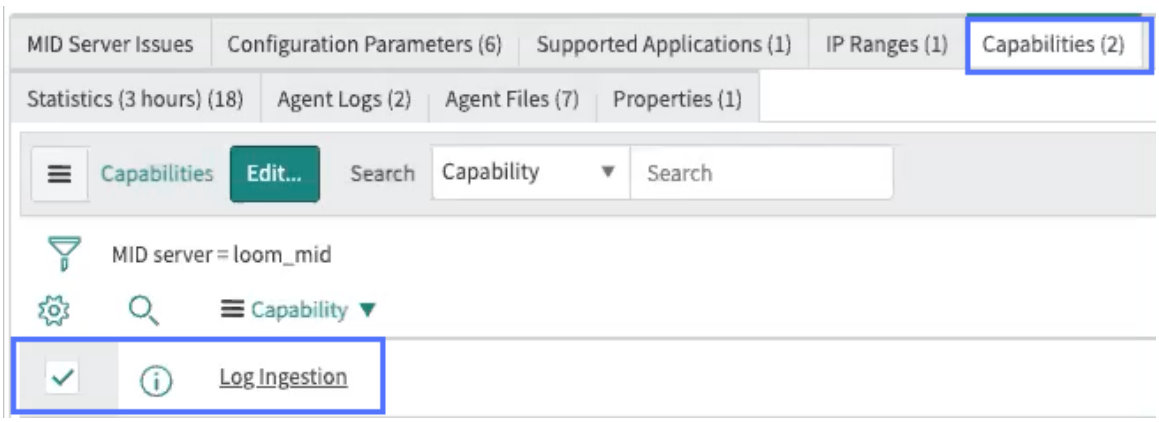
Make sure that the data input is streaming data.

Configure Vector Agent data inputs

Configure a Vector Agent data input to enable Health Log Analytics to process log messages that are streaming into your ServiceNow instance via a Vector Agent.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

- Ensure that you have a `vector.yaml` file on your system, or create one.

Role required: evt_mgmt_admin

About this task

If your organization uses Vector by Datadog to handle log data from multiple sources before sending it to HLA, the log format HLA receives is distinct from other types. The Vector Agent data input enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose **Vector - Stream logs from Vector Agent**.
4. On the **Getting Started** tab, fill in the form and then select **Next**.
   For a detailed description of the fields, see Vector Agent data input configuration fields.
5. On the **vector.yaml** tab, update the code with the relevant values as needed.
   For example, you can specify the sources or source file from which the logs will be streamed.

   Note: Code that you should not modify is preceded by a commented note.

   For more information, consult the Vector documentation.
6. Copy the updated code and paste it into the `vector.yaml` file on your system.
7. Select **Next**.
   The **Finish** tab displays a message confirming that the data input configuration process is complete.
8. Start streaming log data by running Vector with the configuration file.
   Run the following command:`vector --config /path/to/your/vector.yaml`, where `/path/to/your/` is the actual path to your YAML file.
9. **Optional:** Use the other commands displayed on the **Finish** tab as needed.
10. Select **Save** to save the data input.

Result

Health Log Analytics adds the data input record to the **Data Inputs** table. The data input starts streaming log data to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Make sure that the data input is streaming data.

Set up integrations from Integrations Launchpad

Set up integrations for Health Log Analytics from the Event Management Integrations Launchpad in Service Operations Workspace for ITOM.

Integrations Launchpad

The Integrations Launchpad tool provides a unified interface for convenient integration with connectors that feed raw log messages from external sources into your ServiceNow instance for processing and analysis. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Integrations for Health Log Analytics

The Integrations Launchpad enables the following integrations for Health Log Analytics:

Pull integrations

These integrations pull log data from external data sources and stream the data to your instance via a MID Server. Select an integration in the table to open a page with the setup procedure.

Pull integrations

Integration	Description
Elasticsearch	Streams log data from Elasticsearch indices to your instance.
ServiceNow System Logs Retriever	Sends log data from the ServiceNow System Log table to the Health Log Analytics AI engine. **Note:** Only a single ServiceNow System Logs Retriever data input can exist in the system, and only users with the admin role can create and configure it. This data input doesn't run on a MID Server.
Apache Kafka	Streams log data from Apache Kafka to your instance.
Splunk Poller	Pulls log data from Splunk to your ServiceNow instance periodically by query.
Amazon CloudWatch	Streams log data from Amazon CloudWatch to your instance.
Amazon S3	Streams log data from Amazon S3 (Simple Storage Service) buckets to your instance.
Microsoft Azure Log Analytics	Streams log data from Microsoft Azure Log Analytics to your instance. The connector points the Health Log Analytics AI engine to a data source in your Microsoft Azure Log Analytics account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pull integrations (continued)

Integration	Description
MID Server	Collects log messages from the MID Server and streams them to your instance.

Push integrations

These integrations connect to external data sources that push log data to your instance via a MID Server. Select an integration in the table to open a page with the setup procedure.

Push integrations

Integration	Description
UDP	Sends raw log messages to your instance directly over a UDP socket.
TCP	Sends raw log messages to your instance directly over a TCP/SSL socket.
REST API	Streams log data to your instance in JSON format.
GCP PubSub	Receives log messages that were published to a Google Cloud Pub/Sub topic and streams them to your instance.
Splunk UDP	Streams log messages to your ServiceNow instance over the UDP transport protocol using a Splunk heavy forwarder.
Splunk TCP	Streams log messages to your ServiceNow instance over the TCP transport protocol using a Splunk heavy forwarder.
Amazon Data Firehose	Streams log messages from Amazon Data Firehose directly to the collector service in ITOM Gateway, where it's queued for Health Log Analytics processing.
Vector Agent	Enables Health Log Analytics to process log messages that are streaming into your instance via a Vector Agent.

Set up an Amazon CloudWatch integration for Health Log Analytics

Set up an integration for streaming log data from Amazon CloudWatch to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, search for `CloudWatch`.
5. Select the Amazon CloudWatch integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Amazon CloudWatch integration configuration fields.
7. Select **Next** to save your settings and proceed to the next configuration form.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval method** table in Amazon CloudWatch integration configuration fields.
9. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Amazon CloudWatch integration configuration fields.
10. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
11. Do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you completed all the prerequisites before starting the configuration, select **Activate**.

  In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

  When the test is successful, you can activate the integration either with or without AI-powered capabilities. Select the appropriate option:

  - **Activate with AI** enables AI-powered automatic mapping of log data. When the integration is activated successfully, the **Overview** tab is displayed. Now Assist collects and analyzes log data. An AI icon indicates that Now Assist auto-maps log data to service instances and components for contextual alert generation.
  - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

- If you didn't complete all the prior requirements, select **Save draft**.

  The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log data streaming status and sources of an integration.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics.

Set up an Amazon S3 integration for Health Log Analytics

Set up an integration for streaming log data from Amazon S3 (Simple Storage Service) buckets to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

> **Important:** Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, search for S3.
5. Select the Amazon S3 integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Amazon S3 integration configuration fields.
7. Select **Next** to save your settings and proceed to the next configuration form.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval method** table in Amazon S3 integration configuration fields.
9. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Amazon S3 integration configuration fields.
10. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
11. Do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you completed all the prerequisites before starting the configuration, select **Activate**.

  In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

  When the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

- If you didn't complete all the prior requirements, select **Save draft**.

  The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log data streaming status and sources of an integration.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

Set up an Apache Kafka integration for Health Log Analytics

Set up an integration for streaming log data from Apache Kafka to your ServiceNow instance for processing by Health Log Analytics.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

  Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Consider whether to pull the log data to a single MID Server or to a MID Server cluster.

  In MID Server clusters, multiple MID Servers are grouped together for failover protection. The active integration runs on a single MID Server in the cluster. If that MID Server fails, the system moves its tasks to the next available MID Server in the cluster in a configured order.

  If you decide to use a MID Server cluster, verify the following:

  - The MID Server cluster includes only MID Servers that support basic authentication.

    Note: mTLS is not supported for log ingestion.

  - Log ingestion is enabled for each MID Server in the cluster.

    Note: If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically.

  - No more than the default maximum of 10 integrations will pull logs to a single MID Server.

    A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 integrations running on it, even when that MID Server is down.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, search for `Kafka`.
5. Select the Kafka integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Apache Kafka integration configuration fields.
7. Select **Next**.
8. On the **Set data retrieval method** form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the fields, see the **Set data retrieval method** table in Apache Kafka integration configuration fields.

9. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Apache Kafka integration configuration fields.
10. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
11. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

      When the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log data streaming status and sources of an integration.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

Set up an Amazon Data Firehose (MID-less) integration for Health Log Analytics

Set up an integration to stream log data from Amazon Data Firehose directly to the ServiceNow datacenter, where it's queued for Health Log Analytics processing. There's no need to store AWS keys on your ServiceNow instance.

Before you begin

This integration doesn't run on a MID Server.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Firehose` in the search field.
5. Select the Amazon Data Firehose (MID-less) integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see Amazon Data Firehose integration configuration fields.
7. Select **Next**.
8. Follow one of the procedures provided on the **Set-up instruction** screen to install the integration in AWS.
   You can perform the installation procedure using either AWS CloudFormation or the AWS Management Console. Both methods require the same input. The appropriate choice depends on your requirements and the size of your deployment:
   - Use AWS CloudFormation when you need automation, repeatability, and infrastructure-as-code benefits. It's best for deploying standardized configurations across multiple environments. AWS CloudFormation prompts for input automatically.
   - Use the AWS Management Console when you need manual setups or quick configurations without automation.

   Before you perform either of these procedures, copy the access token, the ServiceNow endpoint URL, and the integration ID to the clipboard. You need these values during the installation process.
9. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option:
     - **Activate with AI** enables AI-powered automatic mapping of log data. When the integration is activated successfully, the **Overview** tab is displayed and Now Assist collects and analyzes log data. An AI icon indicates that Now Assist auto-maps log data to service instances and components for contextual alert generation.
     - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.
   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see Activate a draft integration in Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log data streaming status and sources of an integration.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics.

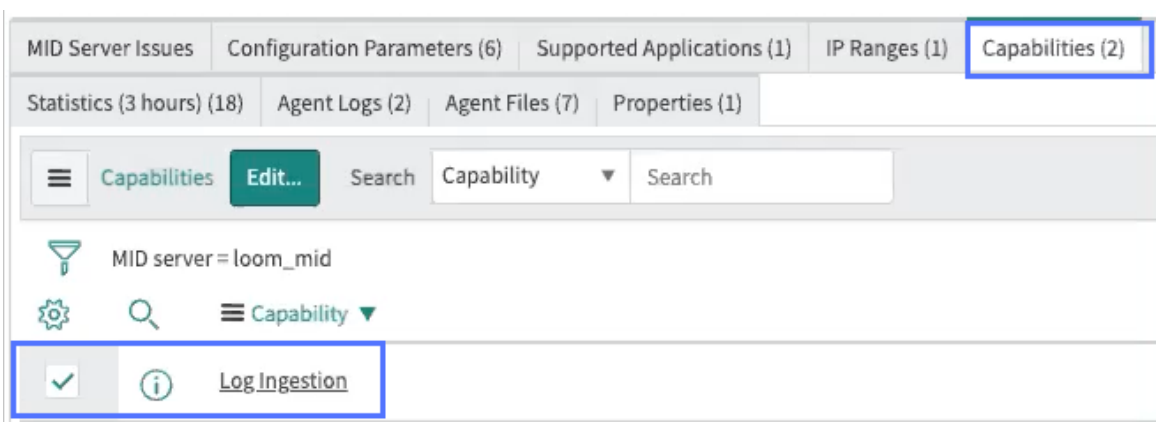
Set up an Elasticsearch integration for Health Log Analytics

Set up an integration to stream log data seamlessly from Elasticsearch indices to your instance for Health Log Analytics processing.

Before you begin

Note: Health Log Analytics supports Elasticsearch versions above 7.10.2 and below 8.18.2. For advanced Elasticsearch log streaming guidance, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the Health Log Analytics AI Engine is up and running.
- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter *`Elasticsearch`* in the search field.
5. Select the Elasticsearch integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Elasticsearch integration configuration fields.
7. Select **Next**.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see Elasticsearch integration configuration fields.
9. **Optional:** Select **Advanced settings** to set advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Elasticsearch integration configuration fields.
10. Do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you completed all the prerequisites before starting the configuration, select **Activate**.

  In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

  When the test is successful, you can activate the integration either with or without AI-powered capabilities. Select the appropriate option:

  - **Activate with AI** enables AI-powered automatic mapping of log data. When the integration is activated successfully, the **Overview** tab is displayed. Now Assist collects and analyzes log data. An AI icon indicates that Now Assist auto-maps log data to service instances and components for contextual alert generation.
  - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

- If you didn't complete all the prior requirements, select **Save draft**.

  The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log data streaming status and sources of an integration.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics.

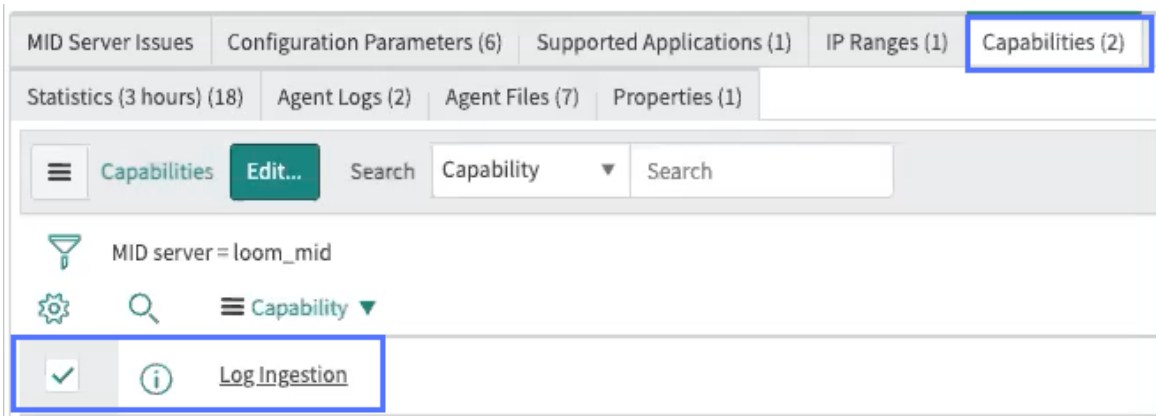
Set up a GCP PubSub integration for Health Log Analytics

Set up an integration for receiving log messages that were published to a Google Cloud Platform (GCP) Pub/Sub topic and streaming them to your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Google Cloud` in the search field.
5. Select the Google Cloud Platform integration tile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in GCP PubSub integration configuration fields.
7. Select **Next**.
8. On the **Set up connection** form, fill in the fields to connect to GCP PubSub.
   For a description of the fields, see the **Set up connection** table in GCP PubSub integration configuration fields.
9. **Optional:** Select **Advanced Settings** and fill in the fields.
   For a description of the fields, see the **Advanced Settings** table in GCP PubSub integration configuration fields.
10. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
11. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

      When the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log data streaming status and sources of an integration.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in MID Server integration configuration fields.
7. Select **Advanced Settings** and fill in the fields.
   For a description of the fields, see the **Advanced Settings** table in MID Server integration configuration fields.
8. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     The integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log data streaming status and sources of an integration.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

Set up a REST API integration for Health Log Analytics

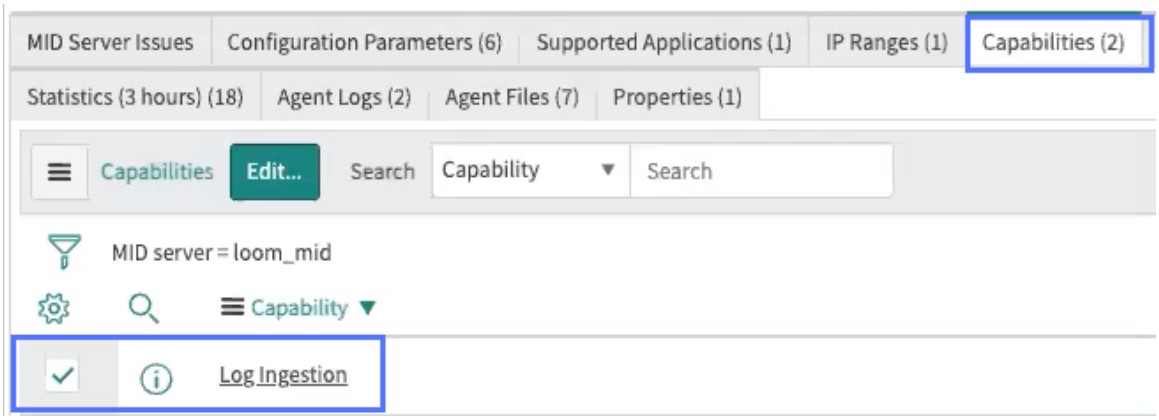
Set up an integration for streaming log data to your ServiceNow instance for processing by Health Log Analytics.

Before you begin

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the Health Log Analytics AI Engine is up and running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

On the MID Web Server Context form, in the **Execute on** field, select *Specific MID Server* and not the cluster option. In the **MID Server** field, select the specific MID Server to which the log data is pulled.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Note: REST API integrations support only UTF-8 encoding for incoming data.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter REST in the search field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the REST API integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see REST API integration configuration fields.
7. Select **Next**.
8. In the **Set-up instruction** screen, copy the provided URL to the clipboard.

   The format of the URL is: `http://(MID_SERVER_IP):(MID_WEB_SERVER_PORT)/ap1/mid/hla/raw`, where `/aps/mid/hla/raw` is the endpoint. HLA has replaced `(MID_SERVER_IP)` and `(MID_WEB_SERVER_PORT)` with the values you configured on the **Provide details** form.

9. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     When the integration is activated successfully, the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

Instruct your API client to send log messages to the MID Server.

1. In the API client, configure a request with the following parameters:
   - HTTP Method: POST.
   - URL: The URL you copied in the **Set-up instruction** screen.
   - Authentication: The required authentication credentials. For example, Basic authentication (username and password).

     Note: The authentication method must be the same as the method configured on the MID Web Server.

   - Headers: Set the `Content-Type` header to match your payload format.
     - For JSON: `application/json`.
     - For raw text: `text/plain`.
   - Body: The logs payload in JSON or raw text.
2. Send the request.

   A successful response indicates that the MID Server has received the payload. When the MID Server has processed the log messages, the data input streams them to your ServiceNow instance using the REST protocol.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up a ServiceNow System Logs Retriever integration for Health Log Analytics

Set up an integration for streaming log data from your ServiceNow platform's System Log table to the HLA engine.

Before you begin

Note:

- This integration doesn't run on a MID Server.
- Only a single ServiceNow System Logs Retriever integration or data input can exist in the system.

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the HLA Engine is up and running.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `System Logs` in the search field.
5. Select the ServiceNow System logs tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. The **Provide details** form is displayed.
   These fields are auto-populated, because only one ServiceNow System Logs Retriever integration or data input can exist in the system. For a description of the fields, see the **Provide details** table in ServiceNow System Logs Retriever integration configuration fields.
7. Select **Next**.
8. **Optional:** On the **Set data retrieval method** page, build conditions for filtering log data from the System Log table before it is streamed to the HLA engine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional) This page helps you focus on the specific logs you want to monitor. For example, you might want to look at Discovery logs or exclude email logs. By default, all logs are included.

9. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     The integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see Activate a draft integration in Health Log Analytics.

Result

Log data starts streaming from the ServiceNow System Log table to the Health Log Analytics AI engine, based on the configured filters. The dedicated HLA engine for your instance starts analyzing your system logs in real-time.

Note: Starting with Health Log Analytics version 37.0.15, you can use the ServiceNow System Logs Retriever integration to automatically detect errors and anomalies in your ServiceNow instance's system log. By combining HLA's anomaly detection with Now Assist's GenAI capabilities, you can identify and resolve platform issues more effectively for a better user experience. For more information, see Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics.

What to do next

Use the information in the **Overview** tab to refine how HLA reads the log data by adjusting your integration configuration. For more information, see Review log data streaming status and sources of an integration.

Note:

- The MID Server streaming status and the **Log streaming sources** table do not appear on the **Overview** tab for this integration, because it doesn't run on a MID Server.
- When the integration is first configured, it may take up to 24 hours for the first alerts to appear. Once the data is populated, you can refresh the screen to see real-time metrics.

Use the More menu to go directly from the **Overview** tab to the **Data Input Mapping**, **Source Type Structures**, and **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More menu also provides direct access to the **Log Viewer**, where you can see the raw logs that the integration ingests.

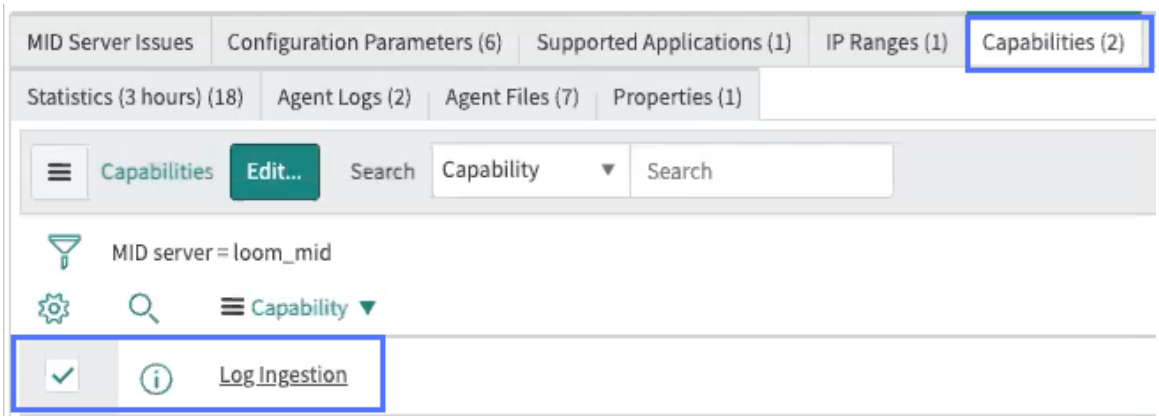
Set up a Splunk Poller integration for Health Log Analytics

Set up an integration that periodically pulls log data from Splunk to your ServiceNow instance for processing by Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.
- The MID Server must support basic authentication.

  Note: mTLS is not supported for log ingestion.

- No more than the default maximum of 10 integrations will stream logs to a single MID Server. You can modify the maximum number by adding the property `sn.occ.log_ingestion.max_datainputs_per_mid` to the MID Server and then changing the default value.

  To find out how many data inputs are streaming logs to the same MID Server, navigate to the **Streaming Sources** table and count the data inputs that stream to a specific MID Server.

- Consider whether to pull the log data to a single MID Server or to a MID Server cluster.

  In MID Server clusters, multiple MID Servers are grouped together for failover protection. The active integration runs on a single MID Server in the cluster. If that MID Server fails, the system moves its tasks to the next available MID Server in the cluster in a configured order.

  If you want to use a MID Server cluster, verify the following:

  - The MID Server cluster includes only MID Servers that support basic authentication.
  - Log ingestion is enabled for each MID Server in the cluster.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically.

- No more than the default maximum of 10 integrations will stream logs to a single MID Server.

  A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 integrations running on it, even when that MID Server is down.

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Splunk Poller` in the search field.
5. Select the Splunk Poller integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Splunk Poller integration configuration fields.
7. Select **Next**.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval method** table in Splunk Poller integration configuration fields.
9. Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see Splunk Poller integration configuration fields.
10. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
11. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

- If you didn't complete all the prior requirements, select **Save draft**.

  The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

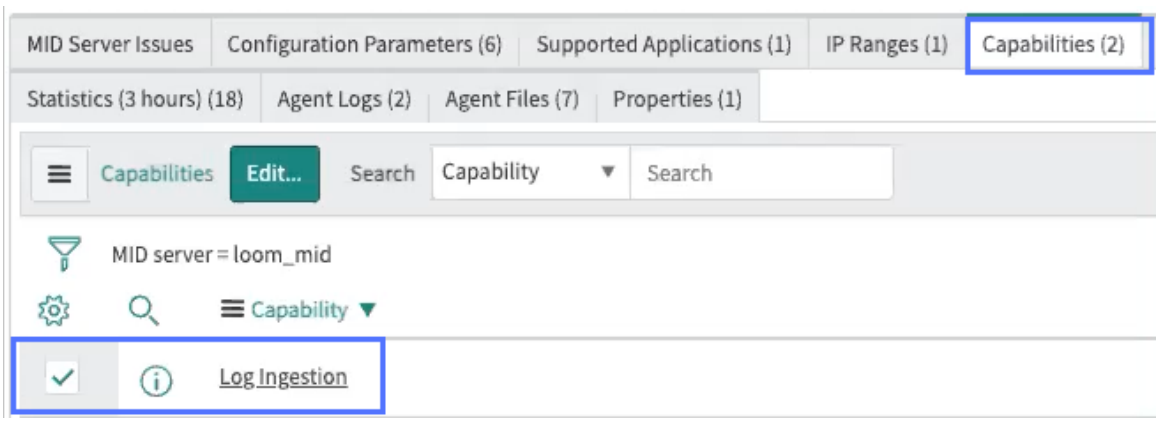
- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log data streaming status and sources of an integration.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

Set up a Splunk TCP integration for Health Log Analytics

Set up an integration to stream log messages to your ServiceNow instance over the TCP transport protocol using a Splunk heavy forwarder. Health Log Analytics processes the ingested log data.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Splunk` in the search field.
5. Select the Splunk TCP integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Splunk TCP integration configuration fields.
7. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.

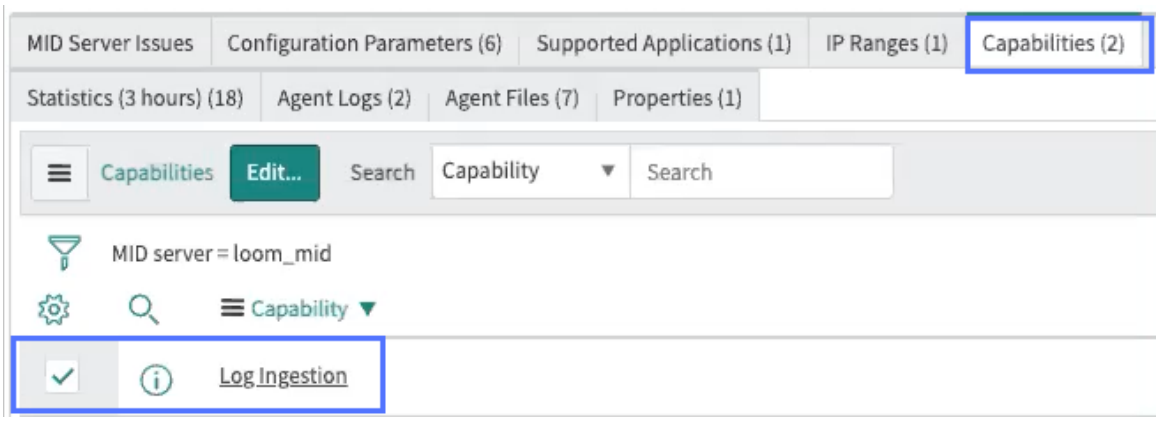
Set up a UDP integration for Health Log Analytics

Set up an integration for sending log data to your ServiceNow instance directly over a UDP socket.

Before you begin

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the HLA Engine is up and running.
- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.

3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter UDP in the search field.
5. Select the UDP integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in UDP integration configuration fields.
7. **Optional:** Select **Advanced Settings** to set advanced configuration fields.
   For a description of the fields, see the **Advanced Settings** table in UDP integration configuration fields.
8. Select **Next**.
9. In the **Setup instruction** screen, follow the instructions on the screen to install the integration in the third-party console.
10. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      When the integration is activated successfully, the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log data streaming status and sources of an integration.
- Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

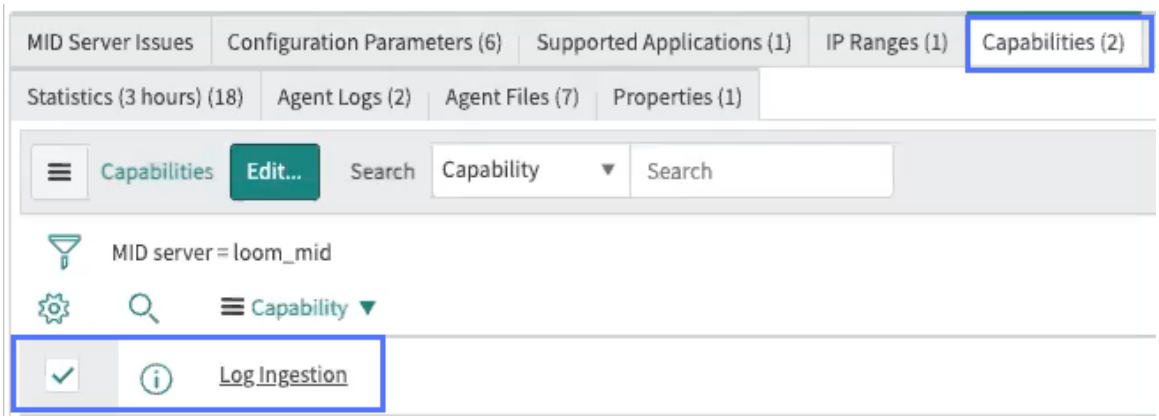
Set up a Vector Agent integration for Health Log Analytics

Set up a Vector Agent integration to enable Health Log Analytics to process log messages that are streaming into your ServiceNow instance via a Vector Agent.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

- Verify that you have a `vector.yaml` file on your machine, or create one.

Role required: evt_mgmt_admin

About this task

If your organization uses Vector by Datadog to handle log data from multiple sources before sending it to Health Log Analytics, the log format HLA receives is distinct from other types. The Vector Agent integration enables HLA to detect and separate transport headers from inner log messages in this format. Only the inner messages are forwarded to the source type structure for processing.

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Vector` in the search field.
5. Select the `Vector` integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Vector Agent integration configuration fields.
7. Select **Next**.
8. In the **Set-up instruction** screen, follow the instructions on the screen to install the integration in your third-party console.
   Update the `vector.yaml` file as explained in the steps.
9. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

     When the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log data streaming status and sources of an integration.
- Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:

© 2026 ServiceNow, Inc. All rights reserved.

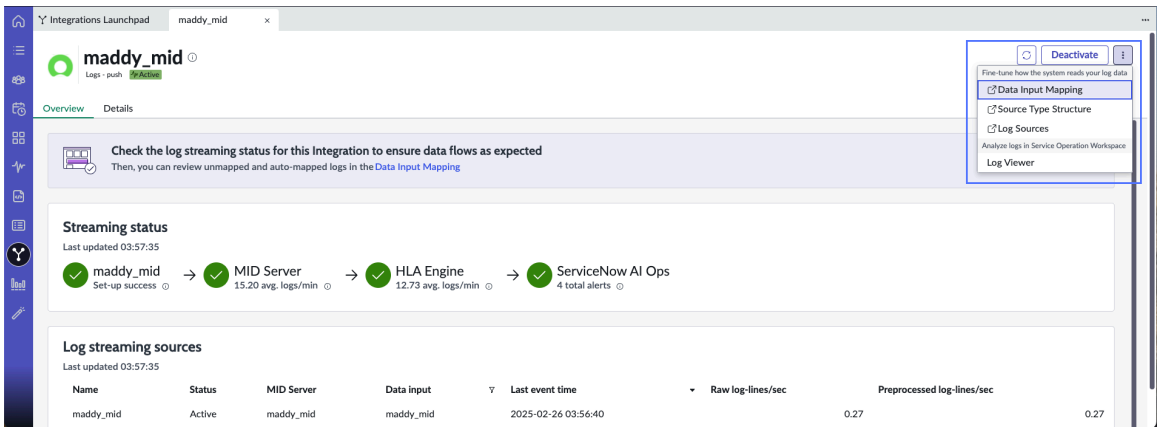
- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

Monitoring log data flow and optimizing integration settings in Health Log Analytics

The Overview screen in Health Log Analytics provides a comprehensive view of the components in the log-processing pipeline of active integrations. From this screen, you can troubleshoot any streaming issues and adjust the integration's settings if needed.

The **Overview** screen shows the log data streaming status and streaming sources of an active integration. It provides direct access to the **Data Input Mapping**, **Source Type Structures**, and **Log Sources** pages, as well as the **Log Viewer**, all with context from the current integration.

Overview screen and View menu items



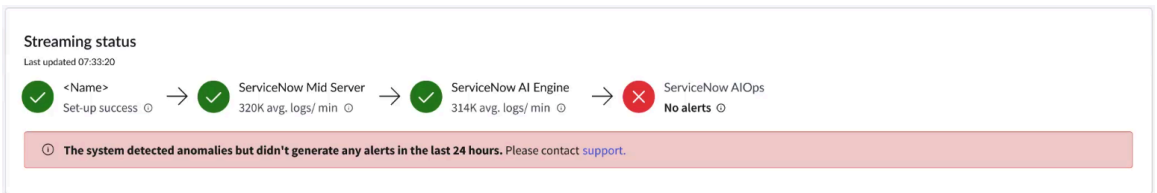
Streaming status

The **Streaming status** section on the **Overview** screen shows the status of data streaming between the log source and the MID Server and between the MID Server and the HLA engine. It displays the number of logs per minute passing through the MID Server and through the HLA engine.

> **Note:** For the ServiceNow System Logs Retriever integration, the **Overview** screen doesn't display the MID Server streaming status because that integration doesn't run on a MID Server.

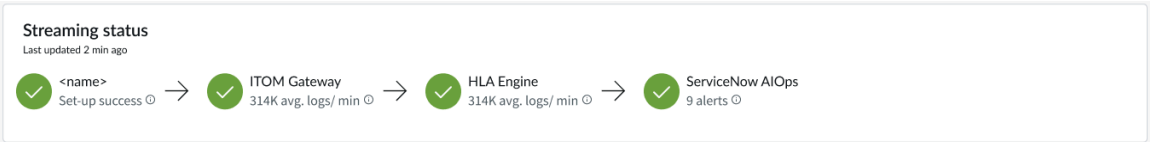
The ServiceNow AIOps component shows the total number of alerts that the HLA engine has created. These statistics are updated when the **Overview** screen loads and are automatically refreshed every minute to show live data. You can change the default auto-refresh time interval through the system property *sn_itom_integ_app.overview_page_data_input_stats_auto_refresh_interval_second*

If data streaming fails, the integration is automatically deactivated and the **Streaming status** marks the component where the failure occurred. In addition, a banner explains the failure and either proposes steps to take to fix it or refers to ServiceNow support.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For MID-less or OpenTelemetry Protocol (OTLP) integrations, such as Amazon Data Firehose, the **Overview** screen displays the ITOM Gateway as a component in the log-processing pipeline. The MID Server component is not shown in the pipeline, because log data is sent directly from the source to the ITOM Gateway. The logs are then processed by the HLA engine to find anomalies.



For these integrations, the **Overview** screen shows the average rate of logs per minute over the last 15 minutes passing through the ITOM Gateway and the HLA engine, similar to the metrics shown for MID-based ingestion.

Note: The ITOM Gateway component is shown only if the MID Server property *mid.hla.itom_gateway_streaming.enabled* is set to true. For more information, see MID Server properties.

When the integration isn't streaming live data from the source, a warning message is displayed. There is a 4-hour interval between the last log source time and the current time before this message is generated. You can change the default time interval through the system property *sn_itom_integ_app.overview_page_log_source_time_threshold_hours*.

Note: The warning message is displayed only when the HLA engine is up and running.

Log streaming sources

Depending on your integration, the **Log streaming sources** table displays the following information about the integration's log streaming sources.

Note: This table isn't available for the ServiceNow System Logs Retriever integration.

Log streaming sources

Column	Description
Name	The name of the log data source.
Status	The streaming status: Active or Not active.
Data input	The integration streaming the data to your ServiceNow instance.
MID Server	The MID Server to which the log data is streaming.
Last event time	The time when the integration received the latest event.
Last log processing time	The time when the last log was received or processed.
Raw log lines/sec	The average number of raw log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value represents the number of raw log lines before preprocessing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log streaming sources (continued)

Column	Description
Pre-processed log lines/sec	The average number of preprocessed log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value can differ from the number of raw log lines per second. For example, the difference can be a result of logs having been dropped during preprocessing.

Example

As an admin, you use the integration **Overview** page to verify continuous data flow into the ServiceNow instance. If log streaming fails, HLA doesn't receive the real-time data needed to detect anomalies or generate alerts.

For example, the **Streaming Status** for an active Elasticsearch integration may show a red circle with a white X for the MID Server component in the log-processing pipeline. This indicates that logs are not reaching the MID Server.

The **Log Streaming Sources** table shows a state of Authentication Failed or Connection Error, with an error message indicating invalid credentials. This points to an issue with the Elasticsearch credentials. Fixing the credentials and either restarting the log service or waiting for the next polling cycle, restores the connection.

The **Log Streaming Sources** table now shows a connection state of Connected or Active with successful authentication. The **Streaming Status** displays a green circle with a white check mark for the MID Server component. With log streaming restored, HLA can resume processing data and generating anomaly alerts.

Related topics

Review log data streaming status and sources of an integration

Review log data streaming status and sources of an integration

Review the log data streaming status and streaming sources of an active integration for Health Log Analytics on the integration's Overview screen. From this tab, you can investigate streaming issues and refine the integration settings. Leverage the displayed data to refine how HLA reads the log data by adjusting the integration's configuration.

Before you begin

Confirm that the integration has been activated on the Integrations Launchpad. For more information, see Set up integrations from Integrations Launchpad.

To access the Log Viewer from the Overview tab with context from the integration, you must have the ServiceNow Service Operations Workspace Log Analytics application installed.

Role required: evt_mgmt_admin

About this task

For more information about the data shown in the **Overview** screen, see Review log data streaming status and sources of an integration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Manage installed integrations**.
   The Integrations Launchpad appears.
4. In the **Installed integrations** tab, search for an active integration and open it.
   The **Overview** screen displays, showing the integration's data streaming status and its log data sources data.

   Note: The ServiceNow System Logs Retriever integration doesn't run on a MID Server. Therefore, for this integration the **Overview** screen doesn't display the MID Server streaming status.

5. Analyze the provided data and investigate any data streaming issues.
6. **Optional:** Adjust the configuration of the integration, if needed.

   Use the options on the View menu ( ) to navigate to the relevant table or the Log Viewer.

   Note: The View menu content changes dynamically depending on whether the referenced tables contain data.

View menu options

Option	Description
Data Input Mapping	Opens the **Data Input Mapping** page. On this page, you can map sources manually if HLA didn't discover properties automatically. For more information, see Map raw log data.
Source Type Structure	Opens the **Source Type Structures** page. In the Source Type Structure, log data is classified and organized based on its origin or type. You can adjust the structure and verify that the HLA AI engine extracts properties properly and classifies them correctly. For more information, see Source type structure adjustment.
Log Sources	Opens the **Log Sources** table. This table enables you to verify that HLA has created all your log sources. If a log source is missing, you can add it manually. For more information, see Verify your log sources.
Log Viewer	Opens the **Log Viewer**, which shows the frequency of anomalies in the log data during a specific time period. For more information,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	see Reviewing the logs for an alert on the Log viewer. **Note:** The Log Viewer option appears only if the Service Operations Workspace Log Analytics application is installed.

7. When you have resolved any data streaming issues and fixed the configuration, select **Test and save**.
   The system saves the updated configuration to the database and tests the configured port, returning either success or an error. If an error is returned, fix the configuration according to the suggestions on the screen and then select **Test and save** again. Once the test is successful, continue with the next step.
8. Reactivate the integration.

Mapping logs for contextual alerts in Health Log Analytics

Map your logs to service instances, components, and source types so that Health Log Analytics (HLA) can generate alerts in context. Contextualizing your log data is especially important when the integration processes logs from multiple service instances and components.

The AI agent suggests the optimal log field for mapping to service instances and components. When you use the AI-suggested field, or when that field is the default, an AI sparkle icon (✨) appears. You can select a different field if needed. If the AI agent cannot find an optimal match, HLA uses the system default. The system default also applies if the selected field is not present in the sample log.

Example

A large financial institution might face performance issues with its e-banking application, which relies on various components like web, application, and database servers. Without log context mapping, logs from these components appear isolated, complicating issue correlation. An anomaly in a Tomcat server log might be detected, but without proper context, the operator struggles to assess its impact. Log context mapping enables defining rules to map logs to the e-banking application service instance and the Tomcat server component. This mapping provides a contextualized view for root cause analysis and resolution.

Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics

Map your logs to service instances, components, and source types so that Health Log Analytics (HLA) can generate contextual alerts.

Before you begin

Configure and activate an integration before you perform this procedure. For more information, see Set up integrations from Integrations Launchpad.

Role required: evt_mgmt_admin

About this task

HLA uses the settings that you define in this procedure to identify service instances, components, and source types in log examples and map log data to them automatically. HLA links logs to the corresponding service instances, components, and source types for contextualized analysis. By default, automatic log context mapping is enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI suggests the optimal log field for mapping to service instances and components. When you use the AI-suggested field or if it's the default field, an AI sparkle icon (✨) appears. You can select a different field if needed. If AI can't find an optimal match or if your selected field is missing from the sample log, HLA uses the system default.

Important: If a manually defined mapping script exists in the **Data Input Mapping** page, automatic mapping overwrites it.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. Under Integrations, select **Manage installed integrations**.
   The Integrations Launchpad appears.
4. On the **Installed integrations** tab, search for an integration and open it.
   The **Overview** screen displays.
5. Under **Next steps**, on the **Log context mapping** card, select **View mapping**.
   The **Log context mapping** table displays.
6. Select the relevant integration.
   The integration's **Log context mapping** page displays.

   Note: If the selected integration has features that are unsupported in Service Operations Workspace, you're referred to the **Data Input Mapping** page. For more information, see Map raw log data.

7. **Optional:** Turn off automatic service instance and component mapping by using the toggle.
   If you turn off automatic mapping, you must define a mapping script manually in the **Data Input Mapping** page. For more information, see Map raw log data.

   The remaining steps in this procedure are only relevant when automatic mapping is enabled.

   Note: When you open the **Log context mapping** form for the first time, the system default values display in all fields.

8. Configure the log field by which HLA identifies a service instance from the **Raw log field** drop-down list.
   A service instance represents a complete business process.
9. Configure the log field by which HLA identifies a component from the **Raw log field** drop-down list.
   A component represents the smallest part of a service instance. A single service instance typically comprises multiple components.
10. **Optional:** Select **Preview** to view the service instances and components the system has identified based on your settings in the previous steps.
    The service instances and components are grouped by service.
11. In **Advanced settings**, review the fallback service and set the log field by which the system identifies a source type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Selected fallback service** field, review the fallback service the system uses if it can't identify the service instance in the log data.
The displayed fallback service is the default service instance that you selected when you configured the integration.

> **Note:** For some integrations, such as Filebeat, this field shows N/A instead of a value. In these integrations, if HLA can't identify the service instance, it uses the system default value rather than the fallback service.

b. Configure the log field by which HLA identifies a source type from the **Raw log field** drop-down list.

c. **Optional:** Select **Preview** to view the log sources the system has identified based on your source type settings.

12. **Optional:** In the Simulator, review a log processing simulation based on your current mapping. The provided simulation helps you understand how the current mapping impacts HLA log processing. Use this information to fine-tune your settings:
    - The **Log fields** tab shows the default service, component, and source type and the raw log.
    - The **Extracted values** tab shows the service instance, component, and source type that the system has extracted from the raw log based on your current settings.
13. Select **Save mapping** to save your settings.

Activate a draft integration in Health Log Analytics

Activate an integration that was configured and saved as a draft in Health Log Analytics (HLA).

Before you begin

Configure an integration in draft mode through the Integrations Launchpad and save it.

Role required: evt_mgmt_admin

Procedure

1. Complete all the prior requirements for the integration.
2. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration tile.
3. On the configuration page, select **Activate**.
    - For Push integrations: The integration is activated and the **Overview** tab is displayed. The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad.
    - For all other integrations: Continue with the following steps.
4. In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity.
If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.
5. When the test is successful, select the appropriate activation option.
    - **Activate**

      The integration is activated and the **Overview** tab is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If your integration supports activation with AI capabilities, you can select this option to activate the integration without enabling these capabilities.

- **Activate with AI**

  Note: This option is only available if your integration supports activation with AI capabilities.

  The integration is activated with AI capabilities enabled and the **Overview** tab is displayed. Now Assist collects and analyzes log data, and an icon indicates that it auto-maps log data to service instances and components for contextual alert generation.

The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad

Edit installed integrations

Edit an installed integration for streaming log data to Health Log Analytics on the Integrations Launchpad. For example, you can switch to a different service instance.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Manage installed integrations**.
   The Integrations Launchpad appears.
4. On the **Installed integrations** tab, search for and select the tile for the integration you want to edit.
5. Select a tab that you want to edit.
6. Select **Deactivate** to deactivate the integration.

   Note: You must deactivate the integration before you can edit it.

7. Select **Edit**.
8. Edit the integration per your requirements.
9. Select **Test and save**.
   Health Log Analytics tests the MID Server connectivity, returning either success or an error. If an error is returned, make adjustments to your configuration as suggested on the screen, and then select **Test and save** again. When the test is successful, you can reactivate the integration.
10. Select **Activate**.

Deactivate log data integrations

Deactivate an integration for streaming log data to Health Log Analytics on the Integrations Launchpad.

Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Manage installed integrations**.
   The Integrations Launchpad appears.
4. On the **Installed integrations** tab, search for and select the integration tile for the integration you want to deactivate.
5. On the **Overview** tab, select **Deactivate**.

Result

The integration is deactivated and stops streaming log data to your ServiceNow instance.
The deactivated integration is still available on the Integrations Launchpad in the **Installed integrations** tab, under **Waiting for your action**.

Identify and resolve log streaming issues

Identify and address log streaming issues to ensure that the data inputs you have configured for Health Log Analytics are streaming data properly to your ServiceNow instance.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Streaming Sources**.
   The Streaming Sources page shows all data inputs and the MID Servers that are receiving logs from them.

   Note:

   - When **Look up hostnames** is selected in the advanced data input configuration, the Streaming Sources page shows the hostname of devices that use an Rsyslog or a Filebeat shipper. For Elasticsearch indices, it displays the index name.
   - Streaming Sources is also available as a related list on the data input form. The related list displays only the endpoint devices that are relevant to that data input.
   - If the HLA engine is down and data has stopped streaming, a notification appears at the top of the Streaming Sources page. When this happens, contact ServiceNow support.

2. Select a data input record to view the streaming data of its sources and identify streaming issues and their possible cause.
   For example, if the last recorded event time for a data input's endpoint server is yesterday, that server might be down or configured incorrectly. A streaming issue might also be caused by the data input configuration file not being installed on the endpoint.

Filter	Description
Status	The status of the source. A red bullet indicates that this source has not streamed data in the last hour.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter	Description
Last event time	The last recorded time an event arrived at the MID Server in the last one-minute interval. Health Log Analytics continuously updates the last event time. If the last event time is not up to date, data is not streaming.
Raw log lines/sec	The average number of raw log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value represents the number of raw log lines before preprocessing.
Preprocessed log lines/sec	The average number of preprocessed log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value can differ from the number of raw log lines per second. For example, the difference can be a result of logs having been dropped during preprocessing.

3. Investigate and resolve any data streaming issues.

Note: If you experience permissions-related issues with streaming log data from Elasticsearch, refer to the Granting privileges for data streams from Elasticsearch [KB0967366] article in the Now Support Knowledge Base.

What to do next

When the logs are streaming properly, proceed to map your raw log data.

Note: You can choose to edit incoming raw log data before Health Log Analytics processes it. For example, preprocessing enables you to discard log portions or remove sensitive data from your logs. This task is optional.

Edit raw log data before processing

You can modify raw log data and drop or break up log messages before they are processed in the MID Server, and therefore before Health Log Analytics maps and structures it. For example, you could prevent sensitive data from reaching the system by replacing user names and passwords with an asterisk (*).

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Input Preprocessor**.
2. Open a record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The first time the preprocessing form is displayed, Health Log Analytics fetches log samples automatically. In subsequent sessions, fetch fresh samples manually by selecting **Refresh Samples**.

3. **Optional:** Prevent showing log samples that are taken from your organization's raw logs by selecting **Disable raw log samples**.
   Select this option if you don't want to expose your logs to Health Log Analytics.
4. **Optional:** View how the current JavaScript function affects the log lines.
   a. Add a sample message in the **Test manual sample** field.
   b. Select **Go**.
   c. Note how the JavaScript function affects the log lines.
5. In the **Raw input samples** field, choose a log sample that will show the effect of your new JavaScript function on log lines when you test it.
6. Define a JavaScript function that modifies your raw log data before Health Log Analytics maps and structures it.

Note:

(ACC data inputs only) When the Agent Client Collector switches to a different MID Server to provide failover protection, it must switch to a different ACC data input. Therefore, all ACC data inputs must have the same JavaScript function. Health Log Analytics provides the latest published JavaScript function to all existing and future ACC data inputs, replacing the previous script. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. For information about failover protection in Agent Client Collector Log Analytics (ACC-L), see Agent Client Collector Log Analytics.

a. In the JavaScript console, either change the provided default JavaScript function, modify an existing custom JavaScript function, or define a new one.

Note: In addition to the default JavaScript function for data preprocessing, Health Log Analytics provides a JavaScript function template named `Scrubbing`. This JavaScript function removes personally identifiable information such as email addresses, social security numbers, and passwords, from the raw log data. The template can act as a starting point for your custom script code. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

Note: (ACC data inputs only) Make sure that your JavaScript function can be used to handle data streamed by all ACC data inputs.

JavaScript functions for preprocessing raw log data use the following objects:

- Signature: function process(sample, metadata)

Object	Description
sample	The current log sample.
metadata	Object that contains the event stream. To access the event stream, call the `metadata.eventStream` function. Because event stream is an object, you can

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Object	Description
	access each of its properties by calling the `metadata.eventStream.origin` or `metadata.eventStream.LocalPort` functions. The list of available event stream properties is available in the **Event Stream: access via metadata** tab.

- Return type and structure

  Note: The JavaScript function returns a map of two entries. Do not change this return structure.

Object	Description
modifiedInput	The current log message after the JavaScript function has modified the original message. If null, the original log message is used.
splitEvents	Array of log messages after the JavaScript function has divided the original message.

- To discard a log message, call `return drop()`.

b. Test the JavaScript function by selecting **Test** and viewing the outcome on your log sample in related lists.

Tab	Description
Outcome	The result of running the JavaScript function on your log sample.
Event Stream: access via metadata	The key-value pairs that present the event stream metadata.
Failures	The log samples on which the JavaScript function failed to run successfully.

Note: If your new JavaScript function is not behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

c. Optional: Make any necessary adjustments and then test the JavaScript function again.

7. Select the **Save template** option to save the JavaScript function.
You can either save the JavaScript function as a new template or overwrite the currently selected template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To save the JavaScript function as a new template, enter a new name in the **Template name** field.
- To overwrite the template currently selected in the **JS function templates** field, leave the **Template name** field empty.

8. Select **Publish** to save the JavaScript function to the database.

Result

When the JavaScript function is published, Health Log Analytics uses it to pre-process your raw log data before mapping and structuring it.

The new script is automatically added to the list of JS function templates from which you can choose. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

(ACC data inputs only) Health Log Analytics provides the published JavaScript function to all existing and future ACC data inputs. The new JavaScript function replaces the previous script.

What to do next

Proceed to the **Data Input Mapping** page by selecting the **Go to Mapping** related link. Map raw data that streams into your instance to determine how Health Log Analytics processes it.

Log data auto-mapping and mapping

By default, the Health Log Analytics AI engine tries to auto-map every incoming log line to the correct tags. You can change automatic mapping results manually by defining a JavaScript function.

Auto-mapping incoming log lines

Health Log Analytics auto-mapping assigns log samples and metadata to three tags: service instance, component, and source type. The service instance assignment is based on the service instance specified in the data input setup. The remaining tags are assigned automatically.

For example, in the following example log line, Health Log Analytics uses the "source" field to find the component and source type.

```
{"beat":{"version":"6.8","name":"abc3.prd.acme.com","hostname":"
abc3.prd.acme.com"},"@timestamp":"2020-08-27T10:12:24.792Z","pro
spector":{"type":"log"},"message":"****
 User null is requesting the following page
 http://www.acme.com PROPS:{"subcategory1":"home
 pages","httpStatus":"200","loginLevel":"Anonymous","userAgent":
"Mozilla5.0",
 ("pageUrl":\"http://www.acme.com","host":"abc3.prd.acme.com","@
version":"1","source":"/opt/oracle/weblogic/abc/online_store3/lo
gs/online_store3.out","offset":3951550786}
```

In the example, Health Log Analytics extracts the string "online_store". It analyzes the following fields if they exist in the log line: source, path, channel, namespace_name, name, pod_name, source_name, and aws_lambda_name. When data is sent over Syslog, it also analyzes the syslog tag.

Stop extraction of unneeded data

If an extracted string is not descriptive enough or contains redundant text or information, you can stop extracting such expendable data. For more information, see Stop extraction of unneeded log data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ensuring extraction of specific data

You can make sure that Health Log Analytics extracts specific desired terms. For more information, see Ensure extraction of specific log data.

Mapping data input sources

You can change automatic mapping results manually by defining a JavaScript function. Data input mapping enables you to organize your log data by service instance and by availability zone. A single service instance can include multiple components, and a component can receive logs from many different source types. An service instance-component pair, however, is unique. Source types are based on a specific log structure and format. Service instances and components are defined more broadly and are therefore used mainly for logical mapping.

Activating **Test mode** avoids blowing up Elasticsearch storage with sample data that is used only for perfecting the log data mapping. When the data input is in Test mode, Health Log Analytics doesn't create the source types, sources, or any other objects it creates in the standard flow. It saves the streamed data in dedicated temporary Elasticsearch indices that appear as components in the Log viewer. When you publish the script and exit Test mode, these temporary indices are deleted to minimize storage space consumption.

When you're defining a JavaScript function, select **Test** to view the outcome of the script as it is currently specified. This functionality enables you to preview the created source types and sources. You can then refine the script until it achieves the desired outcome. For example, it can be useful to compare the test outcome of several versions of the JavaScript function.

Note: By default, the test processes 100 log data samples. You can customize this number in the system properties. For more information, see Configure global Health Log Analytics system properties.

During the data input setup, the system might create an excessive total number of data input sources. For example, this can be due to a faulty mapping script. You can configure limits for the number of sources created per data input in the system properties:

System property	Description	Default
log_source.sources_warning_limit	The warning limit for the number of sources created per data input.	500
log_source.sources_critical_limit	The critical limit for the number of sources created per data input.	600

The number of log sources that a specific data input has created displays in the **Sources count** field for that data input. When the total number of sources created during the data input setup reaches the warning limit, the system sends a warning notification by email. It also displays a message on the **Data Input mapping**, **Log sources**, and **Data input** pages. The notification and the message include the total number of sources created so far and the three data inputs that contributed the most sources to this total. If no action is taken, the system continues to create sources until the total number reaches the critical limit. When this happens, the data input setup and streaming from all data inputs stops automatically. You can't start data inputs again manually until the issue has been resolved. You can resolve this state by following the instructions in the How to handle too many sources in data inputs [KB0963067] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Binding log data

Binding log data to Configuration Items (CIs) in the Configuration Management Database (CMDB) enables you to search the CMDB for endpoints that match a log. When you configure a data input, you bind log entries to a service instance that is bound to a CI in the CMDB. Binding log entries, service instances, and CIs enables the Health Log Analytics AI engine to correlate them for use in root cause analysis (RCA). For more information, see Configure Rsyslog, Filebeat, or Winlogbeat data inputs or Configure Elasticsearch data inputs.

Map raw log data

Mapping raw log data that streams into your instance determines how the data is handled. Health Log Analytics automatically structures logs, creates metrics for anomaly detection, and presents alerts based on how your data is tagged.

Before you begin

Role required: evt_mgmt_admin

About this task

By default, Health Log Analytics tries to auto-map every incoming log line to the correct tag. If properties aren't discovered automatically, map the data input sources manually by defining a JavaScript function.

In the JavaScript function, you are required to map only the service instance (here called application service). Mapping the component and the source type is optional: Health Log Analytics tries to extract their values from the log data automatically. If the attempt fails, it assigns the default values. If you map the component but not the source type or vice versa, the system tries to extract the missing value from the log data. If it fails, it assigns the component value to the source type or vice versa, depending on which one you have mapped. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

Note:

(ACC data inputs only) When the Agent Client Collector switches to a different MID Server to provide failover protection, it must switch to a different ACC data input. Therefore, all ACC data inputs must have the same JavaScript function. Health Log Analytics provides the latest published JavaScript function to all existing and future ACC data inputs, replacing the previous script. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. For information about failover protection in Agent Client Collector Log Analytics (ACC-L), see Agent Client Collector Log Analytics.

Note: You can manipulate raw log data before Health Log Analytics maps and structures it. For more information, see Edit raw log data before processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Data Input Mapping**.
2. Open a record.

Note: The first time the Data Input Mapping form is displayed, Health Log Analytics fetches log samples automatically. In subsequent sessions, fetch fresh samples by selecting **Refresh Samples**.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the Data Input Mapping page. When this happens, contact ServiceNow support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. **Optional:** To forward the complete raw log message, disable automatic header properties detection for this data input by selecting **Disable header detection**.
   For more information, see Header properties detection.
4. **Optional:** Activate Test mode by setting the **Test mode** value to ON.
   In Test mode, Health Log Analytics doesn't create the source types, sources, or any other objects it creates in the standard flow to avoid blowing up Elasticsearch storage with sample data. For more information, see Log data auto-mapping and mapping.
5. **Optional:** View how the current JavaScript function affects log lines.
   a. Add a sample message in the **Test manual sample** field.
   b. Select **Go**.
   c. Note how the JavaScript function affects the log lines.
6. In the **Raw input sample** field, choose a log sample that will show the effect of your new JavaScript function on log lines when you test it.
7. **Optional:** Enable HLA to identify service instances and components from log fields and automatically map log data to them by selecting **Enable auto map from log field**.

   Note:
   - Automatic log context mapping can only be configured in the Service Operations Workspace. For more information about this feature, see Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics.
   - If a manually-defined mapping script exists, automatic log context mapping overwrites it.
   - To be able to define a JavaScript function manually in the current form, the **Enable auto map from log field** check box must be clear.

8. Define a JavaScript function that maps your data input sources to the correct service instance (here called application service), component, and source type.

   Note: (ACC data inputs only) Make sure that your JavaScript function can be used to handle data streamed by all ACC data inputs.

   a. In the JavaScript console, either modify the provided default JavaScript function or a custom JavaScript function selected from the **JS functions templates** drop-down list, or define a new JavaScript function.
   The provided templates can act as a starting point for your custom script code. Available templates are:
   - Default Mapping Script
   - Glide Node Log Mapping Script
   - Glide Sys Log Mapping Script
   - Linux OS logs streamed with Syslog

     Note: Logs must have a syslog wrapper for this JavaScript function to work properly.

   - Mid Server Log Mapping Script
   - Windows - Winlogbeat logs streamed with Winlogbeat

   The JavaScript function for mapping raw log data uses the following objects:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Signature: function map(sample, metadata)

Object	Description
sample	The current log sample after preprocessing.
metadata	Object that contains: ▪ Event Stream: Access via: <metadata value>. For example: `metadata.eventStream.origin` ▪ Transform header 1: Access via: <metadata value>. For example: `metadata.headers.i1.type` ▪ Transform header 2: Access via: <metadata value>. For example: metadata.headers.i2.type ▪ type Transform header 3: Access via: <metadata value>. For example: `metadata.headers.i3.type` ▪ Fallback Assignment: Access via: <metadata value>. For example: `metadata.fallBacks.host`

Note: You can create and associate multiple services per source type.

- Return type and structure

Note: The JavaScript function returns a map of two entries. Do not change this return structure.

Object	Description
applicationService	The existing application service (that is, the service instance) to which this sample will be assigned. **Note:** The service instance must be bound to anomaly alerts related to the log.
component	The component to which this sample will be assigned.
sourceType	The source type to which this sample will be assigned.

- To discard a log message, call `return drop()`.

b. Test the JavaScript function by selecting **Test**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Testing the JavaScript function enables you to view the outcome of the script on the log sample. For a description of the displayed fields, see JavaScript function test outcome fields.

Note: If your new JavaScript function is not behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

c. **Optional:** Make any necessary adjustments and then test the JavaScript function again.

d. **Optional:** Compare the outcome of multiple tests.
Comparing the test results of several versions of the JavaScript function can help you refine the script until it achieves the desired outcome.

9. When you have finalized the JavaScript function, select **Save template** to save it.
You can either save the JavaScript function as a new template or overwrite the currently selected template.
   - To save the JavaScript function as a new template, enter a new name in the **Template name** field.
   - To overwrite the template currently selected in the **JS function templates** field, leave the **Template name** field empty.
10. Select **Publish** to save the JavaScript function to the database.

Result

When the JavaScript function is published, Health Log Analytics uses it to map data input sources.

The new script is automatically added to the list of JS function templates from which you can choose. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

(ACC data inputs only) Health Log Analytics provides the published JavaScript function to all existing and future ACC data inputs. The new JavaScript function replaces the previous script.

What to do next

- (Optional) Edit your raw log data before Health Log Analytics maps and structures it. If you want to perform this task immediately, click the **Go to Preprocessor** related link to proceed to the **Data Input Preprocessor** page.
- (Optional) Fine-tune how the system reads your log data by refining the Source Type structure. This step enables you to reclassify auto-classified properties and change auto-mapped labels.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
Health Log Analytics uses source types to parse logs and utilizes log sources as the framework for detecting anomalies. Each source type provides logs that are analyzed by multiple log sources, and each log source receives logs that are parsed by multiple source types. Reviewing the associations between source types and log sources can help you improve your data input mapping for better performance and outcomes.

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Data Input Mapping**.
2. Ensure that log data is streaming into your instance, and then open a data input mapping record.
3. View the associations between the log sources and the source types.
   - View the log sources that are associated with a source type:
     a. Open the **Source Types** tab to view the generated source type structures.
     b. Open a source type structure record.
     c. Select a source type.
     d. Under **Sources**, view all the log sources that receive data from this source type.
   - View the source types that are associated with a log source:
     a. Open the **Sources** tab to view the generated log sources.
     b. Select a log source record.
     c. On the **Source Types** tab, view all the source types that feed data into this log source.

Note: The displayed results are updated once a day. Results that are older than 24 hours are deleted automatically.

Header properties detection

In Health Log Analytics, automatic header properties detection separates the transport header from the inner log message and forwards only the inner log message to the source type structure. The inner message contains the actual log data without including shipping information.

The Health Log Analytics application supports header properties detection for Fluentd, Beats, and Syslog (RFC 3164, RFC 5424).

Starting with Version 33.0.27 - August 2024, the system also supports header properties detection for logs that follow the OpenTelemetry logs data model and semantic conventions. For more information, see the OpenTelemetry Logs Data Model documentation.

Disabling header properties detection

When you disable header properties detection for a data input, the Health Log Analytics AI Engine stops extracting properties from the header. Forwarding the complete raw message can be useful in the following situations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The inner log message lacks information for parsing, such as timestamp and severity.
- The data input contains information that can be used for structuring.
- The data input forwards the logs fully parsed.

For the procedure to disable header properties detection, see Map raw log data.

Stop extraction of unneeded log data

If an extracted string of data is not descriptive enough or contains redundant text or information, you can set Health Log Analytics to stop extracting such data from your logs.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Excluded values**.
2. Select **New**.
3. In the **Value to exclude** field, enter the string that you want Health Log Analytics to stop extracting.
4. **Optional:** Further specify the values to stop extracting by selecting additional options:
   - Starts with
   - Ends with
   - Contains
   - Case sensitive
5. **Optional:** In the **Description** field, add a description of the value.
6. Select **Submit**.

Ensure extraction of specific log data

Set Health Log Analytics to extract specified terms from fields and map them to specific components.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Extracted values**.
2. Select **New**.
3. In the **Value to extract** field, enter the term that you want Health Log Analytics to extract from your logs.
4. In the **Map to component** field, enter the component that you want the value mapped to.
5. In the **Property** field, choose a property from the list.
6. **Optional:** Further specify the value to extract by selecting additional options:
   - Exact match
   - Case sensitive
7. **Optional:** In the **Description** field, add a description of the value.
8. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Source type structure adjustment

Health Log Analytics enables you to reclassify auto-classified properties and change auto-mapped labels. These adjustments help Health Log Analytics machine learning to better understand your priorities.

What HLA does automatically

HLA automatically separates the transport header from the inner log message and sends only the inner log message to the source type structure. The system extracts properties from incoming log messages and auto-maps labels to source type fields.

- Classification determines how the HLA engine analyzes and processes each field. Available classifications are: METER, GAUGE, ARC_ONLY, HISTOGRAM, INVALID.
- Labels tell HLA what role a field plays in the log structure. Available labels are: MESSAGE, HOST, TIMESTAMP, SEVERITY, EVENT-ID.

Reviewing and, if necessary, modifying automatically mapped labels and auto-classified properties in the source type structure verifies the HLA engine interprets log fields correctly.

Note: Because a single data input can contain multiple source types, HLA structures log data by source type rather than by data input.

AI-powered classification and labeling suggestions

Simplify classification and labeling of parsed log properties with AI-powered automatic classification and labeling suggestions. You can access the AI agent from the **Source Type Structure** page to receive AI-suggested classifications and labels based on dynamic analysis of your log samples. AI-suggested classifications include METER, GAUGE, ARC_ONLY, and INVALID. AI-suggested labels include MESSAGE, HOST, TIMESTAMP, and SEVERITY. After reviewing the suggestions, select your preferred classifications and labels.

Example

The following example shows how to modify values of extracted properties in the source type structure with JavaScript.

Consider the following log:

```
{
  "TenantId": "abc-01-02-03-04-05050708091011121314",
  "@timestamp": "2020-08-28T08:29:23.967Z",
  "Computer": "john Doe_computer",
  "EventType_s": "LogMessage",
  "Job_s": "johnDoe_cell",
  "IP_s": "1.00.00.00",
  "message": "This is the extracted message. This part of the
 message includes superfluous content and values",
  "MessageType_s": "OUT",
  "Timestamp_d": 1598603359017850000,
  "Type": "my_LogMessage_is",
  "_ResourceId": ""
}
```

The sample code contains `"key":"value"` pairs: The key is the property name. The value is the property value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The key "message" in the sample has the following value: `"This is the extracted message. This part of the message includes superfluous content and values"`.

If you wanted your logs to contain only the meaningful part of that message, you would add JavaScript code instructing the system to extract only that part:

```
//Added JavaScript to extract only the first sentence in the
 message! if (output['message'] != null){ output['message'] =
 output['message'].slice(0, output['message'].indexOf("\.")); }
 (edited)
```

You could use the same logic to reclassify a value. For example, if the key "Computer" is insignificant, you could set its value to "Invalid."

For more information about the source type structure, see the Source Type Structure – Labels & Classifications [KB0863562] article in the Now Support Knowledge Base.

Note: You can reactivate the learning mode for a source type structure to use the HLA engine's learning functionality again after the initial learning period becomes outdated. On the **Source Type Structure** form, select **Relearn** to reset parsing, extraction, classification, and labeling for the source type structure and restart the learning process.

Refine the source type structure

Fine-tune how Health Log Analytics reads your inner log messages and detects anomalies by customizing the extracted properties in the source type structure.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Inputs** > **Source Type Structure**.
2. Open a record.

   Note:

   - Health Log Analytics automatically separates the transport header from the inner log message when **Auto extraction** is selected (default).
   - Health Log Analytics fetches log samples automatically the first time the **Source Type Structure** form displays. In subsequent sessions, fetch the latest samples by selecting **Refresh Samples**.

3. **Optional:** Get AI-powered classification and labeling suggestions.

   AI can classify parsed log properties and suggest appropriate labels.

   a. Select **Suggest classifications (AI)** from the **Source Type Structure** page.

      On the **Key/Value Mapping** tab, AI-suggested classifications and labels appear in the **AI-suggested classification** and **AI-suggested label** columns.

   b. Review the suggestions.

   c. In the **Classification** and **Labels to assign** columns, select your preferred classifications and labels from the lists.

4. **Optional:** View how the current JavaScript function affects the log lines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Add a sample message in the **Test manual sample** field.

b. Select **Go**.

c. In the **Key/Value Mapping** tab, note how the JavaScript function affects the log lines.

5. In the **Raw input sample** field, choose a log message.

   When you test your JavaScript function, Health Log Analytics uses this sample message to show the joint effect of automatic extraction and the JavaScript function on the log lines.

   The following fields are read only:

Field	Description
Duration (ms)	The processing time of all samples, in milliseconds.
Dropped	The total number of logs dropped in all the samples.
Errors	The total number of errors that occurred in all the samples.
Timestamp extraction failures	The number of timestamp extraction failures that occurred in all the samples.
Severity extraction failures	The total number of severity extraction failures that occurred in all the samples.
Message extraction failures	The total number of message extraction failures that occurred in all the samples.
Lengthy properties	The total number of lengthy properties in all the samples. Lengthy properties are properties with more than 256 characters. **Note:** Because Health Log Analytics doesn't extract such properties, they aren't indexed as keywords in Elasticsearch.

6. Define a JavaScript function that customizes automatically extracted properties or adds properties to the source type structure.

   a. In the JavaScript console, either change the provided default JavaScript function, modify an existing custom JavaScript function, or define a new one.

      Note: In addition to the default JavaScript function, Health Log Analytics provides several JS function templates for refining the source type structure. The templates can act as a starting point for your custom script code. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JS function templates	Description
Extract Key_Values Using Regex	Script used for parsing logs into a series of key:value pairs by using regular expressions to identify specific regex patterns. Depending on the log data being sent to the source type, it parses either the inner message or the full log line. You can view how the data appears in the samples that are loaded into the source type structure. This process is iterative. It ’s repeated until all key:value pairs are found.
Extract Key_Values Using split-regex	Script used for parsing logs into a series of key:value pairs by using regular expressions to identify specific regex patterns. This process captures the values in a LIST form first, then uses the Java split function to create the key:value pairs. Depending on how the data appears in the raw input, this function might be more efficient than `Extract Key_Values Using Regex`. The raw input is either the inner message that header detection passes on, or the full raw log. If header detection is turned off or doesn't work on that particular log, the full raw log is used.
JSON Parse - flatten	Script used for extracting JSON information that is part of another text string from the raw input. For example, the information could be a JSON request written as part of a longer inner message. Inner JSON sections are difficult to split. In such cases, this script can be used to "flatten" or parse out the key:value pairs.
Extract a new field from raw input	Script that extracts a new field from the raw input, using a regular expression with capture groups to identify the new field's pattern.
Parse XML format	Script used for extracting key:value pairs from the XML by using a regular expression to identify the XML format. This process is iterative. It's repeated until all key:value pairs are found.
Set numerical severity level as textual values	Script used for converting numerical severity values to their corresponding textual severity values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JS function templates	Description
	Note: To enable the system to identify the severity level of a log correctly, severity must be given in text format. No numerical severity values should remain.
Trim function	Script used for removing the double quotes that surround the string from VALUE. You can adapt this function to remove any other characters that surround the output VALUE of a key:value pair.

The JavaScript function for refining the source type structure uses the following objects:

Signature - function construct (sample, output)

Object	Description
sample	The inner message extracted from the sample message.
output	Object that contains the key-value pair map.

b. Test the JavaScript function by selecting **Test**.

c. View the outcome of the JavaScript function in the related lists and modify if needed.

- The **Key/Value Mapping** tab shows the effect of your JavaScript function combined with the system's automatic extraction on your raw input sample.

  Modify keys where appropriate.

  - The **Classification** field enables you to reset the classification of a property. The available types are:

Classification

Type	Description	Example
Meter	A property with this classification detects anomalies in the number of times the property appears in each log message. It presents changes in the quantity of this value as part of Automatic Root Cause analysis. **Note:** Properties classified as Meter consume resources.	Status codes, response codes, actions, or patterns

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Description	Example
Gauge	A property with this classification detects anomalies in a numerical value that is reported continuously. **Note:** Properties with a classification of Gauge consume resources.	CPU, memory, or response time
Timeless Gauge	A property with this classification detects anomalies in a numerical value that is not reported continuously. The system notifies about an anomaly in this value regardless when the anomaly occurred. **Note:** This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.	
Automatic Root Cause (ARC Only)	A property with this classification reports the property as part of the Automatic Root Cause analysis of another anomaly and not as an anomaly by itself.	User name, IP addresses, application components, or datacenter
Invalid	A property with this classification isn't calculated or shown in the Automatic Root Cause analysis. **Note:** Properties classified as Invalid save resources.	

- The **Labels to assign** field enables you to set a property on a label.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Labels to assign

Label	Description
Timestamp	The property that holds the timestamp of the event. **Note:** If automatic header properties detection is enabled and the source type lacks a timestamp, the system extracts the timestamp from the transport header. If header detection is turned off or doesn't work for the relevant log lines in the data input, all log lines must have proper timestamps.
Severity	The property that represents the severity level of the log.
Message	The log message. The system uses this property to identify textual patterns in the data.
Host	The property that represents the host from which the event was sent. **Note:** If automatic header properties detection is enabled and the source type lacks a host, the system extracts the host from the transport header. If header detection is turned off or doesn't work for the relevant log lines in the data input, all log lines must have a host.
External ID	The property that serves as a unique identifier for this event type. For example, Event ID in Windows event log.

  - The **Rename key** field enables you to rename the key.
- The **Outcome Key-Value** tab shows how your JavaScript function processed the data.
- The **Data Input Mappings** tab shows the data input mappings for the current source type.

  The **Last event time** column on this tab shows the last date and time that the AI engine processed a log for the data input mapping. The system refreshes this information every five minutes. Knowing when the last log was processed for this data input mapping makes it easier to verify that log data is streaming.

- The remaining tabs show errors, message extraction failures, severity extraction failures, timestamp extraction failures, and lengthy properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If your new JavaScript function isn't behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

d. **Optional:** Make any necessary adjustments and then test the JavaScript function again.

7. Select the **Save template** option to save the JavaScript function.
   You can either save the JavaScript function as a new template or overwrite the currently selected template.
   - To save the JavaScript function as a new template, enter a new name in the **Template name** field.
   - To overwrite the template currently selected in the **JS function templates** field, leave the **Template name** field empty.
8. Select **Publish** to save the JavaScript function to the database.

Result

When the JavaScript function is published, Health Log Analytics uses it to fine-tune how it reads your inner log messages and detects anomalies.

The new script is automatically added to the list of JS function templates from which you can choose. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

What to do next

Continue with the remaining data input setup tasks: Verify that all your log sources are present and active, and add timestamp formats if necessary.

Additional data input setup tasks

After performing the initial data input setup and configuration, continue with the remaining data input setup tasks.

Add timestamp formats

Define any timestamp format that does not appear in the list of defined formats. Health Log Analytics must be able to read timestamps of any format contained in your log files.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Timestamp Formats**.
2. To determine whether your timestamp format matches a predefined format in the system, do the following:
   a. Select **Find format**.
   b. Enter a sample of your timestamp.
   c. Select **Find format**.
   If the sample matches an existing format, the system provides its ID.
3. If your timestamp sample doesn't match an existing format, then manually define your custom format and add it to the available timestamp formats.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the Timestamp Formats page, select **New**.

b. On the form, fill in the fields.

Timestamp format form

Field	Description
ID	ID of the timestamp format. This value is selected automatically.
Format	Valid timestamp format. For example, dd-MMM-yyyy, HH:mm. **Note:** Health Log Analytics uses the Java 8 API for timestamp syntax.
Sample	Example of the timestamp format. For example, 03-May-2018, 10:20.
Description	Description of the timestamp format.

4. Select **Submit**.

Result
The system validates the timestamp format and adds it to the list of available timestamps.

Add source types manually

Create a source type manually before you configure a data input if you want to stream log data to a specific source type rather than to the source type automatically extracted by Health Log Analytics during the mapping process.

Before you begin
This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Source Types**.
2. On the Source Types page, select **New**.
3. On the form, fill in the fields.

Source type form

Field	Description
Name	The name of the source type. The name must be between 3-50 characters long. Acceptable characters are letters, numeric values, dashes, and underscores.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Examples	One or more raw input samples for this source type. Enter each sample on a new line. **Note:** This field must contain data.

The fields in the following table are read-only.

Field	Description
Created manually	Option for indicating that this source type was created manually. Default: true.
Auto-extraction enabled	Auto-extraction for this source type is disabled by default.
Learning mode	Option for indicating that Learning mode for the source type is ongoing. The AI engine must learn the format of log messages in each new log stream. In Learning mode, it learns the format of messages for this source type and extracts properties based on that knowledge.

4. Right-click the form header and select **Save**.
5. Select **Load examples** to load the raw input samples for this source type that you provided in the **Examples** field.
   When loading the log samples is completed successfully, the **Examples** field and the **Load examples** buttons no longer appear on the form.
6. **Optional:** Check how the AI engine has parsed the raw input samples by selecting the **Go to Source Type Structure** related link and modify the extracted properties if necessary.
7. Click **Submit**.

What to do next

Configure a data input and then map it to the new source type. For more information, see Set up data inputs for Health Log Analytics manually and Map raw log data.

Related topics

Refine the source type structure

Configure source type capabilities

Health Log Analytics extracts source types automatically in the mapping process. You can add timestamp formats and specify, delete, or exclude keywords for individual source types.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Source Types**.
   The Source Types table lists all source types that were extracted automatically during raw data mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Source Types

Field	Description
Auto extraction enabled	Auto-extraction for this source type is either enabled or disabled. This value is set on the Source Type Structure form. Default: true.
Learning mode	Learning mode for the source type is either ongoing or completed. The AI engine must learn the format of log messages in each new log stream. In Learning mode, it learns the format of messages for this source type and extracts properties based on that knowledge.
Stack trace detection enabled	Detection of active stack frames for this source type is either enabled or disabled. Typically, a stack trace enables tracking an error to the log in which it originated.

2. Open a record.
3. **Optional:** Add a timestamp format for this source type.
   a. On the **Source Type Timestamps** tab, select **New**.
   b. In the **Timestamp format** field, select a format from the list of available timestamp formats.
   c. Select **Submit**.
4. **Optional:** Specify a keyword for this source type.
   a. On the **Lexical Keywords** tab, select **New**.

      Note: The **Lexical Keywords** tab contains both global and specified keywords. Selecting **New** creates a specified keyword for this source type.

   b. On the form, fill in the fields.

Field	Description
Name	Unique and descriptive name for the keyword.
Regular expression	The regular expression ("regex") that defines matches.
Exact match	Boolean value. If selected, Health Log Analytics matches the exact regex. For example, 'NullPointerException' in a message would not match the regex 'exception'. Default: True
Case-sensitive	Boolean value. If selected, Health Log Analytics looks for a case-sensitive match of the regex.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Default: False

c. Select **Submit**.

5. **Optional:** Delete a keyword specified for this source type.
   a. Select the row of the specified keyword that you want to delete.
   b. From the **Actions on selected rows** list at the bottom of the page, select **Exclude keyword**.
   c. Select **Continue** to delete the keyword.
6. **Optional:** Exclude a global keyword for this source type
   When you exclude a keyword, Health Log Analytics no longer looks for it in the log data of this source type.
   a. Select the row of the global keyword that you want to exclude.
   b. From the **Actions on selected rows** list at the bottom of the page, select **Exclude keyword**.

   Note: You can delete global keywords from the Lexical Keywords page.
7. Select **Update**.

Verify your log sources

Verify that all your log sources are present and active after Health Log Analytics tagging has assigned a log to a service instance and components, and has automatically mapped the log to a source.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Log Sources**.
   The Log Sources table provides information about the sources created when you mapped the streaming data. The table lists these sources by service instance.

Column	Description
Service instance	The service instance. Service instances represent large or complete business processes. A single service instance can consist of multiple components, whereas different service instances can include the same components.
Component	The components comprising the service instance. Components represent small technical parts or business processes. Typically, they represent Configuration Items (CIs). Several

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	components are often clustered together in a single service instance.
Status	The status of the log source: Active or Inactive. The Active status indicates that logs streamed into the system from this source in the last hour.
Created	The creation date and time of this log source.
Last event time	The last time logs streamed into the system from this source.

2. Make sure that the system has created all your log sources.
3. Verify the creation, status, and log samples of a specific source in the source record.

   Note: Because auto-mapping can map log data to multiple sources, be sure to verify this information per source.

4. If a log source is missing, add it.

   a. Navigate to **Health Log Analytics** > **Data Input** > **Data Input Mapping**.

   b. Use the JavaScript function to manually map a log sample to the correct service instance, component, and source type.
   For more information, see Map raw log data.

   c. Navigate back to the Log Sources page and verify that the status of the new log source is Active.

   The system creates a log source.
5. Make sure that the status of all your log sources is Active.
   If the status of a source is Inactive, double-click it and change it to Active manually.
6. Select **Update**.

Review the properties extracted from a source type in Health Log Analytics

View the properties that were extracted from all the source types in a source type structure in a single table to identify any setup issues.

Before you begin
Role required: evt_mgmt_admin

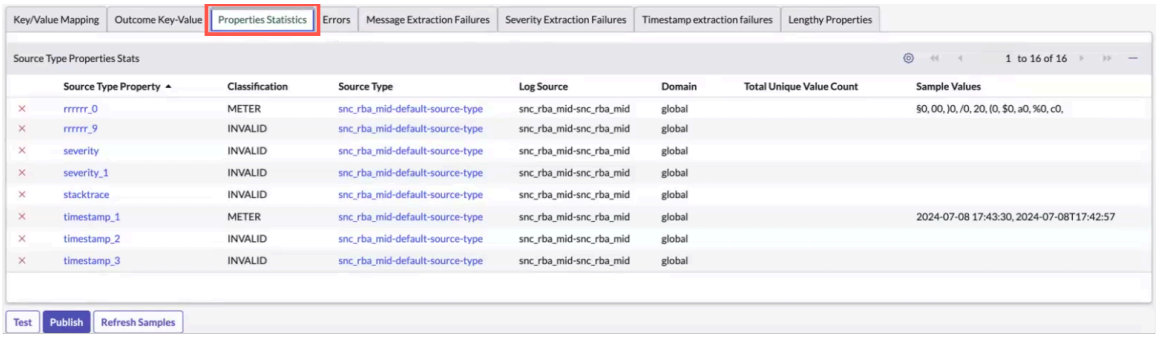
About this task
The Source Type Properties Stats table provides a comprehensive overview of the properties that were extracted from the source types. By reviewing the statistical distribution of their values, you can assess the classification of these properties and adjust your settings if needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The procedure in this section explains how to access the Source Type Properties Stats table via the Source Type Structure. From a source type record, you can navigate to the Source Type Structure by selecting the **Go to Source Type Structure** related link.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Source Type Structures**.
2. Open a source type structure record.
3. Open the **Properties Statistics** related links tab.



The **Source Type Properties Stats** table shows the properties of all the source types that are part of this source type structure.

Source Type Properties Stats

Column	Description
Source Type Property	The property extracted from the source type.
Classification	The classification of the property. The available types are: METER, GAUGE, ARC, and INVALID. **Note:** A property classified as INVALID (the default classification) isn't tracked for anomaly detection or shown in the Meaningful Properties analysis.
Source Type	The source type from which the property was extracted.
Log Source	The list of Log Sources in which this property appeared.
Domain	The domain to which the log source belongs.
Total Unique Value Count	Only for properties classified as METER: The total number of distinct values contained in it. This field is inactive when the property is classified as ARC or GAUGE. **Note:** The Total Unique Value Count is updated once a day. Records older than 24 hours are deleted automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Sample Values	Only for properties classified as METER: Sample unique values tracked by the system. Default is 30 samples. This field is inactive when the property is classified as ARC or GAUGE.

4. Review the properties and identify possible classification issues.
5. **Optional:** View statistics for individual source type properties classified as ARC_ONLY or GAUGE.
   a. Open a source type property classified as ARC_ONLY or GAUGE from the **Properties Statistics** related links tab.
   b. On the **Source Type Property** form, select **Source Type Properties Stats**.
   The following information displays in a pop-up:
   - For an ARC property: The percentage distribution of terms, based on the processed logs. For example, the percentage of Bad Request vs. Success.
   - For a GAUGE property: The average, minimum, and standard deviation from the expected numerical value.
6. **Optional:** Change classification settings on the **Key/Value Mapping** tab.
   For more information, see Refine the source type structure.

Review the patterns extracted from a source type in Health Log Analytics

View all learned patterns extracted from a source type in a source type structure, together with the log sources in which these patterns appeared. Reviewing these patterns can provide valuable insights into the log message patterns that Health Log Analytics tracks for each source type and log source.

Before you begin
Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Source Type Structures**.
2. Select a source type in the **Source type name** column.
3. On the Source Type form, select the **Aggregated Log Patterns** related list.
   The tab shows the following data for each pattern that was extracted from this source type. The displayed data is updated every hour.

Aggregated Log Patterns

Column	Description
Pattern text	The content of the aggregated pattern.
Sources	The sources in which the pattern appeared.
Domain	The domain to which the pattern belongs.

Delete a log source

Delete a log source with or without its associated log data in Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
When you delete a log source, Health Log Analytics automatically deletes its related log data. You can also delete a source while keeping the log data. The associated data will then be deleted according to the log retention policy. For more information, see Storage space for log retention in Health Log Analytics.

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Log Sources**.
2. Open a source record.
3. Delete the log source in one of the following ways:
   - Delete the source and its related data by selecting **Delete**.
   - Delete the source without its related data by selecting the **Delete without logs** related link.

Modify data input configurations

Modify the configuration of a data input for Health Log Analytics by adding a new path to an existing data input configuration or changing the data input's MID Server destination and port.

Before you begin
Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open a record from the Data Inputs table.
3. Modify the data input configuration.

Column	Description
Name	Name of the data input.
Description	Description of the data input.
Port	The port on the MID Server. **Note:** The port must not be occupied by another process. Make sure that your organization's security team opens the selected port.
MID	The MID Server to which the logs stream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	Note: ○ You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. ○ The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties.

Settings

Column	Description
Path	The full path from which to stream logs. You can use a wildcard. **Note:** This column is not available on Windows systems using Winlogbeat.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.
Component	The device type or stack layer as context for the logs that is used for anomaly detection and correlation. For example, Tomcat. Components typically represent CIs in the CMDB. Several components are often clustered together in a single service instance.
Source Type	The source type that defines how Health Log Analytics handles a specific application and parses the log data. For example: Tomcat Catalina. Each data input can have multiple source types depending on the diversity of its log formats. Service instances and components can have any number of source types.
For handling multiline messages on Linux / Windows systems using Filebeat only:	
Match	Specifies how Filebeat combines matching lines into an event, either **after** or **before**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Negate	Boolean that defines whether the pattern identified in the log lines is negated. The default is **false**.
Regex	The regular expression to match.

Note: You can modify the Rsyslog configuration file to make the agent ship system logs in addition to application logs. For more information, see the Shipping system logs using Rsyslog [KB0954507] article in the Now Support Knowledge Base.

4. Select **Update**.
5. For data inputs that use Rsyslog or Beats agents only, rebuild the server-side configuration file and install it on the endpoint device.
   a. Select **Rebuild configuration file**.

      Health Log Analytics rebuilds the file and saves it in the Manage Attachments section. Depending on the agent used, the rebuilt file is saved as either `rsyslog.yml`, `filebeat.yml`, or `winlogbeat.yml`.

      The system automatically renames the previous configuration file by adding a suffix with the date and time the file was rebuilt to the file name.

   b. Install the rebuilt configuration file on the endpoint according to your data input type.

Data input type	Action
Rsyslog	i. Download the file and install it on the endpoint device in the `/etc/rsyslog.d/rsyslog.conf` directory. ii. Validate the configuration by running the `rsyslogd -N1` command. iii. Verify the output. If it contains errors, check the `/var/log/messages` system log file for error messages and fix the errors. iv. Restart Rsyslog by running the `sudo systemctl restart rsyslog` command.
Linux	i. Download the file and install it on the endpoint device in the `/etc/filebeat/` directory. ii. Restart the agent service by running the `sudo service filebeat restart` command. **Note:** The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data input type	Action
Windows using Beats (Filebeat or Winlogbeat):	i. Download the file and install it on the endpoint device in the C : \Program Files\ directory. ii. Restart the agent service by running the appropriate command in PowerShell: ▪ Filebeat: `PS > Restart-Service filebeat` ▪ Winlogbeat: `PS > Restart-Service winlogbeat` **Note:** The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration file.

Configure advanced settings for Rsyslog, Splunk, or TCP data inputs

Configure advanced settings for Beats data inputs

Advanced data input configuration

When you have configured a data input successfully, Health Log Analytics adds a record to the Data Inputs table and attaches the configuration file to it. You can configure advanced settings for your data input. Configuring advanced settings is optional.

Configure advanced settings for Rsyslog, Splunk, or TCP data inputs

Configure advanced settings for data inputs that use Rsyslog, Splunk, or TCP agents.

Before you begin

Role required: evt_mgmt_admin

About this task

You can set system parameters for reading log data that determine the actions that the system performs on log data arriving on the MID Server. For example, you can set the time zone to use if a log lacks a timestamp. If no advanced settings are configured, the system uses the default values.

For information about how to change settings that were configured when the data input was created, such as adding a new path or changing the data input's MID Server destination or port, see Modify data input configurations.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open a Rsyslog, Splunk, or TCP data input record from the Data Inputs table.

   The data input configuration displays.

   Note: The number of log sources that the data input has created is shown in the **Sources count** field. For more information about data input sources, see Log data auto-mapping and mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

3. Select **Advanced**.
4. On the form, fill in the fields.
   For a description of the fields, see Rsyslog, Filebeat, or Winlogbeat data input configuration fields.
5. **Optional:** In the Streaming Sources related list, verify that this data input is streaming log data from all relevant endpoint devices.
   For more information about streaming sources, see Identify and resolve log streaming issues.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Configure advanced settings for Beats data inputs

Configure advanced settings for data inputs that use Beats agents.

Before you begin
Role required: evt_mgmt_admin

About this task
You can set system parameters for reading log data that determine the actions that the system performs on log data arriving on log data arriving on the MID Server. For example, you can set the time zone to use if a log lacks a timestamp. If no advanced settings are configured, the system uses the default values.

For information about how to change settings that were configured when the data input was created, such as adding a new path or changing the data input's MID Server destination or port, see Modify data input configurations.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open a Beats data input record from the Data Inputs table.
   The data input configuration displays.

   Note: The number of log sources that the data input has created is shown in the **Sources count** field. For more information about data input sources, see Log data auto-mapping and mapping.

   Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

3. Select **Advanced**.
4. On the form, fill in the fields.
   For a description of the fields, see Rsyslog, Filebeat, or Winlogbeat data input configuration fields.
5. **Optional:** In the Streaming Sources related list, verify that this data input is streaming log data from all relevant endpoint devices.
   For more information about streaming sources, see Identify and resolve log streaming issues.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

About this task

You can set system parameters for reading log data that determine the actions that the system performs on log data arriving on the MID Server. For example, you can set the time zone to use if a log lacks a timestamp. If no advanced settings are configured, the system uses the default values.

For additional information about streaming logs using the Elasticsearch data input, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open an Elasticsearch data input record from the Data Inputs table.
   The data input configuration displays.

   Note: The number of log sources that the data input has created is shown in the **Sources count** field. For more information about data input sources, see Log data auto-mapping and mapping.

   Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

3. Select **Advanced** and then select the **Advanced** tab.
4. On the form, fill in the fields.
   For a description of the fields, see Elasticsearch data input configuration fields.
5. **Optional:** In the Streaming Sources related list, verify that this data input is streaming log data from all relevant endpoint devices.
   For more information about streaming sources, see Identify and resolve log streaming issues.

   Note: If you experience permissions-related issues with streaming log data from Elasticsearch, refer to the Granting privileges for data streams from Elasticsearch [KB0967366] article in the Now Support Knowledge Base.

6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

Note: You can only publish the data input configuration when the connection is created successfully.

Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Configure Apache Kafka data inputs

Health Log Analytics content packs for quicker time to value

Shorten onboarding time for the Health Log Analytics application by installing content packs. The packs contain default source types and mapping script templates that save you the time it takes to create them from scratch.

After installing a content pack, Health Log Analytics begins to stream and parse your log data immediately. The application recognizes and analyzes the data, generates more relevant alerts, and reduces noise from the moment of the integration. You can still customize the mapping configuration later on, if needed.

You can integrate content packs in two different ways:

- Select a content pack when you're configuring a data input. Health Log Analytics activates the selected pack automatically and uses its mapping script for mapping the data input sources.
- Activate a content pack before you configure a data input. When you have configured the data input and you're mapping the raw log data, select the content pack's mapping script from the **Data Input Mapping** form.

Currently, a content pack is available for streaming logs from Linux using Filebeat.

Note: All configurations in content packs exist in the global domain. If you're using domain separation, the content pack content is only available for logs in the global domain.

This feature is supported in the Health Log Analytics application, Version 25.0.17 - November 2022 and later, available from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Activate a content pack in Health Log Analytics

You can activate a content pack before configuring a data input.

Before you begin

For an overview of this feature, see Health Log Analytics content packs for quicker time to value.

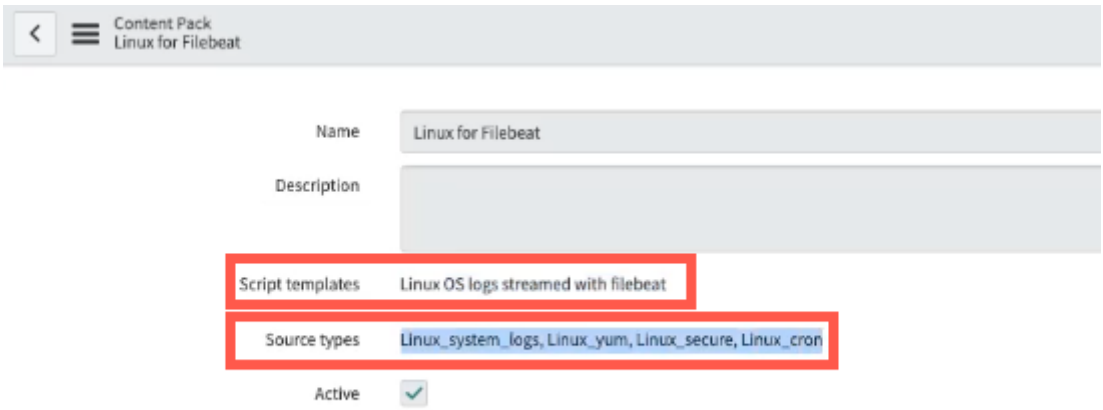
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Content Packs**.
2. Open the appropriate content pack for your data input.

   Note: Currently, a content pack is available for streaming logs from Linux using Filebeat.

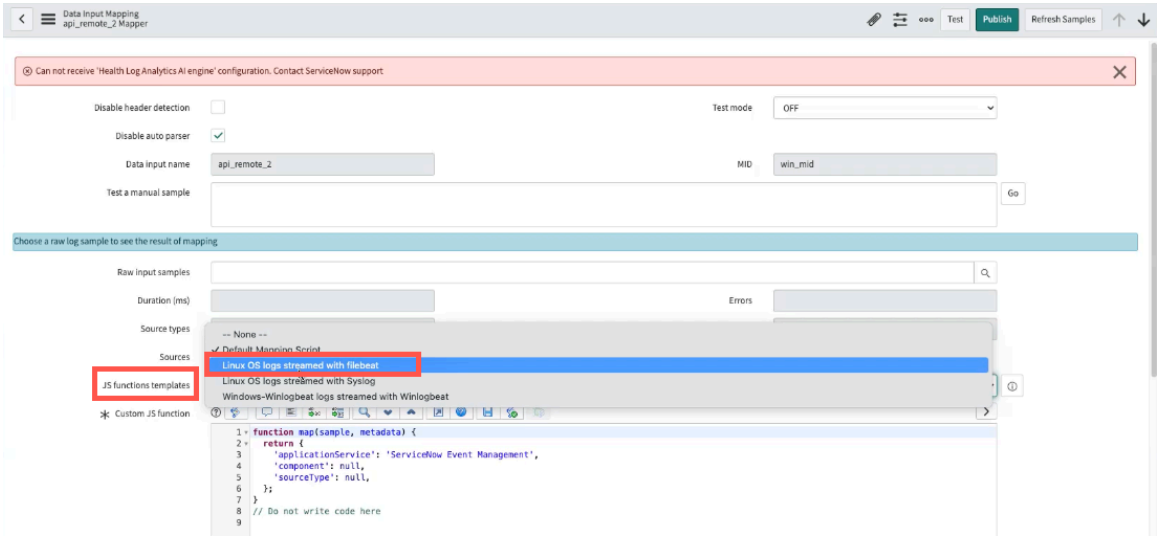
3. On the **Content Pack** form, select **Activate**.
   The **Active** check-box appears selected. The activated content pack displays the script templates and source types that are associated with it.



Note: The source types included in the content pack may already exist on your ServiceNow instance. In this case, Health Log Analytics automatically renames the content pack source types by adding a content pack suffix to their name. If you want to use the content pack source types and their mapping, delete or rename the original source types and then remove the suffix from the content pack source types. Otherwise, Health Log Analytics uses the original source types.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On the **Data Input Mapping** form, the mapping script is listed as a JavaScript functions template option.



What to do next

When you have configured the data input and you're mapping your raw log data, you can select the content pack's mapping script from the **JS functions templates** drop-down.

Stop or restart a data input in Health Log Analytics

You can stop using a data input for streaming log messages to your ServiceNow instance. Restart the data input if you want it to resume streaming data.

Before you begin

This functionality is available only when the data input configuration has been published.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open a data input record from the Data Inputs table.
3. Select **Stop Data Input**.
   The name of the button changes to **Start Data Input**.
4. To start using the data input again, select **Start Data Input**.

Migrating Health Log Analytics data input configurations between instances

Export a Health Log Analytics data input and source types configuration as an update set and import it to a different ServiceNow instance. In the target environment, you can use the migrated data input for streaming and processing log data. This functionality saves time and reduces possible errors by avoiding the need to configure the settings again on the target instance.

The migrated configuration includes mapping and all other relevant settings, except credentials. Depending on the data input that you're exporting, you may need to configure credentials in the target environment. For example, when exporting Amazon CloudWatch or Amazon S3 data inputs, you must configure Amazon Web Services (AWS) credentials.

This feature is supported in the Health Log Analytics application, Version 25.0.17 - November 2022 and later, available from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Using HLA configuration migration with ServiceNow AI Platform versions prior to the Tokyo release requires you to import an update set. For more information, see the HLA Configuration Migration Enablement [KB1274850] article in the Now Support Knowledge Base.

For general information about update sets in the ServiceNow AI Platform, see System update sets.

Export a data input configuration

Export the configuration of a Health Log Analytics data input with or without the related source types to an update set. You can then import the update set to the target environment.

Before you begin

For an overview of this feature, see Migrating Health Log Analytics data input configurations between instances.

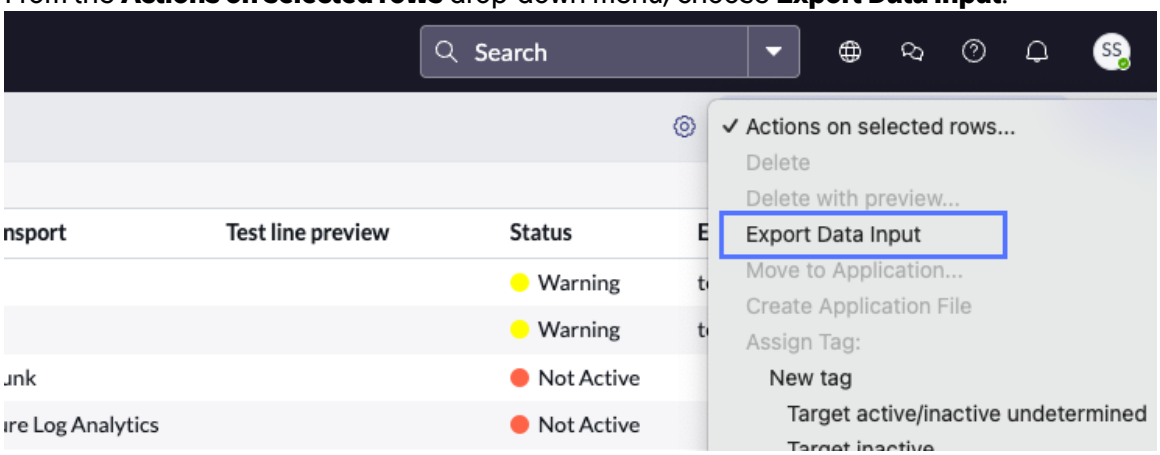
Role required: evt_mgmt_admin

Procedure

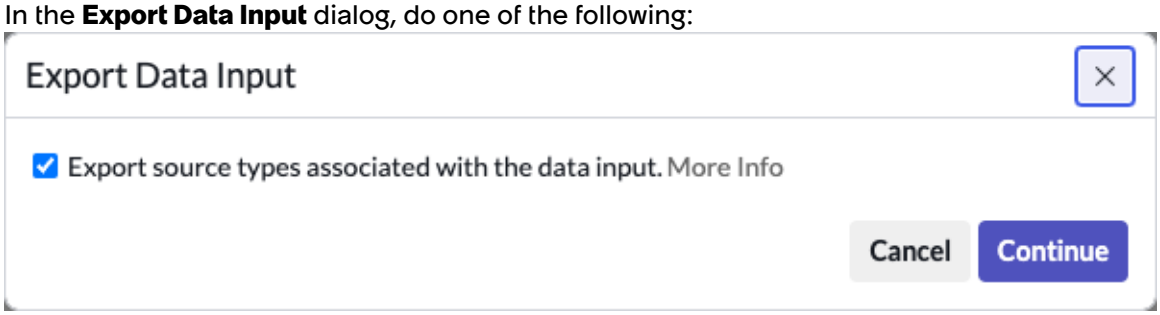
1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. In the Data Inputs list, select the data input that you want to export.
3. Export the data input to an update set.

Note: The exported configuration doesn't include the service instance configured for the data input.

a. From the **Actions on selected rows** drop-down menu, choose **Export Data Input**.



b. In the **Export Data Input** dialog, do one of the following:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Leave the check box selected to include the source types that are associated with the data input in the update set.

  When the box is selected, the update set will include the following source type-related tables:

  - sn_occ_source_type
  - sn_occ_source_type_structure
  - sn_occ_sources
  - sn_occ_timestamp_formats
  - sn_occ_lexical_keywords
  - sn_occ_log_correlator
  - sn_occ_log_source_retention
  - sn_occ_quick_replacements
  - sn_occ_reconstructors
  - sn_occ_replacements
- Clear the box to export the data input without the associated source types. For example, if you want to reuse the data input configuration, but configure the source types from scratch.

  When the box is clear, the update set will not include the source type-related tables.

Note: You can export source types separately. For more information, see Export source types to an update set.

c. Select **Continue**.

The data input, with or without the source types, is exported to an update set.

Note: An update set can act as the parent for multiple child update sets.

4. Select **Download update set** to download the update set to the instance.
   The update set is downloaded as an XML file.

What to do next

Import the update set to the required ServiceNow instance. For more information, see Import a data input to a target instance.

Import a data input to a target instance

Import a Health Log Analytics data input configuration that you've exported from another instance as an update set.

Before you begin

For an overview of this feature, see Migrating Health Log Analytics data input configurations between instances.

