Cloud resource discovery references

ITOM Visibility discovers resources on cloud platforms.

Verify the REST API Permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Data collected for Amazon AWS Cloud Discovery

Discovery collects information about cloud resources in AWS datacenters. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify that the applications are up to date.

- Discovery and Service Mapping Patterns.
- CMDB CI Class Models.
- Visibility Content.

Configure a discovery schedule

Create a discovery schedule in Cloud Discovery Workspace

Verify the REST API Permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor

Label	Field name
DNS Alias [cmdb_ci_dns_alias]	
Name	name
Category	category
Status	status
DNS name [cmdb_ci_dns_name]	
Name	name
IP address	ip_address

Cloud DataBases [cmdb_ci_cloud_database]

Label	Field Name	Description
Name	name	The name of the database that you created in AWS.
Object ID	object_id	This is also the name of the database.
Type	Type	The type of database you created.
Fully qualified domain name	fqdn	The FQDN that AWS assigned to your database. An example format for AWS is as follows: `database-name.{random-number}.{datacenter}.rds.amazonaws.com`
State	state	The state of the database: whether it is Available or Terminated.
TCP port(s)	tcp_port	The TCP port that the database communicates through.
Category	category	The instance class of the database, for example: db.t2.micro.
Automated Backups	automated_backup	Indicates whether automated backups are enabled and the retention period.

Cloud WebServer [cmdb_ci_cloud_webserver]

Label	Field Name
Name	name
Install status	install_status
Vendor	vendor
Fully qualified domain name	fqdn
Operational status	operational_status
State	state

includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

How Discovery finds Microsoft Azure resources

Discovery uses the Cloud Provisioning and Governance API and Discovery and Service Mapping Patterns to find cloud resources.

Default patterns

Pattern	Description
Azure DataBase (LP)	Discovers database types of: • Microsoft.sql/servers • microsoft.sql/managedInstances • microsoft.dbformysql • microsoft.documentdb/databaseaccounts • microsoft.cache/redis • microsoft.dbforpostgresql/servers • microsoft.dbformysql/servers • microsoft.dbformysql/flexibleservers • microsoft.dbforpostgresql/flexibleservers Populates the [cmdb_ci_cloud_database] table.
Azure LoadBalancer TD	Retrieves Microsoft Azure load balancers and populates the cmdb_ci_lb_service table. This pattern is only used by Service Mapping for top-down discovery, not by the Discovery application for horizontal discovery.
Azure WebSite (LP)	Retrieves Microsoft Azure web servers and populates the Cloud WebServers [cmdb_ci_cloud_webserver] and IP address [cmdb_ci_ip_address] tables.

Data collected by Discovery during horizontal discovery

- CMDB CI Class Models.
- Visibility Content.

Configure a discovery schedule

Create a discovery schedule in Cloud Discovery Workspace

Verify the REST API Permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Load balancers

Data collected for load balancers

Table	Field Name / Description
Cloud Load Balancer [cmdb_ci_cloud_load_balancer]	**object_id**: The load balancer's unique identifier.
	name: Name of the load balancer.
	fqdn: Address (Host name) of the load balancer. This is the fully qualified domain name of the load balancer.
	dns_name: Address (Host name) of the load balancer.
	short_description: Description of the load balancer.
	operational_status: The operational status of the load balancer, either **ONLINE** or **OFFLINE**.
	location: References the load balancer's location with type.
	state: Provisioning status of the load balancer, either **Available** or **Terminated**.
Load Balancer Service [cmdb_ci_lb_service]	**object_id**: Unique identifier of the load balancer service.
	name: Name created by the pattern that contains the following: • Load balancer name • Protocol • Port • Resource type: **-listener**
	port: Listener's protocol port number.
	front_end_port: Listener's protocol port number.
	listener_protocol: Listener's protocol, either **TCP**, **HTTP**, or **HTTPS**.

Data collected for load balancers (continued)

Table	Field Name / Description
	operational_status: The provisioning status of the listener.
Load Balancer Pool [cmdb_ci_lb_pool]	**object_id**: Unique identifier of the load balancer pool.
	name: Name created by the pattern that contains the following: • Load balancer name • Protocol • Port • Resource type: **-pool**
	port: Protocol port of the back end.
	pool_status: Provisioning status of a load balancer pool.
	load_balancing_method: Method used to load balance the pool.
Load Balancer Pool Member [cmdb_ci_lb_pool_member]	**object-id**: Unique identifier of the pool member, created from the ID of the member and the listener ID.
	name: Name created by the pattern that contains the following: • Load balancer name • Protocol • Port • Resource type: **-member** • IP address of the pool member
	ip_address: IP address of a load balancer member.
	server_id: ID of the member in the IBM Cloud.
	load_balancer: Name of the related load balancer.
Load Balancer Health Service [cmdb_ci_lb_health_service]	**object_id**: Unique identifier of the healthservice check.
	name: Name created by the pattern that contains the following: • Load balancer name • Protocol • Resource type: **Health Check** • Resource ID
	monitor_type: Type of health check. Valid values are **TCP**, **HTTP**, or **HTTPS**.

IBM Cloud storage

Data collected for IBM Cloud storage

Table	Fields
Storage Volume [cmdb_ci_storage_volume]	• **object_id**: Unique identifier of the storage account. • **size**: Capacity of the storage account, measured in gigabytes. • **size_bytes**: Capacity of the storage account, measured in bytes. • **name**: Username used to access a non-EVault Storage volume. This username is used to register the EVault server agent with the vault backup system. • **label**: Network resource name for the storage. • **storage_type**: Description of the storage object. • **fqdn**: IP address of the storage resource. • **device**: Unique identification number of the guest associated with the storage volume.
Storage Volume Snapshot [cmdb_ci_storage_vol_snapshot]	• **object_id**: Unique identifier of the storage account. • **name**: Name of the storage's network resource. • **capacity**: The volume's configured snapshot space size. • **fqdn**: IP address of the storage resource. • **location**: Unique availability zone where the storage volume is located.

Relationships created for IBM Cloud storage

cmdb_ci_availability_zone	Contains::Contained by	cmdb_ci_storage_volume

IBM Cloud virtual servers

Data collected for IBM Cloud virtual servers

Table	Fields

Virtual Machine Instance [cmdb_ci_vm_instance]	• **name**: Name of the virtual machine.
	• **object_id**: ID of the virtual machine.
	• **dns_domain**: Domain of the virtual machine.
	• **fqdn**: IP address of the virtual machine.
	• **short_description**: Notes attached to the virtual machine on the IBM console.
	• **cpus**: Number of CPUs on the virtual machine.
	• **memory**: Amount of memory on the virtual machine.
	• **disks**: Number of disks used by the virutal machine.
	• **state**: The running state of the virtual machine. The choices are:
	  ○ **Running**
	  ○ **Halted**
	• **placement_group_id**: Name of the IBM placement group containing the virtual machine.
	• **nics**: Number of network interfaces on the virtual machine.

Cloud Mgmt Network Interface [cmdb_ci_nic]	• **name**: Name and port of the NIC, in the format **<name><port>**. • **ip_address**: IP address configured on the NIC. • **mac_address**: MAC address of the NIC. • **netmask**: Netmask of the NIC. • **object_id**: ID of the NIC. • **status**: State of the NIC - AVAILABLE.

Data collected for IBM Cloud virtual servers (continued)

Table	Fields
Image [cmdb_ci_os_template]	• **name**: Long description of the template. For example: **CentOS 7.0-64 Minimal for VSI**. • **version**: Operating system version. For example, **7.0-64 Minimal for VSI**. • **object_id**: ID of the image. • **guest_os**: Operating system of the virtual machine, such as Windows, Ubuntu, or CentOS.
Cloud Key Pair [cmdb_ci_cloud_key_pair]	• **name**: The key label. • **object_id**: ID of the key.
Compute Security Group [cmdb_ci_compute_security_group]	• **name**: Security group name. • **object_id**: ID of the security group • **short_description**: Security group notes.
Storage Volume [cmdb_ci_storage_volume]	**object_id**: The storage volume ID.

cmdb_ci_ibm_datacenter	Hosts::Hosted on	cmdb_ci_network

Data collected for VMware Cloud Discovery

Discovery collects information about VMware resources in your cloud service accounts.

Distributed Resource Scheduler (DRS) discovery

VMware Discovery collects these DRS settings and saves them to the DRS VM Config [cmdb_ci_drs_vm_config] table:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- DRS settings of vCenter clusters.
- DRS settings of VMs configured to override cluster behavior.

DRS VM Config [cmdb_ci_drs_vm_config]

Field label and Name	Description
Cluster [cluster]	The vCenter cluster that the VM belongs to.
DRS behavior [drs_behavior]	The VM-level Distributed Resource Scheduler behavior that overrides cluster defaults.
DRS enabled [drs_enabled]	Indicates whether DRS is active for the VM.
Virtual machine [virtual_machine]	The VM instance using these DRS settings.

VMware tags

VMware Cloud Discovery finds VMware tags from vCenter and saves them to the Key Value [cmdb_key_value] table.

Key Values [cmdb_key_value]

Field label and Name	Description
Configuration item [configuration_item]	Referenced VM with tag attached in vCenter.
Key [key]	Category name of the tag applied to the resource in vCenter.
Tag [tag]	Source in vCenter from which tags are fetched. In this case, the value is always **Tags**.
Value [value]	Tag name that's applied to the resource in vCenter.

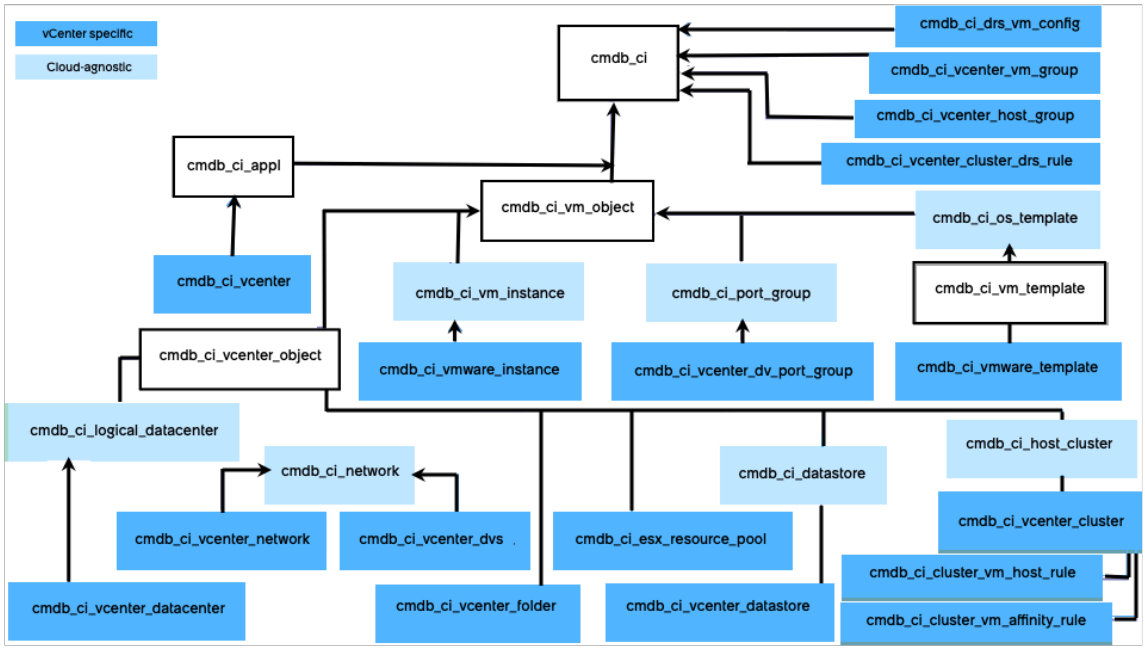
Data collected for VMware vCenter Server

Discovery identifies and classifies information and data about VMware vCenter servers.

The vCenter table schema is illustrated in the following diagram:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vCenter table schema



Several tables are cloud-agnostic tables, meaning that they can be populated for any cloud resource, not just vCenter resources. Look in the sub tables that extend the cloud-agnostic tables to find discovered configuration items (CIs).

Cloud-agnostic table	Look in this vCenter-specific table
Virtual Machine Instance [cmdb_ci_vm_instance]	VMware Virtual Machine Instance [cmdb_ci_vmware_instance]
Operating System Template [cmdb_ci_os_template]	VMware Virtual Machine Template [cmdb_ci_vmware_template]
Logical Datacenter [cmdb_ci_logical_datacenter]	VMware vCenter Datacenter [cmdb_ci_vcenter_datacenter]
Cloud Networks [cmdb_ci_network]	VMware vCenter Network [cmdb_ci_vcenter_network]
Datastore [cmdb_ci_datastore]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]
Host Cluster [cmdb_ci_host_cluster]	VMware vCenter Cluster [cmdb_ci_vcenter_cluster]

vCenter data

Discovery uses multiple vCenter probes to collect this data from vCenter. The data is saved in tables extend from the Configuration item [cmdb_ci] table.

VMware vCenter Instance [cmdb_ci_vcenter]

Field label and Name	Description
Name [name]	The display name of the vCenter instance.
IP Address [ip_address]	The IP address of the vCenter server.
API version [api_version]	The version of the vCenter API in use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMware vCenter Instance [cmdb_ci_vcenter] (continued)

Field label and Name	Description
Full name [fullname]	The full vCenter instance name returned by VMware.
Instance UUID [instance_uuid]	A unique identifier assigned to the vCenter instance.
URL [url]	The endpoint URL used to connect to vCenter.
Fully qualified domain name [fqdn]	The fully qualified domain name of the vCenter server.

The combination of the vCenter instance in the cmdb_ci_vcenter table and the object ID in the cmdb_ci_vm_object table identifies a specific vCenter.

The tables extend from the Virtual Machine Objects [cmdb_ci_vm_object] table, which holds object IDs for all cloud-based resources, except virtualization servers.

DRS VM Config [cmdb_ci_drs_vm_config]

Field label and Name	Description
Cluster [cluster]	The vCenter cluster that the VM belongs to.
DRS behavior [drs_behavior]	The VM-level Distributed Resource Scheduler behavior that overrides cluster defaults.
DRS enabled [drs_enabled]	Indicates whether DRS is active for the VM.
Virtual machine [virtual_machine]	The VM instance using these DRS settings.

This table stores DRS behavior for the VMs that override the cluster behavior. For more information on DRS, see VMware's documentation on Distributed Resource Scheduler.

VMware vCenter VM Group [cmdb_ci_vcenter_vm_group]

Field label and Name	Description
Cluster [cluster]	The cluster that this VM group is associated with.

The VMware vCenter VM group [cmdb_ci_vcenter_vm_group] table has Contains::Contained by relationship with cmdb_ci_vmware_instance. This group has a set of VMs.

VMware vCenter Host Group [cmdb_ci_vcenter_host_group]

Field label and Name	Description
Cluster [cluster]	The cluster that this host group belongs to.

The VMware vCenter Host Group [cmdb_ci_vcenter_host_group] table has Contains::Contained by relationship with cmdb_ci_vmware_instance. This group has a set of hosts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMware vCenter Cluster DRS Rule [cmdb_ci_vcenter_cluster_drs_rule]

Field label and Name	Description
Rule UUID [rule_uuid]	Unique identifier for the DRS rule in vCenter.
Active [active]	Whether the rule is currently enforced.
Cluster [cluster]	The cluster that the rule applies to.

VMware Virtual Machine Instance [cmdb_ci_vmware_instance]

Field label and Name	Description
Name [name]	VM name as discovered from vCenter.
Template [template]	Indicates whether this VM is based on a template.
CPUs [cpus]	Number of assigned virtual CPUs.
Disks [disks]	Number of virtual disks attached to the VM.
Disks size (GB) [disks_size]	Combined size of all VM disks.
Memory (MB) [memory]	Memory allocated to the VM.
Network adapters [nics]	Number of virtual NICs attached.
Image path [image_path]	Path to the VM's image on the datastore.
State [state]	Current VM power or operational state.
vCenter Instance UUID [vcenter_uuid]	Unique ID of the vCenter instance managing this VM.
vCenter Reference [vcenter_ref]	Reference to the vCenter record in CMDB.
BIOS UUID [bios_uuid]	Hardware-level VM UUID from VMware.
VM Instance UUID [vm_instance_uuid]	VMware-provided VM unique ID.
IP address [ip_address]	Primary IP detected for the VM.

VMware Distributed Virtual Port Groups [cmdb_ci_vcenter_dv_port_group]

Field label and Name	Description
Name [name]	Name of the port group.
vCenter Instance UUID [vcenter_uuid]	vCenter instance that manages this port group.
Distributed Virtual Switch Reference [dvs_ref]	Reference to the switch that the port group belongs to.

VMware Virtual Machine Template [cmdb_ci_vmware_template]

Field label and Name	Description
Name [The template name from VMWare.]	Template name in vCenter.
CPUs [cpus]	Number of CPUs assigned when deployed.
Disks size (GB) [disks_size]	Disk size of the template.
Guest ID [guest_id]	VMware guest OS identifier.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMware Virtual Machine Template [cmdb_ci_vmware_template] (continued)

Field label and Name	Description
Memory (MB) [memory]	Allocated template memory.
Image path [image_path]	Path to the template image.
vCenter Instance UUID [vcenter_uuid]	vCenter instance where the template resides.
vCenter Reference [vcenter_ref]	CMDB reference to vCenter record.
Network adapters [nics]	Number of NICs defined in the template.
Base name [base_name]	The base name used for naming VMs created from this template.
VM namer [vm_namer]	VMware auto-naming method for derived VMs.
BIOS UUID [bios_uuid]	Template UUID.
VM Instance UUID [vm_instance_uuid]	Unique template instance ID.

VMware vCenter Object [cmdb_ci_vcenter_object]

Field label and Name	Description
Managed object reference ID [morid]	Unique Managed Object Reference ID in vCenter.
vCenter Instance UUID [vcenter_uuid]	vCenter that owns this object.
vCenter Reference [vcenter_ref]	CMDB reference to the vCenter record.

VMware vCenter Datacenter [cmdb_ci_vcenter_datacenter]*

Field label and Name	Description
Region [region]	Geographic or logical region of the datacenter.
Managed object reference ID [morid]	VMware Managed Object Reference ID.
vCenter Instance UUID [vcenter_uuid]	vCenter that manages this datacenter.
vCenter Reference [vcenter_ref]	CMDB reference back to vCenter.
Top-level folder for VMs [folder_moreid]	Top-level folder where VMs reside.
Top-level folder for hosts [host_morid]	Top-level folder for hosts.

*The VMware vCenter Datacenter [cmdb_ci_vcenter_datacenter] table is extended from the [cmdb_ci_logical_datacenter] table.

VMware vCenter Network [cmdb_ci_vcenter_network]*

Field label and Name	Description
Managed object reference ID [morid]	Object reference ID in vCenter.
vCenter Instance UUID [vcenter_uuid]	Parent vCenter instance.
vCenter Reference [vcenter_ref]	CMDB reference to vCenter.
Network accessible by either hosts or virtual machines [accessible]	Whether hosts or VMs can connect to the network.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

*The VMware vCenter Network [cmdb_ci_vcenter_network] table is extended from the [cmdb_ci_network] table.

VMware Distributed Virtual Switch [cmdb_ci_vcenter_dvs]

Field label and Name	Description
VMCount [vm_count]	Number of VMs attached to the switch.
Host count [host_count]	Number of ESXi hosts connected.

VMware vCenter Folder [cmdb_ci_vcenter_folder]

Field label and Name	Description
Managed object reference ID [morid]	VMware folder identifier.
vCenter Instance UUID [vcenter_uuid]	vCenter managing the folder.
vCenter Reference [vcenter_ref]	CMDB reference to vCenter.
Full path [fullpath]	Full folder hierarchy path.

ESX Resource Pool [cmdb_ci_esx_resource_pool]

Field label and Name	Description
Managed object reference ID [morid]	VMware Managed Object Reference ID.
vCenter Instance UUID [vcenter]	vCenter that manages this pool.
vCenter Reference [vcenter_ref]	CMDB reference.
Owner [owner]	The VM or host that owns the pool.
Owner Managed Object Reference ID [owner_morid]	Managed Object Reference of the owner.
CPU expandable [cpu_expandable]	Whether CPU resources can exceed limits.
CPU limit (MHz) [cpu_limit_mhz]	Max CPU allocation in MHz.
CPU reserved (MHz) [cpu_reserved_mhz]	CPU reserved for the pool.
CPU shares [cpu_shares]	CPU scheduling weight.
Full path [fullpath]	Location path in vCenter hierarchy.
Memory expandable [mem_expandable]	Whether memory can exceed the configured maximum.
Memory limit (MB) [mem_limit_mb]	Memory limit in MB.
Memory reserved (MB) [mem_reserved_mb]	Memory guaranteed for the pool.
Memory shares [mem_shares]	Memory scheduling weight.

VMware vCenter Datastore [cmdb_ci_vcenter_datastore]

Field label and Name	Description
Managed object reference ID [morid]	ID of the datastore in vCenter.
vCenter Instance UUID [vcenter_uuid]	Parent vCenter ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMware vCenter Datastore [cmdb_ci_vcenter_datastore] (continued)

Field label and Name	Description
Accessible [accessible]	Indicates if hosts can access it.
vCenter Reference [vcenter_ref]	CMDB reference.
Type [type]	Filesystem type (NFS, VMFS, etc.).
Capacity (GB) [capacity]	Total datastore capacity.
Free space (GB) [freespace]	Remaining space.
URL [url]	Unique locator.
Clustered [clustered]	Whether it belongs to a storage pod.

The VMware vCenter Datastore [cmdb_ci_vcenter_datastore] table is extended from the [cmdb_ci_datastore] table.

VMware vCenter Cluster [cmdb_ci_vcenter_cluster]*

Field label and Name	Description
Managed object reference ID [morid]	Cluster ID.
vCenter Instance UUID [vcenter_uuid]	Parent vCenter ID.
Effective hosts [effectivehosts]	Number of functioning hosts.
vCenter Reference [vcenter_ref]	CMDB reference.
Effective CPU [effectivecpu]	Available CPU capacity.
Effective memory [effectivememory]	Available RAM.
Number of effective hosts [effectivehosts]	Count of hosts contributing resources.
Number of hosts [numhosts]	Total hosts.
Total CPU [totalcpu]	Total CPU capacity.
Total memory [totalmemory]	Total memory.
Number of CPU cores [numcpucores]	Total core count.
Number of CPU threads [numcputhreads]	Total thread count.
DRS Behavior [drs_behavior]	Cluster-level DRS settings.
DRS Enabled [drs_enabled]	Whether DRS is active.
DRS VMotion Rate [drs_vmotion_rate]	vMotion automation aggressiveness level.

*The VMware vCenter Cluster [cmdb_ci_vcenter_cluster] table is extended from the [cmdb_ci_host_cluster] table.

Cluster VM Host Rule Info [cmdb_ci_cluster_vm_host_rule]

Field label and Name	Description
VM Group [vm_group]	VM group to which the rule applies.
Host Group [host_group]	Host group associated with the rule.

© 2026 ServiceNow, Inc. All rights reserved.

Cluster VM Host Rule Info [cmdb_ci_cluster_vm_host_rule] (continued)

Field label and Name	Description
Mandatory [mandatory]	Indicates whether the rule must be strictly enforced.
Affinity [affinity]	Whether VMs must run together or be separated.

Cluster VM Affinity Rule Info [cmdb_ci_cluster_vm_affinity_rule]

Field label and Name	Description
Affinity [affinity]	Defines whether grouped VMs must stay together.

The Cluster VM Affinity Rule Info [cmdb_ci_cluster_vm_affinity_rule] table has Contains::Contained by relationship with cmdb_ci_vmware_instance. This group has a set of VMs for which this affinity is applied.

VMWare Distributed Virtual Switch [cmdb_ci_vcenter_dvs]

Field label and Name	Description
Name [name]	The name of the distributed virtual switch as defined in vCenter.
VMCount [vm_count]	The number of virtual machines currently connected to this distributed switch.
Host count [host_count]	The number of ESXi hosts participating in this distributed switch.

Discovery also maps the relationships to VMs and to distributed virtual port groups.

VMware Distributed Virtual Port Group [cmdb_ci_vcenter_dv_port_group]

Field label and Name	Description
Name [name]	The name of the port group that provides network configuration for connected VMs.
vCenter Instance UUID [vcenter_uuid]	The VMware-generated UUID of the vCenter instance that manages this port group.
Distributed Virtual Switch Reference [dvs_ref]	The switch to which this port group belongs.

Discovery also maps the relationship to the distributed virtual switch.

You can add these related lists to view additional discovered data:

- **Storage Volumes**

  The virtual disks for this virtual machine. This data is saved in the Storage Volume [cmdb_ci_storage_volume] table with the value `type=v Disk`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Volume [cmdb_ci_storage_volume]

Field label and Name	Description
Name [name]	Name of the storage volume.
Size [size]	Size of the disk/volume.

- **Network Adapters**

  The virtual network adapters for the virtual disks. This data is saved in the Network Adapter [cmdb_ci_network_adapter] table.

Network Adapter [cmdb_ci_network_adapter]

Field label and Name	Description
Name [name]	NIC name.
IP Address [ip_address]	Assigned IP.
MAC address [mac_address]	NIC MAC address.
Netmask [netmask]	Subnet mask.

vCenter discovery with Software Asset Management

If Software Asset Management is active, Discovery populates these vCenter tables using the VMWare - vCenter ESX Hosts License probe.

VMWare License Key [samp_vmware_license_key]

Field label and Name	Description
vCenter Reference [vcenter_ref]	The reference link to the vCenter instance that owns this license.
Cost Unit [cost_unit]	The unit used by VMware to measure license cost.
Edition [edition]	The edition level of the VMware product.
Features [features]	The list of capabilities enabled by this license.
License Key [license_key]	The VMware-issued alphanumeric software license key.
Product Name [product_name]	The VMware product that the license applies to.
Product Version [product_version]	The version of the licensed product.
Rights Owned [rights_owned]	Total entitlements purchased under this license.
Rights Used [rights_used]	Entitlements currently consumed by vCenter hosts.

VMWare License Key Usage [samp_vmware_license_key_usage]

Field label and Name	Description
Rights Used [rights_used]	Number of license units currently in use.
Expiration Date [expiration_date]	The date the license expires.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMWare License Key Usage [samp_vmware_license_key_usage] (continued)

Field label and Name	Description
Used Features [used_features]	The specific product features being used.
License Key [license_key]	The license key to which this usage record applies.
Software Install [software_install]	The installation record tied to the consumed license.
Used By [used_by]	The asset or component consuming the license.

vCenter relationships

Discovery automatically creates relationships for vCenter components using data from a key class. Subsequent discoveries use the same key class to automatically validate and remove relationships that are no longer valid.

vCenter CIs can be members of folders or clusters, which affect how Discovery creates their relationships.

- If a CI is in a folder, Discovery creates a relationship between that CI and the folder. If that CI isn't in a folder, Discovery creates the relationship between the CI and the datacenter. These vCenter CIs can be in a folder:
  - VM Instance
  - VM Template
  - vCenter Network
  - Datastore
  - vCenter Folder
  - vCenter Cluster
- If an ESX server is in a cluster, Discovery creates a relationship between the ESX server and the cluster. If an ESX server isn't a member of a cluster, then Discovery creates a relationship to the datacenter.
- If a resource pool is in a cluster, Discovery creates a relationship between the resource pool and the cluster. If the resource pool isn't a member of a cluster, then Discovery creates a relationship to the ESX server.

Parent class	Relationship type	Child class

VMware tags

You can attach tags to vSphere objects, such as virtual machines, through the vSphere interface. The tags can then be grouped into categories. Objects with tags are sortable and searchable based on the parameters that you give the tags and categories. The VMWare — vCenter VM Tags probe discovers these tags. You can view the discovered tags by opening the virtual machine record in **cmdb_ci_vmware_instance**. Then go to the **Key Values** tab.

Key Values [cmdb_key_value]

Field label and Name	Description
Configuration item [configuration_item]	Referenced VM with tag attached in vCenter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key Values [cmdb_key_value] (continued)

Field label and Name	Description
Key [key]	Category name of the tag applied to the resource in vCenter.
Tag [tag]	Source in vCenter from which tags are fetched. In this case, the value is **Tags**.
Value [value]	Tag name that's applied to the resource in vCenter.

Datastore data collected by Discovery

Discovery identifies each datastore in the system and creates the relationships with the virtual machines and the ESX servers that use these datastores. Discovery uses the VMWare - vCenter Datastores probe to collect this data.

Field label and Name	Table Name	Description
Accessible [accessible]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]	Whether the datastore is collected or not
Capacity (GB) [capacity]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]	Amount of space provided by the datastore.
Clustered [clustered]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]	When the datastore is clustered (belongs to a storage pod).
Free space (GB) [freespace]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]	Amount of space still available on the datastore.
Type [type]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]	The type of file system volume, such as WFS or NFS.
URL [url]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]	The unique URL locator for the datastore.

HostMounts

Discovery uses both the VMWare - vCenter ESX Hosts and VMWare - vCenter Datastores probes to collect datastore host mount data.

Field label and Column	Table	Description
Accessible [accessible]	VMware Datastore HostMount [vcenter_datastore_hostmount]	Whether the ESXi host can access the datastore.
Access Mode [access_mode]	VMware Datastore HostMount [vcenter_datastore_hostmount]	The mode in which the ESXi host accesses the datastore.
VMware vCenter Datastore [datastore]	VMware Datastore HostMount [vcenter_datastore_hostmount]	The datastore mounted on this ESXi host.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field label and Column	Table	Description
ESX Server [esx_server]	VMware Datastore HostMount [vcenter_datastore_hostmount]	The ESXi host that the datastore is mounted on.
vCenter Reference [vcenter_ref]	VMware Datastore HostMount [vcenter_datastore_hostmount]	The vCenter instance that manages this mount.

Relationships

ServiceNow provides tables that contain the relationships between an ESXi host and its datastore and the specific disks to which the datastore is connected.

ServiceNow Discovery establishes the relationships between a datastore, the disks attached to the datastore, and the ESXi server that hosts the virtual machines using that datastore. From the perspective of the ESXi host, iSCSI and fibre channel disks connected to the datastore are treated as physical disks. Discovery doesn't show the direct relationship of the storage disks to the ESXi host.

Note: Storage can be hosted on computers that aren't discovered by Discovery. ESXi hosts are discovered through vCenter, and storage is discovered separately through CIM. The system can only establish the relationship between the two when storage is discovered before ESXi.

Datastore tables

Table	Description
cmdb_ci_vcenter_datastore_disk	Stores the relationship of the physical disk to the datastore.
vcenter_datastore_hostmount	Stores the relationship between the datastore and the ESXi server to which it's connected.
cmdb_ci_disk	Contains the physical disks connected directly to the datastore. This table also contains a reference to the ESXi host.
cmdb_ci_fc_disk	Contains the fibre channel disks in a storage area network (SAN) connected to the datastore. This table also contains a reference to the ESXi host.
cmdb_ci_iscsi_disk	Contains the iSCSI disks in an IP network connected to the datastore. This table also contains a reference to the ESXi host.

VM Instance state and status fields

These tables represent the state and status of the cmdb_ci_vm_instance in various flows such as vCenter Discovery and vCenter Events and the business rules which are triggered.

© 2026 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rules that change various states and status fields related to Virtual Machine Instance and related Server

Business rule	Field name	Plugin name
Cascade Operational Status to vminstance	cmdb_ci_server: Operational status	Pattern Designer
Sync Ops Status for CMDB CI	• cmdb_ci: Operational status, Install Status • cmdb_ci_hardware: Operational status, Hardware Status, Substatus	CMDB

ESXi server discovery

Discovery identifies and classifies information about ESXi servers and ESXi resource pools through the discovery of vCenter and not from the direct discovery of any ESXi servers.

Important: ESXi server discovery is done through vCenter. Don't specify the IP address of the ESXi server in a Discovery Schedule. Instead, discover the vCenter through the Discovery Schedule.

Required Roles

Users with the *itil* and *asset* roles can access ESXii and ESXi configuration item (CI) records. To run discovery on vCenter servers, users must have the *discovery_admin* role.

Credentials

To run a complete Discovery of vCenter/ESXi servers, you need vCenter credentials. If the vmapp port probe is turned off, you must use Windows credentials to access the Windows host on which the vCenter server runs.

Note: Make sure to select a credential *Type* of *VMware*.

ESXi server Discovery Components

Discovery identifies ESXi servers based on the correlation ID (BIOS UUID), when the hardware manufacturer is on a certified inclusion list. So if the manufacturer is in the compatible manufacturers list, the correlation-id must be unique. If the manufacturer isn't on the certified inclusion list, we check for the Managed Object Reference ID (MORID) and Serial Number as well. After running the vCenter classifier, Discovery launches the VMware - vCenter datacenters probe, which launches the probes that explore the ESXi server. For the complete list of vCenter probes, see List of Discovery probes.

Component and Name	Description
Classifier [vCenter]	Classifies standalone vCenter servers.
Probe [VMWare - vCenter ESX Hosts]	Creates records for ESXi servers and host mounts. Creates relationships between ESXi servers and vCenter components. Triggers probes for storage Discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component and Name	Description
Probe [VMWare - vCenter ESX Hosts Storage]	Creates records for ESXi host hardware: network adapters, disks, HBAs, FC ports, iSCSI, and FC disks. Creates relationships between DAS/iSCSI/FC disks and datastore disks.

Data collected

Basic server data from ESXi hosts is collected by the VMware - vCenter ESX Hosts probe.

Data collected by Discovery on ESXi hosts

Field label and Name	Table Name	Description
Operating System [os]	cmdb_ci_esx_server	The OS version running on the ESXi host.
OS Version [os_version]	cmdb_ci_computer	Detailed OS build or release information.
Name [name]	cmdb_ci_esx_server	Hostname of the ESXi server.
DNS domain [dns_domain]	cmdb_ci_esx_server	Domain associated with the ESXi host.
Manufacturer [manufacturer]	cmdb_ci_computer	Hardware vendor of the ESXi host.
Serial number [serial_number]	cmdb_ci_computer	Physical server hardware serial number.
CPU type [cpu_type]	cmdb_ci_esx_server	The CPU model used by the ESXi host.
CPU speed (MHz) [cpu_speed]	cmdb_ci_esx_server	Clock speed of the processors.
CPU count [cpu_count]	cmdb_ci_esx_server	Number of physical CPUs.
CPU core count [cpu_core_count]	cmdb_ci_computer	Total number of cores across all CPUs.
CPU manufacturer [cpu_manufacturer]	cmdb_ci_esx_server	Vendor of the CPU hardware.
Model ID [model_id]	cmdb_ci_computer	Hardware model identifier.
RAM (MB) [ram]	cmdb_ci_esx_server	Total physical memory installed.
Disk space (GB) [disk_space]	cmdb_ci_esx_server	Total disk capacity available.
Type [type]	cmdb_ci_disk	Type of disk.
Model ID [model_id]	cmdb_ci_disk	Hardware identifier for the disk.
Disk space (GB) [disk_space]	cmdb_ci_disk	Disk capacity of the individual disk.
Name [name]	cmdb_ci_disk	Disk name as detected by ESXi.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected by Discovery on ESXi hosts (continued)

Field label and Name	Table Name	Description
Name [name]	cmdb_ci_network_adapter	Network adapter name.
IP address [ip_address]	cmdb_ci_network_adapter	IP assigned to the NIC.
MAC address [mac_address]	cmdb_ci_network_adapter	Hardware address of the NIC.
Netmask [netmask]	cmdb_ci_network_adapter	Subnet mask of the NIC.
Managed object reference ID [morid]	Visualization Server [cmdb_ci_virtualization_server]	Managed Object Reference ID.
Serial Number [serial_number]	Serial Number [cmdb_serial_number]	Serial number record for CMDB correlation.

Relationships

Discovery collects the following relationship data for ESXi servers.

Base Class	Relationship	Dependent Class
ESXi Resource Pool [cmdb_ci_esx_resource_pool]	Defines resources for:Gets resources from	ESXi Server [cmdb_ci_esx_server]
VM Instance [cmdb_ci_vmware_instance]	Registered on:Has registered	ESXi Server [cmdb_ci_esx_server]
ESXi Server [cmdb_ci_esx_server]	Provides storage for:Stored on	VM Template [cmdb_ci_vmware_template]
ESXi Server [cmdb_ci_esx_server]	Provided by:Provides	Networks [cmdb_ci_vcenter_network]
ESXi Server [cmdb_ci_esx_server]	Members of:Members	Cluster [cmdb_ci_vcenter_cluster]
ESXi Server [cmdb_ci_esx_server]	Contains:Contained by	Datacenter [cmdb_ci_vcenter_datacenter]

ESXi resource pools

Resource pools are configured in vCenter and define the maximum amount of resources that virtual machines using that pool can consume. If the ESXi server has additional resources to spare, an ESXi server property enables resource pools to expand. The **Name** and **Owner** fields of each resource pool on the ESXi server must be configured within the ServiceNow AI Platform

in the ESXi Resource Pool [cmdb_ci_esx_resource_pool] table. When Orchestration for VMware executes its manual provisioning tasks, the provisioner must select the proper resource pool for the virtual server requested. Discovery finds resource pools on ESXi machines and populates the fields on the ESXi Resource Pool form automatically. For more information, see Configure ESXi resource pools.

ESXi resource pools require the Orchestration - VMware Support plugin.

Note: Confirm that vCenter and the ESXi server have been fully configured, including the creation of the templates and resource pools.

Standalone ESXi discovery

Standalone ESXi discovery supports discovery of individual ESXi servers that host virtual machines (VMs) and related components without a vCenter. Various CIs and relationships are discovered as part of a discovery schedule.

Required roles:

Users with the *itil* and *asset* roles can access ESXi configuration item (CI) records. To run a standalone ESXi discovery, users must have the *discovery_admin* role.

VMware credentials

To run a standalone ESXi discovery, you need VMware credentials. Create the credentials by navigating to **Discovery** > **Credentials** > **VMware Credentials.**

If you use a domain account to access the ESXi host, specify the domain with the user name in the credential record in one of the supported formats, such as **Domain\UserName**.

Note: The VMware credentials must have a read-only role in the ESXi host.

Requirements

- Make sure the Discovery (com.snc.discovery) plugin is installed and activated and that you have upgraded to Zurich or later.
- Activate the ESXi trigger probe. Navigate to the Trigger Probe [trigger_probe_m2m] table. The esxi record is inactive by default. Mark Active as true to enable Standalone ESXi discovery.
- Create a new Discovery schedule for the host with the appropriate IP address of the ESXi host.

Note: If both SSH and ESXi are triggered, SSH is launched first and may cause Discovery to complete with the message "ESX Discovery is only supported through the vCenter." In this case, open the UNIX - Classify probe and set ESX - OS inactive.

ESXi server Discovery Components

Discovery identifies ESXi servers based on the correlation ID (BIOS UUID), when the hardware manufacturer is on a certified inclusion list. If the manufacturer is on the list, the correlation ID must be unique. If the manufacturer isn't on the certified inclusion list, the Managed Object Reference ID (MORID) and Serial Number are checked as well.

After Shazzam runs, it checks for the port probe esxi. Discovery then launches the VMWare - Standalone ESXi Server probe, which then launches the probes that explore the ESXi server. Other existing Discovery probes are also launched. For the complete list of probes, see List of Discovery probes.

ESXi server Discovery Components

Component and Name	Description
IP Service [ESXi]	IP Service ESXi - VMWare VM console is defined for the Port 902.
Port Probe [esxi]	ESXi Server Appliance web user interface. It's triggered by the IP Service ESXi and it triggers the probe VMWare - Standalone ESXi Server.
Probe [VMWare - Standalone ESXi Server]	Probe to get information about an ESXi server.

ESXi server Discovery Components (continued)

Component and Name	Description
Probe [VMWare - vCenter ESX Hosts]	Creates records for ESXi servers and host mounts. Triggers other probes. • VMware - vCenter ESX Hosts Storage • VMware - vCenter Datastores • VMware - vCenter Networks • VMware -vCenter VMs
Probe [VMWare - vCenter ESX Hosts Storage]	Creates records for ESXi host hardware: network adapters, disks, HBAs, FC ports, iSCSI, and FC disks. Creates relationships between DAS/iSCSI/FC disks and datastore disks.

Basic server data from ESXi hosts is collected by the VMware - vCenter ESX Hosts probe.

ESXi Standalone server data

Discovery uses multiple existing probes to collect this data from ESXi. The data is saved in various tables. Some of the CIs, which have the "server" field have a reference to ESXi Host (for example, cmdb_ci_esx_server).

VMware Virtual Machine Instance [cmdb_ci_vmware_instance]

Field label and Name	Description
Name [name]	VM name.
Memory (MB) [memory]	RAM assigned.
CPUs [cpus]	Number of vCPUs.
Disks [disks]	Number of VM disks.
Network adapters [nics]	Count of NICs.
Object ID [object_id]	Unique object ID.
Server [server]	ESXi host running the VM.
State [state]	Power state.
Correlation ID [correlation_id]	Unique VM identifier for correlation.
VM Instance UUID [vm_instance_uuid]	ESXi VM ID.
Status [install_status]	CMDB install status.

VMware vCenter Datastore [cmdb_ci_vcenter_datastore]

Field label and Name	Description
Name [name]	Datastore name.
Capacity (GB) [capacity]	Total storage size.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMware vCenter Datastore [cmdb_ci_vcenter_datastore] (continued)

Field label and Name	Description
Free space (GB) [freespace]	Available storage.
Accessible [accessible]	Whether the datastore is reachable.
Type [type]	Filesystem type.
Object ID [object_id]	Unique datastore ID.
Server [server]	ESXi host providing the datastore.
URL [url]	Datastore path.
Status [install_status]	CMDB install status.

VMware vCenter Network [cmdb_ci_vcenter_network]

Field label and Name	Description
Name [name]	Network name.
Object ID [object_id]	Unique network ID.
Server [server]	ESXi host providing network connectivity.
Status [install_status]	CMDB install status.

VMware Network Adapter [cmdb_ci_vmware_nic]

Field label and Name	Description
Name [name]	NIC name.
MAC Address [mac_address]	NIC hardware address.
IP Address [ip_address]	Assigned IP.
Netmask [netmask]	Subnet mask.
Configuration Item [cmdb_ci]	CI that owns this NIC.
Object ID [object_id]	Unique NIC ID.
Mac manufacturer [mac_manufacturer]	Vendor of the NIC.
DHCP Enabled [dhcp_enabled]	Whether DHCP is active.
Status [install_status]	CMDB install status.

VMware Datastore HostMount [vcenter_datastore_hostmount]

Field label and Name	Description
VMware vCenter Datastore [datastore]	Mounted datastore.
ESX Server [esx_server]	Host using the datastore.
Accessible [accessible]	Whether the datastore is accessible.
Access Mode [access_mode]	Read/write permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Datastore Disk [cmdb_ci_vcenter_datastore_disk]

Field label and Name	Description
Name [name]	Disk name.
Manufacturer [manufacturer]	Disk vendor.
Location [location]	Disk physical/virtual location.
Description [short_description]	Short description.
Class [sys_class_name]	CMDB class.
Updated [sys_updated_on]	Timestamp of last update.
Maintenance schedule [maintenance_schedule]	Maintenance timing.
Correlation ID [correlation_id]	Identifier linking disk to datastore.
Datastore [datastore]	Associated datastore.
Status [install_status]	CMDB status.

ESX Resource Pool [cmdb_ci_esx_resource_pool]

Field label and Name	Description
Name [name]	Resource pool name.
CPU reserved (MHz) [cpu_reserved_mhz]	Guaranteed CPU.
CPU limit (MHz) [cpu_limit_mhz]	Maximum CPU.
CPU shares [cpu_shares]	CPU priority.
Memory reserved (MB) [mem_reserved_mb]	Guaranteed memory.
Memory limit (MB) [mem_limit_mb]	Maximum memory.
Memory shares [mem_shares]	Memory weight.
Object ID [object_id]	Unique pool ID.
Server [server]	ESXi host.
Managed object reference ID [morid]	Managed Object Reference ID.
Status [install_status]	CMDB install status.

ESX Server [cmdb_ci_esx_server]

Field label and Name	Description
Name [name]	ESXi hostname.
Manufacturer [manufacturer]	Vendor name.
Model ID [model_id]	Server hardware model.
Operating System [os]	OS version.
OS Version [os_version]	Detailed OS version.
Description [short_description]	Summary information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ESX Server [cmdb_ci_esx_server] (continued)

Field label and Name	Description
Class [sys_class_name]	CMDB class.
Status [install_status]	CMDB status.

Network Adapter [cmdb_ci_network_adapter]

Field label and Name	Description
Name [name]	NIC name.
Mac Address [mac_address]	NIC hardware address.
Netmask [netmask]	Subnet mask.
Configuration Item [cmdb_ci]	The CI owning this adapter.
Mac manufacturer [mac_manufacturer]	NIC vendor.
DHCP Enabled [dhcp_enabled]	Whether DHCP is used.
Status [install_status]	CMDB install status.

Disk [cmdb_ci_disk]

Field label and Name	Description
Name [name]	Disk name.
Computer [computer]	System owning the disk.
Size [size]	Disk capacity.
Manufacturer [manufacturer]	Disk vendor.
Model ID [model_id]	Model identifier.
Status [install_status]	CMDB install status.

Storage HBA [cmdb_ci_storage_hba]

Field label and Name	Description
Name [name]	HBA name.
Model ID [model_id]	HBA model number.
Computer [computer]	ESXi host.
WWNN [wwnn]	Worldwide Node Name.
Status [install_status]	CMDB install status.

Fibre Channel Port [cmdb_ci_fc_port]

Field label and Name	Description
Name [name]	Port name.
WWNN [wwnn]	Node Name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fibre Channel Port [cmdb_ci_fc_port] (continued)

Field label and Name	Description
WWPN [wwpn]	Port Name.
Speed [speed]	Link speed.
Controller [controller]	HBA controller.
Computer [computer]	Host system.
Status [install_status]	CMDB status.

iSCSI Disk [cmdb_ci_iscsi_disk]

Field label and Name	Description
Name [name]	Disk name.
Computer [computer]	Host accessing the disk.
Size [size]	Disk size.
Provided by [provided_by]	Storage system provider.
IQN [iqn]	iSCSI Qualified Name.
Device LUN [device_lun]	Logical Unit Number.
Storage type [storage_type]	Storage type.
Status [install_status]	CMDB status.

Fibre Channel Disk [cmdb_ci_fc_disk]

Field label and Name	Description
Name [name]	Disk name.
Computer [computer]	Host using this disk.
Size [size]	Disk capacity.
Provided by [provided_by]	Storage array.
Device LUN [device_lun]	LUN identifier.
WWN [wwn]	Worldwide Name.
Status [install_status]	CMDB install status.

IP Address [cmdb_ci_ip_address]

Field label and Name	Description
IP Address [ip_address]	Assigned network address.
IP version [ip_version]	IPv4 or IPv6.
Netmask [netmask]	Subnet mask.
Nic [nic]	NIC owning the IP.
Status [install_status]	CMDB status.

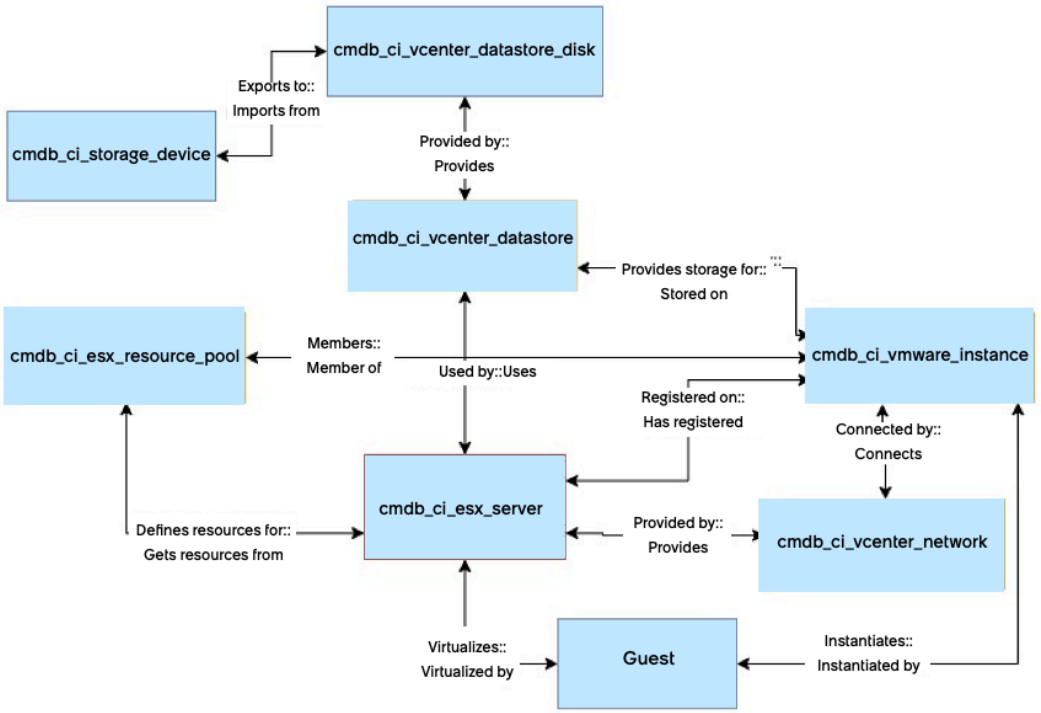
Relationships

Standalone ESXi discovery relationships



Resource pools

Standalone ESXi discovery also fetches the resource pools on the host including the root resource pool. This root resource pool is hidden for every ESXi host. The root resource pool may not be visible in the VSphere web client for the ESXi host, but you can view it using the mob browser.

Navigate to this URL: **<domain name/or ip_address>/mob/?moid=ha-root-pool**

The root resource pool groups the resources of that host. Other child resource pools can also be created from the root resource pool. The root is identified in the ESXi host with the Managed Object ID: ha-root-pool.

Forward migration

If you were using standalone ESXi discovery and now the same ESXi is part of vCenter, you can use vCenter discovery instead. Create a vCenter discovery schedule and trigger it. Triggering a vCenter discovery creates duplicate CIs in the following tables as the identifiers for the CIs are different when ESXi is standalone or part of vCenter:

- VMware VCenter Network [cmdb_ci_vcenter_network]
- ESX Resource Pool [cmdb_ci_esx_resource_pool]
- VMware VCenter Datastore [cmdb_ci_vcenter_datastore]
- Datastore Disk [cmdb_ci_vcenter_datastore_disk]

To avoid duplicates, you must mark the CIs created by standalone ESXi discovery in the above four tables as retired. When vCenter discovery is triggered, the vCenterESXHostsSensor script

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

include checks for all the ESXi servers whether they were previously discovered as standalone ESXi server. If yes, it automatically triggers the ESXMigrationUtil script to mark all the previously discovered duplicate CIs as retired.

Note: If you want to trigger migration manually, you can do so by executing the following script from the background script: // @params esx_sys_ids – array of sys ids of all the ESXi servers that must be migrated.

```
ESXMigrationUtil.
 retireCIsForESXForwardMigration(esx_sys_ids)
```

Once an ESXi server is migrated to vCenter, triggering a standalone ESXi discovery schedule on the same ESXi host results in an error. Discovery is aborted with an error message that "This ESXi is part of vCenter <IP_address of Vcenter> discovery schedule. Aborting discovery".

Operating systems discovery

Discovery identifies the following computers, clusters, and virtual machines.

AIX server discovery

Discovery identifies and classifies information about AIX servers.

Credentials

Configure SSH credentials.

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Use OpenSSH version 7.5.102 and above for AIX machines since lower versions of OpenSSH can impact the discovered devices that are encountered with Discovery.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Classifier, probes, and pattern

Classifier	Probes	Pattern
AIX (UNIX Classification)	• Horizontal discovery probe: launches patterns • AIX - Installed Software^ • AIX - ADM^ • AIX - Identity* • AIX - CPU* • AIX - Hardware Model* • AIX - Memory* • AIX - OS Patches* • AIX - OS Release* • AIX - OS Revision*	AIX server

Apache HBase instance discovery

Discovery creates or updates a CMDB record when it detects a running instance of HBase on a UNIX server.

Note: See the knowledge article KB0687582 for information on model_id and manufacturer.

In the following table, the `HBase Instance@`*`hostname`* source may contain the information on whether the instance is a primary or a secondary instance. The name contains *`Hmaster`* if the instance is a primary instance. The name contains *`HRegionServer`* if the name is a secondary instance.

Data collected

Label	Table Name	Field Name	Source
Name	cmdb_ci_db_hbase_instance	name	HBase Instance@*`hostname`*
Root Directory	cmdb_ci_db_hbase_instance	root_dir	hbase-site.xml
TCP port	cmdb_ci_db_hbase_instance	tcp_port	running process
Site XML	cmdb_ci_db_hbase_instance	site_xml	hbase-site.xml

Hyper-V discovery

The ServiceNow Discovery application finds Microsoft Hyper-V hypervisors in your environment.

Hyper-V is a hypervisor developed by Microsoft that enables you to create and manage virtual machines (VMs) on a physical server or computer. It enables hardware virtualization, enabling multiple virtual machines to run on a single physical machine while sharing the underlying hardware resources, such as CPU, memory, storage, and networking.

Note: See the knowledge article KB0687582 for information on model_id and manufacturer.

Hyper-V supports the following functionality:

- Failover clustering: Failover is managed with Failover Cluster Manager.
- Live migration: Virtual machines can be moved between failover cluster nodes without bringing down the virtual machine.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Supported versions

Discovery is supported for Hyper-V running on the following Windows Server versions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- 2008
- 2012
- 2012 R2
- 2016
- 2019
- 2022
- 2025

Important: Discovery of Hyper-V running on Windows starting from version 2016 supports pattern discovery only. If you upgraded and are still using probes and sensors for discovery, see KB0694773 for instructions on configuring Hyper-V probes.

Hyper-V data models

There are 2 types of Hyper-V:

- Hyper-V on Windows Server: This model, installed as a server role on Windows Servers, is designed for enterprises needing both virtualization and other server roles (for example: file servers, Active Directory, web servers) on the same machine.
- Hyper-V Server (Standalone): A free, lightweight version of Windows Server specifically designed for virtualization. It includes only the Hyper-V hypervisor and no graphical user interface (GUI) or additional server roles.

Discovery supports identifying and mapping both types of Hyper-V environments. However, the CMDB data models differ between the two deployment types.

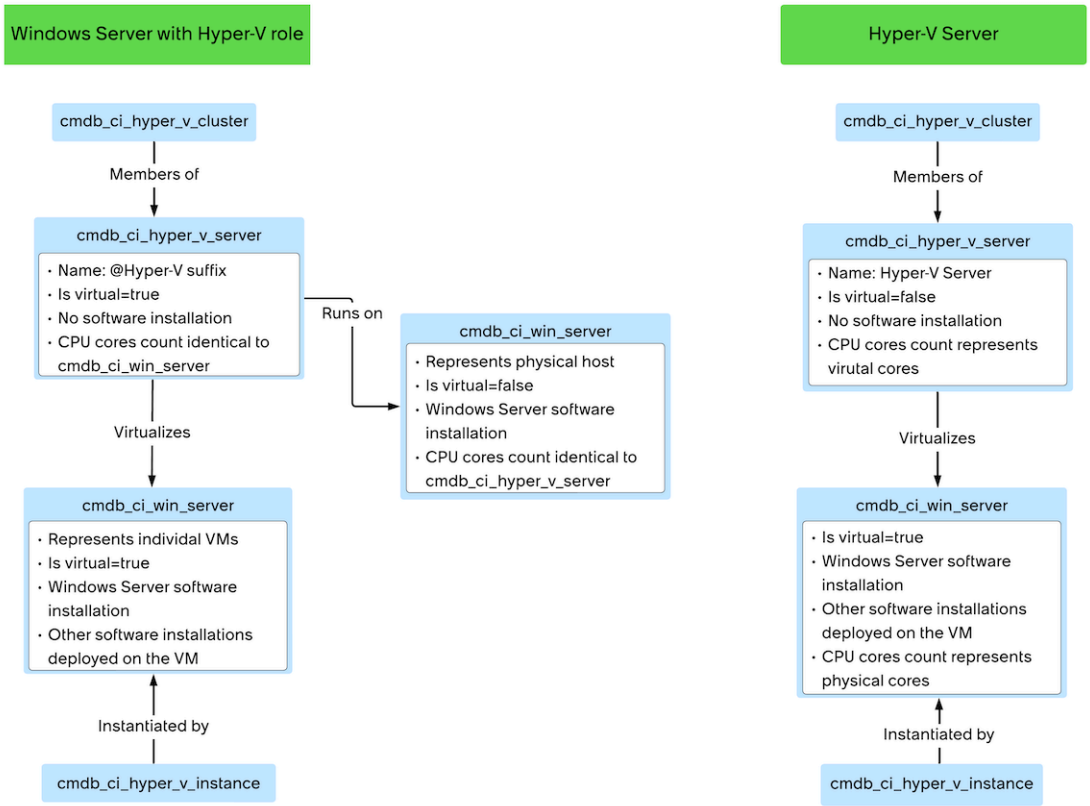
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of Windows Server with Hyper-V role vs. Hyper-V Server (VM shown with Windows OS)



Comparison between Windows Server with Hyper-V role and Hyper-V Server

Key aspects	Windows Server with Hyper-V role	Hyper-V Server
Hyper-V Server CI	• Name of the CI includes the **@Hyper-V Server** suffix. For example: hyperv1@Hyper-V Server. • The **Windows Host** field references the parent Windows Servers table, which represents the physical host of the Hyper-V Server.	Name of the CI is the Hyper-V Server.
Hyper-V Cluster has **Members::Member of** relationship with Hyper-V Server	Yes The Hyper-V Server table: • Has **Is virtual** field set to true • Doesn't have software installation	Yes The Hyper-V Server table: • Has **Is virtual** field set to false • Doesn't have software installation
Hyper-V Server has **Runs on::Runs** relationship with Windows Server	Yes The Windows Server table:	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Comparison between Windows Server with Hyper-V role and Hyper-V Server (continued)

Key aspects	Windows Server with Hyper-V role	Hyper-V Server
	• Represents the physical host • Has **Is virtual** field set to false • Has Windows Server software installation	
Operating system (OS) installed on the VM has **Virtualized by::Virtualizes** relationship with Hyper-V Server	Yes The OS table (for example: Windows Server/Linux Server): • Represents the individual virtual machines (VMs) • Has **Is virtual** field set to true • Has OS software installation, such as Windows or Linux Server • Has other software installations deployed on the VM	Yes The OS table (for example: Windows Server/Linux Server): • Has **Is virtual** field set to true • Has OS software installation, such as Windows or Linux Server • Has other software installations deployed on the VM
OS installed on the VM has **Instantiates::Instantiated by** relationship with Hyper-V Virtual Machine Instance	Yes	Yes
CPU cores count	Is identical between the physical Windows Server host and the Hyper-V Server	The parent Windows Servers table reflects the physical cores, while the Hyper-V Server table displays the virtual cores

Credentials

Configure Windows credentials with Domain administrator rights. You should also Enable PowerShell for the MID Server used to discover Hyper-V servers and instances.

Classifier, probes, and pattern

Classifier	Probes	Pattern
Hyper-V Server The classification applies to standalone Hyper-V servers only (servers NOT running on Windows 2008).	• Horizontal discovery probe: Launches patterns • Windows - ADM^ • Windows - Installed Software^ • Hyper-V - Cluster* • Hyper-V - Resource Pools* • Hyper-V - Virtual Machines*	Hyper-V Server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Classifier	Probes	Pattern
	• Hyper-V - Virtual Networks* • Several other Windows probes also run, such as Windows - Identity, Windows - software, and so on.*	

*These probes aren't active on the classifier, as Discovery uses patterns by default for these discoveries.

^These probes remain active by default, even when Discovery uses pattern discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected by Discovery during horizontal discovery

Virtual instances

Label	Field Name	Data Description	Stored in Table
Object ID ^	object_id	ID	cmdb_ci_hyper_v_instance

Resource pools (continued)

Label	Field Name	Data Description	Stored in Table
Resource type	resource_type	Type of resource discovered (for example, memory, or hard drive space)	cmdb_ci_hyper_v_rpool_comp

Clusters

Label	Field Name	Data Description	Stored in Table	Reference Table
Windows Cluster	name	Reference field displaying the Windows Cluster on which the Hyper-V cluster resides.	cmdb_ci_hyper_v_cluster	cmdb_ci_win_cluster

Relationships

Discovery creates records in the CMDB for the host machine, the parent partition running Windows Server 2008, and all the virtual machines running on the Hyper-V server. Discovery finds the stored templates and maps all the relationships between components.

The instance modifies these tables for use with multiple virtualization products:

Table	Purpose
Virtualization Server [cmdb_ci_virtualization_server]	Contains data on all discovered virtualization servers.
Virtual Machine Instance [cmdb_ci_vm_instance]	Contains data on all discovered virtual machine instances.
Virtual Machine Object [cmdb_ci_vm_object]	Contains data about various objects associated with a Hyper-V server, such as partitions, networks, resource pools, and clusters.

Parent table	Relationship	Child table
Hyper-V Virtual Machine Instance [cmdb_ci_hyper_v_instance]	Registered on::Has registered	Hyper-V Server [cmdb_ci_hyper_v_server]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parent table	Relationship	Child table
Hyper-V Virtual Machine Instance [cmdb_ci_hyper_v_instance]	Connected by ::Connects	Hyper-V Network [cmdb_ci_hyper_v_network]
Hyper-V Network [cmdb_ci_hyper_v_network]	Provided::Provides	Hyper-V Server [cmdb_ci_hyper_v_server]
Hyper-V Resource Pool [cmdb_ci_hyper_v_resource_pool]	Defines resources for:Gets resources from	Hyper-V Server [cmdb_ci_hyper_v_server]
Hyper-V Resource Pool Components [cmdb_ci_hyper_v_rpool_comp]	Contained by::Contains	Hyper-V Resource Pool [cmdb_ci_hyper_v_resource_pool]
Hyper-V Cluster [cmdb_ci_hyper_v_cluster]	Members::Member of	Hyper-V Server [cmdb_ci_hyper_v_server]
Hyper-V Server [cmdb_ci_hyper_v_server]	Runs on::Runs	Windows Servers [cmdb_ci_win_server]
Windows Servers [cmdb_ci_win_server]	Instantiates::Instantiated by	Hyper-V Virtual Machine Instance [cmdb_ci_hyper_v_instance]
Windows Servers [cmdb_ci_win_server]	Virtualized by::Virtualizes	Hyper-V Server [cmdb_ci_hyper_v_server]

Clone Hyper-V virtual machines

When importing (cloning) Hyper-V virtual machines, make sure each virtual machine has a unique ID. Discovery identifies virtual machines with duplicate IDs as the same machine.

1. Export the virtual machine from the Hyper-V server.
2. Import the virtual machine into a different server, making one of the these choices:
   - Move or restore the virtual machine: This selection clones the image, using the same ID, and moves it to another server. The original image remains on the Hyper-V server.
   - Copy the virtual machine: This selection copies the virtual machine, using a different ID, and moves it from the Hyper-V server. This is the best selection and does not require any further action before you run Discovery.
3. If you import the Hyper-V clone using the **Move or restore** selection, be sure to delete the original image from the Hyper-V server.

   When Discovery encounters two virtual machines with the same equivalent serial numbers, it creates only one configuration item (CI).

Red Hat JBoss server discovery

Discovery can detect JBoss application servers running on Linux and Windows systems.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Requirements

For JBoss application servers running on Linux systems.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Set probe permissions to use these Bourne shell commands: *find*, *cat*, and *dirname*.
- Enable SSH on the JBoss application server. The SSH credential must also have read permissions on the `web.xml` and `jboss-service.xml` files.

For JBoss application servers running on Windows systems, enable PowerShell on the MID Server.

Note: See the knowledge article KB0687582 for information on model_id and manufacturer.

Credentials

- Applicative credentials
- Windows credentials
- SSH credentials

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Classifiers, patterns, and probes

Classifier	Trigger probes	Patterns
JBoss Server	• Horizontal Pattern: launches patterns • Windows - JBoss Find web.xml List* • Windows - JBoss Get jboss-service.xml* • JBoss - Find web.xml List* • JBoss - Get jboss-service.xml*	JBoss pattern

*For new instances, these probes are inactive on the classifier. Discovery uses patterns for discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected

Discovery populates the following fields in the JBoss [cmdb_ci_app_server_jboss] table:

Label	Field name
Name	name
Category	category
Version	version

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field name
TCP port(s)	tcp_port

Discovery populates the following fields on the Web Service [cmdb_ci_web_service] and Web Application [cmdb_ci_web_application] servers tables:

Label	Table name	Field name	Source
Name	cmdb_ci_web_service	name	jboss-service.xml
App server	cmdb_ci_web_service	app_server	Internal reference
Description	cmdb_ci_web_application	short_description	web.xml
Name	cmdb_ci_web_application	name	web.xml
Document base	cmdb_ci_web_application	document_base	web.xml
App server	cmdb_ci_web_application	app_server	web.xml
Servlet Name*	cmdb_ci_web_application	servlet_name	web.xml
Servlet Class*	cmdb_ci_web_application	servlet_class	web.xml

*Windows servers only

Relationships

Relationships created

Parent class	Relationship	Child class
cmdb_ci_web_service	Runs on::Runs	cmdb_ci_windows_server
cmdb_ci_app_server_jboss	Contains::Contained by	cmdb_ci_web_application
cmdb_ci_app_server_jboss	Runs:Runs on	cmdb_ci_web_application
cmdb_ci_app_server_jboss	Runs:Runs on	cmdb_ci_web_service

Legacy: JBoss probes and sensors

Discovery identifies a Linux JBoss application server using probes and sensors.

Linux

This process describes the use of probes, which are active on your instance if you upgrade. For new instances, Discovery uses the JBoss pattern.

1. The UNIX - Active Processes probe detects a running process that matches an `org.jboss.main` entry point parameter.
2. If there's a match, a record is created in the JBoss Application Server [cmdb_ci_app_server_jboss] table. The following probes are also triggered:
   - JBoss - Find web.xml list: The sensor of this probe populates information in the Web Application [cmdb_ci_web_application] table if applicable.
   - JBoss - Get jboss-service.xml: The sensor of this probe populates information in the Web Service [cmdb_ci_web_service] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The JBoss - Find web.xml list probe searches for the `web.xml` files of JBoss application server. The probe uses the *`classpath`* parameter in the running process, and then searches in the related `server\default\deploy` directory for the JBoss installation.
4. If associated web applications reside in the `server\default\deploy` directory, the JBoss - Get web.xml probe triggers for each application. This probe reads the `web.xml` file for each web application and the sensor populates additional information to the Web Service [cmdb_ci_web_service] table.
5. The Boss - Get jboss-service.xml probe uses the *`classpath`* parameter in the running process to search for the `jboss-service.xml` file in the related `server\default\conf\` directory for the JBoss installation.
6. If the probe successfully finds the `jboss-service.xml` file in the `server\default\conf\` directory, the sensor reads the contents of the XML file. It then creates additional records in the Web Service [cmdb_ci_web_service] table as necessary.

Windows

This process describes the use of probes, which are active on your instance if you upgrade. For new instances, Discovery uses the JBoss pattern.

1. The Windows - Active Processes probe detects a running process that matches an *`org.jboss.main`* entry point parameter.
2. If there's a match, a record is created in the JBoss Application Server [cmdb_ci_app_server_jboss] table. The following probes are also triggered:
   - JBoss - Find web.xml list: The sensor of this probe populates information in the Web Application [cmdb_ci_web_application] table if applicable.
   - JBoss - Get jboss-service.xml: The sensor of this probe populates information in the Web Service [cmdb_ci_web_service] table.
3. The JBoss - Find web.xml list probe searches for the `web.xml` files of JBoss application server. The probe uses the *`classpath`* parameter in the running process, and then searches in the related `server\default\deploy` directory for the JBoss installation.
4. If associated web applications reside in the `server\default\deploy` directory, the JBoss - Get web.xml probe triggers for each application. This probe reads the `web.xml` file for each web application and the sensor populates additional information to the Web Service [cmdb_ci_web_service] table.
5. The Boss - Get jboss-service.xml probe uses the *`classpath`* parameter in the running process to search for the `jboss-service.xml` file in the related `server\default\conf\` directory for the JBoss installation.
6. If the probe successfully finds the `jboss-service.xml` file in the `server\default\conf\` directory, the sensor reads the contents of the XML file. It then creates additional records in the Web Service [cmdb_ci_web_service] table as necessary.

Linux discovery

Discovery and Service Mapping applications use probes and patterns to discover and map information about Linux computers and servers. The information is populated in the CMDB. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Supportability details

The Linux server pattern can discover only English-based Linux.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported Linux operating systems

For IPv4 discovery:

- Red Hat
- Oracle
- Fedora
- Debian
- SUSE
- CentOS
- Ubuntu
- Alpine Linux (starting from Visibility Content version 6.30.0)*

* Operating System and OS Version only

For IPv6 discovery:

- CentOS 7
- Ubuntu 20

The following operating systems or devices haven't been verified for IPv6 discovery:

- Red Hat cluster
- Oracle Clusterware
- Linux Pacemaker cluster
- Network storage

Classifier, probes, and pattern

Classifier	Probes	Pattern
Linux (Unix classification)	• Horizontal discovery probe: Launches patterns • Linux - Installed Software^ • Unix - ADM^ • Linux - Identity* • Linux - CPU* • Linux - Distribution* • Linux - Find FQDN* • Linux - Memory* • Linux - Memory Modules* • Linux - Network ARP Tables* • Linux - Storage* • Linux - Amazon EC2* • Unix - OS Uptime* • UNIX - OS Filesystems*	Linux Server

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Classifier	Probes	Pattern
	• UNIX - Find FQDN* • Unix - ADM Enhanced*	

*These probes aren't active on the classifier, as Discovery uses patterns by default for these discoveries.

^These probes remain active by default, even when Discovery uses pattern discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Requirements for Linux discovery

Before running a discovery, you must verify that all the required configurations are complete.

Verify the plugins installation and activation

- Plugins or applications installed with ITOM Visibility
- Install Discovery and Service Mapping Patterns
- Install Visibility Content

Verify the required credentials configuration

Configure the credentials by the required SSH permissions. Discovering sensitive Linux data may require a user with appropriate sudo privileges to run the sudo commands. To configure the required sudo privileges, modify the `/etc/sudoers` file to include the commands that Discovery needs. For `/etc/sudoers` line examples for each command, see SSH commands requiring a privileged user during probe-based discovery.

For more information about the commands that require a user with elevated rights, refer to the following documents.

- Commands that require root privileges for Discovery, Orchestration, and Integration Hub.
- For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.
- MID Server privileged commands
- View Patterns commands through the Discovery Patterns module
- Validate commands used in pattern-based discovery

SSH private key credentials are preferable over SSH password credentials for security reasons.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verify the MID Server configuration

For detailed information, see:

- Test MID Server connectivity
- MID Server properties

Verify the configuration of the discovery schedule

For information on creating a discovery schedule, see Schedule a horizontal discovery.

Defining IP ranges ensures that only the specified network adapters and their primary IP addresses are used during Linux discovery. You can configure **Quick Ranges** by entering comma-separated IPv4 address ranges or single IPv6 address.

Alternatively, you can use the *network_adapter_exclusion_list* property to limit Linux discovery to specific network adapters and their primary IP addresses. For more information, see Omit network adapter secondary IP addresses in Linux discovery.

(Optional) Populate Virtual Machine Object field in Hardware [cmdb_ci_hardware] table

Starting with Discovery and Service Mapping Patterns version 1.30.2, you can improve query performance by populating the Virtual Machine Object field in the Hardware [cmdb_ci_hardware] table. For more information, see Improved query performance with direct field population in CI tables.

Set the preferred IP address version for network adapter discovery

Starting with Visibility Content version 6.32.0, if your network adapters support both IPv4 and IPv6, the IPv4 address is populated by default in the IP address [ip_address] field on the Network Adapter [cmdb_ci_network_adapter] table. To control which IP version is populated, see Set the preferred IP version for network adapter discovery.

Data collected

The Linux classifier triggers probes that perform the discovery. Several probes are launched during the discovery. See the classifier for a list of the trigger probes.

Note: See the knowledge article KB0687582 for information on model_id and manufacturer.

* The value in the **disk_space** field is an aggregation of the total capacity (to include used space) for all non-removable disks, including both directly attached and SAN storage.

** Starting with Visibility Content version 6.32.0, for network adapters that support both IPv4 and IPv6, the IPv4 address is populated by default. Before this release, the populated value was selected randomly. To control which IP version is populated, see Set the preferred IP version for network adapter discovery.

Note: Make sure to define unique serial numbers for the RAMs on the Linux server.

Discovery also identifies and classifies information about Linux KVM. Discovery identifies Linux kernel-based virtual machines (KVM) when the process classifier detects `libvirtd` running on a Linux server. The classification triggers the creation of a cmdb_ci_kvm record and launches the SSH Command probes to explore the Linux server with `virsh`, `lbvert` utility, and virtual machine configuration data.

Discovery creates a [cmdb_ci_kvm_instance] record for each virtual machine on the server, and then matches the [cmdb_ci_kvm_instance] record to a corresponding [cmdb_ci_computer] record using the MAC addresses of installed network adapters.

Tables used by Discovery on Linux KVM

Table name	Extends	Description	Source
cmdb_ci_kvm	cmdb_ci_vm	A hypervisor that manages kernel-based virtual machines (KVMs)	Process classifier detects libvirtd running on Linux servers
cmdb_ci_kvm_vm_instance	cmdb_ci_vm_instance	A virtual machine instance on this hypervisor	virsh list-all and dumpxml command
cmdb_ci_kvm_object	cmdb_ci_vm_object	An object connected to a virtual machine instance	<network>, <storage pool>, and <storage volume> elements from the dumpxml command

- Linux discovery error "rbash: PATH: readonly variable Exit status: 1" (KB0866860)

Linux Red Hat cluster discovery

Discovery can find Linux Red Hat clusters that offer high availability and load balancing.

Required credentials

Configure SSH credentials.

Additional requirements

You also need permissions to read the `/etc/hosts/` and `/etc/cluster/cluster.conf` file, which associates host names with IP addresses.

The following commands are run for Oracle clusterware:

Command
`ps -ef | grep corosync | grep -v grep`
`clustat -x`
`ifconfig | grep 'inet addr:' |awk '{print $1, $2 }'`
`hostname -s`
`hostname -s`

Sudo permission to run: `sudo /u01/app/12.1.0.2/grid/bin/ocrcheck | egrep -v 'error|return code'`

Classifier, probes, and pattern

Classifier	Probes	Pattern
Linux (Unix classification)	Horizontal discovery probe: launches patterns	These patterns are an extension of the Linux Server pattern: • UNIX Cluster - Linux Red hat cluster • Linux - Red Hat Cluster

Omit network adapter secondary IP addresses in Linux discovery

Limit Linux discovery to specific network adapters and their primary IP addresses to improve performance by ignoring secondary IP addresses.

About this task

Configuring the *network_adapter_exclusion_list* system property ensures that only specified network adapters and their primary IP addresses are used during Linux discovery. Secondary IP addresses that are not named are automatically omitted.

Before you begin

Role required: admin

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. In the **Name** field, search for `network_adapter_exclusion_list`.
3. Select the *network_adapter_exclusion_list* property.
4. In the **Value** field, enter the network adapter associated with the NIC IP address to exclude it from deletion.

   The network adapter must be entered in one of the formats listed in the following table.

Format	Description
Single name	Single adapter name. For example: `bond0`.
Regular expression matching multiple adapter names	Regular expression that matches multiple adapter names ending with one or more digits. For example: `bond\d+`.
Multiple adapter names	Multiple adapter names, separated by commas, including regular expression. For example: `nic1,bond\d+`.

5. Select **Update**.

Result
When the predefined schedule triggers the Linux server discovery or a scheduled horizontal discovery runs, only the specific network adapters and their primary IP addresses are included in the discovery process.

For more information, see Schedule a horizontal discovery.

Solaris discovery

Discovery identifies and classifies information about Solaris computers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: See the knowledge article KB0687582 for information on model_id and manufacturer.

Supported operating systems

- Oracle Solaris 10
- Oracle Solaris 11

Prerequisites

Handle truncated command line parameters

Discovery stores data in the [cmdb_running_process] table with command line parameters truncated to 80 characters. This can cause multiple applications to be merged into one CI. To get the full command line and prevent this issue, run `pargs -a` and parse the result.

Install SNEEP

To use patterns to find Solaris computers, install SNEEP. Without it, Discovery cannot find the serial number.

Configure unique serial numbers for Solaris zones

Configure each zone to return a unique serial number. If zones return the same number, CI identification fails.

Note: Solaris discovery only supports local zones installed on the same host as the global zone. If the local zone is installed on a different host from the global zone, the `zoneadm list -cip` command can't retrieve the UUID for the local zone.

Install the LSOF command

The Solaris - ADM probe requires the LSOF command to be installed.

Configure SSH credentials

Configure SSH credentials for the systems you are discovering.

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Set the preferred IP address version for network adapter discovery

Starting with Visibility Content version 6.32.0, if your network adapters support both IPv4 and IPv6, the IPv4 address is populated by default in the IP address [ip_address] field on the Network Adapter [cmdb_ci_network_adapter] table. To control which IP version is populated, see Set the preferred IP version for network adapter discovery.

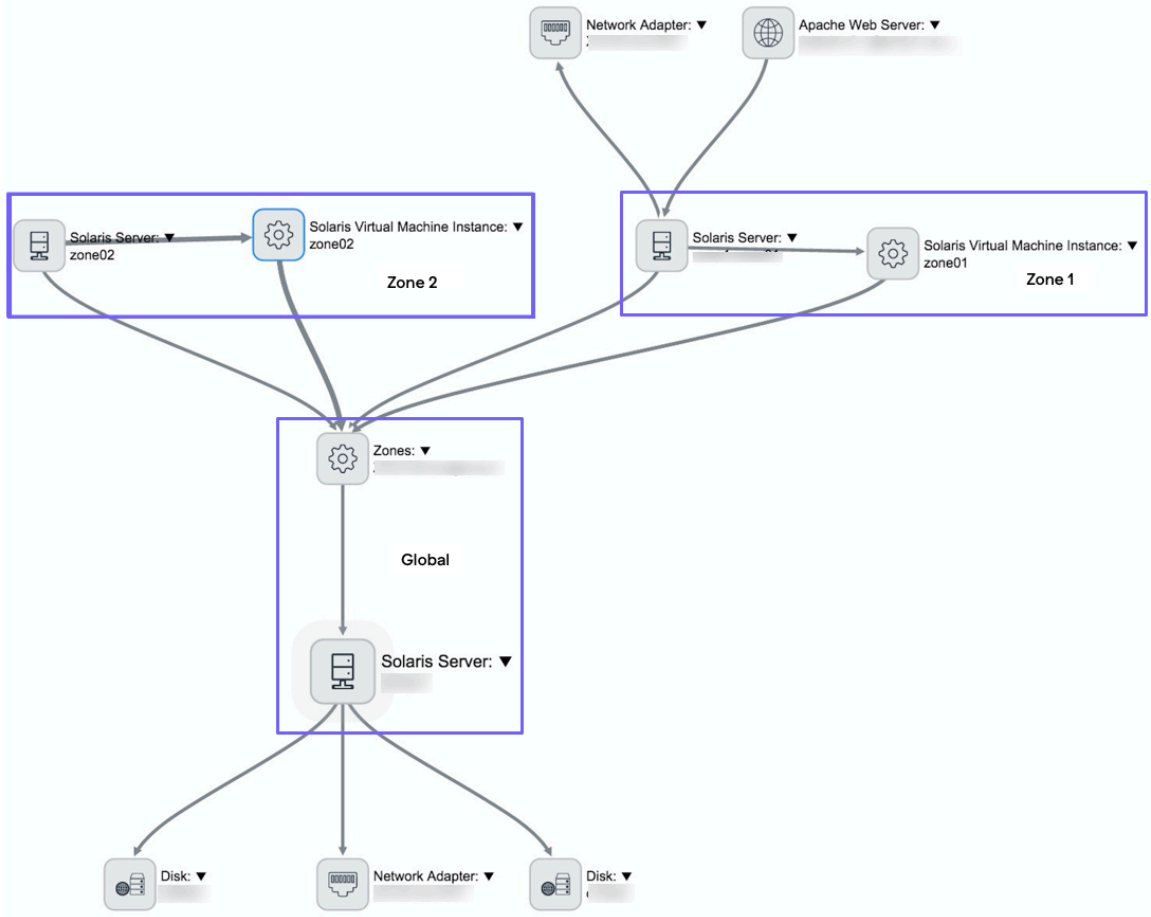
Solaris zone discovery

Discovery maps the relationships between global and local Solaris zones upon detection.

In the following example, a Solaris global zone contains two local zones: zone01 and zone02. Each local zone is represented by a physical Solaris CI record and a Virtual Machine Instance record. Each of the local zones is tied to a Zone Server, demonstrating how virtualization relates to the global zone (mmp1).

Solaris zone relationship map



The TCP connection and process information for local zone servers must be collected by running commands on their parent global zone. The relationship path between the local and global zone physical machines must be established before TCP connection and process information for local zone servers can be collected.

Case 1: Global zone is discovered first.

- The system creates the Solaris server CI for the global zone.
- Discovery detects the local zones, creates a hypervisor zone server record, and creates a virtual machine instance record for each Solaris device in the local zone.
- Discovery creates the relationship between the hypervisor record and the VM instance record.

Case 2: Local zone is discovered first.

- The system creates the Solaris server CI for the local zone.
- Discovery sets the correlation ID, so that it can be reconciled during later global zone discoveries.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case 3: Global zone is discovered after local zone Solaris server CIs are created.

- Global zone Discovery detects local zones.
- Discovery creates a hypervisor zone server record, and creates a virtual machine instance record for each Solaris device in the local zone.
- Discovery creates the relationship between the hypervisor record and the VM instance record. In addition, it creates the relationship between the physical local zone VM and its virtual machine instance record.
- The global zone runs the Solaris - ADM probe on itself, filtering by the local zone, and updates the physical local zone VMs with this data.

Case 4: The relationship path between physical local and global zone machines is established.

Subsequent discoveries of the global zone refresh the TCP connection and process information for the contained local zones.

When the system discovers a global zone, the Solaris - Zones & ADM Launcher probe triggers the Solaris - ADM probe to explore the global zone and each local zone found. Because the Solaris - ADM probe must run on the global zone to detect TCP connection and process information from its local zones, you might see multiple ECC queue records that appear identical.

ECC queue entries for a zone Discovery

2016-01-13 02:02:29	mid.server.demouk	MultiProbe	Solaris - Application Dependency Mapping	10.196.39.206	input	processed	2016-01-13 02:02:31

Discovery for VMware vCenter

Discovery can explore the VMware vCenter process running on a Windows or Linux host. IPv6 is supported for disocvery in VMware vCenter.

Note:

If a Windows or Linux server is running vCenter application, after creating the vCenter CI, a "Runs on" relationship to the Windows or Linux server host is created.

When a vCenter application is running on a dedicated vCenter appliance, a "Runs on" relationship to the vCenter CI isn't created.

Tested vCenter versions

The ServiceNow® platform supports vCenter API versions 4.0 and higher. The following versions were tested with the Zurich release:

- vCenter versions 8.0 and earlier
- vCenter appliance version 6.7 and earlier

For installations based on the vCenter appliance, a server CI is created for the vCenter appliance and the following fields are populated:

- NameIP
- AddressMAC
- AddressDiscovery
- Source

Note: If you're discovering SUSE Linux hosts for vCenter appliances, version 6.0 and earlier, observe these SSH restrictions.

See Data collected for VMware Cloud Discovery for a description of the VMware architecture and component relationships.

vCenter discovery process

After classifying vCenter, Discovery launches the VMware - vCenter Datacenters probe, which in turn launches specific probes that return information about ESX machines, virtual machines, and other vCenter objects. The vmapp port probe is also configured to launch the VMware - vCenter Datacenters probe.

Note: For accurate relationship mapping between server CIs and vCenter resources (such as ESX hosts and datastores), you should initiate discovery of the vCenter environment before discovering Server CIs. This approach helps Discovery associate servers with their corresponding vCenter-managed infrastructure more effectively.

VMWare credentials

To access vCenter with a domain account, specify the domain with the user name in the credential record using a supported format, such as **Domain\UserName**. The VMware credentials must have a read-only role in vCenter. For Software Asset Management (SAM) tracking, the credentials also require the "Assign license" privilege in vCenter, also known as the License Admin privilege.

Important: Windows credentials aren't necessary for vCenter Discovery when valid VMware credentials are used.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Updating the CMDB with vCenter event collector

In addition to finding vCenter data through the standard discovery process, Discovery can also update the CMDB by detecting vCenter events through a MID Server extension called the vCenter event collector.

The event collector allows the CMDB to be updated with changes to virtual machines (VMs), in addition to the updates detected by Discovery. A change to a VM is sent as an event from the vCenter server to the vCenter event collector. When an event is received, the CMDB is updated accordingly. Full vCenter Discovery does not need to rerun. For some events, such as powered on and powered off events, Discovery does not need to run again at all. For most events, Discovery runs only on the necessary vCenter resource.

For instructions on configuring vCenter events, see Configure and run the vCenter event collector extension.

VM deleted from vCenter

If the VM is deleted from vCenter, the cmdb_ci_vm_instance state changes to terminated and the Status field changes to retired.

CIs removed from vCenter

When a vCenter CI, such as a virtual machine, is removed, the ServiceNow instance marks it as "stale" in the CMDB, using either of these procedures:

- When Discovery runs, it creates an audit record in the Components installed with CMDB Health table for the missing CI and marks the CI "stale".
- If the instance is configured to collect vCenter events, the system can also create a "stale" audit record for the CI in the CMDB Health Result [cmdb_health_result] table from the VmRemovedEvent event, without having to run Discovery.

Note: When the **Staleness** setting is configured, the dependency view (BSM map) grays out stale CIs in its relationship diagram to indicate that they were removed from vCenter.

To avoid stale CI health indicators from being generated during VMware discovery, set the system property *glide.cmdb.health.src.cmdb_health_audit_only* to **true**. This disables stale CI reporting from the VMware discovery source, enabling you to manage the CI life cycle through other means. For more information, see CMDB Health system properties.

You have the option of creating a CMDB remediation rule to automatically execute a remediation workflow that can, for example, delete stale CIs. For more information on stale CIs, see CMDB Health Metrics.

vCenter Discovery on Windows host

Windows credentials aren't necessary for vCenter Discovery, when valid VMware credentials are used.

Discovery for VMware virtual machines

Discovery gathers information about virtual machines managed by VMware vCenter.

The Discovery product can extract information from VMware configuration items (CI), including their relationships. Discovery is configured to work with the Orchestration VMware Support Plugin, which enables the automatic cloning of virtual machines by an ESX server managed by vCenter. For information about data collected by Discovery on vCenter, see Data collected for VMware Cloud Discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows discovery

Discovery identifies and classifies information about Windows computers that use IPv4 addresses, IPv6 addresses, or both.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Note: admin$ share access is required for Windows discovery from Madrid P3 and later. A Remote Access role must be configured in the target Windows Server to enable connectivity with ServiceNow Discovery.