Before performing this procedure, export the data input to an update set. For more information, see Export a data input configuration.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On the target instance, import the update set that contains the data input configuration.

   a. Navigate to **All** > **System Update Sets** > **Retrieved Update Sets**.

   b. In the Related Links, select **Import Update Set from XML**.

   c. Select **Choose file** and open the update set XML file from the Downloads folder.

   d. Select **Upload**.
   The update set is uploaded to the instance and appears in the **Retrieved Update Sets** list in the Loaded state.

2. Identify and address errors in the update set.

   a. In the **Retrieved Update Sets** list, open the update set record.

   b. Select **Preview Update Set Batch** to detect errors.
   The **Batch Update Set Preview** dialog indicates failure, which is expected behavior.

   c. Close the dialog and resolve the errors in the **Update Set Preview Problems** related list.

      For more information, see Preview a remote update set.

      You can ignore errors that start with 'Could not find a record in [table]' for the following tables:

      - aws_credentials
      - azure_sas_credentials
      - azure_service_principal
      - basic_auth_credentials
      - cmdb_ci_service_auto - Service instance
      - ecc_agent - MID
      - ecc_agent_cluster - MID Server Cluster
      - kafka_ssl_credentials
      - sn_occ_data_input_preprocess_example
      - sn_occ_data_input_preprocess_example_row
      - sn_occ_gcp_credentials
      - sn_occ_mapper_example
      - sn_occ_source_type_examples
      - sn_occ_source_type_structure_data

   d. Select the errors that you ignored and then select the **Select All** check box.

   e. From the **Actions on selected rows...** drop-down menu, choose **Accept remote update**.

   f. In the **Preview Problems for Batch** related list, select all remaining errors and accept the remote update as explained in the earlier steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. When all errors in the update set have been resolved, select **Commit Update Set Batch**.
   The imported data input appears on the Data Inputs list. The import includes mapping settings and all other relevant configuration.
4. In the imported data input, configure the following.
   - The MID Server to which the logs stream.
   - Credentials.

     Note: Whether you need to configure credentials depends on the data input that you've imported. For example, you must configure Amazon Web Services (AWS) credentials for Amazon CloudWatch and Amazon S3 data inputs.

   - (Optional) The service instance to which to bind the log data.

   For more information, see the configuration documentation for the relevant data input: Set up data inputs for Health Log Analytics manually.

Result
You can begin using the data input for streaming and processing log data.

Export source types to an update set

Export source types to an update set separate from the Health Log Analytics data input configuration. You can then import the update set to the target environment.

Before you begin
For an overview of this feature, see Migrating Health Log Analytics data input configurations between instances.

Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Source Types**.
2. In the Source Types list, select one or more source types that you want to export.
3. From the **Actions on selected rows** drop-down menu, choose **Export Source Types**.
   The source types are exported to an update set.

   Note: An update set can act as the parent for multiple child update sets.

4. Select **Download update set** to download the update set to the instance.
   The update set is downloaded as an XML file.

What to do next
Import the update set to the required ServiceNow instance. For more information, see Import source types to a target instance.

Export source types to an update set by log source in Health Log Analytics

Export all source types related to one or more selected log sources to an update set together. You can then import the update set to the target environment.

Before you begin
For an overview of this feature, see Migrating Health Log Analytics data input configurations between instances.

Role required: evt_mgmt_admin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log Sources**.
2. In the Log Sources list, select one or more log sources for which you want to export the related source types.
3. From the **Actions on selected rows** drop-down menu, choose **Export Related Source Types**.
   The source types are exported to an update set.

   Note: An update set can act as the parent for multiple child update sets.

4. In the **Related Source Type Exporter** screen, select **Download update set** to download the update set to the instance.
   The update set is downloaded as an XML file.

What to do next

Import the update set to the required ServiceNow instance. For more information, see Import source types to a target instance.

Note: Only the related source types and tables for the selected log sources will be imported, not the data inputs.

Import source types to a target instance

Import source types that you've exported separate from the Health Log Analytics data input configuration.

Before you begin

For an overview of this feature, see Migrating Health Log Analytics data input configurations between instances.

Before performing this procedure, export the source types to an update set. For more information, see Export source types to an update set.

Role required: admin

Procedure

1. On the target instance, import the update set that contains the source types.

   a. Navigate to **All** > **System Update Sets** > **Retrieved Update Sets**.

   b. In the Related Links, select **Import Update Set from XML**.

   c. Select **Choose file** and open the update set XML file from the Downloads folder.

   d. Select **Upload**.
      The update set is uploaded to the instance and appears in the **Retrieved Update Sets** list in the Loaded state.

2. Identify and address any errors in the update set.

   a. In the **Retrieved Update Sets** list, open the update set record.

   b. Select **Preview Update Set Batch** to detect errors in the update set.
      The **Batch Update Set Preview** dialog indicates failure, which is expected behavior.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Close the dialog and resolve the errors in the **Update Set Preview Problems** related list. You can ignore errors that start with 'Could not find a record in [table]' for the following tables:

d. Select the errors that you ignored and then select the **Select All** check box.

e. From the **Actions on selected rows...** drop-down menu, choose **Accept remote update**.

f. In the **Preview Problems for Batch** related list, select all remaining errors and accept the remote update as explained in the earlier steps.

3. When all errors in the update set have been resolved, select **Commit Update Set Batch**.

Result
The imported source types appear in the Source Types list.

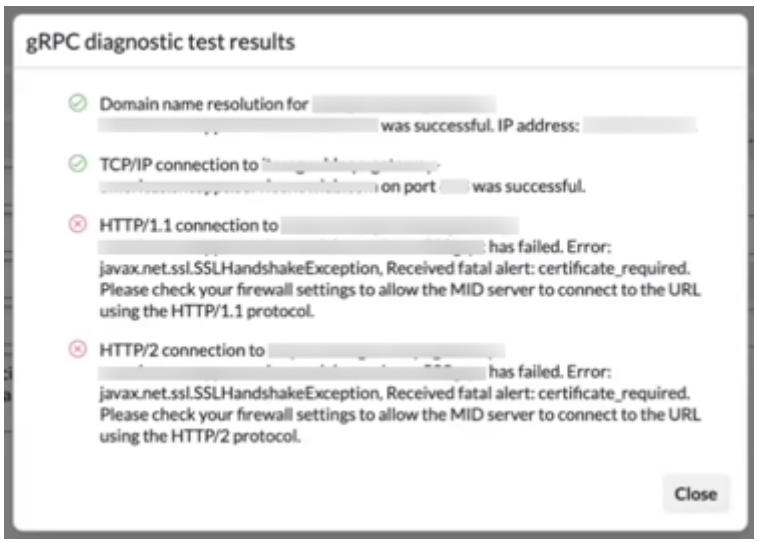
Check gRPC and network connectivity on the MID Server

Verify that Health Log Analytics can function properly by performing diagnostic tests on the MID Server to check gRPC and network connectivity.

Before you begin
Role required: evt_mgmt_admin

About this task
Your organization's network and security configuration may be keeping Health Log Analytics from functioning properly. For example, complex configurations with proxy and firewall settings might block outbound connections. To avoid operational issues, you can test gRPC and network connectivity on the MID Server.

Procedure
1. Navigate to **All** > **MID Servers** > **Servers**.
2. Open the relevant MID Server record.
3. Under Related Links, select **Test gRPC connection**.
   The system performs gRPC connectivity tests, such as domain name resolution, TCP/IP, and HTTP connection. When the testing is complete, the test results are displayed. Successful tests are preceded by a green check-mark, while failed tests are preceded by a red x mark.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Fix the issues that caused any tests to fail by following the instructions on the **gRPC diagnostic test results** screen.
5. Select **Test gRPC connection** again and confirm that all the tests are completed successfully.

Administering Health Log Analytics

This section covers tasks involved in Health Log Analytics administration. It provides system administrators with information needed to keep Health Log Analytics running efficiently.

Configure Health Log Analytics system properties for a single log source

Configure system properties for a specific log source if you need to alter the default values, which should not usually be necessary.

Before you begin

Role required: evt_mgmt_admin

About this task

Changing Health Log Analytics system properties affects back-end processes and can produce unexpected results. Therefore, if you need to make changes to these properties, keep a record of your adjustments. For example, note the value before and after a modification and the time of the change.

Note: To modify a Health Log Analytics system property whose **Requires restart** value is **true**, contact ServiceNow support to modify it for you.

For a complete description of all the Health Log Analytics system properties, see the HLA System Properties [KB0869842] article in the Now Support Knowledge Base.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Log Sources**.
2. On the **Source properties** tab, right-click a property.
3. Select **Override property value** from the pop-up menu.
4. In the **Value** field, enter the appropriate value.
5. Select **Submit**.

Result

The new value overrides the previous setting for the selected log source.

Related topics

Configure global Health Log Analytics system properties

Configure global Health Log Analytics system properties

Configure global Health Log Analytics system properties if you need to alter the default values, which should not usually be necessary.

Note: To modify a Health Log Analytics system property whose **Requires restart** value is **true**, contact ServiceNow support to modify it for you.

For a complete description of all the Health Log Analytics system properties, see the HLA System Properties [KB0869842] article in the Now Support Knowledge Base.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Health Log Analytics Administration** > **System Properties**.
2. Select a property with the scope Source.
3. In the **Value** field, enter the appropriate value.
4. Select **Update**.
   The setting will apply to log sources created from this point forward.
5. Determine the scope of application of the new setting.
   - To apply the setting only to log sources created from this point forward, select **Update**.
   - To override values for this property in all existing log sources and apply the modified setting to all new log sources, select **Override source property**.

Related topics

Configure Health Log Analytics system properties for a single log source

Enable or disable Health Log Analytics system features

Customize the basic configuration of Health Log Analytics by enabling or disabling system features.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Health Log Analytics Administration** > **Features**.
   By default, the table shows the system features that administrators modify most commonly. To view the complete list of features, use the filtering options.
2. Select a feature record from the table.
   The record contains the following information:
   - The name of the feature
   - A description of the feature's purpose
   - The default state of the feature
   - The current state of the feature
3. Set the state of a system feature to ON to enable the feature or to OFF to disable it.
4. Select **Update**.

Alert notification in Slack or Microsoft Teams channels

Health Log Analytics sends notifications for new anomaly alerts in real time to Slack or Microsoft Teams channels. This built-in functionality frees you from having to continuously monitor logs to prevent incidents.

The notifications include the number of the alert, its description, severity, configuration item, state, and priority group. You can filter the alerts for which notifications are sent to your channel.

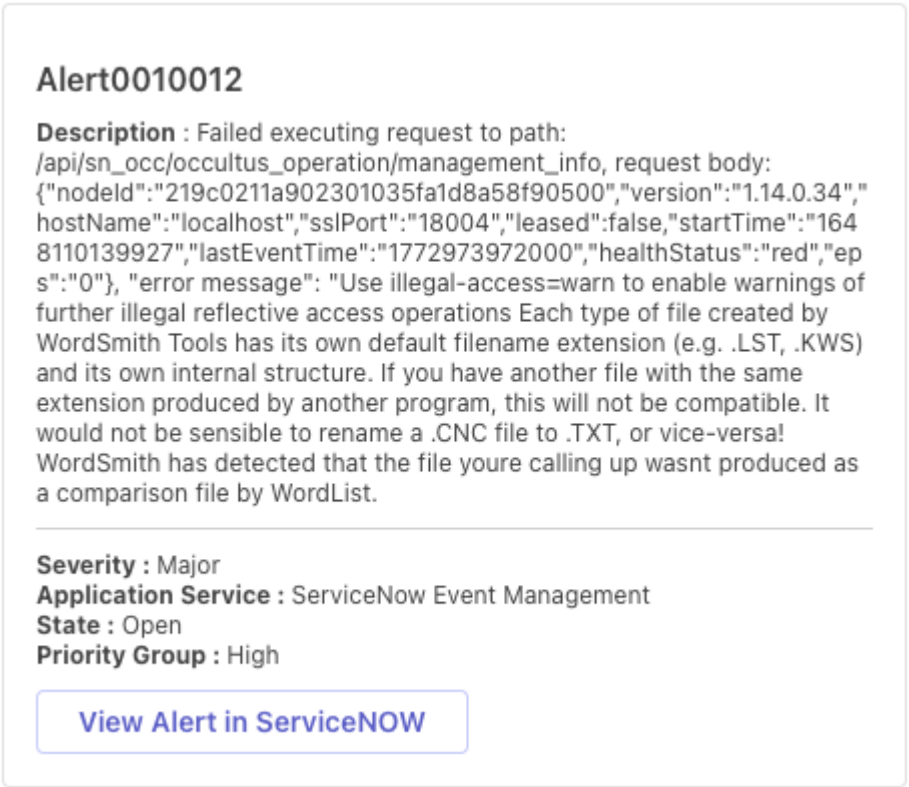
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, you may only want to receive alerts of a Major severity or a High priority group. By default, no notifications are sent on secondary alerts.

To support channel notification, the channel must be configured to receive Health Log Analytics notifications.

Starting with Version 33.0.27 - August 2024, Health Log Analytics uses the Microsoft Teams Graph spoke application to send notifications on new anomaly alerts. The application replaces the Microsoft Teams spoke plugin, which will be deprecated. If you're using an HLA version earlier than 33.0.27, follow the setup procedure in Set up alert notifications in channels. Otherwise, see Set up alert notifications in a Microsoft Teams channel.

Sample HLA alert notification in Microsoft Teams



Set up alert notifications in channels

Set up notifications for new Health Log Analytics anomaly alerts in either a Slack or Microsoft Teams channel.

Before you begin

Starting with Version 33.0.27 - August 2024, Health Log Analytics uses the Microsoft Teams Graph spoke application to send notifications for new anomaly alerts. The new application replaces the Microsoft Teams spoke plugin, which will be deprecated. If you're using an HLA version earlier than 33.0.27, follow the setup procedure below. Otherwise, refer to Set up alert notifications in a Microsoft Teams channel.

Note: If you upgrade from an earlier version to Version 33.0.27 - August 2024 or later, redo the setup using the procedure in Set up alert notifications in a Microsoft Teams channel.

For alert notifications in Slack channels, verify that the plugin Slack Webhooks Spoke for ServiceNow Integration Hub (com.sn.slack.ah) is installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Create a Webhook URL for a channel in Slack or Microsoft Teams.

   Health Log Analytics uses the Webhook to notify about the alerts in the channel.

   Perform the appropriate procedure:

   - Create a Webhook URL for a channel in Slack
   - Create a Webhook URL for a channel in Microsoft Teams
2. Map the Webhook URL for the channel to the service instance associated with the alert.

   a. Navigate to **Health Log Analytics Administration** > **Webhook Notification**.

   b. Select **New**.

   c. On the form, fill in the fields.

   Alert Notification Webhook form

Field	Description
Webhook	The Webhook URL that you created for the channel.
Active	Select to activate the Webhook.
Configuration item	The service instance associated with the alert. If this field is empty, the system uses the default property for the channel: default.slack.webhook.url for Slack or default.teams.webhook.url for Microsoft Teams.

   d. Select **Submit**.

3. Activate the Health Log Analytics Alert Management rule for submitting alerts to the appropriate channel.

   a. Navigate to **Event Management** > **Rules** > **Alert Management Rules**.

   b. Locate the appropriate rule:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For Slack: Submit HLA alerts to slack.
- For Microsoft Teams: Submit HLA alerts to teams.

c. In the **Active** column for the rule, set the value to `true`.

4. **Optional:** Filter the alerts on which notifications will be sent to the channel.
   a. In the Alert Management Rules table, select the rule for your channel.
   b. Select **Alert Filter**.
   c. On the form, set the conditions that must be met for sending a notification on the alert to the channel.
   d. Select **Update**.

Set up alert notifications in a Microsoft Teams channel

Set up notifications for new Health Log Analytics anomaly alerts in a Microsoft Teams channel.

Before you begin

Starting with Version 33.0.27 - August 2024, Health Log Analytics uses the Microsoft Teams Graph spoke application to send notifications on new anomaly alerts. For more information, see Microsoft Teams Graph Spoke. If you're using an HLA version earlier than 33.0.27, refer to the setup procedure in Set up alert notifications in channels.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Install the latest version of the Microsoft Teams Graph spoke from the ServiceNow Store.
2. Set up the Microsoft Teams Graph spoke.
   For instructions, see: Set up the.
3. Activate the Health Log Analytics Alert Management rule for submitting alerts to the Microsoft Teams channel.
   a. Navigate to **Event Management** > **Rules** > **Alert Management Rules**.
   b. Locate the appropriate rule: Submit HLA alerts to teams.
   c. In the **Active** column for the rule, set the value to `true`.
4. Map the service instance to the Microsoft Teams channel.

   a. In the **All** navigation menu, type `sn_occ_teams_alert_notification_config` and then press Enter.

   b. Select **New**.

   c. On the form, fill in the fields.

   Note:

   - You can obtain the Teams ID and Channel ID from the Microsoft Teams channel.
   - The **Configuration Item** field must correspond to the Service instance. If no CI is needed, leave this field empty. In this case, the record is used for alerts when there's no record that matches their CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **Submit**.

e. Optional: Repeat steps 1 to 4 to add additional configurations.

Storage space for log retention in Health Log Analytics

The Health Log Analytics base system typically provides 1,000 GB storage space for log source retention, although the storage capacity may vary depending on your license. The default retention time for logs is three days, but you can modify that period.

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. To activate it, contact your ServiceNow account manager or ServiceNow Support.

When the storage space used by all log sources exceeds 80 percent of the total, you receive an email notification. You can change the default threshold percentage by modifying the *sn_occ.elastic_storage.utilization_limit.percent* system property in the System Properties table.

Automatic reduction of log retention days

By default, logs are retained for three days. You can adjust this period to 3, 7, 14, or 30 days. For more information, see Modify the log source retention period.

If the storage space used by all log sources reaches 100 percent, the number of retention days allocated per source is automatically lowered by one level and you receive an email notification with the specifics. The automatic reduction process starts with the sources that were allocated the highest number of retention days. For example, for a source with 30 retention days, the number is reduced to 14. If the source has 14 retention days, the number is reduced to 7, and so on.

You can change the threshold percentage for the automatic reduction of log retention days by modifying the *sn_occ.log_retention.automatic_reduction_utilization_percent* system property in the System Properties table.

Related topics

Modify the log source retention period

Modify the log source retention period

Modify the period that Health Log Analytics retains logs from a specific source. You can calculate the impact of your intended change on storage to help you make an informed decision.

Before you begin

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. To activate it, contact your ServiceNow account manager or ServiceNow Support.

To display **Log source retention** in the filter navigator:

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Enter the property name *sn_occ.activate_log_source_retention* in the Search box.
3. Ensure that the property value is set to **true**.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

By default, the log retention duration per source is set to three days. You can change this number to 7, 14, or 30 days. For more information, see Storage space for log retention in Health Log Analytics. Note that longer log retention results in higher storage usage.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log source retention**.
2. **Optional:** Calculate how changing the retention period for logs from a particular source affects storage.
   a. Open a log source record.
   b. In the Related Links section, select **Calculate how retention impacts storage**.
   c. From the New retention list, select the proposed number of retention days for logs from this source.
   d. Select **Calculate**.
   The **Projected storage usage (GB)** field displays the amount of storage space in GB that the source would use if the new policy were implemented.

   > **Note:** Health Log Analytics bases its calculation of projected storage usage on the volume of log data that was streamed in the past. The estimate could change as the volume of streamed log data varies.

   e. Compare the projected usage to the amount of storage needed for the current policy that is shown in the **Current storage usage (GB)** field.
   f. Select **Cancel** to close the dialog box.
3. Update the log retention policy per source or for several sources together.
   - To update log retention for a single source:
     a. Open a log source record.
     b. From the Retention days list, select the required number of retention days for logs from this source.
     c. Select **Update**.
   - To update log retention for multiple sources:
     a. Select several log source records.
     b. From the Actions on selected rows choice list, select **Update multiple source retentions**.
     c. From the New retention policy list, select the required number of retention days for logs from the selected sources.
     d. Select **Update**.

   The updated policy takes effect in up to 15 minutes.
4. **Optional:** Restore the default log retention policy per source or for all log sources.
   - To restore the default policy for a single source:
     a. Open a log source record from the table.
     b. In the Related Links section of the record, select **Restore default**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The log retention policy for this log source reverts to the default value of three days.

- To restore the default policy for all sources:

  a. In the Related Links section, select **Restore defaults**.

  b. In the confirmation dialog, select **Continue**.

  The log retention policy for all log sources reverts to the default value of three days.

Scaling Health Log Analytics to stream logs at a higher rate

Stream log data to Health Log Analytics in a scalable, more stable way using the advanced ServiceNow infrastructure.

The new ServiceNow architecture leverages queueing technology in IT Operations Management Cloud Services for authentication and log ingestion. The Health Log Analytics AI engine has been enhanced to scale dynamically in response to increased log ingestion by your organization. Health Log Analytics can be scaled to support more than 50,000 events per second (EPS) or more than 10,000 subscription units (SUs).

You can switch to the advanced ServiceNow infrastructure by submitting a scaling request through the Now Support catalog. For more information, see Submit an HLA scale request through the Now Support catalog. You can also contact your ServiceNow account manager to request scaling. When your scaling request is approved, ServiceNow provisions the number of Elasticsearch and HLA AI Engine nodes required to support your subscription units.

Submit an HLA scale request through the Now Support catalog

Request Health Log Analytics scaling to support streaming logs at a higher rate.

Before you begin

Role required: None

About this task

This procedure explains how to submit a scaling request through the Now Support catalog. You can also contact your ServiceNow account manager to request Health Log Analytics scaling.

Procedure

1. On Now Support, navigate to **All** > **Service Catalog** .
2. In the Request scale dialog, select the appropriate option:
   - Install the Health Log Analytics Prime app from the ServiceNow Store.

     When the app is installed, the additional services for supporting your request can use shared resources in other datacenters besides the one hosting your ServiceNow instance. This ability enables better resource allocation for supporting your current and future requests.

     Note: To install the Health Log Analytics Prime app, you must accept its terms and conditions.

   - Request scale without installing the Health Log Analytics Prime app.

     When you select this option, the additional resources for supporting your request reside in the same datacenter as your instance. You may experience some limitations in terms of capacity.
3. Fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request scale fields

Field	Description
Select instance	The name of your ServiceNow instance.
Number of subscription units	The number of subscription units Health Log Analytics must support.

4. Select **Submit**.
   Your scale request is submitted. When it's approved, ServiceNow notifies you by email.

Enhancing the CMDB with host data found in logs

When Health Log Analytics streams logs, it extracts host data from the log events. If host data is discovered that doesn't match the information in the Configuration Management Database (CMDB), the system creates a configuration item (CI) candidate based on the data it found in the logs for you to review.

After reviewing a CI candidate, you can choose to either add it to the CMDB or dismiss it as irrelevant. The **Log-Based CI Candidates** table lists all CI candidates that Health Log Analytics has created, sorted by system update time. The **Operation** column shows the suggested action to take on each CI candidate. You are automatically notified when there are new CI candidates for your consideration. For more information, see Add log-based CIs to the CMDB.

For a description of the related system properties, see the "logsourceinfo (CMDB)" section in the HLA System Properties [KB0869842] article in the Now Support Knowledge Base.

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. You can use it on the ServiceNow AI Platform using the Rome Patch 6 release (scheduled to be released on January 27, 2022) or later.

Add log-based CIs to the CMDB

Keep the Configuration Management Database (CMDB) updated with host data discovered in your logs by adding log-based configuration items (CIs) to it.

Before you begin

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. You can use it on the ServiceNow AI Platform using the Rome Patch 6 release (scheduled to be released on January 27, 2022) or later.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Health Log Analytics Administration** > **Log-Based CI Candidates**.
2. Handle a single CI candidate or multiple CI candidates together.

Option	Procedure
Take action on a single CI candidate	**a.** Select a CI candidate record and review the information on the form. For field descriptions, see Field descriptions for log-based CI candidates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Procedure
	b. Add the CI candidate to the CMDB or delete it. ▪ If the CI candidate is appropriate, either add it to the CMDB as is or include more information in it before adding it to the CMDB. ▪ To add the CI candidate to the CMDB as is, select **Add to CMDB** and then se lect **Continue**. ▪ To add more information, select **Edit ad ditional CI fields**. Enter data that was not extracted from the logs, such as the name of the company associated with the CI, and then select **Submit**. The CI is added to the CMDB. In the CMDB table for the relevant class type, the discovery source for the new CI is Health Log Analytics. The CI candidate record is automatically deleted from the Log-based CI candidates table. ▪ If the CI candidate is irrelevant, delete it by selecting **Delete**.
Take action on multiple CI candidates at the same time	**Note:** This option does not enable you to add extra information to the selected CIs. ○ Add multiple CIs to the CMDB. **a.** In the Log-based CI candidates table, se lect the CI candidates you want to add to the CMDB. **b.** From the Actions on selected rows list at the bottom of the page, select **Add to CMDB**. The selected CIs are added to the CMDB. The CI candidate records are automatical ly deleted from the Log-based CI candi dates table. ○ Delete multiple CI candidates. **a.** In the Log-based CI candidates table, se lect the CI candidates you want to delete. **b.** From the Actions on selected rows list at the bottom of the page, select **Delete**.

Field descriptions for log-based CI candidates

Field descriptions for the Log-based CI candidates table, the Log-based CI candidate form, and the Add CI candidate to CMDB form.

Log-based CI candidates table

Field	Description
Host name	The host name that Health Log Analytics discovered in the log data.
CI class type	The CI class type discovered in the log data. The CI class type is determined by the data input type: • Rsyslogs – CI class type: Linux Server • Linux Filebeat - CI class type: Linux Server • Windows Filebeat - CI class type: Windows Server • Winlogbeat - CI class type: Windows Server
Last log time	(Read only) The last time this host was found in the log data.
Operation	(Read only) The suggested action to take: Add - Add the CI to the CMDB.
Status	(Read only) The status of the suggested action. • Pending - No action has been taken. • If the taken action failed, this field contains an error message.

Log-based CI candidate form

Field	Description
CI class type	The CI class type discovered in the log data. The CI class type is determined by the data input type: • Rsyslogs – CI class type: Linux Server • Linux Filebeat - CI class type: Linux Server • Windows Filebeat - CI class type: Windows Server • Winlogbeat - CI class type: Windows Server
CI name	The host name that Health Log Analytics discovered in the log data.
Operation	(Read only) The suggested action to take:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log-based CI candidate form (continued)

Field	Description
	Add - Add the CI to the CMDB.
Last log time	(Read only) The last time this host was found in the log data.
Status	(Read only) The status of the suggested action: • Pending - No action has been taken. • If the taken action failed, this field contains an error message.

Add CI candidate to CMDB form (Linux Server)

Field	Description
Name	The name of the CI.
Asset tag	Alphanumeric information to help track the asset associated with the CI.
Manufacturer	The device manufacturer.
Asset	(Read-only) The asset associated with the CI.
Class	The asset group. For example, Linux Server.
Comments	Information about the asset.
Company	The company associated with the CI. This field is required.
Serial number	The serial number associated with the CI.
Model ID	The device model ID.
Assigned to	The person using or primarily responsible for this item.
Host name	The host name of the CI.
OS Domain	The OS domain of the CI.
Operating System	The OS running on the CI.
OS Version	The version of the OS running on the CI.
OS Service Pack	The service pack installed on the OS.
DNS Domain	The DNS domain of the CI.
IP Address	The IP address of the CI.
Disk space (GB)	The amount of disk space, in GB.
Description	Textual description of the CI.
RAM (MB)	The amount of RAM on the computer, in MB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add CI candidate to CMDB form (Linux Server) (continued)

Field	Description
CPU manufacturer	The CPU manufacturer.
CPU type	The CPU type.
CPU speed (MHz)	The speed of the CPU, in MHz.
CPU count	The number of CPUs.
CPU core count	The number of cores per CPU.
IsVirtual	Option for indicating whether the device is running on a virtual machine instance.

Start remediation of a Log Analytics alert from the Overview tab

Begin the remediation process of a Log Analytics alert from the alert **Overview** tab. This tab provides information on the alert, the log data associated with the anomalous behavior, CIs associated with the alert, and services impacted by it.

Before you begin

Important: From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace.

Role required: evt_mgmt_operator, or evt_mgmt_user, or evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the Service Operations Workspace, select the lists icon ( ).
3. Select the appropriate list in the Alerts sub-list and navigate to the relevant alert or group.

   All Health Log Analytics alerts have the value **Log Analytics** in the **Source** column. The value in the **Group** column identifies the type of Log Analytics alert. See Types of Health Log Analytics alerts for a more detailed description of each type of alert or group.

   Tip: To preview an alert in the list, click its info icon ( ).

4. Select the alert number.

   The **Overview** tab displays.

5. View the section of the **Overview** tab that provides the information that you need.

   For a description of the sections and cards, see Sections and cards on the alert Overview tab in Health Log Analytics.

   Note: Because some sections on the **Overview** tab show only a portion of the information, many sections include a link that displays different or more complete information.

Analyzing the logs that surround the anomaly

When Health Log Analytics identifies an anomaly, viewing the logs that surround the anomaly provides clues about the state of faulting systems. This information can help you narrow down the root cause of an alert.

While viewing a Log Analytics alert, the **Surrounding logs** tab lists the log lines that were generated one minute before and one second after the anomaly occurred. The log lines are related to the metric or pattern that triggered the alert. The list is filtered to the relevant component.

Logs generated immediately before the anomaly might point to warning signs or conditions that led to the issue. By reviewing these logs, you can trace the sequence of events that led to the anomaly, helping you understand what went wrong. Logs created right after the anomaly can help you evaluate the impact of the event by analyzing how the system responded and whether other components were affected. The timeline of the logs around the anomaly can help clarify what might have caused the issue, for example a configuration change or a software update.

You can modify the time range of the displayed log lines, for example to investigate logs from more than one minute before the anomaly, or more than a second afterward.

Note: Logs that surround the anomaly are retained and available for 30 days after the creation of the alert. The system does not delete these logs when the global retention period of logs expires. When the retention period expires, the surrounding logs are available only on the **Surrounding logs** tab and not in the Log viewer.

Health Log Analytics enables you to view the anomalous log data graphically on the Log viewer, accessed from the Service Operations Workspace. The Log viewer displays a chart of the frequency of anomalous log lines during one minute before and one minute after the Log Analytics alert and lists the associated log lines. It automatically shows the query that relates to the anomaly, the selected component, and the appropriate time filter. For more information, see Reviewing the logs for an alert on the Log viewer.

Related topics

Analyze log lines that surround an anomaly

Analyze log lines that surround an anomaly

View the log lines around an anomaly to help you identify the root cause of a Log Analytics alert.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Important: From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Analyze log lines that surround an anomaly.

Reviewing the logs for an alert on the Log viewer

The **Log viewer** tab lets you browse the logs for an alert by timestamp or time range, and visualize anomaly frequency within a specific time period. Customizing the displayed data and adjusting time filters enables you to better understand the framework in which the anomaly occurred, helping you find the root cause faster.

The Log viewer presents all data connected with the Log Analytics alert. It shows the query that relates to the anomaly, the selected component, and the appropriate time filter. You can personalize the displayed data, and manually adjust the time range without affecting the other

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

settings. The applied filters appear in the **Filters** pane. You can add or remove filters as needed to show only the data you want to view.

The **Log viewer** displays a chart of the frequency of anomalous log lines during one minute before and one minute after the Log Analytics alert and lists the associated log data. This information helps you identify trends leading up to and following the event, providing context for root cause analysis.

As you analyze the logs for an alert on the **Log viewer**, you can modify the query to fine-tune the search, save useful searches, and share them with others. For a description of the information displayed in the **Log viewer** table, see Log viewer table fields.

You can perform the following tasks on the **Log viewer**:

- View log data for an alert

  View a chart of the frequency of anomalous log lines and the associated log data.

- Define, save, and share a search of log data

  Fine-tune the search query to help determine the causes of the issue, and save and share useful searches.

- Use or modify a saved search

  Use a saved search. As the owner of a saved search, you can modify the search values and save your changes.

- Filter search results on the Log viewer

  Apply filters to show only the data you want to view.

- Customize the Log viewer table

  Add or remove columns in the table to show only the data you want to view.

If you discover an important metric in the log data, you can use it to define a new Log Analytics alert rule. For more information, see Add a Log Analytics alert rule.

Identifying relationships in log data by using log correlators

Log correlators are keys or values in log data that detect correlations between alerts to help you determine whether an alert is part of a larger issue. For example, a log correlator could detect when the interface ID of a particular network device occurs simultaneously in multiple warnings across different service instances.

You can identify related alerts in your log data by using log correlators. The base system includes several log correlators, and you can define custom correlators for a specific log source, all log sources, or only log sources created after the correlator is activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Most log lines include a metadata portion plus a message portion. Some log lines, however, include only message text with metadata included in the text. The two types of log correlators, free text correlators and log property correlators, analyze the different portions of each log to identify relationships between log data from multiple log sources.

Free text correlators

Free text correlators analyze the text within the log message portion of log lines that are associated with an anomaly. The system uses free text correlators to identify correlations between alerts. You use free text correlators to add a term that you expect to appear within log messages. A good choice is a term that is not structured and would not otherwise be extracted as a log property. For example, “policy-id” or “ thread-id”.

You also typically add free text correlators for the names of systems, applications, and services that are unique to your environment. Because such a value can be referred to by multiple sources, layers, middleware, or databases, the free text correlator can be an effective detector of correlated alerts. For example, if your organization's service is called TeaTime, then you might add "teatime" as a free text correlator. The correlator would identify alerts that are related because they were generated for resources that support the TeaTime service, such as a database lock or a connection failure between TeaTime components.

Log property correlators

Log property correlators analyze the metadata portion of log lines. For example, the correlator can analyze the name of a service instance, the interface ID of a network device, or the request ID of a web-facing component. A log property correlator could flag a correlation when the interface ID of a network device simultaneously occurs in multiple warnings in different log sources. Log property correlators are specific to the business context of your environment.

You can specify the set of log sources whose log data are analyzed by a log correlator. Choices are as follows:

- **Only new sources**: The system applies the log correlator only to log lines from log sources that were created after this log correlator is activated.
- **All sources**: The system applies the log correlator to log lines from all log sources.
- **Specified source**: For a log correlator, the system analyzes only log lines from the log source that you specify.

Add a log correlator to identify relationships in logs

Detect related alerts in log data by adding log correlators. The base system includes several log correlators and you can define custom log correlators.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

For information about the types and functions of log correlators, see Identifying relationships in log data by using log correlators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Use one of the following methods to add a log correlator.

Option	Procedure
Add a log correlator for a specific log source	**a.** Navigate to **Health Log Analytics** > **Log Anomaly Detection** > **Log Correlators**. The list of existing log correlators opens. **b.** Click the name of a log correlator. The names appear in the **Correlation indicator** column. **c.** Click **New**.
Add a log correlator that applies either to all log sources or to only those log sources that become active after you define this log correlator	**a.** Navigate to **Health Log Analytics** > **Data Input** > **Log Sources**. **b.** Click the name of the log source. The Log correlators related list displays the list of existing log correlators that analyze log data from the selected log source. **c.** On the **Log correlators** tab, click **New**.

2. Fill in the Log correlator form.
   For a description of the fields, see Log correlators form fields.
3. Select **Active** and then click **Submit**.

Exclude a source from a log correlator

Prevent the system from analyzing log lines from a specific source by excluding that source from the log correlator.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Navigate to **Health Log Analytics** > **Data Input** > **Log Sources**.
2. Open the relevant source on the Log Sources form.
3. On the **Log Correlators** tab, select the option for the log correlator.
4. In the Actions on selected items list, select **Exclude from this source**.

Add a KB article to an alert

Add your own knowledge base (KB) article to an alert that was generated by Health Log Analytics. For example, you can provide additional information that might help to resolve the underlying issue. Health Log Analytics also uses your knowledge to enhance similar alerts.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.

Important: From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Add a KB article to a Log Analytics alert.

Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics

Use Health Log Analytics to detect and resolve emerging issues in your organization's ServiceNow instance before they negatively impact users.

Using the ServiceNow System Logs Retriever integration to detect platform issues automatically

Starting with version 35.0.26 of Health Log Analytics, you can use the ServiceNow System Logs Retriever integration to automatically detect errors and anomalies in your ServiceNow instance's system logs. As an operator you can view, manage, and respond to the generated alerts in the Express List. Filter the list to show only alerts for the impacted service. Then, use Now Assist to get an in-depth analysis of the alert and potential resolutions in straightforward, human-readable language. This AI-driven tool demonstrates a deep understanding of the Glide system and offers actionable insights.

Combining HLA's anomaly detection with Now Assist's GenAI capabilities provides a comprehensive toolkit for identifying and resolving platform system issues more effectively. This collaboration enables Health Log Analytics to help prevent system issues from impacting your platform users.

Using the MID Server and System Logs Retriever data inputs together to monitor your instance

You can also stay ahead of disruptions to your ServiceNow environment by using the MID Server data input and the ServiceNow System Logs Retriever data input together.

As an admin, you select a MID Server from the MID Servers list. Under Related Links, choose **Create MID Server Data Input using HLA** to create a data input specific to the selected MID Server. Then activate the System Logs Retriever data input and configure it to collect your ServiceNow instance's system logs.

As an operator, you navigate to the Express List and select an alert from the Alerts list. Review the alert details, including duration and impacted services, and analyze the logs that surround the anomaly. Use Now Assist to get an in-depth analysis of the alert and potential resolutions in straightforward, human-readable language. If needed, for further investigation, you can navigate to the Log Viewer for a visual presentation of the system logs. Select System Logs Retriever from the components drop-down list to view all the errors that have occurred in the ServiceNow instance. You can customize the visualization by using filters.

By drilling down into the alert and MID Server logs, you can quickly identify the issue and resolve it before it affects your platform users.

Using alert rules to control when Health Log Analytics generates alerts

Alert rules enable you to set thresholds and conditions that determine when Health Log Analytics triggers an alert. When the conditions of an alert rule are met, the system generates a Log Analytics alert. You can add, change, or delete alert rules to create Log Analytics alerts for a specified metric.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In Health Log Analytics, alert rules enable you to specify when alerts are triggered. By using these rules, you ensure that an alert is generated when certain conditions are met, enabling proactive monitoring and remediation of emerging issues. You can create alert rules when you encounter log data that should trigger an alert, and modify or delete alert rules that you have defined.

You can perform the following tasks related to alert rules:

- Add a Log Analytics alert rule

  Add a Log Analytics alert rule when you come across log data that should generate an alert.

- Modify a defined Log Analytics alert rule

  Edit a Log Analytics alert rule that you have defined.

- Delete a defined Log Analytics alert rule

  Delete a Log Analytics alert rule that you have defined if it's no longer needed.

Add a Log Analytics alert rule

Define a Log Analytics alert rule when you encounter log data that should generate an alert. The alert rule generates an alert for a specified metric with a threshold that you specify and sets the properties of the generated alert.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Important: From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Add a Log Analytics alert rule.

Change a defined Log Analytics alert rule

You can alter a Log Analytics alert rule that you have defined.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Important: From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Modify a defined Log Analytics alert rule.

Delete a defined Log Analytics alert rule

Delete a Log Analytics alert rule that you have defined if it is no longer necessary.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Important: From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Delete a defined Log Analytics alert rule.

Assigning higher or lower significance to an alert

Label an alert in Health Log Analytics as meaningful or insignificant, or restore normal importance to the metric involved in generating it.

Assigning higher or lower significance to an alert helps you prioritize the alerts Health Log Analytics generates. Here are some common use cases for adjusting the importance of an alert:

- Labeling alerts as meaningful: You can make a significant alert more likely to be included in a Log Analytics group when its associated metric behaves anomalously. This ensures that important alerts receive appropriate attention.
- Muting distracting alerts: You can mute alerts for insignificant issues to reduce noise and avoid being overwhelmed by alerts for minor problems. This enables you to focus on more critical alerts. You can view a list of muted metrics to ensure you are aware of metrics that are no longer generating alerts.
- Reducing sensitivity to certain anomalies: You can lower the sensitivity of anomaly detection to a specific anomaly. This can help you focus on more significant anomalies.
- Restoring normal significance: If you previously marked an alert as significant, muted it, or if you lowered sensitivity to certain anomalies, you can return the associated metric to its normal significance. This is useful when you no longer want to treat the alert specially.

You can do the following to adjust the importance of an alert or reduce sensitivity to specific anomalies:

- Mark an alert as significant

  Make an alert more likely to be included in a Log Analytics group when the associated metric behaves anomalously by labeling the alert as meaningful.

- Mute an unimportant alert

  Eliminate distracting new alerts for insignificant issues by muting them. View the list of metrics that were muted and no longer generate alerts.

- Decrease sensitivity to similar anomalies

  Make Health Log Analytics anomaly detection less sensitive to anomalies like the one that triggered the current Log Analytics alert.

- Restore normal importance to an alert metric

  Return normal significance to the metric involved in generating a Log Analytics alert.

For detailed information about alert metrics, see How Health Log Analytics generates alerts.

Mark an alert as significant

Make an alert more likely to be included in a Log Analytics group when the associated metric behaves anomalously by labeling the alert as meaningful.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Important: From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Mark an alert as significant.

Mute an unimportant alert

Eliminate distracting new alerts for insignificant issues by muting them.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Important: From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Mute an unimportant alert.

View the list of muted metrics

View the list of metrics that were muted so that they no longer generate alerts.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **Muted Metrics**.

Muted Metrics

Field	Description
Service instance	Service instance where the muted alert with which the metric is associated appears.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Pattern text	Text for the metric that is associated with the muted alert.
Metric	Log text or key that represents a meter or gauge value in the data. For example, patterns, raw metrics, keyword, severity, all events metrics.
Created	Date and time when the metric was added to the list.

Related topics

Mute an unimportant alert

Restore normal importance to an alert metric

Restore a muted alert or a significant alert

If you no longer want a muted alert or an alert that was marked as significant to be treated specially, you can restore normal importance to the metric involved in generating it.

Influencing anomaly detection with lexical keywords

Influence how Health Log Analytics finds anomalies by managing keywords it looks for in your log data. When text in log data for a source matches a lexical keyword that exceeds a specified count threshold, the system identifies an anomaly and generates an alert.

Health Log Analytics scans your logs for words that can indicate important issues. Lexical keywords such as 'crashed' or 'failed' signal conditions that may require attention. The application sets a threshold for each lexical keyword based on its normal occurrence pattern and frequency in your logs.

When Health Log Analytics scans your logs, it identifies all occurrences of the keyword. If the frequency of a lexical keyword in the log data for a source exceeds the specified threshold, the system identifies an anomaly and generates an alert.

Health Log Analytics comes with many default global keywords. You can add, edit, and delete these global keywords or phrases, which apply to all source types.

Note: To add a specified keyword associated with a specific source type, see Configure source type capabilities.

You can manage lexical keywords as follows:

- Add, edit, or delete Health Log Analytics lexical keywords

  Add, edit, and delete global keywords or phrases.

- View the lexical keywords that generate alerts

  View the list of lexical keywords that can indicate important issues in log entries. By default, the table lists only global keywords.

Add, edit, or delete Health Log Analytics lexical keywords

Manage the keywords that Health Log Analytics looks for in your log data.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

In log data, terms like "crash" or "failed" are called lexical keywords because they indicate issues that can merit attention. When text in log data for a source matches a lexical keyword that exceeds a specified count threshold, the system identifies an anomaly and generates an alert.

Important: A lexical keyword differs from a key in a `key : value` pair in a log line. For example, *`Hostname`* is a key that takes on a value: the name or IP address of the host. In contrast, a keyword like *`Failed`* is important by itself and does not take on a value.

The application comes with many default global keywords. You can add, edit, and delete global keywords or phrases. These keywords apply to all source types.

Note: To add a specified keyword that is associated with a specific source type, see Configure source type capabilities.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **Lexical Keywords**.
   By default, the Lexical Keywords table lists only global keywords.
2. **Optional:** Add a global keyword.
   a. Select **New**.
   b. On the form, fill in the fields.

Lexical keyword form

Field	Description
Name	Unique and descriptive name for the keyword.
Regular expression	Regular expression (regex) that defines matches.
Exact match	Option to make Health Log Analytics match the exact regex. For example, 'NullPointerException' in a message would not match the regex 'exception'. This field is automatically set to **True**.
Case-sensitive	Option to make Health Log Analytics look for a case-sensitive match of the regex. This field is automatically set to **False**.
Range of analysis	Range of sources types where Health Log Analytics looks for the keyword in the log data. Choices are as follows: ▪ **All source types** ▪ **Specified source type**
Excluded source types	Source types that are not associated with the keyword. Health Log Analytics does not look for the keyword in the log data of these source types.

   c. Select **Submit**.
3. **Optional:** Edit a global keyword.
   a. Click the keyword that you want to edit in the list.
   b. On the form, edit the relevant fields.
   c. Select **Update**.
4. **Optional:** Delete one or more global keywords.
   a. Select the rows of the keywords that you want to delete.
   b. From the Actions on selected rows list at the bottom of the page, select **Delete**.
   c. Select **OK**.

View the lexical keywords that generate alerts

View the lexical keywords that generate alerts

View the list of lexical keywords that can indicate important issues in log entries.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **Lexical Keywords**.
The Lexical Keywords table appears. By default, the table lists only global keywords.

For information about adding, editing, or deleting global keywords, see Add, edit, or delete Health Log Analytics lexical keywords.

To add a specified keyword that is associated with a specific source type, see Configure source type capabilities.

Reducing noise by adding advanced log alert filters

Use advanced log alert filters to determine whether to allow an alert or drop it. These filters reduce noise by dropping alerts that do not indicate a significant issue.

You can add advanced log alert filters to scan alerts for your defined conditions. For example, you can define a filter that drops alerts coming from specific log sources, or alerts for anomalies that do not cross the specified threshold.

Some examples of the actions that advanced filters can enable:

- Alert only on anomalies that are shared across multiple hosts.
- Do not alert on anomalies that happen outside of working hours.
- Do not alert if the anomaly does not cross the specified threshold.
- Alert only on anomalies that are part of a correlation.

You can manage advanced log alert filters as follows:

- Create advanced log alert filters

  Add advanced log alert filters to scan alerts for conditions that you specify. The filters reduce noise by dropping alerts that do not indicate a significant issue. While developing a filter, you can test, update, publish, or activate the filter at any time.

- Continue modifying the filter by reopening the filter record from the filters list. You can then edit, test, publish, and activate the filter.

For more technical information on log alert filters, see the Advanced Log Alert Filtering [KB0863538] article in the Now Support Knowledge Base.

Create advanced log alert filters

Add advanced log alert filters to scan alerts for conditions that you specify. The filters reduce noise by dropping alerts that do not indicate a significant issue. While developing a filter, you can test, update, publish, or activate the filter at any time.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

The Disable Alert Rule Engine feature and the Disable Detection Rule Engine feature must be in the OFF state. You set the values by navigating to **Health Log Analytics** > **Health Predictive AI Ops Administration** > **Features**.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Navigate to **Health Log Analytics** > **Log Anomaly Detection** > **Advanced Log Alert Filter**.
2. Select **New**.
3. Enter a unique and descriptive name for the filter.
4. **Optional:** Enter a description of the operation of the filter.
5. In the **Script template** field, select the script that most closely matches your intended logic. The template can act as a starting point for your custom script code.
   After you select a template, the Custom JS function text box is populated with the appropriate JavaScript function. The JavaScript function applies the filter to the alert payload data and either allows or drops the alert. The alert payload is the text and metadata for the kind of alert that the filter will analyze.
6. Save the record by selecting **Submit**.
   To continue modifying the filter, you must reopen the record from the filters list. You can then edit, test, publish, and activate the filter.
7. Edit the default **Alert payload** text in preparation for testing your intended logic.

   To remove your changes and revert to the default text for the Alert payload text box, click **Reset**.

   For your convenience, Health Log Analytics provides sample alerts with preconfigured payloads. Select a sample alert in the **Example alert** field to display its payload in the Alert payload text box.
8. **Optional:** Save the current values of the filter without testing by selecting **Update**.
9. When your content for the alert payload and your JavaScript function are complete, select **Test**.
   To simulate the alert operation, the system saves the filter values, applies the filter to the **Alert payload** text, and then displays one of the following results:
   - `Alert will be dropped.`
   - `Alert will be allowed.`

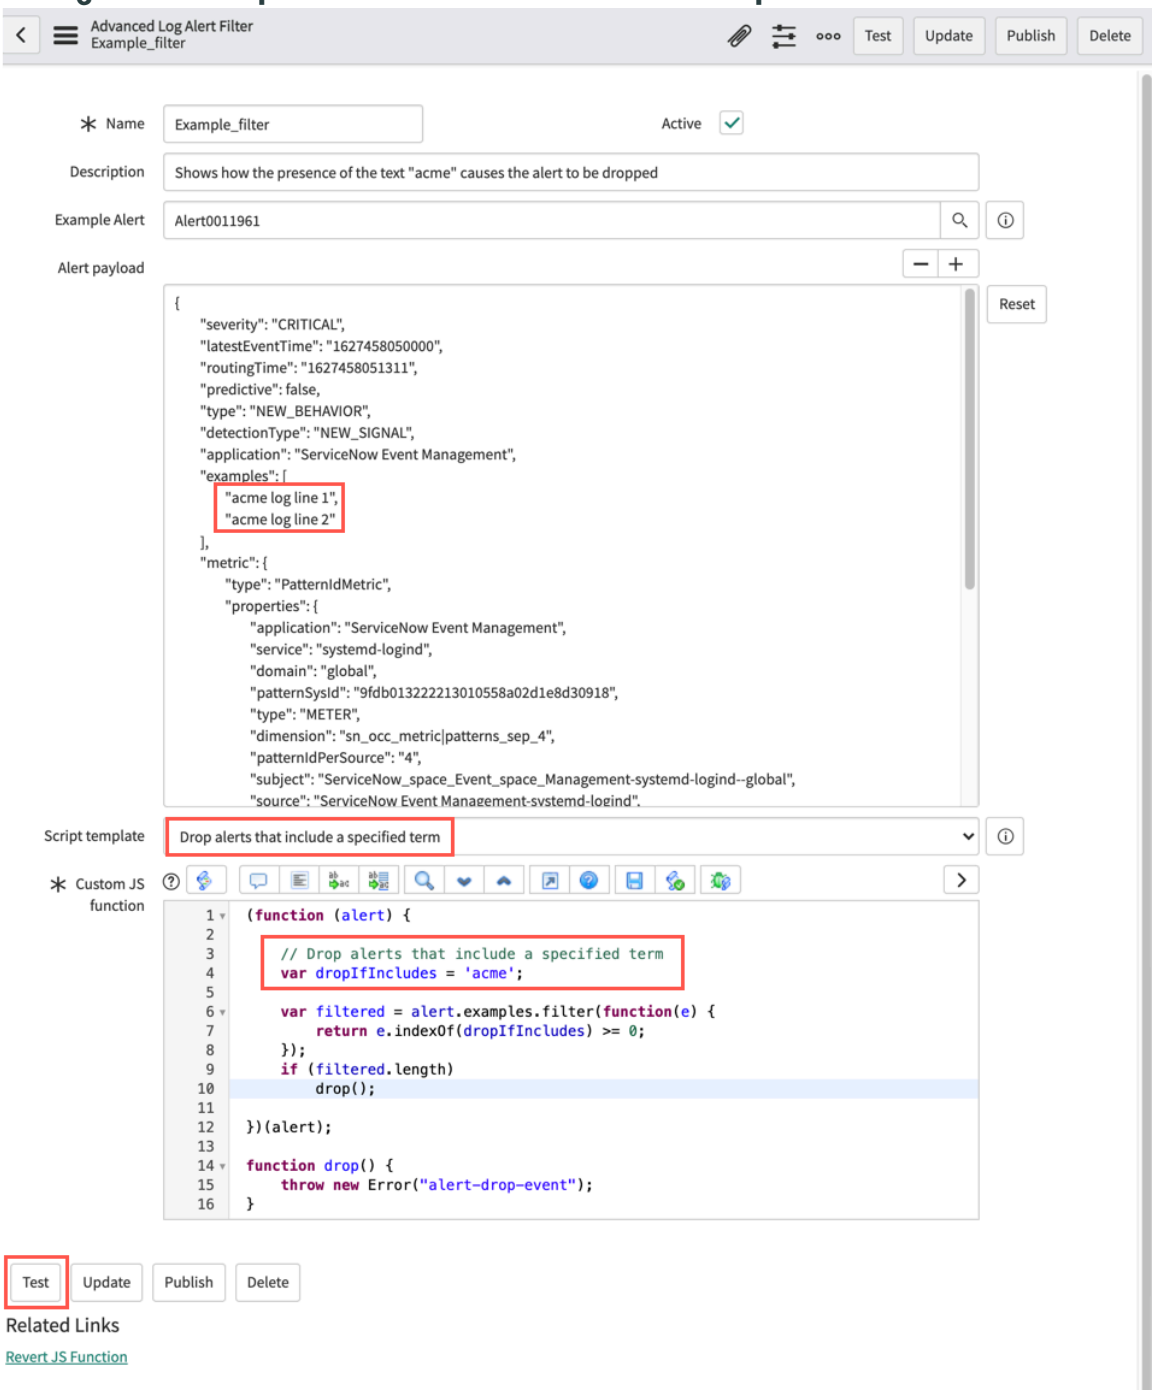
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Testing the JavaScript to determine whether to allow or drop the alert



Note: If your new JavaScript function is not behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

10. Repeat the process of updating the alert payload and testing the JavaScript function as often as needed.
11. When you are satisfied with the filter, save its values and determine whether to apply it to the log stream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To save the values and apply the filter to the log stream, make sure the **Active** check box is selected and select **Publish**.
- To save the filter without applying it to the log stream, clear the **Active** check box and select **Publish.**

Note: If you modify a published filter, you must publish the modified filter to apply it to the log stream.

Result

The values of the active filter are saved. If you selected the Active option, the filter is applied to the log stream.

View the settings of Health Log Analytics system features

View the settings for all Health Log Analytics system features. These features configure many operations that affect your work. The admin can enable or disable features for you.

Before you begin

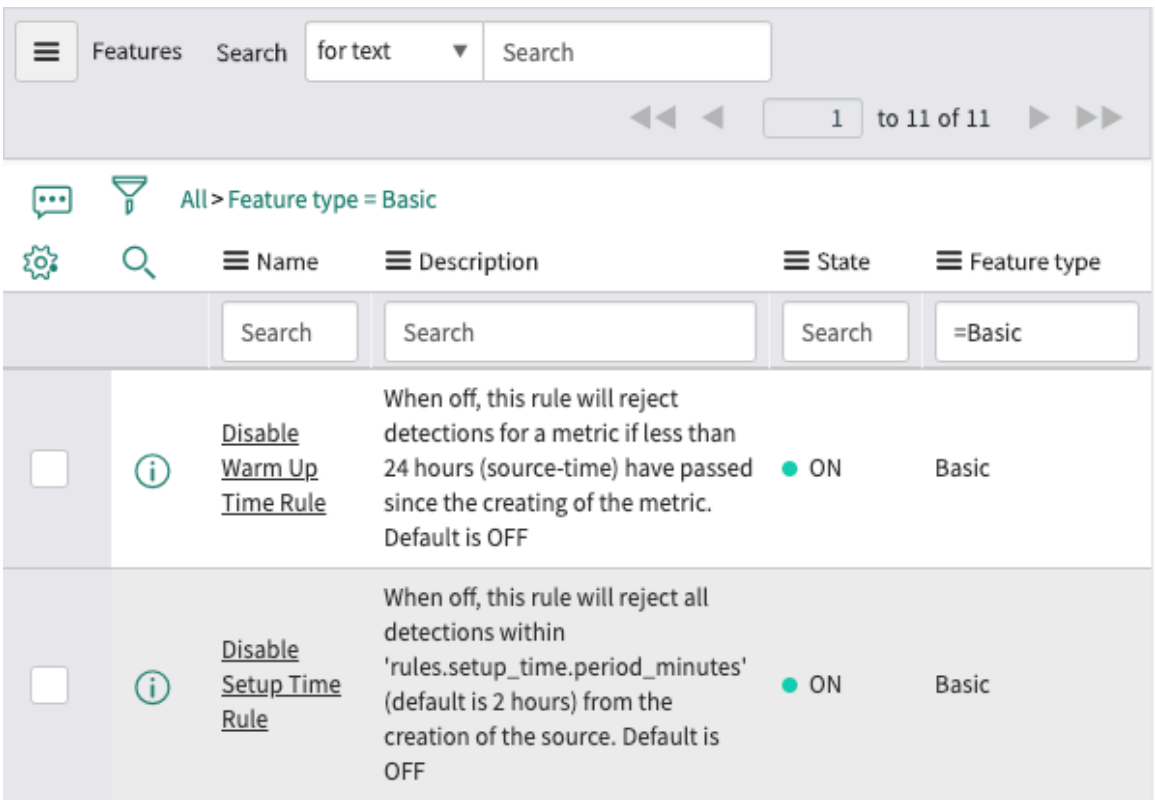
Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Health Predictive AI Ops Administration** > **Features**.

   A full definition of the feature appears in the **Description** field.

   By default, the table shows the system features that administrators modify most commonly. To view the complete list of features, use the filtering options.



2. **Optional:** Ask your admin to activate or deactivate a feature by updating the **State** setting.

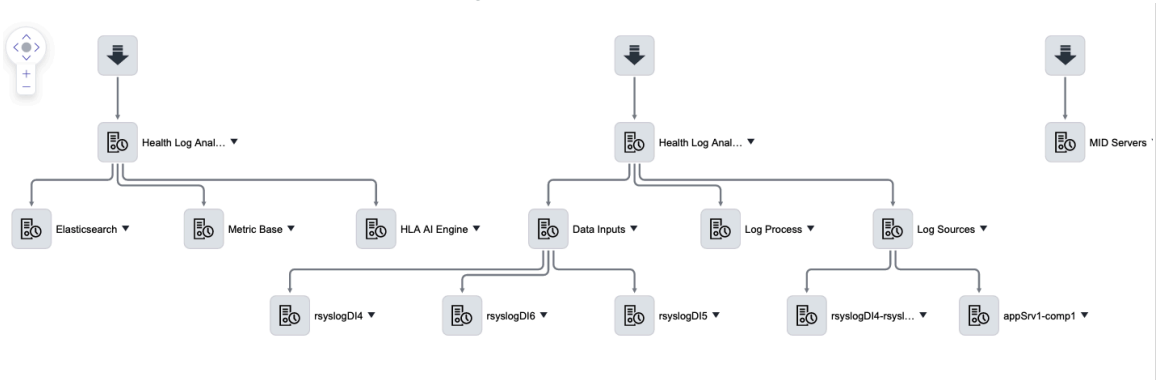
Viewing Health Log Analytics system health alerts on the service map

The ServiceNow Event Management service instance map includes a model of the Health Log Analytics core components and the system health alerts that affect them.

Health Log Analytics and the Event Management application form a single service. Viewing the configuration items (CIs) that comprise Health Log Analytics and their relationships helps you visualize the impact of HLA system health issues on the service.

HLA components on the Event Management service instance map



Health Log Analytics uses self-health checks to monitor the health of its components. When it discovers a system health issue, a notification triggers an alert. System health alerts display on the affected CIs on the service map. A colored bar on an affected CI indicates the criticality level of the alert: A red bar signifies a critical alert, an orange bar a major alert, and a yellow bar a minor alert.

For example, the red bar indicates a critical alert on this CI:

If the alert impacts the parent object, the parent object has a bar of the same color. For more information, see View an alert impact on CIs in a service map.

You can drill down into an alert to view details about the issue and then address it by performing the action proposed in the notification. For more information, see Health Log Analytics self-health checks, notifications, and proposed actions.

Monitored components

Component	What is monitored
Health Log Analytics core	• Elasticsearch • Metric Base • HLA AI Engine
Health Log Analytics	• Data inputs • Log sources

Identify Health Log Analytics system health issues on the service map

Identify Health Log Analytics system health issues on the service map

View Health Log Analytics (HLA) system health issues on the ServiceNow Event Management service instance map.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

Viewing the configuration items (CIs) that comprise Health Log Analytics and their relationships helps you visualize the impact of HLA system health issues on the service. For more information, see Viewing Health Log Analytics system health alerts on the service map.

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Service Instances**.
2. On the **Service Instances** page, locate ServiceNow Event Management and select **View Service**.

   The Event Management service instance map shows the Health Log Analytics core components and the system health alerts that affect them.
3. On the service map, identify Health Log Analytics system health issues.
4. Drill down into an alert to view details about the issue.

What to do next

Address the alert by performing the action proposed in the notification. For more information, see Health Log Analytics self-health checks, notifications, and proposed actions.

Analytics and Reporting in Health Log Analytics

Gain valuable insights into the number of IT issues predicted before your users were affected and the money it saved your organization by using Analytics and Reporting in Health Log Analytics.

Platform Analytics Solutions for Health Log Analytics

Platform Analytics Solutions contain prepackaged Performance Analytics and Reporting content for use with other ServiceNow AI Platform products. This Platform Analytics Solution provides valuable insights into the number of IT issues Health Log Analytics predicted before your users were affected, and the money it saved your organization by preventing critical outages.

Required roles

The following roles and tasks are associated with this solution:

- ServiceNow AI Platform administrator (admin): Install and activate this solution and make any necessary changes to system properties.
- Performance Analytics administrator (pa_admin): Review the indicators, breakdowns, widgets, and dashboards. Set up and start data collection. Share the dashboards with appropriate stakeholders.

Analytics and Reporting Solutions

Activate the Platform Analytics Solution for Health Log Analytics

Activate the content pack ServiceNow Store application for the Platform Analytics Solution.

Before you begin

Activate the full, subscription version of Performance Analytics on the instance where you are activating this Platform Analytics Solution. You can activate Performance Analytics on a non-production instance without purchasing a subscription. For more information, see Activate your Performance Analytics subscription.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Applications** > **ServiceNow Store**.
2. Browse for Health Log Analytics and verify that you have the necessary valid entitlements.

   You need a HI account and permission to request applications for the instances under consideration. The HI account and the instance need to be part of the same company. For more information, see Install a ServiceNow Product on the ServiceNow Store.
3. Search for `Health Log Analytics (sn.occ)`.
4. Install the application.

   When you install this application, you also activate the Performance Analytics - Premium (com.snc.pa.premium) plugin.

   Note: This plugin requires an additional fee.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the Platform Analytics Solution for Health Log Analytics

Run diagnostics, review and customize components, and start collecting data.

Before you begin

A ServiceNow AI Platform administrator must have installed the content pack plugins or ServiceNow Store application for this Platform Analytics Solution.

Role required: pa_admin

Procedure

1. Run diagnostics on all records.

   These diagnostics can catch many mismatches between the configuration of your Platform Analytics Solutions and your tables. For more information, see Performance Analytics diagnostics.

2. Navigate to **All** > **Performance Analytics** > **Administration Console**.
3. Verify the name of the dashboard that has been installed with this Platform Analytics Solution: Health Log Analytics Overview dashboard
4. Open the **Indicator Sources** tab.
5. For each dashboard included in this Platform Analytics Solution:

   a. Filter the indicator sources on the dashboard name.

   Example

   Here you see the indicator sources filtered on the Self-Service Analytics dashboard from the Employee Relations Executive Overview.

   b. Review the facts table, conditions, and frequency of the indicator sources compared to the data structure on your own instance.

   Important: Pay particular attention to time stamp fields such as Resolved or Created that are referenced in the **Conditions** field. You may need to use different time stamp fields.

   c. If necessary, open an indicator source and make corrections.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. If you are editing an indicator source record, go to the Indicators related list and review the **Conditions** field for each indicator.

   Changing the indicator source can also affect the additional conditions on the individual indicators.

6. If you changed the time field stamps in any indicator sources, then change any related Performance Analytics scripts.

   For more information, see Update Performance Analytics scripts.

7. Open the Breakdown Sources tab.
8. For each dashboard included in this Platform Analytics Solution:
   a. Filter the breakdown sources on the dashboard name.
   b. Review the conditions on the breakdown source as described in Review the breakdown sources.
9. Navigate to **All** > **Performance Analytics** > **Jobs**.
10. Set up and run the historical job for this Platform Analytics Solution, *[PA HLA] Historic Data Collection*.
11. Edit and activate the scheduled data collection job for this Platform Analytics Solution, *[PA HLA] Historic Data Collection*.

Health Log Analytics Overview dashboard

The Health Log Analytics Overview dashboard uses Performance Analytics to provide a trend of historical data as well as regular reports.

From the Xanadu release onward, the Health Log Analytics Overview dashboard has been deprecated and replaced with the HLA Operational dashboard. The HLA Operational dashboard uses Performance Analytics to enable you to monitor log data, alerts, and error rate information in Service Operations Workspace and address issues as they occur in the system. For more information, see HLA Operational dashboard.

Health Log Analytics reference

Reference topics provide additional information about the Health Log Analytics application.

Components installed with Health Log Analytics

Activating the Health Log Analytics, Health Log Analytics Viewer and Health Log Analytics Core plugins adds several components.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Plugins

Plugin	Description
Health Log Analytics	Health Log Analytics is an AI-powered log analysis solution capable of preventing IT incidents before users are affected. It automatically identifies your environment and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugin	Description
	logs, predicts IT incidents, generates alerts, and provides expert suggestions for fixing issues. Health Log Analytics is a ServiceNow Store app. Once installed, the module is available, but you can choose not to interact with it. Dependency: • Health Log Analytics Core • The ServiceNow® Event Management application
Health Log Analytics Viewer	Event Management operators use the Health Log Analytics Viewer plugin to browse logs by timestamp or time range. Health Log Analytics Viewer enables Event Management operators to search for a specific log text and visualize the frequency of hits in a particular time period. Dependency: The ServiceNow® Event Management application.
Health Log Analytics Core	This plugin contains essential components for Health Log Analytics, such as the AI Engine and Elasticsearch. Health Log Analytics Core is a ServiceNow Store app. Once installed, the module is available, but you can choose not to interact with it. Dependency: The ServiceNow® Event Management application.

Roles

Health Log Analytics uses the following roles.

Role title [name]	Description
Event Management Administrator [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Health Log Analytics.
Event Management Operator [evt_mgmt_operator]	Has read access to all Event Management features. Has write access to alerts to manage the alert life cycle. Has the itil role to manage incidents created from alerts. Can also activate operations on alerts, such as to acknowledge, close, and open an incident and run remediation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lists

Health Log Analytics adds the following lists.

Table [name]	Description
Advanced Log Alert Filtering [sn_occ_advanced_alert_filtering]	Controls processing of alert metrics with feedback options. Enables providing more complex feedback to the AI engine. Beginning with the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store, this representation no longer displays.
Advanced Log Alert Filter [sn_occ_advanced_alert_filter]	Controls processing of alert metrics with feedback options. Enables providing more complex feedback to the AI engine. **Note:** This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.
Data Inputs [sn_occ_base_data_input_config]	Enables setting up data input connectors to stream log data into the instance.
Data Input Mapping [sn_occ_event_mapper]	Enables mapping raw log data that streams into the instance to determine how Health Log Analytics processes it.
Data Input Preprocessor [sn_occ_data_input_preprocess_screen]	Enables editing raw log data before the system maps and structures it.
Define Alert [sn_occ_custom_alert]	Enables creating custom alerts based on a predefined set of rules.
Excluded Values [sn_occ_auto_service_normalizer]	Enables configuring Health Log Analytics to stop extracting specific log data that is not descriptive enough or contains redundant text or information.
Extracted Values [sn_occ_auto_service_mapper]	Enables configuring Health Log Analytics to extract a specific term found in a field and map it to a specified component.
Features [sn_occ_features]	Lists all Health Log Analytics features. The features can be activated and deactivated.
Lexical Keywords [sn_occ_lexical_keywords]	Shows all default lexical keywords that Health Log Analytics looks for in log data.
Log Correlator [sn_occ_log_correlator]	Shows all correlators that determine whether to correlate different alerts to the same group. Enables adding correlators to Health Log Analytics.
Log Sources [sn_occ_sources]	Provides a view of all data input sources when the log data has been mapped. Enables controlling properties and correlators for these sources.
Muted Metrics [sn_occ_metric_state]	Shows all muted alert metrics together with the muted components. Enables reactivating the muted alert metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table [name]	Description
Source Type [sn_occ_source_type]	Contains the source types extracted in the mapping process.
Source Type Structure [sn_occ_source_type_structure]	Enables fine-tuning the source type structure. Provides a view of all source types when the log data has been mapped. Source types define how Health Log Analytics treats specific sources and how it parses the logs.
Streaming Sources [sn_occ_log_streaming_source_stats]	Enables monitoring all entities that stream log data to the instance.
System Health – Notifications [sn_occ_health_check]	Shows all system health notifications together and enables updating their status.
System Properties [sn_occ_system_settings]	Displays system properties and enables customizing their values.
Timestamp Formats [sn_occ_timestamp_formats]	Displays predefined timestamp formats. Enables defining and adding timestamp formats.
Time Zones [sn_occ_time_zones]	Enables deleting records in sn_occ_time_zones for users with the evt_mgmt_admin role.

Forms

Health Log Analytics adds the following forms.

Table [name]	Description
Beats Data Input [sn_occ_data_input_config_filebeat]	Enables configuring advanced settings for Beats data input connectors.
Beats Linux (Filebeat) [sn_occ_data_input_connector_filebeat]	Enables configuring Filebeat data input connectors.
Elasticsearch Data Input [sn_occ_data_input_config_elastic]	Enables configuring an Elasticsearch data input.
MID Server Data Input [sn_occ_data_input_config_midserver]	Enables configuring a MID Server data input.
Rsyslog [sn_occ_data_input_connector_rsyslog]	Enables configuring Rsyslog data input connectors.
Rsyslog Data Input [sn_occ_data_input_config_rsyslog]	Enables configuring advanced settings for Rsyslog data input connectors.
TCP Data Input Configuration [sn_occ_data_input_config_tcp]	Enables configuring advanced settings for TCP data input connectors.
Windows Beats [sn_occ_data_input_connector_winbeat]	Enables configuring Windows Beats data input connectors.
WinLog Beats [sn_occ_data_input_connector_winlogbeat]	Enables configuring WinLog Beats data input connectors.

Supported data inputs for Health Log Analytics

Health Log Analytics (HLA) enables you to connect your ServiceNow instance to several types of data input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HLA supports the following data input types:

- Passive data inputs (listeners), which wait for log data to be pushed to them. These data inputs require a network port to be open on the MID Server:
  - Rsyslog
  - Beats
  - Splunk
  - TCP
  - UDP
  - MID Server
  - GCP PubSub
  - REST API

  The Agent Client Collector data input is supported for use with the Agent Client Collector Log Analytics application, available from the ServiceNow Store.
- Active data inputs (pullers), which pull data from repositories:
  - Elasticsearch
  - Splunk Polling
  - Amazon CloudWatch
  - Amazon S3
  - Microsoft Azure Log Analytics
  - Microsoft Azure Event Hubs
  - Apache Kafka

  For all active data inputs, Health Log Analytics supports MID Server clusters for failover protection. The active data input runs on a single MID Server in the cluster. If that MID Server fails, the system moves its tasks to the next available MID Server in the cluster in a configured order.

  The Elasticsearch data input fetches data from a data repository or database using credentials. If your data is in Elasticsearch, Health Log Analytics must have the following:
  - Permissions to query Elasticsearch

    One of the following types of credentials:
    - Basic authentication (user and password)
    - AWS, for Elasticsearch on Amazon AWS Cloud
  - Network connectivity to the relevant Elasticsearch cluster

Note: Health Log Analytics must be pointed to the correct index to start pulling the data.

In addition, Health Log Analytics supports Crible, Edge Delta, and Vector Agent data inputs. These data inputs enable HLA to process log messages that are streaming from these tools into your instance.

Native ServiceNow data inputs

Streaming logs from Cloud Observability to Health Log Analytics

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics can process log data it ingests from the ServiceNow® Cloud Observability application, formerly#Lightstep. HLA automatically sets up the configuration needed to enable log streaming from Cloud Observability as part of its native integration. Setting up the connection from Cloud Observability to HLA must be done in the Cloud Observability application. In HLA, you handle log records from Cloud Observability in the same way as any other Data Input Mapping and Source Type Structure records, as explained in Log data auto-mapping and mapping and Source type structure adjustment. For more information about Cloud Observability, see Explore Cloud Observability documentation.

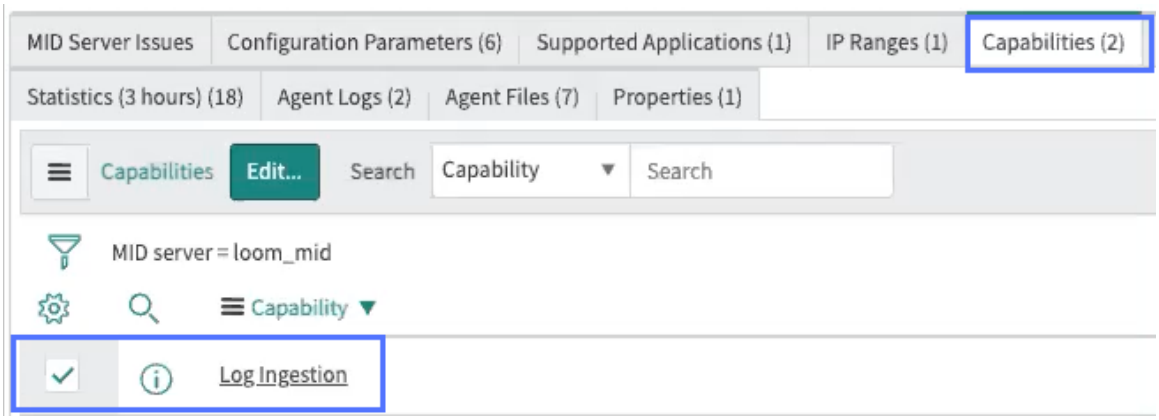
Related topics

Setting up Health Log Analytics on your ServiceNow instance

MID Server proxy preconditions for streaming logs to HLA

Requirements for using a MID Server proxy to stream log data to Health Log Analytics.

- Use a Squid MID Server proxy to enable streaming log data to Health Log Analytics. For more information, see Proxy server configuration for MID Servers used for Cloud Discovery and Cloud Provisioning and Governance.
- Install and configure the MID Server proxy with the log ingestion capability enabled.



In addition, configure the following properties:

- mid.proxy.use_proxy = true
- mid.proxy.host = <proxy_ip>
- mid.proxy.port = <proxy_port>

Health Log Analytics configuration preferences

Commonly used settings for Health Log Analytics properties and general configuration.

MID Server settings

- The MID Server log ingestion capability must be enabled.

Note: Enabling **All capabilities** on the MID Server includes enabling the log ingestion capability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use dedicated MID Servers for log ingestion whenever possible.
- To enable MID Servers to run multiple products, Health Log Analytics must have at least the Java Virtual Machine (JVM) memory setting for the standard product for each MID Server thread configuration.

The preferred MID Server settings for Health Log Analytics are:

- CPUs: 8
  - RAM: 32 GB
  - Network Bandwidth: Up to 10 Gbps
  - EBS Bandwidth: Up to 4,750 Mbps
  - Maximum Java heap size for MID Server: 8,192 MB

  With the above specifications, the expected log ingestion throughput on a Washington DC instance is as follows:
  - For a log message of 300 bytes: 20,000
  - For a log message of 1.1 KB: 12,300
  - For a log message of 2 KB: 7,970

  The minimum requirements for streaming logs to Health Log Analytics are:
  - CPUs: 4
  - RAM: 16 GB
  - Java heap size for MID Server: 8 GB

  For general information, see: MID Server system requirements.

- To increase log ingestion throughput, you can either increase the ulimit or the network bandwidth, or decrease the size of the logs being streamed. The ulimit setting can be configured on an individual MID Server. However, the correlation between the ulimit and the throughput can't be modified.

  The following table lists the ulimit settings for open files relating to network throughput on the MID Server. It shows the size of the logs being streamed from the MID Server to the agent, and the gRPC streaming rate equivalent to the throughput.

Ulimit settings in relation to throughput

Queue Type	Log line size	gRPC rate
In Memory Queue	300 bytes	18,000
In Memory Queue	1.1 KB	13,000
In Memory Queue	2 KB	10,000
Disk-based Queue	300 bytes	11,000
Disk-based Queue	1.1 KB	5,000
Disk-based Queue	2 KB	3,000

Starting from the August 2024 release, you can enhance MID Server communication with the ServiceNow instance by using the Lightning gRPC client, which can increase log streaming speeds to Health Log Analytics by up to six times. The Lightning gRPC client requires manual configuration to activate. For more information, see the Lightning gRPC client - Enabling the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

new MID gRPC streaming architecture [KB1648419] article in the Now Support Knowledge Base.

- By default, the number of data inputs per MID Server is limited to 10. You can configure this limitation for an individual MID Server or for all MID Servers.
- Both in FIPS and non-FIPS mode, MID Servers with Health Log Analytics capability must run on the Java Runtime Environment (JRE) 11 or above.

Note: To support BC-FIPS version 2.0, Health Log Analytics requires an upgrade to version 34.0.37, December 2024.

Log source retention settings

By default, log retention per source is set to three days. This setting can't be modified.

When using Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store , you can modify the log retention policy per source or for multiple sources together. For more information, see Modify the log source retention period.

Health Log Analytics system health notifications

Health Log Analytics system health notifications help to ensure that you're aware of potentially dangerous conditions. You can manually adjust the status of a notification as the issue is being addressed.

Health Log Analytics uses self-health checks to monitor the health of its components. When it discovers a system health issue, a notification is created and an email sent to all subscribers. The Health Log Analytics Administration **System Health - Notifications** list displays all HLA system health notifications, including those about internal errors. You can ask your admin to subscribe you to the system health notifications.

Health Log Analytics System Health - Notifications

Field	Description
Name	Notification header.
Description	Description of the notification.
Created	Date when the notification was created.
State	State of the notification. • **New**: The notification was newly added. • **Acknowledged**: The notification record was read. • **Work in progress**: The issue described in the notification is being addressed. Adjust the value manually. • **Closed**: The issue is no longer active. Adjust the value manually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics System Health - Notifications (continued)

Field	Description
	Note: Changing the state of a notification does not affect the state of the issue described in it. A notification in the Closed state will still display in the table. The notification is automatically filtered out of the table only when the issue is detected as fixed (that is, when the Healthy status is **True**).
Healthy	Field that indicates the status of the issue mentioned in the notification. The table shows only notifications with a Healthy value of **False**. When the issue is detected as fixed, the value is automatically changed to **True** and the notification is filtered out of the table.

Health Log Analytics self-health checks, notifications, and proposed actions

Health Log Analytics provides self-health checks, notifications, and proposed problem-solving steps.

Health Log Analytics system health notifications

Self-health check	Notification	Proposed action
Maximum AI engine queue size exceeded	The AI engine is running at overcapacity (size=%s, threshold=%s, duration=%s). As a result, the accuracy of anomaly detection might deteriorate.	Contact ServiceNow support.
High rate of unclassified errors in %s %s	"%s %s has a high rate of unclassified errors and is failing frequently.	Contact ServiceNow support.
Errors invoking glide API	Errors invoking '%s' for %s.	Contact ServiceNow support.
Log size limitation was exceeded	Log messages from %s: %s are being dropped because the log size limitation was exceeded.	If the difference is minor, increase the log size limitation by adjusting the property *mid.data_inputs.max_length_bytes* on the MID Server Properties form. If the logs are too long or multi-line, you can also modify the log size at the source of the logs.
Excessive data volume for data input %s.	The data volume for data input %s is too high. Log messages are being discarded.	Contact ServiceNow support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics system health notifications (continued)

Self-health check	Notification	Proposed action
Log messages are being dropped due to failed auto-structuring	Log messages are being dropped because auto-structuring of Source Type %s failed.	In the Source Type, find out what could be causing auto-structuring to fail. Inspect the error logs to determine which component or parsing action is failing.
Excessive number of script errors per second in %s:%s	The rate of script errors in %s: %s is too high.	Review the JavaScript Parsing Error in the source given in the message: Data Input Mapping Screen or Source Type Structure Screen.
Log messages that exceed the permitted number of properties are being discarded	The source type %s contains multiple log messages with too many properties. Such log messages are discarded. Review the Source Type Structure record.	On the relevant Source Type Structure record, review the properties that are being extracted. Check for script loops or conditions that might cause too many properties to be created. Avoid using a dynamic property name. For more information, see Refine the source type structure.
Too many clusters are being generated. The accuracy of anomaly detection might deteriorate.	Too many clusters are being generated for Source Type %s. As a result, the accuracy of anomaly detection might deteriorate.	Inspect the created patterns and verify that the Message label is being assigned correctly. On the Source Type Structure form, review the Message property.
Sources are being created at a very high rate	Sources are being created at a very high rate. Data input %s was stopped automatically.	On the Data Input Mapping form, inspect the Mapping script and fix any JavaScript errors that might cause too many sources to be created.
Source Types are being created at a very high rate	Source Types are being created at a very high rate. Data input %s was stopped automatically.	On the Data Input Mapping form, inspect the Mapping script and fix any JavaScript errors that might cause too many Source Types to be created.
Metrics are being created at a very high rate	Source Type %s is generating too many metrics. The properties %s were automatically classified as invalid.	On the Source Type Structure form, observe the metrics being generated. Make sure that the Metric label is assigned only to the required properties. A dynamic property name or inaccurate JavaScript function can cause too many properties to be generated.

Health Log Analytics system health notifications (continued)

Self-health check	Notification	Proposed action
Processing duration of REST calls in the AI Engine is too high	Processing of REST calls in the AI Engine is taking too long.	Contact ServiceNow support.
The number of log messages being discarded is too high	Too many log messages are being discarded from source %s.	Review the log retention settings. Verify that the log lines timestamp is correct and does not represent a future or past time outside the retention period.
Auto-structuring is slowing down the AI engine	Auto-structuring is slowing down the AI engine.	Contact ServiceNow support.
Log messages are being dropped due to a timestamp parsing failure	Log messages from %s %s are being dropped due to a timestamp parsing failure. Search for 'Failed parsing timestamp from log message' in the logs for the relevant Service instance and Component and fix the issue.	On the Data Input Mapping form, locate the extracted timestamp. If it is missing, navigate from the form to the relevant Source Type Structure and open the Timestamp Parsing Error tab. The tab displays the issue that led to the parsing error. Fix the issue.
No memory consumption drop	Memory consumption hasn't dropped in the last few minutes.	Contact ServiceNow support.
Pings the Elasticsearch clusters' health endpoints to determine the health of the connection	Elasticsearch connectivity issues.	Contact ServiceNow support.
Uses the Metric base client connection check to determine the health of the connection	Metric base connectivity issues.	Contact ServiceNow support.
Uses the Glide client connection check to determine the health of the connection	Glide connectivity problems.	Contact ServiceNow support.
The data input is in Failed state	The data input %s failed to stream logs.	On the Data Input form, check the connection to the MID Server and review the error message.

Health Log Analytics language support

Health Log Analytics provides international language support. The default language is US English.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Language support coverage

The current available languages for Health Log Analytics are as follows: US English, UK English, French, German, Italian, Japanese, and Spanish.

Note: To receive keyword-based alerts for languages other than English, keywords in the relevant language must be added to the system before you start streaming. Contact ServiceNow Support for assistance.

Domain separation and Health Log Analytics

Domain separation is supported for Health Log Analytics. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation and Health Log Analytics overview

Domain separation is present in all aspects of the Health Log Analytics application. Users belonging to a specific domain see only the data existing in their own domain.

How domain separation works in Health Log Analytics

When data is domain separated using a single Health Log Analytics server, each Managed Service Provider (MSP) can see the log data only in its own domain or the child domains below it . Users can view alerts that Health Log Analytics generates only in their own domain. Actions to remediate the alerts apply only for the scope of that domain. By default, all users and records are set to the parent domain unless the admin assigns them to a specific domain.

The Health Log Analytics Domain Separation plugin must be installed before you configure your data inputs in the Health Log Analytics application. There is no setup procedure for the plugin. Install the plugin with the Health Log Analytics application Version 21.0.1 - September 2021, and then activate it. Make sure that you map your data into logical silos and configure rules and entities.

You define the domain-separated environment when you configure your data inputs. Users can use data inputs that are only available in their own domain. Health Log Analytics creates alerts only for logs that arrive in those data inputs. All relevant records and all data processing in the Health Log Analytics program flow reside in the same domain as the data input. A data input's domain name is shown in the **Domain** column displayed in the tables in your instance.

Using domain separation in your instance is transparent to Health Log Analytics. The application manages all aspects of the data, such as system settings and custom operations, separately.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a property is changed, the new value affects new sources only in the specific domain. System properties affecting the server are common to all domains because all domains use the Health Log Analytics server.

Note: Health Log Analytics supports up to 60 kilobytes events per second (EPS) across all domains, without the ability to provide a service level agreement (SLA) to a specific domain and without fairness. If a domain streams a large amount of data, the Health Log Analytics server processes it. Other domains might suffer latency, drops, or other issues as a result, even if they stream a low number of logs. On the MID Server side, 10 kilobytes EPS is expected.

Use cases

- An MSP wants to provide the Health Log Analytics application to multiple customers in a similar environment with a single instance.
- An organization with many tenants wants to isolate its sensitive data, such as security logs.
- An administrator of a tenant organization wants to define a data input only for their own domain.
- An operator in a tenant organization wants to view logs only in their own domain.
- An operator in a tenant organization wants to provide feedback for alerts only in their own domain.
- An MSP Admin wants to view log data from all of their organization's tenant domains.

Domain separation for service providers

JavaScript function test outcome fields

Description of the JavaScript function test outcome fields.

The following fields are read-only:

Field	Description
Duration (ms)	The processing time of all samples, in milliseconds.
Source types	The number of source types predicted or created for this data input.
Sources	The number of sources predicted or created for this data input.
Errors	The number of JavaScript errors that occurred in all the samples.
Unmapped	The number of log lines that could not be mapped. These log lines are mapped to default tags.
Samples	The number of log samples on which the test is run. The default value is 1,000.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: You can increase the number of log samples up to a maximum of 5,000 samples in the system property data_input_mapping.max_examples. For more information, see Configure global Health Log Analytics system properties.

In the related lists, view the predicted or created source types and sources.

List/Tab	Description
Outcome Key Value Mapping	The results of running the JavaScript function on the log samples.
Source Types (from samples)	The predicted or created source types. **Note:** You can open source types that have already been created by selecting the appropriate link.
Sources (from samples)	The predicted or created sources. **Note:** You can open sources that have already been created by selecting the appropriate link.
Test Outcome	The log samples used for testing your JavaScript function, ordered by sources and source types. The **Test Outcome** list displays the number of log samples for each source-source type combination, and is updated when the log samples are refreshed and you start testing your script. The list links to samples in the **Mapping Samples** table, which shows the outcome of the JavaScript function for each sample. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.
Source Type Structures	The source type structures for this data input. Reviewing the source type structures can help you gain a better understanding of the data flow. The **Last event time** column on this tab shows the last date and time the AI engine processed a log for the source type structure. The system refreshes this information every 5 minutes. Knowing when the last log was processed for

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List/Tab	Description
	this source type structure makes it easier to verify that log data is streaming.

Health Log Analytics severity mapping

Health Log Analytics (HLA) uses common severity values to identify severity labels in the Source Type Structure.

The **Log severity mapping** table illustrates how HLA identifies severity words from raw logs (shown in the left column), maps them to its own severity values (middle column), and then presents them in Event Management alerts (right column).

Log severity mapping

Raw log severity	HLA log severity	Event Management alert severity
TRACE	TRACE	Keywords-based
VERBOSE	TRACE	Keywords-based
FINE	TRACE	Keywords-based
FINER	TRACE	Keywords-based
FINEST	TRACE	Keywords-based
DEBUG	DEBUG	Keywords-based
DBG	DEBUG	Keywords-based
CONFIG	DEBUG	Keywords-based
INFORMATIONAL	INFORMATIONAL	Keywords-based
INFORMATION	INFORMATIONAL	Keywords-based
INF	INFORMATIONAL	Keywords-based
INFO	INFORMATIONAL	Keywords-based
UNKNOWN	UNKNOWN	Keywords-based
NOTICE	NOTICE	LOW
NOTIFICATION	NOTICE	LOW
WARNING	WARNING	MEDIUM
WARN	WARNING	MEDIUM
ERROR	ERROR	HIGH
ERR	ERROR	HIGH
CRITICAL	CRITICAL	CRITICAL
CRIT	CRITICAL	CRITICAL
FAT	CRITICAL	CRITICAL
FATAL	CRITICAL	CRITICAL
SEVERE	CRITICAL	CRITICAL
ALERT	ALERT	CRITICAL

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log severity mapping (continued)

Raw log severity	HLA log severity	Event Management alert severity
EMERGENCY	EMERGENCY	CRITICAL
EMER	EMERGENCY	CRITICAL

Note: If your raw log contains numerical severities or unrecognized words, map these values to the HLA Log Severity column by creating a conditional statement using the JS function in the Source Type Structure. For more information, see Source type structure adjustment.

Data input configuration field descriptions

This section provides descriptions of the fields on the Health Log Analytics data input configuration forms.

Rsyslog, Filebeat, or Winlogbeat data input configuration fields

Description of the fields on the Rsyslog, Filebeat, and Winlogbeat data input configuration forms.

Basic configuration

Getting Started tab

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
MID Server	The MID Server to which the logs stream. **Note:** • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Port	The port on the MID Server. Choose a port within the suggested range from the array. The port must not be occupied by another process. Make sure that your organization's security team opens the selected port. This field is required.
Content pack	(Linux using Filebeat only) The content pack to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
	Content packs contain default source types and mapping script templates. Health Log Analytics activates the selected pack automatically and uses its mapping script for mapping the data input sources. For more information, see Health Log Analytics content packs for quicker time to value.

Tagging and Binding tab

Field	Description
Path	The full path from which to stream logs. You can use a wildcard. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.
Component	The device type or stack layer as context for the logs that is used for anomaly detection and correlation. For example: Tomcat. Components typically represent CIs in the CMDB. Several components are often clustered together in a single service instance.
Source Type	The source type, which defines how Health Log Analytics handles a specific application and parses the log data. For example: Tomcat Catalina. Each data input can have multiple source types, based on the diversity of its log formats. Service instances and components can have any number of source types.

Advanced configuration

For Rsyslog data inputs:

Rsyslog advanced configuration form

Field	Description	Default values
Use SSL/TLS	Option for selecting to use SSL/TLS.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rsyslog advanced configuration form (continued)

Field	Description	Default values
Look up hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames.	false
Boss thread count	The number of threads that manage connections.	1
Worker thread count	The number of threads that handle incoming data.	4
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.	30
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	

For data inputs that use Beats agents:

Beats advanced configuration form

Field	Description	Default value
Client inactivity timeout (sec)	The timeout, in seconds, to close an inactive channel.	15
Worker thread count	The number of threads that handle incoming data.	4
Default time zone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32766

Beats advanced configuration form (continued)

Field	Description	Default value
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	false

Splunk data input configuration fields

Description of the fields on the Splunk data input configuration form.

Basic configuration

Getting Started tab

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
MID Server	The MID Server to which the logs stream. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Port	The port for the MID Server. Make sure that your organization's security team opens the selected port in the MID Server. This field is required.
Transport Protocol	The protocol used for streaming log messages to your ServiceNow instance. • TCP - When using the Transmission Control Protocol (TCP) protocol, all logs will reach the instance. However, the Splunk pipeline might be blocked if the MID Server is down or the connection to it is lost. TCP is the default transport protocol. • UDP - When using the User Datagram Protocol (UDP) protocol, the Splunk pipeline

Getting Started tab (continued)

Field	Description
	will never be blocked. However, some logs might be dropped before they reach the instance. For more information about streaming log data using the TCP or UCP transport protocol, see the Streaming Splunk data using Heavy Forwarder: Selecting TCP or UDP [KB0998928] article in the Now Support Knowledge Base.
Use Cooked Data	Option to ingest log data from Splunk in the preprocessed ("cooked") format that Splunk uses on the forwarder. Ingesting data into HLA in this format ensures that each log line retains the relevant contextual information that Splunk embeds into it. **Note:** If you select this option, there is no need to edit the `props.conf` and `transforms.conf` files during Splunk data input configuration.
Use Forwarder TimeZone	Option to pass information about the time zone in which the forwarder is located. The MID Server uses this information to adjust for the time zone from which the logs arrive. This option is relevant when using Splunk Universal Forwarders.
Enable Compression	Option to send logs in compressed format. Sending logs in a compressed format minimizes the size of the data being transferred, which is important when dealing with large volumes of log data. This option is relevant when using Splunk Universal Forwarders and can only be used when SSL/TLS is enabled.

Advanced configuration

Advanced configuration form

Field	Description	Default values
Use SSL/TLS	Option for selecting to use SSL/TLS.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default values
	Note: To send logs in a compressed format, SSL/TLS must be enabled.	
Look up hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames.	false
Boss thread count	The number of threads that manage connections.	1
Worker thread count	The number of threads that handle incoming data.	4
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.	30
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	

Splunk Polling data input configuration fields

Description of the fields on the Splunk Polling data input configuration form.

Basic configuration

Getting Started tab

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server.) The MID Server to which the logs are streamed. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
	For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, create a service instance and add CIs to it. Set the status of the new service instance to Operational.
Transport	The protocol used for streaming log messages to your ServiceNow instance.
Sources count	The number of log sources this data input has created.
Status	Status of the data input.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Advanced configuration

Transport tab

Field	Description
Server URL	The URL used to access the Splunk REST API.
Query	The query Splunk uses to search your data.
Authentication Type	The authentication type. • Basic authentication: Sends a username and password with each HTTP request. Basic authentication is simpler than token-based authentication, but less secure. • Token authentication: The client obtains a token from an authentication server and uses that token to authenticate against Splunk.
Splunk Poll Credential Alias	The credential alias to be used. Specify a Splunk Poll credential alias by selecting the magnifying glass icon and then either selecting an existing credential alias from the **Connection & Credential Aliases** list, or selecting **New** to create a new record. The selected credential alias can hold one

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab (continued)

Field	Description
	Basic Auth credential and one Token Auth credential. For information about creating a credential alias, see Credential aliases for Discovery.
From	The date and time from which Splunk searches the data.
To	The date and time until which Splunk searches the data.

Advanced tab

Field	Description
Max documents per query	The maximum number of documents retrieved each time log data is fetched from Splunk. Default: 10,000.
Splunk request timeout (seconds)	The maximum time, in seconds, allowed for data retrieval before the request times out.

Elasticsearch data input configuration fields

Description of the fields on the Elasticsearch data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to determine whether to use a specific MID Server or a MID Server cluster. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Elasticsearch indices is pulled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when the **Execute on** field is set to Specific MID Server Cluster) The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server Clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • If Elasticsearch uses client certificate or CA certificate authentication, all MID Servers in the cluster must have the appropriate certificates. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This data input uses Elastic to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Transport tab

Field	Description
Server URL	URL used to access the cluster. This field is required.
Max connections per route	Maximum number of connections to be opened per node. Default: 2.
Max scroll slices	The number of shards configured for the relevant index in Elasticsearch. This number tells Elastic how many parallel queries to execute in each polling request.
Proxy host	Host name of the HTTP proxy through which requests are sent.
Proxy port	Port of the HTTP proxy through which requests are sent.
Authentication method	The authentication method used to authenticate the data input to Elasticsearch. The options are: Basic auth, apiKey, or client certificate. **Note:** When you select the required authentication method, the corresponding credentials fields display on the form.
Basic auth credentials	User name and password used to connect to the Elasticsearch search engine. **Note:** Fill in either this field or the **AWS credentials** field.
AWS credentials	AWS credentials to use to connect to the AWS-hosted Elasticsearch search engine. **Note:** Fill in either this field or the **Basic auth credentials** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab (continued)

Field	Description
AWS region	AWS region where the Elasticsearch cluster runs.
API key credentials	The API key used to connect to the Elasticsearch search engine.
Client certificate	The client certificate used to connect to the Elasticsearch search engine.
Use MID certificate policy check	Option to enable the MID certificate policy check. Select this option if you want to ship your logs encrypted using SSL TLS. Then navigate to **All** > **MID Server** > **MID Security Policy** and add the MID certificate policy check to the table. For more information, see MID Server certificate check policies.

Query Settings tab

Field	Description	Example
From/To	From and to dates and time for reading the data. • From: Don't read data older than this date. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. • To: Don't read data newer than this date. For live data, set this date far into the future.	From: 1970-01-01 15:59:59 To: 2300-01-01 15:59:59
Use cross-cluster search	Option for searching for data across Elasticsearch clusters. When this check box is selected, the **Clusters to search** field displays. **Note:** Your settings in the **Use minimal privileges** check box and the **Delay in reading current timestamp (seconds)** field on the **Advanced configuration** form affect how data is collected across multiple clusters.	
Clusters to search	The Elasticsearch clusters to search.	east,west,south

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Settings tab (continued)

Field	Description	Example
	This field displays only when the **Use cross-cluster search** check box is selected. Do one of the following: • Leave this field empty or enter "*" to search all the remote clusters defined in Elasticsearch. • Specify the clusters to search in a comma-separated list. **Note:** To also search the local cluster, add a comma at the beginning or end, or add two commas in succession to the list. For example: "east,,west" or ",east,west" or "*,"	
Index prefix	Prefix for the Elasticsearch indices to read from. The data input reads only from indices with this prefix. This field is required.	only-read-these-indices-*
Use minimal privileges	Option for reading log data directly from the Elasticsearch indices with the configured prefix. • When selected, the data input reads the log data directly from the Elasticsearch indices with the configured prefix. To perform this task, it needs only read privileges. **Note:** When this check box is selected and you're using cross-cluster search, data is collected from all the clusters simultaneously. • When clear, the data input fetches all indices with the prefix, filters them, and reads the log data from the filtered

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Settings tab (continued)

Field	Description	Example
	indices. Performing this task requires additional privileges. **Note:** Leaving this check box clear when using cross-cluster search affects how data is collected from the clusters. For more information, see the Enabling and Using Cross-Cluster Search for Elasticsearch Data Inputs in Health Log Analytics [KB1556079] article in the Now Support Knowledge Base. For additional information about streaming logs using the Elasticsearch data input, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.	
Document timestamp field	Timestamp field in documents stored in the read indices. This field is required.	
Timestamp field format	Format of the timestamp field in the documents. If no format is specified, the default Unix epoch time format is used, in milliseconds. For example: 1684168407 (May 15, 2023 4:33:27 PM)	yyyy-MM-dd'T'HH:mm:ss.SSSSSSS'Z'
Term filters	JSON map of the terms to filter. **Note:** Avoid using the term query for text fields. If the target field is mapped as both text and keyword, reference the keyword by using fieldname.keyword.	{"severity": ["error", "warning"]}
Max documents per query	Maximum number of documents fetched in a single query.	
Sliced-scrolling tiebreaker	Value used to slice the data. Each slice is scrolled in parallel. Default: _id	
Search-after tiebreaker	Unique value per document to use as tiebreaker when sorting log entries by timestamp.	
Use search-after API	Option for toggling between using sliced-scrolling and search-after APIs.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Settings tab (continued)

Field	Description	Example
	Note: Sliced-scrolling APIs are preferable when reading historical data, while search-after APIs are better for reading real-time data.	
Index time-suffix format	Format of the time suffix when using time-based index names, such as [logstash-]YYYY.MM.DD. When using aliases, leave this field empty.	uuuu.MM.dd

Advanced configuration

Advanced configuration form

Field	Description
Data reading timeout (milliseconds)	The duration of time, in milliseconds, before a request to the Elasticsearch cluster times out.
Index discovery interval (seconds)	The number of seconds between intermittent MID Server requests to the Elasticsearch cluster for new indices from which to read data.
Scroll context time (milliseconds)	The lifetime of the created scroll when using the scroll API to read data from Elasticsearch. For more information, see the Elasticsearch scroll API documentation.
Event processor workers	The maximum number of CPU cores used in parallel to process events fetched from Elasticsearch. A higher setting increases the data input throughput at the cost of higher CPU usage.
Worker queue size	The maximum number of batches to queue for processing. A higher setting increases throughput, at the cost of higher RAM usage.
Default timezone	The default timezone if the event date and time doesn't include timezone information.
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.
Character encoding	The character encoding for this data input.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no data.
Max length in bytes	The maximum length, in bytes, of log messages.
Delay in reading current timestamp (seconds)	The number of seconds before current time to query to include delayed data. The configured number of seconds is subtracted from the current time for reading the last timestamp. **Note:** If this value is 0 and data is collected from multiple clusters simultaneously, the query may not include data that was sent with a delay on one of the clusters,

TCP data input configuration fields

Description of the fields on the TCP data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Port	The port for the MID Server. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port. This field is required.
MID	The MID Server to which the logs are streamed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to send the log data. Rsyslog and Splunk send data using the TCP protocol.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Use SSL/TLS	Option for selecting to use SSL/TLS.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default value
Look up hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames.	false
Boss thread count	The number of threads that manage connections.	1
Worker thread count	The number of threads that handle incoming data.	4
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.	30
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	
Line breaker delimiters	The line break character separating the raw log lines. Splitting values must be separated by a comma followed by a space: ", ". For example: "\r, \n, , splitHere, #".	

UDP data input configuration fields

Description of the fields on the UDP data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Port	The port for the MID Server. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID	The MID Server to which the logs are streamed. **Note:** • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The fields in the following table show read-only information.

Field	Description
Status	Status of the data input.
Transport	Protocol used to send the log data: UDP.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Advanced configuration

Field	Description	Default value
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description	Default value
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Rate limit	Limitation on the number of events per second that the data input processes.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if many processes are waiting in the queue to access the MID Server.	false

GCP PubSub data input configuration fields

Description of the fields on the GCP PubSub data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Port	The port for the MID Server. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port. This field is required.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server) The MID Server to which the logs are streamed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The fields in the following table show read-only information.

Field	Description
Transport	Protocol used to send the log data: PubSub.
Sources count	The number of log sources this data input has created.
Status	Status of the data input.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab

Field	Description
Project ID	The project ID of the Google Cloud project. For example, my-project-id.
Topic Name	The Google Cloud Pub/Sub topic to which to subscribe Health Log Analytics. For example, my_topic.
GCP Credential Alias	The credential alias to be used. Specify one GCP credential alias by selecting the magnifying glass icon and then either selecting an existing credential alias from the **Connection & Credential Aliases** list, or selecting **New** to create a new record. The default is sn_occ.HLA_Credential_Alias. For information about creating a credential alias, see Credential aliases for Discovery.
Subscription Name	The subscription Health Log Analytics uses to receive log data that is published on the Google Cloud Pub/Sub topic. If you leave this field blank, Health Log Analytics uses ServiceNow-Subscription.

Advanced configuration

Advanced tab

Field	Description	Default value
Subscriber Thread Pool Size	The number of concurrent threads that are downloading files from the Google Cloud Pub/Sub topic.	1
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	(Read-only) The character encoding for this data input.	UTF-8
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Rate limit	The maximum number of events per second that this data input processes.	-1

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced tab (continued)

Field	Description	Default value
Drop if queue is full	Option for selecting to discard logs if many processes are waiting in the queue to access the MID Server.	Clear

MID Server data input configuration fields

Description of the fields on the MID Server data input configuration form.

Basic configuration

Field	Description
Description	Description of the data input.
MID	The MID Server from which the logs are streamed.
Service instance	The service instance to which to bind the log data. **Note:** This field is only available for MID Server data inputs created in the May 2025 store release or later releases. This field is required. By default, it is set to ServiceNow MID Server.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses the MID Server to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration

Field	Description	Default value
Default timezone	The default time zone of events. The system uses this default when the log does not specify a timezone.	GMT
Sub sample drop ratio	The ratio of events to discard.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for discarding logs if there is a load on the MID Server.	

Amazon CloudWatch data input configuration fields

Description of the fields on the Amazon CloudWatch data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Amazon CloudWatch is pulled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Amazon CloudWatch to stream log data to your instance.
Sources count	The number of log sources this data input has created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Field	Description	Example
From	The date and time to start reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week
Group Name(s)	The log groups to search. If multiple log groups must be searched, specify the groups in a comma-separated list. To fetch log data from all groups, use an asterisk (*) as a wildcard character. This field is required.	hla-cw-loggroup1,hla-cw-loggroup2
Prefix	Name prefix for the Amazon CloudWatch log streams to read from. The data input reads only from log streams with this name prefix. **Note:** Only a single log stream prefix per data item is supported. For multiple prefixes, create multiple data inputs.	hla-cw

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query settings tab (continued)

Field	Description	Example
Filter pattern	Pattern by which to filter incoming events. Various types of filter patterns are supported. For example: • A pattern for fetching log events that contain a single term. • A pattern for fetching log events that contain multiple terms. • A pattern for fetching log events that include a term and exclude another. **Note:** Filter patterns are case sensitive. For more information, see https://docs.aws.amazon.com/AmazonCloudWatch/latest/logs/FilterAndPatternSyntax.html	• Pattern for fetching log events that contain a single term, "STATUS_CODE": "STATUS_CODE" • Pattern for fetching log events that contain multiple terms, “STATUS_CODE” and “200”: “STATUS_CODE 200” • Pattern for fetching log events that include a term, “STATUS_CODE,” and exclude another term, “200”: “STATUS_CODE” – “200”

Transport tab

Field	Description
AWS credentials	Field that refers to the AWS Credentials list (aws_credentials.list). The list contains the AWS access and secret access keys.
AWS region	The AWS region where the Amazon CloudWatch cluster runs, for example, us-west-1. For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-regions-availability-zones.html#concepts-regions This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Connection timeout	The number of milliseconds to wait before timing out the AWS connection attempt.	1000
Batch size	The maximum number of logs retrieved per query.	2500
Socket timeout	The number of milliseconds to wait before timing out a data transfer over an established connection.	10000
Default timezone	The default timezone if the log date and time doesn't include timezone information.	GMT
Sub sample drop ratio	The number of logs to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched logs.	-1
Sub sample receive ratio	The number of logs to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received logs.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32766
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no logs.	60
Polling interval	The interval, in seconds, to wait before polling for new logs.	0
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Amazon S3 data input configuration fields

Description of the fields on the Amazon S3 data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Amazon S3 is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Amazon S3 to stream log data to your instance.
Sources count	The number of log sources this data input has created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Disabled since	Time when the data input stopped or failed.
Last log time	Time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Field	Description	Example
From/To	Starting and ending dates and time for reading the data. • From: Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. • To: Data newer than this date and time is not read. For live data, set this date far into the future. This field is required.	From: Now -1 week To: 2300-01-01 15:59:59
Bucket name	The Amazon S3 bucket to stream. This field is required.	my-s3-bucket
Prefix	Prefix for the objects to be fetched. The data input fetches only objects that begin with this prefix. This field is typically used to fetch only specific folders in a bucket.	/only/this/folder/
Include	File or object to include when the system performs pattern matching.	.*include-me.*
Exclude	File or object to exclude when the system performs pattern matching.	.*skip-me.*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab

Field	Description
AWS credentials	Field that refers to the AWS Credentials list (aws_credentials.list). The list contains the AWS access and secret access keys.
AWS region	The AWS region where the Amazon S3 bucket is located, for example, us-west-1. For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-regions-availability-zones.html#concepts-regions This field is required.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Anonymous	Option to force accessing the Amazon S3 bucket without credentials, while ignoring default credentials if they exist.	False
Traverse	Option to access each directory in the bucket.	False
Object sorted by Last Modified Time	Option to fetch objects if the objects in the bucket are sorted by time.	False
Connection timeout	The number of milliseconds to wait before timing out the attempt to establish a connection to AWS.	100
Threadpool size	The number of concurrent threads that are downloading files from the bucket.	1
Buffer size	Size of the download buffer, in bytes.	100MB
Socket timeout	The number of milliseconds to wait before timing out data transfer over an established connection.	10000
Max retry for file	The maximum number of times to retry file processing in case of failure.	10

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default value
Default timezone	The default timezone if the log doesn't include timezone information.	UTC
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Rate limit	The maximum number of events per second that this data input processes.	-1
Max length in bytes	The maximum length, in bytes, of events.	32766
Character encoding	The character encoding for this data input.	UTF-8
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no events.	60
Polling interval	The interval, in seconds, to wait before polling for new events.	0
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Microsoft Azure Log Analytics data input configuration fields

Description of the fields on the Microsoft Azure Log Analytics data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Microsoft Azure Log Analytics is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Microsoft Azure Log Analytics to stream log data to your instance.
Disabled since	The time when the data input stopped or failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Sources count	The number of log sources this data input has created.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Health Log Analytics uses the values set in these fields to generate the query for receiving log data from Microsoft Azure Log Analytics. The Log query field enables you to configure a custom query

Field	Description	Example
From	Starting date and time for reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week
Data source name	The name of the table in Microsoft Azure Log Analytics where the data input fetches the log data. For more information, see the View table information section in the Microsoft Azure documentation. This field is required.	ContainerLog
Event time property name	The Microsoft Azure Log Analytics field in which to detect the event time. This field is required.	TimeGenerated
Max documents per query	The highest number of rows retrieved in each query.	500

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query settings tab

Health Log Analytics uses the values set in these fields to generate the query for receiving log data from Microsoft Azure Log Analytics. The Log query field enables you to configure a custom query

(continued)

Field	Description	Example
Columns to select	Comma-separated list of column names to return. **Note:** This field is ignored when you provide a custom query.	LogEntry,LogEntrySource
Log query	A custom query for receiving log data from Microsoft Azure Log Analytics. The settings in this field override those in all other fields on the **Query settings** tab except the **From** field. If the **Log query** field is empty, Health Log Analytics generates the query using the values set in the other fields. For the custom query, use the following JSON format: `{"query": "query | where TimeGenerated > %s | take 500"}`	`{ "query":"ContainerLog | where LogEntry contains 'cartservice' | where TimeGenerated > %s | take 500", "workspaces": ["defaultworkspace-3ab145ff-f9cd-433f-8533-d1b1ee24aee6-eus"], "project": ["TimeGenerated", "LogEntry", "LogEntrySource"] }`

Transport tab

Field	Description
Redirect Url	The redirect URL of the access log application. The URL refers to the Microsoft Azure redirect_uri authorization property. For more information, see the Authorization code URL (GET request) section in the Microsoft Azure documentation. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab (continued)

Field	Description
Azure service principal credentials	The credentials used to access Microsoft Azure resources. Choose **Client Secret** from the drop-down list. **Note:** You do not need Azure Enterprise Agreement (EA) credentials. This field is required.
Workspace Id	The Customer ID used to call the Microsoft Azure Log Analytics REST API.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Event Processor workers	The number of concurrent event processing workers, where each worker processes a batch of events independently.	4
Workers Queue Size	The queue size of the Event Processor workers.	5
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Character encoding	The character encoding for this data input.	UTF-8
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no events.	60
Polling interval	The interval, in seconds, to wait before polling for new events.	0

Advanced configuration form (continued)

Field	Description	Default value
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Microsoft Azure Event Hubs data input configuration fields

Description of the fields on the Microsoft Azure Event Hubs data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Microsoft Azure Event Hubs is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to

Field	Description
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Field	Description	Example
From	Starting date and time for reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week
Max batch size	The maximum number of events passed to a single process call.	100

Transport tab

Field	Description
Event Hubs namespace	The scoping container for the event hub or hubs. This field is required.
Event Hub name	The event hub from which to fetch log data. This field is required.
Event Hub credentials	Shared access authorization policy with which to authenticate to the event hub. This field is required.
Consumer Group name	The Consumer Group to use. This field is required.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Restore point rate	The number of events the data input can read before a restore point is saved.	100
Processor threads count	The total number of processor threads.	2
Operation timeout	The number of seconds to wait before timing out event hubs operations.	120
Receive idle timeout	The number of seconds to wait before timing out receive operations.	60
Prefetch count	The number of events received in advance of event hubs operations.	500
Default timezone	The default timezone if the log doesn't include timezone information.	GMT
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Max length in bytes	The maximum length, in bytes, of events.	32766
Character encoding	The character encoding for this data input.	UTF-8
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no events.	60
Polling interval	The interval, in seconds, to wait before polling for new events.	0
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Kafka SSL credentials fields

Description of the fields on the Kafka SSL credentials form.

SSL security protocol

Field	Description
SSL keystore	The content of an actual server.keystore.jks file, encoded as a Base64 string.
SSL keystore type	Format of the SSL keystore file. Default: Java KeyStore (JKS).
SSL keystore password	Password to the keystore, identical to the value of the ssl.keystore.password property in Apache Kafka.
SSL key password	Password, identical to the ssl.key.password property value in Apache Kafka.
SSL truststore	The content of an actual client.truststore.jks file, encoded as a Base64 string.
SSL truststore type	Format of the truststore file. Default: Java KeyStore (JKS).
SSL truststore password	Password to the truststore, identical to the value of the ssl.truststore.password property in Apache Kafka.
SSL provider	Name of the security provider used for SSL connections.
Disable hostname verification	Option to disable verification of the hostname.
Additional Kafka consumer properties	Semicolon-separated string of additional Kafka consumer properties. For example: ssl.protocol=TLSv1.2;ssl.enabled.protocols=TLSv1.2,TLSv1.1

SASL_SSL security protocol

Field	Description
SSL truststore	The content of an actual client.truststore.jks file, encoded as a Base64 string.
SSL truststore type	Format of the SSL truststore file. Default: Java KeyStore (JKS).
SSL truststore password	Password to the truststore, identical to the value of the ssl.truststore.password property in Apache Kafka.
SSL provider	Name of the security provider used for SSL connections.
Disable hostname verification	Option to disable verification of the hostname.
User name	The user name, if any, associated with this credential.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SASL_SSL security protocol (continued)

Field	Description
	Note: The specified user name is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain.P required username=<user_name> password=<password>`
Password	The password associated with this credential. **Note:** • The specified password is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain. required username=<user_name> password=<password>` • The password you specify is invisible. It is stored in the database in encrypted form.
Additional Kafka consumer properties	Semicolon-separated string of additional Kafka consumer properties. For example: ssl.protocol=TLSv1.2;ssl.enabled.protocols=TLSv1.2,TLSv1.1

SASL_PLAINTEXT security protocol

User name	The user name, if any, associated with this credential. **Note:** The specified user name is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain.P required username=<user_name> password=<password>`
Password	The password associated with this credential.

SASL_PLAINTEXT security protocol (continued)

	Note: • The specified password is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain.required username=<user_name> password=<password>` • The password you specify is invisible. It is stored in the database in encrypted form.
Additional Kafka consumer properties	Semicolon-separated string of additional Kafka consumer properties. For example: ssl.protocol=TLSv1.2;ssl.enabled.protocols=TLSv1.2,TLSv1.1

Apache Kafka data input configuration fields

Description of the fields on the Apache Kafka data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Apache Kafka is pulled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Apache Kafka to stream log data to your instance.
Sources count	The number of log sources this data input has created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query Settings tab

Field	Description	Example
From	Starting date and time for reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week

Transport tab

Field	Description	Example
Kafka node names	A comma-separated list in the format HOST:PORT,HOST:PORT. The list does not have to include all the Apache Kafka Cluster servers.	123.4.5.6:9092,123.3.4.5:9093
Topics	A comma-separated list of topics to which the data input must subscribe. This field is required.	FirstTopic,SecondTopic,ThirdTopic
Kafka credentials	Reference to the Apache Kafka credentials. You can display the Kafka SSL credentials form by selecting the information icon (ⓘ) and then selecting **Open Record**. The form enables you to choose the security protocol	None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab (continued)

Field	Description	Example
	used for authenticating with Apache Kafka from the following options: • **SSL** - SSL channel. • **SASL_SSL** - SASL authenticated, SSL channel. • **SASL_PLAINTEXT** - SASL authenticated, non-encrypted channel. For a description of the fields on the Kafka SSL credentials form, see Kafka SSL credentials fields.	
Group Id	The name of the Apache Kafka Consumer Group.	logs

Advanced configuration

Advanced configuration form

Field	Description	Default value
Timeout	The time, in milliseconds, spent waiting in the poll if data is not available in the topics.	500
Node discovery timeout	The time, in milliseconds, before node discovery times out.	30
Default timezone	The default timezone if the log doesn't include timezone information.	GMT
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Max length in bytes	The maximum length, in bytes, of events.	32766

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default value
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

REST API data input configuration fields

Description of the fields on the REST API data input configuration form.

Note: REST API integrations support only UTF-8 encoding for incoming data.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
MID Web Server	MID Server to which the log data is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. When you select the MID Server, the **MID** and **Port** fields are completed automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses REST to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

ServiceNow System Logs Retriever data input configuration fields

Description of the fields on the ServiceNow System Logs Retriever data input configuration form.

ServiceNow System Logs Retriever data input form fields

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Service instance	The service instance to which to bind the log data. The default value is ServiceNow Glide Sys Log. This field is required. **Note:** Health Log Analytics comes with the source type glide_sys_log for log traffic from the ServiceNow Glide Sys Log service instance.
From	From date and time for reading the data. The data input doesn't read data older than this date and time. This field is required.
Status	Status of the data input.
Disabled since	The time when the data input stopped or failed.
Syslog table filter	The criteria used to filter log data from the System Log table before streaming it to the AI engine.

Cribl data input configuration fields

Description of the fields on the Cribl data input configuration form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
MID server	The MID Server to which the Cribl logs are streamed. This field is required.
Port	The port on the MID Server. Choose a port within the suggested range from the array. The port must not be occupied by another process. Make sure that your organization's security team opens the selected port. This field is required.

Config

Field	Description
Cribl instance URL	The URL of the Cribl instance. HLA uses this URL to establish the connection with the Cribl instance.
Cribl API token	The Cribl API token HLA uses to authenticate with Cribl and make API calls.

Process

Field	Description
Cribl route	The Cribl route that directs log data to a specific destination. This field is auto-populated with a drop-down list of all available routes, each configured with a default destination. You must select the desired route from this list. This field is required.
Cribl destination	The created Cribl destination. The Cribl destination points to the MID Server host and port configured in the data input. This field is read-only.

Edge Delta data input configuration fields

Description of the fields on the Edge Delta data input configuration form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edge Delta data input configuration form

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
Transport	The Edge Delta destination used for streaming log messages to the ServiceNow instance. The options are: • TCP - Frequently used for handling large volumes of log data. If you select TCP, you must provide the MID Server and port. When choosing the TCP transport option, create a TCP destination in Edge Delta to send log data to the instance from any source, using the same MID Server host and port you have configured for the Edge Delta data input. **Note:** For TCP, TLS/SSL is not supported. • HTTP: Frequently used for sending smaller logs via RESTful APIs, HTTP, or HTTPS for secure transmission. **Note:** For the HTTP protocol, authentication is used. If you select HTTP, you must provide the MID Web Server that is running on the MID Server. The system then populates the MID Server and port fields automatically, based on the provided MID Web Server. Depending on the MID Web Server configuration, you can send logs using either HTTP or HTTPS. If the **Secure Connection** check box on the MID Web Server extension form is clear, use HTTP. If it is selected, use HTTPS. For more information, see Event Management MID Web Server extension form. In addition, if the **Authentication Type** on the MID Web Server extension form is Basic, provide Basic authentication details in the Authorization header. If the **Authentication Type** is API Key, provide the key as “Key Api_Key". When choosing the HTTP transport option, create an HTTP destination in Edge Delta and enter the Endpoint URL in the following format: http://{MID_SERVER_IP}:{MID_WEB_SERVER_PORT}/api/mid/hla/raw. In Advanced Settings, create two headers to be attached to the HTTP request: ○ An Authorization header with the MID Web Server API key value or basic credentials as MID Web Server configured. ○ A Content-Type header named with the application/json value.
MID web server	The MID Web Server to which the log data is streamed.
MID server	The MID Server to which the Edge Delta logs are streamed. This field is required. If you selected HTTP in the **Transport** field, this field is populated automatically based on the selected MID Web Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edge Delta data input configuration form (continued)

Field	Description
Port	The port on the MID Server used for listening to logs. Choose a port within the suggested range from the array. In the case of TCP transport, the port must not be occupied by another process. Make sure that your organization's security team opens the selected port. This field is required. If you selected HTTP in the **Transport** field, this field is populated automatically based on the selected MID Web Server.
Service instance	The service instance to which to bind the log data. This field is required. Choosing the service instance enables HLA to correlate CIs and service instances in the CMDB for root cause analysis. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

Vector Agent data input configuration fields

Description of the fields on the Vector Agent data input configuration form.

Getting Started tab

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
MID Server	The MID Server to which the Vector Agent logs are streamed. This field is required. **Note:** If the MID Server is down or the connection is lost, the Vector pipeline may get blocked.
Port	The port on the MID Server used for listening to logs. This field is required. Choose a port within the range of 6000-6200.
Transport	The protocol used for streaming log messages to your ServiceNow instance. Currently, only TCP is available.
Status	Status of the data input.

Integration configuration field descriptions

This section provides descriptions of the fields on the integration configuration forms for Health Log Analytics.

Amazon CloudWatch integration configuration fields

Description of the fields on the Amazon CloudWatch integration configuration forms for Health Log Analytics.

For the Amazon CloudWatch integration setup procedure, see Set up an Amazon CloudWatch integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My CloudWatch integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) The MID Server to which log data from Amazon CloudWatch is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of integrations streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: CloudWatch. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
How to extract data from AWS CloudWatch?	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
Authentication method	The AWS credentials needed to access resources in AWS service accounts. This field is required. Choose AWS credentials from the list, or add new AWS credentials to the list by selecting **Manage Credentials** and then defining new credentials on the **AWS Credentials** page.
Group Name(s)	The log group(s) to fetch log data from in Amazon CloudWatch. This field is required. If you want the integration to search multiple log groups, specify the relevant groups in a comma-separated list. To fetch log data from all groups, use an asterisk (*) as a wildcard character.
AWS Region	The AWS region where the Amazon CloudWatch cluster is hosted. For example: us-west-1. This field is required. For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-regions-availability-zones.html#concepts-regions
Which data to send to ServiceNow?	
Filter pattern	The pattern by which to filter incoming events. Various types of filter patterns are supported. For example: • A pattern for fetching log events that contain a single term. • A pattern for fetching log events that contain multiple terms. • A pattern for fetching log events that include a term and exclude another. **Note:** Filter patterns are case sensitive. For more information, see https://docs.aws.amazon.com/AmazonCloudWatch/latest/logs/FilterAndPatternSyntax.html
Prefix	Option to define a name prefix for Amazon CloudWatch log streams to read from. The integration reads only from log streams with this name prefix.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
	Note: Only a single log stream prefix per data item is supported. For multiple prefixes, create multiple integrations.

Advanced settings

Field	Description
Connection timeout (ms)	The number of milliseconds to wait before timing out the AWS connection attempt.
Socket timeout (ms)	The number of milliseconds to wait before timing out a data transfer over an established connection.
Sub sample drop ratio	The number of logs to batch together, out of which one will be dropped. The default value is -1: No logs are dropped. This setting is used to reduce the number of fetched logs. For example, if you want one log out of every five to be dropped, change the value to 5.
Polling interval	The interval, in seconds, to wait before polling for new logs.
Character encoding	The character encoding used for this integration: UTF-8.
Batch size	The maximum number of logs retrieved per query.
Max length in bytes	The maximum length of log messages, in bytes.
Sub sample receive ratio	The number of logs to batch together, out of which one log will be received and the remaining ones dropped. The default value is -1: No logs are received. This setting is used to reduce the number of received logs. For example, if you want to receive one log out of every five, change the value to 5.
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no logs.
Default timezone	The default timezone if the log date and time doesn't include timezone information.
Drop if queue is full	Option to select discarding logs if there is a load on the MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Amazon S3 integration configuration fields

Description of the fields on the Amazon S3 integration configuration forms for Health Log Analytics.

For the Amazon S3 integration setup procedure, see Set up an Amazon S3 integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My S3 integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) The MID Server to which log data from Amazon S3 is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: S3. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
Bucket name	The Amazon S3 bucket to stream. This field is required.
Region	The AWS region where the Amazon CloudWatch cluster is hosted. For example: us-east-2. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
	For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-regions-availability-zones.html#concepts-regions
Authentication method	The AWS credentials needed to access resources in AWS service accounts. This field is required. Choose AWS credentials from the drop-down list, or add new AWS credentials to the list by selecting **Manage Credentials** and then defining new credentials on the **AWS Credentials** page.

Advanced settings

Field	Description
Include	The file or object to include when the system performs pattern matching.
Exclude	The file or object to exclude when the system performs pattern matching.
Bucket prefix	The prefix for the objects to be fetched. The integration fetches only objects with this prefix. **Note:** This field is typically used to fetch only specific folders within a bucket.
Buffer size	The size of the download buffer, in bytes.
Threadpool size	The number of concurrent threads that are downloading files from the bucket.
Anonymous	Option to force accessing the bucket without credentials, while ignoring default credentials if they exist.
Traverse	Option to access each directory in the bucket.
Sorting object by last modified time	Option to fetch objects if the objects in the bucket are sorted by time.
Sub sample drop ratio	The number of logs to batch together, out of which one will be dropped. The default value is -1: No logs are dropped. This setting is used to reduce the number of fetched logs. For example, if you want one log out of every five to be dropped, change the value to 5.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no events.
Max length in bytes	The maximum length, in bytes, of events.
Connection timeout (ms)	The number of milliseconds to wait before timing out the attempt to establish a connection to AWS.
Max retry per file	The maximum number of times to retry file processing in case of failure.
Socket timeout (ms)	The number of milliseconds to wait before timing out data transfer over an established connection.
Default timezone	The default timezone if the log doesn't include timezone information.
Sub sample receive ratio	The number of logs to batch together, out of which one log will be received and the remaining ones dropped. The default value is -1: No logs are received. This setting is used to reduce the number of received logs. For example, if you want to receive one log out of every five, change the value to 5.
Polling interval	The interval, in seconds, to wait before polling for new events.
Character encoding	The character encoding used for this integration: UTF-8
Drop if queue is full	Option to select discarding logs if there is a load on the MID Server.

Apache Kafka integration configuration fields

Description of the fields on the Apache Kafka integration configuration forms for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Kafka integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Apache Kafka is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify the maximum number by adding the property `sn.occ.log_ingestion.max_datainputs_per` to the MID Server and then changing the default value. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Kafka. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
Kafka node names	A comma-separated list in the format HOST:PORT,HOST:PORT. This field is required. The list does not have to include all the Apache Kafka Cluster servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
Topics	A comma-separated list of topics to which the data input must subscribe. This field is required.
Kafka credentials	The Apache Kafka credentials. You can select existing Kafka SSL credentials, or create new ones by selecting **Create Kafka credentials** from the drop-down list. For a description of the fields on the Kafka SSL credentials form, see Kafka SSL credentials fields.
Group ID	The name of the Apache Kafka Consumer Group.

Advanced settings

Field	Description	Default value
Timeout	The time, in milliseconds, spent waiting in the poll if data is not available in the topics.	500
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.	GMT
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Character encoding	The character encoding for this data input. This field is read-only.	UTF-8
Node discovery timeout	The time, in milliseconds, before node discovery times out.	30
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description	Default value
Max length in bytes	The maximum length, in bytes, of events.	32766
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Amazon Data Firehose integration configuration fields

Description of the fields on the Amazon Data Firehose integration configuration forms for Health Log Analytics.

For the Amazon Data Firehose integration setup procedure, see Set up an Amazon Data Firehose (MID-less) integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Firehose integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Transport	The protocol used for streaming log messages to your instance: Amazon CloudWatch Logs. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Elasticsearch integration configuration fields

Description of the fields on the Elasticsearch integration configuration forms for Health Log Analytics.

For the Elasticsearch integration setup procedure, see Set up an Elasticsearch integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Elasticsearch integration. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to determine whether to use a specific MID Server or a specific MID Server cluster.
MID server name	(Only when **Execute on** is set to Specific MID Server) The MID Server to which log data from Elasticsearch indices is pulled. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server Cluster) The MID Server cluster to which the log data is pulled. This field is required. When you select a cluster, the MID Servers in the selected cluster and their status are displayed. The integration runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the integration tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the integration form, the MID Server Clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • If Elasticsearch uses client certificate or CA certificate authentication, all MID Servers in the cluster must have the appropriate certificates. • The default maximum number of integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 integrations running on it, even when that MID Server is down.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Elastic. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Data retrieval method

Field	Description
Server URL	The URL used to access the cluster. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data retrieval method (continued)

Field	Description
Authentication method	The authentication method used to authenticate the integration to Elasticsearch. Default is none. When you select the authentication method, the corresponding credentials fields display on the form. **Note:** As an admin, you can create an authentication method by navigating to **All** > **Health Log Analytics** > **Authentication Methods** and selecting **New**.
Index prefix	Prefix prepended to the names of the Elasticsearch indices from which you want to read data. The integration only reads data from indices that match the configured prefix. For example: network-logs-* matches indices such as network-logs-2024.01.01. This field is required. This setting ensures that HLA only ingests data from the relevant indices. For example: only-read-these-indices-*
Document timestamp field	Timestamp field in documents stored in the read indices. This field is required.
Timestamp field format	Format of the timestamp field in the documents. If no format is specified, the default Unix epoch time format is used, in milliseconds. For example: 1684168407 (May 15, 2023 4:33:27 PM)
Term filters	JSON map of the terms to filter. **Note:** Avoid using the term query for text fields. If the target field is mapped as both text and keyword, reference the keyword by using fieldname.keyword. For example: {"severity": ["error", "warning"]}

Advanced settings

Field	Description
Max connections per route	The maximum number of connections to be opened per node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Max scroll slices	The number of shards configured for the relevant index in Elasticsearch. This number tells Elastic how many parallel queries to execute in each polling request.
Proxy host	Host name of the HTTP proxy through which requests are sent.
Proxy port	Port of the HTTP proxy through which requests are sent.
Use MID certificate policy check	Option to enable the MID certificate policy check. Select this option if you want to ship your logs encrypted using SSL TLS. Then navigate to **All** > **MID Server** > **MID Security Policy** and add the MID certificate policy check to the table. For more information, see MID Server certificate check policies.
Use cross-cluster search	Option to search for data across Elasticsearch clusters. When this check box is selected, the **Clusters to search** field displays. **Note:** Your settings in the **Use minimal privileges** check box and the **Delay in reading current timestamp (seconds)** field on the **Advanced configuration** form affect how data is collected across multiple clusters.
Clusters to search	The Elasticsearch clusters to search.This field displays only when the **Use cross-cluster search** check box is selected. Do one of the following: • Leave this field empty or enter "*" to search all the remote clusters defined in Elasticsearch. • Specify the clusters to search in a comma-separated list. **Note:** To also search the local cluster, add a comma at the beginning or end, or add two commas in succession to the list. For example: "east,,west" or ",east,west" or "*,"

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Use minimal privileges	Option to read log data directly from the Elasticsearch indices with the configured prefix. • When selected, the integration reads the log data directly from the Elasticsearch indices with the configured prefix. To perform this task, it needs only read privileges. **Note:** When this check box is selected and you're using cross-cluster search, data is collected from all the clusters simultaneously. • When clear, the integration fetches all indices with the prefix, filters them, and reads the log data from the filtered indices. Performing this task requires additional privileges. **Note:** Leaving this check box clear when using cross-cluster search affects how data is collected from the clusters. For more information, see the Enabling and Using Cross-Cluster Search for Elasticsearch Data Inputs in Health Log Analytics [KB1556079] article in the Now Support Knowledge Base. For additional information about streaming logs using the Elasticsearch integration, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.
Max documents per query	Maximum number of documents fetched in a single query.
Sliced-scrolling tie breaker	Value used to slice the data. Each slice is scrolled in parallel. Default: _id
Search-after tie breaker	Unique value per document to use as tiebreaker when sorting log entries by timestamp.
Use search-after API	Option to toggle between using sliced-scrolling and search-after APIs. **Note:** Sliced-scrolling APIs are preferable when reading historical data, while search-after APIs are better for reading real-time data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Index time-suffix format	Format of the time suffix when using time-based index names, such as [logstash-]YYYY.MM.DD. When using aliases, leave this field empty. For example: uuuu.MM.dd
Data reading timeout (milliseconds)	The duration of time, in milliseconds, before a request to the Elasticsearch cluster times out.
Index discovery interval (seconds)	The number of seconds between intermittent MID Server requests to the Elasticsearch cluster for new indices from which to read data.
Scroll context time (milliseconds)	The lifetime of the created scroll when using the scroll API to read data from Elasticsearch. For more information, see the Elasticsearch scroll API documentation.
Event processor workers	The maximum number of CPU cores used in parallel to process events fetched from Elasticsearch. A higher setting increases the data input throughput at the cost of higher CPU usage.
Worker queue size	The maximum number of batches to queue for processing. A higher setting increases throughput, at the cost of higher RAM usage.
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.
Character encoding	The character encoding for this data input.
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no data.
Max length in bytes	The maximum length, in bytes, of log messages.
Delay in reading current timestamp (seconds)	The number of seconds before current time to query to include delayed data.The configured

Advanced settings (continued)

Field	Description
	number of seconds is subtracted from the current time for reading the last timestamp. **Note:** If this value is 0 and data is collected from multiple clusters simultaneously, the query may not include data that was sent with a delay on one of the clusters,
Polling interval	How frequently the system polls for new log data.

GCP PubSub integration configuration fields

Description of the fields on the GCP PubSub integration configuration forms for Health Log Analytics.

For the GCP PubSub integration setup procedure, see Set up a GCP PubSub integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My GCP PubSub integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service Instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID Server name	(Only when **Execute on** is set to Specific MID Server.) The MID Server to which the logs are streamed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • You can only select a MID Server with log ingestion capability that supports basic authentication. MID Servers that support mTLS are not listed. • If log ingestion is not enabled on the selected MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
MID Server cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Source	The source of the log data that the integration pulls to your ServiceNow instance: PubSub. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set up connection

Field	Description
Project ID	The project ID of the Google Cloud project. For example, my-project-id. This field is required. You can obtain the project ID from your Google Cloud homepage by selecting My Project. The project ID will be displayed.
Authentication method	The credential alias ServiceNow® uses to access Google Cloud. The default value is sn_occ.HLA_Credential_Alias. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up connection (continued)

Field	Description
	Note: You can add more credential aliases to the list of available aliases to choose from by selecting **Manage credential aliases** from the list and adding a credential alias.
Topic name	The Google Cloud Pub/Sub topic to which to subscribe Health Log Analytics. For example, my_topic. This field is required. You can obtain the topic name from your Google Cloud homepage by searching for Pub/Sub. All topic names will be displayed.
Subscription name	The subscription Health Log Analytics uses to receive log data that is published on the Google Cloud Pub/Sub topic. If you leave this field blank, Health Log Analytics uses ServiceNow-Subscription.

Advanced Settings

Field	Description	Default value
Subscriber thread pool size	The number of concurrent threads that are downloading files from the Google Cloud Pub/Sub topic.	1
Sub sample receive ratio	The ratio of logs to receive. This setting determines the number of logs to group together, out of which one is received. It reduces the number of logs you receive. The default value is -1, meaning no logs are received. For example, if you want to receive one log out of every five, change the value to 5.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	The character encoding for this data input. This field is read-only.	UTF-8
Sub sample drop ratio	The ratio of logs to discard. This setting determines the number of logs to group	-1

Advanced Settings (continued)

Field	Description	Default value
	together, out of which one is dropped. It reduces the number of fetched logs. The default value is -1: no logs are discarded. For example, if you want one log out of every five to be dropped, change the value to 5.	
Rate limit	The maximum number of events per second that this data input processes.	-1
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Drop if queue is full	Option to discard logs if many processes are waiting in the queue to access the MID Server.	Clear

Microsoft Azure Event Hubs integration configuration fields

Description of the fields on the Microsoft Azure Event Hubs integration configuration forms for Health Log Analytics.

For the Microsoft Azure Event Hubs integration setup procedure, see Set up a Microsoft Azure Event Hubs integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Event Hubs integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service Instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Source	The source of the log data that the integration pulls to your ServiceNow instance: PubSub. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

© 2026 ServiceNow, Inc. All rights reserved.

Provide details (continued)

Field	Description
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID Server name	(Only when **Execute on** is set to Specific MID Server.) The MID Server to which the logs are streamed. **Note:** • You can only select a MID Server with log ingestion capability that supports basic authentication. MID Servers that support mTLS are not listed. • If log ingestion is not enabled on the selected MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
MID Server cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.

Set data retrieval method

Event Hubs namespace	The scoping container for the event hub or hubs. This field is required.
Event Hub name	The event hub from which to fetch log data. This field is required.
Consumer Group name	The Consumer Group to use. This field is required. Enter an existing Consumer group or create one in the event hub. The default value is $Default.
Event Hub Credentials	The Event Hub credentials to use. This field is required. Select existing Azure Shared Access Signature (SAS) credentials or create the Azure SAS credentials to use. If you create new Azure

	SAS credentials, you must provide the SAS policy name and key.

Advanced settings

Field	Description
Restore point rate	The number of logs the integration can read before a restore point is saved.
Processor threads count	The total number of processor threads.
Sub sample drop ratio	The ratio of logs to discard. This setting determines the number of logs to group together, out of which one is dropped. It reduces the number of fetched logs. The default value is -1: no logs are discarded. For example, if you want one log out of every five to be dropped, change the value to 5.
Sub sample receive ratio	The ratio of logs to receive. This setting determines the number of logs to group together, out of which one is received. It reduces the number of logs you receive. The default value is -1, meaning no logs are received. For example, if you want to receive one log out of every five, change the value to 5.
Operation timeout (seconds)	The number of seconds to wait before timing out event hubs operations.
Receive idle timeout (seconds)	The number of seconds to wait before timing out receive operations.
Max length in bytes	The maximum length, in bytes, of log messages. The default value is 32766.
Prefetch count	The number of logs received in advance of event hubs operations.
Max batch size	The maximum number of events passed to a single process call. The default value is 100.
Default timezone	The default time zone of logs. The system uses this default when the log does not specify a time zone. The default value is GMT.
Character encoding	The character encoding for this integration. The default value is UTF-8.
Drop if queue is full	Option to select discarding logs if there is a load on the MID Server.

Microsoft Azure Log Analytics integration configuration fields

Description of the fields on the Microsoft Azure Log Analytics integration configuration forms for Health Log Analytics.

For the Microsoft Azure Log Analytics integration setup procedure, see Set up a Microsoft Azure Log Analytics integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Azure Log Analytics integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Microsoft Azure Log Analytics is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of integrations streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to

Field	Description
	the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Azure Log Analytics. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
Redirect url	The redirect URL of the access log application. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
	The URL refers to the Microsoft Azure redirect_uri authorization property. For more information, see the Authorization code URL (GET request) section in the Microsoft Azure documentation.
Authentication method	The credentials used to access Microsoft Azure resources. This field is required. If no credentials exist, select **Create new Azure Service Principal credential**. Create a credential by filling in the fields and then selecting **Submit**. For information on the **Tenant ID**, **Client ID**, and **Secret key** fields, refer to the Microsoft Azure documentation. When you have created a credential, you can select it from the drop-down list.
Workspace ID	The Customer ID used to call the Microsoft Azure Log Analytics REST API. This field is required.
Table name	The name of the table in Microsoft Azure Log Analytics where the data input fetches the log data. For more information, see the View table information section in the Microsoft Azure documentation. This field is required.
Event time property name	The Microsoft Azure Log Analytics field in which to detect the event time. This field is required.

Advanced settings

Field	Description
Event Processor workers	The number of concurrent event processing workers, where each worker processes a batch of events independently.
Workers queue size	The queue size of the Event Processor workers.
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.
Max documents per query	The highest number of rows retrieved in each query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Columns to select	Comma-separated list of column names to return. **Note:** This field is ignored when you provide a custom query.
Character encoding	The character encoding for this data input.
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no events.
Polling interval	The interval, in seconds, to wait before polling for new events.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.

Log Query	Option to define your own Log Analytics query. This field overrides the values configured in the other query settings fields.
	
	Note: If this field is empty, Health Log Analytics generates the query using the values set in the other fields.
	
	For your custom query, use the following JSON format:
	
	`{"query": "query | where TimeGenerated > %s | take 500"}`
	
	For example:
	
	`{ "query":"ContainerLog | where LogEntry contains 'cartservice' | where TimeGenerated > %s | take 500", "workspaces": ["defaultworkspace-3ab145ff-f9cd-433f-8533-d1b1ee24aee6-eus"], "project": ["TimeGenerated", "LogEntry", "LogEntrySource"] }`

MID Server integration configuration fields

Description of the fields on the MID Server integration configuration forms for Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For the MID Server integration setup procedure, see Set up a MID Server integration for Health Log Analytics.

Provide details

Field	Description
MID server name	The name of the MID Server from which the integration collects log messages and streams them to the instance. **Note:** You can only create one MID Server integration per available MID Server. If an existing MID Server integration or data input uses the same MID Server, you can't create an additional one for this MID Server. This field is required.
Integration Name	The name of the integration. When you select the MID Server name, this field is auto-populated with the selected MID Server. This field is read-only.
Service instance	The service instance to which to bind the log data. This field is required. By default, it is set to ServiceNow MID Server. **Note:** This field is only available for MID Server integrations created in version 36.0.17 or later versions.
Description	Option to add a brief description of the integration to help identify it.

Advanced settings

Field	Description
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Sub sample drop ratio	The ratio of events to drop. The default value is -1.
Sub sample receive ratio	The ratio of events to receive. The default value is -1.
Max length in bytes	The maximum length of log messages, in bytes. The default value is 32,766.
Character encoding	The character encoding for this data input. The default value is UTF-8.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Drop if queue is full	Option to discard logs if many processes are waiting in the queue to access the MID Server.

REST API integration configuration fields

Description of the fields on the REST API integration configuration forms for Health Log Analytics.

For the REST API integration setup procedure, see Set up a REST API integration for Health Log Analytics.

Note: REST API integrations support only UTF-8 encoding for incoming data.

Provide details tab

Field	Description
Integration Name	Unique name of this integration. For example: My REST API integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID web server	The MID Web Server to use. This field is required.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create a service instance and add CIs (Configuration Items) to it. Set the status of the new service instance to Operational.
Transport	The protocol used for streaming log messages to your ServiceNow instance: REST. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.
MID server name	The MID Server to which the log data is pushed. This field is auto-populated when the MID Web Server is chosen. It is read-only.
Port	The port for the MID Server. This field is read-only. It is auto-populated when the MID Web Server is chosen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow System Logs Retriever integration configuration fields

Description of the fields on the ServiceNow System Logs Retriever integration configuration form for Health Log Analytics.

For the ServiceNow System Logs Retriever integration setup procedure, see Set up a ServiceNow System Logs Retriever integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My System Logs integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required. The default service instance for this integration is ServiceNow System Logs.
Description	Option to add a brief description of the integration to help identify it.

Splunk Poller integration configuration fields

Description of the fields on the Splunk Poller integration configuration forms for Health Log Analytics.

For the Splunk Poller integration setup procedure, see Set up a Splunk Poller integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Splunk is pulled. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Splunk. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
REST API Server URL	The URL used to access the Splunk REST API. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
	Note: • By default, the Splunk REST API endpoint is available on port 8089. Therefore, the default endpoint for the Splunk REST API is: `http://<splunk-server>:8089`. • The REST API endpoint is different from the front-end endpoint.
Authentication method	The credential alias to be used. This field is required. The Splunk integration uses credential aliases instead of direct references to credentials for authentication. The credential aliases are listed by type: aliases that contain basic auth credentials, and those that contain token auth credentials. If an alias holds both credential types, it appears in both categories. You can select **Manage credential aliases** to manage your credential aliases and create new ones in the **Connection & Credential Aliases** list.
Query	The query Splunk uses to search your data. This field is required. For example, the query `sourcetype="adc_access_log"` instructs the Splunk Poller integration to retrieve all logs with the source type adc_access_log.

Advanced settings

Field	Description
Max documents per query	The maximum number of documents retrieved each time log data is fetched from Splunk. Default: 10,000.
Splunk Request Timeout (seconds)	The maximum time, in seconds, allowed for data retrieval before the request times out.

Splunk TCP integration configuration fields

Description of the fields on the Splunk TCP integration configuration forms for Health Log Analytics.

For the Splunk TCP integration setup procedure, see Set up a Splunk TCP integration for Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Splunk TCP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	MID Server to which log data from Splunk is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
Port	The port for the MID Server. This field is required. Make sure that your organization's security team opens the selected port on the MID Server.
Description	Option to add a brief description of the integration to help identify it.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Use Cooked Data	Option to ingest log data from Splunk in the preprocessed ("cooked") format that Splunk uses on the forwarder. Ingesting data into HLA in this format ensures that each log line retains the relevant contextual information that Splunk embeds into it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings

Field	Description
Use SSL/TLS	Option to use SSL/TLS, for enhanced data security and protection. **Note:** SSL/TLS must be enabled if you want to send logs in a compressed format.
Lookup hostnames	Option to perform DNS lookup to resolve IPs to hostnames. The default value is false.
Use Forwarder TimeZone	Option to pass information about the time zone in which the forwarder is located. The MID Server uses this information to adjust for the time zone from which the logs arrive. This option is displayed when **Use Cooked Data** is selected. It is relevant when using Splunk Universal Forwarders.
Enable Compression	Option to send logs in compressed format. Sending logs in a compressed format minimizes the size of the data being transferred, which is important when dealing with large volumes of log data. This option is displayed when **Use Cooked Data** and **Use SSL/TLS** are selected. It is relevant when using Splunk Universal Forwarders.
Sub sample drop ratio	The ratio of logs to drop. The default value is -1: no logs are dropped. For example: If you want one out of every five logs to be dropped, change the value to 5.
Sub sample receive ratio	The ratio of logs to receive. The default value is -1: no logs are received. For example: If you want one out of every five logs to be received, change the value to 5.
Max length in bytes	The maximum length of log messages in bytes. The default value is 32766.
Character encoding	The character encoding for this data input. Default is UTF-8.
Boss thread count	The number of threads that manage connections.
Worker thread count	The number of threads that handle incoming data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.

Splunk UDP integration configuration fields

Description of the fields on the Splunk UDP integration configuration forms for Health Log Analytics.

For the Splunk UDP integration setup procedure, see Set up a Splunk UDP integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Splunk UDP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	MID Server to which log data from Splunk is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.

Provide details (continued)

Field	Description
Port	The port for the MID Server. This field is required. **Note:** Make sure that your organization's security team opens the selected port on the MID Server.
Description	Option to add a brief description of the integration to help identify it.
Transport	The protocol used for streaming log messages to your ServiceNow instance: UDP. This field is read-only.

Advanced settings

Field	Description
Lookup hostnames	Option to perform DNS lookup to resolve IPs to hostnames. The default value is false.
Sub sample receive ratio	The ratio of logs to receive. The default value is -1: no logs are received. For example: If you want one out of every five logs to be received, change the value to 5.
Character encoding	The character encoding for this data input. The default value is UTF-8. This field is read-only.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.
Sub sample drop ratio	The ratio of logs to drop. The default value is -1: no logs are dropped. For example: If you want one out of every five logs to be dropped, change the value to 5.
Max length in bytes	The maximum length of log messages in bytes. The default value is 32766.
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.

TCP integration configuration fields

Description of the fields on the TCP integration configuration forms for Health Log Analytics.

For the TCP integration setup procedure, see Set up a TCP integration for Health Log Analytics.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details tab

Field	Description
Integration Name	Unique name of this integration. For example: My TCP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	The MID Server to which the logs are streamed. This field is required. • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties.
Port	The port for the MID Server. This field is required. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port.
Service instance	The service instance to which to bind the log data. This field is required.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Advanced settings

Field	Description
Use SSL/TLS	Option to use SSL/TLS.
Lookup hostnames	Option to perform DNS lookup to resolve IPs to hostnames.
Boss thread count	The number of threads that manage connections.
Worker thread count	The number of threads that handle incoming data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Read timeout seconds	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.
Sub sample drop ratio	The ratio of events to drop.
Sub sample receive ratio	The ratio of events to receive.
Max length in bytes	The maximum length of log messages in bytes.
Character encoding	The character encoding for this data input.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.
Line breaker delimiters	The line break character separating the raw log lines. Splitting values must be separated by a comma followed by a space: ", ". For example: "\r, \n, , splitHere, #".

UDP integration configuration fields

Description of the fields on the UDP integration configuration forms for Health Log Analytics.

For the UDP integration setup procedure, see Set up a UDP integration for Health Log Analytics.

Provide details tab

Field	Description
Integration Name	Unique name of this integration. For example: My UDP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	The MID Server to which the logs are streamed. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details tab (continued)

Field	Description
	Note: • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Port	The port for the MID Server. This field is required. The port must be within the range 6000-6200. Make sure that your organization's security team opens the selected port on the MID Server.
Transport	The protocol used for streaming log messages to your ServiceNow instance: UDP. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Advanced

Field	Description
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Sub sample drop ratio	The ratio of events to drop. The default value is -1.
Sub sample receive ratio	The ratio of events to receive. The default value is -1.
Rate limit	Limitation on the number of events per second that the data input processes. The default value is -1.
Max length in bytes	The maximum length of log messages, in bytes. The default value is 32,766.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced (continued)

Field	Description
Character encoding	The character encoding for this data input. The default value is UTF-8. This field is read-only.
Drop if queue is full	Option to discard logs if many processes are waiting in the queue to access the MID Server.

Vector Agent integration configuration fields

Description of the fields on the Vector Agent integration configuration forms for Health Log Analytics.

For the Vector Agent integration setup procedure, see Set up a Vector Agent integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Vector Agent integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	The MID Server to which the Vector Agent logs are streamed. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of integrations streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. • If the MID Server is down or the connection is lost, the Vector pipeline may get blocked.
Port	The port on the MID Server. This field is required. Choose a port within the range 6000-6200 from the array. The port must not be occupied

© 2026 ServiceNow, Inc. All rights reserved.

Field	Description
	by another process. Make sure that your organization's security team opens the selected port on the MID Server.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP.
Description	Option to add a brief description of the integration to help identify it.

Sections and cards on the alert Overview tab in Health Log Analytics

The **Overview** tab helps you understand component-based alerts, Log Analytics alerts, and Log Analytics alert groups.

Information on the Overview tab for a Component-based alert

The alert **Overview** tab in Health Log Analytics helps you understand Component-based alerts.

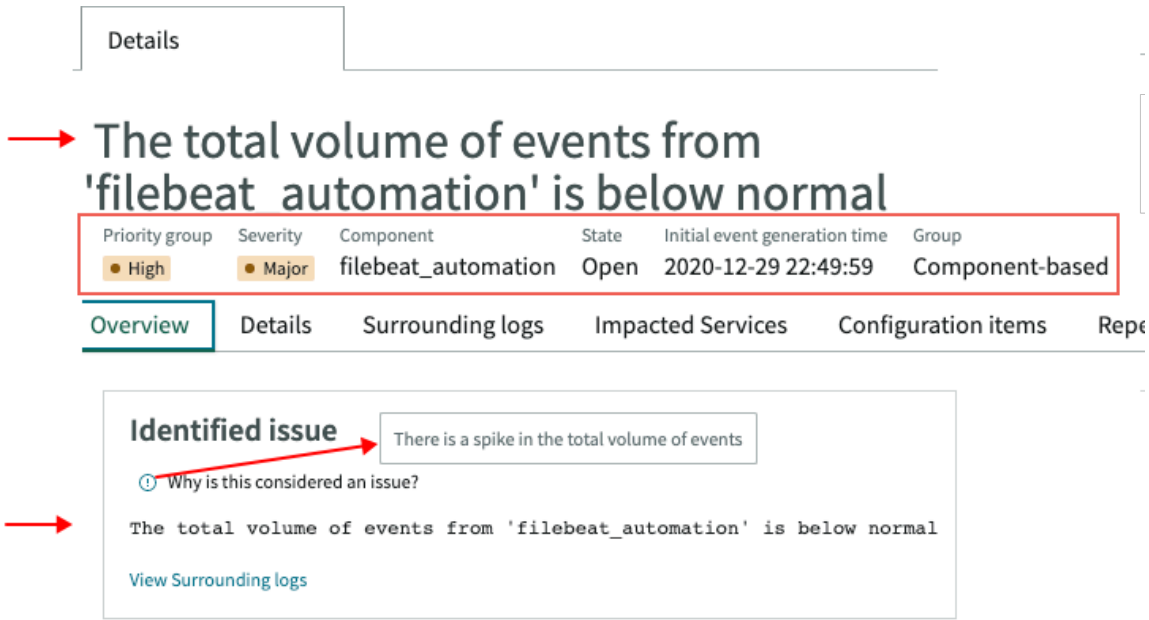
Sections on the Overview tab for a Component-based alert

For a detailed description of Component-based alerts, see Types of Health Log Analytics alerts.

Identified issue

The "identified issue" led to the alert. The issue appears in the title for the alert and on a card on the tab. Information about the alert appears in the banner.

Identified issue



- Click the information icon (ⓘ) to see how the issue was identified.
- Click **View surrounding logs** to view the log lines that were generated one minute before and one minute after the alert. See Analyze log lines that surround an anomaly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration Items

To view more detailed information on the CIs that are associated with the alert, click the **Configuration Items** tab or click **View more** in the Configuration Items section. See Operator phase 1: Analyze and acknowledge an alert.

Impacted services

To view detailed information on the services that are impacted by the alerts, click the **Impacted services** tab. See Operator phase 1: Analyze and acknowledge an alert.

Anomaly

The Anomaly card illustrates the anomalous activity that led to the alert.

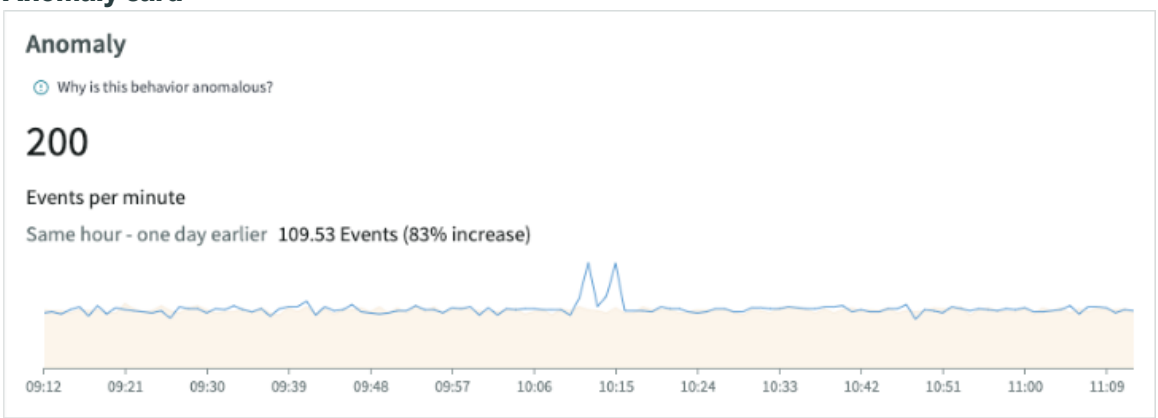
- The blue line shows the recent anomalous activity.
- On some charts, the lightly shaded area indicates the expected (learned baseline) behavior.

  A peach-shaded area represents the baseline values for the same hour one day earlier. A pink-shaded area shows the values for the same period in the previous week.

- Click the information icon to see how the anomaly was identified: ⓘ.

In this example, the peach-shaded area shows the same data for the same hour one day earlier. The spike in the metric value (events per minute) is clearly visible.

Anomaly card



In this example, the pink-shaded area represents the baseline values for the same hour in the previous week.

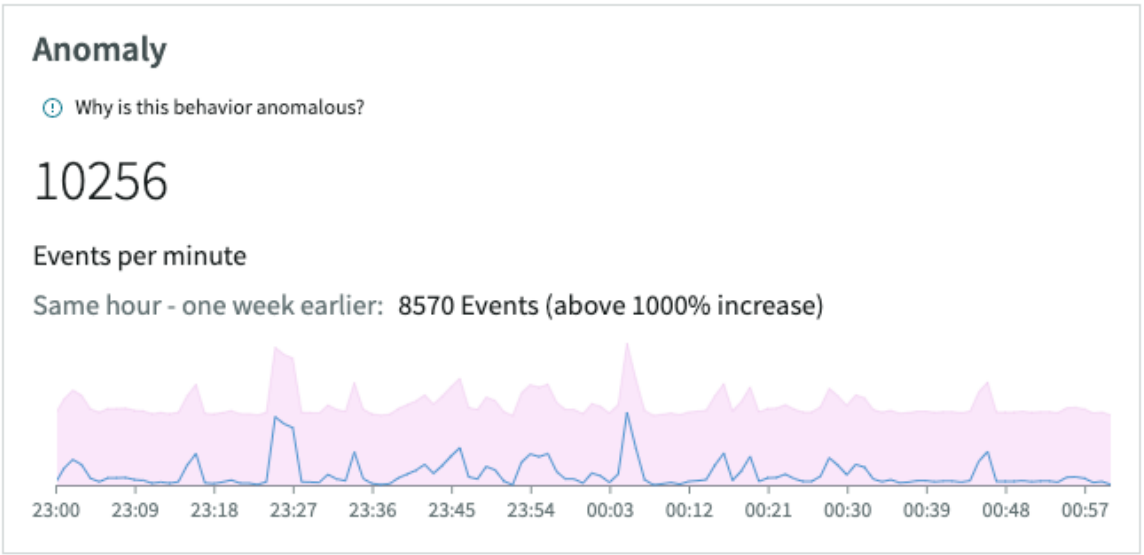
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Anomaly card with baseline values one week earlier

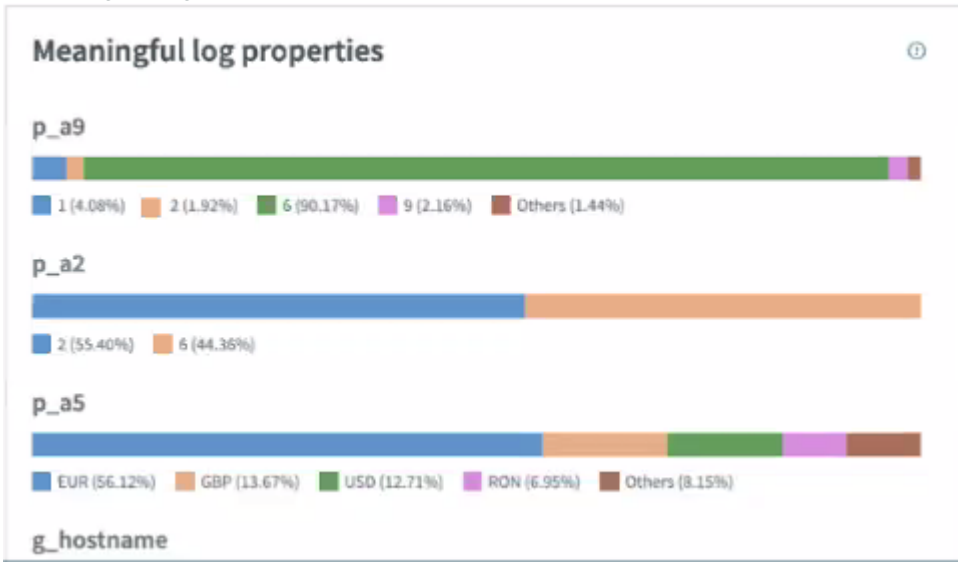


For more information on the kinds of anomalies that you might encounter, see Types of anomalous behavior.

Meaningful log properties

On the Meaningful log properties card, each bar chart shows the distribution of values for a single log property that contributed to the anomaly. Each property value is associated with a color. The length of a color bar correlates to the percentage that the property value holds in comparison with all other values for the property. For the *p_a5* property in the example, the value *EUR* appeared in 56.12% of log lines, *GBP* in 13.67%, and so on.

Meaningful log properties



Top alerts

The Top alerts card displays summaries of data from the **Similar alerts** and **Repeated alerts** tabs. The Total results value is the sum of the two values. Click **More details** to open the **Alert Insight Similar Alerts** tab. For details, see Information on the Alert Insight Similar Alerts tab.

© 2026 ServiceNow, Inc. All rights reserved.

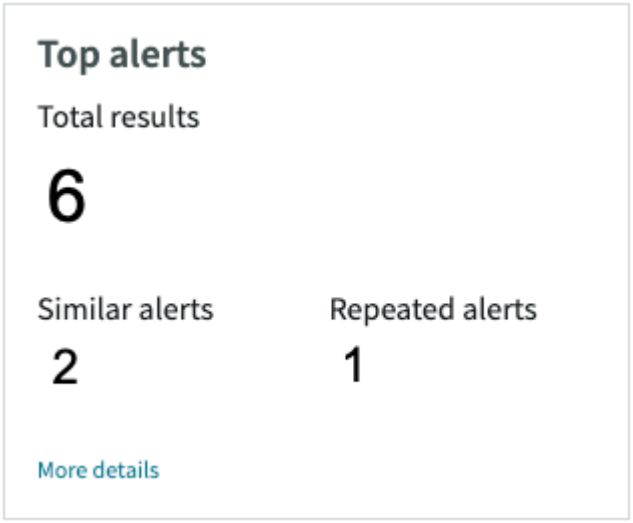
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Top alerts



Top incidents

The Top incidents card displays summaries of data from the **Incidents on CI** and **Incidents on related CIs** tabs. The Total results value is the sum of the two values. Click **More details** to open the **Incidents on CI** tab.

Top incidents

Information on the Overview tab for a Log Analytics group

The alert **Overview** tab in Health Log Analytics helps you understand Log Analytics groups.

Sections on the Overview tab for Log Analytics groups

For a detailed description of Log Analytics groups, see Types of Health Log Analytics alerts.

Correlations banner

During initial analysis, alerts are scored. Each correlation in the alert's log data with another alert contributes to the score. The higher the score, the more likely the alert is to be included as a Log Analytics alert in a Log Analytics alert.

The following kinds of data are considered when determining whether alerts are correlated:

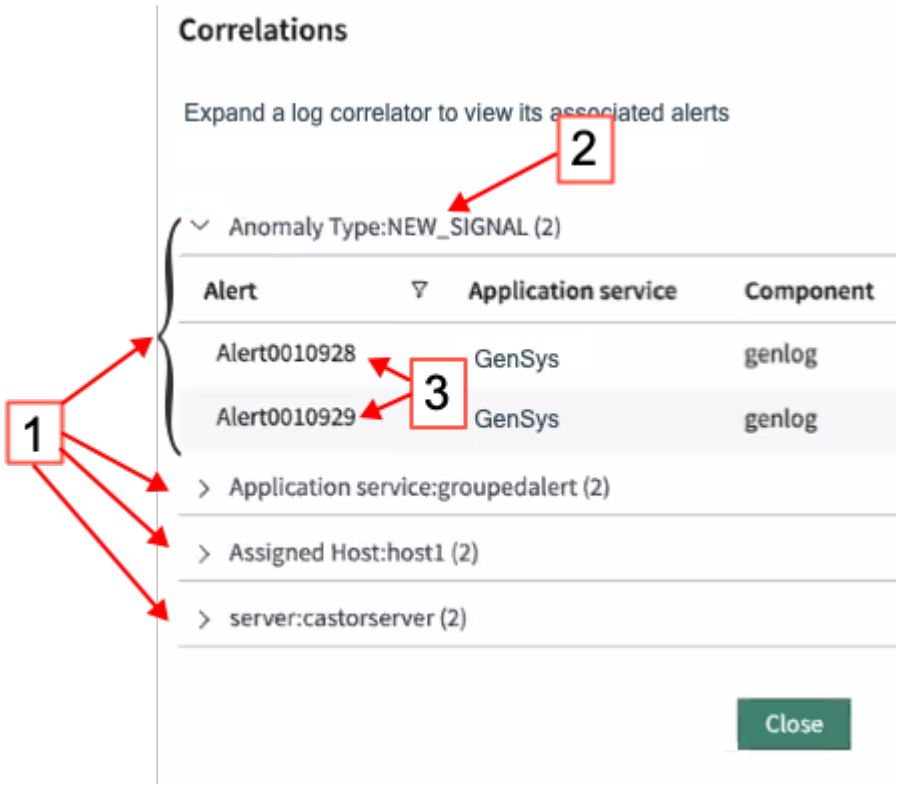
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Time: The events all occurred within a configured time interval.
- Metadata: The alerts have matching values in log-line metadata. For example, all alerts involve the same host.
- Message text: The message text in the log data is similar or identical between alerts.
- Trend: The alerts show a similar tendency in values or rates. For example, a particular metric value is increasing in all alerts.

Click the **More info** link on the Correlations banner to view the list of correlations that relate the Log Analytics alerts.

Correlations banner

Correlations



1. List of correlations: The first correlation in the list is expanded to show the individual Log Analytics alerts that are correlated and the log correlator that the alerts share. The number in parentheses is the number of alerts in the correlation.
2. An individual log correlator: The identifier for a group of correlated Log Analytics alerts. The alerts are grouped by the log-line data or metadata that is common to the alerts (for example, IP address, host name, or user name). The number in parentheses indicates the number of correlated alerts.
3. Log Analytics alerts that are correlated.

Alerts in group

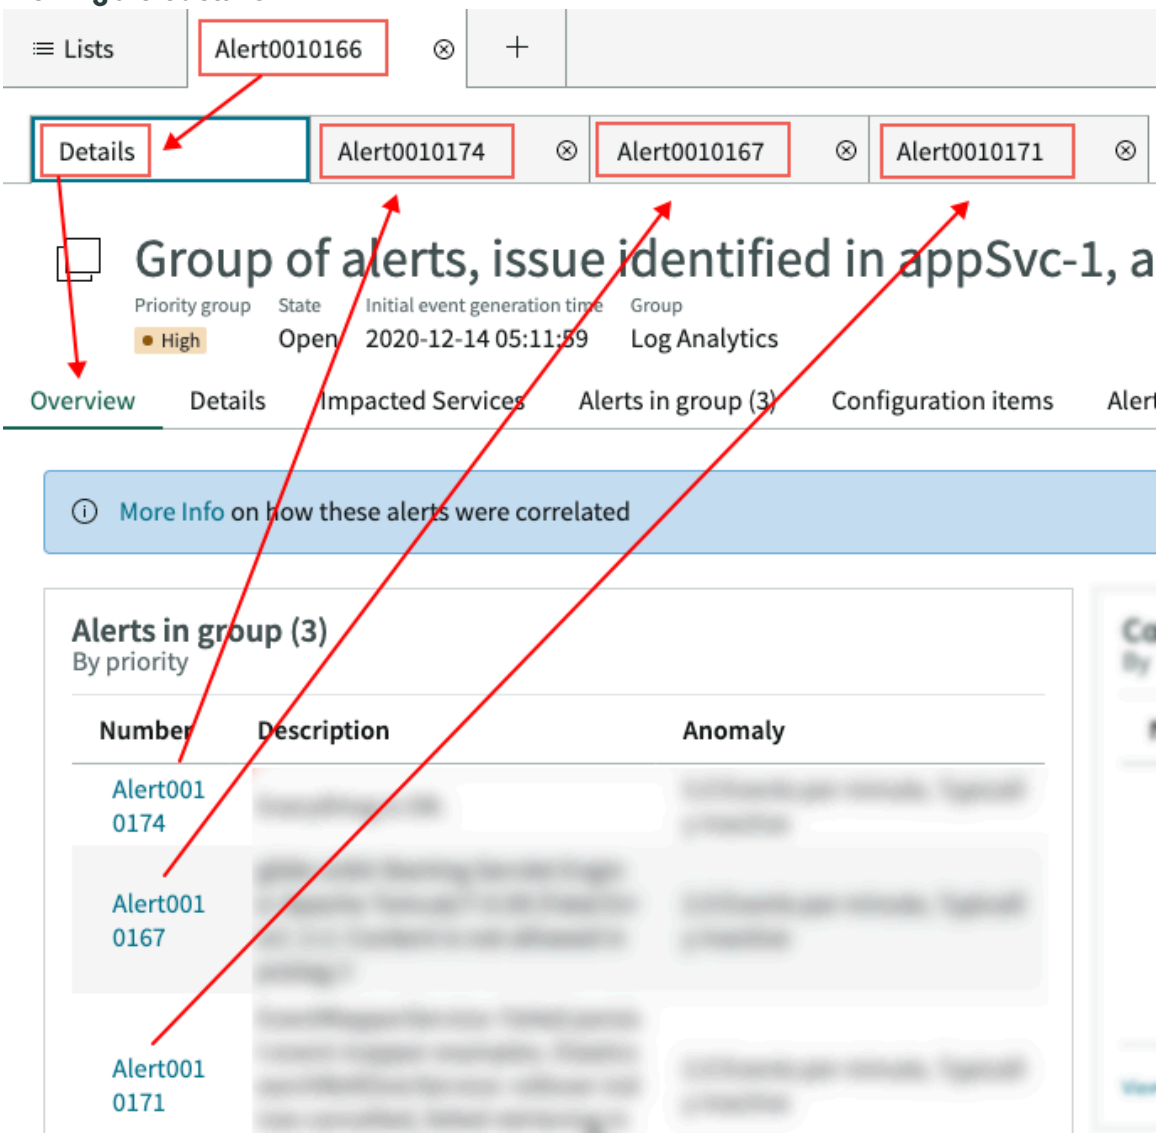
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a Log Analytics alert (Alert0010166 in the example), the Alerts in group section shows the Log Analytics alerts that are grouped under the Log Analytics alert.

Click a Log Analytics alert to view its details. To view the full list of Log Analytics alerts, click **View more** or click the **Alerts in group** tab.

Viewing alert details



Configuration Items

To view more detailed information on the CIs that are associated with the alerts, click the **Configuration Items** tab or click **View more** in the Configuration Items section. See Operator phase 1: Analyze and acknowledge an alert.

Impacted services

To view detailed information on the services that are impacted by the alerts, click the **Impacted services** tab. See Operator phase 1: Analyze and acknowledge an alert.

Log Analytics alerts in the Alerts in group tab

The table describes the Log Analytics alerts in a Log Analytics group on the **Alerts in group** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts in group tab

Column	Description
Number	The number of the alert that appears in the list of alerts on the Operator Workspace dashboard. To view detailed information for an alert on the **Details** tab, click the alert number. This field is automatically set.
Group	Type of group that the alert belongs to: a standalone Log Analytics alert or a Component-based alert.
Description	Anomalous pattern or metric that caused the alert to be generated.
Severity	Severity value for the alert. The available values are: • **Critical**: Immediate action is required. Either the resource is not functional or critical problems are imminent. • **Major**: Major functionality is severely impaired or performance has degraded. • **Minor**: Either performance has degraded or there is a partial, non-critical loss of functionality. • **Warning**: Attention is required even though the resource is still functional. • **Info**: An informational message. An alert is created, but the resource is still functional. • **Clear or Resolved**: No action is required. An alert is not created from this event. Existing alerts are closed.
Priority group	Priority group that indicates the order in which to resolve alerts. Choices are as follows: • **Urgent** • **High** • **Moderate** • **Low** The priority group value is more important than severity alone. For example, a high priority and low severity alert should be addressed before a low priority and high severity alert. For information on how priority is calculated, see Alert priority.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts in group tab (continued)

Column	Description
State	Processing state of the alert. A newly generated alert is in the **Open** state. Other states are as follows: • **Reopen**: A previously closed alert is open again, and it requires your attention. • **Flapping**: The alert is receiving identical events from the same source at high frequency. This state can cause an alert to re-open from the Closed state, resulting in a high frequency of changes between Open and Closed states. • **Closed**: The alert is closed and does not require any further action. You close an alert when it is remediated.
Configuration item	CI in the CMDB. The CI is applied to by the alert.
Node	Node field that is received in the log message. The event described in the log message occurred on this node. Often, the node is the name of the CI that is associated with the alert. For example, a computer name, IP address, FQDN, or MAC address.
Source	All Health Log Analytics alerts have the value **Log Analytics** in the **Source** column to indicate that the Health Log Analytics app generated the alert.
Metric name	Name of the metric whose anomalous behavior led to the alert. For example, the *`I/O request`* in the case that the I/O request took longer than 15000 ms to complete.
Updated	Most recent time when the alert information or state was updated.

Information on the Overview tab for a Log Analytics alert

The alert **Overview** tab in Health Log Analytics helps you understand Log Analytics alerts.

Sections and cards on the Overview tab for Log Analytics alerts

For a detailed description of Log Analytics alerts , see Types of Health Log Analytics alerts.

Identified issue

The "identified issue" led to the alert. The issue appears in the title for the alert and on a card on the tab. Information about the alert appears in the banner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

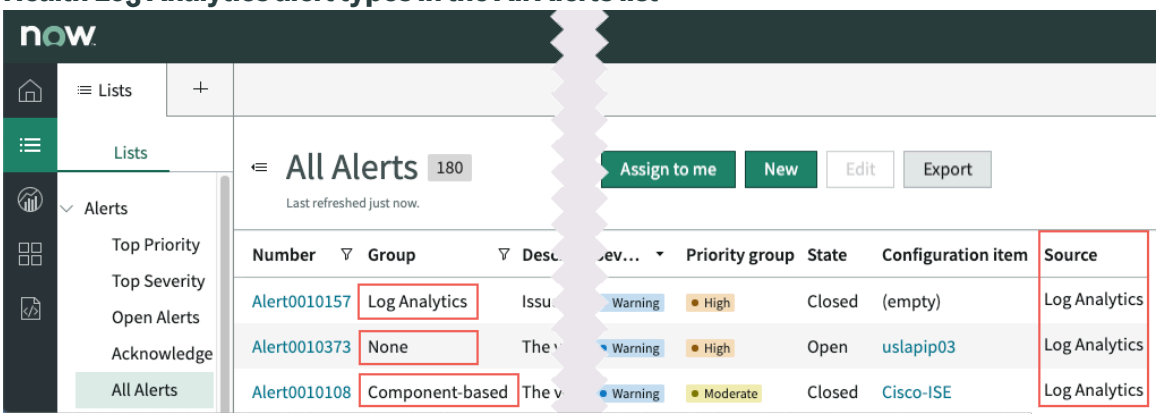
Types of Health Log Analytics alerts

Health Log Analytics generates several types of alerts.

In a list of alerts, all alerts that are generated by Health Log Analytics have the value **Log Analytics** in the **Source** column. The value in the **Group** column identifies the kind of alert, as follows:

Health Log Analytics alert types in the All Alerts list



Component-based alert (Alert0010108 in the example)

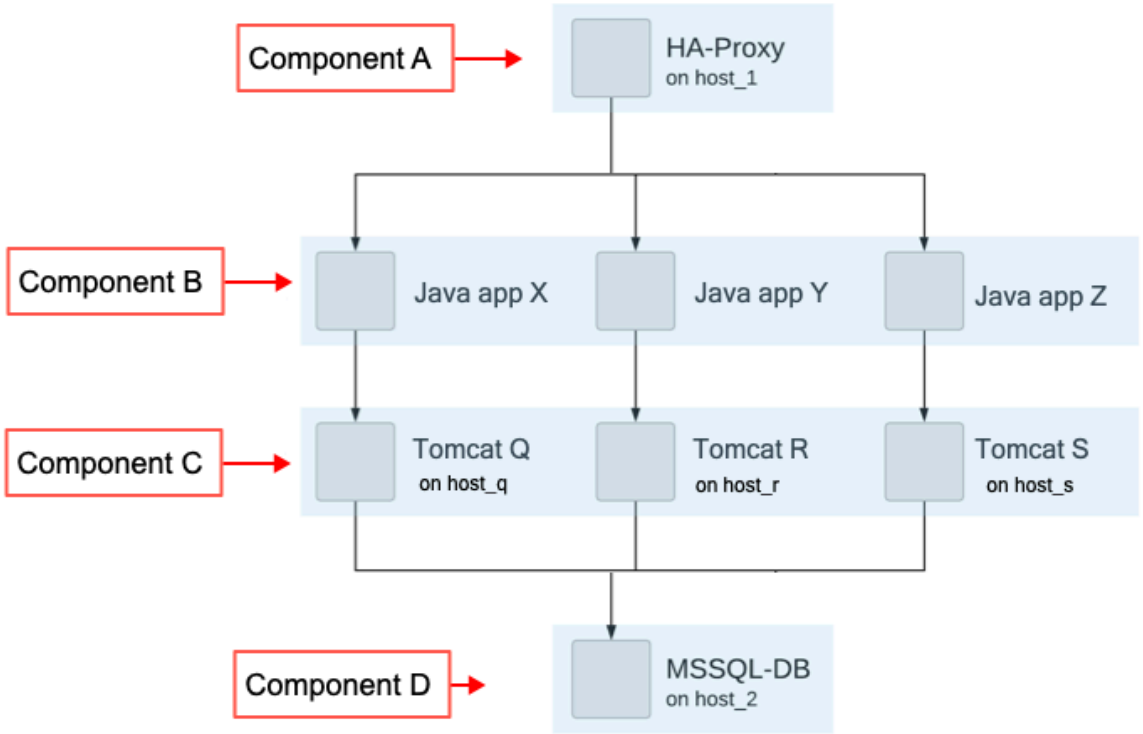
Component-based alerts involve more than one configuration item (CI). A component is a logical component of a service instance that caused the alert. A component can be multiple CIs that perform the same function, such as multiple redundant hosts.

Important: Each Component-based alert is the parent of a number of read-only alerts. You do not work directly on read-only alerts. You work only on the parent Component-based alert.

In this example service instance, the identical Java apps X, Y, and Z make up a single component: Component B. Tomcat servers Q, R, and S and their hosts make up a different single component: Component C.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example service instance



Starting in the May 2025 store release, component-based alert groups are eliminated as Health Log Analytics transitions to a single alert model where alerts are bound directly to services. This change improves alert visibility, simplifies alert correlation, and enhances overall alert management efficiency.

Log Analytics alert (Alert0010373 in the example)

A Log Analytics alert identifies an anomaly that involves a single CI. A Log Analytics alert has the value **None** in the **Group** column. The anomaly that leads to the alert can be an unexpected number of log entries or an unexpected value of a metric.

Log Analytics group (Alert0010157 in the example)

When the system identifies multiple Log Analytics alerts that are related in important ways, it groups them into a Log Analytics group. A Log Analytics group can group up to four alerts. The system generates a Log Analytics group when the Log Analytics alerts share one or more of the following relationships:

- Time: The events all occurred within a configured time interval.
- Metadata: The alerts have matching values in log-line metadata. For example, all alerts involve the same host.
- Message text: The message text in the log data is similar or identical between alerts.
- Trend: The alerts show a similar tendency in values or rates. For example, a particular metric value is increasing in all alerts.

Note: You can mark an alert as significant. A significant alert is more likely to be included in a Log Analytics group when the associated metric behaves anomalously. For more information, see Mark an alert as significant.

Types of anomalous behavior

Anomalous behavior in a CI or a service can indicate an important issue. For example, a spike in the frequency or number of messages of a particular type can indicate a problem.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Understanding anomalies

To build models of expected behavior, the system monitors the log stream to learn baselines for patterns, metrics, and gauges over various time periods. Time periods can be hourly, daily, weekly, or unlimited. Behavior that departs from the learned models is considered anomalous behavior.

Types of log property

Pattern

A pattern is a value or rate that repeats, whether in text, time, or relationships.

Meter

A meter property is a numeric or text value. For example, a status code, a response code, an action, or a pattern.

Gauge

A gauge property has a numerical value that is reported continuously. Gauge properties represent operations that consume resources. For example, CPU usage, memory usage, or response time.

How anomalies appear in the Service Operations Workspace

The Anomaly card illustrates the anomalous activity that led to the alert.

- The blue line shows the recent anomalous activity.
- On some charts, the lightly shaded area indicates the expected (learned baseline) behavior.

  A peach-shaded area represents the baseline values for the same hour one day earlier. A pink-shaded area shows the values for the same period in the previous week.

- Click the information icon to see how the anomaly was identified: ⓘ.

In this example, the peach-shaded area shows the same data for the same hour one day earlier. The spike in the metric value (events per minute) is clearly visible.

Anomaly card

Kinds of anomalies

Some of the kinds of anomalies

Behavior	Description
New behavior	A pattern that has not ever been seen. The New Behavior alert type does not display a chart.
Signal dead/Stopped appearing	All pattern or log data from a source has stopped. There has been no signal for at least five minutes.
Signal alive/Appearing again	A pattern or log data from a "dead" source is appearing again. For a baseline of one hour, a pattern is "dead" if it appears less than once per minute.
Anomaly above average or below average	Activity that deviates from expected baseline behavior for pattern or meter or gauge metrics, such as keywords metrics or severity metrics.
Baseline reference increase or decrease	An increase or decrease in the value or volume of a log property as compared to the one-hour or one-week baseline.
Correlation of severity and keyword alerts	An increase in the volume of a severity level or keyword.

Surrounding logs tab fields

This section describes the information displayed on the **Surrounding logs** tab.

Surrounding logs tab

Column	Description
Time	Timestamp of the log line in the format that the source uses. If no value appears, then check the source type structure of the raw data.
Application service	Service instance in which the metric was found.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Message	Inner message of the raw log line that contains the text of the system-generated log message regarding the nature of the occurrence.
Level	Type of event. The available values, in order of importance, are: • **Emergency** • **Alert** • **Critical** • **Error**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Surrounding logs tab (continued)

Column	Description
	• **Warning** • **Notice** • **Informational** • **Debug**
Host	Host identifier from the log line that consists of the hostname or IP address of the endpoint.
Log message	The raw log message without the header.

Log viewer table fields

This section describes the information displayed in the **Log viewer** table.

Log viewer table fields

Column	Description
Time	Timestamp of the log line in the format that the source uses. If no value appears, then check the source type structure of the raw data.
Service instance	Service instance in which the metric was found.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Message	Inner message of the raw log line that contains the text of the system-generated log message regarding the nature of the occurrence.
Level	Type of event. The available values, in order of importance, are: • **Emergency** • **Alert** • **Critical** • **Error** • **Warning** • **Notice** • **Informational** • **Debug**
Host	Host identifier from the log line that consists of the hostname or IP address of the endpoint.
Log message	The raw log message without the header.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: By default, the Raw message column does not appear in the Log viewer table. You can display this column by selecting it from the **Filters** pane. For more information, see Customize the Log viewer table.

Log correlators form fields

This section describes the fields on the Log correlators form.

Log correlators form

Field	Description
Type	Type of log correlator. Choices are as follows. • **Free text correlator**: The log correlator analyzes text in the log message. • **Log-key correlator**: The log correlator analyzes log metadata. For example, the name of a service instance in your infrastructure. Log property correlators are specific to the business context of your environment. For more information, see Identifying relationships in log data by using log correlators.
Free text term or Identifier	Text that the log correlator isolates when parsing log lines. The label for this field is **Free text term** for free text log correlators and **Identifier** for log property correlators. **Note:** The value of this field can be the text for either type of log correlator. As a result, the label for this column in the resulting list of log correlators is **Correlation indicator**.
Active	Option to apply the log correlator. When you select this field, the system applies the log correlator to the log stream.
Range of analysis	Set of sources whose log data are analyzed by this log correlator. Choices are as follows: • **All sources**: The log correlator is applied to log lines from all sources in the data stream. • **Only new sources**: The log correlator is applied to log lines from all sources created after this log correlator is activated. • **Specified source**: The log correlator is applied only to the log lines from the source that you specify on this form.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log correlators form (continued)

Field	Description
Excluded sources	Sources that are excluded from the log correlator. The system does not analyze log lines from sources that are listed in this field. **Note:** This field applies only when the **Range of analysis** field is set **All sources** or **Only new sources**. For information about excluding a source from a log correlator, see Exclude a source from a log correlator.
Source	Source of the log correlator. The log correlator analyzes the data of this log source. This field appears only when you are adding the log correlator from the Log Sources form. The field is automatically set to the log source that you are working on.

Information on the Alert Insight Similar Alerts tab

View the list of alerts that are provided by the Alert Insight feature on the **Alert Insight Similar Alerts** tab. The Alert Insight feature generates the information to help you resolve the alert.

Alert Insight Similar Alerts tab

The tab lists information on other alerts generated over the preceding 30 days that have the same CI type, source, resource, metric name, and so on.

Service Operations Workspace provides a context-aware alert triage based on data from IT Service Management (ITSM), such as from incidents, change requests, and problems. The Alert Insight feature helps you to determine the root cause and recommends a solution. Using smart launch in context, you can perform any of the following actions:

- Launch an application
- Open a browser at a specified URL
- Perform remediation (based on orchestration)
- Launch a subflow (workflow based on flow designer).

Service Reliability Management

Service Reliability Management (SRM) helps your organization respond, collaborate, track, and self-remediate when working on alerts and incidents. SRM is available when you have both ITSM Standard and ITOM Operator Professional subscriptions.

- Contact Customer Service and Support

Exploring Service Reliability Management

Service Reliability Management (SRM) provides a self-serve, guided experience for teams to manage service health. The experience is built using the Service Operations Workspace application and combines ITOM and ITSM capabilities into a single workflow.

SRM overview

Optimize service health with site reliability engineering (SRE) practices. SRM is a single operations workspace that empowers teams to improve the reliability of digital services with SRE.

- Use on-call escalations to respond to issues in a timely manner.
- Reduce setup friction with guided self-service to onboard distributed teams with separated data, empowered access, and minimal governance from central IT.

When SRM is installed, several plugins and applications are also activated. For more information, see Plugins or applications installed with ITOM AIOps.

SRM users

Users

Users	Description	Contains Roles
admin	A ServiceNow administrator is responsible for the administration, development, operation, education, and maintenance of the ServiceNow platform. Responsible for installation and can perform Service Operations Workspace Admin Center configuration of SRM.	All
Administrator [srm_admin] **Note:** This role differs from the ServiceNow admin role.	SRM administrators can manage account settings, configurations, and users. Administrators can perform the following actions: • Access, create, edit, or delete all SRM configurations. • Add or manage integrations. • Create integrations with Application Performance Monitoring (APM) tools.	• Manager • Responder

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

Users	Description	Contains Roles
	• Set up and maintain reliability metrics. • Set up and maintain error budget policies.	
Manager [srm_manager]	Managers oversee a team of SREs. Managers assign SREs to the team on-call schedule, monitor their performance, and create procedures to handle incidents and develop solutions. Managers promote resilience across all the systems and the DevOps workflows. Managers can perform the following actions within the context of their teams: • Define and set up teams, on-call schedules, and services. • Add and delete users such as responders and managers for the teams they're a part of. • Add or manage integrations. • Create Integrations with Application Performance Monitoring (APM) tools. • Set up and maintain reliability metrics. • Set up and maintain error budget policies.	Responder
Responder [srm_responder]	A Service Reliability Engineer (SRE) that uses SRM to perform everyday tasks. Responders are the individuals who are on call and diagnose and remediate incidents. Responders can only access configurations that they're a part of. They can only access the alerts or incidents for which they have permissions. SREs can perform the following actions, within the context of their teams: • Set up services, teams, and integrations. • Confirm their on-call schedules.	Inherits 17 roles including the following: • cmdb_read • sn_sow.sow_user • sn_sow_srm.srm_responder • workspace_user • slo_operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

Users	Description	Contains Roles
	• Manage incident and alert records. • Update teams that they've created. • Add other responders. • Create integrations with Application Performance Monitoring (APM) tools. • Set up and maintain reliability metrics. • Set up and maintain error budget actions.	

For more information, see SRM roles and responsibilities.

SRM workflow

1. Product teams in IT or Lines of Business continuously deliver new technical and application services. Example: New customer billing portal.
2. Along with SLO Management, teams can register services and define service level objectives (SLOs), helping them reach business outcomes. Example: 95% monthly availability for the billing portal.
3. Monitoring integrations are set up by the teams to collect the real-time health of these services. Example: Cloud Observability.
4. Monitoring creates service level indicators (SLIs) impacting alerts when services are underperforming. Automation groups and enriches. Example: Billing portal latency is exceeding 7 s.
5. When the alerts indicate an outage or customer-impacting degradation, incidents are created and on-call notifications notify appropriate team resources. Example: A Billing SRE team is notified via phone of a latency issue on the billing portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. After teams collaboratively diagnose and remediate incidents, they identify action items for improving the system's resilience. Example: The Billing team decides to add additional web server capacity.
7. Management continually reviews SLO performance, helps to prevent changes when the error budget is exhausted, and prioritizes improvement initiatives for underperforming services.

SRM benefits

Benefit	Feature	Users
Team-based experience	Working with SRM teams	SRM administrators, managers, and responders
Service registration	Working with SRM services	SRM administrators, managers, and responders
Prebuilt integrations	Working with SRM integrations	SRM administrators, managers, and responders
Measure service health	Working with reliability metrics	SRM administrators, managers, and responders
On-call coverage	Create an SRM on-call schedule	SRM administrators, managers, and responders
Remediate high severity alerts and incidents	Working with SRM reliability tasks	SRM administrators, managers, and responders

What to explore next

To learn more about configuring and using SRM, see:

- Configuring Service Reliability Management
- Using Service Reliability Management
- Service Reliability Management reference

Get started with Service Reliability Management

Service Reliability Management (SRM) accelerates your path to viewing service health in the context of service level objectives and incident resolution. Helps IT Operations and DevOps teams deliver on the promise of agility, performance, and uptime.

Get started with SRM to understand the different sections in the SRM interface.

For more information on roles, see SRM roles and responsibilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic SRM tasks

Step	Description	Reference
Set up teams and services	Setup guides for the Home, Services, and Teams pages show how to add a team or service to SRM.	Add an SRM team
Visit and learn about your Home page	The Home page is where you find the things most important to you. For example, the services with critical alerts and incidents and work assigned to you and your team.	SRM Home page
Learn how to navigate SRM	Get familiar with the different sections and elements of the SRM interface. The sections and elements are used throughout the documentation.	SRM interface

SRM helps you when you must create and administer teams, services, and integrations.

SRM tasks

Step	Description	See this
Manage an application or technical service in SRM	Define the basic tasks and parameters that make up your service and how it should behave.	Add a service to SRM
Set up an SRM team	Set up a team. Teams are responsible for the issues that occur in their associated services.	Add an SRM team
Set up on-call schedules and escalation policies	Create an on-call schedule for your team to make sure they're available to resolve issues. You can set up an escalation policy to make sure at least one team member is engaged in incident response.	Create an SRM on-call schedule
Configure service relationships	Use a map canvas to add, configure, and arrange services. You can add child services that depend on parent services.	View impact of child service on parent service
Integrate services with third-party monitoring tools	Set up a third-party integration, such as Datadog or ServiceNow Cloud Observability, with SRM so that alerts are available to your teams within SRM.	Working with SRM integrations
Establish SLOs, SLIs & error budgets for services	Establish goals for how well your service should operate. Also, specify the maximum amount of time that a technical system can fail without contractual consequences.	Service Level Objective Management
Set up alert automations	Alert automations enable you to define alert conditions. Set up alert rules for each APM tool to define the conditions	The Alert automation application is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SRM tasks (continued)

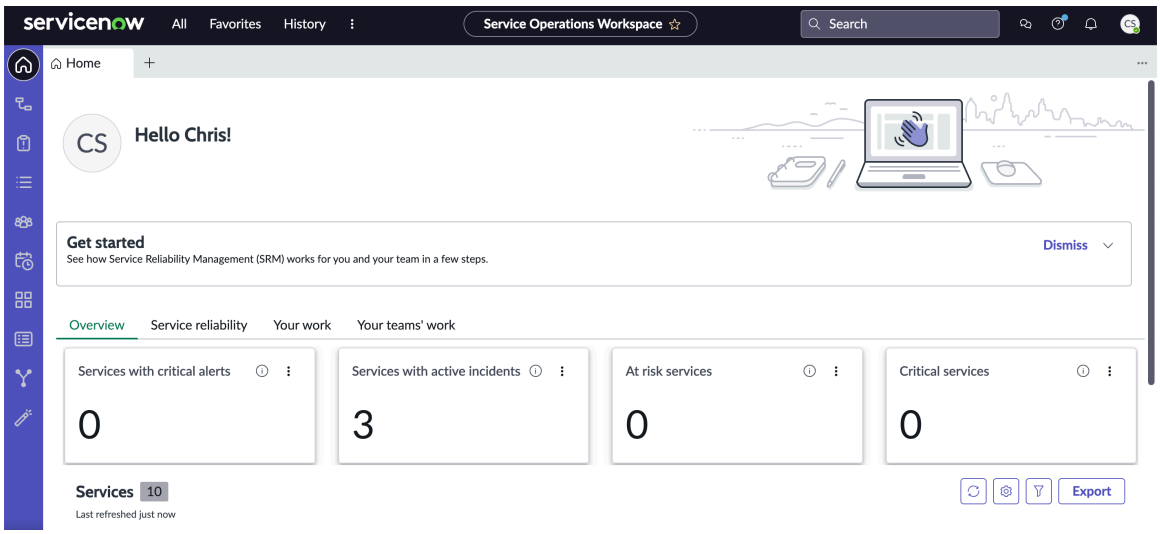
Step	Description	See this
Note: This functionality is only available if you have installed the Alert automations application.	when the APM tool should send notifications to SRM.	available from the ServiceNow Store.

SRM Home page

The Service Reliability Management (SRM) Home page provides relevant information about your work, services, schedules, maintenance reminders, and teams. View the Home page by navigating to **Service Reliability Management**.

Service Reliability Management Home page sections

In the workspace, select **Home** ( ) to view the Home page.



When you're on-call, your schedule is listed.

Home page sections

Get started	Contains setup tasks and their progress for teams and services. For more information on completing setup, see Add a service to SRM and Edit SRM service details. **Note:** You can skip any section and come back to it later. Progress is marked in percentages by the actions that you take. As long as a step remains incomplete, the tiles are available. You can minimize them, at any point, by selecting the Up icon . Use **Dismiss** to remove it from your page. The checklist states are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Home page sections (continued)

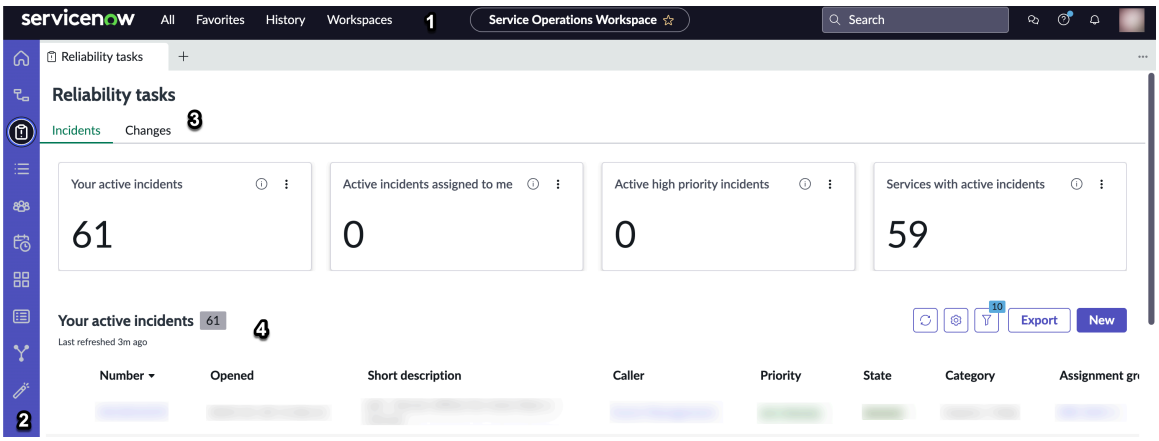
	• **None**: No action has been taken. • **Done**: All required fields have been added. • **Pending**: Some fields or approvals still must be added or granted.
Overview	Contains an overview of all service alerts, incidents, and at-risk and critical services. **Services with critical alerts** are the default list view. Select a card to see the list view for that area.
Service reliability	Displays a dashboard for monitoring and managing service performance. The dashboard offers multiple visualizations to help you track error budgets, monitor service level objectives, and identify issues across services.
Your work	Contains incidents and alerts assigned to you. Select a card to see the list view for that area.
Your teams' work	Contains incidents and alerts assigned to your team. Select a card to see the list view for that area.

SRM interface

The different components on the Service Reliability Management (SRM) interface provide easy access to different functions. The features and functions that appear depend on your role and permissions.

The SRM interface has the following different sections:

Interface sections



Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics. Depending on your role, you may see other icons in the primary navigation.

If you see the SOW Home page, select an SRM icon to view SRM-specific information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sections	Description
1 - Header	A home for your organization logo and system-level utilities present everywhere in the interface. • All • Favorites • History • Workspaces • Current workspace • Search • Sidebar discussions • Help • Notifications • Profile icon: Represents your profile
2 - Primary navigation	Easy access to specific pages in SRM. The primary navigation uses icons, including icons for Services, Reliability tasks, Teams, and Schedules. Use tooltips to identify them. **Note:** The Alert automation icon is only available if you have installed the Alert automation application from the ServiceNow Store.
3 - Content headers	Tabs, cards, or buttons that provide the means to accomplish product-level tasks. The elements in the content header differ from one page to another.
4 - Content area	Canvas or the main area where you can gather information, read metrics, and perform tasks. **Note:** If you want to minimize the side panel on forms, by default, navigate to **Preferences** > **Workspace** and disable the **Show sidebar** option. That action disables it across the Service Operations Workspace, not just SRM.

Search, filters, lists, forms, and guides

An overview of the additional elements in the Service Reliability Management (SRM) interface that help you find items, view available forms and lists, and follow setup processes.

Table List view

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View services and incidents as a list.

- Search using the header text box.
- Order items using the list columns.
- Filter list results using the list columns.

Note: View the active filters using the filter icon in the list view header.

Each view contains its own unique items. See those pages for details.

Form view

When you open any of the table records from the list view, you see the details of the record as a form.

Each view contains its own unique items. See those pages for details.

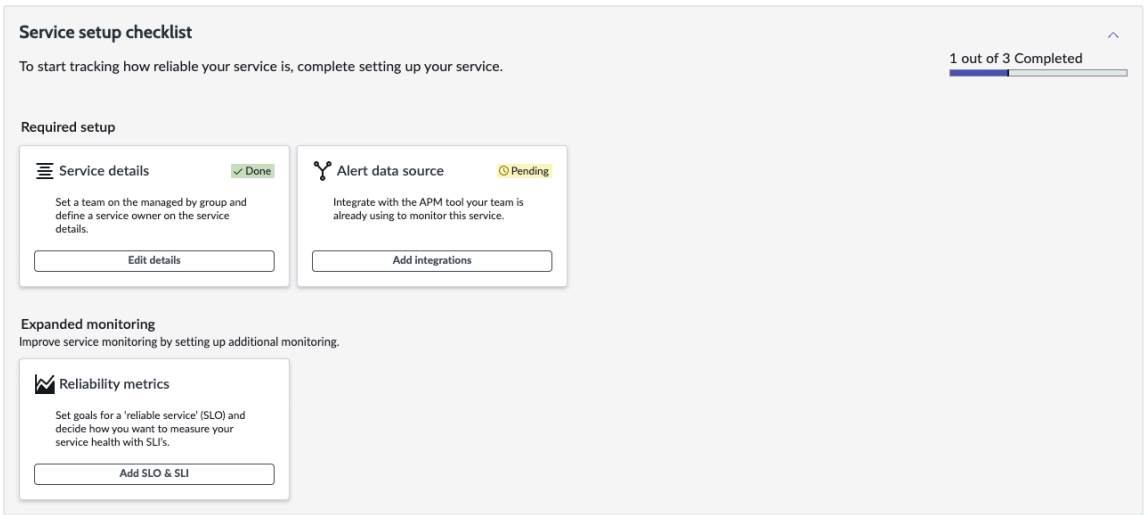
Note: Grayed out fields can't be changed.

The Attachments panel is often visible by default, to hide it select the Attachment icon .

Setup checklists

Use the setup checklists to visualize the process that you go through to reach your goals. Each step is highlighted as you complete it.

Service setup checklist example



Export list information to a file

You can export live information to a file in Service Reliability Management (SRM).

Before you begin

Note: Bulk selection doesn't impact exports. The export includes all records that match the current filter criteria. It doesn't consider the selections you make in the list view.

Role required: srm_admin, srm_manager, or srm_responder

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select the list view in any landing page section in SRM with an **Export button**.
3. Determine which filters you want to use and select them from the Filters or More actions menu in the list columns.

   Note:

   The Export button only becomes available if there are records in the list view.

   The export contains all list data that matches your filtered/grouped lists.

4. Select **Export**.
   In the pop-up window select:
   - File Type:
     - Excel
     - CSV
     - JSON
     - PDF
   - Delivery type:
     - Download
     - Email: Provide an email address

   For **Email**: Once the export is complete, a success message appears with your email address at the top of the screen. It's useful for larger files because, depending on the size of the file, exporting might take some time. Email runs in the background, so you're free to do something else while waiting.

   For **Download**: The pop-up begins exporting and the file appears in your Download directory. Depending on the size of the file, it might take some time. You can open it in any application that supports the file format.

Manually create SRM tags

Add tags to classify, categorize, and add context to data. Service Reliability Management (SRM) imports tags and attaches them to services, alerts, and incidents. You can also manually create tags.

Before you begin

Role required: srm_admin, srm_manager, or srm_responder

About this task

There are two ways that tags can enter the system and attach to an alert or incident. The first is automated but the last one is manual.

- Imported from a third-party integration such as Datadog.
- Using the tag icon in the header of a service, alert, or incident.
- Added using the **Modify field values** action in an automation rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This task describes how to add tags to services and incidents in SRM. For information about managing alerts, see Alerts in Service Operations Workspace.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Services** or **Reliability tasks**.
3. Open a service or incident.
4. In the header, select the **Tag** icon to add tags.
5. Enter your tag in the pop-up window.
   Your tag is saved and appears below the Add Tag box alongside any existing tags.
6. Select anywhere in the form to close the pop-up.

Note:

Tags are also shown under the description in the incident list view.

SRM incidents

Track and collaborate on incidents in the Incidents tab, helping you and your teams resolve issues efficiently.

The Incidents tab appears in the Service Reliability Management (SRM) Reliability tasks page. Its top header shows description information, tags, priority information, state, service, and assignment group.

Note: Tags are imported from third-party integrations and attached to incidents. However, you can also create tags to categorize data and drive system logic using the Tag icon . For more information on creating and viewing tags, see Manually create SRM tags.

When selecting an incident, you're taken to an overview. This section contains three content panels: Summary, Activity, and Recommended actions.

Note: When an editable field is updated, notifications are sent based on user notification preferences.

In the Impact Summary, you find the following information:

Affected CIs

Field	Description
Configuration item	Name of and link to the configuration item associated with this incident.

Impacted Services

Field	Description
Configuration item	Name of and link to the configuration item associated with this incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impacted Services (continued)

Field	Description
Managed by	Team responsible for the incident.
Owned by	Incident owner.
Approval group	Team responsible for approvals.
Location	Geographical location of the incident if defined.
Operational status	Status of the incident.
Manually added.	Whether this incident was manually added or the result of an error budget policy.

Details

Contains incident details and related alerts

Field	Description
Short description	Brief description of the incident.
Description	Detailed description of the incident.
Number	Incident identifier.
Impact	Impact is a measure of the effect of an incident on business processes. Choices are: • 1 - High • 2 - Medium • 3 - Low
Assignment group	Team assigned to the incident.
Priority	Priority is based on **Impact** and **Urgency**, and it identifies how quickly the incident should be addressed. Choices are: • High Impact = Critical Priority • Medium Impact = High Priority • Low Impact = Moderate **Note:** See Priority Data Lookup rules below.
Category	Category of the incident. Choices are: • Inquiry/Help • Software • Hardware • Network • Database

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details

Contains incident details and related alerts

(continued)

Field	Description
Urgency	Urgency is a measure of how long the resolution can be delayed until an incident has a significant business impact.
Service	Affected service associated with the incident. You can edit this field from a list menu. **Note:** When you set a service, and that service has an assigned team, the assigned team of that service is automatically assigned to the incident.
Severity	Imported severity on the incident. Values P1–P5.
Configuration item	Asset associated with the incident.
Assigned to	Individual responsible for resolving the incident.
State	State of the incident. The state moves and tracks incidents through several stages of resolution. Choices are: • New • In Progress • Ob Hold • Resolved • Canceled
Watch list	Individuals interested in the incident. Subscribes them to notifications according to their preferences.
Resolution code	Code associated with the resolution. Choices are: • None (default) • Duplicate • Known error • No resolution provided • Resolved by caller • Resolved by change • Resolved by problem • Resolved by request • Solution provided
Resolution notes	Detailed information on the resolution. Resolution notes are posted to the **Activity** timeline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Priority is calculated according to the following sample data lookup rules:

Priority Data lookup rules

Impact	Urgency	Priority
1 - High	1 - High	1 - Critical
1 - High	2 - Medium	2 - High
1 - High	3 - Low	3 - Moderate
2 - Medium	1 - High	2 - High
2 - Medium	2 - Medium	3 - Moderate
2 - Medium	3 - Low	4 - Low
3 - Low	1 - High	3 - Moderate
3 - Low	2 - Medium	4 - Low
3 - Low	3 - Low	5 - Planning

When a service is deleted, its integrations, alerts, incidents, and automations are removed. Deleting a service isn't a recoverable action so consider deactivating the service instead.

The Related Records tab contains any alerts associated with this incident.

Note: All field values are imported from the related records and aren't editable from SRM.

Child Incidents

Field	Description
Number	Identifier for the related incident.
Short description	Brief description of the related incident.
Priority	Priority of the related incident.
State	State of the related incident.
Assigned to	Team member assigned to the related incident.
Assignment group	Team assigned to the related incident.
Service	Service associated with the related incident.

Alerts

Field	Description
Number	Identifier for the related alert.
Severity	Severity of the related alert.
Short description	Brief description of the related alert.
Acknowledged	Whether the related alert has been acknowledged or not.
Assigned to	Team member assigned to the related alert.
Configuration item	Asset associated with the related alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts (continued)

Field	Description
Parent	Primary alert associated with the related alert.

Recent Impactful Changes

Field	Description
Number	Identifier for the related changes associated with this incident.
Short description	Brief description of the related changes associated with this incident.
Type	Type of the recent changes associated with this incident.
State	State of the recent changes associated with this incident.
Planned start date	Date and time to begin changes associated with this incident.
Planned end date	Date and time to begin changes associated with this incident.
Assigned to	Team member responsible for the change request associated with this incident.

Change Requests

Field	Description
Short description	Brief description of the change request associated with this incident.
Type	Type of the change request associated with this incident.
State	State of the change request associated with this incident.
Planned start date	Date and time to begin change request work associated with this incident.
Planned end date	Date and time change request work associated with this incident ended.
Assigned to	Team member responsible for the change request associated with this incident.

Postmortem tab

About Postmortem owner:

- If a Scribe has already been chosen in the Collaboration panel Responders list, they're automatically made the owner.
- If there's more than one scribe, the first one assigned is chosen. Otherwise, you can select an owner from the list menu.
- If a new scribe is added or an existing user persona is changed to Scribe, that user is made the owner.
- If you manually remove an owner, no new owner is automatically selected.

Use the drag-and-drop feature to edit postmortem sections. You can exclude sections from PDFs, delete sections, or reorder sections.