Supported Windows versions

For IPv4 discovery:

- Windows Workstation 7, 8, 10
- Windows Server versions:
  - 2008
  - 2008R2
  - 2012R2
  - 2016
  - 2019
  - 2022
  - 2025

For IPv6 discovery:

- Windows 2019 (10.0.17763)
- Windows Server 2016
- Windows Desktop 10
- Windows 2019 Datacenter

Note: For fiber channel discovery on a Windows 2008 host, the Microsoft Fibre Channel Information Tool (`fcinfo.exe`) must be installed on that machine. The `fcinfo` executable should be available on the environment path. The Microsoft Fibre Channel Information Tool tool is available for download at http://www.microsoft.com.

IPv6 supportability limitations

The following device types haven't been verified for IPv6 discovery:

- Printers
- Network Storage (NFS, CIFS, NAS, FC, ISCSI)
- Azure virtual machines (IPv6 native mode isn't supported by Microsoft)

Requirements

Verify PowerShell support

ServiceNow now supports PowerShell 3.0 up to 5.1.

Configure Windows credentials

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Windows credentials.

Verify user access

Verify that the user configured for the credential has the following permissions:

- Local admin access to the Windows machine.
- Access to the WMI service to the current namespace and subnamespaces.
- Access to the PowerShell service.
- Membership in the Distributed COM Users local security group.

(Optional) Populate Virtual Machine Object field in Hardware [cmdb_ci_hardware] table

Starting with Discovery and Service Mapping Patterns version 1.30.2, you can improve query performance by populating the Virtual Machine Object field in the Hardware [cmdb_ci_hardware] table. For more information, see Improved query performance with direct field population in CI tables.

Set the preferred IP address version for network adapter discovery

Starting with Visibility Content version 6.32.0, if your network adapters support both IPv4 and IPv6, the IPv4 address is populated by default in the IP address [ip_address] field on the Network Adapter [cmdb_ci_network_adapter] table. To control which IP version is populated, see Set the preferred IP version for network adapter discovery.

*** Starting with Visibility Content version 6.32.0, for network adapters that support both IPv4 and IPv6, the IPv4 address is populated by default. Before this release, the populated value was selected randomly. To control which IP version is populated, see Set the preferred IP version for network adapter discovery.

The Windows registry

Discovery can find software that has been installed on a Windows machine by looking at the Windows Registry. Discovery can find the following attributes of discovered software:

- **Product Name**: Combination of name and version, such as Windows Imaging Component 3.0.
- **Name**: Name of the product only without the version.
- **Version**: Version of the product.
- **Uninstall String**: Path to the uninstaller, such as C : `\Program Files\Notepad++ \uninstall.exe`.
- **Part of**: Update for which this registry is a part, such as Windows Internet Explorer 8 - Software U.
- **Install Date**: The date the software was installed. The Windows - Installed Software sensor appends a timestamp of 00:00:00 to the install_date retrieved from the registry. The installation time of all Windows software is independent of the time zone and is set to midnight

Windows probes and permissions

Windows server cluster discovery

Discovery establishes the relationships between a Windows server cluster and its nodes.

When a Windows server is found, and Discovery detects that it is part of a cluster, the system launches the Windows - Cluster probe. Navigate to **Discovery Definition** > **Probes** and open the record for the Windows - Cluster probe to see the specific data Discovery collects.

Note: Discovery collects cluster resources based on the MSCluster_ResourceType WMI class. To see a list of default cluster resources, see Resource Types. To understand how cluster resources are related to process classifiers, see Relate the process classifier to Windows cluster resources.

Cluster data tables

Discovery creates CIs for clusters in these tables:

- Windows Cluster [cmdb_ci_win_cluster]
- Windows Cluster Resource(s) [cmdb_ci_win_cluster_resource]
- Windows Cluster Node(s) [cmdb_ci_win_cluster_node]
- Cluster Node Resource(s) [cmdb_ci_cluster_node_resource]
- Cluster Virtual IP(s) [cmdb_ci_cluster_vip]

Cluster relationships

Discovery creates a CI Relationship [cmdb_rel_ci] record for each node, using these relationships:

- **Cluster of::Cluster**: Relationship between the cluster nodes and the cluster. Service Mapping uses this relationship to map the Windows cluster and it's nodes.
- **Members::Member of**: Relationship between the cluster and the cluster node.
- **Hosted on::Hosts**: Relationship between the cluster nodes and the Windows server.
- **Uses::Used by**: Cluster VirtualIP and Windows Cluster Node.
- **Defines resources for::Gets resources from**: Windows Cluster Resources and Windows Cluster.
- **Defines resources for::Gets resources from**: Windows Cluster Resources and Windows Cluster Node.

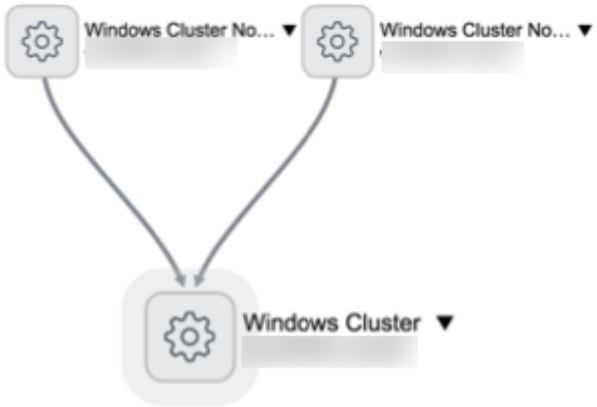
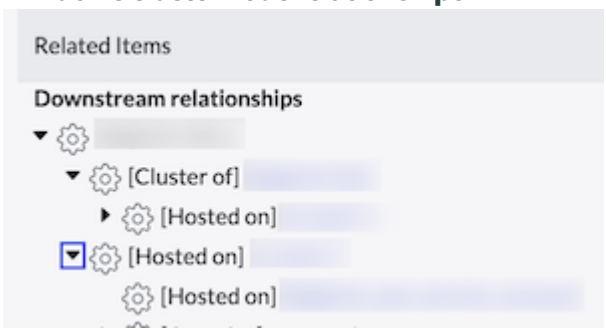
Windows cluster map



Windows cluster node relationships



Cluster references

Discovery creates the following cluster references:

- From Windows Cluster Nodes to the associated Windows Cluster.
- From Windows Cluster Resources to the associated Windows Cluster.
- From Cluster Virtual IPs to the associated Windows Cluster.
- From Cluster Node Resources to the associated Windows Cluster Node.
- From Cluster Virtual IPs to the associated Windows Cluster Node.

Note: References are maintained in Discovery to provide backward compatibility for systems that use them.

z/OS discovery

Discovery and Service Mapping Patterns finds computers running the z/OS operating system using the IBM zOS Server pattern. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The IBM zOS Server pattern performs infrastructure-level discovery for z/OS servers. To discover applications on z/OS, use application patterns, such as DB2 on Linux, WMQ On Unix, or Websphere On Unix. For more information, see IBM z/OS Discovery requirements and expectations [KB0623031] article in the Now Support Knowledge Base.

Prerequisites

Verify that the UNIX System Services (USS) is running on port 22

Verify that the USS service is running on port 22 on z/OS.

Verify the required commands on the host machine

Verify that you can run the following commands on the host machine:

- `uname`
- `hostname`
- `sysvar SYSNAME`
- `netstat`
- `df`
- `ls`
- `cat`
- `grep`
- `ps`
- `cut`

Verify required permissions

Verify that you have the following permissions:

- Write permission to `/tmp`
- Read access to all user processes
- Ability to run REXX scripts

Create SSH credentials

For more information, see SSH credentials.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the IBM zOS Server pattern. The pattern discovers USS-mounted file systems.

IBM zOS server [cmdb_ci_ibm_zos_server]

Field	Description
Name [name]	Hostname of the z/OS system.
OS Version [os_version]	z/OS operating system version. For example: V2R5 or 3.1.
Operating System [os]	Operating system type. The value is set to **IBM_ZOS**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IBM zOS server [cmdb_ci_ibm_zos_server] (continued)

Field	Description
Manufacturer [manufacturer]	Hardware manufacturer. The value is set to **IBM**.
Serial number [serial_number]	Hardware chassis serial number.
Model ID [model_id]	Hardware model display name based on model code lookup. For example: z14, z15, or zEnterprise 196. If the model code isn't in the lookup table, this field remains empty.
IP Address [ip_address]	Management IP address used for discovery connection.

IP Address [cmdb_ci_ip_address]

Field	Description
IP Address [ip_address]	IPv4 or IPv6 address.
Netmask [netmask]	Network mask for the IP address. The value is set to **0.0.0.0**.
MAC Address [mac_address]	Hardware MAC address. If unavailable, the value is set to **NOT_FOUND**.
Nic [nic]	References the Network Adapter [cmdb_ci_network_adapter] table.

Network Adapter [cmdb_ci_network_adapter]

Field	Description
Name [name]	Network interface name. If unavailable, the value is set to **VIP**.
IP Address [ip_address]	IPv4 or IPv6 address assigned to this network adapter.
Netmask [netmask]	Network mask for the adapter. The value is set to **0.0.0.0**.
MAC Address [mac_address]	Hardware MAC address for the network adapter. If unavailable, the value is set to **NOT_FOUND**.
Configuration Item [cmdb_ci]	References the IBM zOS server [cmdb_ci_ibm_zos_server] table.

File System [cmdb_ci_file_system]

Field	Description
Name [name]	Name of the USS file system set to the mount point path. For example: `/`, `/tmp`, or `/u`.
Volume ID [volume_id]	Volume identifier, set to the mount point path.
Mount point [mount_point]	Directory path where the file system is mounted in the USS hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File System [cmdb_ci_file_system] (continued)

Field	Description
File system [file_system]	USS dataset name of the zFS file system. For example: OMVS . ROOT . ZFS or OMVS . TMP . ZFS.
Size bytes [size_bytes]	Total capacity of the file system in kilobytes (KB), as retrieved by the *df -Pkv* command.
Free space bytes [free_space_bytes]	Available free space in the file system in KB, as retrieved by the *df -Pkv* command.
Computer [computer]	References the IBM zOS server [cmdb_ci_ibm_zos_server] table.

CI relationships

CI	Relationship	CI
IBM zOS server [cmdb_ci_ibm_zos_server]	Owns::Owned by	Network Adapter [cmdb_ci_network_adapter]
IBM zOS server [cmdb_ci_ibm_zos_server]	Owns::Owned by	IP Address [cmdb_ci_ip_address]
IBM zOS server [cmdb_ci_ibm_zos_server]	Contains::Contained by	File System [cmdb_ci_file_system]
IP Address [cmdb_ci_ip_address]	References	Network Adapter [cmdb_ci_network_adapter]
Network Adapter [cmdb_ci_network_adapter]	References	IBM zOS server [cmdb_ci_ibm_zos_server]
Serial Number [cmdb_serial_number]	References	IBM zOS server [cmdb_ci_ibm_zos_server]
File System [cmdb_ci_file_system]	References	IBM zOS server [cmdb_ci_ibm_zos_server]

Set the preferred IP version for network adapter discovery

Control which IP version Discovery populates on a Network Adapter CI during Linux, Windows, and Solaris discovery.

Before you begin

Verify that you have at least version 6.32.0 of Visibility Content.

Role required: discovery_admin

About this task

When a network adapter supports both IPv4 and IPv6, Discovery populates the IP Address [ip_address] field on the Network Adapter [cmdb_ci_network_adapter] CI with one IP address. Before Visibility Content version 6.32.0, Discovery selected

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the value randomly. Starting from this release, IPv4 is populated by default. Use the *network_adaptor_preferred_ip_version* MID Server property to specify which IP version to populate.

Procedure

1. Navigate to **All** > **MID Server** > **Properties**.
2. In the **Name** column, search for `network_adaptor_preferred_ip_version`.
3. Select the *network_adaptor_preferred_ip_version* property.
4. In the **Value** field, enter the accepted value for the IP version to populate.

   Values are case-sensitive. Use only the accepted values listed in the table.

   Accepted IP version values

IP version	Accepted values
IPv4	ipv4, IPv4, or v4.
IPv6	ipv6, IPv6, or v6.

5. Select **Update**.

What to do next

Run discovery again or wait for the scheduled run to apply the changes.

Related topics

Linux discovery

Solaris discovery

Windows discovery

Operating system-level virtualization discovery

Discovery can collect image and container information from Operating system-level virtualization (OS-level virtualization) engines.

Discovery can determine container status and size and identify images and their tags provided by operating-system-level virtualization.

Note: Currently, the ServiceNow® platform supports the discovery of Docker virtualization containers only.

Table schema

Table	Description
cmdb_ci_oslv_engine	Base table for all OSLV engines.
cmdb_ci_oslv_image	Base table for globally unique OSLV images.
cmdb_ci_oslv_local_image	Base table for local instances of OSLV images.
cmdb_ci_oslv_image_tag	Base table for tags on OSLV images.
cmdb_ci_oslv_container	Base table to store containers found on the host.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected

Table	Fields
Operating System Level Virtualization Engine [cmdb_ci_oslv_engine]	Server [server]
Operating System Level Virtualization Image [cmdb_ci_oslv_image]	• Image ID [image_id] • Image digest [image_digest] • Image created [image_created_at] • Size (bytes) [size_bytes]
Operating System Level Virtualization Local Image [cmdb_ci_oslv_local_image]	Image ID [image_id]
Operating System Level Virtualization Image Tag [cmdb_ci_oslv_image_tag]	• Image ID [image_id] • Repository [repository] • Tag [tag]
Operating System Level Virtualization Container [cmdb_ci_oslv_container]	• Container ID [container_id] • Status [status] • Size (bytes) [size_bytes] • Image ID [image_id]

Docker virtualization

Discovery uses the *Docker Pattern* to collect data about specific objects in a Docker engine, running on a Linux host.

The ServiceNow® platform supports the discovery of Docker release 1.11.0 or later.

Discovery runs the Docker Engine process classifier in the network. If the classifier identifies the **dockerd** or **docker daemon** process, the classifier triggers the Horizontal Pattern (HorizontalDiscoveryProbe) probe, which launches the Docker Pattern and begins collecting data from Docker components.

Starting with Discovery and Service Mapping Patterns version 1.31.0, you can choose to discover Docker image CIs only, without discovering Docker container CIs. Check your entitlements to determine whether you have access to 2026 Container Packaging. For more information, see Disable Docker container CI discovery.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Prerequisites

User privileges

The user whose credentials are used to perform Docker Discovery must have privileges defined by one of these methods:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Provide a user with elevated rights for running commands, since the Docker daemon runs as the root user. The Docker pattern supports the use of privileged commands, such as *sudo* or *pbrun*, to run as the root user.
- Assigned to a group named **docker**, which has special privileges for running Docker commands. For instructions on setting up a group, see documentation on Docker.

Latest patterns

Deploy the latest Discovery and Service Mapping Patterns application from ServiceNow Store.

Docker restrictions and considerations

When using Docker virtualization, consider the following:

- The initial Discovery process scan can identify an application in a container and classify it correctly. However, subsequent probes launched to explore that application cannot see inside the container and cannot return details about the application.
- Discovery scans all containers it finds, including inactive containers, which can slow down Discovery. You should delete containers that are not running.
- Before setting *sn_itom_pattern.manifest_digest_image_id* property to **true** and running discovery: prevent duplicate Docker records from being created by deleting all Docker image records.
- Only one Docker engine is permitted per computer (on either a physical or virtual machine).

Data collected by Discovery during horizontal discovery

These attributes are discovered, in addition to the attributes derived from the parent OSLV tables.

Table and fields	Description
Docker Engine [cmdb_ci_docker_engine]	
Name [name]	Stores information about instances of the Docker engine.
OS Arch [os_arch]	
GIT Commit [git_commit]	
Build Date [build_date]	
Version [version]	
API Version [api_version]	
Go Version [go_version]	
Is Clustered [is_clustered]	
Running Process [running_process]	
Running Process Command [running_process_command]	
Running Process Key Parameters [running_process_key_parameters]	
Docker Image [cmdb_ci_docker_image]

Table and fields	Description
Name [name]	Stores information on the globally unique representation of Docker images.
Image id [image_id]	
Image digest [image_digest]	
Size (byte) [size_byte]	
Image created [Image_created_at]	
Docker Local Image [cmdb_ci_docker_local_image]	
Name [name]	Stores local instances of Docker images.
Image id [image_id]	
Docker Image Tag [cmdb_ci_docker_image_tag]	
Name [name]	Stores tags from local Docker images.
Image id [image_id]	
Repository [repository]	
Tag [tag]	
Docker Container [cmdb_ci_docker_container]	
Name [name]	Stores Docker containers found on the host. In cases where duplicate records are created, deduplication tasks appear once discovery runs. For information on how to resolve these tasks, see the Making docker container identifier independent [KB1443042] article in the ServiceNow® Knowledge Base.
Image id [image_id]	
Container id [container_id]	
Size (bytes) [size_bytes]	
Command [command]	
Container created [container_created]	
Status [status]	

The *Collect Container Repository* extension section discovers this information.

Table and field	Description
Container Repository [cmdb_ci_container_repository]	
Name [name]	The name of the container repository.
Container Repository Entry [cmdb_ci_container_repository_entry]	
Name [name]	The name of the container repository entry.
Category [category]	The category of the container repository entry.

CI relationships

The Docker Pattern identifies the following relationships between discovered CIs.

CI	Relation	CI
cmdb_ci_server	Runs::Runs On	cmdb_ci_docker_engine

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI	Relation	CI
cmdb_ci_docker_engine	Manages::Managed By	cmdb_ci_docker_container
cmdb_ci_docker_engine	Manages::Managed By	cmdb_ci_docker_local_image
cmdb_ci_docker_image	Instantiates::Instantiated By	cmdb_ci_docker_container
cmdb_ci_docker_local_image **Note:** The direction of this relation is the opposite for all store versions earlier than 1.0.99, February 2023.	Instantiates::Instantiated By	cmdb_ci_docker_container
cmdb_ci_docker_image_tag	Registered On::Has Registered	cmdb_ci_docker_local_image
cmdb_ci_docker_local_image	Instantiates::Instantiated By	cmdb_ci_docker_image

The *Collect Container Repository* extension section of the Docker Pattern identifies these relationships.

CI	Relationship	CI
Docker Image [cmdb_ci_docker_image]	Provisioned From::Provisioned	Container Repository Entry [cmdb_ci_container_repository_entry]
Container Repository Entry [cmdb_ci_container_repository_entry]	Hosted on::Hosts	Container Repository [cmdb_ci_container_repository]

Identification, containment, and hosting rules

Discovery uses an application rule identifier to find the Docker engine and then applies other rules to identify specific Docker objects.

Application rule identifier

The system creates the cmdb_ci_docker_engine configuration item (CI) during process classification. Based on this, Discovery uses the Application Rule identifier on the Application [cmdb_ci_appl] table to identify the particular Docker engine encountered. After establishing this identity, Discovery uses the relationships defined in the containment and hosting rules to accurately create and update the individual Docker component CIs related to that engine.

Identifiers

Name	Table	Attributes
Docker Container	Docker Container [cmdb_ci_docker_container]	container_id
Docker Global Image	Docker Image [cmdb_ci_docker_image]	image_id
Docker Local Image	Docker Local Image [cmdb_ci_docker_local_image]	image_id

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Table	Attributes
Docker Image Tag	Docker Image Tag [cmdb_ci_docker_image_tag]	repository, tag

Containment and hosting rules

Docker Discovery uses these Create or edit a collection of containment rules and Create or edit a collection of hosting rules rules to create configuration items (CI) from the data returned by the Docker Pattern. After Discovery identifies the Docker engine by its relationship to the Application [cmdb_ci_appl] table, it uses these rules to identify the specific CIs connected to that engine from their relationships to one another. By connecting the components to one another in this fashion, from the application down, starting with the engine, Discovery avoids creating duplicate CIs for components from other Docker engines that use the same name or image_id.

Containment rule

Parent	Child	Relationship
Docker Local Image	Docker Image Tag	Has registered

Hosting rules

Parent	Child	Relationship
Docker Container	Docker Engine	Managed by
Docker Local Image	Docker Engine	Managed by

Software discovery

Discovery identifies several types of software.

Active Directory Domain Controller discovery

The Discovery and Service Mapping Patterns application uses the Active Directory Domain Controller On Windows pattern to find Active Directory domain controllers running on a Windows server. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

When discovery runs on a domain controller, the pattern also creates LDAP endpoint connections to child domains in the same forest, triggering discovery of those domain controllers as well.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Prerequisites

Verify that the applications are up to date

- Discovery and Service Mapping Patterns
- Visibility Content

Verify an LDAP or TCP entry point is configured

Verify that the relevant port is open and listening on the domain controller.

Create Windows credentials with WMI access

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verify that the credentials have permission to run WMI queries on the `\\root\CIMV2` namespace. For more information, see Windows credentials.

Schedule a horizontal discovery

For more information, see Schedule a horizontal discovery.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Active Directory Domain Controller On Windows pattern.

Active Directory Domain Controller [cmdb_ci_ad_controller]

Field	Description
Name [name]	Name of the domain controller, which is the domain name.
Domain name [domain_name]	Name of the Active Directory domain.
Domain Controller name [domain_controller_name]	Name of the domain controller server.
Forest name [forest_name]	DNS name of the Active Directory forest.

CI relationships

The Active Directory Domain Controller On Windows pattern creates the following relationships to support Active Directory Domain Controller discovery.

CI relationships

CI	Relationship	CI
Active Directory Domain Controller [cmdb_ci_ad_controller]	Runs on::Runs	Windows Server [cmdb_ci_win_server]

Adobe JRun discovery

Discovery creates or updates a CMDB record when it detects a running instance of Adobe JRun.

By default, Discovery uses the *Jrun* pattern to perform the Discovery.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Privileged commands

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Data collected for Adobe JRun

The following data is collected in the Jrun `[cmdb_ci_app_server_jrun]` table:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field Name
Name	name
Version	version
Installation directory	install_directory
Configuration directory	config_directory
Configuration file	config_file

Apache web server discovery

Discovery identifies and classifies information about Apache web servers on both Windows and Linux computers.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Credentials

- Applicative credentials
- Windows credentials
- SSH credentials

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Classifier, patterns, and probes

Classifier	Trigger probes	Patterns
Apache Server	• Horizontal discovery probe: Launches patterns • Apache - Version* • Apache - Get Configuration* • Apache - Get JK ModuleApache - Get Proxy Module*	• Apache On Windows Pattern • Apache On Unix Pattern

*For new instances, these probes are inactive on the classifier. Discovery uses patterns for discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected using probes

Discovery collects the following data on the Apache [cmdb_ci_apache_web_server] table for both Unix and Windows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field name
Name	name
Version	version
Description	description
TCP port(s)	tcp_port

Connections found by Service Mapping during top-down discovery

Service Mapping uses discovery patterns to discover the following connections:

- Any application using java
- Any application using the LDAP port
- Oracle WebLogic Module Oracle, and WebLogic Server (version 10.3)
- (On Windows only) Jiva applications
- (On Windows only) Tomcat server
- (On UNIX only) Applications discovered using the mod_jk process
- (On UNIX only) Hosts to which the Apache web server is connecting in the load balancing mode
- (On UNIX only) Epic application

Apache mod_jk and mod_proxy discovery

Discovery uses SSH to find Apache connectors mod_jk and mod_proxy.

Discovery uses the **Unix - Active Processes** probe to identify an Apache web server process by matching one of the following criteria: the **name** of the process is:

- `httpd`, or
- `apache`, or
- `httpd2`, or
- `httpd2-prefork`
- `httpd.worker`

If there is a match on one of these criteria, a record is created in the Web Server [cmdb_ci_web_server] table if one does not already exist for that running process.

The following probes are triggered after classification:

Apache web server probes

Probe	Description	Commands
Apache – Version	The sensor of this probe populates the Apache version information in the Web Server record.	httpd
Apache – Get Configuration	This probe contains a Bourne shell script and an argument that determines the path of the Apache configuration file. The sensor of this probe populates some additional information in the Web Server record.	echo, sed, httpd, cut, grep, egrep (within the Borne shell script)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The sensor processing of the **Apache – Get Configuration** probe identifies whether either the mod_jk or mod_proxy modules are present and triggers the appropriate probe.

Apache module probes

Probe	Description	Commands
Apache – Get JK Module	If the mod_jk module is running as a load balancer on the server, the sensor of this probe populates the information in the Load Balancer Service [cmdb_ci_lb_service], Load Balancer Pool [cmdb_ci_lb_pool] and Load Balancer Pool Member [cmdb_ci_lb_pool_member] tables.	echo, sed, httpd, cut, grep, egrep (within the Borne shell script)
Apache – Get Proxy Module	If the mod_proxy module is running as a load balancer on the server, the sensor of this probe populates the information in the Load Balancer Service [cmdb_ci_lb_service], Load Balancer Pool [cmdb_ci_lb_pool] and Load Balancer Pool Member [cmdb_ci_lb_pool_member] tables.	grep, egrep (within the Borne shell script)

In addition to data population, the following relationships are created in the CI Relationship [cmdb_rel_ci] table:

- The records in the cmdb_ci_lb_appl table run on the cmdb_ci_web_server table records.
- The records in the cmdb_ci_lb_service table use the cmdb_ci_lb_pool table records.
- The records in the cmdb_ci_lb_pool table are used by the cmdb_ci_service table record.
- The records in the cmdb_ci_lb_pool table are members of the cmdb_ci_lb_pool_member table.
- The records in the cmdb_ci_lb_pool_member table are members of the cmdb_ci_lb_pool table.

Legacy: Add sudo access for the Unix - Active Processes probe

For an Apache web server the Unix - Active Processes probe requires sudo privileges.

Before you begin

Role required: admin

About this task

You can configure the Unix - Active Processes probe to elevate privileges.

Procedure

1. Navigate to **All** > **Discovery** > **Probes**.
2. In the **Search** field, search for Unix - Active Processes.
3. Click field, search for Unix - Active Processes probe.
4. In the **Probe Parameters** related list, click**New**.
5. Click **New**
6. Use the following information to fill out the form:

Probe	Commands
Name	must_sudo

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Probe	Commands
Value	true

7. Click **Submit**

Data collected by Mod_jk module

The Apache mod_jk module forwards requests from the Apache web server to a Servlet container, such as Tomcat.

Additional mod_jk directives can also manage load balancing. Discovery populates the CMDB when it detects an Apache Server. When the Apache Web Server process is detected, if the mod_jk module is running on the web server as a load balancer, the related information populates to the CMDB.

- The MID Server user account to explore the target server must have access to the httpd.conf configuration file in the /etc/httpd/conf/ folder.
- Discovery uses secure shell (SSH) commands to identify the following associated elements:
  - Apache Get Configuration
  - Apache Version
  - Apache Get JK Module
- The following probes require execute privileges to run commands:

Probes that require execute privileges

Probe	Command
Apache – Get Configuration	echo, sed, httpd, cut, grep, egrep (within the Borne shell script)
Apache – Version	httpd
Apache – Get JK Module	echo, sed, httpd, cut, grep, egrep (within the Borne shell script)

Probes and sensors

Discovery uses the Unix - Active Processes probe to identify an Apache server that contains the mod_jk module:

1. The Unix - Active Processes probe detects a running process that matches one of the following criteria:
   - The name of the process is httpd.
   - The name of the process is apache.
2. If there is a match on one of these criteria, a record is created in the Web Server table [cmdb_ci_web_server] if one does not already exist for that running process. The following probes are also triggered:
   - Apache – Version: the sensor of this probe populates the Apache version information in the Web Server record.
   - Apache – Get Configuration: this probe contains a Bourne shell script and an argument that determines the path of the Apache configuration file. The sensor of this probe populates some additional information in the Web Server record.
3. The sensor processing of Apache – Get configuration probe results triggers the following probes if the mod_jk module is running on the web server:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Apache – JK Module: if the mod_jk module is running as a load balancer on the server, the sensor of this probe populates the information in the Load Balancer Service [cmdb_ci_lb_service], Load Balancer Pool [cmdb_ci_lb_pool] and Load Balancer Pool Member [cmdb_ci_lb_pool_member] tables.

Data Collected

For the mod_jk module with no load balancer, the following data is collected by default:

Default Data Collected by Discovery

Table Name	Field and Label Name	Probe
cmdb_ci_web_server	Name [name]	Apache – Get Configuration
cmdb_ci_web_server	Version [version]	Apache – Version
cmdb_ci_web_server	Description [short_description]	Apache – Version

If the mod_jk module is enabled for load balancing, Discovery connects the following data:

Data Collected by Discovery When the mod_jk Module is Identified as a Load Balancer

Table Name	Field and Label Name	Probe
cmdb_ci_lb_appl	Name [name]	Apache – Apache - Get JK Module
cmdb_ci_lb_appl	IP Address [ip_address]	Apache – Apache - Get JK Module
cmdb_ci_lb_appl	Last Discovered [last_discovered]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool_member	Name [name]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool_member	Last Discovered [last_discovered]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool_member	IP Address [ip_address]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool_member	Load Balancer [load_balancer]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool_member	Port [port]	Apache – Apache - Get JK Module
cmdb_ci_lb_service	Input URL [Input_url]	Apache – Apache - Get JK Module
cmdb_ci_lb_service	Last Discovered [last_discovered]	Apache – Apache - Get JK Module
cmdb_ci_lb_service	IP Address [ip_address]	Apache – Apache - Get JK Module
cmdb_ci_lb_service	Name [name]	Apache – Apache - Get JK Module

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Collected by Discovery When the mod_jk Module is Identified as a Load Balancer (continued)

Table Name	Field and Label Name	Probe
cmdb_ci_lb_service	Load Balancer [load_balancer]	Apache – Apache - Get JK Module
cmdb_ci_lb_service	Port [port]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool	Last Discovered [last_discovered]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool	Load balancing Method [load_balancing_method]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool	Load Balancer [load_balancer]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool	Name [name]	Apache – Apache - Get JK Module

Relationships

In addition to data population, the following relationships are created in the CI Relationship [cmdb_rel_ci] table:

- The records in the cmdb_ci_lb_appl table run on the cmdb_ci_web_server table records.
- The records in the cmdb_ci_lb_service table use the cmdb_ci_lb_pool table records.
- The records in the cmdb_ci_lb_pool table are used by the cmdb_ci_service table record.
- The records in the cmdb_ci_lb_pool table are members of the cmdb_ci_lb_pool_member table.
- The records in the cmdb_ci_lb_pool_member table are members of the cmdb_ci_lb_ pool table.

Data collected by Mod_proxy module

The Apache mod_proxy module implements a proxy, gateway, or cache for the Apache web server.

An additional mod_proxy_balancer can also manage load balancing. Discovery populates the CMDB when it detects an Apache server. When the Apache Web Server process is detected, if the mod_proxy module is running on the web server as a load balancer the related information populates to the CMDB.

Consider the following requirements for discovering an Apache server that contains the mod_proxy module:

- The MID Server user account to explore the target server must have access to the [httpd.conf] configuration file in the /etc/httpd/conf/ folder.
- Discovery uses secure shell (SSH) commands to identify the following associated elements:
  - Apache Get Configuration
  - Apache Version
  - Apache Get Proxy Module
- The following probes require execute privileges to run commands:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected from the mod_jk module

Probe	Commands
Apache – Get Configuration	echo, sed, httpd, cut, grep, egrep (within the Borne shell script)
Apache – Get Proxy Module	grep, egrep (within the Borne shell script)
Apache – Version	httpd

Probes and sensors

Discovery uses the Unix - Active Processes probe to identify an Apache server that contains the mod_proxy module. The probes and sensors operate in the following manner:

1. The Unix - Active Processes probe detects a running process that matches one of the following criteria:
   - The name of the process is httpd.
   - The name of the process is apache2.
2. If there is a match on one of these criteria, a record is created in the Web Server table [cmdb_ci_web_server] if one does not already exist for that running process. The following probes are also triggered:
   - Apache – Version: the sensor of this probe populates the Apache version information in the Web server [cmdb_ci_web_server] record.
   - Apache – Get Configuration: this probe contains a Bourne shell script and an argument that determines the path of the Apache configuration file. The sensor of this probe populates some additional information in the Web server [cmdb_ci_web_server] record.
3. The sensor processing of the Apache – Get configuration probe results triggers the following probes if the mod_proxy module is running on the web server:

   Apache - Get Proxy Module: if the mod_proxy module is running as a load balancer on the server, the sensor of this probe populates the information in the Load Balancer Service [cmdb_ci_lb_service], Load Balancer Pool [cmdb_ci_lb_pool] and Load Balancer Pool Member [cmdb_ci_lb_pool_member] tables.

Data Collected

For the mod_proxy module with no load balancer, the following data is collected by default:

Data collected by Discovery by default

Table Name	Field and Label Name	Probe
cmdb_ci_web_server	Name [name]	Apache – Get Configuration
cmdb_ci_web_server	Version [version]	Apache – Version
cmdb_ci_web_server	Description [short_description]	Apache – Version

If the mod_proxy module is enabled for load balancing, Discovery connects the following data:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected by Discovery if the mod_proxy module is identified as a load balancer

Table Name	Field and Label Name	Probe
cmdb_ci_lb_appl	IP Address [ip_address]	Apache - Get Proxy Module
cmdb_ci_lb_appl	Last Discovered [last_discovered]	Apache - Get Proxy Module
cmdb_ci_lb_pool_member	Name [name]	Apache - Get Proxy Module
cmdb_ci_lb_pool_member	Last Discovered [last_discovered]	Apache - Get Proxy Module
cmdb_ci_lb_pool_member	IP Address [ip_address]	Apache - Get Proxy Module
cmdb_ci_lb_pool_member	Load Balancer [load_balancer]	Apache - Get Proxy Module
cmdb_ci_lb_pool_member	Port [port]	Apache - Get Proxy Module
cmdb_ci_lb_service	Input URL [Input_url]	Apache - Get Proxy Module
cmdb_ci_lb_service	Last Discovered [last_discovered]	Apache - Get Proxy Module
cmdb_ci_lb_service	IP Address [ip_address]	Apache - Get Proxy Module
cmdb_ci_lb_service	Name [name]	Apache - Get Proxy Module
cmdb_ci_lb_service	Load Balancer [load_balancer]	Apache - Get Proxy Module
cmdb_ci_lb_service	Port [port]	Apache - Get Proxy Module
cmdb_ci_lb_pool	Last Discovered [last_discovered]	Apache - Get Proxy Module
cmdb_ci_lb_pool	Load balancing Method [load_balancing_method]	Apache - Get Proxy Module
cmdb_ci_lb_pool	Load Balancer [load_balancer]	Apache - Get Proxy Module
cmdb_ci_lb_pool	Name [name]	Apache - Get Proxy Module

Relationships

In addition to data population, the following relationships are created in the CI Relationship [cmdb_rel_ci] table:

- The records in the cmdb_ci_lb_appl table run on the cmdb_ci_web_server table records.
- The records in the cmdb_ci_lb_service table use the cmdb_ci_lb_pool table records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The records in the cmdb_ci_lb_pool table are used by the cmdb_ci_service table records.
- The records in the cmdb_ci_lb_pool are members of the cmdb_ci_lb_pool_member table records.
- The records in the cmdb_ci_lb_pool_member is a member of the cmdb_ci_lb_pool table records.

Application Mapping for UNIX discovery

To perform the mapping that establishes application relationships, Discovery must be able to detect TCP connections.

The best way to accomplish this is to run the lsof command on target machines. For AIX machines, Discovery is configured to use the active connection probe for AIX targets. However, the user that executes the shell script on AIX machines might require additional privileges to execute commands, such as kdb, employed in the script.

On Linux machines, Discovery uses the `lsof` command (installed by default on Linux) to detect TCP connections. The Linux classification probe triggers the Linux - Active Connections probe, which uses `lsof` to discover application relationships and does not produce any pauses. The `lsof` command is the recommended method of returning active TCP connections and can be installed on Solaris and AIX target machines to eliminate any issues produced by the shell script.

Note: Discovery of active connections on HP-UX is not supported.

Using the lsof Command

Use the ls of command to return active TCP connections and can be installed on Solaris and AIX target machines.

Before you begin

Role required: admin

Procedure

1. Install `lsof` on the Solaris and AIX machines on which you want to gather application relationship data.
2. In the instance, navigate to **Discovery Definition** > **CI Classification** > **UNIX**.
3. Select **Solaris** from the list.
4. In the UNIX Classification form for Solaris, select the **Triggers probes** related list, and then select **Edit**.
5. Move **Linux - Active Connections** from the Collections list to the Triggers probe List.
   This probe is configured to use `lsof`.
6. Select **Save**.
7. Repeat this procedure for the AIX classification probe.

Citrix License Server and Delivery Controller discovery

Discovery can find Citrix License Server instances and Delivery Controller components that run on Windows machines.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirements

- Configure Windows administrative credentials to access the host machine.
- Make sure that PowerShell for Discovery is installed on your MID Servers. The patterns used for Citrix discovery require the ability to run PowerShell commands.
- For OS users, make sure you can execute “Get-XDSite.” The Citrix Studio Admin should provide permissions.
- (Optional) For top-down discovery with Service Mapping, on Citrix Delivery Controller, install the Citrix.Broker module.
- (Optional) For top-down discovery with Service Mapping, a user with permission to run PowerShell commands.
- (Optional) (Optional) For discovering using the WinRM protocol, see Configure WinRM trusted hosts on MID Server.

Patterns

Discovery uses these patterns to perform horizontal discovery:

Pattern	Process detected
Citrix License Server	lmadmin.exe
Delivery Controller	BrokerService

Data collected and relationships

Table	Fields
Citrix License Server [cmdb_ci_appl_license_server]	Name [name] TCP ports [tcp_port] Operational status [operational_status]
Citrix Delivery Controller [cmdb_ci_appl_delivery_controler]	Name [name] Version [version] Operational status [operational_status]

CI	Relationship	CI
Citrix License Server [cmdb_ci_appl_license_server]	Runs on::Runs	Windows Server [cmdb_ci_win_server]
Citrix Delivery Controller [cmdb_ci_appl_delivery_controler]	Runs on::Runs	Windows Server [cmdb_ci_win_server]

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Clustered application discovery on Windows

A process and its corresponding resource information can be used to determine whether the process is a clustered process.

The **Microsoft SQL Server** process classifier that comes with your instance identifies clustered SQL Servers. You can leverage the same technique to detect other clustered applications on Windows using Discovery.

To detect Windows clustered applications with Discovery, you create a process classifier that detects whether a process is a clustered process. Perform the following steps:

Create a classifier for clustered processes

To detect Windows clustered applications, create a process classifier for that CI type.

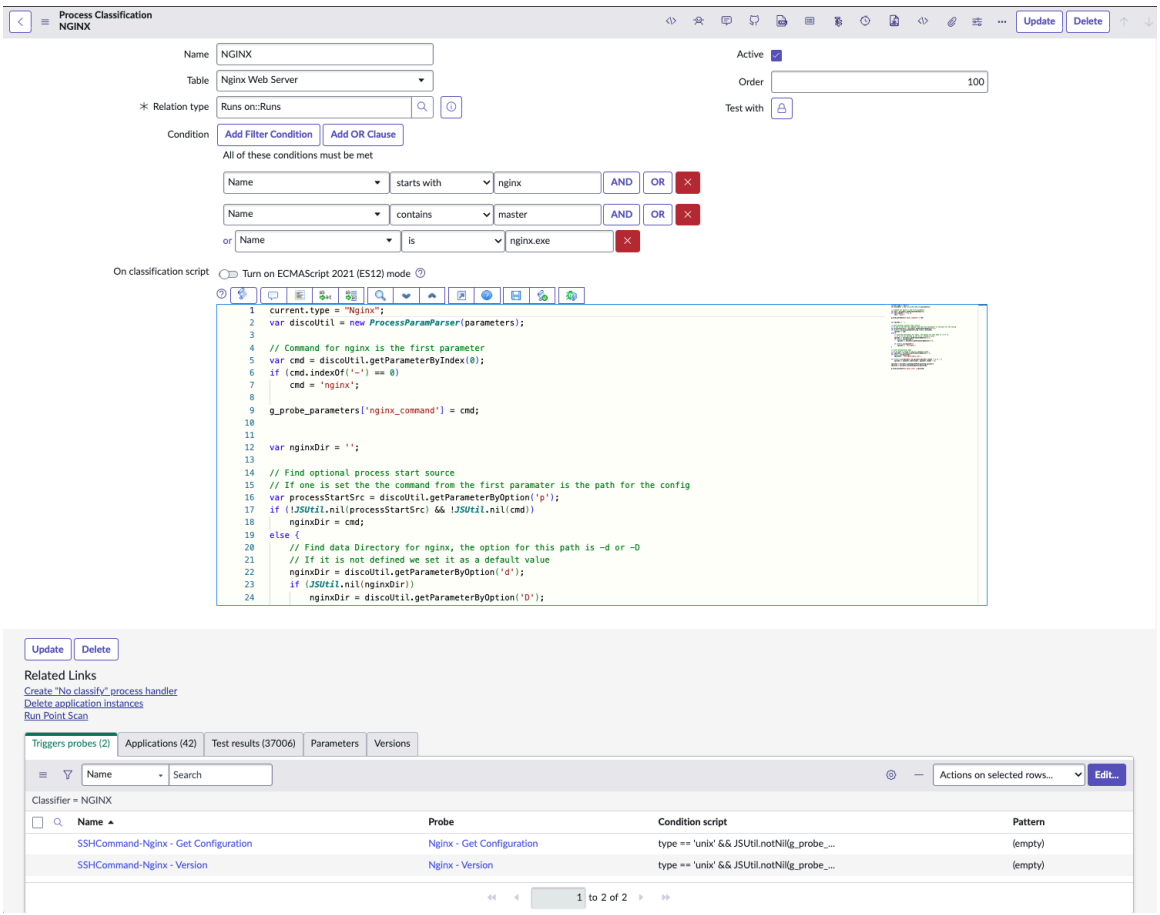
Before you begin

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery Definition** > **CI Classification** > **Processes**.
2. Click **New**.
3. Fill out the form using the fields from the table.
4. Click **Submit**.

Process Classification form



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process classification form

Field	Description
Name	A unique name for the process classifier.
Table	Select **Application**.
Relation type	Select the CI relationship type for this classification. The relationship field is only available for Process and Scan Application classifications. Discovery process classifications typically use one of these relationship types: ○ **Runs on::Runs**: Defines the relationship of an application to the host on which it runs. This relationship is expressed from the perspective of the host and the application. For example: My database application runs on server001::server001 runs my database application. ○ **Depends on::Used by**: Defines the relationship of an application that communicates with another application. This relationship is expressed from the perspective of each application. For example: The Tomcat application depends on the MySQL database:: The MySQL database is used by Tomcat. ○ **Virtualized by::Virtualizes**: Defines the relationship of a virtual machine to its host. This relationship is expressed from the perspective of the virtual machine and of the host. For example: server001 is virtualized by ServerESX::Server ESX virtualizes server001. ○ **Cluster of::Cluster**: Defines the relationship of a cluster node to the cluster to which it belongs. This relationship is expressed from the perspective of the cluster node and of the cluster. ○ **Hosted on::Hosts**: Defines the relationship of a cluster node and the Windows host. This relationship is expressed from the perspective of the cluster node and of the Windows host.
Active	Select this box to activate the process classification. Deselect to deactivate it.
Order	Enter the order in which Discovery should run this process classification when there are multiple classifications available for a table. Discovery runs process classifications from the lowest to the highest order.
Test with	Lists the host CI where an automatically generated process classification conditions were met. Use this field to test changes to the process classification to ensure that the updated classification behaves as expected.
Condition	Configure the appropriate condition. The example screenshot triggers this process classification when the process command contains the string `MSFT SQL Server 2000`.

Relate the process classifier to Windows cluster resources

In the second step, relate the process classifier to the information that is in the Windows Cluster resources table.

Before you begin

Role required: admin

About this task

The Windows Cluster resources table is cmdb_ci_win_cluster_resource. This relationship is built through JavaScript.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate back to the process classification you just made.
2. Select the **Parameters** tab.
3. Select **New**.
4. Fill out the fields on the form.

Classifier parameter form

Field	Description
Name	Select a unique name.
Application	Select **Global**.
Type	Enter **Cluster**.
Value	This field defines two JavaScript objects, called `resourceType` and `isMatch`. For more information, see Populate the Value field on the Classifier Parameter form.

5. Select **Submit**.

Populate the Value field on the Classifier Parameter form

The value field defines two JavaScript objects, called `resourceType` and `isMatch`.

Before you begin
Role required: admin

About this task
The `resourceType` value refers to the Resource Type column in the Windows Cluster Resources table [cmdb_ci_win_cluster_resource]. The `resourceType` value can not be empty or null.

Procedure

1. Navigate to a Windows cluster page to access the Windows Cluster Resources table.
2. Click the **Windows Cluster Resources** tab.

Example:
The **isMatch** value evaluates whether the process is a clustered process.

- An evaluation that returns **true** indicates the process is a clustered application, and the process is classified as a clustered application in the cluster.
- An evaluation that returns **false** classifies the process as a regular application running on the cluster node.

The **isMatch** value is a function that contains two input variables, process and resource:

- process: Process is the GlideRecord of the process application. It is determined by the **Table** field in the classifier. In this example, it is the GlideRecord entry of the Application table (cmdb_ci_app) for the process that is being classified. You have access to any field values for the CI type such as name or version.
- resource: Resource is the GlideRecord entry in the Windows Cluster Resource table after the resourceType condition has been applied. In the example, it is the GlideRecord entry of the sixth row.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Examples of JavaScript for the Value field.

In the following example code: resourceType: "SQL Server" the query filters the Windows Cluster Resources table entry for the Resource Type field that has a value that is equal to SQL Server. In the following example table, the sixth record would be returned.

The following script indicates that if there is a resource of type SQL Server, the process is classified as a clustered application.

```
resourceType: "SQL Server"
isMatch: function(process, resource) {
    return true;
}
```

The following script indicates that if if there is a resource of type SQL Server, and the application name is equal to the resource name, then the process is classified as a clustered application.

```
resourceType: "SQL Server"
isMatch: function(process, resource) {
    if (process.name == resource.name)
        return true;
}
```

If there are multiple matches to the resourceType condition, the matching function is called multiple times. For the following resourceType example, the matching function is called twice because there are two entries that have **Physical Disk** in the **Resource Type** column in the sample Windows Cluster Resources table.

```
resourceType: "Physical Disk"
```

Discovery with Software Asset Management

The table structure for managing software installations behaves differently when the Software Asset Management (SAM) application is activated.

The presence of this application affects the way Discovery stores the software installation data it returns from a scan and require additional configuration within configuration item (CI) records.

The following tables are created when the Software Asset Management plugin is activated:

- Software Discovery Model [cmdb_sam_sw_discovery_model]
- Software Model [cmdb_software_product_model]
- Software Installation [cmdb_sam_sw_install]

> **Note:** The original schema used by previous versions is not affected when the Software Asset Management plugin is not activated.

When it runs, Discovery populates the Software Installation [cmdb_sam_sw_install] table. The appropriate configuration item (CI) references the software data. A business rule on this table runs, searching for a matching record on the Software Discovery Model [cmdb_sam_sw_discovery_model] table. If a record exists in the Software Discovery Model table, then the Software Installation table updates the record. If no record exists in the Software Discovery Model table, then one is created.

These tables are not used by Discovery with Software Asset Management:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Software [cmdb_ci_spkg]
- Software Model [cmdb_software_product_model]

> **Important:** When SAM is installed, the Software Installation [cmdb_sam_sw_install] table is the appropriate source for all current software data. This means you need to update any related lists or customized reference fields you added to CI records.

Starting with the Kingston release, the Discovery populates the VMWare License Key [samp_vmware_license_key] and VMWare License Key Usage [samp_vmware_license_key_usage] tables. See Data collected for VMware Cloud Discovery for more information on where Discovery saves vCenter data.

Configure a CI to display Software Asset Management data

Configure computer configuration item (CI) forms to display data from the Software Installations [cmdb_sam_sw_install] table.

Before you begin

Confirm you have installed and activated the Software Asset Management (com.sn_samp_master_ws) plugin.

Role required: admin

Procedure

1. Navigate to **All** > **Configuration** > **Servers** > **All**.
   Alternatively, enter `cmdb_ci_computer.list` in the filter navigator to open the Computer [cmdb_ci_computer] table list view.
2. Select a **Name** from the list to open any computer CI record.
3. Right-click in the header of the record and select **Configure** > **Related Lists** from the context menu.
   The Configuring related lists on Computer form page displays.
4. Scroll through the Available list and select **Software Installation->Installed on**.
5. Select the add icon.
   Software Installation->Installed on now displays in the Selected list.
6. Select **Save**.
7. Select the back icon to return to the computer record.
   The Software Installations tab now displays in the record's related list.

Microsoft Exchange Client Access Server discovery

Discovery creates or updates a CMDB record when it detects a running instance of Microsoft Exchange Client Access Server (Microsoft Exchange CAS).

By default, Discovery uses the *CAS On Windows* pattern to discover the Exchange Client Access Server.

> **Note:** For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery on the Exchange Client Access Server

The following data is collected on the Exchange Client Access Server `[cmdb_ci_exchange_cas]` table:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field Name
Name	name
Version	version
Class	sys_class_name
Fully qualified domain name	fqdn
IP Address	ip_address
Installation directory	install_directory
Type	type

Exchange Hub Transport Servers discovery

Discovery creates or updates a CMDB record when it detects a running instance of Exchange Hub.

By default, Discovery uses the Hub Transport Server On Windows pattern to discover Exchange Hub Transport Servers.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Hub Transport Server On Windows pattern.

ExchangeHub [cmdb_ci_exchange_hub]

Label	Field Name
Name	name
Version	version
Class	sys_class_name
Fully qualified domain name	fqdn
IP Address	ip_address
Installation directory	install_directory
Type	type

CI relationships

The Hub Transport Server On Windows pattern doesn't discover any relationships.

Exchange MailBox discovery

Discovery creates or updates a CMDB record when it detects a running instance of Exchange Mailbox.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prerequisites

The `Microsoft.Exchange.Management.PowerShell` module must be installed on the server that you want to discover.

The service `winRM` must be running on the host machine. Run the following command in the Powershell window to verify: `New-PSSession -ConfigurationName Microsoft.Exchange -ConnectionUri "http://$hostname/PowerShell/" -Authentication Kerberos`

Pattern

By default, Discovery uses the *`MailBox On Windows`* pattern to discover Exchange MailBox.

Credentials

Configure these credentials:

Credential type	Additional notes
Applicative credentials	The user must be able to run Powershell commands against the Exchange hosts. Use **Exchange Mailbox** as the CI type for the applicative credential. **Important:** Do not use the **Exchange Mailbox server** CI type.
Windows credentials	The OS user must be a domain user, not a local user for the server.

Data collected

The following data is collected on the Exchange Mailboxes [cmdb_ci_exchange_mailbox] table:

Label	Field Name
Name	name
Version	version
Class	sys_class_name
Fully qualified domain name	fqdn
IP Address	ip_address
Installation directory	install_directory
Type	type

General software package discovery

General software packages are collections of programs that work together, often with similar user interfaces. Examples include Microsoft Office 365 (Word, Excel, PowerPoint), and Apple's iWork (Pages, Numbers, Keynote). Discovery identifies and classifies information about general software packages. Data it collects include, Name, Version, Install Count, License Count, Installation Date, Software, and more.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected by Discovery on General Software Packages

Label	Table name	Field name	Source
Name	cmdb_ci_spkg	name	Various
Version	cmdb_ci_spkg	version	Various
Install count	cmdb_ci_spkg	install_count	Various
License count	cmdb_ci_spkg	license_count	Various
Microsoft SMS ID	cmdb_ci_spkg	msft_sms_id	Various
Installed on	cmdb_software_instance	installed_on	Various
Software	cmdb_software_instance	software	Various

GlassFish Server discovery

Discovery creates or updates a CMDB record when it detects a running instance of GlassFish Server.

By default, Discovery uses the following patterns to perform the discovery: *`GlassFish Server`* and *`GlassFish WAR`*.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery for GlassFish

The following data is collected in the GlassFish [cmdb_ci_appl_glassfish] table:

Label	Field name
Inst name	inst_name
Port	port
Class	sys_class_name
Version	version
Configuration file	config_file
Domain directory	domain_directory
Install Status	install_status
Installation directory	install_directory
PID	pid
Running process	running_process
Running process command	running_process_command
Running process key parameters	running_process_key_parameters
TCP port(s)	tcp_port
Operational status	operational_status

The following data is collected in the GlassFish War [cmdb_ci_appl_glassfish_war] table:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field name
Name	name
Class	class

HP Operations Manager discovery

Discovery creates or updates a CMDB record when it detects a running instance of HP Operations Manager.

By default, Discovery uses the *HP Operations Manager for Windows* pattern to discover the HP Operations Manager.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery for HP Operations Manager

The following data is collected in the HP Operations Manager `[cmdb_ci_appl_hp_operations]` table:

Label	Field Name
Name	name

HP Service Manager discovery

Discovery creates or updates a CMDB record when it detects a running instance of HP Service Manager.

By default, Discovery uses the *HP Service Manager Application Server* pattern to discover HP Service Manager.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Name	name
Vendor	vendor

IBM App Connect Enterprise and HTTP listener discovery

Discovery and Service Mapping Patterns application uses the WMB patterns to discover Integration Bus (formerly WebSphere Message Broker and IBM Integration Bus) and HTTP listeners running on both Linux and Windows. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

By default, Discovery uses the following patterns to perform the discovery:

- WMB On UNIX
- WMB On Windows
- WMB HTTP Listener On UNIX
- WMB HTTP Listener On Windows

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

To learn about IBM WebSphere Message Broker (WMB) and WMB HTTP Listener components and versions that you can discover, see Detailed information on products discovered by ITOM Visibility.

Prerequisites

Verify the applications are up to date

- Discovery and Service Mapping Patterns
- Visibility Content

Data collected by Discovery during horizontal discovery

Resources discovered by the WMB On UNIX pattern

IBM WebSphere Message Broker [cmdb_ci_appl_ibm_wmb]

Field	Description
Name [name]	Name of the message broker
Installation directory [install_directory]	Install directory of the message broker
Version [version]	Version of the message broker

Resources discovered by the WMB On Windows pattern

IBM WebSphere Message Broker [cmdb_ci_appl_ibm_wmb]

Field	Description
Name [name]	Name of the message broker
Installation directory [install_directory]	Install directory of the message broker
Version [version]	Version of the message broker

Resources discovered by the WMB HTTP Listener On UNIX pattern

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IBM WMB Http Listener [cmdb_ci_appl_ibm_wmb_listener]

Field	Description
Name [name]	Name of the HTTP listener
Installation directory [install_directory]	Install directory of the HTTP listener

Resources discovered by the WMB HTTP Listener On Windows pattern

IBM WMB Http Listener [cmdb_ci_appl_ibm_wmb_listener]

Field	Description
Name [name]	Name of the HTTP listener
Installation directory [install_directory]	Install directory of the HTTP listener

IBM MQ discovery

The ServiceNow Discovery application uses the WMQ On Unix and WMQ On Windows patterns to find IBM MQ (formerly IBM WebSphere MQ) resources. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Discovery uses the following patterns to perform horizontal discovery:

- *WMQ On Unix*
- *WMQ On Windows*

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery for IBM MQ

Discovery populates the data in the CMDB when running the WMQ patterns.

IBM MQ Manager (formerly IBM WebSphere MQ) [cmdb_ci_appl_ibm_wmq]

Label	Field Name
Name	name
Version	version
Installation directory	install_directory
Class	sys_class_name

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft IIS server discovery

Discovery identifies and classifies information about Microsoft IIS servers.

Prerequisites

Install IIS Management Scripts and Tools on a Microsoft IIS Server.

Credentials

Configure these credentials:

- Applicative credentials
- Windows credentials

Classifier, pattern, and probe

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Discovery uses these classifiers, probes, and patterns for IIS discovery:

Classifier	Trigger probes	Pattern
Microsoft IIS Server	• Horizontal discovery probe: launches patterns • Windows - Get IIS Information*	IIS

*Probes inactive on new instances.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected by Discovery for IIS Web Server

The following data is collected in the IIS Web Server [cmdb_ci_microsoft_iis_web_server] table:

Label	Field name
Name	name
Version	version
Type*	type
Running process command	running_process_command
Running process key parameters	running_process_key_parameters

*The Type is always IIS.

The following data is collected in the Web site [cmdb_ci_web_site] table:

Label	Field name	Source
Name	name	wmi

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field name	Source
TCP Port	tcp_port	wmi

Microsoft SharePoint discovery

Discovery creates or updates a CMDB record when it detects a running instance of Microsoft SharePoint.

By default, Discovery uses the *SharePoint* pattern to discover Microsoft SharePoint. For information on supported Microsoft SharePoint versions, see Detailed information on products discovered by ITOM Visibility.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery for Microsoft SharePoint

The following data is collected in the SharePoints `[cmdb_ci_appl_sharepoint]` table:

Label	Field Name
Name	name
Class	sys_class_name
Fully qualified domain name	fqdn
IP Address	ip_address
Version	version

NGINX web server discovery

NGINX is an open source web server with a load balancer. Discovery identifies the web server and information related to the load balancer.

Discovery identifies NGINX server software using the following process:

1. The NGINX Process Classifier detects a running process that matches the following criteria during the exploration of a Linux server:
   - Name starts with nginx
   - Name contains master
2. If there is a match:
   - A record is created in the NGINX Web Server [cmdb_ci_nginx_web_server] table.
   - A Runs on relationship is created in the CI Relationship [cmdb_rel_ci] table for a Linux server (Linux Server [cmdb_ci_linux_server]) and for an NGINX web server (NGINX Web Server [cmdb_ci_nginx_web_server]).

     The following two probes are triggered:

     - NGINX – Version: This probe contains a Bourne shell script. It determines the version of NGINX and populates the NGINX Web Server [cmdb_ci_nginx_web_server] table.
     - NGINX – Get Configuration: This probe contains a Bourne shell script and an argument that determines the path of the NGINX configuration file. The probe identifies configuration parameters based on keywords within the configuration file and returns them as a single payload result.

     The sensor on the ServiceNow instance parses the payload result and populates the CMDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You must have the following requirements to discover an NGINX webserver:

- NGINX is installed and running on the server.
- The MID Server has access to the NGINX configuration file, which is `/etc/nginx/nginx.conf` by default.

Requirements

For NGINIX servers:

- Ensure that the NGINX software is installed and running on the server.
- Grant the MID Server has access to the NGINX configuration file, which is `/etc/nginx/nginx.conf` by default.
- Enable secure shell (SSH) commands to identify the following associated elements:
  - NGINX Version
  - NGINX Get Configuration

The following probes require execute privileges to run commands:

Commands

Probe	Commands
Nginx – Version	nginx
Nginx – Get Configuration	echo, sed, httpd, cut, grep, egrep (within the Bourne shell script)

Note: The Nginx pattern performs top-down discovery on both Windows and Linux servers. For information on prerequisites for top-down discovery for NGINX web servers, see Prerequisites for performing top-down discovery using Service Mapping.

Probes and Sensors

Discovery identifies NGINX server software using the following process:

1. The Nginx Process Classifier detects a running process that matches the following criteria during the exploration of a UNIX server:
   - The name of the process starts with `nginx`.
   - The name of the process contains `master`.
2. If there is a match:
   - A record is created in the Web Server [cmdb_ci_web_server] table.
   - A Runs on relationship is created in the CI Relationship [cmdb_rel_ci] table for the Linux Server [cmdb_ci_linux_server] table and the Web Server [cmdb_ci_web_server] table.
3. The following two probes are triggered:
   - **Nginx – Version**: this probe contains a Bourne shell script. It determines the version of NGINX and populates the Web Server [cmdb_ci_web_server] table.
   - **Nginx – Get Configuration**: this probe contains a Bourne shell script and an argument that determines the path of the NGINX configuration file. The probe identifies configuration parameters based on keywords within the configuration file and returns them as a single payload result.
4. The sensor on the ServiceNow instance processes the payload and populates the CMDB.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Collected

Discovery creates or updates CMDB records when it detects a running NGINX process. The following data is collected.

Data Collected by Discovery for NGINX

Table Name	Field and Label Name	Probe
Name	cmdb_ci_lb_appl [name]	Nginx– Get Configuration
IP Address	cmdb_ci_lb_appl [ip_address]	Nginx– Get Configuration
Last Discovered	cmdb_ci_lb_appl [last_discovered]	Nginx– Get Configuration
Version	cmdb_ci_lb_appl [version]	Nginx– Version
Name	cmdb_ci_lb_pool_member [name]	Nginx– Get Configuration
Last Discovered	cmdb_ci_lb_pool_member [last_discovered]	Nginx– Get Configuration
IP Address	cmdb_ci_lb_pool_member [ip_address]	Nginx– Get Configuration
Load Balancer	cmdb_ci_lb_pool_member [load_balancer]	Nginx– Get Configuration
Fully Qualified Domain Name	cmdb_ci_lb_pool_member [fqdn]	Nginx– Get Configuration
Port	cmdb_ci_lb_pool_member [port]	Nginx– Get Configuration
Last Discovered	cmdb_ci_lb_service [last_discovered]	Nginx– Get Configuration
IP Address	cmdb_ci_lb_service [ip_address]	Nginx– Get Configuration
Name	cmdb_ci_lb_service [name]	Nginx– Get Configuration
Load Balancer	cmdb_ci_lb_service [load_balancer]	Nginx– Get Configuration
Input URL	cmdb_ci_lb_service [input_url]	NGINX – Get Configuration

Relationships

In the table [cmdb_rel_ci] the following relationships are populated:

- The records in the cmdb_ci_lb_appl table run on the cmdb_ci_web_server table records.
- The records in the cmdb_ci_lb_service table use the cmdb_ci_lb_pool table records.
- The records in the cmdb_ci_pool table are used by the cmdb_ci_service table records.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The records in the cmdb_ci_pool table are members of the cmdb_ci_pool_member table.
- The records in the cmdb_ci_pool_member table are members of cmdb_ci_pool table.

Oracle Tuxedo discovery

The ServiceNow Discovery application uses the Tuxedo pattern to find Oracle Tuxedo resources. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Discovery uses the **Tuxedo** pattern to run horizontal discovery.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery for Oracle Tuxedo

Discovery populates the data in the CMDB when running the Tuxedo pattern.

Tuxedo [cmdb_ci_appl_tuxedo]

Name	Description
Port [port]	The network communication port used by Oracle Tuxedo services and processes for network communication.
Domain [domain]	The logical grouping of Oracle Tuxedo components and services operating within a defined environment.
Installation directory [install_directory]	The location that contains all binaries and configuration files necessary for running Oracle Tuxedo.
Log dir [log_dir]	The directory that stores all log files generated by Oracle Tuxedo for monitoring and troubleshooting.
Version [version]	The specific release of Oracle Tuxedo that is installed and currently in use.
Mode [mode]	The definition of the interaction protocol between Oracle Tuxedo and various clients or other domains, such as Jolt, Workstation, or Domain Gateway, based on the operational configuration.

Puppet automation software discovery

Discovery identifies Puppet Masters running on UNIX servers.

Discovery uses secure shell (SSH) commands to collect information.

To access Puppet Master records, navigate to **All** > **Configuration** > **Automation Servers** > **Puppet Masters**. You can view the resources in the related list of the Puppet Master record.

How the Puppet Master probe works

Discovery identifies the Puppet Master using the following process:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. The **UNIX - Active Processes** probe detects a running process that matches one of the following criteria:
   - The name of the process is `pe-httpd`.
   - The name of the process is `ruby` and the parameters of the process contain *`puppet master`*.
2. If there is a match on one of these criteria:
   - A record is created in the Puppet Master table [cmdb_ci_puppet_master] if one does not already exist for that running process.
   - The **Puppet - Master Info** probe is triggered. The sensor of this probe populates additional information in the Puppet Master [cmdb_ci_puppet_master] record.

Requirements to discover a Puppet master

By default, Discovery identifies Puppet Masters running on UNIX servers. Discovery uses secure shell (SSH) commands to collect information.

The credentials used to discover the UNIX server must have privileges to execute the following commands. The use of sudo is supported, but you must add the *`must_sudo`* parameter to the probe.

Probe	Commands
Puppet – Master Info	puppet, echo, hostname (within the Borne shell script)
Puppet – Certificate Requests	puppet
Puppet – Manifests	echo, sed, find (within the Bourne shell script)
Puppet – Modules	puppet

Data collected

Data collected by Discovery for Puppet automation software, by default

Name	Puppet Master [cmdb_ci_puppet_master]	name	Puppet - Master Info
Configuration directory	Puppet Master [cmdb_ci_puppet_master]	config_directory	Puppet - Master Info
Manifest directory	Puppet Master [cmdb_ci_puppet_master]	manifestdir	Puppet - Master Info
Module path	Puppet Master [cmdb_ci_puppet_master]	modulepath	Puppet - Master Info
Fully qualified domain name	Puppet Master [cmdb_ci_puppet_master]	fqdn	Puppet - Master Info
IP Address	Puppet Master [cmdb_ci_puppet_master]	ip_address	Puppet - Master Info
Version	Puppet Master [cmdb_ci_puppet_master]	version	Puppet - Master Info

Add the must_sudo parameter to the Puppet probe

To use the Puppet probe with sudo, you must add the *must_sudo* parameter to each probe that requires it.

Before you begin
Role required: admin

About this task
You add the must_sudo parameter for each Puppet probe.

Procedure

1. Navigate to **All** > **Discovery** > **Probes**.
2. In the **Search** field, search on the name **Puppet**.
3. Click the name of the probe.
   For example, **Puppet Master - Info**.
4. In the **Related Links** pane, select the **Probe parameters** tab.
5. Click **New**.
6. In the **Name** field, enter `must_sudo`
7. In the **Value** field, enter `true`.
8. Click **Submit**.

SAP products discovery

ITOM Visibility can discover SAP applications, SAP HANA Database, and SAP HANA DB Catalog. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

To learn about the SAP components and their versions that you can discover, refer to Detailed information on products discovered by ITOM Visibility.

Prerequisites

Verify that the applications are up to date

Discovery and Service Mapping Patterns

Visibility Content

CMDB CI Class Models

Verify the configuration of the credentials

- (If hosted on a UNIX server) On the ServiceNow AI Platform, configure applicative credentials and SSH credentials. The SSH credentials are used to create connections from SAP Central Instance (CI) to other applications and devices. In addition, provide the user elevated rights to be able to run commands requiring a privileged user: Service Mapping commands requiring a privileged user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- (If hosted on a Windows server) On the ServiceNow AI Platform, configure Windows credentials to create connections from SAP CI to other applications and devices.
- (Optional) For discovering using the WinRM protocol, see Configure WinRM trusted hosts on MID Server.
- (Optional for top-down discovery by Service Mapping) Provide a user with permissions to run SOAP on RFC read table function.
- (Optional for top-down discovery by Service Mapping) If your organization deploys SAP Digital Business Services using web services and you want to map all connected services, perform the following actions:
  - Configure applicative credentials for a user with permissions to access the following tables: CVERS, DBCONS, and RFCDES.
  - Ensure that you have the web service URL. For information on how to create web services, see https://blogs.sap.com/2012/10/24/how-to-create-web-services-abap-based/.

SAP HANA 2.0 DB Catalog on UNIX

Verify that the Applicative Credentials for **SAP HANA DB App Creds** are configured with **SAP Hana Db [cmdb_ci_appl_sap_hana_db]** as CI type.

Verify the permissions to run Service Mapping commands

Service Mapping commands not requiring a privileged user

Verify the user has the permissions to run the Patterns queries

The following commands are executed when running the SAP HANA DB and SAP HANA DB Catalog Patterns.

- `select * from schemas;`
- `select * from M_HOST_INFORMATION where upper(KEY) like '%TIMEZONE%';`
- `select SCHEMA_NAME, round(sum(TABLE_SIZE) /1024/1024) from M_TABLES GROUP BY SCHEMA_NAME`

The query type	Fallback commands executed in order
Schemas Info	1. `$hdbsql_path + " -n " + $entry_point.ip_address + ":" + $query_port + " -i " + $digits + " -u '$$username$$' -p '$$password$$' \"select * from schemas;\""` 2. `$hdbsql_path + " -n " + $ip_address + ":" + $query_port + " -i " + $digits + " -u '$$username$$' -p '$$password$$' \"select * from schemas;\""`

SAP HANA DB Catalog on UNIX CI relationships

CI	Relationship	CI
SAP HANA DB [cmdb_ci_appl_sap_hana_db]	Contains::Contained by	SAP HANA DB Catalog [cmdb_ci_db_hana_catalog]

Limitations

Service Mapping can map only one instance of ASCS per deployment.

The SAP HANA DB Catalog pattern can only run on UNIX.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Map application services containing SAP applications

Map a service instance containing an SAP application and verify that Service Mapping discovered all SAP components correctly.

Before you begin

Role required: service_mapping_admin

Procedure

1. Create a service instance.
   a. Navigate to **All** > **Service Mapping** > **Service Instances**.
   b. Select **New**.
   The **Discoverable by Service Mapping** option is selected by default.
   c. In the **Name** field, enter a descriptive name for the service instance.
2. Define the entry point for this application service:
   a. Select the **SAP application** tile.
   The **Discoverable by Service Mapping** option is selected by default.
   b. Define the entry point as follows:
      - A URL to any SAP module
      - A TCP connection to any SAP module
      - To discover environments with connected services, provide the URL to the web service in the following format:

        ```
        http://<hostname>:<port>/sap/bc/srt/scs/sap/z_servicenow_read?sap-client=003
        ```

   c. Select **Add**.
   d. Select **Save**.
3. Select **Additional Info** on the left and clear the **Traffic based discovery** check box.
4. Select **Update**.
5. Verify that the mapping result is satisfactory:
   a. Select **View Map** and wait until the mapping is complete.
   It may take a few minutes.

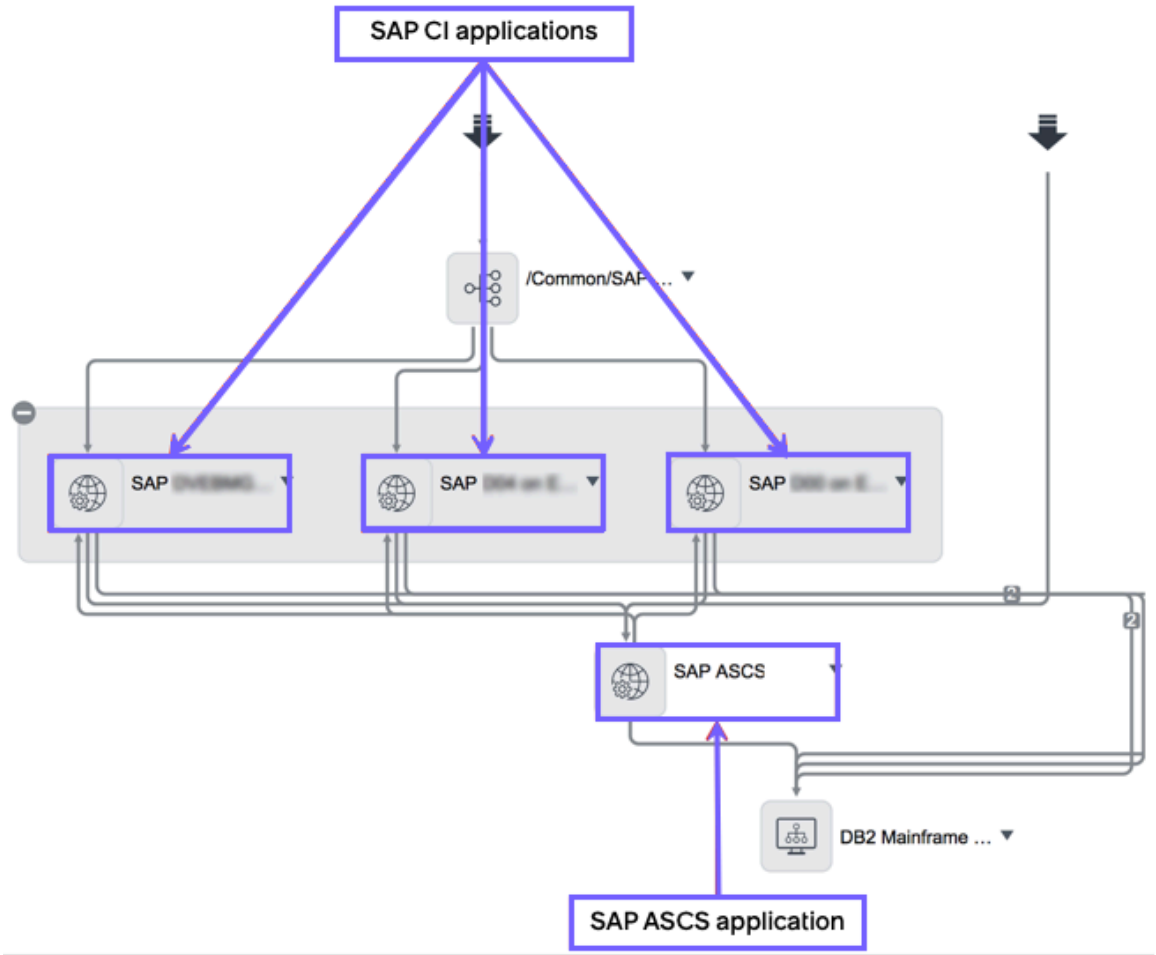
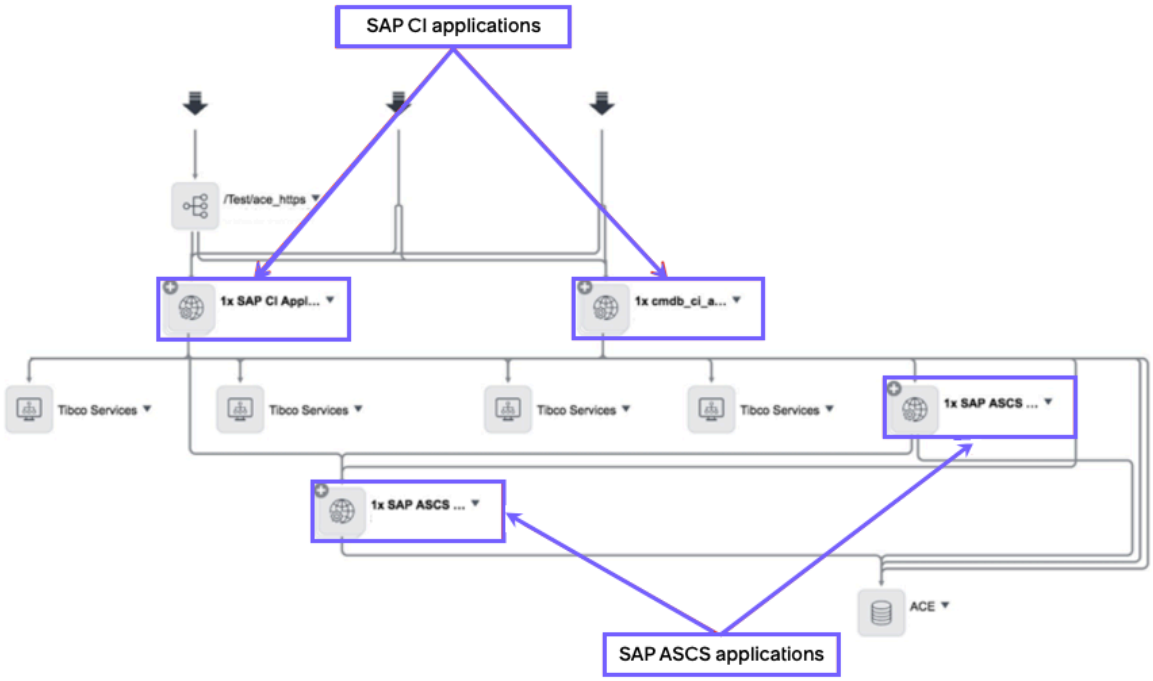
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Review the application service map and make sure that the service layout is as in the following examples.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the SAP environment integrates SAP components with Tibco services, you can expect this mapping result:



Troubleshoot application services containing SAP applications

Fix basic discovery issues based on the symptoms and discovery messages.

Symptom

The application service map in Service Mapping displays the following message `Failed to discover <SAP component name>.`

Cause

The CI failed to identify, and process detection retrieves the process attributes.

Solution

Perform the following steps:

1. Open the failed pattern step in Debug mode:
   a. On the business service or service instance map, right-click the error message and select **Show discovery log**.

      The Discovery Log window opens.

   b. In the right pane, locate the failed identification section and the failed step within this section.
   c. Select this failed identification section and click **Debug**.

      The Debug Identification Section window opens.

   d. If necessary, fill in the required details and click **Connect**.
2. Click the **set variables** step under **Steps**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Make sure that the regular expression includes `SYS`.
4. Click the **set install_dir** step under **Steps**.
5. Make sure that the regular expression includes `sap`.

Symptom

Service Mapping fails to discover the web service your organization uses to deploy SAP digital business services.

Cause 1

The pattern fails at the EVAL function for identifying the web service.

Solution 1

1. Verify that the format of the entry point is the URL to the web service as described in the mapping procedure.
2. Verify that you configured the necessary applicative credentials as described in the mapping procedure.
3. Check that the discovery log contains the following message: GROOVE_CODE_FAILURE: No such property: com for class: Script1.
4. Open the failed pattern step in Debug mode:
   a. On the business service or service instance map, right-click the error message and select **Show discovery log**.

      The Discovery Log window opens.

   b. In the right pane, locate the failed identification section and the failed step within this section.
   c. Select this failed identification section and click **Debug**.

      The Debug Identification Section window opens.

   d. If necessary, fill in the required details and click **Connect**.
5. Pattern Designer opens showing the selected identification section.
6. Select the failed step on the right.
7. Verify that the function running on EVAL is `com.snc.sw.util.HttpInvokerUtil.post`.
8. Try to map the application service again and check the result.

Cause 2

The pattern fails at the EVAL function for identifying the web service, because the web service was configured incorrectly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solution 2

1. Verify that the format of the entry point is the URL to the web service as described in the mapping procedure.
2. Verify that you configured the necessary applicative credentials as described in the mapping procedure.
3. Check that the discovery log contains the following message: "Debug run railed: Test step failed. GROOVE_CODE_FAILURE: All command implementations (HTTP) failed on host 10.x.x.x. Host must be down or unreachable. ()"
4. Recreate the web service as described in https://blogs.sap.com/2012/10/24/how-to-create-web-services-abap-based/ .
5. Try to map the application service again and check the result.

Cause 3

The pattern fails at the EVAL function for identifying the web service, because the URL configured in the entry point is not correct or because the MID Server cannot access this URL.

Solution 3

1. Verify that the format of the entry point is the URL to the web service as described in the mapping procedure.
2. Verify that you configured the necessary applicative credentials as described in the mapping procedure.
3. Check that the discovery log contains the following message: "Debug run railed: Test step failed. GROOVE_CODE_FAILURE: All command implementations (HTTP) failed on host 10.x.x.x. Host must be down or unreachable. ()"
4. Verify that you used the correct URL for the service entry point:
   a. In the TCode SOAMANAGER, navigate to **Simplified Web Service Configuration**.
   b. On the **Configuration** tab of the Simplified Service Configuration window, search for the web service that is part of the service instance.
   c. Click the check box under **User Name/Password (Basic)** for this web service.
   d. Click **Show Details**.
   e. On the Details of the Service Definition window, verify the actual URL of the web service under WSDL URLs.
   f. If necessary, fix the URL you configure for the entry point and try to map the service instance again.

Cause 4

MID Server cannot access this URL configured in the entry point of the service instance.

Solution 4

1. Verify that the format of the entry point is the URL to the web service as described in the mapping procedure.
2. Verify that you configured the necessary applicative credentials as described in the mapping procedure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Check that the discovery log contains the following message: "Debug run failed: Test step failed. GROOVE_CODE_FAILURE: All command implementations (HTTP) failed on host 10.x.x.x. Host must be down or unreachable. ()"
4. Verify that you used the MID Server that can access the URL you configured in the service entry point:
   a. Log into the MID Server host remotely.
   b. Open a browser.
   c. Paste the URL into the browser address bar and press Enter.
   d. If the page does not open, it means that there is a network issue, for example, there is a firewall that prevents the MID Server from accessing this URL.
5. Resolve the network issue and verify that the MID Server can access the URL as described in step 4.

Cause 5

MID Server cannot access this URL configured in the entry point of the service instance.

Solution 5

1. Verify that the format of the entry point is the URL to the web service as described in the mapping procedure.
2. Verify that you configured the necessary applicative credentials as described in the mapping procedure.
3. Check that the discovery log contains the following message: "Debug run railed: Test step failed. GROOVE_CODE_FAILURE: All command implementations (HTTP) failed on host 10.x.x.x. Host must be down or unreachable. ()"
4. Verify that the applicative credentials you configured on the ServiceNow AI Platform for the web service are valid:
   a. Log into the MID Server host remotely.
   b. Open a browser.
   c. Paste the URL into the browser address bar and press Enter.
   d. The browser page displays the credentials pop-up window.
   e. Enter the credentials and check that the page opens.

      The page does not open, it means that the configured applicative credentials are incorrect.
5. Find out the right credentials.
6. Verify the new credentials as described in step 4.
7. If the page opens after you use the new credentials, configure these credentials as applicative credentials on the ServiceNow AI Platform.

Cause 6

MID Server cannot access this URL configured in the entry point of the service instance.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solution 6

1. Verify that the format of the entry point is the URL to the web service as described in the mapping procedure.
2. Check that the discovery log contains the following message: "Debug run railed: Test step failed. GROOVE_CODE_FAILURE: Missing applicative credentials for CI type <name of the CI type>".
3. Verify that you defined applicative credentials for the relevant CI according as described in Map application services containing SAP applications.

SQL Server Analysis Services (SSAS) discovery

The Discovery and Service Mapping application uses the SSAS pattern to find SQL Server Analysis Services (SSAS) on your infrastructure. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store..

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify the applications are up to date.

Discovery and Service Mapping Patterns

CMDB CI Class Models

Visibility Content

Verify the configuration of credentials

On the ServiceNow AI Platform®, verify the configuration of the Windows credentials. For more information, see Windows credentials

Data collected during horizontal discovery

Discovery populates the following data when running the SSAS pattern.

SQL Server Analysis Services [cmdb_ci_db_mssql_analysis]		
Label	**Field**	**Description**
Name	name	The SSAS on the Windows sever name
IP Address	ip_address	The SSAS IP address
Version	version	The SSAS version
Edition	edition	The SSAS edition
Installation directory	install_directory	The SSAS install directory
Instance Name	instance	The SSAS instance name
TCP port(s)	tcp_port	The SSAS TCP port

CMDB CI Class Models

Visibility Content

Verify the configuration of credentials

On the ServiceNow AI Platform®, verify the configuration of the Windows credentials. For more information, see Windows credentials

Data collected during horizontal discovery

Discovery populates the following data when running the SSIS pattern.

SQL Server Integration Services [cmdb_ci_db_mssql_integration_list]		
Label	**Field**	**Description**
Name	name	The SSIS on the Windows sever name
IP Address	ip_address	The SSIS IP address
Version	version	The SSIS version
Edition	edition	The SSIS edition
Installation directory	install_directory	The SSIS install directory
Instance Name	instance	The SSIS instance name

Sun Java Enterprise System (JES) discovery

Discovery creates or updates a CMDB record when it detects a running instance of Sun Java Enterprise System (JES).

By default, Discovery uses the *Sun JES pattern* pattern to discover Sun Java Enterprise System.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery for Sun Java Enterprise System

The following data is collected in the JES [cmdb_ci_email_server_jes] table:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field Name
Name	name
IP Address	ip_address
Class	sys_class_name
Fully qualified domain name	fqdn

Tomcat server discovery

Discovery identifies and classifies information about Tomcat server Web applications running on UNIX machines.

Discovery can identify and classify Web applications present in either the `CATALINA_BASE` directory or the `CATALINA_HOME` directory.

The classifier that finds Tomcat server processes uses the condition: [Parameters] [contains] [org.apache.catalina.startup.Bootstrap].

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Credentials

Configure these credentials:

- Applicative credentials
- SSH credentials

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Classifier, pattern, and probes

Classifier	Trigger probes	Pattern
Tomcat	• Horizontal pattern: launches patterns • SSHCommand-Tomcat - Find web.xml List* • SSHCommand-Tomcat - Get server.xml* • SSHCommand-Tomcat - Get Version*	Tomcat

*Probes inactive on new instances.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected

Discovery collects the following data on the Tomcat [cmdb_ci_app_server_tomcat] table for both Unix and Windows:

Label	Field name	Source
Name	name	server.info
Install Directory	install_directory	server.xml
Version	version	server.info
Server Port	server_port	server.xml
Attributes	attributes	server.xml

The following data is collected on the Tomcat Connector [cmdb_ci_tomcat_connector] table for both Unix and Windows:

Label	Field name	Source
Tomcat	tomcat	server.xml
Port	port	server.xml

The following data is collected on the Web Application [cmdb_ci_web_application] table for both Unix and Windows:

Label	Field name	Source
Description	description	web.xml
Document base	document_base	web.xml
App server	app_server	web.xml

Relationships

Parent class	Relationship	Child class
cmdb_ci_app_server_tomcat	Contains::Contained by	cmdb_ci_web_application

WebLogic application server discovery

Discovery creates or updates a CMDB record when it detects an instance of an Oracle or BEA Weblogic application server running on a Windows or Linux system.

Requirements

For Windows

- PowerShell must be enabled on the MID Server.
- The WebLogic Administration Server instances that start via WebLogic NodeManager must have the `-Dweblogic.RootDirectory=<path>` parameter defined upon server startup. The Windows credential must also have read permissions on the `config.xml` file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For Linux

- Discovery requires the use of these Bourne shell commands:
  - `find`
  - `cat`
  - `dirname`
- WebLogic administration server instances started via NodeManager must have the *`-Dweblogic.RootDirectory=<path>`* parameter defined and visible through the Linux *`ps process stat`* command (for each AdminServer) for the rest of the Linux WebLogic application server and web application information to be populated in the CMDB.
- The following configuration must be set on the sudorers file:

  `User ALL=(root) NOPASSWD: /bin/sh *`

  `User` is the user name on the SSH credential that you create for this discovery.
- This command must be able to be run:

  `/bin/sh /tmp/snc-*-findcat.sh * *"`

  Do not make any changes to `findcat.sh`.
- If you are using probes, not patterns, for Weblogic discovery, the *`Linux - Weblogic - Find config.xml`* probe must specify this parameter and value: *`must_sudo`* = *`true`*

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Credentials

- Applicative credentials
- Windows credentials
- SSH credentials

Classifier, pattern, and probes

Classifier	Trigger probes	Pattern
Weblogic Server	• Horizontal Pattern: launches patterns • Windows - Weblogic - Get web.xml* • Windows - Weblogic - Find config.xml* • Linux - Weblogic - Find config.xml*	WebLogic

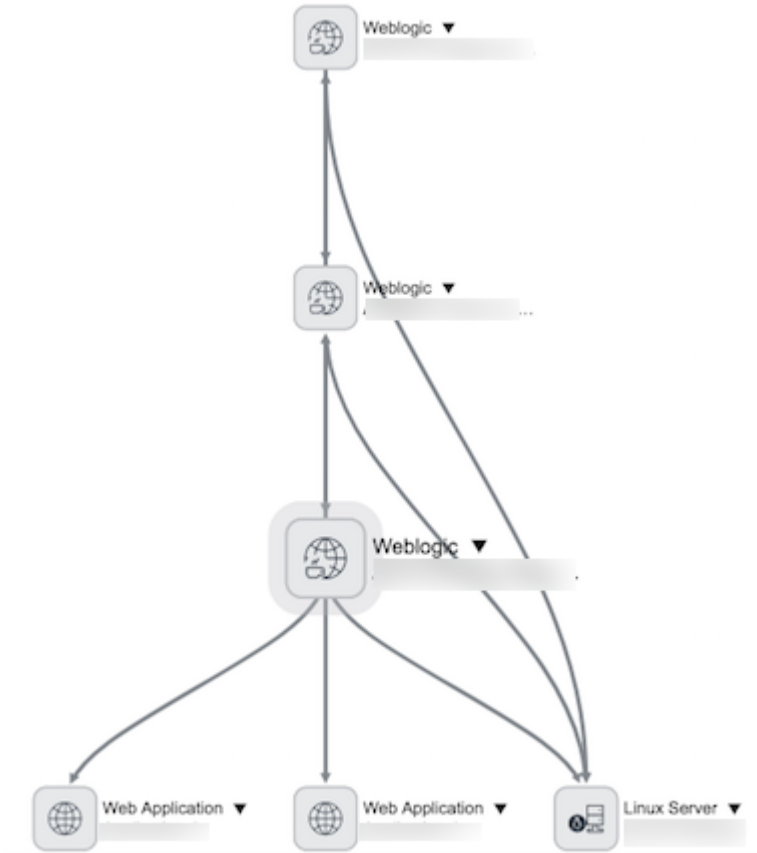
Example Weblogic relationships



Add sudo access for the Weblogic - Find config.xml probe

If you are not using the Weblogic pattern, you can add sudo privileges to the Linux, the Weblogic - Find config.xml probe.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Discovery Definition** > **Probes**.
2. Search for and select the **Linux - Weblogic - Find config.xml** probe.
3. In the **Probe Parameters** related list, click**New**
4. Use the following information to complete the form

Probe	Commands
Name	must_sudo

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Probe	Commands
Value	true

5. Click **Submit**

Identifying Windows WebLogic application servers

If you are not using the Weblogic pattern, Discovery follows this process when it uses the Windows - Active Processes or Linux - Active Processes probes.

This process describes the use of probes, which are active on your instance if you upgrade. For new instances, Discovery uses the Weblogic pattern.

1. The Windows - Active Processes probe or Linux - Active Processes detects a running process that matches one of the follow criteria:
   - The parameters of the process contain *`weblogic.Server`*.
   - The parameters of the process contain *`-Dweblogic.name`*.
2. If there is a match on one of the criteria:
   - A record is created in the BEA Weblogic [cmdb_ci_app_server_weblogic] table. The record is populated with the server name and TCP port, which is gathered from the running process.
   - The Windows - Weblogic - Find config.xml probe or the Linux - Weblogic - Find config.xml probe triggers. The sensor of this probe populates additional information in the BEA Weblogic [cmdb_ci_app_server_weblogic] record and the Web Application [cmdb_ci_web_application] record if applicable.
3. The Windows - Weblogic - Find config.xml probe or the Linux - Weblogic - Find config.xml probe attempts to find the related `config.xml` file for the server by:
   - Using the *`-Dweblogic.RootDirectory=<path>`* parameter defined in the running process.
   - [Windows] Searching for `config.xml` files under the *`-Dplatform.home=<path>`* parameter defined in the running process (not as efficient using the parameters of the process).
   - [Linux] Searching for the parent process that started the WebLogic server (only viable if the weblogic jvm was started via the *`startWeblogic.sh`* or related custom script and not the init process).
4. If there are associated web applications found in the WebLogic `config.xml` file, the Windows – Weblogic find web.xml probe triggers for each application. This probe reads the WebLogic `web.xml` file for each web application and the sensor, and then populates additional information.

IBM WebSphere server discovery using probes

The IBM WebSphere application server is a software framework with middleware that hosts Java-based web applications. Discovery creates or updates a CMDB record when it detects an instance of a WebSphere application server running on a Windows or Linux system.

Note: Starting with Visibility Content version 6.1.0, pattern-based discovery is the default method for discovering IBM WebSphere Application Servers. The WebSphere probes are disabled by default. For more information, see IBM WebSphere Application Server discovery using patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Websphere discovery on Windows

Requirements for discovery:

For WebSphere application servers running on Windows systems, enable PowerShell on the MID Server.

Websphere discovery on Linux

Requirements for discovery:

- Enable SSH on the WebSphere Application Server.
- Set execute privileges to enable the following probes to run commands:
  - WebSphere - Get serverindex.xml: cat/read permissions on the `serverindex.xml` file
  - WebSphere - Get cell.xml: cat/read permissions on the `cell.xml` file
  - WebSphere - Get server.xml: cat/read permissions on the `server.xml` file

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Probes and sensors

Discovery uses this process to identify Linux WebSphere application servers:

1. The Unix - Active Processes probe detects a running process that matches the *`com.ibm.ws.runtime.WsServer`*. For example, the *`...com.ibm.ws.bootstrap.WSLauncher com.ibm.ws.runtime.WsServer`* process output has a parameter of */opt/IBM/WPS/profiles/ccmdb/config localhostNode01Cell ccmdb01 server1*. The values are:
   - last parameter = server_name = server1
   - last parameter - 1 = node_name = ccmdb01
   - last parameter - 2 = cell_name = localhostNode01Cell
   - last parameter - 3 = config_path = '/opt/IBM/WPS/profiles/ccmdb/config'
2. If there is a match, a record is created in the IBM Websphere [cmdb_ci_app_server_websphere] table. The following probes are triggered:
   - WebSphere - Cell
   - WebSphere - Web Applications
   - WebSphere –Web Services
3. The WebSphere - Cell probe searches for the `cell.xml` file for the instance by using the parameters in the running process, and then searching in the related `<config_path>\cells\<cell_name>\` directory.
4. If the probe successfully finds the `cell.xml` file, the sensor reads its contents and populates additional Websphere Cell [cmdb_ci_websphere_cell] table records as necessary.
5. If the probe successfully finds the `serverindex.xml` file, the sensor reads its contents and populates additional Web Application [cmdb_ci_web_application] table records as necessary.
6. If the probe successfully finds the `server.xml` file, the sensor reads its contents and populates additional Web Service [cmdb_ci_web_service] table records as necessary.

Discovery uses this process to identify Windows WebSphere application servers:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. The Windows - Active Processes probe detects a running process that matches the *com.ibm.ws.runtime.WsServer*. For example, the *...com.ibm.ws.bootstrap.WSLauncher com.ibm.ws.runtime.WsServer* process output has a parameter of */opt/IBM/WPS/profiles/ccmdb/config localhostNode01Cell ccmdb01 server1*. The values are:
   - last parameter = server_name = server1
   - last parameter - 1 = node_name = ccmdb01
   - last parameter - 2 = cell_name = localhostNode01Cell
   - last parameter - 3 = config_path = '/opt/IBM/WPS/profiles/ccmdb/config'
2. If there is a match, a record is created in the IBM Websphere [cmdb_ci_app_server_websphere] table. The following probes are triggered:
   - Windows - WebSphere - Cell
   - Windows - WebSphere - Web Applications
   - Windows - WebSphere –Web Services
3. The Windows - WebSphere - Cell probe searches for the `cell.xml` file for the instance by using the parameters in the running process, and then searching in the related `<config_path>\cells\<cell_name>\` directory.
4. If the probe successfully finds the `cell.xml` file, the sensor reads its contents and populates additional Websphere Cell [cmdb_ci_websphere_cell] table records as necessary.
5. The Windows - WebSphere - Web Applications probe searches the `serverindex.xml` file for the instance by using the parameters in the running process, and then searching in the related `<config_path>\cells\<cell_name>\nodes\<node_name>` directory.
6. If the probe successfully finds the `serverindex.xml` file, the sensor reads its contents and populates additional Web Application [cmdb_ci_web_application] table records as necessary.
7. The Windows WebSphere - Web Services probe searches for the `server.xml` file for the instance by using the parameters in the running process, and then searching in the related `<config_path>\cells\<cell_name>\nodes\<node_name>\servers\<server_name>` directory.
8. If the probe successfully finds the `server.xml` file, the sensor reads its contents and populates additional Web Service [cmdb_ci_web_service] table records as necessary.

Data collected

Data collected on Windows Websphere servers

Table	Field	Source
cmdb_ci_app_server_websphere	Name (name)	Running process
cmdb_ci_websphere_cell	Name (name)	cell.xml
cmdb_ci_websphere_cell	Cell ID (cell_id)	cell.xml
cmdb_ci_websphere_cell	Cell type (cell_type)	cell.xml
cmdb_ci_websphere_cell	Cell discovery protocol (cell_discovery_protocol)	cell.xml
cmdb_ci_web_service	Name (name)	server.xml
cmdb_ci_web_service	Service ID (service_id)	server.xml

Data collected on Windows Websphere servers (continued)

Table	Field	Source
cmdb_ci_web_application	Name (name)	serverindex.xml

Data collected on Linux Websphere servers

Label	Table Name	Field Name	Source
Name	cmdb_ci_websphere_cell	name	server.xml
App server	cmdb_ci_web_service	app_server	Internal reference
Name	cmdb_ci_web_service	name	server.xml
Name	cmdb_ci_web_application	name	serverindex.xml
App server	cmdb_ci_web_application	app_server	serverindex.xml

Relationships

These relationships are created in the CI Relationship [cmdb_rel_ci] table.

Parent class	Relationship type	Child class
cmdb_ci_app_server_websphere	Runs on::Runs	cmdb_ci_linux_server
cmdb_ci_win_server	Runs on::Runs	cmdb_ci_win_server
cmdb_ci_app_server_websphere	Contains::Contained by	cmdb_ci_web_application
cmdb_ci_web_service	Runs on::Runs	cmdb_ci_app_server_websphere
cmdb_ci_websphere_cell	Contains::Contained by	cmdb_ci_app_server_websphere

Database discovery

Discovery can find database applications, such as MySQL, Oracle, and MongoDB. Discovery can also find database management system software, such as MSSQL Server.

Database catalog discovery

The database catalog lists all the catalog objects, or databases, discovered for an instance of a database.

Databases vs. catalogs

Most database manufacturers use the term catalog to mean database, while Microsoft SQL uses the term database. Database catalogs can be imported into your instance from a third-party discovery tool, entered into the platform manually, or found by Discovery.

Important: Discovery does not support MySQL database catalog discovery in the base system. The Oracle DB on Unix and Oracle DB on Windows patterns discover Oracle catalog objects through the pattern extension Get Catalog info. The MSSql DB On Windows and MSSql 2000 DB patterns discover both database instances and catalogs and store them in the database instance records.

For more information about Oracle catalog discovery, see Oracle Catalog discovery.

For more information about Microsoft SQL database instances, see Microsoft SQL Server and Cluster discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you discovered database catalogs using probes before migrating to patterns, you can view the probe-based database catalogs by navigating to **All** > **Configuration** > **Database Catalogs** and selecting a database.

Database Administrator (DBA) report discovery

Discovery and Service Mapping uses the Patterns extension sections to provide a Database Administrator report (DBA report) for the Apache Cassandra, Microsoft SQL, MySQL, MongoDB, and Oracle databases. The extension sections for each DB pattern populate the related entries tables. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify the plugins setup

- CMDB CI Class Models 1.49.0 (September 2023)
- Discovery and Service Mapping Patterns 1.8.0 (September 2023)

Verify the system properties are enabled

By default, the system properties for DBA reports are set to **false**. To enable the report collection, verify that the system properties value for each pattern is set to **true**.

Pattern	System property
Cassandra	cassandra_dba_report_enabled
MongoDB	mongo_dba_report_enabled
MSSQL DB On Windows	mssql_dba_report_enabled
My SQL server On Windows and Linux	mysql_dba_report_enabled
Oracle DB	oracle_dba_report_enabled

Verify the configuration of the credentials

For more information, see Applicative credentials.

MongoDB execute command	Applicative credentials should have read access to run `"getSiblingDB (databaseName)"`
Apache Cassandra execute command	Discovery credentials should have read access to `"nodetool"`
MySQL tables and execute commands	Discovery credentials should have read access to:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	• `"information_schema.tables"` table • run `"show databases"` command
Microsoft SQL tables	Discovery credentials should have read access to the following tables: • *`master.sys.databases`* • *`sys.sysprocesses`* • *`sys.dm_os_sys_info`* • *`sys.dm_os_ring_buffers`* • *`msdb.dbo.backupset`* • *`master.dbo.sysdatabases`* • *`master..sysprocesses`* • *`msdb..sysjobactivity`* • *`sys.master_files`* • *`sys.dm_tran_session_transactions`* • *`sys.dm_os_sys_memory`* • *`sys.database_files`*
Oracle DB tables and execute commands	Discovery credentials should have read access to: • Run `"lsnrctl services"` and `"sqlplus"` commands • *`dba_data_files`* table • *`dba_segments`* table • *`v$database`* table • *`gv$instance`* table • *`dba_hist_osstat`* table • *`dba_hist_snapshot`* table • *`v$asm_disk`* table • *`v$asm_diskgroup`* table • *`dba_audit_session`* table • *`gv$session_longops`* table • *`gv$session`* table • *`gv$sqlarea`* table • *`gv$process`* table

Verify that a Discovery schedule is configured

For more information, see create a discovery schedule

Microsoft SQL Server and Cluster discovery

The Discovery and Service Mapping Patterns application uses the MSSql DB On Windows pattern to find Microsoft SQL DB servers and clusters on your infrastructure. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

For detailed information on SQL Server supported versions see: Detailed information on products discovered by ITOM Visibility

Prerequisites

Verify that the following applications are up to date

- Discovery and Service Mapping Patterns starting with version 1.7.0 (August 2023)
- Visibility Content starting with version 6.12.1 (August 2023)

Create Windows credentials

After verifying that the MID Server is connected to the target Windows server, create Windows credentials on the ServiceNow AI Platform. For more information, see Windows credentials.

Create applicative credentials when using SQL authentication

For more information, see Applicative credentials.

Verify the configuration of the MID Server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verify that the MID Server has the necessary permissions to read the Windows Registry on a remote mode. The MSSql DB On Windows pattern uses registry values to discover SQL cluster details.

Verify SQL Server discovery report is active

Verify that the SQL Server discovery report is active on your server. Discovery uses the SQL Server discovery report to discover Microsoft SQL Server components.

Verify the permissions to run WMI queries

Verify remote read-only access to the following WMI namespaces:

- `Root\CIMv2`
- `Root\Microsoft\SqlServer\ComputerManagement*`

Verify the SQL Server table permissions

The MSSql DB On Windows pattern requires read-only permissions to read the following tables:

- `@@version`
- `sys.configurations`
- `sys.dm_exec_sessions`
- `sys.dm_os_schedulers`
- SERVERPROPERTY

Verify availability group table permissions

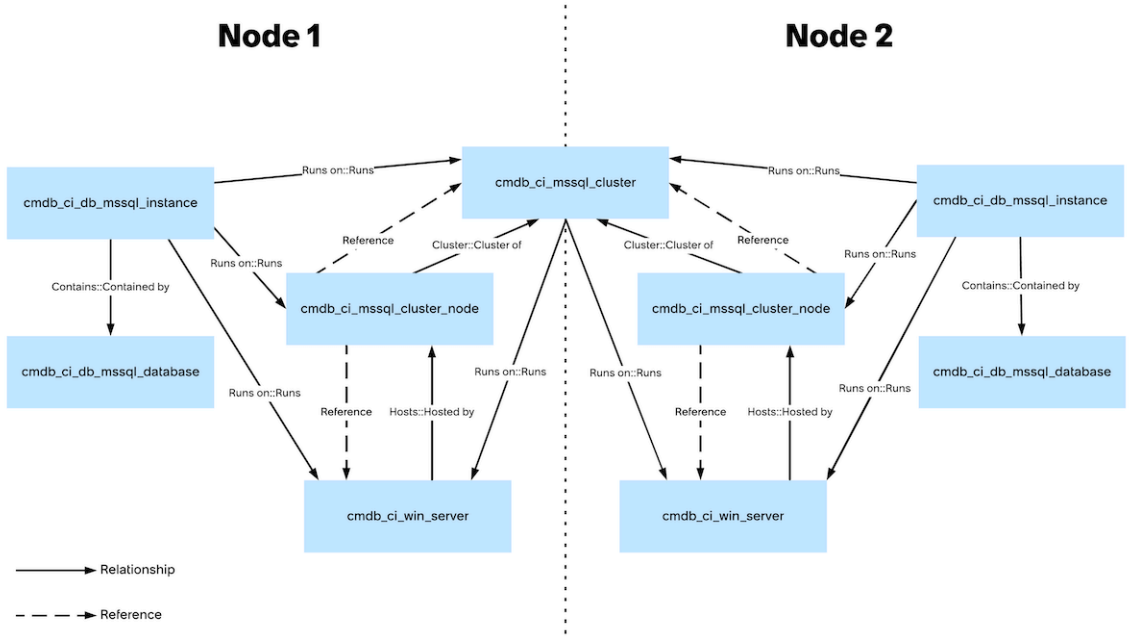
Verify the following table permissions to discover Microsoft SQL Server Always On availability groups:

- **VIEW SERVER STATE** access to the `sys.dm_hadr_availability_group_states` table
- Read access permission to the following tables:
  - `sys.availability_groups`
  - `sys.availability_group_listeners`
  - `sys.availability_group_listener_ip_addresses`

SQL failover cluster instance (FCI)

Updating the version 1.6.1 set of Patterns available from the ServiceNow® Store starting August 2023 enables an appropriate discovery of the Always On availability group details and the SQL Failover Clusters. When the failover scenario is occurring, the MSSql DB On Windows pattern discovers the failover cluster (Node 2). Then a new MSFT SQL instance and databases are created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The following procedure enables appropriate visibility of the SQL clusters.

1. Set the *sn_itom_pattern.discover_mssql_cluster.load_cluster_name_from_registry=true* MID Server property to **true** to enable the **Collect MSSQL Cluster info- MSSQL Cluster** extension section.
2. Ensure that an `sqlservr.exe` process to trigger the MSSql DB On Windows pattern is running on the server.
3. Run a CI discovery.

   For more information, see Running discoveries in your network.
4. Either keep duplicate instances and databases or delete them.
   - To keep the duplicate instances and databases, keep the default configuration.
     - The install status of the nodes of the passive cluster changes to **Absent**.
     - The install status of the nodes of the active cluster changes to **Installed**.
   - To delete the passive instances and databases, set the *discovery.mssql.cluster.instance.postsensor.delete* system property to **True**.

Microsoft SQL Server Always On availability groups support

Starting from Discovery and Service Mapping Patterns version 1.27.0, the MSSql DB On Windows pattern extension **Collect MSSQL HADR - Availability Group Info** supports the discovery of Microsoft SQL Server Always On availability groups.

The Collect MSSQL HADR - Availability Group Info pattern extension introduces the following CI classes that extend existing CMDB classes:

CI classes introduced by this pattern

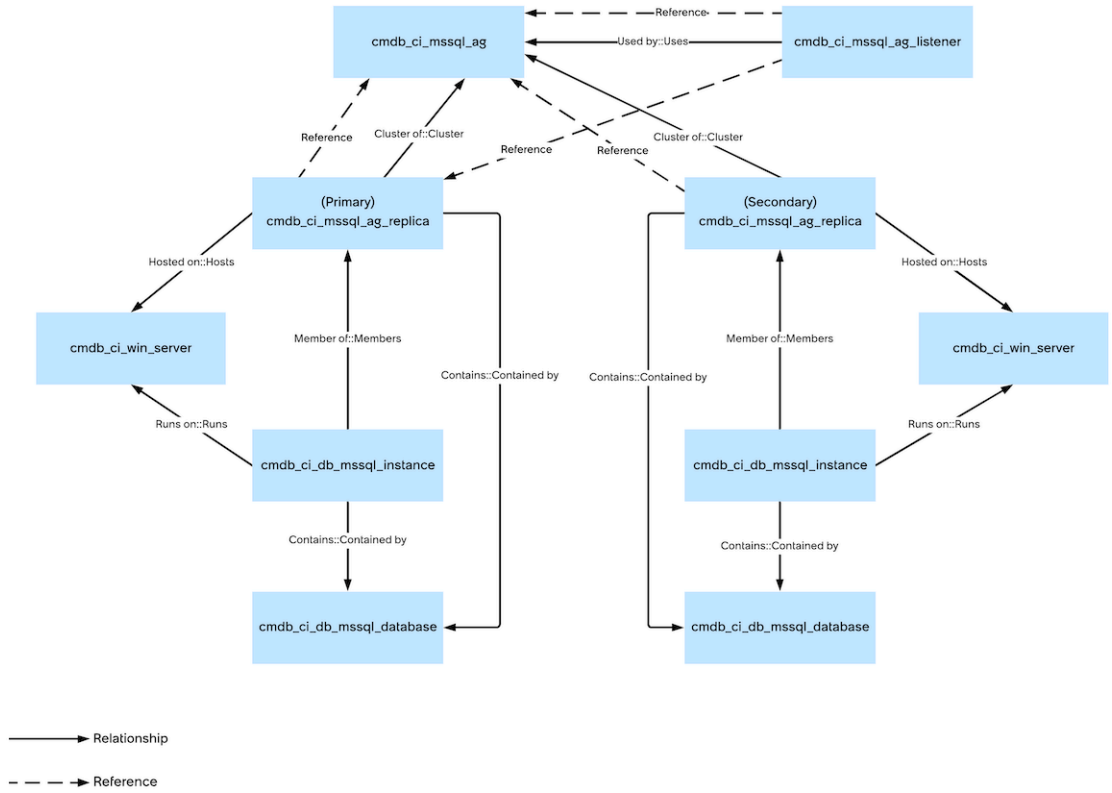
CI class	Extends from
MSSQL Availability Group [cmdb_ci_mssql_ag]	Cluster [cmdb_ci_cluster]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI classes introduced by this pattern (continued)

CI class	Extends from
MSSQL Availability Group Listener [cmdb_ci_mssql_ag_listener]	Endpoint [cmdb_ci_endpoint]
MSSQL Availability Group Replica [cmdb_ci_mssql_ag_replica]	MSSQL Cluster Node [cmdb_ci_mssql_cluster_node]

Data model of Collect MSSQL HADR - Availability Group Info



Prerequisites

Verify availability group table permissions

Discovered resources

Resources discovered by the pattern extension: Collect MSSQL HADR - Availability Group Info

Discovered relationships

Relationships discovered by the pattern extension: Collect MSSQL HADR - Availability Group Info

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the MSSql DB On Windows pattern.

MSFT SQL instance [cmdb_ci_db_mssql_instance]

The data collected for the running processes of the database (the actual SQL server) is referred to as the database instance

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name [name]	The field name. For example: MSSQLSERVER@windows_server_name
Instance Name [instance_name]	The SQL server instance name. For example: MSSQLSERVER
Is clustered [is_clustered]	Indicates the type of installation: • If this value is set to **true**,the SQL server is a part of a cluster, and the failover mechanism is enabled. • If this value is set to **false**, the SQL server is a standalone deployment and the failover mechanism is disabled.
Comments [comments]	The type of instance: • standalone_instance • failover_cluster • always_on
Version [version]	The SQL server version number. For example: 16.0.1000.6
Version Name [version_name]	The SQL server version by release dates. For example: The value **2022** represents version **16.0.1000.6**
Service Pack [service_pack]	The service pack version. For example: SP2.
Edition [edition]	The type of the edition. For example: Enterprise Edition.
TCP Port [tcp_port]	The TCP port that the MSSQL instance uses to accept connections.
Install Status [install_status]	The install status of the instance: **Installed**- The instance is currently running. **Absent**- The instance isn't running and it's the backup instance for a failover scenario.

MSSQL database [cmdb_ci_db_mssql_database]

Field	Description
Name [name]	The name of the database. For example: msdb.
Install Status [install_status]	The install status of the database.
Instance name [instance_name]	References the MSFT SQL instance [cmdb_ci_db_mssql_instance] table.

MSSQL Cluster Node [cmdb_ci_mssql_cluster_node]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name [name]	The server host name
IP Address [ip_address]	The hosting Windows server's IP address
Cluster [cluster]	Reference to the SQL cluster record.
Server [server]	Reference to the hosting Windows server record.

MSSQL Cluster [cmdb_ci_mssql_cluster]

Field	Description
Name [name]	The SQL cluster network name
IP Address [ip_address]	The SQL cluster's virtual IP address.

MSSQL Service Info [mssql_sqlservice_info]

Field	Description
Description [description]	Describes the MSSQL service. For example: "Provides storage, processing, and controlled access of data and rapid transaction processing."
Service Name [service_name]	The MSSQL service name as presented on the server. For example: MSSQL$NAMEDMSSQL2016
Binary Path [binary_path]	The file path of the service. For example: `C:\Program Files\Microsoft SQL Server\MSSQL13.NAMEDMSSQL2016\MSSQL\Binn\sqlservr.exe`
CI [ci]	Reference the MSFT SQL instance [cmdb_ci_db_mssql_instance] table.
Installed On [installed_on]	Reference to the Windows server record [cmdb_ci_win_server] **Note:** This field isn't populated for standalone deployments.

MSSQL Components Info [mssql_components_info]

Field	Description
Install Path [install_path]	The install path of the component service. Foe example: `C:\Program Files\Microsoft SQL Server\MSSQL16.SQLEXPRESS\MSSQL`
Service Name [service_name]	The components service type of the server. For example: **Database Engine Services**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
SKU Name [sku_name]	The MSSQL version of the component service. For example: **Express Edition (64-bit)**
Version [version]	The MSSQL version number of the component service
CI [ci]	Reference the MSFT SQL instance [cmdb_ci_db_mssql_instance] table.
Installed On [installed_on]	Reference to the Windows server record [cmdb_ci_win_server]. **Note:** This field is populated only for SQL Clusters and not for standalone deployments.

MSSql DB On Windows pattern extension: Collect MSSQL HADR - Availability Group Info

MSSQL Availability Group [cmdb_ci_mssql_ag]

Field	Description
Cluster ID [cluster_id]	Globally unique identifier (GUID) of the availability group.
Name [name]	Cluster name.
IP Address [ip_address]	IP address of the cluster.

MSSQL Availability Group Replica [cmdb_ci_mssql_ag_replica]

Field	Description
Replica ID [replica_id]	Unique ID of the replica.
Role [role]	Role of the replica. Possible values are: • Primary • Secondary • Resolving
Availability Mode [availability_mode]	Availability mode of the replica. Possible values are: • Asynchronous Commit • Synchronous Commit • Configuration Only
Failover Mode [failover_mode]	Failover mode of the availability replica. Possible values are: • Automatic • Manual

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MSSQL Availability Group Replica [cmdb_ci_mssql_ag_replica] (continued)

Field	Description
Readable Secondary [readable_secondary]	Whether an availability replica that's performing the secondary role can accept connections from clients. Possible values are: • true • false
Availability Group [availability_group]	References the MSSQL Availability Group [cmdb_ci_mssql_ag] table.
Name [name]	Name of the replica server.
Serial number [serial_number]	Unique ID of the replica.
State [state]	Failover state. Possible values: • Pending • Online • Offline • Failed • Failed No Quorum

MSSQL Availability Group Listener [cmdb_ci_mssql_ag_listener]

Field	Description
Name [name]	Name of the availability group listener.
Listener ID [listener_id]	Resource globally unique identifier (GUID) from Windows Server Failover Clustering (WSFC) cluster.
IP Subnet Mask [ip_subnet_mask]	IP subnet mark for the IPv4 address, if any, that's configured for the availability group listener.
Availability Group [availability_group]	References the MSSQL Availability Group [cmdb_ci_mssql_ag] table.

CI relationships

The MSSql DB On Windows pattern creates the following relationships and references to support Microsoft SQL Server and Cluster discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Windows Server [cmdb_ci_win_server]	Runs::Runs on	MSSQL Cluster [cmdb_ci_mssql_cluster]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI relationships (continued)

CI	Relationship	CI
MSFT SQL instance [cmdb_ci_db_mssql_instance]	Runs::Runs on	MSSQL Cluster [cmdb_ci_mssql_cluster]
MSSQL Cluster Node [cmdb_ci_mssql_cluster_node]	Cluster::Cluster of	MSSQL Cluster [cmdb_ci_mssql_cluster]
MSSQL Cluster Node [cmdb_ci_mssql_cluster_node]	Hosted on::Hosts	Windows Server [cmdb_ci_win_server]
MSFT SQL instance [cmdb_ci_db_mssql_instance]	Runs on::Runs	Windows Server [cmdb_ci_win_server]
MSFT SQL instance [cmdb_ci_db_mssql_instance]	Runs on::Runs	MSSQL Cluster Node [cmdb_ci_mssql_cluster_node]
MSFT SQL instance [cmdb_ci_db_mssql_instance]	Contains::Contained by	MS SQL Database [cmdb_ci_db_mssql_database]

CI references

CI	Field	Referenced CI
MSSQL Cluster Node [cmdb_ci_mssql_cluster_node]	Cluster [cluster]	MSSQL Cluster [cmdb_ci_mssql_cluster]
MSSQL Cluster Node [cmdb_ci_mssql_cluster_node]	Server [server]	Windows Server [cmdb_ci_win_server]
MSSQL Service Info [mssql_sqlservice_info]*	CI [ci]	MSFT SQL instance [cmdb_ci_db_mssql_instance]
MSSQL Components Info [mssql_components_info]	CI [ci]	MSFT SQL instance [cmdb_ci_db_mssql_instance]
MS SQL Database [cmdb_ci_db_mssql_database]	Instance name [instance_name]	MSFT SQL instance [cmdb_ci_db_mssql_instance]

*This reference is created only when the pattern uses the WMI queries.

The MSSql DB On Windows pattern creates the following relationships and references using the **Collect MSSQL HADR - Availability Group Info** pattern extension. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
MSFT SQL instance [cmdb_ci_db_mssql_instance]	Member of::Members	MSSQL Availability Group Replica [cmdb_ci_mssql_ag_replica]
MSSQL Availability Group Listener [cmdb_ci_mssql_ag_listener]	Used by::Uses	MSSQL Availability Group [cmdb_ci_mssql_ag]
MSSQL Availability Group Replica [cmdb_ci_mssql_ag_replica]	Contains::Contained by	MS SQL Database [cmdb_ci_db_mssql_database]

Add the Horizontal Pattern probe to a classifier

Horizontal Pattern probe

Database Administrator (DBA) report discovery

MySQL discovery

Discovery can identify an instance of MySQL that is running on UNIX or Windows operating systems.

Requirements

Discovery searches for the MySQL configuration file location from the following areas:

- UNIX: Discovery searches for the MySQL configuration file location from the mysqld process, or port 3306.
- Windows: Discovery searches for the MySQL configuration file location from the mysqld.exe process, or port 3306.

For each process, the following process parameters are explored in the following order:

--defaults-extra-file

--defaults-file

If the MYSQL configuration file location is not found from that search, then the following occurs:

- UNIX: The configuration file location defaults to `/etc/my.cnf`.
- Windows: No default configuration file location exists, and the probe to read the configuration file location is skipped.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Credentials

Configure these credentials:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Windows credentials
- SSH credentials
- Applicative credentials (When applications require credentials in addition to the credentials the that host machine requires.)

> **Note:** There's no need to configure applicative credentials unless your Discovery prerequisites mention them.

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Classifiers, patterns, and probes

Discovery uses these classifiers, probes, and patterns for MySQL discovery:

Classifier	Trigger probes	Pattern
MySQL Server	• Horizontal Pattern: launches patterns • Windows - MySQL Configuration* • Windows - MySQL Version* • MySQL - Configuration* • MySQL - Version*	My SQL server On Windows and Linux Pattern

*For new instances, these probes are inactive on the classifier. Discovery uses patterns for discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected

Discovery populates these fields in the MySQL Instance [cmdb_ci_db_mysql_instance] table:

Label	Field name	Source
MySQL configuration	myconf	my.cnf
TCP port(s)	tcp_port	running_process
Version	version	mysqld

Related topics

Database Administrator (DBA) report discovery

MongoDB discovery

Discovery creates or updates a CMDB record when it detects a running instance of MongoDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credentials

Configure SSH credentials.

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

The following data is collected:

Data Collected by Discovery on MongoDB instances

Label	Table Name	Field Name	Source
Version	cmdb_ci_db_mongodb_instance	version	mongod (UNIX) or mongod.exe (Windows)
Mongo configuration	cmdb_ci_db_mongodb_instance	mongodb_conf	mongod.conf
TCP port(s)	cmdb_ci_db_mongodb_instance	tcp_port	Process Classification or mongod.conf

PostgreSQL discovery

Discovery can find running instances of PostgreSQL on Windows and Linux systems.

Credentials and other prerequisites

These credentials are required:

- SSH credentials
- [optional] Applicative credentials

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

The user must have root-level access to the database to access the `postgresql.conf` file.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Classifiers, patterns, and probes

Classifier	Trigger probes	Patterns
PostgreSQL Instance	• Horizontal Pattern: launches patterns • PostgreSQL - Configuration* (add the *must_sudo* parameter to this probe) • PostgreSQL - Version*	PostgreSQL DB

*For new instances, these probes are inactive on the classifier. Discovery uses patterns for discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected

The following gathers specified information from the target. If the source is not configured, it brings back default information. For instance, for PostgreSQL Instance@hostname (default name), the source needs to be modified. If not, all the "PostgreSQL Instance@hostname" will be added in the source for the [cmdb_ci_db_postgresql_instance] table.

Label	Table Name	Field Name	Source
Name	cmdb_ci_db_postgresql_instance	name	PostgreSQL Instance@*hostname*
Data Directory	cmdb_ci_db_postgresql_instance	data_dir	running process
TCP port	cmdb_ci_db_postgresql_instance	tcp_port	running process
SQL Configuration	cmdb_ci_db_postgresql_instance	postgres_conf	*data_directory*/postgresql.conf
Version	cmdb_ci_db_postgresql_instance	version	postmaster/postgres

Relationships

Parent class	Relationship	Child class
cmdb_ci_db_postgresql_instance	Runs on:Runs	cmdb_ci_windows_server or cmdb_ci_linux_server

Oracle database discovery

Discovery can identify an Oracle database instance that is running on UNIX or Windows operating systems. It can also find Oracle clusterware, which runs Real Application Clusters (RAC).

Patterns perform the discovery of Oracle installations. These patterns replace several probes for new instances. If you want to continue to use probes, you can deactivate the Horizontal discovery probe, which launches the pattern, and then activate the necessary probes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Oracle DB on Unix and Oracle DB on Windows do not support RAC single-node discovery.

The Oracle DB on Unix and Oracle DB on Windows patterns discover Oracle catalog objects through the pattern extension Get Catalog info. For more information, see Oracle Catalog discovery. For general information about database catalog discovery, see database catalogs.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Credentials

Configure these credentials:

Credential type	Additional information
Applicative credentials	Applicative credentials are mandatory for two use cases: • Executing SQL queries against the remote Oracle DB Instance • Creating connections to database links • Software Asset Management activated You must add the database user you configured during Oracle database installation. Specify `Oracle instance [cmdb_ci_db_ora_instance]` as the CI type. The user must also have access to the *`tnsnames.ora`* parameters file. Make sure that the tnsnames.ora is configured correctly and exists in the Oracle path on the target Windows host. Also, verify that the utilized Discovery Credentials can read tnsnames.ora file. The user needs permissions for the SQL*Plus command line tool and permissions to execute SELECT queries against the following tables: • PRODUCT_COMPONENT_VERSION • V$VERSION • V$DATABASE • V$PARAMETER
Oracle Wallet authentication	You can use Oracle Wallet instead of applicative credentials (for UNIX only).
Windows credentials	Required for Windows targets. The user must have read permissions to the `tnsnames.ora` file. For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.
SSH credentials	Required for UNIX targets. The user must have read permission to the `oratab` file and read permission to the System Parameter file. For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credential type	Additional information
	list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Additional requirements

Discovery identifies a running instance of an Oracle database on UNIX from the process that starts with `ora_pmon_`. Ensure this process is running in the IP range you designate for Discovery. Discovery identifies a running instance of an Oracle database on Windows from the `oracle.exe` process. Ensure this process is running in the IP range you designate.

For Oracle clusterware, you also need permissions to read the `/etc/hosts/` file, which associates host names with IP addresses.

The following commands are run for Oracle clusterware:

Command	Description
`ps -ef | grep 'crsd.bin' |grep -v grep`	Verifies if Oracle CRS process is running.
`ps -ef |grep LISTENER | grep -v $$ | head -1 | awk '{print $8}'`	Gets Oracle home from the listener process path. Used when the ORACLE_HOME environment variable is unavailable.
`ps -ef | grep 'd.bin' | grep -v grep | grep -v bash | awk '{print $8}'`	Gets Oracle Grid home from the CRS daemon process path.
`/u01/app/12.1.0.2/grid/bin/olsnodes -c | egrep -v 'error|return code'`	Gets Oracle CRS cluster name.
`sudo /u01/app/12.1.0.2/grid/bin/ocrcheck | egrep -v 'error|return code'`	Gets Oracle CRS cluster ID.
`/u01/app/12.1.0.2/grid/bin/crsctl query crs softwareversion| egrep -v 'error|return code'`	Gets Oracle CRS version.
`/u01/app/12.1.0.2/grid/bin/olsnodes | egrep -v 'error|return code'`	Gets Oracle CRS nodes.
`/u01/app/12.1.0.2/grid/bin/crsctl status server | egrep -v 'error| return code'`	Gets Oracle CRS node status.
`/u01/app/12.1.0.2/grid/bin/crsctl stat res -f | tr '\n' '#'`	Gets Oracle CRS resources.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Command	Description
`/u01/app/12.1.0.2/grid/bin/crsctl stat res -p | grep -v CHECK_R |grep -v error |grep -v failed`	Gets Oracle CRS VIP resources.
`/u01/app/12.1.0.2/grid/bin/srvctl config scan | tr '\n' ' '`	Gets Oracle RAC SCAN VIP configurations.
`/u01/app/12.1.0.2/grid/bin/srvctl config vip -node ol7-121-rac1| egrep ' Name' | awk '{print $3}'`	Gets Oracle CRS VIPs name.
`/u01/app/12.1.0.2/grid/bin/srvctl config vip -node ol7-121-rac1| grep ' IPv4 Address:' | awk '{print $4}'`	Get Oracle CRS VIPs ip_address.

Important: Sudo permission are required to run `sudo /u01/app/12.1.0.2/grid/bin/ocrcheck | egrep -v 'error|return code'`.

Classifiers, patterns, and probes

Discovery uses these classifiers, probes, and patterns for Oracle database discovery:

Classifier	Trigger probes	Pattern
Oracle Instance	• Horizontal discovery probe: launches patterns • Powershell-Oracle - Instance PFile (for Windows)* • Powershell-Oracle - Instance Version (for Windows)* • SSHCommand-Oracle - Instance Details (for Linux)*	Application patterns: • Oracle DB On Windows Pattern • Oracle DB on UNIX Pattern This shared library pattern used by the Linux Server pattern: UNIX Cluster - ORACLE Clusterware **Note:** This shared library pattern is triggered if the `crsd.bin` process is running on the Oracle database server.
Oracle Listener	SSHCommand-Oracle - Listener Details	none

*Probes inactive for new instances.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected

The following data is collected on the Oracle Instances [cmdb_ci_db_ora_instance] table for both UNIX and Windows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected on UNIX machines

Label	Field name	Additional information
SID	sid	Obtained from the name of the process that starts with `ora_pmon_`
Install directory	install_directory	Obtained from the path of ORA_HOME
Version	version	Obtained in this order: • From the output of the `ORA_HOME/bin/sqlplus /NOLOG` command • From the output of the `ORA_HOME/bin/lsnrctl` status command • From the path of ORA_HOME
Parameter file	pfile	The following locations are explored for the location of the System Parameter File. If this file does not exist in one of the explored locations, Discovery does not find the file and reports an error. • *oracle_home*/dbs/spfile*SID*.ora • *oracle_home*/dbs/spfile.ora • *oracle_home*/dbs/init*SID*.ora
Oracle Home	oracle_home	Obtained from the *ORATAB* file.
Edition	edition	Obtained from the `context.xml` file.
Name	name	Combination of SID name Host name in the format *SID@HOST_NAME*.
TCP port(s)	tcp_port	Obtained from the `tnsnames.ora` file, or *lsnrctl* status command. If no valid information is retrieved, the default port 1521 is assigned.

Note: See Oracle options for pattern extensions and additional information collected.

Data collected on Windows machines

Label	Field name	Additional information
SID	sid	Obtained from the process parameter that is passed to the *oracle.exe* process.
Install directory	install_directory	
Version	version	Obtained from the output of the *ORA_HOME/bin/sqlplus.exe -V* command.
Parameter file	pfile	The following locations are explored for the location of the System Parameter File. If this file does not exist in one of the explored locations, Discovery does not find the file and reports an error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected on Windows machines (continued)

Label	Field name	Additional information
		• *oracle_home*\database\spfile*SID*.ora • *oracle_home*\database\spfile.ora • *oracle_home*\database\init*SID*.ora
Oracle Home	oracle_home	Parsed from the path of *oracle.exe*
Edition	edition	

Note: See Oracle options for pattern extensions and additional information collected.

Oracle options

For general information on Oracle options, see https://docs.oracle.com/en/.

Discovery can also find the Oracle options that you enable on the instance using the legacy pattern extension, Oracle option extension for Windows/Unix. Note that to discover Oracle options, the Software Asset Management Professional for Oracle (com.snc.samp.oracle) plugin is required.

Oracle Options [samp_oracle_options]

Label	Field name
Instance	instance
Option	option
Licensable	licensable
Currently used	currently_used
First usage date	first_usage
Last usage date	last_usage
Last sample date	last_sample
Detected usage	detected_usage
Sample interval	sample_interval

Table privileges needed	Additional information
The following tables are accessed as part of the Oracle option extension for UNIX and Windows: • DBA_FEATURE_USAGE_STATISTICS • CDB_FEATURE_USAGE_STATISTICS • V$DATABASE • V$VERSION • GV$PARAMETER	The following pattern extensions use the Oracle script: options_packs_usage_statistics.sql. This sql script is for DB Server version 11.2 and later. You need the **Select any dictionary** privilege to execute the script. See the support document ID13172651.1 on https://support.oracle.com/portal/ for more information about usage scripts.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table privileges needed	Additional information
• V$CONTAINERS • V$INSTANCE	• Oracle option extensions for UNIX • Oracle option extensions for Windows

Data collected on clusterware

Table	Labels and field names
Unix Cluster [cmdb_ci_unix_cluster]	Name [name] Cluster status [cluster_status] Cluster type [cluster_type] IP address [ip_address] Short description [short_description] Cluster ID [cluster_id] Cluster version [cluster_version]
cmdb_ci_unix_cluster_node	Name [name] Node state [node_state] IP address [ip_address] Node status [node_status]
cmdb_ci_unix_cluster_resource	Name [name] Resource type [resource_type] Resource status [resource_status] Properties [properties]
cmdb_ci_cluster_vip	Name [name] IP address [ip_address] Cluster name [cluster_name] Cluster ID [cluster_id]

On the dependency view, a **+1** on an Oracle database server signifies that it is part of a cluster.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extend Oracle instance extension

Note: Discovery can also find additional attributes for the instance using the Extend Oracle instance extension. See the Oracle website for more information on options https://docs.oracle.com/en/. Discovery saves these attributes to the Oracle Instances [cmdb_ci_db_ora_instance] table.

Label	Field name
Instance	instance
Host Name	host_name
IS_CDB	cdb_yn
DB Unique Name	db_unique_name
DB Name	database_name
Replication Enabled	replication_enabled

Table privileges needed	Additional information
The following tables are accessed as part of the Extend Oracle Instance extension for UNIX and Windows: • V$DATABASE • V$INSTANCE	The Extend Oracle Instance extension needs to be installed. This extension is included in the Discovery and Service Mapping Patterns application, version 1.0.72 or higher, which can be downloaded from the ServiceNow Store.

Oracle instances on virtual machines

When Oracle instances are hosted on virtual machines, the system creates relationships between CIs.

CI	Relationship	CI
Oracle instance	Hosted on	Computer [cmdb_ci_computer] or Server [cmdb_ci_server] **Note:** This is a virtual machine. The **Is virtual** field is **true**.
Computer [cmdb_ci_computer] or Server [cmdb_ci_server] **Note:** This is a virtual machine. The **Is virtual** field is **true**.	Virtualized by	Computer [cmdb_ci_computer] or Server [cmdb_ci_server] **Note:** This is not a virtual machine.

SAP Sybase ASE discovery

Discovery and Service Mapping uses the Sybase pattern to find SAP Sybase Adaptive Server Enterprise (ASE) databases and catalogs in your infrastructure. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify that the applications are up to date.

Discovery and Service Mapping Patterns

CMDB CI Class Models

Visibility Content

For details on the product discovered see Detailed information on products discovered by ITOM Visibility

Note: Discovery finds Sybase Catalog that run on Linux only.

Verify the configuration of OS server credentials.

Verify the configuration of the Applicative Credentials

When configuring the Applicative Credentials, make sure you specify `Sybase Instance [cmdb_ci_db_syb_instance]` as the CI type.

For more information on Applicative Credentials, see Applicative credentials

Verify that the user have permission to run the following commands

Execute the *`isql`* command.

Have the Sybase environment run one of the commands:

- `"echo -ne 'set nocount on select name from sysdatabases \ngo\n' | " + $isql_path + " -U $$username$$ -P '$ $password$$' -S " + $instance + " -w 999 -b -y " + $process.environmentVariables.SYBASE.value`
- `"export SYBASE=" + $process.environmentVariables.SYBASE.value + " && . " + $process.environmentVariables.SYBASE.value`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
+ "/SYBASE.sh && echo -ne 'set nocount on
select name from sysdatabases\ngo\n' | " +
$isql_path + " -U $$username$$ -P '$$password
$$' -S " + $instance + " -w 999 -b -y " +
$process.environmentVariables.SYBASE.value
```

Verify the configuration of a Discovery schedule

For detailed information, see Running discoveries in your network

Data collected during Horizontal discovery

Discovery populates the following data in the CMDB when running the Sybase pattern.

Sybase instance [cmdb_ci_db_syb_instance]	
Label	**Field Name**
Name	name
Version	version
Installation directory	install_directory
Instance name	Instance
Configuration file	config_file

Sybase Catalog [cmdb_ci_db_syb_catalog]	
Label	**Field Name**
Name	name

CI relationships

These relationships are created to support the Sybase ASE discovery.

CI	Relationship	CI
[cmdb_ci_db_syb_instance]	Contains::Contained by	[cmdb_ci_db_syb_catalog]

Network device discovery

Discovery identifies several network devices, including load balancers, routers, TCP connections, IP networks, and so on. It can find devices through traditional port probes, and then through identifications and exploration probes, or through patterns. It also supports discovery by identifying HTTP and TCP connections.

Note: See the knowledge article KB0687582 for information on model_id and manufacturer.

Load balancer discovery

Discovery can collect data about network routers, switches, and applications.

Discovery supports data collection from the following applications and hardware:

- A10
- Apache mod_jk and Apache mod_proxy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Big-IP F5 Traffic Manager
- Cisco
- Citrix NetScaler
- HAProxy
- NGINX
- Alteon
- ACE
- Radware

Important: Discovery treats load balancers as licensable entities and attempts to discover them primarily using SNMP. If a load balancer in your system, running on a Linux host, has SNMP and SSH ports open, Discovery might classify it based on the SSH port. This classification has priority over SNMP. To ensure that Discovery properly classifies your hardware load balancers, create a Discovery behavior for load balancers that includes SNMP but not SSH. Software load balancers are treated as applications.

Load balancer patterns

Starting with the Jakarta release, Discovery uses out-of-box patterns to find some types load balancers for new instances (see table).

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Load balancer	Pattern names and description	Main CI table populated
A10	A10 LoadBalancer	A10 Load Balancer [cmdb_ci_lb_a10]
ACE	ACE Load Balancer by SSH (formerly ACE Load Balancer)	ACE [cmdb_ci_lb_ace]
Alteon	Alteon Load Balancer	Alteon [cmdb_ci_lb_alteon]
F5 BIG-IP	F5 - HD, F5 Load Balancer	F5 BIG-IPs [cmdb_ci_lb_bigip]
NetScaler	Netscaler Load Balancer	Citrix NetScalers [cmdb_ci_lb_netscaler]
Radware - AppDirector	AppDirector Load Balancer	Radware Load Balancer [cmdb_ci_lb_radware]
HAProxy load balancer discovery with patterns	HA Proxy	HAProxy Load Balancer [cmdb_ci_lb_haproxy]

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Load balancer discovery, Service Mapping, and customized CI fields

Discovery collects information about the install status and operational status of load balancers. If you are using Discovery with Service Mapping, do not customize the [operational_status] or [install_status] fields. By default, Service Mapping ignores all host CIs for which the value of the *[operational_status]* field is not *1* (Operational) or the value of the status

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

[install_status] field is *100* (absent). For additional information, see Preparing customized ServiceNow deployments to work with Service Mapping [KB0647574] in the HI Knowledge Base.

A10 load balancer discovery

Discovery and Service Mapping uses patterns to collect information about A10 load balancers.

Note: Probe-to-pattern migration is supported for the New York release and later. See the knowledge article KB0694477 for more information.

The following patterns support the A10 load balancer discovery:

- A10 Load Balancer
- A10 Load Balancer SSH
- A10

The A10 IP Source NAT (Network Address Translator) is an extension of the A10 Load Balancer Pattern. The IP Source NAT Pattern extension discovers IP Source NAT pools. This extension is available on Store from the February 2023 release, Store version 1.0.98.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Credentials

Configure SNMP credentials or (optionally) SSH credentials.

Discovery and Service Mapping Patterns application

To discover A10 load balancer partitions, deploy Discovery and Service Mapping Patterns application 1.0.98 release from the ServiceNow Store.

Data collected by Discovery during horizontal discovery

Table and field	Description
A10 Load Balancer [cmdb_ci_lb_a10]	
Serial number [serial_number]	Serial number of the load balancer.
Load Balancer Interface [cmdb_ci_lb_interface]	
Name [name]	Name of the load balancer interface.
MAC Address [mac_address]	MAC address of the load balancer interface, in the following format: 55:0d:f9:98:3i:ae.
Operational status [operational_status]	Operational status of the load balancer interface.
Load Balancer Pool [cmdb_ci_lb_pool]	
Name [name]	Name of the load balancer pool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Description
Load balancing method [load_balancing_method]	The method used by the load balancer.
Load Balancer Pool Member [cmdb_ci_lb_pool_member]	
Name [name]	Name of the pool member.
IP Address [ip_address]	IP address of the pool member host.
Service port [service_port]	Port used by the pool member.
Operational status [operational_status]	Operational status of the load balancer pool members.
Pool [pool]	Pool member.
Load Balancer Services [cmdb_ci_lb_service]	
Name [name]	Name of the load balancer, in the following format: <LB name>:<LB port>.
IP Address [ip_address]	IP address of the FQDN.
Port [port]	Port of the load balancer.
Operational status [operational_status]	Operational status of the load balancer service.
Install Status [install_status]	Install status of the load balancer service.
Pool [pool]	Pool member of the load balancer service.
DNS [cmdb_ci_dns_name]	
Name [name]	DNS name.
IP Address [ip_address]	DNS IP address.
A10 Load Balancer Partition [cmdb_ci_lb_a10_partition]	
Name [name]	Name of the partition.
Index [index]	Partition ID. An admin assigns this ID in the process of creating a partition.
Max Aflex [max_aflex]	Maximum number of aFleX scripts that can belong to the partition.
Admin Count [admin_count]	Number of admins assigned to the partition.
L3V [l3v]	Value indicating whether Layer 2/3 virtualization is enabled for the partition.
Network Adapter [cmdb_ci_network_adapter]	
Operational status [operational_status]	Operational status of the network adapter.
Mac address [mac_address]	MAC address of the network adapter.
Alias [alias]	Alias of the network adapter.
IP Address [ip_address]	IP address of the network adapter.
Name [name]	Name of the network adapter.
Netmask [netmask]	Netmask of the network adapter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Description
PrimaryIP [primaryIP]	PrimaryIP address of the network adapter.
IP Address [cmdb_ci_ip_address]	
IP Address [ip_address]	IP address.
Netmask [netmask]	Netmask to which the IP address belongs.
Version [version]	IP version.
Operational Status [operational_status]	Operational status of the IP address.
SNAT IP Pool [cmdb_ci_snat_ip_pool]	
NAT Pool Failed [nat_pool_failed]	The total misses in the pool.
HA Group [ha_group]	High Availability group number associated with the NAT pool.
NET Mask [net_mask]	Netmask of the NAT pool address range.
NAT Pool Total Free [nat_pool_total_free]	The total of free addresses in the pool.
NAT Pool Total Used [nat_pool_total_usage]	The total of used addresses in the pool.
NAT Pool Port Usage [nat_pool_total_used]	The total port usage in the pool.
NAT Pool End Address [nat_pool_end_address]	The IP NAT pool end address (IPv4 or IPv6).
NAT Pool Start Address [nat_pool_start_address]	The IP NAT pool start address (IPv4 or IPv6).
Object ID [object_id]	A unique identifier for the NAT pool, assigned by the A10 device.
Configuration Item [cmdb_ci]	References the A10 Load Balancer [cmdb_ci_lb_a10] table.

Cisco GSS load balancer discovery

Discovery of Cisco GSS load balancers is performed by both SNMP and SSH.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Classifiers

Discovery uses the Cisco GSS Load Balancer classifier, which contains the condition: `sysdescr contains Global Site Selector` to classify the device.

Probes

Discovery uses several probes, including an SNMP probe to discover the specific GSS device and a **Serial Number** probe to identify the serial number of the device. See the table below for the list of related probes.

Warning: You must have SNMP and SSH credentials configured correctly for the GSS load balancers on your network.

The following probes are triggered after classification:

Probe	Description	Type
Cisco GSS - Identity	A multiprobe that identifies the GSS device and serial number.	MultiProbe
Cisco GSS - Network	This is included in the Cisco GSS - Identify probe.	Java-SNMP
Cisco GSS - Serial Number	This is included in the Cisco GSS - Identify probe.	JavaScript
Cisco GSS - Get Domains	A probe that discovers global domain names corresponding to the device.	JavaScript

Tables

Discovery creates a record for each GSS device in the Cisco GSS [cmdb_ci_lb_cisco_gss] table. Domains are populated in the DNS Names [cmdb_ci_dns_name] table. Host names and IP addresses are stored in the IP Address to DNS Name [cmdb_ip_address_dns_name] table. Service Mapping uses this information. You can see the DNS name information on the **DNS Names for CIs** related list of the Load Balancer form.

Note: The Cisco GSS pattern is available by default to use with the Pattern Designer.

Cisco CSS load balancer

Discovery of Cisco CSS load balancers is performed by SNMP.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Classifiers

Discovery uses the Cisco CSS Load Balancer classifier, which contains the OID Classification: 1.3.6.141.9.9.368.4.5.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Probes

The following probes are triggered:

Probe	Description	Type
SNMP - Load Balancer - Identity	A multiprobe that identifies load balancers.	Java-SNMP
Cisco CSS - Get Services	A Java probe that includes the Cisco CSS sensor to identify services defined on the load balancer in the Load Balancer Services [cmdb_ci_lb_service] table. For every service, Discovery populates **Name**, **ip_address**, and **port**.	Java-SNMP

Tables

Discovery creates a record for each CSS device in the Cisco CSS [cmdb_ci_lb_cisco_css] table, which includes the device's **Name**, **Model**, **Serial Number**, **Manufacture**, and **NIC** (ip_address). It also creates a record for each service in the Load Balancer Services [cmdb_ci_lb_service] table.

.

Citrix NetScaler load balancer discovery

Discovery and Service Mapping find Citrix NetScaler load balancers including Server Load Balancing (GSLB).

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Requirements and support

Important: Discovery treats load balancers as licensable entities and attempts to discover them primarily using SNMP. If a load balancer in your system, running on a Linux host, has SNMP and SSH ports open, Discovery might classify it based on the SSH port. This classification has priority over SNMP. To ensure that Discovery properly classifies your hardware load balancers, create a Discovery behavior for load balancers that includes SNMP but not SSH. Software load balancers are treated as applications.

Virtual NetScaler load balancers are not fully supported. Discovery supports local server load balancers and GSLB.

Credentials

- Configure SNMP credentials. The SNMP community string requires read-only access to the Citrix NetScaler MIB (`1.3.6.1.4.1.5951`).

  Note: You also have the option of using SSH credentials. The SSH user requires permission to run NetScaler `show` commands only. However, if the payload size of the data that's returned to the instance is large, the discovery process can fail. In this case, use SNMP credentials instead.

- (Optional) When using the NS.CONF pattern, provide a user with read-only access to the *NS.conf* configuration file if you don't want to provide SNMP or SSH credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use basic authentication credentials for discovery via REST. Configure the credential as a credential alias. The NITRO API user requires read-only access to the following resources:
  - `lbvserver`
  - `csvserver`
  - `service`
  - `servicegroup`
  - `interface`
  - `lbvserver_binding`
  - `csvserver_binding`
  - `nspartition`
  - `nshardware`
  - `nshostname`
  - `nsconfig`
  - `hanode`

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Classifier, pattern, and probes

Classifier	Trigger probes	Patterns

NetScaler Load Balancer	• Horizontal discovery probe: launches patterns (see the Patterns column)
	• NetScaler - Network Path Information (multiprobe)
	  ◦ NetScaler - ARP Information
	  ◦ NetScaler - Route Information
	• SNMP - NetScaler - Identity
	• SNMP - NetScaler - Identity - Serial
	• SNMP - NetScaler - Identity Info
	• SNMP - NetScaler - System
		• NetScaler Load Balancer
		• NetScaler Load Balancer NS.CONF
		• NetScaler Load Balancer SSH
		• Netscaler Loadbalancer NITRO

To use probes for the horizontal discovery, make sure that the *`NetScaler - Network Path Information`* multiprobe is active on the **Trigger probes** related list for the *`NetScaler Load Balancer`* classifier. Then deactivate or remove the *`Horizontal discovery`* probe from the **Trigger probes** related list.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When using probes and sensors and the system properties *glide.discovery.hostname.snmp_trusted* and/or *glide.discovery.hostname.dns_nbt_trusted* are set to false, the system uses *dns_name* as the load balancer name. When using the Netscaler Load Balancer pattern, the system currently doesn't recognize these system properties when they are set to false.

Connections discovered by Service Mapping during the top-down discovery

Service Mapping performs the top-down discovery of the NetScaler Global Server Load Balancer in the context of application services. It discovers configured URLs of the NetScaler Global Server Load Balancer.

Data collected by Discovery during horizontal discovery

Table and field	Description
DNS name [cmdb_ci_dns_name]	
Name [name]	The name or the DNS name alias of the NetScaler Global Server Load Balancing (GSLB).
IP address [ip_addresses]	Management IP address of the NetScaler Global Server Load Balancing (GSLB).
Port [port]	The DNS port that Global Server Load Balancer listens to.
Citrix NetScaler [cmdb_ci_lb_netscaler]	
Serial Number [serial_number]	The serial number of the NetScaler device and its current operational status.
Operational Status [operational_status]	
Load Balancer Pool [cmdb_ci_lb_pool]	
Name [name]	The name of the pool and the method of load balancing it enables.
Load Balancing Method [load_balancing_method]	
Load Balancer Pool Member [cmdb_ci_lb_pool_member]	
Name [name]	The name, IP address and service port that each pool member uses.
IP Address [ip_address]	
Service Port [service_port]	
Load Balancer VLAN [cmdb_ci_lb_vlan]	
Name [name]	The name of the VLAN and the tag that is associated with this VLAN to identify it.
Tag [tag]	
Load Balancer Services [cmdb_ci_lb_service]	
Name [name]	Details about the service running on the load balancer, including
IP Address [ip_address]	
Port [port]	
Operational Status [operational_status]

Load balancer	load_balancer	Reference	Configuration Item (Load Balancer)
Name	name	String	
Pool	pool	Reference	Load Balancer Pool
Service port	service_port	Integer	

To see the DNS names and alases for a NetScaler load balancer, you must configure the form and add the **DNS Names for CIs** related list. DNS names also include aliases.

Note: Discovery populates load balancer interface information that is necessary to map the network path in Service Mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration item (CI) Relationships

These relationships are created to support NetScaler Global Server Load Balancer discovery:

CI	Relationship	CI
DNS name [cmdb_ci_dns_name]	Uses:Used by	IP address [cmdb_ci_ip_addresses]

These relationships are created to support NetScaler Loadbalancer NITRO:

CI	Relationship	CI
Netscaler [cmdb_ci_lb_netscaler]	Owns::Owned by	interfaces [cmdb_ci_lb_interface]
Netscaler [cmdb_ci_lb_netscaler]	Owns::Owned by	vlan [cmdb_ci_lb_vlan]
Netscaler [cmdb_ci_lb_netscaler]	Owns::Owned by	service groups [cmdb_ci_lb_pool]
service groups [cmdb_ci_lb_pool]	Owns::Owned by	lbvservers [cmdb_ci_lb_pool_member]
services [cmdb_ci_lb_service]	Runs on::Runs	Netscaler [cmdb_ci_lb_netscaler]

NetScaler device sysName

To verify the NetScaler device sysName, check the snmp mib and verify the sysName value by running the command: *`show snmp mib`*.

To change the value of the sysName, run the command: *`set mib -name <DNS_NAME or NAME_OF_THE_NETSCALER_LB>`* to set the name of the SNMP MIB.

F5 BIG-IP load balancer discovery

Discovery and Service Mapping can find F5 BIG-IP load balancers via SNMP, SSH, and through the REST API.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Important: Discovery treats load balancers as licensable entities and attempts to discover them primarily using SNMP. If a load balancer in your system, running on a Linux host, has SNMP and SSH ports open, Discovery might classify it based on the SSH port. This classification has priority over SNMP. To ensure that Discovery properly classifies your hardware load balancers, create a Discovery behavior for load balancers that includes SNMP but not SSH. Software load balancers are treated as applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can download VMware images of BIG-IP with a free 90-day trial from https://www.f5.com/trial.

For F5 Global Traffic Manager (GTM) BIG-IP load balancers, Discovery can resolve the DNS name of the F5 GTM hardware as well as the DNS names of all the servers associated with the load balancer that receive distributed traffic. To view this data, navigate to **All** > **Configuration** > **Load Balancers** > **LB Hardware** and open the F5 load balancer record and then select the **DNS Names for CIs** related list. Service Mapping uses this information to map F5 relationships.

Note: If your F5 BIG-IP device is part of a failover cluster, it can be associated with two cluster nodes. In this case, one of the nodes appears as Operational in the **Operational Status** field, and the other appears as Non-Operational.

Prerequisites

- To successfully discover the load balancer pool members, set the **display service names** option (*bigpipe.displayservicenames*) of the load balancer to **false** on the F5 load balancer.
- For F5 Load Balancer pattern:
  - Configure SNMP credentials on the ServiceNow AI Platform.
  - (Optional) If there are iRules or SNMP community credentials are not enough for discovering outgoing connections, configure SSH credentials.

    Note: If you do not want to use SSH credentials, you can use the REST API to create a connection to F5 BIG-IP devices.

    Service Mapping uses the SSH credentials to retrieve connections that are not from CMDB. Discovering connections using the SSH protocol is a failover mechanism for the SNMP-based discovery.
- For F5 Load Balancer SSH pattern:
  - Configure SSH credentials.
  - Verify permissions for the following SSH commands:
    - `list auth partition all`
    - `list sys global-settings`
    - `show sys hardware`
    - `list sys db failover.state`
    - `list net self one-line`
    - `show sys mac-address | grep interface`
    - `show net interface field-fmt`
    - `show net self | grep -e 'Mac Address' 'IP:'`
    - `list ltm pool | grep -e 'pool' 'mode'`
    - `list ltm pool /<partition_name>/* | grep -e 'pool' 'mode'`
    - `show ltm pool | grep -e 'Ltm::' 'Total Connections'`
    - `show ltm pool /<partition_name>/* |grep -e 'Ltm::' 'Total Connections'`
    - `list sys db bigpipe.displayservicenames | grep value`
    - `show /net vlan | grep -e 'Interface Name' 'Mac' 'Tag'`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `show ltm virtual detail | grep -e 'Server:' 'State' 'Pool:' 'Destination' 'Total Connections'`
- `show ltm virtual detail /<partition_name>/* | grep -e 'Server:' 'State' 'Pool:' 'Destination' 'Total Connections'`
- `show gtm wideip | grep -e 'WideIp' 'State'`
- `list wideip a /<partition_name>/* | grep -e 'WideIp' 'State'`
- `show gtm wideip all | grep -e 'WideIp' 'State'`
- `list gtm wideip`
- `list gtm wideip all`

- For F5REST pattern:
  - For horizontal discovery using Discovery, provide read-only permissions to run the following APIs:
    - `"https://" + $ipAddress + "/mgmt/tm/ltm/pool"`
    - `"https://" + $ipAddress + "/mgmt/tm/sys/global-settings"`
    - `"https://" + $ipAddress + "/mgmt/tm/sys/hardware"`
    - `"https://" + $ipAddress + "/mgmt/tm/sys/failover"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/self"`
    - `"https://" + $ipAddress + "/mgmt/tm/ltm/virtual?$select=destination,mask,vlans"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/interface"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/interface/stats"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/trunk"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/vlan"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/vlan/"+<vlan id>+"/interfaces"`
    - `"https://" + $ipAddress + "/mgmt/tm/gtm/wideip"`
    - `"https://" + $ipAddress + "/mgmt/tm/cm/traffic-group/"`
    - `"https://" + $ipAddress + "/mgmt/tm/cm/device"`
  - Create basic authentication credentials.
- For F5 REST OAuth 2.0 authentication pattern:
  - Verify read-only permission for the following APIs:
    - `"https://" + $ipAddress + "/mgmt/shared/authn/login"`
    - `"https://" + $ipAddress + "/mgmt/tm/ltm/pool"`
    - `"https://" + $ipAddress + "/mgmt/tm/sys/global-settings"`
    - `"https://" + $ipAddress + "/mgmt/tm/sys/hardware"`
    - `"https://" + $ipAddress + "/mgmt/tm/sys/failover"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/self"`
    - `"https://" + $ipAddress + "/mgmt/tm/ltm/virtual?$select=destination,mask,vlans"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/interface"`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- "https://" + $ipAddress + "/mgmt/tm/net/interface/stats"
- "https://" + $ipAddress + "/mgmt/tm/net/trunk"
- "https://" + $ip_address + "/mgmt/tm/net/vlan"
- "https://" + $ipAddress + "/mgmt/tm/net/vlan/"+<vlan id> +"/interfaces"
- "https://" + $ipAddress + "/mgmt/tm/gtm/wideip"
- "https://" + $ipAddress + "/mgmt/tm/cm/traffic-group/"
- "https://" + $ipAddress + "/mgmt/tm/cm/device"

  - Create basic authentication credentials.
  - Create a credential alias for the basic authentication credential.
  - Create a serverless discovery schedule.

- For top-down discovery using Service Mapping, provide permissions to run the following APIs:
  - https://" get_attr {"managementIP"}"/mgmt/tm/ltm/"get_attr {"irule"}
  - https://" get_attr {"managementIP"}"/mgmt/tm/ltm/virtual/~Common~"get_attr {"vip_name"}
  - https://" get_attr {"computer_system.managementIP"}"/mgmt/tm/ltm/pool/"get_attr {"pool_name"}"/members?
- (Optional) For top-down discovery with Service Mapping, configure applicative credentials.
- (Optional) For top-down discovery with Service Mapping, provide a user with permissions to run the following commands:
  - bigpipe commands (for BIG-IP LTM F5 or BIG-IP GTM F5 version 9)
  - bigpipe and Traffic Management Shell (TMSH) commands (for BIG-IP LTM F5 or BIG-IP GTM F5 version 10)
  - Traffic Management Shell (TMSH) commands (for BIG-IP LTM F5 or BIG-IP GTM F5 version 11)
  - Traffic Management Shell (TMSH) advanced commands (for BIG-IP LTM F5 or BIG-IP GTM F5 version 10, 11, and 12)
  - The *show cm traffic-group – get command* for discovering F5 BIG-IP Device Service Clustering
- (Optional) For top-down discovery with Service Mapping, give the user elevated rights to be able to run Service Mapping commands requiring a privileged user.

F5 cluster discovery

The horizontal discovery process can find F5 clusters. To discover clusters, the credentials must have read permission to traffic groups. For SNMP, this is the regular read permission. For SSH, you need to have **Traffic Management Shell (TMSH shell)** enabled and accessible.

Note: Because F5 clusters share the same virtual IPs and addresses for all devices, the horizontal discovery process cannot find specific IP addresses for each device.

Classifier, patterns, and probes

Discovery uses these classifiers, probes, and pattern for F5 discovery:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Classifiers	Trigger probes	Patterns
F5 BIG-IP Load Balancer	Horizontal discovery probe: launches patterns	These patterns are used for standard horizontal discovery including identifying clusters: • F5 Load Balancer • F5 Load Balancer SSH • F5REST • F5 REST OAuth 2.0 authentication **Note:** The F5 Load Balancer and F5 Load Balancer SSH patterns include the extension section that discovers F5 certificates.
F5 HTTP	The F5 HTTP classifier does not use a trigger probe. It triggers the F5 Load Balancer REST pattern to perform data collection via REST.	These patterns use iRules to get information via REST. Service Mapping uses these patterns for top-down discovery: • F5 Load Balancer REST • F5 BigIP GTM • F5 BigIP LTM

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Connections discovered by Service Mapping during the top-down discovery

Service Mapping performs the top-down discovery of the GTM BIG-IP load balancer in the context of application services. It discovers configured URLs of the GTM BIG-IP load balancers.

Data collected by Discovery during horizontal discovery

The following data is collected on the F5 Big-IP `[cmdb_ci_lb_bigip]` table.

Table and field	Description
F5 Big-IP [cmdb_ci_lb_bigip]	
Name [name]	Details about the load balancer. View a record in this table to see the upstream and downstream relationships with the load balancer.
Serial Number [serial_number]	
Operational Status [operational_status]	
Load Balancer Interface [cmdb_ci_lb_interface]	
Name [name]	Details about each interface for the load balancer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Description
MAC Address [mac_address]	
Operational Status [operational_status]	
Load Balancer Pool [cmdb_ci_lb_pool]	
Name [name]	The name of the pool and the method of load balancing it enables.
Load balancing method [load_balancing_method]	
Load Balancer Pool Member [cmdb_ci_lb_pool_member]	
Name [name]	The name, IP address, and service port that each pool member uses.
IP Address [ip_address]	
Service Port [service_port]	
Pool [pool]	
Load Balancer VLAN [cmdb_ci_lb_vlan]	
Name [name]	The name of the VLAN and the tag that is associated with this VLAN to identify it.
Tag [tag]	
MAC Address [mac_address]	
Load Balancer Services [cmdb_ci_lb_service]	
Name [name]	Details about the load balancer service that distributes the workload to other servers, such as web servers.
IP Address [ip_address]	
Port [port]	
Operational Status [operational_status]	
Hit count [hit_count]	
DNS [cmdb_ci_dns_name]	
Name [name]	The name and IP address of the Domain Name Server for the network adapters.
IP Address [ip_address]	
Network Adapter [cmdb_ci_network_adapter]	
Name [name]	Details about the network adapters on the load balancer.
IP Address [ip_address]	
Netmask [netmask]	
Mac address [mac_address]	
Cluster [cmdb_ci_cluster]	
Name [name]	Details about the load balancer cluster.

© 2026 ServiceNow, Inc. All rights reserved.

Table and field	Description
Cluster status [cluster_status]	
Cluster ID [cluster_id]	
IP address [ip_address]	
Cluster Node [cmdb_ci_cluster_node]	
Name [name]	Details about each node in a cluster.
Cluster ID [cluster_id]	
Cluster status [cluster_status]	

Configuration item (CI) relationships for clusters

These relationships are created for clusters:

CI	Relationship	CI
cmdb_ci_cluster	Hosts::Hosted on	cmdb_ci_lb_bigip
cmdb_ci_cluster_node	Hosted on::Hosts	cmdb_ci_lb_bigip
cmdb_ci_cluster_node	Cluster of::Cluster	cmdb_ci_cluster

Create a serverless schedule for F5 BIG-IP REST OAuth 2.0 authentication-based discovery

Create a serverless discovery schedule to discover F5 BIG-IP load balancers through REST OAuth 2.0 authentication (tokens).

Before you begin

- Verify you have the IP address for the F5 BIG-IP load balancer.
- Create a basic authentication credential. For more information, see Basic authentication credentials.
- Create a alias for the basic authentication credential. For more information, see Credential aliases for Discovery.

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery** > **Discovery Schedules**.
2. Create the discovery schedule record.
   a. Select **New**.
   b. On the form, fill in the fields.

Discovery Schedule New record form

Field	Description
Name	Unique name for this discovery schedule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Discover	Scan type, which should be Serverless.
MID server	Name of the MID Server to use for this schedule.
Active	Enables this schedule for discovery.

c. Select **Submit**.

3. Create the execution pattern.

a. In the Discovery Schedules page, select the record you created.

b. In the **Serverless Execution Patterns** tab, select **New**.

c. On the form, fill in the fields.

Serverless Execution Pattern New record form

Field	Description
Name	Descriptive name for this record.
Pattern	Pattern to be used for this schedule, which should be the F5 REST OAuth 2.0 authentication pattern.
Proxy Host	Fully qualified domain name of the machine on which you're installing the proxy server, which should be Global.
Active	Enables this schedule for discovery.

d. Select **Submit**.

4. Set the pattern launcher parameters.

a. In the **Discovery Pattern Launcher Parameters** tab, select the record you created.

b. On the form, fill in the fields.

Parameter	Value
ip_address	IP address of the F5 BIG-IP load balancer.
credential_alias	Name of the credential alias you created.

c. Select **Submit**.

What to do next

Either execute discovery immediately by selecting **Discover now** or wait until the predefined schedule triggers the discovery.

HAProxy load balancer discovery using probes

Discovery of HAProxy Community edition load balancers is performed by SSH.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Starting with Discovery and Service Mapping Patterns 1.15.0 version, pattern-based discovery is the default method for discovering HAProxy load balancers.

- For information about enabling probe-based discovery, see Enable HAProxy load balancer discovery with probes.
- For information about the HA Proxy pattern, see HAProxy load balancer discovery with patterns.
- For information about Probe to Pattern migration see the knowledge article KB0694477.

HAProxy is an open-source load balancer that can manage any TCP service. It is particularly suited for HTTP load balancing because it supports session persistence and Layer 7 processing. Discovery supports HAProxy for HTTP load balancing. TCP load-balancing is not supported.

Consider the following requirements for discovering the HAProxy:

- The HAProxy software is installed and running on a Linux server.
- The MID Server is deployed to explore the server and the MID Server has access to the server HAProxy configuration file.
- The configuration probe checks for the `haproxy.cfg` file using one of the following methods:
  - Using the *f* parameter for the HAProxy process output.
  - Using the default `/etc/haproxy/haproxy.cfg` path.
- The HAProxy probes require credentials and execute privileges to run commands.

Discovery uses the **Unix - Active Processes** probe to identify an HAProxy load balancer when the name of the process is *haproxy*. If this criterion matches, a record is created in the HAProxy Load Balancers [cmdb_ci_lb_haproxy] table if one does not already exist for that running process.

The following probes are triggered after classification:

HAProxy probes

Probe	Description	Commands
HAProxy – Version	The sensor of this probe populates the HAProxy version in the HAProxy Load Balancers [cmdb_ci_lb_haproxy] table.	haproxy
HAProxy – Get Configuration	The sensor of this probe populates additional information in the HAProxy Load Balancers [cmdb_ci_lb_haproxy] table. The probe also populates information in the Load Balancer Service [cmdb_ci_lb_service], Load Balancer Pool [cmdb_ci_lb_pool], Load Balancer Pool Member [cmdb_ci_lb_pool_member], Load Balancer Interface [cmdb_ci_lb_interface], and Load Balancer Application [cmdb_ci_lb_appl] tables.	echo, sed, cut, grep, egrep (within the Borne shell script)

In addition to populating the data, the following relationships records are created in CI Relationships [cmdb_rel_ci] table:

- The records in the cmdb_ci_lb_appl table run on the cmdb_ci_web_server table records.
- The records in the cmdb_ci_lb_service table use the cmdb_ci_lb_pool table records.
- The records in the cmdb_ci_pool table are used by the cmdb_ci_service table records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The records in the cmdb_ci_pool table are members of the cmdb_ci_pool_member table records.
- The records in the cmdb_ci_pool_member table are members of the cmdb_ci_pool table records.

Enable HAProxy load balancer discovery with probes

If you prefer not to start using the default HAProxy pattern-based discovery, enable probe-based HAProxy discovery to continue using it instead.

Before you begin

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery Definition** > **CI Classification** > **Processes**.
2. In the **Name** field, search for `HAProxy`.
3. Select the HAProxy classifier.
4. In the **Triggers probe** related list, select **Edit**.
5. Remove **Horizontal Pattern** from the Triggers probes List.
6. From the Collection list, add **HAProxy - Get Configuration** and **HAProxy - Version** to the Triggers probe list.
7. Select **Save**.

What to do next

Schedule a horizontal discovery to discover HAProxy load balancer with probes. For more information, see Schedule a horizontal discovery.

Related topics

HAProxy load balancer discovery using probes

NGINX load balancer discovery

Discovery of NGINX load balancers is performed by SSH.

NGINX is an open source web server with a load balancer. Discovery identifies the web server and information related to the load balancer.

Consider the following requirements for discovering NGINIX servers:

- Ensure that the NGINX software is installed and running on the server.
- Grant the MID Server has access to the NGINX configuration file, which is `/etc/nginx/nginx.conf` by default.
- Enable secure shell (SSH) commands.
- The NGINX probes require credentials and execute privileges to run commands.

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

The Nginx Process Classifier detects a running process that matches the following criteria during the exploration of a UNIX server:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The name of the process starts with `nginx`.
- The name of the process contains `master`.

Both of these conditions must match:

- A record is created in the Web Server [cmdb_ci_web_server] table.
- A **Runs on** relationship is created in the CI Relationship [cmdb_rel_ci] table for the Linux Server [cmdb_ci_linux_server] table and the Web Server [cmdb_ci_web_server] table.

The following probes are triggered after classification:

NGINX probes

Probe	Description	Commands
Nginx – Version	This probe contains a Bourne shell script. It determines the version of NGINX and populates the Web Server [cmdb_ci_web_server] table.	nginx
Nginx – Get Configuration	This probe contains a Bourne shell script and an argument that determines the path of the NGINX configuration file. The probe identifies configuration parameters based on keywords within the configuration file and returns them as a single payload result.	echo, sed, cut, grep, egrep (within the Bourne shell script)

In addition to populating the data, the following relationships records are created in CI Relationships [cmdb_rel_ci] table:

- The records in the cmdb_ci_web_server table run on the cmdb_ci_linux_server table records.
- The records in the cmdb_ci_lb_service table use the cmdb_ci_lb_pool table records.
- The records in the cmdb_ci_pool table are used by the cmdb_ci_service table records.
- The records in the cmdb_ci_pool table are members of the cmdb_ci_pool_member table records.
- The records in the cmdb_ci_pool_member table are members of the cmdb_ci_pool table records.

Radware Alteon load balancer discovery

Discovery identifies and classifies information about Alteon load balancers.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Radware-appDirector load balancer discovery

Discovery of Radware load balancers is performed by SNMP.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Requirements

Important: Discovery treats load balancers as licensable entities and attempts to discover them primarily using SNMP. If a load balancer in your system, running on a Linux host, has SNMP and SSH ports open, Discovery might classify it based on the SSH port. This classification has priority over SNMP. To ensure that Discovery properly classifies your hardware load balancers, create a Discovery behavior for load balancers that includes SNMP but not SSH. Software load balancers are treated as applications.

Credentials

Configure SNMP credentials.

Load balancer fields and probes

Discovery stores load balancer information in several tables.

The information in this topic pertains to discovery with probes and sensors only. If you are using patterns, such as to discover F5 Big-IP load balancers, see the relevant topic for that type of load balancer.

Note: By default, the system uses the discovered IP address of a load balancer for the CI record. This can be the management IP created for the device that is used in the Discovery schedule. For instructions on how to force Discovery to use the IP address of the load balancer's NIC rather than that of a management IP, see IP address selection properties.

Apache web server data

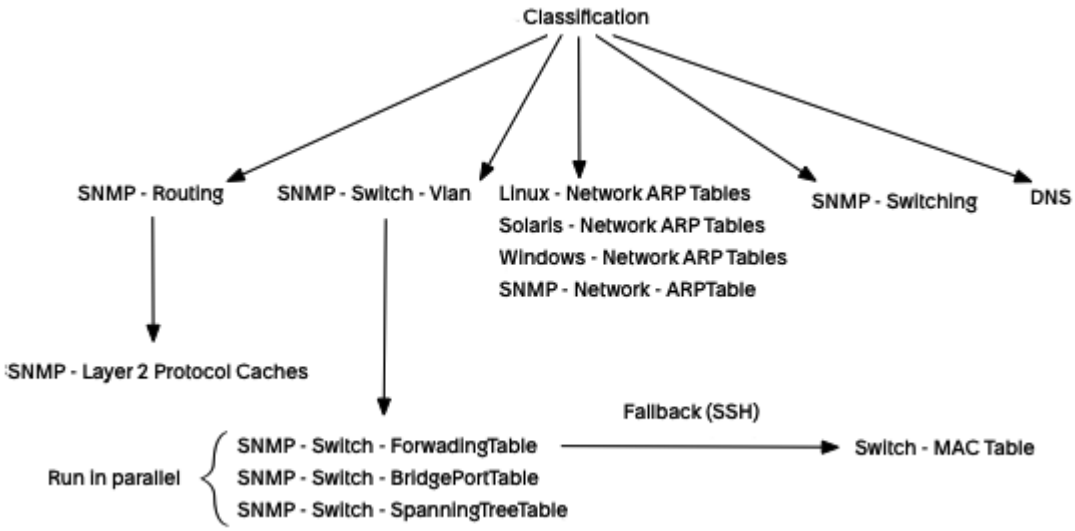
Discovery also collects data on Apache web serer load balancing modules using SSH. See Apache mod_jk and mod_proxy discovery for more information on probes for Apache web server data. For information on the tables, fields, and data sources that discovery populates for Apache web servers, see Apache web server discovery.

Layer 2 discovery

Discovery can detect the physical connections, known as layer 2, between network devices.

Layer 2 discovery process

Discovery uses multiple probes to gather information about network adapters and their Layer 2 connections. The following diagram shows the probes that Discovery launches for network Discovery, including those used for Layer 2 Discovery.



For example, if Discovery finds a switch in a network, it triggers the *SNMP - Switch - Vlan* probe and the *SNMP - Network - ARPTable* probe. For every Vlan that Discovery finds, it triggers various switch probes. If a switch has routing capabilities, Discovery triggers the *SNMP - Routing* probe to collect network adapter information in the Network Adapter [cmdb_ci_network_adapter] table. If Discovery finds a server, it triggers the appropriate Address Resolution Protocol (ARP) probe for that operating system. Discovery also supports the use of patterns, such as the *Network Switch* and *Network Router* patterns, which are available by default in Discovery. See Network switch and router discovery for more information.

During the discovery of a network device, Discovery creates records in the Router Interface [dscy_router_interface] table and the Switchport [dscy_switchport] table. This information contains network adapter information for that device. For SNMP-enabled devices, Discovery gathers the information from a routing probe during the exploration phase. The Layer 2 protocol cache probe runs next to collect neighbor data from the device.

Retrieving neighbor data

As Discovery gathers network information from the probes on a device, the SNMP - Layer 2 Protocol Caches identifies device neighbors via CDP and LLDP. This probe updates the Device Neighbors [discovery_device_neighbors] table, which contains the Layer 2 connections between switches. Sometimes, the neighbors of this device might not yet be known to the instance. The neighbor's interface cannot be resolved to a record until Discovery eventually finds the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

neighbor's side of the relationship. When Discovery runs on the neighboring device, Discovery completes the information for the neighbor's interface for the original reporting device.

Discovery can retrieve neighbor data from these caches on a network device:

- Cisco Discovery Protocol (CDP): Cache on Cisco devices that contains device neighbor information in the form of a protocol specific neighbor ID. Cisco Discovery Protocol (CDP).
- Link Layer Discovery Protocol (LLDP): Generic cache that contains device neighbor information in the form of a protocol specific neighbor ID.
- Address Resolution Protocol (ARP): Cache that contains the IP and MAC addresses of all connecting devices and servers.

How Layer 2 Discovery works

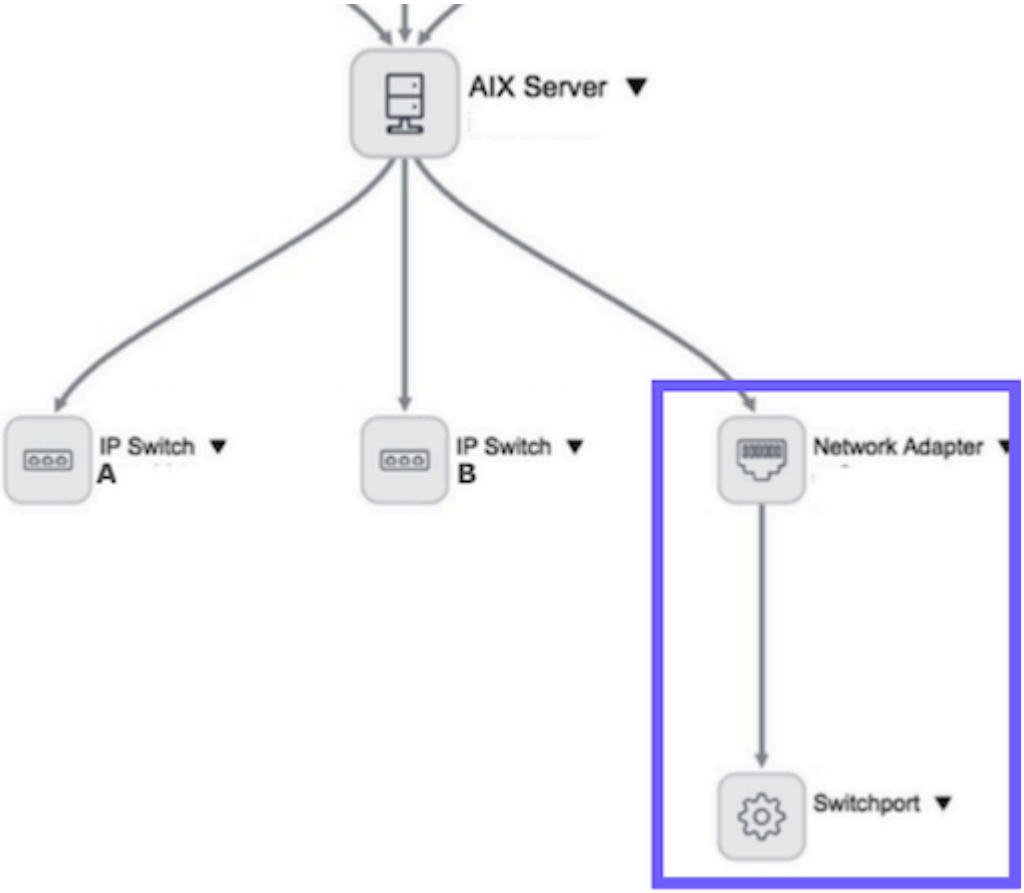
When device discovery is complete, the system runs the Service Discovery - Device Complete business rule on the Device [discovery_device_history] table. This business rule uses several strategies, together with information from various tables to create *Connects to:Connected by* relationships in the CMDB. Relationships can be created between:

- A server and a switch
- Two switches
- A device and the port of another device
- The ports of two devices

In the following example, Discovery found a server running AIX, and was also able to find two IP switches on the network. These relationships were created:

- A *Connects to* relationship between the AIX Server and the two IP switches A and B.
- A reference between the AIX server and its own network adapter.
- A *Connects to* relationship between the adapters on the two IP switches (not shown in the following image).
- A *Connects to* relationship between the network adapter of the AIX server and the switch port of IP switch A (highlighted in red). This kind of relationship is created by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To view these relationships, open the dependency view for the server. To view the relationship between the two IP switches, open the dependency view from one of the switches and select the **Physical Network Connections** option for the **Dependency Type** in the map settings.

Layer 2 connection strategies

Layer 2 Discovery uses the following strategies to create relationships between devices in a network:

PhysicalHostConnectionStrategy

This strategy creates a connection between a discovered server, which is not a network device, and a network device. This strategy can only create a Layer 2 connection if there is a single MAC address on the port in the switch's forwarding table. If the port has multiple MAC addresses, Discovery does not create a connection between the server and the switch.

If the switch's port is identified, Discovery creates a **Connects to::Connected by** relationship between the server adapter and the switch port. Otherwise, Discovery creates a **Connects to::Connected by** relationship between the server adapter and the switch itself.

VMLayer2ConnectionStrategy

This strategy creates a connection between a VM and a network device. If the number of exceptional MAC addresses is very low (less than 3 and less than 15% of all MAC address of the ESX server and its VMs), Discovery creates a Layer 2 connection.

NetworkDeviceLayer2ConnnectionStrategy

This strategy creates a connection between a network device and its neighbors. Discovery creates a Layer 2 connection if there is a single neighbor with a neighbor

address, a neighbor interface, or both. If the neighbor's interface exists, Discovery creates a **Connects to::Connected by** relationship between the origin interface and the neighbor's interface. Otherwise, Discovery creates a **Connects to::Connected by** relationship between the origin interface and the switch with the neighbor's address.

SpanningTreeLayer2ConnectionStrategy

This strategy creates a connection between a network device and the parent of the network device in the spanning tree.

JavaScriptLayer2ConnectionStrategy

This strategy calls a Javascript function with empty implementation. This allows for the creation of an additional strategy.

Address Resolution Protocol (ARP) in Layer 2 discovery

The probes for Address Resolution Protocol (ARP) map the IP address of a computer or network device to a MAC address. These probes retrieve the IP address and MAC address for a CI from the Network Infrastructure Item [dscy_net_base] table. Devices that support SNMP, such as Linux computers and network devices, cache two types of address information:

- **Static**: Manually added address resolutions.
- **Dynamic**: Hardware name and IP address pairs added to the cache by previous, successful ARP resolutions.

When the ARP table Discovery completes, the system collects all static and dynamic table entries from devices via SNMP. If a new ARP entry is available, it is added to the Network ARP Table [discovery_net_arp_table]. If any previously discovered ARP entries are no longer cached in the device ARP table, the system removes the corresponding records from the CMDB using the reconciliation process.

Note: If new ARP entries are created after Discovery runs, they are not discovered until the next Discovery schedule. If ARP entries are removed from the device after Discovery runs, the CMDB ARP table is not updated until Discovery runs again.

Discovery provides these probes for extracting IP and MAC address resolution information:

Probe	ECC queue topic	Command	Description
Linux - Network ARP Tables	SSHCommand	sh ${file:linux_arp.sh} This runs a script file to try the net-tools command (arp -n) first. If that fails, it will then try the iproute2 command (ip neighbor).	SSH command probe that retrieves the network information from the ARP table on a Linux server.
Solaris - Network ARP Tables	SSHCommand	arp -an	SSH command probe that retrieves the network information from the ARP table on a Solaris server.
Windows - Network ARP Table	Powershell	arp -a	Powershell probe that retrieves the network information

Probe	ECC queue topic	Command	Description
			from the ARP table on a Windows server.

SNMP - Network - ArpTable	SNMP	Table
		
		The SNMP probe uses this OID first:
		`iso.org.dod.internet.mgmt.mib-2.ip.ipNetToM`
		`ipNetToMediaPhysAddress,ipNetToMediaNetAddr`
		
		If the probe fails to return results, it uses this OID:
		`iso.org.dod.internet.mgmt.mib-2.ip.ipNetToP`
		`ipNetToPhysicalNetAddress,ipNetToPhysicalPh`
			SNMP probe that collects information from the ARP table on a switch or router.

SNMP switch probes

These probes return bridging information from VLANs connected across network switches, including port selection, forwarding tables, and the use of the spanning tree protocol.

SNMP - Switch - BridgePortTable

This probe returns all the ports from a switch that are used to create a bridge between network segments.

Bridging data returned

Table	Switch Bridge Port Table [discovery_switch_bridge_port_table] This table is used to map between a port number in the discovery_switch_fwd_table and an interface index.
OID	iso.org.dod.internet.mgmt.mib-2.dot1dBridge.dot1dBase.dot1dBasePortTable dot1dBasePort,dot1dBasePortIfIndex
Fields populated	• cmdb_ci • port • interface_index

SNMP - Switch - SpanningTreeTable

This probe returns the active path between any two network nodes bridged by a switch.

Spanning tree data returned

Table	Switch Spanning Tree Table [discovery_switch_spanning_tree_table]. This table is used to find Layer 2 connections between switches.
OID	iso.org.dod.internet.mgmt.mib-2.dot1dBridge.dot1dStp.dot1dStpPortTable dot1dStpPort,dot1dStpPortState,dot1dStpPortEnable,dot1dStpPortDesignatedRoot,dc

Spanning tree data returned (continued)

Fields populated	• cmdb_ci • port • port_state • port_enable • designated_root • designated_bridge_mac

SNMP - Switch - ForwardingTable

This probe returns information from a switch's forwarding table.

Forwarding table data returned

Table	Switch Forwarding Table [discovery_switch_fwd_table] This is the forwarding table for the switches.
OIDs	These OIDs are built as needed by the *DiscoveryVlanSwitchProcessor* script include. • **Non-Cisco**: ◦ **Q-BRIDGE MIB**: `oid_spec_list = 'table iso.org.dod.internet.mgmt.mib-2.dot1dBridge.qBridgeMIB dot1qTpFdbAddress.' + vlanIndex + ',dot1qTpFdbPort.' + vlanIndex + ',dot1qTpFdbStatus.' + vlanIndex;` ◦ **BRIDGE MIB**: oid_spec_list = 'table iso.org.dod.internet.mgmt.mib-2.dot1dBridge.dot1dTp.dot1dTpFdbTable dot1dTpFdbAddress,dot1dTpFdbPort,dot1dTpFdbStatus'; • **Cisco BRIDGE MIB**: `oid_spec_list = 'table iso.org.dod.internet.mgmt.mib-2.dot1dBridge.dot1dTp.dot1 dot1dTpFdbAddress,dot1dTpFdbPort,dot1dTpFdbStatus';`
Additional probe called	The SSH probe `Switch - MAC Table` can be triggered by the *DiscoveryVlanSwitchProcessor* script include to populate additional Layer 2 data. If you are missing Layer 2 data after you run discovery on multiple VLANs, you should enable the triggering of the `Switch - MAC Table` probe and run discovery again. To do this, add this property to the System Property [sys_properties] table: `glide.discovery.sensors.forwardingtable.ssh`. Set the value of the property to **true**. By default this property is false.
Command	show mac address-table

Forwarding table data returned (continued)

Fields populated	• cmdb_ci • vlan_id • port • status • mac_address (from the **cmdb_ci** field in the Network Infrastructure Item [discovery_net_base] table)

SNMP - Switch - Vlan

This probe returns VLAN IDs from a network switch and these OIDs:

```
iso.org.dod.internet.private.enterprises.cisco.ciscoMgmt.ciscoVtpMIB.vtpMIBObjects.vlanInfo.vtpVlanTable vtpVlanState

iso.org.dod.internet.private.enterprises.cisco.ciscoMgmt.ciscoVlanMembershipMIB.ciscoVlanMembershipMIBObjects.vmMembership.vmMembershipSummaryTable vmMembershipSummaryVlanIndex,vmMembershipSummaryMemberPorts,vmMembershipSummaryMember2kPorts

iso.org.dod.internet.private.enterprises.juniperMIB.jnxMibs.jnxExMibRoot.jnxExSwitching.jnxExVlan.jnxVlanMIBObjects.jnxExVlanTable jnxExVlanTag

iso.org.dod.internet.mgmt.mib-2.system.sysDescr
```

Other switch types are not supported.

Port tables

These port tables are populated during horizontal Discovery of a device:

- Network Adapter [cmdb_ci_network_adapter]
- Switchport [dscy_switchport]
- Router Interface [dscy_router_interface]
- Load Balancer Interface [cmdb_ci_lb_interface]

TCP connection discovery

Discovery identifies and classifies information about TCP connections using the ADM and ADME probes.

Discovery populates this data in the TCP Connections [cmdb_tcp] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Table Name	Field Name	Description
Absent	cmdb_tcp	absent	If the process is no longer running on this device. The first time the process is detected, the value is not selected (meaning that it is not absent). If Discovery runs again and does not detect the process, it is selected.
Computer	cmdb_tcp	computer	The device that is connected to or is listening on the TCP port.
IP	cmdb_tcp	ip	The IP address that this device or process is listening on or is connected to. If the IP address is 127.0.0.1, it is the host computer itself.
PID	cmdb_tcp	pid	The ID of the process that is connecting to or listening on this device (IP address).
Port	cmdb_tcp	port	The port number through which TCP traffic was detected.
Process	cmdb_tcp	process	The process that is connecting to or listening on the port.
Type	cmdb_tcp	type	• **Listening on**: the process is listening to the device via TCP. • **Connecting to**: if the process is connected to this device via TCP.
count	cmdb_tcp	count	The number of times that Discovery detects a specific TCP connection. This field is used by ADM enhanced probes.

Discovery populates this data in the Running Process [cmdb_running_process] table.

Label	Field Name	Description
Name	name	The name of the running process.
Computer	computer	The device that the process is running on.
Parent	parent	The parent process of this process, if any.
Listening on	listening_on	The ports that the processes is listening on.
Connected to	connected_to	The ports that the processes is connected to.
Command	command	The command for this process, including the path.
PID	pid	The ID for the process.
PPID	ppid	The ID for the parent process.
Absent	absent	If the process is no longer running on this device. The first time the process is detected, the value is not selected (meaning that it is not absent). If Discovery runs again and does not detect the process, it is selected.
Classify	classify	If the running process should be classified.
Key parameters	key_parameters	The key parameters for the command.

Label	Field Name	Description
Parameters	parameters	The parameters for the command.
Count	count	The number of times that Discovery detects a specific TCP connection. This field is used by ADM enhanced probes.

Standard ADM probes

Discovery launches these probes with standard ADM discovery:

Name	Description	Includes these sub-probes
AIX - ADM	Queries for information about active (running) AIX processes and active connections - the information required to perform application dependency mapping.	• AIX - Active Connections • AIX - Active Processes
HP-UX - ADM	Queries for information about active (running) HP-UX processes and active connections - the information required to perform application dependency mapping. This probe requires that lsof be installed and the UNIX - Active Connections probe be activated, which is inactive by default.	• UNIX - Active Connections • HP-UX - Active Processes
Solaris - ADM	Queries for information about active (running) Solaris processes and active connections - the information required to perform application dependency mapping. This probe is triggered by the Solaris Zones probe. The system triggers an ADM probe for each local zone contained in a global zone. This probe requires that lsof be installed on the global zone.	• Solaris - Active Processes • Solaris - Active Connections
UNIX - ADM	Queries for information about active (running) UNIX processes and active connections - the information required to perform application dependency mapping.	• UNIX - Active Connections • UNIX - Active Processes
Windows - ADM	Queries for information about active (running) Windows processes and active connections - the information required to perform application dependency mapping.	• Windows - Active Connections • Windows - Active Processes
UNIX - ADM netstat	Performs the same functions as the UNIX ADM probe relying on netstat to support continuous TCP-based discovery. Service Mapping uses this probe for traffic-based discovery.	• UNIX - Active Connections with Netstat. This probe retrieves TCP connections to populate the cmdb_tcp and

Name	Description	Includes these sub-probes
		cmdb_tcp_connection tables. • UNIX - Active Processes. This probe retrieves TCP processes and populates the cmdb_running_process table.

Enhanced ADM probes

Discovery launches these probes when enhanced ADM is activated:

Probe	Description
Windows - ADM Enhanced	Performs the same functions as the Windows ADM probe with additional parameters to control continuous TCP-based discovery. This probe is compatible with WinRM and non-WinRM supported MID Servers. Configure your MID Server using the `mid.windows.management_protocol` parameter. See MID Server parameters for the values you can use for this parameter.
UNIX - ADM Enhanced	Performs the same functions as the UNIX ADM probe with additional parameters to control continuous TCP-based discovery.

Use these probe parameters with the enhanced ADM probes:

Parameter	Description
mid.adme.max_result_size	Control the size of the TCP tracking file.
max.adme_result_payload_size	Controls the size of the result, including the payload. **Note:** If this is greater than the MID Server properties mid.discovery.max_payload_size, a configuration error can occur.

Network switch and router discovery

Discovery identifies and classifies information about network switches and routers.

Network switches and routers often have very similar capabilities. It is very common for some switches known as Layer 3 switches to have IP routing. Larger routers with optional modules might accept switching modules. Because of these overlaps and the resulting ambiguity of a particular device's classification, Discovery collects the same data for both routers and switches, if it is available in any given device. For details on how Discovery collects data about connections between network devices and other components, see Layer 2 discovery.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Prerequisites

- The router or switch needs to have IP Address information.
- The system property glide.discovery.L3_mapping is set to true to discover routers and switches.
- The router or Layer 3 switch that provides the IP Address needs to have been successfully discovered with populated Exit Interface Routing Rules.
- If you must populate the [discovery_device_neighbors] table during horizontal layer 2 discovery of the bgp-enabled devices, set the **BGP router exploration disable** property to **No**. Notice that enabling this property can cause performance issues including out-of-memory issues on the MID Server.

System properties

You can configure many aspects of Discovery to work according to your personal preferences. The following properties apply to network routers and switches. To view the properties, navigate to **Discovery Definition** > **Properties** unless indicated otherwise.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
glide.discovery.L3_mapping	This creates IP Connecton::IP Connection relation between servers and network devices. • **Type:** string • **Default value:** true • **Location:** System Property [sys_properties] table
glide.discovery.max_concurrent_invocations_per_schedule	Sets a maximum number of scheduled invocations of the same Discovery schedule. It prevents a backlog of scheduled runs if Discovery does not finish before the next invocation is scheduled to run. The value is an integer that represents the max number of automated invocations of the same schedule that may proceed at one time. If the limit has been reached, subsequent scheduled invocations are canceled. A value of 0 or any negative number disables this property. • **Type:** integer • **Default value:** 3 • **Location: Discovery Definition > Properties** **Note:** This property does not apply to schedules that have a 'Run after' configuration set to 'Even if canceled'.

For a list of properties used in discovery in general, see Discovery properties.

Credentials

Discovery explores many kinds of devices, such as switches, routers, and printers, using the SNMP protocol. SNMP Community Credentials do not include a user name, just a password, which is the community string. The default read-only community string for many SNMP devices is public, and Discovery will try that automatically. SNMPv3 credentials require a user name and a key, depending on the protocol selected. Enter the appropriate SNMP credentials if they differ from the public community string.

Note: SSH is not supported for routers and switches, but is supported for load balancers.

Classifier, pattern, and probes

Classifiers	Trigger probes	Pattern
Standard Network Router Standard Network Switch	• Horizontal Pattern: launches patterns • SNMP-Routing^ • DNS* • SNMP-Identity* • SNMP-Switch-Vlan* • SNMP-Switching* • SNMP - Network - ArpTable* (Standard Network Switch only)	Network Router Network Switch

*For new instances, these probes are inactive on the classifier. Discovery uses patterns for discovery.

^This probe remains active by default for the Standard Network Router classifier, even when Discovery uses pattern discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Discovering stacked switches

The Network Switch shared library supports Cisco stacked switches. The CI table for this is IP Switch [cmdb_ci_ip_switch]. Multiple switches in the stack are identified by the primary IP address. Each member of the stack is identified by a combination of elements, including the primary IP address, a name associated with the switch, and the stack mode. The relationship is created between a primary and all of the secondaries. The primary switch has all the fields listed in the table below. The secondary switch has name, serial_number, model_id, manufacturer, stack, and stack_mode.

Note: If all the ports on a switch are open for port 161, that switch will have multiple IPs (one for each port) but the serial number for all the ports is the same. The CI identification is performed based on the serial number, therefore the same record is updated every time instead of creating a new record.

Turn off collection of port data for SNMP network devices

In some environments you may not want to collect the port data for SNMP network devices.

Before you begin

Role required: admin

About this task

If the network devices contain an extremely large number of ports and each individual port's information is not critical to the overall management of the devices, you may not want to collect the port data for SNMP network devices. This would affect records from being created in the Switchports table (dscy_switchport). This process only impacts probe discovery.

Procedure

1. Navigate to **Discovery Definition** > **Probes**.
2. Go to the **SNMP - Switching** probe.
3. In the **SNMP Fields** tab, find the field named **ports**, double-click the value in the **Active** column, and change the value to **false**.
   The collection and processing of ports information for switches is then disabled. The **ports** field for the switch CI should have the correct ports count even though the related list **switchports** is empty.
4. Click the check mark to save the change.

IP service and daemon discovery

Discovery identifies and classifies information about services and daemons.

IBM WebSphere DataPower discovery

ITOM Visibility discovers IBM WebSphere DataPower. The Discovery feature uses the DataPower Server pattern for horizontal discovery. The Service Mapping feature uses the DataPower pattern for top-down discovery.

Prerequisites

Configure the following credentials before discovering the IBM WebSphere DataPower devices:

SNMP credentials

SNMP credentials are necessary for using the following SNMP queries:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For horizontal discovery of the Data Power Hosting Server [cmdb_ci_datapower_server]:
  - 1.3.6.1.2.1.1.1
  - 1.3.6.1.2.1.1.5
  - 1.3.6.1.2.1.4.20.1
  - 1.3.6.1.2.1.2.2.1
  - 1.3.6.1.4.1.14685.3.1.196.1
  - 1.3.6.1.4.1.14685.3.1.11.1
  - 1.3.6.1.4.1.14685.3.1.112.1
- For top-down discovery of the Data Power [cmdb_ci_datapower_server]:
  - 1.3.6.1.2.1.1.1
  - 1.3.6.1.2.1.1.5
  - 1.3.6.1.4.1.14685.3.1.11.1

Applicative credentials

Together with SNMP credentials, applicative credentials are required to discover DataPower application domains, otherwise known as logical CIs.

In addition, SNMP and applicative credentials are used for top-down discovery of applicative relationships (corresponding application DataPower domain).

User with permissions to run SOAP

Permissions to run SOAP queries are necessary for top-down discovery of the DataPower Web Service and MQ connection.

Data collected by Discovery during horizontal discovery

By default, Discovery uses the DataPower Server pattern to perform the discovery.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Table and field	Description
Data Power Hosting Server [cmdb_ci_datapower_server]	
Model number [model_number]	The model of the server hosting the WebSphere DataPower.

Cisco Unified Computing System (UCS)-HD device discovery

Discovery and Service Mapping Patterns application uses the to find Cisco UCS equipment, including chassis and blades. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Create SNMP credentials

For more information, see SNMP credentials.

Create applicative credentials

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create applicative credentials for the **Cisco UCS Equipment [cmdb_ci_ucs_equipment]** CI type. For more information, see Applicative credentials.

Verify network connectivity

Verify that the MID Server has HTTPS access to the UCS Manager on port 443 and is able to reach the management IP address of the UCS equipment.

Verify UCS Manager account requirements

Verify that the account has at least the **read-only** role in UCS Manager and has permissions to execute XML API queries for the following object classes:

- `computeRackUnit`
- `equipmentChassis`
- `computeBlade`
- `mgmtIf`
- `topSystem`
- `versionEp`
- `equipmentFan`

Classifier, pattern, and OIDs

The UCS classifier uses HorzontalDiscoveryProbe to launch the UCS - HD pattern. The classifier also uses these SNMP OIDs, which specify the Cisco UCS Equipment `[cmdb_ci_ucs_equipment]` table:

OID	Manufacturer	Model	Table
1.3.6.1.4.1.9.12.3.1.3.847	Unified Computing Cisco UCS 6120XP 20-Port Fabric Interconnect	1.4(3u)(NX-OS) 5.0 Aggregation Switch	Cisco UCS Equipment
1.3.6.1.4.1.9.12.3.1.3.899	Unified Computing Cisco UCS 6140XP 40-Port Fabric Interconnect	1.4(3u)(NX-OS) 5.0 Aggregation Switch	Cisco UCS Equipment
1.3.6.1.4.1.9.12.3.1.3.1062	Unified Computing Cisco UCS 6248UP 48-Port Fabric Interconnect	2.0(1t)(NX-OS) 5.0.2 Aggregation Switch	Cisco UCS Equipment
1.3.6.1.4.1.9.12.3.1.3.1063	Unified Computing Cisco UCS 6296UP 96-Port Fabric Interconnect	2.0(1t)(NX-OS) 5.0.2 Aggregation Switch	Cisco UCS Equipment

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the UCS - HD pattern pattern. Only B-series devices are discovered. The UCS - HD pattern does not find C, S, or E series devices.

Dell Remote Assistant Card discovery

The Dell™ Remote Assistant Card (DRAC) and Integrated Remote Assistance Card (iDRAC) provide users with tools and functionality to monitor, troubleshoot, and repair servers. You can generate DNS URLs to access out-of-band devices when security prevents access from IP addresses.

To identify the DRAC, Discovery uses the **SNMP – DRAC** probe. This probe uses SNMPv1 and SMNPv2c. Out-of-band devices have a dedicated management channel for device maintenance. System administrators can remotely monitor and manage devices with the dedicated management channel, including hardware sensor monitoring, access to local media drives, or adjusting BIOS settings. DNS URLs can be generated for out-of-band devices to access the out-of-band device page when the SSL certificate forbids navigating through the IP address.

Prerequisites

Create SNMP credentials

SNMP credentials are required to discover DRAC devices. For more information, see SNMP credentials.

Run network discovery

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information on configuring and running network discovery to discover DRAC devices, see Run network Discovery.

Data collected

Data collected by Discovery for Dell DRAC

Label	Table	Name	Command
Firmware version	cmdb_ci_outofband_device	firmware_version	SNMP walk: drsFirmwareVersion (racFirmwareVersion for iDRAC7)
Host *	cmdb_ci_outofband_device	host	SNMP walk: drsSystemServiceTag (systemServiceTag for iDRAC7)
IP Address	cmdb_ci_outofband_device	ip_address	DNS probe
Name	cmdb_ci_outofband_device	name	SNMP Identity probe
Product version	cmdb_ci_outofband_device	product_version	SNMP walk: drsProductVersion (racVersion for iDRAC7)
Type	cmdb_ci_outofband_device	type	SNMP walk: drsProductType (racType for iDRAC7)
URL	cmdb_ci_outofband_device	url	SNMP walk: drsProductURL (racURL for iDRAC7)

* **Host** is a reference to the cmdb_ci_computer table via the serial number. For the cmdb_ci_outofband_device.host field to be populated correctly, the host machine must be discoverable or exist within the CMDB with the appropriate serial number.

Out-of-band devices

A **DNS URL** is generated for configuration items in the **Out-Of-Band Device** list if the configuration item has a **Name** and **DNS Domain**. The **DNS URL** enables you to access the out-of-band device page when the SSL certificate forbids navigating through the **IP URL**. The **DNS URL** has the format `https://Name.DNS_Domain`. If either the **Name** or **DNS Domain** field is empty, the **DNS URL** contains the value in the **URL** field.

HTTP device discovery

Discovery can find devices that use the HTTP protocol.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Classifier, probes, and patterns

HTTP discovery relies on a the *HTTP* port probe, which Discovery runs after trying to run SSH and SNMP port probes. This port probe launches the *HTTP - Classify* probe which runs an HTTP GET request for every entry in the HTTP classification table. You should configure your own classifications that the *HTTP - Classify* probe can access.

The HTTP port probe uses mappings between a protocol and port number in the IP Service [cmdb_ip_service] table. You can add additional port-to-protocol definitions in this table, or you can override the protocol used for a specific HTTP classifier.

Classifier	Probes	Pattern
	HTTP (port probe): this probe launches the HTTP - Classify probe, which runs an HTTP GET request for every entry in the HTTP classification table.	

Run discovery through an HTTP or HTTPS REST call

Discovery can classify devices using the HTTP(S) protocol. You can create your own HTTP classifier to find devices and access them with Basic Auth credentials, rather than using SNMP or SSH credentials.

Before you begin

Role required: discovery_admin

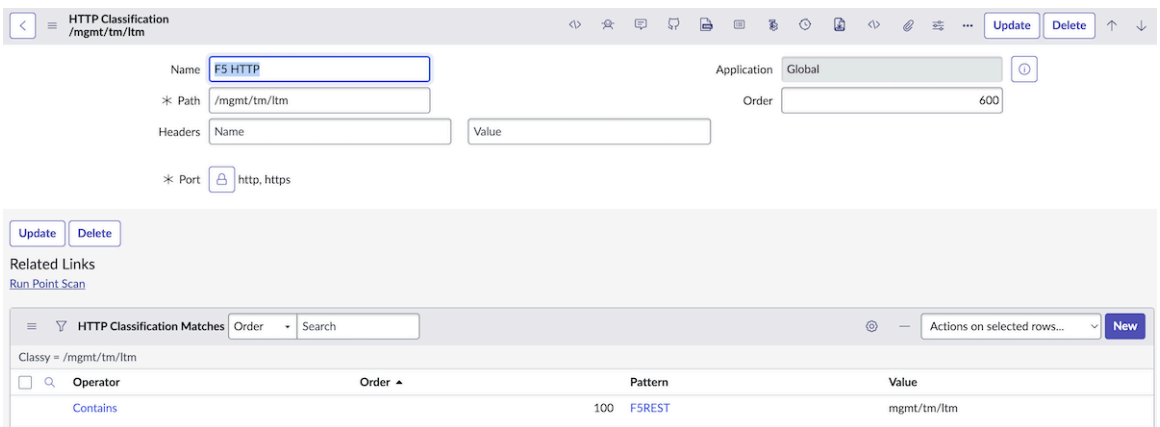
Procedure

1. Navigate to **All** > **Discovery** > **Credentials**.
2. Select **New**.
3. Select **Basic Auth Credentials**.
   In most cases, you can use Basic Auth Credentials to access a device through an HTTP or HTTPS REST call.

> **Important:** The HTTP Classify probe no longer attempts credentials over the HTTP protocol by default. To override this behavior, you can enable *mid.http_classy.allow_credentials_over_http*. However, enabling this setting can expose credentials to man-in-the-middle (MitM) attacks. Therefore, it's strongly recommended to keep this property set to **false** and use HTTPS whenever possible.

4. Add the user name and password that you need to access the device.
5. Select **Submit**.
6. Set up an HTTP classifier by navigating to **Discovery Definition** > **CI Classification** > **HTTP**.
7. Select **New**.
8. Fill out the form fields (see table):

The F5 HTTP classification



Field	Description
Name	Enter a name for the classifier.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

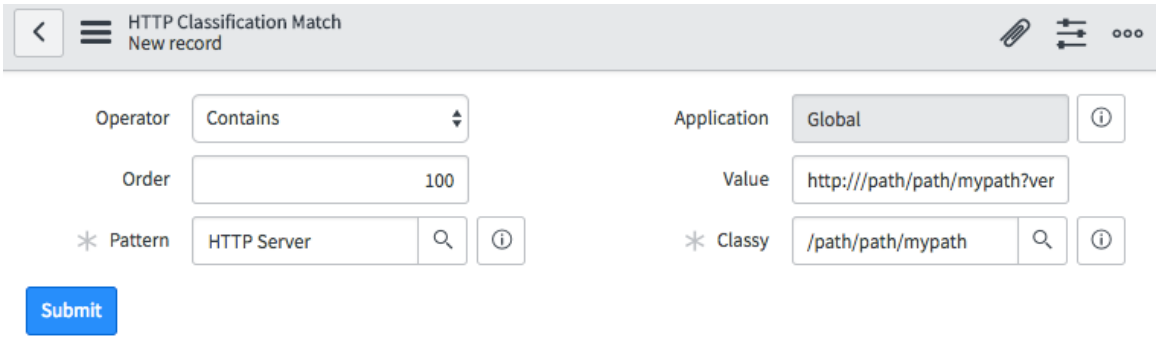
Field	Description
Path	Enter the path for the HTTP GET request.
Headers	Add an option header with a value. You can use a variable in the format `${variable}` instead of a static value. Supported headers depend on the REST web service provider that you want to connect to. See the documentation for your web service provider to identify which headers are valid or required.
Port (IP Service)	If you want this classifier to use a custom port that is not already a default value in the IP Service [cmdb_ip_service] table, do the following: **a.** Select the lookup icon to see the list of IP Services. **b.** Select **New** and create a port-to-protocol mapping. **c.** Select that port-to-protocol mapping for this **Port** field. Many commonly used protocols are already mapped to ports by default, such as `http` to port 80 and the `https` to port 443. If you want to use one of these default port-to-protocol mappings, don't enter any values in the **Port** field. The HTTP port probe uses the correct one by default.
Order	Enter a number that represents the priority of this classifier. If Discovery finds more than one classifier that applies, it uses the classifier with lower **Order** number.
Protocol [optional] This field isn't visible by default. You must configure the form to add it.	If you configure a unique port-to-protocol mapping for the **Port** field, enter an optional protocol override that Discovery uses with this classifier. For example, if you want to use port 5000 and the HTTP protocol, add the 5000/HTTP port-to-protocol mapping to the **Port** field, and then choose **http** in the **Protocol** field.

9. Right-click the header and select **Save**.
   The HTTP Classification Match related list appears. This related list shows criteria that you can configure to match against the body of the response to the GET Request that Discovery sent.
10. In the HTTP Classification Match related list, define the match criteria and specify the pattern to launch for this classifier:

    a. Select **New**.

    b. On the HTTP Classification Match form, fill in the form fields (see table).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Description
Operator	Choose the operator that the system uses to evaluate the condition: ▪ **Contains** ▪ **Equals** ▪ **Regex**
Order	Enter a number that represents the priority of this condition. If Discovery finds more than one condition that applies, it uses the condition with lower Order number.
Pattern	Specify the pattern to launch upon a correct match. This pattern must use HTTP to discover the device.
Value	Enter the value that the body of the returned REST method must have.

c. Select **Submit**.

d. Define as many HTTP Classification Matches as necessary.
You might want to do this if there are different patterns for different versions of the device you're trying to discover.

Example:
In this example, HTTP classification is configured to use the F5 load balancer API:

What to do next
If you don't have other types of credentials that can find devices, such as Linux credentials or SNMP credentials, you can see how the Discovery application processes HTTP discovery:

1. Navigate to **Discovery** > **Discovery Schedules** and run a discovery.
2. After the discovery process completes, check the ECC Queue to see the results of the HTTP discovery.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You should see that after the Shazzam probe was launched, and that UNIX and SNMP classification probes failed. Both the HTTP - Classify probe and the pattern that you specify in the HTTP classification record should launch.

Storage discovery

Discovery collects information on Direct Attached Storage (DAS), Storage Area Networks (SAN), and Network Attached Storage (NAS).

Storage can be located on specialized devices, such as Storage Arrays, Fibre Channel Switches, iSCSI disks, or on host operating systems, including Windows, Linux, and Solaris.

Discovery finds and maps dependencies for the following types of storage:

- Direct-attached storage (DAS), network-attached storage (NAS), or storage area network (SAN).
- NAS or SAN storage that is discovered via a Storage Management Initiative Specification (SMI-S) and Common Information Model (CIM).
- Virtual storage for VMware ESX servers and Linux Kernel-based Virtual Machines (KVM). Discovery maps this storage to the underlying physical storage.

Discovery of storage via a host reconciles data and creates relationships between the host's file systems and associated local storage devices. The local storage devices represent the storage available to the host, whether it's directly attached or provided by Fibre Channel or iSCSI. This reconciliation assumes that the storage server has been discovered first.

Note: Tape storage drivers are not discovered.

Discovery collects and creates CIs in the CMDB for the following information:

- File systems (local and NAS).
- Disks (both SAN disks and DAS drives).
- Fibre Channel (FC) HBAs and ports.
- Linux Volume Manager (LVM) volumes. LVM volume data resides in the Storage Pool [cmdb_ci_storage_pool] table.
- Veritas Volume Manager disks, subdisks, disk groups, plexes, and volumes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For details about the discovery of direct attached or multipath block storage provisioned on a Linux host, see KB0622583.

Probes, sensors, and patterns

- KVM - Storage Pools: identifies storage attached to KVM virtual machines.
- Linux - Storage: identifies storage attached to systems running the Linux operating system.
- Solaris - Storage: identifies storage attached to systems running the Solaris operating system.
- Windows - Storage 2008: identifies storage attached to systems running Windows 2008.
  - Windows - Storage 2008 - PS: identifies storage attached to systems running Windows 2008, using the PowerShell.
  - Windows - Storage 2008 - WMI: identifies storage attached to systems running Windows 2008, using WMI Runner.
- Windows - Storage 2012: identifies storage attached to systems running Windows 2012 and later.
  - Windows - Storage 2012 - PS: identifies storage attached to Windows systems, using PowerShell.
  - Windows - Storage 2012 - WMI: identifies storage attached to Windows systems, using WMI Runner.
- VMWare - vCenter ESX Hosts Storage: collects information about ESX servers and creates relationships from datastores to underlying disks.
- Patterns for NetApp storage discovery:
  - NetApp 7-mode: finds NetApp servers via REST with two nodes.
  - NetApp cluster mode: finds NetApp servers via REST when more than two nodes are connected through a cluster interconnect switch.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Requirements

Windows

- Supports the following configurations:
  - Windows Server 2012, DAS or NAS with Fibre Channel (FC) or Internet Small Computer System Interface (iSCSI).
  - Windows Server 2008, DAS or NAS with FC or iSCSI.
- Install the `fcinfo.exe` tool on Windows 2008 and 2012 servers that attach to storage via FC.
- Install Windows Management Instrumentation (WMI).
- Enable Powershell on the MID Server host server.
- Provide the instance with the necessary credentials to the host server.
- Put the MID Server and the target machine in the same domain or add the target machine to the trusted host list on the MID Server machine.
- Optionally, install Windows Remote Management (WinRM) on the host server to discover Fibre Channel information. WinRM is on by default for Windows 2012 and Windows 2016 machines, but not for Windows 2008.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux

- Supports the following configurations:
  - Solaris, DAS, NAS, or SAN with iSCSI
  - CentOS, DAS, NAS, or SAN with FC or iSCSI
  - Ubuntu Server, DAS, NAS, or SAN with iSCSI
- Provide the device with SSH credentials that have root or sudo access.
- Provide the MID Server with the necessary credentials to the host server.

Relationships

Discovery creates the following relationships for storage CIs:

Parent Component	Relationship	Child Component
Storage Export [cmdb_ci_storage_export]	Exports to::Imports from	Storage Device [cmdb_ci_storage_device]
Fibre Channel Disk [cmdb_ci_fc_disk]	Provides::Provided by	File System [cmdb_ci_file_system]
iSCSI Disk [cmdb_ci_iscsi_disk]	Provides::Provided by	File System [cmdb_ci_file_system]

Configure discovery of hosts with attached storage

Discovery can find information about UNIX, Linux, and Windows hosts with attached storage.

Configure Discovery for UNIX or Linux hosts with attached storage

Discovery can find information about a UNIX or Linux host and attached storage.

Before you begin

Role required: discovery_admin

Procedure

1. **Optional:** On the host, assign elevated privileges to the account that Discovery will use.
2. On the ServiceNow instance, add credentials to the Discovery Credentials table.
3. Create a Discovery Schedule for each host IP address.
4. **Optional:** Create a behavior that uses a functionality definition with a wbem port probe to make the initial port-scanning phase (Shazzam) more efficient.
5. Run network discovery.

> **Note:** If the host also connects to a NAS or SAN storage array, set up the SMI-S Provider and CIM credentials.

Configure Discovery for Windows hosts with attached storage

Discovery can find information about a Windows host and attached storage.

Before you begin

Role required: discovery_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Follow the steps if you're using the Windows 2008 servers that is attached to storage:
   a. Download and install the Microsoft Fibre Channel Information Tool from http://www.microsoft.com and search the website for Microsoft Fibre Channel Information Tool.
   b. Set the environment path for the fcinfo executable and run the `fcinfo.exe` file.

   Note: For servers that are using newer operating systems, similar functionality is present with the operating system; this step is not required.

2. For all Windows hosts including Windows 2008, add Windows credentials to the Discovery Credentials table.
3. On the ServiceNow instance, create a Discovery Schedule for each host IP address.
4. **Optional:** Create a behavior that uses a functionality definition with a wbem port probe to make the initial port-scanning phase (Shazzam) more efficient.
5. Run network discovery.

   Note: If the host also connects to a NAS or SAN storage array, set up the SMI-S Provider and CIM credentials.

Discovery data collected for storage via a host

Discovery gathers information about storage units that connect to Linux, Solaris, and Windows hosts via a local I/O port or Host Bus Adapter (HBA).

Probes used to discover storage from a host

Storage Discovery via SMI-S and CIM

Discovery can explore storage devices that contain a Storage Management Initiative Specification (SMI-S) provider that is a specialized Common Information Model (CIM) server.

To see the current list of vendors and products conforming to SMI-S as tested by SNIA, see the SNIA website.

Other types of storage, such as storage that is attached via a host, VM storage that is available on VMware ESX servers, and storage for Kernel VM (KVM), use a separate set of probes and sensors.

Discovery collects information about storage area networks (SAN) and network-attached storage (NAS) from specialized devices, such as storage arrays and Fibre Channel (FC) switches. Discovery collects and creates CIs in the CMDB for the following information items:

- Array disks, pools, and volumes
- Fibre Channel HBAs, ports, and controllers
- FC exports
- Fabrics, including endpoints, zoning, and switches
- Dependencies between storage sub-components

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For more information on storage discovery and using the CIM Query tool for troubleshooting, see the knowledge article KB0782305.

Requirements

- A CIM server using SMI-S 1.4 or later.
- One or more CIM server per storage vendor.
- NAS and SAN systems from major vendors such as EMC, Hitachi, HP, and NetApp. SAN storage devices must use FC.
- FC switches from major vendors such as Brocade and Cisco.
- The CIM credentials must be available for SMI-S configuration. The CIM credentials can be different than the credentials for the system hosting the CIM server.
- Ensure that SMI-S is enabled for your storage product.
- Ensure the connectivity between the MID Server and CIM server.
- New CIM credentials need to be configured in the instance. CIM server credentials could be different from the system hosting the prerequisite CIM server.

Note: Because the SMI-S Provider caches storage device information, the Discovery query to the provider does not affect storage device performance.

CIM architecture

CIM probes can explore any device based on the Common Information Model (CIM) by querying a CIM server, also referred to as a CIMOM - Common Information Model Object Manager. By default, Discovery uses CIM probes to explore storage systems as well as to get the serial numbers of ESX servers.

Discovery queries SMI-S compliant storage devices using CIMIQL queries.

The following components are part of CIM:

- Common Information Model (CIM): CIM allows multiple parties to exchange information about managed elements. CIM represents these managed elements and the management information, while providing the mechanism to actively control and manage the elements.
- Storage Management Initiative Specification (SMI-S): SMI-S is a standard of use that describes methods for storage discovery on the vendor's side. ServiceNow uses SMI-S to determine how to discover CIM. SMI-S is based on the Common Information Model (CIM) and the Web-Based Enterprise Management (WBEM) standards, which define management functionality via HTTP. The main objective of SMI-S is to enable management of dissimilar storage products. ServiceNow supports SMI-S version 1.4 or higher.
- Web-Based Enterprise Management (WBEM): WBEM defines a particular implementation of CIM, including protocols for discovering and accessing each CIM implementation.
- Service Location Protocol (SLP): SLP is an ad hoc protocol for retrieving and associating configuration information about CIM servers, such as default paths, capabilities, and the exact interop namespace. Discovery retrieves the interop namespace of a CIM server via SLP and passes that information to the CIM Classify probe. SLP, referred to here as the SLP server, uses

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

service agents (SA) to gather and disseminate information about a CIM server on a subnet. A subnet can have multiple service agents.

Note:

The *mid.cim.interop.namespace* system property defines four default storage namespaces:

- interop
- root/interop
- root/pg_interop
- pg_interop

If you're using multiple storage vendors with custom namespaces not specified as one of the defaults, add the new namespaces to the comma-separated list in this property. If you intend to continue using any of the default namespaces, make sure to include them in the property.

SLP and WBEM support

SLP is required for CIM Discovery as it is part of the Storage Management Initiative Specification (SMI-S) stack. Some storage devices may support the WBEM protocol, but may not support SLP.

You can manually register the WBEM services on SLP using a common Linux tool like *slptool*. This tool has a command line interface that you can use to make SLPv2 User Agent (UA) requests, which usually come with the SLP daemon package. To register a service, provide a URL and list of attributes. An example can be extracted from a working SLP server by using the same tool.

Storage Discovery tables and probes

Discovery uses the following tables and probes to gather information about storage devices that are managed by a SMI-S provider.

Data Collected

Table	Probe
Disk [cmdb_ci_disk]	SMI 1.5 - Storage Server
Fibre Channel Export [cmdb_ci_fc_export]	SMI 1.5 - Storage Server
Fibre Channel Port [cmdb_ci_fc_port]	SMI 1.5 - Storage Server
SAN Export [cmdb_ci_san_export]	SMI 1.5 - Storage Server
Storage Controller [cmdb_ci_storage_controller]	SMI 1.5 - Storage Server
Storage Export [cmdb_ci_storage_export]	SMI 1.5 - Storage Server
Storage File Share [cmdb_ci_storage_fileshare]	SMI - Array - File Shares
Storage Pool [cmdb_ci_storage_pool]	SMI 1.5 - Storage Server
Storage Server [cmdb_ci_storage_server]	CIM - Identity
Storage Switch [cmdb_ci_storage_switch]	CIM - Identity
Storage Volume [cmdb_ci_storage_volume]	SMI 1.5 - Storage Server
Storage Device [cmdb_ci_storage_device]	SMI 1.5 - Storage Server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Collected (continued)

Table	Probe
Storage Area Network [cmdb_ci_san]	SMI - Fabric
SAN Connection [cmdb_ci_san_connection]	SMI - Fabric
SAN Endpoint [cmdb_ci_san_endpoint]	SMI - Fabric
SAN Fabric [cmdb_ci_san_fabric]	SMI - Fabric
SAN Zone [cmdb_ci_san_zone]	SMI - Fabric
SAN Zone Alias [cmdb_ci_san_zone_alias]	SMI - Fabric
SAN Zone Alias Member [cmdb_ci_san_zone_alias_member]	SMI - Fabric
SAN Zone Member [cmdb_ci_san_zone_member]	SMI - Fabric
SAN Zone Set [cmdb_ci_san_zone_set]	SMI - Fabric

These probes are available but not currently used:

- SMI - Storage Server
- SMI - Array - Controllers
- SMI - Array - Disks
- SMI - Array - Pools
- SMI - Array - Ports
- SMI - Array - Volumes

Discovery of storage area networks (SAN)

Discovery collects information about storage area networks from specialized devices, such as storage arrays and Fibre Channel (FC) switches, and creates specific references between the tables in the SAN schema.

Multipath SAN storage example

Storage accessible to the Linux host consists of two physical fibre channel (FC) disks, mpatha and mpathb, connected to the host via a multipath FC SAN. The two HBAs on the host interface are connected with two fibre cables each to separate FC switches for failover capability. The FC fabric switches are connected to two FC storage processors on the storage server. In this example, each storage processor is connected to the storage volume's, **LUN 1** and **LUN 2**.

How CIM Discovery works

This is the processing flow for classifying Common Information Model (CIM) storage systems.

Processing flow

1. The Shazzam probe launches the wbem port probe as part of network discovery.
2. The wbem port probe detects activity on target ports SLP 427, CIM 5989 and 5988, and then examines the **Service Registry Queries** related list, at **Discovery Definition** > **Port Probes**, for the SLP query. The base system provides this query to detect the service:wbem service type, which indicates the presence of an SLP server.
3. The Shazzam probe launches a scanner for the WBEM service type. The scanner retrieves:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The attributes of the service from the SLP server.
- The interop namespaces of CIM servers in the network.

4. The scanner appends the namespace values it finds to the port probe results.
5. The wbem port probe appends the SLP data it carries to the CIM Classify probes.
6. The CIM Classify probe uses that information to explore the CIM servers.

The wbem port Probe

The **wbem** probe stores the data it retrieves in the CIM Classification `[discovery_classy_cim]` table. To view the wbem port probe, navigate to **Discovery Definition** > **Port Probes**.

SLP query

The SLP query detects the wbem service (service:wbem) on an SLP server and gathers the attributes of the service. To view the SLP Query record, open the wbem port probe record and select **SLP Query** from the **Service Registry Queries** related list.

CIM - Classify probe

The wbem port probe appends the SLP data it carries, including namespaces, to the CIM - Classify probe before launching it. The CIM classification probe extracts VMware ESX serial numbers and connector relationships between the SAN and NAS components from CIM Servers in the network.

To access the CIM classification probe, navigate to **Discovery Definition** > **Probes** and select **CIM - Classify** from the list of probes.

Note:

The *`mid.cim.interop.namespace`* system property defines four default storage namespaces:

- interop
- root/interop
- root/pg_interop
- pg_interop

If you're using multiple storage vendors with custom namespaces not specified as one of the defaults, add the new namespaces to the comma-separated list in this property. If you intend to continue using any of the default namespaces, make sure to include them in the property.

SMI-S and CIM probes and sensors

SMI-S and CIM probes and sensors

Probe/Sensor	Description
CIM - Identity	Identifies a system via CIM per SMI-S.
SMI - Array - Controllers	Retrieves controller information.
SMI - Array - Disks	Retrieves storage disk information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SMI-S and CIM probes and sensors (continued)

Probe/Sensor	Description
SMI - Array - File Shares	Enumerates NAS file shares from a storage server.
SMI - Array - Pools	Retrieves storage pools.
SMI - Array - Ports	Retrieves storage ports.
SMI - Array - Volumes	Retrieves storage volumes.
SMI - Fabric	Retrieves SANs, fabrics, zone sets, zones, zone aliases, endpoints, and connections.
SMI - Fibre Channel Switch	Retrieves FC switches.
SMI - NAS Head - Component Systems	Retrieves all virtual file servers in a NAS head profile.
SMI - NAS Head - File Server IPs	Retrieves IP addresses for each NAS file server.
SMI - NAS Head - File Servers	Retrieves NAS file servers such as Common Internet File System (CIFS) and Network File System (NFS).
SMI - NAS Head - File Shares	Retrieves file shares for each NAS file server.
SMI - Storage Server	Retrieves SAN and NAS arrays and servers.
SMI - WBEM Service	Retrieves WBEM Service information such as profiles and SMI-S version.

Configure SMI-S Provider for storage Discovery

Use this procedure for configuring a standalone storage device with the required SMI-S Provider for Discovery.

Before you begin

Role required: admin

Procedure

1. On the storage device, if the SMI-S Provider is not present, install the SMI-S Provider software. The SMI-S Provider software is often part of the device management software. For more information, download the SMI-S Provider instructions from the storage provider manufacture.
2. For NetApp storage devices, install the SMI-S agent on the storage device host.

   Note: Discovery can also perform native discovery of NetApp servers without accessing the SMI-S server. See NetApp Server and Cluster discovery for more information.

3. Start the SMI-S Provider service.
4. In the SMI-S Provider or agent, configure the **Discovery Interval** with a synchronization rate that allows the wbem probe to receives the most current information during discovery.
5. On the ServiceNow instance, set up CIM credentials.
6. Create a Discovery Schedule with the IP addresses of each SMI-S Provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** Create a Discovery behavior that uses a functionality definition with a *wbem* port probe to make the initial port-scanning phase (Shazzam) more efficient.
8. Run a basic IP address Discovery.

Data collected by Discovery on storage devices

Discovery identifies and classifies information about storage devices.

Resources discovered on the Storage Disks [cmdb_ci_storage_disk] table

Field	Description
Name	Name of the storage disk.
Computer	Reference to the host CI.
Interface	Interface type with which the storage disk is connected to the host.
Size	Size of the storage disk.
Free disk space (GB)	Free space in GV available on the disk.
Manufacturer	Manufacturer of the storage disk.
Model ID	Model name of the disk.

Resources discovered on the Storage File Shares [cmdb_ci_storage_fileshare] table

Field	Description
Name	Name of the CI.
Path	Path to the file share.

Resources discovered on the Storage Pools [cmdb_ci_storage_pool] table

Field	Description
Name	Name of the storage pool.
Size	Size of the storage pool.
Free space	Free space available in the pool.
Hosted by	Reference to the CMDB CI.

Resources discovered on the Storage Ports [cmdb_ci_storage_port] table

Field	Description
Name	Name of the storage port.
WWPN	Unique Worldwide Port Name (WWPN) for the storage port.
Speed	Speed of the storage port.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resources discovered on the Storage HBAs [cmdb_ci_storage_hba] table

Field	Description
Name	Name of the Storage Host Bus Adapter (HBA).
Model ID	Model name of the HBA.
Computer	Reference to the computer CI.

Resources discovered on the Storage Servers [cmdb_ci_storage_server] table

Field	Description
Name	Name of the CI.
Manufacturer	Manufacturer of the storage server.
Model ID	Model name of the storage server.
Operating System	Operating system (OS) of the storage server.
OS Version	OS version of the storage server.
Description	Short description of the storage server.

Resources discovered on the Storage Volumes [cmdb_ci_storage_volume] table

Field	Description
Name	Name of the storage volume.
Object ID	Unique ID for the storage volume.
State	State of the storage volume.
Size	Size of the storage volume.
Storage Type	Type of storage volume.

Storage relationships

Discovery establishes the correct relationships between Network-Attached Storage (NAS) storage devices and remotely mounted client servers that consume the storage. Discovery maps NAS file shares. It maps by taking the IP or hostname of a remote mounted disk on the client computer. It then matches it to the IP or hostname of the storage server providing the exported file system.

Discovery creates the following relationships for storage CIs running on Storage Area Networks.

SAN CI relationships

Parent Component	Relationship	Child Component
Storage Volume [cmdb_ci_storage_volume]	Exports to::Imports from	Fibre Channel Disk [cmdb_ci_fc_disk]
Storage Volume [cmdb_ci_storage_volume]	Exports to::Imports from	iSCSI [cmdb_ci_iscsi_disk]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovery maps NAS file shares. It maps by resolving the hostname of a remote mounted disk on the client computer to an IP address. It then matches it to the IP address of the storage server that provides the exported file system. Discovery extracts the hostname or IP address from the NAS path to determine the identity of the storage server. If the hostname is an actual hostname, the system immediately resolves that value into an IP address. It also stores it in the **nas_ip_address** field of the NAS File System [cmdb_ci_nas_file_system] table.

Discovery creates the following relationships for storage CIs running on Network Attached Storage (NAS). These relationships are the same between Linux and Windows operating system hosts.

NAS CI relationships

Parent Component	Relationship	Child Component
NAS File System [cmdb_ci_nas_file_system]	Allocated from::Allocated to	Storage File Share [cmdb_ci_storage_fileshare]

Data collected for Veritas Volume Manager on Linux

Discovery collects disk and volume information for Veritas Volume Manager (VxVM) on Linux hosts and maps file systems mounted on Veritas volumes to the upstream storage provider.

Note: Ensure that VxVM is correctly installed and configured. If you are using 3rd party drivers, you must configure sudo permission for *vxdmpadm*.

Table schema

VxVM tables

Table	Extends table
Veritas Disk [cmdb_ci_veritas_disk]	Storage Pool [cmdb_ci_storage_pool]
Veritas Disk Group [cmdb_ci_veritas_disk_group]	Configuration Item [cmdb_ci]
Veritas Plex [cmdb_ci_veritas_plex]	Storage Pool [cmdb_ci_storage_pool]
Veritas Subdisk [cmdb_ci_veritas_subdisk]	Storage Pool Member [cmdb_ci_storage_pool_member]
Veritas Volume [cmdb_ci_veritas_volume]	Storage Pool [cmdb_ci_storage_pool]

Data collected

VxVM data collected

Table	Fields	Relationship
Veritas Disk [cmdb_ci_veritas_disk]	• name • size_bytes • disk_group	Provided by::Provides relationship to the physical disk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VxVM data collected (continued)

Table	Fields	Relationship
Veritas Disk Group [cmdb_ci_veritas_disk_group]	name	Contains::Contained by relationship to Veritas Disks in the group.
Veritas Plex [cmdb_ci_veritas_plex]	• name • size_bytes • layout (CONCAT, STRIPE, RAID)	
Veritas Subdisk [cmdb_ci_veritas_subdisk]	• partition_number • source_start_offset: Offset in the disk from which this subdisk is partitioned. • source_end_offset: Offset in the disk from which this subdisk is partitioned. • start_offset: Offset of this subdisk in the plex that is using it. • end_offset: Offset of this subdisk in the plex that is using it. • size_bytes	
Veritas Volume [cmdb_ci_veritas_volume]	name	Stored on::Provides storage for relationship to Veritas Disks on which the volume is stored.

Displaying data

VxVM Discovery maps file systems to the disks that supply storage. By default this is the only information displayed in the UI. The file system to disk relationship is shown as an upstream **Stored on** relationship on the File System form. To see the remainder of the information that Discovery captures for VxVM, you must add the appropriate related list to the Linux Server form. The available lists are:

- Veritas Disk Group
- Veritas Disk
- Veritas Plex
- Veritas Subdisk (Computer)
- Veritas Subdisk (Storage)
- Veritas Volume

NetApp Server and Cluster discovery

Discovery and Service Mapping find NetApp servers and clusters using patterns. Discovering some of these resources may require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

NetApp discovery isn't supported for NetApp servers in the AWS cloud. To learn about the components and versions of NetApp servers and clusters that you can discover, refer to Detailed information on products discovered by ITOM Visibility.

NetApp Server and Cluster discovery methods

Method	Supported modes	Upgrades
Discovery with patterns using ONTAP API. These patterns support native discovery of NetApp servers without requiring the discovery of the SMI-S server.	• NetApp 7-Mode • NetApp Cluster-Mode	Active by default.
Discovery with patterns using HTTP REST API.	NetApp Cluster-Mode	Available on Discovery and Service Mapping Patterns store application starting August 2023.
Discovery with probes and sensors using SMI-S.	• NetApp 7-Mode • NetApp Cluster-Mode	Legacy

NetApp discovery properties

To use discovery with patterns, navigate to **Discovery Definition** > **Properties** and enable these properties:

Property label	Name
For 7-Mode NetApp storage servers, use native discovery instead of SMI-S.	glide.discovery.sensors.netapp_native_7mode
For Cluster-Mode NetApp storage servers, use native discovery instead of SMI-S.	glide.discovery.sensors.netapp_native_cluster_mode

The following patterns support the NetApp storage discovery:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- NetApp Storage 7-Mode
- NetApp Storage Cluster-Mode
- NetApp Storage Cluster-Mode - HTTP

The Cluster-Mode patterns support chassis and disk shelf chassis discovery through an extension section.

Note: If you have already performed NetApp discovery with Probes and then enable these properties, a migration script runs the next time you perform NetApp discovery. This script could delete configuration items (CIs) for items like storage pools, which probes discover but the patterns don't. It also creates relationships.

SNMP-based discovery prerequisites

Configure SNMP community credentials

Configure SNMP community credentials to classify the NetApp server. For more information, see SNMP community credentials.

Enable read-only access to the ONTAP API

Enable **read-only** access to the ONTAP API on the NetApp server.

- NetApp Storage 7-Mode: The user must have a custom role with the following capabilities:
  - `login-snmp, login-ndmp, login-sp, and login-http-admin`
  - `Api-*`
- NetApp Storage Cluster-Mode: The user can have a read-only role with default access.

Verify read-only permission for ONTAP SDK APIs

Verify that the user has **read-only** permissions for the following ONTAP SDK APIs:

- NetApp Storage 7-Mode:
  - `aggr-list-info`
  - `cifs-share-list-iter-start`
  - `disk-list-info`
  - `fcp-adapter-initiators-list-info`
  - `fcp-adapter-list-info`
  - `igroup-list-info`
  - `iscsi-node-get-name`
  - `lun-list-info`
  - `lun-map-list-info`
  - `net-config-get-active`
  - `nfs-exportfs-list-rules`
  - `system-get-info`
  - `system-get-version`
  - `volume-list-info`
- NetApp Storage Cluster-Mode:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `aggr-get-iter`
- `cifs-share-get-iter`
- `cluster-identity-get`
- `fcp-interface-get-iter`
- `fcp-initiator-get-iter`
- `igroup-get-iter`
- `iscsi-initiator-get-iter`
- `lun-get-iter`
- `lun-map-get-iter`
- `net-interface-get-iter`
- `net-port-get-iter`
- `storage-disk-get-iter`
- `storage-pool-get-iter`
- `storage-shelf-info-get-iter`
- `system-get-node-info-iter`
- `system-get-version`
- `system-node-get-iter`
- `volume-get-iter`
- `vserver-get-iter`

Configure basic authentication credentials

Configure basic authentication credentials for the read-only user. For more information, see Basic authentication credentials.

REST-based discovery prerequisites

Disable SNMP-based discovery

For more information, see Disable SNMP-based NetApp storage cluster discovery.

Verify read-only role and permissions

Verify that the user has **read-only** role and permissions for the following ONTAP REST APIs:

- `/api/cluster`
- `/api/cluster/chassis?fields=nodes.name,nodes.uuid,id`
- `/api/cluster/nodes?fields=name,serial_number,model,system_id,controller,version`
- `/api/cluster/nodes?fields=name,state`
- `/api/cluster/nodes?fields=name,uuid,model`
- `/api/network/ethernet/ports?fields=mac_address,name,node.name`
- `/api/network/fc/interfaces?fields=svm.name,wwnn,wwpn,port_address,name,location.node.name`
- `/api/network/fc/logins?fields=initiator,interface.name`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `/api/network/ip/interfaces?fields=ip.netmask,svm.name,ip.address,location.home_node.name,location.`
- `/api/network/ip/interfaces?fields=location,svm,state`
- `/api/network/ip/interfaces?fields=name,ip,state,enabled,svm,location`
- `/api/protocols/cifs/shares?fields=path,name,svm.name`
- `/api/protocols/san/igroups?fields=initiators.name,name,os_type,svm.name`
- `/api/protocols/san/iscsi/sessions?fields=svm.name,initiator.alias`
- `/api/protocols/san/lun-maps?fields=svm.name,lun.uuid,lun.name,lun.node.name,logical_unit_number,igr`
- `/api/storage/aggregates?fields=space.block_storage.size,space.block_storage.available,node.name`
- `/api/storage/disks?fields=sector_count,bytes_per_sector,node.name,serial_number,model,type`
- `/api/storage/luns?fields=space.used,space.size,svm.name,location.volume.name,location.vol`
- `/api/storage/pools?fields=name,capacity.total,capacity.remaining,nodes.name`
- `/api/storage/shelves?fields=name,model,serial_number,paths.node.name,id`
- `/api/storage/volumes?fields=aggregates.name,space.size,space.available,svm.name&return_timec`
- `/api/svm/svms?fields=name,subtype`
- `/api/svm/svms?fields=subtype,name`

Configure basic authentication credentials

Configure basic authentication credentials for the read-only user. For more information, see Basic authentication credentials.

General prerequisites

Verify that the following applications are up to date

- Discovery and Service Mapping Patterns
- Visibility Content

Disable SSLv3 and enable TLS for the target NetApp server

Disable SSLv3 and enable TLS for the target NetApp server, as the Java Runtime used by the MID Server doesn't enable SSLv3 by default. The key to encrypt the certificate must be at least 1024 bits.

Schedule a horizontal discovery

To run discovery using Patterns, create a Discovery schedule that targets the management IP address of the NetApp server. For more information, see create a discovery schedule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: NetApp creates different storage volume identifiers when running with different protocols. When running discovery with HTTP after running discovery with SNMP, duplicate CIs are created for the same storage volume. One CI is created for the unique identifier (UUID) NetApp ONTAP API provides, and one CI is created for the unique identifier (UUID) NetApp HTTP REST API provides.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the NetApp patterns.

Storage Server [cmdb_ci_storage_server]

Field	Description
Name [name]	Name of the NetApp storage server or Storage Virtual Machine (SVM)
Manufacturer [manufacturer]	Manufacturer of the storage server. The value is set to NetApp.
Model ID [model_id]	Model identifier of the storage server. For SVMs in Cluster-Mode, the value is set to SVM.
Firmware version [firmware_version]	ONTAP firmware version running on the storage server.
Serial number [serial_number]	Unique serial number of the storage server.
Description [short_description]	Full version information of the ONTAP software.
IP Address [ip_address]	Management IP address of the storage server.
Physical Capacity (GB) [physical_capacity]	Total amount of physical storage space available within the NetApp system, measured in gigabytes (GB). This capacity includes both allocated and unallocated storage resources.
Free Physical Capacity (GB) [free_physical_capacity]	Available physical storage space within the NetApp system, measured in GB.
Used Physical Capacity (GB) [used_physical_capacity]	Used physical storage space within the NetApp system, measured in GB.

Storage Cluster [cmdb_ci_storage_cluster]

Field	Description
Description [short_description]	Full version information of the ONTAP software running on the cluster.
Name [name]	Name of the NetApp storage cluster.
Correlation ID [correlation_id]	Unique identifier (UUID) of the cluster.
IP Address [ip_address]	Cluster management IP address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Cluster [cmdb_ci_storage_cluster] (continued)

Field	Description
Manufacturer [manufacturer]	Manufacturer of the storage server. The value is set to NetApp.
Serial number [serial_number]	Unique serial number of the cluster, constructed from cluster UUID and name. This field is applicable to HTTP pattern only.
Cluster Version [cluster_version]	ONTAP version running on the cluster, for example: 9.14.1P4. This field is applicable to HTTP pattern only.

Storage Cluster Node [cmdb_ci_storage_cluster_node]

Field	Description
Name [name]	Name of the cluster node.
Operational status [operational_status]	Operational status of the cluster node. Default status is Operational.
Cluster [cluster]	References the Storage Cluster [cmdb_ci_storage_cluster] table.
Server [server]	References the Storage Node Element [cmdb_ci_storage_node_element] table.

Storage Node Element [cmdb_ci_storage_node_element]

Field	Description
Name [name]	Name of the storage node element.
Manufacturer [manufacturer]	The hardware manufacturer of the node element, which is: NetApp. This field is applicable to HTTP pattern only.
Model ID [model_id]	Model identifier of the node hardware.
Serial number [serial_number]	Serial number of the physical node.
Description [short_description]	Full version information of the ONTAP software running on the node.
RAM (MB) [ram]	Memory size of the node in megabytes (MB).
CPU core count [cpu_core_count]	The total number of CPU cores in the node element.
CPU type [cpu_type]	The processor type used in the node element.
CPU manufacturer [cpu_manufacturer]	References the Company [core_company] table.
Chassis [chassis]	References the Chassis [cmdb_ci_chassis] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Node Element [cmdb_ci_storage_node_element] (continued)

Field	Description
	This field is applicable to Cluster-Mode patterns only.

Network Adapter [cmdb_ci_network_adapter]

Field	Description
Name [name]	Name of the network adapter port.
MAC Address [mac_address]	MAC address of the network adapter.
IP Address [ip_address]	IP address.
Netmask [netmask]	Network subnet mask for the IP address.
Configuration Item [cmdb_ci]	References the Storage Server [cmdb_ci_storage_server] or Storage Node Element [cmdb_ci_storage_node_element] table. Physical resources are owned by Storage Node Elements, while logical resources are owned by Storage Servers.

IP Address [cmdb_ci_ip_address]

Field	Description
Name [name]	IP address.
IP Address [ip_address]	IP address.
Netmask [netmask]	Network subnet mask for the IP address.
MAC Address [mac_address]	MAC address of the network adapter.
Nic [nic]	References the Network Adapter [cmdb_ci_network_adapter] table.
IP version [ip_version]	Indicates whether the IP address is IPv4 or IPv6. This field is applicable for storage 7-Mode pattern only.

Disk [cmdb_ci_disk]

Field	Description
Name [name]	Name of the disk in ONTAP format.
Device ID [device_id]	Device identifier of the disk.
Manufacturer [manufacturer]	Manufacturer name of the disk.
Model ID [model_id]	The model identifier for the disk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Disk [cmdb_ci_disk] (continued)

Field	Description
Serial number [serial_number]	Serial number of the disk.
Size bytes [size_bytes]	The total capacity of the disk in bytes.
Device interface [device_interface]	The interface type used to connect the disk.
Interface [interface]	Interface type of the disk.
Drive type [drive_type]	Drive type. The value is set to disk.
Storage type [storage_type]	The type of storage used by the disk. The value is set to disk.
Disk space (GB) [disk_space]	The total capacity of the disk in GB.
Size [size]	Display value of the total disk capacity in GB or terabytes (TB).
Computer [computer]	• Storage 7-Mode pattern: References the Storage Server [cmdb_ci_storage_server] table • Cluster-Mode patterns: References the Storage Node Element [cmdb_ci_storage_node_element] table.
Diskshelf chassis [diskshelf_chassis]	References the Disk Shelf Chassis [cmdb_ci_diskshelf_chassis] table. This field is applicable to Cluster-Mode patterns only.

Storage Pool [cmdb_ci_storage_pool]

Field	Description
Name [name]	The unique name of the storage pool.
Description [short_description]	A brief summary describing the storage pool.
Pool ID [pool_id]	The unique identifier assigned to the storage pool.
Size bytes [size_bytes]	The total capacity of the storage pool, in bytes.
Free space bytes [free_space_bytes]	The amount of available space in the pool, in bytes.
Size [size]	Display value of the total storage pool capacity in GB or TB.
Free space [free_space]	Display value of the available storage pool capacity in GB or TB.
Hosted by [hosted_by]	References the Storage Server [cmdb_ci_storage_server] or Storage Node Element [cmdb_ci_storage_node_element] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Pool [cmdb_ci_storage_pool] (continued)

Field	Description
	Physical resources are owned by Storage Node Elements, while logical resources are owned by Storage Servers.

Storage Volume [cmdb_ci_storage_volume]

Field	Description
Name [name]	Name of the storage volume.
Object ID [object_id]	Unique object identifier (UUID) for the storage volume. This field is applicable to Cluster-Mode patterns only.
Volume ID [volume_id]	The UUID of the storage volume.
LUN [lun]	The logical unit number (LUN) associated with the volume.
Size bytes [size_bytes]	Total capacity of the volume in bytes.
Free space bytes [free_space_bytes]	Available free space in the volume in bytes.
Size [size]	Display value of the total storage volume capacity in GB or TB.
Consumable Size [free_space]	Display value of the available storage volume capacity in GB or TB.
Provided by [provided_by]	References the Storage Pool [cmdb_ci_storage_pool] table.
Computer [computer]	References the Storage Server [cmdb_ci_storage_server] table.

Storage File Share [cmdb_ci_storage_fileshare]

Field	Description
Path [path]	The file system path or mount location of the shared storage.
Name [name]	The unique name identifying the file share.

Storage Controller [cmdb_ci_storage_controller]

Field	Description
Name [name]	Name of the initiator group (igroup) that acts as the storage controller.
Device ID [device_id]	UUID of the LUN associated with this storage controller.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Controller [cmdb_ci_storage_controller] (continued)

Field	Description
Computer [computer]	References the Storage Server [cmdb_ci_storage_server] table.

Fibre Channel Port [cmdb_ci_fc_port]

Field	Description
Name [name]	The name identifying the Fibre Channel (FC) port.
WWNN [wwnn]	The World Wide Node Name (WWNN) of the FC port.
WWPN [wwpn]	The World Wide Port Name (WWPN) of the FC port.
Speed [speed]	Speed of the FC port in Gigabit Fibre Channel (GFC).
Computer [computer]	References the Storage Server [cmdb_ci_storage_server] table.

iSCSI Export [cmdb_ci_iscsi_export]

Field	Description
Name [name]	The name of the iSCSI export target.
LUN [lun]	The LUN mapped to the iSCSI export.
Export ID [export_id]	Unique identifier combining LUN path and controller name.
Initiator IQN [initiator_iqn]	The iSCSI Qualified Name of the connecting initiator.
IQN [iqn]	The iSCSI Qualified Name of the target being exported.
Exported by [exported_by]	References the Storage Controller [cmdb_ci_storage_controller] table.
Hosted by [hosted_by]	References the Storage Server [cmdb_ci_storage_server] table.
Storage [storage]	References the Storage Volume [cmdb_ci_storage_volume] table.

Fibre Channel Export [cmdb_ci_fc_export]

Field	Description
Name [name]	Name of the FC export combining LUN path and initiator WWPN.
LUN [lun]	LUN ID number for the FC export.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fibre Channel Export [cmdb_ci_fc_export] (continued)

Field	Description
Export ID [export_id]	Unique identifier combining LUN path and controller name.
Initiator WWPN [initiator_wwpn]	The WWPN of the Fibre Channel initiator.
Exported by [exported_by]	References the Storage Controller [cmdb_ci_storage_controller] table.
Hosted by [hosted_by]	References the Storage Server [cmdb_ci_storage_server] table.
Storage [storage]	References the Storage Volume [cmdb_ci_storage_volume] table.

Discovery populates the data in the CMDB when running the NetApp Cluster-Mode Patterns Only.

Chassis [cmdb_ci_chassis]

Field	Description
Name [name]	Name of the cluster that the chassis belongs to.
Manufacturer [manufacturer]	The value is set to NetApp.
Model ID [model_id]	Model identifier of the chassis hardware.
Serial number [serial_number]	Serial number of the chassis.
Description [short_description]	The value is set to NetApp Storage Chassis.

Disk Shelf Chassis [cmdb_ci_diskshelf_chassis]

Field	Description
Name [name]	Identifier of the disk shelf.
Manufacturer [manufacturer]	The value is set to NetApp.
Model ID [model_id]	Model identifier of the disk shelf.
Serial number [serial_number]	Serial number of the disk shelf.
Description [short_description]	The value is set to NetApp Storage Disk Shelf Chassis.
Chassis [chassis]	References the Chassis [cmdb_ci_chassis] table.

Note: For more information on NetApp discovery with CIM, see Storage Discovery via SMI-S and CIM.

CI relationships

Discovery creates these relationships to support the NetApp discovery.

* The CI table (Storage Server or Storage Node Element) is determined by the resource type and owner information returned by the NetApp ONTAP API. Physical resources are owned by Storage Node Elements, while logical resources are owned by Storage Servers.

** The CI table (Storage Server or Storage Node Element) is determined by the pattern type. The Storage 7-Mode pattern uses the Storage Server table, while the Cluster-Mode patterns use the Storage Node Element table.

Discovery creates these relationships when running the NetApp Cluster-Mode patterns only.

Disable SNMP-based NetApp storage cluster discovery

Disable the default SNMP-based NetApp storage cluster discovery and use REST-based discovery instead for enhanced security.

Before you begin

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery Definition** > **CI Classification** > **SNMP**.
2. In the **Name** field, search for `NetApp Storage Server Cluster-Mode`.
3. Select the NetApp Storage Server Cluster-Mode record.
4. Clear the **Active** check box.
5. Select **Update**.

What to do next

Configure basic authentication credentials for a user with a read-only role. For more information, see Basic authentication credentials.

Manage large storage payloads in Linux and Solaris

Large payloads for Linux and Solaris direct attached storage can cause out of memory errors if not configured to serialize the processing of the payload.

Before you begin

Role required: discovery_admin or admin

About this task

When Linux or Solaris storage sensors process payloads from large disk arrays, worker threads run simultaneously and can run an instance node out of memory, requiring a restart. To prevent this, the [discovery_sensor_yield] table controls the behavior of worker threads used to process large payloads. When Discovery processes a sensor, it checks the [discovery_sensor_yield] table for that sensor. If the sensor is listed in the table, and if the payload size exceeds the configured limit in the table, then the worker attempts to secure a lock before processing the payload. If the lock is not available because another worker is already processing a large payload, the waiting worker re-schedules the next job for 30 seconds later and moves on to other tasks. The job then waits in the Schedule Item [sys_trigger] table for an idle worker to pick it up. This serialization occurs per node, enabling multiple nodes to process large payloads simultaneously. The processing interval of 30 seconds is not configurable.

Important: These threshold values were created for Linux and Solaris storage sensors only and, in most cases, should not be changed. If your instance is running out of memory while simultaneously processing multiple, large storage payloads, consider scheduling Discovery of these systems to times of lower activity. If this is not possible, examine the ECC queue to determine which storage sensor might be causing the issue and note the size of the payload. If the payload size is below that of the threshold in the [discovery_sensor_yield] table, lower the threshold value enough to serialize that payload. If a sensor other than the Linux or Solaris storage sensor is responsible, you can add that sensor to the [discovery_sensor_yield] table. Make sure to set the threshold value correctly for the payload size. Serializing sensor processing can slow Discovery.

Procedure

1. In the application navigator filter, enter **discovery_sensor_yield.list**.
   The base Discovery system serializes these sensors when their payloads exceed 512 KB:
   - **Solaris - Storage**
   - **Linux - Storage**
   - **Unix - ADM Enhanced**
   - **Windows - ADM Enhanced**
2. To change the threshold, double-click in the **Value** column in the list and edit the size.

Editing the sensor yield threshold

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. To add another sensor and configure it for payload serialization, click **New** and complete the fields in the form.
   - **Sensor**: Storage sensor to configure.
   - **Value**: Threshold size for the sensor.
4. Click **Submit**.

Storage discovery examples

Discovery creates configuration items (CI) and CI relationships for physical and logical storage components attached directly to application and database servers or by fibre channel switched fabric in a multi-path configuration.

Direct attached storage

In this example of direct attached storage (DAS), a SCSI drive with two partitions, `/dev/sda1` and `/dev/sda2`, is attached to a Linux host. The `/dev/sda1` partition is bootable and supports the system software. The `/dev/sda2` partition contains a logical volume configured as a storage pool and mounted to the Linux root file system by Logical Volume Management (LVM). The storage pool uses only 1.5GB of the partition, leaving 13GB of storage available for additional logical volumes.

CIs and relationships created for direct attached storage (DAS)

Configuration item	Description	Tables	Key reference and Relationships
/dev/sda	SCSI physical storage device	• [cmdb_ci_disk] • [cmdb_ci_storage_device] • [cmdb_rel_ci]	[cmdb_rel_ci] • **Provides**: /dev/sda • **Provided by:**/dev/sda1
			[cmdb_rel_ci] • **Provides**: /dev/sda • **Provided by:**/dev/mapper/lvm-root-333-0
/dev/sda1	Partition 1 on the SCSI storage device	• [cmdb_ci_partition] • [cmdb_ci_storage_volume] • [cmdb_ci_file_system] • [cmdb_rel_ci]	[cmdb_ci_file_system] • **Mount point**: /boot • **File system**: Ext4
			[cmdb_rel_ci] • **Provides**: /dev/sda • **Provided by:**/dev/sda1

CIs and relationships created for direct attached storage (DAS) (continued)

Configuration item	Description	Tables	Key reference and Relationships
/dev/sda2	Partition 2 on the SCSI storage device	• [cmdb_ci_partition] • [cmdb_ci_storage_pool_member]	[cmdb_ci_storage_pool_member] • **Pool**: /dev/mapper/lvm-root-333-0 • **Storage**: /dev/sda2
/dev/mapper/lvm-root-333-0	Linux logical volume, mapped with LVM to a physical disk storage partition.	• [cmdb_ci_storage_device] • [cmdb_ci_storage_volume] • [cmdb_ci_file_system] • [cmdb_ci_storage_pool] • [cmdb_ci_storage_pool_member] • [cmdb_ci_lvm_pool] • [cmdb_ci_lvm_pool_member] [cmdb_rel_ci]	[cmdb_ci_file_system] • **Mount point**: / • **File system**: Ext4 [cmdb_rel_ci] • **Provides**: /dev/sda • **Provided by:**/dev/mapper/lvm-root-333-0 [cmdb_ci_storage_pool_member] • **Pool**: /dev/mapper/lvm-root-333-0 • **Storage**: /dev/sda2

Multipath fibre channel storage

In this example of a fibre channel storage area network (SAN), two physical storage devices, `mpatha` and `mpathb`, are attached to a Linux host through fibre switches, which provide failover capabilities. The `mpatha` drive contains two partitions, `mpatha1` and `mpatha2`. The first partition is mounted directly to `/boot` on the Linux host. Three logical volumes are mapped to the `mpatha2` partition and to the physical device `mpathb`. The logical volumes are mounted as Ext4 file systems in folders on the Linux root structure. This example shows the CIs that Discovery manages for each component and the mounting points for the logical volumes on the Linux host.

Switched fibre fabric details

Discovery creates CIs for the logical sub-components in NAS and SAN environments, such as fibre channel disks and pool components, as well as for host bus adapters (HBA) and physical block storage. In multipath environments, Discovery creates CI relationships within the switched fibre fabrics that connects the Linux host to the physical storage devices. In this diagram, the fibre fabrics have redundant paths that the SAN environment can use for failover if connections fail.

ITOM Visibility and CSDM reference

ITOM Visibility consists of two ServiceNow products: Discovery and Service Mapping. These products are responsible for creating Configuration Items (CIs) in the CMDB and relating them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The goal of this product view is to help you to understand how ITOM Visibility works with the core CSDM framework.

Aspects of ITOM Visibility

Discovery

Discovery finds computers, servers, printers, a variety of IP-enabled devices, and the applications that run on them. It can then update the CIs in your CMDB with the collected data.

Service Mapping

Service Mapping discovers all application services in your organization and builds a comprehensive map of all devices, applications, and configuration profiles that support the associated business services.

Service Mapping maps dependencies based on the connections between devices and applications. This method, called top-down mapping, helps you immediately see the impact of a problematic object on the rest of the application services.

Implementing CMDB data

For details on implementing CMDB data to conform with the CSDM framework, see Implementing the CSDM framework in stages.

ITOM Visibility and CMDB tables

ITOM Visibility manages and uses CMDB tables. Several ServiceNow products benefit from and add value to ITOM Visibility.

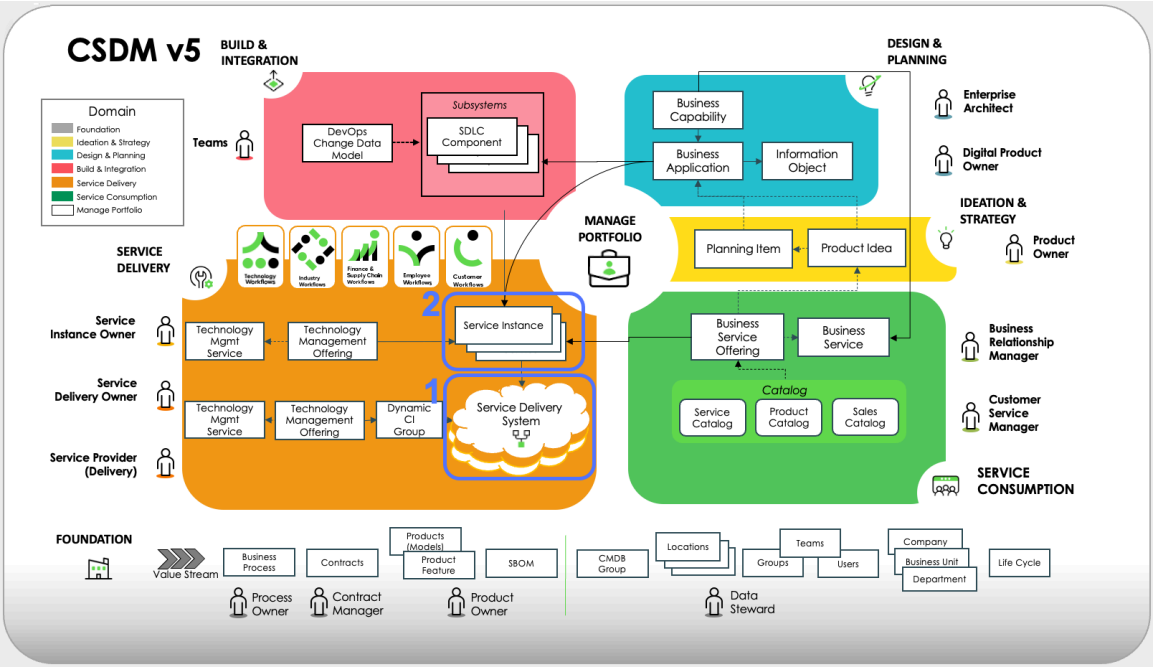
Tables that ITOM Visibility manages



Mapped application service tables

The tables that ITOM Visibility manages depend on the method used to map the service instance (the label for the table was formerly application service) . You can use the Application Service wizard to populate an application service.

- Map the Service instance using top-down discovery of CI connections. This method requires Service Mapping, the sm_admin role, and the current domain must be a leaf domain. This is the best option for accuracy and complete mapping. ITOM Visibility manages the Mapped Application Service table [cmdb_ci_service_discovered]
- Map the service instance using a tag list or tag family. This method requires Service Mapping and is preferred for public or private cloud where tags are typically used. ITOM Visibility manages the tag-based maps table [cmdb_ci_service_by_tags].
- Manually map the service instance. This method requires that you select specific CIs — no automation is used. ITOM Visibility manages the service maps table [cmdb_ci_service_manual].
- Use Dynamic Service to synchronize manually-created CI relationships to a Service Map view.

Configuration items (CIs) tables [cmdb_ci_*]

- Application table [cmdb_ci_appl]
- Server table [cmdb_ci_server]
- Virtual machines table [cmdb_ci_vm_instance]
- Load balancer table [cmdb_ci_lb]
- Network gear table [cmdb_ci_netgear]

Products that benefit from ITOM Visibility

- IT Service Management
- Customer Service Management (CSM)
- Event Management
- Cloud Management
- Asset Management (Hardware Asset Management and Software Asset Management)
- Strategic Portfolio Management (Financial Management — Showback statements, Application Portfolio Management [APM])
- Security Operations (Incident Response, software vulnerability management)

Implementing CMDB data

For details on implementing CMDB data to conform with the CSDM framework, see Implementing the CSDM framework in stages.

ITOM Visibility use case

The ITOM Visibility use cases are described in this section.

Discovery use case

- Gain increased visibility into your on-premises and cloud resources.
- Keep track of changes in your on-premises, cloud, and serverless infrastructure in the Configuration Management Database (CMDB).
- Set a strong foundation with accurate data and relationship views for ServiceNow products, including Change Management, Software Asset Management, Customer Service Management (CSM), and Security Operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key features of the Discovery use case

- Set up and manage Discovery jobs.
- See IT resources and dependencies at-a-glance.
- Build queries to validate discovered IT resources.
- Manage your public key infrastructure (PKI) certificates in one dashboard.

Results of the Discovery use case

The CSDM framework gives Discovery a prescribed model for how infrastructure and software CIs relate to other areas, such as application services, business applications, and assets.

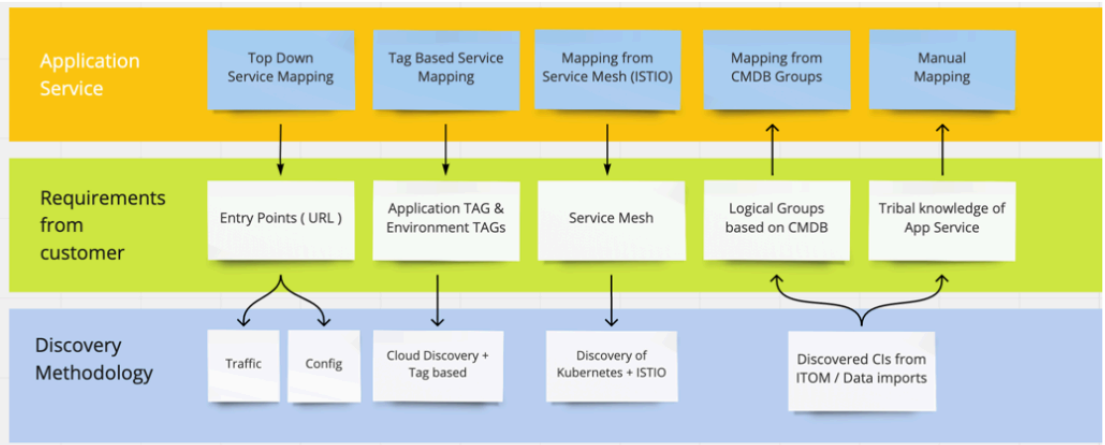
Service Mapping use case

You can create application services manually, using an API, or by having Service Mapping discover them. Regardless of creation method, all application services are stored in the Mapped Application Service table [cmdb_ci_service_discovered].

Results of the Service Mapping use case

Service Mapping automates a critical aspect of CSDM with a consistent, automated approach to connect the logical layer of the CSDM model to the physical model CIs in the CMDB. This approach lets you more effectively manage your business applications. The approach also enables you to automate modeling of your business applications for impact assessment and analysis. For impact assessments and analysis, you can use a number of ServiceNow products including Change Management, Incident Management, or the CMDB Query Builder.

Application Services flow



Application services view in Operator Workspace

You can specify a life-cycle status for an application service. Application services with an Operational life-cycle status can be used on service maps for the relevant workflows, such as Artificial Intelligence for IT Operations (AIOPs) workflows.

- Life cycle of product entities

ITOM Visibility considerations for CSDM framework

Consider these points while implementing the CSDM framework.

You can use Service Mapping to define application services.

Here are alternative methods for defining application services:

- Define manually.
- Use a Dynamic CI group, based on a query.
- Use a tag-based approach (commonly used for Cloud integrations).

For more information about creating application services, see Create an application service.

Run options for discovery schedules

Both horizontal and top-down discovery use these run options.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovery schedule run options

Run option	Description
On Demand	Doesn't run on a schedule. Select **Discover now** to run Discovery. This is the default
Daily	Runs every day. Use the **Time** field to specify the time of day.
Weekly	Runs on one designated day of each week. Use the **Time** field to specify the time of
Monthly	Runs on one designated day of each month. Use the **Day** field to select the day of th specify the time of day. If the designated day doesn't occur in the month, the schedu example, if you designate day 30, the schedule doesn't run in February.
Periodically	Runs every designated time. Use the **Repeat Interval** field to define the time in days, The first Discovery runs at the point in time defined in the **Starting** field. The subsequ **Repeat Interval** period passes. **Note:** For schedules configured as "Periodically", the "Time" column won't disp time. To determine the next execution time for schedule that is configured to run Schedule [sys_trigger] table and locate the corresponding schedule record. The the next scheduled run.
Once	Run one time as designated by the date and time defined in the **Starting** field.
Weekdays	Runs every Monday, Tuesday, Wednesday, Thursday, and Friday. Use the **Time** field t
Weekends	Runs every Saturday and Sunday. Use the **Time** field to select the time of day.
Month Last Day	Run the last day of every month. Use the **Time** field to select the time of day.
Calendar Quarter End	Runs on March 31, June 30, September 30, and December 31. Use the **Time** field to s the dates, modify the *`DiscoveryScheduleRunType`* script include.
After Discovery	Allows you to sequentially stagger the schedule. Use this option to run this schedule in the **Run after** field finishes. Select the **Even if canceled** check box to designate tha even if the **Run after** Discovery is canceled before it finishes. • This option isn't valid when Discovery is started via DiscoverNow, or when using th • You can't designate an inactive Discovery schedule. • You can't create a loop by designating the run after Discovery to be the same Disc • This Discovery doesn't run if the **Run after** Discovery doesn't finish, with the excep check box is selected and the Discovery is canceled.

Plugins or applications installed with ITOM Visibility

Tables that list the plugins or applications that are installed with ITOM Visibility applications. When you update your application, any newly required application dependencies are installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovery

Plugins or applications installed with Discovery (com.snc.discovery)

Plugin or application name	Description
Cloud Provisioning and Governance Core (com.snc.cloud.core)	Contains resource blocks and cloud Application Programming Interface (cloud API) mappings related to Cloud API-based discovery and events processed by either response mapping or calling patterns.
Service Watch Suite commons (com.snc.service-watch.commons)	Contains common UI components for Discovery and Service Mapping.
Discovery - IP Based (com.snc.discovery.ip_based)	Contains shared components of horizontal discovery used by Discovery and Service Mapping.

Discovery Admin Workspace

Plugin activated with Discovery Admin Workspace (sn_disco_workspace)

Plugin or application name	Description
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.

Service Mapping

Plugins or applications installed with Service Mapping (com.snc.service-mapping)

Plugin or application name	Description
Service Mapping – Map (com.itom-map-app)	A dependent internal plugin necessary to support the core components of the Service Mapping, Event Management, and Service Operations Workspace ITOM applications.
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.
Event Management and Service Mapping Core (com.snc.service-watch)	Comprises the common components of Event Management and Service Mapping.
Cloud Provisioning and Governance Core (com.snc.cloud.core)	Contains resource blocks and cloud Application Programming Interface (cloud API) mappings related to Cloud API-based discovery and events processed by either response mapping or calling patterns.
Pattern Designer (NG version) (com.snc.ng.pattern.designer)	The next generation (NG) version of the Pattern Designer that enables you to create, edit, and debug patterns used by horizontal and top-down discovery.
Service Mapping Plus (sn_sm_scoped_app)	Offers extended features for Service Mapping, and if related ServiceNow® Store applications and plugins aren't already installed, it installs them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag Governance

Plugins or applications installed with Tag Governance (sn_itom_tag)

Plugin or application name	Description
Cloud Access Interface (sn_cai)	Provides easy access to the cloud through scripting. You can use this ServiceNow Store application to perform actions on virtual machines provisioned on Amazon Web Services (AWS) and Microsoft Azure.
Certification Core (com.snc.certification_core)	Contains core certification structures such as filters and templates, and provides compliance functionality.
ITOM Visibility License (com.snc.itom.vis.license)	Enables the activation of any ServiceNow Store application that requires ITOM Visibility licensing.
ITOM/OT SU Licensing (sn_itom_licensing)	Calculates and displays how many subscriptions for ITOM applications your organization purchases and consumes.
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.
Flow Designer Action Step - Script on MID (com.glide.hub.action_step.script_mid)	Provides an action step to execute custom JavaScript within a reusable action on a MID Server.

Cloud Discovery Workspace

Plugins or applications installed with Cloud Discovery Workspace (sn_cloud_ops_ws)

Plugin or application name	Description
Discovery and Service Mapping Patterns (sn_itom_pattern)	Provides the latest versions of the Discovery and Service Mapping Patterns released on the ServiceNow Store. ServiceNow releases new patterns on the ServiceNow® Store on a monthly basis, enabling your organization to discover the latest industry-standard devices and applications.
Cloud Provisioning and Governance Core (com.snc.cloud.core)	Contains resource blocks and cloud Application Programming Interface (cloud API) mappings related to Cloud API-based discovery and events processed by either response mapping or calling patterns.
Performance Analytics Content Pack for Cloud Resources (sn_disco_cd)	Displays the aggregated view of all your Cloud Resources. It also provides analytics tables and views that associate tags with resources, enabling you to build your own custom dashboards and reports.
Pattern Designer (NG version) (com.snc.ng.pattern.designer)	The next generation (NG) version of the Pattern Designer that enables you to create, edit, and debug patterns used by horizontal and top-down discovery.

Agent Client Collector for Visibility - Content

Plugins or applications installed with Agent Client Collector for Visibility - Content (sn_acc_visibility)

Plugin or application name	Description
Agent Client Collector for Visibility - Content Content (sn_acc_vis_content)	Provides agent-based infrastructure discovery and collects Software Asset Management (SAM) metrics to support Discovery and Digital End-User Experience (DEX) applications.
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
CMDB CI Class Models (sn_cmdb_ci_class)	Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Applications such as Discovery and Service Mapping can use these class extensions to populate configuration items (CIs) and discover various technologies and software.

Agent Client Collector for Visibility - Content Content

Plugins or applications installed with Agent Client Collector for Visibility - Content Content (sn_acc_vis_content)

Plugin or application name	Description
Expanded Model and Asset Classes (sn_ent)	Provides new, expanded model classes, asset classes, and model categories that come with the base system, defined by ServiceNow. Install the Asset Management (com.snc.asset_management) plugin as a prerequisite for using this application.
Discovery – IP Based (com.snc.discovery.ip_based)	Contains shared components of horizontal discovery used by Discovery and Service Mapping.
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
CMDB CI Class Models (sn_cmdb_ci_class)	Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Applications such as Discovery and Service Mapping can use these class extensions to populate configuration items (CIs) and discover various technologies and software.

Agent information modules (continued)

Option	Description
	• Details: Details about the error. • Error Message Suggestions: Suggestions on how to fix the selected error. • Agents for error: The agents on which the selected error appears.

ITOM AIOps

The ServiceNow® ITOM AIOps product includes the ServiceNow® Event Management and ServiceNow® Metric Intelligence applications, which help you track and maintain the health of services in your organization.

Features of ITOM AIOps

Event Management

Event Management gathers alerts from infrastructure events captured by third-party monitoring tools. Event Management uses IT-related information gathered by Discovery to map alerts to configuration items. Based on the collected information, Event Management then provides dashboards showing a consolidated view of all service-impact events.

Agent Client Collector

Use the ServiceNow® Agent Client Collector application to monitor your service availability, examine the health and performance of your environment, and ensure that your infrastructure and its applications are running properly. You can also proactively analyze your IT infrastructure to spot issues and prevent service outages, using Metric Intelligence. Using advanced machine learning to analyze information about your IT infrastructure, the Metric Intelligence application automatically determines dynamic thresholds and identifies anomalies that may indicate potential service outages.

Health Log Analytics

The ServiceNow® Health Log Analytics application predicts IT issues before they impact users. The application helps you solve problems faster by ingesting, understanding, and correlating machine-generated log data in real time. It notices any deviation from normal behavior when it happens and alerts you of possible business-impacting issues. Health Log Analytics receives and processes logs via the MID Server and sends events to the ServiceNow® Event Management application.

Service Observability

The ServiceNow® Service Observability application helps operations teams triage and manage incidents in a complex and distributed production system. It combines external application performance monitoring (APM) systems' telemetry with related data from the Configuration Management Database (CMDB) and displays both in a single workflow in the Service Operations Workspace.

Synthetic monitoring

he ServiceNow® Synthetic monitoring application empowers organizations to proactively manage and enhance the performance and availability of critical

© 2026 ServiceNow, Inc. All rights reserved.

services. By simulating user transactions on API endpoints, this solution identifies performance bottlenecks, helps ensure up-time, and optimizes user experiences.

Service Operations Workspace for ITOM

Service Operations Workspace for ITOM is a configurable workspace that provides a unified experience for multiple IT Operations Management workflows. Service Operations Workspace for ITOM enables you to manage the life cycle of alerts, including running actions to resolve alerts and identifying the underlying issue of an alert.

ITOM AIOps licensing

The ServiceNow AI Platform® uses a licensing method where your organization is billed for using ITOM AIOps applications. ITOM AIOps and Health Log Analytics are available as separate licenses. The ServiceNow Product Documentation doesn't provide information on prices, packaging, or other details determined by your organization customer contract. For general information about licensing and subscriptions, see ITOM/OT SU Licensing and subscriptions.

Using guided setup to implement IT Operations Management applications

IT Operations Management Guided Setup provides a sequence of tasks that help you configure IT Operations Management applications on your ServiceNow instance. To open IT Operations Management guided setup, navigate to **Guided Setup** > **ITOM Guided Setup**. For more information about using the guided setup interface, see Using guided setup .

Configure the MID Web Server extension

The MID Web Server is an extension that enables external clients to push metric data and events to the MID Server. Configure the MID Web Server extension to enable ITOM Health features (Event Management, Agent Client Collector, and Health Log Analytics).

ITOM AIOps use case

Modern organizations are turning to artificial intelligence (AI) technologies within IT operations (AIOps) to tackle the escalating volumes and diversity of data. AIOps platforms offer solutions for analyzing data, automating processes, and predicting issues preemptively, addressing the growing complexity of IT environments.

Key features of the ITOM AIOps use case include:

- Ingesting events and metrics through base-system integrations with chosen monitoring systems.
- Processing events and metrics to create alerts.
- Correlating alerts and conducting root cause analysis.
- Detecting anomalies within the system.
- Calculating the impact on application services.
- Utilizing the Service Operations workspace for operational management.
- Automating remediation actions based on alerts.

Application service maps are instrumental for Network Operations Center (NOC) operators located at central hubs as they facilitate precise prediction of root cause alerts and correlation of these alerts with discovered topology data. This correlation enables accurate prediction of service impact, allowing for effective impact analysis to determine the effect on application services, visualized within the application service map.

Products that add value to ITOM AIOps

In the context of ITOM AIOps, which focuses on maintaining the health and performance of IT systems and infrastructure, there are several ServiceNow products that can add significant value:

Discovery

Discovery automatically identify and collect information about IT assets, configurations, and relationships, providing organizations with a comprehensive inventory to effectively manage and monitor their IT infrastructure.

Service Mapping

Service Mapping offers detailed information about application instance services within the [cmdb_ci_service_discovered] table. This data helps establish connections between infrastructure and application configuration items (CIs) stored in the [cmdb_ci_appl] table, enhancing visibility into IT environments and facilitating efficient management and monitoring processes.

Service Portfolio Management

Service Portfolio Management (SPM) offers the associated product model, while Software Asset Management (SAM) and Hardware Asset Management (HAM) provide life-cycle data for Technology Portfolio Management (TPM). Together, they enable comprehensive management of IT assets, ensuring effective utilization, compliance, and optimization throughout their life cycles.

Products that benefit from ITOM AIOps

Incident Management

Incident Management tools leverage downstream information from Event Management to create incidents swiftly, ensuring timely resolution of issues.

Customer Service Management (CSM)

Customer Service Management (CSM) systems benefit from ITOM AIOps by utilizing application service impact data to identify affected users promptly, enhancing customer support efficiency and satisfaction.

Event Management

ServiceNow® Event Management is a robust application that helps keep your IT systems healthy by spotting problems quickly and fixing them. It collects events from different sources, figures out what's causing the issues, and converts them into alerts. These alerts are then analyzed, grouped, and acted upon to resolve issues and maintain system health.

Event Management seamlessly integrates with various monitoring tools via connectors and listeners, enabling comprehensive data collection and correlation. Available as a separate subscription from the main ServiceNow platform, Event Management allows organizations to tailor their usage to specific needs, ensuring effective and efficient incident management without unnecessary overhead.

Exploring Event Management

Explore Event Management to understand its overview, process flow, user roles, and benefits for comprehensive IT issue monitoring and resolution.

Event Management provides comprehensive monitoring, analysis, and remediation of IT issues by effectively managing various components within an IT environment. These components include discovered services, application services, dynamic CI groups, and alert groups.

- Discovered Services: Defined by interrelated Configuration Items (CIs) from the CMDB, a discovered service is identified through Service Mapping. It includes a service map with mapping relationships, an impact tree showing outage severity, active and related alerts, and CI properties. This service information is displayed on dashboards, the Alerts list, and the Events list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Application Services: Created by selecting specific CIs, application services allow for targeted monitoring and management. For more details, refer to the Application Services documentation.
- Dynamic CI Groups: These are collections of CIs grouped based on shared criteria, such as location. Dynamic CI groups help populate application services, simplifying management.
- Alert Groups: Alert groups organize sets of alerts to streamline maintenance and management, making it easier to respond to IT issues efficiently.

Process flow

Event Management receives external events and generates alerts based on predefined rules. The MID Server polls external event tracking tools and sends data to Event Management for storage and processing. Events are stored in the Event [em_event] table, and alerts are created by matching event rules. Alerts are then transformed and enriched with additional content, accumulated if thresholds are met, and mapped to specific fields. The system searches for matching message keys to update existing alerts or create new ones, associating related events under a single alert. Alerts are bound to specific Configuration Items (CIs) for root cause analysis. For more information, see Event Management process flow.

Users

Role title [name]	Description
Admin [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Event Management. **Note:** Exercise caution with the evt_mgmt_admin role, as it can be elevated to the admin role. A user with the evt_mgmt_admin role has the ability to add and modify scripts that run on a global scope. Ensure proper access control. With this role, the user can create and/or update the following scripts: • Alert correlation rules • Alert management rules • Maintenance rules • Advanced scripts • Event field mapping • Pre- and post-binding scripts
Operator [evt_mgmt_operator]	Manages alerts, including closing and acknowledging them. Oversees the overall Event Management process, ensuring events are properly categorized, prioritized, and routed for resolution.
Team Operator [evt_team_operator]	Manages Event Management operations within a specific team as defined in the **Assignment Group** field. This role allows the operator to read and write alerts exclusively for their assigned team. Additionally, the operator can make configuration changes specific to their team, including updates to Alert Automation and the Integrations Launchpad.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description
	Note: The evt_team_operator role must be assigned to an assignment group to view and manage alerts for that group. If the role is created but not associated with any groups that have alerts assigned, the operator cannot see any alerts.
User [evt_mgmt_user]	Manages the lifecycle of alerts, including performing basic operations such as viewing and acknowledging them.

Benefits

- Rapid Issue Detection: Quickly identifies and highlights potential IT issues.
- Efficient Alert Handling: Aggregates and correlates alerts for streamlined management.
- Automated Actions: Initiates automatic remediation processes to speed up issue resolution.
- Comprehensive Monitoring: Integrates with multiple tools for a complete system overview.
- Root Cause Analysis: Offers tools to identify underlying causes of issues.
- Customizable Rules: Tailors event and alert management rules to specific needs.
- Reduced Downtime: Minimizes system downtime with prompt problem resolution.
- Enhanced Visibility: Real-time dashboards offer insights into system health.
- Cost Efficiency: Lowers operational costs by preventing prolonged issues.

Event Management process flow

Event Management collects, analyzes, and converts events into alerts, enabling efficient tracking and remediation.

Event Management receives external events and generates alerts based on event and alert management rules. Events are sent directly to your instance via email server, script, SNMP trap, or web service API. The corresponding alerts appear on dashboards for tracking and remediation purposes.

As the computer, software, or service generates events, the MID Server polls the external event tracking tool. The MID Server, maintaining a connection to Event Management, sends the information to your instance for storage, processing, and remediation.

The instance stores events in the Event [em_event] table and attempts to generate alerts based on predefined rules and event mappings. Regardless of whether an alert is generated, the original event is available for review and remediation. Alerts are generated according to the following process flow.

1. Match Event Rule: Find the best matching event rule for an event.

   A rule is matched if the source of the event matches the source specified in an existing rule. Additionally, a rule is matched if the event matches the optional rule filter and the event additional_info value matches the rule Additional Information filter. A rule without any filter is ignored, such as when the source filter or Additional Information filter is missing. If multiple rules are defined for the same type of event, use the rule order to determine the sequence of rule application.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Ignore Rule: If the rule **Ignore** check box is selected, no alert is generated. However, the event is still available for review and remediation.
3. Apply Transforms:
   - If transforms have been defined, apply them.
   - If compose parameters are set, apply the additional content to display to the user in the alert.
4. Threshold Accumulation: If Active in the threshold section is selected, accumulate all events until the threshold is met, then generate a single alert for the events.
5. Event Field Mapping
   - Search for an event field mapping even if there was no event rule.
   - If an event field mapping is found, apply the mapping information.
   - If the event has no severity after the event transformations, retain the event for reference purposes and do not generate an alert.
6. Alert Generation
   - Search the Alert [em_alert] table for a matching message key.
   - If a matching message key exists, update the alert according to the event information.
   - If a matching message key does not exist, create an alert.
   - If another event has the same matching key, associate the events under a single alert.
   - For root cause analysis purposes, bind the alert to a specific Configuration Item (CI).

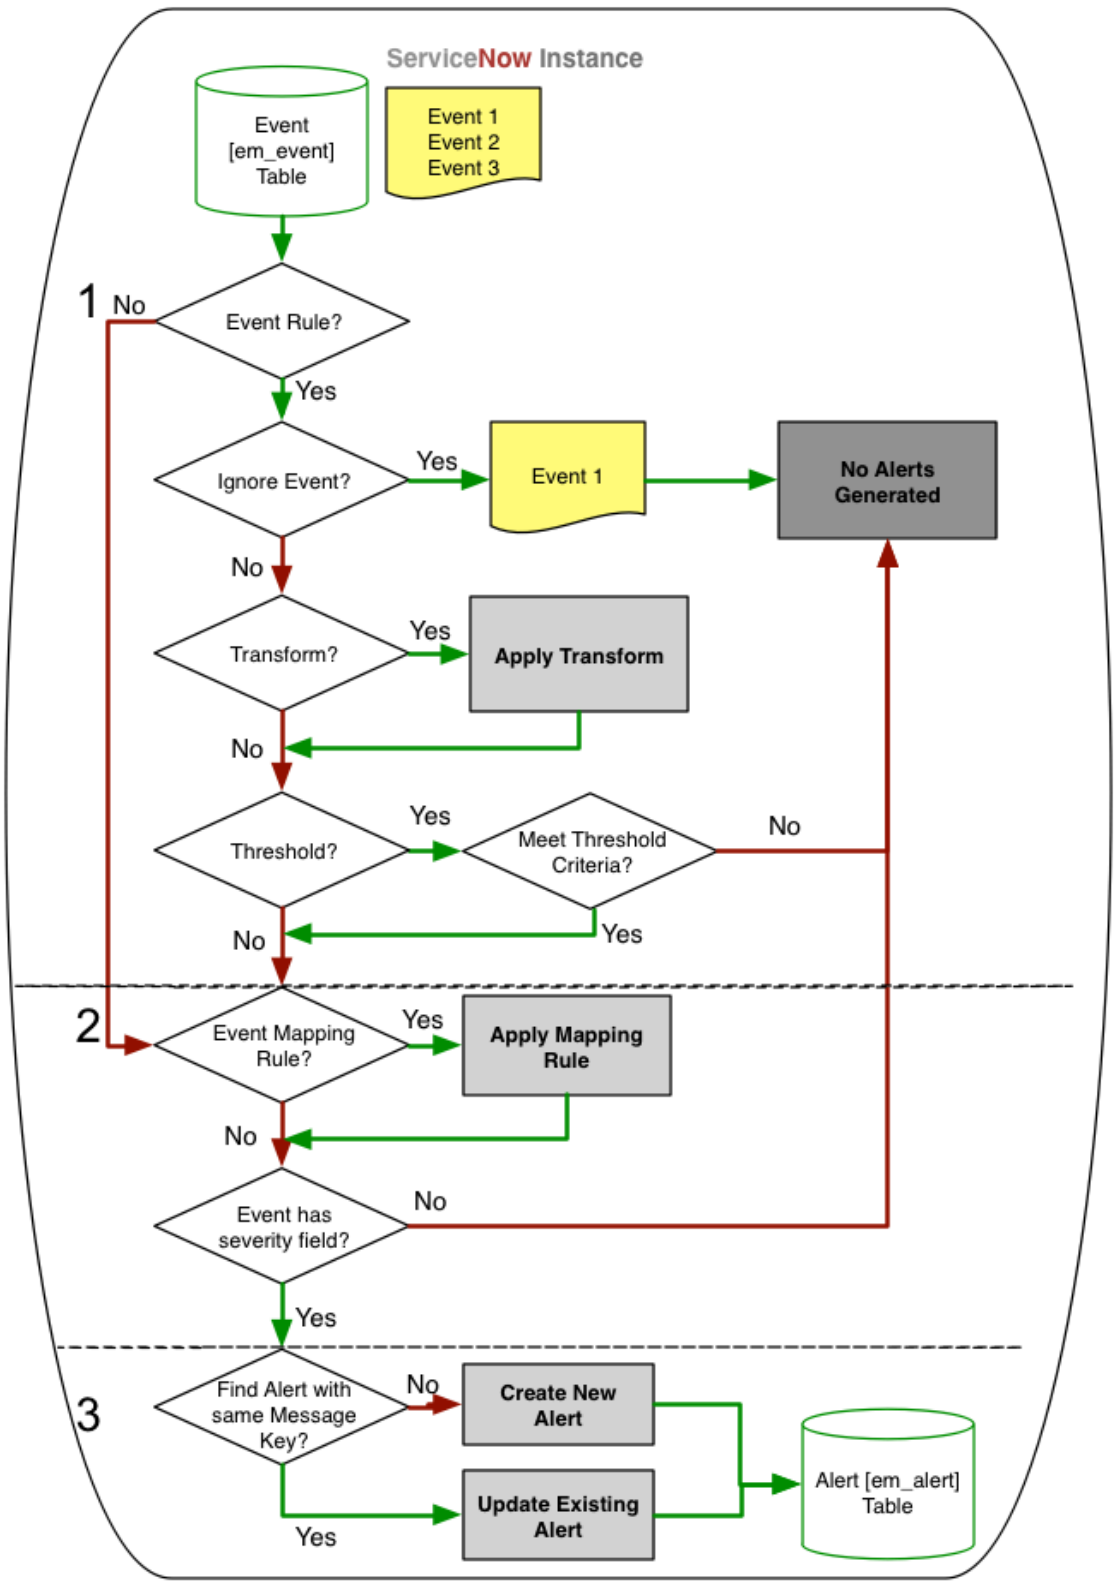
Event workflow



Event Management architecture

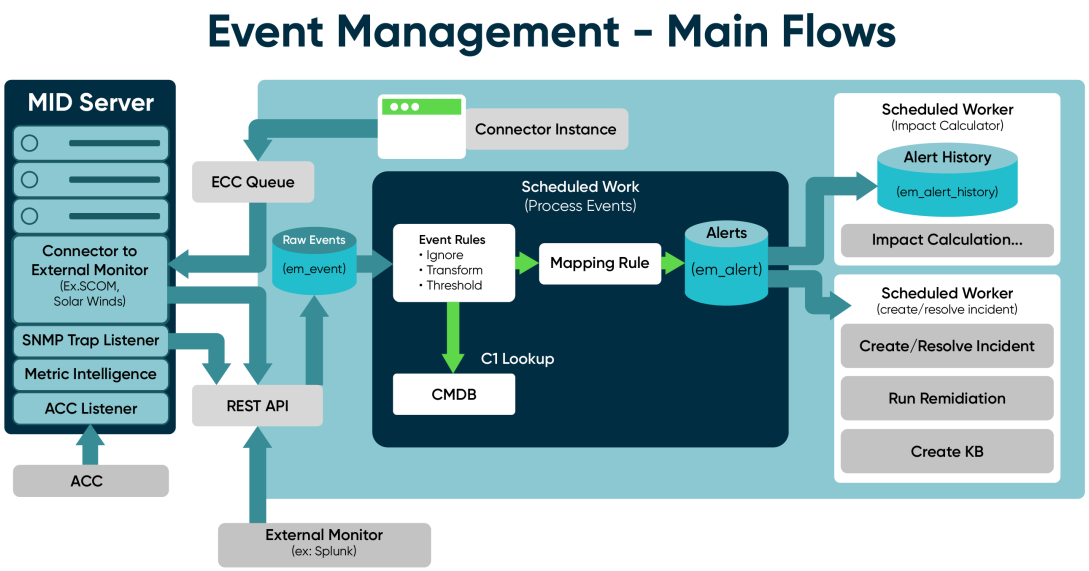
Event Management architecture integrates data collection, processing, and alerting into a unified system for streamlined IT issue detection and resolution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Architecture

As events occur on various systems, the MID Server connector instance sends them to the main instance. Event Management generates alerts, applies alert management rules, and prioritizes alerts for remediation and root cause analysis. This information can be viewed on dashboards, the alert list in Alert Intelligence, or from a service map.

Event Management architecture



Configuring Event Management

Event Management administrators administer events, manage and monitor alerts, aggregate alerts, and work review and monitor services' status with the Operator Workspace service monitor.

Event Management operators find alerts, analyze them, and take action to resolve the underlying issue.

ITOM Configuration console for Event Management

The ITOM Configuration console gives administrators a single place to complete all Event Management setup steps — from installing plugins to configuring alert automations.

The console contains two modules: Discovery and Event Management.

Discovery guides you through the end-to-end setup of your IT infrastructure scanning. It covers assigning administrators, deploying and validating MID servers, configuring IP and cloud credentials, scheduling discovery runs, and reviewing schedules. It also includes diagnostics to identify discovery errors and detect anomalies, ensuring your environment is fully validated before you promote your configuration to production.

Event Management helps you take control of your IT alerts from start to finish. It begins with assigning administrators, setting up integration accounts, and installing the necessary integrations to connect your monitoring tools. From there, you can review and enrich incoming alerts, automatically create incidents, and reduce noise by grouping, ignoring, or delaying alerts. The platform also provides structured training for your operations team on key tools such as Service Operations Workspace, Express List, and Service Dashboard. Finally, built-in dashboards help you report on outcomes and measure progress before promoting your configuration to production.

Install ITOM AIOps apps

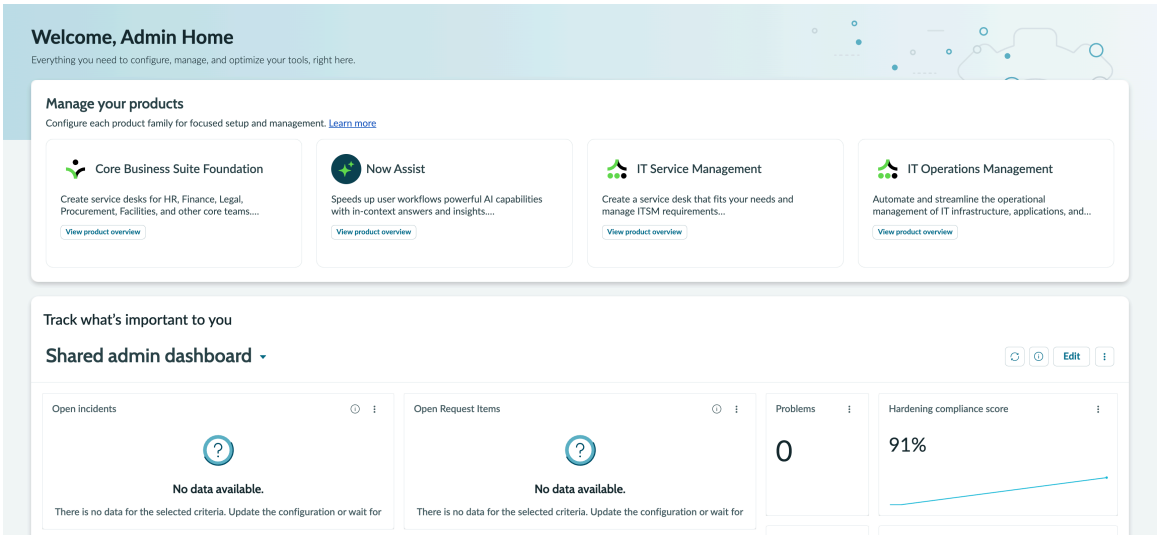
Install two plugins to enable ITOM AIOps functionality: ITOM AIOps and Now Assist for IT Operations Management.

Before you begin

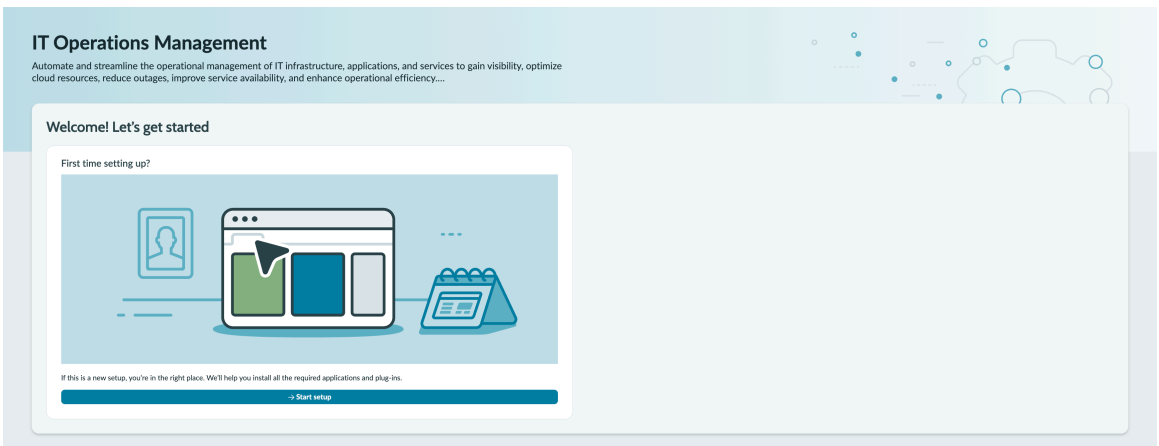
Role required: admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
   The Admin Home page opens.



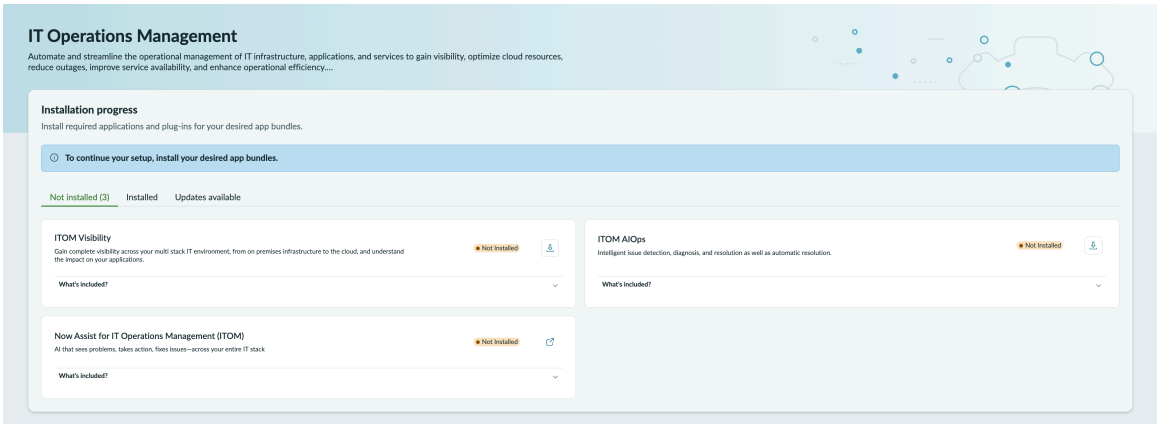
2. In the IT Operations Management tile, select **View product overview**.
   The Welcome! Let's get started dialog box appears.



3. Select **Start setup**.

   View all unavailable plugins in the **Not Installed** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Install the ITOM AIOps plugin by selecting the install icon ( ).
5. To select the Now Assist for IT Operations Management (ITOM) plugin, perform the following steps:
   a. Select the Application manager icon ( ).
   b. On the Application manager page, select **Install**.

   Both plugins are installed and listed in the **Installed** tab in the IT Operations Management page.

Access Event Management configuration console

Access the IT Operations Management configuration console to set up Event Management and configure AIOps capabilities.

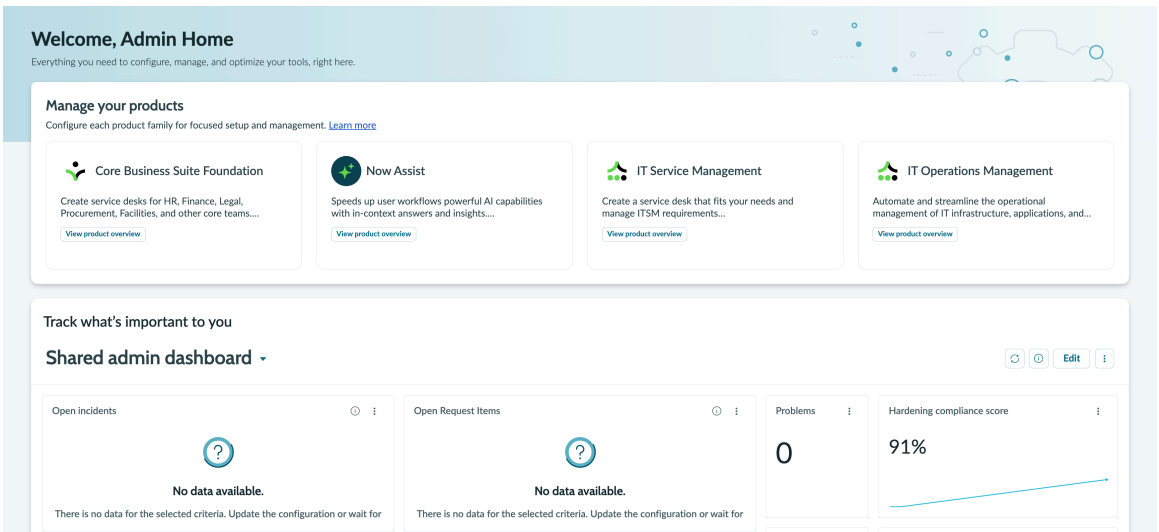
Before you begin

Verify that the ITOM AIOps and Now Assist for IT Operations Management plugins are installed.

Role required: admin

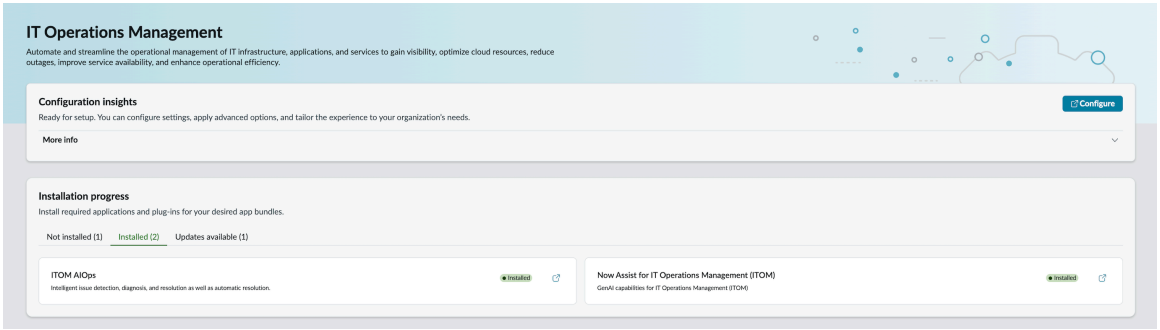
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
   The Admin Home page opens.

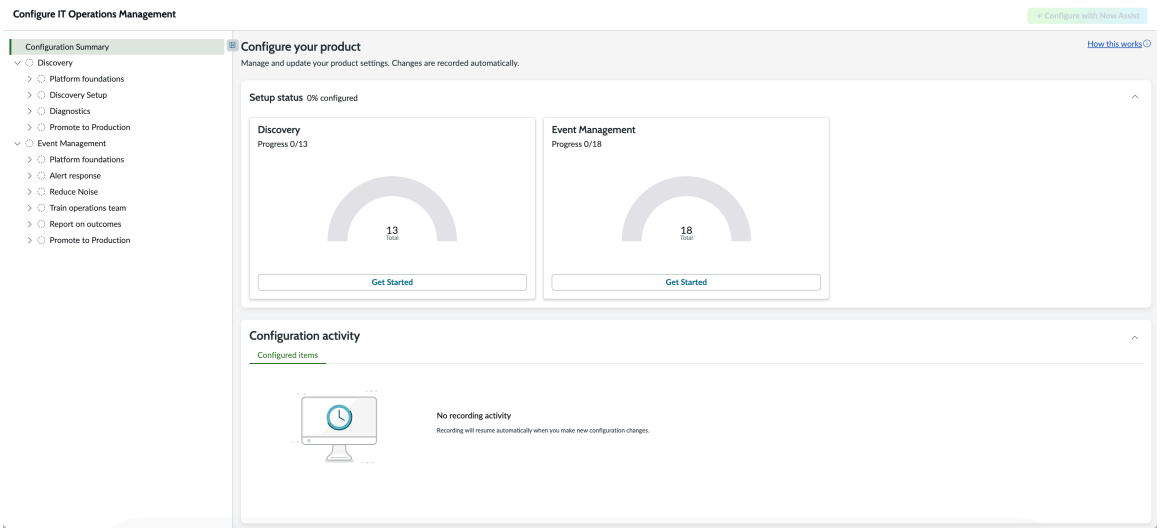


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. In the IT Operations Management tile, select **View product overview**.
3. In the IT Operations Management page, select **Configure**.



The Configure IT Operations Management page opens.



Assign user to Event Management admin role

Assign the evt_mgmt_admin role to users who will be in charge of Event Management configuration and operational control.

Before you begin

Verify that the ITOM AIOps and Now Assist for IT Operations Management plugins are installed.

Ensure you're in the Configure IT Operations Management page.

Role required: admin

About this task

The evt_mgmt_admin role provides users with the necessary permissions to configure and manage Event Management settings, including alert processing, incident creation, and operational controls.

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Platform foundations**.
2. Expand **Platform foundations**.
3. Select **Assign Event Management admins**.
4. In the **User** field, select the user to assign the role to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Role** field is read-only and displays evt_mgmt_admin.

5. Select **Assign role**.
   The role is assigned to the selected user.
6. To complete the setup, select **Mark as configured**.

Remove user from Event Management admin role

Remove user from the evt_mgmt_admin role when you no longer need them.

Before you begin

Verify that you have installed the ITOM AIOps and Now Assist for IT Operations Management (ITOM) plugins.

Ensure you're in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Platform foundations**.
2. Expand **Platform foundations**.
3. Select **Assign Event Management admins**.
4. Select the check box next to the user you want to remove.
5. Select **Remove role**.
   The user is removed from the list of Assign Event Management admins page.

Create integration account

Create a dedicated account with the evt_mgmt_integration role for third-party monitoring systems to push events to ServiceNow.

Before you begin

Verify that the ITOM AIOps and Now Assist for IT Operations Management plugins are installed.

Ensure you're in the Configure IT Operations Management page.

Role required: admin

About this task

A dedicated integration account ensures third-party monitoring systems have secure, stable, and appropriately scoped access to push events into ServiceNow without relying on personal user accounts.

Note: Create an integration account user only if you plan to use basic authentication. This step is not required if you're using API keys or OAuth. If you prefer those methods, refer to the corresponding documentation for setup instructions.

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Platform foundations**.
2. Expand **Platform foundations**.
3. Select **Integration account**.
4. Select **Create account**.
   The Create integration account page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **User ID** field, enter the account id or the name of the account.
6. In the **Password** field, enter the password for the integration account.
7. Select **Create account**.
   The integration account is created.
8. To complete the setup, select **Mark as configured**.

Install Discovery

Configure Discovery to lay the groundwork for AIOps success by establishing a key foundation for your team.

Before you begin

Verify that the ITOM AIOps and Now Assist for IT Operations Management plugins are installed.

Ensure you're in the Configure IT Operations Management page.

Role required: admin

About this task

Discovery serves as the source of truth for your IT operations by automatically identifying, mapping, and cataloging all IT infrastructure components and their relationships within an organization's technology ecosystem. This configuration enables faster root cause analysis, improved impact assessment of alerts, and reduced operational noise.

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Platform foundations**.
2. Expand **Platform foundations**.
3. Select **Discovery**.
4. Select **Configure Discovery**.

   If the Discovery plugin is installed, the system takes you to the Assign Discovery Admins page where you can assign users to the discovery admin role (discovery_admin). If the Discovery plugin is not installed, you're directed to the IT Operations Management page where you need to install the ITOM Visibility plugin, which also installs the Discovery plugin automatically.
5. To complete the setup, select **Mark as configured**.

Remove user from Discovery admin role

Remove user from the discovery_admin role when you no longer need them.

Before you begin

Verify that you have installed the ITOM AIOps and Now Assist for IT Operations Management (ITOM) plugins.

Ensure you are in the Configure IT Operations Management page.

Role required: admin

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Platform foundations**.
2. Expand **Platform foundations**.
3. Select **Discovery**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the check box next to the user you want to remove.
5. Select **Remove role**.
   The user is removed from the list of Assign Discovery admins page.

Learn the basics

ServiceNow® Event Management and AIOps help IT operations teams manage high alert volumes by reducing noise and turning raw events into prioritized, actionable alerts. This section covers core concepts, implementation stages, CMDB considerations, prerequisites for setup, and resources to help you get started quickly and confidently.

ServiceNow Event Management

Event Management is the central hub that ingests events from monitoring tools, applies automation and rules to create prioritized alerts, and uses AI agents to automate triage. It reduces noise, improves availability, and seamlessly integrates with ITSM, CMDB, ITOM, and external monitoring tools — making it a foundational part of the ServiceNow AIOps suite.

Implementation Stages

Follow a phased approach to deploying Event Management, starting with a single high-value service and progressively moving through four stages — getting basic alert response working, reducing alert noise, reducing mean time to resolve (MTTR), and shifting from reactive to proactive operations — ensuring measurable value at every step.

Should I Wait for CMDB

Deploy Event Management and improve your CMDB in parallel to show value quickly. Modern observability tools already provide useful event metadata. Use Alert Automations to improve alert deduplication and grouping without waiting for full CMDB population. Then you can strengthen results by adding Discovery and Service Mapping over time to improve CI/service context.

Prerequisites for Setup

Before implementation, gather credentials for your monitoring tools and submit any necessary access requests to Network and Security teams to avoid delays. If your setup requires pull-based integrations, Agent Client Collector, or Health Log Analytics, a MID Server will also need to be deployed and configured in advance.

How to get help

A curated set of resources is available to support your implementation journey — including training courses, workshop presentations, implementation guides, official documentation, community forums, and video content. You can also reach out to your account team or raise a ticket through the ServiceNow Support Portal at any time.

- Event Management Fundamentals – ServiceNow University course to build a strong foundation in setup, operations, and optimization.
- Event Management Workshop Presentation - slide deck for onboarding and staff training
- Event Management Implementation Guide - Detailed guidance to implement Event Management
- Event Management Documentation - official reference for configuration, administration, and troubleshooting.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Event Management Forum – Post questions, share knowledge, and join discussions.
- ServiceNow YouTube Channel - Official video content, demos, and event recordings.

Install integrations

Access Integrations Launchpad to configure and install integrations for Event Management monitoring tools.

Before you begin

Verify that you have installed the ITOM AIOps and Now Assist for IT Operations Management (ITOM) plugins.

Ensure you're in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Alert response**.
2. Expand **Alert response**.
3. Select **Install integrations**.
4. Select **Install integrations in Integration Launchpad**.
   The Integrations Launchpad page opens.
5. Follow the steps in Integrations Launchpad in Service Operations Workspace for ITOM that apply to your integration installation.
6. To complete the setup, select **Mark as configured**.

Review alerts

Access the Express List interface to review and manage alerts in your Event Management system.

Before you begin

Verify that you have installed the ITOM AIOps and Now Assist for IT Operations Management (ITOM) plugins.

Ensure you are in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

About this task

When reviewing alerts, validate the following to ensure your event pipeline is healthy and alerts are actionable:

- Check CI binding. Alerts should populate the cmdb_ci field. If there is no CI, your binding rules need tuning.
- Verify severity spread. If everything lands as Critical or Info, your mapping needs work.
- Confirm that clear events close alerts. Trigger a condition, then resolve it at the source. The alert should auto-close.
- Spot-check key fields. Ensure node, source, resource, and message_key are meaningfully populated (not blank or generic).
- Review Error events. Check em_event status = Error for parsing or mapping issues.
- Check the alert count. Make sure it matches in both your source system and in ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Alert response**.
2. Expand **Alert response**.
3. Select **Review alerts**.
4. Select **Review alerts in Express List**.
   Express List opens with a list of active alerts.

   Note: To get more information on alerts so you can more efficiently monitor systems and services, resolve alerts, evaluate the alert impact, track issues, and report incidents, see Express List in the Service Operations Workspace for ITOM.

5. To complete the setup, select **Mark as configured**.

Alert enrichment automations

Configure alert enrichment rules to automatically add context and metadata to incoming alerts for better analysis and response.

Before you begin

Verify that you have installed the ITOM AIOps and Now Assist for IT Operations Management (ITOM) plugins.

Ensure you're in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

About this task

Alert enrichment rules automatically enhance incoming alerts with additional context such as configuration item details, service mappings, and operational metadata. This enrichment helps operations teams understand the business impact and take appropriate action more quickly.

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Alert response**.
2. Expand **Alert response**.
3. Select **Enrich alerts**.
   A list of enrich alert automations appear.
4. Select **Create automation**.
   The Enrich alerts page opens.
5. Follow the steps in Create Enrich automation.
6. To complete the setup, select **Mark as configured**.

Create incidents

Configure automation rules to automatically create incidents from alerts that require immediate attention and resolution.

Before you begin

Verify that you have installed the ITOM AIOps and Now Assist for IT Operations Management (ITOM) plugins.

Ensure you are in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Incident creation rules automatically generate incident records from alerts that meet specific criteria. This automation ensures that critical issues are promptly escalated to the appropriate teams for resolution while reducing manual effort in the incident management process.

Procedure
1. Navigate to **Configuration Summary** > **Event Management** > **Alert response**.
2. Expand **Alert response**.
3. Select **Create incidents**.
   A list of respond alert automations appears.
4. Select **Create automation**.
   The Respond to alert page opens.
5. Follow the steps in Create Respond automation.
6. To complete the setup, select **Mark as configured**.

Alert ignore automations

Configure ignore rules to automatically suppress alerts that are not actionable or relevant to your operations team.

Before you begin
Verify that you have installed the ITOM AIOps and Now Assist for IT Operations Management (ITOM) plugins.

Ensure you are in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

About this task
Ignore rules help reduce alert noise by automatically suppressing alerts that match specific criteria. This allows operations teams to focus on actionable alerts while filtering out known non-critical events, maintenance notifications, or false positives.

Procedure
1. Navigate to **Configuration Summary** > **Event Management** > **Reduce Noise**.
2. Expand **Reduce Noise**.
3. Select **Ignore alerts**.
   A list of ignore alert automations appears.
4. Select **Create automation**.
   The Ignore alerts page opens.
5. Follow the steps in Create Ignore automation.
6. To complete the setup, select **Mark as configured**.

Alert group automations

Configure grouping rules to automatically consolidate related alerts into single actionable items for more efficient incident management.

Before you begin
Verify that you have installed the ITOM AIOps and Now Assist for IT Operations Management (ITOM) plugins.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ensure you are in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

About this task

Alert grouping rules automatically combine related alerts that represent the same underlying issue or event. This reduces alert volume and helps operations teams focus on resolving the root cause rather than managing multiple individual alerts for the same problem.

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Reduce Noise**.
2. Expand **Reduce Noise**.
3. Select **Group alerts**.
   A list of group alert automations appears.
4. Select **Create automation**.
   The Group alerts page opens.
5. Follow the steps in Create Group automation.
6. To complete the setup, select **Mark as configured**.

Delay incidents

Configure delay rules to postpone incident creation for alerts that may resolve automatically or represent transient conditions.

Before you begin

Verify that you have installed the ITOM AIOps and Now Assist for IT Operations Management (ITOM) plugins.

Ensure you're in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

About this task

Delay incident rules help reduce unnecessary incident creation by waiting for a specified period before generating incidents from alerts. This is particularly useful for flapping conditions or transient issues that may resolve automatically, preventing ticket creation for self-resolving problems.

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Reduce Noise**.
2. Expand **Reduce Noise**.
3. Select **Delay incidents**.
   A list of respond alert automations appears.
4. To create an automation and set a wait time before incident creation, select **Create automation**.
   The Respond to alerts page opens.
5. Follow the steps in Create Respond automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Note:** To modify the wait time in an existing automation, open the automation and update the wait time under **Create incident and other response actions**. Ensure you select **Create Incident (Advanced)** — the delay configuration form is only available through this option.

6. To complete the setup, select **Mark as configured**.

Training operations team

Get your L1/L2 operators up to speed with ServiceNow Event Management. This section walks through the key concepts, tools, and workflows they need to confidently triage alerts, understand service impact, and take action from day one.

Key Concepts

The foundational primer for L1/L2 operators new to ServiceNow Event Management. It covers eight core ideas they need to understand before working alerts: a single pane of glass across monitoring tools (SolarWinds, Datadog, Azure Monitor, etc.), deduplication and noise filtering, the separation of alerts from incidents, priority-based focus, alert grouping, CI impact visibility, maintenance windows, and operator feedback loops.

Service Operations Workspace

An integrated environment where IT operations and service management converge — alerts, incidents, services, and operational context all in one place. Key highlights include a shift-start landing page for quick situational awareness, shared context (CIs, changes, related records) visible without tool-switching, playbooks and remediation actions built in, and cross-team alignment so acknowledgements and escalations are immediately visible to teammates.

Express List

A live, continuously updating alert queue designed for active triage. Operators are coached to prioritize by business impact over raw severity, work alert groups rather than individual alerts, use Now Assist's Alert Analysis for plain-language summaries, acknowledge purposefully, escalate quickly when stuck, and document work notes to avoid repeated investigation by the next tier.

Service Dashboard

The business-impact lens on what's firing. While the Express List shows what is alerting, the Service Dashboard shows what it means for the business. It surfaces service health tiles, business criticality ratings, CI topology maps, and service dependencies — transforming "I have 15 alerts" into actionable service-level awareness for operators and leadership alike.

Dashboards

Access Event Management dashboards to monitor system performance, alert trends, and operational metrics for your IT operations.

To get to the AIOps dashboards in Service Operation Workspace page, navigate to **Configuration Summary** > **Event Management** > **Report on outcomes** > **Dashboards**.

AIOps dashboards

The Dashboards section surfaces three purpose-built AIOps dashboards inside Service Operations Workspace, each serving a different reporting need:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AIOps 360° Overview: A comprehensive view of AIOps activities and their overall impact, including time saved through automation and grouping, workload savings, and incident prevention rates.
- AIOps Value Realization: Focused on business value metrics, helping stakeholders see the tangible ROI of AIOps adoption.
- AIOps Operational: A monitoring view of AIOps system behavior and operations, useful for admins tracking how the system is performing day to day.

To open a dashboard, select its tile.

Learn how to deploy Event Management to production

Understand the process and considerations for deploying Event Management configurations from development to production environments using update sets.

Deploying Event Management configurations to production requires careful planning and execution to maintain system stability and performance. Update sets provide a controlled method for moving configurations between environments.

Deployment planning

Before deploying to production, verify that all configurations work correctly in your development or staging environment. Test alert automation rules, integration accounts, and role assignments to confirm they function as expected.

Update set process

Update sets capture configuration changes made in your development environment and allow you to transfer them to production. This includes Event Management automation rules, user roles, integration settings, and custom configurations.

The deployment process involves creating an update set, capturing your changes, exporting the update set, and importing it into your production environment. Always review the update set contents before deployment.

When deploying Event Management to production via update set, it is important to understand what is and is not automatically captured.

Update set: included and excluded components

Category	Components
Included in update sets	• Custom tables and fields • Form and list layouts, form sections • Business rules, client scripts, UI actions, UI policies, UI pages, UI macros, and UI scripts • Script includes and workflows • System properties (except those tagged as Private) • Reports and views • Access Control Lists (ACLs)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Update set: included and excluded components (continued)

Category	Components
Not included in update sets	• Transactional data records (incidents, problems, change requests, knowledge articles) • Users, groups, and group memberships • Configuration Items (CIs) and CMDB data • Scheduled jobs and schedulesHomepages (unless manually added) • Email and notification logs • Number counter records (sys_number_counter) • System properties tagged as Private • Plugin-specific elements and business rules in deactivated applications

Deployment considerations

- Schedule deployments during maintenance windows to minimize impact on operations
- Back up your production environment before applying updates
- Test automation rules in production with a limited scope before full activation
- Verify that integration accounts and credentials are properly configured in production
- Confirm that all required plugins are installed in the production environment
- Review role assignments to confirm they align with your production security model

Post-deployment verification

After deployment, monitor your Event Management system to confirm that alerts are processed correctly and automation rules function as expected. Check integration connections and verify that incidents are created appropriately.

Additional resources

For detailed guidance on update sets and deployment procedures, refer to the ServiceNow documentation on application deployment and change management processes.

Assign group or team to Event Management operator role

Assign the evt_mgmt_operator role to groups to enable operations teams to work with alerts and manage Event Management workflows.

Before you begin
Verify that you have installed the ITOM AIOps and Now Assist for IT Operations Management (ITOM) plugins.

Ensure you are in the Configure IT Operations Management page.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
The evt_mgmt_operator role provides the necessary permissions for operations teams to view alerts, manage incidents, and use Event Management tools. Assign this role to groups that contain your L1 and L2 operations staff who will be working with alerts on a daily basis.

Procedure
1. Navigate to **Configuration Summary** > **Event Management** > **Promote to Production**.
2. Expand **Promote to Production**.
3. Select **Assign Event Management operators**.
4. In the **Group or team** field, select the team to be assigned the evt_mgmt_operator role. The Role field is read-only and displays **evt_mgmt_operator**.
5. Select **Assign role**.
6. To complete the setup, select **Mark as configured**.

Request Event Management

AIOps Experience plugin (`sn_sow_aiops`) requires a separate subscription and must be activated by ServiceNow personnel. This plugin includes the required Event Management components.

Before you begin
Role required: admin

About this task
To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Procedure
1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.
3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Install Event Management

Retrieve the most updated apps for the Event Management application (com.glideapp.itom.snac) in the ServiceNow® Store. Periodically check the ServiceNow® Store for new app versions.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Role required: admin

About this task

The following items are installed with Event Management:

- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with Event Management.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the ITOM AIOps application using the filter criteria and search bar.

   If you cannot find the application, request it from the ServiceNow Store.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install Event Management.
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.

   (Optional) Demo data comprises sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: If you don't load the demo data during installation, it's unavailable to load later.

5. Select **Install**.

Enhance Event Management performance

The Event Management Accelerator plugin ensures that Event Management maintains performance at a high level. This plugin is optional.

Before you begin

Role required: admin

About this task

The *em_alert_history* and *em_impact_status* tables can grow to be very large, negatively impacting Event Management performance. Installing the Event Management Performance Accelerator plugin ensures that Event Management performs at a high level. The plugin includes fix scripts that populate missing data, update key fields to maintain data accuracy, and create indexes to enhance performance. These actions help optimize large datasets and reduce the impact on query speed and overall system responsiveness.

When upgrading from an earlier version with more than 5 million records in either the *em_alert_history* or *em_impact_status* tables, you must activate this plugin manually. When there are less than 5 million records, it runs automatically. You can customize this number by modifying the *evt_mgmt.plugin_activation.table_max_size* property.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.
3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Event Management setup

After activating Event Management, set it up to receive and process events, and generate and analyze alerts.

Event Management setup without using guided setup

Set up Event Management by completing these tasks in the following order:

1. Configure a MID Server to receive and process events via the MID Server.
2. Configure the MID Web Server extension.
3. Configure Configure Event Management connectors.
4. Configure event field mappings and Binding alerts to CIs to manage alert generation.
5. Alert management rules for resolving alerts, perform, and CI remediation for alert management.
6. Request Service Mapping and get a top-down discovery to receive CI relationships for software and hardware.
7. Configure impact calculation for services, to establish priority for alert resolution.
8. Configure alert groups to consolidate related alerts.
9. Configure the Predictive Intelligence plugin (com.glide.platform_ml) to enable machine learning and finding similar alerts.
10. Configure any other general tasks that appear in this section as appropriate.

Note: Event Management does not support creating incidents on remote instances.

Event Management setup using guided setup

Event Management guided setup provides a sequence of tasks that help you configure Event Management on your ServiceNow instance. To open Event Management guided setup, navigate to **Guided Setup** > **ITOM Guided Setup**. For more information about using the guided setup interface, see Using guided setup.

Event Management during a platform upgrade

During a platform upgrade Event Management jobs whose **Upgrade safe** flag is marked as `true` remain running.

During an upgrade of the platform, the Event Management connectors are working and continue to retrieve events. The events are being processed, transformed to an alert using event rules and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

if there is a suitable alert management rule, a task is created. However, the impact calculation is not supported during the platform upgrade. When applying configuration changes or upgrades, all impacted MID Servers restart.

Note: Event Management jobs that started running before the platform upgrade commenced continue to run during the upgrade.

The following Event Management jobs remain running as their **Upgrade safe** flag is marked as `true`:

- Event Management - Connector execution
- Event Management - Update stuck connect
- Event Management - Alert Priority Queue
- Event Management - Close flapping alerts
- Event Management - Close threshold alert
- Event Management - Evaluate Scoped Alert Rules Management0
- Event Management - Maintenance Calculator
- Event Management - Process events

During the platform upgrade, all other Event Management jobs wait for the platform upgrade to finish.

Note: During an Event Management plugin upgrade, all Event Management jobs do not work.

MID Web Server

The MID Web Server is part of the common infrastructure of the MID Server.

The MID Web Server extension provides options for authentication and data security, and runs for as long as it is enabled. The extension starts a web server on the MID Server to handle web requests from external systems. The raw data is pushed to the extension, either from a client or with a customized script. The data is collected by the MID Server and is transmitted to the ServiceNow instance.

The MID Web Server extension supports MID Server clusters that are configured for failover. When selecting a MID Server cluster option, an algorithm determines which MID Server in the cluster runs the extension. The extension can run on only one MID Server. If the MID Server in the cluster that runs the MID Web Server extension goes down, the extension automatically starts to run on the secondary MID Server, which is activated when the primary MID Server goes down.

Related topics

Configure the MID Web Server extension

Configure a secure MID Web Server extension

Configure the MID Web Server extension

The MID Web Server is a MID Server extension that enables developing REST APIs to send events and metrics to the MID Server. The extension is leveraged by other MID Server extensions, such as Metric Intelligence, MID WebService Event Listener, and the Agent Client Collector websocket endpoint extension.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Deploy and start a MID Server.
- Enable the MID Web Server [com.snc.sa.mid.webserver] plugin.

Role required: agent_admin.

About this task

Agent Client Collector supports the following authentication strategies:

- **Keybased**: For backwards (pre-Zurich release) compatibility only. See Configure key-based MID Web Server authentication.
- **API key**: See Configure MID Web Server API key authentication.
- **mTLS**: See MID Web Server and agent mTLS Authentication.

Procedure

1. Navigate to **All** > **MID Server** > **Extensions** > **MID Web Server**.
2. In the MID Web Server Contexts list, click **New**.
3. Fill in the values on the Event Management MID Web Server extension form.
4. Click **Save** to save the data.
5. Restart the MID Web Server extension to apply your changes.
6. Navigate to **All** > **MID Server** > **Extensions** > **MID Web Server** and select the MID Server you just created.
7. In the **Related Links** section, click **Start** to start the extension.

Configure a secure MID Web Server extension

Configure a TLS listener for extra security and encryption of data transferred to and from the MID Web Server extension. Access both a private key and a certificate (or certificate chain) from a Java keystore to use during the TLS handshake where the MID Web Server and the client acknowledge each other.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **MID Server** > **Extensions** > **MID Web Server**.
2. Select **New**.
3. In the **Authentication Type** field, select an authentication type to be used.
   - Keybased – See Configure key-based MID Web Server authentication
   - Basic – Standard username/password authentication
   - API key – See Configure MID Web Server API key authentication
   - mTLS – See MID Web Server and agent mTLS Authentication
4. Select either the MID unified keystore or the web server keystore.
   The MID Web Server unified keystore is the most efficient option. If you want to enable backward compatibility and the ability to store keypairs in an additional keystore, use the Web server keystore (which allows you to use the MID unified keystore as well).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
MID unified keystore	**a.** Select the **Use MID Unified Keystore** check box **b.** Enter an alias name in the **Keystore Certificate Alias** field or leave the field empty to use the keystore's default alias. For more information, see the **Install custom certificates in the MID Server unified key store** section in MID Server unified key **Important:** Leaving the **Keystore Certificate Alias** field empty causes connecting clients to skip certificate verification. Instead, the MID Server uses its own self-signed certificate.
Web server keystore	**a.** Clear the **Use MID Unified Keystore** check box. **b.** Specify an alias name in the **Keystore Certificate Alias** field or leave the field empty if you have a single alias in that keystore. **c.** If the password to the private key of the required alias is different from the keystore password, specify the alias in the **Keystore Key Password** field. **d.** Enter the keystore password in the **Keystore Password** field.

Related topics

Connect the agent to the MID Server using mTLS

Configure key-based MID Web Server authentication

Provide added security to your MID Web Server extension by using key-based authentication. Generate an authentication token to be sent in the Authorization header of incoming client requests.

Before you begin

Note: This procedure is only for compatibility with releases prior to Zurich. For details on the procedure in the Zurich release for configuring the MID Web Server, see Configure the MID Web Server extension.

- Deploy and start a MID Server.
- Configure a MID Web Server extension and select Keybased as the authentication type. For details, see Configure the MID Web Server extension.

Role required: agent_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Using a script program, create a token by constructing a string using defined elements of the HTTP/HTTPS request (HTTP verb, content type header, and request path, received from the client accessing the MID Web Server extension endpoints).
2. Create an HMAC (Hash Message Authentication Code) of the string by signing the generated string with the auto-generated secret key that is displayed in the **Secret Key**.
   This key is unique per context.
3. Provide information to send this authentication token in the request Authorization header.

Item	Value
Path to a web service API for sending raw data	URL format: `https://<MID Server IP address>:<port number>/api/mid/sa/metrics` Use a port number that matches one of the port numbers set up in the Web Server extension. Example: `http://10.10.10.10:8097/api/mid/sa/metrics`
Request type	POST
Date format	`yyyy-MM-dd'T'HH:mm:ss.SSS'Z'` For example: 2016-06-08T20:54:58.917Z
Content-Type	application/json

Use the following request elements to generate the required string: HTTP-Verb, Content-Type, Date, and request path. Specify these elements and place them in this order:

- HTTP-Verb + "\n" +
- Content-Type + "\n" +
- Date + "\n" +
- Request-Path

For this example, the request string is:

`POST\napplication/json\n2016-06-08T20:54:58.917Z\n/api/mid/sa/metrics`

For the timestamp requirement, a valid timestamp that uses HTTP date header is required for authenticating the request. Ensure that the timestamp is within 15 minutes of the MID Server.

Example: How to generate the HMAC of the string that uses defined elements of the HTTP/HTTPS request, using Java