To add new sections, select the **Add** icon .
Compose panel

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

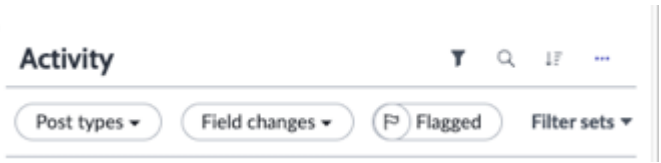
Work notes are added to the Activity timeline automatically. Visible to responders and above. Add comments using the **Compose** text box.

Comments are added to the Activity timeline automatically. Visible to everyone in SRM.

Activity section

Stream that contains all the system activity, and resolution notes. You can filter, sort, expand or collapse all posts using the header icons.

Note: The filter option includes **Post types**, **Field changes**, and **Filter sets**. All choices are selected by default. Flagged entries are either all or none.



Actions panel

Note:

The **Notifications**, **Agent assist**, **Expert on-call**, and **Email templates** panels aren't currently supported in SRM.

Attachments section

Open the **Attachments** section using the Attachment icon .

On the **Attachments** section, you can initially **Browse** your local hard drive for files.

Once you have added attachments, you can:

- Search for an attachment based on its name or extension

  Note: You must have two or more attachments to search.

- Upload a new attachment using the ( ) icon.
- Download, remove, or rename existing attachments using the More actions icon ( ).

Template section

Open the **Template** panel using the Template icon .

Note: Existing templates are displayed, but creating templates isn't available in SRM.

Collaboration panel

Displays the available Zoom meetings, Microsoft Teams, or Slack channels to start or join.

To start or join a Zoom meeting:

Note: The Zoom integration and recognized IDs must be active in your instance. If Start Channel is unavailable, contact your administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Select **Start Zoom**.
   - A meeting pop-up appears.
   - Add participants.
   - Select **Create Meeting**.
   - The meeting is created, invitations are sent, and you join the meeting.

   Note: Any issues found when starting a meeting are shown in a banner message.

2. Select **Join Meeting**
   - **Sign in** to your Zoom account.
   - You join the Zoom meeting.

1. Select **Start Channel**.
   - Sign in to your Microsoft Teams account.
   - Select **Create**. You are redirected to the Microsoft Teams application.
   - Back in the Collaboration column, the **Join Channel** button is activated.

   Note: Any issues found when joining a channel are shown in a banner message.

2. Select **Join Channel** in the Collaboration panel in SRM.
3. Sign into your Microsoft Teams account.

   You are taken to the channel in Microsoft Teams.

Start or join a Slack channel:

Note: The Slack integration and recognized IDs must be active in your instance. If Start Channel is unavailable, contact your administrator.

1. Select **Start Slack**.
   - Add participants in the Create a Slack channel pop-up.
   - Select **Create**. You are redirected to the Slack application.
   - Back in the Collaboration column, the **Join Slack** button is activated.

   Note: Any issues found when starting a channel are shown in a banner message.

2. Select **Join Channel** in the Slack application window.
3. Sign into you Slack account.

   You are taken to the Slack channel.

Service Operations Workspace setup for SRM

Install and configure Service Reliability Management within the Service Operations Workspace Admin Center so that SRM admins, managers and responders can provide service reliability efficiently.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can Install Service Reliability Management from Admin Center or ServiceNow Store from the Service Operations Workspace Admin Center.

Note: The Data visualizations app v24.1.8 is also required. See Data visualizations in the ServiceNow Store to install the app.

Once installed, configuring SRM within the Service Operations Workspace Admin Center sets up the SRM workspace with options and actions.

Using the Service Reliability Management menus in the Service Operations Workspace Admin Center, you can:

- Assign an administrator to Service Reliability Management.
- Activate teams and services in SRM
- Customize service approval settings in SRM.
- Customize team approval settings in SRM
- Access and publish the request catalog item for users.
- Configure error budget actions for breached SRM SLOs.

Alert automations are conditional triggers that execute response actions automatically, based on the contents of the alert. This functionality is available to SRM upon request, from the Alert automations application in the ServiceNow Store.

Configuring Service Reliability Management

Configuring Service Reliability Management (SRM) involves installing it from the ServiceNow Store or Service Operations Workspace Admin Center. You can also assign administrators and import services and teams.

Using guided setup for SRM

The guided setup provides a sequence of tasks to help you configure SRM on your instance. To open the guided setup, navigate to **All** > *Service Operations Workspace* **Admin Center** > **Overview**. Next, find the Service Reliability Management tile and select **Configure**.

SRM configuration documentation

Visit the following pages to set up and configure SRM. The content is primarily for srm_admin or admin users.

Install Service Reliability Management from Admin Center or ServiceNow Store

Install the Service Reliability Management (SRM) application from the Admin Center or ServiceNow Store.

Before you begin
Subscriptions required: ITSM Standard and ITOM Operator Professional subscriptions.

Note: The data visualizations store app v24.1.8 is also required. See Data visualizations in the ServiceNow Store to install the app.

To create and manage alert automations, install the Alert automation application available on request in the ServiceNow Store.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

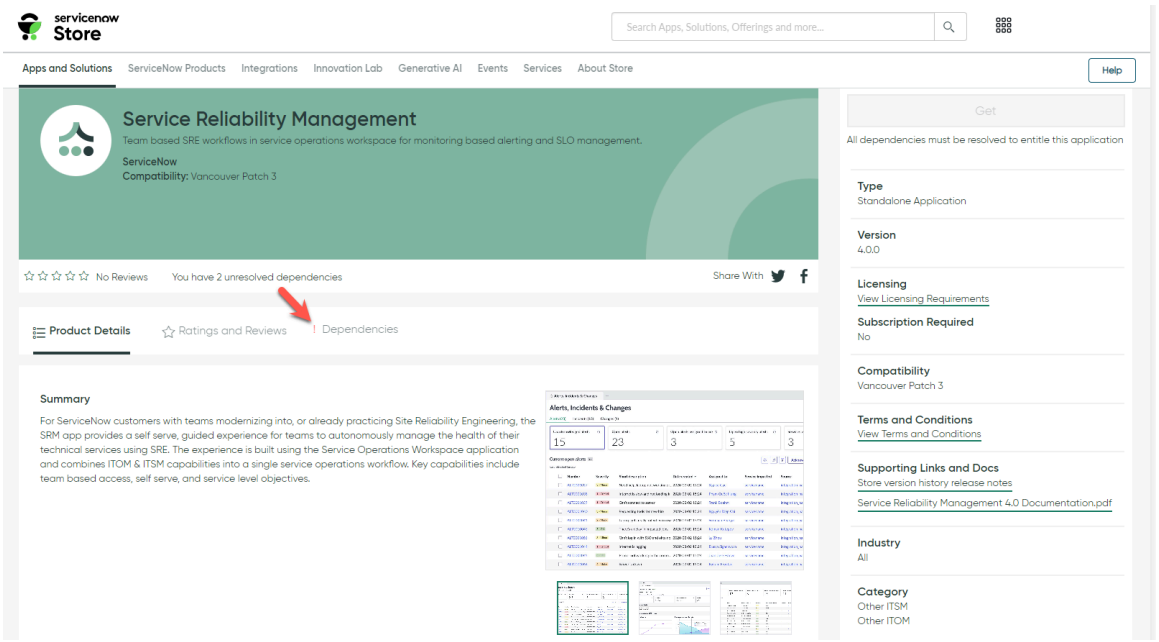
Roles and demo data are installed with SRM. The demo data includes templates that help accelerate implementation and SRM use.

Procedure

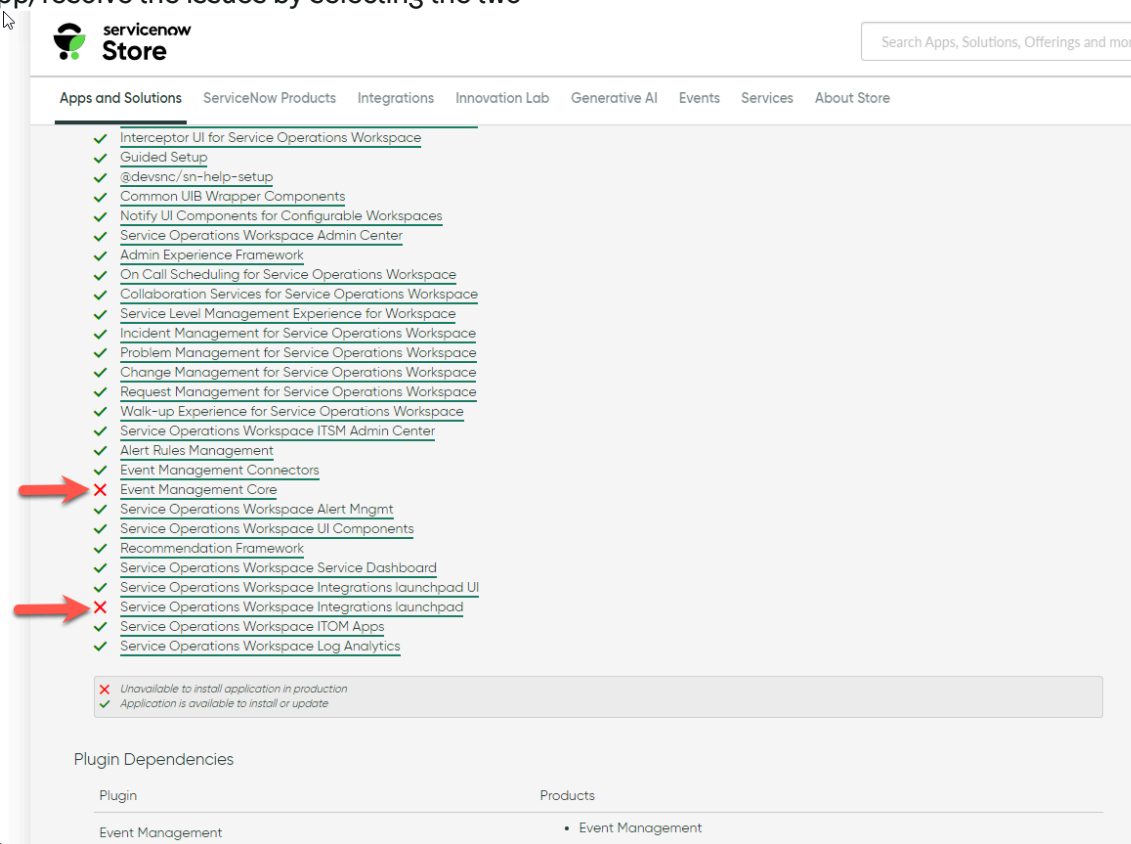
1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Overview**.
2. Locate the *Service Reliability Management* card and select **Install**.
3. In the pop-up window, select **Start Install**.
   You're taken to the ServiceNow Store portal.
4. Complete the necessary steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If any dependencies are red on the app store listing, select the row to open the dependent app and install it. If the dependent app is already installed but still appears in red, you can get or reopt it as needed.



The example shows two unresolved dependencies. Before installing the app, resolve the issues by selecting the two dependencies.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demo data comprises the sample records that describe application features for the common use cases. Demo data is loaded when you first install the application on a development or test instance.

Following installation, the *Service Reliability Management* card can be used to configure SRM.

Assign an administrator to Service Reliability Management

Add people from your ServiceNow instance to administer Service Reliability Management (SRM) and your service operations.

Before you begin
Role required: admin

About this task
The SRM admin can add and create teams. They can also manage data across all SRM teams.

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Overview**.
2. In the *Service Reliability Management* tile, select **Configure**.
3. Navigate to **Assign admins** > **Service reliability management admins**.
4. Enter user names in the field.
5. Select **Save**.

Activate teams and services in SRM

Activate teams and services to be managed in the Service Reliability Management (SRM) application.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Activate** > **Teams and services**.
3. Select **Activate teams and services** to begin importing or adding teams.
4. Use the condition builder to filter the teams shown in the Assignment groups list.

   Note:

   Filters on the same field use AND logic, and filters on different fields use OR logic. For example, filtering for multiple `Business Criticality` levels and `State = Open`, evaluates as `(Criticality = 1 OR 2 OR 3 OR 4) AND (State = Open)`.

   List view filters are saved automatically and persist when you navigate away and return.

5. In the Assignment groups list, select the teams you want to add and then select **Activate**. You reach the **Activate services** option to add services.
6. From the **Select a service class** list, select a service.
   The following service types are available:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Application Services
- Mapped Application Services
- Calculated Application Services
- Dynamic CI Group
- Technical Services
- Tag-based Services

7. Use the condition builder to add new services to the list view.
8. Select the services that you want to add and then select **Activate**.
   The **Activate Services** pop-up opens.
9. From the **Support Group** drop-down, select the relevant support group and select **Confirm**.

Result

On the **Activate teams and services** page, the following options appear:

- Existing teams
- Existing services

You can select the options to view the teams or services.

Customize service approval settings in SRM

Add an approval process to your services for governance.

Before you begin

Role required: admin

About this task

Require approval when Service Reliability Management (SRM) admins, managers, or responders request to create or add a service in SRM.

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Governance and autonomy** > **Service governance**.
3. Choose one or both processes by selecting the relevant check box.

   Approval requirement types:

   - Approval required when creating a new service:

     Requires approval when creating a service in SRM, and assigns it to the team responsible for new services.

   - Approval required when associating an existing Configuration Management Database (CMDB) service:

     Requires approval to add an existing service to SRM, and assigns it to the team responsible for existing services.

4. Enter or select the team responsible for approvals.
5. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This action initiates the approval process and assigns approval to the team responsible for approving the new service.

Note: Approvals take two steps. First, the request is approved, which appears in the **Stage** field of the request record. Next, the request remains **Pending** until the request item is approved in the **Request** record.

Customize team approval settings in SRM

Customize how team approvals work when non-admin users create or add a team in Service Reliability Management (SRM). This feature, also known as team governance, helps you control access and align with internal policies.

Before you begin

Role required: srm_admin or admin

About this task

By default, team governance is active in SRM. When non-admin users request a team, SRM creates two records: a parent request and a requested item. The approval team is notified, and any member can approve the request from My approvals. Once approved, the team is created or added, the parent request is set to `Approved`, and the requested item is set to `Closed Complete`.

You can customize team governance by turning off approvals or changing the approval team.

Note: Non-admin users are SRM managers and SRM responders. When team governance is active, admins and SRM admins can still create and add teams without approval.

Procedure

1. Navigate to **All** > *`Service Operations Workspace`* **Admin Center** > **Configurations**.
2. Under **Service Reliability Management**, select **Governance and autonomy** and then select **Team governance**.
3. Review or update the approval options.

Option	Description
Approval required when creating a new team	Clear this option to let non-admin users cre ate teams in SRM without approval.
Approval required when associating an ex isting team	Clear this option to let non-admin users add existing teams to SRM without approval.

4. Review or update the approval team for one or both options.
   By default, the approval team is set to `SRM Team approvers`. You can view its members in `sys_user_group.list`.

   Note: Any member of the approval team can approve requests, but they need the `sn_request_read` role to view request details. Without that role, they only see the approval task.

5. Select **Save** to update your team governance settings.

Configure error budget actions for breached SRM SLOs

Configure the actions that the team can select when the error budget of a service level objective (SLO) is breached.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Governance and autonomy** > **Error budgets**.
3. Select **Configure error budget actions** to edit the Process Error Budget Policy Threshold subflow in Workflow Studio.

Note: Working in Workflow Studio requires advanced ServiceNow expertise. For more detailed information on editing workflows or creating custom workflows, see Flow Designer.

Approve a change request for SRM

Approve a service change request in Service Reliability Management (SRM) to allow the requested action to proceed.

Before you begin
Only open change requests are available on the **Reliability tasks** page.

Role required: SRM approval team or admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Changes** tab.
4. Select a change request and then select the **Details** tab.
5. On the **State** field, select the list and select **Approved**.
6. Select **Save**.
   The change request state updates from `Assess` to `Approved`.

   On approval, the new service is created and added to the SRM team. The owner is set to the person shown in the Assigned to field. And the Managed by group is set to the SRM team associated with the assignee.

Configure Twilio to send notifications in SRM

Connect your Service Reliability Management (SRM) instance and Twilio account to send notifications to teams.

Before you begin
Before you begin, you must have a String Identifier (SID) and an authentication token for an active Twilio account.

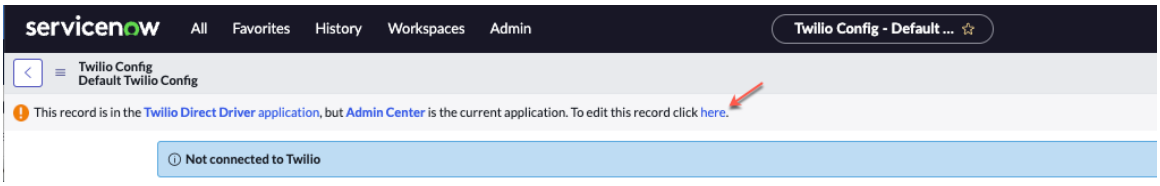
Note: Performing this action requires ServiceNow expertise.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task
You can adjust what gets sent from Twilio by editing the on-call workflow in the system.

Procedure
1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Integrations** > **Twilio API Key**.
3. Select **Twilio Config**.
4. In the new window, select **here** to edit the record.



5. Enter the **Account SID** value.
6. **Optional:** Enter a **Validity Period** value.
7. Select **Connect** to activate the key or **Save** to save your changes without activating.

Install the Alert Automation application

Install the **Alert Automation** application and any supporting applications.

Before you begin
Role required: admin

Subscriptions required: ITSM Professional or ITOM Operator Professional subscriptions.

About this task
Before creating management rules, you must install and configure the Service Reliability Management (SRM) application, available in the ServiceNow Store.

Procedure
1. To access the ServiceNow Store and download the application onto your SRM instance, select the link in the email you received.
2. In your ServiceNow AI Platform instance, navigate to **All** > **System Applications** > **All Available Applications** > **All**.
3. Locate the *Service Operations Workspace* **Alert Automation** application and select **Install**.
   Alert automation rules are ready to use in SRM.

Using Service Reliability Management

SRM enables you to register services, monitor service health, respond to service degradations with on-call shifts and escalation policies and triggers, and onboard distributed teams with minimal governance from central IT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic Tasks in SRM

Working with SRM services

A service represents a functional outcome like networking, payments, or HR services, that is owned by a team. To deliver that outcome, a service can contain one or more technical components like a user authentication service, or a piece of shared infrastructure like a database.

Service Reliability Management (SRM) works with integrations to prioritize and route alerts to the relevant responders. It follows up with escalations until the alert is acknowledged and someone responds. When you create or add a service in SRM, it must reflect a service in your SRM infrastructure.

Note: You might want multiple tool integrations to monitor each technical service and receive events from those tools. See Working with SRM integrations for more information.

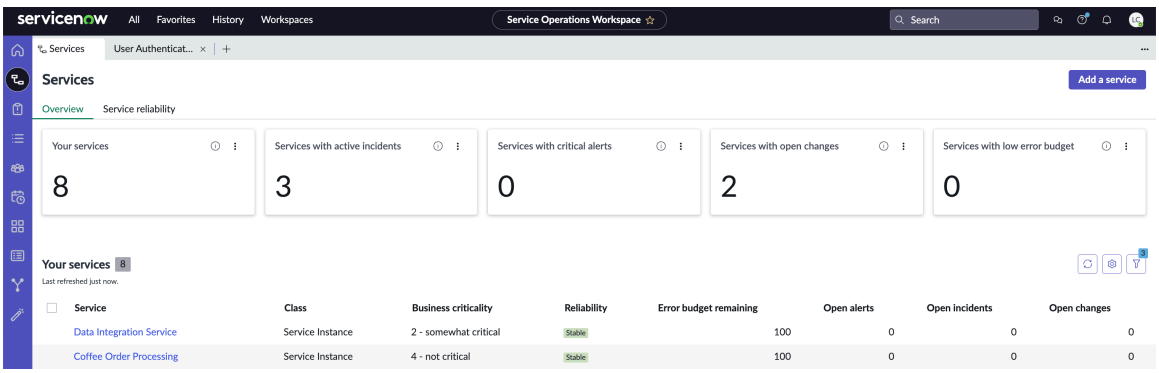
In addition, you can create reliability metrics for the service. See Working with reliability metrics.

Tying a team and policies to that service makes it easier to divide responsibilities and track technical outcomes. It also makes it easier to automate response routines and focus on who you notify and when.

The state of an exiting service is inherited. The state of a created service in SRM is **None**.

Services Overview

Information on the Overview tab



The cards on the Overview tab display the following metrics. By default, the list view shows information related to the Your services card. Select a different card to view different information in the list view.

- **Your services**: Count of all the services you or your team manages and monitors for reliability.
- **Services with active incidents**: Services with open incidents sorted in the following order:
  - Business criticality - most critical first.
  - Number of active incidents - highest first.
  - Percentage of error budget remaining - lowest first.
- **Services with critical alerts**: Services with open alerts sorted in the following order:
  - Business criticality - most critical first.
  - Number of alerts - highest first.
  - Percentage of error budget remaining - lowest first.
- **Services with open changes**: All the services your team manages and monitors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Services with low error budget**: Services with less than 25% error budget remaining.

  The error budget metric is represented as the amount of service level objective (SLO) that you can spend over a specified time. It can be used to manage release velocity.

Note: To refresh the card and list values, select Refresh .

You can interact with the list in the following ways:

- Group or filter columns to customize the view.
- Edit, sort, or export the list as needed. See Export list information to a file.

For more information about individual service details, see Edit service details form.

Services list view definitions

The columns include the following details:

- **Service**: Name of the service.
- **Class**: Application or technical service.
- **Business criticality**: Importance of the service to the business.
- **Open alerts**: Number of open alerts assigned to the service.
- **Open incidents**: Number of open incidents assigned to the service.
- **Error budget remaining**: Percentage of error budget remaining for the service.

Service reliability

The Service reliability tab is a customizable dashboard showing high-level service performance. For more information about the dashboard, see Visualizations in the Service reliability dashboard.

Add a service to SRM

Add services to Service Reliability Management (SRM) to help your teams manage service health.

Before you begin

If you're adding a technical service to SRM, make sure it doesn't have a support group. You assign the support group when you add the service to SRM.

Role required: srm_admin, srm_manager, or srm_responder

About this task

Add a service to SRM to assign it to your teams and let them access its incidents and alerts. You can either create a service or import an existing one. SRM supports both application and technical services:

- Application services - Business-facing services, such as an HR portal. Application services often have multiple infrastructure components.
- Technical services - IT-focused services that support a business or application service. For example, an authentication service or database service.

When you add a technical service to SRM, you also add its Technical Service Offerings (TSOs). TSOs are specific components within a parent technical service. For example, Spam filtering is a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

TSO within the Email technical service. In SRM, you can assign a parent technical service and its TSOs to different teams.

Note: When you import an existing technical service, its TSOs don't inherit its support group. TSOs either keep their existing support group or, if they don't have one, you must assign it before setting up SRM Service Level Objectives (SLOs).

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select the Services icon and then select **Add a service**.
3. In the Add services for your teams modal, you can either create a service or add existing services.

Option	Steps
Create a new service	**a.** Select **Create a new service**. **b.** Fill in the fields. For field descriptions, see Add service form. **c.** Select **Next**.
Select existing services	**a.** Select **Select existing services**. **b.** Search for and select your service. You can add more than one. **c.** Select **Next**. **Tip:** Select the search box to view up to 25 services not yet in SRM, ordered by creation time. After you enter three characters, it shows up to 25 matching results. Both lists can include services with or without a support group. If a ser vice has one, the support group can be an SRM team or a group outside SRM.

4. In the Assign a team step, assign your service to an existing or new support group.
   In SRM, support groups are also known as teams.

Option	Steps
Select an existing team	Enter your team's name in the search box.
Create a team	Select **Create a team**. For more information about creating teams, see Add an SRM team.

5. Select **Add service**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If approvals aren't enabled, your service appears in the service list. If approvals are enabled, your request is sent for approval. After it's approved, the service appears in the services list.

Note: If you added a technical service, its TSOs appear in the Offerings tab on the parent technical service's page. TSOs also appear in the services list. To view a TSO without an assigned support group, remove all filters from the services list.

What to do next

If a TSO doesn't have a support group, assign it to a support group before setting up SLOs. For how to assign support groups, see Edit SRM service details.

You can also add integrations to your service to start monitoring its health.

Working with SRM integrations

Connect your services to monitoring tools using the Integrations Launchpad . Integrations send information to Service Reliability Management (SRM), helping you track alerts, manage incidents, and maintain service health.

Access the Integrations Launchpad

As an SRM admin, manager, or responder, you can access the Integrations Launchpad in the following ways:

- From the primary navigation, select the Integrations Launchpad icon ( ).
- From the Services page ( ), select a service, select the **Integrations** tab, and then select **Add an integration**.
- From the Services page ( ), select a service, expand **Complete setup**, and then select **Add integrations**.

Integration details specific to SRM

Be aware of the following when using the Integrations Launchpad for SRM:

Connector type support

SRM supports custom, pull, and push connectors. Pull connectors retrieve data from external sources, and push connectors send data from external sources to your instance.

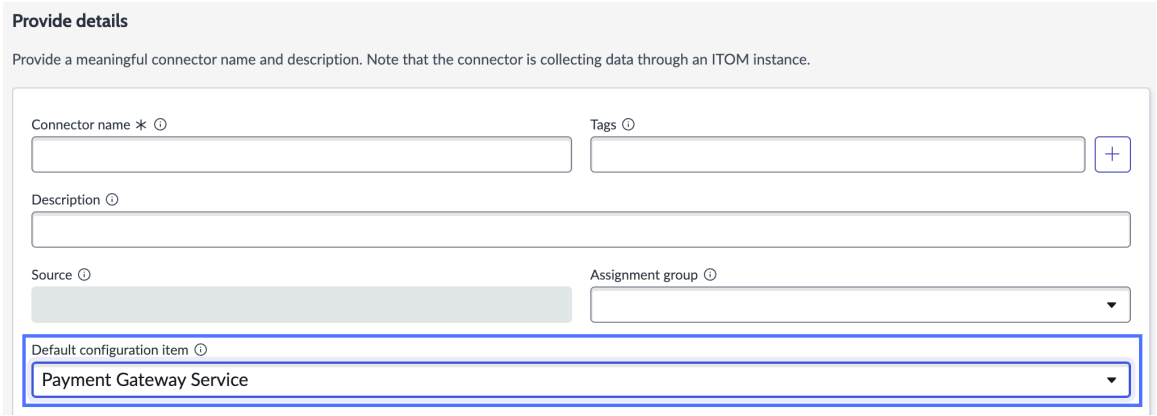
Note: For information about setting up connectors, see Integrations Launchpad in Service Operations Workspace for ITOM.

Configuration item field

When you set up an integration for SRM, the Provide details step has an additional field called Default configuration item.

Set this field to the service your integration monitors. If an incoming alert doesn't include service details, SRM uses this field to connect the alert to the relevant service. This field helps make sure that your teams receive alerts for the services they support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Learn more

Visit the following links to set up and manage integrations with the Integrations Launchpad. The pages are in a different section because the Integrations Launchpad is part of the broader Service Operations Workspace.

- Activate integration
- Configure a custom connector
- Configure a pull connector
- Configure a push connector
- Deactivate integration
- Delete integration

Edit SRM service details

Edit an existing service owned by your team. For each service that you support in SRM provide general information about the service and the SRM team that supports it.

Before you begin

Role required: srm_admin, srm_manager, or srm_responder

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select the **Services** icon ( ).
3. From your services list, select the service that you want to edit or update.
   To view and select a Technical Service Offering (TSO) without an assigned support group, remove all filters from the services list.
4. On the Overview page, select the **Details** tab.
5. Fill in or edit the fields.
   For more information on the field descriptions, see Edit service details form.
6. To save the updated service details after editing, select **Save**.

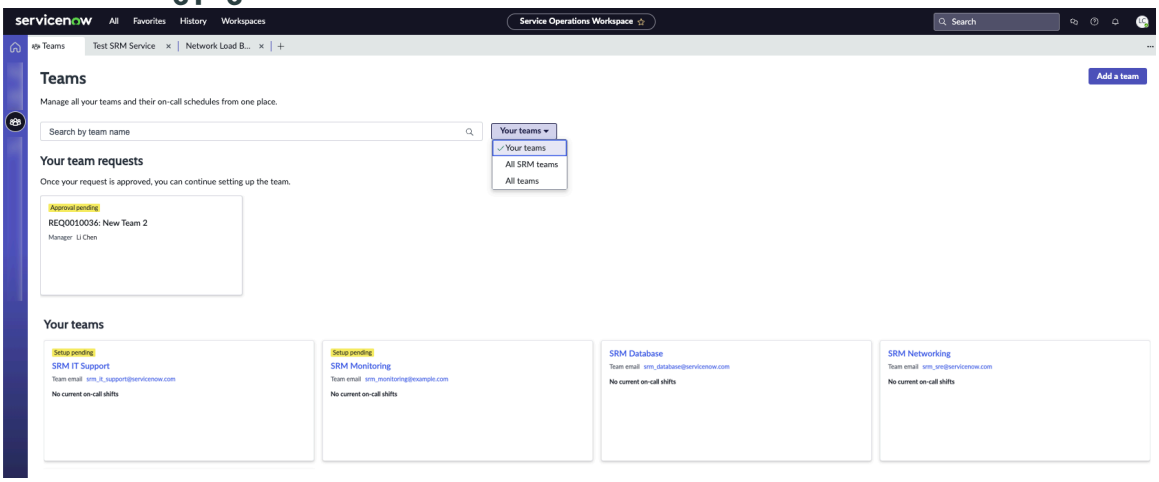
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Working with SRM teams

Manage schedules and define escalation policies for your team. That way, your team sees who is on call and accountable and can have the confidence that critical alerts or incidents are acknowledged in a timely manner.

On the Teams landing page, view and manage your teams and team requests.

Teams landing page



Search by team name among teams you belong to, all SRM teams, or all teams in your organization.

Your selection determines the cards that you're shown on the Teams landing page.

Choices are:

- **Your teams** (default)
- **All SRM teams**: All the SRM teams.

  Note: Your ability to take actions in each team depends on permissions for that team.

- **All teams**: All teams you have access to in your organization.

  Note: Your ability to take actions in each team depends on permissions for that team.

The Your team requests section contains team cards for any pending requests, if there are any.

The Your teams section contains cards that provide information about a specific team, such as the status of the team, name of the team, manager, team email, current shift name and duration, and primary responder. See Manage your SRM team details for more information.

Add an SRM team

Request to create a team to start monitoring your services. Teams are responsible for the issues that occur in the associated services.

Before you begin

Role required: srm_admin, srm_manager, or srm_responder

About this task

The ServiceNow system administrator can set up teams in your workspace using a different process. See Activate teams and services in SRM for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select **Teams** ( ), select **Add a team**.
3. Create a new team or add an existing one.

Option	Steps
Add a new team	**a.** In the **New or existing** field, select **I am creating a new team**. **b.** On the form, fill in the fields. For more information on the field descriptions, see Create team form. **c.** Select **Add team**.
Register an existing team	**a.** In the **New or existing** field, select **I want to give a group access to SRM app**. **b.** Select an existing team from the **Select team** list. **c.** Select **Add team**.

Result
When the request is approved, the team is created. Your team appears in the Teams landing page under **Your teams**.

What to do next
- Manage your SRM team details
- Set up escalation policies for your team in SRM
- Create an SRM on-call schedule
- Add team members to SRM
- Manage or add a service to your SRM team

Manage your SRM team details

Add or edit team members, description, contact information of you team.

Before you begin
Role required: Responder, Manager, or Administrator

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select the **Teams** icon ( ).
3. Select the team card whose details you want to update.
4. On the form in the **Details** tab, update the details as required.

Field	Description
Name	Unique name of the team.
Manager	Person who manages the team.
Group email	Email contact for the team that includes all team members.
Description	Description of the team that helps others to understand its responsibilities, purpose, or location.

5. Select **Save**.

Add team members to SRM

Add new team members to your team as required to plan, manage, resolve issues, and increase the efficiency of your business operations.

Before you begin

Role required: Manager, or Administrator

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select the **Teams** icon ( ).
3. Select the team card to open.
4. Select **Teams members** tab.
5. Select **Add**.
6. In the pop-up window select members to add from the list menu.

Note: Member details are imported from user records and not editable.

7. Select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage or add a service to your SRM team

Add a service to an incident to increase the amount of data for the incident.

Before you begin

Role required: Responder, Manager, or Administrator

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select the **Teams** icon ( ).
3. Select a team card to open any team you want to view or add a service to.
4. From the team page, select the **Services managed** tab.
   You can export the list of services. See Export list information to a file for more information.
5. **Optional:** Add a service to your team by selecting **Add**.
6. Add a new service or register an existing one.

Option	Steps
Add a new service	**a.** In the **New or existing** field, select **Create a new service in Service Reliability Management**. **b.** On the form, fill in the fields. For more information on the field descriptions, see Add service form. **c.** Select **Next**.
Register an existing service	**a.** In the **New or existing** field, select **Associate existing CMDB services to Service Reliability Management**. **b.** Select one or more services. **c.** Select **Next**.

7. In the Assign a team step, fill in the fields.
   - In the **Service owner** field, select the user who will own the services.
   - In the **Support Group** field, select a team that will monitor services.

   The service record has been added.
8. Finish setting up your service or do it later.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
Finish setting up your service	**a.** Select **Continue to setup**. **b.** Select **Add integrations** and connect your service to a data source to monitor events. **c.** Select **Add SLO & SLI** and create a service level objective and measure your service health with a service level indicator.
Do it later	Select **Do it later**.

See Edit SRM service details and Edit service details formfor information on the service and completion steps for setup.

Create an SRM on-call schedule

Set up an on-call schedule to make sure that someone is available to respond to incidents and critical alerts.

Before you begin

Before creating an on-call schedule, a team must exist in Service Reliability Management (SRM). The Alert table [em_alert] must also be added to the Trigger Rule Table Config list. See Add an SRM team and Add alert table to enable on-call scheduling for Service Operations Workspace for ITOM for more information.

Role required: srm_manager, srm_responder, or srm_admin

About this task

Shifts in SRM let you define variable time periods for your shift-based workforce. Create shifts for particular dates and times when you need coverage, and assign them to team members.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** > **Teams (** **)**.
2. On the Teams page, select your team.
3. Select the **Schedule** tab and then select **Create shift**.
4. In the Create new dialog, select either **Create new** or **Use template**.
   Your system admin can create predefined templates for you to use to create shifts.
5. Fill in the fields.
   For more information on the field descriptions, see Create a shift form in Service Reliability Management.
6. Select **Create shift**.

Set on-call team preferences in SRM

Set on-call preferences for team members to increase the efficiency of your business operations.

Before you begin

Role required: srm_manager or srm_admin

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select the **Teams** icon ( ).
3. Select the team card to open.
4. Select the **On-call team preferences** button.
5. On the form, fill in the fields.

Field	Description
On-call shift managers	Team managers for the on-call shift.
PTO requests	Requests for Paid Time Off (PTO) made by team members. Choices are: ○ System default (Not allowed) ○ With approval ○ Without approval ○ Not allowed
First day of the week	First day of your work week. **Note:** This option is available for Wash ington DC and later releases only.
Allow shift schedule overlap	Option to allow schedules to overlap
Escalation rule on shift overlap	Choices are: ○ System default (Escalate to all shifts) ○ Escalate to outgoing shift ○ Escalate to incoming shift ○ Escalate to all shifts

6. Select **Save**.

Set up escalation policies for your team in SRM

Set up an escalation policy for your team to ensure that alerts or incidents are resolved in a timely manner by the appropriate team member.

Before you begin

Before creating an escalation policy, you must create an on-call shift for your team.

Note: Only the responder who created the team or the manager of the team can set up an escalation policy for that team.

Role required: Responder, Manager, or Administrator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

An escalation policy is a set of guidelines that outlines how and when incidents should be elevated to higher levels of authority. It delineates clear procedures and responsibilities for escalation to help responders promptly address problems. It defines the order in which notifications should be escalated if an alert or incident isn't acknowledged or resolved within a defined amount of time. If no one responds, the escalation is based on your defined policies until someone responds. After a team member responds, the escalation policy stops escalating and no further notifications are sent.

Note: Escalation workflow is triggered only if there's an active shift.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select the **Teams** icon ( ).
3. Select the **Escalation triggers and policies** tab.
4. Under **Escalation policies** in the left panel, select **Create policy**.
5. On the Escalation policy form, fill in the fields.
   For more information, see Set up escalation policies form in SRM
6. **Optional:** Select **Add escalation step** to define the additional steps for escalation and escalation path.
   For more information on the Add escalation step form, see Set up escalation policies form in SRM.
7. Select **Save changes**.
8. **Optional:** Add another escalation policy to the team for another category of alert or incident by selecting **Add a policy**.

Create an escalation trigger for an SRM team

Define conditions that trigger a team's escalation policy in Service Reliability Management (SRM).

Before you begin

Role required: srm_manager or srm_admin

About this task

This procedure shows how to create escalation triggers in SRM. If your organization manages on-call scheduling using IT Service Management (ITSM), you can also use ITSM On-Call Scheduling to define escalation triggers. See Create an escalation trigger rule for more information. While that procedure lists ITSM roles, SRM users only need the srm_manager or srm_admin role to complete the task.

For a broader overview of escalation processes in ITSM, see Designing an escalation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The following procedure supports trigger conditions based on assignment group changes only. For trigger conditions based on other fields, a workaround is required. Contact ServiceNow Support about accessing KB1702299 in the ServiceNow Support Knowledge Base.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select the **Teams** icon ( ).
3. Select your team and then select the **Escalation triggers and policies** tab.
4. Under **Escalation triggers** in the panel, select **Create trigger**.
5. On the Escalation trigger form, fill in the fields.

Escalation trigger form

Field	Description
Escalation trigger name	Name of the trigger.
Order	Order of execution. When there are multiple escalation triggers in a team, the one with smaller order number is checked first.
Active	Option to activate or deactivate the trigger.
Conditions	Conditions for the trigger. Select a table and condition set. When conditions are met, escalation triggers are triggered for shifts in SRM team.

6. Select **Save**.

   You can also add support for escalation triggers to run on alerts instead of incidents. You can add up to 5000 events or 250 alerts per second stream. To add the on-call for alerts support, either run the XML on trigger_rule_table_cfg trigger table or create the record manually in the Trigger Rule Table Config page.

Working with SRM reliability tasks

Alerts, incidents, and change requests are reliability tasks. From creation to resolution, SRM helps you manage your alerts throughout the response life cycle.

The Reliability Tasks pane ( ) has several tabs:

- **Incidents** are created manually or based on Service Level Objectives (SLOs) and Service Level Indicators (SLIs). For more information on incidents, see Working with Incidents in SRM. For more information on SLO, SLI, and error budget actions, see Create SLOs, SLIs, and error budget policies.
- **Changes** can be created within SRM. See Manually create an SRM change task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

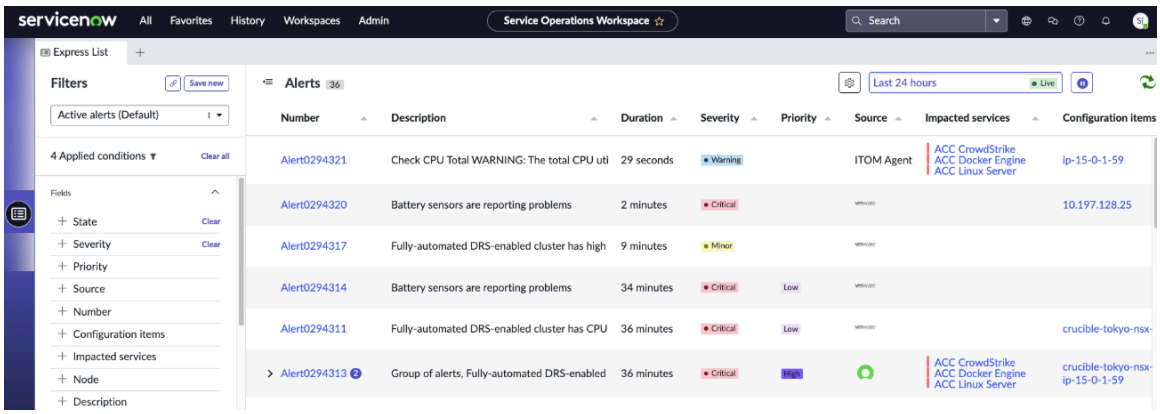
The Express List pane ( ) provides a focused view of alerts to help you monitor, evaluate, and resolve health issues efficiently. You can create alerts from SRM service pages or by using integrations. For more information on alerts, see Express List in the Service Operations Workspace for ITOM and Manually create an SRM alert.

Responders and above are notified for updates to reliability tasks based on their notification preferences.

Working with alerts in SRM

Monitor, evaluate, and resolve health issues in the Express List.

The Event Management Express List feature provides a customizable, sortable view for accessing and managing alerts. Use the Express List feature to prioritize alerts, understand their impact, and resolve issues faster.



As a Service Reliability Management (SRM) user, you automatically have the evt_team_operator role, which lets you access the Express List feature ( ). To learn more about that role, see Roles used by Express List.

Visit the following to work with alerts in the Express List feature:

- Acknowledge viewed alerts in Express List
- Assign alerts in Express List
- Close an alert in Express List
- Create an incident from an alert in Express List
- Monitor incoming alerts
- Place an alert in the Acknowledged state
- Place an alert in the Maintenance state

In SRM, integrations create alerts or you create alerts manually. Visit the following link to learn how to create an alert from the **Services** page:

Manually create an SRM alert

Create an alert for testing purposes or if you think an issue poses a risk.

Before you begin

Role required: srm_admin, srm_manager, or srm_responder

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. In the navigation pane, select **Services**.
3. Select the service that you want to trigger an alert for.
4. Select the **Related alerts** tab.
5. Select **Trigger alert** and fill out the **Trigger an alert** form.

   To trigger an alert, you must first create an event to get processed. Only **Service** is required.

Trigger an alert

Field	Description
Service	Select a service for the event.
Source	Manual.
Node	Enter the name of the node (for example, FQDN, IP address, or MAC address) associated with the event.
Type	Enter a type of event.
Resource	Enter a node resource (process or service) associated with the event.
Metric Name	Enter the name of the metric associated with the event.
Source instance	Enter a data source for the event.
Message key	Enter an identifier for multiple events related to the same event.
Severity	Select the expected impact of this event. Choices are: ○ Critical: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ Major: Major functionality is severely impaired or performance has degraded. ○ Minor (default): Partial, non-critical loss of functionality or performance degradation occurred. ○ Warning: Attention is required, even though the resource is still functional. ○ OK: The resource is still functional.
Time of the event	Select the date and time that the event occurred in the source system.
Description	Enter information describing the event.
Additional information	Add more information relevant to the event.
Processing notes	Enter relevant processing information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Trigger**.
   Service Reliability Management (SRM) creates an event to generate the alert. Refresh the screen to see the event processing results.

   Express List automatically displays your alert. If enabled, SRM triggers the applicable automations and on-call escalation workflows.

What to do next

Consider making the following optional adjustments to your alert for testing purposes or team collaboration:

- Acknowledge the alert or assign it to someone on your team.
- Add comments or work notes in the **Compose** panel.
- Add an attachment related to the alert using the attachment icon .

Working with Incidents in SRM

Plan ahead of service disruptions and have SRM send notifications and create status when incidents occur. Distractions are minimized and teams stay focused on remediation.

You can manually create incidents within SRM or create an error budget action to do so. See Manually create an SRM incident or Create SLOs, SLIs, and error budget policies for more information.

- Manual creation from an alert.
- Manual creation from the incident view.
- Automatically from Alert automations, if Alert automations are installed.

The **Assigned to** field on an incident specify who should be notified. When a team is selected as a responder, team automations are checked to determine which schedule to use for the notifications.

Note:

The **Assigned to** field is cleared when the **Assigned-team** or **Service** field is updated on an incident. Escalation policies for the newly assigned teams run. The field remains cleared until a user on the new team acknowledges an escalation notification.

If the Service is changed and the new Service does not have an assigned team, no changes occur.

When a service is deleted, its integrations, alerts, incidents, and automations are removed. Deleting a service isn't a recoverable action so consider deactivating the service instead.

Responders and above are notified for updates to incidents based on their notification preferences. If you made the update, you won't be notified.

You can resolve incidents by selecting specific incidents or in bulk. See Resolve an SRM incident, or Close an SRM incident or Cancel an SRM incident.

Note:

Incidents in the **Resolved** state are automatically closed after 3 days.

For more information on the areas and fields available in an incident, see SRM incidents.

Export list information to a file from the list view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Respond to an incident in the following ways:

- Tag an incident.
- Update the priority of an SRM incident.
- Set the state of the incident.
- Copy an SRM incident.
- Add a service to an SRM incident.
- SRM incidents.
- Resolve an SRM incident.
- Cancel an SRM incident.
- Close an SRM incident.
- Reopen an SRM incident.

Manually create an SRM incident

Create an incident if you think an issue poses a serious risk and should be taken care of as soon as possible.

Before you begin

Role required: Responder, Manager, or Administrator

About this task

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the Incidents tab.
4. Select **New**.
5. Fill in the fields on the Create New Incident form, as appropriate.

   Only the **Short Description** field is required.

Incident Field mapping

Field	Description
Short Description	Add brief description of the incident.
Description	Add detailed description of the incident.
Number	Identifier assigned to the incident.
Impact	Select is a measure of the effect of the incident. Impact affects **Priority**. Choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ 1 - High ○ 2 - Medium ○ 3 - Low
Assignment group	Select a team to work on the incident by typing or searching.
Priority	Automatically set based on **Impact** and **Urgency**. It identifies how quickly the incident should be addressed. See **Priority Data lookup rules** table below. Values are: ○ 3 - Moderate ○ 4 - Low ○ 5 - Planning
Category	Select a category for the incident. Choices are: ○ --None-- ○ Inquiry/Help (default) ○ Software ○ Hardware ○ Network ○ Database
Urgency	Select a measure of how long the resolution can be delayed until an incident has a significant business impact. Urgency affects **Priority**.
Service	Select a service associated with the incident.
Severity	Select a severity to associate with the incident by typing or searching. Choices are: ○ 1 - High ○ 2 - Medium ○ 3 - Low
Configuration item	Select a asset to associate with the incident by typing or searching.
Assigned to	Assign team member to work on the incident by typing or searching.
State	Choose a state for the incident. Choices are: ○ New (default) ○ In Progress ○ On Hold ○ Resolved ○ Canceled See SRM incident states for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Watchlist	Select individuals to watch the incident by typing or searching.
Resolution code	Select a resolution code when you have one. Choices are: ○ None (default) ○ Duplicate ○ Known error ○ No resolution provided ○ Resolved by caller ○ Resolved by change ○ Resolved by problem ○ Resolved by request ○ Solution provided
Resolution notes	Enter any relevant resolution information.

Note: Priority is calculated according to the following sample data lookup rules:

Priority Data lookup rules

Impact	Urgency	Priority
1 - High	1 - High	1 - Critical
1 - High	2 - Medium	2 - High
1 - High	3 - Low	3 - Moderate
2 - Medium	1 - High	2 - High
2 - Medium	2 - Medium	3 - Moderate
2 - Medium	3 - Low	4 - Low
3 - Low	1 - High	3 - Moderate
3 - Low	2 - Medium	4 - Low
3 - Low	3 - Low	5 - Planning

6. Select **Save**.
   The incident is created and the new incident form displayed.
7. Add an attachment related to the incident in the **Actions** panel using the **Attachments** icon .
8. Create an incident template using the Template icon .
9. Start or join a Zoom meeting, Microsoft Teams, or Slack channel in the **Collaboration** panel..
10. Select **Save**.
    The incident appears with comments, work notes, and incident activity captured in the **Activity** stream. For more information on incident fields, see SRM incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reassign an SRM incident

Reassign an incident to a responder when the incident tasks should be addressed by a particular team member.

Before you begin

This action is available when the **Assigned to** field in the incident is populated.

Role required: Responder, Manager, or Administrator

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Incidents** tab.
4. You have two options.

Option	Description
Option	Description
In the incident list view	Double-click the **Assigned to** field for the inci dent and replace the team member from the list menu.
In the Details tab of incident form	Delete the name in the **Assigned to** field and reassign. Select **Save**.

   The incident is now assigned to the new responder and an email notification sent. The assignee is displayed in the list view and on the form.

Update the priority of an SRM incident

If the priority of an incident should be changed, you can manually update it to reflect its new criticality.

Before you begin

Role required: Responder, Manager, or Administrator

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the **Incidents** tab.
4. In the Incident list view, select a **Priority** value from the list menu.
   - 1 - Critical
   - 2 - High
   - 3 - Moderate
   - 4 - Low
   - 5 - Planning (default)
5. Select **OK**.
   The new priority is reflected in the incident list view and incident header and form field.

Add a service to an SRM incident

Add a service to an incident to increase the amount of data for the incident.

Before you begin

Role required: Responder, Manager, or Administrator

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. You have two options.

Option	Description
In the incident list view	Double-click the **Service** field for the incident and replace the team member using search. Select **OK**.
In the incident form	Select a new **Service** value from the list menu. Select **Save**.

   For value choices see SRM incidents.
   The new service is displayed in the incident list view and incident form.

Add resolution code and notes to an SRM incident

Add a resolution code and notes to an incident when you have resolved the incident.

Before you begin

Role required: Responder, Manager, or Administrator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Open the incident.
4. In the Incident **Details** panel, select a **Resolution code** from the list menu.
5. Enter text in the **Resolution notes** text box.
   The resolution notes are displayed in the **Activity** timeline panel.
6. Select **Save**.

Copy an SRM incident

Copy an incident, if you have a similar issue.

Before you begin
Role required: Responder, Manager, or Administrator

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Open the incident you want to copy.
4. Using the list menu under the More option button, select **Copy incident**.
5. Select a team member from the list menu for the **Caller** field.
   After the incident is copied, the **Activity** timeline of the new incident is updated with the original incident as a work note.

Resolve an SRM incident

Resolve an incident, if you need it reviewed, or you think it has already been handled, but aren't ready to close it.

Before you begin
Role required: Responder, Manager, or Administrator

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Incidents** tab.
4. You have two options.

Option	Steps
In the incident list view	**a.** Double-click the **State** field (or use the key board shortcut) for the incident and select from the list menu. **b.** Select **OK**.
In the incident form	**a.** Select a new **State** field value from the list menu. **b.** Select **Save**.

For value choices, see SRM incidents.
The new state is displayed in the incident list view and incident form and form header.

Result
Resolved incidents remain in the Incidents list view. Check your filters if you don't see them.

Note:

When you resolve an incident, the related alerts remain open until you close the incident.

Cancel an SRM incident

Close an incident, if you think it is not an issue, or if it has already been handled.

Before you begin
Role required: Responder, Manager, or Administrator

Procedure
1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
You're taken to your SRM Home page.

Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Open the incident you want to cancel.
4. You have two options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
In the incident list view	**a.** Double-click the **State** field (or use the key board shortcut) for the incident and select from the list menu. **b.** Select **OK**.
In the incident form	**a.** Select a new **State** field value from the list menu. **b.** Select **Save**.

For value choices, see SRM incidents.
The new state is displayed in the incident list view and incident form and form header.

Result
Canceled incidents remain in the Incidents list view. Check your filters if you don't see them.

Note:

When you cancel an incident, the related alerts are closed.

Close an SRM incident

Close an incident, if you think it is not an issue, or if it has already been handled.

Before you begin
Role required: Responder, Manager, or Administrator

Procedure
1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. You have two options.

Option	Steps
In the incident list view	**a.** Double-click the **State** field (or use the key board shortcut) for the incident and select from the list menu. **b.** Select **OK**.
In the incident form	**a.** Select a new **State** field value from the list menu. **b.** Select **Save**.

For value choices, see SRM incidents.
The new state is displayed in the incident list view and incident form and form header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Closed incidents remain in the Incidents list view. Check your filters if you don't see them.

Note:

When you close an incident, any related alerts are closed.

Reopen an SRM incident

Reopen a closed incident if you think the issue is not yet resolved.

Before you begin
Role required: Responder, Manager, or Administrator

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Find and open the incident you want to reopen.
   Check your filters if you don't see them.
4. You have two options.

Option	Steps
In the incident list view	**a.** Double-click the **State** field (or use the key board shortcut) for the incident and select from the list menu. **b.** Select **OK**.
In the incident form	**a.** Select a new **State** field value from the list menu. **b.** Select **Save**.

   For value choices, see SRM incidents.
   The new state is displayed in the incident list view and incident form and form header.

Manually create an SRM change task

Create a change task to implement a controlled process for modifying approved and supported actions for SRM.

Before you begin
For general information on Change requests, see Using Change Management .

Role required: Responder, Manager, or Administrator

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select **Reliability tasks** ( ).
3. Select the **Changes** tab.
4. Select **New** from the **Changes** list header.
5. In the **Select a change** window, search for a change record or select an SOW change creation page card to select the type of change request.
6. Select **Next**.
7. In the form Details tab, fill in the fields on the **Change request**, **Impact**, **Assignment**, **Planning**, **Schedule**, **Notes**, and **Closure information** forms.
   For more information, see Create change request forms.
8. **Optional:** Select **Assign to me**.
9. Select **Save**.

   The change request is created and a **Related Records** tab appears for the request.
10. **Optional:** You can take the following steps in **State** workflow.

    (Optional) If the change request requires approval, you'll see the **Request approval** button. Select **Request approval** and **State** moves to **Assess**. See Approve a change request for SRM for instructions on approving a change request.

    If the change request is pre-approved or doesn't require approval, you can move the **State** to **Scheduled**.

    Once approved and scheduled, you can select **Implement** to put the change request into action.

    Once implemented, you only after reviewing the details on the change request, select Review. The change request is moved to the **Review** state.

    Note: All open change tasks are set to **Canceled**.

    For more information on **State** in Change requests, see, SRM change request states

Service Reliability Management reference

Reference topics provide additional information about administering Service Reliability Management.

SRM roles and responsibilities

Roles grant users access to different parts of the SRM console. Roles determine the actions that users can or can't perform in Service Reliability Management.

SRM has the following predefined roles:

Note: The SRM experience was optimized for you to having just the SRM roles. Additional roles could change the UI and have unintended consequences.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles List

Role	Tasks
SRM Administrator [srm_admin]	• Update a service managed by any SRM team • Assign new incidents • Create and edit incidents • Create and edit changes • Create teams • Update any SRM team • Create and edit on-call shifts • Delete on-call shifts • Create and edit escalation policies and triggers • Delete escalation policies and triggers • Schedule coverage request • Submit time off • Create event
SRM Manager [srm_manager]	• Update a service managed by your SRM team • Assign new incidents • Create and edit incidents • Create and edit changes • Create teams • Update SRM teams that you manage • Create and edit on-call shifts • Delete on-call shifts • Create and edit escalation policy and trigger • Delete escalation policies and triggers • Schedule coverage request • Submit time off • Create event
SRM Responder [srm_responder]	• Update a service if you are in the support group tied to the service • Assign new incidents • Create and edit incidents • Create and edit changes • Create teams

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles List (continued)

Role	Tasks
	• View on-call shifts • View escalation policies and triggers • Edit contact preferences • Schedule coverage request • Submit time off • Create event
Administrator [admin]	• Update a service managed by your SRM team • Delete services • Assign new incidents • Create and edit incidents • Create and edit changes • Delete incidents • Create teams • Update SRM teams that you manage • Delete on-call shifts • Override contact preferences • Manually create an alert • Delete alerts • Submit time off

Create team form

Request to create a team to start monitoring your services.

Create a team form

For more information, see Add an SRM team.

Field	Description
Team name	Name the team.
Team manager	Manager for the team.
Team email	Email contact for the team.
Team members	Members for your team.
Tags	Words that describe or relate to your team.
Briefly describe the team responsibilities	Description of your team. For example, team responsibilities or geographic location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a shift form in Service Reliability Management

Set up an on-call schedule for your team to ensure that the right person is always available to quickly respond to incidents and critical alerts.

Create a shift form

For more information, see Create an SRM on-call schedule.

Create new shift

Field	Description
Shift name	Name for the shift.
All day shift	If selected, the shift is an all-day commitment.
Shift starts	Date and time the shift begins.
Shift ends	Date and time the shift ends.
Repeats	Shift repetition. Choices are: • Never • Daily • Weekly
Every	How often to repeat. Display depends on the time frame chosen.
More options	More options to customize your schedule.
Timezone	User time zone.
Holiday schedule	Schedule to use for the holiday.
Repeats until	Date and time to end repetition.

Create shift using shift template

Field	Description
Shift name	Name for the shift.
Template/Schedule	Existing templates for shifts. Choices are: • 24 x 7 • Off hours (workday 8:00 - 5:00) • Off hours (workday 9:00 - 5:00) • Workday 8:00 - 5:00 • Workday 9:00 - 5:00

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add service form

Create or add an existing service to your instance so that alerts and incidents on that service are available to your teams within SRM.

Add a service form

For more information, see Add a service to SRM.

Add services for your teams

Field	Description
Service name	Enter a name for your service. For example, Cloud storage service. Your teams see this name in SRM.
Service class	Select either application service or technical service.
Business criticality	Specify how important the service is to the business: • 1 - most critical • 2 - somewhat critical • 3 - less critical • 4 - not critical
Operational status	Select the status of your service: • Operational • Non-operational • Repair in Progress • DR Standby • Ready • Retired • Pipeline • Catalog
Short description	Describe your service to help your teams understand its purpose and other relevant information.

Edit service details form

Edit an existing service owned by your team.

Service Details form

For more information, see Edit SRM service details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Name of the service.
Support group	SRM team managing the service.
Business criticality	How important this service is the business.
Owned by	Service owner. May not be part of an SRM team.
Operational Status	Status for the service's ability to perform operational functions.
Stakeholders	Product owners or service consumers who determine the target availability of a service.
Environment	Choices are: • None • Development • Production • Test
Managed by group	Team manager responsible for the service. Add by search or edit using the text editor.
Change group	Team responsible for changes. Add by search or edit using the text editor.
Status	Status of the service.
Life Cycle Stage	Choices are: • Deploy • Design • End of Life • Ideation • Operational
Phase	Phase of the service. Choices are: • None • Pipeline • Catalog • Retired
Location	Address where the service resides. Add by search or edit using the text editor.
Used for	Purpose for the service. Choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Production (default) • Staging • QA • Test • Development • Demonstration • Training • Disaster recovery
Short description	Additional information about the service.
Support by	SRM team managing the service. Add by search or edit using the text editor.

Set up escalation policies form in SRM

Escalation policies define the order and conditions in which members or devices receive notifications.

Escalation policy form

Field	Description
Name	Name of the escalation policy.
Active on shift	Team that receives the notifications on their shift..
Create from scratch	Option to create your own policy.
Create from template	Option to create a policy by using a template created by your admin.
Description	Text describing the policy.
Active	Option to activate or deactivate the policy.
Use as default	Option to use this team as the default
Order	Order of execution. This is the hierarchy or chain of command. When there are multiple escalation policies with the same conditions for a team, the escalation policy with the smaller order number is executed first.
Conditions	Conditions for the policy. The table and conditions that define the escalation policy These conditions are checked after the escalation is started by an escalation trigger. If the conditions are met, the policy is run.
Escalation steps	Escalation steps to add. See the Escalation steps form for more information about the fields.
Escalation notifications	Notification conditions for the policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: When user preference override is on, your escalation policy overrides any policy that the on-call agents set for their own notification preferences. When user preference override is off, the on-call agents' notification preferences take priority over this escalation policy.
Add notification step	Additional notification steps to add. You can select email, call, or SMS. You can add as many attempts as you like.

Escalation steps form

Add escalation step

Field	Description
Escalation step name	Name of the escalation step.
Order	Order of execution. This is the hierarchy or chain of command.
Responder level	Level of authority or expertise needed to respond to the incident.
Rotate through members	Option to notify all members, one by one, until one of them acknowledges the incident or until all of them are notified.
Additional audience	Specific users, teams, groups, or devices that you want to notify.
Time to next step after last notification	The maximum amount of time that will pass before the issue is escalated to the next step. For example, if a responder can't resolve the issue within 30 minutes of the notification, the issue is escalated to the manager.

Domain separation and SRM

Domain separation is supported for Service Reliability Management (SRM).

Support level: Basic*

The support level is Basic but has some exceptions or special conditions.

- Business logic: Ensure that data goes into the proper domain for the application’s service provider (SP) use cases.
- The user interface, cache keys, reporting, rollups, and aggregations all use the domain at production run time.
- The owner of the instance must be able to set up the application to function across multiple tenants.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample use case: When an SP uses chat to respond to a tenant-customer's message, the client must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview of domain separation

- Domain separation is present in all metadata tables in the application. Instance level tables also have domain separation explicitly. Other internal tables, such as the internal Team Request table, are domain-separated implicitly by referencing domain-separated records.
- System properties are not domain-separated, which has implications for Team Management features. The properties are shared by multiple domains and are set at the instance level. Domain-specific setup for these is not supported.
- Where another application is being leveraged (for example the Event Management Connectors) domain separation is determined by the domain-separation capabilities of that application.

How domain separation works in the Service Reliability Management application

The specific conditions indicated by the Basic* support level rating above relate to team management:

- New teams created through a catalog item backed by an Integration Hub flow are setup by the Service Operations Workspace administrator. They can initiate it from the Service Portal. An SRM admin, manager or responder can do it through the SRM workspace. Instructions appear in the SRM documentation.
- Integration Hub subflows and actions control management of SRM teams.
- Only one catalog item and flow can be set up for each instance. The customer is responsible for setting up team properties to support domain separation as a customization of the existing flows.
- The requestor of a team catalog item is associated with the domain and is available as part of the request item. As a result, if needed, the requester can create the team in a specific domain or the catalog Item and extend it to capture the domain another way. In either case, the Service Operations Workspace must make changes to the Integration Hub flows and actions to support this.

For more information, see Domain separation and On-Call Scheduling.

Domain separation for service providers

Create change request forms

Fill out the fields in the forms to create a change task to implement a controlled process for modifying approved and supported actions for SRM.

Change request form

Create a new change request. For more information, see Manually create an SRM change task.

Field	Description
Short description	Brief description of the change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Description based on Short description.
Number	Identifier for the change request.
Category	Category for the change request. Choices are: • Hardware • Software • Service • System Software • Application Software • Network • Telecom • Documentation • Other (default)
Model	Model to use for the change request. Standard (default)
Risk	Risk the issue poses. Choice are: • High • Moderate (default) • Low
Type	Type of change request. Standard (default). Read-only.
Impact	Impact the issue poses. Choices are: • 1 - High • 2 - Medium • 3 - Low (default)
State	State of the change request. Choices are: • New (default) • Assess If approval is required further states are unavailable. • Scheduled

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Implement • Canceled
Work notes list	Team members to receive notifications when work notes are added. **Note:** An administrator must have already created an email notification for the work notes list for this to be available.
Work notes	Any additional information related to the request.

Impact, Assignment, Planning, Schedule, Notes, and Closure information

Field	Description
Configuration item	Asset affected by the issue.
Service	Service affected by the issue.
Service offering	Service offering affected by the issue.
Assignment group	Team assigned to the change request
Assigned to	User assigned to the change request.
Justification	Reasoning for the change request.
Implementation plan	Imported text.
Risk and impact analysis	Analysis of risk and impact of the issue.
Backout plan	Imported text.
Test plan	Imported text.
Planned start date	Expected date to begin change.
Planned end date	Expected date to finish change.
Actual start date	Date change implementation began.
Actual end date	Date change implementation ended.
Conflict status	Not run. Read-only.
Conflict last run	Based on Conflict status. Read-only
Watch list	Interested users.
Work notes list	Team members to receive notifications when work notes are added. **Note:** An administrator must have already created an email notification for the work notes list for this to be available.
Additional comments	Additional notes for the request.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Work notes	Additional notes on the work done for the request
Close code	Code for the change request. Choices are: • None (default) • Successful • Successful with issues • Unsuccessful
Close notes	Notes on the change request closure.

SRM incident states

Incidents can be in a few different states depending on how they are acted on.

An incident is created in SRM when a third-party monitoring tool has an event. Incidents can be manually created or assigned. Edit actions from the incident form using the state button in the form. Use the **Save** button in the form to keep any changes you've made. Changes to incidents in the list view are automatically saved.

Incident states

State	Description
New	State on incident creation. The incident is logged but not yet worked on.
In Progress	The incident is assigned being worked on.
On Hold	The responsibility for the incident shifts temporarily to another entity to provide further information, evidence, or a resolution.
Resolved	A satisfactory fix is provided for the incident to ensure that it does not occur again.
Closed	The incident is closed when it is confirmed that the incident is satisfactorily resolved.
Canceled	Incident was triaged but found to be a duplicate incident, an unnecessary incident, or not an incident at all. To reopen an incident. Select **New**.

SRM alert states

Alert can be in a few different states depending on how they are acted on.

An alert is created in SRM when a third-party monitoring tool has an event. Alerts are manually assigned. An alert is one of four states. You can edit actions from either the Alerts list or the Alert form. Use the **Save** button in the form to keep any changes you've made. Changes to Alerts in the list view are automatically saved.

Note: You can acknowledge and assign an alert in any state.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert actions

State	Description
Open	State on alert creation. From this state you can acknowledge and set to: **Flapping** Flapping occurs when the event source continues to generate events even after its associated alert has been closed. See Configure alert flapping for more information on event flapping. **Closed** Closes the alert.
Reopen	From this state you can acknowledge and set to: **Open** Sets the alert to the **Open** state. **Flapping** Flapping occurs when the event source continues to generate events even after its associated alert has been closed. **Closed** Closes the alert.
Flapping	Flapping occurs when the event source continues to generate events even after its associated alert has been closed. From this state you can set to: **Open** Sets the alert to the **Open** state. **Reopen** Reopens the alert. **Closed** Closes the alert.
Closed	From this state you can set to: **Open** Sets the alert to the **Open** state. **Reopen** Reopens the alert. **Flapping** Flapping occurs when the event source continues to generate events even after its associated alert has been closed.

SRM change request states

Incidents can be in a few different states depending on how they are acted on.

Change requests can be manually created in SRM. Edit actions from the change request form using the state field in the form or using buttons in the change request record. Use the **Save**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

button in the form to keep any changes you've made. Changes to change requests in the list view are automatically saved.

Change request states

State	Description
New	State on change request creation. The request is logged but not yet worked on.
Assess	The change request approval is being worked on.
Scheduled	The change request is scheduled for work.
Implement	The change request is taking action.
Review	The change request is moved to the **Review** state. **Note:** All open change tasks are set to **Canceled**.
Closed	The change request is closed.
Canceled	Change request was triaged but found to be a duplicate, or unnecessary. **Note:** You cannot reopen a canceled changed request.

CMDB service classes

Service Reliability Management typically supports several Configuration Management Database (CMDB) service classes.

Types of CMDB service classes that Service Reliability Management support:

- Service instances (cmdb_ci_service_auto)
- Technical services (cmdb_ci_service_technical)
- Query-based services (cmdb_ci_query_based_service)
- Mapped application services (cmdb_ci_service_discovered)
- Calculated application services (cmdb_ci_calculated)
- Tag-based application services (cmdb_ci_service_by_tags)

ITOM Mobile Agent

Stay connected and keep services reliable with ITOM Mobile Agent, which lets you access Service Reliability Management (SRM) features on iOS and Android devices. Use it to track alerts, manage incidents, work on change and catalog tasks, and manage on-call shifts on the go.

ITOM Mobile Agent overview

Use ITOM Mobile Agent to access Service Reliability Management (SRM) features on iOS and Android devices. With ITOM Mobile Agent, you can track alerts, manage incidents, and work on change and catalog tasks on the go. You can also manage on-call schedules by checking shifts, requesting time off, and filling scheduling gaps.

To help you manage service reliability in one place, ITOM Mobile Agent auto-integrates with existing ServiceNow mobile apps. It runs in the ServiceNow Agent app and automatically includes ITSM Mobile Agent features. With that setup, you can manage alerts, incidents, on-call schedules, and tasks in one mobile app.

Note: If you already use ITSM Mobile Agent for incidents, on-call schedules, and tasks, install ITOM Mobile Agent to add alerts to your mobile experience. With ITOM Mobile Agent, you get and configure alert notifications and view alerts in the My work, My team, and Notifications tabs. See Install ITOM Mobile Agent for installation instructions.

ITOM Mobile Agent users

The following table lists user roles and what each user can do in ITOM Mobile Agent:

User	Description
Admin	Admins install ITOM Mobile Agent so teams can access service reliability features on the go.
SRM admin	SRM admins customize alert and incident notifications for ITOM Mobile Agent. They make sure that the relevant people are aware of critical issues.
SRM manager	SRM managers track team progress, monitor unassigned issues, and review performance metrics. They also handle on-call schedules, including shift rescheduling, time-off requests, and scheduling gaps.
SRM responder	SRM responders manage alerts, incidents, and tasks on the go. They accept, assign, and close alerts; create and collaborate on incidents; and process critical issues. They can also view upcoming shifts and request time off.

ITOM Mobile Agent workflow

This sample workflow shows how ITOM Mobile Agent helps you manage services and the teams assigned to them:

1. Monitoring tools generate critical alerts when they detect issues, and the ITOM Mobile Agent system sends mobile alert notifications to on-call responders.
2. As an on-call SRM responder, you acknowledge, reassign, or close the alerts. If needed, you create incidents from the alerts, and then the ITOM Mobile Agent system assigns them to the appropriate team.
3. You troubleshoot and collaborate on incidents, escalating them to major incidents when necessary, and then resolve and close the incidents, providing relevant details as needed.
4. As an SRM manager, you adjust shifts, approve time-off requests, and resolve scheduling gaps for the on-call responders. Use dashboards to view alert trends, incident resolution times, and team performance.

ITOM Mobile Agent benefits

Working with ITOM Mobile Agent has the following benefits:

Improve service reliability

Minimize downtime by managing alerts and incidents on the go.

Respond to issues faster

Keep on-call engineers connected, letting them accept, assign, and close alerts from anywhere.

Notify the right people

Customize push notifications to make sure that the relevant people are aware of critical issues.

Boost collaboration

Help teams work efficiently by managing on-call schedules and filling coverage gaps on mobile.

What to explore next

To learn more about configuring and using ITOM Mobile Agent, see:

- Configuring ITOM Mobile Agent
- Using ITOM Mobile Agent
- ITOM Mobile Agent reference

Configuring ITOM Mobile Agent

Set up and configure ITOM Mobile Agent.

Configuration overview

Use the pages in this section to set up and configure ITOM Mobile Agent. The information covers required and optional setup steps, including installing the app, managing alerts, and customizing alert recipients.

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, so you can manage alerts, incidents, and on-call schedules from the same mobile app. Where relevant, this section links to ITSM Mobile Agent content, providing additional configuration options for your mobile experience.

Required configuration steps

If you're an admin, start by installing ITOM Mobile Agent. If you're a Service Reliability Management admin, manager, or responder, you can start by downloading the ServiceNow Agent app and then logging in.

- Install ITOM Mobile Agent
- Download the ServiceNow Agent app
- Log in to ITOM Mobile Agent

Optional configuration steps

After you log in to ITOM Mobile Agent, you can work with the core features. Visit the following links to configure and customize ITOM Mobile Agent further to meet your team's needs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configure when to send alert notifications for ITOM Mobile
- Customize ITOM Mobile Agent email recipients
- Customizing other mobile settings for ITOM Mobile Agent

Install ITOM Mobile Agent

Install and give your teams access to ITOM Mobile Agent.

Before you begin

Service Reliability Management (SRM) services, service integrations, teams, and on-call schedules must be set up. ITOM Mobile Agent connects to your existing SRM setup, helping your teams manage alerts, incidents, tasks, and on-call schedules.

Role required: admin

About this task

ITOM Mobile Agent runs in the ServiceNow Agent app. When you install ITOM Mobile Agent, your teams can access it in the ServiceNow Agent app on their devices.

This procedure is for admins managing mobile access for their teams. If you aren't an admin and want to use ITOM Mobile Agent on your mobile device, see Download the ServiceNow Agent app.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Search for and select ITOM Mobile Agent.
   If you can't find ITOM Mobile Agent, request it from the ServiceNow Store.
3. Review the listed dependencies and, if needed, install the required plugins and applications.
4. Select **Install**.

   After the application is installed, your teams can access ITOM Mobile Agent by downloading the ServiceNow Agent app and logging in to the relevant instance.

What to do next

To start using ITOM Mobile Agent, see Download the ServiceNow Agent app and Log in to ITOM Mobile Agent.

You can also customize ITOM Mobile Agent to meet your team's needs:

- Configure when to send alert notifications for ITOM Mobile
- Customize ITOM Mobile Agent email recipients
- Customizing other mobile settings for ITOM Mobile Agent

Download the ServiceNow Agent app

Download the ServiceNow Agent app to use ITOM Mobile Agent on your device.

Before you begin

ITOM Mobile Agent must be installed. See Install ITOM Mobile Agent for more information.

Role required: srm_manager, srm_responder, or srm_admin

About this task

The ITOM Mobile Agent application runs in the ServiceNow Agent app. To access ITOM Mobile Agent, download the ServiceNow Agent app on your device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Download the ServiceNow Agent app for your device:
   - For iOS, use the App Store.
   - For Android, use Google Play.
2. Confirm that the app is on your device.

   Look for the ServiceNow Agent app icon ( ). The app appears on your device with the name Agent.

What to do next

To start using ITOM Mobile Agent, see Log in to ITOM Mobile Agent. You must log in to receive push notifications about alerts and incidents.

Log in to ITOM Mobile Agent

Log in to your ITOM Mobile Agent instance on the ServiceNow Agent app to manage alerts, incidents, and on-call schedules on the go.

Before you begin

ITOM Mobile Agent must be installed, and the ServiceNow Agent app must be downloaded on your device. See Install ITOM Mobile Agent and Download the ServiceNow Agent app for more information.

You must also have your instance address, for example `nebula-dev.service-now.com`, or a QR code for the instance. If you don't have one, contact your admin.

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Tap the ServiceNow Agent icon ( ) on your device.
2. Enter the address of your instance manually or with a QR code.

Option	Description
Manual entry	Replace `example.service-now.com` with the address of your instance. You don't need to include `service-now.com`. For example, enter `nebula-dev` for `nebula-dev.service-now.com`.
QR code	Tap the QR code icon and scan the QR code.

3. **Optional:** In the **Nickname** field, enter an alternative name for your instance.
   Alternative names can help you quickly navigate between different instances on your device.
4. Tap **Save and log in**, enter your credentials, and then tap **Log in**.
   The app displays `Logged into <instance-name> as <username>` and the ITOM Mobile Agent **My work** tab.

> **Note:** You must be logged in to get push notifications about alerts and incidents. If you aren't, you only get email notifications.

What to do next

Visit these links to start using ITOM Mobile Agent:

- Work with alerts in ITOM mobile
- Managing incidents and major incidents on mobile
- Working with On-Call Scheduling on mobile
- Working with tasks on mobile

Configure when to send alert notifications for ITOM Mobile

Keep your teams informed by configuring when ITOM Mobile Agent sends a notification about an alert.

Before you begin

Role required: admin

About this task

By default, ITOM Mobile Agent sends a push notification and email when an alert meets these conditions:

- **Assigned to is empty** - The alert isn't assigned to anyone.
- **State is not Closed** - The alert state isn't closed. It's either empty, flapping, open, or reopen.
- **Severity is Critical** - The alert severity is critical. It isn't clear, empty, OK, major, minor, or warning.

You can update those conditions as needed. For example, the ITOM Mobile Agent app can send notifications for both critical and major alerts. However, if you customize the conditions, the conditions don't receive future release updates. That behavior is intentional to avoid overwriting your work.

Note: To get push notifications, you must log in to ITOM Mobile Agent. If you log out, you only get email notifications.

This procedure is for admins configuring alert push notifications and emails. To manage other notification features, see Customizing other mobile settings for ITOM Mobile Agent.

Procedure

1. Navigate to **All** > *Mobile App Builder*.
2. Search for and select **ITOM Mobile Agent**.
3. Select **Mobile notifications**.
4. In the **When to send** section, update or add to the assigned to, state, and severity conditions. For example, adding the condition **OR [Severity][is][Major]** under the condition **[Severity][is][Critical]** sends a push notification and email when the **Severity** field of an alert is Critical or Major.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Implement your changes by selecting **Save**.
   The page displays `Your changes have been saved.`

What to do next

To customize who receives emails about alerts, see Customize ITOM Mobile Agent email recipients. You can also customize other notification features, such as setting custom notification tones and overriding the Do Not Disturb setting for critical issues. See Customizing other mobile settings for ITOM Mobile Agent for more information.

Customize ITOM Mobile Agent email recipients

Customize who receives emails about alerts to help reduce notification overload and efficiently delegate responsibilities.

Before you begin

Role required: srm_admin or admin

About this task

By default, ITOM Mobile Agent sends emails about alerts to everyone in a team's group email. You can customize the email recipients as follows:

- Exclude managers from alert emails, reducing notification overload.
- Include individual team members on alert emails, making sure that the right people stay informed.

Procedure

1. Navigate to **All** > **Service Reliability Management** > **Teams**.
2. In the list, find the team that you want to customize.
3. Choose one or more options to include or exclude certain recipients from email alerts.

Option	Instruction
Exclude managers from alert emails	In the **Exclude manager** column, set **false** to **true**.
Include individual team members on alert emails	In the **Include members** column, set **false** to **true**.

4. Save your changes by selecting the check mark.
   Your updates appear in the **Teams** list, and ITOM Mobile Agent sends emails accordingly.

Customizing other mobile settings for ITOM Mobile Agent

Learn how to customize your mobile experience further. Configure actionable notifications, set custom notification tones, and override the Do Not Disturb setting for critical issues to help your teams stay informed.

Explore other settings

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Visit the following ITSM Mobile Agent documentation to learn about customizing mobile notifications.

- Configurable actionable notifications for ITSM Mobile Agent
- Enable Push notification categories for ITSM Mobile Agent

- ITSM Mobile email notification redirection via web
- Set custom alert tones in ITSM Mobile Agent for different incident priority
- Enable Override do not disturb to receive critical alerts

Using ITOM Mobile Agent

Work with alerts, incidents, on-call schedules, and tasks on the go.

ITOM Mobile Agent tasks

Work with alerts in ITOM mobile

Manage alerts on the go. Learn how to assign, reassign, and close alerts in ITOM Mobile Agent. You can also add work notes to alerts and create incidents from alerts.

Add work notes to an alert

Add work notes to an alert to update your team, share important information, and document your actions.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the More options icon ( ).
4. Select **Add work notes** and enter your notes.
5. Save and add your notes to the alert by tapping **Submit**.

ITOM Mobile Agent displays `Success! Comments added`. The assigned team member also receives a push notification that the alert has had comments added.

To view an alert's work notes on mobile, navigate to the alert and select the **Activity** tab.

Assign an alert

Assign an alert to make sure the correct team member acts on it. You can assign an alert to yourself.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the More options icon ( ) and select **Assign alert**.
4. Tap **Assigned to** and select a team member to assign the alert to.
5. Implement your changes by tapping **Submit**.

The assigned team member receives a push notification that the alert has been assigned to them. The alert also appears in their **My work** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Close an alert

Close an alert to show that the issue is resolved or that no further action is needed.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the **More options** icon ( ) and select **Close alert**.

ITOM Mobile Agent displays Alert closed successfully. The alert no longer appears in the assigned team member's **My work** tab.

To view closed alerts that were assigned to you, tap **My work** and then tap **See all** in the My Alerts section. The **Closed** tab shows your closed alerts.

Create an incident from an alert

Create an incident when an alert signifies a critical issue that disrupts or could disrupt your system.

When you create an incident from an alert, ITOM Mobile Agent assigns the incident to the same team but not the same responder. For example, if the alert is assigned to the Network Ops team and responder Alex, the incident is assigned to the Network Ops team.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the **More options** icon ( ) and select **Create incident**.

ITOM Mobile Agent displays a notification similar to `INC0013579 was created from Alert0002468`. You can view the incident in the **My team** tab. For more information about managing incidents in ITOM Mobile Agent, see Managing incidents and major incidents on mobile.

Note: If you don't see the option to create an incident from an alert, make sure that the alert is assigned to a team. To assign the alert to a team, see Assign alerts in Express List. In the Express List, teams are also known as assignment groups.

Reassign an alert

Reassign an alert to make sure the correct team member or an available team member acts on it. You can reassign an alert to yourself.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the **More options** icon ( ) and select **Reassign alert**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Tap **Assigned to** and select a team member to reassign the alert to.
5. Implement your changes by tapping **Submit**.

ITOM Mobile Agent displays Alert reassigned successfully. The assigned team member receives a push notification and the alert appears in their **My work** tab.

Managing incidents and major incidents on mobile

Manage and resolve incidents on the go using ITOM Mobile Agent. Learn how to create, process, and collaborate on incidents on your mobile device. You can also track and collaborate on major incidents.

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Refer to the following ITSM Mobile Agent documentation to learn about managing incidents on your mobile device.

Manage an incident

- Collaboration with incidents
- Collaboration with incident tasks
- Create an incident from app landing page
- Generating task summarization for incident records
- My team dashboard
- Performance metrics
- Process a breached incident
- Process an incident at risk
- Unassigned incidents

Manage a major incident

- Active major incidents
- Collaboration with major incidents
- Major incident dashboard
- Review and work on a major incident candidate

Working with On-Call Scheduling on mobile

Manage on-call schedules on the go using ITOM Mobile Agent. As a manager, learn how to manage shifts, time-off requests, and scheduling gaps. As a responder, learn how to request time off, view who is on call, and see upcoming shifts.

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Refer to the following ITSM Mobile Agent documentation to learn about managing on-call schedules on your mobile device.

On-Call Scheduling for managers

- Manage gaps and conflicts with On-Call Scheduling
- Manage time-off requests with On-Call Scheduling
- Manage upcoming shifts with On-Call Scheduling

On-Call Scheduling for responders

- Request time off with On-Call Scheduling
- View on-call group members
- View upcoming shifts with On-Call Scheduling

Working with tasks on mobile

Manage change and catalog tasks on your mobile device using ITOM Mobile Agent. Learn how to respond to issues quickly by viewing, closing, and adding comments to tasks on the go.

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Refer to the following ITSM Mobile Agent documentation to learn about managing tasks on your mobile device.

Manage change tasks

- Change tasks
- Overdue changes

Manage catalog tasks

View catalog tasks

ITOM Mobile Agent reference

Learn about ITOM Mobile Agent settings. You can view the app version, give feedback, and adjust your preferences.

Explore reference documentation

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Visit the following ITSM Mobile Agent documentation to learn more about your mobile app settings.

Settings

Service Level Objective Management

Service Level Objective Management (SLO Management) helps your organisation define, track, and meet agreed-upon service quality standards. It works in conjunction with Service Level Agreements (SLAs) to ensure service delivery meets customer expectations.

Overview of how SLO Management works

- SLAs set the expectations

  SLAs are formal agreements that outline the level of service a customer can expect. This can include things such as response times, resolution times, and uptime targets.

- SLOs defines how to meet expectations

  SLOs are specific, measurable objectives that an organization sets to achieve the SLAs. They translate the broad goals of the SLA into actionable metrics.

- ServiceNow SLO Management helps manage SLOs. It offers functionalities to:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Define SLOs based on various metrics.
- Monitor SLO performance in real-time.
- Generate alerts when SLOs are at risk of being breached.
- Track historical data to identify trends and improve processes.

Exploring SLO Management

Service Level Objective Management (SLO Management) is a crucial aspect of IT service management that ensures IT services meet customer expectations.

SLO Management overview

SLO Management is a framework for setting clear expectations and measuring the performance of IT services. It helps organizations ensure consistent service delivery and identify areas for improvement. SLOs define the target service level for a specific service, such as incident resolution or service request fulfillment. Effective SLO management involves setting realistic objectives, monitoring performance, and continuously improving services to meet customer needs.

SLO Management users

Users

Users	Description	Contains Roles
admin	A ServiceNow administrator is responsible for the administration, development, operation, education, and maintenance of the ServiceNow platform. Responsible for installation and can perform Service Operations	All

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

Users	Description	Contains Roles
	who are on call and diagnose and remediate incidents. Responders can only access configurations that they're a part of. They can only access the alerts or incidents for which they have permissions. SREs can perform the following actions, within the context of their teams:	• cmdb_read • sn_sow.sow_user • sn_sow_srm.srm_responder • workspace_user • slo_operator

Note: Users of the SLO plugin without SRM should ensure that the required alert and cmdb_ci read access is granted to their team members.

SLO Management workflow

1. Define SLOs - Identify critical services and define SLOs based on customer expectations and business requirements.
2. Establish SLIs - Develop Service Level Indicators (SLIs) to measure SLO performance.
3. Monitor and analyze - Track SLI data and analyze performance against SLO targets.
4. Identify gaps and improve - Determine areas where SLOs are not being met and implement changes to improve service performance.
5. Review and refine - Regularly review SLO performance and refine SLOs as needed.

SLO Management benefits

- Improved service quality - SLOs ensure IT services meet customer expectations, leading to increased satisfaction and loyalty.
- Increased transparency - Clear SLOs provide a shared understanding of service expectations between IT and customers.
- Better resource allocation - SLOs help prioritize resources and focus on areas that need improvement.
- Enhanced collaboration - SLO management encourages collaboration between IT teams and customers to achieve common goals.
- Data-driven decision making - SLO performance data informs decisions and drives continuous service improvement.

Working with reliability metrics

Learn about the reliability metrics and features that can help you track service health, respond to issues, and support business goals.

Service reliability dashboard

The Service reliability dashboard displays a customizable, high-level view of service performance. It helps you monitor and manage reliability using visualizations that track service states, error budgets, and service level objectives (SLOs) over time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The dashboard displays information about all services in Service Reliability Management (SRM). You can access the dashboard in Service Operations Workspace in the following ways:

- Navigate to **Services ( )** > **Service reliability**.
- Navigate to **Home ( )** > **Service reliability**

For more details, see Visualizations in the Service reliability dashboard.

Note: You can also view SLO information for all services on the Services Overview tab. See Working with SRM services for more information.

Notification destinations

Notification destinations help keep teams informed about service reliability. Attach them to error budget policies to send notifications when a policy is breached.

To view and manage notification destinations in Service Operations Workspace, navigate to **Teams** > **[Your team]** > **SLO Notification destinations**.

Visit the following links to learn more about creating and working with notification destinations:

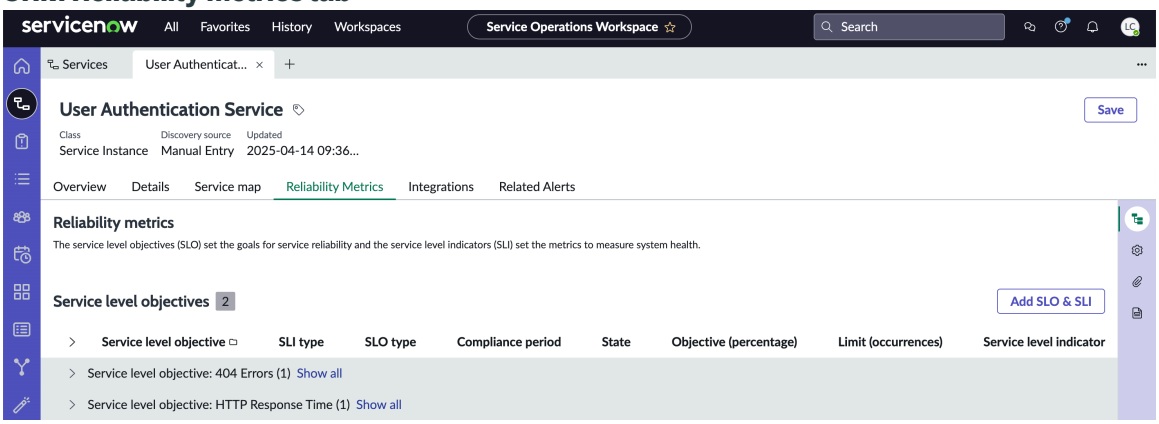
- Create a notification destination in SRM
- Create SLOs, SLIs, and error budget policies
- Notifications for breached error budgets

Reliability metrics tab

The Reliability metrics tab shows how well a specific service is meeting its reliability goals. Use it to track SLOs, service level indicators (SLIs), and error budgets for a service.

To view the Reliability metrics tab in Service Operations Workspace, navigate to **Services ( )** > **[Your service]** > **Reliability Metrics**.

SRM Reliability metrics tab



See these links to learn more about what you can do in the Reliability metrics tab:

- Create SLOs, SLIs, and error budget policies
- Edit a reliability metric
- View SRM reliability metrics

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service level objectives table

On the Reliability metrics tab, the Service level objectives table includes the following details about the selected service:

- **Service level objective**: Name of the SLO. The SLO is a target value or the objective that your team must reach to meet your service level agreement (SLA).
- **SLI type**: Performance category being measured:
  - Availability: Percentage of time your service or configuration item is available, also known as uptime.
  - Errors: Frequency of your service errors.
  - Latency: Time that it takes to service a request.
  - Saturation: Fullness of your system, focusing on resource usage.
- **Compliance period**: Time window used to calculate performance:
  - Month: Current month, for example, if the current date is January 26, the month is January 1 through January 31.
  - Rolling 7, 30, or 90 days: Number of days from the current date. For example, for rolling 7 days, the duration is 7 days back from the current date.
- **State**: Status of the SLO, such as draft, running, or retired.
- **Objective (percentage)**: Target percentage of SLI performance.
- **Limit occurrences**: Number of limit breaches that have occurred. Used by count-based SLOs only.
- **Service level indicator**: SLI associated with the SLO.
- **Error budget**: Allowable failure time for the compliance period, calculated using the compliance period and objective (percentage).
- **Remaining error budget**: Error budget still available.
- **Remaining breach occurrences**: Number of breaches still available before the limit is reached.

Note: For performance purposes, SLO and SLI records ([sn_sow_srm_slo_history] and [sn_sow_srm_sli_metric]) are archived after one year and deleted five years later. Archived data is omitted from tables and visualizations.

Using SLO Management

Using SLO management ensures IT services meet customer expectations, improves service quality and transparency, and enables data-driven decision making.

Activate SLO-based change approval decisions

Activate Service Level Objective (SLO) change approval decisions to evaluate change requests based on SLO performance.

Before you begin

Review change approval policies and their terminology, including policy inputs, decisions, and approval definitions. For more information, see Change approval policies.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Activate the Service Level Objective Change policy's decisions to include SLO performance in your change management process. The policy is active by default, however, its decisions are inactive.

When you activate the policy's decisions, the policy evaluates SLOs as inputs and implements the following:

- Require group manager approval if these conditions are true:
  - The lowest SLO error budget is less than 25%.
  - The highest SLO burn rate is greater than 1%.
- Auto-approve change requests if these conditions are true:
  - The lowest SLO error budget is greater than 25%.
  - The highest SLO burn rate is less than 1%.

Procedure

1. Navigate to **All** > **Change** > **Change Policy** > **Change Approval Policies**.
2. Select the **Service Level Objective Change policy**.
3. In the **Decisions** tab, set **Active** to true for these decisions:
   - **Budget < 25% and Burn Rate > 1**
   - **Budget > 25% and Burn rate < 1**
4. Select **Update** to save your changes.
   The decisions are active and part of your change management process.

What to do next

Use a test change request to verify that change requests are either auto-approved or routed to a manager as expected.

You can also customize the Service Level Objective Change policy, including its name and conditions, as needed.

For more advanced setups, use Flow Designer to customize the SLOs and services included as policy inputs:

> **Important:** Customizing the flow prevents it from receiving future release updates. That behavior is intentional to avoid overwriting your customizations.

1. Navigate to **Process Automation** > **Flow Designer**.
2. In the list of flows, select **Change - SLO – Authorize** and then select **SLO - Get worst performing SLOs**.
3. Customize the **Action Inputs** section.
4. Select **Done** to implement your changes.

Create a notification destination in SRM

Set up notification destinations to help keep teams informed about service reliability.

Before you begin

Before creating notification destinations, set up the Microsoft Teams Graph spoke. When registering an application in the Microsoft Azure portal, grant the following Microsoft Teams Graph API permissions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `ChannelMessage.Send`
- `Group.ReadWrite.All**`

For setup instructions, see Set up the Microsoft Teams Graph spoke.

Role required: srm_manager, srm_admin, or admin

About this task

Create a notification destination to deliver messages to a specific Microsoft Teams channel. After you set up a notification destination, team members can attach it to error budget policies to receive messages about policy breaches.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
2. From the primary navigation, select **Teams** ( ).
3. On the Teams page, select the team you want to use the notification destination.
4. Select the **SLO Notification destinations** tab, select **Create a destination**, and then fill out the form.

Field	Description
Channel URL	Deep link to the relevant Microsoft Teams channel. You can find deep links to channels in Microsoft Teams. They follow this general format: `https://teams.microsoft.com/l/channel/19%abcdef`.
Destination name	Display name of the notification destination. Teams see this name when adding notification destinations to error budget policies.

5. **Optional:** Select **Send test notification** to verify your setup.
   When successful, a message appears in the relevant Microsoft Teams channel. The message is titled `Test Notification` and includes the following text:

```
This is a test notification from the Service Reliability
 Management (SRM) Team '<team-name>'.
```

6. Select **Save**.
   The notification destination appears in the SLO Notification destinations tab. The table includes details about the Microsoft Teams channel and when the notification destination was last updated.

What to do next

To use and learn more about notification destinations, visit the following pages:

- Create SLOs, SLIs, and error budget policies
- Notifications for breached error budgets

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also edit and delete notification destinations from the SLO Notification destinations tab. Deleting a notification destination removes it from all error budget policies where it was previously used.

Create SLOs, SLIs, and error budget policies

Define service level objectives (SLOs), service level indicators (SLIs), and error budget policies to monitor service health. These tools help you and your teams track performance and take action when needed.

Before you begin

If you plan to notify teams when an error budget policy is breached, make sure a notification destination is available for your team. To check, navigate to **Teams** > **[Your team]** > **SLO Notification destinations** in Service Operations Workspace.

To create a notification destination, see Create a notification destination in SRM.

Role required: srm_admin, srm_manager, or srm_responder

About this task

Create SLOs, SLIs, and error budget policies to monitor service health and help make sure your services support business goals.

- SLOs are specific targets that you set for SLIs. They define the expected performance level.
- SLIs are metrics that measure performance, such as availability or latency.
- Error budget policies define the acceptable margin of error and what happens if that threshold is breached.

In Service Reliability Management (SRM), an SLO must have at least one SLI. SLIs can be filtered to a service or configuration item (CI) within the parent service's hierarchy. Filtering an SLI to a CI can help you more accurately track service health and identify root causes faster.

For more high-level information about SLOs, SLIs, and error budget policies in SRM, see Working with reliability metrics.

Note: In SRM, each SLI can only be associated with one SLO. Using the same SLI in multiple SLOs creates multiple objectives for the same metric, which can lead to confusion or conflicting performance expectations.

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select the **Services** icon ( ).
3. On the **Services** page, select the service for which you want to create SLOs and SLIs.
4. Select the **Reliability metrics** tab and then select **Add SLO & SLI**.
5. In the Service Level Objective (SLO) form, fill in the fields for your SLO.
   For information about the SLO fields, see Create SLO form.
6. In the Service Level Indicators (SLI) form, select **Add SLI**, and fill in the fields for your SLI.
   For more information about the SLI fields, see Create SLI form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If your service includes one or more CIs in its hierarchy, a banner appears below the Service Level Indicators (SLI) header. The banner lists the number of available CIs and links to the service map, letting you visualize their connections. You can use this information to filter your SLIs to specific CIs in the Add SLI form, giving you a more granular measure of service health.

7. **Optional:** In the Error budget policies form, select **Add threshold**, and fill in the fields for your error budget policy.
   For more information, see Add an error budget policy form.

   Note: If you don't add an error budget policy, the SLO's objective percentage is only informational. Adding a policy helps you take corrective actions based on the performance data. If you're not ready to add a policy now, you can add one later.

8. Review your SLO, SLI, and error budget policy, and then select **Activate**.

   Your SLO, SLI, and, if added, error budget policy are active, helping you monitor service health and take action when necessary. For information about viewing and updating reliability metrics, see Edit a reliability metric.

Edit a reliability metric

Update a reliability metric to keep it relevant and aligned with your team's goals.

Before you begin

Role required: srm_admin, srm_manager, or srm_responder

Updating reliability metrics, such as Service Level Objectives (SLOs) or Service Level Indicators (SLIs), during active measurement periods can result in graph inconsistencies.

About this task

To help you manage reliability-metric history, Service Reliability Management (SRM) follows specific naming conventions. When you edit a reliability metric, SRM does the following:

- Retires the existing SLO.
- Creates a copy of the SLO with your edits in a draft state. You can either:
  - Save the copy as a draft.
  - Activate the copy.
- Appends a number to the copy's name, for example, Uptime (2) or Uptime (3).
- Displays all SLO versions in the **Reliability metrics** tab.

Note: In the **Reliability metrics** tab, SLO headers have two numbers, for example, HTTP response time (2) (3). The first number is its version. The second is the number of SLIs associated with the SLO.

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Follow these steps to access the **Reliability metrics** tab:
   a. Select the **Services** page icon ( ).
   b. Select the service that uses the reliability metric you want to edit.
   c. Select the **Reliability metrics** tab.
3. To edit a reliability metric, select the relevant reliability metric, and then select **Edit** and **Continue to edit**.
4. To save and implement your changes, select **Activate**.
   Your edited reliability metric appears in the **Reliability metrics** tab. SRM sets the state to running and includes a version number in its name, for example, Uptime (3).

What to do next

Managing SLOs requires ongoing updates to make sure they reflect your reliability goals. You can edit or retire existing SLOs and, if needed, reactivate retired SLOs.

Note: If you reactivate a retired SLO, SRM creates and activates a new copy of it. For example: If there are two versions of an SLO, Uptime (1) and Uptime (2), and you reactivate Uptime (1), SRM leaves it in the retired state and creates an active version called Uptime (3).

View SRM reliability metrics

View a service level objective (SLO) and service level indicator (SLI) that your or your team owns.

Before you begin

Role required: Responder, Manager, or Administrator

Note: Administrators can view any SRM SLO.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select the **Services** icon ( ).
3. Select the **Reliability metrics** tab.
4. Open a **Service level objective**.
5. View the SLO header.

   The top header contains service information for:

   - **SLI type**:

     Type of the SLI based on which the metrics are calculated. The available types of SLI are as follows:

     - **Availability**: Percentage of time your service is available. (Default)
     - **Errors**: Measurement of how frequently service error occurs.
     - **Latency**: Time taken to service a request. The actual amount of time that elapsed.
     - **Saturation**: Measurement of your system fraction, emphasizing the resources that are most constrained.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

.

- **SLO Type**:

  Type of SLO based on which metric you choose. The available types of SLO are as follows:

  - **Duration**: The amount of time the service spends without breaching. It's the only value available.

    Metrics for **Duration** are as follows:

    - **Objective (percentage)**: Percentage of the desired SLI performance.
    - **Error budget**: Displays, in days and time, how much error budget is left.
  - **Count**: Number of occurrences in a given compliance period.

    Metrics for **Count** are as follows:

    - **Limit (occurrences)**: Number of occurrences after which a breach has occurred.
    - **Remaining breach occurrences**: Number of occurrences left.
- **State**:

  State of the SLO. Choices are:

  - Draft: The SLO isn't running in your instance yet. You can add new SLIs or update existing SLIs and you can delete the SLO.
  - Running: The SLO is active in your instance. You can edit, retire, or delete the SLO.

    Note: Editing an SLO in the running state retires it and a new copy is created.
  - Retired: The SLO is no longer running in your instance. You can reactivate it.
- **Service**: Service associated with the SLO.
- **Reliability**: How reliable the service is.
  - **Stable**: All SLOs in this Service have more than 25% of the error budget still available.
  - **At RISK**: All SLOs in this Service Have EB left, and at least one SLO for this Service has less than 25% of the error budget left.
  - **Critical**: Any one SLOs in this Service has burnt through its error budget

From the header you can **Delete SLO**, **Retire**, or **Edit**.

If you delete an SLO any associated SLIs are deleted as well.

If you retire an SLO, it changes the state. You can **Re-activate** it from the SLO page or later from the **Reliability metrics** tab.

Note: If you edit an SLO, it changes the state, retires the SLO record, and opens a new copy for editing. See Create SLOs, SLIs, and error budget policies for more information. You can reactivate the original SLO by returning to the **Reliability metrics** tab.

6. View the **Overview** tab and select a Historic period from the list menu.
   The periods listed are from the date that the SLO was created to the present in the selected increments.
7. View **Summary** metric cards for the SLO.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The metrics show aggregate or average values depending on the type of SLIs chosen and error policy thresholds chosen. See Create SLOs, SLIs, and error budget policies for more detailed information.

8. View the **Service level indicators** section.

   This section lists your indicators by name.

9. View the **Service level objective (SLO) history** section.
   Depending on your **SLO type**, this section displays the following in bar graph reports:

   For **Duration**:

   - Error budget used
   - Error budget remaining
   - Burn rate

   For **Count**, **Count by periods**, or **Count by occurrences**:

   - Cumulative breach occurrences
   - Burn rate
   - Alerts, incidents & changes impacting this service

   Selecting into one of the analytics line chart reports shows the values on that day.

10. View the **Details** tab.
    The fields in this tab are auto-populated and uneditable. See Create SLOs, SLIs, and error budget policies for detailed information on the fields.

11. View the **Service level indicators** tab.
    This tab lists the SLIs associated with this SLO.

12. View the **Error budget policy** tab.
    In this tab, you can add more thresholds and edit or delete existing ones.

Fields in the Add an error budget policy form

The following table describes the available options in the Add an error budget policy form. For step-by-step instructions, see Create SLOs, SLIs, and error budget policies.

Field	Description
Policy name	Display name of the error budget policy.
Threshold type	Select how you want to track your error budget. • **Burn rate (count)**: Tracks how quickly the error budget is being consumed. A higher burn rate means faster consumption. • **Error budget remaining (%)**: Tracks the percentage of the error budget that's still available during the specified period. **Note:** You can add multiple thresholds to a policy, but each must be unique. If you try to add a duplicate threshold, an error message appears.
Threshold value	The point at which you get notified based on the selected SLO indicator. • Burn rate: Set a value that indicates the burn rate is too high. For example, to be notified when your service or configuration item is burning through its error budget twice as fast as expected, set the threshold to 2. • Error budget remaining: Set a value that indicates the remaining error budget is too low. For example, to be notified when only 25% or less of the error budget remains, set the threshold to 25%. **Note:** The threshold values support up to 4 decimal places and then round up.
Policy action	[Optional] If a breach occurs, select the action that you want to take: • Create incident. • Send an email. • Notify Microsoft Teams. If you select this option, you must also select a relevant notification destination. To set up

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	a notification destination for your team, see Create a notification destination in SRM. **Note:** To learn about the notifications that teams receive for breached error budget policies, see Notifications for breached error budgets.

Create SLO form

Learn about the available fields for adding a service level objective (SLO) to Service Reliability Management.

Service level objective form

The following table describes the available options in the Service level objective form. For step-by-step instructions, see Create SLOs, SLIs, and error budget policies.