```
package sample;
import com.glide.util;
import java.security.SignatureException;
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
import javax.crypto.Mac;
import javax.crypto.spec.SecretKeySpec;

public class AuthUtil {

private static final String HMAC_SHA1_ALGORITHM = "HmacSHA1";

/***
 * Generates base64-encode the HMAC(Hash Message Authentication
 Code) of input data
 *
 * @param data
 * @param key
 * @return
 * @throws java.security.SignatureException
 */
public static String signData(String data, String key) throws
 java.security.SignatureException {
 String result;
 try {
  // get an hmac_sha1 key from the raw key bytes
  SecretKeySpec signingKey = new SecretKeySpec(key.getBytes(),
 HMAC_SHA1_ALGORITHM);

  // create hmac_sha1 Mac instance and initialize with the
 signing key
  Mac = Mac.getInstance(HMAC_SHA1_ALGORITHM);
  mac.init(signingKey);

  // compute the hmac on input data bytes
  byte[] rawHmac = mac.doFinal(data.getBytes("UTF-8"));

  // base64-encode the hmac
  result = Base64.encode(rawHmac);

 } catch (Exception e) {
  throw new SignatureException("Failed to generate HMAC : " +
 e.getMessage());
 }
 return result;
}
}
```

Configure MID Web Server API key authentication

Authenticate incoming requests from clients to the MID Web Server extension using API key authentication. API authentication is a secure and simple way to authenticate your request. You can create or modify a MID Web Server API key.

Before you begin

Create a MID Web Server extension to use API Key authentication, as described in Configure the MID Web Server extension. Ensure that you select **API Key** in the extension's **Authentication Type** field.

Role required: event_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

By default, the maximum number of API keys you can create on an instance is 10. To change this number, modify the *mid.webserver.max.api.keys* property value on the System Properties page.

When working in the global domain while Domain Separation is enabled, API keys are available to all extensions, regardless of their domain. When working in a specific domain, API keys are available to extensions in that domain, its parent domains, and the global domain.

You can configure API keys to expire on a specified date.

When creating a new extension with API key authentication (or updating an existing one to use API key authentication), the system checks for an available API key for the extension. If there is no available API key, the system creates one.

Procedure

1. Navigate to **All** > **MID Server** > **Profiles and Deployments** > **MID Web Server API Key**.
2. Either create a new API key or modify an existing API key.
   - To create a new API key:
     a. Select **New**.
     b. On the MID Web Server API Key form, fill in the fields.

MID Web Server API Key form

Field	Description
Name	Name for the API key.
Active	Option for activating the API key.
Authentication key	Read-only encoded value of the authentication key. No value appears until after you configure the key.
Expires	Option for setting an expiration date for the API key. Expired, deactivated, or deleted API keys are not accepted by the web server extension.

     c. Select **Submit** to save the API key.

        The API key appears on the Mid Web Server API Keys page.

   - To modify an existing API key:
     a. Navigate to **MID Server** > **Profiles and Deployments** > **MID Web Server API Key**.
     b. Select an API key on the page.
     c. In the **Related Links** section, select **View API Key**.
     d. Copy the API key that appears in the MID Web Server dialog box.

        When connecting to a MID Web Server extension configured with API Key authentication, place an API key that the extension has access to in the Authorization header of the request in the following format:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`Key <API_KEY>`

where `<API_KEY>` is the value of the API key displayed after selecting **View API Key**.

e. Select **Submit**.

MID Web Server and agent mTLS Authentication

Mutual authentication using the Transport Layer Security protocol (mTLS) is a secure, certificate-based authentication scheme. With mTLS, the server (the MID Web Server extension) and the client (the agent) authenticate each other.

TLS authentication occurs when a client (such as a web browser) authenticates the server it's accessing by validating the certificate presented by the server. The client verifies that the certificate (or certificate chain) is signed by a trusted certificate authority (CA). The client must have access to a bundle of CA certificates, which it uses to validate the server certificate.

When mTLS is configured, the client presents a certificate or certificate chain to the server, and the server authenticates the client in the same way that the client authenticates the server (mutual authentication).

In addition to verifying the certificate signature, some TLS implementations also check the revocation status of the certificate. In these cases, the Online Certificate Status Protocol (OCSP) is used. In this protocol, the verifying party sends a request to the OCSP responder set up by the CA that issued the presented certificate. (The responder's address is typically embedded in the CA-issued certificates). The response indicates whether the presented certificate is revoked.

Before enabling mTLS, you must first create keys and certificates, install the .pem file on your MID Server, and connect the agent to your MID Server.

Related topics

Configure the MID Web Server extension

Configure mTLS authentication for a MID Web Server

Create keys and certificates

Create keys and certificates in your root directory to enable Transport Layer Security (TLS) setup. TLS setup is necessary before you can configure mTLS on the MID Web Server and agent.

Before you begin

- Ensure that there are no keys installed in the MID unified keystore by running the following command:

  ```
  bin/scripts/manage-certificates.(sh/bat) -l
  ```

  When there are no keys installed, the output is: `defaultsecuritypairhandle`

- Invalidate your MID Server.

  If additional keys exist in the output, reinstall those keys after invalidating the MID Server.

- Ensure that the MID Server is connected to the instance.
- Select a directory in which you want to create certificates, to be called the *`root`* directory.

Note: The commands specified in the following procedure are relevant only for a Centos7 host. When working with another OS, use the commands relevant for your host.

Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In your root directory, create subdirectories for your certificates.

```
mkdir -p labca labmid labacc;
```

2. In your root directory:

   a. Generate a custom certificate authority key pair.

```
openssl ecparam -list_curves;
openssl ecparam -out labca/ec-labcakey.pem -name prime256v1
 -genkey;
ls labca/;
```

   The generated output is the `ec-labcakey.pem` file.

   b. Run the following commands:

```
openssl ecparam -in labca/ec-labcakey.pem -text -noout;
openssl req -x509 -new -nodes -key labca/ec-labcakey.pem
 -sha512 -days 365 -out labca/labcacert.pem -subj
 "/C=<country>/ST=<state>/L=<location>/O=<organization>
 Lab/OU=<organization unit>/CN=<cn abbreviation>";
openssl verify labca/labcacert.pem;
```

   The generated output is:

   - `labca/labcacert.pem: C = <country>, ST = <state>, L = <location>, O = <organization>, OU = <organization unit>, CN = <cn abbreviation>`
   - `error 18 at 0 depth lookup: self signed certificate`
   - `OK`

   Note: The `error` message can be ignored.

3. Prepare the MID Web Server key and certificate.

   a. Run the following commands in the root directory:

```
sudo cp -a
 labca/labcacert.pem /etc/pki/ca-trust/source/anchors/;
sudo update-ca-trust extract;
openssl verify labca/labcacert.pem
```

   The generated output is: `labca/labcacert.pem: OK`

   b. Run the command `"hostname --all-fqdns"` to obtain all of the valid hostnames for the specific VM.

   c. Run the following commands:

```
openssl req -new -newkey rsa:4096
 -keyout labmid/rsa-labmidkey.pem
 -sha512 -nodes -out labmid/mid.csr -subj
 "/C=<country>/ST=<state>/L=<location>/O=<organization>/OU=<o
rganization unit>/CN=<hostname>";
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
openssl x509 -req -days 365 -in labmid/mid.csr -CA
 labca/labcacert.pem -CAkey labca/ec-labcakey.pem
 -CAcreateserial -extensions SAN -extfile
 <(cat /etc/pki/tls/openssl.cnf <(printf
 "\n[SAN]\nsubjectAltName=DNS:<hostname>")) -out
 labmid/mid.crt;
```

Enter the FQDN as the `<hostname>` value in the previous command. If more than one fqdn value is returned by the command, use the value with the following format: `hostname.domain.domain.com`.

The generated output is: `Signature ok subject=/C=<country>/ST=<state>/L=<location>/O=<organization>/OU=<organization unit>/CN=<mid server host fqdn>: Getting CA Private Key`

4. In your root directory, combine the key and cert files into one file, named `mid.pem`.

```
cat labmid/rsa-labmidkey.pem labmid/mid.crt > labmid/mid.pem;
```

What to do next

Install the .pem file in the MID unified keystore and set up the MID Web Server.

Install the .pem file in the MID unified keystore and set up the MID Web Server

Install the .pem file into the MID unified keystore and set up the MID Web Server to enable configuring mTLS on your MID Web Server and agent.

Before you begin

Copy the `labmid/mid.pem` file (created in the Create keys and certificates procedure) to your MID Web Server host directory.

Role required: agent_client_collector_admin

Procedure

1. Access the `agent` subdirectory under the MID Server's host directory.
2. Run the following commands:

```
bin/scripts/manage-certificates.sh -a midwss /<path>/mid.pem;
bin/scripts/manage-certificates.sh -l;
```

The relevant part of the output is, `"defaultsecuritypairhandle,midwss”`

3. Validate your MID Server on the instance.
4. Select the MID Server on the instance and select **Setup ACC listener**.
A new MID Web Server is created.
5. Navigate to the newly created MID Web Server record (*ecc_agent_ext_context_webserver*) on the instance.
6. On the instance, select the MID Web Server and set the **Keystore certificate alias** value to **midwss**.
7. Select **Save**.
8. Restart the MID Web Server.

What to do next

Connect the agent to the MID Web Server using TLS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect the agent to the MID Web Server using TLS

Connect the agent to the MID Web Server to enable configuring mTLS on your MID Web Server and agent.

Before you begin

Ensure that you have installed the .pem file and set up the MID Web Server. For details, see Install the .pem file in the MID unified keystore and set up the MID Web Server.

Role required: agent_client_collector_admin

Procedure

1. Add the `labcacert.pem` file to your agent host's truststore.

```
sudo cp
 -a /<path>/<to>/labcacert.pem /etc/pki/ca-
trust/source/anchors/;
sudo update-ca-trust extract
openssl verify /<path>/<to>/labcacert.pem
```

   The generated output is `/<path>/labcacert.pem: OK`

2. Configure the `acc.yml` file to use TLS.

   a. Set the *`insecure-skip-tls-verify`* property to **false**.

   b. Set the *`backend-url`* property to use the MID Server's FQDN.

```
backend-url="wss://<mid server fqdn>:<mid web server port>/
ws/events"
```

3. Restart the agent.

```
systemctl restart acc;
```

4. Verify in the logs that the agent is connected to the MID Server.

What to do next

Configure mTLS authentication for a MID Web Server.

Configure mTLS authentication for a MID Web Server

Enhance security in your MID Web Server extension by enabling mTLS authentication.

Before you begin

Ensure that you have enabled Transport Layer Security (TLS) on the agent. For details, see Connect the agent to the MID Server using mTLS.

Ensure that the *`insecure-skip-tls-verify`* parameter in the `acc.yml` configuration file is set to **false**. For details on the `acc.yml` file, see Configuration file options.

Role required: agent_client_collector_admin

About this task

The MID Web Server extension searches the following locations (in the specified order) to access the truststore location and password:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Truststore location: The *mid.webserver.truststore.path* JVM system property.

  If that property is empty, the extension retrieves the location from the *javax.net.ssl.trustStore* JVM system property.

  If no location is specified, the truststore location defaults to the absolute path of the `cacerts` file of the JRE running the MID Server.

- Truststore password: The **Truststore Password** field on the extension form in the instance.

  If that field is empty, the system retrieves the password from the *javax.net.ssl.trustStorePassword* JVM system property.

  If no location is specified, the password defaults to *changeit*.

Procedure

1. Navigate to the root folder of your MID Server.
2. Run the following command to add your certificate to the MID trust store:

```
./jre/bin/keytool -importcert
 -file /etc/pki/ca-trust/source/anchors/labcacert.pem
 -destkeystore ./jre/lib/security/cacerts -alias mtlsca
```

3. Enter **changeit** when prompted for a password.
4. Select **yes** on the confirmation message window to indicate that you trust the certificate.
5. Run the following command to verify that your certificate was successfully added to the MID trust store.

```
./jre/bin/keytool -list -keystore ./jre/lib/security/cacerts
 -alias mtlsca
```

6. Enter **changeit** when prompted for a password.
7. In the MID Server wrapper override configuration file (`wrapper-override.conf`, located in the `home/conf` directory of the MID Server), configure the revocation of client certificates in the *mid.webserver.cert.revocation.check.enabled* property.
   - If you have a custom internal certificate, set to **false** by adding the following line to the `conf/wrapper-override.conf` file on the MID Server:

```
wrapper.java.additional.4=-Dmid.webserver.cert.revocation.che
ck.enabled=false
```

   - When enabling this property (**true**), configure the *mid.webserver.ocsp.responder.url* property with the OCSP responder URL. This value overrides any URL embedded in the certificate.
8. If you have changed properties in the wrapper override configuration file, restart the MID Server.
9. On your ServiceNow® instance, access the MID Server record and change the value of the **Authentication type** field to **mTLS**.
10. Restart the MID Web Server.
11. Verify that the MID Web Server and websocket endpoint are up and running.

What to do next

Connect the agent to the MID Server using mTLS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect the agent to the MID Server using mTLS

Before configuring mTLS authentication on the agent, you must run a series of commands that enable configuring Transport Layer Security (TLS) authentication.

Before you begin

Ensure that you have performed the following tasks:

1. Create keys and certificates
2. Install the .pem file in the MID unified keystore and set up the MID Web Server
3. Connect the agent to the MID Web Server using TLS
4. Configure mTLS authentication for a MID Web Server
5. Connect the agent to the MID Server using mTLS

Role required: agent_client_collector_admin

Procedure

1. Generate a key for your agent.

```
openssl ecparam -out labacc/acc.key -name prime256v1 -genkey
```

2. Generate a certificate request for your agent, according to the following format:

```
openssl req -new -key labacc/acc.key -out labacc/acc.csr -subj
 "/C=<country>/ST=<state>/L=<location>/O=<organization>/OU=<org
anization unit>/CN=<cn abbreviation>/emailAddress=<email
 address>"
```

   For example:

```
openssl req -new -key labacc/acc.key -out labacc/acc.csr
 -subj "/C=US/ST=NC/L=Raleigh/O=ServiceNow/OU=ITOM
 Lab/CN=acclinux/emailAddress=john.smith@servicenow.com"
```

3. Generate a signed certificate for your agent.

```
openssl x509 -req -days 365 -in labacc/acc.csr -CA
 labca/labcacert.pem -CAkey labca/ec-labcakey.pem
 -CAcreateserial -extensions client -out labacc/acc.crt
```

4. In the `labacc` folder, copy your key and certificate files to the agent host's virtual machine.

```
cp ./acc.key <agent host config folder>
cp ./acc.crt <agent host config folder>
```

   The configuration folder paths depend on your OS.

   - Linux: `/etc/servicenow/agent-client-collector/`
   - Windows: `C:\ProgramData\servicenow\agent-client-collector\config\`
   - macOS: `/Library/Application\ Support/servicenow/agent-client-collector/`

5. Navigate to the location where you copied the `.key` and `.crt` files from.
6. Run the following commands to update the files' read permissions and enable the agent to read from them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Linux:
  a. `chown servicenow:servicenow acc.key`
  b. `chmod 0400 acc.key`
- Windows:
  a. Select and hold (or right-click) the `.key` file and select the **Security** tab from the file properties.
  b. Add the *`servicenow`* user to the list of users with read access to the file.
- macOS:
  a. `chown _servicenow:_servicenow acc.key`
  b. `chmod 0400 acc.key`

Note: The agent must be run with the default servicenow user.

7. In the acc.yml configuration file, add the following parameters to specify the path to your key and certificate files.