Fields in the Service Level Objective form

Field	Description
Name	Name of the SLO.
SLI type	Type of the SLI based on which the metrics are calculated. The available types of SLI are as follows: • **Availability**: Percentage of time your service is available. (Default) • **Errors**: Measurement of how frequently service error occurs. • **Latency**: Time taken to service a request. The actual amount of time that elapsed. • **Saturation**: Measurement of your system fraction, emphasizing the resources that are most constrained.
How do you want to measure this objective?	You can measure this objective by: • **Duration**: The amount of time the service spends without breaching. It's the only value available. • **Count**: The number of periods or occurrences in a given compliance period.

Measuring by Duration

Field	Description
Objective (%)	The percentage of how available (uptime) you want the service to be over a length of time. If measuring by duration, an objective

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Measuring by Duration (continued)

Field	Description
	percentage of Five Nines (99.999%) means that the service wasn't available for 26 seconds per month, or about 5 minutes and 35 seconds per year. This is used to calculate your error budget.
Compliance period	Period for which the metrics are calculated. The available options are: • **Month**: The duration is considered to be the current month. For example, if the current date is 26th January, the duration will be considered from 1st January until 31st January. • **Rolling 7 days**: The duration is considered to be 7 days from the current date. • **Rolling 30 days**: The duration is considered to be 30 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th December. • **Rolling 90 days**: The duration is considered to be 90 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th October.
Error budget	Auto-populated. The maximum level of errors (downtime) allowed over a certain period. A percentage of total service availability. Once you set your objective (%), your error budget is automatically calculated using this formula: 1 – (Desired) Availability. The error budget of a service will be calculated in days, hours, minutes, and seconds for a desired availability of 99.99% (Four Nines) of the year by: **1.** Calculating the total time in seconds in a year: 31536000 seconds. **2.** Determining the error budget as 1 – (Desired) Availability: 1 - 0.9999 = 0.0001. **3.** Converting the error budget to time units. For example, if the error budget is 0.0001:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Measuring by Duration (continued)

Field	Description
	• Error Budget in Seconds = 0.0001 * 31,536,000 seconds = 3,153.6 seconds. • Error Budget in Minutes = 3,153.6 seconds / 60 = 52.56 minutes. • Error Budget in Hours = 52.56/60 = 0.875 hours. • Error Budget in Days = 52.56 minutes / (24 * 60) ≈ 0.0364 days. **Note:** Your error budget appears in units of days, hours, minutes, and seconds only when you measure your SLO by duration.

Measuring by Count

SLO type	Count by periods or Count by occurrences
Limit occurrences	The number of occurrences after which a breach occurs. Limit occurrences act as an error budget.
Compliance period	Period for which the metrics are calculated. The available options are: • **Month**: The duration is considered to be the current month. For example, if the current date is 26th January, the duration will be considered from 1st January until 31st January. • **Rolling 7 days**: The duration is considered to be 7 days from the current date. • **Rolling 30 days**: The duration is considered to be 30 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th December. • **Rolling 90 days**: The duration is considered to be 90 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th October.

Note: The **Assignment group** is auto-populated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create SLI form

Learn about the available fields for adding a service level indicator (SLI) to a service level objective (SLO).

Add SLI form

The following table describes the available options in the Add SLI form. For step-by-step instructions, see Create SLOs, SLIs, and error budget policies.

Fields in the Add SLI form

Field	Description
SLI name	Enter a name for your SLI. For example, Critical router issue.
Data source	This field is auto-populated. The alerts from this data source, also known as integration, are used to calculate the error budget.
Set conditions (optional) Customize your SLI by filtering it to specific configuration items or alerts. The fields in this section are optional.	
Filter by CI	Filter your SLI to a configuration item (CI) within the parent service's hierarchy. Filtering an SLI to a CI can help you more accurately track service health and identify root causes faster.
Add condition set	Select this option to specify the alerts included in the error budget. For example, if you set the condition to **Status is Critical**, only alerts with a critical status count toward the error budget.

Notifications for breached error budgets

Details about the notifications that teams receive for breached error budget policies.

When notifications are sent

When a service or configuration item breaches its error budget policy and a notification destination is set, Service Reliability Management (SRM) sends a notification to the configured Microsoft Teams channel.

Notification content

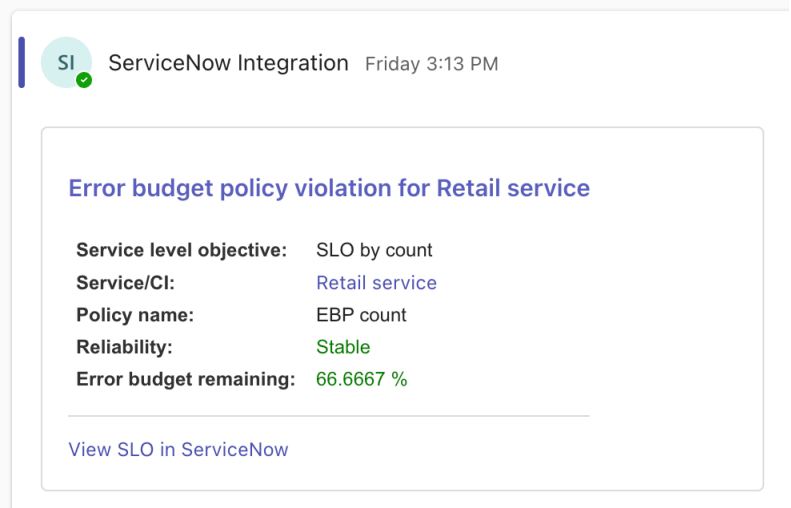
The message contains details about the breach to help team members learn about the issue and act. In Microsoft Teams, the message is titled `Error budget policy violation` and lists the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Service level objective - Name of the service level objective (SLO), for example, `Navigation service availability 99.95`.
- Service/CI - Name of the associated service or configuration time. Select the name to open the relevant service in SRM.
- Policy name - Name of the error budget policy that was breached.
- Reliability - The service state: critical, at risk, or stable.
- Error budget remaining - Percentage of error budget left at the time of the breach.
- View SLO in ServiceNow - Link to view the SLO details in SRM.

Sample notification

The following image is a sample notification in Microsoft Teams. It shows an error budget policy violation for the Retail service and details about the SLO, service state, and error budget remaining.



Related documentation

See Create a notification destination in SRM and Create SLOs, SLIs, and error budget policies.

Visualizations in the Service reliability dashboard

List of visualizations and options on the Service reliability dashboard in Service Reliability Management (SRM).

Service state charts

Top-level charts show the number of services in critical, at-risk, and stable states. Their states are based on the error budget remaining on their service level objectives (SLOs). You can select the charts to view service names, adjust the time range, and access additional chart options.

Note: An error budget is the amount of failure a service can experience before breaching its SLO.

Each visualization also includes a trend line showing changes in service count over the past 12 months. Smaller figures indicate how the count has changed compared to a week ago, for example, ↓25 (22%) since Jun 11.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart	What it is	How to use it
Critical	Displays the number of services in a critical state. Critical services have 0% error budget remaining on their SLOs.	View how many services have consumed their error budgets and identify the services needing immediate attention.
At risk	Displays the number of services at risk. At-risk services have <= 25% error budget remaining on their SLOs.	Monitor how many services are approaching critical thresholds and find issues early.
Stable	Displays the number of stable services. Stable services have more than 25% error budget remaining on their SLOs.	Get insights into overall service health and identify if services are staying reliable over time.

Risk trends over time

Line charts track the number of SLOs with high burn rates and low error budget remaining over the past 12 months. You can use them to find recurring patterns and potential reliability risks.

Chart	What it is	How to use it
High burn rate (>=1)	Shows the number of SLOs with a burn rate >= 1 over time. A high burn rate indicates that the service linked to the SLO is likely to breach its error budget before the compliance period ends. For example, if a service has 30 days to meet its SLO but is using up its error budget in 15 days, the burn rate is 2.	• Find risks early by seeing when services begin consuming error budgets too quickly. • Identify emerging or recurring reliability issues by tracking burn rates over time. • Point to the chart to see the number and percentage of SLOs with a high burn rate at that time. • Select the chart to view SLO details, including measured reliability, burn rate, and percentage of error budget remaining.
Low budget remaining (<=25%)	Shows the number of SLOs with low or no error budget remaining over time.	• Monitor how many services are nearing or have breached their SLOs. • Track rising trends, which might indicate declining reliability or recurring issues that need investigation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart	What it is	How to use it
		• Point to the chart to see the number and percentage of SLOs with little or no error budget remaining at that time. • Select the chart to view SLO details, adjust the time range, and access additional chart options.

Service level objectives (SLOs) table

The SLOs table lists the SLOs defined in Service Reliability Management (SRM), and it's sorted by SLO name by default. Use the table to monitor overall reliability, identify services at risk, and find the assigned teams.

The SLO table includes the following columns by default. To customize the columns shown, select the gear icon.

- Name - Name of the SLO. You can select the arrow to sort the table by SLO name, and you can select the name to view the SLO record.
- Reliability - Current state of the SLO. For example, stable, at risk, or critical.
- Measured reliability - Percentage showing the actual performance of the service. For example, if your SLO is 99.9% success, and the actual performance for the month is 99.7%, the measured reliability is 99.7%.
- Objective (percentage) - Target SLO value.
- Burn rate - Numeric value showing how quickly the service is consuming its error budget.
- % Error budget remaining - Percentage of the error budget still available in the current compliance period.
- Service - Name of the service associated with the SLO. You can select the service name to view the service record.
- Assigned - Team responsible for the service.

Dashboard filters and actions

The Service reliability dashboard is built with Platform Analytics and includes standard dashboard features. For details on customizing, duplicating, or sharing dashboards, see the Dashboards in Platform Analytics documentation.

Note: Changes to the Service reliability dashboard affect all SRM users on your instance. To create a personalized version, either build a new dashboard or duplicate the existing dashboard and edit it. Learn more in Create a dashboard with the in-line editor and Duplicate a Platform Analytics dashboard.

Service Observability

The ServiceNow® Service Observability application enables operators to triage and manage incidents in a complex and distributed system. Application and platform telemetry insights from multiple observability tools are combined into a centralized workflow.

Exploring Service Observability

Service Observability helps operations teams triage and manage incidents in a complex and distributed production system. It combines external application performance monitoring (APM) systems' telemetry with related data from the Configuration Management Database (CMDB) and displays both in a single workflow in the Service Operations Workspace (SOW).

Service Observability overview

Service Observability displays health metrics in the SOW related to a given service. Metrics can be ingested from an external APM system and displayed alongside information for related configuration items in the CMDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability supports the following APM vendors:

- Amazon CloudWatch
- AppDynamics
- Datadog
- Dynatrace
- Microsoft Azure Monitor
- New Relic
- Prometheus (on-premise)
- SolarWinds on-premise
- Splunk Observability

Service Observability supports the following databases:

- MySQL
- PostgreSQL (not supported with Splunk)
- RDS (Relational Database Service) (Amazon CloudWatch)

After connecting an APM instance to Service Observability, map services in the CMDB to APM metrics using existing tags.

With this data mapping, Service Observability displays APM metrics for entities such as host or database along with details about related CI information. Operators use these metrics and contextual information, including current incidents and alerts, to assess service health.

For example, say you use Dynatrace to monitor your `checkout` service, and metrics from your database and host use the tag `checkout-service` to denote requests coming from that service. By mapping the `checkout` service CI to the APM data tagged with `checkout-service`, Service Observability retrieves metrics for those databases and hosts and CIs related to the service, then displays them together. Operators can pinpoint issues on entities related to the service and narrow down the mitigation process without having to leave the SOW.

Service Observability users

Users

User	Description
System admin	Version 1.5 only. System admins configure users and teams, register services to be monitored, connect Service Observability to APMs, and then map those services to that data. They can also view the data in the SOW
Service Observability admin	Version 1.6.x and later. Service Observability admins can configure users and teams, connect Service Observability to APMs, and then map services to that data. They can also view the data in the SOW. Admins can also customize dashboard templates used to display metrics and related information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

User	Description
Operator/ operations manager **Note:** These users must belong to an `srm` group type to see all data.	Operators use Service Observability when triaging incidents in the SOW. They can view basic health metrics for a service, along with related incidents, alerts, and changes. They can get more detailed information by navigating to the **Observability** tab to view additional service metrics, along with metrics from related entities, such as a host or database.

Service Observability workflow

Admins configure Service Observability by registering services, connecting APM metrics, and then mapping the services to that data. Operators use Service Observability to determine if another related entity is causing issues surfaced by the service's performance.

As an admin, you:

1. Determine the services to be monitored by Service Observability based on business criticality.
2. Connect existing APM instances to Service Observability.
3. Map services with APM metric data based on APM-based tags used on that data.
4. Customize the templates used to display metric charts.

As an operator or manager, you:

1. Spot an issue with a service while working in the SOW, for example, from an alert, the Service dashboard, or Express List, then navigate to the Service Details page.
2. View overall health metrics for the service, along with related incidents, alerts, and changes. If one of the metrics seems unhealthy, navigate to the Observability tab.
3. View more detailed service metrics, as well as information from related entities, to start root cause investigation. When finding that the issue is further down the system's stack, identify the ownership for that entity to start remediation.

Service Observability benefits

Benefit	Feature	Users
Centralize critical signals and bridge workflows to increase agility and reliability: • Connect data from external APMs • Map that data to CMDB services • View combined data in the SOW	• Connect a Service Observability data source • Create and manage data mappings .	Admins
Increase efficiency and reduce mean time to resolution (MTTR). View combined metrics from entities associated with a service to begin to determine blast radius and ownership of an incident.	View service health metrics	Operators
See related changes to the system and alerts associated with a service in one place.	View overall service health.	Operators
Customize dashboard templates.	Customize Service Observability dashboard templates	Admins

What to explore next

To learn more about configuring and using Service Observability, see:

- Configuring Service Observability
- View overall service health
- View service health metrics
- Service Observability reference

Configuring Service Observability

After you install Service Observability, you must register services, connect external application performance management (APM) instances, and map that APM data to those services.

Configuration overview

Install Service Observability

If you have the system admin role, you can install the Service Observability application (`sn_sow_svcobs`). The application installs related ServiceNow® Store applications and plug-ins if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Service Observability application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: system admin [admin]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The following items are installed with Service Observability:

- Plugins
- Store applications
- Roles
- Tables

For more information, see Components installed with Service Observability.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Service Observability application (`sn_sow_svcobs`) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Activate teams and services

Follow this step only if you are on version 1.5.0 of Service Observability. Assign existing teams to Service Observability so they can view the data returned by the Configuration Management Database (CMDB) on those pages. Activate the services in the CMDB for use in Service Observability.

Before you begin

- Users assigned to a group that manage the activated services.
- Services that you want to monitor in Service Observability should be configured in the CMDB.

Role required: system admin

About this task

Note: Follow this step only if you are on version 1.5.0 of Service Observability.

Teams are used in both Service Reliability Management and Service Observability to give existing roles and groups the ability to view CMDB data on the **Overview** and **Observability** tabs.

The services that you want to monitor in Service Observability must be activated. Activation enables you to map data from an application performance management (APM) instance to that service and then view that service's related data on the **Overview** and **Observability** tabs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Teams and services activated for Service Observability are also activated for Service Reliability Management (SRM). Service Observability admins can create a single service. For more information, see Add a service to SRM. When Service Observability admins create a single service, it's automatically activated for Service Observability and SRM. For more information, see Service Reliability Management.

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations** and choose the **Service Operations Management** card.
2. Navigate to **Service Operations Management** > **Assign and activate** > **Activate teams and services**.
3. Choose **Activate teams and services**.
4. Select the assignment groups that you want as teams in Service Observability and then select **Activate**.
   Only teams that haven't already been assigned are displayed.
5. In the modal, select **Confirm**.
6. In the Service class drop-down menu, select a CMDB service type.
7. From the list of services, select which services to activate for Service Observability and select **Activate**.
8. In the modal, select a support team for the services and choose **Confirm**.
   You now have services that can be monitored in Service Observability

What to do next

1. Connect a Service Observability data source
2. Create and manage data mappings

Connect a Service Observability data source

Connect Service Observability to an external application performance management (APM) instance. Service Observability displays metrics in the Service Operations Workspace (SOW) from that APM instance.

Before you begin

You must enter a connection URL and credentials for your APM vendor. You can either use an existing connection or create one. Note the following for specific vendors:

Vendor-specific connection information

APM Vendor	Connection information
AWS	The connection URL must be specific to the region to be monitored, for example, `https://monitoring.us-east-2.amazonaws.com`.
Azure	The connection URL should be `https://management.azure.com`.
Splunk Observability	The connection URL must include the Realm, for example, https://stream.[REALM].signalfx.com

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you're using existing credentials, you need the credential name. If you're creating credentials, collect the following information.

Vendor-specific credential requirements

APM vendor	Credential type	Information needed
AppDynamics	OAuth 2.0	• OAuth Client ID • OAuth Client secret • OAuth token URL • AppDynamics account name
Azure	OAuth 2.0	• OAuth Client ID • OAuth Client secret • OAuth token URL • Subscription ID
AWS	AWS credentials	• Access key • Secret key If the user associated with this key is restricted to specific permissions, they must include the following, scoped to all resources: • `cloudwatch:Describe` scoped to all resources • `cloudwatch:Get` scoped to all resources • `cloudwatch:List` scoped to all resources • `cloudtrail:LookupEvents` • `tag:GetResources` • `tag:GetTagKeys`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor-specific credential requirements (continued)

APM vendor	Credential type	Information needed
		• `tag:GetTagValues` • `apigateway:Get`
Datadog	API	• API key • Application key If an application key is restricted to a specific scope, those scopes are required for the following endpoints: • https://api.datadoghq.com/api/v2/catalog/entity • https://api.datadoghq.com/api/v1/hosts • https://api.datadoghq.com/api/v1/query • https://api.datadoghq.com/api/v2/query/timeseries
Dynatrace	API	API key The API key must have `Read entities` and `Read metrics` scope permissions.
New Relic	API	• Account ID • API key
Prometheus (on-premise)	Basic Auth	• Basic Auth credential user name • Basic Auth credential password • The name of the MID Server your Prometheus instance is hosted on

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor-specific credential requirements (continued)

APM vendor	Credential type	Information needed
SolarWinds	Basic Auth	• Basic Auth credential user name • Basic Auth credential password • The name of the MID Server your SolarWinds instance is hosted on
Splunk Observability	API	Access token

Role required: sn_sow_svcobs.admin

About this task

The first step to ingesting APM data is to create a connection to the APM instance.

Service Observability supports the following APM vendors:

- Amazon CloudWatch
- AppDynamics
- Datadog
- Dynatrace
- Microsoft Azure Monitor
- New Relic
- Prometheus (on-premise)
- SolarWinds on-premise
- Splunk Observability

Procedure

1. Navigate based on your version of Service Observability.
   - Version 1.5.0: Navigate to **All** > **Service Operations Workspace** > **Configurations**, then navigate to **Service Observability Management** > **Manage Observability** > **Data sources**
   - Version 1.6 or later: Navigate to **All** > **Service Operations Workspace** > **Configurations**, then navigate to **Service Observability** > **Data sources**.
2. Select your APM vendor.
3. On the **Add connection** form, fill in the fields.
   You can use an existing HTTP or HTTPs connection and an existing API key credential or create one.
4. Select **Save**.

Result

A new connection appears in the list of observability data sources. You use this connection when you create a data mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Map your connection to the services that you want to monitor in Service Observability. See Create and manage data mappings.

Create and manage data mappings

Map your services to the data from a connected external application performance management (APM) instance, and view it in charts for the service.

Before you begin

- If you are on version 1.5.0, activate the services that have data from an external APM instance. For instructions on how to activate the services, see Activate teams and services. For later versions, you don't need to activate services. You can map any of the following service types:
  - Application
  - Mapped application
  - Calculated application
  - Dynamic CI group
  - Technical
  - Tag-based
  - Service offerings
  - Business services
- Connect a Service Observability data source

Role required: sn_sow_svcobs.admin

About this task

When a service CI is mapped to specific APM metric tag key/value pairs, Service Observability displays metrics containing those tags for that service. These metrics are grouped by the following entity types:

- Application metrics: Metrics associated with the selected service
- Compute metrics: Metrics associated with the hosts the service is run on
- Databases: Metrics associated with databases used by the service

For example, say you have metrics from New Relic that are used to monitor services, databases, and hosts. On those metrics, you have used the tag `service_name`. Say you have also mapped the `checkout` service CI to the APM metadata key/value pair `service_name = checkout`. Service Observability shows you all the database and host metrics tagged with `service_name = checkout` in the context of the `checkout` service CI.

If some of your metrics on different entities use a different key name or a different key value, you can create exceptions. For example, if your host metrics use `service` instead of `service_name`, you can create an exception to include those metrics.

Each entity type has its own dashboard and each metric or related CI has its own default chart. You can customize the templates used for the dashboards and charts. See Customize Service Observability dashboard templates for more information.

Note: To understand how Service Observability creates these mappings, see APM vendor entity mappings for Service Observability.

For a description of the field values, see Service Observability data mapping form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the Data mappings page, following the procedures for your version of Service Observability.
   - Version 1.5.0: Navigate to **All** > **Service Operations Workspace** > **Configurations**, then navigate to **Service Observability Management** > **Manage Observability** > **Data mappings**
   - Version 1.6.x or later: Navigate to **All** > **Service Operations Workspace** > **Configurations**, then navigate to **Service Observability** > **Data mappings**.
2. Select **Create your first mapping** or **Create mapping**.
3. On the Observability data mapping page, enter a name for the mapping.
4. Choose the services that should use this mapping.
   - For version 1.5.0: Enter the names of the activated services that you want to map. For information about activating services, see Activate teams and services
   - For version 1.6.x and later:
     a. Choose **Select services**.
     b. Use the navigation to narrow down the list to the type of service you're searching for.
     c. Select the services to add to the mapping. You can add services from any combination of service type.

        Note: Use the filter to narrow down the service list.

     d. Select **Add services** to add them to the mapping.

   The Mapping preview pane updates to show the selected service, or the first service in a list of services.
5. Create a rule to determine how Service Observability should map internal services to the APM entities using tag keys and values.

   a. Select the data source for this map.

   b. Enter the tag key that you want to use to map the APM data to the service.
   The key can be any tag you use on your APM metadata, for example `service`. The entered key must match the tag you use in the APM metadata and is case-sensitive.

      Note: If you use more than one tag to represent a service, you can create an exception. For example, if most tags use `service` except for database metrics, which use `service_name`, you can create an exception for the database metrics.

   c. Manually enter a tag value or choose one from the drop-down menu.

      Note: Values are case-sensitive.

      Values can be strings that are from your APM metadata, like a service name, or they can be a variable used to represent multiple instances, for example `$(service)`. When your key represents a service, a drop-down menu shows fields from the corresponding CI that can be used as a variable. If you choose to use a variable, be sure that the values resolve to values sent in the APM data.

      Note: If you selected more than one service to map, the drop-down displays only the fields that are common to all selected services.

   You can now test your mapping or add exceptions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. **Optional:** If some of your entities use different key names or values, create exceptions to the default policy by configuring them in the Exceptions card.
7. Test the mapping.
   The **Mapping preview** panel shows the test results for the first service mapped. Service Observability sends a request through the connection and returns the entities found using the provided mapping. If you created an exception using a different source, the panel shows the results from each source separately. If the results don't seem correct, try reconfiguring the mapping by changing the tag key or value.

   If you have more than one service mapped, use the **Service** drop-down menu to select and test a different service.
8. Select **Save mapping**.

Result

On the **Observability** tab of the Service details page, dashboards and charts appear for the entities found from the mapping.

Customize Service Observability dashboard templates

You can customize the Service Observability dashboards on both the Overview and Observability tabs of the Service Details page. You can change or add metrics and related data to fit your business needs.

Service Observability dashboards are built using templates specific for each Application Performance Monitor (APM) vendor and entity tab. They're built using Platform Analytics, letting you customize templates to meet your business needs. For example, you might want to display metrics from your APM vendor that aren't available by default.

The Service Observability dashboards use APM-specific templates. You can see what each template displays by default from its respective reference topic.

- Amazon CloudWatch templates for Service Observability
- AppDynamics templates for Service Observability
- Azure Monitor templates for Service Observability
- Datadog templates for Service Observability
- Dynatrace templates for Service Observability
- New Relic templates for Service Observability
- Prometheus templates for Service Observability
- SolarWinds templates for Service Observability
- Splunk templates for Service Observability

Note: When you make a customization, you're changing the template and not the individual service's dashboard. This means that dashboards for any services that also use the same data source are also changed.

Along with APM data, you can also add charts for data from ServiceNow tables and also from data stored in the MetricBase and Health Log Analytics applications.

When you customize a template, a copy of the original is saved so that you can reimplement it if needed. Default dashboards display a `Certified` tag.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Creating APM queries for a chart

When you edit or add a chart on a dashboard, you use the Edit data source page of Platform Analytics to create a query. You use the built-in query editor for simple metric queries and the Advanced mode to paste a query copied from a chart in your APM vendor instance.

Service Observability dashboards are scoped to the service currently displayed in the Service Details page. If you want to use a single query for multiple services and entities and any time range, you can replace hard-coded values with Service Observability template variables.

Add ServiceNow Tables

You can include data from ServiceNow problem records and business application records to dashboards and the data is scoped to the selected service.

Add MetricBase data charts

You can add charts based on data stored in the MetricBase application. The data is scoped to the selected service.

Add Health Log Analytics data charts

You can add charts based on data stored in the Health Log Analytics application. The data is scoped to the selected service.

Edit APM data charts on Service Observability dashboard templates

Edit Service Observability dashboard templates to view different APM vendor metrics on the Overview or Observability tabs' charts.

About this task

When creating an APM chart, you can use the query builder to create simple queries or use the advanced mode to create more substantial queries.

Use simple queries to return metrics associated with services, hosts, and databases. The returned metrics are aggregated across the time window set by the user.

Use advanced query mode to cut and paste queries from existing APM charts into Service Observability. For most APM vendors, you can simply copy a query from an existing chart in your APM instance.

Both query types support template variables that let you use the same query to return metrics for multiple entity instances.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Trouble?
If charts are displaying error messages, see Chart error states.

2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit Platform Analytics dashboard elements.
4. To add an APM query for a new chart, follow these steps:
   a. In Edit mode, select **Add new element** and choose **Data visualization** > **New visualization**.
   b. In the **Configuration panel**, select `Line` for **Visualization type** and choose **Add data source**.
   c. In the **Add data source** page, open **Service Observability** in the navigation panel and select your APM vendor.
   Be sure to select the same APM vendor used on the template you're editing.
   d. Enter a query in the **Metric** card.

      Use the query builder to edit a simple APM-specific query.

      To copy a full query from your APM vendor chart, activate the **Advanced** switch and paste in a query from your APM vendor chart.

      For AWS and Azure, instead of entering a query in advanced mode, you can import selected charts from an existing dashboard. Select **Import from AWS/Azure Dashboard**. Select a data source name, then select a dashboard and from the list of charts, select the one to import, then select **Import query**. The query for the chart is pasted into the Query box.

      Use template variables to replace any hard-coded entities or time periods to have the query return results that match both the service and time period selected in the UI.

      Note: Use the **Docs** link to refer to the APM-specific documentation for help with creating the query.
   e. To preview your query, select **Run** and then choose a service and entity.
   f. When satisfied with your query, select **Add this source** to add the chart to the template.
5. To edit an existing query, follow these steps.
   a. In Edit mode, select the chart to edit.
   b. In the **Data sources** section of the Configuration panel, use the **More actions** menu to select **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **Edit data source** page, edit the query in the **Metric** card.

Use the query builder to create a simple APM-specific query.

To copy a full query from your APM vendor chart, activate the **Advanced** switch and paste in a query from your APM vendor chart.

For AWS and Azure, instead of entering a query in advanced mode, you can import selected charts from an existing dashboard. Select **Import from AWS/Azure Dashboard**. Select a data source name, then select a dashboard and from the list of charts, select the one to import, then select **Import query**. The query for the chart is pasted into the Query box.

Use template variables to replace any hard-coded entities or time periods.

Note: Use the **Docs** link to refer to the APM-specific documentation for help with creating the query.

d. To preview your query, select a service and an entity and select **Run**.

e. When satisfied with your query, select **Apply** to add the chart to the template.

6. When done customizing, select **Save** and then **Exit editing mode.**
7. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Edit ServiceNow data on Service Observability dashboard templates

Edit Service Observability dashboard templates to view data from problem and business app records on the Overview or Observability dashboards.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.

3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit Platform Analytics dashboard elements.
4. To add a new ServiceNow table, follow these steps:
   a. In Edit mode, select **Add new element** and choose **List**.
   b. In the **Configuration panel** in the **Data sources** section, choose **Add data source**.
   c. In the **Add data source** page, find the **Table** whose data you want to display and choose **Add this source**.
   d. In the **Columns and rows** section, add and arrange the columns to display.
5. To edit an existing chart, follow these steps.
   a. In Edit mode, select the chart to edit.
   b. In the **Data** section of the Configuration panel, verify that the correct table is selected in **Table** field.
   c. In the **Columns and rows** section, add and arrange the columns to display.
6. When done customizing, select **Save** and then **Exit editing mode.**
7. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Add MetricBase charts to Service Observability dashboard templates

Add MetricBase data to charts on Service Observability dashboard templates when you want to view those metrics in context of Service Observability.

About this task

You can add metrics that are stored in the MetricBase application to your Service Observability dashboards. These charts display with data scoped to the selected service.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.

3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit Platform Analytics dashboard elements.
4. To add a new chart with MetricBase data, follow these steps:
   a. In Edit mode, select **Add new element** and choose **Data visualization**, select **New Visualization**, and then select **Line**.
   b. In the **Data sources** section of the Configuration panel, select **Add data source**.
   c. In the **Add data source** page, navigate to **MetricBase** > **Monitorable Item** and select the data to display, and then choose **Add this source**.
   The data is added to the dashboard.
   d. Use the controls in the **Data** section of the Configuration panel to select the metric and configure the query.
5. When done customizing, select **Save** and then **Exit editing mode.**
6. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Add Health Log Analytics data

Add a graph showing logs from Health Log Analytics (HLA) in a Service Observability dashboard.

About this task

You can add logs from HLA to your Service Observability dashboards. These charts display with data scoped to the selected service.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you're editing a certified template, select **Duplicate**.
- If you're editing a custom template, select **Edit**.

> **Note:** Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.

3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit Platform Analytics dashboard elements.
4. To add a new chart with HLA data, follow these steps:

   a. In Edit mode, select **Add new element** and choose **Data visualization**, select **New Visualization**, and then select **Line**.

   b. In the **Data sources** section of the Configuration panel, select **Add data source**.

   c. In the **Add data source** page, navigate to **Health Log Analytics** > **Log components**.

   d. Enter a saved search or select a component and then optionally add conditions or a Lucene query, as described in Step 5 of Create log data dashboards and visualizations.

   e. Once the filter is correct, choose **Add this source**.
   The data is added to the dashboard.

   f. Use the controls in the **Data** section of the Configuration panel to further configure the chart.

5. When done customizing, select **Save** and then **Exit editing mode.**
6. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Use synthetic monitoring with Service Observability

Create a synthetic monitor to test your service's endpoints. Then display the results by customizing a Service Observability dashboard.

Overview of using synthetic monitoring with Service Observability

Synthetic monitoring simulates user transactions on a service's HTTP endpoints, enabling you to identify performance bottlenecks, help confirm up-time, and optimize user experiences. It continually calls a service's endpoint to test availability, response times, or the presence of a defined string in the response body. When a test fails the configured criteria, it can send an alert. For more information about synthetic monitoring, see Exploring synthetic monitoring.

The results of the monitor's test can be added to the Service Observability Overview dashboard and to the Observability Service dashboard. To view synthetic data related to a service on a dashboard, you first create a monitor that tests the endpoints of your service. Then you customize a dashboard template to add the monitor's test results.

> **Note:** When you customize the template to add synthetic monitoring, you're adding it to all dashboards that use that template. Services that don't have a configured monitor display an empty chart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Create a synthetic monitor to test a service.

   Install and configure synthetic monitoring and then create a monitor to continually test your service's endpoints using status code, response time, or response body as criteria.

2. Add synthetic monitor results to a Service Observability dashboard

   Customize a Service Observability dashboard template to add synthetic monitoring test results.

Create a synthetic monitor to test a service

Install and configure synthetic monitoring and then create a monitor for your service.

Before you begin

Your service must have an HTTP-reachable endpoint, configured as a CI in the HTTP(S) Endpoints [cmdb_ci_endpoint_http] table of the Configuration Management Database (CMDB).

Role required: n_sow_svcobs.admin, sn_sow_synthetics.synthetics_admin

Procedure

1. Install synthetic monitoring.
   See Install synthetic monitoring for more information.
2. If needed, create a location to run the monitor from.
   Monitors can be run locally from a ServiceNow Glide instance or from your environment using either a cluster of Agent Client Collector (ACC) agents or from a MID Server. If you choose to run them from your environment, you must create a location. See Create synthetic monitoring locations for more information.
3. Create the monitor.
   Follow the steps in Create and edit a synthetic monitor. Be sure to select the service you want to monitor as the **Related service CI**.

What to do next

Once you create the monitor, it begins running tests. View the results of those tests to verify the results before embedding synthetic monitoring into a Service Observability dashboard. For more information about viewing monitor test results, see Identifying system issues with synthetic monitoring.

Once you have expected results, move on to Add synthetic monitor results to a Service Observability dashboard.

Add synthetic monitor results to a Service Observability dashboard

Add a synthetic monitor to a dashboard in Service Observability by customizing an existing dashboard template.

About this task

Once you have created monitors for your services, you can display those results on your Service Observability dashboards by customizing the template to include a chart that queries synthetic monitoring. You can add synthetic monitoring to either the Overview dashboard or the Observability > Service dashboard.

Note: When you customize the template to add synthetic monitoring, you're adding it to all dashboards that use that template. Services that don't have a configured monitor display an empty chart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_sow_svcobs.admin

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To add a new ServiceNow table, follow these steps:
   a. In Edit mode, select **Add new element** and choose **List**.
   b. In the **Configuration panel** in the **Data sources** section, choose **Add data source**.
   c. In the **Add data source** page, search for and select the synthetic monitoring data source, depending on the data you want to display.
   - If you want to display the status of all tests associated with a service, select the `Single API` [sn_synthetics_check_single_api] table.
   - If you want to display the results of a single synthetic test for a service, select the `Single API Result` [sn_synthetics_check_single_api_result] table.

   Note: Leave the **Follow filters** check box selected. This control enables the chart to display information for the selected service.
4. In the **Default display** section, choose **Add** to begin adding columns from the table to the new list.
5. Choose **Save** and then **Exit editing mode** to return to the dashboard.
   The synthetic monitoring data now appears on the dashboard.

What to do next
For detailed instructions about editing dashboards, see Edit Platform Analytics dashboard elements.

Monitoring services and investigating issues

Operators use Service Observability to monitor the health of their services and to triage and manage incidents. They can view performance metrics from external application performance

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

management (APM) systems in the context of an application service and its related CIs (Configuration Item).

Overview of using Service Observability

Service Observability can display metrics from an APM instance in context of a service. Along with metrics for the service and information about related CIs, Service Observability can infer entities related to the service, like a host or database, and display their metrics. This functionality gives an operator a more holistic view of what might be affecting performance.

The **Overview** tab on the Service Details page shows high-level performance metrics for the service and other contextual information such as open alerts or incidents affecting the service. The **Observability** tab displays more detailed metrics from the APM for the service, along with metrics for inferred entities that are found through data mappings configured during setup. It also shows information about CIs related to those inferred entities. Instead of having to switch to an external tool, an operator can view those external metrics in the context of the Service Operations Workspace (SOW).

- View overall service health

  In the **Overview** tab of the Service Details page in the SOW, view overall service health and related information, like alerts and changes.

- View service health metrics

  In the **Observability** tab, view more detailed service metrics, as well as metrics from related APM-monitored entities such as databases and hosts.

View overall service health

View overall service health and related events, like alerts and changes, with the **Overview** tab on the Service Details page in the SOW.

Before you begin

- For version 1.5, a service must be activated. For more information, see Activate teams and services.
- A data mapping must be configured. For more information, see Create and manage data mappings.

Role required: operator [snc_sow_svcobs.manager]

About this task

When you have been notified that a service is experiencing performance issues, you can begin your investigation with the **Overview** tab on the Service Details page.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Trouble?
If charts are displaying error messages, see Chart error states.

2. Use the charts in the Overview section to help determine where there might be performance issues.
   The Overview section shows the basic rate, error, and duration (RED) metrics along with metrics for key transactions found on the service. Hover over a metric to view more details.

   Note: If more than one service is found with the same name, select an individual service using the **All services** drop-down menu.

3. Change the time period using the time picker.
4. Use the other charts on the page to view related information about the service, such as recent changes, open incidents, and trends for incidents and alerts.
   These charts help explain whether recurring incidents or alerts might be caused by performance issues on the service. For detailed information about using this page, refer to the corresponding Overview templates for your Application Performance Management (APM) vendor described in Service Observability templates.

What to do next

To view more detailed metrics and metrics for related entities, select the **Observability** tab. For more information, see View service health metrics.

View service health metrics

View detailed metrics for a service, as well as metrics from related entities, such as databases and hosts, on the **Observability** tab in SOW.

About this task

The **Observability** tab on the Service details page displays metrics for related entities inferred from external application performance management (APM) instances, enabling you to view related metrics without having to leave the ServiceNow platform.

The metrics are grouped by the following entity types:

- Application metrics: Metrics associated with the application services
- Computer metrics: Metrics associated with the hosts of the service
- Databases: Metrics associated with databases used by the service

For example, say you have metrics from New Relic used to monitor services, databases, and hosts. Say that you also have an issue with the `checkout` service and want to view performance information and metrics related to that service. Service Observability can show you the service, database, and host metrics related to that service that are coming from New Relic, along with related CI information from the ServiceNow platform. Each entity type has its own dashboard and each metric and related CI information has its own chart.

Before you begin

- For version 1.5.0, a service must be activated. For more information, see Activate teams and services.
- A data mapping must be configured. For more information, see Create and manage data mappings.

Role required: operator [snc_sow_svcobs.manager]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Select the **Observability** tab.
   The **Observability** tab shows the related metrics and CI information available for the service. Use the navigation pane to view the entity dashboards.

   Note: If you don't see navigation options for an entity, then the metrics for that entity haven't been discovered or mapped.

3. Select an entity to view its dashboard.
   You can do the following with the charts:
   - Display metrics for a single entity by electing the **All [entity type]** drop-down list and choosing an entity.

     Note: If more than one entity returned metrics, charts display multiple lines with one line for each entity.

   - Display metrics from a different time period using the time picker. The default time period is the last hour.
   - Refresh the charts to the current time period of the last hour by selecting the **Refresh** button.
   - Hover over a point to view detailed information.

   For detailed information about using this page, refer to the corresponding Observability templates for your APM vendor described in Service Observability templates.

Service Observability reference

Reference topics provide additional information about administering and using Service Observability.

Components installed with Service Observability

Several types of components are installed with activation of the Service Observability plugin, including tables and user roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed

Role title [name]	Description	Contains roles
Operator/ Operations manager [snc_sow_svcobs.manager]	Triages incidents in the SOW. Views basic health metrics for a service and more detailed service metrics from related entities.	• sn_sow_srm.srm_responder • connection_admin • evt_mgmt_connector_instance_write
Service Observability admin [sn_sow_svcobs.admin]	Configures data sources and adds data mappings. Customizes dashboard templates.	• sn_sow_srm.srm_admin • connection_admin • evt_mgmt_connector_instance_write • sn_sow_itsm_admin.sow_admin_user

Store applications installed

The following are installed when you install Service Observability.

Store application [plugin]	Description
Service Observability UI [sn_service_obs_ui]	The Overview and Observability tabs in the Service Details page of the SOW.
Service Reliability Management	Service Reliability Management and Service Observability display service performance metrics together to give a holistic view into service health.
Platform Analytics	Enables customizing the dashboards.

Tables installed

Table	Description
Dashboard fragments [sn_sow_svcobs_dashboard_fragments]	Contains the definitions of dashboards in JSON format.
Service to data mapping configuration map [sn_sow_svcobs_svc_to_config_map]	Associates data mapping configurations with a registered service using the CMDB Group Contains Configuration Item [cmdb_group_contains_ci] table.
Data mapping configurations [sn_sow_svcobs_mapping_config]	Defines a data mapping configuration for a service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Data mapping configuration rules [sn_sow_svcobs_mapping_config_rules]	Defines a single tag-based mapping rule.
Observability data source [sn_sow_svcobs_data_source]	Defines a third-party APM vendor data source (an `http_connections`) that can be used to get telemetry for services.
Service Observability entity records [sn_sow_svcobs_entity_records]	Records configuration items and unknown monitored objects for entities that appear in dashboards.
Service Observability PA Dashboards sn_sow_svcobs_pa_dashboards	Contains reference information for customized dashboards.

Domain separation and Service Observability

Domain separation is supported for Service Observability. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation and Service Observability overview

Domain separation is present in all aspects of the synthetic monitoring application. Users belonging to a specific domain see only the data existing in their own domain.

How domain separation works in Service Observability

When data is separated by domains in Service Observability, users can only configure and see the observability data in their own domain. By default, all users and records are set to the parent domain unless the admin assigns them to a specific domain.

You define the domain-separated environment when you configure your data inputs. All relevant records and data processing in the Service Observability program flow reside in the same domain as the data input. The domain name of a data input appears in the Domain column that is displayed in the tables in your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability manages all aspects of the data, such as the data mappings and the data displayed on dashboards. When a property is changed, the new value affects new sources only in the specific domain.

Domain separation for service providers

APM vendor entity mappings for Service Observability

Understand how Service Observability maps service, host, and database entities to your Application Performance Management (APM) vendor resources.

Service Observability displays metrics from your APM vendor for services, hosts, and databases on the Observability dashboards based on the key:value pairs in the mapping rules you create during configuration. Service Observability sends a request to the APM vendor using that mapping as a filter to find related entities. Any additional filtering needed to find the entities is noted in the following sections.

Amazon CloudWatch entity mapping

Resources are returned using the AWS `GetResources` API.

Service Observability entity category	Service Observability entity dashboard	AWS resource
Application	API Gateway - HTTP	API Gateway HTTP APIs
	API Gateway - REST	API Gateway REST APIs
	ELB	ELB application load balancers
	Lambda	Lambda functions
Compute	Host	EC2 instances
Databases	RDS	RDS database instances

AppDynamics entity mapping

Resources are returned using the value of the `entityName` property.

Service Observability entity category	Service Observability entity dashboard	AppDynamics resource
Application	Service	AppDynamics applications returned by the `/controller/rest/applications/` API
Compute	Host	Server nodes for applications returned by the `/controller/sim/v2/user/machines/keys/` API
Databases	MySQL	MySQL database instances returned by the `/controller/`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	AppDynamics resource
		`rest/databases/collectors/`
	PostgreSQL	MySQL database instances returned by the `/controller/rest/databases/collectors/`

Azure entity mapping

Resources are returned using the Azure `ResourceGraph` API.

Service Observability entity category	Service Observability entity dashboard	Azure resource
Application	Service	• `Microsoft.Compute/cloudServices` • `Microsoft.Web/sites`
Compute	Host	`Microsoft.Compute/virtualMachines`
Databases	MySQL	• `Microsoft.DBforMySQL/servers` • `Microsoft.DBforMySQL/flexibleServers`
	PostgreSQL	• Microsoft.DBforPostgreSQL/servers • `Microsoft.DBforPostgreSQL/flexibleServers`

Datadog entity mapping

Service Observability entity category	Service Observability entity dashboard	Datadog resource
Application	Service	Entities returned from the Software Catalog: List Entities API

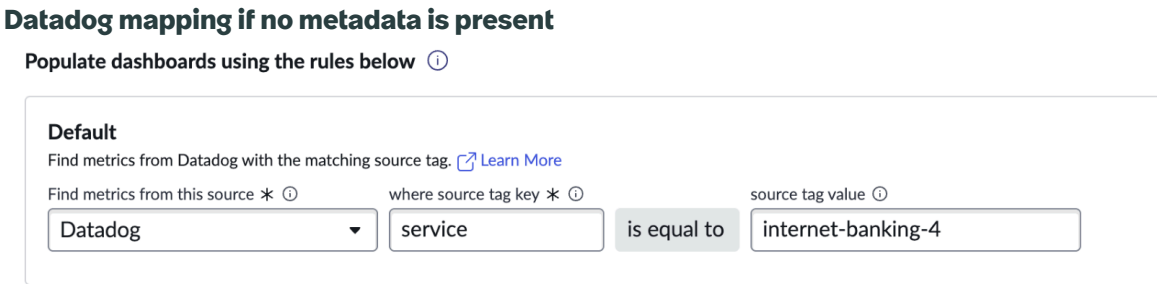
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	Datadog resource
Compute	Host	Hosts returned from the Hosts: List Hosts API
Databases	MySQL	Databases returned by filtering the `mysql.net.max_connections` metric, filtered by the provided key:value pair in the data mapping. **Note:** If your databases don't emit this metric, they aren't mapped.
	PostgreSQL	Databases returned by filtering the `postgresql.connections` metric, filtered by the provided key:value pair in the data mapping. **Note:** If your databases don't emit this metric, they aren't mapped.

Items of note:

- Service entities: The `Software Catalog list entities` API only returns data for services that include metadata. If you want to map services that don't include metadata, you must create a mapping using `service` as the tag and the name of the service as the value.

  For example, say you have a service named `internet-banking-4` that you want to use in a mapping and it doesn't contain metadata. You set up the mapping as shown in this screenshot.

- Default dashboard templates: The Requests, Errors, and Latency charts on the Overview and Observability dashboard templates are created using the Datadog `trace.http.request` trace metric. If a service isn't emitting that metric, no data is found. You can customize the template to use a different trace metric query. See Customize Service Observability dashboard templates for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynatrace entity mapping

Service Observability entity category	Service Observability entity dashboard	Dynatrace resource
Application	Service	Services
Compute	Host	Hosts
Databases	MySQL	MySQL database instances
	PostgreSQL	PostgreSQL database instances

New Relic entity mapping

Service Observability entity category	Service Observability entity dashboard	New Relic resource
Application	Service	APM application services
Compute	Host	Hosts
Databases	MySQL	MySQL database instances
	PostgreSQL	PostgreSQL database instances

Prometheus entity mapping

Service Observability entity category	Service Observability entity dashboard	Prometheus resource
Application	Service	Applications
Compute	Host	Server nodes for applications
Databases	MySQL	MySQL database instances
	PostgreSQL	PostgreSQL database instances

SolarWinds entity mapping

Service Observability entity category	Service Observability entity dashboard	SolarWinds resource
Application	Service	APM application services
Compute	Host	Hosts

Splunk entity mapping

Resources are returned using the Splunk Metric time series Metadata API. Service Observability searches for matching key:value pairs in custom properties and then falls back to searching dimensions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The returned payload is then filtered by the presence of a specific metric in the metadata that corresponds with an entity type.

Service Observability entity category	Service Observability entity dashboard	Splunk Property or dimension	Splunk metric used for filtering
Application	Service	• Property: `sf_service` • Dimension fallback: `service.name`	`sf_metric:service.request`
Compute	Host	• Property: `host.name` • Dimension fallback: `host.id`	`sf_metric:disk.summary_util`
Databases	MySQL	• Property: `mysql.instance.name` • Dimension fallback: `mysql.instance.endpoint`	`sf_metric:mysql.threads`
	PostgreSQL	Not supported	

Advanced query support for AWS and Azure

Understand how to create advanced queries for Service Observability dashboard charts.

Advanced queries in Service Observability support most vendor-specific query languages. Simply copy a query from the APM chart and paste it into the Advanced query field in Service Observability. However, queries to AWS and Azure must be JSON-formatted and follow the guidelines outlined in this topic.

Note: As of version 1.10, you can import charts directly from AWS and Azure. See Edit APM data charts on Service Observability dashboard templates for more information.

AWS advanced queries

Data from AWS is accessed using the `GetMetricData` API. Queries can be either a direct request in JSON format to that API or they can be in the form of a `DashboardBody` metric widget. For example, you can use the widget representation for a chart that exists on an AWS CloudWatch dashboard.

Example: Direct GetMetricData request

The following example shows a `GetMetricData` JSON query for a chart that displays the average CPU Utilization for an ELB instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{

    "StartTime": 1637061900, // can be replaced with “${START}”
    "EndTime": 1637074500, // can be replaced with “${END}”
    "MetricDataQueries": [
        {
            "Expression": "SELECT AVG(CPUUtilization) FROM
 SCHEMA(\"AWS/EC2\", InstanceId)",
            "Id": "q1",
            "Period": 300,
            "Label": "Cluster CpuUtilization"
        },
        {
            "Id": "m1",
            "Label": "Unhealthy Behind Load Balancer",
            "MetricStat": {
                "Metric": {
                    "Namespace": "AWS/ApplicationELB",
                    "MetricName": "UnHealthyHostCount",
                    "Dimensions": [
                        {
                            "Name": "LoadBalancer",
                            "Value":
 "app/EC2Co-EcsEl-EXAMPLE69Q/fdd2210e799e4376" // can be
 replaced with “${ENTITIES}” or “${ENTITIES_ELB}”
                        }
                    ]
                },
                "Period": 300,
                "Stat": "Average"
            }
        }
    ]
}
```

Example: Copied source for a single object in an AWS CloudWatch dashboard

This example shows the JSON copied directly from a single object in the widgets list of the Source view for a CloudWatch dashboard.

```
{
  "type": "metric",
  "x": 9,
  "y": 0,
  "width": 15,
  "height": 5,
  "properties": {
    "view": "timeseries",
    "metrics": [
      [ "AWS/ApplicationELB", "RequestCountPerTarget",
 "TargetGroup", "targetgroup/api-tg/1e3dc9z72fe21ca2",
 "AvailabilityZone", "us-west-1a" ],
      ["...", "targetgroup/api-tg-cs/82a1db5f950073e1", ".",
 "." ]
    ],
    "region": "us-west-1"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }
}
```

Both types of queries can use template variables to represent a set of entities or the start and end time selected in the UI. For example, instead of querying for a single ELB instance, you can replace the `Value` field for the `LoadBalancer` dimension with `${ENTITY_ELB}`. The query is run against each ELB instance associated with the selected service in the Service Observability UI. The chart displays a time series for each one.

Note: JSON objects copied from the source of a CloudWatch dashboard don't include explicit time fields. The values from the time picker in the Service Observability UI are used automatically.

Template variables

AWS field	Template variable
`Dimensions[n].Value`	• `ENTITIES` • `ENTITIES_HOST` • `ENTITIES_LAMBDA` • `ENTITIES_API_GATEWAY_HTTP` • `ENTITIES_API_GATEWAY_REST` • `ENTITIES_ELB` • `ENTITIES_RDS` The `Dimensions[n].Value` field must be a resource identifier key.
`StartTime`	`START`
`EndTime`	`END`

Azure advanced queries

You run an advanced query for an Azure-based chart by copying the source from the Azure UI and pasting it in the **Advanced query** field.

To copy the source:

1. In the Azure UI, export and download the dashboard.
2. Copy the JSON for a single chart. Charts are located at `properties.lenses[i].parts[j].metadata.settings.content.options.chart`.
3. Paste the JSON into the query field. The JSON must include at least the following:

```
```
{
“metrics”: [
  “name”: string,
  “resourceMetadata”: {
    “id”: string
    }
  ]
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
```

```
}
```

The `id` field must be either an Azure resource ID or a template variable.

Service Observability template variables

Understand the template variables that you can use in your queries when editing Service Observability dashboards and charts.

You can use the following template variables in your query. Variables enable the query to be used for multiple services, hosts, and database instances, as well as for the time period currently selected for the dashboard.

Note: Amazon CloudWatch uses slightly different template variables. See Advanced query support for AWS and Azure for more information.

Aside from the variables listed below, you can also use any tag key used in the chart's data mapping as a template variable.

Template variables

Variable	Description
`{$ENTITIES_HOST}`	Returns metrics for the selected host
`{$ENTITIES_MYSQL}`	Returns metrics for the selected MySQL instance
`{$ENTITIES_POSTGRESQL}`	Returns metrics for the selected PostgreSQL instance
`{$ENTITIES_SERVICE}`	Returns metrics for the selected service.
`{$ENTITIES}`	Returns metrics for the selected entity; either service, host or database.
`{$START_TIME}`	Returns metric time series using the selected start time.
`{$END_TIME}`	Returns metric time series using the selected end time.

Example query

Let's say you're using NewRelic and you create a data mapping that maps the key `service` to the value `checkout-service`.

A simple query built using the query builder might look like this:

```
rate(count(apm.service.transaction.duration), 1 minute
```

It would return the rate of transactions for the `checkout-service` service.

Instead you might use a full vendor query like this:

```
SELECT rate(count(apm.service.transaction.duration), 1
 minute) as 'Web throughput' FROM Metric WHERE (entity.guid
 = 'NDc2NDMyNXxBUE18QVBQTElDQVRJTO58MTA3NjIyODQwMw') AND
 (transactionType = 'Web') LIMIT MAX SINCE 30 minutes ago
 TIMESERIES UNTIL now
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

It would return the duration for the hard-coded NDc2NDMyNXxBUE18QVBQTE1DQVRJT058MTA3NjIyODQwMw entity from the last 30 minutes.

To create a query that would return the time series for any selected service at any time period, you can replace the entity and times with template variables:

```
SELECT average(convert(apm.service.transaction.duration, unit,
 'ms')) as metricValue,
 average(convert(apm.service.transaction.duration, unit, 'ms'))
 - 100 as loop FROM Metric WHERE entity.guid IN (${ENTITIES})
 FACET entity.guid, entity.name SINCE ${START} UNTIL ${END}
 TIMESERIES LIMIT 25
```

Service Observability templates

View the templates for your Application Performance Management (APM) vendor to understand the default dashboards provided by Service Observability.

See Customize Service Observability dashboard templates for information about customizing these templates.

Amazon CloudWatch templates for Service Observability

Templates used to create Amazon CloudWatch dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Amazon CloudWatch Overview tab for Service Observability

Information that is displayed on the Amazon CloudWatch **Overview** tab of the Service Details page in the SOW.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Invocations	Aggregate rate of transactions through the service.	AWS
Errors	Number of transactions that have an error.	AWS
Duration	Aggregate duration of transactions through the service, in milliseconds.	AWS

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related Configuration Items (CIs) that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
All active alerts	Listing of active alerts that affect this service.	CMDB

Amazon CloudWatch Observability tab for Service Observability

Dashboard and charts on the Amazon CloudWatch tab of the Service Details page in the SOW.

Application dashboards

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

API Gateway - HTTP

Chart	Description	Data source
Request Count	Aggregate rate of transactions through the service, per minute.	AWS
Latency	Aggregate duration of transactions through the service, in milliseconds.	AWS
4xx Errors	Number of errors returned with a status of 4xx.	AWS
5xx Errors	Number of errors returned with a status of 5xx.	AWS

API Gateway - REST

Chart	Description	Data source
Request Count	Aggregate rate of transactions through the service, per minute.	AWS

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API Gateway - REST (continued)

Chart	Description	Data source
Latency	Aggregate duration of transactions through the service, in milliseconds.	AWS
4xx Errors	Number of errors returned with a status of 4xx.	AWS
5xx Errors	Number of errors returned with a status of 5xx.	AWS

ELB

Chart	Description	Data source
Request Count	Aggregate rate of transactions through the service, per minute.	AWS
Latency	Aggregate duration of transactions through the service, in milliseconds.	AWS
4xx Errors	Number of errors returned with a status of 4xx.	AWS
5xx Errors	Number of errors returned with a status of 5xx.	AWS

Lambda

Chart	Description	Data source
Errors	Number of errors reported by the Lambda function.	AWS
Duration	Aggregate duration of transactions through the service, in milliseconds.	AWS
Invocations	Number of Lambda invocations executed by this service.	AWS

Compute dashboards

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed by this service.	AWS

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Host (continued)

Chart	Description	Data source
Disk Write Bytes	Number of bytes written to the database by this service.	AWS
Disk Read Bytes	Number of bytes read from the database by this service.	AWS
Network In Bytes	Amount of incoming network traffic in bytes for this service.	AWS
Network Out Bytes	Amount of outgoing network traffic in bytes for this service.	AWS
All EC2 VM Instances	Information for all EC2 VM instances the service is actively using. Select a link to view more detailed information.	CMDB
All Active Servers	Information for all servers the service is actively using. Select a Server link to view more detailed information.	CMDB

Database dashboards

This dashboard displays metrics for RDS databases related to the service.

RDS

Chart	Description	Data source
CPU utilization	Percent of the database's processing power being consumed by this service.	AWS
Free Memory	Amount of memory in bytes available on this database.	AWS
Free Storage	Amount of storage in bytes available on this database.	AWS
Current Connections	Number of connections from this service to the database.	AWS
Read Latency	Time taken in milliseconds for read operation from the database to complete.	AWS
Write Latency	Time taken in milliseconds for write operation from the database to complete.	AWS
All RDS Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

AppDynamics templates for Service Observability

Templates used to create AppDynamics dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

AppDynamics Overview tab for Service Observability

Information that is displayed on the AppDynamics **Overview** tab of the Service Details page in the SOW.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Average Response Time	Average rate of transactions through the service.	AppDynamics
Errors per Minute	Rate of errors per minute on transactions for the service.	AppDynamics

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

AppDynamics Observability tab for Service Observability

Dashboard and charts on the AppDynamics Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service

Chart name	Description	Data source
Average Response Time	Average rate of transactions through the service.	AppDynamics
Errors per Minute	Rate of errors per minute on transactions for the service.	AppDynamics
Calls per Minute	Number of calls to the server, per minute.	AppDynamics
Number of slow calls	Number of calls to the server that have a response time slower than the set slow threshold.	AppDynamics
Number of Very Slow Calls	Number of calls to the server that have a response time slower than the set very slow threshold.	AppDynamics

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU %Busy	Percent of the host processing power being consumed.	AppDynamics
Memory Used %	Percent of memory the host is using.	AppDynamics
Disk Reads/sec	Percent of disk space being used, per second.	AppDynamics
Disk Writes/sec	Percent of disk space being written to, per second.	AppDynamics
Network Incoming KB/sec	Number of kilobytes coming into the service, per second.	AppDynamics
Network Outgoing KB/sec	Number of kilobytes being sent by the service, per second.	AppDynamics
All Active Servers	Information for all servers the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MySQL

Chart	Description	Data source
Calls Per Minute	Number of database calls made by the service, per minute	AppDynamics
Time Spent in Executions	Number of seconds spent executing database calls by the service.	AppDynamics
DB Inserts	Number of database inserts by the service.	AppDynamics
DB Reads	Number of database reads by the service.	AppDynamics
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Calls Per Minute	Number of database calls made by the service, per minute	AppDynamics
Time Spent in Execution(s)	Time in seconds the database in execution mode for this service.	AppDynamics
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

Azure Monitor templates for Service Observability

Templates used to create Azure Monitor dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Azure Monitor Overview tab for Service Observability

Information that is displayed on the Azure Monitor **Overview** tab of the Service Details page in the SOW.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Requests	Aggregate rate of transactions through the service.	Azure
Response Time	Aggregate duration of transactions through the service, in milliseconds.	Azure
Http 5xx	Number of errors returned with a status of 5xx.	Azure

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status indicators section

The Status indicators section displays charts for related Configuration Items (CIs) that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
All Active alerts	Listing of active alerts that affect this service.	CMDB

Azure Monitor Observability tab for Service Observability

Dashboard and charts on the Azure Monitor Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service

Chart	Description	Data source
Requests	Aggregate rate of requests through the service.	Azure
Http 4xx	Number of transactions that have an HTTP 4xx response.	Azure
Response time	Aggregate duration of transactions through the service, in milliseconds.	Azure
Data Out	Volume in bytes of outgoing network traffic from this service.	Azure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service (continued)

Chart	Description	Data source
Http 2xx	Number of transactions that have an HTTP 2xx response.	Azure
Data In	Volume in bytes of incoming network traffic to this service.	Azure

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
Available Memory Percentage	Percent of the memory available to the service.	Azure
CPU %	Percent of the host processing power being consumed.	Azure
VM Cached Bandwidth Consumed Percentage	Percent of the virtual machine's cached bandwidth that the service is consuming.	Azure
All Active VM Instances	Information for all virtual machines (VM) the service is actively using. Select a VM link to view more information.	CMDB
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Storage %	Percentage of storage currently being consumed by the service.	Azure
CPU %	Percentage of CPU currently being consumed by the service.	Azure
Memory %	Percentage of memory currently being consumed by the service.	Azure
Active Connections	Number of connections currently used by the service.	Azure
Aborted Connections	Number of connections from the service terminated by the database	Azure
MySQL Uptime	Total time in seconds that this MySQL instance has been running since its last restart.	Azure
Slow Queries	Number of queries that take longer than the specified threshold to execute. This threshold is typically defined by the `long_query_time` parameter in MySQL.	Azure

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL

Chart	Description	Data source
Storage %	Percentage of storage currently being consumed by the service.	Azure
CPU %	Percentage of CPU currently being consumed by the service.	Azure
Memory %	Percentage of memory currently being consumed by the service.	Azure
Active Connections	Number of connections currently used by the service.	Azure
Aborted Connections	Number of connections from the service terminated by the database	Azure
Succeeded Connections	Number of successful connections from the service to the database.	Azure
Deadlocks	Number of deadlocks encountered by the service.	Azure
Is Database Alive	`1` if database is up, `0` if it is down.	Azure
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

Datadog templates for Service Observability

Templates used to create Datadog dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Datadog Overview tab for Service Observability

Information that is displayed on the Datadog**Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Request	Aggregate rate of transactions through the service.	Datadog
Errors	Percent of transactions that have an error.	Datadog
Latency	Aggregate duration of transactions through the service, in milliseconds.	Datadog

Transactions charts

The Transactions charts show metrics for specific key transactions on the service. The key transactions are determined by your Application Performance Management (APM) system configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
Requests	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Datadog
Errors	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Datadog
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Datadog

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

Datadog Observability tab for Service Observability

Dashboard and charts on the Datadog Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Host (continued)

Chart	Description	Data source
All Active VM Instances	Information for all virtual machines (VM) the service is actively using. Select a VM link to view more information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Max Connections	Maximum number of concurrent connections that can be established with the MySQL database server.	Datadog
Failed Connections	Number of failed attempts to connect to the MySQL server.	Datadog
Slow Queries Rate	Number of database queries that have been categorized as slow by the APM.	Datadog
Data Reads	Number of read operations performed on the MySQL database.	Datadog
Data Writes	Number of write operations performed on the MySQL database.	Datadog
Cache Utilization	Percentage of the cache memory being used by the MySQL database.	Datadog
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Connections	Total number of connections to the database server, including all connection states such as active, idle, and others.	Datadog
Connections Used	Number of connections to the database used by this service.	Datadog
Active Waiting Queries	Number of queries in the queue waiting to be executed.	Datadog
Deadlocks	Number of deadlocks encountered by the service.	Datadog
Rollbacks	Number of transactions rolled back by the service.	Datadog
Buffer Hits	Number of times disk blocks were found in the buffer cache, so that a read wasn't necessary.	Datadog
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

Dynatrace Observability tab for Service Observability

Dashboard and charts on the Dynatrace Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service Basic metrics

Chart	Description	Data source
Rate	Aggregate rate of transactions through the service.	Dynatrace
Error %	Percent of transactions that have an error.	Dynatrace
Latency	Aggregate duration of transactions through the service, in milliseconds.	Dynatrace
Client error rate	Rate of errors the service clients experienced.	Dynatrace
Client throughput	Rate of client requests for this service.	Dynatrace
Client response time	Response time for client requests on this service, in milliseconds.	Dynatrace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Basic metrics (continued)

Chart	Description	Data source
Total DB connections	Number of databases that this client has connections to.	Dynatrace
DB connection errors	Number of errors received by the client when trying to access databases.	Dynatrace
Time spent in database calls	Duration of requests to databases, in milliseconds.	Dynatrace

Service Transactions

Chart	Description	Data source
Key Request Count	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Dynatrace
Key Request Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Dynatrace
Key Request Response Time	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Dynatrace

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed.	Dynatrace
Memory utilization	Percent of memory the host is using.	Dynatrace
Disk utilization	Percent of disk space being used.	Dynatrace
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service basic metrics

Chart	Description	Data source
Rate	Aggregate rate of transactions through the service, per minute.	New Relic
Error %	Percent of transactions that have an error.	New Relic
Latency	Aggregate duration of transactions through the service, in milliseconds.	New Relic
Time spent in database calls	Duration of requests to databases, in milliseconds.	New Relic
Database throughput	Rate of database requests for this service, per minute.	New Relic
Time spent in database queries	Time spent querying the database, in milliseconds.	New Relic

Service transactions

Chart	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	New Relic
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	New Relic
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	New Relic

Compute dashboard

This dashboard displays metrics for hosts related to the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed.	New Relic
Memory utilization	Percent of memory the host is using.	New Relic
Disk utilization	Percent of disk space being used.	New Relic
All Active Servers	Information for all servers the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
CPU utilization	Percent of the database's processing power being consumed.	New Relic
Memory utilization	Percent of memory the database is using.	New Relic
Availability	Percent of time the database is available.	New Relic
Connections	Number of connections to the database.	New Relic
Slow queries	Number of database queries that have been categorized as slow by the APM.	New Relic
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Scheduled Checkpoints	Average number of scheduled checkpoints that were performed.	New Relic
Buffers Written for Checkpoint	Average number of buffers written during checkpoints.	New Relic
Buffers Written by Background Writer	Average number of buffers written by the background writer.	New Relic
Buffers Allocated	Average number of buffers allocated.	New Relic

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL (continued)

Chart	Description	Data source
Checkpoint Write Time	Time in milliseconds spent writing files to disk.	New Relic
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

Prometheus templates for Service Observability

Templates used to create Prometheus dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Prometheus Overview tab for Service Observability

Information that is displayed on the Prometheus **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Request Rate	Aggregate rate of transactions through the service, per second.	Prometheus
Error %	Percent of transactions that have an error.	Prometheus
Average Response Time	Average duration of transactions through the service, in seconds.	Prometheus

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
All Active alerts	Listing of active alerts that affect this service.	CMDB

Prometheus Observability tab for Service Observability

Dashboard and charts on the Prometheus Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service KPIs

Chart	Description	Data source
Request Rate	Aggregate rate of transactions through the service, per second.	Prometheus
Error %	Percent of transactions that have an error.	Prometheus
Average Response Time	Aggregate duration of transactions through the service, in seconds.	Prometheus
Throughput	Count of successful transactions, per second.	Prometheus
Active Requests	Count of current in-flight requests to the service.	Prometheus
Response Time (95th Percentile)	95th percentile response time for HTTP requests, in seconds.	Prometheus
Average Request Size	Average size of requests to the service, in bytes.	Prometheus
Average Response Size	Average size of responses from the service, in bytes.	Prometheus

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed.	Prometheus
Memory utilization	Percent of memory the host is using.	Prometheus
Disk utilization	Percent of the host disk being used.	Prometheus
All Active Servers	Information for all servers the service is actively using. Select a host link to view more detailed information.	CMDB
All Active VM Instances	Information for all virtual machines the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Thread Utilization %	Percent of the database's threads being consumed.	Prometheus
Queries Per Second	Number of queries made to the database by the service, per second.	Prometheus
InnoDB Memory %	Percent of InnoDB buffer pool being consumed.	Prometheus
Active Connections	Number of connections to the database.	Prometheus
Aborted Connections	Rate of aborted connections.	Prometheus
Uptime	Average number of hours the database has been available.	Prometheus
Inbound Network Traffic	Number of bytes per second of inbound traffic to the database.	Prometheus
Outbound Network Traffic	Number of bytes per second of outbound traffic to the database.	Prometheus
Slow Queries	Rate of slow queries detected by MySQL, per second.	Prometheus
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL

Chart	Description	Data source
Active Sessions	Count of sessions currently active.	Prometheus
Idle Sessions	Count of idle sessions.	Prometheus
Committed Transactions	Total committed transactions since server start.	Prometheus
Failed Transactions	Total rolled back transactions since server start.	Prometheus
Deadlocks	Total deadlocks detected since server start.	Prometheus
Locks Count	Current count of locks given out by the database.	Prometheus
Cache Hit Ratio	Percentage of database requests that can be served by the cache.	Prometheus
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

SolarWinds templates for Service Observability

Templates used to create SolarWinds dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

SolarWinds Overview tab for Service Observability

Information that is displayed on the SolarWinds **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Rate	Aggregate rate of transactions through the service.	SolarWinds
Error %	Percent of transactions that have an error.	SolarWinds
Latency	Aggregate duration of transactions through the service, in milliseconds.	SolarWinds

Transactions charts

The Transactions charts show metrics for specific key transactions on the service. The key transactions are determined by your Application Performance Management (APM) system configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	SolarWinds
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	SolarWinds
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	SolarWinds

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

SolarWinds Observability tab for Service Observability

Dashboard and charts on the SolarWinds Observability tab of the Service Details page in the SOW.

Note: The X axis on SolarWinds charts use Universal Time Code (UTC) instead of the user's timezone.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Database Dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Queries Per Second	Number of queries per second the service is sending to the database.	Splunk
Row Locks Rate	Frequency at which row locks are encountered by transactions from this service.	Splunk
Buffer Pool Usage	Usage of the buffer pool to access cached data by this service.	Splunk
Table I/O Wait Time	Time in milliseconds that the database is waiting on Input/Output operations on tables sent by this service to complete.	Splunk
Threads	Number of threads used by this service	Splunk
Uptime	Amount of time in (?) that the database has been running since its last restart.	CMDB

Service Observability data mapping form

Field descriptions for the Observability data mapping form. Use this form to map activated services in Service Observability to metrics from your application performance monitoring (APM)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

instance. Each service can be mapped only once, but can contain exceptions to include all related entities.

Field	Description
Mapping name	Name for the mapping. The name should be descriptive so that users understand where the data is coming from.
Services	Service to use for this mapping. Each service can be mapped only once. For version 1.5.0 of Service Observability, services must be activated to be mapped. To activate a service, see Activate teams and services.
Default	
Find metrics from this source	Existing data connection to use for metrics. To add a connection, see Connect a Service Observability data source.
where source tag key	Tag key that you want to map to the activated service. If you use more than one tag to represent a service, you can create an exception. For example, most tags use `service_name` except for database metrics, which use `service`.
source tag value	Value that represents the service name. Values can be strings or a variable that represents fields on the CI for the service. You can use variables on your APM data as the value to map multiple entities at once. For example, if your APM data uses the `$service_name` variable and you enter that as the **source tag value**, all services using that value are mapped.
Exceptions	
For entity type	Entity that uses a different key or value than the default.
Find metrics from this source	Existing data connection to use for metrics. To add a connection, see Connect a Service Observability data source.
where source tag key	Tag key that you want to map to the activated service for this entity.
source tag value	Value that represents the service name. Values can be strings or a variable that represents fields on the CI for the service.

Chart error states

Understand the different error states that the charts in Service Observability might display and how to fix them.

Error message	Fix
Set up this service's observability data mapping	Observability mapping hasn't been configured for the service by an admin. See Create and manage data mappings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

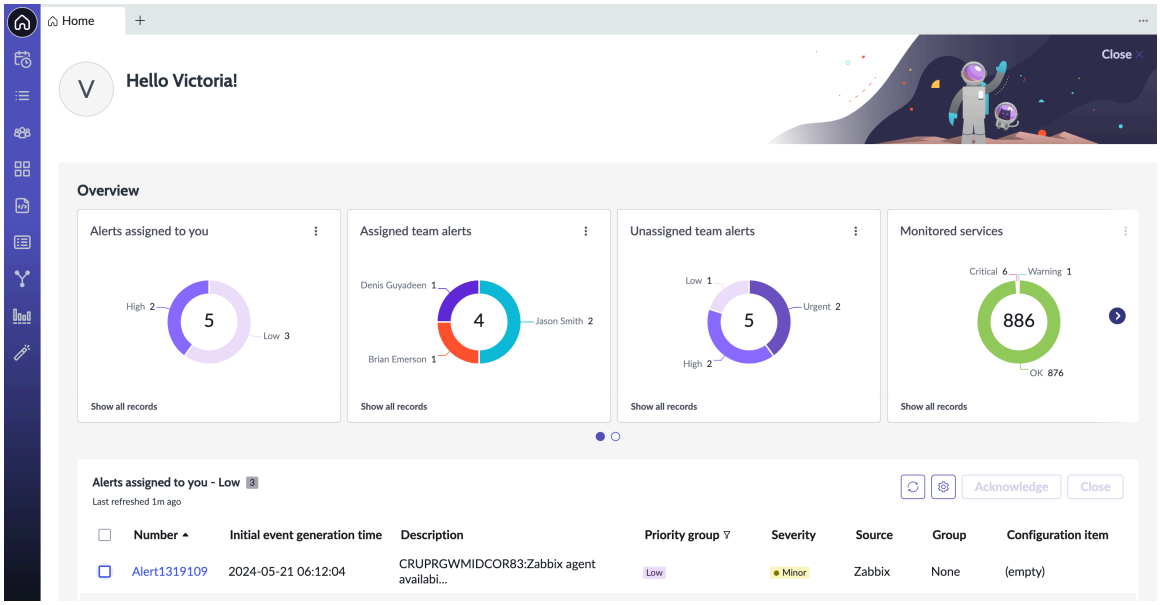
Error message	Fix
Data mapping is not configured	Observability mapping hasn't been configured for the service by an admin. See Create and manage data mappings.
Authentication failed	Service Observability can't connect to the data source. See Connect a Service Observability data source.
No results found	No metrics were found for the chart.
Something went wrong	Connection to the data source was successful, but the application performance management (APM) instance didn't respond. This error might be due to a connection timeout on the APM side.
No impacted systems found (Impacted systems chart on the Overview page)	Only services found on your service map can be displayed. Update your service map to include all services that should be included in the chart. See Service Mapping.
Set up objectives (SLO Error Budget chart on the Overview page)	SLOs haven't been configured for Service Reliability Management. See Create SLOs, SLIs, and error budget policies.

Service Operations Workspace for ITOM

ServiceNow® Service Operations Workspace (SOW) is a configurable workspace designed to streamline IT Operations Management (ITOM) workflows, offering a unified experience for multiple IT operational processes. Configurable and user-friendly, it consolidates various tasks into a single interface, allowing seamless navigation and easy access to tools and information.

By centralizing workflows, it enhances collaboration, facilitates efficient task management, and provides real-time insights through different metrics. Highly customizable, it enables you to tailor the workspace to your specific needs, optimizing productivity and workflow efficiency. With its comprehensive set of features, including automation and collaboration tools, Service Operations Workspace empowers users to work more effectively across different workflows, boosting productivity organization-wide. Scalable to accommodate evolving business needs, it ensures continued support for IT environments of all sizes, delivering superior services and driving operational excellence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For information regarding subscriptions for ITOM Service Operations Workspace, check the ITOM AIOps subscription at Subscription for ITOM Health.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

To know about the ITSM features, see Service Operations Workspace for ITSM.

Exploring Service Operations Workspace for ITOM

Discover how Service Operations Workspace for ITOM streamlines the entire life cycle of alerts, including alert generation, notification, grouping, analysis, investigation, resolution, and closure.

Overview of Service Operations Workspace

Service Operations Workspace for ITOM provides powerful AIOps Experience capabilities, namely the Express List, Integrations Launchpad, Alert Automation, and AIOps Dashboards, each delivering unique value.

Express List

Express List revolutionizes alert management by providing a consolidated platform for efficient triage, root cause analysis (RCA), and alert remediation. With real-time updates, dynamic filtering, and an intuitive preview pane, users can effortlessly manage their alert workflows and take immediate action with unparalleled ease and speed.

Integrations Launchpad

Integrations Launchpad offers a hub of seamless connections to various external tools and services, simplifying the onboarding of new data sources. This streamlines the integration process, allowing users to effortlessly leverage their existing ITOM ecosystem within the ServiceNow platform. The Integrations Launchpad enhances data exchange and cross-platform collaboration, boosting efficiency and productivity.

Alert Automation

Alert automation provides crucial support as organizations navigate complex IT infrastructures and rising data volumes. Manual alert handling is error-prone and inefficient, underscoring the need for automated systems. By disregarding irrelevant or false-positive alerts through ignore alert automation, and by using alert enrichment, grouping, and response, these systems streamline alert response, reduce human error, and ensure consistent, timely actions.

AIOps Dashboards

AIOps Dashboards provide comprehensive visualizations of critical operational data and insights. Users can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment. These customizable dashboards empower users with actionable insights, facilitating data-driven decision-making and ensuring proactive responses to potential issues.

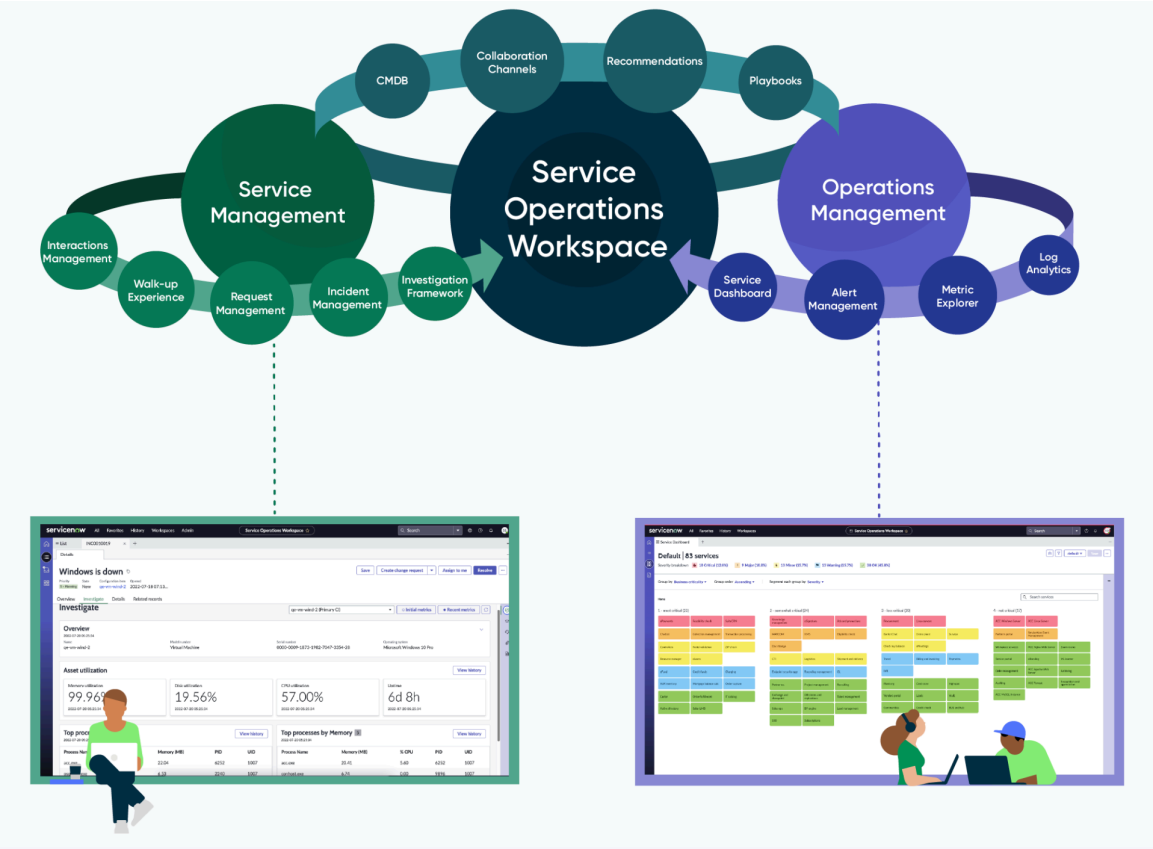
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

For more information, see Exploring Service Operations Workspace for ITSM.



Operator experience in Service Operations Workspace

1. Start of day: The operator begins by reviewing an overview of alerts and metrics in the Service Operations Workspace to prioritize work.
2. Alert prioritization: The operator prioritizes alerts based on SLAs, priority level, and urgency.
3. Alert investigation: The operator investigates alerts in detail, leveraging historical data and trends.
4. Access alert information: The operator accesses all related information from the alert record page for a comprehensive view.
5. Resolve alerts: Using tailored recommendations, the operator resolves alerts efficiently.
6. Subject matter expert (SME) consultation: For complex or high-priority tasks, the operator reaches out to SMEs or uses automated tools.
7. Collaboration: The operator collaborates with team members and stakeholders directly from the alert, sharing insights and coordinating responses.
8. Initiate change requests or maintenance: To prevent future occurrences, the operator initiates change requests or maintenance activities, addressing root causes and implementing long-term solutions.

Users

Role title [name]	Description
Admin [evt_mgmt_admin]	Configures and sets up Event Management properties and rules.
Operator [evt_mgmt_operator]	Manages alerts, including closing and acknowledging them.
User [evt_mgmt_user]	Manages the lifecycle of alerts, including performing basic operations such as viewing and acknowledging them.

Benefits

Unify experience for multiple workflows

Consolidate various IT operations workflows into a single, intuitive interface, allowing seamless task management across different areas of IT operations, thus enhancing efficiency and reducing complexity.

Provide automated recommendations

Enhance efficiency and decision-making with automated recommendations tailored to operator actions.

Deliver real-time insights

Provide real-time analytics and reporting capabilities for each integrated workflow, enabling informed decision-making and proactive problem-solving by monitoring key performance metrics and tracking operational status in real-time.

Targeted experience

Offer dynamic and minimal content based on the current task, with the next task accessible with minimal clicks. Provide access to related alerts to support faster response times.

Customize configurability

Enable organizations to tailor the workspace to specific requirements and preferences, optimizing productivity by displaying relevant data and tools for each workflow.

Enhance productivity

Empower users to work more efficiently across multiple workflows by automating routine tasks, providing access to relevant information, and facilitating collaboration, thus boosting productivity organization-wide.

Scale seamlessly

Accommodate changes in workload, requirements, and operational complexity for all integrated workflows, ensuring continued support for evolving IT environments, regardless of organizational size.

Service Operations Workspace for ITOM user interface

Explore the interface to understand how an operator can prioritize tasks and offer solutions.

Access Service Operations Workspace

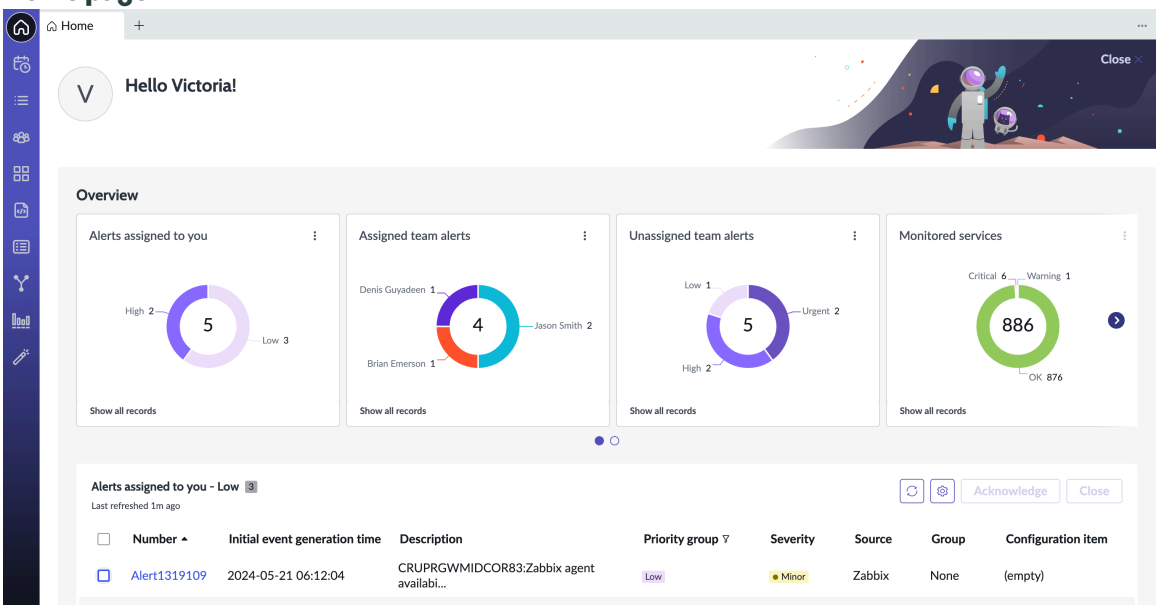
Open the workspace by navigating to **Workspaces** > **Service Operations Workspace**.

Home page

To access information on the Home page, select the home icon ( ).

The home page provides operators with a comprehensive snapshot of the current operational landscape. The Overview section presents vital insights, including alerts assigned to the operator, team-based alerts, unassigned team alerts, monitored services, and open alerts. This Alerts Assigned to You section furnishes operators with specific details regarding alerts tailored to their responsibilities. Information includes the alert number, initial event generation time, description, priority group, severity, source, group, configuration item, state, node, metric name, and last updated timestamp. Both sections streamline operations by offering operators a concise overview and personalized insights into alerts relevant to their responsibilities, facilitating swift prioritization and proactive resolution of critical issues.

Home page



List page

To access information on alerts from List, select the List icon ( ).

The **Lists** tab displays predefined lists, while the **My Lists** tab allows users to create and customize their own lists for personalized task management. For detailed instructions on creating a list, see Create a list in Service Operations Workspace for ITOM.

Alert automation

Automations streamline processes, enabling timely responses to potential issues by ignoring, enriching, grouping, and responding to alerts. They reduce manual intervention, lower the risk of errors, and free up IT teams to focus on strategic tasks, boosting system reliability and customer satisfaction.

To access information on automations, select the alert automations icon ( ).

Configuring Service Operations Workspace for ITOM

Configure Service Operations Workspace for ITOM so that you can manage IT alert volumes efficiently and customize the workspace to enhance service delivery and operational visibility.

The Service Operations Workspace for ITOM is a centralized hub designed to optimize IT Operations Management by focusing on the handling and resolution of alerts. By leveraging this workspace, administrators can streamline the process of monitoring, triaging, and resolving alerts, thus enhancing service delivery and operational efficiency.

Note: Installing the AIOps Experience application [sn_sow_aiops] provides you with Service Operations Workspace for ITOM.

If you want information regarding subscriptions for ITOM Service Operations Workspace, check the ITOM AIOps subscription at Subscription for ITOM Health.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

To know about the ITSM configurations, see Configuring Service Operations Workspace for ITSM.

Install Service Operations Workspace for ITOM application

You can install the AIOps Experience [sn_sow_aiops] application to get Service Operations Workspace for ITOM if you have the admin role.The application includes demo data and installs related ServiceNow® Store applications if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the AIOps Experience application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Service Operations Workspace supports domain separation. For details, see Domain separation and Event Management.

Role required: admin

About this task

The following items are installed with AIOps Experience [sn_sow_aiops] plugin.

- Roles
- Plugins

For more information, see Components installed with AIOps Experience.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the AIOps Experience [sn_sow_aiops] using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Customize the Service Operations Workspace for ITOM home page

You can customize the data displayed in sub pages of the home page that is available in the base system. For any visual styling changes, you need to create a copy of that landing page and edit it.

Modify the greeting text on the landing page

Customize the header message that is a part of the greeting text on the home page. This will create a more personalized user experience, making visitors feel welcomed and valued, and can also help in setting the right tone and context for the information presented.

Before you begin

Role required: evt_mgmt_admin or admin

About this task

The Get service desk agent shift data broker server script calls the `SOWServiceDeskAgentShift` script includes to display the shift information in the greeting text.

While the display text can be customized for the default landing page, the visual styling changes to the text can be done only by creating a copy of the landing page.

Suppose you are on call until Monday, March 21. You can update your greetings to reflect your on-call status.

Header

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. On the **Overview** tab, from the **Initial Setup** section, select the **Configure the landing page** option.
3. On the Landing Page form, select **Configure** next to **Greetings**.
   The Script Includes form is displayed for SOWServiceDeskAgentShift, which internally calls the SOWServiceDeskAgentShiftSNC
4. Copy the **Script** value of SOWServiceDeskAgentShiftSNC.

   a. Navigate to **All** > **System Definition** > **Script Includes**.

   b. From the list of Script Includes, open SOWServiceDeskAgentShiftSNC.

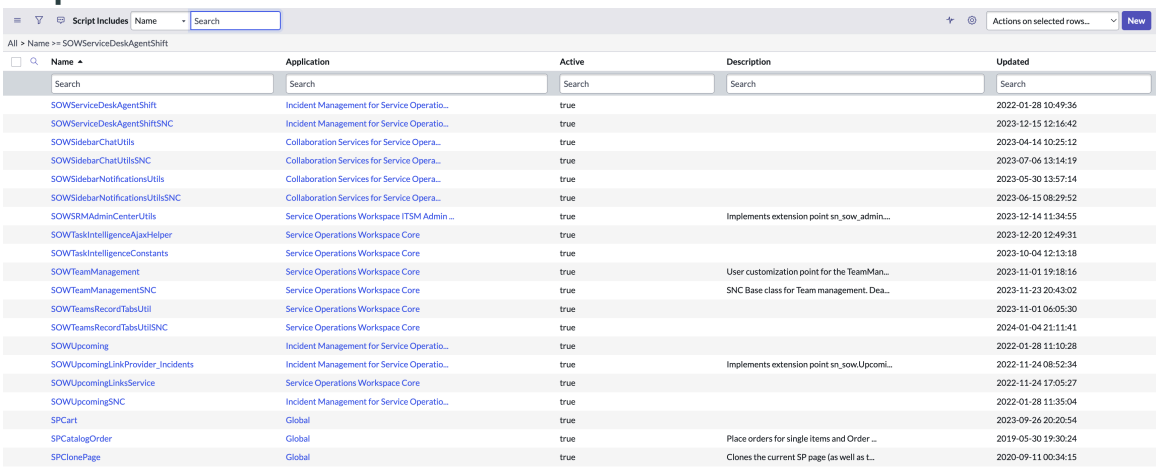
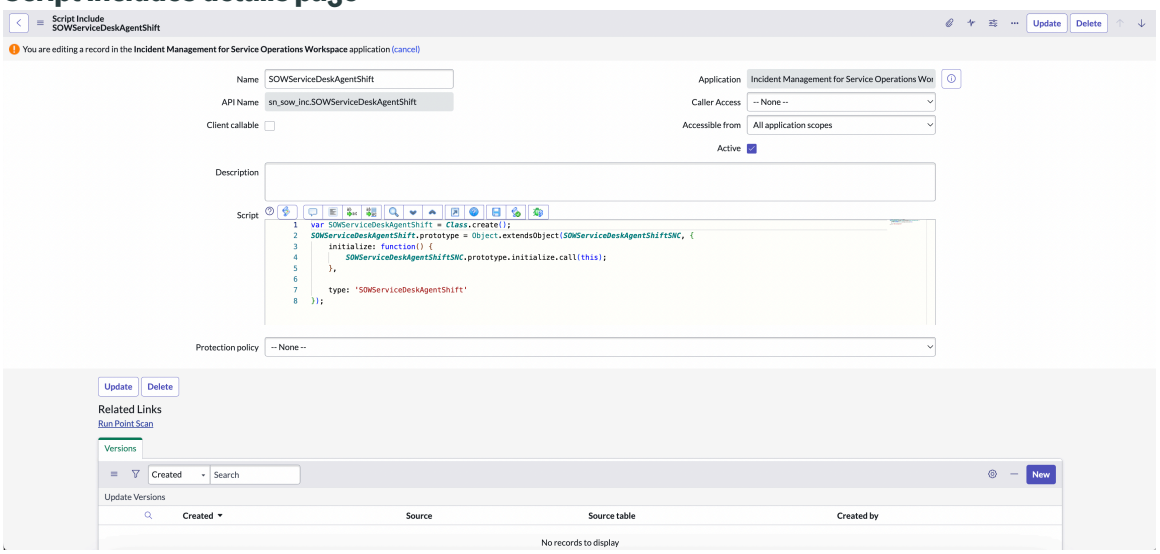
Script Includes list



c. Copy the **Script** field value.

Script includes details page



5. Edit the SOWServiceDeskAgentShift script.

a. Navigate to **All** > **System Definition** > **Script Includes**.

b. From the list of Script Includes, open SOWServiceDeskAgentShift.

c. Paste the **Script** field value that you copied from SOWServiceDeskAgentShiftSNC.

6. Select **Update**.

Modify the first-level cards in the Service Operations Workspace for ITOM Overview section

Customize the data displayed in the first-level cards in the Overview section by configuring various parameters such as the header label, data source, metric, group by field, and viewAllQuery. This allows for a more tailored and relevant display of information.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **sys_ux_client_script_include.list**.
2. From the UX Client Script Includes list, select `SowEMLandingPageUtilsSNC` client script include definition.
3. On the UX Client Script Include form, edit the **Script** field.
   For example:

```
  }
    };
   const labelMap = {
       'em_alert': {
           'alerts_assigned_to_you': {
               '1': 'Alerts assigned to you - Urgent',
               '2': 'Alerts assigned to you - High',
               '3': 'Alerts assigned to you - Moderate',
               '4': 'Alerts assigned to you - Low'
           },
           'open_alerts': {
               '1': 'Open alerts - Urgent',
               '2': 'Open alerts - High',
               '3': 'Open alerts - Moderate',
               '4': 'Open alerts - Low'
           },
           'team_alerts_assigned': 'Assigned team alerts - to
',
           'team_alerts_unassigned': {
               '1': 'Unassigned team alerts - Urgent',
               '2': 'Unassigned team alerts - High',
               '3': 'Unassigned team alerts - Moderate',
               '4': 'Unassigned team alerts - Low'
           }
       }
```

4. Click **Update**.

Create a copy of the Service Operations Workspace for ITOM landing page

Make visual styling changes to the sub-pages in the home page. This will enhance the overall user experience by providing a consistent and visually appealing interface, improving navigation, and ensuring that key information is easily accessible and engaging.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: evt_mgmt_admin or ui_builder_admin

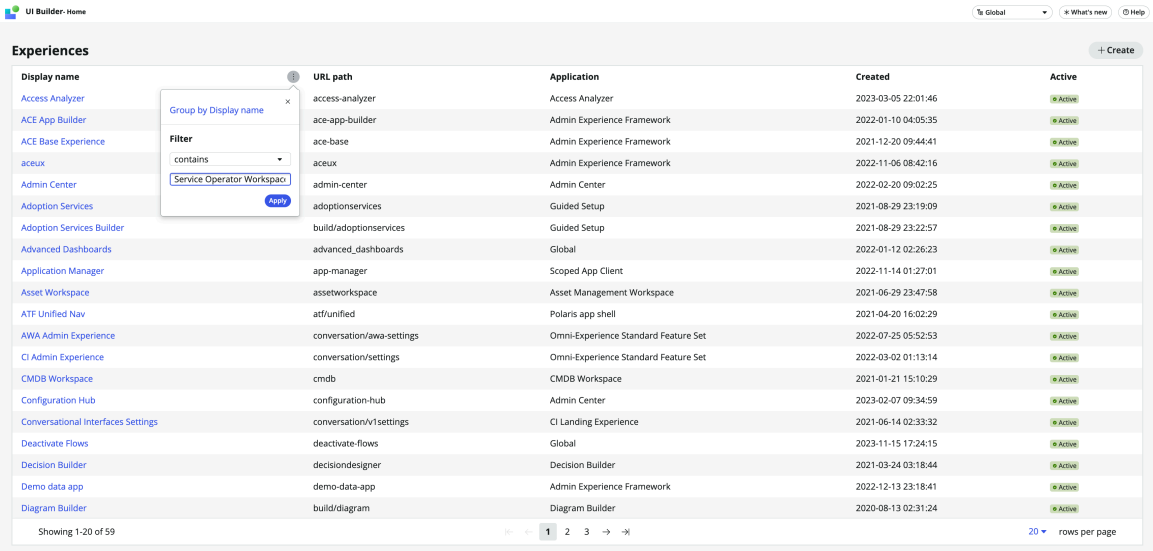
About this task

A page is content that lives at a specific URL. When a user opens the URL, they will see a different variant of this page based on the audience, conditions, and order that you set.

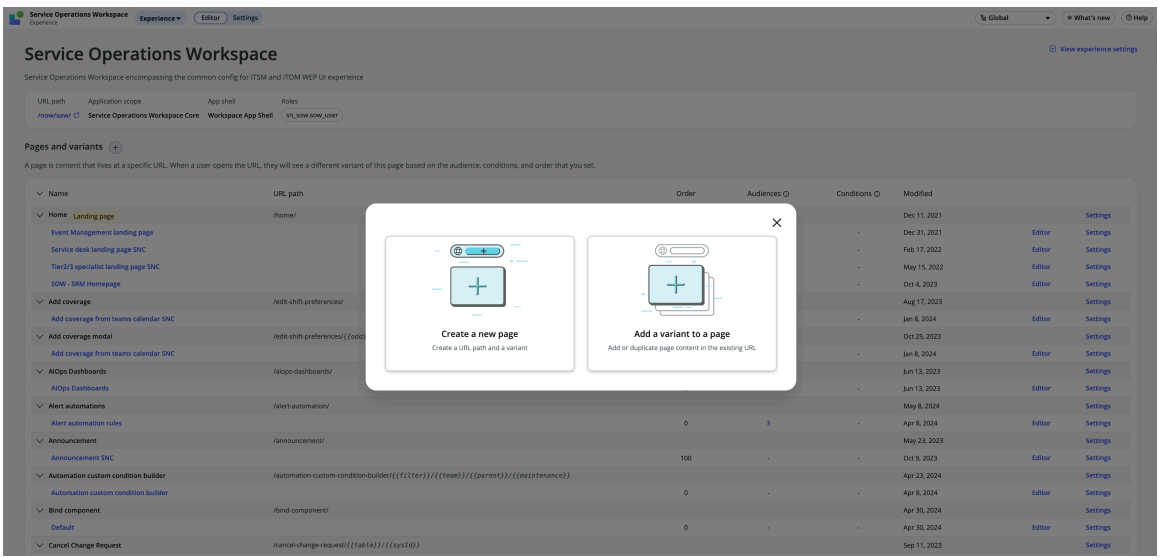
Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. From the **Display name** field, filter and search for **Service Operations Workspace**.

   The Experiences page opens.



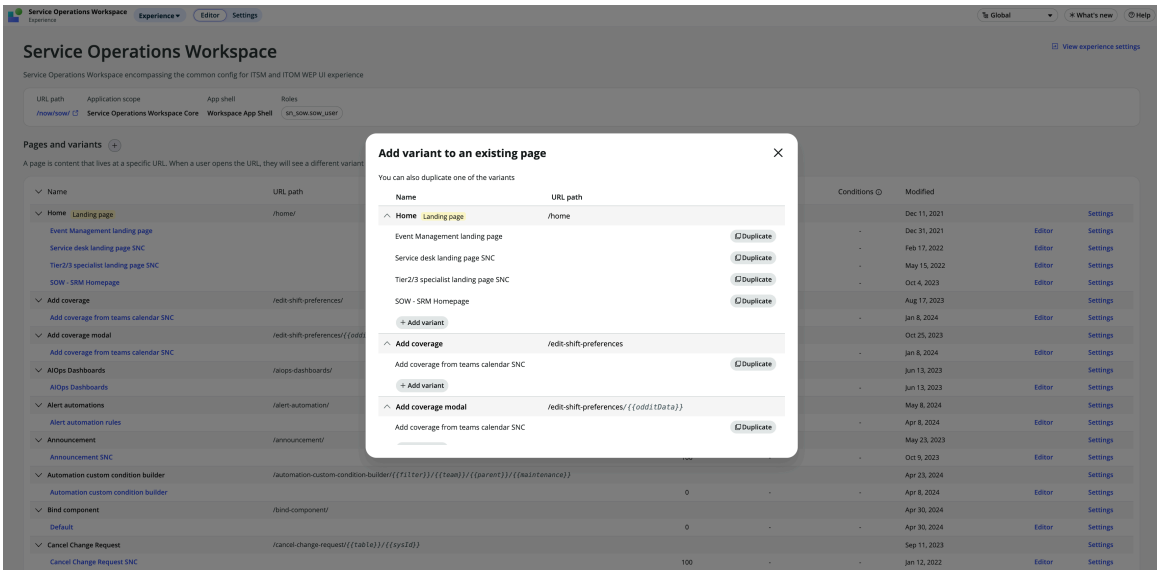
3. Open **Service Operations Workspace** by selecting it.
4. Next to **Pages and variants**, select the plus icon (⊕).



5. Select **Add a variant to a page**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Add variant to an existing page window opens.



6. To create a duplicate page content in the existing URL path, select **Duplicate** and follow the steps.

Open your configurable workspace experience in UI Builder

Access your Configurable Workspace experience in UI Builder for editing.

Before you begin

Role required: admin, ui_builder_admin

Procedure

1. In the navigation filter, navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select **Experiences**.
3. Select your experience.

Result

Your configurable experience opens in UI Builder.

Redirect to the Service Operations Workspace home page

Enable quick task prioritization by directing agents to the homepage immediately upon logging into the ServiceNow instance. This improves workflow efficiency by granting agents immediate access to essential tools and information, facilitating the timely resolution of critical tasks and issues.

Before you begin

Ensure that the value of the *glide.login.home property* is set to `/now/nav/ui/home`. This property specifies the default homepage that is displayed upon logging in.

Role required: evt_mgmt_admin

Procedure

1. Select **All** and then search for `sys_properties.list`.
2. Add the *sn_sow.service_desk_groups* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Value** field, enter the sys_id of the user group to which the operator belongs.

   Note: If you want to specify multiple service desk groups, add a comma-separated list of group sys_ids in the value field.

4. Select **Update**.

Open your Configurable Workspace experience in UI Builder

Access your Configurable Workspace experience in UI Builder for editing.

Before you begin
Role required: admin, ui_builder_admin

Procedure

1. In the navigation filter, navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select **Experiences**.
3. Select your experience.

Result
Your configurable experience opens in UI Builder.

Service Operations Workspace

The Service Operations Workspace monitors services within your Event Management environment, enabling you to review their status and identify those at risk of suboptimal performance. This empowers you to promptly address any issues.

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

You can configure the Service Operations Workspace to remain logged in for up to 24 hours. For more information, see Manage user sessions.

View application service health information in Service Operations Workspace

Monitor the health of services and filter the information that you want to view, allowing you to focus on the most relevant data and make informed decisions quickly.

Before you begin
Role required: evt_mgmt_user or evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list.

3. Perform the following actions as required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Features and actions

Features	Actions
Make the tile size larger or smaller.	**a.** Select the Display settings icon ( ). **b.** From the **Display settings** pop-up window, select the size. Group services by selected criteria	Select the arrow next to **Group By** and then select the criteria by which you want to group services. Group order	Select the arrow next to **Group order** and then select the criteria by which you want to group services. Segment each group by	Segment each group by severity, business criticality, and cost to categorize and organize them into distinct groups based on these attributes. Filter information	Filter the information displayed on the dashboard ensuring you focus on relevant data for effective monitoring.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Features	Actions
	○ To set a global filter, select the Filter icon ( ) and set the global filter condition, add filter conditions, and then select **Apply**.  ○ To exclude a severity from the display, select it in the **Severity Breakdown** ribbon. Filtered-out severities will appear dimmed. To restore a dimmed severity to the display, simply select it again. 
Create a user view in Service Operations Workspace

Create and customize a user view in the Service Operations Workspace to enable viewing information in the format you want.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list.

3. Customize the dashboard appearance by selecting output criteria from the **Group by**, **Group order**, or **Segment each group by** filters, or by selecting the relevant **Severity breakdown**. Selecting **Service group** > **All** in the **Group by** filter displays all service groups.
4. Configure the information for the view to display by clicking the filter services icon ( ) and setting a global filter.
   For example, you can configure a filter to display only those services assigned to a specific user.

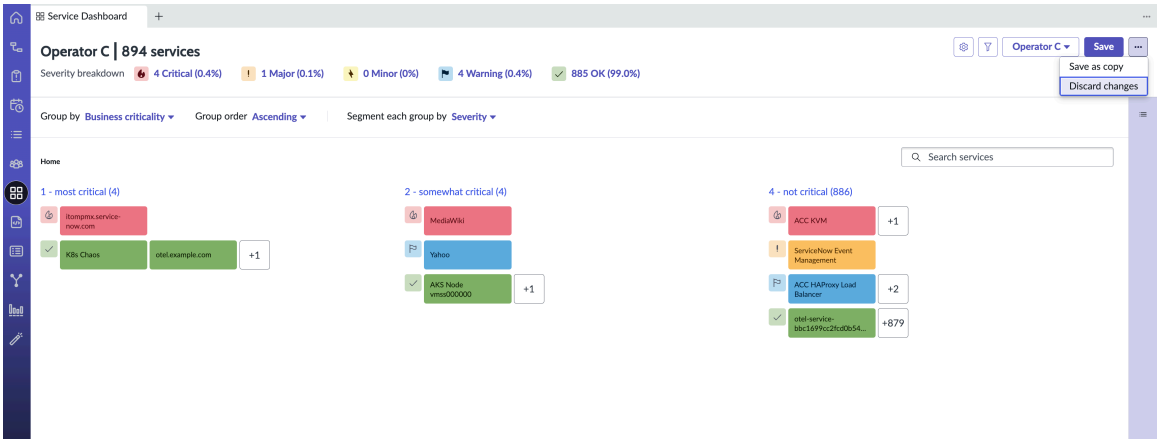
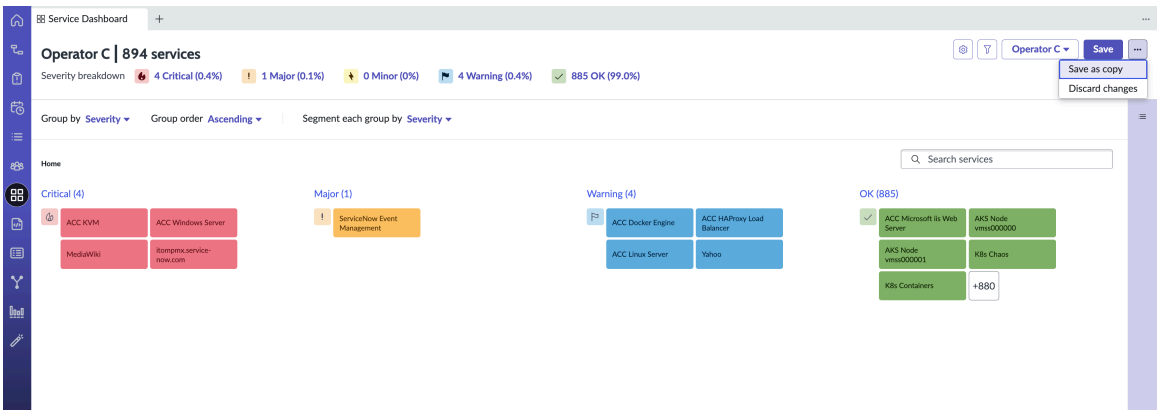
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: To discard your changes and revert to the view's most recently saved state, select the More actions icon (•••) and select **Discard changes**.



5. Save your new view by clicking the More actions icon (•••) next to the **Save** button and select **Save as copy**.



6. In the Save as copy dialog box, enter the name of your view in the **View name** field.

   The view is saved as a **Private view** (visible only to the logged-in user) and is available for use.

   Views are grouped in the following categories:

   - **Global views**: Visible to all users. Only an Event Management administrator can create a global view.
   - **Private views**: Visible only to the logged-in user.

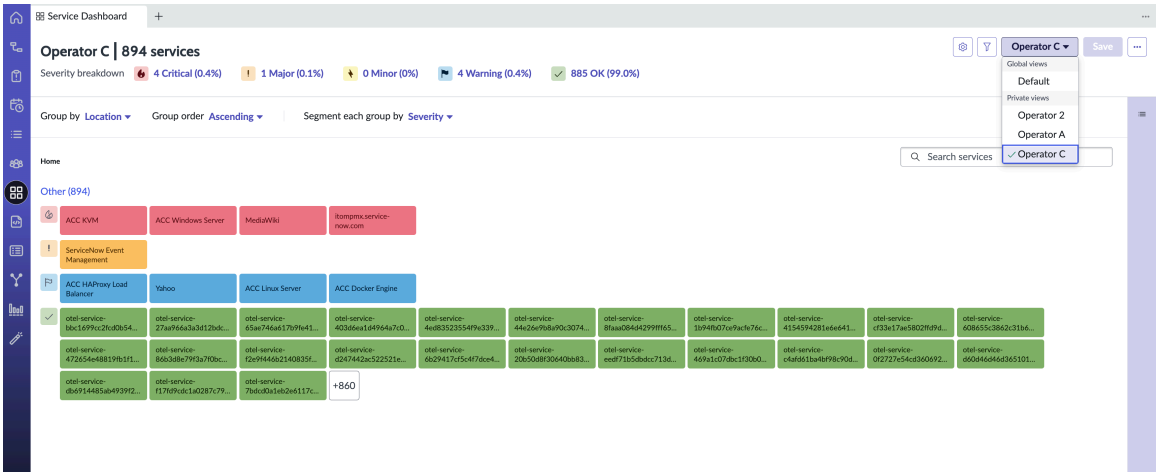
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can switch between different views by selecting a view from the list next to the **Save** button.



Delete a user view in Service Operations Workspace

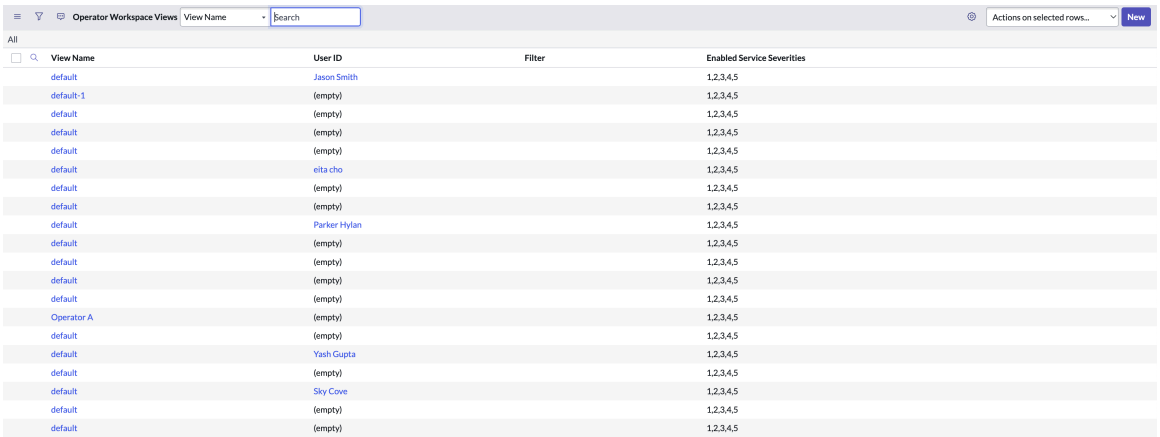
Delete a Service Operations Workspace user view you no longer need. You perform this action from the Event Management menu, outside of Service Operations Workspace.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. In your Event Management instance, in the navigation pane, search for *`noc_user_view.list`*.
   The Operator Workspace Views page opens.



View Name	User ID	Filter	Enabled Service Severities
default	Jason Smith		1,2,3,4,5

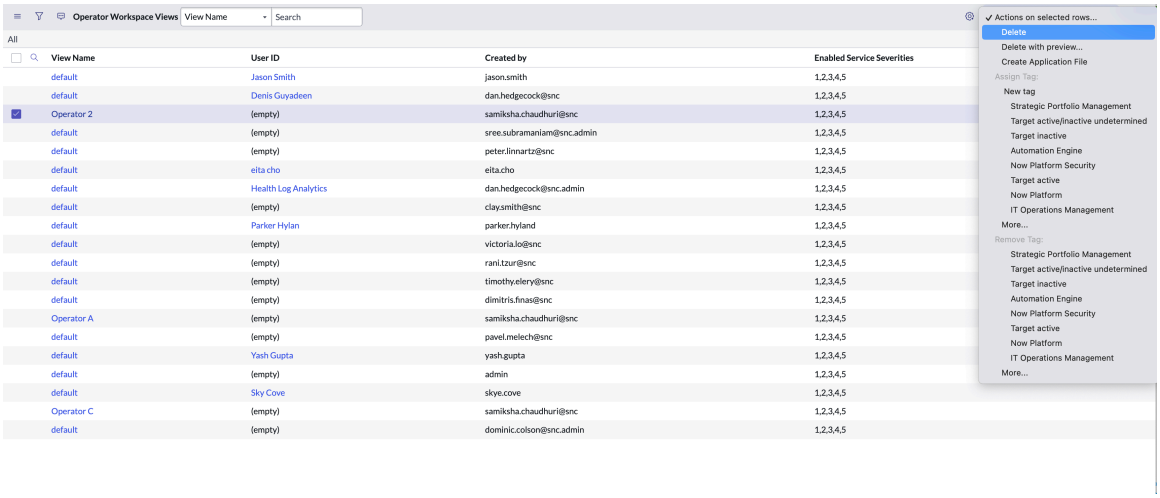
3. In the **Actions on selected rows** list, select **Delete**.



View application service details in Service Operations Workspace

View comprehensive information about an application service, including its name, business criticality, ownership, process and operational status, traffic-based discovery details, discovery status, and relevant comments. This enables thorough analysis of the application service's current state and usage, provides clarity on ownership and criticality, and facilitates effective prioritization of resources and actions.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator, or evt_mgmt_admin

About this task

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list.

3. Select a service tile.
   A pop-up window displays the business criticality and severity of a service.

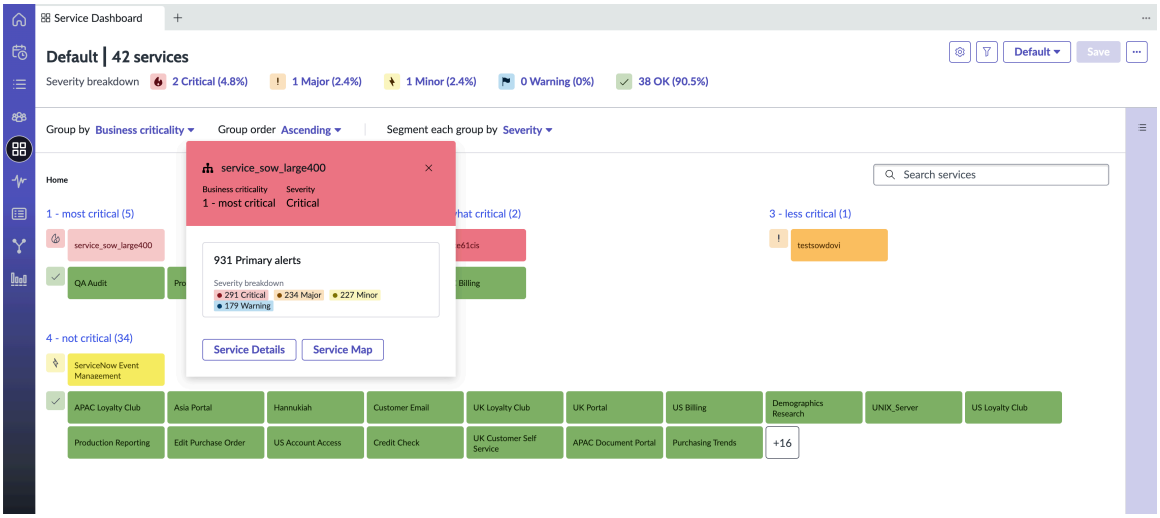
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Service Details**.
   By default, the **Details** tab is selected.

   The details page provides comprehensive information about an application service.

   For information on the fields, see Application service details page.

View primary alerts associated with a service

View the primary alerts associated with a service to help troubleshoot issues with the service.

Before you begin

Role required: evt_mgmt_admin

Procedure

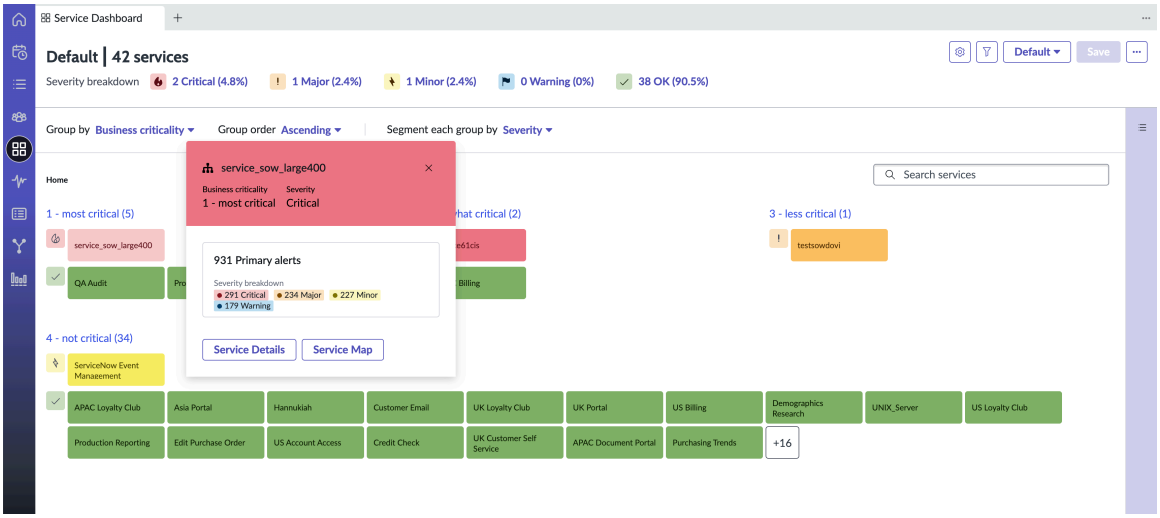
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list.

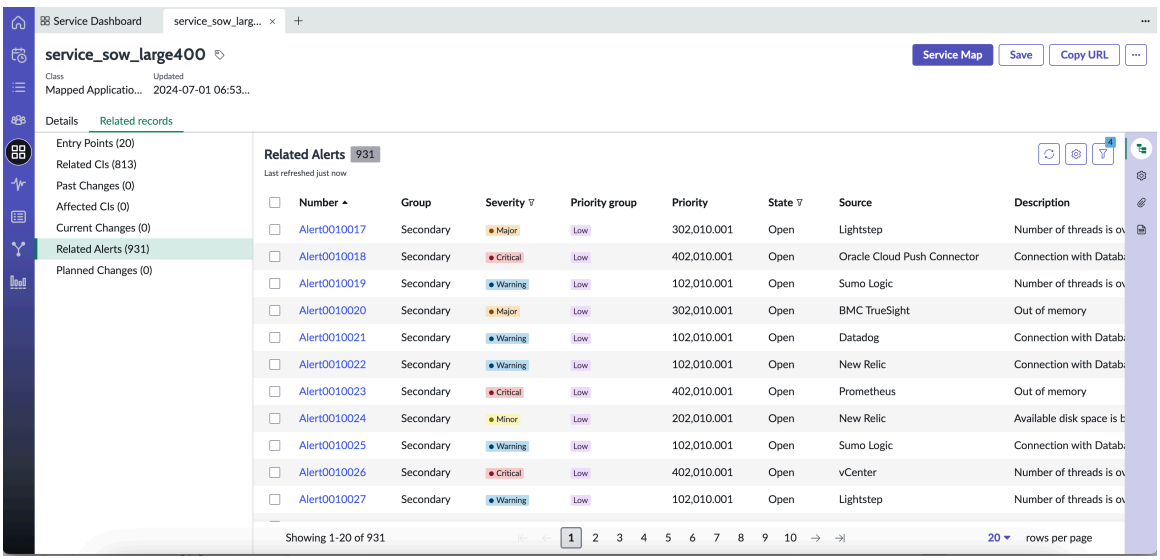
3. Select a service tile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A pop-up window displays the business criticality and severity of a service.



4. Select **Service Details**.
   By default, the **Details** tab is selected.
5. Select the **Related records** tab.
6. From the left pane, select **Related Alerts**.



View details about an alert by selecting its number in the **Number** column.

Create a list in Service Operations Workspace for ITOM

Customize lists in Service Operations Workspace by creating new lists, changing their order, modifying their content, or deleting lists as needed. This flexibility allows operators to organize information according to their specific requirements, facilitating easier navigation, quicker access to relevant data, and streamlined workflow management.

Before you begin

Role required: itil

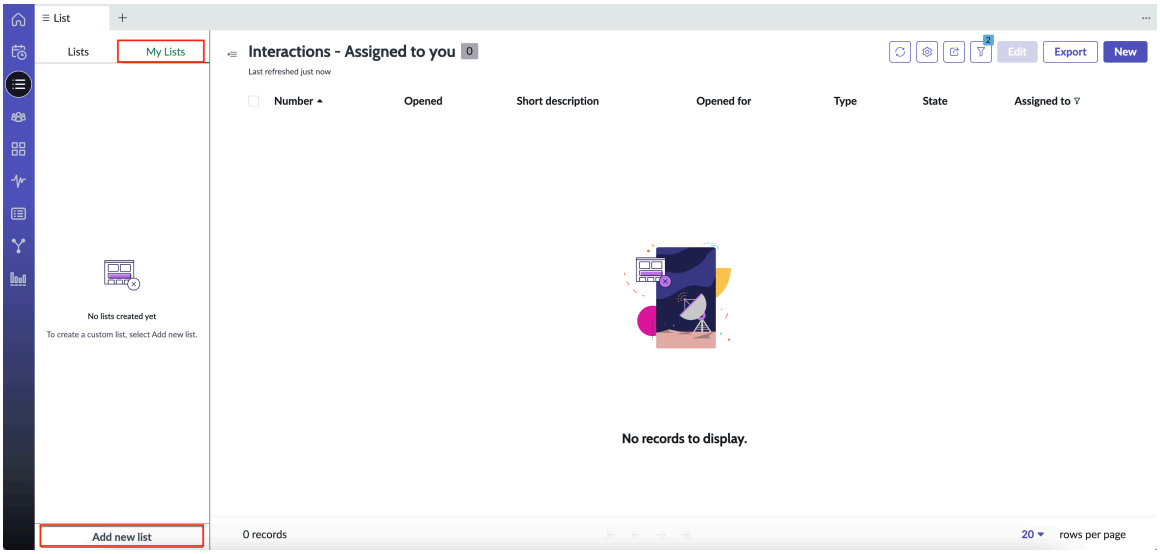
About this task

Create custom groupings of records listed under the **Lists** tab, such as incidents tied to a specific company. Customize existing lists or create new ones exclusively visible under the **My Lists** tab for personalized organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.
4. Select **Add new list**.



5. Create a list by either basing it on an existing list or creating a new one.
   - To base your list on an existing list, select **Start from existing**.
   - To begin a new list, select **Create your own.**
6. On the form, fill in the fields.
   For more information on the fields, see Create list fields.
7. Select **Create**.
   The list appears in the **My Lists** tab.

Rename a list in Service Operations Workspace for ITOM

Rename a list to better reflect its content or purpose. This customization allows operators to align list names with their workflow terminology, improving clarity and usability.

Before you begin

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.
4. Select the list you wish to rename.
5. Select the settings icon ( ) and then select **Rename**.

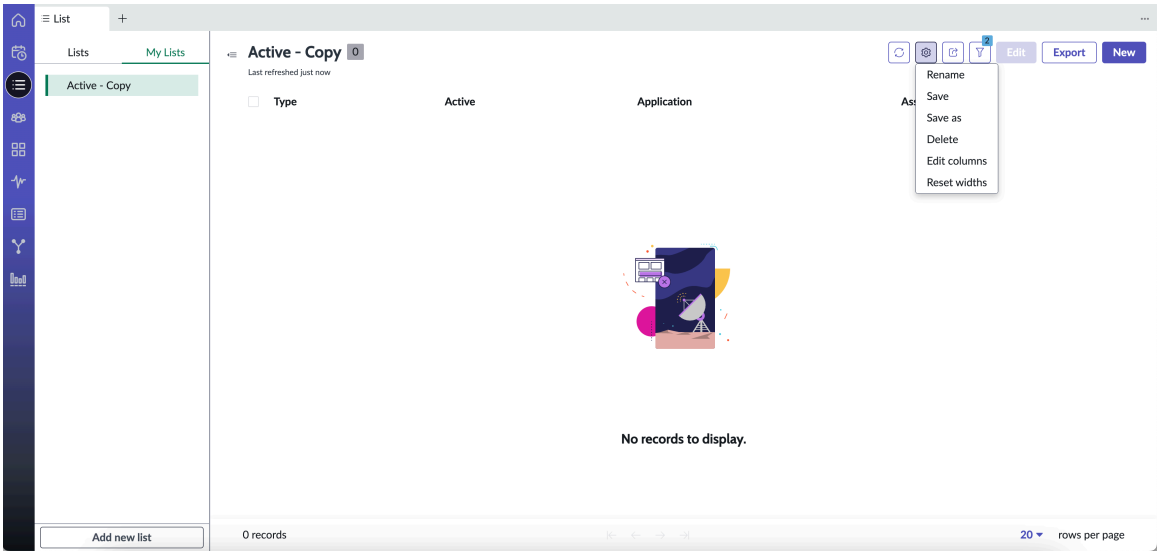
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. In the **Rename** pop-up window, in the **Title** field, rename the name of the list and select **Save**. The list is renamed.

Reorder list in Service Operations Workspace for ITOM

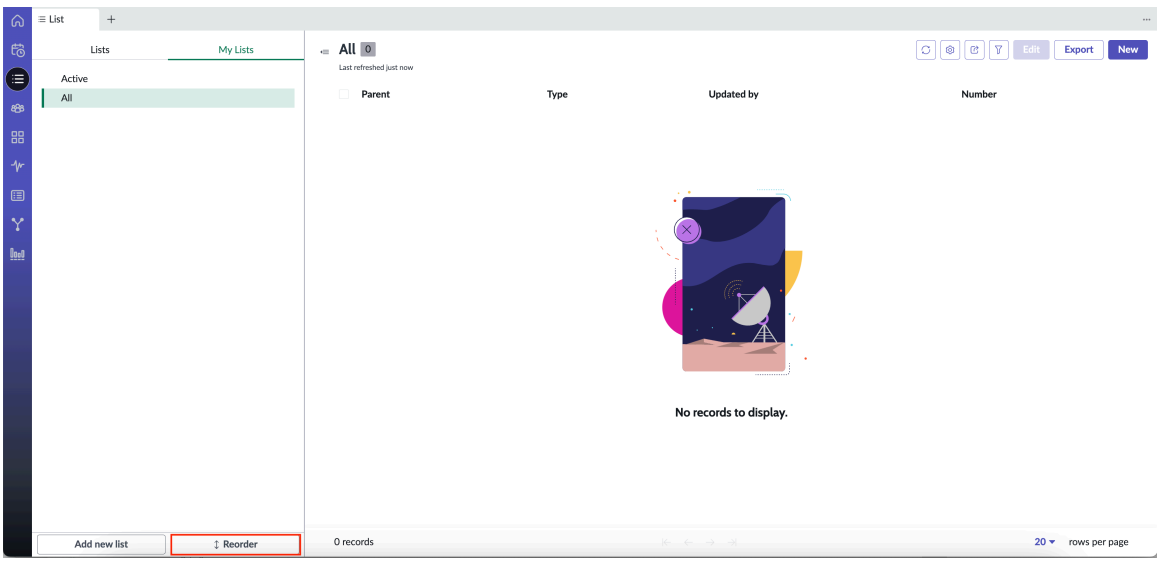
Reorder lists to prioritize information and enhance workflow organization.

Before you begin

Role required: itil

Procedure

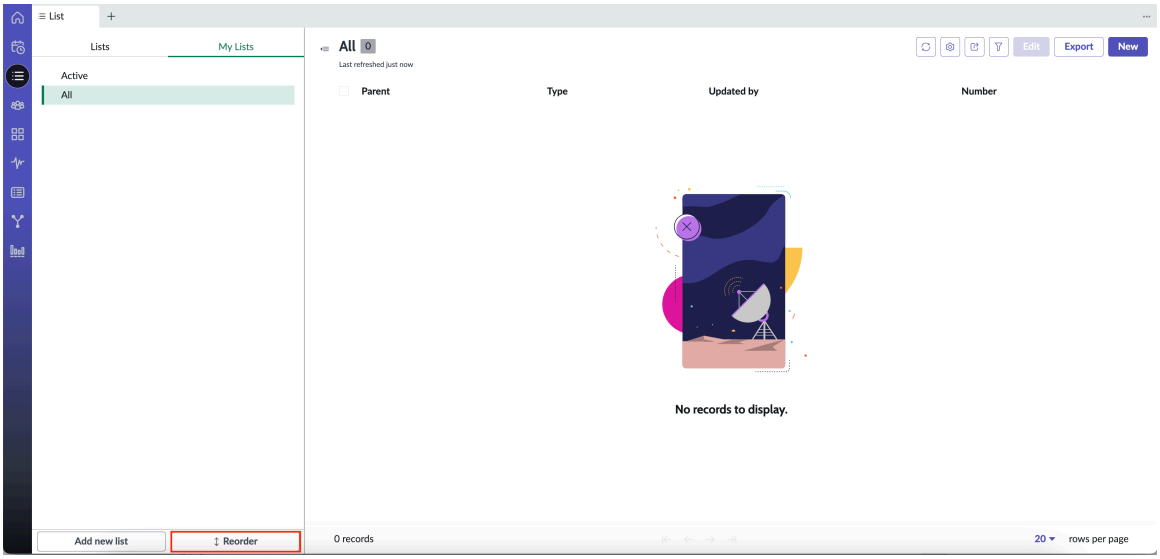
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.



4. Select the list you want to reorder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Reorder** to adjust the position of the list.



Delete a list in Service Operations Workspace for ITOM

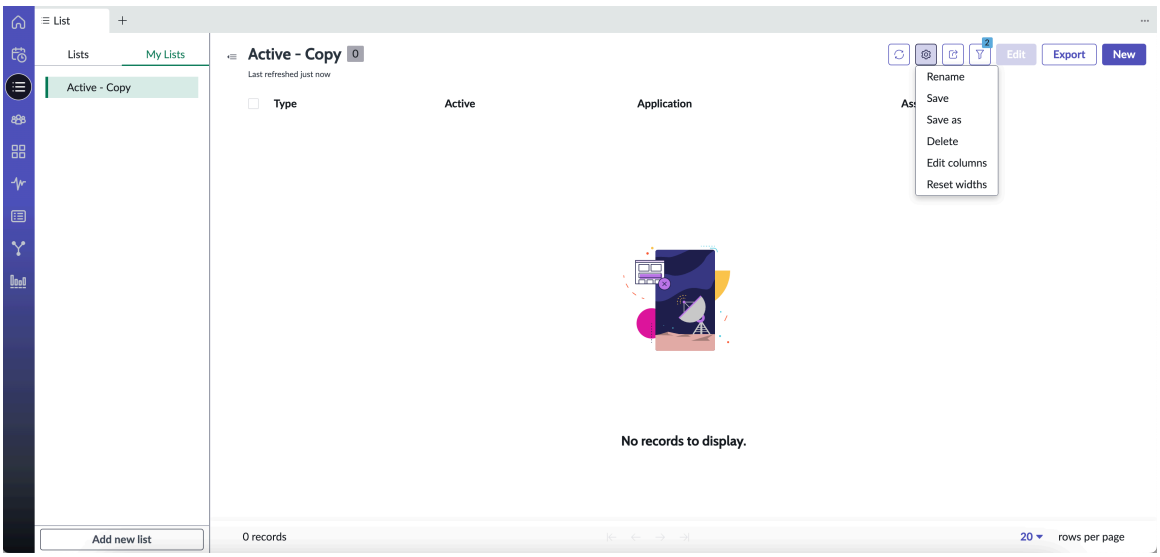
Delete a list to efficiently manage data sets, declutter your workspace, and maintain organized information.

Before you begin

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.
4. Select the list you wish to delete.
5. Select the settings icon ( ) and then select **Delete**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the confirmation pop-up window, select **Delete**.
   The list is delete.

View unified service map and the impact paths in Service Operations Workspace

Visualize relationships between Configuration Items (CIs) and alerts with real-time updates and detailed impact paths. Enhance troubleshooting and proactive management by quickly identifying root causes and dependencies for both discovered services and application services.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator, or evt_mgmt_admin

About this task

The enhanced service map in Service Operations Workspace displays the impacted path of an alert to enable you to quickly assess its impact on a service. You can access the enhanced service map directly from the Service Dashboard, or from the preview panel or from an impacted service in the Express List.The service map has several modes of display:

- For a service with up to 60 CIs, regardless of alert status, the map shows all CIs.
- For a service with more than 60 CIs without alerts, the map shows up to 60 CIs.
- For a service with more than 60 CIs with alerts, the map shows the impacted path of the most recent alert with the highest severity.

You can also investigate a wider view of the service topology on the service map for up to 250 CIs regardless of alerts. For a broader view, select **Clear** and choose a mode of either up to 60 or up to 250 nodes.

Note: Admins can continue using the legacy service map to manage the propagation of severity. Access the map by navigating to **Services** > **Application Services**.

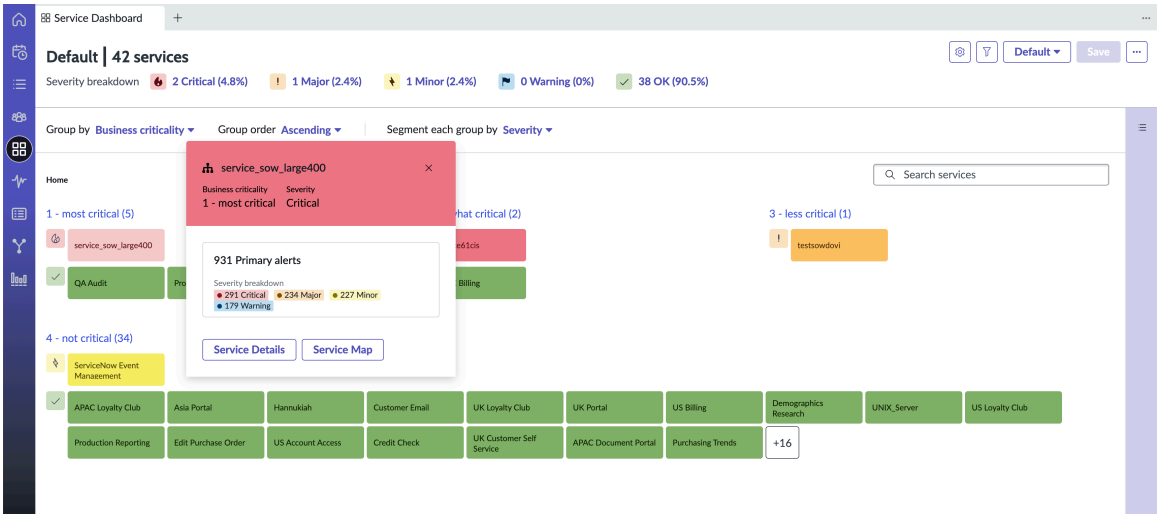
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list.

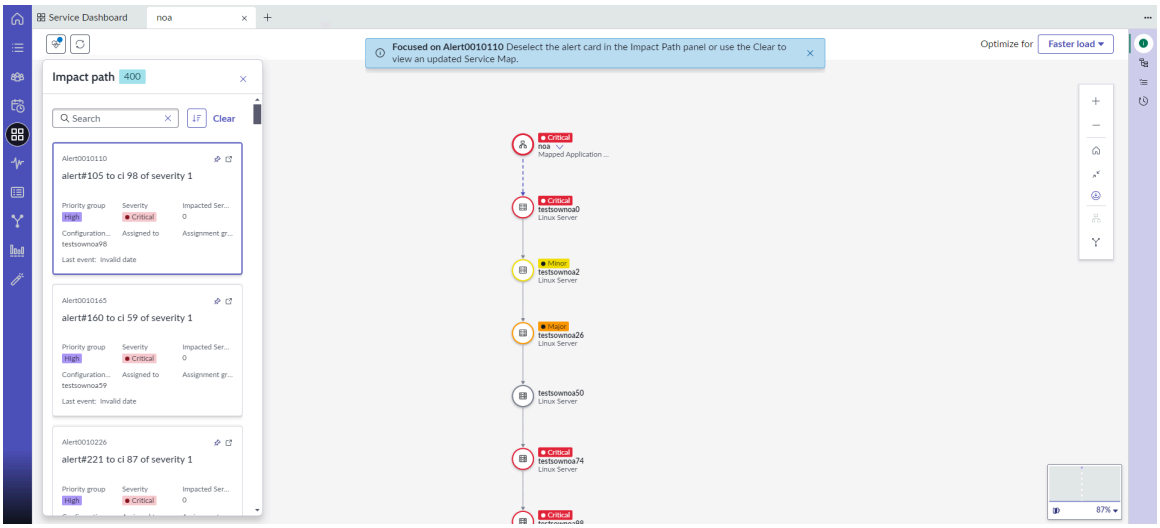
3. Select a service tile.
   A pop-up window displays the business criticality and severity of a service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Service Map**.

The application map along with the CI relationships appears.

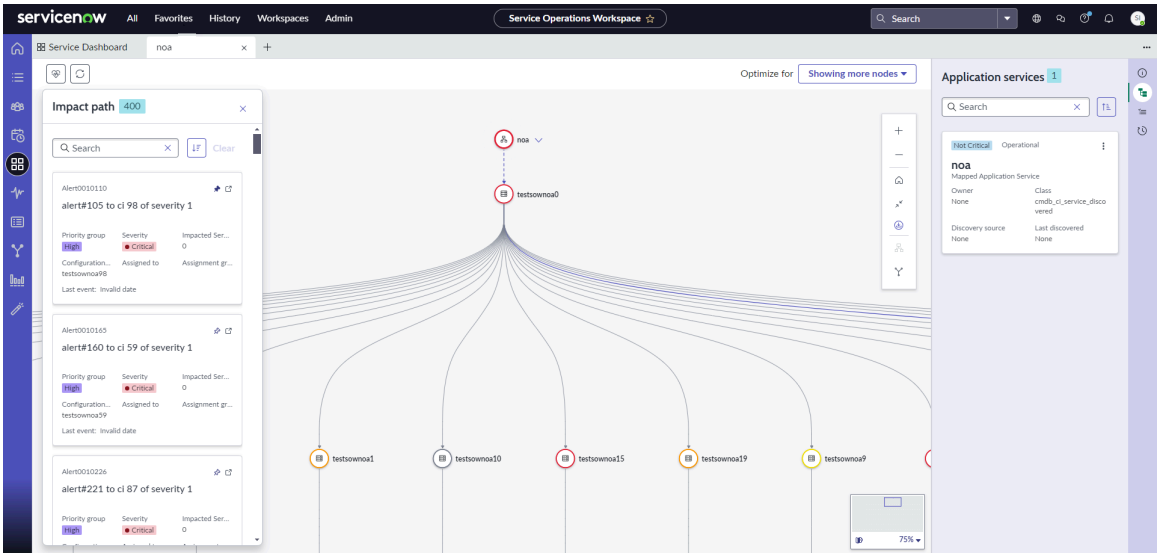


Note:

Depending on the size of the service, the unified map either shows the full map (if it contains up to 60 CIs) or an Impact Path leading to the most critical alert (for maps with over 60 CIs). For large maps, you can reveal more CIs by clearing the existing selecting and navigating to the **Showing more nodes** optimization option.

Impact Path shows alerts on the selected CI and all CIs within its impact subtree.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



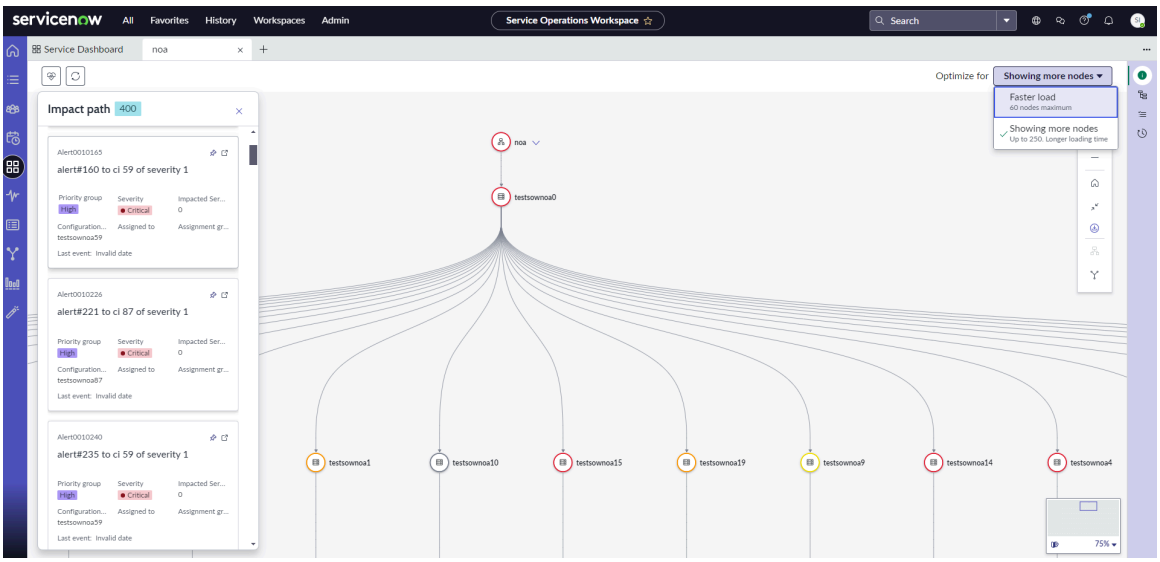
If the **Impact path** panel is closed, you can open it by selecting the Impact path icon ( ).

To view active alerts directly associated with the selected CI, select the Related items icon () in the right pane, then select **Active Alerts**.

5. Navigate between alerts by selecting an alert card.

Alternatively, use the search function to find an alert by description, CI, or alert number and focus on its impact path.

Selecting any alert tile displays the unified map for that alert. To return to the full map for the service, select **Clear**.



6. To view alert details, select the Open Record Form icon ( ) on the alert card.

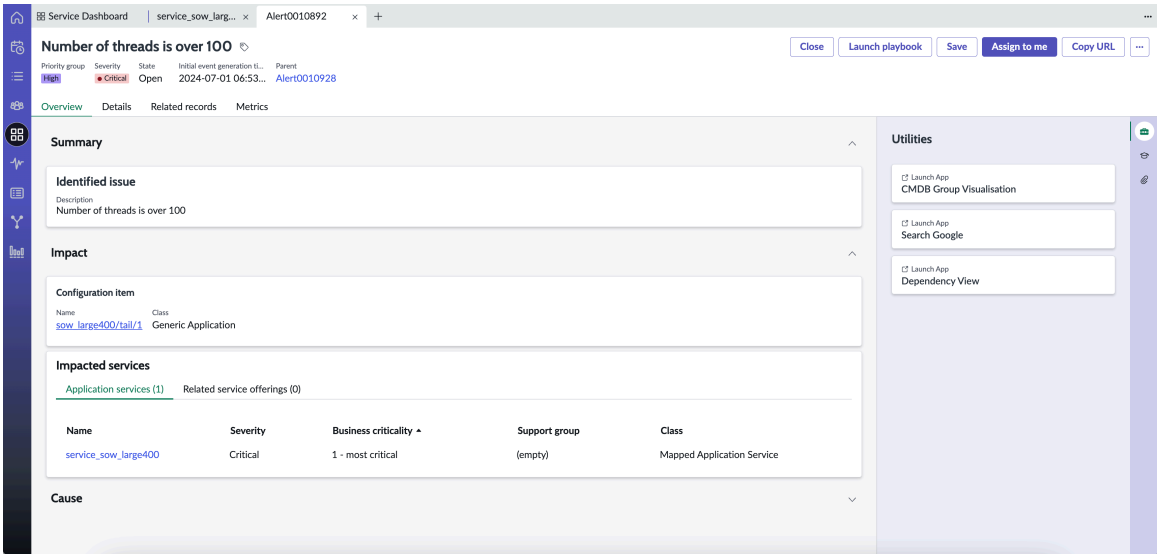
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The alert details page opens.



Configure auto-refresh settings for alert lists

Set up auto-refresh settings for alert lists to ensure real-time updates and seamless monitoring. This enhances the accuracy and timeliness of the information displayed, enabling quicker response times and improving overall system reliability and performance.

Before you begin

Role required: evt_mgmt_admin

About this task

By default, alerts in the alert lists are automatically updated (auto-refresh) whenever an action is performed on an alert. You can configure the amount of time, in seconds, after which the alert list refreshes following an action. You can also disable auto-refresh and configure how often the alert list is updated. This is useful when many alerts are being processed continuously, to prevent excessive refreshing.

Note: Set Read Role permissions to the Event Management user (evt_mgmt_user). Otherwise, the property will not be available.

Procedure

1. Navigate to **All** and in the search field, enter `sys_properties_list.do`.

   The System Properties window opens.

2. Search for the following properties and configure their values as required.

Properties to configure alert list refresh

Property	Description
`evt_mgmt.ai_refresh_time_to_wait_after_manual_action`	Alert list refresh time (in millisec a manual action has been perfo alert. If multiple actions have been pe successively, the refresh time b after the last action. This ensure

Property	Description
	alert list reflects the latest state promptly following user interact
`evt_mgmt.ai_refresh_time_interval`	If an alert update is received wit defined time interval (5000 mill no immediate refresh will occur during that period. Instead, the perform another refresh at the e interval to ensure the alert list re current information available.
`evt_mgmt.disable_lists_auto_refresh`	Disables the auto-refresh proce lists. You can create a new list on the **Lists Auto Refresh** page by ent *`em_alert_lists_auto_re`* in the navigation pane. To preve refresh of the list, clear the **Enal** option.

Configure alert metrics

Configure the metrics you want to be visible for Service Operations Workspace alerts or use the metrics configured with the base system to focus on relevant data for faster troubleshooting.

Before you begin

Ensure you have the Metric Intelligence (sn_metrics_ng) plugin installed.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Metrics View Configuration**.

View alert metric trends in Service Operations Workspace

View the metrics for an alert and adjust the time range to see the trends for either the alert or its associated Configuration Item (CI), enabling more accurate analysis and timely decision-making.

Before you begin

Ensure you have the Metric Intelligence (sn_metrics_ng) plugin installed.

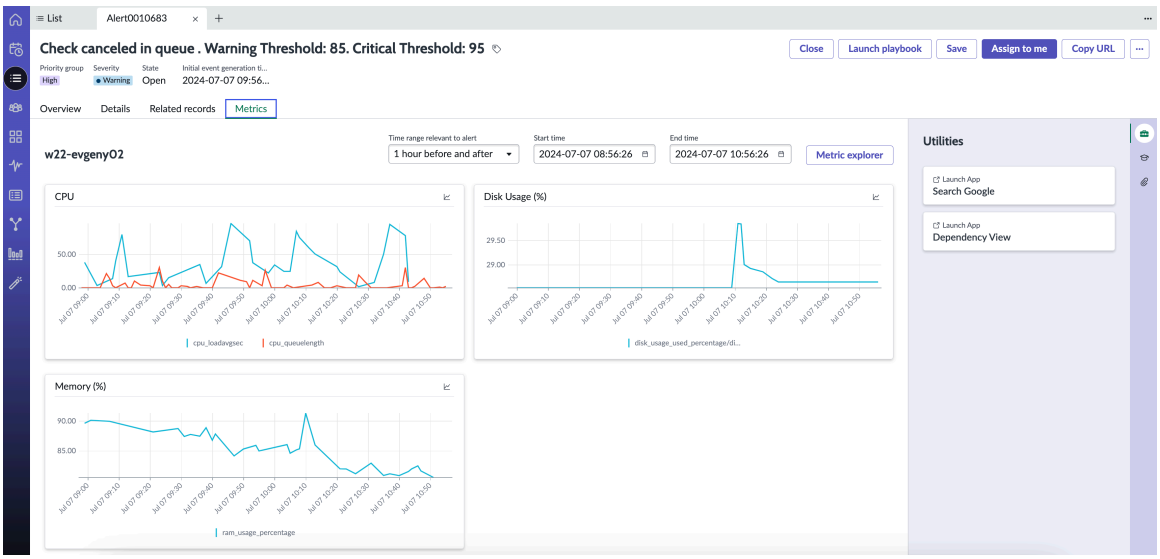
Configure the metrics to be displayed for the alert, as described in Configure alert metrics.

Role required: evt_mgmt_admin

Procedure

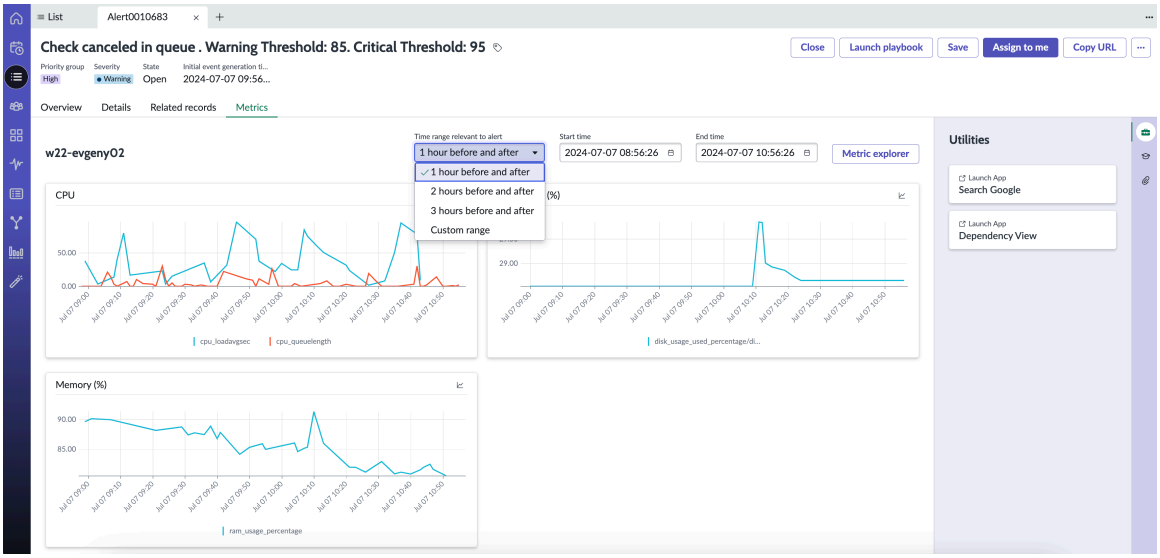
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select **Lists** > **Alerts** > **All Alerts**.
   The Alerts - All Alerts page opens.
4. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.
5. Select the **Metrics** tab.

Metrics tab



6. In the fields above the metric charts, configure the time range for the alert's metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To customize the metrics display, configure the following properties on the **System Properties** > **All Properties** page:

- *ws_metric.widgets_number_limit*: Specify the number of widgets/records that can be displayed on the metrics tab.
- *ws_metric.datasets_per_widget_limit*: Specify the number of charts/datasets that can be displayed on a chart.

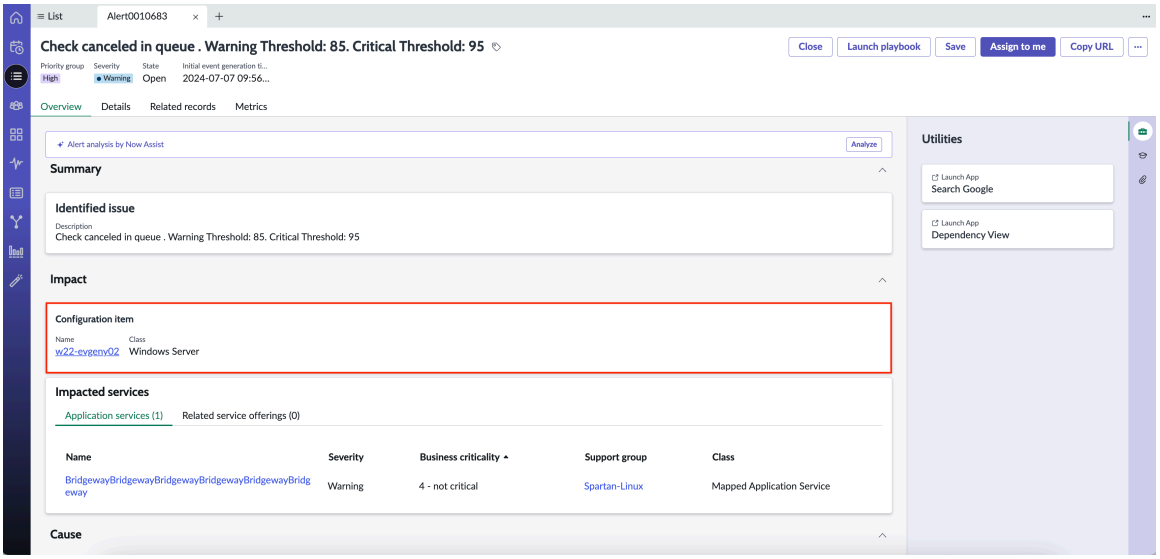
Field name	Description
Time range relevant to alert	Duration for calculating metrics around the alert.
Start time	Start date and time for metric calculations.
End time	End date and time for metric calculations.

7. Select a parameter below a chart to hide the specified parameter's data on the chart.
8. **Optional:** Select the **Insights Explorer** button to view metrics by dragging and dropping them onto a timeline.
9. Select **Save**.
10. **Optional:** View a time range for an alert's CI.

    a. Select the **Overview** tab.

    b. Under the Impact section, on the **Configuration item** card, select the link to the CI that appears under the **Name** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Select the **Metrics** tab.

d. Select **Save**.

View CI health in Metric Explorer

View the health and performance of an alert's CI using Metric Explorer, to help troubleshoot problematic areas in the CI.

Before you begin

All plugins related to Event Management, Metric Intelligence, and Metric Explorer, are required.

Roles required:

- To access Metric Intelligence metrics in Metric Explorer, the workspace_agent and itil roles are required.
- To configure the set of metrics that appears in Metric Explorer for a class, the admin or evt_mgmt_admin role is required.

About this task

Metric Explorer displays the following Metric Intelligence data:

- Charts, control bounds, and aggregations for key metrics for Configuration Items (CIs), in a single location.
- Aggregation of metrics for CIs with resources, in a single consolidated time series.
- Ability for administrators to configure which metric types appear for each CI class.

Metrics are displayed only for alerts containing a CI.

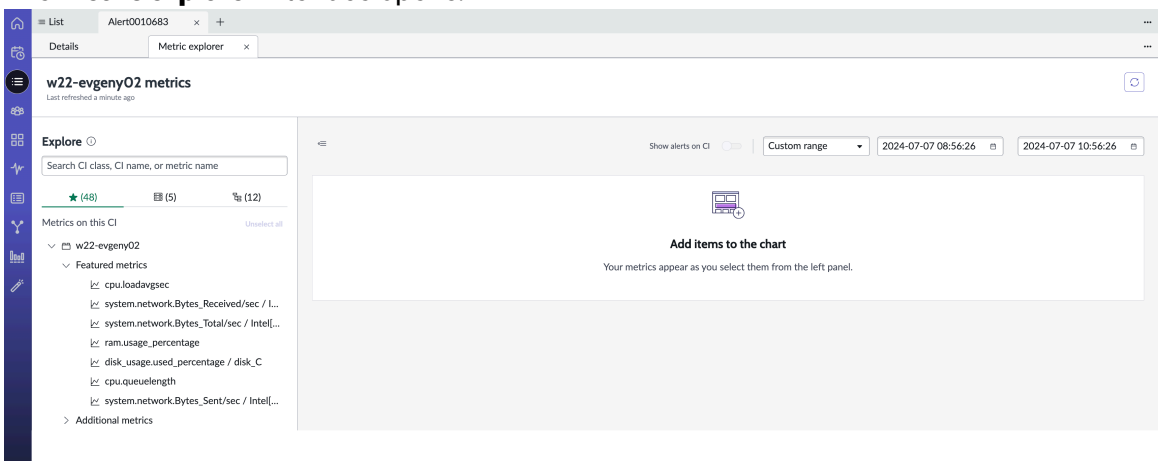
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select **Lists** > **Alerts** > **All Alerts**.
   The Alerts - All Alerts page opens.
4. Select the alert number to open it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The alert opens in a separate tab, displaying the **Overview** tab.

5. Select the **Metrics** tab.
6. Select the **Metric explorer** button.
   The **Metric explorer** interface opens.



Note: You can also access the **Metrics** subtab and **Metric Explorer** button when selecting a CI.

7. Select metrics in the Explore section to display the metrics in graph format in the **Custom chart** section.
   Metrics are divided according to the following subtabs:

Explore section subtabs

Subtab	Description
★	Displays metrics on the current CI.
	Displays metrics on other CIs on the same host.
	Displays metrics on entry points that relate to the service that the CI is impacting. **Note:** When working with large quantities of entry points (100K or more), collecting entry point metrics may cause system degradation. To prevent this, create the *sn_disable_selection_entry_point* property (**All** > **System Properties** > **All Properties**) and set it to **true** to turn off metric collection for entry points.

8. In the **Custom chart** section, configure a time range for which you want to view the displayed metrics.
9. Label alerts on the Custom chart by turning on the **Show alerts on CI** option.

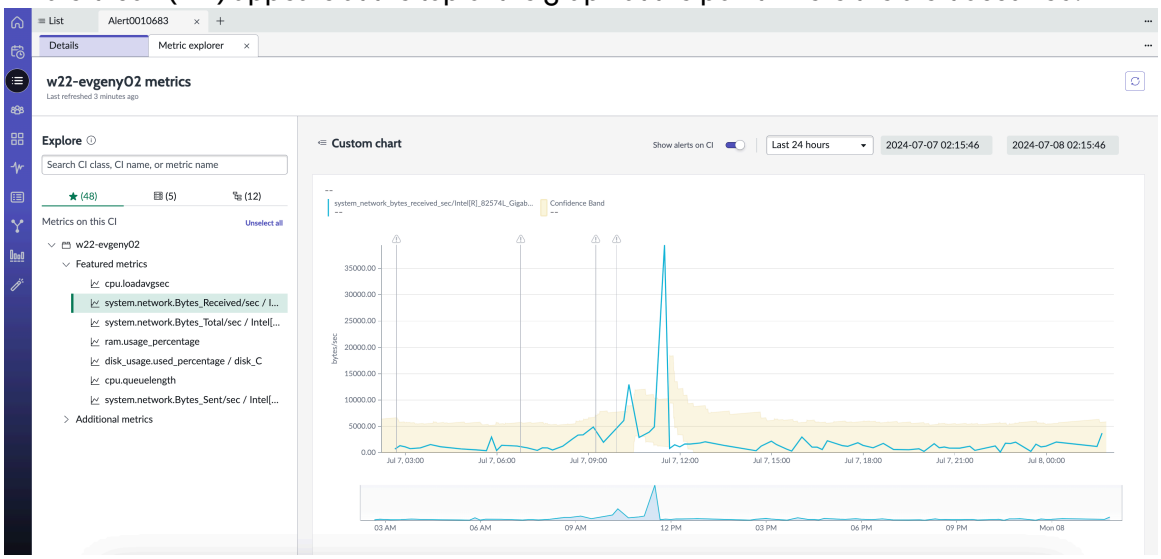
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An alert icon ( ) appears at the top of the graph at the point where the alert occurred.



On-call scheduling in Service Operations Workspace for ITOM

ITOM Service Operations Workspace supports creating and managing your on-call shifts and schedules. On-call schedule determines who is on-call at a given time. Learn how to configure on-call calendars and escalation policies to ensure timely responses to critical issues, reducing downtime and maintaining service continuity. Streamlining these processes enhances team readiness, minimizes disruptions, and improves service reliability.

Getting started with on-call scheduling

To enable on-call scheduling for alerts, first incorporate the Alert table [em_alert] into the Trigger Rule Table Config list. For more information, see Add alert table to enable on-call scheduling for Service Operations Workspace for ITOM.

Teams in Service Operations Workspace

Use the Teams menu ( ) in Service Operations Workspace to view all teams. Select a team card to view and manage a team's schedule, define escalation policies, and team preferences for the selected shift. This feature verifies that your team knows who is on call, is accountable, and is confident that critical alerts or incidents are acknowledged. For information on creating a shift, see Create on-call shift for your team .

Add alert table to enable on-call scheduling for Service Operations Workspace for ITOM

Enable on-call scheduling by incorporating the Alert table [em_alert] into the Trigger Rule Table Config list. This allows for creating shifts and implementing escalation triggers and policies, ensuring teams can promptly respond to alerts and maintain operational continuity.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** and in the search field, type `trigger_rule_table_cfg.list`.
   The Trigger Rule Table Configs page opens.
2. On the form, fill in the fields with the following values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the **Table** field, select **Alert [em_alert]**.
- In the **Trigger group** field, select **Assignment group**.
- In the **Trigger user** field, select **Assigned to**.
- In the **Journal** field, select **Work notes**.

3. Select **Submit**.

What to do next

Create on-call shift for your team.

Using Service Operations Workspace for ITOM

Service Operations Workspace for ITOM delivers a unified platform integrating various applications, specializing in streamlined alert management. Seamlessly manage IT Operations workflows while efficiently handling alerts, ensuring optimal performance and productivity.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

For more information on the tasks within ITSM, see Service Operations Workspace for ITSM.

Integrations Launchpad in Service Operations Workspace for ITOM

The Integrations Launchpad showcases all Event Management connector integrations, allowing users to pull or push events from external or internal devices. This centralized hub simplifies Event Management by consolidating integration options in one place.

The Integrations Launchpad streamlines the process of managing and utilizing event connectors, enhancing operational efficiency and ensuring seamless integration of event data from various external sources. This centralization helps users maintain better control and visibility over their Event Management ecosystem.

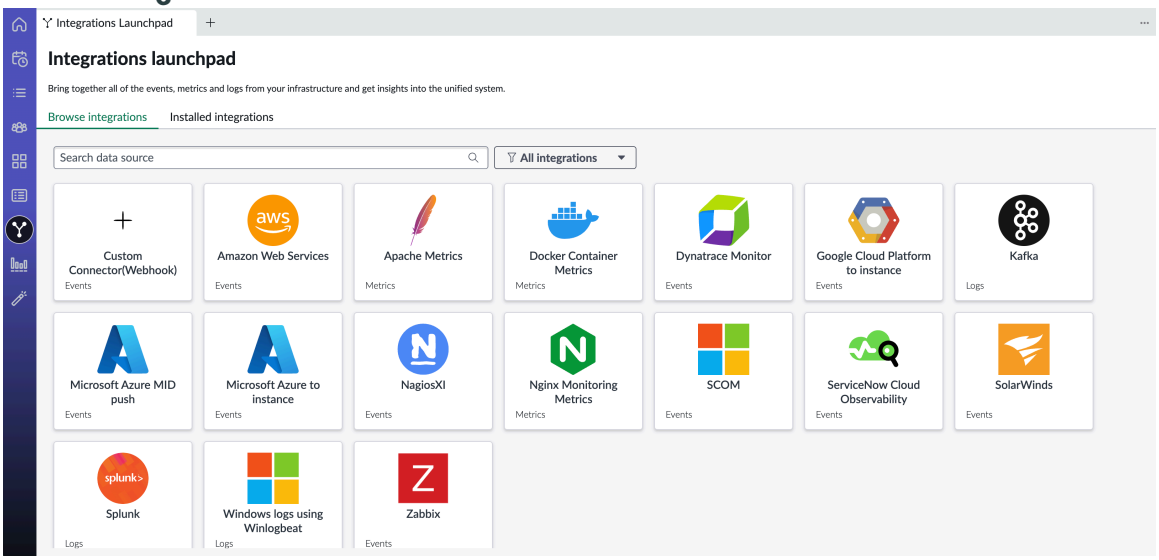
Browse Integrations tab

Displays all pull, push, and custom connector integrations, including connectors available from the ServiceNow store and third parties. This tab features:

- Search Box: Helps you quickly find a specific data source by entering keywords, improving efficiency and saving time.
- All Integrations list: Organizes integrations into categories such as All Integrations, Events (Push, Pull, Custom), Metrics (ACC-M), and Logs (HLA). This categorization makes it easier for users to browse the list and select the relevant type of integration they need.

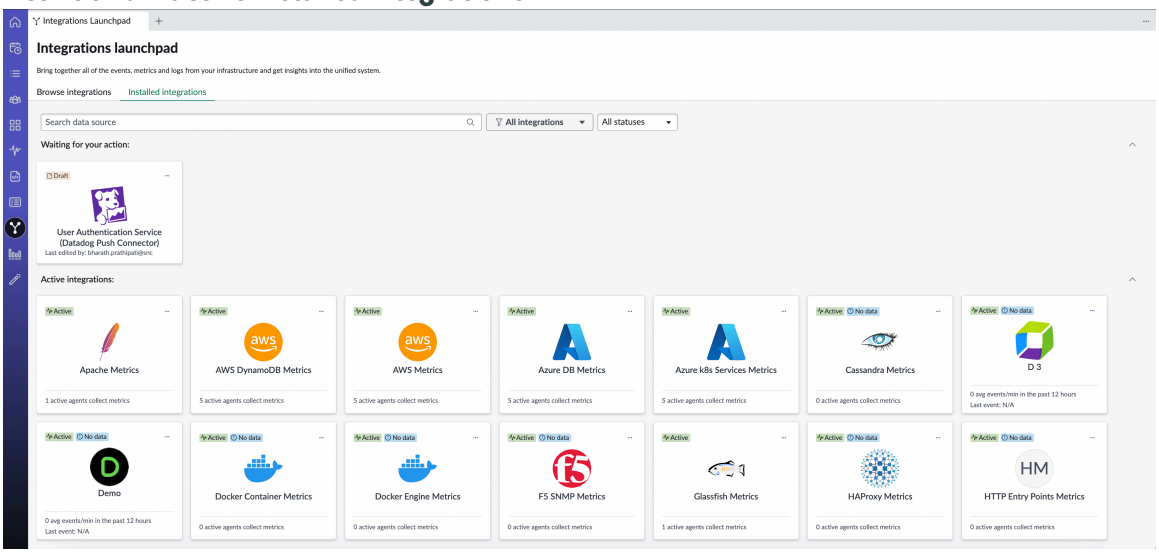
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Browse integrations tab



Installed Integrations tab

Active and inactive installed integrations



Lists all user-configured integrations, both active and inactive. This tab features:

- Search Box: Helps users quickly find a specific data source by entering keywords, improving efficiency and saving time.
- All Integrations list: Organizes integrations into categories such as All Integrations, Events (Push, Pull, Custom), Metrics (ACC-M), and Logs (HLA). This categorization makes it easier for users to browse the list and select the relevant type of integration they need.
- All statuses list: Allows you to filter integrations by their status—All Statuses, Active, Inactive, Draft, or No Data. This helps users quickly identify and manage integrations based on their current state.

Integration status and description

Status	Description
All statuses	All integration statuses
Active	Active integrations that were successfully installed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status	Description
Inactive	Inactive integrations that were successfully installed
Draft	In-progress integrations with a configuration that was started but not completed
No data	Integrations that were successfully installed with no data

Configure a pull connector

Configure pull connectors that require a script, connector definition, and connector instance to pull events from external devices. These connectors automate the data retrieval process, ensuring the seamless integration of external events into your system for efficient monitoring and management.

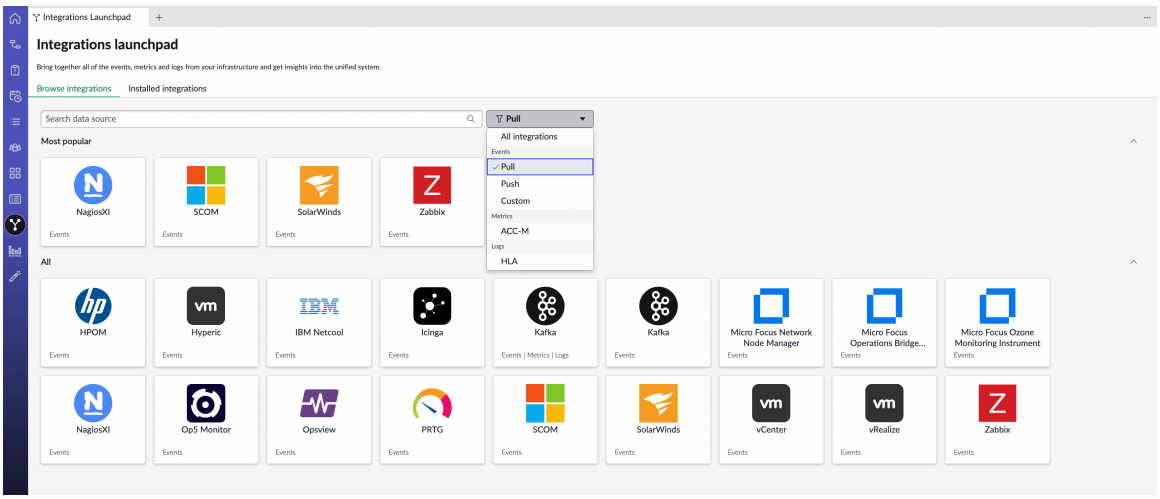
Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Pull**.
   Only pull connector tiles are displayed.

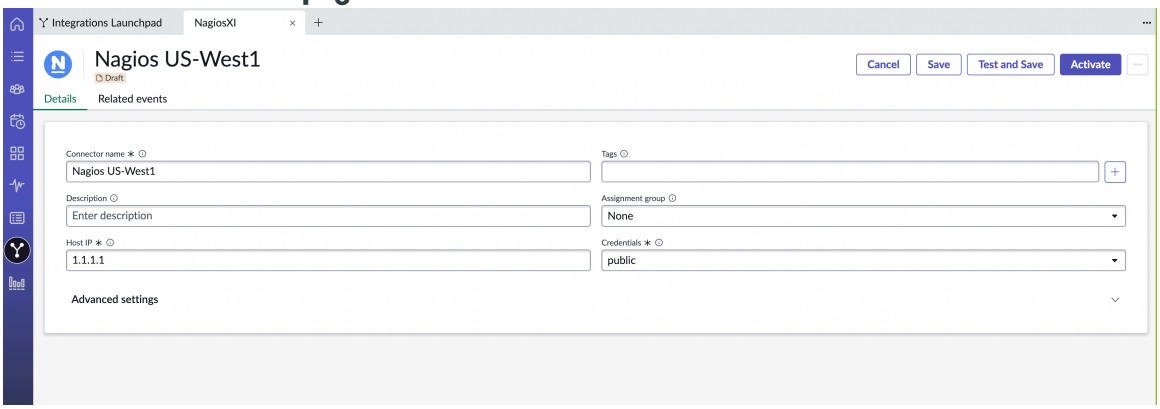
Pull connectors



4. Select a pull connector tile.
   If a pop-up menu opens, select the data to track from that connector and select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pull connectors details page



5. In the **Details** tab, in the **Connector name** field, enter a unique name for the connector type.
6. **Optional:** In the **Tags** field, enter tags to help locate and identify connectors of this type on the Express List.

   To add additional tags, select the plus icon ( ) next to the **Tags** field. The Add tags window opens.

   a. In the **Key** field, enter a tag key.

   b. In the **Value** field, enter a tag value.

   c. Select **Add**.
7. **Optional:** In the **Description** field, enter brief information about this connector.
8. **Optional:** From the **Assignment group** drop-down list, select the group or team that is responsible for managing and maintaining the connector.
9. In the **Host IP** field, enter the IP address that is used to select the appropriate MID Server for communicating with the event source host.
   You can use the host name instead of the host IP.
10. From the **Credentials** drop-down list, select the valid credentials to access the event source host.
    To create a new credential, select **Create new credentials** and continue with the process.
11. **Optional:** If you want to customize configurations to meet specific requirements, select **Advanced settings** and fill in the form.

Field	Description
Connected MID Server	Determine whether you want to have the system choose the optimal MID Server or choose a specific MID Server yourself. Perform only if you must make modifications to the MID Server otherwise leave it empty and let the system choose the optimal MID Server.
Event collection schedule (seconds)	Enter the frequency in seconds that indicates how often the system should check for new events from the external event source. The value can't be lower than the minimum schedule property, which by default is 120 seconds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Protocol	Defines the communication protocol used for retrieving events from external devices.
severity_by_state_type	Determines the severity level assigned to events based on their state type.
time_zone	Specifies the time zone used for recording and displaying event timestamps.
offset_min	Sets the time offset for event retrieval to ensure accurate synchronization.
Port	Verify the default values for your connector type such as port details or time formats and modify them as necessary. Default values from your connector are filled-in. Specifies the port number used for communication with external devices.
max_fetch_interval_min	Limits the maximum interval between event fetch operations.
initial_sync_in_days	Sets the duration for the initial synchronization process when retrieving historical data.

12. **Optional:** Test the connector before activating it by selecting **Test and Save**.
13. To save the connector, select **Save**.
14. To activate the pull connector, select **Activate**.
    The pull connector is activated and its tile is displayed in the **Installed Integrations** tab.

What to do next

To confirm the successful configuration of the pull connector and the flow of events into the system, select the **Related events** tab. If the setup is successful, proceed to **Add automation** to establish an alert automation. For details on **Related events** tab, see Review integration and configuration health and for information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Configure a push connector

Integrate with a push connector to connect to an external event source and push event information to your ServiceNow instance.

Before you begin

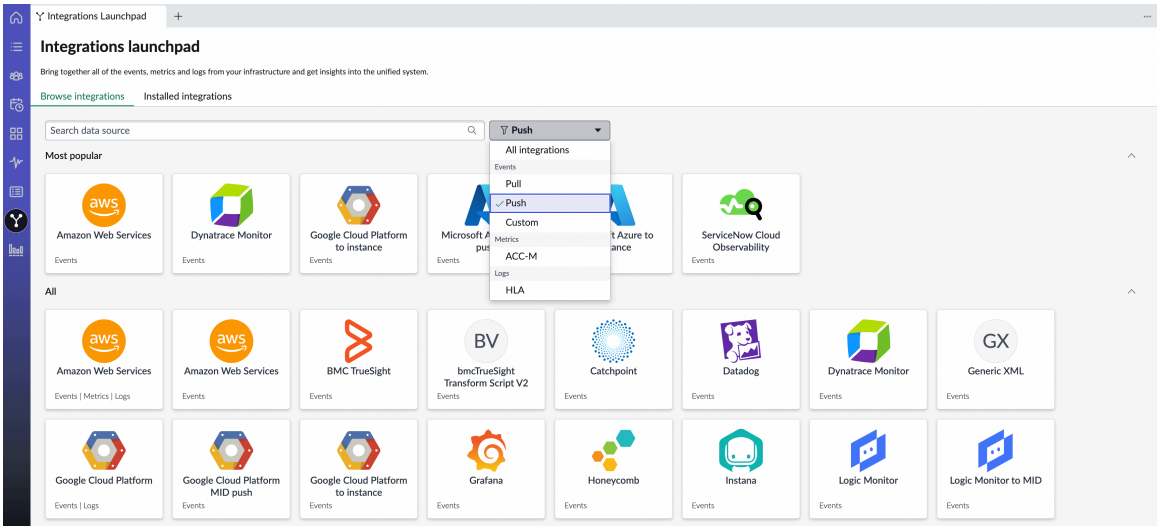
Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Push**.
   Only push connector tiles are displayed.

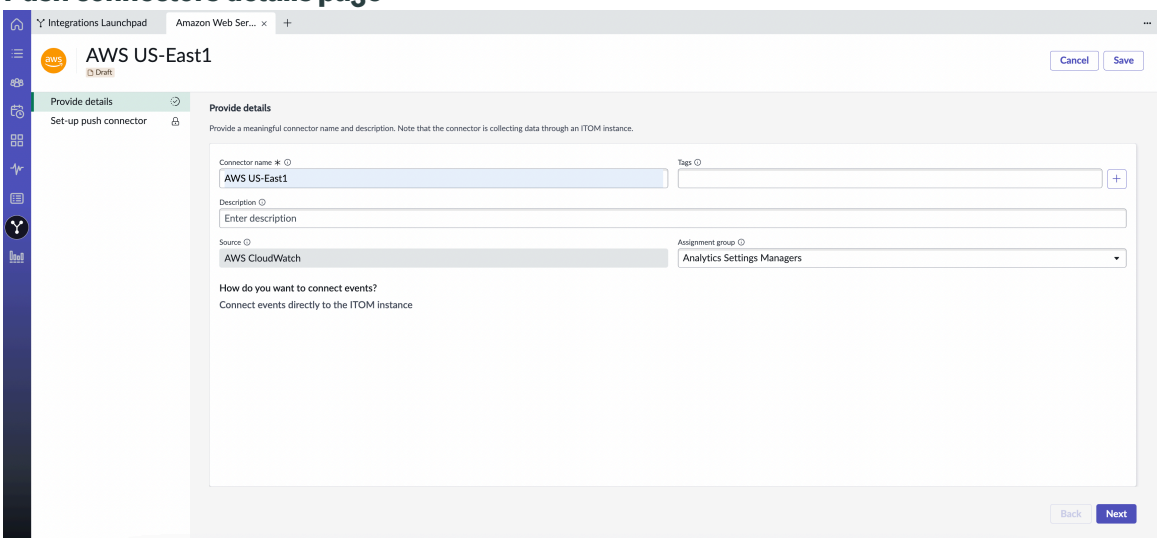
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Push connectors



4. Select a push connector type tile.
5. Provide details about the connector type on the **Provide details** screen.

Push connectors details page



a. In the **Connector name** field, enter a unique name for the connector type.

b. **Optional:** In the **Tags** field, enter tags to help locate and identify connectors of this type on the Express List.
To add additional tags, select the plus sign next to the **Tags** field. The Add tags window opens.

   i. In the **Key** field, enter a tag key.

   ii. In the **Value** field, enter a tag value.

   iii. Select **Add**.

c. **Optional:** In the **Description** field, enter information to help identify this connector type.

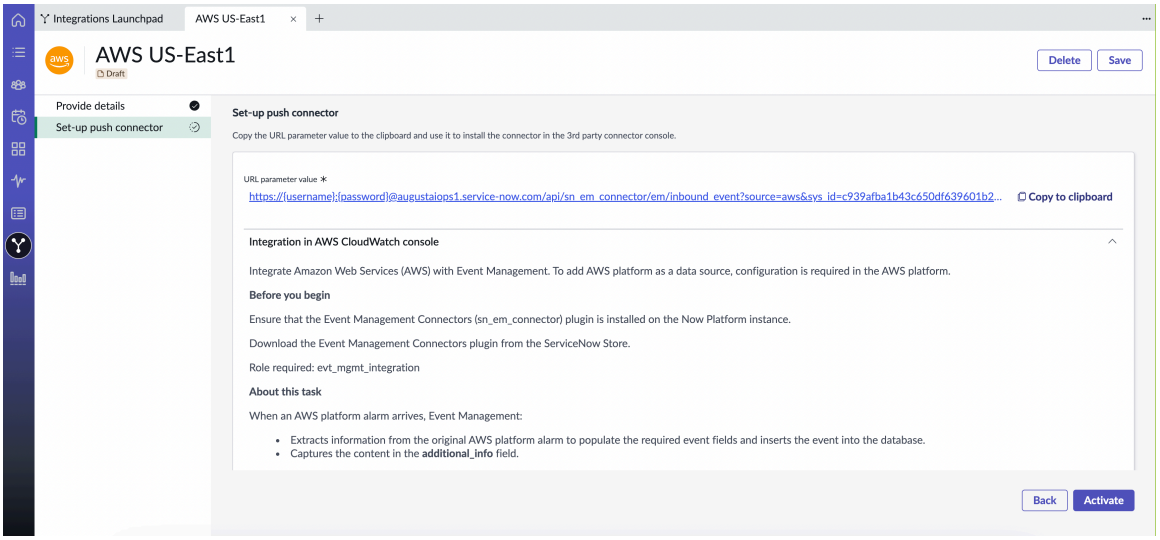
d. Verify that the vendor name in the **Source** field is correct.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. **Optional:** From the **Assignment group** drop-down list, select the group or team that is responsible for managing and maintaining the Push connector.

f. Select **Next**.

The connector is saved in draft mode, and the process advances to the Set-up push connector section.



6. In the **URL parameter value** field, select **Copy to clipboard** to copy the auto-generated URL parameter value to the clipboard.

   This URL is generated by the code that depends on the ServiceNow instance and connector type to receive events from the third-party connector. Pasting the URL in your third-party connector configuration creates a webhook that enables it to send events to the ServiceNow instance.

7. Select **Activate** and then select **OK**.
8. In the **Details** tab, view the connector details and the URL link and follow the step-by-step instructions to integrate your third-party connector with Event Management.
   The connector is saved and a notification is sent after the connector is active.

What to do next

To confirm the successful configuration of the pull connector and the flow of events into the system, go to the **Related events** tab. If the setup is successful, proceed to **Add automation** to establish an alert automation. For details on **Related events** tab, see Review integration and configuration health and for information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Configure a custom connector

Authenticate your custom connector as a data source to enable the pushing of event information to your ServiceNow instance. Define the custom connector by providing its details and mapping fields. This allows the extracted information from your custom connector's event messages to populate the required event fields. Finally, create and supply a URL for the custom connector webhook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure the Event Management connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance. For more information, see Configure Event Management connectors.
- Ensure that the configuration items for the hosts managed by your custom connector exist in the ServiceNow AI Platform instance. These CIs can be physical or virtual and can be either manually created or discovered via IP discovery or Cloud Discovery. For more information, see Access to cloud environments for ITOM products.

Role required: evt_mgmt_admin

About this task

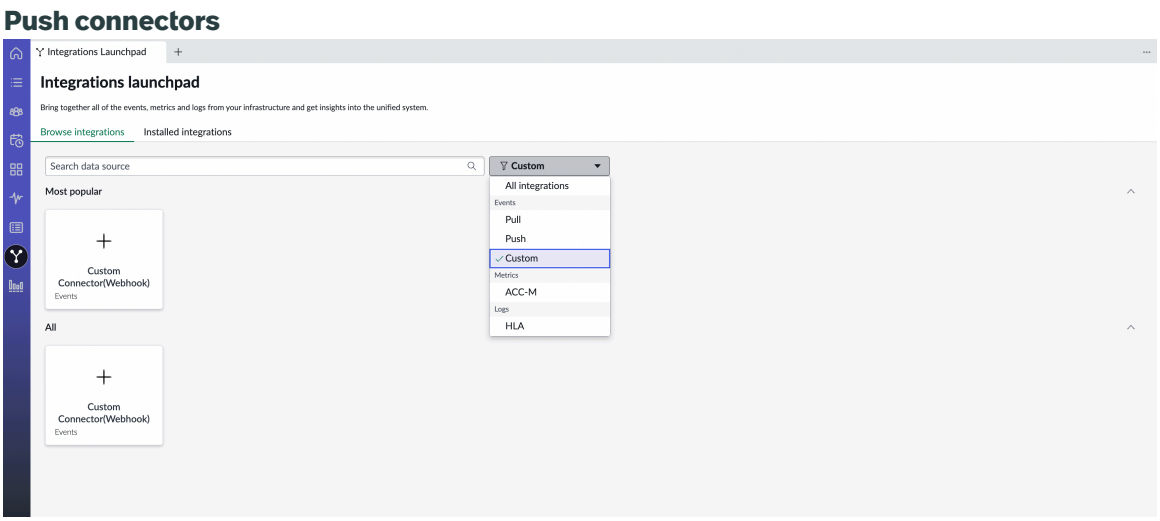
To start pushing event information to your ServiceNow instance, you must set your ServiceNow AI Platform instance as the REST endpoint using a standard webhook on your custom connector.

By providing connector details and mapping fields, you define the custom connector. The extracted information from the custom connector's event messages then populates the required event fields and inserts the event into the database.

The URL is generated by the code based on the ServiceNow instance and the custom connector. Use this URL to create a webhook that enables your custom connector to send events to the ServiceNow instance.

Procedure

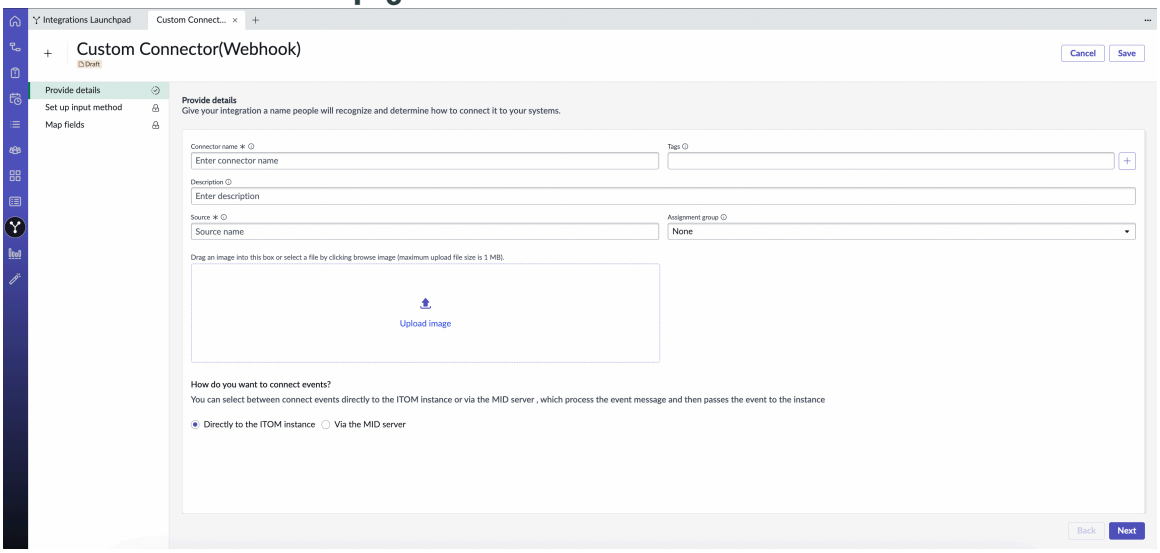
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Custom**.
   Only custom connector tiles are displayed.



4. Select a custom connector type tile.
5. On the **Provide details** page, provide the details for the connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom connectors details page



a. In the **Connector name** field, enter a unique integration name for the connector.

b. Optional: In the **Tags** field, enter tags to help locate and identify connectors of this type on the Express List.

To add additional tags, select the plus icon ( ) next to the **Tags** field. The Add tags window opens.

i. In the **Key** field, enter a tag key.

ii. In the **Value** field, enter a tag value.

iii. Select **Add**.

c. Optional: In the **Description** field, enter brief information about this connector.

d. In the **Source** field, enter the vendor used to gather events from the external event source.

The **Source** field identifies the connector and serves as an identifier to recognize the source of events and alerts once the connector is active.

e. Optional: From the **Assignment group** drop-down list, select the group or team that is responsible for managing and maintaining the connector.

6. Optional: Drag or upload an image to display in your connector tile.

- Drag an image into the box.
- Browse to the image file by selecting **Upload image** and then choose the file.

The maximum upload file size is 1 MB.

7. Determine whether you want to connect events directly to the ITOM instance or through a MID Server.

- To send events directly to the ITOM instance, select **Directly to the ITOM instance**.
- To send events through a MID Server, which processes and then passes the event to the instance, select **Via the MID server**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

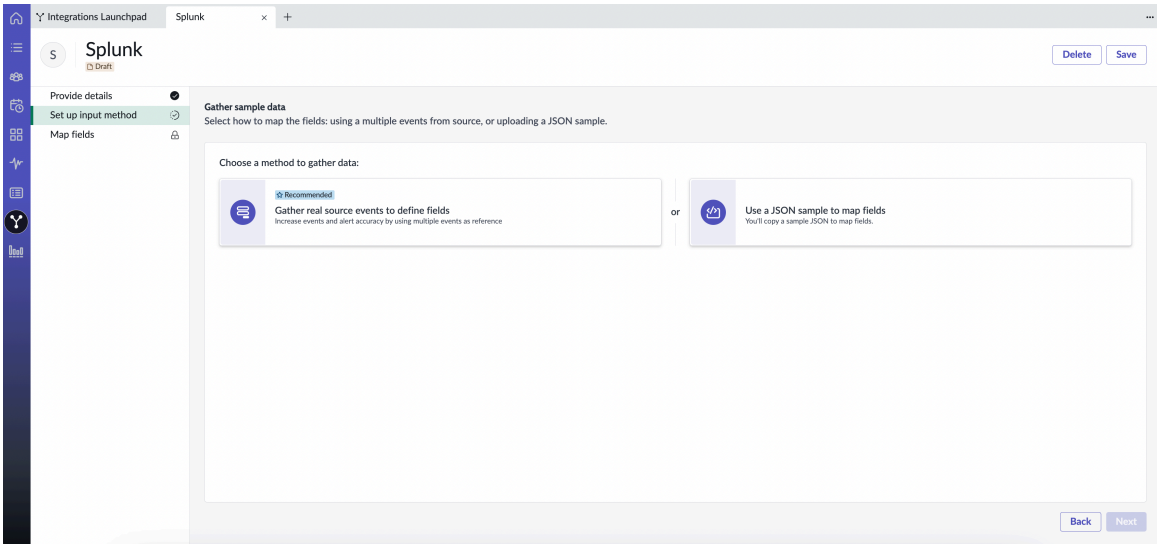
If a MID Server exists, from the **Select MID server** field, select an available MID Server connected to an events listener.

If you must create a MID Server, then select one of the following.

- **Configure MID web server extension**
- **Configure MID web service event collector context**

For more information, see Configure the MID Web Server extension and Configure the MID WebService Event Collector Context.

8. Select **Next**.



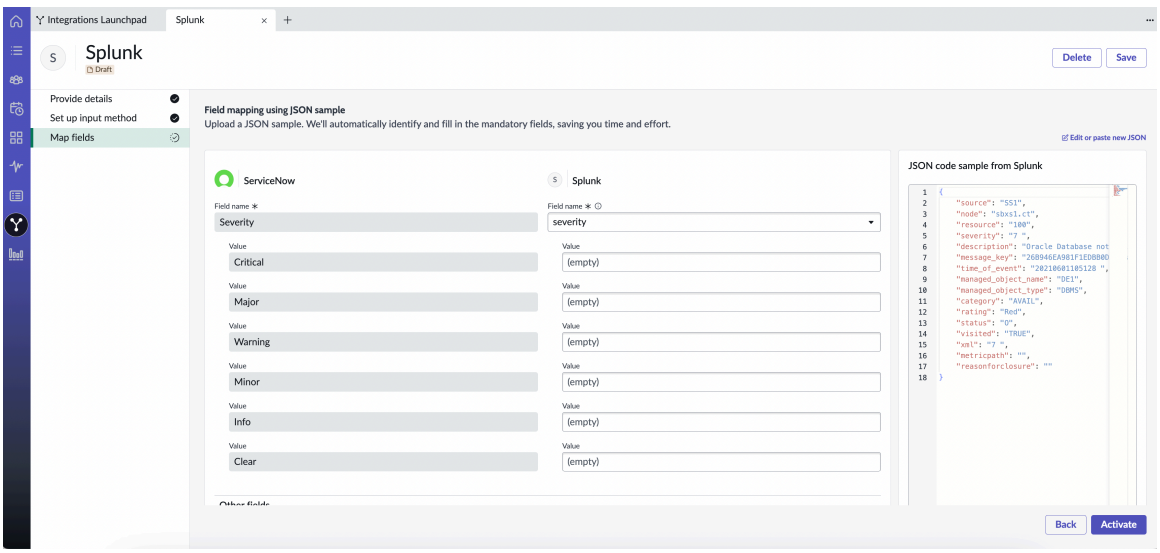
9. On the **Set up input method** page, select a method to gather event data.

Method	Description
Gather real source events to define fields	**a.** Select **Gather real source events to define fields**. **Note:** By gathering real-source events from your custom connector, you increase events and alert accuracy by using multiple events as a reference to define the fields. **b.** Select **Copy to clipboard** and copy the URL. **c.** Paste the URL into your custom connector's web hook setup to create a webhook that enables your custom connector to send events to the Service Now instance. Enter your basic authentication cre dentials into the monitoring system's webhook con figuration (such as the username and password). The webhook enables your custom connector to send events to the instance. **d.** Select **Check for events**. The number of events are displayed. The event creates JSON files that you can browse after selecting **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Method	Description
Use a JSON sample to map fields	**a.** Select **Use a JSON sample to map fields**. **Note:** Only if you have a sample JSON se lect this option. **b.** In the **Enter payload** dialog box, copy and paste your JSON sample payload to create and view the mapping to map the fields.  **c.** Select **Upload JSON**. **d.** Select **Edit or paste new JSON** to edit the JSON that you uploaded or paste a new one. **e.** Select **Copy to clipboard** and copy the URL. **f.** Paste the URL into your custom connector's web hook setup to create a webhook that enables your custom connector to send events to the Service Now instance. Enter your basic authentication cre dentials into the monitoring system's webhook con figuration (such as the username and password). The webhook enables your custom connector to send events to the instance.

10. Select **Next**.
The page opens where you can map fields.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. On the **Map fields** page, in the connector field names column, enter at least one value that maps to the severity values listed in the ServiceNow **Severity** field column.
12. On the **Map fields** page, in the connector field names column, enter at least one value that maps to the severity values listed in the ServiceNow **Severity** field column.

    You can enter the severity value from the JSON code sample. To set a severity value, you must be familiar with your custom connector's payload and the types of severity it supports. The severity values of the received events must match the generated events in your system.

    Enable the system to create events correctly from incoming data by mapping the fields in your JSON code sample to the ServiceNow fields. The **Severity** and **Message key** information are automatically filled in to save you time and effort. The **Message key** provides the correct identifier for the events, ensuring de-duplication works correctly and redundant alerts are not generated.
13. **Optional:** To view multiple JSON files, select the arrow above the JSON sample.
14. **Optional:** In the Other fields section, in your connector column, specify custom event parameters that are optional but provide additional information about the event.
    If you choose not to provide the optional information, leave the field empty.

    a. In the **Description** field, enter a meaningful alert description.

    b. In the **Metric name** field, enter a metric name that allows you to associate events with the performance metrics or KPIs that triggered the alert.

    c. In the **Node** field, enter a node value to be used for CI binding.

    d. In the **Event time** field, enter the creation time of the custom connector event.
    If the event time isn't mapped, the system will use the default event time.

    e. In the **Event time settings** field, select the time format and the event time zone.
    - **Time format**: A GlideDateTime field in UTC or GMT format, with a maximum length of 40 characters.
    - **Time zone**: Times are stored in Coordinated Universal Time (UTC) and are displayed globally based on the system time zone.
15. Activate and save the connector by selecting **Activate** and then select **OK** on the confirmation pop-up window.
    You can view the connector details on the **Details** tab and your field mappings on the **Fields mapping** tab.

    Note: You cannot modify connector details when it is active. Deactivate the connector to make any changes.

Result

After the connector is activated, events start flowing from your custom connector console into the ServiceNow instance. The plug-in extracts information from the original custom connector event message to populate the required event fields and inserts the event into the database. To see the events in your ServiceNow AI Platform instance, navigate to All Events. For more information, see View events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

To verify that the process was successfully completed and events are flowing into the system, view the related events on the **Related events** tab. If the setup is successful, proceed to **Add automation** to establish an alert automation. For information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Review integration and configuration health

Review your events to ensure alerts are created as intended. Start this process by checking the health status of your integration. This provides useful statistics to highlight where you can make improvements to enrich alerts with relevant business context, group them for better noise reduction, escalate critical alerts promptly, and notify your team for swift response and resolution.

Before you begin

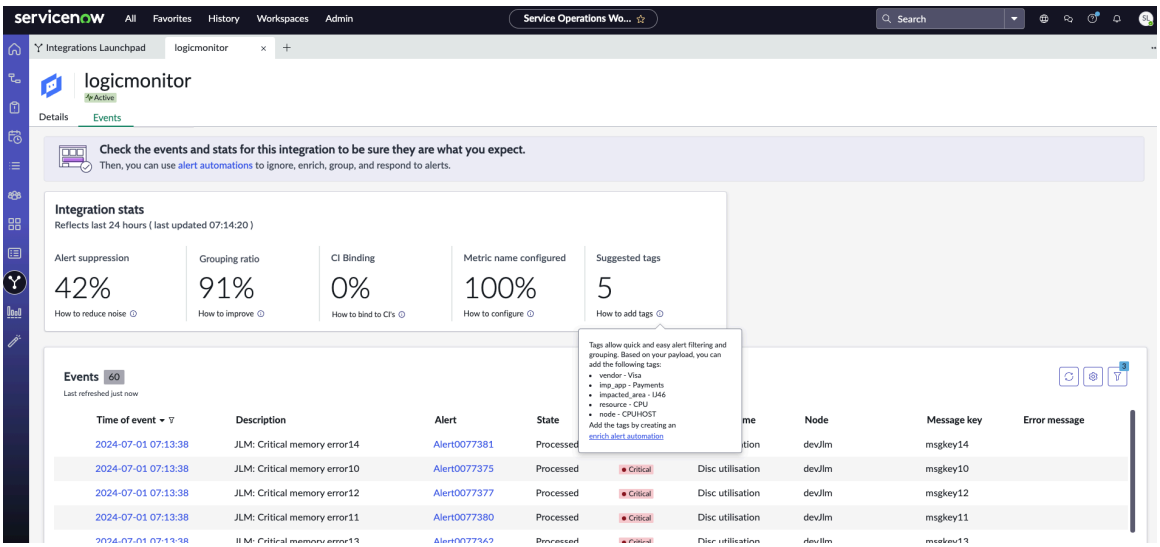
Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

Health state metrics indicate how effectively alert automations add context and reduce noise, helping operators lower the Mean Time to Repair (MTTR). When adding a new integration, review these metrics, assess the rates, and develop new rules to further enhance noise reduction and improve overall system performance.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Pull** or **Push** as required.
4. Select a pull, push, or a custom connector type tile.
   If a pop-up menu opens, select the data to track from that connector and select **Continue**.
5. Select the **Related events** tab.



6. In the Health state section, view the data for alerts and their associated attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert attributes

Alert attribute	Description
Alert Suppression	The suppression ratio indicates the proportion of alerts created to events received. Reducing unwanted alerts can be achieved by de-duplicating or ignoring them. ○ De-duplication: The **message_key** field is a unique identifier for an alert in the source monitoring system. It is used for de-duplication and alert flapping detection purposes. If the source event does not provide reliable unique values, you can use the default value or create your own. If the message key is not defined, the default message key will be <Source + Node + Type + Resource + Metric Name>. The guideline is for the event source to automatically populate the <Source + Node + Type + Resource + Metric Name> fields and generate the message key. This practice facilitates better distribution of event processing across instance workers and nodes. If the source event does not provide values for these fields, ensure they are populated using transform rules. This action, which does not impact event processing, is essential for de-duplication. Populate as many of these fields as possible before sending the event to the instance. Doing so enhances the distribution of events across processor workers, resulting in improved throughput and scalability. To learn more about de-duplication, see Event Management configuration preferences. To set the message key in your custom connector integration, see Configure a custom connector. ○ Ignore alert event rules: Filter out low-quality alerts by creating an ignore automation.
Alert compression rate	When you group alerts, a high compression rate is desirable because it means fewer alerts remain for your operations team to review and act on. This can lead to improved team efficiency. The compression rate is calculated as 1 – (the number of alert groups + the number of ungrouped alerts) / total alerts. To learn about alert aggregation, see Alert grouping. One way to improve your alert compression rate is by defining a new grouping automation.
CI Binding	The percentage of alerts successfully bound to a Configuration Item (CI) in your CMDB is crucial. Aim for this number to be at or near 100% to enhance alert grouping, root cause analysis, assignment, and more. To bind a host, machine, or any device with an IP, populate the **Node** field with a unique hostname, FQDN, IP, or MAC address. This can be done within the integration itself or by creating an enrich automation. For more complex scenarios, you can override node-based binding

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert attribute	Description
	using event rules. For more information on CI binding, see Binding alerts to CIs.
Metric name configured	Shows the percentage of alerts that have a metric name defined. It's crucial to aim for near 100% because it's used by default in our automated correlation algorithm. This can be achieved within the integration itself or by creating an enrich automation.
Suggested tags	Provides suggested alert tags based on the integration payload. Alert tags are structured fields that you can define to facilitate easier filtering and grouping of alerts. The tags are stored in *sn_itom_integ_app_recommendation_tags_suggestion*, and only the top 5 most popular tags are displayed. In case you prefer to refine the results of suggestion mechanism, you can use property *sn_itom_integ_app.evt_mgmt_tag_suggestion_ignore_keys*, which displays a list of lowercase field names or keywords, separated by commas, to be ignored when scanning additional alert info for tag suggestions. Default value is time.

7. In the Events section, ensure that your events are generating alerts as expected.

   Verify that alert fields and tags are populated correctly to make the alerts easier to read and filter in Express List. Confirm that severity values align with your operations team's expectations and that fields and tags follow a standardized format across sources for easier grouping.

   By verifying alert generation, you can be confident that your system is properly configured to detect and notify you of noteworthy occurrences. For information on the fields in the Events section, see Integration and configuration health event fields.

What to do next

Now that you've confirmed alerts from the events, you can initiate the alert automation process by selecting **Add automation**. This takes you to the ignore automation step, where you can disregard irrelevant or false-positive alerts. Following that, proceed to enrich, group, and automate responses. This process involves transforming raw alerts into a format understandable by ServiceNow, grouping the alerts, and escalating an alert to ensure an immediate response from the appropriate team or individual. For more information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Activate integration

Activate integration allows you to enable a previously deactivated connector integration, restoring its functionality. This feature helps you seamlessly resume data flow and integration activities, ensuring continuity and efficient event management without the need to reconfigure the integration.

Before you begin

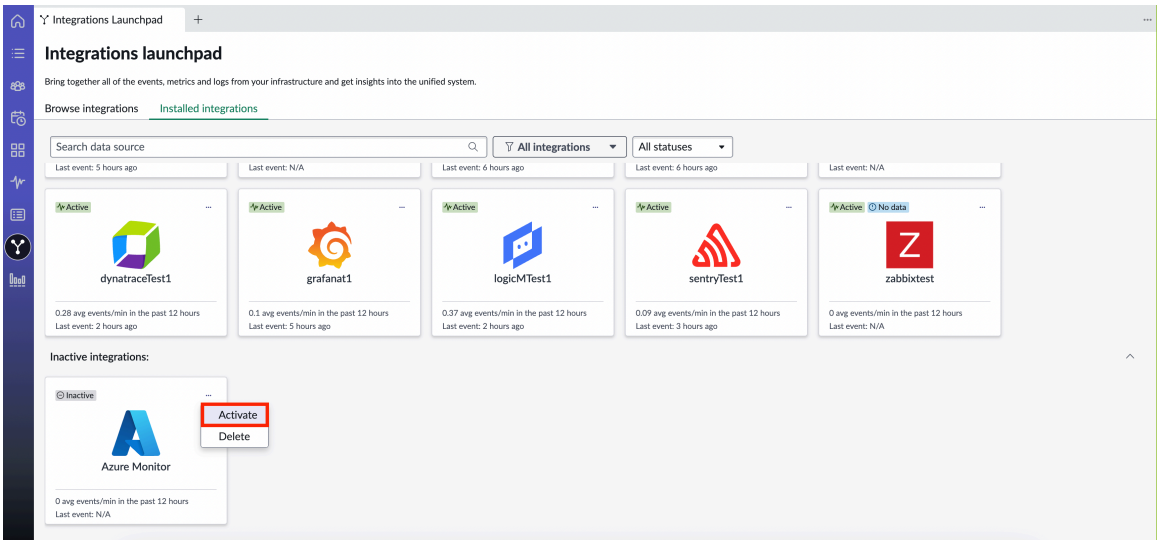
Ensure the integration is deactivated.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. Select the **Installed integrations** tab.
4. For the integration that you want to activate, select the Ellipses icon (•••) and then select **Activate**.



The selected integration is activated, and its status is shown as **Active** on the installation tile.

Deactivate integration

Deactivate integration allows you to temporarily disable an active connector integration without deleting it. This feature helps you manage integrations more effectively by pausing data flow when needed, reducing unnecessary event processing and improving system performance.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. Select the **Installed integrations** tab.
4. For the integration that you want to deactivate, select the Ellipses icon (•••) and then select **Deactivate**.

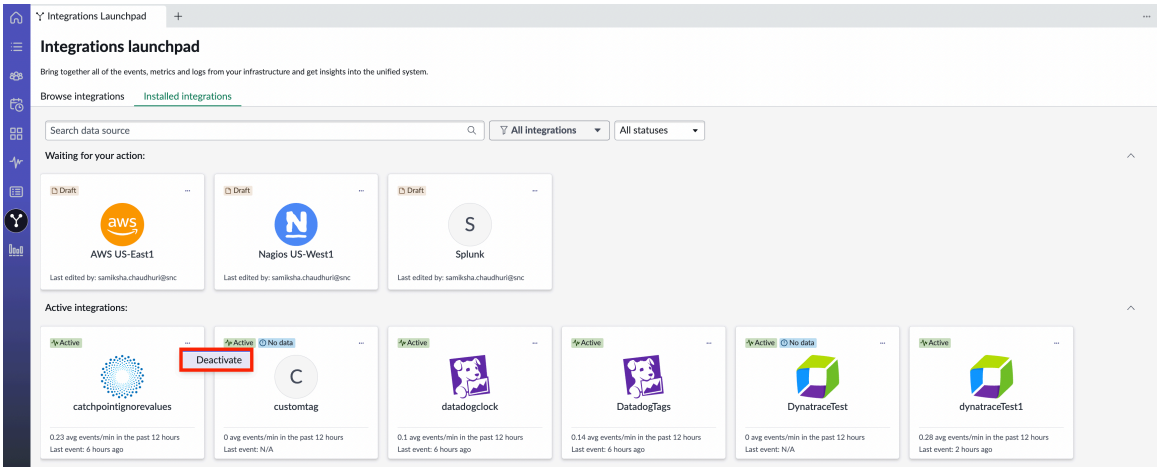
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The selected integration is deactivated, and its status is shown as **Inactive** on the installation tile.

Delete integration

Delete integration allows you to permanently remove a connector integration from your system. This feature helps you maintain a clean and organized system by eliminating unused or obsolete integrations, freeing up resources and reducing potential clutter.

Before you begin

Ensure the integration is deactivated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. Select the **Installed integrations** tab.
4. For the integration that you want to delete, select the Ellipses icon (•••) and then select **Delete**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the confirmation window, select **Delete**.
   The integration is deleted.

Express List in the Service Operations Workspace for ITOM

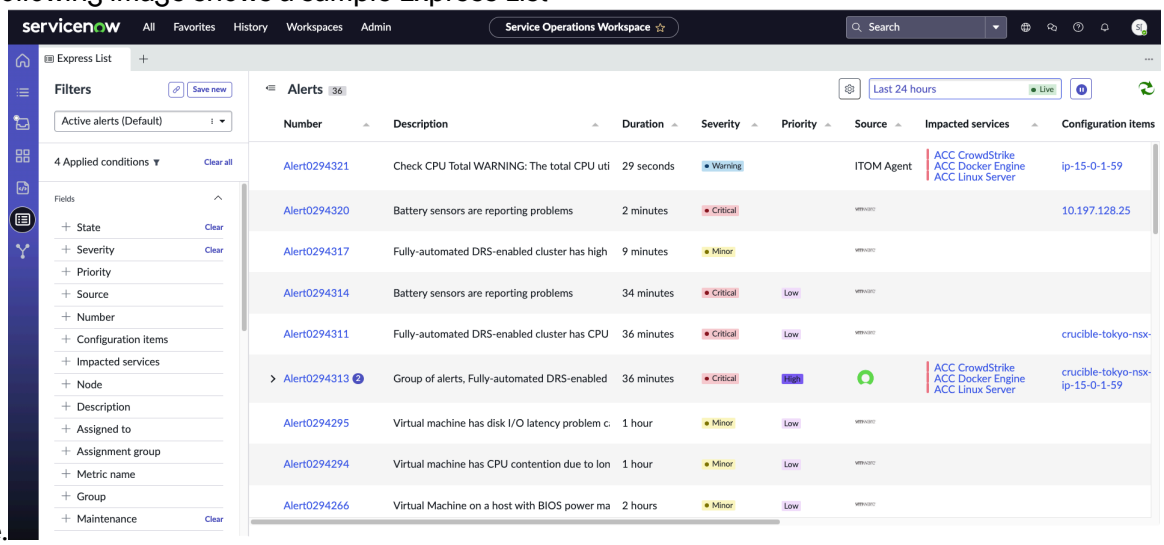
The ServiceNow Event Management Express List feature helps you identify health issues across the datacenter on the Service Operations Workspace. It provides a list of quick information on alerts so you can more efficiently monitor systems and services, resolve alerts, evaluate the alert impact, track issues, and report incidents.

The Express List pane sortable alert list reduces the number of clicks necessary to access alert information. Selecting the check box of an alert opens a preview panel where you can view data that helps for prioritization, impact realization, and root cause analysis. You can easily modify the Express List pane to narrow down the display by using a provided fields list, displaying additional alert information, and filtering out or showing matching alerts. You can also modify the displayed time range.

Note:

Exporting alerts is not supported from the Express List. To export alerts, open the list view in Service Operations Workspace.

The following image shows a sample Express List pane.



Express List benefits

The Express List pane enables operators to more efficiently perform the following actions:

- **Monitoring systems or application services**. Monitoring the performance and capability of computer systems to see any discrepancies.
- **Resolving alerts**. Working on discrepancies to troubleshoot issues and promote the efficient functioning of IT infrastructure.
- **Tracking issues**. Tracking and documenting defects and resolutions in detail and reporting incidents.
- **Reporting incidents**. Escalating complex issues to management, other IT resources, third parties or vendors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert information displayed in the Express List preview panel

The Express List preview panel displays additional alert information on the Express List pane. This information enables you to conduct an assessment that helps in resolving incidents without having to open multiple alert forms.

The **Info** tab on the preview panel displays the following information for a selected alert:

- Alert number (link)
- Status
- Duration
- Configuration items (with links)
- Metric name
- Node
- Resource
- Source
- Assigned to
- Assignment group
- Last Updated
- Impacted services

  For more information, see View data on impacted services on the preview panel in Express List.

- Additional info
- Custom field

You can view additional alert information by selecting any of the linked items.

The **Alerts in group** tab on the preview panel displays alert information for a selected alert group. Information for each alert is displayed in a tile with additional options for each alert in the group.

Each tile displays the following alert information:

- Alert number (link)
- Status
- Severity
- Configuration items
- Duration
- Metric name

Customizing the alert display time range

You can determine the time range of the displayed alerts. The default time range is the last 24 hours. The list continues to update with new alerts until you select the pause icon ( ). Selecting the current range setting in the upper right displays a dialog box with date and time range options:

- All time - The last 90 days
- Last 24 hours

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Last week
- Last 12 hours
- Last hour
- Last 15 minutes
- Custom - Enables you to select a date and time range from the pop-up calendar.

Default time ranges can be defined by your administrator using the system property sn_sow_em.evt_mgmt.express_list.all_time_days.

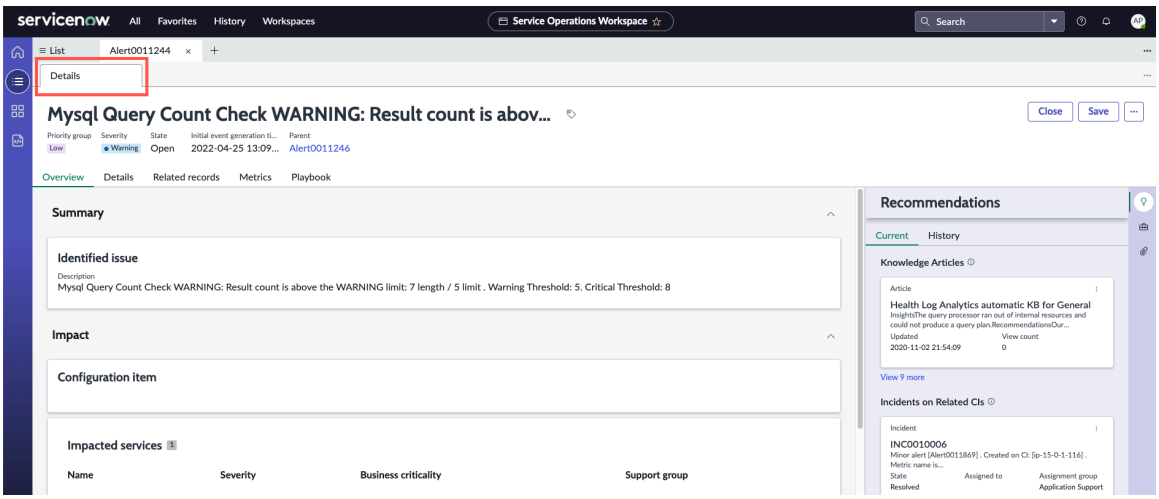
Roles used by Express List

Alerts in Service Operations Workspace

The Service Operations Workspace interface displays an alerts list and details on specific alerts.

When clicking an alert in the alerts list, the **Details** tab of the selected alert appears and the issue that caused the alert (the identified issue) appears in the alert title. Only the subtabs relevant to the alert appear on the resulting page. For example, the **Alerts in Group** option appears in the **Related records** tab only for alert groups.

Details tab



The following table describes areas on the alert form.

Alert form areas

Feature	Description
Header	The header includes these details: • Description: The text from the **Description** field of the alert is displayed. • Priority group: Priority group to which the alert belongs. • Severity: Severity of the alert. • State: The state of the alert. • Initial event generation time: Date and time when the initial event was generated. • Parent: The primary alert in the group (relevant only for child alerts in a group).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert form areas (continued)

Feature	Description
	• Group: Group type to which the alert belongs (relevant only for alerts in a group). • Task: Number of the incident with which the alert is associated. The displayed information varies according to the alert type.
Overview tab	When viewing an alert with an assigned CI, this tab opens when selecting the alert. The information displayed varies depending on the type of alert (grouped, secondary, or primary). If you have installed the Health Log Analytics app, alert types include Health Log Analytics alerts and component-based alerts.

Assign alerts in Express List

Assign alerts in Express List to yourself, to someone else, or to an assignment group to balance your organization's work load.

Before you begin

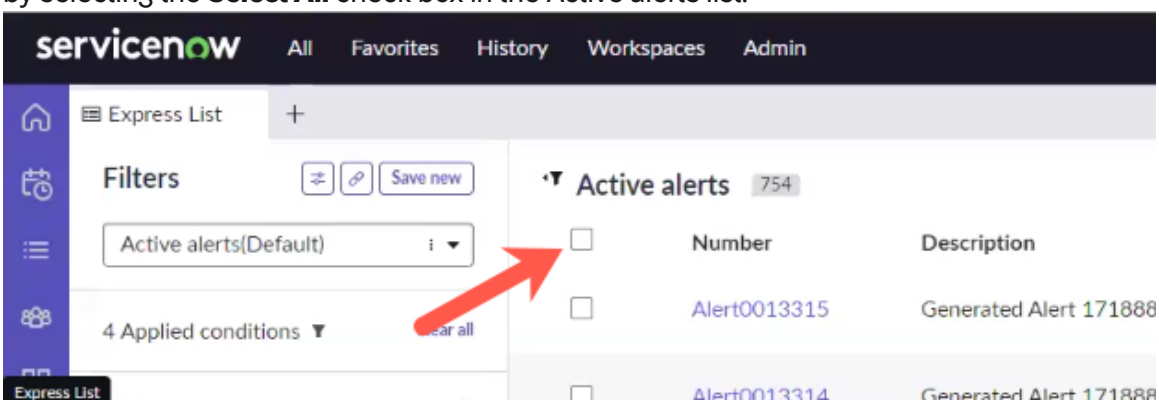
Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

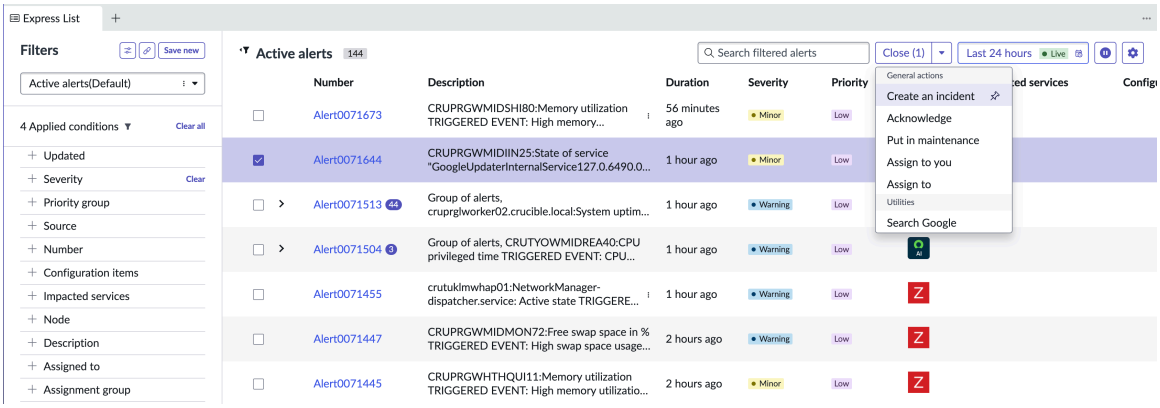
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select the check box next to the alert number that you want to assign.

Note: You can perform the action on up to 1,000 alerts simultaneously by selecting the **Select All** check box in the Active alerts list.



4. Select the **Close** drop-down list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Perform one of the following actions.

Assignment	Actions
Yourself	Select **Assign to you** and then select **OK**.
Someone else	**a.** Select **Assign to**. **b.** Select the name of the person to whom you want to assign the alert from the **Assigned to** field. **c.** (Optional) Enter information about the assignment or alert in the **Work notes** field. **d.** Select the **Assign <number> alerts** button.
Assignment group	**a.** Select **Assign to**. **b.** Select the name of the group from the **Assignment group** field. **c.** Select the name of the person to whom you want to assign the alert from the **Assigned to** field. **d.** (Optional) Enter information about the assignment or alert in the **Work notes** field. **e.** Select the **Assign <number> alerts** button.

Result

The assigned person appears in the **Assigned to** column and the assignment group appears in the **Assignment group** column in the Express List pane.

Express List keyboard shortcuts

Use keyboard shortcuts to quickly perform common actions in the Express List.

Navigation shortcuts

Action	Keyboard shortcut
Go to the previous/next row	Arrow up/down
Move focus forward between clickable elements	Tab

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigation shortcuts (continued)

Action	Keyboard shortcut
Move focus backward between clickable elements	Shift + Tab

Action shortcuts

Action	Keyboard shortcut
Open an alert record	Option/Alt + R
Acknowledge an alert	Option/Alt + K
Assign an alert to yourself	Option/Alt + Y
Close an alert	Option/Alt + X
Create an incident	Option/Alt + I
Search free text	Option/Alt + S
Pause/Restart live updates	Option/Alt + L
Open/close the preview panel	Enter

Selection shortcuts

Action	Keyboard shortcut
Expand/collapse a selected group of alerts	Space
Select multiple neighboring alert rows	Shift + arrow up/down
Select multiple separate alert rows	Command/Control + arrow up/down
Activate a selected link or button	Enter

Note: The information presented in this section is also available as in-product help in the Help Center panel for the Express List.

Identify an assigned Express List view

Identify Express List views assigned to you by your Event Management admin to make sure that you focus on specific services, priorities, or alerts.

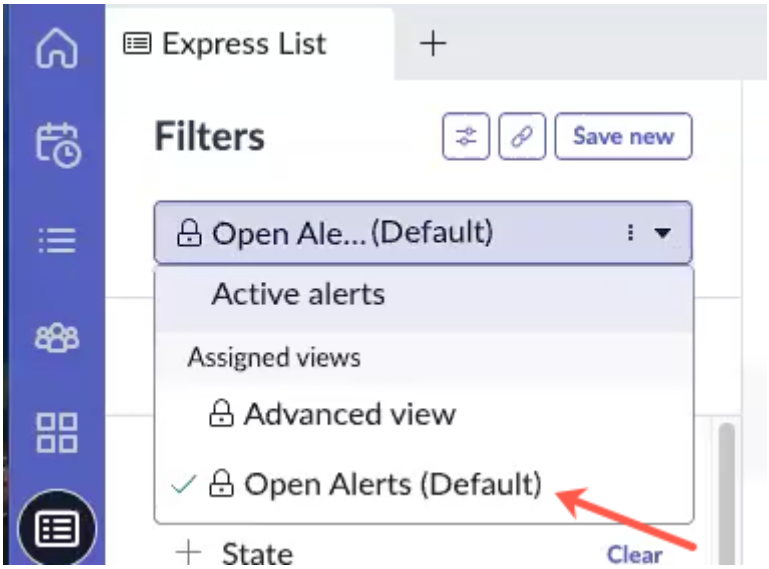
Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. **Optional:** In the Filters pane, turn on the **Use advanced filters** option to access advanced filters assigned to you.
4. From the drop-down list in the Filters pane, select an Express List view assigned to you. The default view is marked as Default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: You can't override the filters in views assigned to you. However, you can modify, save, and share these views locally.

The Filters pane lists the predefined filters. The Express List table displays the columns configured for the selected view.

Related topics

Configuring Express List views for users and user groups

Add or modify Express List columns

Add columns to the Event Management Express List display to focus the list of alerts that is displayed or modify the existing columns that are displayed.

Before you begin

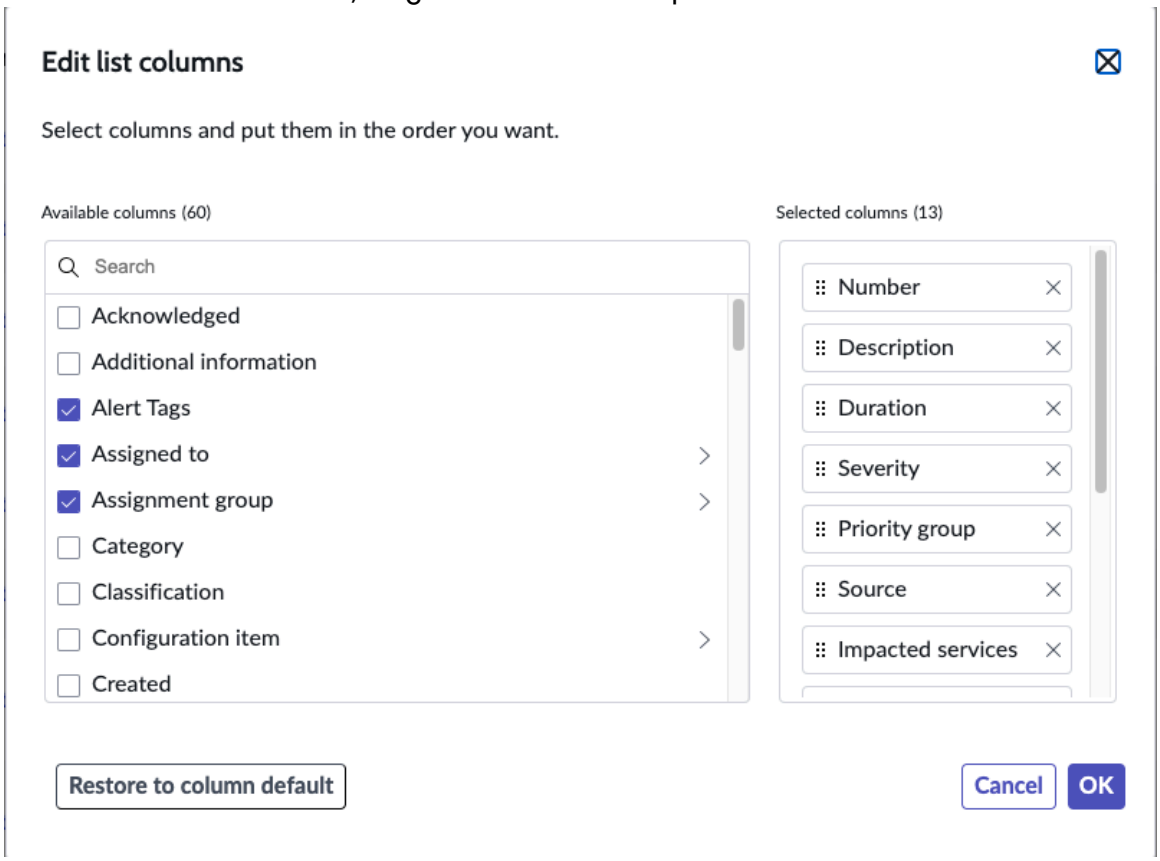
Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Edit the default columns in the pane.
   a. Select the gear icon ( ).
   b. In the **Available columns** list, select the desired columns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **Selected columns** list, drag selected columns up or down to reorder the fields.



d. **Optional:** Select **Restore to column default** to return the columns to the default state.

e. Select **OK**.

4. **Optional:** Modify the column width, order, and sort direction directly in the Express List pane.

Option	Action
Column width	Point to the right side of the column until the bi-directional arrow appears and drag the col umn to the desired width.
Column order	Select the column header and drag it to the desired location.
Column sort	Select the column header and then select the arrow. The arrow direction indicates the sort order. Each selection of the arrow changes the sort direction.

Result

The layout is automatically saved in the User preference [sys_user_preference] table. When you reopen the list, the same columns and order are displayed.

Add custom fields to the Express List preview panel

Add custom fields from the Alert [em_alert] table to the Express List Info preview panel to track alert information.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **System Properties** > **All Properties**.
2. In the **System Properties** list, select **evt_mgmt.express_list.custom_fields**.

   If a message appears about the application scope, select **here** to be able to edit the record.
3. In the **Value** field, enter the custom name from the Alert [em_alert] table.
   If you want to provide more than one field, use commas to separate the field names.
4. Select **Update**.
5. **Optional:** View the custom fields on the preview panel:
   a. In the primary navigation, select the Express List icon ( ).
   b. Select a row or the information icon at the beginning of a row.

Result

The Info tab on the preview panel displays the custom fields at the bottom of the fields list.

Acknowledge viewed alerts in Express List

Acknowledge alerts that you've viewed to remove clutter in the Express List pane.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

About this task

Use Acknowledge to denote that the alert is known, and can temporarily be ignored. Do not use Acknowledge to mark an alert as needing attention.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Acknowledge selected alerts.
   You can acknowledge alerts regardless of whether you are working in the main pane or in the preview panel. The preview panel opens only when a single alert or alert group is selected.

Location	Action
The Express List pane	**a.** In the Express List pane, select the alert to acknowledge. You can select more than one alert row.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Location	Action
	Note: You can perform the action on up to 1,000 alerts simultaneously by selecting the **Select All** check box in the Active alerts list.  To display the individual alerts inside a group, select the chevron icon (›) at the beginning of the alert group row. **b.** From the **Close** drop-down list at the top right of the alert list, select **Acknowledge**.
The Express List preview panel for group alerts	**a.** Select an alert group row check box. **b.** In the **Alerts in group** tab, select an alert tile. **c.** Select the more actions icon (⋮). **d.** Select **Acknowledge**.

Result
The alert is acknowledged and its status is displayed at the top of the preview panel.

Monitor incoming alerts

You can monitor incoming alerts in Service Operations Workspace. You can also monitor and manage alerts in the Event Management interface.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. View the alert information.

Alerts column headings

Column heading	Description
Number	Unique ID generated by Event Management to identify the alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column heading	Description
Group	An entry in this column indicates that the associated alert is a member of an alert group. Alerts that do not have an entry in this column are ungrouped alerts. ○ **Automated**: Aggregated automatically by alert aggregation. A virtual alert is added to the group as the primary alert of the group. ○ **Rules-based**: Alert group created as a result of a user-configured correlation rule. ○ **Manual**: This alert is a member of an alert group that is formed when right-clicking an alert and setting it as secondary to the selected primary alert. ○ **CMDB**: CIs without historical data that were aggregated by alert aggregation based on CI relationships in the CMDB. ○ **Secondary**: This alert is a component of an alert group. The alert at the head of the group is known as the primary alert. When **Correlated Alerts** is selected, the secondary alerts that are under the primary alert do not display, making the Alerts list less cluttered and easier to review. ○ **None**: This alert is an ungrouped alert. To make an ungrouped alert become a member of a group, right-click it and select in the topic **Add to Groups**. Select the alert and click **Add Selected**. ○ **Text**: This alert is a member of an alert group that was created based on the similarity of their text or description. ○ **Log Analytics**: This alert is a member of a Log Analytics alert group. ○ **Component-based**: This alert is a member of a Log Analytics group that was created based on the affected IT components or services. ○ **Tag Cluster**: This alert is a member of an alert group that was created based on common tags or labels assigned to them. ○ **Network Traffic**: This alert is a member of an alert group that was created based on network traffic connections between processes of host CIs.
Severity	The severity of the event. The value for this field is copied from the event unless the event closes the alert, in which case the previous severity is retained for reporting. ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **OK**: An alert is created. The resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.
Priority group	Indicates which alerts should be attended to first. Priority is calculated for each open alert and then mapped into one of four priority categories.
Priority	Value providing a guide as to the priority of the alert, based on a number of accumulated categories. For example, alert state and business criticality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column heading	Description
Source	Event monitoring software that generated the event, for example, SolarWinds or SCOM. Optionally, you can enter a description, for example, `Group Alert`. This field has a maximum length of 100.
Description	The alert description.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. This field has a maximum length of 100.
Configuration item	JSON string that represents a configuration item. For example, {"name":"SAP ORA01","type":"Oracle"}. The CI identifier that generated the event appears in the **Additional information** field. This field has a maximum length of 1000. Click to open the alert in dependency view.
Impacted Services	Lists the services affected by this alert group. Select an impacted service to view its record. **Note:** You can access the Service Map in Service Operations Workspace directly from the impacted service form by selecting **Service Map**. The service map shows the impacted path of alerts, enabling you to quickly assess their effect on the service. For more information, see View unified service map and the impact paths in Service Operations Workspace.  el-imp-service-open-map.png
Metric Name	Unique name that describes which metrics are collected and for which this alert has been created.
Maintenance	Shows whether the resource affected by the alert is in maintenance, Valid values are `true` or `false`.
Task	The corresponding task for the alert, such as an incident, change, or problem.
Parent	Reference to a parent alert.
Initial event generation time	Time that the initial event occurred in the remote system.

What to do next

If Operational Intelligence is activated, you can right-click an alert and click **View Metrics** to open the integrated Insights Explorer and Dependency Views map for the CI that is associated with the alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Close an alert in Express List

Manually close alerts directly from the Express List pane or from the preview panel without waiting for them to be automatically closed if you already know the root cause or have fixed the problem.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Close selected alerts.
   You can close alerts regardless of whether you are working in the main pane or in the preview panel. The preview panel opens only when a single alert or alert group is selected.

Location	Action
The Express List pane	**a.** In the Express List pane, select the alert. You can select more than one alert row. **Note:** You can perform the action on up to 1,000 alerts simultaneously by selecting the **Select All** check box in the Active alerts list.  To display the individual alerts inside a group, select the chevron icon (›) at the beginning of the alert group row. **b.** From the **Close** drop-down list at the top right of the alert list, select **Close alert**.
The Express List preview panel for group alerts	**a.** Select an alert group row. **b.** In the **Alerts in group** tab, select an alert tile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Location	Action
	c. Select the more actions icon ( ).
	d. Select **Close alert**.

Result
The alert is closed and its status is displayed at the top of the preview panel.

Create an incident from an alert in Express List

Create an incident from an alert directly from the Express List pane, saving you the time and effort of navigating to the incident record.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Create an incident from a selected alert.
   a. In the Express List pane, select the alert.

      Note: To display the individual alerts inside a group, select the chevron icon ( ) at the beginning of the alert group row.

   b. From the **Close** drop-down list, under Remediation actions, select **Create Incident**.
   An incident is created from the selected alert and a confirmation message is displayed.
4. **Optional:** View a created incident by selecting **View incident** in the confirmation message.

Create an incident with Now Assist in Express List

Create an incident with a human-readable, AI-generated description using Now Assist.

Before you begin
Currently, this feature is available for CMDB, Log Analytics, tag-based, and component-based alerts.

Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Express List icon ( ) in the left navigation bar.
3. Create an incident from a selected alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Express List pane, select the alert.

> **Note:** To display the individual alerts inside a group, select the chevron icon ( ) at the beginning of the alert group row.

b. From the **Close** drop-down list, under Remediation actions, select **Create Incident with Now Assist**.

An incident with a human-readable, AI-generated description is created from the selected alert and a confirmation message is displayed.

4. **Optional:** View the created incident by selecting **View incident** in the confirmation message or on the alert preview panel.

Mute a CI's alerts in Express List

Mute a CI's alerts in Express List to avoid alerts being issued when replacing or upgrading the CI.

Before you begin

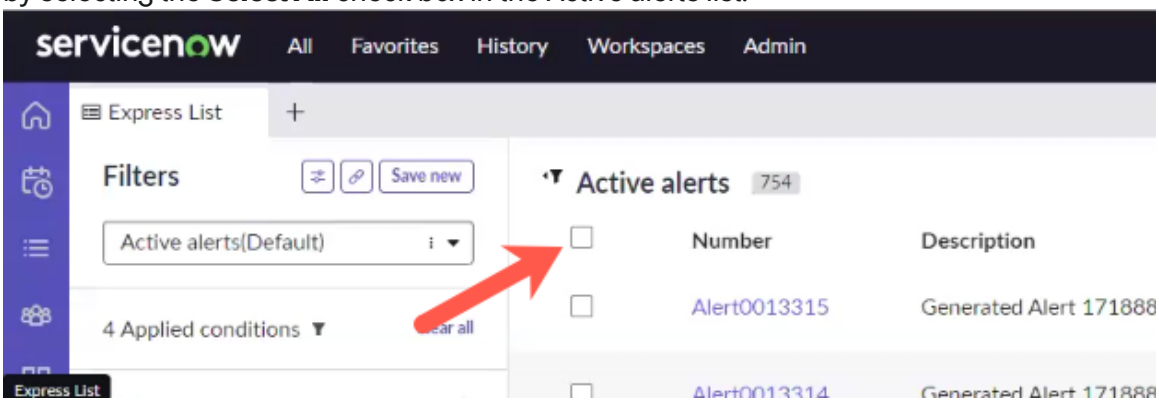
Role required: evt_mgmt_operator, evt_mgmt_admin

> **Note:** The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select the alert row check box.

> **Note:** You can perform the action on up to 1,000 alerts simultaneously by selecting the **Select All** check box in the Active alerts list.



4. From the **Close** drop-down list, select **Put in Maintenance**.

Result

Alerts are muted for the configuration items of that alert.

Place an alert in the Maintenance state

Placing an alert into the Maintenance state indicates that there are issues with the alert's CIs that are being addressed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin or evt_mgmt_operator

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Filter with **Active alerts**.
4. Select an alert.

5. On the **Details** subtab, select the **Maintenance** check box to place the alert into the Maintenance state.
6. Click **Save**.

Place an alert in the Acknowledged state

Placing an alert into the Acknowledged state indicates that the alert has issues that need to be addressed.

Before you begin
Role required: evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Filter with **Active alerts**.
4. Select an alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the **Details** subtab, select the **Acknowledged** check box to place the alert into the Acknowledged state.
6. Click **Save**.

Remediate an alert in Express List

Take a remediation action to fix an issue manually on an alert directly from the Express List pane.

Before you begin

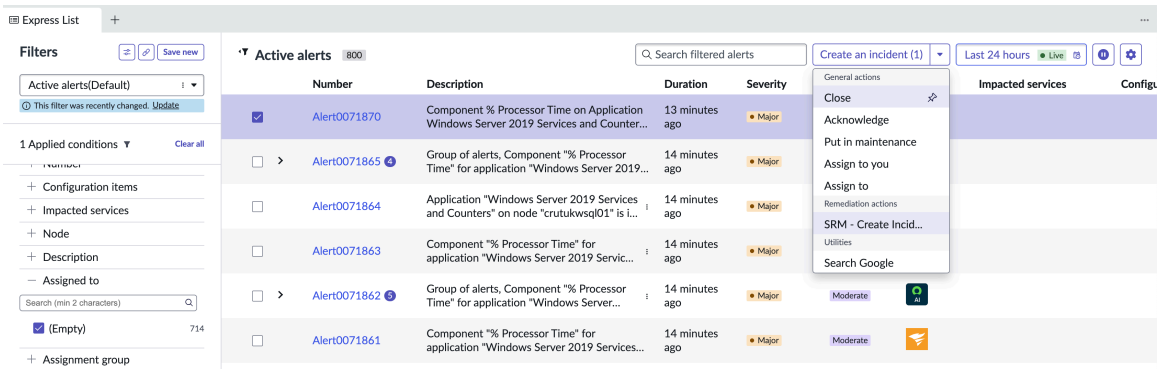
Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select the alert number to open it.
4. Select the remediation action for the alert from the **Close** drop-down list.

Note: If the list is empty, no remediation actions are available.



View metrics for an alert

Viewing metrics enables you to understand historical data related to an alert's CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that you install the Operational Intelligence (com.snc.sa.metric) plugin.
- Configure the metrics to be displayed for the alert, as described in Configure alert metrics.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select an alert to open it.
4. Click the **Metrics** subtab.
   The configured metrics appear on the page.

   To customize the metrics display, configure the following properties on the **System Properties** > **All Properties** page:

   - *ws_metric.widgets_number_limit*: Specify the number of widgets/records that can be displayed on the metrics tab.
   - *ws_metric.datasets_per_widget_limit*: Specify the number of charts/datasets that can be displayed on a chart.

5. In the **Time range relative to alert** list, select the time range for which you want the metrics to be displayed for the alert:
   - 1 hour before and after (default setting)
   - 3 hours before and after
   - 5 hours before and after
   - Custom range (to configure a customized time range for the metrics to measure)
6. Click a parameter below a chart to hide the specified parameter's data on the chart.
7. **Optional:** Click the **Insights Explorer** button to view metrics by dragging and dropping them onto a timeline.

Related topics

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View details about the impact and cause of an alert in Express List

View information about an alert on the alert's Overview tab in the Express List.

Before you begin

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.
4. View alert information on the **Overview** tab.

Overview tab

Section	Description
Summary	Contains a description of the selected alert, describing why it is considered an issue.
Impact	Lists the Configuration item and any services impacted by the alert. The **Impacted Services** tile includes the following subtabs: ○ **Application services:** The application services affected by the alert. For details on application services, see Application services . ○ **Related service offerings:** The service offerings connected to the application services affected by the alert. Application services and their related service offerings display on a many-to-many basis. That is, several service offerings can relate to one or more application services, and several application services can relate to one or more service offerings.
Cause	Lists the log properties with information contributing the alert issue, as well as probable root causes for the alert.

View the Dependency Views map for CMDB alerts in Express List

The Dependency Views map provides insights into how and why alerts are grouped, supporting both troubleshooting and proactive management. It displays the connecting CIs among CMDB alerts within a group. Even if a CI isn't part of the group, it appears on the map if it connects to other alert CIs within the group.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select either the List icon ( ) or the Express List icon (.
3. For an alert for which you want to see the CI dependency view, in the Configuration items columns, select the configuration item.
4. In the configuration items window, select **Open Dependency View**.
   You can see the dependency view of the CMDB alerts.

View anomaly alert metric data on the preview panel in Express List

View visualizations for anomaly alerts to investigate anomalies using metric data. You can view visualizations from the Express List preview panel or the alert record.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

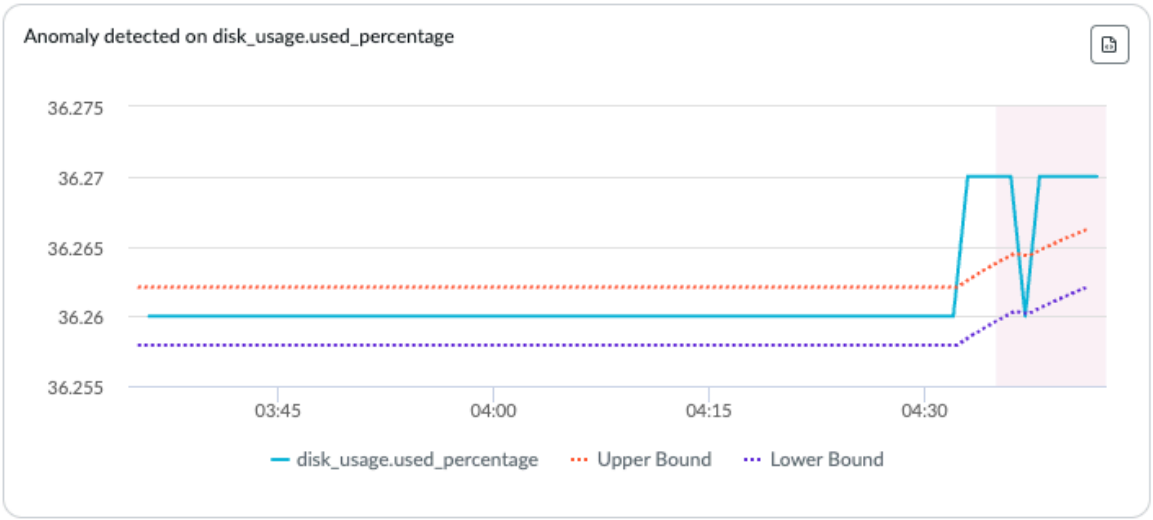
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the Active Alerts list, locate an anomaly alert.
   Information in the **Description** column can help you determine which alerts are anomaly alerts. For example, an alert description might warn about values nearing or exceeding configured thresholds, or metrics above or below a defined boundary.
4. Choose where to view the anomaly chart.

Option	Procedure
View the chart in the preview panel	**a.** Select the check box for the anomaly alert. **b.** In the preview panel, select the **Info** tab. A chart with a visual representation of the anomaly appears.
View the chart in the alert record	Select the number of the anomaly alert to open the alert record. The **Overview** tab opens by default. The anomaly chart is displayed.

Depending on how the metric anomaly is configured, one of two charts is displayed.

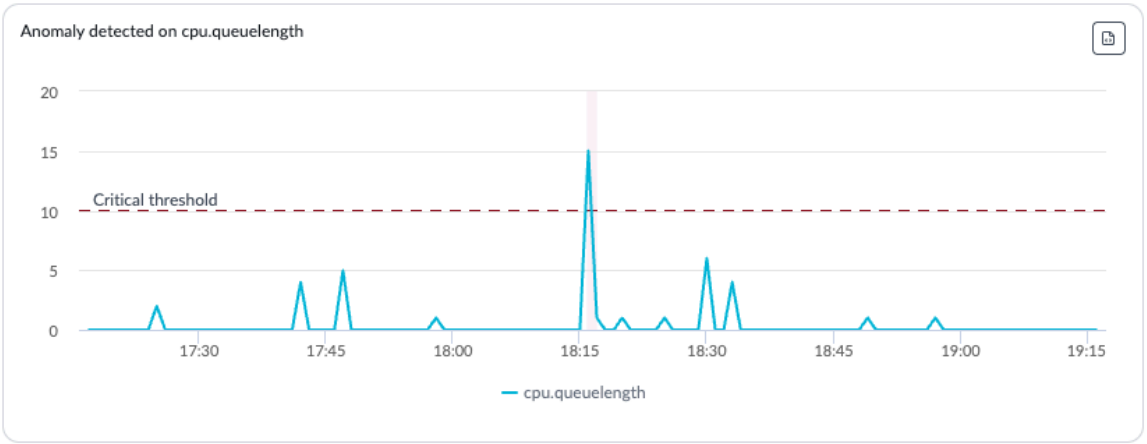
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When the Metric Intelligence statistical model is used to detect anomalies, the anomaly alert chart is displayed with upper and lower bounds based on machine learning models.



For more information, see Understanding Metric Intelligence.

- When thresholds are configured by administrators, the static threshold metric anomaly alert chart shows anomalies defined using the configured thresholds.



Note:

The raw data used for the metric chart in the preview panel is available only for seven days. If older alerts are selected and the raw data is no longer available, a chart isn't shown.

For more information, see Create metric rules.

5. **Optional:** Review surrounding metric data by selecting the **Open in Metric explorer** icon ( ) in the information panel.

   (Optional) The **Metric Explorer** tab displays the time frame of the anomaly. For an open alert, the chart shows one hour before and after the last time of event generation. For a closed alert, the chart shows one hour before and after the first event that created an alert. If there's no data, the chart isn't displayed.

   For more information, see Metric Explorer.

View Log Analytics anomaly alert charts on the preview panel in Express List

View visualizations for Health Log Analytics anomaly alerts to identify periods of behavior that deviate from expected ranges. You can view visualizations from the Express List preview panel or the alert record.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the Active Alerts list, locate a Log Analytics based alert.
   This option is available only for individual alerts or the underlying individual alerts within a group.
4. Choose where to view the anomaly chart.

Option	Procedure
View the chart in the preview panel	**a.** Select the check box for a Log Analytics based alert. **b.** In the preview panel, select the **Info** tab. A chart with a visual representation of the anomaly appears.
View the chart in the alert record	Select the number of the anomaly alert to open the alert record. The **Overview** tab opens by default. The anomaly chart is displayed.

5. **Optional:** Select the parameter to visualize anomaly data within that time period:
   - **Events per minute** - The default setting, which shows the detected anomaly.
   - **Day ago**
   - **Week ago**
6. **Optional:** Review relevant logs in context by selecting the Open in Surrounding logs icon: .
   The **Surrounding logs** tab displays the list of log lines that were generated one minute before and one second after the Log Analytics alert. For more information, see How Health Log Analytics generates alerts.

View data on impacted services on the preview panel in Express List

View extra information on the preview panel about impacted services that are bound to alerts.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the Active alerts list, select an alert check-box.
4. On the preview panel, open the Info tab.
5. Hover over the Impacted services section to display information icons.

6. Select the relevant icon to display extra information on an impacted service.

Impacted service information icons

Icon	Name	Description
ⓘ	Info	Displays the severity, the business criticality, and a short description of the impacted service. From this pop-up, you can open the service map in Service Operations Workspace by selecting **View service map**.  The service map shows the impacted path of alerts, enabling you to quickly assess their effect on the service. For more information, see View unified service map and the impact paths in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Icon	Name	Description
		If metrics data exists for this service, you can open the Metric Explorer from the pop-up by selecting **View related metrics**.
	Contact person/group	Displays the name of the owner of the impacted service and the support group assigned to it.

View data on configuration items on the preview panel in Express List

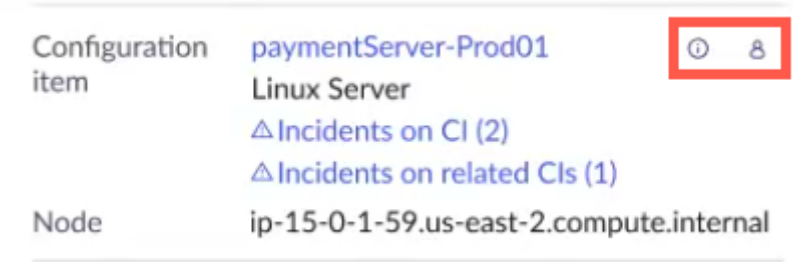
View additional details about configuration items (CIs) that are bound to alerts on the Express List preview panel.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the Active alerts list, select an alert check box.
4. On the preview panel, open the Info tab.
5. Hover over the Configuration item section to display information icons.



6. Display extra information on a CI by selecting the relevant icon.

Configuration item information icons

Icon	Name	Description
	Info	Shows the class, IP address, location, and environment of the CI.
	Contact person/group	Shows the name of the owner of the CI, the support group assigned to it, and avatars of the individual team members.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** View how the current CI is connected to other CIs by selecting **View CI topology** in the additional information panel.
   The **Dependency View** map opens. The map visually represents the relationships between CIs, helping you understand how different components are interconnected.

Hide closed alerts in Express List

Choose whether to display the closed alerts in an alert group as well as the open alerts on the preview panel and in Link View.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the Active alerts list, select an alert group.

   The preview panel shows the default display:

   - The Alerts tab and Timeline view show only the open alerts. The closed alerts are hidden.
   - Link View shows the attributes of both open and closed alerts.
4. On the relevant tab, change the display.

   On the preview panel, Alerts tab:

   a. Show both the open and the closed alerts by switching the **Hide closed alerts** toggle to the closed position.

   b. (Optional) Sort the displayed alerts by time or by severity by selecting the sort icon ( ) and then choosing the relevant menu item.

> **Note:** If you switch the toggle or sort the alerts in the Timeline view, the Alerts tab adjusts to reflect your selection.

   In Link View: Show only the attributes of open alerts while hiding those of closed alerts by switching the **Hide attributes of closed alerts** toggle to the open position.

View an alert analysis by Now Assist in Express List

View an alert analysis created by ServiceNow® Now Assist using generative AI. Alert analyses include a human-readable brief of the alert and technical information to help you investigate the alert more effectively.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the ServiceNow® Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

Note: Currently, Now Assist for ITOM only analyzes tag-based, CMDB, Log Analytics, Mixed and Network Traffic-based alert groups. For all other alert group types, Now Assist for ITOM only analyzes the parent alert.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the Active alerts list, select the information icon ( ) next to the alert.
4. On the preview panel **Info** tab, select **Analyze** in Alert analysis by Now Assist.
5. View the information provided in the Alert analysis.
6. **Optional:** Use the Alert analysis icons to perform related tasks.

Alert analysis icons

Icon	Description
	Copy the content of the alert analysis to the clipboard.
	Refresh the alert analysis. **Note:** Refreshing regenerates the results. Past results are deleted.

Generating case from an alert

Enable swift resolution by generating cases from alerts, either manually or automatically.

Customer Service Management provides integration with ITOM Event Management. This integration enables you to improve the customer experience by breaking down the silos that exist between the processes and systems used by front line customer service and back-office operations teams. By monitoring issues and creating cases proactively, you can better correlate customer issues and provide faster responses.

If you are using the integration between the Customer Service Management and Event Management applications, you can create a case for the customer install base affected by an alert. For more details, see Manually create a proactive case from an alert. You can also activate an alert rule to automatically create a proactive case from an alert when an incident is created. For more details, see Activate an alert rule to automatically create a proactive case from an alert.

Remove alerts from an alert group in Express List

Remove secondary alerts from an alert group directly from the Express List pane or from the preview panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Remove a secondary alert from an alert group.
   You can remove alerts from a group regardless of whether you are working in the main pane or in the preview panel. The preview panel opens only when a single alert or alert group is selected.

Location	Action
The Express List pane	**a.** In the Active alerts list, select the chevron icon ( ) at the beginning of one or more alert group rows to display the alerts con tained in the group. **b.** Select one or more secondary alerts. **c.** From the **Close** drop-down list at the top right of the list, select **Remove from group**. **Note:** When you are trying to remove the only secondary alert from an alert group, thereby ungrouping the group, a message displays that enables you to undo the action.
The Express List preview panel for a group of alerts	**a.** In the **Alerts in group** tab, select an alert tile. **b.** Select the more actions icon ( ). **c.** Select **Remove from group**.

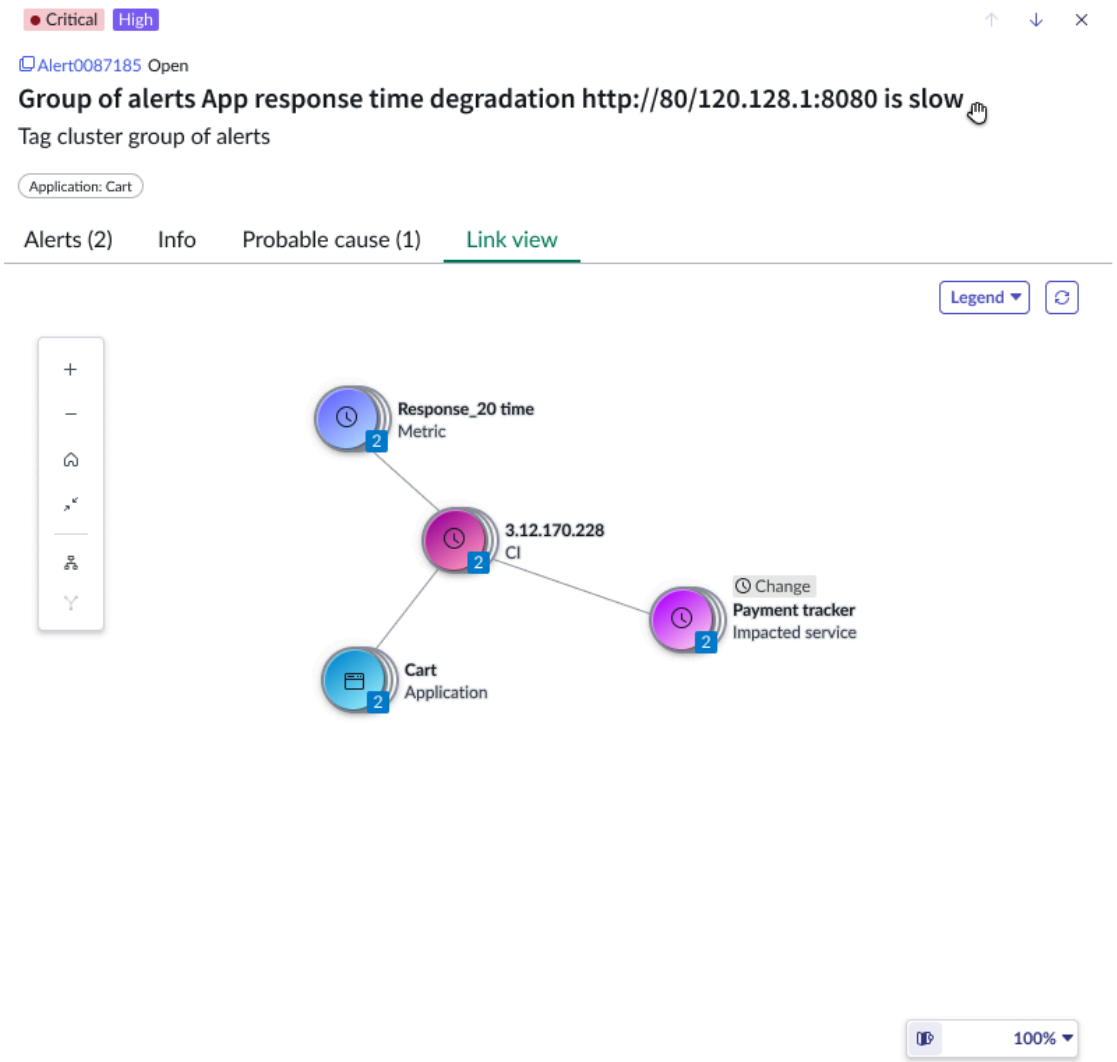
Viewing links between alerts in alert groups in Express List

Gain a better understanding of the relationships between alerts in alert groups in the Express List by using Link View. Link View offers a visual representation of the relationships between the alerts in a group.

When Event Management generates an alert group, Link View shows how the attributes of the alerts in the group are linked. The colored tags represent Configuration Items (CIs) and other environment items in relation to the alerts. The information shown in Link View is available without the need for a populated Configuration Management Database (CMDB). However, when the CMDB is populated, Link View offers additional value by providing the probable cause of the alerts and the service that the alert group impacts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

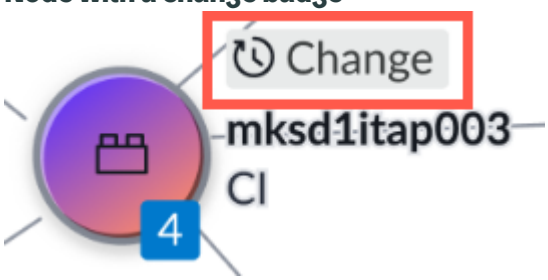
Sample alert group in Link View



You can focus on your areas of interest by dragging the nodes in Link View to different positions. When you refresh an alert group, rearranged nodes appear in their original position again. Therefore, Link View is not refreshed automatically, but waits for you to do so manually. If an alert on a CI impacts a service in the Configuration Management Database (CMDB), Link View shows the impacted service, enabling you to view it at a glance for quick triage.

A stacked node indicates that multiple nodes were mapped for the same tag. When the same key-value pair appears in more than one alert, the corresponding node is shown with a badge. For example, when the same key-value pair appears in two alerts, the badge on the node shows the number 2, as seen on the Payment tracker node in the sample alert group figure. When a node has no badge, the key-value pair appeared in only one alert. An active change request, a probable cause of the alert, is marked by a Change badge.

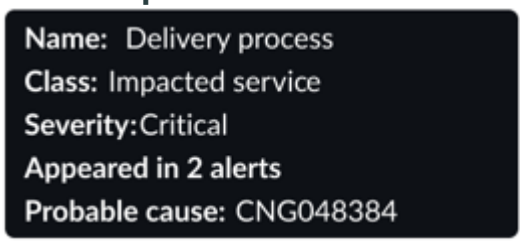
Node with a change badge



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Link View legend lists the meaning of the symbols and colors used and allows you to toggle between hiding and showing types of tags to reduce noise. In addition, the legend describes the meaning of the various lines linking the alert attributes. Attributes linked by a solid line share one or more alerts, whereas attributes linked by a dotted line are correlated by grouping criteria. For a description of each tag, see Attributes in Express List Link View. Hovering over a node displays a tooltip that includes the name of the tag, its class, its severity, the number of alerts in which it appeared, and whether the alert is primary or secondary or the probable cause of the alert, if applicable.

Node tooltip



Currently, Link View is supported for tag-based, rule-based, CMDB-based, and network traffic-based alert groups. For more information, see:

- Viewing links between alerts in tag-based alert groups
- Viewing links between alerts in rules-based alert groups
- Viewing links between alerts in CMDB-based alert groups
- Viewing links between alerts in network traffic-based alert groups

Related topics

View links between alerts in a group in Express List

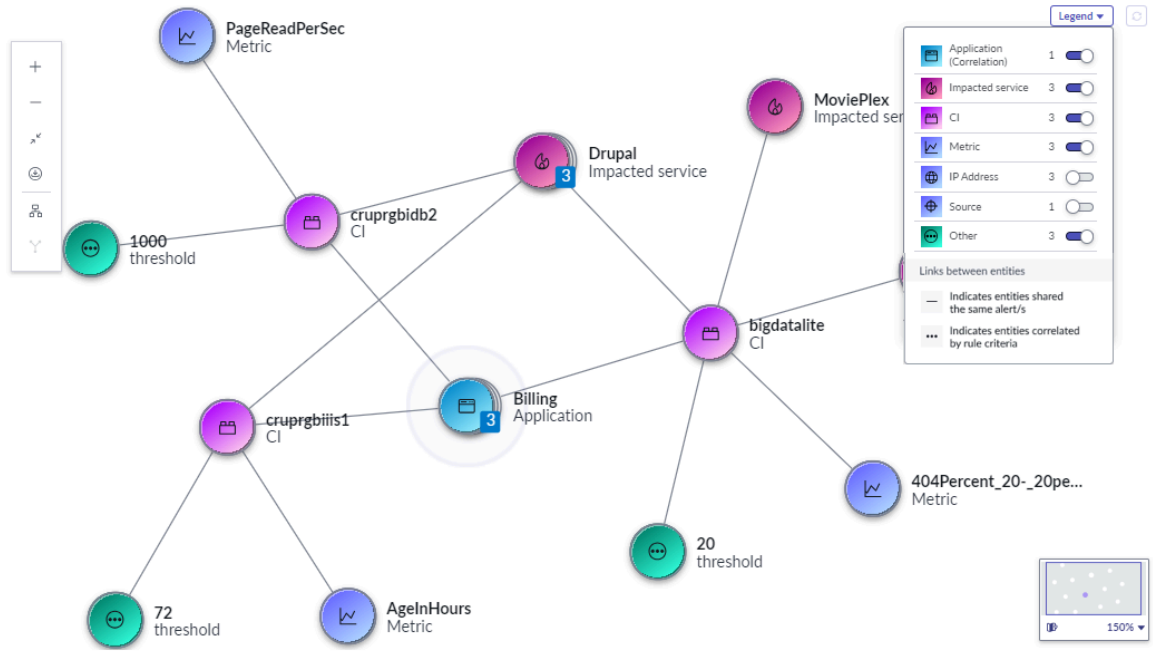
Viewing links between alerts in tag-based alert groups

View the connections between alerts in a tag-based alert group in Express List by using Link View. Link View shows how the attributes of the alerts in the group are linked with each other.

When you've set alert tags and Event Management has generated an alert group based on tag-based rules, Link View offers a visual representation of the relationships between the alerts in the group. The colored tags in the view represent Configuration Items (CIs) and other environment items in relation to the alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample tag-based alert group in Link View



In this example, the defining tag for the correlation, Application, is linked to the tags of the relevant CIs. However, a correlation can be defined by any tag or combination of two tags, such as Resource and Metric name. When the defining tag is missing from Link View, the correlation was based on information that is not represented in the view, such as the description. Each CI node is further linked to the tags that appeared on the same alert as that CI.

In an alert group that was generated from tag rules, nodes connected by a dashed line signify an approximate, "fuzzy" match. This means that the nodes were correlated when the match on the tag rule was not exact, but close enough to be significant. For example, this could happen when a location, email address, or IP pattern was similar enough to qualify as a match.

The Link View legend lists the meaning of the symbols and colors used to represent the tags and their number of unique nodes. In the legend, defining tags are marked as Correlation. You can toggle between hiding and showing tag types to reduce noise. For a description of each tag, see Attributes in Express List Link View.

Viewing links between alerts in rules-based alert groups

View the connections between alerts in a rules-based alert group in Express List by using Link View. Link View shows how the attributes of the alerts in the group are linked with each other.

When you've set alert rules and Event Management has generated an alert group based on these rules, Link View offers a visual representation of the relationships between the alerts in the group. The colored tags in the view represent Configuration Items (CIs) and other environment items in relation to the alerts.

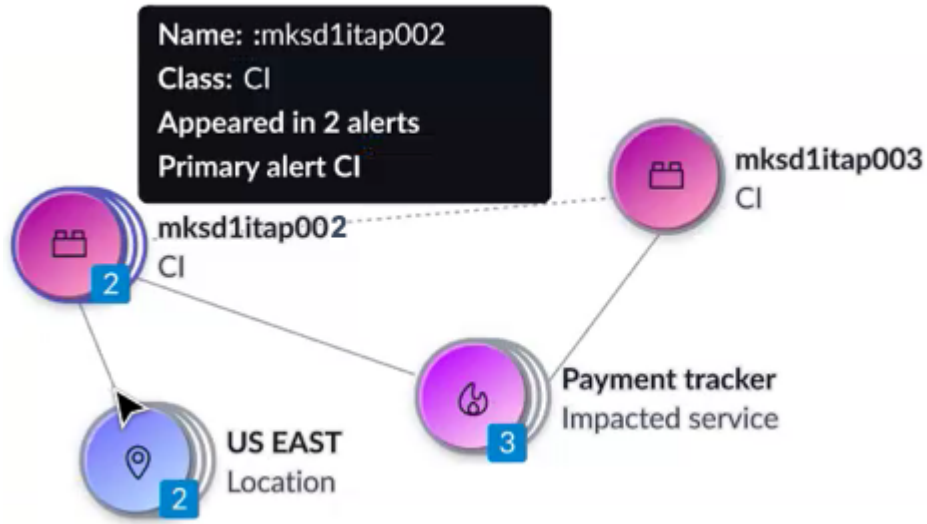
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample rules-based alert group in Link View



Rules-based alert groups are comprised of a primary alert and one or more secondary alerts. The primary alert is generated directly and is represented in Link View as the Home node. Secondary alert nodes are connected to the Home node by a dashed line, indicating that they don't share the same alert, but are correlated using rule criteria. A solid line between nodes indicates that the connected nodes share the same alert or multiple alerts.

If an alert on a CI impacts a service in the Configuration Management Database (CMDB), Link View shows the impacted service, enabling you to view it at a glance for quick triage. Hovering over a node displays a tooltip that includes the name of the tag, its type, the number of alerts in which it appeared, and whether it is a primary or secondary alert.

Viewing links between alerts in CMDB-based alert groups

View the connections between alerts in alert groups in Express List that were created based on the proximity of Configuration Items (CIs) in the Configuration Management Database (CMDB). Link View shows how the attributes of the alerts in the group are linked with each other.

When alerts on CIs that are located near each other in the CMDB topology occur within a certain time-frame, Event Management generates a CMDB-based alert group. Event Management correlates CIs in a service map when they are separated by a maximum of three other CIs. The colored tags in Link View offer a visual representation of the CIs and other environment items in relation to the alerts in the group.

Viewing links between alerts in log analytics-based alert groups

Use Link View in Express List to see why alerts in a log analytics-based alert group are correlated together through the visualization of shared attributes.

Link View for log analytics-based alert groups shows the connections between component-based alerts. Each component-based alert may involve multiple host configuration items (CIs). A component represents a logical part of a service instance where the alert was detected. Components can consist of multiple CIs that perform the same function, such as multiple redundant hosts. For more information, see Types of Health Log Analytics alerts.

The colored tags in the link view represent attributes of the alerts such as hosts, users, or correlation indicators extracted from the logs. The lines connect attributes that share the same alert. This visualization helps you understand the relationships between different alerts in the group using their shared attributes.

Log analytics-based groups often contain multiple correlation attributes within a single group. Link View enables you to explore why anomalies detected on different components were correlated into one group. By manipulating the attribute display, you can better understand the relationships between alerts that share common attributes.

View links between alerts in a group in Express List

When an alert group is generated, understand better how the alerts in the group are linked by viewing a visual representation of their relationships in Link View.

Before you begin

For an overview of Link View in Express List, see Viewing links between alerts in alert groups in Express List.

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the fields in the interactive filter panel, select **Group** and then the check box for the alert groups you want to display.

   Note: Currently, Link View is supported for tag-based, rules-based, CMDB-based, and network traffic-based alert groups.

   - **Tag Cluster**
   - **Rules-based**
   - **CMDB**
   - **Network Traffic**

4. In the **Active alerts** list, select the description of an alert group.
   The preview panel opens to the **Alerts in group** tab, which lists all the correlated alerts in the selected group.
5. Navigate to **Link View**.
6. View the relationships between all the alerts in the selected group.
7. **Optional:** Perform the following optional tasks.

Task	Action
Focus on an area of interest	Select one or more nodes and rearrange them in Link View by dragging them to a new location. **Note:** After refreshing the alert group, the nodes appear in their original posi tion again.
Refresh the alert group	Select **Refresh**. When you've refreshed the alert group, re arranged nodes appear in their original posi tion again. Newly-added nodes are marked as New. **Note:** The **Refresh** button is enabled when new data for the alert group is available. Link View doesn't refresh auto matically.
View the meaning of icons and colors	Select the Link View legend. (Optional) The legend also indicates the num ber of unique nodes displayed per tag. For a description of each tag, see Attributes in Ex press List Link View.
Reduce noise	In the Link View legend, toggle between hid ing and showing a tag type.
View information about an alert	Hover over a node to display a tooltip with in formation.

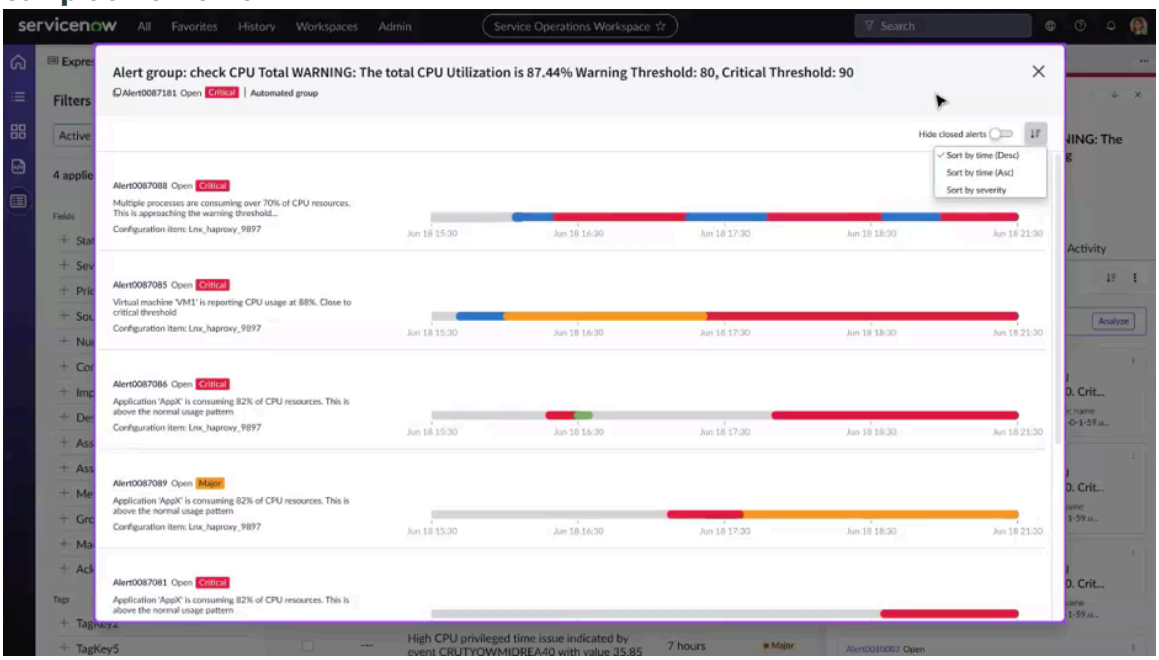
Exploring chronological data on the alerts in an alert group in Express List

Visualize the chronological sequence of events within an alert group in Express List using the Timeline view. This feature provides a comprehensive overview of when the alerts occurred, their severity changes, and other pertinent data for efficient triage and Mean Time to Resolution (MTTR).

In Timeline view, each alert is represented by a bar, enabling you to quickly discern the order of occurrence, severity transitions, and closure status. The timeline begins with the creation of the first alert and extends to the present moment.

Sample timeline view



Standard severity colors are used in the bars, with gray segments indicating periods before alert creation or after its closure. Hovering over a severity bar reveals a tooltip with key alert details.

Severity range by color in Timeline view

Color	Severity
	Critical
	Major
	Minor
	Warning
	OK

The title of the Timeline view for an alert group summarizes the group's description, number, state, severity, and grouping type, derived from the primary alert. Detailed information including alert number, state, severity, a brief description, and associated Configuration Item (CI) or node, when available, is displayed for each alert within the group.

View a timeline of the alerts in an alert group

Gain insight into the sequence of events relating to an issue by viewing chronological information of the alerts in an alert group in Express List.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

About this task

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. In the Active alerts list, select the information icon ( ) for an alert.
4. On the preview panel Alerts tab, select **Timeline view**.
5. Analyze the information provided in the Timeline view.
6. **Optional:** Sort the displayed alerts by ascending or descending time or by severity.
   a. Select the sorting icon ( ).
   b. Select the preferred sorting option from the pop-up menu.
7. **Optional:** Show or hide closed alerts by toggling the **Hide closed alerts** slider.

Exploring chronological data on the alerts in an alert group in Express List

Find alert records in Express List using text search

Perform a text search for alert records in a filtered list of alerts.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

About this task
Event Management searches through the alerts that you're currently seeing in the Express List based on the filters and time range you have set. It searches in the following predefined fields even if they aren't visible: **Metric name**, **Node**, **Alert number**, **Alert Tags**, and **Description**. It treats the text that you enter as a single string rather than individual words.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the Search filtered alerts field, enter the search text.
   - Ensure that the text string meets or exceeds the minimum character requirement specified in the notification message.
   - The maximum character limit is 50.
   - The search isn't case-sensitive.

Note: The minimum character requirement is determined by the *evt_mgmt.express_list.min_search_chars* system property setting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** Expand the search to all alerts, including secondary alerts that are a part of alert groups, by selecting **Switch search scope** and then selecting **Extended**.
5. Perform the search by selecting the check icon or pressing **Enter**.

Result

The results match both the filters that you have applied and the string you entered in the Search filtered alerts field. In the resulting alert records, the string is highlighted and the filters show the number of records that match the string. Recent searches are saved and accessible from the Search filtered alerts field.

Run actions to resolve alert issues in Service Operations Workspace for ITOM

Resolve the underlying issue of an alert by running predefined remediation tasks, ensuring faster issue resolution and ensuring consistent resolution.

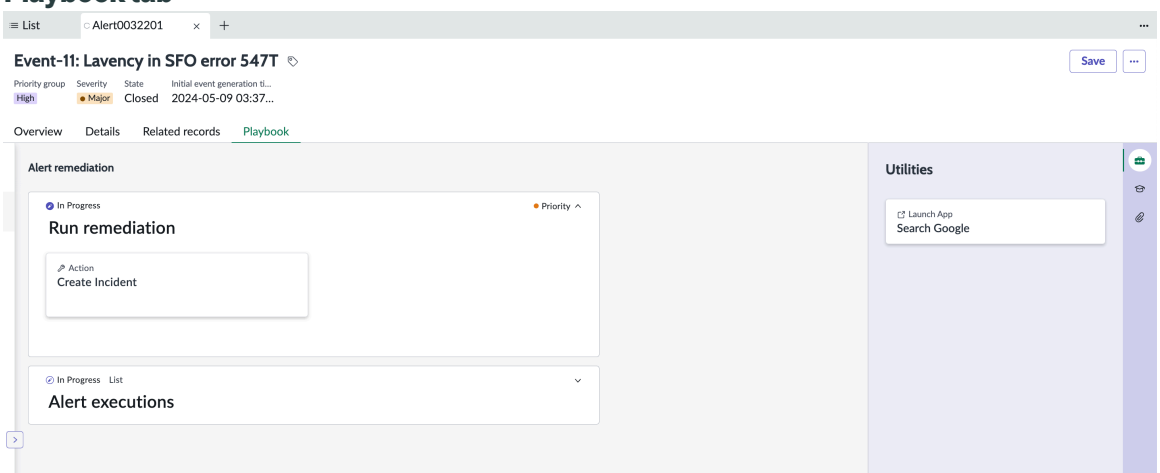
Before you begin

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.
4. Select **Launch playbook**.
5. Select the **Playbook** tab.
   The **Run remediation** card displays the available remediation actions.

Playbook tab



6. Select the tile corresponding to the action you want to run.
   The selected action appears on the **Alert executions** card.

Result

When the action is complete, it appears in the **Completed** card underneath the Alert remediation section.

Launch a web application for an alert in Service Operations Workspace for ITOM

Launch a web application that was configured in an alert management rule to quickly access necessary tools, improving response times and efficiency.

© 2026 ServiceNow, Inc. All rights reserved.

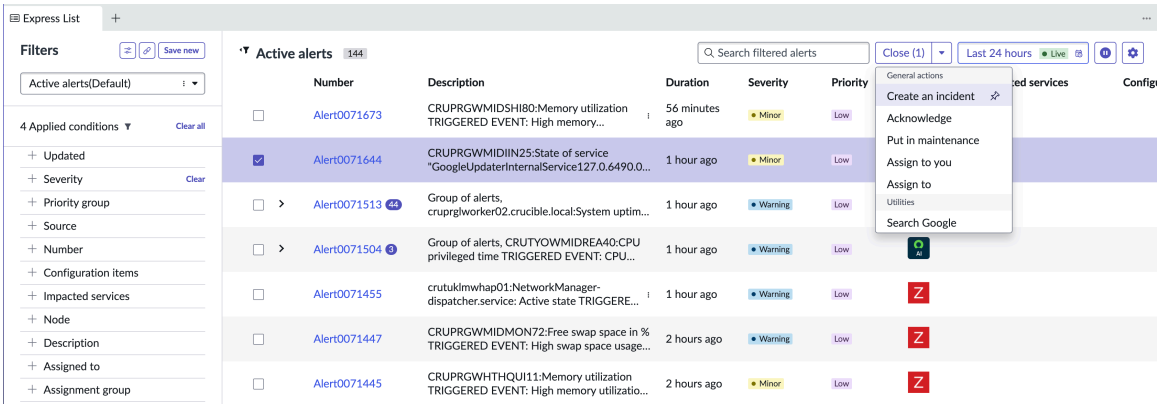
Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select the alert number to open it.

   The alert opens in a separate tab, displaying the **Overview** subtab. In the right panel, the **Utilities** tab is selected by default.



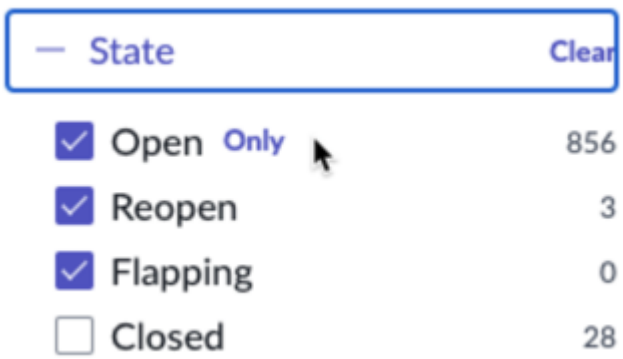
4. In the Utilities section, select the web application to launch the app.

Filtering the alert display in the Express List pane

Filters help you create different views of categorized alerts, creating a targeted list of alerts to prioritize and focus on, saving time and minimizing distractions.

The fields in the interactive Filters pane in Express List help you create different views of alerts. The default filters are determined by the selected Express List view.

You can interactively view the result of adding or removing any of the fields. The numbers next to each attribute indicate the number of alerts that are returned.



Alternatively, you can turn on the **Use advanced filters** option to set complex filters using a condition builder. The and/or logic provides more flexibility in filtering the alerts.

In the Filters pane, you can perform the following actions:

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Filter by string, number, or date attributes. For more information, see Filter the Express List display using attributes.
- Add filters to or remove filters from the default filter list to focus on the applied filters. The most common filters are State, Priority, CI, and Impacted services. For more information, see Filter the Express List display by adding or removing fields
- Add or remove alert tags. Tags enable you to identify and group alerts easily without the need for discovery or accessing the Configuration Management Database (CMDB). For more information, see Categorize alerts displayed in Express List
- Display or hide alerts that match a selected alert. For more information, see Filter out or show matching alerts.
- Save, delete, assign as the default, or share the filter layout. For more information, see Save a custom filter in Express List.

Filter the Express List display using attributes

Filter the Express List display by text, number, and date attributes using the interactive Express List filter panel. Create a targeted list of alerts to prioritize and focus on.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. From the Filters panel on the left side, select whether to filter to text, number, or date attributes depending on your filter type.

Filter attribute type	Action
Text	Find elements by name by typing the first few characters to display the elements that start with those characters. Then select the values

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter attribute type	Action
	that you want to view in the Express List pan  el.
Number of impacted services	Enter a condition to view alerts according to the number of alerts on the selected fil ter. For example, to display alerts that have fewer than 10 impacted services, you would select the **less than** condition and enter  10.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter attribute type	Action
Date	View alerts according to the selected date and time range in the pop-up calendar in the Express List panel. 
Filter the Express List display by adding or removing fields

Add fields to or remove fields from the Express List pane filter using the interactive filter panel. Use filtering to create different views of categorized alerts.

Before you begin

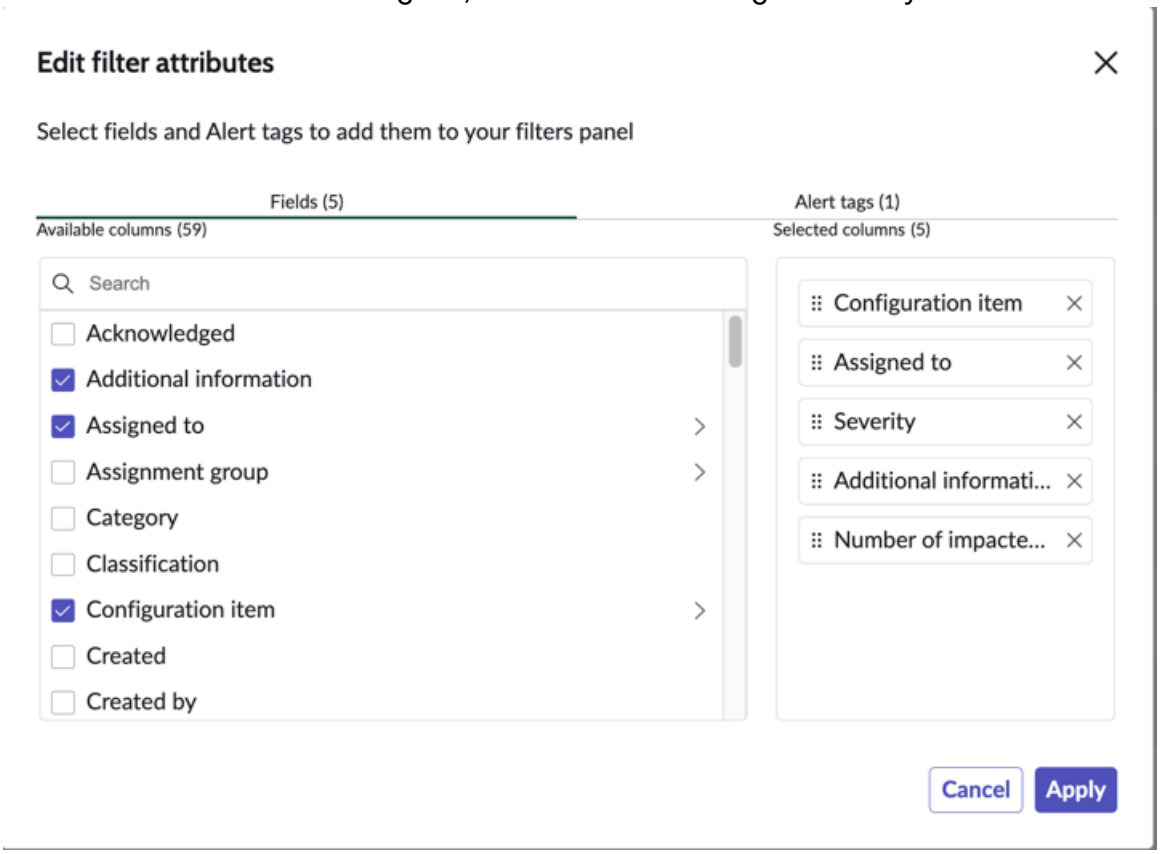
Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. In the left filter pane, select the Edit filter attributes icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Edit filter attributes** dialog box, select fields or alert tags to add to your filter.

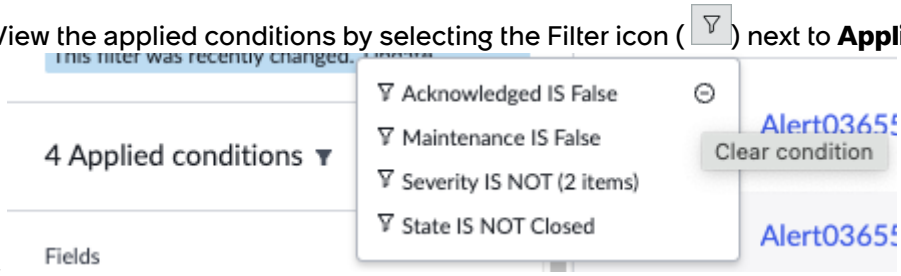


The **Fields** tab is displayed by default and displays the number of selected fields.

The number of available fields is displayed at the top of the column next to **Available columns**.

The selected fields are displayed in the right column. The number of selected columns are displayed at the top of the column next to **Selected columns**.

5. **Optional:** Find a specific field by entering its name in the **Search** field.
6. **Optional:** Rearrange the order of the selected columns by dragging them up or down in the right column.
7. **Optional:** Remove a column by selecting the **X** next to its name.
8. Select **Apply**.
9. **Optional:** Clear a filter by selecting **Clear** next to that filter name.
   Clear appears only if you selected or cleared any of the attribute check boxes of the selected filter.
10. **Optional:** View the applied conditions by selecting the Filter icon ( ) next to **Applied conditions**.



11. **Optional:** Remove a condition by selecting the **Clear condition**( ) icon.

Result

All the selected fields are displayed in the **Filters** panel in the **Fields** column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Categorize alerts displayed in Express List

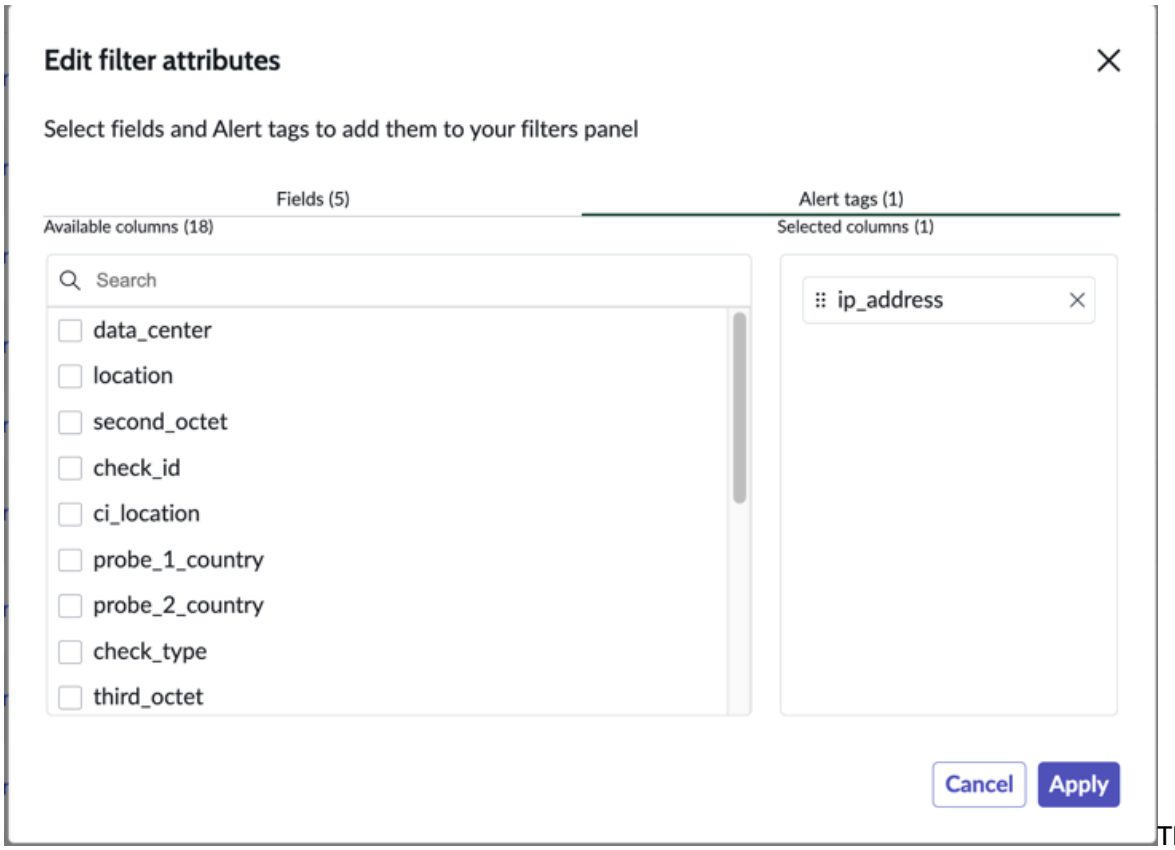
Create different views of alerts by adding tags in Express List to enable you to easily identify and group alerts without the need for discovery or accessing the CMDB.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. In the left filter pane, select the **Edit filter attributes** icon ( ).
4. In the **Edit filter attributes** dialog box, select the **Alert tags** tab.



The **Alert tags** tab title displays the number of selected alert tags.

The left column displays the number of available tags in the **Available columns** column title.

The selected tags are displayed in the right column. The number of selected tags is displayed in the **Selected columns** column title.

5. **Optional:** Find a specific tag by entering its name in the **Search** field.
6. **Optional:** Rearrange the selected tags by dragging them up or down in the right column.
7. **Optional:** Deselect a tag by selecting the (**X**) next to it.
8. Select **Apply**.

Result

All the selected tags are displayed in the **Filters** pane under the **Alert tags** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter out or show matching alerts

Create different views of categorized alerts in Express List by either displaying or filtering out alerts that match a selected alert.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. Right-click an alert row.
4. Match or filter out matching alerts.
   - Display matching alerts by selecting **Show Matching** from the context menu.
   - Filter out matching alerts by selecting **Filter Out** from the context menu.

Save a custom filter in Express List

Save your custom view of categorized alerts in Express List to use again, share, or set as your default view. Saving your custom view saves all filters, tags, and conditions.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. Once you have set up a filter that you want to reuse, set as your default view, or share with others, save the filter.
   For more information about filtering the Express List alert display, see the following topics:
   - Filter the Express List display using attributes
   - Filter the Express List display by adding or removing fields
   - Filter out or show matching alerts

   a. In the Express List select **Save new**.

   b. In the **Save new filter** dialog box in the **Filter name** field, enter a name for the filter.

   c. **Optional:** Make this filter your default filter by selecting **Set as default**.

   d. Select **Save** to save the filter.
4. **Optional:** Share a saved filter by copying its link to send to others.

   a. In the **Filters** panel, select the filter from the drop-down list.

   b. Select the Copy link to clipboard icon ( ).
5. **Optional:** Set a saved filter as your default filter.

   a. In the **Filters** panel, select the filter from the drop-down list.

   b. Select the More Actions icon ( ) and select **Set as default**.
6. **Optional:** Delete a saved filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Filters** panel, select the filter from the drop-down list.

b. Select the More Actions icon ( ) and select **Delete filter**.

Viewing an alert group analysis by Now Assist in Express List

View an analysis of alert groups in Express List, generated by Now Assist using AI. The analysis helps you better understand the nature of the alert group, why the alerts in the group were correlated, and how to proceed in the remediation process.

The AI-driven alert group analysis offers a simplified, human-readable description of the group and technical information to help you investigate it more efficiently. The information provided is based on descriptions and Configuration Item (CI) details relating to the individual alerts in the group. Alert group analysis is supported for the following alert group types:

Tag-based alert groups

Tags help categorize alerts based on common attributes, such as impacted systems or services. Alerts in tag-based alert groups share certain tags, indicating similarities in the issues. The alert analysis for these groups presents the shared tags that were used to correlate the alerts in the group. It also provides insights into why these alerts were grouped. In addition, the analysis offers suggestions for a course of action based on the similarities between the tags.

CMDB alert groups

When an alert is created on a CI in the Configuration Management Database (CMDB), Event Management looks for alerts on other CIs that are closely related to it in the CMDB topology. A close topological relationship between CIs suggests an interdependence between components in the IT infrastructure and contributes to alert correlation. When a relationship between CIs is found, a CMDB alert group is formed. The alert analysis for CMDB alert groups explains the nature of the group and why it was formed, and the relationships between the CIs. It also provides technical information to help you decide on which alerts to concentrate your investigation.

Log Analytics alert groups

When Event Management identifies multiple Log Analytics alerts that are related in important ways, it groups them into a Log Analytics group. The system generates a Log Analytics group when the Log Analytics alerts share one or more relationships related to time, metadata, message text, and trend. The alert analysis for Log Analytics alert groups is based on the analysis of anomaly information provided by Health Log Analytics, and on the descriptions, CIs, and tags of the alerts in the group.

Network Traffic-based alert groups

The Network Traffic-based alert grouping method groups alerts by analyzing network traffic connections between processes across hosts. It leverages service candidates identified by ML Service Mapping to group the alerts. Alert analysis for network traffic-based alert groups gives a description for all the alerts in the group and the connections between them.

Mixed alert groups

The Mixed grouping method combines alerts using multiple grouping strategies, such as those used in CMDB alert groups and tag-based groups, in a single, cohesive group. This method leverages the strengths of each strategy to reduce alert noise, improve alert correlation, and highlight the true root cause of incidents.

View an alert group analysis by Now Assist in Express List

View an alert group analysis created by Now Assist using generative AI. The analysis offers a simplified, human-readable description of the alert group and technical information to help you investigate it more efficiently.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

Note: Currently, Now Assist for ITOM only analyzes tag-based, CMDB, Log Analytics, Mixed, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the navigation bar, select the Express List icon ( ).
3. In the Active alerts list, select the information icon ( ) next to an alert group to display the preview panel.
4. On the preview panel **Info** tab, select **Analyze** in Alert analysis by Now Assist.
5. View the information provided in the Alert analysis.
6. **Optional:** Use the Alert analysis icons to perform related tasks.

Alert analysis icons

Icon	Description
	Copy the content of the alert analysis to the clipboard.
	Refresh the alert analysis. **Note:** Refreshing regenerates the results. Past results are deleted.

Related topics

Viewing an alert group analysis by Now Assist in Express List

Update an alert description in Express List based on a Now Assist analysis summary

Update alert descriptions in alert groups or single alerts in Express List, to a human-readable summary generated by Now Assist.

About this task

Updating the alert description is available for the alert types:

- Tag-based alert group.
- CMDB correlation alert group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Network Traffic correlation alert group.
- Log Analytics single alerts and alert groups.
- Mixed alert group.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the navigation bar, select the Express List icon ( ).
3. In the Active alerts list, select the information icon ( ) of an alert.
4. On the preview panel **Info** tab, select **Analyze** in Alert analysis by Now Assist.
5. Review the human-readable, AI-generated summary in the Alert analysis.
6. On the preview panel **Info** tab, select **Update description** to update the description based on the summary content of the alert group.
   The AI-generated summary content replaces the original description of the alert group.

Roles used by Express List

Detailed information on all roles that can access the Express List feature on the Service Operations Workspace.

Role title	Description	Contains roles
Event Management Administrator [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Event Management. **Note:** Be careful with the evt_mgmt_admin role because it can be elevated to the admin role.	• evt_mgmt_user • template_editor_global
Event Management Operator [evt_mgmt_operator]	In combination with the evt_mgmt_user permissions, can also activate operations on alerts such as acknowledge, close, open incident, and run remediations.	evt_mgmt_user
Event Team Operator [evt_team_operator]	Manages Event Management operations within a specific team as defined in the **Assignment Group** field. This role allows the operator to read and write alerts exclusively for their assigned team. Additionally, the operator can make

Role title	Description	Contains roles
	configuration changes specific to their team, including updates to Alert Automation and Integrations Launchpad. **Note:** The evt_team_operator role must be assigned to an assignment group to view and manage alerts for that group. If the role is created but not associated with any groups that have alerts assigned, the operator cannot see any alerts.	
Event Management User [evt_mgmt_user]	Has read-only access to all Event Management features. The contained itil role grants access to manage incidents that are created from alerts. Can only view Express List.	itil
Event Management Integrator [evt_mgmt_integration]	Has create access to the Event [em_event] and Registered Nodes [em_registered_nodes] tables to integrate with external event sources.	

Alert automation in Service Operations Workspace for ITOM

Alert automation is crucial as organizations deal with increasing number of alerts and complex IT infrastructures. Manual alert handling is slow, error-prone and inefficient, underscoring the need for automated systems. Automation can improve the mean time to resolve alerts, improve service reliability and better scale staff resources.

Alert automations also support both centralized administrator and distributed team roles. This enables qualified teams to self-serve and create their own alert automations. For example, you may consider granting access to site reliability engineers (SREs). Members of teams can manage automations for their own team and their own alerts without impacting other teams.

For users familiar with our classic experience, alert automation offers an easier user interface and better team support for event rules, tag-based clustering definitions and alert management rules. Some advanced features are currently only available to admins in the classic experience. These two experiences use the same backend tables. You can use whichever experience is most convenient, and changes in one will also update the other.

Alert automation types

Currently, Service Operations Workspace ITOM provides the following types of automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Ignore automation: Reduce irrelevant or false-positive alerts, efficiently manage alert fatigue by filtering out noisy notifications, and allow teams to focus on critical issues.
2. Enrich automation: Enhance raw alerts with contextual information to make them more informative and actionable. In simple terms, this involves taking the raw events generated by monitoring tools and transforming them into a common and standard format to aid automated grouping and response.
3. Group automation: Group multiple related alerts into a single primary alert to reduce alert noise and identify the root cause.
4. Respond automation: Respond to alerts automatically by notifying appropriate stakeholders, escalate them as needed or run remediation actions. Determine how and when alerts are escalated based on severity or type. Integrate with third party systems to create cases, notifications or run remediation actions.

Alert automation process flow

You may start by sending alerts or events from monitoring systems to ServiceNow using the Integrations Launchpad. This is where administrators establish connections between ServiceNow and monitoring tools. These integrations enable the collection of monitored data, generating events from third-party sources.

When alerts are received by ServiceNow, alert automations run in the order shown on the page. First, we ignore alerts to reduce noise. Next, we enrich alerts with extra context, then group the alerts using the added context. Finally, we respond to alerts by escalating or running remediations. There can be several automations for each type. Each automation runs based on specific trigger conditions and executes specific actions. Alerts are only automated when they are received; we do not apply automations to past alerts.

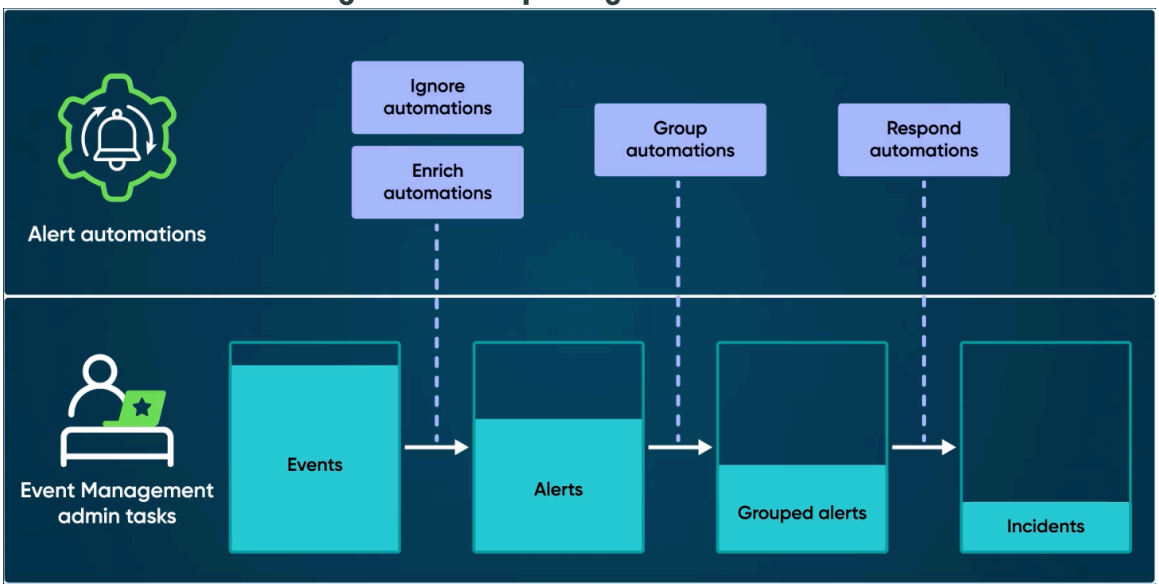
In the alert enrichment phase, administrators add or extract necessary fields from alerts to provide essential information for swift resolution. This ensures that alerts contain all relevant details required for effective incident response. Administrators add context to alerts by modifying and normalizing them. This enhances the correlation of alerts, making it easier to identify patterns and potential threats.

The enriched and composed alerts are then grouped based on predefined criteria, consolidating related alerts. This reduces alert fatigue and facilitates efficient remediation. Finally, escalated alerts trigger notifications to stakeholders through various channels, ensuring timely communication and response to critical alerts.

The following diagram illustrates this process flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert automation: Reducing noise and improving resolution time



This comprehensive alert automation process can reduce alert noise, improve mean time to resolution (MTTR), enhance service reliability, and boost staff productivity.

Create Ignore automation

Ignore automation streamlines the process of disregarding irrelevant or false-positive alerts from monitoring systems, efficiently managing alert fatigue by filtering out unnecessary notifications. This allows teams to focus on critical issues.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

About this task

Ignore automations filter out alerts from source monitoring systems that match specific conditions. Separately, Event Management ignores alerts that have a duplicated message key field or where the severity is **Clear**.

For users familiar with the classic Event Management experience, ignore automations provide a simpler interface with enhanced team support for the event filter section of event rules.

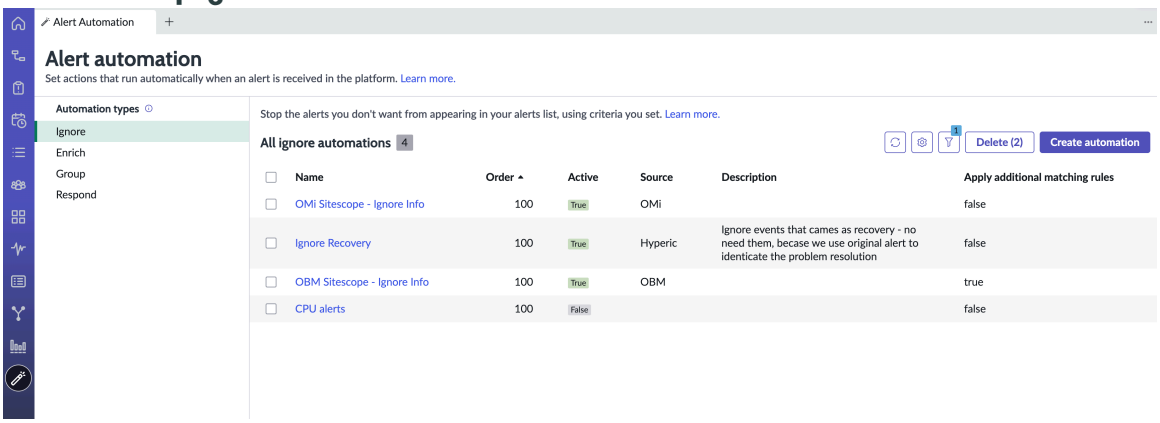
Note: Ignoring alerts before enriching them improves performance and simplifies the processing flow. The condition filter in ignore automations applies only to the original event, not the enriched one. Enrich automations can prevent ignore automations from running when **Don't run other enrich alert automations** is set to false, they apply to the same source, have a lower order, and match the filter conditions. To avoid conflicts, it is best to consider this when creating enrichments or event rules.

Procedure

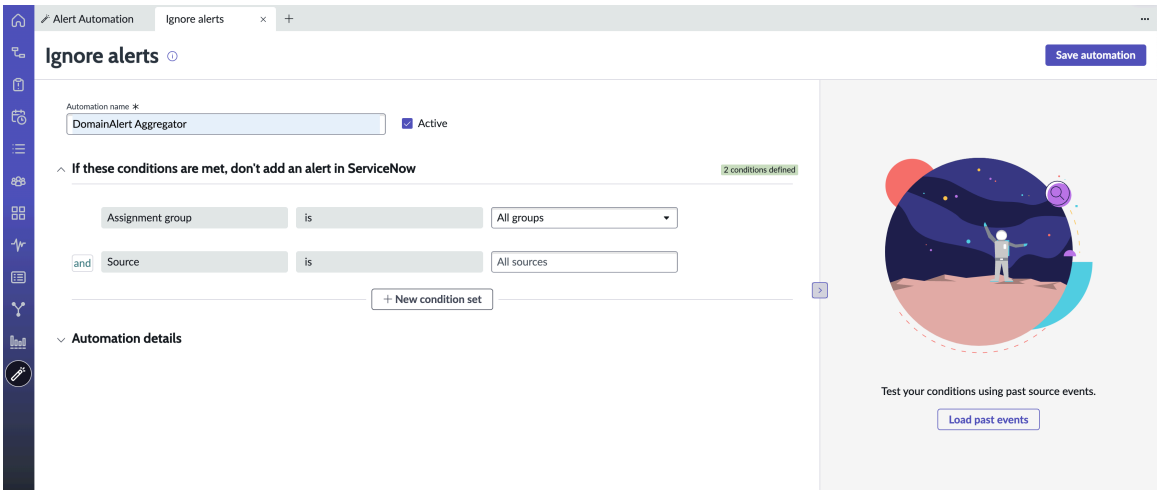
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Alert Automation icon ( ).
3. On the Alert automation page, under **Automation types**, select **Ignore**.
   The Ignore alerts page is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automations page



4. Select **Create automation**.



5. In the **Automation name** field, enter the name of the automation for ignoring alerts.
6. Activate the automation by enabling the **Active** toggle switch.
7. In the **If these conditions are met, don't add an alert in ServiceNow** section, set up filter criteria to identify the events you want to capture.
   a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

      The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

      Note:

      - If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
      - If you're an operator, only the group you're a part of is available.
      - Only members of the selected group or administrators can update or delete the automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

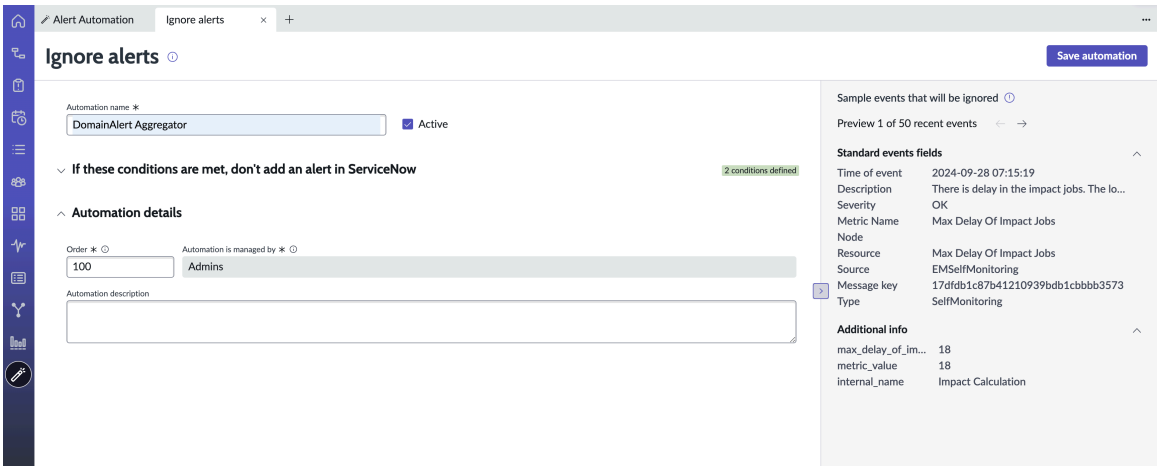
b. From the **Source** field menu, select the monitoring tool from where the alert is generated.

c. Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators.

To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

8. To verify that you are ignoring the correct events or to see examples of fields that can be used to set the conditions, select **Load past events**.
You can preview the details of some past events.

9. In the **Automation details** section, provide an order and automation description.



a. In the **Order** field, enter the automation order.

Note: Automations run in order from the lowest to the highest.

The **Automation is managed by** field displays the team or assignment group who owns, edits, and can delete this automation. The assignment group is the same as the one defined in the **If these conditions are met** section.

b. In the **Automation description** field, enter a brief description of the automation.

10. Select **Save automation**.
A notification appears when the automation is successfully saved. Otherwise, an error message is displayed. The ignore automation that you created appears on the **Ignore alerts** page where you can view, edit, or delete the existing automation.

What to do next

You can transform raw events into an understandable format by creating Create Enrich automation.

Create Enrich automation

Alert enrichment involves transforming raw events from monitoring tools into a standard format, aiding automated grouping and response. This includes extracting fields from lengthy alert payloads or composing them into a standardized format. Additionally, you can create tags, which are metadata added to alerts for easier filtering and grouping.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

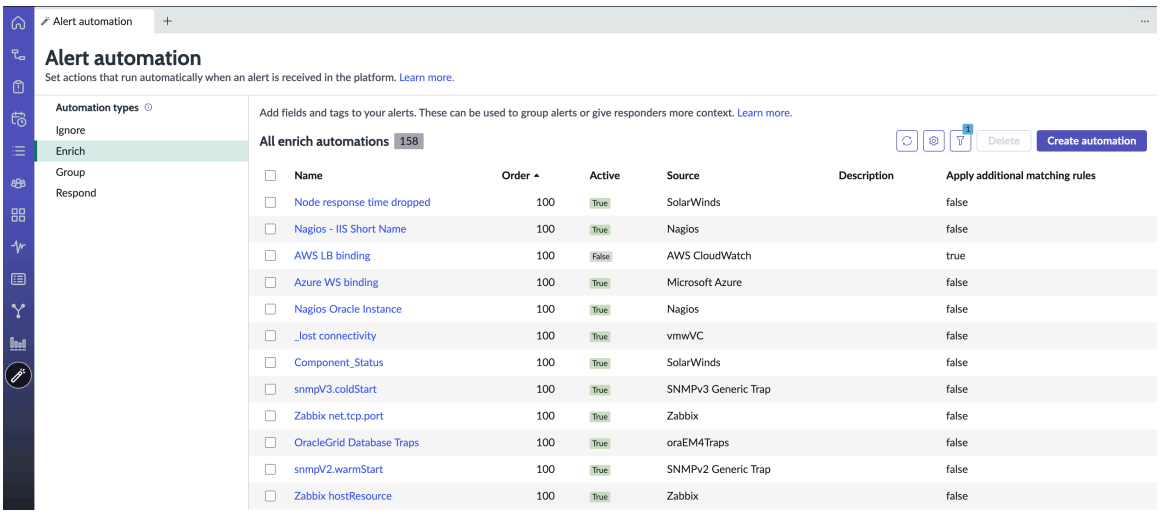
About this task

Extracting takes values from event payload fields and places them in alert output fields, while composing combines multiple alert fields into one. For more information, see Extracting and composing alert fields.

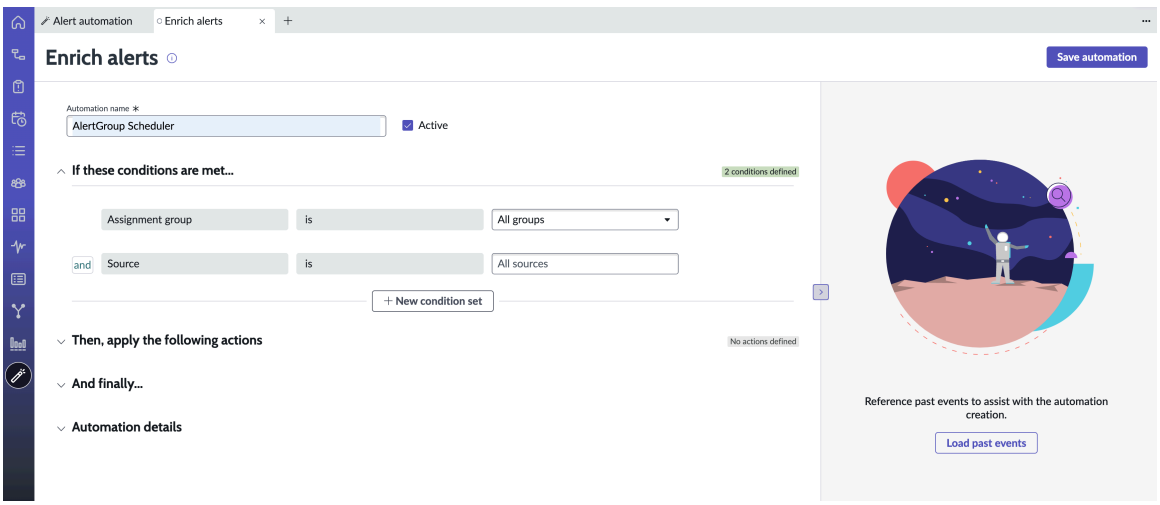
For users familiar with the classic Event Management experience, enrich automations create event rules but with an easier interface and with better teams support. Event rules offer a few advanced features like thresholds and CI identification using IRE that are not yet available in enrich automations. Admins may also enrich alerts with event field mapping rules. Changing alert values creates an event field mapping rule with the mapping type **Map field and transform value (Single field)**. This rule is linked to the event rule and runs simultaneously, allowing for streamlined mapping and transformation of event data to enrich alerts.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Alert Automation icon ( ).
3. On the Alert automation page, under **Automation types**, select **Enrich**.
   The Enrich alerts page is displayed.



4. Select **Create automation**.
5. In the **Automation name** field, enter the name of the automation for enriching alerts.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Activate the automation by selecting the **Active** check box.
7. To continue running other enrichment automations with same filter conditions after this automation is executed, enable the **Continue running automations of this type** toggle switch. When disabled, additional automations of this type will stop running after this automation is executed once. If the automation is managed by an administrator, it will stop running administrator-owned automations but will continue to run automations owned by other assignment groups.
8. In the **If these conditions are met** section, set up filter criteria to identify the alerts you want to enrich.

   The condition is evaluated against the raw event received from the source monitoring system and does not account for enriched fields.

   a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

      The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

      Note:

      - If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
      - If you're an operator, only the group you're a part of is available.
      - Only members of the selected group or administrators can update or delete the automation.

   b. From the **Source** field menu, select the monitoring tool from where the alert is generated.

   c. Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators.

      To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

9. In the **Then, apply the following actions** section, select the automation actions that will be triggered by this automation.
   You must select at least one action.
   - **Extract alert fields**: Retrieves alert field values from the event payload and places them in an alert output field.
   - **Copy or compose fields**: Merges various alert fields, tags and text to generate a composed alert output.
   - **Change alert values**: Maps the current value of alert fields to specified new values.

Option	Action
Extract alert fields	**a.** Enable the **Extract alert fields** toggle switch. **b.** From the **Source input field** menu, select a value. The menu displays the standard event fields, additional info, and tags. The field value is then displayed. You can also manually enter a field name that is not displayed and add your own value.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
	The example source events pane displays a sample of recent events in your system. If no events are displayed, you may cre ate an event, see Create or edit an event rule. **c.** In the **Regular expression** field, create a regular expression to extract the value that you want to extract. **Note:** You can compose text using regular expression (regex) format conventions. Use one or more capture groups with parentheses to extract parts of the input. Capture groups in the regular expression are assigned to alert outputs based on the order in which they appear. The regex must match the entire input, so consider sur rounding your regex with `.*` on each end. For example, `(\w+).acme.com.*` captures the host name in a fully qualified domain name. The parser for the regex engine is Perl Compatible Regular Expressions (PCRE) compat ible. Nested JSON data is preprocessed to strip quotes and replace colons with equal signs. **d.** In the **Alert output** field, select an alert field or an alert tag. You can also manually enter a new field name. If you want to add an alert tag, select the **Set as a tag** check box. **Tip:** Create alert tags that can be shared across sources for easier filtering and grouping, such as the out-of-the-box tags.  **e.** Select **Preview multiple events** to verify that the regular ex pression (regex) is general-purpose enough to correctly ex tract values across many examples.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
	Note: This option is available only when example source events are available and matched with the regex filter.  To include additional fields for extraction, select **+ Add fields**.
Copy or compose fields	**a.** Enable the **Copy or compose fields** toggle switch. **b.** From the **Source input field** menu, select alert fields and/or alert tags, manually enter a field name or even add free text. Alert fields are displayed in the `${field}` syntax format. **c.** In the **Alert output** field, select an existing alert field or alert tag, or manually enter an alert field. The **Alert output** field is an enriched alert containing the composed alert data. For easier grouping, you can select a tag from the menu. If you want to use the new field name as a tag for grouping, select the **Set as a tag** check box. **Tip:** Create alert tags that can be shared across sources for easier filtering and grouping, such as the out-of-the-box tags.  To create additional alert data compositions, select **+ Add fields**.
Change alert values	**a.** Enable the **Change alert values** toggle switch. **b.** In **Alert field**, enter the field in the alert that you want to map values for. **c.** In the **From value** field, enter original value in the alert field that you want to change. **d.** In the **To value** field, enter the new value that will replace the original value in the alert field. To add more field values, select **+ Add value** and to add more fields to map, select **+ Add field to map**.

Option	Action
Improve configuration item (CI) identification	This option allows you to change how alerts are bound or linked to a Configuration Item (CI), ensuring alerts are associated with the correct IT components for better visibility and faster issue resolution. The default and most common way to bind alerts to CIs is based on the **Node** field. This works out of the box with no configura tion needed. Use it by populating the **Node** field in your alert with a CI's Name, Fully Qualified Domain Name (FQDN), IP, or MAC ad dress. This supports host CIs including Computers, Operating Systems (OS), Switches, Routers, or any CI type or any class that extends the [cmdb_ci_hardware] table. You may enable this action to improve the CI identification for other types of CIs such as processes or service instances. The system searches for a matching CI in the appropriate CMDB ta ble based on the selected CI type. For example, if you select File System as the CI class, the system searches for a matching record in the [cmdb_ci_file_system] table using details from the event rule record, specifically the **Additional info** fields. **a.** If the CI is running on a specific host (such as a Tomcat appli cation): **i.** Select the CI class to bind. Select **View items** to see the list of CIs of this type and their attribute values. **ii.** Ensure that the **Node** field in the alert is populated correctly to identify a host CI. Select **Show me how** to see where the **Node** field value ap pears. **iii.** Ensure that at least one CI attribute is present in the **Addi tional info** field of the alert. For instructions on how to populate these fields, see Set additional info fields to match CI attribute format. The sys tem attempts to match values from the **Additional info** field of the alert with the CI table. If a match is found, the alert is bound to the corresponding CI. **b.** If the CI is not running on a specific host: **i.** Select the CI class to bind. Select **View items** to see the list of CIs of this type and their attribute values. **ii.** In the **Copy or compose fields** section, clear the **Node** field so that the host identified by the node is not considered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
	Select **Show me how** to learn how to clear the **Node** field. You can clear it by using the compose action above to set the **Node** field to a blank value. **iii.** Ensure that at least one CI attribute is present in the **Additional information** field of the alert. For instructions on how to populate these fields, see Set additional info fields to match CI attribute format. The system attempts to match values from the **Additional info** field of the alert with the CI table. If a match is found, the alert is bound to the corresponding CI. For more information on CI binding, see Binding alerts to CIs.

10. In the **And finally** section, to continue running other enrichment automations with same filter conditions after this automation is executed, select **Run other enrich alert automations**.
If you select **Don't run other enrich alert automations**, additional automations of this type will stop running after this automation is executed once. If the automation is managed by an administrator, it will stop running administrator-owned automations but will continue to run automations owned by other assignment groups.
11. In the **Automation details** section, provide an order and automation description.

    a. In the **Order** field, enter the automation order.

    > **Note:** Automations run in order from the lowest to the highest. Ensure there are no enrichment automations with a lower order number that have matching conditions and have **Apply additional automations of this type** set to false. Otherwise, this may prevent subsequent automations from running.

    The **Automation is managed by** field displays the team or assignment group who owns, edits, and can delete this automation. The assignment group is the same as the one defined in the **If these conditions are met** section.

    b. In the **Automation description** field, enter a brief description of the automation.

12. Select **Save automation**.
A notification appears when the automation is successfully saved. Otherwise, an error message is displayed. The enrich automation that you created appears on the Enrich alerts page where you can view, edit, or delete the existing automation.

© 2026 ServiceNow, Inc. All rights reserved.

What to do next

You can manage alerts more effectively by grouping similar alerts together with the help of Create Group automation.

Related topics

Extracting and composing alert fields

Extracting and composing alert fields

Extracting and composing are ways to manage what you see in the alert output, making it simpler to filter, group, and read. Alert automation enables you to extract values from event payload's alert field and place it in an alert output field. Composing allows you to merge multiple alert fields into a single output field.

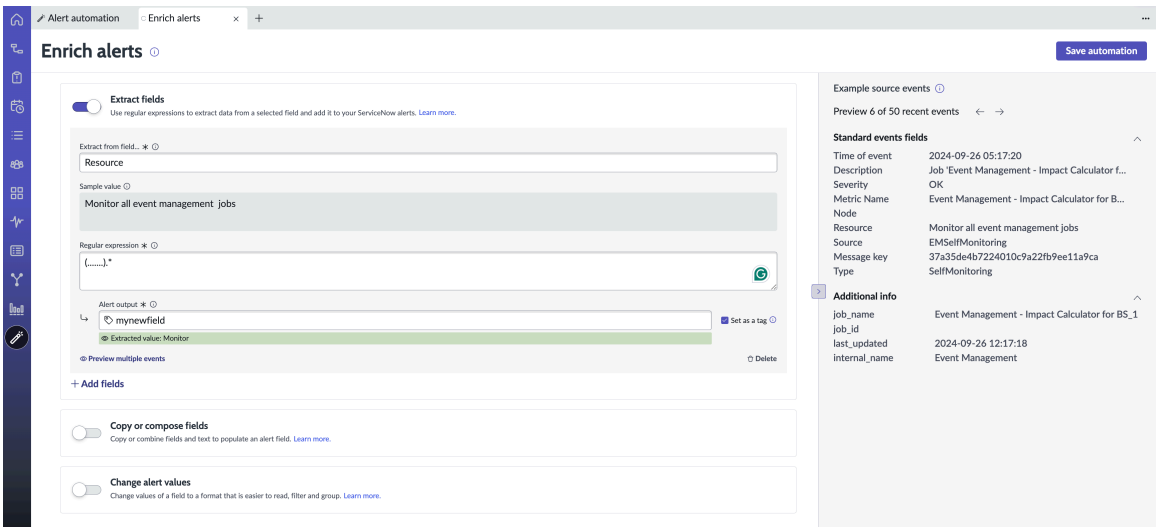
Extracting alert fields

Alert notifications often contain relevant context buried within event payloads. By enriching alert outputs with values from the existing payload, you can better understand the significance of alerts and determine the appropriate steps for resolution. For example, a host name typically includes crucial information such as service, node, cluster, datacenter, and domain. To automatically add the value for a cluster tag based on incoming host data, you can extract just the cluster data.

When extracting alert fields, use regular expressions (regex) to build value formulas. Regex allows you to precisely identify and capture the relevant portions of the payload, enabling the creation of meaningful and actionable alert notifications.

Note: You can compose text using regular expression (regex) format conventions. Use one or more capture groups with parentheses to extract parts of the input. Capture groups in the regular expression are assigned to alert outputs based on the order in which they appear. The regex must match the entire input, so consider surrounding your regex with `.*` on each end. For example, `(\w+).acme.com.*` captures the host name in a fully qualified domain name. The parser for the regex engine is Perl Compatible Regular Expressions (PCRE) compatible.

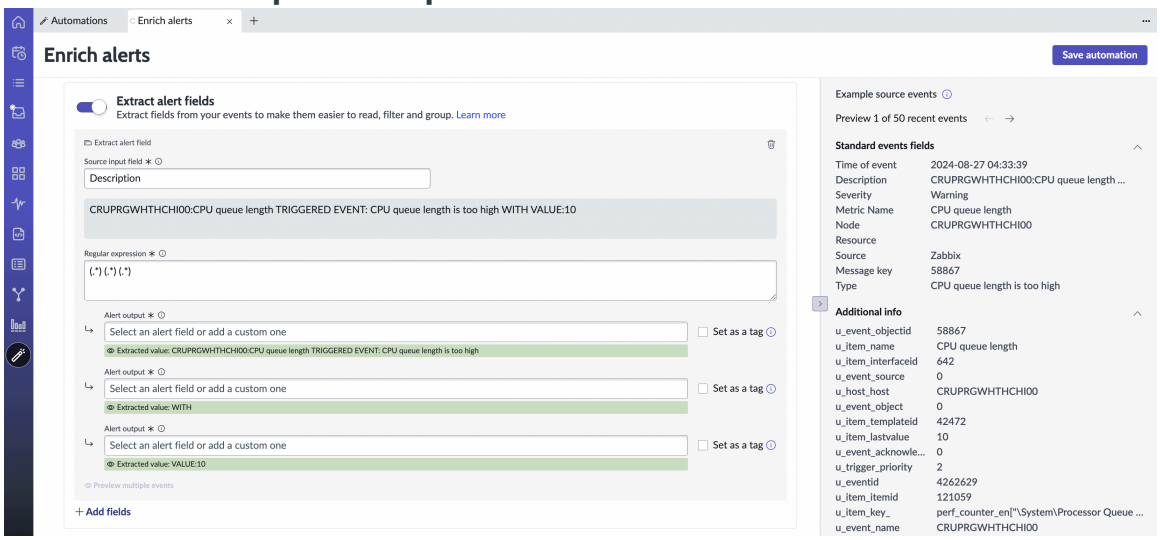
Extract alert fields



If you use multiple capture groups with parentheses, each extracted value appears in a separate output field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extract field for multiple alert outputs



Preview the alert output across example events to verify that the values are extracted as expected by selecting **Preview multiple events**.

Note: This option is available only when example source events are available and matched with the regex filter.

Example: Extracting alert fields

Suppose you need to extract only six letters from a specific field of an event and display them in a new alert field named `mynewfield`. You also want to tag this new alert field for later use in alert grouping. Here's how you can achieve this:

- **Source input field**: Select the event field from which you want to extract data. In this case, the field is **Resource**.
- **Regular expression**: Use a regular expression to extract the specific part you need from the selected field's value. For example, if the Resource field value contains "Zabbix integration" and you want to extract "Zabbix", your regular expression must be (……).*.
- **Alert output**:
  - Choose an existing alert field, an existing alert tag, or manually enter a new field name. In this case, let's enter a new field name `mynewfield`.
  - Set `mynewfield` as a tag for later use in tag-based grouping. Notice the tag displayed before the field name.

  After applying the regular expression to the selected field's value (in this case the **Resource** field value), verify the extracted word displayed below the **Alert output** field. For instance, it should show "Zabbix" if the regular expression matches correctly.

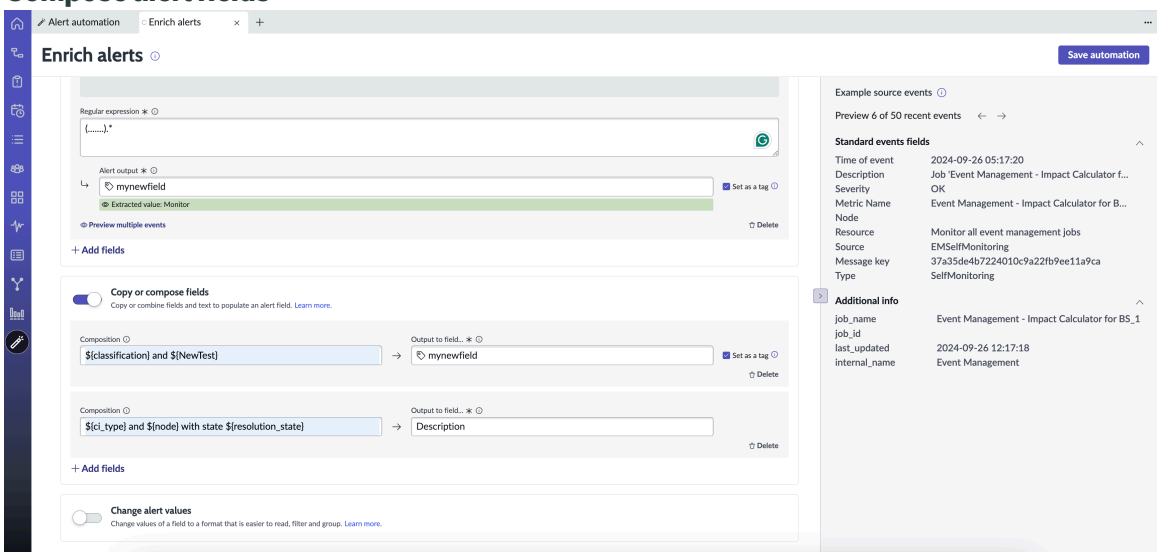
- **Preview multiple events**: Previewing multiple events allows you to verify if the regular expression accurately extracts data from a range of example events. This helps determine if any adjustments to the regular expression are needed.

Composing alert fields

When creating an alert output, you can select or manually enter fields, tags, or free text to include. This data can be easily read, filtered, and grouped for better management and understanding of the alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compose alert fields



Example: Composing alert fields

Suppose you want to have two input fields that compose data and display it in two different alert output field. In one scenario, you want the source value to come from an existing alert field along with a new field, showing the composed value in a new alert output field. You also plan to tag the new alert output field for later use in tag-based grouping. In the other scenario, you combine existing fields with free text and select the alert output to display in an existing alert field. Here's how you can achieve this:

- Scenario 1:
  1. **Source input field**: Select an existing alert field and add the text "and", followed by entering a new field name such as `NewTest`. For example: ${classification} and ${NewTest}.

     Note that alert fields are displayed in the `${field}` syntax format. You can also select the field name from the drop-down list, and the syntax will be added automatically.

  2. **Alert output**: Enter the name of the new alert field where you want to display the values from the input fields. For example, let's name it `mynewfield`.

     Set `mynewfield` as a tag for later use in tag-based grouping. Notice the tag displayed before the field name.

- Scenario 2:
  1. **Source input field**: Select existing alert fields and include any desired free text for how you want them to appear in the alert output field. For example: ${ci_type} and ${node} with state ${resolution_state}.

     Alert fields are displayed in the `${field}` syntax format. You can also select the field name from the drop-down box, and the syntax will be added automatically.

  2. **Alert output**: Select an existing alert field where you want to display the values from the input fields. For instance, select **Description**.

Set additional info fields to match CI attribute format

Set additional info fields in alerts to match the field and value format of CI attributes in CI records. This ensures accurate alert-to-CI binding, improving alert tracking and reducing manual effort.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Ensure that you are on the Enrich Alerts page and the **Improve configuration item (CI) identification** toggle switch is enabled.

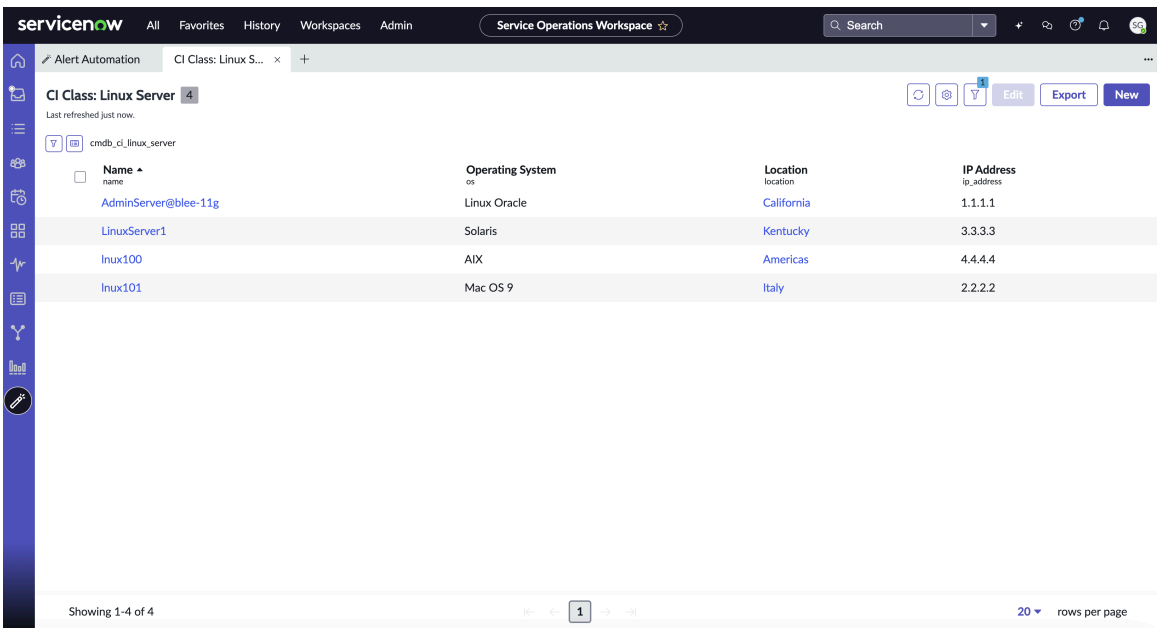
Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

About this task

The system attempts to match the **Additional Info** fields of the alert with attributes in the CI table. If exactly one matching CI is found, the alert is linked to that CI. For CI identification to be successful, add new fields or ensure that your alert has additional info fields corresponding to column name for CI attributes. For example, use column name **ip_address** instead of the column label **IP Address**. Each matching key name must have matching values. If there are matching fields in your alert that you don't wish to use for binding, copy them to another field then clear the original field.

Procedure

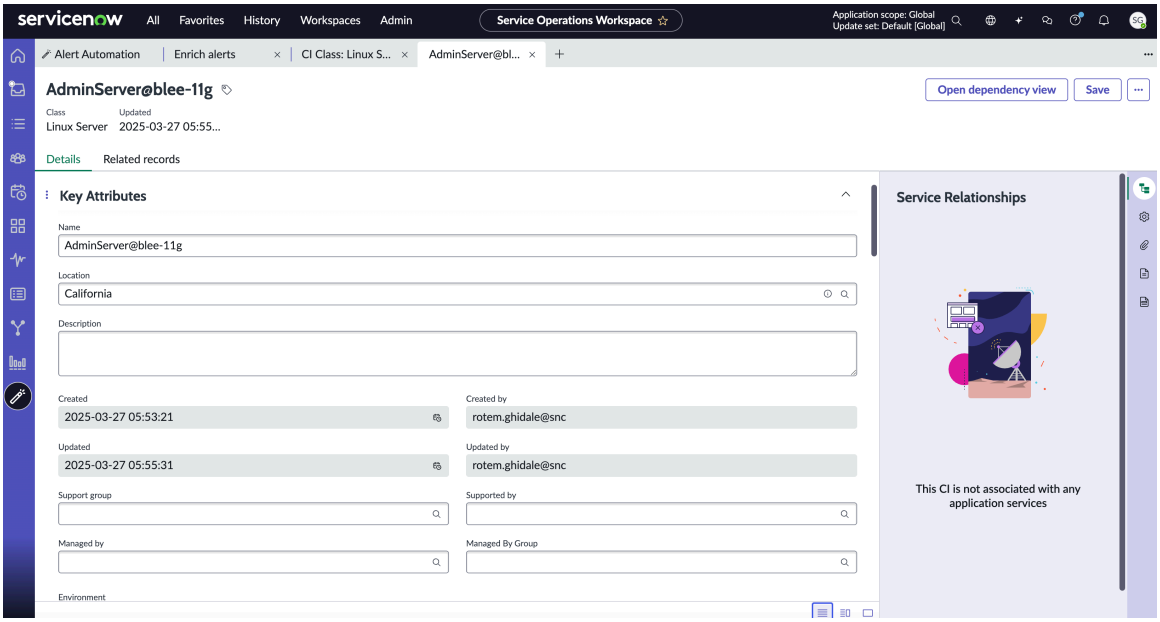
1. In the **Select which CI class you'd like to identify** field, select the CI class.
2. Select **View items** next to the **Select which CI class you'd like to identify** field to open the list of CIs of the selected CI class.



3. Select a CI name to open its details or record page.

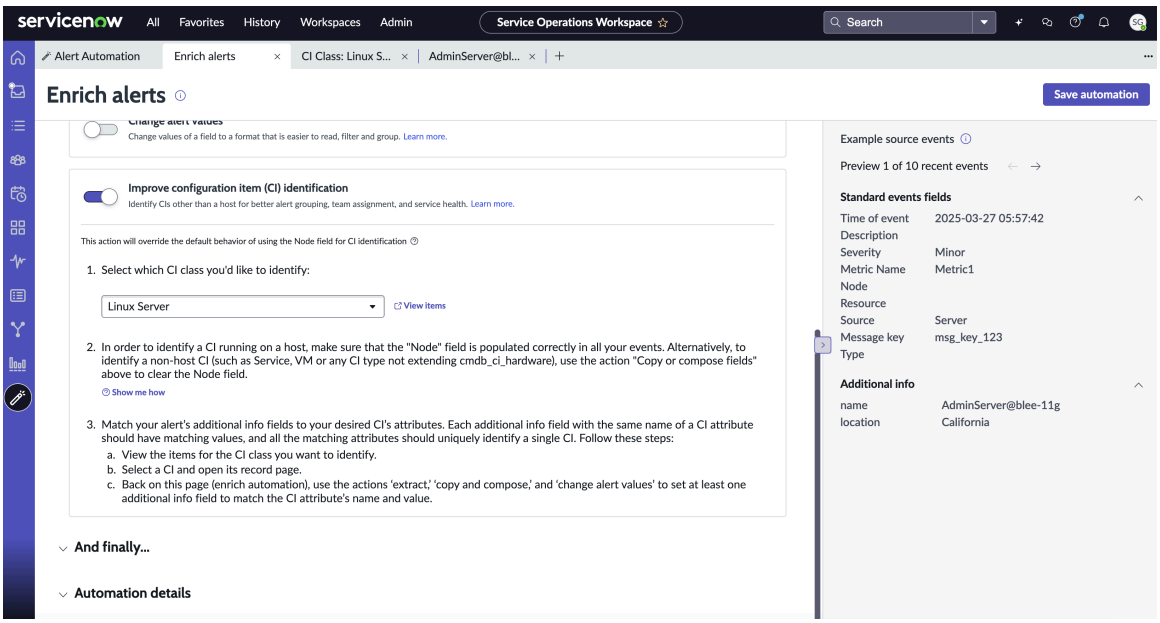
   At least one field and its corresponding value from the CI details page must appear in the **Additional info** field of the alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. In the Enrich Alerts page, use **Extract fields**, **Copy or Compose fields**, and **Change alert values** to set at least one **Additional info** field in your alert to precisely match the field and value format of the CI attributes in the CI record.

   Example: Suppose the CI record page has the **name** field with the value **AdminServer@blee-11g** and the **location** field with the value **California**. To include these fields and their values in the **Additional info** field of the alert, set the fields as shown in the image.



Create Group automation

Grouping automation helps you manage alerts more effectively by collecting similar alerts together. This makes it easier to see patterns, quickly identify issues, and respond efficiently. By organizing alerts in this way, you can reduce alert noise, identify root causes, and assign them to the appropriate teams.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

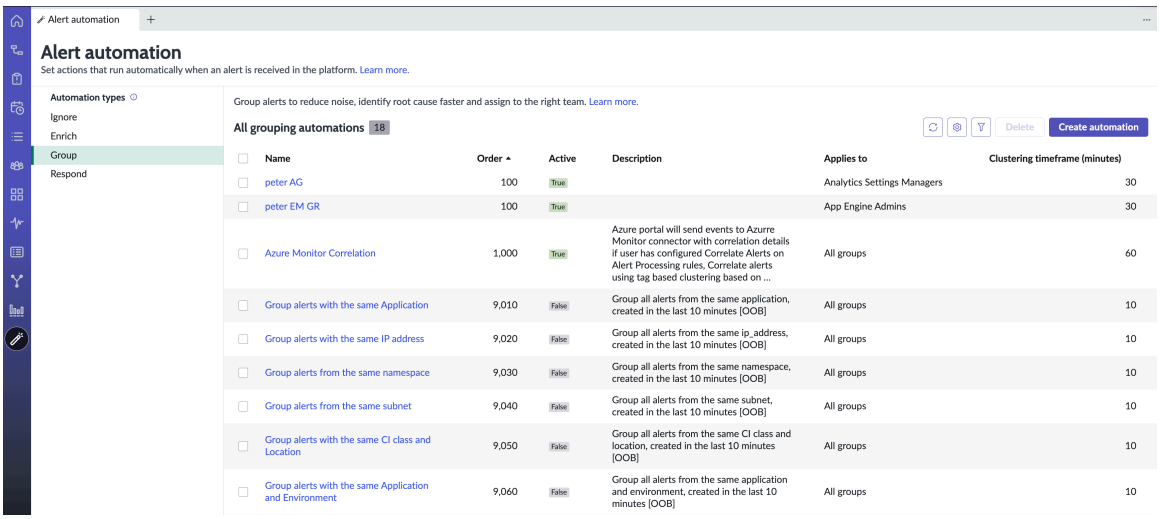
Grouping of this method is most useful when alerts share common data or tags, such as a node or location. You can use fields or tags populated via an enrich automation. It's the best way to group alerts when your CMDB or service maps are immature. This complements our other grouping algorithms, including alert correlation rules, CMDB, ML, and text-based grouping. Alerts are grouped with their first match, and you can control the priority order of these algorithms via system property. For information on correlation logic order, see Configure alert correlation logic order.

Alert automation also provides a simulation feature allowing you to test how many alert groups would be formed, how many are left ungrouped, and the compression rate. A higher compression rate means your team will be more productive and may be able to identify root causes faster. However, consider whether the groups are accurate, operationally correct, and assigned to the right teams. You may adjust the group criteria until you are satisfied with the resulting groups.

For users familiar with the classic Event Management experience, this feature offers an easier interface with improved team support for creating tag-based alert clustering definitions.

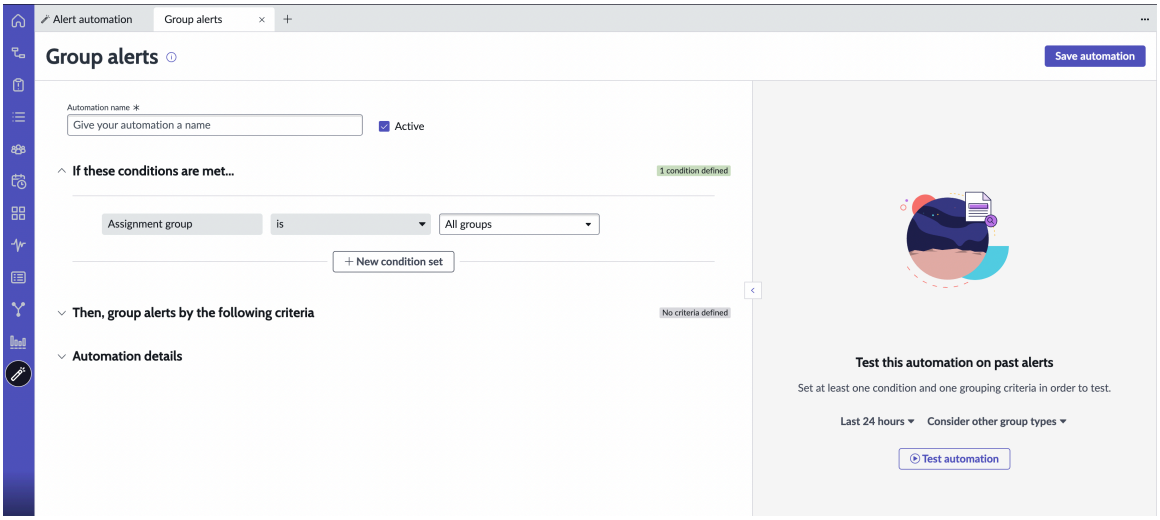
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Alert Automation icon ( ).
3. On the Alert automation page, under **Automation types**, select **Group**.
   The Group alerts page is displayed.

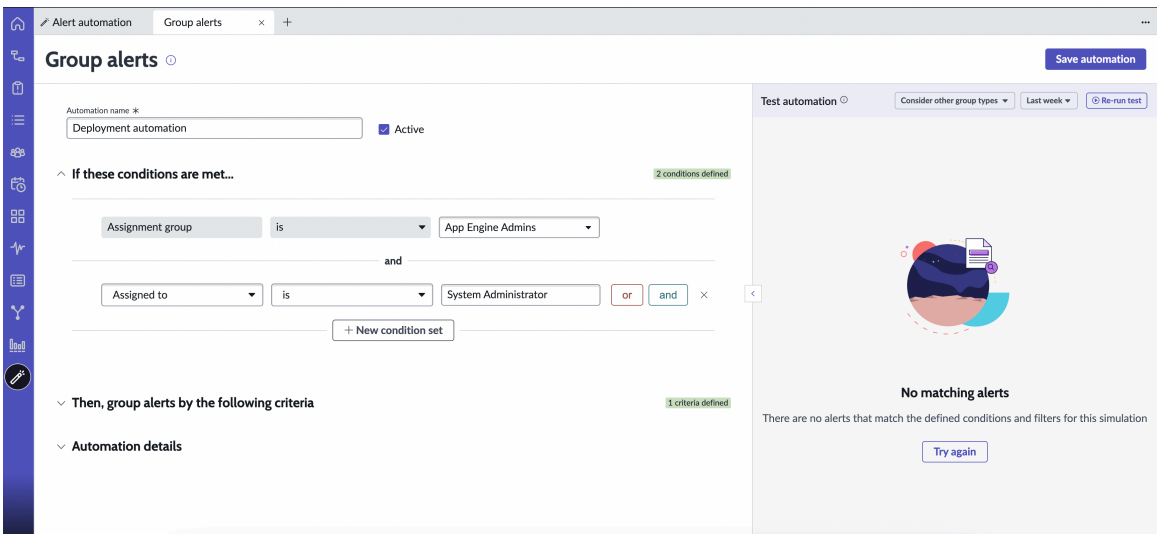


4. Select **Create automation**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. In the **Automation name** field, enter the name of the automation for grouping alerts.
6. Activate the automation by selecting the **Active** check box.
7. In the **If these conditions are met** section, set up filter criteria to identify the alerts that you want to group.



a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

   The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

   Note:

   - If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
   - If you're an operator, only the group you're a part of is available.
   - Only members of the selected group or administrators can update or delete the automation.

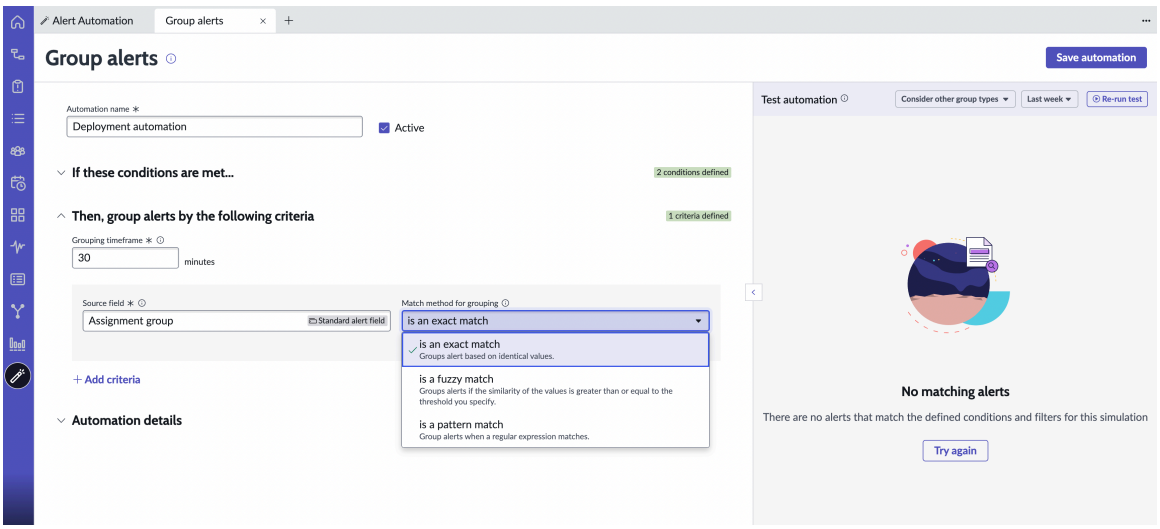
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators. You must add at least one more filter besides the assignment group.

> **Tip:** Select a more specific filter to enhance performance.

To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

8. In the **Then, group alerts by the following criteria** section, perform the following steps.



a. In the **Grouping timeframe** field, specify the duration (in minutes) when alerts must be collected and grouped together.

b. In the **Source field** menu, select the source from which you want the alerts to be grouped.

> **Note:** You can manually add a field name and select the type of the field. The available options include additional info field, alert tag, and CI tag. This flexibility allows you to customize the information being captured according to your specific needs.

c. In the **Match method for grouping** field, select one of the following options: group alerts based on an exact match, fuzzy match, or pattern match.

When you select a value for the fuzzy match method in the grouping field, the **Similarity threshold (percentage)** field becomes visible. Alerts are grouped when their similarity is greater than or equal to the specified percentage based on edit distance.

For example, if you have alerts from USA, CA, and USA, NY, and you want to group the alerts by country, you would set the **Source** field to USA. If the **Match Method for Grouping** is a fuzzy match and the **Similarity threshold (percentage)** is 50%, then alerts will be grouped if they are at least 50% similar, meaning they share the country "USA" as a common attribute.

d. When you select a value for the pattern match method in the grouping field, the pattern matching field becomes visible. Alerts are grouped when the specified pattern matches. For more information, see Pattern matching.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use asterisks (*) in the search string to match any number of characters or a question mark (?) to match any single character. Everything else in the search string matches itself. For example, use "HTTP Error 5??" to match all HTTP 500 errors.

To include additional fields for grouping, select **+ Add criteria**.

9. In the **Automation details** section, provide an order and automation description.

   a. In the **Order** field, enter the automation order.

      Note: Alerts are grouped based on the first match, executed in order from the lowest to the highest number. The **Automation is managed by** field displays the team or assignment group who owns, edits, and can delete this automation. The assignment group is the same as the one defined in the **If these conditions are met** section.

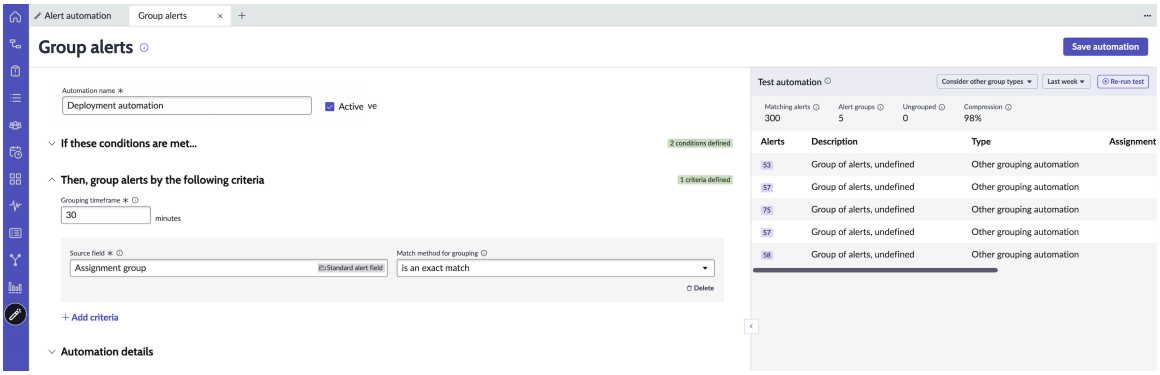
   b. In the **Automation description** field, enter a brief description of the automation.

10. To test if the alert grouping is working correctly, navigate to **Test this automation on past alerts**, select the timeframe for the simulation from the drop-down list, select whether you want to consider other grouping types, and then select **Test automation**.

    Note: From the Consider other group types menu, you can select either **This automation only** or **Consider other group types**. Selecting **This automation only** ignores other alert group types while choosing **Consider other group types** includes all alert grouping automations, such as tag-based, automated, text-based, and CMDB-based alert grouping.

    During the simulation, it shows both the grouped alerts and the ungrouped alerts for the specified timeframe. If any alerts are grouped, you are shown the number of alerts that are grouped. You can select this number to view the grouped alerts. Additionally, selecting an individual alert displays the details of that specific alert. You can also modify any alert grouping conditions or field values and initiate the process again by selecting **Re-run test**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The header of the Test Automation section also displays the following: matching alerts, alert groups, ungrouped alerts, and compression.

- **Matching alerts**: The total number of matching alerts before grouping that match the conditions defined for this automation.
- **Alert groups**: The number of groups containing more than one alerts matching the automation conditions. The smaller number in parentheses represents the number of groups created by this automation.
- **Ungrouped**: The number of alerts matching the automation conditions that remain ungrouped.
- **Compression**: The percentage reduction in the number of total alerts achieved by grouping, calculated as 1 - (Alert groups + Ungrouped) / Total alerts. You can improve the compression rate by grouping your alerts into related problems. The smaller number in parentheses indicates the percentage of matching alerts compressed by this automation.

The Test Automation section displays three key columns: **Description**, **Type**, and **Time**. The **Description** column outlines the alert group details. Preceding the **Description** column, a number indicates the total alerts contained within that group. **Type** specifies the category of grouping, such as This grouping automation, Other grouping automation, CMDB group, or Single alert, among others. Selecting **Other grouping automation** directs you to the corresponding automation page that generated the group. Additionally, the **Time** column shows when the test was conducted.

> **Important:** You can run the simulation of alerts on your test as well as production instance. The test automation simulates the automation using up to 200 recent alerts that match the specified conditions. It only considers groups where all alerts meet the conditions for this automation, although additional grouping algorithms may be applied during actual runtime.

11. Select **Save automation**.
    A notification appears when the automation is successfully saved. Otherwise, an error message is displayed. The group automation that you created appears on the Group alerts page where you can view, edit, or delete the existing automation.

What to do next

You can escalate alerts needing quicker responses from teams or individuals by implementing respond automation.

Create Respond automation

Respond to alerts automatically by notifying appropriate stakeholders, escalating them as needed based on severity and type, or other executing response actions. This process ensures that alerts are managed promptly and effectively.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

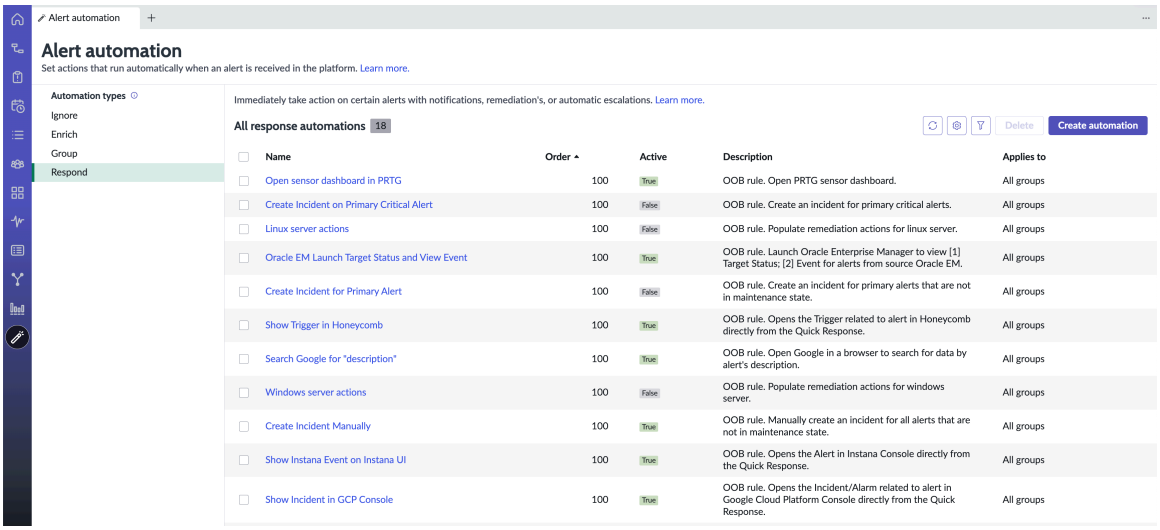
Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

About this task

For users familiar with the classic Event Management experience, this provides an easy interface with enhanced team support for creating response automations or alert management rules. Alert management rules or response automations are configurable automated actions triggered in response to alerts which match specific conditions, helping IT teams resolve issues faster and with minimal manual effort. These advanced features are currently only available to administrators and other personas mentioned in the role required section.

Procedure

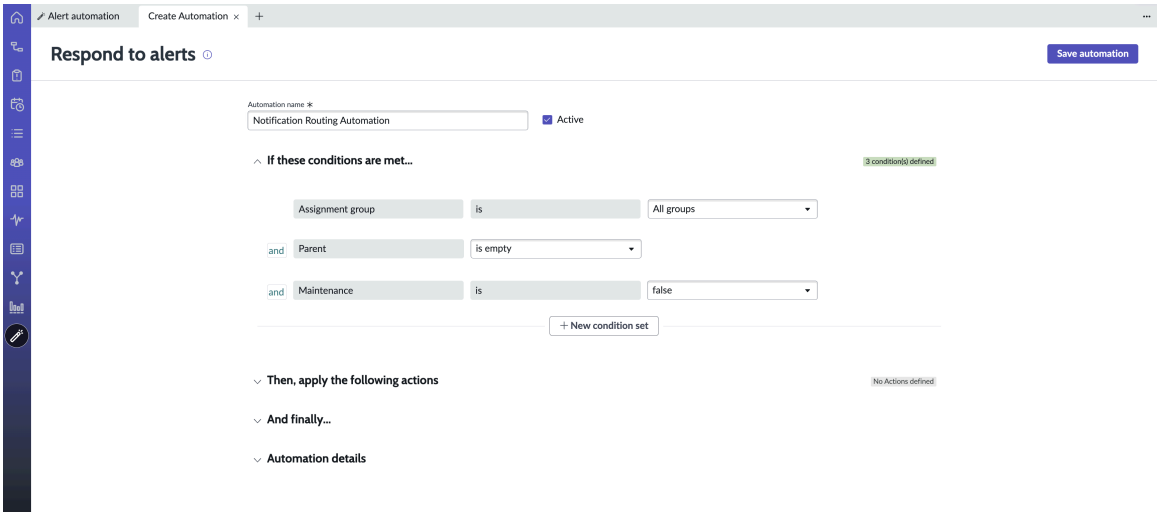
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Alert Automation icon ( ).
3. On the Alert automations page, select **Respond**.
4. Select **Create automation**.
   The Respond page appears.



5. In the **Automation name** field, enter the name of the automation.
6. Activate the automation by selecting the **Active** check box.
7. In the **If these conditions are met** section, create filter criteria to identify the alerts you want to capture.

> **Important:** You can limit respond automations to primary alerts to prevent secondary alerts from being overwhelmed by unnecessary noise. Ensure these automations are applied only to alerts associated with CIs that are not currently undergoing maintenance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

Note:

- If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
- If you're an operator, only the group you're a part of is available.
- Only members of the selected group or administrators can update or delete the automation.

b. For the **Parent** field value, select whether the alert for which you want a response is grouped under a parent alert.

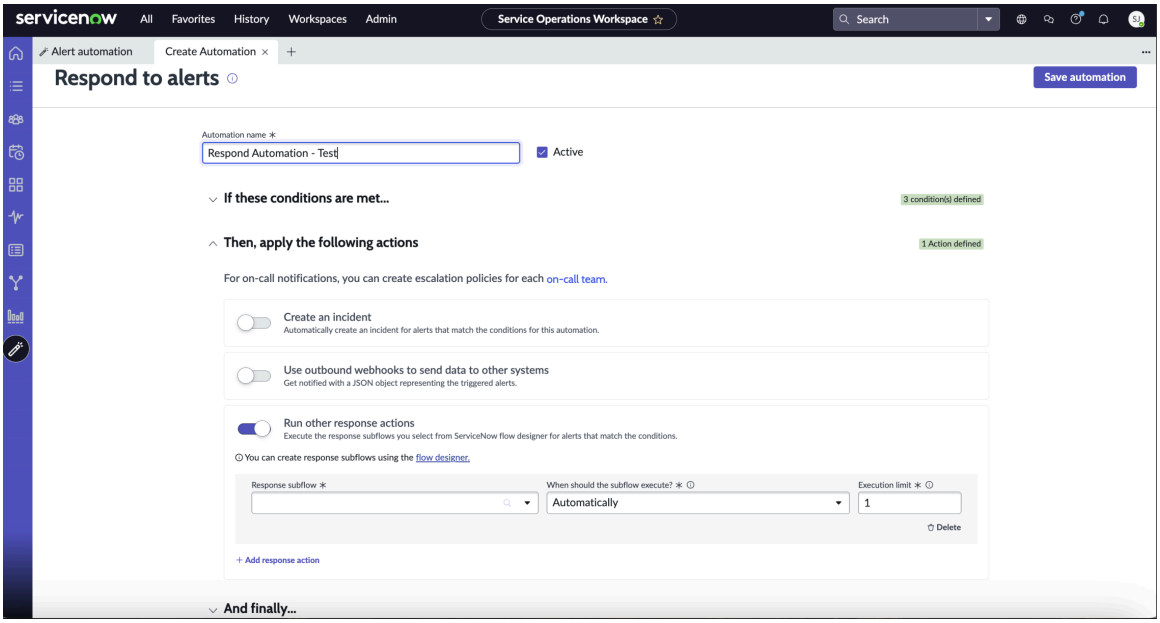
c. For the **Maintenance** field value, select whether the alert for which you want a response is under maintenance.

d. To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators.

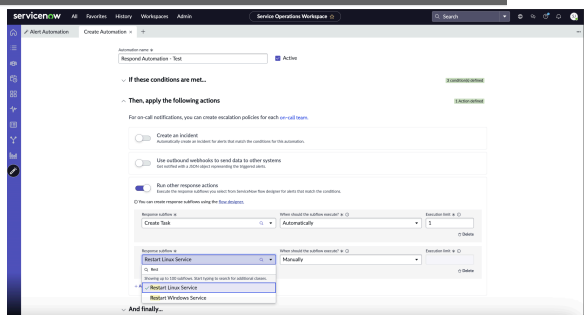
8. In the **Then, apply the following actions** section, select one or more of the three automation actions that can be triggered by the automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Action	Description
Create an incident	Creates an incident for the alerts that match the specified filter. For details on mapping the alert fields to the incident fields, see Alert field mapping on the Respond page. To include additional fields in the incident, se lect **+ Add**.
Use outbound webhooks to send data to oth er systems	Sends notifications to other systems using outbound webhooks. For example, this capa bility can be used to send a chat notification, create a case, or trigger an external runbook to remediate the issue. For details on configuring an outbound web hook, see Outbound webhook parameters. To create an additional property, select **+ Add property**. The property can be any custom key-value pair that you want to include in the webhook payload, such as "Content-Type: ap plication/json" or "Authorization: Bearer <to ken>".
Run other response actions	Executes selected subflows from Workflow Studio for alerts that match the specified con dition. For example, you may out-of-the-box subflows to restart services. You can also cre ate your own custom subflows, leveraging hundreds of integrations available in Integra tion Hub.

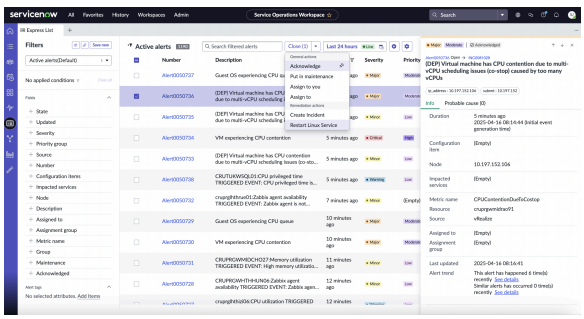
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
	


a. In the **Response subflow** field, select the subflow.

b. In the **When should the subflow execute?** field, select **Automatically**, **Manually** or **Au tomatically and Manually**.

> **Note:** If you select a subflow with an execution type of **Manually** or **Au tomatically and Manually**, and then save the automation, it appears in the Express List.



c. In the **Execution limit** field, specify the max imum number of times the subflow can run. After reaching the limit, the subflow will not execute again.

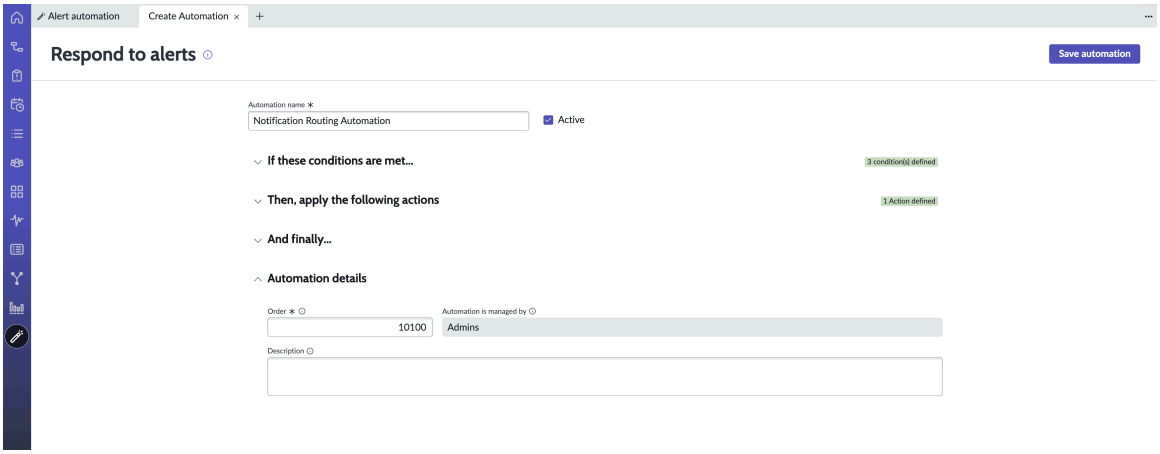
To add another response action, select **+ Add response action**.

To learn how to create your own subflow, see Create a custom subflow for alerts.

> **Note:** If you don't select at least one action, the automation is deactivated.

9. In the **And finally** section, to continue running other response automations with same filter conditions after this automation is executed, select **Run other response automations**. If you select **Don't run response automations**, additional automations of this type will stop running after this automation is executed once. If the automation is managed by an administrator, it will stop running administrator-owned automations but will continue to run automations owned by other assignment groups.
10. In the **Automation details** section, provide an order and automation description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For information on the Automation details fields, see #unique_2161.

11. Select **Save automation**.

    A notification appears when the automation is successfully saved. Otherwise, an error message is displayed.

    The response automation that you created appears on the All response automations page where you can view, edit, or delete the existing automations.

Delete an automation

Delete an automation to permanently remove an automated alert handling rule from your system.

Before you begin

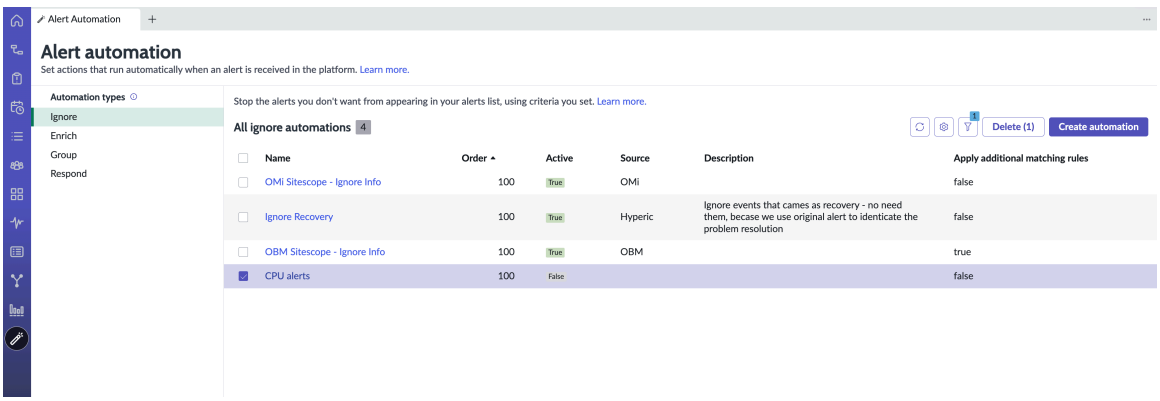
Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Alert Automation icon ( ).
3. On the Alert Automation page, under **Automation types**, select the automation type that you want to delete, such as Ignore, Enrich, Group, or Respond.

   The page for that automation type opens, displaying all the existing automations.

4. To delete an automation, select the check box next to its name and then select **Delete**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the confirmation window, select **Delete**.
   The alert is permanently deleted.

AIOps Dashboards in Service Operations Workspace for ITOM

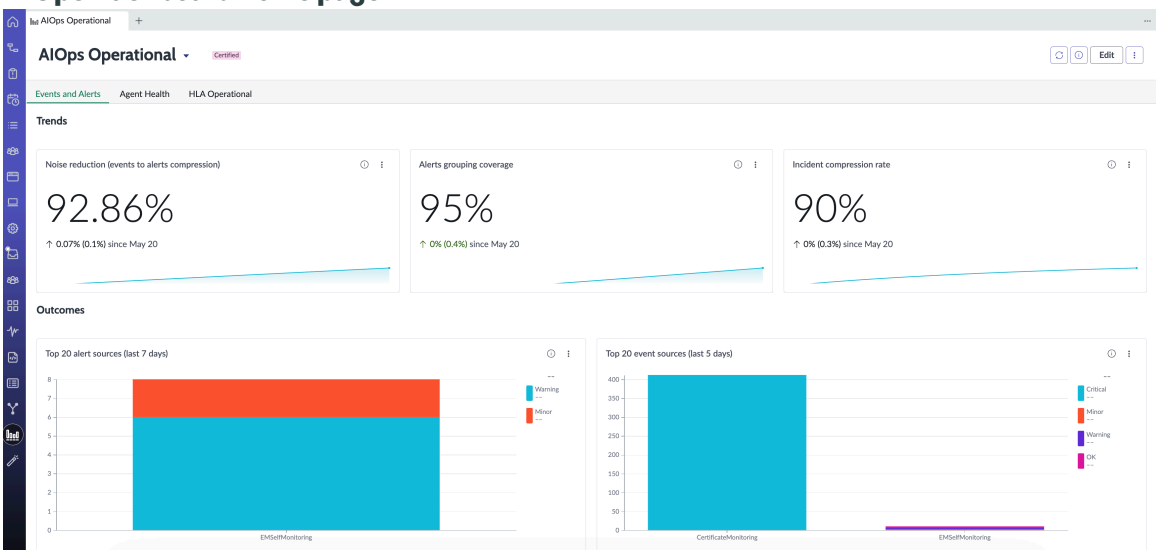
The AIOps dashboards offer comprehensive visualizations of critical operational data. You can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment. These dashboards provide actionable insights that facilitate proactive responses to potential issues.

Key benefits of using the AIOps dashboards:

- Configure the dashboards to focus on the metrics and data most relevant to your role.
- Enjoy interactive visual representations of critical operational data.
- Monitor KPIs, service health metrics, and other important performance data at a glance.
- Leverage actionable insights derived from data analysis for better decision-making.

Note: Opening a set of dashboards shows the most recently accessed dashboard in that category.

AIOps Dashboard home page



To view AIOps Operational dashboards, such as AIOps Value Realization, select the AIOps Operational list and then select the dashboard name.

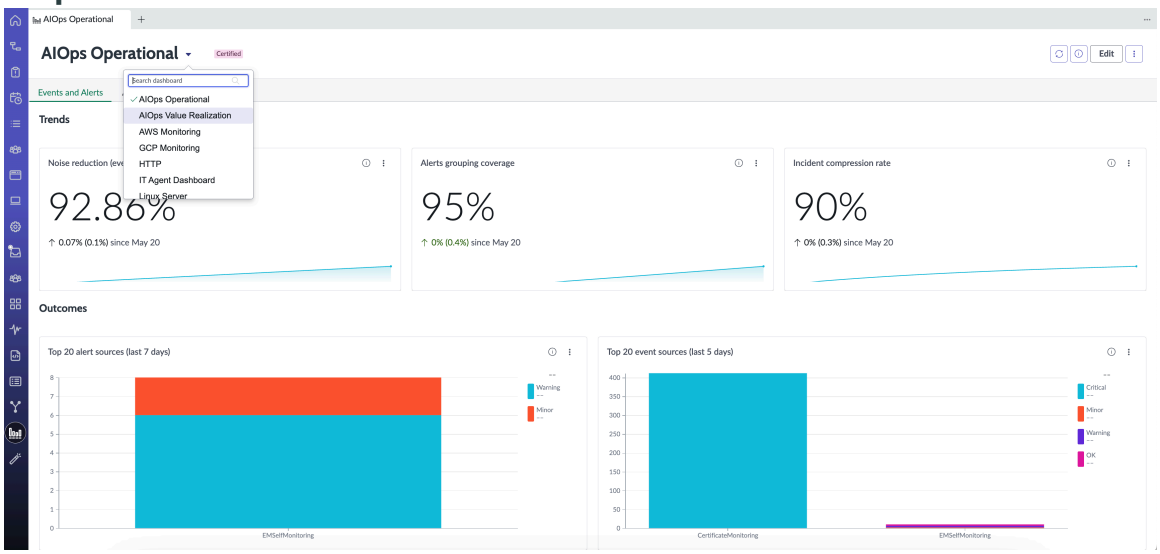
AIOps dashboard list

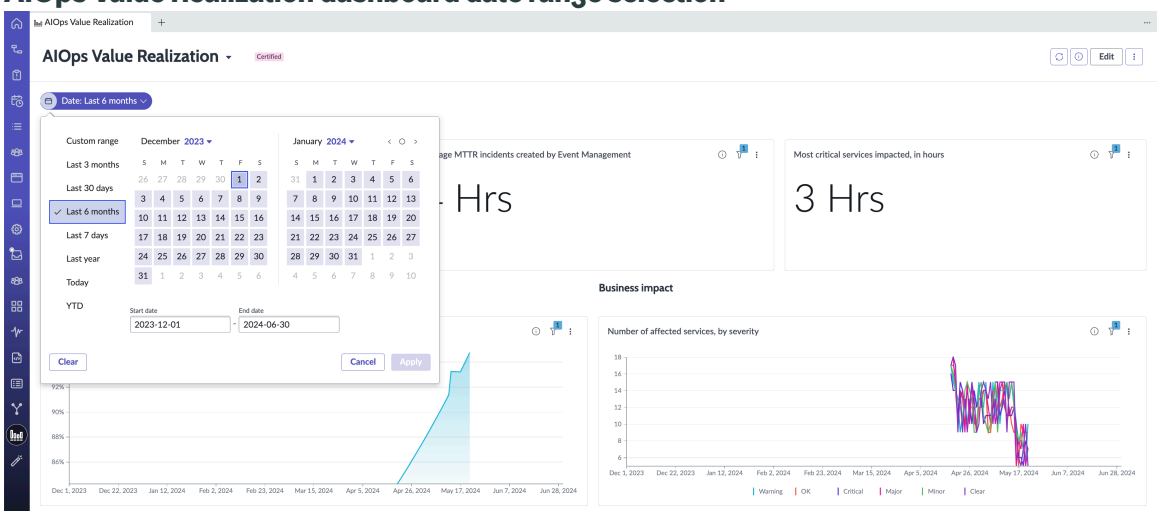


AIOps Value Realization dashboard

The AIOps Value Realization dashboard uses Performance Analytics to offer comprehensive visibility into the business outcomes of alerts, events, and incidents. It features metrics such as noise reduction (events to alerts compression), average MTTR for incidents created by Event Management[var.event-mgmt], and the most critical services impacted by hours.

The AIOps Value Realization dashboard includes a calendar feature that enables users to select various date ranges such as custom dates, the last 3 months, the last 30 days, the last 6 months, the last 7 days, the last year, today, and year-to-date (YTD). You can specify a custom start and end date and apply these selections to view reports specifically for the chosen date range. This feature facilitates tailored analysis and reporting based on specific time periods of interest.

AIOps Value Realization dashboard date range selection



The AIOps Value Realization dashboard offers key insights and metrics crucial for operational efficiency and business impact assessment. It includes features such as noise reduction to enhance focus on critical issues by reducing event-to-alert conversions. Tracking average MTTR for incidents and measuring downtime on critical services aids in improving operational efficiency and prioritizing resolutions. Categorized into Operational Excellence and Business Impact sections, the dashboard provides detailed coverage on alerts grouping, swift resolution of critical incidents reported by users, and quantifying service impacts by severity to optimize operational stability.

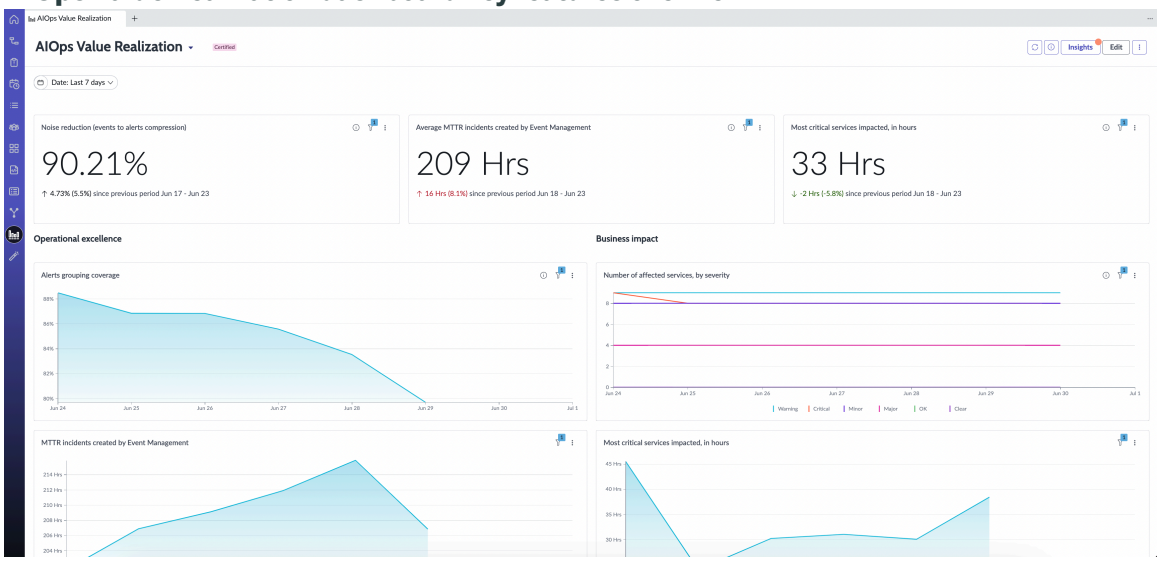
Run the [PA EM] Historic Data Collection job once to enable the partial collection of historical Event Management data:

1. Navigate to **All** > **Performance Analytics** > **Data Collector** > **Jobs**.
2. Select [PA EM] Historic Data Collection.
3. Select **Execute Now**.

AIOps Value Realization dashboard key features overview



Prerequisites

Ensure that the Event Management application is installed.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

Access the AIOps Value Realization dashboard

To open the dashboard, use one of the following methods:

- Navigate to **All** > **AIOps Dashboards** > **AIOps Value** > **Value Realization**.
- Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ), then, from the **AIOps Operational** drop-down menu, select **AIOps Value Realization**.

Use cases

For examples of how different people in your organization would use this dashboard, refer to these use cases.

User	Dashboard use
evt_mgmt_admin or admin	Edit the dashboard and grant view and share permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User	Dashboard use
evt_mgmt_operator or admin	View the dashboard and review record details to visualize and track the business impact of alerts, events, and incidents.

Breakdowns

Breakdowns available in the AIOps Value Realization dashboard are:

- Operational Excellence
- Business Impact

Reports

Title	Type	Description
Noise reduction (events to alerts compression)	Line graph	The compression rate from events to alert creation: a higher number indicates fewer alerts are being created.
Average MTTR incidents created by Event Management	Line graph	The average Mean Time to Repair (MTTR) of an incident created by Event Management: a lower number indicates greater efficiency of your IT team.
Most critical services impacted, in hours	Line graph	The total time your organization's most critical business services are impacted: a higher number indicates more time critical services are affected by open alerts.
Alerts grouping coverage	Line graph	The percentage of total alerts that are grouped: a higher number indicates more alerts are being correlated and grouped within an alert group.
Number of affected services, by severity	Line graph	The number of services impacted by alerts, grouped by severity, such as the count of services experiencing critical issues per day.
Number of new P1 incidents on monitored services created by users	Line graph	The number of incidents created on services monitored by Event Management: a lower number indicates fewer users are being impacted by a service outage or performance degradation.

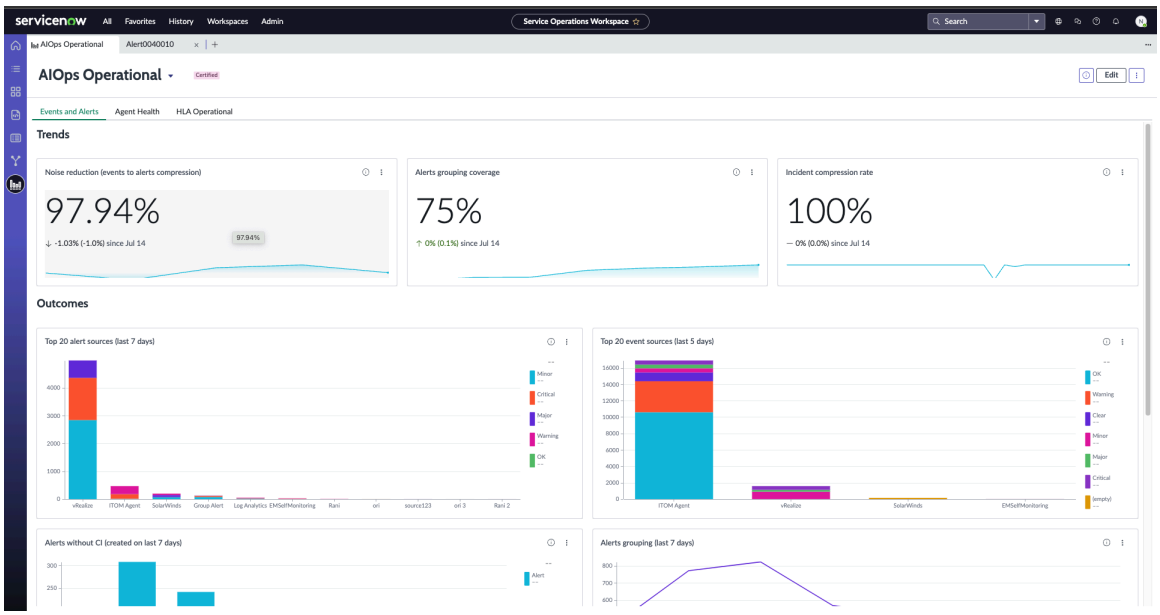
Event and Alert dashboard

The Event and Alert dashboard uses Performance Analytics to provide real-time visibility into events and alerts in Event Management, showcasing key trends, outcomes, and the most impacted configuration items. It highlights metrics such as noise reduction, alert grouping coverage, and top alert sources.



Run the [PA EM] Historic Data Collection job once to enable the partial collection of historical Event Management data:

1. Navigate to **All** > **Performance Analytics** > **Data Collector** > **Jobs**.
2. Select [PA EM] Historic Data Collection.
3. Select **Execute Now**.

Prerequisites

Ensure that the Event Management application is installed.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

Access the Events and alerts dashboard

To open the dashboard, use one of the following methods:

- Navigate to **All** > **AIOps Dashboards** > **AIOps Operational** > **Events and Alerts**.
- Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ).

  By default, the **Events and Alerts** tab is selected.

Use cases

For examples of how different people in your organization would use this dashboard, see these use cases.

User	Dashboard use
evt_mgmt_admin or admin	Edit the dashboard and grant view and share permissions.
evt_mgmt_operator or admin	View the dashboard and details of the records contained in it to visualize and track events, alerts, trends, outcomes, and the most impacted Configuration Items in your organization.

Breakdowns

Breakdowns available in the Event and Alert dashboard are:

- Trends
- Outcomes

Reports

Title	Type	Description
Noise reduction (events to alerts compression)	Line graph	The compression rate from events to alert creation. The higher the number, the fewer alerts are being created.
Alerts grouping coverage	Line graph	The percentage of alerts aggregated into grouped alerts over time.
Incident compression rate	Line graph	The percentage of alerts that did not result in incident creation. A higher percentage means more alerts were resolved without generating incidents.
Top 20 alert sources (last 7 days)	Bar chart	The number of alerts per source categorized by severity over the last 7 days.
Top 20 event sources (last 5 days)	Bar chart	The number of events per source categorized by severity over the last 5 days.
Alerts without CI (created on last 7 days)	Line graph	The number of alerts without CI binding created over the last 7 days.
Alerts grouping (last 7 days)	Bar chart	The distribution of grouped alerts over the last 7 days.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

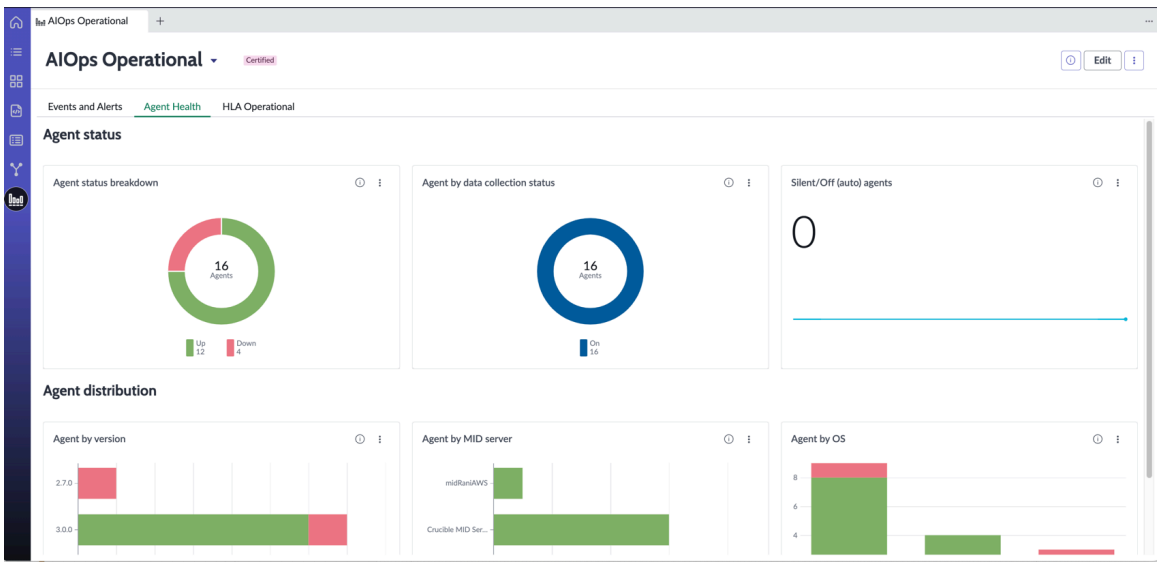
Most impacted Configuration Items

The Most Impacted Configuration Items section of the Event and Alert dashboard provides a comprehensive overview of the configuration items (CIs) that are most impacted by the issue. This section lists key details such as the name of each CI, the number of associated alerts, their classification (such as application service), and location. Additionally, it identifies the owner and support group responsible for each CI, facilitating targeted and efficient incident resolution. By highlighting the most impacted CIs, this section helps prioritize critical assets and resources, ensuring that the most significant issues are addressed promptly to maintain system stability and performance.

Agent Health dashboard

The Agent Health dashboard provides visibility into the status and distribution of agents installed in your system. It allows you to quickly assess the number of deployed agents and their distribution, helping you prioritize your work more efficiently.

The following example shows the agents in your system that are currently up, which agents are configured to collect data, and which agents have stopped data collection due to having reached their CPU threshold (Silent/Off). It also displays the agents according to their version, OS, and connected MID Server.



Prerequisites

The Agent Client Collector application must be installed.

Required ServiceNow AI Platform roles

A user must have the agent_client_collector_admin role to see all the widgets in the dashboard.

Access the Events and alerts dashboard

To open the dashboard, use one of the following methods:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Navigate to **All** > **AIOps Dashboards** > **AIOps Operational** > **Agent Health**.
- Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ) and then select the **Agent Health** tab.

- After upgrading to Discovery Admin Workspace version 1.3.1 (August 2024 Store), you can navigate to **Workspaces** > **Discovery Admin Workspace** > **Insights** and use the enhanced dashboard.

Use case

For examples of how different people in your organization would use this dashboard, see the use case in the following table.

Dashboard use case

User	Dashboard use
admin	Visibility into the status of the agents.

Breakdowns

Breakdowns available in the Agent Health are:

- Agent status: The status of the agents currently deployed in your system.
- Agent distribution: The distribution of the agents by the agent version number, the MID Server that the agent is assigned to, and the OS that the agent is working on.

Reports

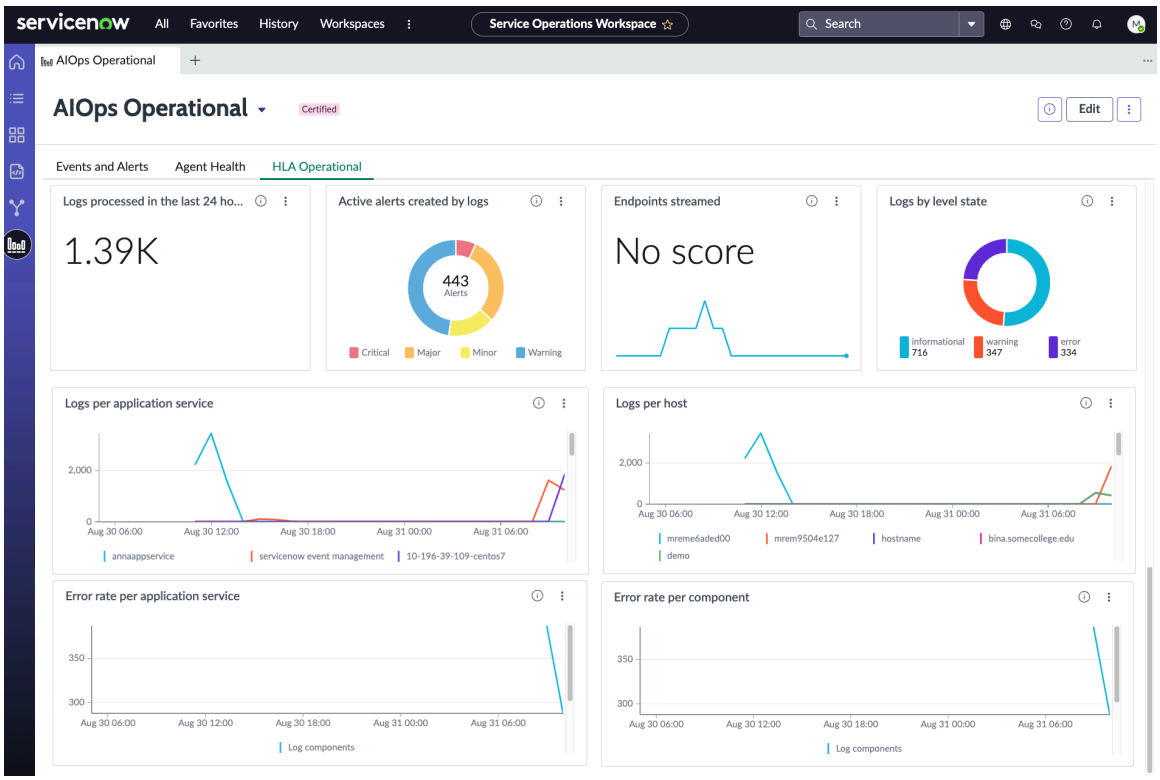
Title	Type	Description
Agent status breakdown	Pie chart	Agents deployed in your system that are up and down. Select the relevant color in the widget to display a list of up or down agents.
Agent by data collection status	Pie chart	Agents deployed in your system with data collection turned on and off. Select the relevant color in the widget to display a list of agents with data collection on or off.
Silent/Off (auto) agents	Line graph	Agents that automatically stopped collecting data after crossing the CPU usage threshold. The CPU usage threshold is configurable in the `acc.yml` configuration file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Description
		For more information on the `acc.yml` configuration file, see Configuration file options.
Agent by version	Bar chart	Breakdown of your deployed agents by their version numbers.
Agent by *MID Server*	Bar chart	Breakdown of the deployed agents according to the *MID Server* they're assigned to.
Agent by OS	Bar chart	Breakdown of your deployed agents according to the operating systems they are working on.

HLA Operational dashboard

The Health Log Analytics Operational dashboard uses Performance Analytics to enable you to monitor log data, alerts, and error rate information in Service Operations Workspace and address issues as they occur in the system.



Prerequisites

Ensure that the Health Log Analytics application is installed.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the HLA Operational dashboard

To open the dashboard, use one of the following methods:

- Navigate to **All** > **AIOps Dashboards** > **AIOps Operational** > **HLA Operational**.
- Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ), then display the HLA Operational dashboard.

Use cases

These use cases provide examples of how different people in your organization would use this dashboard.

User	Dashboard use
evt_mgmt_admin	Edits the dashboard and grants view and share permissions.
evt_mgmt_operator or evt_mgmt_admin	Monitors the dashboard to visualize and track HLA log and alerts data, error rates, and other relevant information.

Breakdowns

Breakdowns available in the HLA Operational dashboard are:

- HLA Overview
- Error rate

Reports

Title	Type	Description
Logs processed	Bar chart	The number of logs that were processed and analyzed in the selected period. By default, the dashboard visualizes log data that was ingested in the last 24 hours.
Active alerts created by logs	Table	Detailed data on all currently active alerts.
Endpoints streamed	Line graph	The number of endpoints (IPs, networks, and devices) that are streaming into Health Log Analytics, by application service.
Logs by level state	Bar chart	The severity level of the logs for the streaming sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Description
Logs per application service	Line graph	The number of logs streamed for each application service in the selected period. Monitor this data to ensure that log data is streaming as expected for each application service.
Logs per host	Line graph	The number of processed logs for each host in the selected period. Monitor this data to detect hosts that are logging more or less data than expected.
Error rate per application service	Line graph	The number of logs with errors for each application service analyzed in the selected period. Monitor this data to further investigate the errors. **Note:** Health Log Analytics automatically creates alerts for Error anomalies.
Error rate per component	Line graph	The number of logs with errors for each component analyzed in the selected period. Monitor this data to ensure that the error rate for each component is normal.

Using Service Operations Workspace for ITOM Log Analytics

View and address the alerts that Health Log Analytics generates in the Service Operations Workspace.

Take action on a Health Log Analytics alert from the Overview tab

Start the remediation process from the **Overview** tab in the Service Operations Workspace. This tab provides information on alerts, log data that is associated with the anomalous behavior, CIs that generated the triggering metric, and services that are impacted by the alerts.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_user, or evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Service Operations Workspace, select the lists icon ( ).
2. Select the appropriate list in the Alerts sublist and navigate to the desired alert or group.

   All Health Log Analytics alerts have the value **Log Analytics** in the **Source** column. The value in the **Group** column identifies the type of Log Analytics alert. See Types of Health Log Analytics alerts for a more detailed description of each type of alert or group.

   Tip: To preview an alert in the list, click its info icon ( ).

3. Select the alert number.

   The **Overview** tab displays.

4. View the section of the **Overview** tab that provides the information that you need.

   For a description of the sections and cards, see Sections and cards on the alert Overview tab in Health Log Analytics.

   Note: Because some sections on the **Overview** tab show only a portion of the information, many sections include a link that displays different or more complete information.

Sections and cards on the Overview tab for a Component-based alert

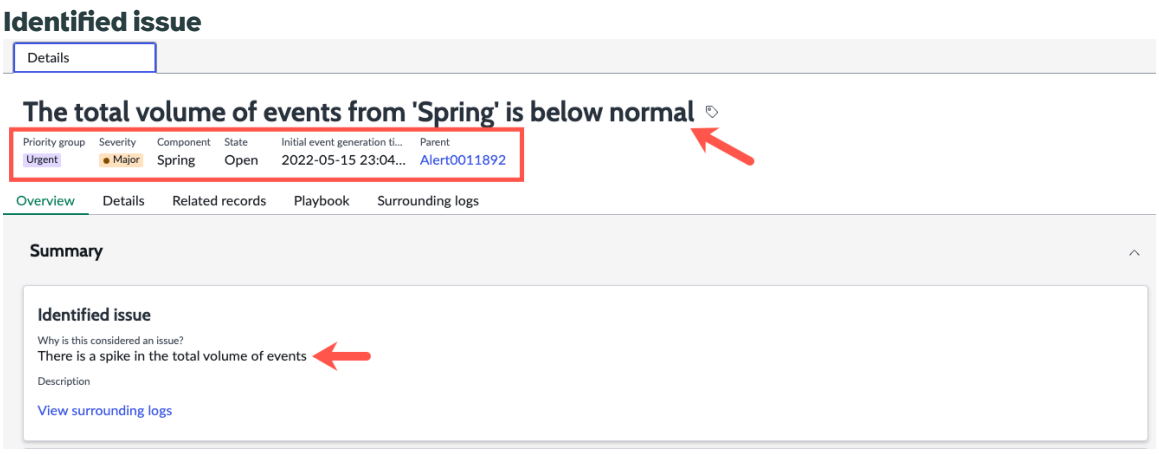
The **Overview** tab in the Service Operations Workspace helps you understand Component-based alerts.

For a detailed description of Component-based alerts, see Types of Health Log Analytics alerts.

Summary

Identified issue

This card describes the issue that led to the alert. The identified issue appears on the card and in the title for the alert. Information about the alert appears in the banner.



Select **View surrounding logs** to view log messages that are relevant to the alert. See Analyze log lines that surround an anomaly.

Anomaly

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

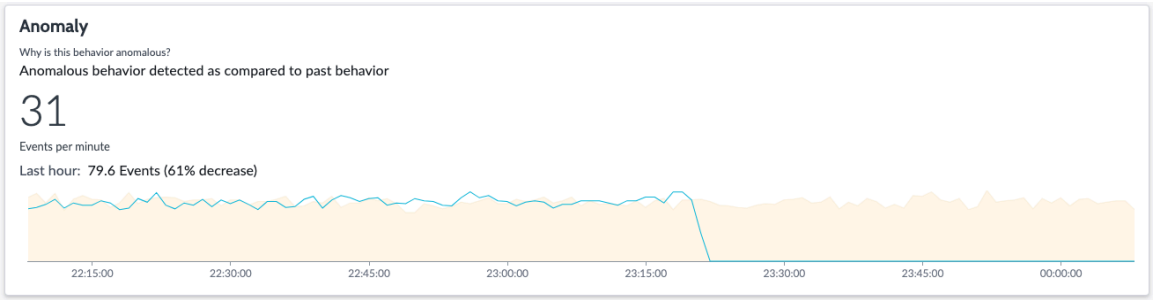
This card illustrates the anomalous activity that led to the alert.

- The blue line shows the recent anomalous activity.
- On some charts, the lightly shaded area indicates the expected (learned baseline) behavior.

  A peach-shaded area represents the baseline values for the same hour one day earlier. A pink-shaded area shows the values for the same period in the previous week.

In this example, the peach-shaded area shows the data for the same hour one day earlier. The drop in the metric value (events per minute) is clearly visible.

Anomaly card



For more information on the kinds of anomalies that you might encounter, see Types of anomalous behavior.

Impact

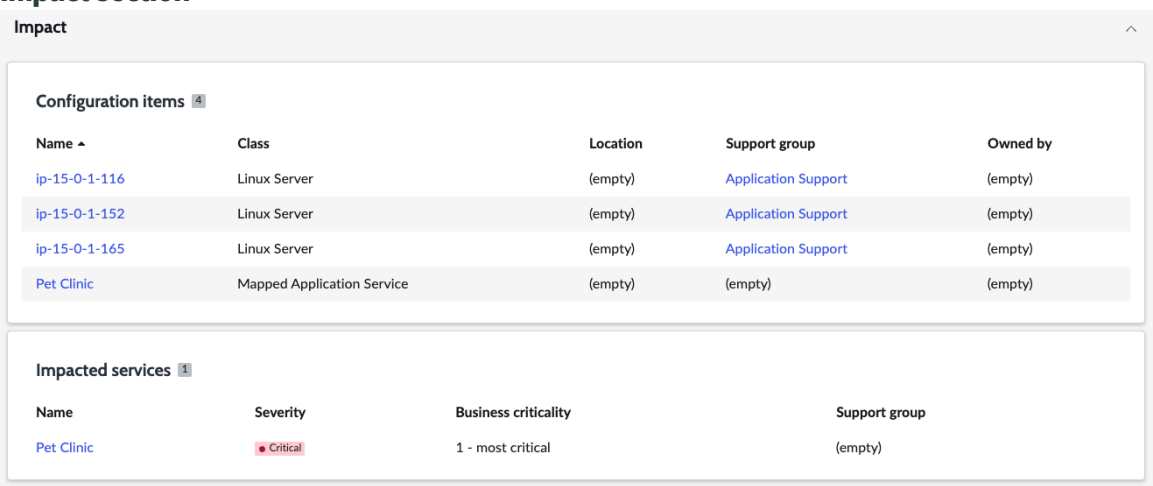
Configuration Items

This card provides information about the CIs that are impacted by the alert.

Impacted services

This card provides information about the services that are impacted by the alert.

Impact section

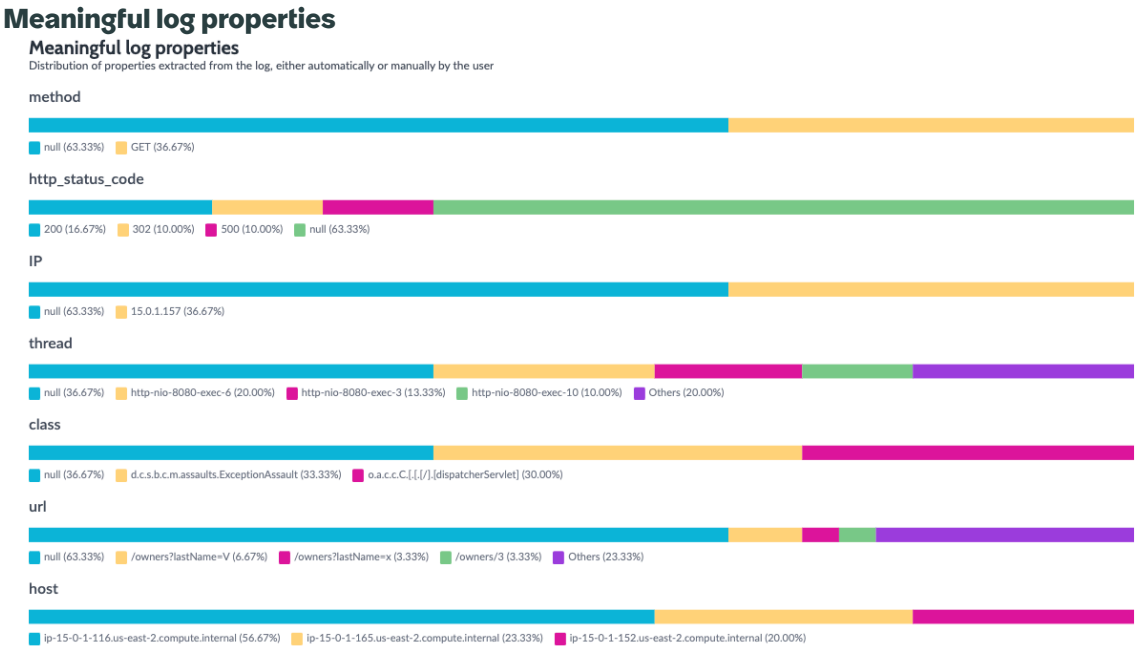


Cause

Meaningful log properties

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On this card, each bar chart shows the distribution of values for a single log property that contributed to the anomaly. Each property value is associated with a color. The length of a color bar correlates to the percentage that the property value holds in comparison with all other values for the property.



Sections and cards on the Overview tab for a Log Analytics group

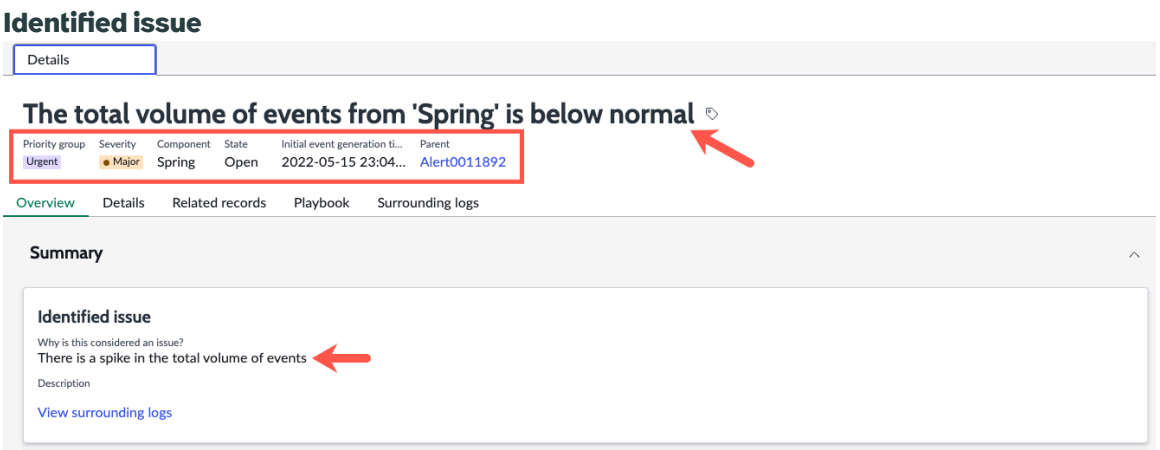
The **Overview** tab in the Service Operations Workspace helps you understand Log Analytics groups.

For a detailed description of Log Analytics groups, see Types of Health Log Analytics alerts.

Summary

Identified issue

This card describes the issue that led to the alert. The identified issue appears on the card and in the title for the alert. Information about the alert appears in the banner.



Select **View correlations** to view the list of correlations that relate the Log Analytics alerts.

Correlations list

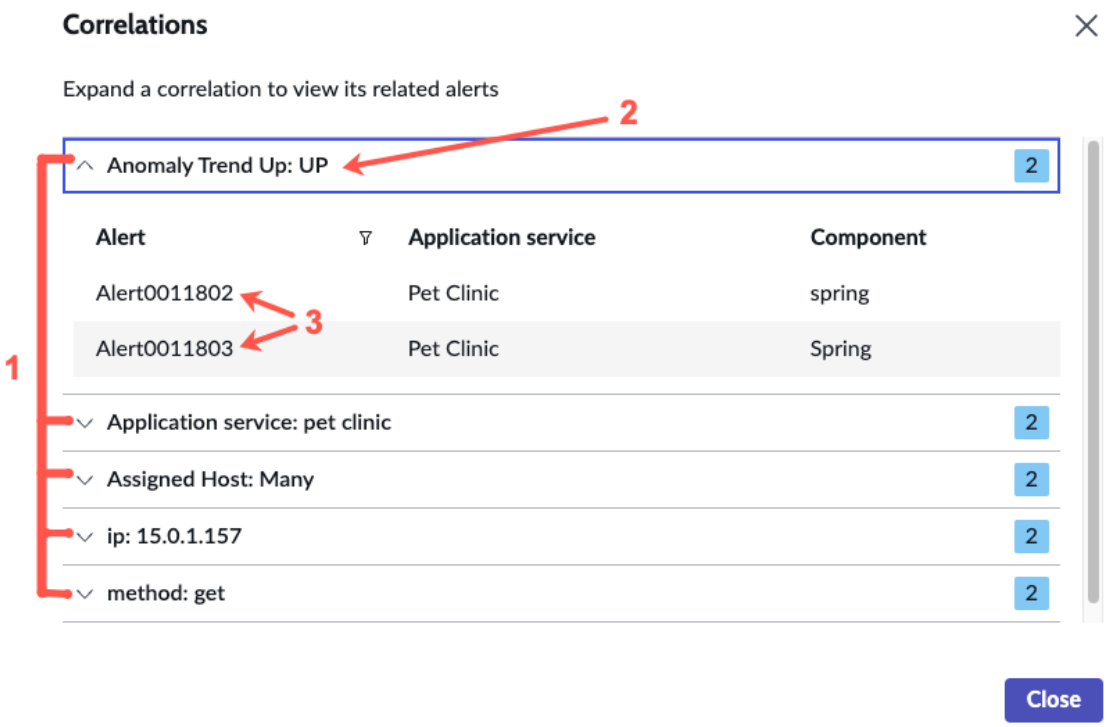
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

During initial analysis, alerts are scored. Each correlation in the alert's log data with another alert contributes to the score. The higher the score, the more likely the alert is to be included as a Log Analytics alert in a Log Analytics group.

The following kinds of data are considered when determining whether alerts are correlated:

- Time: The events all occurred within a configured time interval.
- Metadata: The alerts have matching values in log-line metadata. For example, all alerts involve the same host.
- Message text: The message text in the log data is similar or identical between alerts.
- Trend: The alerts show a similar tendency in values or rates. For example, a particular metric value is increasing in all alerts.

Correlations



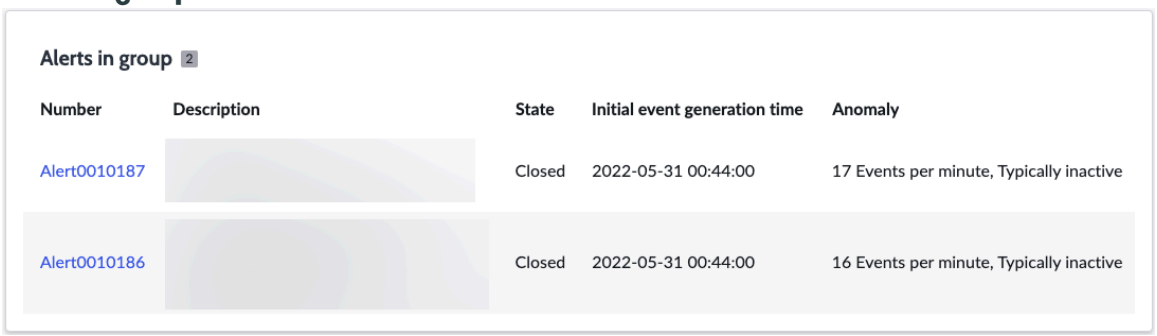
1. List of correlations: The first correlation in the list is expanded to show the individual Log Analytics alerts that are correlated and the log correlator that the alerts share.
2. An individual log correlator: The identifier for a group of correlated Log Analytics alerts. The alerts are grouped by the log-line data or metadata that is common to the alerts (for example, IP address, host name, or user name). The number in the blue square indicates the number of correlated alerts.
3. Log Analytics alerts that are correlated.

Alerts in group

For a Log Analytics alert, the Alerts in group card shows the Log Analytics alerts that are grouped under the Log Analytics alert. Select a Log Analytics alert to view its details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts in group



Select **View all** to the view the list of all Log Analytics alerts in the group and relevant information about them. You can also view the Alerts in group list by selecting the **Related records** tab and then selecting **Alerts in group**. For more information, see View the list of Log Analytics alerts in a Log Analytics group

Impact

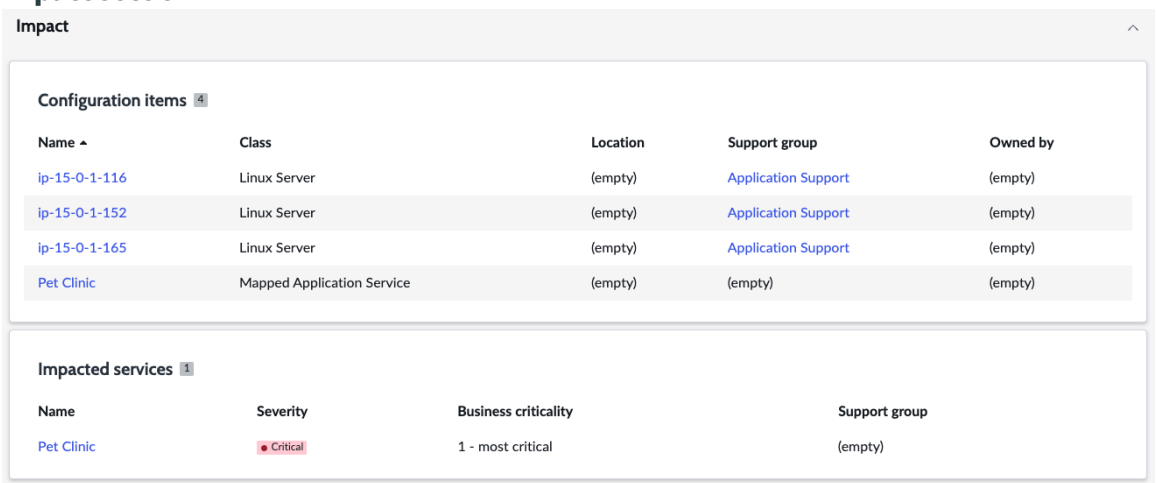
Configuration Items

This card provides information about the CIs that are impacted by the alert.

Impacted services

This card provides information about the services that are impacted by the alert.

Impact section



View the list of Log Analytics alerts in a Log Analytics group

View the list of all Log Analytics alerts in a Log Analytics group on the **Related records** tab.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_user, or evt_mgmt_admin

About this task

For a detailed description of Log Analytics groups and Log Analytics alerts, see Types of Health Log Analytics alerts.

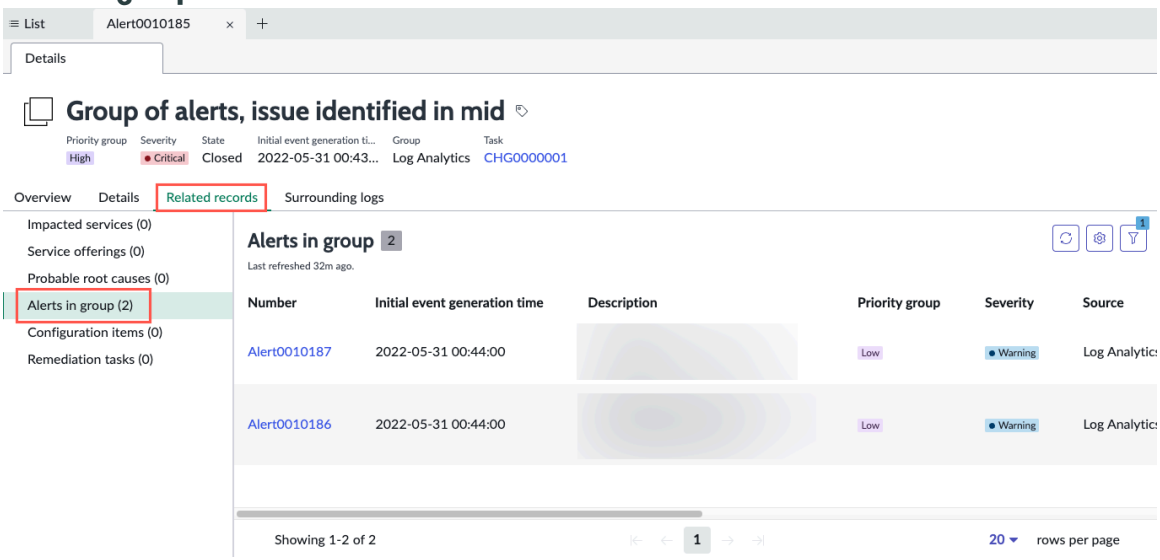
Procedure

1. On the **Overview** tab for a Log Analytics alert, go to the **Alerts in group** card and select the **View all** link.

   The **Alerts in group** section on the **Related records** tab displays.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts in group section on the Related records tab



2. For each Log Analytics alert in the Log Analytics group, the information described in the table is available.

Alerts in group

Column	Description
Number	The number of the alert. Select the number to view detailed information for an alert. This field is automatically set.
Initial event generation time	The time when the event that generated the alert first occurred. **Note:** Time here is the ServiceNow processing time, not the source system time.
Group	Type of group that the alert belongs to: a standalone Log Analytics alert or a Component-based alert.
Description	Anomalous pattern or metric that caused the alert to be generated.
Severity	Severity value for the alert. The available values are: ○ **Critical**: Immediate action is required. Either the resource is not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded.