```
key-file: "<path to acc.key file>/acc.key"
cert-file: "<path to acc.cert file>/acc.crt"
```

8. Restart the agent.
   - Linux: `systemctl restart acc`
   - Windows:
     a. Open the Services application.
     b. Select and hold (or right-click) the Agent Client Collector entry and select **Restart**.
   - macOS:
     a. `launchctl unload -w /Library/LaunchDaemons/com.sn.acc.plist`
     b. `launchctl load -w /Library/LaunchDaemons/com.sn.acc.plist`
9. Check the logs to verify that the agent was able to connect to the instance using TLS.

   Agent Client Collector logs are accessible from:

   - Linux: `/var/log/servicenow/agent-client-collector/acc.log`
   - Windows: The location specified by the `log-file` configuration flag. The default location is: C : `/ProgramData/ServiceNow/agent-client-collector/log/acc.log`

     If the C : `/ProgramData` directory is hidden (such as on older Windows versions), change the Explorer filter to show hidden elements.
   - macOS: The default location is: `/Library/Application\ Support/servicenow/agent-client-collector/log/acc.log`

MID Web Server and agent mTLS Authentication

Event Management configuration preferences

Preferred settings of properties and general configuration.

Use the Known Error Portal and the Community to further help you find information issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

General preferences

Self-health

By default, the self-health monitoring feature is not enabled. To enable it, navigate to **Event Management** > **Settings** > **Properties** and select **Yes** for the *Enable Event Management self-health monitoring* (evt_mgmt.self_health_active) property. Use this feature to monitor and track many Event Management features.

Note: CIs used in the self-health service are created in the CMDB.

Use the following settings to help with preventing performance degradation.

Topic	Details
Business rules	• Avoid writing business rules for event [em_event] tables, as they do not run in the current default REST URL that is used for event injection. • Business rules that are written for alert [em_alert] tables must be highly efficient or they may result in performance degradation. Instead of writing a business rule, consider whether it is more appropriate to write a job. An inefficient business rule can cause incident creation for an alert to fail and the alert impact calculation to fail. • Do not write async business rules for alert tables. • Business rules must not change the **Category** field on event [em_event] tables.
Scaling up	Check the average event processing time before scaling up event throughput when first starting with Event Management. Do this check after an initial flow of events and all rules are in place. If processing time takes over a few milliseconds per event, determine the cause for the processing slowdown before continuing to scale. Performance duration can be checked in the Performance Statistics [sa_performance_statistics] table.
Configure for large-scale environments	• Set the **Enable multi node event processing** (*evt_mgmt.event_processor_enable_multi_node*) property to **Yes**. Enable multi-node in production environments and set values based on the size of the deployment and expected event rate. • Set the **Number of scheduled jobs processing events** (*evt_mgmt.event_processor_job_count*) property to 4. • If you are sending events from a custom source, verify that events have**Message Key** or **Source**, **Node**, **Type**, and **Resource** data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Topic	Details
Latency issues for receiving events	Check the following settings: • Verify that the **Bucket** field in the event [em_event] table is set to a value that is greater than zero (*0*). • Navigate to **System Scheduler** > **Scheduled Jobs** and search for *- process events**. Check that all *- process events** jobs exist according to the **Number of scheduled jobs processing events** (*event_processor_job_count*) property configuration. Verify that the **State** is *Running* or *Ready*. If the state is *Queued* or *Error*, set the job state to *Ready*.
Archive events	• Avoid changing the default retention time for events. • To log events for a longer time, create an archive table and a job that copies new events to it. Do this by scheduling a job to regularly back up events [em_event] to a custom table. • Do not extend table rotation by adding more days.

Event integration

SNMP traps

- Use a monitoring tool to send SNMP traps, rather than sending them directly from devices.
- To avoid having to rewrite event rules, upload MIBs prior to defining the event rules.

Web service API

- Using a web service API for integration can reduce the number of event rules needed. This action avoids having to transform events (prepared data is sent in an event to the instance).
- Use dedicated credentials for integration. Optionally, designate credentials specific to each event source.

CloudWatch

Use dedicated credentials for integrating CloudWatch with ServiceNow.

Email

Use email only if the source has a low volume and other options are not available, such as, running a script or forwarding an SNMP trap.

Event rules

Configuration settings when creating event rules:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Write Event Rules to apply to the broadest number of events possible. More specific rules can then be created as necessary and should use a lower-order value.
- If a more general rule can achieve the same outcome, avoid writing Event Rules that apply only to a certain subset of events.
- When Event Rules are applied to events, no changes are made to the original event. All processing occurs in memory, so use the **Processing Notes** field and/or use the **Check Process of Event** UI action link to troubleshoot.
- If you change a rule/transform that has existing mapping rules, you should review and retest with events that are either actual or simulated.
- Ensure that the **From** field value exactly matches a string in the JSON in the *additional_info* field of an event. This matching happens when a rule has been configured based on information in a MIB file. If the MIB file is not uploaded, the JSON for the SNMP trap shows varbinds (variable binding) with dotted names, instead of the translated name in the MIB. The event field mapping rule then fails to be applied.
- Establish a consistent naming convention. A common convention is: *<customer acronym>.<Event Source>.<Description>*. For example, *ACME.OEM.Normalize*
- If two Event Rules have similar conditions set, use the **Order** field to control which Event Rule runs.
- Use Event Rules to associate an alert with a CI.

Additional settings for constructing event rules:

Desired result	Required activity
Effective de-duplication and enabling efficient parallel event processing	Populate the **Source**, **Node**, **Type**, **Resource**, **Metric Name** fields.
CI binding	• Bind to host - by populating the **Node** field and optionally **CI identifiers**. • Binding to application and / or device – by populating the **CI Identifiers** field and the **Additional information** field.
Alert Correlation, using alert aggregation	Populate the **Resource** and **Metric Name** fields. **Note:** If CI is also bound, Alert Correlation is improved.

Custom event fields

Include additional fields in the **Additional information** field of the event only.

Do not add additional fields to an event by adding a custom field to the event [em_event] table.

Do not add columns to the event [em_event] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about how to include additional fields in events, see Custom alert fields.

De-Duplication

Configuration settings for de-duplication.

- The **message_key** field is used for De-Duplication. If reliable message key values are not provided with the source event, it is important to have a well-defined plan for constructing these identifiers.
- If the message key is not defined, then the default message key is *<Source + Node + Type + Resource + Metric Name>*.
- The guideline is to have the event source populate the *<Source + Node + Type + Resource + Metric Name>* fields out-of-the-box and populate the message key. This action enables a better distribution of event processing among instance workers and nodes.
- If the source event does not have values for these fields, make sure to populate them using transform rules. This action does not affect event processing, but is used for de-duplication. Populate as many of these fields as possible before they are sent to the instance. This action provides better distribution of events over the processor workers, and therefore better throughput and scale.

CI binding

- Where possible, always attempt to bind an alert to a CI.

  Note: Although Event Rules are defined on events, CIs are bound to alerts that result from those events, and are not bound to the event.

- To bind a host, machine or any device with an IP, populate the event **Node** field with a unique host name, FQDN, IP, or MAC address. If other identifiers are necessary to identify a host, then populate the ci_identifiers field with a JSON format. The JSON format must contain the **CMDB** field name and value to perform the match.

  Note: The event **Node** field must be populated from an event rule or populated with a unique host name from the source before the event is inserted.

- The primary binding strategy is to use the **Node** field. If the **Node** field is not pre-populated in the event, it can be populated using event rules.

Alert settings

Alert lifecycle

General alert functionality:

- An alert is opened whenever an event is not ignored or its threshold is exceeded by an event rule, and de-duplication does not identify the event as belonging to an existing alert.
- An alert is closed when a closing event is sent on the same message key, or the alert is closed manually.
- An alert is reopened if an opening alert that has the same message key is sent within the timeframe defined in properties (default is one hour).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If an alert is opened and closed at a high rate, as defined in properties, it becomes flapping. When this opening and closing rate stops, the alert goes out of flapping state.
- If an incident is opened from an alert, that alert remains open as long as the incident remains open. By default, when either the incident or the alert is closed the other is closed as well. This behavior can be configured using properties.
- Do not close an alert when creating a corresponding incident.
- Do not delete an open alert. Close an alert first and then delete it.
- Use `Acknowledge` to denote that the alert is known, and can temporarily be ignored.
- Do not use `Acknowledge` to mark an alert as needing attention.
- Do not create alerts in any of these states:
  - `Closed`
  - `OK`
  - `Open`
- The `evt_mgmt.alert_auto_close_interval` property automatically closes alerts after the specified period. Do not specify 0, as this value disables the feature and may lead to performance degradation.
- Do not create alerts in `OK` state. In some monitoring systems `OK` denotes that an issue has been resolved, while in other monitoring systems `OK` is used to denote events that are not of operational significance. For the former case, use `Clear` instead of `OK` using a Mapping Rule. For the latter case, have an Ignore rule, unless the events are of specific value.

Alert management rules

- Use alert management rules to define automated responses to alerts, such as opening incidents, running subflows, and launching applications or URLs. For more information, see Alert management rules for resolving alerts.
- Use alert filters to specify which alerts the rule applies to. For more information, see Create an alert management rule.
- Use the **Order** field to control which alert management rule runs first when rules have similar conditions. For more information, see Create an alert management rule.
- Use subflows to customize alert handling. For example, you can resolve alerts or notify teams. For more information, see Create a custom subflow for alerts.
- A scheduled job applies alert management rules to new or updated alerts every 11 seconds. If an alert management rule does not start immediately, allow 10–15 seconds before you start troubleshooting. For more information, see Alert management rules for resolving alerts.

Business rules

- Business rules created on alert tables should not take more than a few milliseconds. In place of using a business rule, consider if the same functionality can be achieved using a job.
- Do not use business rules to associate an alert with a CI. Use event rules to do binding instead of using business rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Planning

- Organize event source configuration of filters, modules, and so on, into multiple parallel efforts, rather than in serial.
- Validate processed event formats to ensure that data that is parsed is aligned with desired results.
- Test production events in a non-production environment. Integrate with non-production element managers and ServiceNow instances. If non-production element managers are not available, send events from element managers to both production and non-production environments.

Services and dashboard

- Use Service Groups to group services into logical groups to reduce the number of services displayed on the Service Health dashboard.
- Import manually built service maps.

Metric Intelligence collector logs and files

Metric Intelligence collector logs and files are located under the path `$(MID_SERVER_DIR)/agent`. Use these logs and files for troubleshooting and monitoring purposes.

Location of Metric Intelligence collector logs and files

Log or file	Path
PowerShell metric collector log file	Logs/retrieve_metrics{connector instance ID}.log
PowerShell output file	work/metrics/metrics_output_{connector instance ID}.txt
PowerShell input file	work/metrics/parameters_{connector instance ID}.txt

Metric Intelligence performance can be checked in the MID Server log file when the *`mid.log.level`* MID Server parameter is in debug mode.

Metric Intelligence performance numbers are available in the Performance Statistics [sa_performance_statistics] table. To view the performance numbers, filter the Performance Statistics list for **Metric Collector**.

Rotate event and alert table for cleanup

Domain separation and Event Management

Domain separation is supported in Event Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

How domain separation works in Event Management

When domains are separated in Event Management, users can only see and manage alerts and events in their own (tenant) domain.

A domain column is present for Event Management tables that are provided in the base system. The column displays the name of the domain to which the event or alert belongs.

Note:

If the domain column does not display in the list, click (Update Personalized List) and add the required column. In addition, you can add a column that displays the domain path.

For information about domain separation limitations in Event Management, see Configure Event Management domain separation.

Domain separation for service providers

Configure Event Management domain separation

You can configure Event Management for **domain separation** to create logically defined domains that limit unauthorized access to data. When domains are separated in Event Management, users can only see and manage alerts and events in their own (tenant) domain.

Before you begin

Role required: evt_mgmt_admin and evt_mgmt_integration

About this task

Activate the **Domain Support – Domain Extension Installer** plugin and configure the MID Server for Event Management.

The following Event Management features have limited domain separation support.

Features with limited domain separation support

Feature	Support
Event – alert flow	Supported. Separation is based on the domain user that sent events. User access is required for the credentials of the sending API events or in the configuration of the MID Server reporting events. In a multi-domain environment, each MID Server can serve only one domain according to the integration user that it uses. In the configuration of the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Features with limited domain separation support (continued)

Feature	Support
	connector instance, make sure that the MID Server have same domain as Connector instance. To configure pull connectors to support custom domain separation, see Personalize domains for pull connector events to use in event creation.
Impact calculation	Supported. Segregation is based on the manner in which CIs are segregated.
Application services	Partially supported. Segregation is based on the manner in which CIs are segregated.
Dynamic CI groups	Partially supported. Segregation is based on the manner in which CIs are segregated. **Note:** The discovery process does not segregate CIs by domain.
Remediation	Supported. While editing alert management rules, users can only apply relevant workflows. For more information on domain separation in the Flow Designer, see Domain separation and Flow Designer.
Alert Aggregation	Supported. In domain-separated environments, alert groups are created only for alerts in the same domain.

Procedure

1. If it is not already active, activate the Domain Support – Domain Extension Installer plugin.
2. Configure the connector instance to be in the same domain as the MID Server.

Event Management Integrations

An event is a notification from one or more monitoring tools that indicate something of interest has occurred, such as a log message, warning, or error.

Events are processed and alerts are generated based on the following factors:

- Event collection configuration via a MID Server, script, SNMP trap collector, or email message.
- An Event rule, alert binding, or event field mapping configuration for processing events from various sources.

When a package of events that contains events with a custom (non-supported) state is processed, the events with the custom state are not processed.

Integration with external events

Event Management receives external events via an integration or scripts. If you are using a script to collect events, no configuration is required. All other integrations require configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When an integration is configured, Event Management can collect events that are sent directly to the ServiceNow AI Platform instance or via the MID Server, SNMP trap or email.

The integration with external systems can be initiated from a ServiceNow AI Platform instance using a pull connector, or from an external system using a push mechanism.

Integration via a ServiceNow AI Platform instance

The ServiceNow AI Platform instance includes push connectors that help external monitoring systems to integrate with Event Management directly.

You can configure the authentication in the ServiceNow AI Platform instance and update the external monitoring systems to use endpoints to send the events for the push connectors that are available. For more information, see Push Connectors.

Integration via MID Server

The MID Server facilitates communication and movement of data between external applications, data sources, services, and the ServiceNow AI Platform instance.

Connector operation	Description
Pull	You can configure connector instances to use connector definitions (script instructions). This enables the MID Server to connect to external servers to obtain event information using a pull operation.
Push	You can configure external systems to push event information to the ServiceNow AI Platform instance via MID Server. For example, you can configure the MID WebService Event Collector to push event messages to the MID Server. For more information, see Pushing events to the MID Server using web service API.

Standard event form

A standard event form must be used by all events, regardless of how they arrive at the ServiceNow AI Platform instance. For more information, see Event field format for event collection.

Event Management Connectors domain personalization

Create events in different domains for all Event Management connectors using just a single connector instance by personalizing domain separation of Event Management connectors.

How the domain is identified

In a ServiceNow instance, events are created within the logged-in or MID Server user domains. However, you can create events in a different domain by providing metadata values in the event HTTP request, including the URL, headers, request body (payload), and connector parameters.

The logged-in user or the MID Server user must have access to the provided domain. The connector resolves the domain based on the provided identifier and creates events in that domain.

System properties provide the default metadata that sets the domain-separated table to identify the domain. For more information, see Domain properties installed with Event Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector Exceptions

You cannot personalize domain separation for the following pull connectors:

- SCOM
- IBM Netcool (supports only IBM Netcool_v2)
- HPOM
- Hyperic

You cannot personalize domain separation for the following push connectors:

- SAP SolMan Transform Script
- bmcTrueSight Transform Script
- Transform Generic Events MID
- TransformEvents_xmlSample

Domain separation and Event Management

Personalize domains for pull connector events to use in event creation

Configure pull connectors to personalize domain separation of events so you can use them to create events in domains other than the user's currently logged-in or MID Server domain.

Before you begin

Make sure that you have the following setup:

- You have read access to the domain information table for the evt_mgmt_integration role (default table: core_company). For more information, see Configure an ACL rule.
- You enabled the *evt_mgmt.connector_enable_custom_domain_separation* system property .
- You installed the following plug-ins on your ServiceNow instance:
  - Event Management *com.glideapp.itom.snac* plug-in
  - Event Management connectors *sn_em_connector* plug-in
  - Domain Support - Domain Extensions Installer *com.glide.domain.msp_extensions.installer* plug-in

  You can download the plug-ins from the ServiceNow Store.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances** > **.**
2. On the **Connector Instances** list, deactivate the connector instance of the connector for which you want to configure domain separation by selecting it and clearing the **Active** check box.
3. Select **Update**.
4. Navigate to **All** > **Event Management** > **Integrations** > **Connector Definitions**.
5. From the **Connector Definitions** list, select your connector definition.
6. Determine whether all events should be created in a provided domain or determined by a domain provided in the payload of each event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Connector Parameters** table, double-click **Insert a new row**

b. Choose the event creation domain definition location.

- To have all events be created in the provided domain, enter `payloadDomainInfoFieldValue` in the **Name** column.
- To have events be created in the domain provided in the payload of the event, enter `payloadDomainInfoFieldName` in the **Name** column.

Note: If both the *`payloadDomainInfoFieldValue`* and the *`payloadDomainInfoFieldName`* are provided, the domain provided in the payload of the event takes precedence.

c. Select **Update**.

7. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
8. On the **Connector Instances** page, select your connector instance from the list.
9. In the Connector Instance Values list, provide a value in the **Value** field of the parameters.

Parameter	Value
`payloadDomainInfoFieldValue`	The value that will be used to match the do main record. For example, ServiceNow.

`payloadDomainInfoFieldName`	The key in the payload that has the domain identifier. For example, if the payload key **com pany** holds the domain identifier, then the value in the **Value** column would provide the company information. For example:
	company
	{
	“source”: “Solarwinds”,
	“host”: “127.0.0.1”,
	“company”: “ServiceNow”
	}
	Note: Dot-walking isn’t supported.

10. Select **Save**.
11. Select **Test Connector** to verify the connection between the MID Server and the connector.
    - If the test is successful, a confirmation message appears.
    - If the test fails, a message provides instructions to correct the problem.

On a successful test, an onscreen message appears. If the test fails, follow the onscreen message instructions to correct the problem and then run another test.

Note: Use a network tool such as *`ping`* to verify whether the credentials are correct and network connection from the MID Server to the connector server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. After the connector is verified, select the **Return to Connector Instance** link.
13. Activate the connector instance by selecting **Active** and **Update**.
14. **Optional:** Configure the domain for events by providing domain metadata through the connector parameters.

    For example, to use the User [sys_user] table for a single connector instance in the **Connector Definitions** form, create parameters with the following names, and add their values in the **Connector Instance** form.

    - *connectorDomainInfoTableName* - sys_user

      Note: The table must be domain separated.

    - *connectorDomainInfoColumnName* - user_name
    - *connectorDomainIdColumnName* - sys_domain
    - *connectorDomainPathColumnName* - sys_domain_path

    For more information, see Connector domain metadata.

Result

The Event Management connector is set up for domain separation.

Personalize domains for push connector events to use in event creation

Configure push connectors to personalize domain separation of events so you can use them to create events in different domains other than the user's currently logged-in or MID Server domain.

Before you begin

Make sure that you have the following setup:

- You have read access to the domain information table for the evt_mgmt_integration role (default table: core_company). For more information, see Configure an ACL rule.
- You enabled the *evt_mgmt.connector_enable_custom_domain_separation* system property.
- You installed the following plug-ins in the ServiceNow AI Platform® instance:
  - Event Management (*com.glideapp.itom.snac*)
  - Event Management connectors (*sn_em_connector*)
  - Domain Support - Domain Extensions Installer (*com.glide.domain.msp_extensions.installer*)

    You can download the plug-ins from the ServiceNow Store.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connectors**.
2. Open a push connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the **Push Connector** screen, scroll down to the **Push Connector Configurations** list and select **New**.

   Note: If this list is not displayed, you must create a push connector configuration parameter. For more information, see Create a push connector configuration parameter.

4. In the **Push Connector Configurations** screen, determine whether events should be created in the provided domain or the domain provided in the payload of each event.

Domain creation location	Parameter and values
The provided domain	○ **Field name**: payloadDomainInfoFieldValue ○ **Value**: domain-identifier

The domain provided in the payload of each event	○ **Field name**: payloadDomainInfoFieldName
	○ **Value**: field-name-in-payload
	Example: If the payload key “company” holds the domain identifier, then “company” is the value.
	“company”
	{
	“source”: “Solarwinds”,
	“host”: “127.0.0.1”,
	“company”: “ServiceNow”
	}

   Note: If both the *payloadDomainInfoFieldValue* and the *payloadDomainInfoFieldName* parameters are provided, then the *payloadDomainInfoFieldName* takes precedence.

5. Select **Submit**.

Result
Events are created in the domain referred to by the domain identifier.

Note: The table that stores domain information records (for example, core_company) must be domain separated. For more information, see Domain-separate a custom table.

Provided connectors (pull)

This table lists the connectors that are provided with Event Management.

Note:

- The Azure Metrics and AWS CloudWatch Metrics connectors display in the base system only when the Operational Intelligence plugin (com.snc.sa.metric) is activated.
- All connectors support external credential storage solutions. For details on configuring external credential storage, see External credential storage configuration.

Connectors	Supported version	Description
Azure Monitor		Send alert state changes to the Azure Portal.
HPOM	08.60.005	Receive events from the HP Operations Manager (HPOM).
Hyperic	5.8.4.0	Receive events from the VMware vRealize Hyperic server.
Logicmonitor	156	Receive events from the Logicmonitor server.
IBM Netcool	8.1.0	Receive events from IBM Netcool/OMNIbus Object Servers and Impact Servers.
Icinga2	2.4.1	Receive events from the Icinga2 server.
Apache Kafka Consumer Connector	• 3.0.0 • 3.2.0	Receive events from the Apache Kafka server.
ServiceNow Cloud Observability	2.1.1 or higher	Receive events from the ServiceNow Cloud Observability platform.
NagiosXI	5.5.2	Receive events from the Nagios XI server.
NNMi	10.30.653	Receive events from the NNMi server.
OBM, also known as OMi v2	10.01, 10.10, 10.11, 10.12, 10.60, 10.61, and 11.01	Receive alerts from the OBM server.
OMi	10.01, 10.10, 10.11, 10.12, 10.60, and 10.61	Receive alerts from OMi server.
Op5	7.3.15	Receive alerts from an OP5 Monitor.
Opsview	5.4.0	Receive alerts from an Opsview Monitor
PRTG	21.3.71	Receive alerts from a Paessler PRTG Network Monitor source.

Create a custom pull connector

You can create a customized pull connector that requires a script, connector definition, and connector instance, to retrieve events on behalf of an event source.

Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

A custom connector script can make remote API calls for a new event source to send events to the ServiceNow instance. You can create a script, and then add it as part of a new Event Management connector definition and connector instance. This procedure automatically creates a JavaScript code file using the name that you enter in the **Name** field as the filename. The JavaScript custom code that accomplishes these actions must:

- Connect to an event monitoring tool.
- Retrieve events from an event monitoring tool.
- Send events to the Event [em_event] table using a web service API. See REST API.

Each connector definition is specific to an event source vendor. The connector definition specifies the MID Server script include that pulls events from the external event source. In addition, the connector definition specifies what connector instance value parameters are needed to connect to the external event source host.

Procedure

1. Create a custom MID Server script include.
   This example uses Groovy (deprecated). In place of a script include in Groovy, it is recommended to use JavaScript.

   a. Implement these methods:
      - `@Override OperationStatus testConnection()`
      - `@Override OperationStatus execute()`

   b. Design the class to extend the `ThirdPartyConnector`.

      Example

      ```
      public class HypericConnector extends ThirdPartyConnector
      ```

   c. Import platform classes for event creation, sending, logging, and third-party connector base classes.

      Example

      ```
      package com.service_now.mid.probe.tpcon.test

      import com.glide.util.Log
      import com.service_now.mid.MIDServer
      import com.service_now.mid.probe.event.IEventSender
      import com.service_now.mid.probe.event.SNEventSender
      import com.service_now.mid.probe.tpcon.OperationStatus
      import com.service_now.mid.probe.tpcon.OperationStatusType
      import com.service_now.mid.probe.tpcon.ThirdPartyConnector
      import com.snc.commons.eventmgmt.Event
      ```

   d. Connect to the data collector, such as SCOM or VMware vRealize Hyperic (Hyperic), with the API provided by the collector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Use the *context* parameters to set the event field values that came from a connector instance.

Example

```
def authString = (context.username +
 ':'+ context.password).getBytes().encodeBase64().toString()
def urlStr = 'http://'+context.host + ':'
 + context.parameters.port + '/' + apiFunction
```

f. Implement the *execute* function in the script.
It reads events from the connector using its API to create Event objects and send them to the ServiceNow instance. For example:

Example

```
GPathResult alertsResponse1 =
 readAlerts('hqu/hqapi1/alert/find.hqu?begin=' + lastSignatureStr +
'&end='+ tillStr +'&count=1000000&severity=1&inEscalation=false&notFixed=false');
Event event = new Event()
event.emsSystem = context.name
event.source = "Hyperic"
event.description = it.@reason
event.type = it.@name
...
IEventSender eventSender =
 MIDServer.getSingleton(SNEventSender.class)
    for (Event event  : list) {
        eventSender.sendEvent(event)
     }
```

2. Navigate to **MID Server** > **MID Server Script Files** and create a script.
3. Specify the **Parent** field as *Groovy*, complete the form as appropriate, and then click **Submit**.
4. Navigate to **Event Management** > **Integrations** > **Connector Definitions** and create a connector definition.
5. In the **Groovy script to run** field, select the MID Server script file, complete the form as appropriate.
In addition to **username** or **host**, you can add any other parameter, for example, **port**, and then click **Submit**.
6. Navigate to **Event Management** > **Integrations** > **Connector Instances** and create a connector instance.
7. In the **Connector definition** field, select the connector definition, complete the form as appropriate, and then click **Submit**.
8. To confirm or debug the script, use debug printouts from Groovy to the MID Server log.
9. To monitor incoming events using the custom connector instance, navigate to **ECC** > **Queue** and filter on **ConnectorProbe**.
10. Create a custom connector definition.
    a. Navigate to **All** > **Event Management** > **Integrations** > **Connector Definitions**.
    b. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **Name** field, type a descriptive name for the connector definition.

d. In the **Script type** field, select **Javascript**.

e. Right-click the form header and select **Save**.
The **Javascript to run** field is automatically populated with the name of the JavaScript template file.

11. To edit the default JavaScript file, click the information icon ( ) to the right of the JavaScript file name and follow these steps:

    a. Specify the information required for the **testConnection** function.
    This function tests the connector definition to verify if the connection to the target is valid.

    b. Specify the information required for the **execute** function.
    This function retrieves the information from the external source.

    c. Specify the information required for the **retrieveKpi** function.
    This function retrieves the metric data from the external source.

12. **Optional:** You can replace the default JavaScript with your JavaScript code.

13. Fill in the fields, as appropriate.

Connector Definition form

Field	Description
Default schedule	The number of seconds between attempts to receive events.
Bi-directional	Specify to enable the external monitoring system to be updated if the alert is changed. There is default implementation for SCOM.
Alert field identifier	Specify the alert field that, if changed manually, causes the external monitoring system to be updated. **Note:** This field appears only if **Bi-directional** is selected.
Collect metrics	Select to enable the collection of metrics. **Note:** Metrics are collected only for SCOM external event sources.
Metrics collection default schedule (seconds)	Specify the number of seconds of information that must be collected. The default is 10 seconds. **Note:** This field appears only if **Collect metrics** is selected.
Connector Parameters	Specify the parameters to enable communication with an event server.
Connector Definition to MID Server Capabilities	The MID Server name to process events from the event server. If not specified, an available MID Server is used.

14. Click **Submit**.

Configure a pull connector

Configure a pull connector to schedule the frequency of event collection.

Before you begin

Before starting this procedure:

- Locate or define a connector definition.
- Create the credentials to connect to the event source.
- If the connector instance is to be used for the collection of Metric Intelligence metric data, the Metric Intelligence plugin must be activated.

Role required: evt_mgmt_admin

About this task

You can use a connector instance to control the location and manner in which events arrive from external sources. You can optionally select to collect Metric Intelligence information from the external sources that you are connecting to. The Metric Intelligence feature is for the analysis of trends, threshold definitions, and anomaly detection. You can run a test to confirm that connector instance parameters let the MID Server receive events from a supported external event source to the Event [em_event] table. The test also confirms:

- The MID Server is running.
- The host is running on the IP address that is in the **Host IP** field.
- Both the MID Server and the host are running in the same domain.
- The connector instance value fields are valid.
- A connection can be made to the event source, using API, to retrieve events.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. Fill in the fields, as appropriate.

Connector Instance Form

Field	Description
Name	A unique name for the connector instance record, such as the name of event source host.
Description	Any optional information that the administrator wants to use to identify this record.
Connector definition **Note:** Metric Intelligence connectors (such as the AWS CloudWatch and AzureConnector), appear in the base system only if the Metric Intelligence plugin (com.snc.sa.metric) is activated.	The vendor and protocol used to gather events from the external event source. Select the connector definition that matches the source of external events. The options available in the base system are, for example: ○ AWS CloudWatch ○ AzureConnector ○ HPOM ○ IBM Netcool ○ NagiosXI

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ NNMi ○ OMi ○ SCOM ○ SolarWinds ○ Op5 ○ PRTG ○ vCenter ○ Zabbix For a list of the connector definitions available in the base system, see Configure Event Management connectors.
Host IP	The IP address of the event source host. The system uses this IP address to select the appropriate MID Server for communicating with the event source host.
Credential	The record from the Credentials [discovery_credentials] table containing valid credentials to the event source host.
Event collection last run time	The date and time of the most recent event import. The value of this field is automatically populated.
Last event collection status	The status of the last import. The value of this field is automatically populated. ○ **None** - A valid connection has not yet been established. ○ **Success** - A successful connection was established. ○ **Error** - A connection was established. However the external event source was not updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the external event source. This value cannot be lower than the minimum schedule property, which by default is 120 seconds.
Last error message	Last error message received by the connector. If the test connector fails, an error message appears in this field.
Active	This option appears only after the form has been saved. Do not select this check box until after you test the connection between the MID Server and the connector. Select this check box to enable pulling events from this external event source.
Bi-directional	Select to invoke the bi-directional option. This option is available only when the specified connector definition has been configured with bi-directional values. When selected, this option enables the bi-directional exchange of values to-and-from the external event

Field	Description
	source. The **Last bi-directional status** option appears only when this option is selected. This option appears only if the connector definition that is selected is SCOM.
Last bi-directional status	The value of this field is automatically populated. The status values are: ○ **None** - A valid connection has not yet been established. ○ **Success** - A successful connection was established. ○ **Error** - A connection was established. However the external event source was not updated. This option appears only if the connector definition that is selected is SCOM.
Metrics collection	Designates collection of Metric Intelligence metric data. **Note:** The metrics connector supports working against the SCOM database (MSSQL) that is configured to work with SSL. This option appears only if the connector definition supports metric collection, such as SCOM.
Metrics collection last run time	The date and time of the most recent metric data collection. The value of this field is automatically populated.
Last metrics collection status	Status of the metric data collection activity. The value of this field is automatically populated. This option appears only if the connector definition that is selected supports metric collection (such as SCOM) and if the **Metrics collection** option is selected.
Metrics collection schedule (seconds)	The time, in seconds, to repeat the metric data collection scheduled job. This option appears only if the connector definition that is selected supports metric collection (such as SCOM) and when the **Metrics collection** option is selected.
Metrics database host	Enter either the IP address or the host name of the metrics database host. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Connect using a named instance	Select to specify the MSSQL named instance to connect to. This option appears only if the connector definition that is selected is SCOM.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Metrics database named instance	The name of the metrics database instance. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Metrics database port	The port used by the metric database. The connection is made using JDBC. The base system value is 1,433. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Database login with Windows authentication	Perform database login with the credentials of the log-on user that is defined on the MID Server service. This option appears only if the connector definition that is selected is SCOM.
Metrics collection running	When selected, indicates that the Metric Intelligence collection is running. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Metrics database credential	Credentials for the metric database. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Connector Instance Values	The related list containing connection parameters for the event source host. The list of parameters depends on the selected connector definition.
MID Servers for Connectors	The name of theMID Server to process events from the event server.

4. Right-click the form header and select **Save**.
5. Click **Test connector** to verify that the MID Server can communicate with the external server host.
6. If the test fails, follow the instructions on the page to correct the problem and then run another test. The description of the reason for failure is shown in the MID Server log, according to the type of error, such as Events, Metrics, or Bi-Directional.
7. After a successful test, select the **Active** check box and then click **Update**.
8. Confirm that Event Management processes events using this connector instance by manually creating an event.

Related topics

Configure Event Management connectors

Configure a default MID Server for connectors

You can set a default MID Server for connectors to ensure that there is always a MID Server available to receive external events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_operator

About this task
The default MID Server must have connectivity to all external event sources.

Procedure
1. Enter `sys_properties.list` in the navigation filter to open the System Property [sys_properties] table.
2. Select the `mid.server.connector_default` system property.
3. On the form, fill in the fields.

Task Template form

Field	Description
mid.server.connector_default	Default MID Server for connectors Determines the MID Server connectors to use when no MID Server is specified. Must match a MID Server name. ○ **Type**: select `string` from the list ○ **Value**: enter the name of an existing MID Server, for example, SNC MID Server ○ **Location**: System Property [sys_properties] table

Note: You can reset the default MID Server by clearing the *`mid.server.connector_default`* property or by updating the value of this property to a different MID Server. This property is not automatically reset in all scenarios.

4. Click **Update**.

Configure the Dynatrace metrics connector instance

Configure the Dynatrace connector instance to receive Metric Intelligence raw data from the Dynatrace server.

Before you begin
To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

- Create an access token in Dynatrace with Read Metrics (metrics.read) scope permissions, to enable fetching metric data. This token is used in the connector to call the Dynatrace REST API.
- Configure the Service graph connector for Dynatrace. This is configured in the instance and discovers Dynatrace CIs. For details on configuring this connector, see Configure Service Graph Connector for Observability - Dynatrace using guided setup.

Role required: evt_mgmt_admin

About this task
By default, the Dynatrace service graph connector discovers CIs and supports metric collection for the following entity types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- HOST
- APPLICATION
- SERVICE
- PROCESS_GROUP_INSTANCE

Configure other entity metrics for collection when creating event rules for CI binding.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Dynatrace connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Dynatrace parameters.
   For details on the connector instance value parameters, see Dynatrace connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the Dynatrace connector to use.
6. In the Related Links section, select **Configure metrics to collect**.
   Only metrics with the value **Active=true** are collected by the instance.
7. Configure the metrics you want the instance to collect with the value **Active=true**.
   Metrics with the value **Active=false** are not collected by the instance.
8. **Optional:** Select **New** to create new metrics.
   Configure the fields on the Connector instance metrics - New record (sn_em_connector_instance_metric) page.

Connector instance metrics page - New record

Field	Description
Metric name	Display name for the metric to be configured in the ServiceNow instance.
Metric connector instance	Set by default to **Dynatrace connector instance**. All metrics are collected for the Dynatrace connector instance.
Metric type	The name of the Dynatrace entity type which the metric belongs to.
Metric ID	The Dynatrace metric ID of the metric being collected.
Active	Select for the metrics to collect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Ensure that the CIs related to the metrics exist in the instance.
- Create an event rule to perform CI binding, as needed. For details, see Create or edit an event rule.

9. Select **Test Connector** to verify the connection between the MID Server and the connector.
10. After a successful test, select the **Active** check box and then select **Update**.

Configure the Datadog metrics connector instance

The Datadog Metrics connector retrieves performance metrics from your Datadog environment and sends them to your ServiceNow instance. Users can use SN anomaly detection capabilities and correlate metric anomalies with events and logs alerts.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

- Create an API key and Application Key in Datadog. These are used in the connector to call the Datadog REST API.
- Configure the Service graph connector for Datadog. This is configured in the instance and discovers Datadog CIs. For details on configuring this connector, see .

Create a Credentials record in your ServiceNow instance:

1. Navigate to **Credentials & Connections** > **Credentials**.
2. Select **New** and select **API Key Credentials**.
3. In the **Name** field, enter a descriptive name. For example, Datadog API Key.
4. In the **API Key** field, enter your Datadog API key.
5. Select **Submit** to save the record.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. In the list, select **Datadog Metrics**.
   The form displays the default parameters for the connector. You typically do not need to modify these parameters on the definition itself.

   Note: The blue information banner at the top of the page serves as a permanent reminder of the automatic capping applied to key performance parameters to ensure system stability.

3. In the Connector Instances related list, click **New**.
4. On the Connector Instance form, fill in the fields.
   For details on the connector instance fields displayed on the page, see Datadog connector instance form.
5. Right-click the form header and select **Save**.
   The Connector Parameters and Connector Instance Metrics related lists appear. For details on the connector instance value parameters, see Datadog connector instance value parameters.

6. **Optional:** To add custom, select **New** and fill the form.

Connector instance metrics page - New record

Field	Description
Metric name	Display name for the metric to be configured in the ServiceNow instance.
Metric connector instance	Set by default to **Datadog connector instance**. All metrics are collected for the Datadog connector instance.
Metric type	The name of the Datadog entity type which the metric belongs to.
Metric ID	The Datadog metric ID of the metric being collected.
Active	Select for the metrics to collect.

   - Ensure that the CIs related to the metrics exist in the instance.
   - Create an event rule to perform CI binding, as needed. For details, see Create or edit an event rule.
7. Select **Test Connector** to verify the connection between the MID Server and the connector.
8. After a successful test, select the **Active** check box and then select **Update**.

Configure the Kafka metrics connector instance

Configure the Kafka metric consumer connector instance to read message send to Kafka server over topic.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

OAuth authentication for the Kafka Metrics Connector is supported only in the Australia release and later. Ensure your instance is upgraded to Australia or a newer version before configuring OAuth.

- Create Kafka SSL credentials on ServiceNow instance. For more information, see Kafka SSL credentials fields.
- ServiceNow does not support discovery for Kafka. Therefore, create the CI entry manually in the respective table.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Kafka connector instance form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the MID Servers for connectors section,specify a MID Server that is up and is valid.
4. Right-click the form header and select **Save**.
5. In the table presenting the connector instance values, verify the populated connector instance values based on your Kafka setup and the message (JSON payload) that you received from the Kafka topic with <field_mappings> value.
6. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Kafka parameters.
   For details on the connector instance value parameters, see Kafka connector instance value parameters.
7. Right-click the form header and select **Save**.
8. Test the connection between the MID Server and the Kafka Metric Consumer connector.
   - Select **Test Connector**.
   - If the test connection fails, verify whether the credential is valid, and that the network is connected from the MID Server to the Kafka broker.

     Note: Kafka topic name validation occurs only in Test Connector validation.
9. After a successful test, make the connector instance active by selecting the **Active** check box.
10. Select **Update**.

Configure the Nagios metrics connector instance

Configure the Nagios metric connector instance to receive Metric Intelligence raw data from the Nagios server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

- Create basic authentication credentials on ServiceNow instance with Nagios SQL database username and password.
- ServiceNow does not support discovery for Nagios. Therefore, create the CI entry manually in the respective table using the hostname configured on the Nagios platform.

Role required: evt_mgmt_admin

About this task

By default, CI binding will occur for the following entities:

- HOST HTTP Endpoint: The event rule applies to the Nagios metric HTTP if you are running a check that includes command_name as service_http.
- MySQL Instance: The event rule applies to the Nagios metric MySQL if you are running a check that includes command_name as mysql.

If you are running any other checks on HTTP endpoints or MySQL, you can edit the existing event rule to add the command_name. For other entities, configure event rules based on CI binding requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Nagios connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Nagios parameters.
   For details on the connector instance value parameters, see Nagios connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the Nagios connector to use.
6. Ensure that the CIs related to the metrics exist in the instance.
7. Create an event rule to perform CI binding, as needed.
   For details, see Create or edit an event rule.
8. Select **Test Connector** to verify the connection between the MID Server and the connector.
9. After a successful test, select the **Active** check box and then select **Update**.

Configure the Zabbix metrics connector instance

Configure the Zabbix Metric connector instance to receive Metric Intelligence raw data from the Zabbix server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

Create basic authentication credentials on ServiceNow instance with Zabbix server username and password.

Role required: evt_mgmt_admin

About this task

ServiceNow does not support discovery for Zabbix, so CI entries must be manually created in the appropriate table using the hostname configured in the Zabbix platform.

- Create an Event Rule to bind specific CIs.
- Users can add tag information to Zabbix items, and the relevant tags will be included in the metric-to-CI records. These tags can also be used as filter conditions in the Event Rule for CI binding.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Zabbix connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Zabbix parameters.
   For details on the connector instance value parameters, see Zabbix connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the Zabbix connector to use.
6. Select **Test Connector** to verify the connection between the MID Server and the connector.
7. After a successful test, select the **Active** check box and then select **Update**.

Note: ServiceNow supports only unsigned float and unsigned integer metric types for Zabbix.

Configure the SolarWinds metrics connector instance

Configure the SolarWinds connector instance to receive Metric Intelligence raw data from the SolarWinds server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

Configure the Service graph connector for SolarWinds. This is configured in the instance and discovers SolarWinds CIs. For details on configuring this connector, see Service Graph Connector for SolarWinds.

Role required: evt_mgmt_admin

About this task

By default, the Solarwinds Metric Connector Collects metrics from the following tables:

- Orion.CPULoad
- Orion.NPM.InterfaceTraffic
- Orion.VolumePerformanceHistory
- Orion.VolumeUsageHistory
- Orion.ResponseTime

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Solarwinds connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory SolarWinds parameters.
   For details on the connector instance value parameters, see Solarwinds connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the SolarWinds connector to use.
6. In the Related Links section, select **Configure metrics to collect**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Only metrics with the value **Active=true** are collected by the instance.

7. Configure the metrics you want the instance to collect with the value **Active=true**. Metrics with the value **Active=false** are not collected by the instance.
8. **Optional:** Select **New** to create new metrics.
   Configure the fields on the Connector instance metrics - New record (sn_em_connector_instance_metrics_solarwinds) page.

Connector instance metrics page - New record

Field	Description
Metric name	Name for the metric to be configured in the ServiceNow instance.
Metric connector instance	Set by default to **SolarWinds connector instance**. All metrics are collected for the SolarWinds connector instance.
Additional columns	(Optional) List of additional columns to fetch for CI-related information. For example: DateTime, Node, Resource. If **DateTime** is not provided, the current time is used as the metric timestamp. If **Node** and **Resource** are provided, they are populated accordingly. To reference fields from a parent table, use dot-walking format, such as `Interface.InterfaceName`. If a field should populate a specific standard field (like **Resource**), use an alias with the same name. For example, to use `InterfaceName` as the resource, specify it as `Interface.InterfaceName AS Resource`.
Table Name	Name of the table from which metrics are collected.

   - Ensure that the CIs related to the metrics exist in the instance.
   - Create an event rule to perform CI binding, as needed. For details, see Create or edit an event rule.
9. Select **Test Connector** to verify the connection between the MID Server and the connector.
10. After a successful test, select the **Active** check box and then select **Update**.

Note: Ensure that **Registration Mode** is enabled for the SolarWinds source in the Metric Sources table.

Configure event collection from HP OMi

Configure the HP Operations Manager (OMi) connector instance to receive alerts from the HP OMi server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Supported versions: 10.01, 10.10, 10.11, 10.12, 10.60, and 10.61.
The OMi connector is not supported on versions below version 10.

Create Basic Auth type of credential to connect to OMI.

Role required: evt_mgmt_admin

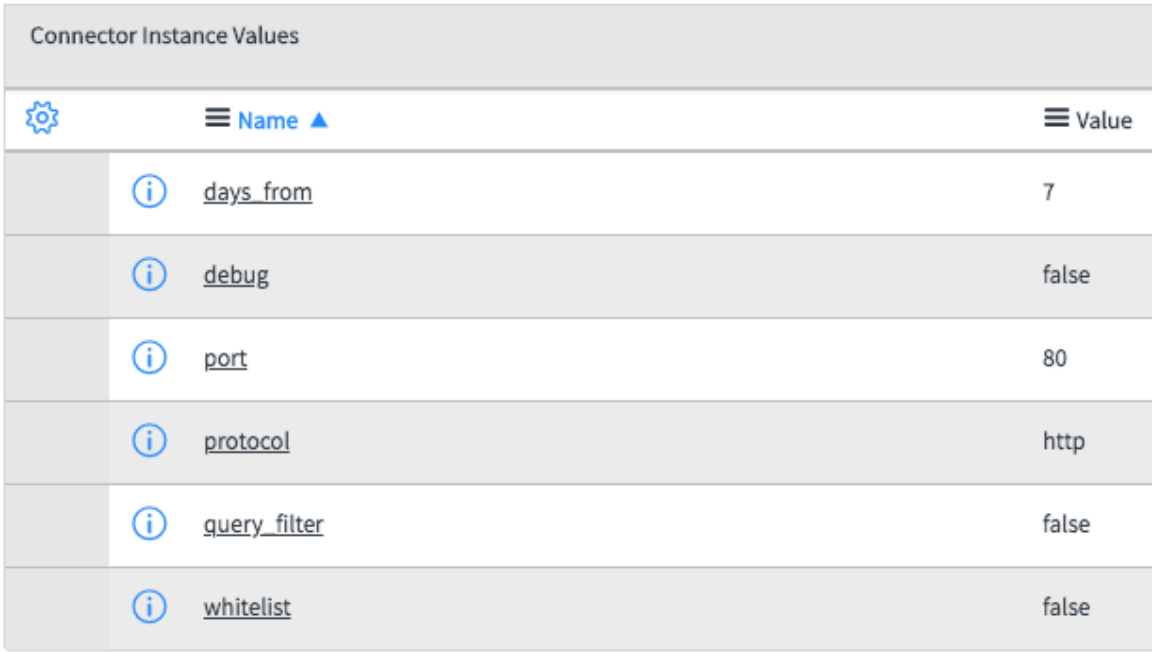
Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the OMi connector.
Description	Description for the use of the OMi event collection instance.
Host IP	Specify the OMi IP address.
Credential	Click in the **Credential** field. Select a Basic Auth credential from the list or click the search icon. Either select the required credentials from the list or click **New** and create the required credentials using Basic Auth type. If you create the credentials, save them using a unique and recognizable name, for example OMiOPS.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run time status. Automatically updated.
Event collection schedule (seconds)	Frequency in seconds that the system checks for new events from OMi. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.
Connector Definition	Select **OMi**.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. In the Connector Instance Values section, specify the OMi values.

   a. **days_from**.
   Specify the number of days for which events must be collected on the first collection cycle. Default `7`.

   b. **debug**.
   Default `false`. To enter debug mode, specify `true`.

   c. **port**.
   Default `80`.

   d. **protocol**.
   Default `http`.

   e. **query_filter**.
   Default value is false. If you do want to use this extra filter to query events, specify the event attributes. For example, `assigned_user = "admin" AND title = "My Title"`. The query filter criteria are:

   - A filter property that specifies an event attribute, such as, `related_ci`
   - A supported operator, for example, OR or AND
   - A value for the filter property, for example, `admin` or `integrator`

   Everything from the query_filter field undergoes URL encoding and is then passed as a parameter to the OMi API call. For detailed information on how to build the filter query, see “Filtering by Event Attributes: query” in the HP OMi Extensibility Guide. For example, to query the events for a list of events that are assigned to the admin user, specify:

   `event_list?query=assigned_ user%20EQ%20"admin"`

   To nest query_filter event attributes, specify the hierarchy using square brackets "[ ]".

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. **inclusion list**.
Default value: `false`. Specify a comma-separated list to include this feature to add attributes that should be collected and added to the Event Management **Additional information** field.

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

> **Note:** Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the HP OMi server.

8. After a successful test, select the **Active** check box and then click **Update**.

Configure event collection from HPOM

Configure the HPOM connector instance to receive events from HP Operations Manager (HPOM).

Before you begin

Role required: evt_mgmt_admin
Supported version: 08.60.005.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create an HPOM connector instance with the following details:

Field	Value
Name	Specify a unique name for the HPOM connector instance.
Host IP	Specify the HPOM IP address.
Credential	Click in the **Credential** field. Select a credential from the list or click the search icon. Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, HPOMOPS.
Schedule (seconds)	The frequency in seconds that the system checks for new events from HPOM.
Description	Type a description for the use of the HPOM event collection instance.
Connector definition	The vendor and protocol used to gather events from the external event source. Select the **HPOM** connector definition.
Last error message	The last error message is automatically updated.
Last run time	The last run time value is automatically updated.
Last run status	The last run time status is automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and click **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Parameters section, specify the values of the mandatory HPOM parameters.
   - **driver**. Specify the driver to be used to make the call. This driver is specific to the type of database you are calling into.
     - For an IBM DB2 Universal driver, specify: com.ibm.db2.jcc.DB2Driver
     - For an Oracle driver, specify: oracle.jdbc.OracleDriver
     - For a Microsoft SQL driver, specify: com.microsoft.sqlserver.jdbc.SQLServerDriver
     - For a MySQL driver, specify: com.mysql.jdbc.Driver
     - For a Sybase driver, specify: com.sybase.jdbc3.jdbc.SybDriver
   - **url**. Specify a URL. The JDBC protocol uses a connection string to establish the authentication and other parameters to establish a connection between the client and the database. Each database has its own connection string format. In the following URLs, replace the variables, for example, <username> and <password>, with your values.
     - For an IBM DB2 Universal URL, specify: [jdbc:db2://sysmvs1.stl.ibm.com:<port number>/<database name>:user=<username>;password=<password>]

       For example: jdbc:db2://sysmvs1.stl.ibm.com:5021/regionsdb:user=example;password=wlrs21.
     - For an Oracle URL, specify: [jdbc:oracle:thin:@<IP address>:<port number>:<database name>]

       For example: jdbc:oracle:thin:@172.31.255.255:4028:OracleMain.
     - For a Microsoft SQL URL, specify: [jdbc:sqlserver://<IP address>;user=<username>;password=<password>]

       For example: jdbc:sqlserver://localhost;user=example;password=w3lrs2.
     - For a MySQL URL, specify: [jdbc:mysql://<IP address>/database?user=<username>;password=<password>]

       For example: jdbc:mysql://localhost/database?user=example;password=65wlrs.
     - For a Sybase URL, specify: [jdbc:sybase:Tds:<IP address>:<port number>/<database name>?user=<username>;password=<password>]

       For example: jdbc:sybase:Tds:172.31.255.255:4100/SYBMAIN?user=example;password=wlrs1m.
5. Use a network tool, such as ping, to verify that the HPOM server is running and the IP address matches the value in the *Host IP* field.

Configure a pull connector

Configure event collection from Hyperic

Configure the Hyperic connector instance to receive events from the VMware vRealize Hyperic server.

Before you begin

Role required: evt_mgmt_admin
Supported version: 5.8.4.0.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a Hyperic connector instance with the following details:

Field	Value
Name	Specify a unique name for the Hyperic connector instance.
Host IP	Specify the Hyperic IP address.
Credential	In the Credentials form, click **New** and create the required credentials. Save the credentials using a unique and recognizable name, for example, HypericOPS.
Schedule (seconds)	The frequency in seconds that the system checks for new events from Hyperic.
Description	Type a description for the use of the Hyperic event collection instance.
Connector definition	The vendor and protocol used to gather events from the external event source. Select the **Hyperic** connector definition.
Last error message	The last error message is automatically updated.
Last run time	The last run time value is automatically updated.
Last run status	The last run time status is automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on.

Configure a pull connector

Configure event collection from IBM Netcool

Configure the IBM Netcool_V2 connector to receive events from IBM Netcool/OMNIbus Object Servers and Impact Servers. The IBM Netcool_V2 connector uses REST API calls and is bidirectional.

Before you begin

For the IBM Netcool_V2 connector:

- Role required: evt_mgmt_admin
- Perform connector validation on IBM NetCool/OMNIbus version 8.1.0.

About this task

To use IBM Netcool_V2 connector, configure a connector instance for the MID Server.

Note: The IBM Netcool connector is deprecated and only IBM Netcool_V2 connector is supported.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Specify a unique name for the Netcool connector instance.
Description	Type a description for the use of the Netcool event collection instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Host IP	Specify the Netcool IP address.
Credential	In the Credentials form, click **New**, and create the required credentials. Save the credentials using a unique and recognizable name, for example, NetcoolOPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from Netcool. The default value is 120 seconds.
Last error message	The last error message is automatically updated.
Connector definition	Select IBM Netcool_V2 to gather events from the external event source.
MID Servers (MID Server for Connectors section)	Specify a MID Server that is up and is valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section. If no MID Server is specified, an available MID Server that has a matching IP range is used.

3. Right-click the form header and click **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Parameters section, specify the value of the required Netcool parameters.

Connector	Required parameters
IBM Netcool_V2	○ *additional_alert_columns*: com ma separated list of columns to include in event additional information from net cool alert. Specify here if the desired columns are not already part of event. ○ *debug*: Boolean flag to enable debug logs. Default: false. ○ *initial_sync_in_days*: The number of days of data fetched on first pull. The de fault value is 3, but can be changed accord ing to your requirements. ○ *message_key_delimiter*: Separate hi erarchical parts of a message key, enabling structured namespacing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector	Required parameters
	○ *port*: The port number on which IBM Net cool is running. For example: 8080. ○ *Protocol*: Protocol to use when connect ing to the Netcool server. Default: https.

5. Verify that Netcool servers are up and running:
   For the IBM Netcool_V2 connector, use this REST API call to verify that the Netcool API is up and running: `http://hostname:port/objectserver/restapi/alerts/status`
6. Right-click the form header and click **Save**.
7. Click **Test connector** to verify the connection between the MID Server and the Netcool connector.
8. If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.
9. After a successful test, select the **Active** check box and then click **Update**.

Related topics

Configure a pull connector

Configure event collection from an Icinga2 connector

Configure the Icinga 2 (Icinga) connector instance to receive events while monitoring your network resources.

Before you begin

Role required: evt_mgmt_admin

Supported version: 2.4.1.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Connector Instance form

Field	Description
Name	Descriptive and unique name for the Icinga connector.
Description	Description for the use of the Icinga event collection instance.
Connector definition	Name of the required connector definition. Select **Icinga2**.
Host IP	IP address where Icinga is installed.
Credential	Permission to connect to Icinga. Click the search icon in the **Credential** field. Use Basic Authentication credentials. Either select the required credentials from the list or click **New** and create the required credentials on the Credentials form. If you create the credentials, save them using a unique and recognizable name, for example, ICINGA2CHCK.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run status. Automatically updated.
Event collection schedule (seconds)	Frequency, in seconds, that the system checks for new events from Icinga. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.

   a. debug: Display debug messages. Default value: false. Specify true to see debug messages.

   b. logPayloadForDebug: Display payload related debug messages. Default value: false. Specify true to see payload related debug messages.

5. In the Connector Instance Values section, verify and where required, modify the default connector instance values.

Field	Description
debug	Display debug messages. Default value: `false`. Specify `true` to see debug messages.
port	Number of the connector port. Default value: `5665`.
protocol	Type of protocol. Default protocol type: `https`.
alert_type	Provide the Icinga alert type details. There are 2 types of an alert in Icinga2: SOFT and HARD SOFT: Connector instance will pull a soft alert. HARD: Connector instance will pull a hard alert.

6. **Optional:** In the MID Servers for Connectors section, specify a MID Server that is up and is valid.
   If no MID Server is specified, an available MID Server that has a matching IP range is used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

7. Right-click the form header and select **Save**.
8. Test the connection between the MID Server and the Icinga connector.

   a. Click **Test Connector**.
   If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

   Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the external monitoring tool.

   b. After a successful test, select the **Active** check box.

9. Click **Update**.

Configure event collection from Logicmonitor

The Logicmonitor pull connector sends information from Event Management to Logicmonitor. It sends responses received from a Push connector in a bi-directional environment to Logicmonitor.

Before you begin
Role required: evt_mgmt_admin

About this task
Starting from the Xanadu release, the OOTB (Out-Of-The-Box) rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the**Apply additional matching rules**check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the connector.

Note: This feature applies only to active event rules.

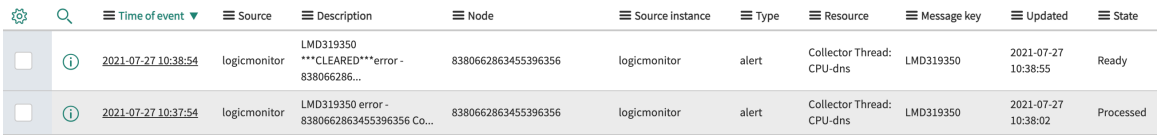
Procedure
1. Navigate to**All** > **Event Management** > **Event Connectors (Pull)** > **Connector Instances**.
2. Click**New**.
   The**Connector Instance New Record**page appears.
3. Enter values in the required fields, which are indicated by a red asterisk.

Field	Description
Name	Descriptive name for the connector.
Connector definition	Search for and select**Logic Monitor**.
Credential	Select**Basic Auth**for basic authentication. Pro vide access_id and access_key from Logic monitor's token based API authentication in the credentials as the basic authentication username and password.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

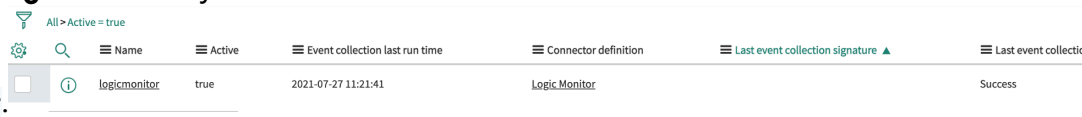
Field	Description
Host IP	The Logicmonitor IP address.

When adding bi-directional functionality for a Push connector, the Connector Instance name must match the Source Instance field of the event generated by that source.



Time of event	Source	Description	Node	Source instance	Type	Resource	Message key	Updated	State
2021-07-27 10:38:54	logicmonitor	LMD319350 ***CLEARED***error - 838066286...	8380662863455396356	logicmonitor	alert	Collector Thread: CPU-dns	LMD319350	2021-07-27 10:38:55	Ready
2021-07-27 10:37:54	logicmonitor	LMD319350 error - 8380662863455396356 Co...	8380662863455396356	logicmonitor	alert	Collector Thread: CPU-dns	LMD319350	2021-07-27 10:38:02	Processed

The source of events is**logicmonitor**so you should create an instance with the name`logicmonitor`.



All > Active = true

Name	Active	Event collection last run time	Connector definition	Last event collection signature	Last event collectio
logicmonitor	true	2021-07-27 11:21:41	Logic Monitor		Success

Note: The Update queue business rule in the Alert table identifies each manual update of the alert and updates the connector queue accordingly. By default, changes to all alert fields are tracked.

4. Select the**Active**check box and click**Save**.
   The LogicMonitor pull connector does not retrieve Events or populate the Events [em_event] table.

Configure event collection from NNMi

Configure the HP Network Node Manager i (NNMi) connector instance to receive events while monitoring your network resources.

Before you begin

Supported version: NNMi 10.30 and later, including NNMi 25.5.

Note: The connector supports NNMi versions 10.30.653 and 25.5. If you use another version and encounter issues, contact ServiceNow Support.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Connector Instance form

Field	Description
Name	Descriptive and unique name for the NNMi connector.
Description	Description for the use of the NNMi event collection instance.
Connector definition	Name of the required connector definition. Select **NNMi**.
Host IP	IP address where NNMi is installed.
Credential	Permission to connect to NNMi. Click the search icon in the **Credential** field. Either select the required credentials

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	from the list or click **New** and create the required credentials on the Credentials form. If you create the credentials, save them using a unique and recognizable name, for example, NNMiCHCK. The selected credentials use basic authentication.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run status. Automatically updated.
Event collection schedule (seconds)	Frequency, in seconds, that the system checks for new events from NNMi. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.

4. Right-click the form header and select **Save**.
The connector instance values are added to the form and the parameters that are relevant to the connector appear.

5. In the Connector Instance Values section, verify and where required, modify the default connector instance values.

Field	Description
days_from	Number of days for which events must be collected at the first collection cycle. Default value: 7 days. **Note:** The maximum number of past events that can be collected is 3,000. The first time that the connector runs, it collects all events (up to the 3,000 limit) that were created from the `days_from` date until the current date.
debug	Display debug messages. Default value: `false`. Specify `true` to see debug messages.
port	Number of the connector port. Default value: 80.
protocol	Type of protocol. Default protocol type: `http`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. **Optional:** In the MID Servers for Connectors section, specify a MID Server that is up and is valid.
   If no MID Server is specified, an available MID Server that has a matching IP range is used.

   You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

7. Right-click the form header and select **Save**.
8. Test the connection between the MID Server and the NNMi connector.

   a. Click **Test Connector**.
   If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

   Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the external monitoring tool.

   If you encounter the error `"TypeError: Cannot read property 'inc:getIncidentsResponse' from undefined`, refer to the Known Error article KB0262185 for the updated script and instructions.

   b. After a successful test, select the **Active** check box.

9. Click **Update**.

Configure event collection from NagiosXI

Configure the NagiosXI connector instance to receive events from the Nagios Core monitor.

Before you begin

Supported version: 5.5.2.
The NagiosXI connector instance requires a credential that lets the instance access NagiosXI accounts. You can use an existing credential or create a new one. For more information, see Create Nagios XI server credentials.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Field	Description
Name	Descriptive name for the Nagios connector.
Description	Description for the use of the NagiosXI event collection instance.
Host IP	Specify the Nagios XI IP address.
Credential	Select the credential with basic authentication that you created for this connector. For more information, see Create Nagios XI server credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Ensure that the user password contains the NagiosXI user API key, for example 04lquEPqf4JimWCm8RWbJokOpW8LYBUfEvJp9OSHSRYe4QDrHPFndYbV
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency, in seconds, that the system checks for new events from Nagios. The default value is 120 seconds.
Last error message	The last error message is automatically updated.
Connector Definition	Select **NagiosXI**.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
5. In the Connector Instance Values section, specify the Nagios values.
   - **initial_sync_in_days**. Specify the number of days for which events must be collected at the first collection cycle. Default value `7` days.
   - **port**. Default value `80`.
   - **protocol**. The default protocol type is `http`.
   - **time_zone**. The default time zone is `GMT`; update this value to the Nagios timezone. For example, if Nagios is sending the events according to the EDT time zone, update this value to `GMT-04:00` (abbreviations such as **EDT** are not supported).
   - **severity_by_state_type**. The default value is `false`. When set to `true`, the state_type is used along with the state to determine the severity which creates less critical events as shown in the following mapping table.

Mapping Table

_state_type(Connect definition parameter)	State (Nagios JSON payload attribute)	State_type (Nagios JSON payload attribute)	ServiceNow Severity
false	2	0/1	1 (Critical)
false	1	1	1(Critical)
false	1	0	2(Major)
false	0	0/1	5(OK)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

_state_type(Connect definition parameter)	State (Nagios JSON payload attribute)	State_type (Nagios JSON payload attribute)	ServiceNow Severity
true	0	0/1	5(OK)
true	1	0	4 (Warning-soft -> Warning)
true	2	0	2(Critical-soft -> Major)
true	3	0	4(Unknown-soft-> Warning)
true	1	1	3(Warning-hard -> Minor)
true	2	1	1(Critical-hard -> Critical)
true	3	1	3(Unknown-hard -> Minor)

6. Right-click the form header and select **Save**.
7. Click **Test Connector** to verify the connection between the MID Server and the connector.
8. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.
   If this message appears: `Connection test failed: Failed to connect to Nagios on test connector. Invalid API Key`, then enter the API Key for the specific user to be able to read the Nagios events.

   Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the Nagios Core monitor.

9. After a successful test, select the **Active** check box and then click **Update**.

Create Nagios XI server credentials

Create credentials to access Nagios XI server.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential. For example, you might call it `Nagios authentication`.
User name	Name to identify the user. Ensure that the user password contains the NagiosXI user API key, for example, `04lquEPqf4JimWCm8RWbJokOpW8LYBUfEvJp9OSHSR`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Click **Submit**.

Result
The credential for use with the Nagios XI server connector is created.

Configure event collection from OBM

Configure the Operation Bridge Manager (OBM), also known as OMi v2, connector instance to receive alerts from the OBM server. The OBM connector script OBM v2 will be available after installing the Event Management Connectors app.

Before you begin
Role required: evt_mgmt_admin

Supported versions: 10.01, 10.10, 10.11, 10.12, 10.60, 10.61, and 11.01.

About this task
Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Procedure

1. Navigate to **All** > **Event Management** > **Event Connectors (Pull)** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the OBM connector.
Description	Description for the use of the OBM event collection instance.
Host IP	Specify the OBM IP address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Credential	Select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example OBMOPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time value is automatically updated.
Event collection schedule (seconds)	Frequency in seconds that the system checks for new events from OBM. The default value is 120 seconds.
Last error message	The last error message is automatically updated
Connector Definition	Select **OBM V2**. **Note:** This script will be available after installing the Event Management connector scoped app.
MID Servers (MID Server for Connectors section)	Specify the MID Server to run the OBM connector instance. You can configure several MID Servers. If the first server is down, the next MID Server If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section. If no MID Server is specified, an available MID Server that has a matching IP range is used.

3. Right-click the form header and select **Save**.
   The parameters that are relevant to the OBM connector appear.
4. In the Connector Instance Values section, specify the OBM values.

   a. **days_from**.
   Specify the number of days for which events must be collected on the first collection cycle. The default value is `7` days and data can only be pulled a maximum of 7 days from the OBM system.

   b. **debug**.
   The default value is `false`. To enter debug mode, change the value to `true`.

   c. **port**.
   The default value is `80`.

   d. **protocol**.
   The default value is `http`.

   e. **query_filter**.
   The default value is false. If you do want to use this extra filter to query events, specify the event attributes. For example, `assigned_user = "admin" AND title = "My Title"`. The query filter criteria are:

   - A filter property that specifies an event attribute, such as, `related_ci`
   - A supported operator, for example, `OR` or `AND`
   - A value for the filter property, for example, `admin` or `integrator`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Everything from the query_filter field undergoes URL encoding and is then passed as a parameter to the OBM API call. For detailed information on how to build the filter query, see "Filtering by Event Attributes: query" in the OBM Extensibility Guide. For example, to query the events for a list of events that are assigned to the admin user, specify:

```
event_list?query=assigned_ user%20EQ%20"admin"
```

To nest query_filter event attributes, specify the hierarchy using square brackets "[ ]".

f. **inclusion list**.
The default value is `false`. Specify a comma-separated list to include this feature to add attributes that should be collected and added to the Event Management **Additional information** field.

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

   Note: Use a network tool, such as ping, to verify that the OBM server is running and the IP address matches the value in the **Host IP** field.

8. After a successful test, select the **Active** check box and then click **Update**.

Configure OP5 or OP5_v2 connector

Configure the OP5 or OP5_v2 Monitor connector instance to receive alerts from an OP5 Monitor source.

Before you begin

The OP5_v2 connector is supported in Event Management connectors version 2.3.0 - August 2022, available from the ServiceNow Store.

Supported version:

- OP5: 7.3.15
- OP5_v2: 8.3.8

Role required: evt_mgmt_admin

About this task

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Name	Descriptive name for the OP5 or OP5_v2 connector.
Description	Description for the use of the OP5 or OP5_v2 event collection instance.
Host IP	Specify the OP5 or OP5_v2 IP address.
Credential	Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, OP5OPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from OP5 or OP5_v2.
Last error message	The last error message is automatically updated.
Connector definition	Select **OP5** or **OP5_v2**.
Connector Instance Values section	The parameters that are specific to **OP5** or **OP5_v2** display here when the form is saved.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Instance Values section, specify the OP5 or OP5_v2 values.

   a. **days_from**.
   Specify the number of days for which events must be collected at the first collection cycle. Default value 7 days.

   b. **debug**.
   Displays debug messages. Default value: false. Specify true to see debug messages

   c. **logPayloadForDebug**.
   Displays payload related debug messages. Default value: false. Specify true to see payload related debug messages.

   d. **port**.
   Default value 443.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. **state_types**.
Specify filters for event collection based on the **state_types** attribute. You can filter events based on state type. Specify the type, for example, `soft` or `hard`.

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.
8. After a successful test, select the **Active** check box and then click **Update**.

Configure Opsview_v2 connector

Configure the Opsview_V2 connector instance to receive alerts from an Opsview Monitor source.

Before you begin

Ensure you have the supported version of the Opsview_V2 connector: 6.7.0.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the Opsview connector.
Description	Description for the use of the Opsview event collection instance.
Host IP	Specify the Opsview IP address.
Credential	Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, OpsviewOPS. **Note:** User should have the CONFIGUREVIEW role with access to 'VIEW ALL, CHANGE NONE'.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from Opsview.
Last error message	The last error message is automatically updated.
Connector definition	Select **Opsview_v2**.
Connector Instance Values section	The parameters that are specific to Opsview_V2 display here when the form is saved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Instance Values section, specify the Opsview_v2 values.

   a. **days_from**.

   Specify the number of days for which events must be collected at the first collection cycle. Default value 7 days.

   b. **debug**.
   Display debug messages. Default value: false. Specify true to see debug messages.

   c. **logPayloadForDebug**.
   Display payload related debug messages. Default value: false. Specify true to see payload related debug messages.

   d. **eventtype_filter**.
   Specify filters for event collection based on the eventtype attribute. Specify one of these values 0,1,2,3.

   e. **port**.

   Default value is 80.

   .

   f. **protocol**.
   The default protocol type is HTTPS.

5. Right-click the form header and select **Save**.
6. To verify the connection between the MID Server and the connector, select **Test Connector**.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.
   If this message appears: `Connection test failed: Failed to connect to Opsview on test connector. Invalid API Key`, then enter the API Key for the specific user to be able to read the Opsview events.

   Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the Opsview Monitor source.

8. After a successful test, select the **Active** check box and then select **Update**.

Configure PRTG connector

Configure the PRTG connector instance to receive alerts from a Paessler PRTG Network Monitor source.

Before you begin

Role required: evt_mgmt_admin
Supported version: 21.3.71.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the PRTG connector.
Description	Description for the use of the PRTG event collection instance.
Host IP	Specify the PRTG IP address.
Credential	Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, PRTGOPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from PRTG.
Last error message	The last error message is automatically updated.
Connector definition	Select **PRTG**.
Connector Instance Values section	The parameters that are specific to **PRTG** display here when the form is saved.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Instance Values section, specify the PRTG values.

   a. **add_columns**.
   Specify which columns to be returned by the connector. Separate the names with a comma and without a space between the names. The output is stored in the **Additional information**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

field of the event. Default value `false`. If `false` is specified, only the default list of columns is retrieved: parent, name, type, objid, tags, message, status, priority, datetime, actions, baselink, basetype, modifiedby.

> **Note:** Only columns names that are applicable to the **Message** content type can be specified.

b. **date_format**.
The format date and time. Default format M/d/yyyy/ h:mm:ss a. If you receive an event whose date is in a different format, modify this value to match the format of the incoming event. If you do not, the event will not be processed correctly.

For example, if an event arrives on June 27, 2019 at 11:25 AM with a listed date of *`2019/06/27/ 11:25:00 a`*, modify the **date_format** value to *`yyyy/M/d/ h:mm:ss a`* to match the format of the received event.

In the **date_format**, `a` represents AM, and `p` represents PM.

c. In the **days_from** field, specify the number of days for which events must be collected at the first collection cycle.
Default value `7` days.

d. **debug**.
Default value `false`.

e. **port**.
Default value `80`.

f. **protocol**.
The default protocol type is `http`.

g. **prtg_api_fetched_events_num**.
Maximum number of events, per query, that can be fetched from the PRTG client into the MID Server. Default number: `50,000`.

h. **time_zone**.
The default time zone is the `GMT` time zone; update this value to the PRTG time zone. For example, if PRTG is sending events according to the EDT time zone, update this value to `GMT-4` (abbreviations such as EDT are not supported).

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.
If this message appears: `Connection test failed: Failed to connect to PRTG on test connector. Invalid API Key`, then enter the API Key for the specific user to be able to read the PRTG events.

> **Note:** Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to PRTG.

8. After a successful test, select the **Active** check box and then click **Update**.

Apache Kafka Consumer Connector

The Apache Kafka Consumer connector instance enables you to create events from messages collected from the Apache Kafka topic as a JSON payload that contains essential information in a data block.

Apache Kafka is a distributed publish-subscribe messaging system that receives data from disparate source systems and makes the data available to target systems in real time.

You can use this connector to create ServiceNow events from Kafka messages. Messages in the Kafka topic must be in JSON format.

Like other message broker systems, Kafka facilitates the asynchronous data exchange between processes, applications, and servers.

Kafka software runs on one or more servers. Each node, called a broker, in a Kafka cluster helps producer applications write data to topics, which are where records are stored and published. Consumer applications read from topics. Topics are divided into partitions to make them more manageable and Kafka guarantees strong ordering for each partition.

Configure the Apache Kafka Consumer connector

Configure the Apache Kafka Consumer connector instance to create events from streaming messages collected by the Apache Kafka connector.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New**.
3. On the form, fill in the fields.

Connector instance form

Field	Value
Name	Descriptive and unique name for the Kafka Consumer connector.
Description	Description to be used by the Kafka Consumer event collection instance.
Connector definition	Name of the required connector definition, which in this case should be Kafka Consumer.
Host IP	The host IP. **Note:** This field must contain a value to complete the creation process so the placeholder 1.1.1.1 should be entered as a temporary value.
Event collection last run time	This field is automatically set to the last runtime value.
Last event collection status	This field is automatically set to the last runtime status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the Kafka Consumer. The default value is 60 seconds.
Last error message	This field is automatically set to the last error message.

4. For PLAINTEXT or SASL_PLAINTEXT, in the **Credential** field, create a Basic authentication credential.
   Use the **Kafka SSL credential** type for a new Kafka pull connector instance with **SASL_PLAINTEXT** authentication. Go to step 5.

   Use the **Kafka SSL credential** type when the Kafka server's **sasl.enabled.mechanisms** or **sasl.mechanism** parameter's value don't equal **PLAIN**. Go to step 5.

   a. Select the Search icon next to the **Credential** field.

   b. On the Credentials screen, select **New**.

   c. From the list of available credentials, select **Basic Auth Credentials**.

   d. On the Basic Authentication screen, give information for either PLAINTEXT authentication, which doesn't require credentials, or SASL_PLAINTEXT authentication, which requires credentials.
      - For PLAINTEXT authentication, in the **Name** field, type any value and leave the **User Name** and **Password** fields empty.
      - For SASL_PLAINTEXT authentication, give a name for the credential in the **Name** field, preferably prefaced by SASL. Provide the user name and password In the **User Name** and **Password** fields.

   e. Select **Submit**.

5. For a SASL_PLAINTEXT, SSL, or SASL_SSL authentication credential, in the **Credential** field, create a Kafka SSL credential.

   a. Select the Search icon next to the **Credential** field.

   b. On the Credentials screen, select **New**.

   c. From the list of available credentials, select **Kafka SSL Credentials**.

   d. On the Kafka SSL Authentication screen, fill in the Kafka SSL credentials fields.
      For the Kafka SSL credentials fields descriptions, see .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you clear the **Disable hostname verification** field, then in the **Additional Kafka consumer properties** field, enter the value of the *ssl.endpoint.identification.algorithm* parameter the same as of the Kafka server parameter value. For example:

```
ssl.enabled.protocols=TLSv1.2,TLSv1.1,TLSv1;
sasl.jaas.config=org.apache.kafka.common.security.plain.Pl
ainLoginModule required username=<username>
 password=<password>;
sasl.enabled.mechanisms=PLAIN;ssl.endpoint.identification.
algorithm=;
```

e. Select **Submit**.

6. To use SASL_SSL with OAuthbearer, perform the following steps:
   - Select the value of the **Security protocol** field as **SASL_SSL**
   - Select the value of the field **SASL mechanism** as OAUTHBEARER
   - For **User name** field, provide the <client id value>.
   - For the **Password** field, provide the <client_secret>.
   - For the **SASL JAAS config template** field, enter the value as `org.apache.kafka.common.security.oauthbearer.OAuthBearerLoginModule required clientId="${user_name}" clientSecret="${password}" scope="openid";`

     Note: OAuth authentication for the Kafka Event Connector is supported only in the Australia release and later. Ensure your instance is upgraded to Australia or a newer version before configuring OAuth.

7. Right-click the form header and select **Save**.
8. In the table presenting the connector instance values, verify the populated connector instance values based on your Kafka setup and the message (JSON payload) that you received from the Kafka topic.

   Change the connector instance values if necessary.

Connector instance Values table

Field	Description
authentication_type	The Kafka Consumer authentication type. The currently supported values are: ○ PLAINTEXT (no authentication) (Default) ○ SASL_PLAINTEXT (basic authentication – user name and password)
bootstrap_servers	The servers that establish the connection with the Kafka cluster. Values in this field should be in the form host1:port1, host2:port2, and so on (comma-separated).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field is required.
consumer_group_name	The Consumer group name. If the same Kafka topic is being consumed from two different instances, use different consumer group names so all events are captured for both instances. This field is required.
time_of_event_field	The name of the field in the JSON payload/message that includes the time of the event. If a field in the JSON payload/message includes the time of the event, that value should be the value for this parameter. If no time field value is given, then the received time of the event in the ServiceNow instance is set as time_of_event. The time_of_event field should be a first-level field in the JSON payload/message. Nested field names aren't allowed.
timezone	The time zone of the time_of_event field in the JSON payload/message. The timezone value isn't used when the time_of_event field is empty. For example, if the time_of_event in the payload/message is in the IST time zone, the value would be GMT+0530. Default: GMT.
date_format	The date_time format of the time_of_event field in the JSON payload/message. If no time field value is given, then the time when the event was received in the instance in GMT time is used. The date_time value isn't used when the time_of_event field is empty. Default: yyyy-MM-dd HH:mm:sss.
debug	Displays debug messages. Default value: false. Specify true to see debug messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
logPayloadForDebug	Displays payload related debug messages. Default value: false. Specify true to see payload related debug messages.
topic	The Kafka topic from which the messages are fetched. This field is required.

9. In the **MID Servers for Connectors** section, specify a MID Server that is up and is valid.

   Note: You can configure several MID Servers. If the first server is down, the next MID Server is used. If that MID Server isn't available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the **MID Servers for Connectors** section.

   If you do not specify a MID Server, an available MID Server that has a matching IP range is used.

10. Right-click the form header and select **Save**.
11. Test the connection between the MID Server and the Kafka Consumer connector.

    a. Select **Test Connector**.

    b. If the test connection fails, verify whether the credential is valid, and that the network is connected from the MID Server to the Kafka broker.

       Note: Kafka topic name validation occurs only in **Test Connector** validation.

12. After a successful test, make the connector instance active by selecting the **Active** check box.
13. Select the **Update** button.

What to do next

After the connector is created, you must map the fields. For more information, see Map Kafka message payload attributes to alert fields.

Map Kafka message payload attributes to alert fields

Map Kafka message attributes to alert fields to make alerts based on the messages more meaningful. Use event field mapping to map Kafka severity values to appropriate ServiceNow values.

Before you begin

Role required: evt_mgmt_admin

About this task

Depending on your payload, Use event field mappings to provide more comprehensive information in an event alert by substituting values from the event field mapping rule into the event. Depending on your payload, transform information in events to populate specified alert field values and compose alert fields from various values to generate alerts for tracking and remediation. If needed, use both event field mappings and alert rules.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following table compares a message received from a topic and a flattened payload in the event **Additional info** field. The message received from a topic is flattened as a single field and appears in the event **Additional info** field. Use these flattened messages to create event rules and mappings.

Actual versus flattened payload

Actual Payload inserted into a topic	Flattened payload in the Additional Info field

Actual Payload inserted into a topic	Flattened payload in the Additional Info field

<pre>}</pre>	<pre>"flattened.groups.0.Group": "GroupA",
	"flattened.groups.0.Result": 12296.815478000368,
	"flattened.trigger.Result": 12296.815478000368
	}</pre>

Procedure

1. To map the Kafka message attributes to the predefined alert fields to generate alerts by creating event field mappings.
   a. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
   b. In the Event Field Mapping window, select **New**.
   c. In the Name field, enter a name for the field mapping.
   d. In the Source field, enter **Kafka Consumer**.
   e. In the Mapping type field, select the appropriate mapping type
   f. For a list of the available mapping types, see Event Field Mappings.
2. To map the Kafka message attributes to the predefined alert fields to generate alerts by creating event rules.
   a. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
   b. Select **New** .
   c. In the Name field, enter a name for the event rule.
   d. In the Source field, enter **Kafka Consumer**.
   e. Select **Event Filter**.
   f. Enter the appropriate filter according to your requirement.
   g. Select **Transform and compose alert output**.

   When creating event rules, the event fields are displayed in the Event Rules Transform and Compose Alert Output tab. Because the Kafka message varies from user to user, you must transform the event fields to the alert fields to see the details in the alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Because the severity value is required to create an alert, you must map the **Severity** field using event rules or event field mappings. If the Severity field is empty, the event isn't processed and enters into an error state.

h. Map the fields of the event and **Additional Info** field to the fields of the alert.

i. Select **Binding**.

j. Enter the appropriate binding according to your requirement.

k. Select **Submit**.
For more information, see Create or edit an event rule.

3. In the All Events screen, check whether any of the events from Kafka are in an error state due to a missing event rule and provide missing rules.

a. Navigate to **All** > **Event Management** > **All Events**.

b. In the All Events table, open any Kafka consumer event that shows Error as the state in the **Severity** column.

The message received from the Kafka consumer can vary. Because the connector cannot know the attributes that will be received, you must map the **Severity** field or other event fields to the fields in the message to ensure that alert fields are correctly populated.

c. On the All Events screen, create a new event rule by selecting **Create Event Rule**.
For more information on creating event rules, see Event Rules.

If no event field mappings exist to handle the new type of event, create event field mappings.
For more information, see Create event field mappings.

Result

Your Apache Kafka consumer connector is configured. When new messages arrive into the Kafka topic, they are received into the ServiceNow instance as events, and alerts are then created from those events.

Configure SAP Solution Manager connector

Configure the SAP Solution Manager (Solman) connector instance to enable communication between the SAP Solution Manager and Event Management.

Before you begin

Role required: admin
Supported versions: Tested on SAP Solution Manager 7.2. Might also work on other versions.

About this task

This configuration enables you to update the SAP Solution Manager with the statuses that have been updated by ServiceNow. For general information about the SAP Solution Manager, see SAP configurations enabling the SAP Solution Manager connector.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Fill in the fields on the form.

Connector instance form

Field	Description
Name	Descriptive name for the SAP Solman connector.
Description	Description for the use of the SAP Solman event collection instance.
Active	Option that activates the connector instance. Select this option only after running a successful test.
Connector definition	The vendor and protocol used to gather events from the external event source. Select **SAP Solman**.
Host IP	The IP address where SAP Solman is installed.
Credential	Required credentials entered either by selecting them from the results of a search through the search icon or by clicking **New**. or creating them. If you create credentials, save them using a unique and recognizable name, such as SAPSOLMANOPS.
Event collection last run time	The last run time value. Automatically updated.
Last event collection status	The last run time status. Automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from SAP Solman.
Bi-directional	Ensure that you select this option to invoke the bi-directional exchange of values to-and-from the external event source. The **Last bi-directional** status option appears only when selecting this option.
Last bi-directional status	This field appears only when **Bi-directional** is selected. This field is automatically populated with the most recent bi-directional status.
Last error message	Last error message. Automatically updated.
Connector Instance Values section	The parameters that are specific to SAP Solman, automatically displayed when saving the form.
MID Servers (MID Server for Connectors section)	MID Server that is up and valid. You can configure several MID Servers so that if the first server is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order in which their details are entered into the MID Server for Connectors section. If no MID Server is specified, an available MID Server that has a matching IP range is used.

4. Right-click the form header and select **Save**.

   The connector instance values are added to the form and the parameters that are relevant to the connector appear.

5. In the Connector Instance Values section, specify the default connector instance values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Client**: Default value = `001`
- **Port**: Default value = `8000`

6. Right-click the form header and select **Save**.
7. Click **Test Connector** to verify the connection between the MID Server and the connector. If the test fails, follow the instructions in the error message and then run another test.

   Note: Use a network tool such as *`ping`* to verify the credentials and the network connectivity from the MID Server to the SAP Solman monitor.

8. After a successful test, select the **Active** check box and click **Update**.

Use the SAP Solution Manager Push connector

SAP configurations enabling the SAP Solution Manager connector

Configure your SAP environment to work with the ServiceNow Event Management platform so you can use the SAP Solution Manager connector.

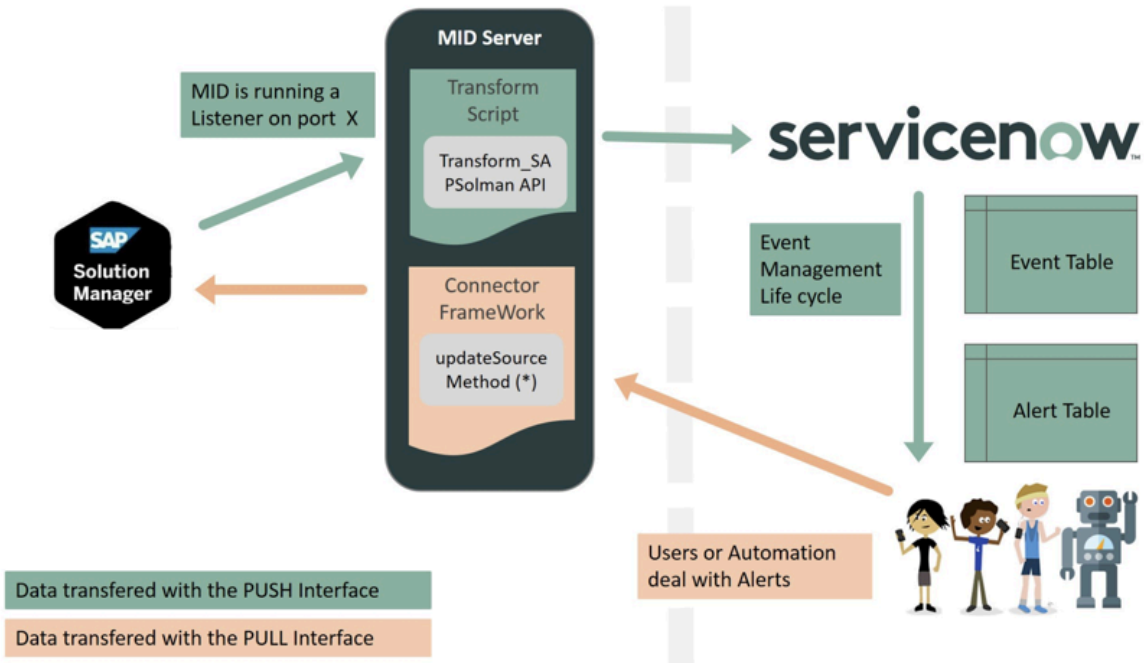
When integrating your SAP environment with Event Management, the SAP Solution Manager sends events through a MID Server to Event Management, which generates an alert from the event.

After the MID Server processes events, you can perform the following actions in the SAP Solution Manager:

- Add comments
- Confirm alerts
- Set status to **Externally Managed**

The following diagram illustrates the flow of data between SAP and Event Management.

SAP Solution Manager connector



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data moves between SAP and Event Management using both Push and Pull interfaces.

- **Pull interface**:

  The Connector Update Queues table [em_connector_update_queue] lists manual updates of alerts and sends them to the SAP Solution Manager.

  The table's business rule identifies each manual update of alerts in Event Management and updates the connector queue with these changes. By default, changes to all alert fields are tracked. For information on adjusting this setting, see the SAP Solution Manager documentation.

  The Event Management - Queue connector processor scheduled job removes alert changes from the queue and sends them to the MID Server. By default, the system performs this process in batches of 1,000 alerts. You can customize this batch size by setting the *evt_mgmt.max_update_source_records* property.

  Note: You must define the Pull interface to enable bi-directional functionality in the SAP Solution Manager connector. For details, see the SAP Solution Manager documentation.

- **Push interface**: Because SAP can only push data to an external source, the integration uses the Push interface to store alerts sent from SAP to Event Management.

  SAP alerts create events in Event Management that use both event rules and CI identification rules to create Event Management alerts.

  After Event Management creates alerts, a business rule listens for a change to the alert. If it detects a change, Event Management updates the SAP Solution Manager alerts.

Event Management Integrations

Use the SAP Solution Manager Pull connector

Use the SAP Solution Manager Pull connector

The SAP Solution Manager Pull connector sends information from Event Management to the SAP Solution Manager. The Pull connector sends responses received from a Push connector in a bi-directional environment.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Event Connectors (Pull)** > **Connector Instances**.
2. Click **New**.
   The **Connector Instance New Record** page appears.
3. Enter values in the required fields, which are indicated by a red asterisk.

Field	Description
Name	Descriptive name for the connector.
Connector definition	Search for and select **SAP Solution Manager**.
Credential	Select **Basic auth** for basic authentication.

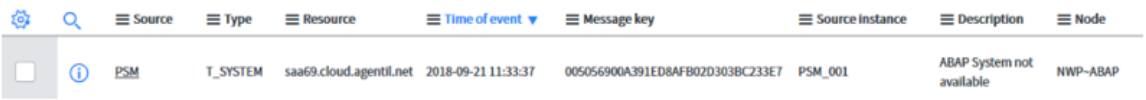
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Host IP	The SAP Solution Manager IP address.

The Connector Update Queues table [*em_connector_update_queue*] lists manual updates of alerts and sends an event to the SAP Solution Manager, using the Pull interface.

Note: When adding bi-directional functionality for a Push connector, the Connector Instance name must match the Source Instance field of the event generated by that source. The **Connector Instance** field value is a combination of `SID + _ + Mandant`.

For example, the following image displays an event generated by the instance source **PSM_001**. To enable sending information back, you would have to name your connector instance **PSM_001**.



4. Set the following values for the connector instance:
   - **Client**: Represents the client value in SAP, usually 001.
   - **Port**: The SAP Solution Manager WebService port. Default value = 8000.

The following table lists the actions you can perform in Event Management, and the resulting updates occurring in SAP Solution Manager.

Event Management actions and SAP Solution Manager updates

Action in Event Management	Result in SAP Solman
Close an alert.	Confirms an alert in the alert inbox. The alert is removed.
Select the **Maintenance** setting in an alert.	Adds a comment indicating that the alert is in Maintenance mode.
Clear the **Maintenance** setting in an alert.	Removes the Maintenance mode comment.
Select the **Acknowledged** setting in an alert.	Adds a comment indicating that the alert is in the Acknowledged mode.
Clear the **Acknowledged** setting in an alert.	Removes Acknowledged mode comment.

Note the following behaviors:

- The Update queue business rule in the Alert table identifies each manual update of the alert and updates the connector queue accordingly. By default, changes to all alert fields are tracked.
- The Event Management — Queue Connector Processor job removes alert changes from the queue and sends them to the MID Server. By default, Event Management performs this dequeue process in batches of 1,000 alerts. You can configure the batch size by setting the `evt_mgmt.max_update_source_records` property.

Use the SAP Solution Manager Push connector

The MID Server web service Event Collector enables you to collect alerts sent from the SAP Solution Manager through event stream notification capabilities. The interface runs both a Push and a Pull interface to interact directly with the SAP Solution Manager.

Before you begin

- Deploy and start the MID Server.
- Configure and start the MID Web Server.
- Configure and start the MID Server web service Event Collector.

Role required: evt_mgmt_admin

About this task

SAP Solution Manager sends JSON formatted event messages to the MID Server. The MID Server parses the collected alert messages and transforms them using the SAP Solman Transform [*TransformEvents_SAPSolman*] script.

JSON formatted messages are collected using basic authentication. For details on other supported authentication methods, see Configure the MID Web Server extension.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Push connectors**.
2. Select the **SAP Solman Transform Script** script.
3. Use the following URL to push alert messages from SAP Solution Manager to the MID Server: `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_SAPSolman`, where the following are true:
   - **MID_Server_IP** is the IP address of the MID Web Server extension
   - **MID_Web_Server_Port** is the listening port of the MID Web Server extension

What to do next

Create an Remote Function Call (RFC) in the SAP Solution Manager and install a transport, as described in Configure RFC in SAP Solution Manager.

Related topics

Configuring MID Servers

Configure the MID Web Server extension

Configure the MID WebService Event Collector Context

SAP Solution Manager setup configurations

As part of the SAP Solution Manager setup, you must perform several configurations to enable SAP Solution Manager to interact with Event Management.

Configure RFC in SAP Solution Manager

As part of enabling communication with Event Management, you must create a Remote Function Call (RFC) in the SAP Solution Manager and install a transport.

Before you begin

Role required: evt_mgmt_admin

Download the following .psm files and import them into the SAP Solution Manager system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- https://downloads.docs.servicenow.com/resource/enus/cad/K900249.PSM
- https://downloads.docs.servicenow.com/resource/enus/cad/R900249.PSM

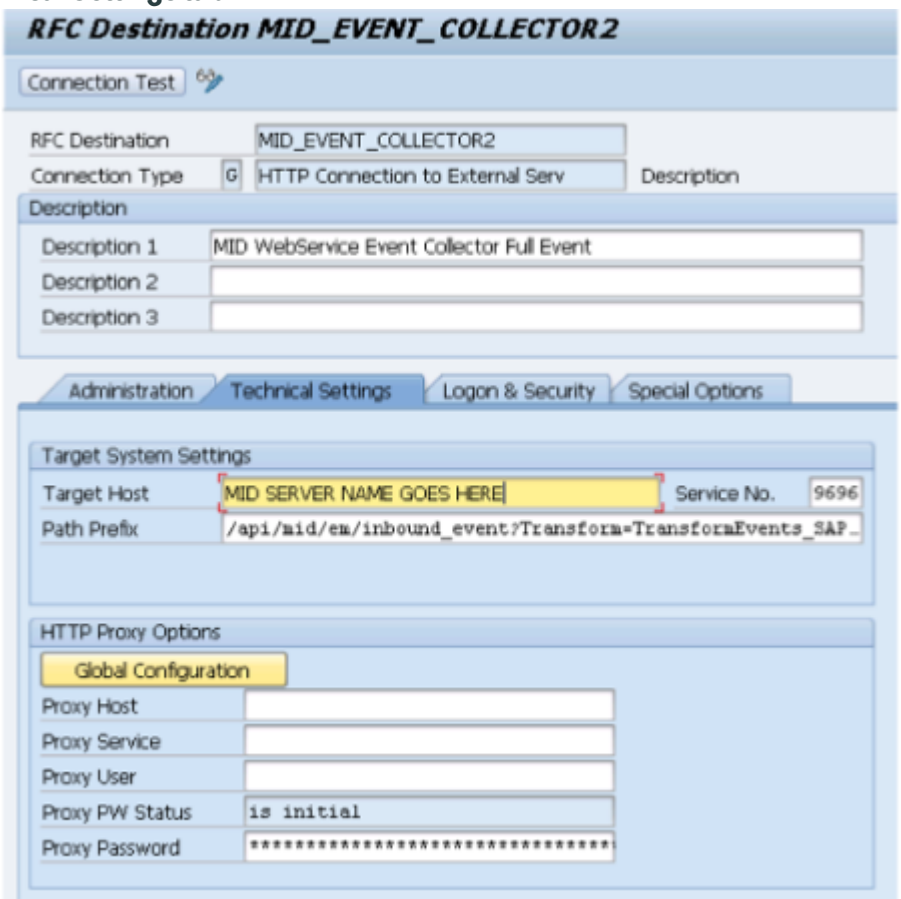
Procedure

1. On the SAP UI, enter the transaction code `SM59` and create a new RFC with the following parameters on the **Technical Settings** tab:

RFC parameters

SAP Parameter	Value
Target Host	Name of the MID Server.
Service No	Listener port on the MID Server
Path Prefix	The URL of the MID Server transform script: `/api/mid/em/inbound_event?Transform=TransformEvents_SAPSolman`

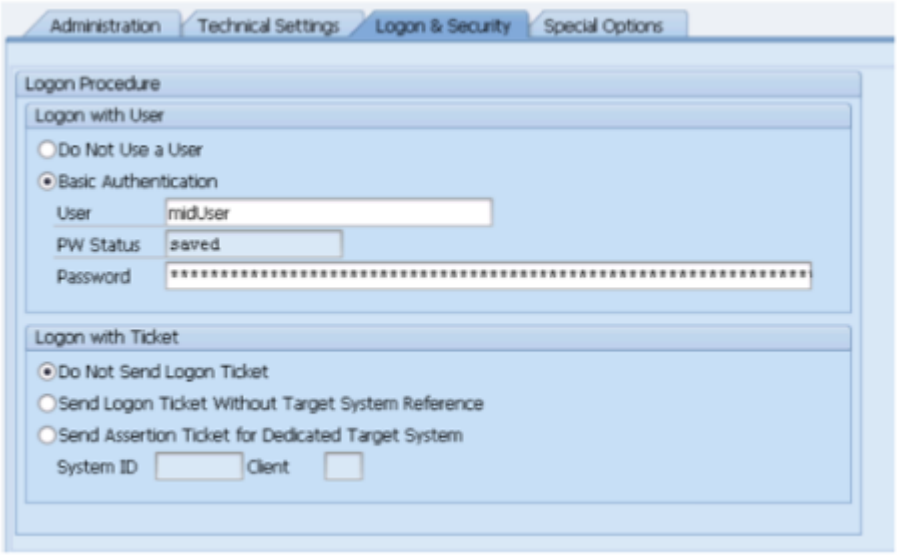
Technical Settings tab



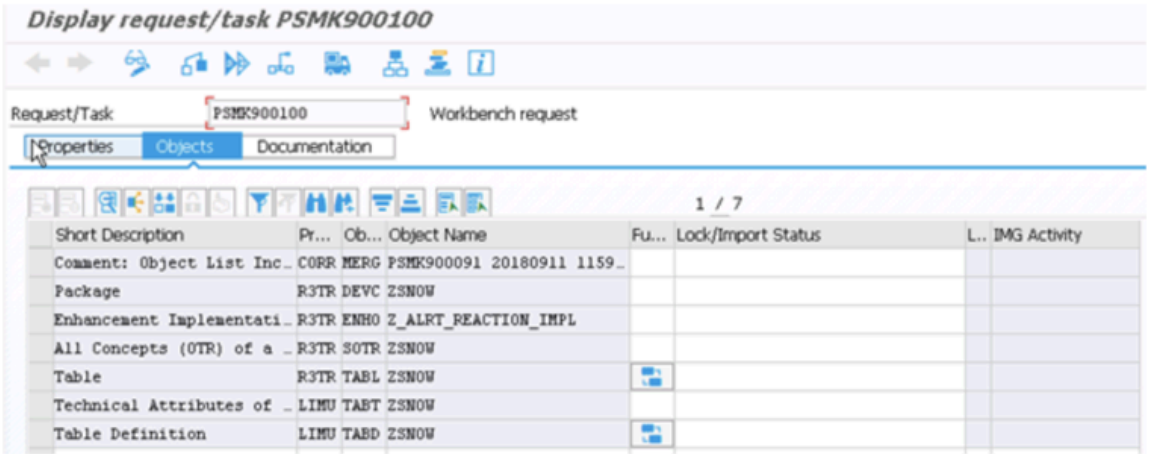
2. On the **Logon & Security** tab, select **Basic Authentication** and enter your Event Management logon credentials in the **User** and **Password** fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Logon & Security tab



A custom SAP BADI (Business Add-in) named Z_ALRT_REACTION_IMPL is created and stored as a workbench transport request. After installation, this BADI calls the RFC to connect to Event Management.



Configure SAP to forward alerts to your BADI

After setting up SAP Solution Manager monitoring, you must configure SAP to forward alerts to the BADI (Business Add-in) you create as the first step in the SAP integration setup.

Before you begin

Role required: evt_mgt_admin

About this task

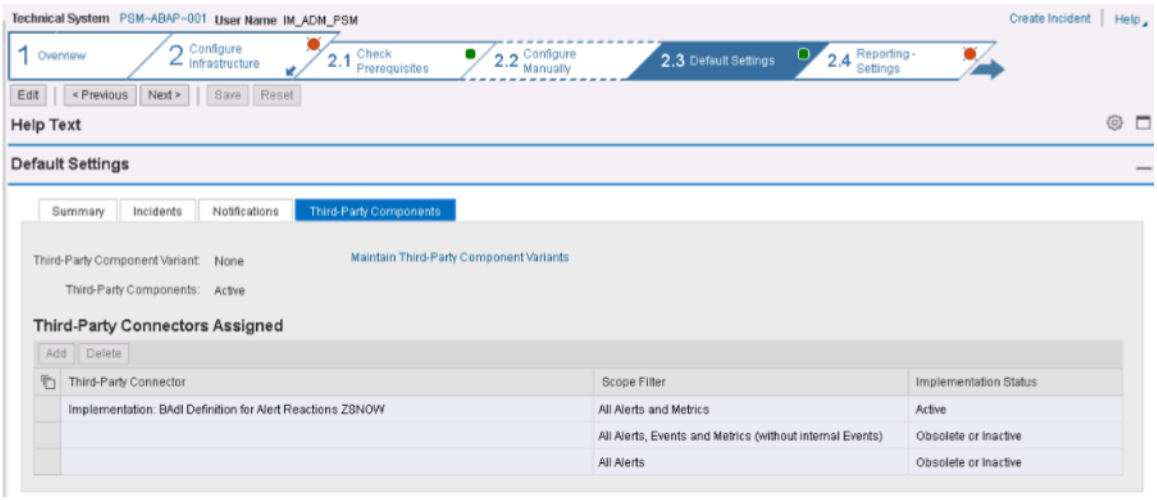
Third-party alerts get forwarded globally. You can configure the alert reaction only for a specific monitoring template.

Procedure

1. On the SAP UI, navigate to **Application Operations** > **System Monitoring**.
2. In the ribbon at the top of the System Monitoring configuration page, select **2 Configure Infrastructure** > **2.3 Default Settings**.
   The **Default Settings** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default Settings page



3. Configure and activate a third-party component.
   a. Enter edit mode by clicking the **Edit** button.
   b. Select the **Third-Party Components** tab.
   c. Click **Add** and add the following value as the third-party connector: `Implementation: BADI Definition for Alert Reactions ZSNOW with scope = All Alerts and Metrics`.
   d. Click **Save** to activate third-party components globally.
4. Define the objects to which the monitoring template will be assigned.
   a. In the ribbon at the top of the page, select **5 Define Scope**.
   The Define Scope page appears.

   b. Select the managed object to which you want to assign the monitoring template.
   The monitoring template is assigned to the selected objects.

5. Reactivate the monitoring of templates.
   a. Select ***6 Setup Monitoring***.
   b. Search for and locate entries with **Setup Status = Reconfigure Required** and assign the monitoring template to those entries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Apply** and **Activate**.
When the jobs finish, verify that the **Assignment Status** is green.
All templates and active alerts assigned to the selected objects use the new forwarding method.

What to do next
View alerts generated in SAP Solution Manager to see any pressing issues, as described in View alerts in the SAP Solution Manager inbox.

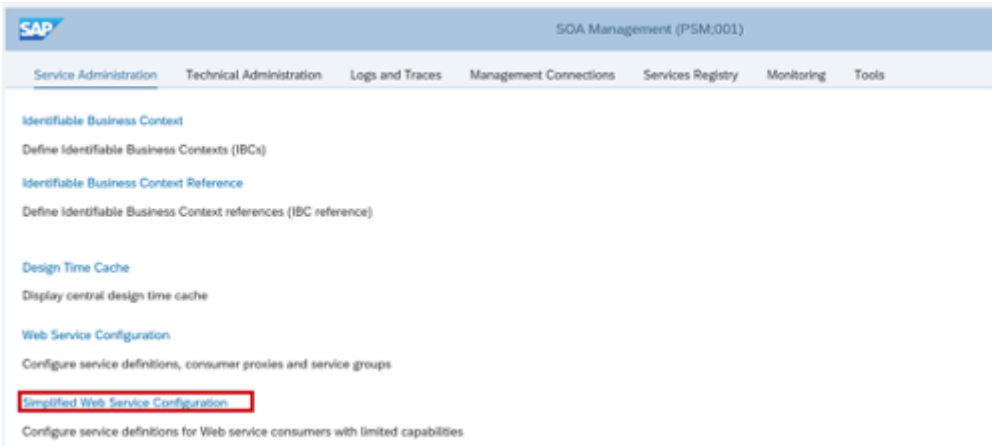
Configure the alert inbox in SAP Solution Manager

Configure SAP solution manager to retrieve alerts in the system by enabling the alert inbox with the SOA manager.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to SOA MANAGER in your solution manager: `/sap/bc/webdynpro/sap/appl_soap_management?sap-client=XXX&sap-language=EN#`
2. Select **Simplified Web Service Configuration**, then validate the form to activate the service.
You must use simplified mode else the resulting web services is different with other modes and not compatible with the connector.



3. Select **Search**.
4. Check the row with the creation type **Simple consumer related**.
If anything goes wrong, check Configuring a Service Provider (Simplified)

What to do next
View alerts generated in SAP Solution Manager to see any pressing issues, as described in View alerts in the SAP Solution Manager inbox.

View alerts in the SAP Solution Manager inbox

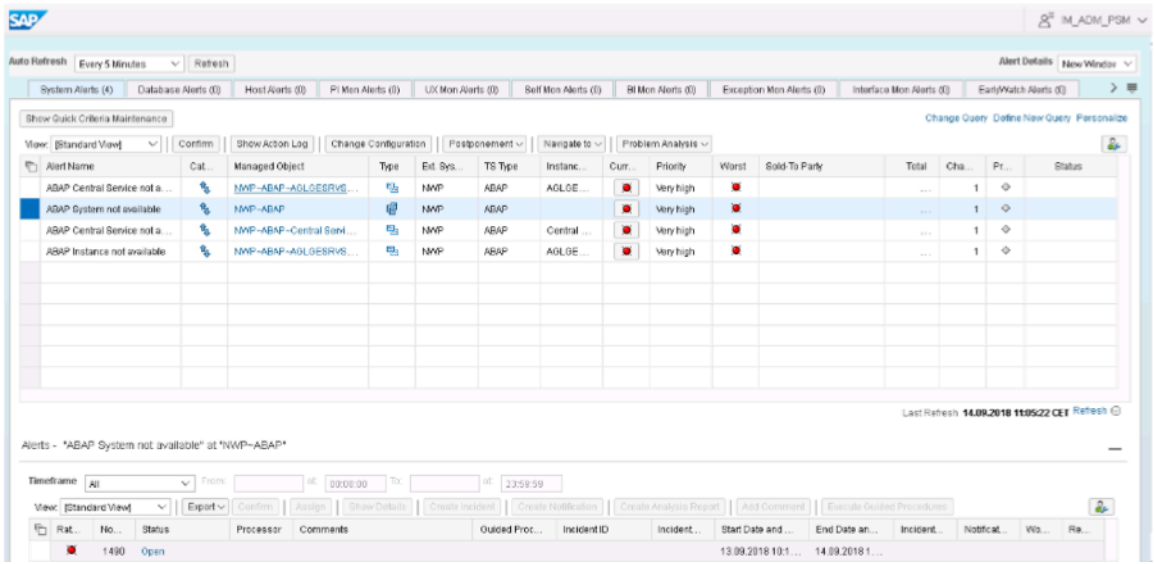
You can view alerts generated in SAP Solution Manager to see any pressing issues. All alerts also forward to Event Management automatically.

Before you begin
Role required: evt_mgt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

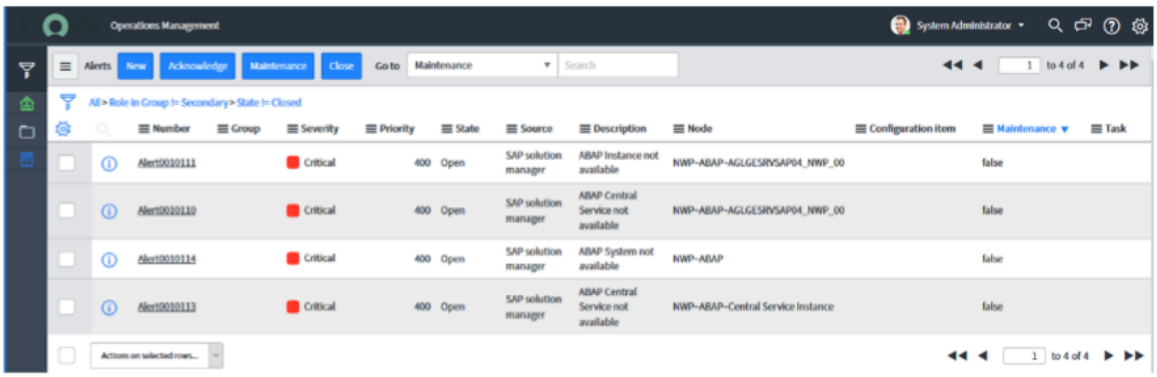
Procedure

1. On the SAP UI, open Solution Manager and select the **System Alerts** tab.



The system alerts are listed on the page.

2. Navigate to (**Event Management** > **All Alerts)** to view the alerts in Event Management.



The following table describes the field mapping between SAP Solution Manager and Event Management for alerts.

Field mapping for SAP Solution Manager and Event Management

SAP Field	Event Management Field	Description
severity	severity	SAP uses a number from 1 (less critical) to 9 (more critical)
message_key	message_key	SAP message group ID, messageGUID
description	description	Event description
source	source	SAP system ID
managed_object_type	type	The type of the object, such as Host or Instance
node	node	Object name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAP Field	Event Management Field	Description
managed_object_name	resource	Solution manager node name
N/A (there is no value provided by SAP. Event Management generates the indicated field.)	source instance	The event class must match the connector pull instance name, with the structure <Source>_<Client>.
source	additional_info.sid	SAP system ID
rating	additional_info.rating	Event color in SAP
resource	additional_info.mandant	SAP mandant
metric_name	metric_name	Metric name for the SAP event
time_of_event	time_of_event	Time of event in SAP

Example: High CPU Usage on SAP Host

Scenario: An alert is generated in SAP Solution Manager when the CPU usage on a critical host exceeds 90% for more than 10 minutes.

SAP Solution Manager Alert

Field	Value
Severity	8 (Critical)
Message Key	CPU_Overload_12345
Description	High CPU usage on SAPHost01
Source	SAP_Prod
Type	Host
Node	SAPNode_01
Time	2024-07-31T14:23:00Z

Here's how the alert is mapped in Event Management:

Mapped Event Management alert

Field	Value
Severity	8
Message Key	CPU_Overload_12345
Source	SAP_Prod
Type	Host
Node/Resource	SAPNode_01
Source Instance	SAP_Prod_100
SID	SAP_Prod
Rating	Red

Mapped Event Management alert (continued)

Field	Value
Mandant	100

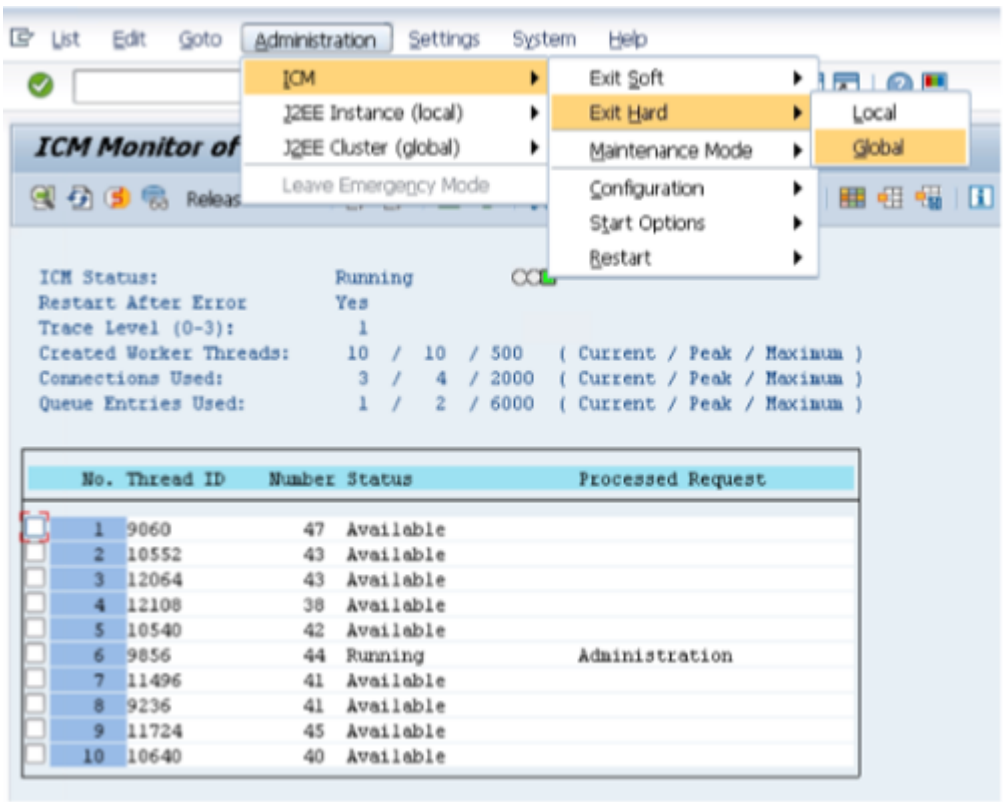
View and update your SAP Solution Manager certificate

View your SAP Solution Manager certificate, and update the certificate if necessary.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Connect to SAP on client 00.
2. Enter the `strust` transaction.
3. In the Trust Manager UI, open the SSL client.
4. Import the SSL certificate and save it.
5. Use the `smicm` transaction to enable the system to work with both HTTP and HTTPS clients.
6. Navigate to **Administration** > **ICM** > **Exit Hard** > **Global**.



The ICM module restarts.

View the SAP interface log

View the SAP interface log to help you debug issues.

Before you begin
Role required: admin

Configure alert collection from SCOM

Alerts from the Microsoft System Center Operations Manager (SCOM) are collected using the SCOM connector instance.

Before you begin
Role required: evt_mgmt_admin

About this task
The SCOM connector instance requires configuration before receiving alerts and Metric Intelligence raw data from the SCOM server. You can limit the collection of SCOM alerts to only those alerts that belong to the SCOM group that you specify.

Procedure

1. Configure the SCOM connector instance.
2. Configure the Microsoft System Center Operations Manager (SCOM) connector instance to receive alerts and Metric Intelligence raw data from the SCOM server.
3. Limit collected SCOM alerts to specific SCOM groups.

Configure the SCOM connector instance

Configure the Microsoft System Center Operations Manager (SCOM) connector instance to receive alerts and Metric Intelligence raw data from the SCOM server.

Before you begin
To activate **Metric Collection**, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

Windows authentication is used by the connector to access the SCOM database (OperationsManagerDW). Therefore, if **Metric Collection** is selected and the **Database login with Windows authentication** option is also selected, ensure that the MID Server service runs with a user having read access to the SCOM database. Ensure that the correct credentials are used:

1. In the local services, select and hold (or right-click) the MID Server service and select **Properties**.
2. In the **Log On** tab, ensure that **This account** is selected. Include the details of the Windows domain user that has read access to the SCOM database.

Before starting the procedure to configure the connector, ensure that:

- The MID Server is running with a user that has local admin permissions to enable the MID Server to run PowerShell.
- The MID Server user has read access to the SCOM API.
- The MID Server resides in the same domain as the SCOM server.
- The MID Server uses the same time zone as the SCOM server.
- The MID Server is running on Windows.
- The MID Server has .NET framework version 3.5.

If **Bi-directional** is selected, ensure that:

- PowerShell version 3.0 is installed on Windows.
- The MID Server is running with a user that has local admin permissions to enable running PowerShell.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To upgrade an existing SCOM connector:

1. On the Connector Instance - SCOM connector page (**All** > **Event Management** > **Integrations** > **Connector Instances**), clear the **Collect Metrics** check box.
2. Install the *em-connectors* plugin from the store.

Role required: evt_mgmt_admin

About this task

To receive SCOM alerts, you can obtain the redistributable SCOM files from your SCOM application. Add the files to the MID Server, and then configure a SCOM connector instance to collect the alerts and Metric Intelligence raw data.

The collection of Metric Intelligence is performed using JavaScript running JDBC in place of PowerShell.

You can also use this setup for the SCOM managed instance on Azure.

This connector has the *logPayloadForDebug* log parameter enabled, which logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

Supported versions:

- 2007 – version 6.1.7221.0
- 2012 – version 7.1.10226.0
- 2016 – version 7.2.117190 and 7.3.13261.0
- 2019 – version 10.19.10050.0
- 2022 – version 10.22.10118.0

Procedure

1. On the SCOM server, download the following files to a local computer.

Version	SCOM path and library names
SCOM 2012R2 or SCOM 2012	`%ProgramFiles%\Microsoft System Center 2012 R2 or 2012\Operations Manager\Server\SDK Binaries` ○ `Microsoft.EnterpriseManagement.Core.dll` ○ `Microsoft.EnterpriseManagement.OperationsManager.Common.dll` ○ `Microsoft.EnterpriseManagement.Runtime.dll`

Version	SCOM path and library names
SCOM 2025	○ `Microsoft.EnterpriseManagement.Core.dll` ○ `Microsoft.EnterpriseManagement.OperationsManager.dll` ○ `Microsoft.EnterpriseManagement.OperationsManager.Common.dll` ○ `Microsoft.EnterpriseManagement.Runtime.dll` **Note:** The MID Server must be installed with .NET 4.6 or higher.

Note: A connection cannot be made to SCOM 2012/SCOM 2016/SCOM 2019/SCOM 2022 and SCOM 2007 from the same MID Server. To work with both SCOM 2012/SCOM 2016/SCOM 2019/SCOM 2022 (any of them) and SCOM 2007 in your instance, do the following before uploading files to your instance:

a. Append .2012 to the end of the `Microsoft.EnterpriseManagement.OperationsManager.dll` file, so it becomes: `Microsoft.EnterpriseManagement.OperationsManager.dll.2012`. Do this for 2012/2016/2019/2022.

b. Append .2007 to the end of the `Microsoft.EnterpriseManagement.OperationsManager.dll` file found in the 2007 path.

Using these modified file names enables the relevant MID Server to load the applicable DLL when both SCOM versions are deployed. Do not append 2007 to the `Microsoft.EnterpriseManagement.OperationsManager.Common.dll` file (for SCOM 2007).

At any given time, you can define connectors of either SCOM 2007, SCOM 2012/2016, or SCOM2019. Since SCOM 2012 and SCOM 2016 use the same library files, they are able to work at the same time. Although, SCOM 2019 uses the different SCOM DLL files so you cannot configure SCOM 2012, 2016, and 2019 all together. Each SCOM connector can use the database of another connector, for metric support.

2. Navigate to **MID Server** > **JAR Files**.
3. Select **New** and add a separate record for the SCOM version for each of the DLL files that you downloaded from the SCOM server.

   a. In the **Name** field, specify the SCOM version and an identifier to make the name unique, for example `2012 1`.
   If you are using SCOM 2016, specify 2012 as the version.

   b. Select the paper clip icon in the form header and then attach one of the appropriate DLL files that you downloaded.

   c. Select **Submit**.

4. Repeat step 3, creating a separate record for each of the remaining DLL files.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ensure that you have a unique identifier after the SCOM version for each file that you attach, for example `2012_2`.

5. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
6. Click **New** and create a new connector instance.
   For details on the connector instance fields displayed on the page, see SCOM connector instance form.
7. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
8. In the Connector Instance Values section, you can edit the values of the mandatory SCOM parameters.

   a. **login_with_windows_authentication** Default value: **false**.
   Set to **true** to enable SCOM event collection and the bi-directional exchange of event values to work with Windows authentication.

   When invoking this value, ensure that you do the following on the MID Server:

   i. Navigate to the list of local services, select and hold (or right-click) the MID Server service, and select **Properties**.

   ii. In the **Log On** tab, ensure that **This account** is selected with the details of the user in the Windows domain with read access to the SCOM database.

   b. **metric_chunk_size**: Default value: 50000.

   c. **scom_date_format**: Default format: M/d/yyyy/ h:mm:ss a
   If you receive an event whose date is in a different format, modify this value to match the format of the incoming event. If you do not, the event does not process correctly.

   For example, if an event arrives on June 27, 2019 at 11:25 AM with a listed date of `2019/06/27/ 11:25:00 a`, modify the **scom_date_format** value to `yyyy/M/d/ h:mm:ss a` to match the format of the received event.

   In **scom_date_format**, `a` represents AM, and `p` represents PM.

   d. **scom_initial_sync_in_days**: Default value: 7.

   e. **scom_version**: It is mandatory to specify the SCOM version.
   Select from 2022, 2019, 2016, 2012, or 2007.

   f. **stop_isMonitorAlert_bidirectional**: Boolean.
   Set to **true** to stop only SCOM monitoring alerts bi-directionally. Stopping SCOM monitoring alerts can prevent false alarms on the SCOM console when attempting to update the alerts. When set to **false**, SCOM monitoring alerts continue running bi-directionally for all types of SCOM alerts.

   Default value = false.

9. Select and hold (or right-click) the form header and select **Save**.
10. Restart the MID Server service to copy the files.
11. Select **Test connector** to verify the connection between the MID Server and the connector.
    If the test fails, correct the problem by following the instructions issued by the error and then run another test.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to SCOM.

12. After a successful test, select the **Active** check box and then select **Update**.

Note:

The default binding rules that contain SCOM as the external source, that applies to IT alerts and Metric Intelligence raw data, are the following SCOM Management Packs:

- All OS Management Packs
- MS SQL Server
- IIS

Example:
If bi-directional is configured, the bi-directional exchange of values to-and-from the external event source is enabled.
These scenarios describe the default bi-directional functionality for SCOM connectors:

- When an alert is resolved in SCOM, it is auto-closed in ServiceNow. However, it is updated irrespective of the bi-directional feature because during each collection cycle, all alert changes are updated.
- When an alert is manually closed in ServiceNow, it is auto-closed in SCOM. If the alert state is changed to **Reopen**, SCOM is also updated.
- When an incident is created and associated to an alert in ServiceNow, SCOM receives the incident number as a ticket ID. However, the state of the incident is not available on SCOM. Therefore when the incident is resolved in ServiceNow, SCOM is not updated as the incident number remains the same. When the alert is associated with a new incident, the new incident number is updated in SCOM.

Limit collected SCOM alerts to specific SCOM groups

Limit the collection of SCOM alerts to only those alerts that belong to the specified SCOM group.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Use the SCOM Authoring workspace and Operations console to define a SCOM group and ensure that the group contains the required computers or instances.
   For further information about SCOM groups, see the SCOM documentation.
2. Create a role that has a scope of the SCOM group.
3. Add the new role to the SCOM user.
4. Assign the role to the user defined in the credentials given to the SCOM connector instance.
5. Remove all other roles from the user.

Result
Only alerts from the specified SCOM group arrive at the instance.

SCOM metric event rules

The base system comes with Microsoft System Center Operations Manager (SCOM) metric event rules. SCOM metric event rules bind event metrics to configuration items (CIs).

When an event's metrics match the event filter conditions, the metrics bind to the indicated CI. The event rules that come with the base system are:

Base system metric event rules

Rule Name	CI type
SCOM Metrics - Windows Server	cmdb_ci_win_server
SCOM Metrics - IIS Web Server	cmdb_ci_microsoft_iis_web_server
SCOM Metrics - SQL Server Reporting Services	cmdb_ci_db_mssql_reporting
SCOM Metrics - MS SQL Database	cmdb_ci_db_mssql_database
SCOM Metrics - MSFT SQL Instance	cmdb_ci_db_mssql_instance

You can create a custom event rule to bind metrics with other CI types. For details, see Create or edit an event rule.

If the event rule filter doesn't match, the default rule, *SCOM Metrics - Default* (CI type = *cmdb_ci_hardware*) is invoked. The order number of the default event rule must be higher than the order number of any SCOM event rules (both those that come with the base system and any custom rules), so that all other rules are checked for matching before invoking the default rule. For details on event rules, see Event rules.

Configure event collection from SolarWinds monitor

Configure the SolarWinds monitor connector instance to receive events from the SolarWinds monitor.

Before you begin

Supported versions:

- SAM 6.2.1
- NPM 2024.1

Note: The SolarWinds monitor connector instance can import events from:

- Network Performance Monitor (NPM)
- SolarWinds Service & Application Monitor (SAM)

The SolarWinds monitor connector instance requires a credential that lets the instance access SolarWinds monitor accounts. You can use an existing credential or create a new one. The provided user must have access to the SolarWinds API to receive events from the SolarWinds connector.

Role required: evt_mgmt_admin and evt_mgmt_integration

About this task

This connector has the *debug* and *logPayloadForDebug* log parameters enabled. The *debug* parameter logs debug messages, such as calls made to the source system to retrieve events. The *logPayloadForDebug* parameter logs event and metric payloads from the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Field	Description
Name	Type a descriptive name for the SolarWinds monitor connector.
Description	Type a description for the use of the SolarWinds monitor event collection instance.
Connector Definition	Select **Solarwinds_v2**.
Host IP	Specify the SolarWinds monitor IP address.
Credential	Select the credential with basic authentication that you created for this connector. For more information, see Create SolarWinds monitor credentials.
Event collection last run time	The last run time value of the scheduled job. This field is updated automatically.
Last event collection status	The last event collection status. This field is updated automatically.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the SolarWinds monitor server.
Last error message	The last error message received by the connector is automatically updated.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
5. In the Connector Instance Values section, specify these fields:

Field	Value
initial_sync_in_days	Specify how many days the initial pull must contain to retrieve events. The default value is 7 days.
nodes_custom_properties	Specify the SolarWind monitor property names that are associated with the relevant node. This information is added to the **Additional Information** field of the event in JSON format. The SolarWinds monitor custom properties are user-defined fields, for example, country, building, or serial number, that you can associate with monitored network objects. Separate multiple entries with a comma.
port	Specify the value of the port. By default, the value is 17774.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	Note: For version 2023.1 and above, the port is 17774.
queryAlertTable	A boolean toggle that determines the source table for event queries. Setting the value to **false** queries the Orion.Event table, while setting it to **true** queries the Orion.AlertHistory table. Default: false

6. **Optional:** Name of a MID Server.
   If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section. The privileges that are required for the user account that is used for the MID Server to collect events from SolarWinds monitor is that of evt_mgmt_integration.
7. Click **Test connector** to verify the connection between the MID Server and the SolarWinds monitor connector.
   If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.

   Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to SolarWinds monitor.

8. After a successful test, select the **Active** check box and then click **Update**.

Configure a pull connector

Create SolarWinds monitor credentials

Create a Basic Auth credential in ServiceNow to store the SolarWinds user name and password that the SolarWinds monitor connector uses to access the SolarWinds API.

Before you begin

- Role required: evt_mgmt_admin
- Make sure that you have a SolarWinds account with access to the SolarWinds API.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential. For example, you might call it `SolarWinds authentication`.
User name	Enter the user name of the SolarWinds account that the connector uses to access the SolarWinds API.
Password	Enter the password for the SolarWinds account.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Click **Submit**.

Result
The credential for use with the SolarWinds monitor connector is created.

Configure event collection from vCenter

Configure the VMware vCenter Server (vCenter or vCenter_V2) connector instance to receive events from your VMware vSphere environment.

Before you begin
Events collected by this connector are events that match the vCenter ESX Servers event rule. Supported version: 7.0.2.00500.

Role required: evt_mgmt_admin

About this task
Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

This connector has the *debug* and *logPayloadForDebug* log parameters enabled. The *debug* parameter logs debug messages, such as calls made to the source system to retrieve

events. The *logPayloadForDebug* parameter logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

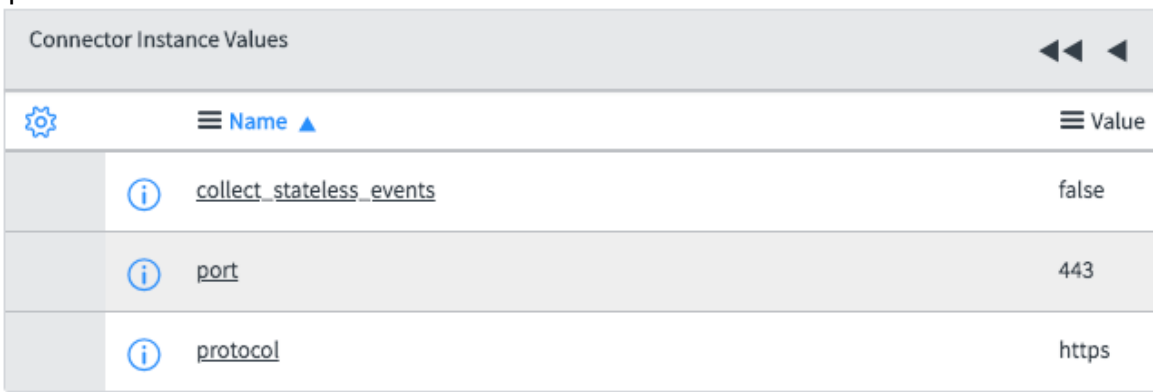
Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Connector Instance form

Field	Description
Name	Descriptive and unique name for the vCenter connector.
Description	Description for the use of the vCenter event collection instance.
Connector definition	Name of the required connector definition. Select **vCenter** or **vCenter_V2** (vCenter_V2 is located in the Event Management connectors scope).
Host IP	IP address where vCenter is installed.
Credential	Permission to connect to vCenter. Click the search icon in the **Credential** field. Either select the required credentials from the list or click **New** and create the required credentials on the Credentials form. If you create the credentials, save them using a unique and recognizable name, for example, vCenterCHCK.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run status. Automatically updated.
Event collection schedule (seconds)	Frequency, in seconds, that the system checks for new events from vCenter. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.



5. In the Connector Instance Values section, specify the vCenter values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
collect_stateless_events	Events that have a status (stateful) are collected when this field is set to `false` (default). These events are of type AlarmStatusChangedEvent and AlarmClearedEvent. If this field is set to `true`, events of other types are collected as well.
port	Specify the value of the port. Default value: `443`.
protocol	Specify the protocol. Default value: `https`.

6. **Optional:** In the MID Servers for Connectors section, specify a MID Server that is up and is valid.
   If no MID Server is specified, an available MID Server that has a matching IP range is used.

   You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.
7. Right-click the form header and select **Save**.
8. Test the connection between the MID Server and the vCenter connector.

   a. Click **Test Connector**.
   If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

   > **Note:** Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the external monitoring tool.

   b. After a successful test, select the **Active** check box.
9. Click **Update**.

Configure event collection from vRealize

Configure the VMware vRealize Operations (vRealize or vRealize_V2) connector instance to receive events from the vRealize Operations Log and Event Management servers. vRealize uses basic authentication. vRealize_V2 uses token-based authentication.

Before you begin

Role required: evt_mgmt_admin

Supported version: 8.10.0.

> **Note:** Connect to vRealize using a local account with at least Read-only vRealize Operations permission. You can use an existing credential or create a new one.

About this task

This connector has the *debug* and *logPayloadForDebug* log parameters enabled. The *debug* parameter logs debug messages, such as calls made to the source system to retrieve events. The *logPayloadForDebug* parameter logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a vRealize Operations connector instance with the following details:

Field	Value
Name	Specify a unique name for the vRealize Operations connector instance.
Host IP	Specify the vRealize Operations IP address.
Credential	Select the credential with basic authentication that you created for this connector. vRealize_V2 uses token-based authentication providing that the user can generate the token. For more information, see Create vRealize credentials.
Schedule (seconds)	The frequency in seconds that the system checks for new events from vRealize Operations.
Description	Type a description for the use of the vRealize Operations connector.
Connector definition	The vendor and protocol used to gather events from the external event source. Select **vRealize** or **vRealize_V2** (vRealize_V2 is located in the Event Management connectors scope).
Last error message	The last error message is automatically updated.
Last run time	The last run time value is automatically updated.
Last run status	The last run time status is automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Parameters section, specify the values of the mandatory vRealize Operations parameters.

   a. **port**: Default value = `443`.

   b. **protocol**: Default value = `https`.

   c. **days_from**:
   Number of days worth of data to be pulled on the first event collection run. Default value = `14`. The **days_from** option is available only when using vRealize_V2.

5. Click **Test connector** to verify the connection between the MID Server and the vRealize Operations connector.

Credentials and connection information

Configure a push connector

You can configure listeners and connectors to push event information to the instance or MID Server.

Event Management receives external events through a push connector or script. If you are using a script to collect events, no configuration is required. All other methods of collecting events require configuration.

After event collection configuration, Event Management can collect events that are sent directly to the instance, or via the MID Server, SNMP trap, or email.

Note: Integrating with push connectors is only available by installing the Event Management Connector plugin from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Standard event form

All events must use a standard event form, regardless of how they arrive at the instance. For more information, see Event field format for event collection.

Event collection

Event Management facilitates communication and movement of data between external applications, data sources, services, and the ServiceNow AI Platform instance.

Event collection modes	Description
Provided by the base system	Listeners and connectors provided with the Event Management application: • AWS CloudWatch, see Integrate AWS platform as a data source. • Azure event messages, see Integrate Azure Monitor as an authenticated data source. • BMC TrueSight events, see Event collection from BMC TrueSight and BMC TrueSight_v2. • Datadog events, see Integrate Datadog platform events. • Dynatrace events, see Integrate Dynatrace platform events. • Google Cloud Platform (GCP) events, see Integrate Google Cloud Platform (GCP) events • New Relic events, see Integrate New Relic platform events. • Generic event collection through the MID Server. • Generic event collection through the instance. Where event messages are received in XML, you can base your script on the example XML transform script provided with the base system.
Via MID WebService	You can configure the MID WebService Event Collector to push event messages to the MID Server. For more information, see Pushing events to the MID Server using web service API.
Create your own content	You can configure your own listener: • Via MID WebServer API. See Pushing events to the instance using web service API. • Via Custom Transformation. See Event collection from custom payloads.
Via SNMP	SNMP listeners provided with the Event Management application: Generic SNMPv2. See Configure event collection for SNMP traps. In addition, you can create your own custom listener. See Integrate with push connectors.
Via Email	Email listener. See Configure event collection from email.

Configure ServiceNow Cloud Observability event collection

Integrate ServiceNow Cloud Observability with Event Management by adding a standard webhook in the ServiceNow Cloud Observability platform. Download the Event Management Connector plugin from the ServiceNow Store so you can integrate with ServiceNow Cloud Observability.

Before you begin

- Role required: evt_mgmt_integration

About this task

Authenticate ServiceNow Cloud Observability as a data source to enable Event Management to collect events from ServiceNow Cloud Observability. In your ServiceNow Cloud Observability platform, use a standard webhook to set your ServiceNow AI Platform instance as the rest endpoint.

Procedure

1. Create a CI.

> **Note:** Discovery for ServiceNow Cloud Observability services is not supported. Create a CI manually in a ServiceNow instance (cmdb_ci_service_auto table) to enable binding.

a. Navigate to **All** > **Configuration** > **Application Service**.

b. Select **New**.

c. In the form, enter the name.
The name must be the service name provided in the ServiceNow Cloud Observability platform.

d. From the Operational Status list, set the operational status to **Operational**.

e. Select **Next**.

f. Select **Done**.

2. In your ServiceNow Cloud Observability platform, create a notification destination.

a. From the navigation bar, click#**Alerts**.

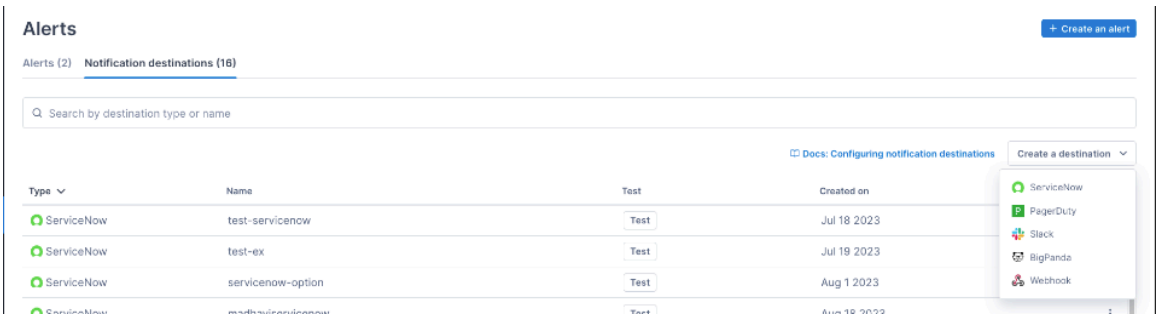
b. Select the#**Notification destinations** #tab.

c. Select#**Create a destination**.

d. Select **webhook**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select Webhook



e. In the Name field, enter a name for the webhook.

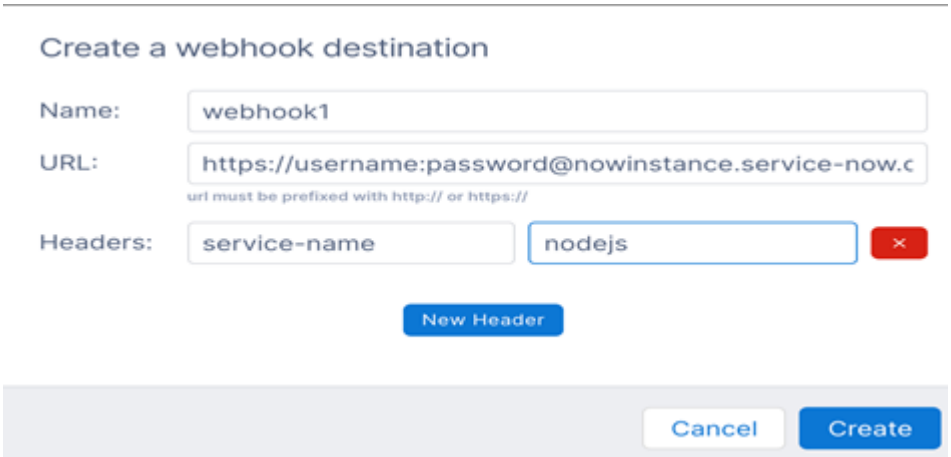
f. In the URL field,#provide the webhook URL.
This is the default #format of the URL to push events from#ServiceNow Cloud Observability to the#ServiceNow AI Platform Instance. Use this format: `https//<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=lightstep`

g. Select **New Header**.

h. In the Headers field, enter the **service-name** and define its **value**.

> **Note:** In a ServiceNow instance, CI binding occurs only if the **service-name** header value matches the name fields of the CI you created in the**cmdb_ci_service_auto table**.

Create a Webhook



i. Click **Create**.

3. In the ServiceNow Cloud Observability platform, configure an alert.

a. From the navigation bar, click#**Alerts**.

b. Select#**Create an Alert** and enter an alert name.

c. In the Alert Configuration area, define the threshold.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the Notification Rules area, in the Send Notifications to fields, select the notification destination as **webhook** and search for the destination name for the webhook that you created in step 2.

e. Select **Save**.
The default severity for stream based alerts is **Critical**. You can change the default in the #Push Connector Configuration area of an ServiceNow AI Platform instance. The valid severity values are:

- 1- Critical
- 2- Major
- 3- Minor
- 4- Warning
- 5- Info

Configure a MID Server for event collection using a push operation (listener)

The MID Server supports the collection of event messages, using the MID Web Server to collect data from external sources and transforming (parsing) them to the format required for event fields in the event [em_event] table. The transformed events are then transmitted to the instance.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

The MID Web Server extension enables external clients to push metric data and events to the MID Server. See Configure the MID Web Server extension. Use the MID WebService Event Collector to enable a URL method to push event messages to the MID Server. See Configure the MID WebService Event Collector Context.

Configure a MID Server with either *`EventManagement`* or *`All`* in the Supported Applications List.

To ensure uninterrupted services, consider also configuring a failover MID Server cluster.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Double-click the MID Server that you want to configure, or click **New** to create a new MID Server.
3. In the **Supported Applications** section, click **Edit**.
   a. Click **Edit**.
   b. In the slushbucket, either select **Event Management** or **ALL** and click the **>** add button.
   c. Click **Save**.
4. To ensure that the MID Server is validated, under Related Links, select **Validate**.
   For more information, see Validate a MID Server.
5. Click **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Configure the MID WebService Event Collector to enable a URL method to push event messages to the MID Server. For more information, see Configure the MID WebService Event Collector Context.

Related topics

- Configure key-based MID Web Server authentication
- Configure the MID Web Server extension
- Configure the MID WebService Event Collector Context

Pushing events to the MID Server using web service API

Configure the MID WebService Event Collector to provide a URL method to push event messages to the MID Server.

The MID WebService Event Collector, by default, enables you to connect to an event generator and send event messages through the MID Server, using a URL in the format: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/jsonv2`

The JSON v2 format is the same as the format that clients use to send event messages to the instance. This URL provides good performance.

For more information, see Configure the MID WebService Event Collector Context.

Note: Event Management accepts events in the timezone of the MID Server through which the listener has sent the event message. If you require a different timezone, you can configure the script as required, see Integrate with push connectors.

URL to push custom payloads

The MID Server can also receive a custom payload in JSON, XML, or plain text format. In this case, the MID Server transforms the event messages using the script include that you provide, and then sends the events to the instance. The URL in this case is:

`http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Transform_script_name}` For an example of a script include, see the default `TransformEvents_xmlSample` script include.

For an example of how the MID WebService Event Collector transforms JSON formatted event messages, see Event collection from BMC TrueSight and BMC TrueSight_v2.

To send events in generic JSON format, you can use the URL in this format:

`http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform=TransformEvents_MidJsonGeneric`

In this case, the `TransformEvents_MidJsonGeneric` MID script include that is provided in the base instance transforms the event messages into the event fields. All fields are added as **Additional Information** fields into the ServiceNow event that is generated.

Note: The URL in the format `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/{transform_script_name}`is also supported.

The REST API URL for validating connectivity is: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/ping`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script include to transform collected events

Use the required MID Server script include to transform (parse) collected event messages and populate them into the mapped event field. The MID Server script include name is composed of a prefix and suffix. The prefix is the mandatory text `TransformEvents_` and the suffix is the transform name on the URL, for example, `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/xmlSample` . The composed script name is therefore `TransformEvents_xmlSample`.

You must supply a script include that receives the event messages in a text variable. The script must have a `transform()` function that performs the transformation and prepares the return array of Event objects. When the Event Management plugin is activated, you are provided with the `TransformEvents_xmlSample` sample include script that transforms events from XML format.

Note: Event fields that are not identical to fields in the event table are saved in the **Additional information** field.

Event message headers

Specify the relevant request header value for the **Content-Type** field according to the format of the event message.

Request header values for the Content-Type

Message format	Content-Type value
JSON	application/json
XML	application/xml
text	text/plain

Authentication and data security options

Options for authentication and data security:

- **Authentication type**, which can be set to either `API Key`, `mTLS`, or `Basic`.
- **Secure Connection**, which lets you choose whether incoming and outgoing data is secured when transmitted. If you choose the advanced secured option, it requires that you obtain a certificate from a well-known certificate authority, and then provide the **Keystore Certificate Alias** and the **Keystore Password**.
- **Use MID Unified Keystore**, which provides encryption protection and enables you to install a custom certificate in the MID Server unified keystore. For details, see Install custom certificates in the MID Server unified key store .
- Users must supply a script that receives the JSON, XML, or text formatted event messages in a text variable. The script must have a transform() function that performs the transformation and prepares the return array of event objects. The `TransformEvents_xmlSample` include script that transforms events from XML format is provided as an example when the Event Management plugin is activated.

For more information about authentication and data security, see Configure the MID Web Server extension.

Pushing events to the instance using web service API

You can use a web service interface, supported by ServiceNow, that operates on the JSON object as the data input and output format.

Before you begin

Role required: evt_mgmt_integration

About this task

To insert records in the event [em_event] table with a single call, use this web service API: `https://<instancename>.service-now.com/api/global/em/jsonv2`

Note: Business rules on the event table are not invoked when this URL is used.

Do not add additional fields to an event by adding a custom field to the event table [em_event]. However, additional fields should be included in the **Additional information** [additional_info] field of the event. For more information about how to include additional fields in events, see Custom alert fields.

The URL in the format: `http://<instancename>.service-now.com/em_event.do?JSONv2&sysparm_action=insertMultiple` is also supported in case you do want to activate Business rules. However, the performance of the first URL is superior.

To work with the URL that ends with `=insertMultiple`, add the following properties, with their respective values, to the MID Server:

- "mid.probe.event.queue.compress" - value: false
- "mid.probe.event.bulk_size" - value: 100
- "mid.probe.event.endpoint.url" - value: em_event.do?JSONv2%26sysparm_action=insertMultiple

Procedure

1. Send the request with these headers:

Parameter	Type	Description
Accept	String	The acceptable type for this message. The default value is `application/json`.
Content-Type	String	The content type for this message. The default value is `application/json`.
POST	String	The request type is POST, with one or more trailing records.

2. One or more events in JSON format can be sent as the payload of the web service call. Event fields that should be populated are:

Variable	Description
source	The name of the event source type. For example, SCOM or SolarWinds.
event_class	Specific instance of the *source*. For example, `SCOM 2012 on 10.20.30.40`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variable	Description
node	The **node** field should contain an identifier for the Host (Server/Switch/Router/etc.) that the event was triggered for. The value of the **node** field can be one of the following identifiers of the Host: ○ Name ○ FQDN ○ IP ○ Mac Address If it exists in the CMDB, this value is also used to bind the event to the corresponding ServiceNow CI.
resource	If the event refers to a device, such as, Disk, CPU, or Network Adapter, or to an application or service running on a Host, the name of the device or application must be populated in this field. For example, `Disk C:\` or `Nic 001` or `Trade web application`.
metric_name	Name of the metric that triggered the alert. For example, `Used Memory` or `Total CPU utilization`.
type	The type of event. This type might be similar to the **metric_name** field, but is used for general grouping of event types.
message_key	This value is used for de-duplication of events. For example, there might be two events for the same CI, where one event has CPU of 50% and the next event has CPU of 99%. Where both events must be mapped to the same ServiceNow alert, they should have the same message key. The field can be left empty, in which case the field value defaults to `source+node+type +resource+metric_name`. The **message_key** should be populated only when there is a better identifier than the default.
severity	Severity of the event. ServiceNow values for severity range from 1 – Critical to 5 – OK, with the severity of 0 – Clear. Original severity values should be sent as part of the additional information.
additional_info	This field contains a JSON string (stringified JSON) with key/value pairs representing supplemental information not mapped to standard event fields. Examples include IDs of objects in the event source, event priority (if different from severity), and assignment group information. Values not already in JSON key/value format are normalized to stringified JSON when the event is processed.
time_of_event	Time when the event occurred on the event origin. The format is: yyyy-MM-dd HH:mm:ss The specified time must be according to GMT.
resolution_state	Optional – To indicate that an event has been resolved or no longer occurring, some event monitors use 'clear' severity, while other event monitors use a 'close' value for severity. This field is used for those monitors proffering the latter. Valid values are `New` and `Closing`.

3. To create multiple records with a single call, trigger the event web service using the following URL, where the <instance name> variable is replaced with the name of the required instance:
`https://<instancename>.service-now.com/api/global/em/jsonv2`

Example
Example showing the payload for two events that are sent in a single web service call:

© 2026 ServiceNow, Inc. All rights reserved.

```
{
  "records": [
    {
      "source": "SCOM",
      "event_class": "SCOM 2012 on scom.server.com",
      "resource": "D:",
      "node": "name.of.node.com",
      "metric_name": "Percentage Logical Disk Free Space",
      "type": "Disk space",
      "severity": "4",
      "description": "The disk D: on computer
 V-W2K8-abc.abc.com is running out of disk space. The value
 that exceeded the threshold is 38% free space.",
      "additional_info": "{\"scom-severity\":
 \"Medium\", \"metric-value\": \"38\", \"os_type\":
 \"Windows.Server.2008\"}"
      }
    },
    {
      "source": "SCOM",
      "event_class": "SCOM 2012 on scom.server.com",
      "resource": "MSSQL-database-name",
      "node": "other.node.com",
      "metric_name": "DB Allocated Size (MB)",
      "type": "Database Storage",
      "severity": "3",
      "description": "High number of active connections for
 MSSQL-database-name running on name.of.node.com. Active
 connections exceed 5000.",
      "additional_info": "{\"scom-severity\":
 \"Medium\", \"metric-value\": \"38\", \"os_type\":
 \"Windows.Server.2008\"}"
      }
    }
  ]
}
```

4. To create one record with a single call, trigger the event web service using the following URL, where the <instancename> variable is replaced with the name of the required instance:
`https://<instancename>.service-now.com/api/global/em/jsonv2`

Example
Example showing the payload for one event that is sent in a single web service call:

```
{
  "records": [
    {
      "source": "SCOM",
      "event_class": "SCOM 2007 on scom.server.com",
      "resource": "C:",
      "node": "name.of.node.com",
      "metric_name": "Percentage Logical Disk Free Space",
      "type": "Disk space",
      "severity": "4",
      "description": "The disk C: on computer
 V-W2K8-dfg.dfg.com is running out of disk space. The value
 that exceeded the threshold is 41% free space.",
```

      "additional_info": "{\"scom-severity\":
 \"Medium\", \"metric-value\": \"38\", \"os_type\":
 \"Windows.Server.2008\"}"
      }
    }
  ]
}
```

Example
Example: cURL request:

```
{
  curl -X POST
 "https://<instancename>.service-now.com/api/global/em/jsonv2"
 \
  --header "Content-Type: application/json" \
  --user "username:password" \
  --data '{
    "records": [
      {
        "source": "SCOM",
        "event_class": "SCOM 2007 on scom.server.com",
        "resource": "C:",
        "node": "name.of.node.com",
        "metric_name": "Percentage Logical Disk Free Space",
        "type": "Disk space",
        "severity": "4",
        "description": "The disk C: on computer
 V-W2K8-dfg.dfg.com is running out of disk space. The value
 that exceeded the threshold is 41% free space.",
        "additional_info": "{\"scom-severity\":
\"Medium\", \"metric-value\": \"38\", \"os_type\":
\"Windows.Server.2008\"}"
      }
    }
  ]
  }'
```

Related topics

Pushing events to the MID Server using web service API

Configure the MID WebService Event Collector Context

Configure the MID WebService Event Collector Context to provide a URL method to push event messages from an external source to the MID Server.

Before you begin
Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task
The default format of the URL to push event messages from an external source to the MID Server is `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/jsonv2`. This URL provides good performance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

From an external source, to push event messages that are not in jsonv2 format, the format of the URL is: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Name_of_Transform_Script}`, where the *{Name_of_Transform_Script}* variable is the full name of the script and always begins with the text: `TransformEvents_`.

For example, assume the following values:

- {MID_Server_IP}: 10.118.69.27
- {MID_Web_Server_Port}: 8097
- Transform script name: EventsToProcess

The URL to be used is therefore: `http://10.118.69.27:8097/api/mid/em/inbound_event/TransformEvents_EventsToProcess`

Note:

- The URL in the format `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/{transform_script_name}` is also supported.
- The date format for events is yyyy-M-d h:mm:ss.

  If you receive an event whose date is in a different format, you must use a `{transform_script_name}` that is appropriate for the incoming event's date format. If you do not, the event will not be processed correctly.

  For example, if an event arrives on June 27, 2019 at 11:25 AM with a listed date of *2019/06/27/ 11:25:00 a*, use a `{transform_script_name}` with a date format of *yyyy/MM/dd/ HH:mm:ss a* to match the format of the received event.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **MID WebService Event Listener**.
2. In the MID WebService Event Collector Contexts list, click **New**.
3. On the form, fill in the fields.

MID WebService Event Collectors Context form

Field	Description
Name	A unique name for this collector for easy identification.
Short description	Enter a brief, meaningful description of this collector.
MID Web Server Extension	Specify and then start the MID Web Server extension. The supported authentication methods are listed in the **Authentication Type** field of the MID Web Server extension. For information about how to configure a MID Web Server extension, see Configure the MID Web Server.
Status	This field is auto-populated with the status of the MID Web Server extension. This field is blank until the MID Web Server extension is started. After issuing a command to the MID

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Web Server extension, one of the following values is displayed: ○ **Started**: The collector is running. ○ **Stopped**: The collector is not running. ○ **Offline**: The MID Server is down. ○ **Error**: The collector failed with an error (the error message is displayed in **Error Message**). ○ **Warning**: A run-time exception has occurred.
Execute on	**Specific MID Server** or **Specific MID Server Cluster**, as defined on the specified MID Web Server extension.
MID Server	The **Specific MID Server** or **Specific MID Server Cluster**, as defined on the specified MID Web Server extension.
Executing on	The name of the MID Server on which the MID Web Server extension is running.

4. Right-click the form heading and click **Save**.
5. Under **Related Links**, click **Start** to start the collector.

Commands in the Event Management Context form

Related Link	Description
Start	If it is not running, start the collector. This action verifies that a web service API endpoint with the Event Management application is running on the MID Server.
Stop	Stops the running collector on the configured MID Server. If the collector is not running, no action is taken.
Restart	Stops, then starts the collector on the configured MID Server.
Update parameters	Sends updated parameters to the collector. Parameters are also updated when the Event Management MID Server context extension is updated. If you click this control when the collector is not running, no update is made.

Example:
Showing the use of the URL to transform JSON v2 formatted event messages

Assume that JSON v2 formatted event messages are sent to the MID Server. When using the `jsonv2` URL, there is no need to use a script include.

Data for the JSON v2 example

Field	Value
MID_Server_IP	10.218.64.27
MID_Web_Server_Extension_Port	8097
Event message format	jsonv2

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Replace the variables in the default format of the URL `http://<my-instance>.service-now.com/api/global/em/jsonv2`with values from the preceding table:`http://10.218.64.27:8097/api/global/em/jsonv2`

Example showing the URL to push messages not in jsonv2 format

The format of the URL to push event messages from an external source that are not in jsonv2 format is `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event/Transform={Name_of_Transform_Script}` where the {Name_of_Transform_Script} variable is the full name of the script and always begins with the text: TransformEvents_. The script name must be specified as the `Transform` header parameter and must always start with the prefix `TransformEvents_`.

For this example, assume that the script name is EventsToProcess, the URL is therefore:`http://10.138.64.27:8097/api/mid/em/inbound_event/TransformEvents_EventsToProcess`

Example showing JSON v2 formatted event messages

Note: When copying and pasting the text following, hidden characters might also be copied and can cause unexpected results.

```
curl -v -H "Accept: application/json" -H "Content-Type:
 application/json" -X POST --data "{
    \"records\":
    [ {
         \"source\" : \"Simulated\",
        \"node\" : \"nameofnode\",
        \"type\" : \"High Virtual Memory\",
        \"resource\" : \"C:\",
        \"severity\" : \"5\",
        \"description\" : \"Virtual memory usage exceeds 98%\",
        \"ci_type\":\"cmdb_ci_app_server_tomcat\",
        \"additional_info\":\"{\\\"name\\\":\\\"My
 Airlines\\\"}\"
      },
      {

- Event collection from Google Cloud Platform

Event collection from custom payloads

The MID WebService Event Collector enables you to collect event information from custom payloads in JSON, XML, or plain text format.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

The MID Server transforms the collected event messages and populates the Event table fields (em_table) in the instance. The collection of formatted event messages is described in this procedure using basic authentication. For information about supported authentication methods, see Configure the MID Web Server extension.

The format of the required MID Server URL is: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Transform_script_name}`. The name of the MID Server script include is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

composed by appending a suffix to the default `TransformEvents_` prefix. For information about the collection of JSON v2 event messages, see Configure the MID WebService Event Collector Context.

Note: The URL in the format `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/{transform_script_name}` is also supported.

Procedure

1. Configure the MID WebService Event Collector, see Configure the MID WebService Event Collector Context.
2. Start the MID WebService Event Collector.

Example:
Transformation of XML formatted event messages using the custom payload URL

Assume that XML formatted event messages are sent to the MID Server. Use this example to return an array of event objects from the collected event messages. The name of the MID Server script include is composed by appending a suffix to the default `TransformEvents_` prefix. For the purposes of this example, the user supplied the xmlSample script include. Using these details, the name of the MID Server script include is `TransformEvents_xmlSample`. The MID Server transforms the collected event messages by parsing the messages using the script include and then transmitting them to the instance.

Data for the XML example

Field	Value
MID_Server_IP	10.218.64.27
MID_Web_Server_Extension_Port	8097
transform_script_suffix _name	xmlSample

Replace the variables in the URL with the values from the above table:
`http://10.218.64.27:8097/api/mid/em/xmlSample`

Note: When copying and pasting the text below, hidden characters might also be copied and can cause unexpected results.

Example showing XML formatted event messages:

```
<records>
    <event>
    <source>My Source</source>
    <node>host1</node>
    <type>type1</type>
    <severity>3</severity>
    <description>Virtual memory usage exceeds 98%</description>
    </event>
    <event>
    <source>My Source</source>
    <node>host2</node>
    <type>type2</type>
    <severity>2</severity>
    <description>Virtual memory usage exceeds 90%</description>
    </event>
```

Integrate with push connectors

Integrate with a push connector to connect to an external event source. Push connectors process the collected event messages and transform them to the required event format.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed.

Role required: evt_mgmt_admin

Note: If you are upgrading a ServiceNow AI Platform instance from Paris or earlier, you can use legacy listener transform scripts. See Use legacy listener transform scripts for further information.

About this task

The push connectors accept event messages that are generated by external event sources. Configure a connector to listen to an external event source. Using a custom push connector, send the event messages through either the MID Server or the instance.

Note: You can use this generic JSON target URL to collect events:`https://<<INSTANCE>>/api/sn_em_connector/em/inbound_event?source=genericJson`. This URL can be used as-is and requires that an event rule be configured.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connectors**.
2. Click **New** or click the push connector that you want to modify, for example, AWS or Azure.
3. On the form, fill in the fields.

Field	Description
Name	Unique name for this push connector for easy identification.
Description	Enter a description for the use of the push connector.
Header name	Specify the name of the header that you want the value for, such as Set-Header.
Header value	The value of the header name that you want the value for, such as Set-Header.
Type	Select to send events either `Instance` or `MID`. In each case, use the URL of the selected type. See the description of the **URL parameter value** field.
Active	Select to enable pulling events from this external event source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	Order in which an event rule is evaluated when multiple rules are defined for the same type of event. Event rules are evaluated in ascending order.
URL parameter value	○ Send events to the instance. Use the URL in this format for all connectors: `https://<<INSTANCE>>/api/sn_em_connector/em/inbound_event?source={URL_parameter_value}` ○ Send events through the MID Server. Use the URL in the format:`http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Transform_script}` **Note:** Sending events to the MID Server requires the prior configuration of the MID WebService Event Listener extension.

4. In the Script section:
   - If the value selected for the **Type** field is `MID`, the **Transform script** field appears. In this field, specify or search for the name of the MID script include that accepts event messages that the required external event source generates and that the script parses into the required event format. Use this naming convention for the script: `TransformEvents_<your source>`
   - If the value selected for the **Type** field is **Instance**, the **Script** editor appears. In the **Script** editor, enter the customized script that accepts event messages that the required external event source generates and that the script parses into the required event format.

Example
This example shows the fields that have been transformed, being added to an event form.

```
(function process(/*RESTAPIRequest*/ request, body) {
 /*Function that receives a JSON object, adding all its fields
 to the Additional information object. The field name is a
 concatenation of the field key and the parent field key if it
 exists.*/
 function updateAdditionalInfo(event,
 field,jsonObject,additionalInfo) {
        for (var key in jsonObject) {
            var newKey = key;
            if (field != "") {
                newKey = field + '_' + key;
            }
   // You can do some transformation here and set fields on the
 event
   //if(key == "MySource")
   //   event.source = jsonObject[key];
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            additionalInfo[newKey] = jsonObject[key];
        }
    }

    try
{
        gs.info("TransformEvents_generic received body:" +
body);
 var jsonObject = JSON.parse(body);
        var event = new GlideRecord('em_event');
 event.source = "GenericJson"; //TODO: Need to define
        event.event_class = "GenericJsonClass"; //TODO: Need to
define
        event.severity = "5";

        var additionalInfo = {};
        updateAdditionalInfo(event,
"",jsonObject,additionalInfo);
 /*Iterates over Additional information JSON object and
adds all nested objects' fields as fields of the Additional
information object*/
        var notDone = true;
        while (notDone) {
            notDone = false;
            for (var key in additionalInfo) {
                if
(Object.prototype.toString.call(additionalInfo[key]) ==
'[object Object]') {
                    notDone = true;
                    updateAdditionalInfo(event,
key,additionalInfo[key],additionalInfo);
    additionalInfo[key] = "";
                }
            }
        }
 gs.info("TransformEvents_generic generated additional
information:" + JSON.stringify(additionalInfo));
        event.additional_info = JSON.stringify(additionalInfo);
        event.insert();
}
catch(er){
 gs.error(er);
 status=500;
 return er;
}
return "success";
})(request, body);
```

Use legacy listener transform scripts

Use legacy listener transform scripts when upgrading a ServiceNow AI Platform instance from Paris or earlier. These scripts can be run as part of existing integrated systems, or in unison with Event Management push connectors.

You can use listener transform scripts to ensure that previous integrations are supported. For example, if you are using the `https://<instance-name>.service-now.com/api/`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`global/em/inbound_event` endpoint in various existing integrations, you can continue to use this endpoint in a Quebec or later ServiceNow AI Platform instance.

If you want to use the Event Management push connectors, download the plugin from the ServiceNow Store website. You can then access the push connectors in the ServiceNow AI Platform instance, and the `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event` endpoint is also created.

Use the legacy endpoint with push connectors

You can continue to use the `https://<instance-name>.service-now.com/api/global/em/inbound_event` endpoint with the push connectors, by deactivating the relevant transform scripts. To deactivate a script, navigate to **Event Management** > **Integrations** > **Listener Transform Scripts**. Then click the relevant script in the displayed list, and clear the **Active** check box in the form.

Use the legacy endpoint and deactivate all listener transform scripts

You can also continue to use the `https://<instance-name>.service-now.com/api/global/em/inbound_event` endpoint but deactivate all listener transform scripts to use the push connectors instead. To deactivate all scripts, navigate to **System Properties** > **All Properties**, locate the *sn_em_connector_listener_table_for_InboundEvent* property, and set its value to **True**.

Migrate custom listener transform scripts to the push connectors module

If you have created custom listener transform scripts, they must be migrated to the push connectors module if you want to use the new `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event` endpoint. To migrate the custom script, navigate to **Event Management** > **Integrations** > **Listener Transform Scripts**, click the relevant listener transform script, and select the displayed script. Then navigate to **Integrations** > **Push Connectors**, click **New**, and paste in the script you copied from the listener transform script.

Integrate AWS platform as a data source

Integrate Amazon Web Services (AWS) with Event Management. To add AWS platform as a data source, configuration is required in the AWS platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Download the Event Management Connectors plugin from the ServiceNow Store.

Role required: evt_mgmt_admin

About this task

When an AWS platform alarm arrives, Event Management:

- Extracts information from the original AWS platform alarm to populate the required event fields and inserts the event into the database.
- Captures the content in the **additional_info** field.

The AWS platform push connector is located in **Event Management** > **Integrations** > **Push Connectors**. In the Push Connectors page, click **AWS Events Push Connector**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The AWS push connector that is provided in the base system handles AWS CloudWatch alarms only and not CloudWatch events created through event rules. To handle Simple Notification Service (SNS) alarms that are other than AWS CloudWatch, create a new push connector or customize the AWS push connector.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Procedure

1. In the AWS platform console, select **Simple Notification Service** .
   If an SNS topic does not exist, create one.
2. Under the SNS topic, create a new subscription.

   a. Take **Topic ARN** from the topic that you created.
   The Amazon Resource Name (ARN) is necessary for binding an Event Management alert to a CI.

   b. Set **Protocol** to: *`https`*.

   c. In the ServiceNow instance, create a user account or identify an existing ServiceNow user for this integration.
   Also ensure the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. Set **Endpoint** to: `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=aws`

   If AWS platform multi-factor authentication (MFA) is enabled, when signing in to the AWS platform website, you're prompted for the user name and password, as well as an authentication code from the AWS platform MFA device of the user.
3. Wait until the subscription changes from `Pending` to `Confirmed` and the subscription ARN is populated.
   This can take a few minutes.
4. Create alarms in AWS platform to send to Event Management and link the alarms to the SNS topic that you created.
   Raw message delivery must not be enabled in AWS alarm. These following event rules are provided with the base system:

Event rule	Description
AWS host binding	Bind AWS platform alarms, on either the host or virtual machine (VM), to the host Hardware CI.
AWS - General	Bind AWS platform alarms on the Load Balancer (LB) to the Cloud Load Balancer CI, Amazon Relational Database Service (RDS) to the Cloud Database CI, and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event rule	Description
	Host or Virtual Machine (VM) to the Virtual Machine Instance CI. **Note:** To bind events from the Host or Virtual Machine to the Virtual Machine Instance CI, disable the AWS host binding rule.

Note: For the push connector to handle the incoming event, you must sent a request header **x-amz-sns-message-type** with value **Notification**.

This example shows a JSON string for AWS VM binding:

```
{
"Type" : "<type>",
"MessageId" : "<message ID #>",
"TopicArn" : "<topic arn>",
"Subject" : "ALARM: \"<alarm type>\" in <location>",
"Message" : "{\"AlarmName\":\"<alarm
 name>\",\"AlarmDescription\":<alarm
 description>,\"AWSAccountId\":\"<account ID
 #>\",\"NewStateValue\":\"ALARM\",\"NewStateReason\":
\"Threshold Crossed: <threshold and datapoint which
 it crossed>.\",\"StateChangeTime\":\"<date and
 time>\",\"Region\":\"<location>\",\"OldStateValue\":\"OK\",
\"Trigger\":{\"MetricName\":\"CPUUtilization\",\"Namespace\":
\"<namespace>\",\"Statistic\":\"<statistic
 name>\",\"Unit\":null,\"Dimensions\":[{\"name\":
\"InstanceId\",\"value\":\"<dimension
 value>\"}],\"Period\":<period
 number>,\"EvaluationPeriods\":<number of evaluation
 periods>,\"ComparisonOperator\":
\"GreaterThanOrEqualToThreshold\",\"Threshold\":<threshold
 number>}}",
"Timestamp" : "<date and time>",
"SignatureVersion" : "<version number>",
"Signature" : "<signature>",
"SigningCertURL" : "<URL>",
"UnsubscribeURL" : "<URL>"
}
```

5. To enable multiple member accounts to forward CloudWatch or EventBridge events to a centralized account, where a single SNS topic delivers them to the ServiceNow Event Ingestion endpoint, you need to make configuration on AWS side.
   To configure it, see https://repost.aws/knowledge-center/cloudwatch-cross-account-sns.
   This design simplifies integration, avoids duplicating SNS topics across accounts, and provides a single entry point for all monitoring events flowing into ServiceNow.

Event field format for event collection

Integrate with push connectors

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrate AWS with REST API key token

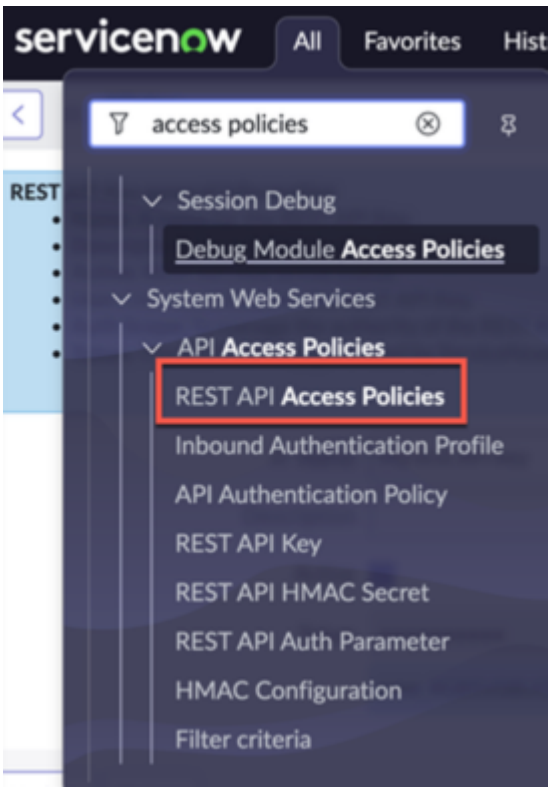
Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

Before you begin

Role required: evt_mgmt_integration

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:** The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

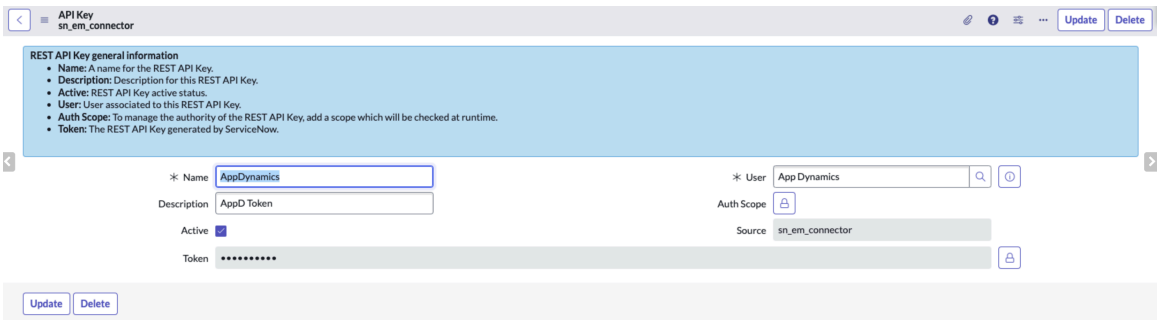
Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



6. In the AWS environment, under **Simple Notification Service**, create a new topic and then create a new subscription by selecting the topic that you have created.
7. In the Create Subscription window, enter the ServiceNow endpoint value in the **Endpoint** field. Format of the api-key value must be: `https://[INSTANCENAME].service-now.com/api/sn_em_connector/em/inbound_event?source=[SOURCENAME]&sys_id=[SYSID OF PUSH CONNECTOR INSTANCE]&x-sn-apikey=[AUTH TOKEN]`.

   The [AUTH TOKEN] value is the system-generated token displayed in the **Token** field.

Integrate Azure Monitor as an authenticated data source

Integrate Microsoft Azure with Event Management by adding the Azure Monitor as an authenticated data source.

You can configure the Event Management environment for the collection of events from Azure Monitor by setting your ServiceNow AI Platform instance as the rest endpoint.

Once the endpoint is configured, when an Azure Monitor alert message arrives, Event Management:

- Authenticates the Azure Monitor alert message with the relevant ServiceNow user, using OAuth configuration or a standard webhook.
- Extracts information from the original Azure Monitor alert message to populate required event fields and inserts the event into the ServiceNow AI Platform database.
- Captures specified content in the **Additional Information** field of the event form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using Azure Monitor V1 or V2 access tokens. For more information, see Integrate Azure Monitor with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for Azure Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate Azure Monitor with basic authentication.

What to know before you begin

You can use your integrated Azure Monitor as a data source only after you have verified the following:

- For both methods of authentication, the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role.
- The Event Management Connectors plugin is installed in the ServiceNow AI Platform instance. You can download the plugin from the ServiceNow Store website.
- Azure Cloud Discovery must be performed to ensure that the created alerts are bound to the configuration items in the ServiceNow AI Platform. For more information, see Discovery for Microsoft Azure Cloud.

Event Rules and Event Field mappings

These event rules and event field mappings are provided with the base system:

Module	Description
Event Rules	**Azure Monitor**: A general event rule to handle all Azure Monitor events.
Event Field Mappings	**Azure Monitor - ci_type**: To map ci_type of events based on resourceType field. A base set of mapping pairs are provided.

These are the mappings provided with the base system in **Azure Monitor - ci_type**:

Transform Value Pairs

Event Mapping Pairs

Key	Value
microsoft.compute/virtualmachines	cmdb_ci_vm_object
microsoft.documentdb/databaseaccounts	cmdb_ci_cloud_database
microsoft.sql/servers	cmdb_ci_cloud_database
microsoft.web/sites	cmdb_ci_cloud_webserver
microsoft.cache/redis	cmdb_ci_cloud_database
microsoft.documentdb	cmdb_ci_cloud_database
microsoft.sql/servers/databases	cmdb_ci_cloud_database

Note: You can add new mapping pairs to the Event Field Mapping - **Azure Monitor - ci_type** as per the requirement, to map events to the respective ci_type based on resourceType.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the connector.

Note: This feature applies only to active event rules.

If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector.

Severity mapping from Azure severity to ServiceNow event severity

Azure severity condition	ServiceNow event severity
When an Azure alert monitorCondition is Fired	
Azure Sev0	ServiceNow Critical (severity "1")
Azure Sev1	ServiceNow Major (severity "2")
Azure Sev2 and Sev3	ServiceNow Warning (severity "4")
Azure Sev4	ServiceNow OK (severity "5")
When an Azure alert monitorCondition is resolved	
Any Azure severity	ServiceNow CLEAR (severity "0")

Integrate Azure Monitor with basic authentication

Integrate Microsoft Azure with Event Management by adding a standard webhook in Azure Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Roles required: evt_mgmt_admin and web_service_admin

About this task

Configure the Event Management environment for the collection of events from Azure by authenticating Azure Monitor as a data source. In your Azure Monitor portal, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

On the Azure portal, alert correlation rules are defined through the *`Correlate alerts`* setting within Alert Processing Rules. When *`Correlate alerts`* is assigned on the Azure portal, the Azure Monitor alerts received on the ServiceNow® instance within 60 minutes are grouped using tag based alert clustering.

Procedure

1. In the ServiceNow AI Platform, create a user account or identify an existing ServiceNow user for this integration.
   Also ensure the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.
2. In your Azure Monitor portal, update the Azure Monitor alert rules to use an action group with a standard webhook:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Create an action group with *action type=webhook*, and provide the URL that includes the user ID and password of the ServiceNow user in the endpoint.
For example:

```
https://<username>:<password>@<instance-name>.service-now.com/
api/sn_em_connector/em/inbound_event?source=azuremonitor
```

> **Note:** If you have multiple tenants on the Azure portal and you want to use bidirectional functionality to acknowledge, close, or reopen an alert on the Azure Portal, then the URL for the webhook has to be in the following format: `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor&event_class=<new_connector_instance_name>`. The <new_connector_instance_name> is the new Azure pull connector instance that you need to create for each tenant with other Azure service principal credentials. To know how to create the pull connector, see Configure Azure Monitor Bi-directional connector.

b. In the Webhook section, make sure that **Yes** is selected for the **Enable the common alert schema** option.

Result

Alerts start flowing from the Azure Monitor into the Event Management plugin. The plugin extracts information from the original Azure Monitor alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

What to do next

If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector.

Integrate Azure with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

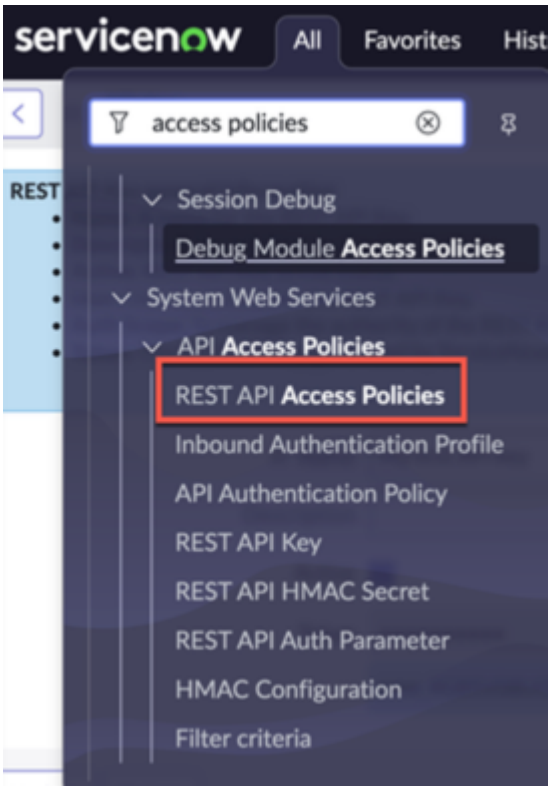
Before you begin

Role required: evt_mgmt_integration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

Note: The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

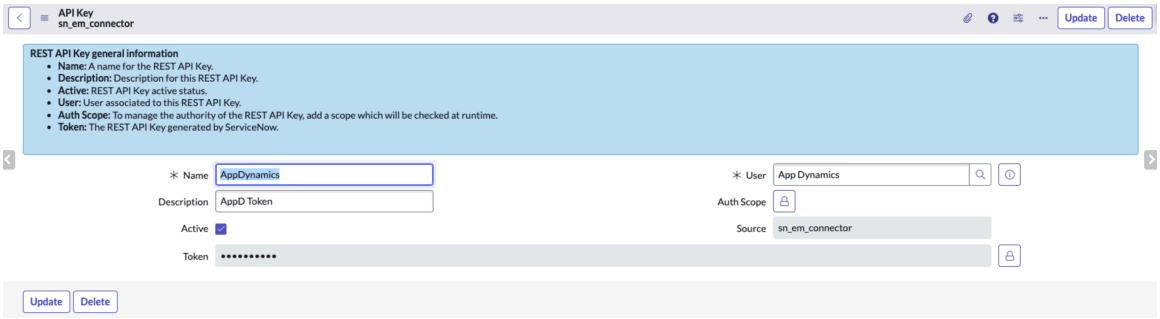
API Key

Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate Azure Monitor with OAuth authentication

Integrate Microsoft Azure with Event Management by authenticating Azure V1 or V2 tokens in the Azure Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

On the Azure portal, alert correlation rules are defined through the *`Correlate alerts`* setting within Alert Processing Rules. When *`Correlate alerts`* is assigned on the Azure portal, the Azure Monitor alerts received on the ServiceNow® instance within 60 minutes are grouped using tag based alert clustering.

Roles required: evt_mgmt_admin, web_service_admin, and oauth_admin

About this task

Configure the Event Management environment for the collection of events from Azure Monitor. In your Azure Monitor portal, set your ServiceNow AI Platform instance as the rest endpoint using V1 or V2 tokens.

Procedure

1. In the Azure Monitor portal:

   a. Perform app registration and expose an API.
   For more information about registering an app and exposing an API in Azure, see https://docs.microsoft.com/en-us/azure/active-directory/develop/quickstart-configure-app-expose-web-apis.

   b. Create an action group with a secure webhook, and provide the rest endpoint as `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you have multiple tenants on the Azure portal and you want to use bidirectional functionality to acknowledge, close, or reopen an alert on the Azure Portal, then the URL for the secure webhook has to be in the following format: `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor&event_class=<new_connector_instance_name>`. The <new_connector_instance_name> is the new Azure pull connector instance that you need to create for each tenant with other Azure service principal credentials. To know how to create the pull connector, see Configure Azure Monitor Bi-directional connector.

For servicenowservices.com instances, the rest endpoint has to be `https://<instance-name>.servicenowservices.com/api/sn_em_connector/em/inbound_event?source=azuremonitor`.

For more information about adding a secure webhook to an action group, see https://docs.microsoft.com/en-us/azure/azure-monitor/platform/action-groups.

c. Navigate to **Alerts** > **Manage Alert Rules**.

d. In the Secure Webhook section, make sure that **Yes** is selected for the **Enable the common alert schema** option.

e. Add the action group with the secure webhook to an alert rule.

2. In the Azure Monitor portal, verify which Azure token is in use by your registered application.

a. Navigate to **App Registration**, and select the registered application.

b. In the Manage section, click **Manifest**.

c. In the editor screen, select the **Microsoft Graph App Manifest** tab and locate the *requestedAccessTokenVersion* parameter or select the **AAD Graph App Manifest** tab and locate the *accessTokenAcceptedVersion* parameter.
If the value of *requestedAccessTokenVersion* or *accessTokenAcceptedVersion* is **2**, the integration must use V2 tokens.

If the value of *requestedAccessTokenVersion* or *accessTokenAcceptedVersion* is **1** or **null**, the integration must use V1 tokens.

3. In your ServiceNow AI Platform instance, ensure that the ServiceNow user is assigned with the correct Application (client) ID or Application ID URI.
Also ensure the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role.

a. Navigate to **System Security** > **Users and groups** > **Users**.

Note: To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

b. Verify that the **Source** field for the ServiceNow sys_user is populated with the correct Application (client) ID or Application ID URI, as defined in the Azure Monitor portal.
If the application is using an Azure V1 token, the **Source** field must be populated with the Application ID URI of the registered application. If the application is using an Azure V2

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

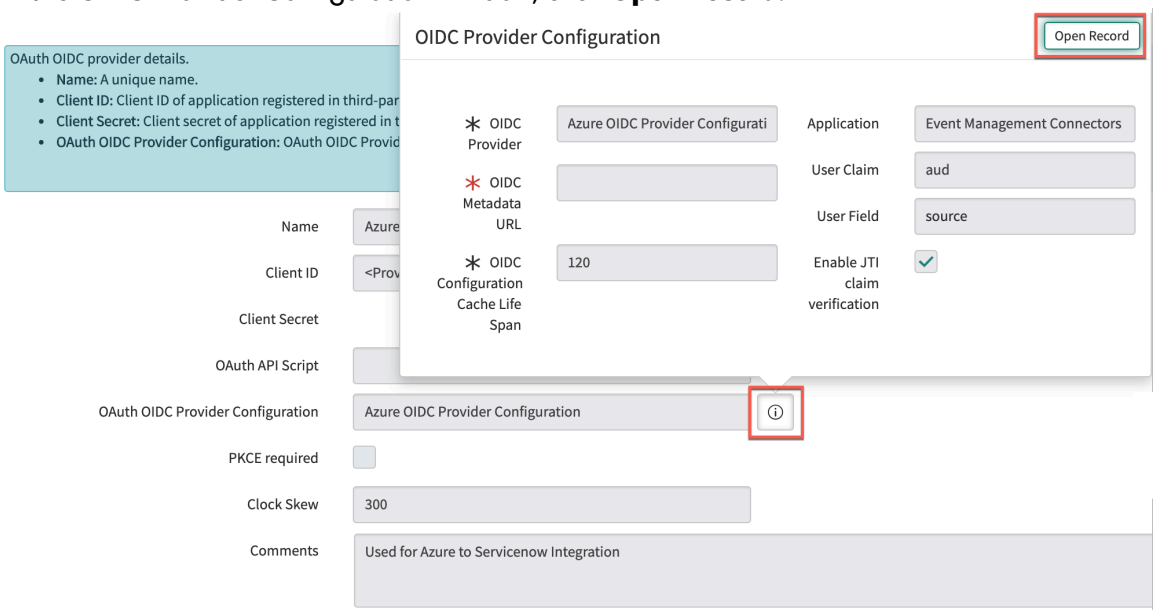
token, the **Source** field must be populated with the Application (client) ID of the registered application.

If the **Source** field is not displayed, change the form layout to display this field. Click the context menu icon ( ) and select **Configure > Form Layout**. Move **Source** to the Selected list.

Note: If your ServiceNow AI Platform instance version is earlier than Paris Patch 2 or Orlando Patch 9, the **Source** field value must be enclosed in square brackets. For example, `[api://azuretest]`.

4. In your ServiceNow AI Platform instance, navigate to **Event Management** > **Integrations** > **Azure OAuth Config**.
5. Click **Azure OAuth OIDC Entry** and enter the `Client ID`.
   If the registered application is using an Azure V2 token, the `Client ID` should be the same as the `Application (client) ID` of the app registrations defined in your Azure Monitor portal.

   If the registered application is using an Azure V1 token, the `Client ID` should be the same as the `Application ID URI` of the app registrations defined in your Azure Monitor portal (the exposed API).
6. In the **OAuth OIDC Provider Configuration** field, click the info icon ( ).
7. In the OIDC Provider Configuration window, click **Open Record**.



8. Enter the `OIDC Metadata URL` according to the Azure token used by the registered application, as shown in the following table.

Azure token	OIDC Metadata URL
V2	In the OIDC Provider Configuration form, add the following URL to the **OIDC Metadata URL** field: `https://login.microsoftonline.com/<tenant-id>/v2.0/.well-known/openid-configuration`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure token	OIDC Metadata URL
	Ensure that `<tenant-id>` is replaced with the correct Azure Tenant ID. **Note:** If attempting to integrate Azure Gov Cloud with the ServiceNow Azure Monitor Connector, remember to change the claim value to `f1f34126-d4ef-40e1-ad4b-bf5d47b4860d`.
V1	In the OIDC Provider Configuration form: ○ In the Claim Name column, change `azp` to `appid`.  **Note:** If attempting to integrate Azure Gov Cloud with the Service Now Azure Monitor Connector, re member to change the claim value to `f1f34126-d4ef-40e1-ad4b-bf5d47b4860d`. ○ In the **OIDC Metadata URL** field, add the following URL: `https://login.microsoftonline.com/<tenant-id>/.well-known/openid-configuration` Ensure that `<tenant-id>` is replaced with the correct Azure Tenant ID.

Result

When an alert is created in Azure Monitor as part of the alert rule, the notification is sent to the ServiceNow AI Platform using the secure webhook endpoint. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events. If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector .

Configure Azure Monitor Bi-directional connector

The Azure Monitor Pull connector sends information from ServiceNow Event Management to the Azure Portal. The pull connector sends the alert state changes from the ServiceNow environment to the Azure Portal.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When an alert is triggered in the Azure Portal a Secure Webhook is created to send the alert notifications into ServiceNow. The Azure Monitor Connector will receive the alert notification as an event in the ServiceNow instance.

The Azure Monitor Bi-directional connector is supported in the following ServiceNow AI Platform versions:

- Quebec Patch 9 or later.
- Rome Patch 3 or later.
- San Diego.

Role required: evt_mgmt_admin

About this task

When you configure the Azure Monitor Bi-directional Connector, the bi-directional exchange of values to and from the external event source is enabled. When an alert is **Acknowledged**/**Closed**/**Reopened** on the ServiceNow instance, the state changes in the Azure Portal alert using the bi-directional connector.

These scenarios describe the default bi-directional functionality for the Azure Monitor connector:

- When an alert is closed in the Azure Portal, it is automatically closed in ServiceNow. However, it is updated irrespective of the bi-directional feature because closing the event received from the Azure Portal will close the alert.
- When an alert is manually closed in ServiceNow, all the associated Azure alerts will be closed in the Azure Portal.
- If the alert state is changed to **Reopen** in ServiceNow, all the associated Azure alerts will be opened in the Azure Portal.
- When an alert is **Acknowledged** in ServiceNow, all the associated Azure alerts will be acknowledged in the Azure Portal.

Note: For changing the alert state on the Azure Portal, Mid Server gets access token connecting to https://login.microsoftonline.com/ and to change the alert state on the Azure portal Mid Server calls changestate API on URL https://management.azure.com/ as described in https://learn.microsoft.com/en-us/rest/api/monitor/alertsmanagement/alerts/change-state?view=rest-monitor-alertsmanagement-2023-07-12-preview&tabs=HTTP.

Procedure

1. For a single tenant, perform the following steps:
   - Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
   - Select **Azure Monitor**.
   - Select the **Active** check box.

     For this configuration, the **Host IP** field has no functional impact and is not used, so a dummy IP address (1.1.1.1) is provided.
   - In the **Credential** field, add the Azure Service Principal credentials that has authorization to perform actions.

     To change the alert state, the service principal must have the Microsoft.AlertsManagement permissions and the Monitoring Contributor role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select or add the MID Server to be used for this connector.

  If alerts on the MS Azure portal are not updating as expected, check the MID Server logs for errors.

2. For multiple tenants, perform the following steps:
   - Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
   - Select **New**.
   - In the **Name** field, enter the name of <new_connector_instance_name> that you have mentioned in the URL for secure webhook at Integrate Azure Monitor with OAuth authentication.
   - In the Host IP, enter any dummy IP address such as 1.1.1.1.
   - In the **Credential** field, add the Azure Service Principal credentials of that tenant that has authorization to perform actions.
   - Select the **Bi-directional** check box.
   - Select or add the MID Server to be used for this connector.
   - Select **Submit**.
   - Select the **Active** check box.
   - Select **Update**.

What to do next

Multiple alerts from the Azure Portal may be mapped to a single ServiceNow alert by de duplication. The mapping between the ServiceNow alert and Azure alerts will be maintained in the sn_em_connector_event_data table. The retention of records will depend on the alert's state:

- If the Azure Bi-directional Connector is not active, the records will be deleted in 2 days.
- When the Azure Bi-directional Connector is active:
  - If the alert is in a closed state, then it will retain the data for 7 days. This duration can be customized by the sn_em_connector.eventdata_closedevent_interval system property.
    - If the closed alert is re-opened in 7 days then it will reopen the corresponding closed alerts from the Azure Portal.
    - If the closed alert is re-opened after 7 days then it will not reopen the corresponding closed alerts from the Azure Portal.
  - If the alert is in an open state, then it will retain the data for 30 days. . This duration can be customized by the sn_em_connector.eventdata_openevent_interval.
    - If you want to close or acknowledge an open ServiceNow alert in 30 days, you will be able to close or acknowledge all corresponding Azure alerts on the Azure Portal.
    - If you want to close or acknowledge an open ServiceNow alert after 30 days, you will not be able to close or acknowledge all corresponding Azure alerts on the Azure Portal.

Event collection from Microsoft Azure Monitor

The MID WebServer Event Collector enables you to collect JSON formatted event messages sent from the Microsoft Azure portal.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task

On the Azure portal, alert correlation rules are defined through the *Correlate alerts* setting within Alert Processing Rules. When *Correlate alerts* is assigned on the Azure portal, the Azure Monitor alerts received on the ServiceNow® instance within 60 minutes are grouped using tag based alert clustering.

JSON formatted event messages are sent from Microsoft Azure. The MID Server transforms the collected event messages by parsing them using the TransformEvents_MidAzureMonitor script include, located here: **Event Management** > **Integrations** > **PushConnectors**. In the Push Connectors page, click **Azure Monitor Mid Push Connector**.

The default format of the URL to push event messages from Microsoft Azure to the MID Server is `http://<MID_Web_Server_User>:<MID_Web_Server_Password>@<MID_Server_IP>:<MID_Web_Serv api/mid/em/inbound_event?Transform=TransformEvents_MidAzureMonitor`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server.

The following procedure describes the collection of JSON formatted event messages using basic authentication.

Procedure

1. In the Azure Monitor Portal, make sure the MID Server IP is accessible from the Azure portal and the MID rest point is accessible from Microsoft Azure or install the MID Server on a Azure VM and provide the Azure VM public address in the URL and allow the mid_web_Server_port in **Azure VM** > **Networking Settings** > **Inbound port rules**.
2. Create an action group with a webhook and provide the rest endpoint as `http://<MID_Web_Server_User>:<MID_Web_Server_Password>@<MID_Server_IP>:<MID_Web_Se api/mid/em/inbound_event?Transform=TransformEvents_MidAzureMonitor`

   Note: For more information about adding a webhook to an action group, see Create and manage action groups in the Azure portal on the Microsoft documentation site.

3. In the Webhook section, make sure **Yes** is selected for the **Enable the common alert schema** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Navigate to **Alerts** > **Manage Alert Rules**.
5. Add the action group with the webhook to an alert rule.

What to do next

If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector.

Event collection from BMC TrueSight and BMC TrueSight_v2

The MID WebService Event Collector enables you to collect JSON formatted event messages sent from BMC TrueSight Operations Management (TrueSight), previously known as BMC ProactiveNet Performance Management (BPPM), utilizing event stream notification capabilities.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task

JSON formatted event messages are sent from BMC TrueSight. The MID Server transforms the collected event messages by parsing them using the TransformEvents_bmcTrueSight script include, located here: **Event Management** > **Integrations** > **Listener Transform Scripts**. In the Listener Transform Scripts page, click **TransformEvents_bmcTrueSight**.

The default format of the URL to push event messages from BMC TrueSight to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_bmcTrueSight`.

The default format of the URL to push event messages from BMC TrueSight_v2 to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_bmcTrueSight_v2`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server Extension. However, encode the password in BASE64. For example, if the MID Web Server Extension password is `admin`, in this case use `YWRtaW4=` as the password for MID_Web_Server_Password.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variables in the default URL (continued)

Variable	Description
	To determine the BASE64 value, you can use the utility at this website: https://www.base64encode.org/

The following procedure describes the collection of JSON formatted event messages using basic authentication. For more information about supported authentication methods, see Configure the MID Web Server extension.

Procedure

1. In BMC TrueSight, set the MID WebService Event Collector as the target for BMC TrueSight notification, using these parameters:

Variables in the generic BMC URL

Variable	Description
serverHost	Name of the BMC TrueSight server.
port	Number of the BMC TrueSight port.

2. In the message body and generic BMC URL, replace the parameters with the values in the preceding table and connect to BMC TrueSight.
Use the BMC Publish-Subscribe REST approach to create a stream event subscription and send event messages in JSON format. The generic format of the BMC URL to create a stream event subscription is: `http|https://<serverHost>:<port>/bppmws/api/stream/subscribe?dataType=event`. For example: `http://TrueSight1server:40/bppmws/api/stream/subscribe?dataType=event`.

Result

Example of mapping event messages to event fields in the Event (em_event) table

Event field	Event message
node	mc_host
type	mc_object_class
metric_name	mc_parameter
resource	mc_object
severity	severity
time_of_event	date_reception
description	msg

Example:
Example, showing the message body.

Integrate Dynatrace platform events

Integrate Dynatrace with Event Management by adding the Dynatrace Monitor as an authenticated data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using Dynatrace Monitor V1 or V2 access tokens. For more information, see Integrate Dynatrace with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for Dynatrace Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate Dynatrace with basic authentication.

Note: When a problem is reopened in Dynatrace, the original start time is retained and not updated to the time of reopening. This behavior is intentional and reflects how Dynatrace manages the problem lifecycle. Problems reopened within the defined reopening period (typically 30 minutes) are treated as a continuation of the original issue. The start time continues to reflect the timestamp of the earliest triggering event, even after reopening.

Do not use the evidence details timestamp as a substitute for the problem start time. The evidence timestamp refers to individual contributing events within the problem. It is part of the Root Cause Analysis (RCA) and does not indicate the start or duration of the overall problem.

Starting from the Xanadu release, the base system rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the connector.

Note: This feature applies only to active event rules.

Integrate Dynatrace with basic authentication

Integrate Dynatrace with Event Management by adding a standard webhook in the Dynatrace console.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that configuration items for the hosts managed by Dynatrace exist in the ServiceNow AI Platform instance. These CIs can be physical or virtual and can be either manually created or discovered via IP discovery or Cloud Discovery.

Roles required: evt_mgmt_integration and web_service_admin

About this task

Configure the Event Management environment for the collection of events from Dynatrace by authenticating Dynatrace as a data source. In your Dynatrace console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Procedure

1. In your Dynatrace console, define Host Naming rules:
   a. Navigate to **Settings** > **Process and contextualize** > **Naming** > **Host Naming**.
   b. Define the Host Naming rules for each cloud provider (Azure/AWS/GCP) to uniquely identify a CI from ServiceNow.
   This ensures the ServiceNow CIs can be uniquely identified from the payload received from Dynatrace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You do not need to create a Host Naming rule for VMware machines because Dynatrace manages them as physical servers.

2. Define anomaly detection rules:
   a. Navigate to **Settings** > **Analyze and alert** > **Alerts** > **Hosts**.
   b. In the **Hosts** tab, define rules on when to create alerts on the managed hosts.
3. Define the integration settings:
   a. Navigate to **Settings** > **Analyze and alert** > **Notifications** > **Problem notifications**.
   b. In the Set up custom integration form, add the Webhook URL: `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=dynatrace`
   For basic authentication, select **Create basic authorization header**. You can see the username and password fields for the user.
   c. Enter the user name and password of the relevant user.

Note: Ensure the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. In the Custom payload section, add in the following payload structure for the events that will be generated.

```
{
  "connectionId": <connections_alias_sys_id>,
  "ImpactedEntities": {ImpactedEntities},
  "ImpactedEntity": "{ImpactedEntity}",
  "PID": "{PID}",
  "ProblemDetailsHTML": "{ProblemDetailsHTML}",
  "ProblemDetailsJSONv2": {ProblemDetailsJSONv2},
  "ProblemDetailsMarkdown": "{ProblemDetailsMarkdown}",
  "ProblemDetailsText": "{ProblemDetailsText}",
  "ProblemID": "{ProblemID}",
  "ProblemImpact": "{ProblemImpact}",
  "ProblemSeverity": "{ProblemSeverity}",
  "ProblemTitle": "{ProblemTitle}",
  "ProblemURL": "{ProblemURL}",
  "State": "{State}",
```

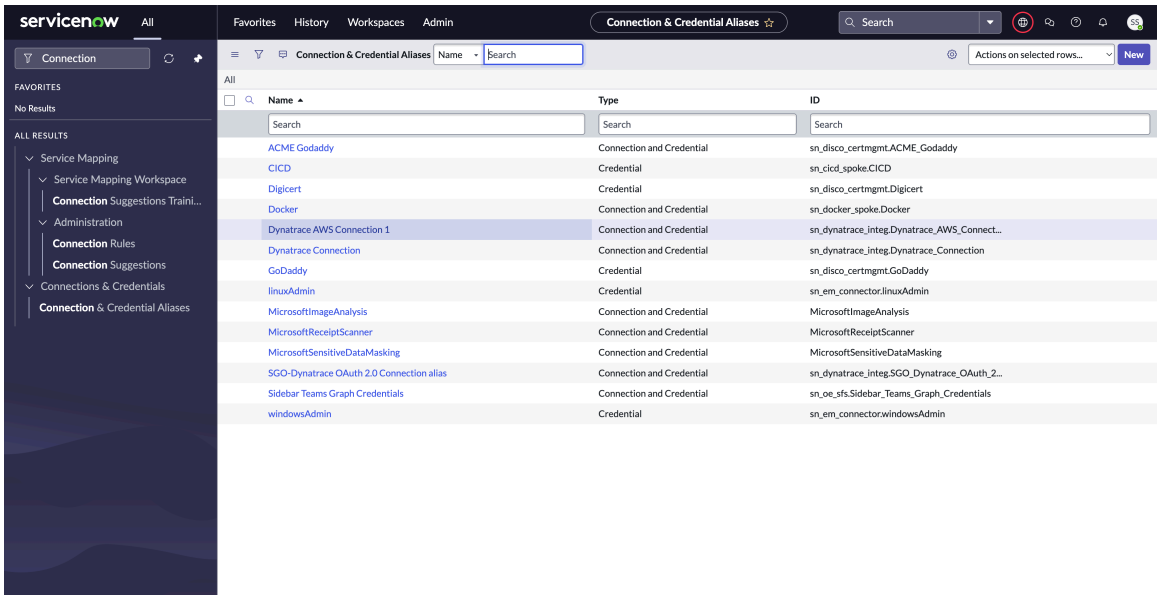
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "Tags": "{Tags}"
}
```

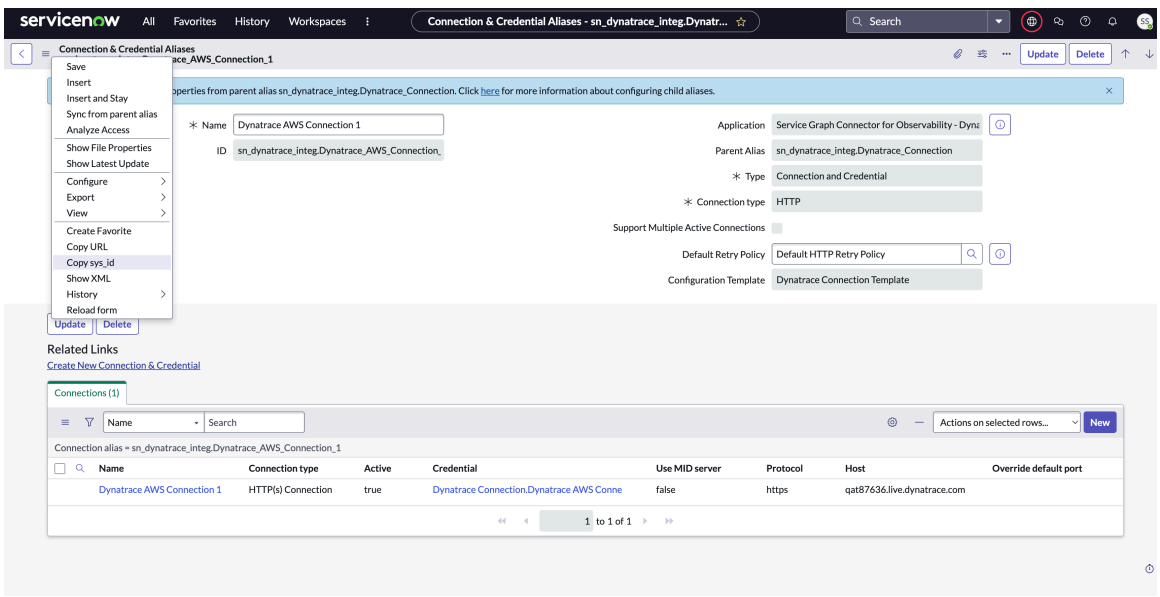
Note: For the <connections_alias_sys_id>:

i. Navigate to **All** > **IntegrationHub** > **Connection & Credentials** > **Connection & Credential Aliases**.

ii. Select to open the connector for which you want to get the <connections_alias_sys_id>.



iii. Right-click the context menu (☰) and then select **Copy sys_id**.



Result

Alerts start flowing from the Dynatrace console into the Event Management plugin. The plugin extracts information from the original Dynatrace alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: By default, host binding is enabled for Dynatrace events for all providers (Azure/AWS/Google). If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the **Dynatrace - General** event rule. For further information about Event rules, see Event rules.

Integrate Dynatrace with OAuth authentication

Integrate Dynatrace with Event Management by authenticating Dynatrace V1 or V2 tokens in the Dynatrace Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

The Event Management plugin must be installed on the ServiceNow AI Platform instance.

Verify Configuration Items for the hosts managed by Dynatrace exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.

Role required: evt_mgmt_integration

About this task

Dynatrace integration with OAuth authentication is available starting from the Washington DC platform release or later.

Procedure

1. Configuration on the ServiceNow instance.

   a. Create *glide.oauth.inbound.client.credential.grant_type.enabled* system property to use Client Credentials grant type for OAuth inbound integrations.
      - Type: true|false
      - Value: true

   b. Create an OAuth Entity endpoint for clients to access the instance.

      i. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.

      ii. On the interceptor page, select **Create an OAuth API endpoint for external clients** and then fill in the form.

      iii. To create an OAuth client record, select **Submit**.

   c. Add the OAuth Application User and the Default Grant Type to the created OAuth client record.

      i. On the OAuth Entity form, add the **OAuth Application User** and the **Default Grant Type** fields to use the Client Credentials grant type for OAuth inbound integrations.

      ii. Open the created OAuth client record.

      iii. From the page header, select the **More** options icon.

      iv. Select **Configure** > **Form Layout**

      v. On the Form Layout page, add **OAuth Application User and Default Grant Type** from the list of fields.

      vi. **Save** or **Update** the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vii. For the **OAuth Application User** field, select the user.

The user must have the evt_mgmt_integration role that will be used to create the events sent by Dynatrace.

Note: To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

viii. Set **Default Grant Type** field value to **Client Credentials**.

2. In the Dynatrace console, define the integration settings.
   a. Navigate to **Settings** > **Integration** > **Problem notifications** > **Set up notifications**.
   b. In the Set up custom integration form, webhook URL.

```
https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=dynatrace
```

   c. Enable **Use OAuth 2.0 for authentication**.
   d. In the OAuth 2.0 credentials section, perform the following steps.
      i. Provide Access token URL as `https://<instance_name>.service-now.com/oauth_token.do`.
      ii. Provide the value for **Client ID** with the client id of the OAuth Entity Client created in ServiceNow instance.
      iii. Provide "Client secret" with the client secret of the OAuth Entity Client created in ServiceNow instance.
      iv. Select **Save**.
   e. In the Custom payload section, add in the following payload structure for the events that will be generated. Ensure that `ImpactedEntities` and `ProblemDetailsJSONv2` are passed as JSON objects, not strings.

```
{
  "ImpactedEntities": {ImpactedEntities},
  "ImpactedEntity": "{ImpactedEntity}",
  "PID": "{PID}",
  "ProblemDetailsHTML": "{ProblemDetailsHTML}",
  "ProblemDetailsJSONv2": {ProblemDetailsJSONv2},
  "ProblemDetailsMarkdown": "{ProblemDetailsMarkdown}",
  "ProblemDetailsText": "{ProblemDetailsText}",
  "ProblemID": "{ProblemID}",
  "ProblemImpact": "{ProblemImpact}",
  "ProblemSeverity": "{ProblemSeverity}",
  "ProblemTitle": "{ProblemTitle}",
  "ProblemURL": "{ProblemURL}",
  "State": "{State}",
  "Tags": "{Tags}"
}
```

Result

Alerts start flowing from Dynatrace agents into the Event Management plugin. The plugin extracts information from the original Dynatrace alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to All Events to see the events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: By default, host binding is enabled for Dynatrace events for (AWS/Azure/GCP) providers. If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the Dynatrace - General event rule. For further information about Event rules, see Event rules.

Integrate New Relic platform events

Integrate New Relic with Event Management by adding a standard webhook in the New Relic old and new consoles.

Before you begin

Verify that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from New Relic by authenticating New Relic as a data source. Set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook. Use procedure step 1 for the new console. Use procedure step 2 for the old console.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Procedure

1. For the new console:

   a. Create a destination.

      i. Navigate to **Alerts & AI** > **Destinations**.

      ii. In the **Add destinations** section, select the **Webhook** channel type.

      iii. In the **Webhook name** field, enter the webhook name.

      iv. In the **Endpoint URL** field enter: `https://<InstanceName>.service-now.com/api/sn_em_connector/em/inbound_event?source=newrelic`

      v. In the **Basic Auth** section, enter your user name and password.

      Note: Verify the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

      vi. Select **Save destination**.

   b. Create a policy.

      i. Navigate to **Alerts & AI** > **Alert Conditions & Policies**.

      ii. Select **New Alert policy** and define a policy.

      iii. Select **Set up Notifications**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iv. In the **Add Channel** section select **Webhook**, and then select the destination that you created in the previous substep.

v. In the **Payload template** section, paste the following JSON payload.

```
{ "account_id": {{nrAccountId}}, "account_name": {{json
 accumulations.tag.account.[0]}}, "closed_violations_count":
 {{closedIncidentsCount}}, "open_violations_count":
 {{openIncidentsCount}}, "condition_description":
 "{{escape accumulations.conditionDescription.[0]}}",
 "condition_family_id":
 {{accumulations.conditionFamilyId.[0]}}, "condition_name":
 "{{escape accumulations.conditionName.[0]}}",
 "current_state": {{json state}}, "details":
 {{json issueTitle}}, "duration": {{#if
 issueDurationMs}}{{issueDurationMs}}{{else}}0{{/if}},
 "event_type": "INCIDENT", "incident_acknowledge_url":
 {{json issueAckUrl}}, "incident_id": {{json issueId}},
 "incident_url": {{json issuePageUrl}}, "metadata":
 { {{#if locationStatusesObject}}"location_statuses":
 {{json locationStatusesObject}},{{/if}} {{#if
 accumulations.metadata_entity_type}}"entity.type":
 {{json accumulations.metadata_entity_type.[0]}},{{/if}}
 {{#if accumulations.metadata_entity_name}}"entity.name":
 {{json accumulations.metadata_entity_name.[0]}},{{/if}}
 "section": "metadata" }, "owner": {{json owner}},
 "policy_name": {{json accumulations.policyName.[0]}},
 "policy_url": {{json policyUrl}}, "runbook_url": {{json
 accumulations.runbookUrl.[0]}}, "severity": {{json
 priority}}, "targets": [ { "id": "{{labels.targetId.[0]}}",
 "name": "{{#if accumulations.targetName}}{{escape
 accumulations.targetName.[0]}}{{else
 if entitiesData.entities}}{{escape
 entitiesData.entities.[0].name}}{{else}}N/A{{/if}}",
 "link": "{{issuePageUrl}}", "product":
 "{{accumulations.conditionProduct.[0]}}", "type": "{{#if
 entitiesData.types.[0]}}{{entitiesData.types.[0]}}{{else}}
}N/A{{/if}}", "labels": { {{#each
 accumulations.rawTag}}"{{escape @key}}": {{#if
 this.[0]}}{{json this.[0]}}{{else}}"empty"{{/if}}{{#unless
 @last}},{{/unless}}{{/each}} } } ], "timestamp":
 {{updatedAt}}, "violation_callback_url": {{json
 issuePageUrl}}, "violation_chart_url": {{json
 violationChartUrl}} }
```

vi. Select **Send test notification** to get the test event in your ServiceNow instance.

vii. Select **Save message**.

viii. Select **Activate workflow** to activate the workflow.

c. Create alert conditions to apply to the policy:

i. Navigate to **Alerts & AI** > **Alert Conditions & Policies**.

ii. Select **Create alert condition**, define the required alert details, and add it to the policy you created in the previous step.

iii. Select **Save Condition**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. For the old console.

   a. Create a notification channel.

      i. Navigate to **Alerts & AI** > **Notification channels**.

      ii. In the **Channel details** tab, select the **Webhook** channel type.

      iii. In the **Base Url** text box, enter: `https://<InstanceName>.service-now.com/api/sn_em_connector/em/inbound_event?source=newrelic`

      iv. In the Basic Auth section, enter the user name and password of the relevant user.

      > **Note:** Verify the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

      v. In the **Custom Payload** section, select **Add Custom Payload**, and select the **JSON** payload type.

      vi. Paste the following JSON payload into the **Custom Payload**.

```
{ "account_id": "$ACCOUNT_ID", "account_name":
 "$ACCOUNT_NAME", "closed_violations_count_critical":
 "$CLOSED_VIOLATIONS_COUNT_CRITICAL",
 "closed_violations_count_warning":
 "$CLOSED_VIOLATIONS_COUNT_WARNING",
 "condition_description": "$DESCRIPTION",
 "condition_family_id": "$CONDITION_FAMILY_ID",
 "condition_name": "$CONDITION_NAME", "current_state":
 "$EVENT_STATE", "details": "$EVENT_DETAILS",
 "duration": "$DURATION", "event_type":
 "$EVENT_TYPE", "incident_acknowledge_url":
 "$INCIDENT_ACKNOWLEDGE_URL", "incident_id": "$INCIDENT_ID",
 "incident_url": "$INCIDENT_URL", "metadata":
 "$METADATA", "open_violations_count_critical":
 "$OPEN_VIOLATIONS_COUNT_CRITICAL",
 "open_violations_count_warning":
 "$OPEN_VIOLATIONS_COUNT_WARNING", "owner": "$EVENT_OWNER",
 "policy_name": "$POLICY_NAME", "policy_url": "$POLICY_URL",
 "runbook_url": "$RUNBOOK_URL", "severity": "$SEVERITY",
 "targets": "$TARGETS", "timestamp": "$TIMESTAMP",
 "violation_callback_url": "$VIOLATION_CALLBACK_URL",
 "violation_chart_url": "$VIOLATION_CHART_URL" }
```

   b. Create a policy.

      i. Navigate to **Alerts & AI** > **Policies**.

      ii. Select **New Alert policy** and define a policy.

      iii. In the **Notification Channels** section, select **Add**, select **Webhook**, and then select the channel you created in the previous step.

   c. Create alert conditions to apply to the policy:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Navigate to **Infrastructure** > **Settings** > **Alerts**.

ii. Select **Create alert condition**, define the required alert details, add it to the policy you created in the previous step.

iii. Select **Create**.

Result

Alerts start flowing from the New Relic console into the Event Management plugin. The plugin extracts information from the original New Relic alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

Note: By default, host binding is enabled for New Relic events for all providers (Azure/AWS/GCP). If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the **New Relic - General** event rule. For further information about Event rules, see Event rules.

Integrate New Relic with REST API key token

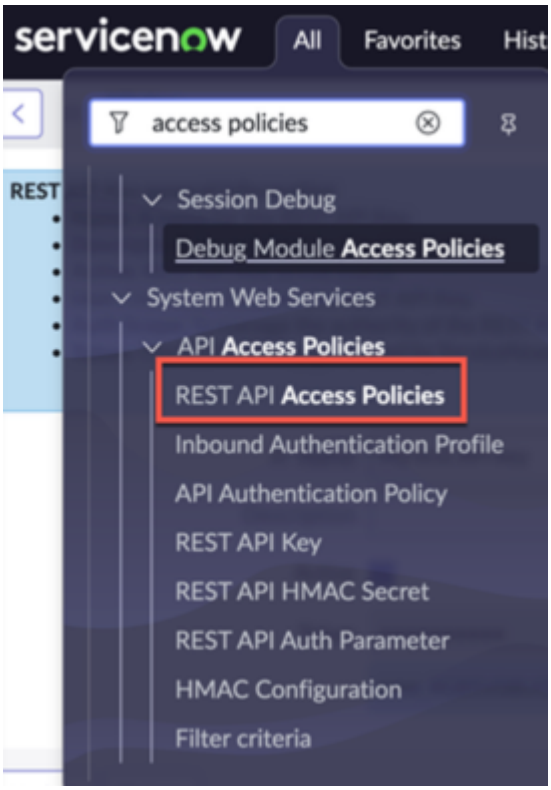
Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

Before you begin

Role required: evt_mgmt_integration

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill the fields.

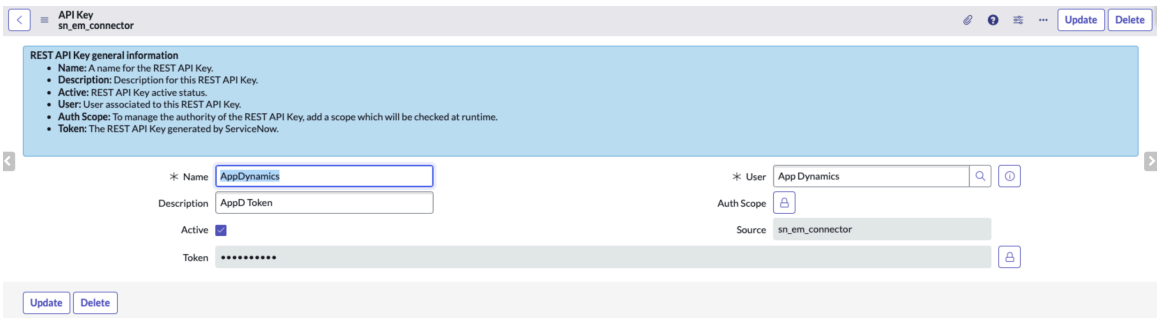
> **Note:** The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate Catchpoint events

Integrate Catchpoint with Event Management by adding an alert webhook in the Catchpoint platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Configure the Event Management environment for the collection of events from Catchpoint by authenticating Catchpoint as a data source. In the Catchpoint platform, set your ServiceNow AI Platform as the rest endpoint using a webhook.

Procedure

1. In the Catchpoint platform, create an alert webhook destination.

   a. Login to the Catchpoint platform.

   b. Navigate to **Catchpoint** > **Setting** > **API** > **Alert Data Webhook** to set the webhook endpoint.

   c. In the API Alert Webhook, provide the following details.

API Alert Webhook form

Field	Value
Name	Any name based on your requirement.
URL	The default format of the URL to push events from Catch Point to the ServiceNow AI Platform instance, `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=catchpoint`.
On Failure Alert	The email address for the API Alert webhook.
Notification Trigger	Select based on your requirement. The default value is 3.
Add the following headers	▪ Authorization: **Basic {Base 64 | username:password}** ▪ Content-Type: **application/json**
Format	Select **Template** and add the following template: `{ "Source": "CatchPoint", "severity": "${notificationLevelId}", "alertType": "${AlertType}", "time_of_event": "${alertCreateDateUtc(YYYY-MM-DD HH:MI:SS)}", "monitorType": "${Switch(${MonitorTypeId},'0', 'IE','2', 'Object','3','Emulated','8', 'Ping','9', 'Tracert','10', 'DNS-Traversal','11', 'Ping-TCP','12', 'DNS-Exp',`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value

	'13','DNS-Direct',
	'14','Tracert-UDP', '15',
	'Port-TCP','16', 'FTP','17',
	'Data-Push-API','18',
	'Chrome','19', 'Playback',
	'20', 'Playback-Mobile',
	'21', 'SMTP', '22',
	'Port-UDP', '23',
	'Ping-UDP', '24',
	'Streaming', '25', 'API',
	'26', 'Mobile',
	'27', 'SFTP', '28', 'SSH',
	'29', 'Tracert-TCP')}",
	"testName": "${TestName}",
	"testId": "${TestId}",
	"testUrl": "${TestUrl}",
	"testPath": "${testPath}",
	"testLink": "${testLink}",
	"productName":
	"${ProductName}",
	"clientId": "${ClientId}",
	"productId": "${productId}",
	"nodeName":"${nodeDetails("${
	nodeName}")}",
	"nodeClientServerAddress":"${
	nodeDetails(\"${NodeClientAdd
	ress},\"),}",
	"nodeServerAddress":
	"${nodeDetails(\"${nodeServe
	rAddress},\"),}",
	"Labels" : "${testLabels}",
	"addtionalInformation":
	"Test initial URL:
	${testUrl}\n\nAlert type:
	${AlertType}\n\nScatter
	Chart:
	${scatterplotChartURL}\n\nWa
	terfall Chart:
	${waterfallChartURL}\n\nTest
	properties:
	${testLink}\n\nTest time
	of run / Test time of
	alert (Central Time):
	${reportDateLocal(YYYY-MM-DD
	HH:MI:SS)} /
	${alertCreateDateLocal(YY
	YY-MM-DD HH:MI:SS)}"}

2. For the HTTP Endpoint monitoring tests, in the ServiceNow instance, create a CI.

Note: The Catchpoint connector supports multiple types of monitoring tests such as Endpoint, Networking, and others. The following steps apply only to the HTTP Endpoint monitoring tests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Configuration** > **CI Class Manager**.

b. Click **Hierarchy** and search for **HTTP(S) Endpoint**.

c. In the CI Type field, select **cmdb_ci_endpoint_http**.
If the services are not modeled, then you should manually add the CIs under the [cmdb_ci_endpoint_http] table. Also, the manual endpoint should be removed before the automatic discovery of services. For other type tests CI bindings, you can create Event rules based on their requirements.

Result
Alerts start flowing from the Catchpoint connector into the Event Management plugin. The following table shows how the Catchpoint severity mapping translates into the ServiceNow mapping.

Severity levels between Catchpoint and ServiceNow

Catchpoint severity	ServiceNow severity
0	Warning
1	Critical
2/3	Clear

Integrate Datadog platform events

Integrate Datadog with Event Management by adding a standard webhook in the Datadog console.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using Datadog Monitor V1 or V2 access tokens. For more information, see Integrate Datadog with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for Datadog Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate Datadog with basic authentication.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Integrate Datadog with basic authentication

Integrate Datadog with Event Management by adding a standard webhook in the Datadog console.

Before you begin
Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Role required: evt_mgmt_integration
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- Verify Configuration Items for the hosts managed by Datadog exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.

About this task

Configure the Event Management environment for the collection of events from Datadog. In your Datadog console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Procedure

1. In the Datadog console, add cloud provider tags:

a. Navigate to **Menu** > **Infrastructure** > **Infrastructure List**

b. Click **Inspect** for the VM on which the Datadog agent is installed.

c. Click **Edit Tags** and add the *cloud_provider* tag.
The tag should be suffixed with the value of **aws**, **azure**, or **gcp** to identify the AWS, Microsoft Azure, or Google Cloud Platform (GCP) provider options. For example: cloud_provider:aws

d. Click **Save Tags** to save the new tag.

Note: Datadog adds the *cloud_provider* tag by default when the Azure and Google integration is installed on the Datadog agent. Tags can also be added at the cloud provider level. Datadog collects all the tags defined at the VM level on the cloud.

2. In the Datadog console, add a webhook:

a. Navigate to **Menu** > **Integration** > **Integrations**, and search for webhooks.

b. Create a webhook that includes the user ID and password of the ServiceNow user in the endpoint.
For example, use `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=datadog`.

Note: Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

c. Add in the following payload structure.

```
{
    "body": "$EVENT_MSG",
    "last_updated": "$LAST_UPDATED",
    "event_type": "$EVENT_TYPE",
    "title": "$EVENT_TITLE",
    "date": "$DATE",
    "org": {
        "id": "$ORG_ID",
        "name": "$ORG_NAME"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    },
    "id": "$ID",
    "alert_id": "$ALERT_ID",
    "alert_metric": "$ALERT_METRIC",
    "metric_namespace": "$METRIC_NAMESPACE",
    "alert_priority": "$ALERT_PRIORITY",
    "alert_transition": "$ALERT_TRANSITION",
    "alert_status": "$ALERT_STATUS",
    "alert_title": "$ALERT_TITLE",
    "alert_type": "$ALERT_TYPE",
    "host_name": "$HOSTNAME",
    "priority": "$PRIORITY",
    "tags": "$TAGS",
    "alert_scope": "$ALERT_SCOPE"
}
```

3. In the Datadog console, define rules:
   a. Navigate to **Menu** > **Monitors** > **Manage Monitors**, and configure rules on when to create a problem from Datadog on the managed hosts.
   b. In the **Notify your team** section, select the webhook on which the problem should be notified.

Result

Alerts start flowing from Datadog agents into the Event Management plugin. The plugin extracts information from the original Datadog alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

Note: By default, host binding is enabled for Datadog events for (AWS/Azure/GCP) providers. If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the **Datadog - General** event rule. For further information about Event rules, see Event rules.

Integrate Datadog with OAuth authentication

Integrate Datadog with Event Management by authenticating Datadog V1 or V2 tokens in the Datadog Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

The Event Management plugin must be installed on the ServiceNow AI Platform instance.

Verify Configuration Items for the hosts managed by Datadog exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.

Role required: evt_mgmt_integration

About this task

Datadog integration with OAuth authentication is available starting from the Washington DC platform release or later.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Configuration on the ServiceNow instance.

   a. Create *glide.oauth.inbound.client.credential.grant_type.enabled* system property to use Client Credentials grant type for OAuth inbound integrations.
      - Type: true|false
      - Value: true

   b. Create an OAuth Entity endpoint for clients to access the instance.

      i. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.

      ii. On the interceptor page, select **Create an OAuth API endpoint for external clients** and then fill in the form.

      iii. To create an OAuth client record, select **Submit**.

   c. Add the OAuth Application User and the Default Grant Type to the created OAuth client record.

      i. On the OAuth Entity form, add the **OAuth Application User** and the **Default Grant Type** fields to use the Client Credentials grant type for OAuth inbound integrations.

      ii. Open the created OAuth client record.

      iii. From the page header, select the **More** options icon.

      iv. Select **Configure** > **Form Layout**

      v. On the Form Layout page, add **OAuth Application User and Default Grant Type** from the list of fields.

      vi. **Save** or **Update** the form.

      vii. For the **OAuth Application User** field, select the user.

      The user must have the evt_mgmt_integration role that will be used to create the events sent by Datadog.

      Note: To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

      viii. Set **Default Grant Type** field value to **Client Credentials**.

2. In the Datadog console, add cloud provider tags.

   a. Navigate to **Menu** > **Infrastructure** > **Infrastructure List**.

   b. Select **Inspect** for the VM on which the Datadog agent is installed.

   c. Select **Edit Tags** and add the cloud_provider tag.

   The tag must be suffixed with the value of aws, azure, or gcp to identify the AWS, Microsoft Azure, or Google Cloud Platform (GCP) provider options. For example: cloud_provider:aws.

   d. Select **Save Tags**.

   Note: Datadog adds the cloud_provider tag by default when the Azure and Google integration is installed on the Datadog agent. Tags can also be added at the cloud provider level. Datadog collects all the tags defined at the VM level on the cloud.

3. In the Datadog console, add a webhook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Menu** > **Integration** > **Integrations** and search for webhooks.

b. On the webhook tile, select **Configure**.

c. Select the **Auth Methods** tab and then select **New Auth Method**.

d. Enter the name and select the protocol as **OAuth 2.0 Client Credentials**.

e. Provide Access token URL as `https://<instance_name>.service-now.com/oauth_token.do`.

f. Provide the value for **Client ID** with the client id of the OAuth Entity Client created in ServiceNow instance.

g. Provide “Client secret” with the client secret of the OAuth Entity Client created in ServiceNow instance.

h. Select **Save**.

i. Create webhook URL as

`https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=datadog`

j. Select the OAuth Method created in the previous steps in AuthMethod dropdown.

k. Add in the following payload structure.

```
{
    "body": "$EVENT_MSG",
    "last_updated": "$LAST_UPDATED",
    "event_type": "$EVENT_TYPE",
    "title": "$EVENT_TITLE",
    "date": "$DATE",
    "org": {
        "id": "$ORG_ID",
        "name": "$ORG_NAME"
    },
    "id": "$ID",
    "alert_id": "$ALERT_ID",
    "alert_metric": "$ALERT_METRIC",
    "metric_namespace": "$METRIC_NAMESPACE",
    "alert_priority": "$ALERT_PRIORITY",
    "alert_transition": "$ALERT_TRANSITION",
    "alert_status": "$ALERT_STATUS",
    "alert_title": "$ALERT_TITLE",
    "alert_type": "$ALERT_TYPE",
    "host_name": "$HOSTNAME",
    "priority": "$PRIORITY",
    "tags": "$TAGS",
    "alert_scope": "$ALERT_SCOPE"
}
```

Result

Alerts start flowing from Datadog agents into the Event Management plugin. The plugin extracts information from the original Datadog alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to All Events to see the events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: By default, host binding is enabled for Datadog events for (AWS/Azure/GCP) providers. If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the Datadog - General event rule. For further information about Event rules, see Event rules.

Integrate Google Cloud Platform (GCP) events

Integrate Google Cloud Platform (GCP) with Event Management by adding a standard webhook in the GCP console.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- Verify Configuration Items for the hosts managed by GCP exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.
- The Event Management Connector plugin supports GCP alert data in JSON 1.2 format only.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from GCP. In your GCP console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Procedure

1. In the GCP console, add a webhook.
   a. Navigate to **Monitoring** > **Alerting**, and click **Edit Notification Channels**.
   b. In the Webhooks section, click **Add New**.
   c. Select the **Use HTTP Basic Auth** check box, and enter the user name and password of the relevant ServiceNow user.

      Note: Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. Enter the endpoint URL.
      For example, use`https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=googlemonitor`.
2. In the GCP console, create an alerting policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Monitoring** > **Alerting**, and select **Create Policy**.

b. Configure policy conditions that initiate alerts when the conditions are violated.

c. Select the webhook on which the problem should be notified.

Note: If you need to directly open an incident in the GCP console from the alert, navigate to **Quick Response (in Alert)** > **Show Incident in GCP Console**.

Result

Alerts start flowing from GCP into the Event Management plugin. The plugin extracts information from the original GCP alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to**All Events** to see the events.

GCP does not send values such as the severity level in the payload. The default severity is Minor, which can be changed in the*Push Connector Configuration* section of **Push Connectors** > **Google Monitor Push Connector**. The valid values of severity are**1- Critical**,**2- Major**,**3- Minor**,**4- Warning**, and**5- Info**.

Note:

To map the GCP hosts to the**cmdb_ci_server**record instead of**cmdb_ci_vm_object**, disable the**Google Monitor - General**event rule created for GCP. For further information about event rules, see Event rules.

Event collection from Google Cloud Platform (GCP)

The MID WebService Event Collector enables you to collect JSON formatted event messages sent from Google Cloud Platform (GCP).

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task

JSON formatted event messages are sent from Google Cloud Platform. The MID Server transforms the collected event messages by parsing them using the TransformEvents_MidGoogleMonitor script include, located here: **Event Management** > **Integrations** > **PushConnectors**. In the Push Connectors page, click **Google Monitor Mid Push Connector**.

The default format of the URL to push event messages from the GCP to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidGoogleMonitor`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server.

The following procedure describes the collection of JSON formatted event messages using basic authentication.

Procedure

1. In the Google Cloud Platform (GCP) console, make sure the MID Server IP is accessible from the GCP console and MID rest point is accessible from GCP or install the MID Server on a GCP VM and provide the GCP VM external IP address in the URL.
   In the GCP console, create a firewall rule.
   a. Navigate to **VPC Network** > **Firewall** > **Create Firewall**.
   b. Set the direction to **ingress** to allow the mid_web_server_port to connect.
   c. Add the GCP VM that the MID Server is installed on to the **Applicable to instances** list.
2. In the GCP console, add a webhook.
   a. Navigate to **Monitoring** > **Alerting** and click **Edit Notification Channels**.
   b. In the Webhooks section, click **Add New**.
   c. Select the **Use HTTP Basic Auth** check box, and enter the username and password of the MID Webserver User.

      Note: Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. Enter the endpoint URL.
      For example, use `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidGoogleMonitor`
3. In the GCP console, create an alerting policy.
   a. Navigate to **Monitoring** > **Alerting** and click **Create Policy**.
   b. Configure the policy conditions that initiate alerts when the conditions are violated.
   c. Select the webhook notification channel on which the problem should be notified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select the **Notify on incident closure** check box to send the closure events to the MID Server and save the alert policy.

> **Note:** If you need to directly open an incident in the GCP Console from the alert, navigate to **Quick Response (in Alert)** > **Show Incident in GCP Console**. For more information about creating an alert policy, see Managing alerting policies on the Google Cloud documentation site.

Result

GCP does not send values such as the severity level into the payload. The default severity is Minor, which can be changed in the *Push Connector Configuration* section of **Push Connectors** > **Google Monitor MID Push Connector**. The valid values of severity are **1- Critical**, **2- Major**, **3- Minor**, **4- Warning**, and **5- Info**.

Integrate Grafana events

Integrate Grafana with Event Management by adding a standard webhook in the Grafana console.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- The CI binding happens through the IP, instances should be discovered as servers to initiate the binding. CIs discovered through cloud or CIs in **cmdb_ci_vm_object** don't get bounded as Grafana doesn't provide any information for object IDs.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from Grafana. In your Grafana console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

> **Note:** Perform steps 1 and 2 for Grafana v7.4.3. For Grafana v9.3.2. skip to step 3.

Procedure

Grafana v7.4.3

1. In the Grafana console, create a notification channel.

   a. Navigate to **Alerting** > **Notification Channels**.

   b. Click **New Channel** and select the type as **Webhook**.

   c. Enter a URL.
   For example, use `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=grafana`.

   d. Under the **Optional WebHook** settings, select the HTTP Method, **POST**, and enter the user name and password of the relevant ServiceNow user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

e. Click **Test** to verify the connection.

2. In the Grafana console, create alerting rules.

a. Click **Edit** on the required panel and then **Create Alert**.

b. In the **Alert** tab, add the following tags:

Tags	Description
Severity	(This tag is optional and has to be lower cased.) Severity with which the alert has to be created.
Count	(This tag is required, otherwise the alerts don't close automatically in ServiceNow.) The number of devices, hosts, or servers monitored by this alert rule.

c. Add the notification channel under **Notifications** in the alert rule.

d. Click **Save**.

e. Navigate to **Alerting** > **Alert Rules** to access the created rule.

Grafana v9.3.2.

3. In the Grafana console, create a contact point.

a. Navigate to **Alerting** > **Contact Points**.

b. Click **New Contact Point**, enter a name, and select the type as **Webhook**.

c. Enter a URL.
For example, use `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=grafana`.

d. Under the **Optional WebHook** settings, select the HTTP Method, **POST**, and enter the user name and password of the relevant ServiceNow user.

Note: Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

e. Click **Save** and **Test** to verify the connection.

4. In the Grafana console, create a notification policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Alerting** > **Notification Policies**.

b. Select **New Policy**, add matchers.
Matchers are labels that direct alert rules to the contact point.

c. Select your contact point.

d. Select **Save Policy**.

5. In the Grafana console, create alert rules.

a. Navigate to **Alerting** > **Alert Rule**.

b. Select **New Rule**.

c. Set the Query and Alert Condition.

d. Set the data source, metrics, and the necessary filters.

e. Set the alert evaluation behavior.

f. Enter the rule name.

g. In the summary and annotations section, add a summary or a description.

h. From the scroll down, select **+Add New**.

i. Enter the node, resource, and metric information.
This information is required for the node, resource, and metric_name fields for the event.

Note: Use the value string to pass these values. For example, a node can be {{ $values.C0.Labels.instance }}.

j. Under custom labels, provide the required labels to direct your notifications to the appropriate contact point.

Note: You can also pass the severity under custom labels. The same is used for events. The available severity options are: critical, major, minor, warning.

k. Click **Save**.

Result

Alerts start flowing from Grafana into the Event Management plugin. The plugin extracts information from the original Grafana alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- For Grafana v7.4.3, you may see extra clear events coming into ServiceNow which aren't bound to an alert. Ignore them as they're created to overcome the issue of Grafana not sending information in the clear notification.
- A severity parameter is added which is used only for Grafana 8 and above. The provided value is used as a severity for an event if the severity isn't passed in custom labels.

Integrate Grafana with REST API key token

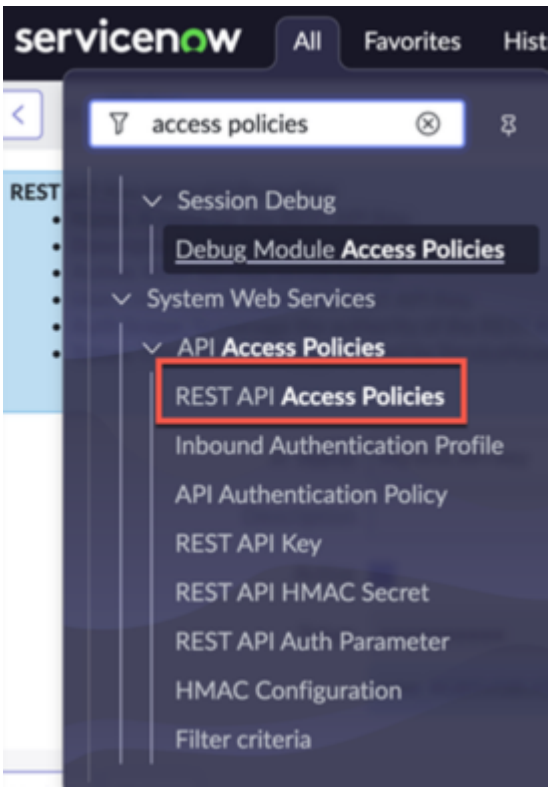
Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

Before you begin

Role required: evt_mgmt_integration

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

Note: The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

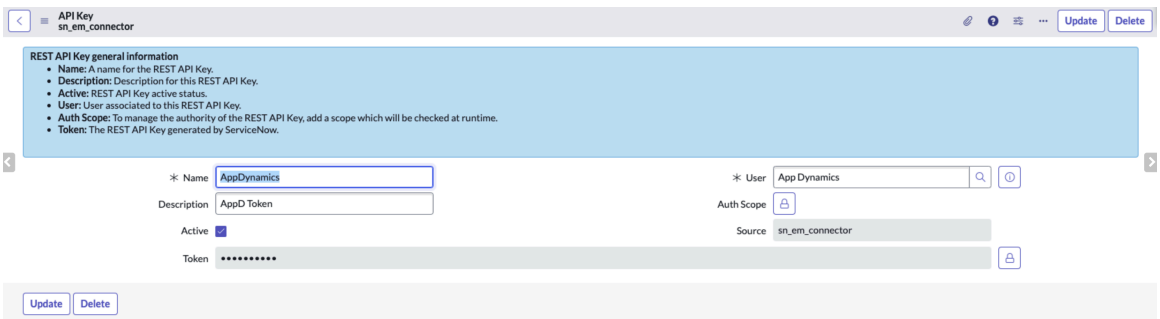
Field	Description
Name	Name to identify the REST API Key

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate Honeycomb events

Integrate Honeycomb with Event Management by creating a webhook and configuring it as a trigger in the Honeycomb platform.

Before you begin

Discovery for Honeycomb services and datasets is not supported. For event/CI binding to work, manually create a CI in the ServiceNow instance.

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

Configure the Event Management environment for the collection of events from Honeycomb by authenticating Honeycomb as a data source. In the Honeycomb platform, set your ServiceNow AI Platform as the rest endpoint using a webhook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Honeycomb platform, create an integration of *type=webhook*.
   a. Navigate to **Usage** > **Integrations**.
   b. Select the **Add Integration** button.
   c. Enter values in the **Name** and **Webhook URL** fields.
   When enting the Webhook URL, use the following format: `https://<USERNAME>:<PASSWORD>@<INSTANCE_NAME>.service-now.com/api/sn_em_connector/em/inbound_event?source=honeycomb`
   d. In the **Provider** field, select **Webhook**.
   e. Select **Add** to complete webhook creation.
2. Add the webhook to a trigger.
   a. Navigate to **Triggers** > **Create New Trigger**.
   b. Add a name and description for the trigger in the relevant fields.
   c. In the **Alerts** section, configure the threshold and frequency in the relevant fields.
   d. In the **Recipients** section, select **Add Recipient** and select the webhook created in step 1.
   e. Select **Save Trigger**.

> **Note:** To view the trigger in the Honeycomb platform, navigate to **Quick Response (in Alert)** and select **Show Trigger in Honeycomb**.

Result

Alerts flow from the Honeycomb connector into the Event Management plugin. The plugin extracts information from the original Honeycomb trigger message to populate the required event fields, and inserts the event into the database. You can view the events in your ServiceNow AI Platform instance by navigating **All Events**.

Honeycomb does not send severity information in the trigger message. The default severity for the Honeycomb alert is *3 - Minor*, which can be changed in the Push Connector Configuration section of **Push Connectors** > **Honeycomb Push Connector** . The valid severities are: *1 - Critical*, *2 - Major*, *3 - Minor*, *4 - Warning*, and *5 - Info*.

Integrate Instana events

Integrate Instana with Event Management by adding a standard webhook in the Instana console.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

Procedure

1. In the Instana console, navigate to **Settings** > **Events & Alerts** > **Alert Channels**.
2. Open the **Add Alert Channel** dropdown and select the **Generic Webhook** option.
3. In the **Webhook URLs** field, create an alert channel by entering the following URL:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
https://<instance>.service-now.com/api/sn_em_connector/
em/inbound_event?source=instana
```

4. To authenticate the ServiceNow URL, enter the following in the **Custom HTTP Request Headers**:

Field	Value
Key	Authorization
Value	Basic <base64_encoded username:password>

5. Configure Instana to create alerts for event types or events.

   a. Navigate to **Settings** > **Events & Alerts** > **Alerts**.

   b. Select **New Alert**.

   c. In the **Events** section, select one of the following:

   - Alert on Event Type(s)
   - Alert on Event(s)

   d. When creating alerts for event types:

   i. Select the type of events for which you want alerts to be created, such as **Critical Issues**, **All Incidents**, **Warning issues**, and so forth.

   ii. In the **Alerting** section, select the **servicenow** alert channel.

   e. When creating alerts for events:

   i. Select the events for which you want alerts to be created.

   ii. In the **Alerting** section, select the **servicenow** alert channel.

   When Instana creates an alert, the alert is sent to the ServiceNow instance. Alerts created for the host entity are bound to the Server (cmdb_ci_server) table, and alerts created for the website entity are bound to the HTTP(S) (cmdb_ci_endpoint_http) table.

   Add other entity types in the Instana - ci_type Event Field Mapping table to ensure that the entity binds with the correct CI in the ServiceNow instance.

6. To view the event in the Instana source system, you can access it from a ServiceNow instance:

   a. Navigate to **All** > **Event Management** > **Service Operations Workspace**.

   b. Select **All Alerts**.

   c. Select the relevant alert.

   d. On the **Details** tab, locate the **Actions** section on the right side of the page and in the **Show Event on Instana UI** cell, select **Launch app**.

Integrate ServiceNow Cloud Observability Events

Integrate ServiceNow Cloud Observability with Event Management by adding a standard webhook in the ServiceNow Cloud Observability platform. Download the Event Management Connector plugin from the ServiceNow Store so you can integrate with ServiceNow Cloud Observability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Role required: evt_mgmt_integration

About this task

Authenticate ServiceNow Cloud Observability as a data source to enable Event Management to collect events from ServiceNow Cloud Observability. In your ServiceNow Cloud Observability platform, use a standard webhook to set your ServiceNow AI Platform instance as the rest endpoint.

Note: Ensure the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Procedure

1. Create a CI.

   Note: Discovery for ServiceNow Cloud Observability services isn't supported. Create a CI manually in a Service Instance (cmdb_ci_service_auto) table to enable binding.

   a. Navigate to **All** > **Configuration** > **Application Service**.

   b. Select **New**.

   c. In the form, enter the name.
   The name must be the service name provided in the ServiceNow Cloud Observability platform.

   d. From the Operational Status list, set the operational status to **Operational**.

   e. Select **Next**.

   f. Select **Done**.

2. In your ServiceNow Cloud Observability platform, create a notification destination.

   a. From the navigation bar, select **Alerts**.

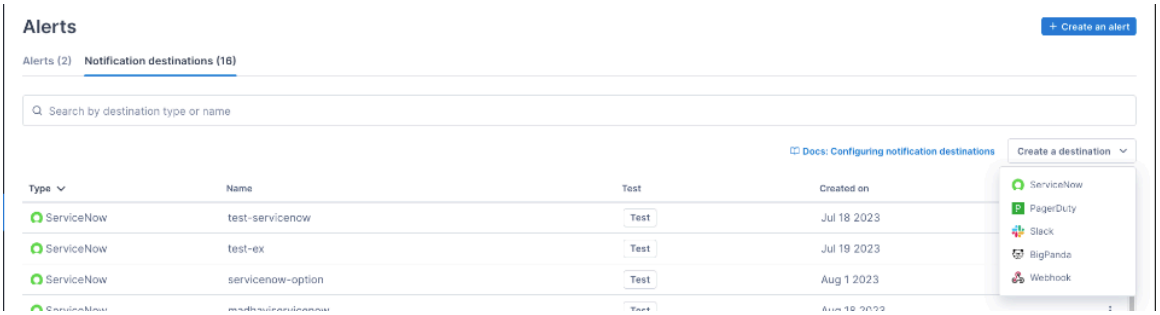
   b. Select the **Notification destinations** tab.

   c. Select **Create a destination**.

   d. Select **ServiceNow** or **webhook**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the ServiceNow destination to connect only with the ServiceNow platform. If you have any issues with the ServiceNow destination, then use the **webhook** destination option.



3. In your ServiceNow Cloud Observability platform, create a ServiceNow notification destination.

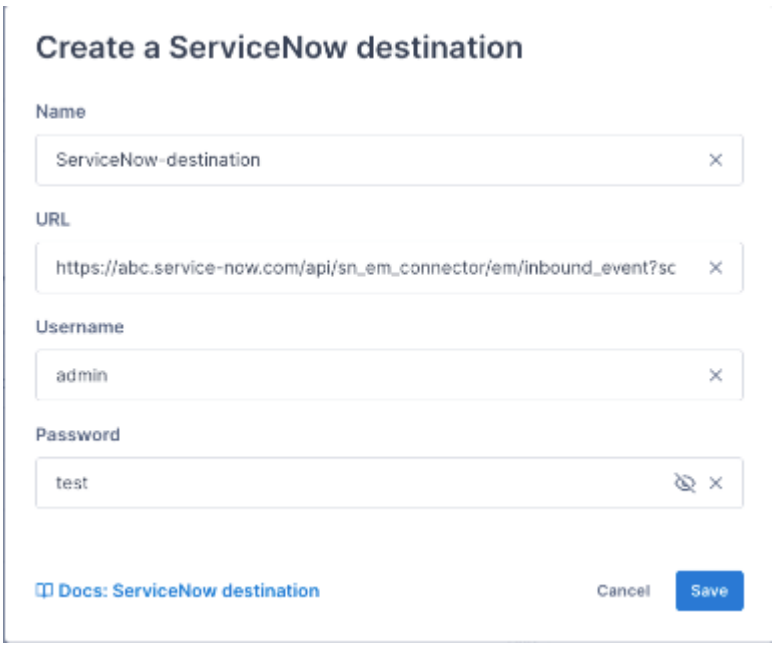
   a. In the **Name** field, enter a name for the ServiceNow destination.

   b. In the **URL** field, provide the ServiceNow instance URL.
   This is the default format of the URL to push events from ServiceNow Cloud Observability to the ServiceNow AI Platform instance. Use this format: `https//<instance-name>.servicenow.com/api/sn_em_connector/em/inbound_event?source=lightstep`

   c. In the **Username** field, enter your ServiceNow user name.

   d. In the **Password** field, enter your ServiceNow user password.

Create a ServiceNow destination



> **Note:** In a ServiceNow instance, CI binding occurs only if the name of the service in the ServiceNow Cloud Observability platform value matches the name fields of the CI you created in the *`cmdb_ci_service_auto`* table.

   e. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Note:** If you have any issues with the ServiceNow destination in the previous step, then use the **webhook** destination option.

   In your ServiceNow Cloud Observability platform, create a **webhook** notification destination.

   a. In the **Name** field, enter a name for the webhook destination.

   b. In the **URL** field, provide the webhook URL.
   This is the default format of the URL to push events from ServiceNow Cloud Observability to the ServiceNow AI Platform instance. Use this format: `https//<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=lightstep`

   c. Select **Payload Template**.

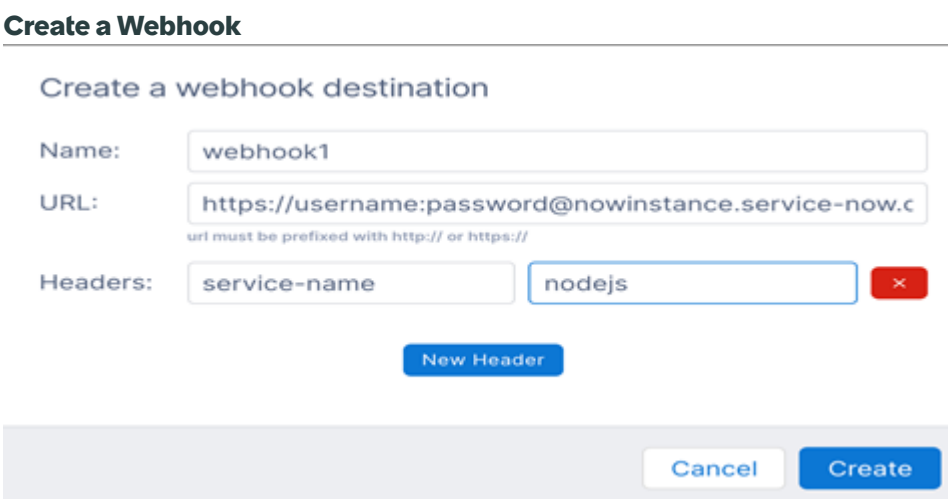
   d. Select the **ServiceNow Event Management** option.

   Note: In a ServiceNow instance, CI binding occurs only if the name of the service in the ServiceNow Cloud Observability platform value matches the name fields of the CI you created in the *`cmdb_ci_service_auto`* table.

   e. If you selected the **Default Template** option in the previous substep, then select **New Header** and in the **Headers** field, enter the **service-name** and define its **value**.

   Note: In a ServiceNow instance, CI binding occurs only if the **service-name** header value matches the name fields of the CI you created in the **cmdb_ci_service_auto table**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



f. Select **Create**.

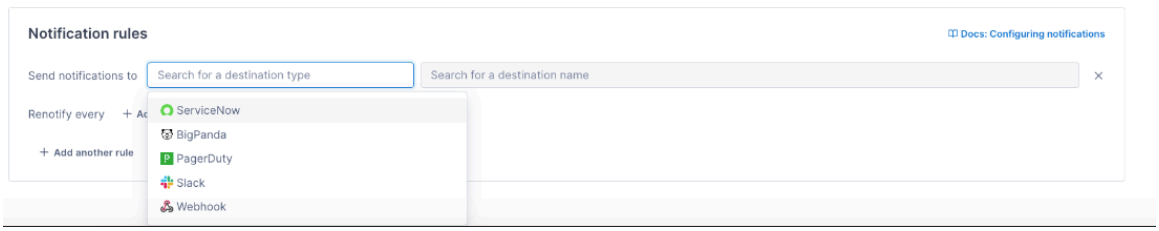
5. In the ServiceNow Cloud Observability platform, configure an alert.

a. From the navigation bar, select **Alerts**.

b. Select **Create an Alert** and enter an alert name.

c. In the Alert Configuration area, define the threshold.

d. According to the destination that you created, in the **Notification Rules** area, in the **Send Notifications to** field, select your notification destination type and search for the destination name.



e. Select **Save**.
The default severity for stream-based alerts is **Critical**. You can change the default in the Push Connector Configuration area of an ServiceNow AI Platform instance. The valid severity values are:

- 1- Critical
- 2- Major
- 3- Minor
- 4- Warning
- 5- Info

Integrate Logicmonitor events

Integrate Logicmonitor with Event Management to send events into ServiceNow by adding a webhook using Basic Authentication, it will also be available with bi-directional functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from Logicmonitor. In your Logicmonitor console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Procedure

1. In the Logicmonitor console, create a custom HTTP Delivery integration.
   a. Navigate to **Settings** > **Integrations** and click **Add** > **Custom HTTP Delivery Integration**.
   b. In the Manage Custom HTTP Delivery Integration form, fill in the **Name** and **Description** field and select the **Use the same URL and data to notify on various alert activity** check box.
   c. Specify when to send a notification on alert activities by selecting the **Acknowledged**, **Cleared**, and **Escalated/De-escalated** check boxes as needed.

      Note: If you are using the bi-directional Connector update, do not select the **Acknowledged** check box. Doing so can trigger a loop back to the Alert and close the Alert record unintentionally.

   d. In the HTTP method menu, select **HTTP POST**.
   e. Fill in the **Username** and **Password** field, and enter a URL with the format as, `https://{Instance-name}.service-now.com/api/sn_em_connector/em/inbound_event?source=logicmonitor`.
   f. Under the Alert Data section, select **Raw** and select the format as **JSON**.
   g. Add the custom payload provided in the description of the connector.
   h. Click **Test Alert Delivery** to verify the connection or **Save**.
2. When you're finished creating the integration, create an escalation chain for the alert settings.
   a. Navigate to **Settings** > **Alert Settings** > **Escalation Chains** and click **Add**.
   b. In the Manage Testing chain form, fill in the **Name** and **Description** field and select the rate at which the alerts should be notified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Under the Stages section, select the Add icon to add a stage and click **Save**.

d. When you create the new stage, select the Add icon again to search for the user and add the integration as the Contact Method and click **Save**.

3. After creating the escalation chain, configure alert rules for the chain you created.

a. Navigate to **Settings** > **Alert Settings** > **Alert Rules**, and click **Add**.

b. On the Add Alert window, configure the conditions that initiates the alerts when conditions are violated.

c. Under the Escalation chain menu, select the escalation chain you created.

d. Click **Save**.

Note: To map the CI to the **cmdb_ci_vm_object** record instead of the **cmdb_ci_server**, enable the event rule created for Logicmonitor. The Logicmonitor's collector name, which comes in as a hostname in the payload, should be the same as the object_id of the virtual machine discovered in the **cmdb_ci_vm_object** record.

Event collection from Logicmonitor

The MID WebService Event Collector enables you to collect JSON formatted event messages from the Logicmonitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task

JSON formatted event messages are sent from Logicmonitor. The MID Server transforms the collected event messages by parsing them using the TransformEvents_MidLogicmonitor script include, located here: **Event Management** > **Integrations** > **PushConnectors**. In the Push Connectors page, click **Logicmonitor Mid Push Connector**.

The default format of the URL to push event messages from Logicmonitor to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidLogicmonitor`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variables in the default URL (continued)

Variable	Description
MID_Web_Server_Password	Password of the user of the MID Web Server.

Procedure

1. In the Logicmonitor console, create a custom HTTP Delivery integration.
   a. Navigate to **Settings** > **Integrations** and click **Add** > **Custom HTTP Delivery Integration**.
   b. In the Manage Custom HTTP Delivery Integration form, fill in the **Name** and **Description** field and select the **Use the same URL and data to notify on various alert activity** check box.
   c. Specify when to send a notification on alert activities by selecting the **Acknowledged**, **Cleared**, and **Escalated/De-escalated** check boxes as needed.
   d. In the HTTP method menu, select **HTTP POST**.
   e. Fill in the **Username** and **Password** field, and enter a URL with the format as, `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidLogicmonitor`.
   f. Under the Alert Data section, select **Raw** and select the format as **JSON**.
   g. Add the custom payload provided in the description of the connector.
   h. Click **Test Alert Delivery** to verify the connection or **Save**.
2. When you're finished creating the integration, create an escalation chain for the alert settings.
   a. Navigate to **Settings** > **Alert Settings** > **Escalation Chains** and click **Add**.
   b. In the Manage Testing chain form, fill in the **Name** and **Description** field and select the rate at which the alerts should be notified.
   c. Under the Stages section, select the Add icon to add a stage and click **Save**.
   d. When you create the new stage, select the Add icon again to search for the user and add the integration as the Contact Method and click **Save**.
3. After creating the escalation chain, configure alert rules for the chain you created.
   a. Navigate to **Settings** > **Alert Settings** > **Alert Rules**, and click **Add**.
   b. On the Add Alert window, configure the conditions that initiates the alerts when conditions are violated.
   c. Under the Escalation chain menu, select the escalation chain you created.
   d. Click **Save**.

> **Note:** To map the CI to the **cmdb_ci_vm_object** record instead of the **cmdb_ci_server**, enable the event rule created for Logicmonitor. The Logicmonitor's collector name, which comes in as a hostname in the payload, should be the same as the object_id of the virtual machine discovered in the **cmdb_ci_vm_object** record.

Integrate Oracle Cloud Infrastructure alarms

Integrate Oracle Cloud Infrastructure (OCI) alarms with Event Management to send events into ServiceNow by adding a https subscription using Basic Authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- Oracle Cloud Discovery must be performed to ensure that the created alerts are bound to the configuration items in the ServiceNow AI Platform. For more information, see Oracle Cloud Infrastructure Discovery.
- Role required: evt_mgmt_integration

About this task

The Oracle Cloud Notifications service enables you to set up communication channels for publishing messages using topics and subscriptions. When a message is published to a topic, the Notifications service sends the message to all of the topic's subscriptions.

When an Oracle Management Cloud alert is raised, worsens in severity, or clears, you may want to be actively notified through an https custom URL to the ServiceNow instance. The Oracle Cloud connector will be used to create events in ServiceNow®.

You can configure the Event Management environment for the collection of alarms from Oracle Cloud by setting your ServiceNow AI Platform instance as the https subscription.

Procedure

1. In the Oracle Cloud console, set up a https subscription.

   a. On the Create Subscription form, under the Configure Subscription section in the Protocol list, select **HTTPS (Custom URL)**.

   Note: When the subscription is created, the password will not be shown in clear text.

   b. In the URL field, enter a URL with the format: `https://<username>:<password>@<instancename>.service-now.com/api/sn_em_connector/em/inbound_event/oraclecloud`.
   For example, `https://oracleevents:oracleevents@instance1.service-now.com/api/sn_em_connector/em/inbound_event/oraclecloud`.
   When the subscription is created with the ServiceNow instance URL, the Oracle Cloud Push connector will receive a payload that will confirm the subscription and is moved to an **Active** state in the Oracle Cloud console.

2. In the Oracle Cloud console, you can create an alarm definition and set the notification destination with the topic containing the https ServiceNow subscription.

   a. Navigate to **Observability & Management** > **Alarm Definitions**.

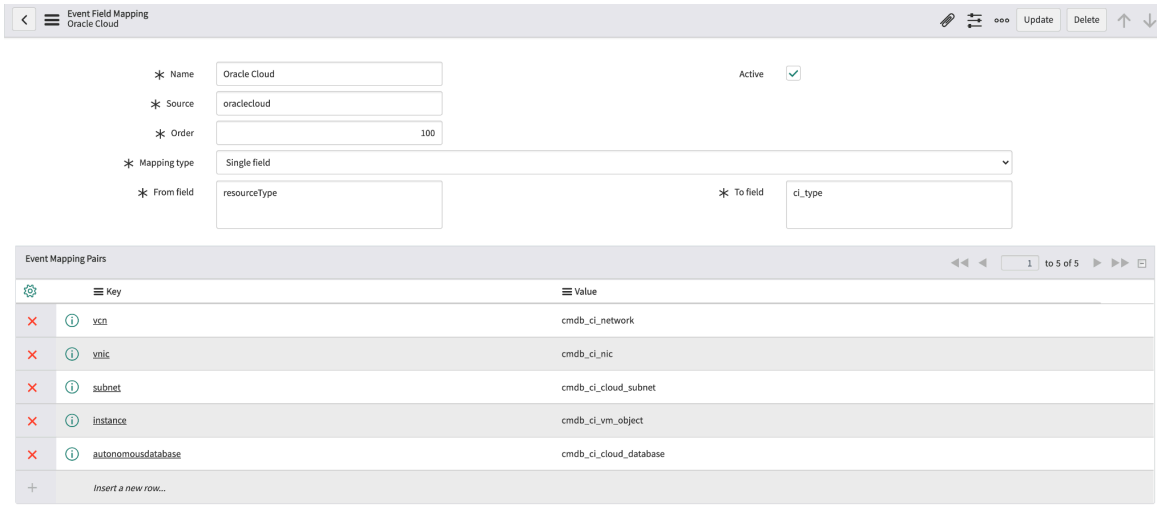
   b. Click **Create Alarm** or select an existing alarm that you want to set the topic containing the https ServiceNow subscription.

   c. In the Destinations section in the Topic list, select the topic with the https ServiceNow subscription.
   When an alarm is triggered in the Oracle Cloud console, the same alarm will be received in the Oracle Cloud Push connector in the ServiceNow instance and an event will be created.

Result

Depending on the Oracle Cloud alarm resource, the alert will bind to the CI using the following Event Field Mapping:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can create other event rules or modify the Event Field Mapping to map to other resource types.

Once the https subscription is configured and an Oracle Cloud alarm triggers a message in Event Management the message:

- Authenticates the Oracle Cloud alarm message with the relevant ServiceNow user given in the https subscription.
- Extracts information from the original Oracle Cloud alarm message to populate the required event fields and inserts the event into the ServiceNow AI Platform database.
- Captures specified content in the **Additional Information** field of the event form.

Integrate Prometheus events

Integrate Prometheus with Event Management by adding a standard webhook in Prometheus's Alert Manager.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- Verify Configuration Items for the hosts managed by Prometheus exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from Prometheus.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Prometheus instance, add a webhook.
   a. Navigate to Alertmanager.yml and add a webhook entry under the recievers.
   b. Enter the endpoint uRL. For example, use `https://<instance-name>/service-now.com/api/sn_em_connector/em/inbound_event?source=prometheus`.
   c. Type `basic_auth` underneath *`http_config`*.
   d. Add a username and password under *`basic_auth`*, then add the created webhook name in the receiver under *`route`*.
2. In the Prometheus instance, create an alert rule.
   a. Create a file for the alert rule and add its' path inside prometheus.yml under *`rules_files`*.
   b. Create the alert rule as per the prometheus format using PromQL.
   c. Restart AlertManager and Prometheus to reflect the changes.

Result

Alerts start flowing from Prometheus into the Event Management plugin. The plugin extracts information from the original Prometheus alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

If severity isn't received in the payload, the default severity is Major, which can be changed in the *`Push Connector Configuration`* section of **Push Connectors** > **Prometheus Push Connector**. The valid values of severity are **1- Critical**, **2- Major**, **3- Minor**, **4- Warning**, and **5- Info**.

Note:

To map hosts to the *`cmdb_ci_vm_object`* record instead of *`cmdb_ci_hardware`*, enable the **Prometheus VM Binding** event rule created for Prometheus. For further information about event rules, see Event rules.

Integrate Sentry events

Integrate Sentry with Event Management by adding a standard webhook in the Sentry platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Discovery for Sentry services are not supported. You must create a CI manually in the [cmdb_ci_service_auto] table to enable binding by completing the following steps:

1. From the navigation bar, go to **Configuration/Application Service**.
2. Provide the project name you are monitoring on the Sentry application.
3. Set the operational status to **Operational**.
4. Click **Next** then **Done**.

Role required: evt_mgmt_admin

About this task

Configure Event Management for the collection of events from Sentry by authenticating Sentry as a data source. In your Sentry platform, use a standard webhook to set your ServiceNow AI Platform as the rest endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Sentry console, create an internal integration.
   a. Navigate to **Settings** > **Developer Settings**.
   b. Click **New Internal Integration**.
   c. In the Internal Integration Details section, on the Sentry Integration Details page, fill in the fields.

Sentry Integration Details

Fields	Description
Name	Name of your integration.
Webhook URL	The default format of the URL to push events from Sentry to the ServiceNow AI Platform instance. For example, `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=sentry`.
Alert Rule Action	Option to enable the integration. **Note:** When enabled, the integration becomes available in the Issue Alert and Metric Alert rules in Sentry. The alerts will be sent to the ServiceNow instance.
Schema	Schema for your UI components. This field should be left empty.
Overview	Description for the integration.
Authorized JavaScript Origins	Auth Tokens from the browser to enable the origins of the pages making the requests. This field should be left empty.

   d. In the Permissions section, under Issue & Event, specify the level of access you want. You can select **Read**, **Read & Write**, or **Admin**.
   e. In the Webhooks section, select the **Issue** check box.
   f. Click **Save Changes**.
2. In the Sentry console, create alert rules and configure them to receive alerts for issues from Sentry to the ServiceNow instance.
   a. Navigate to **Alerts** > **Create Alert Rule**.
   b. Select the alert type and click **Set Conditions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The Issues alert type creates issue alerts. The other alert options create metric alerts.

c. On the Alert Rule page, create either an issue alert or a metric alert.

Alert Rule

Option	Description
Issue alert	**i.** Enter the environment, team, and alert name for your alert. **ii.** Under Set conditions, enter the **When** and **If** conditions that will trigger the alert. **iii.** For the **Then** condition, select **Send a notification via an integration** and select your internal integration from the list. **iv.** Set the action interval for the alert.
Metric alert	**i.** Add a filter to your transactions. **ii.** Select the function and time interval. **iii.** Set the thresholds that will trigger the alert. **iv.** Add the actions to be performed when the thresholds defined are met. **v.** Add your internal integration from the list to the list of actions to receive the alerts. **vi.** Add a rule name and team for the alert.

d. Click **Save Rule**.

Integrate Scout APM events

Enable the collection of events from Scout APM by authenticating Scout APM as a data source to integrate it with Event Management.

Before you begin

The Event Management plugin (com.glideapp.itom.snac) must be installed.

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Discovery for Scout APM applications is not supported. To enable binding, you must manually create a CI in a ServiceNow instance in the Service Instance [cmdb_ci_service_auto] table.

Role required: evt_mgmt_admin

Procedure

1. Enable Scout APM monitoring as an application service on your ServiceNow instance.

a. Navigate to **Configuration** > **Application Service**.

b. Provide the application name that you are monitoring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Set the operational status to Operational.

d. Select **Next**

e. Select **Done**.

2. Log in to the Scout APM console.

3. Create a notification channel.

a. Navigate to **Organization** > **Alerts & Notifications**.

b. Select **New Webhook**.

c. Provide the name of the webhook and the webhook URL.
Use the following URL format: `https://<USERNAME>:<PASSWORD>@<INSTANCE_NAME>.service-now.com/api/sn_em_connector/em/inbound_event?source=scout`

d. Validate whether the webhook is operational by selecting **Send Test Alert**.
A new event appears on your ServiceNow instance in the Events [em_event] table with the data source as Scout APM.

4. In the Organization section, create a new notification group.

a. On the **Alerts & Notifications** page, navigate to **Organization** > **Notification Groups**.

b. Add a name for the group and select the webhook channel you created.

c. Select the **Create Notification Group** button.

5. In the application section, create alert conditions and configure them to receive alerts for notifications from Scout APM to the ServiceNow instance.

a. Navigate to **Applications** > **Alert Conditions**.

b. Select the type of alert condition.
For more information, see the Scout APM documentation.

c. Select **Create Alert condition**.

d. In the Alert Conditions table, select the notification group you created.
The alert condition is displayed on the Scout console.

6. Configure error notifications to receive alerts for errors from the Scout APM to the ServiceNow instance.

a. Navigate to **Application** > **Error Notifications**.

b. Add a name and description for the notification.

c. Select the notification group that you created.
The Scout APM notification channel is configured with the error notifications.

d. Select the **Add Notification Group** button.
For any new error notifications in the Scout APM application, a new event will be generated in the Events [em_event] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You can view all notifications on your ServiceNow instance in the Events [em_event] table with the data source as Scout APM.

Integrate Sumo Logic events

Use the Sumo Logic push connector to integrate Sumo Logic with Event Management by adding a standard webhook in the Sumo Logic platform.

Before you begin
Ensure that the Event Management connector's plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_integration

About this task
Configure the Event Management environment for the collection of events from Sumo Logic by authenticating Sumo Logic as a data source. In the Sumo logic site, set your ServiceNow AI Platform instance as the rest endpoint using a webhook.

Procedure
1. In the Sumo Logic site, create a notification destination.
2. Go to Monitoring and select **Custom Webhook**.
3. Fill in the form with the Name, Description, and the URL.

   Use this URL format to push events from Sumo logic to the ServiceNow Instance `.https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=sumologic`

   Note: Use a credential having the evt_mgmt_integration role as the username and password.

   In the Payload section, use the following template:

```
{
    "type": "{{MonitorType}}",
    "node": "{{ResultsJSON._sourceHost}}",
    "metric_name": "{{Name}}",
    "description": "monitor Query: {{Query}}\n
 Trigger Condition:{{TriggerCondition}}\n
 Trigger Value:{{TriggerValue}}\n Trigger Time
 Range:{{TriggerTimeRange}}\n View Trigger
 Query:{{TriggerQueryURL}}\n View Monitor:{{QueryURL}} \n
 Results:{{ResultsJSON}}",
    "name": "{{Name}}",
    "short_description": "{{Description}}",
    "MonitorType": "{{MonitorType}}",
    "Query": "{{Query}}",
    "QueryURL": "{{QueryURL}}",
    "ResultsJson": "{{ResultsJson}}",
    "NumQueryResults": "{{NumQueryResults}}",
    "Id": "{{Id}}",
    "DetectionMethod": "{{DetectionMethod}}",
    "TriggerType": "{{TriggerType}}",
    "TriggerTimeRange": "{{TriggerTimeRange}}",
    "time_of_event": "{{TriggerTime}}",
    "TriggerCondition": "{{TriggerCondition}}",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "TriggerValue": "{{TriggerValue}}",
    "TriggerTimeStart": "{{TriggerTimeStart}}",
    "TriggerTimeEnd": "{{TriggerTimeEnd}}",
    "SourceURL": "{{SourceURL}}",
    "alertResponseUrl": "{{alertResponseUrl}}"
  }
```

Log Monitors Type events can be created without CI binding since you're receiving the node value as "node": "{{ResultsJSON._sourceHost}}" in the event payload from Sumo Logic. You can create events but you can't bind them since you don't get them as host names for the log monitor type. A push connector parameter was created - "create_log_monitorType_events" with a value of False. If the param value is False, the payload is ignored, and "log" events aren't created. If you change the param to True, events are created, and then you must define event rules for CI binding.

Refer to the following ServiceNow Severity Mapping with Sumo logic TriggerType table:

Severity Mapping

Sumo Logic Trigger Type	Severity
Critical	Critical
Warning	Minor
MissingData	Warning
ResolvedCritical/ResolvedWarning/ ResolvedMissingData	Clear

Integrate Sumo Logic with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

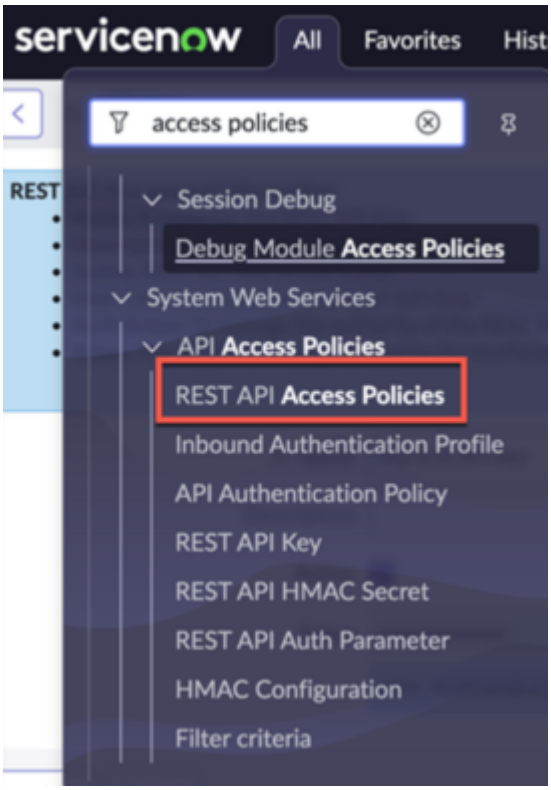
Before you begin

Role required: evt_mgmt_integration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:** The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

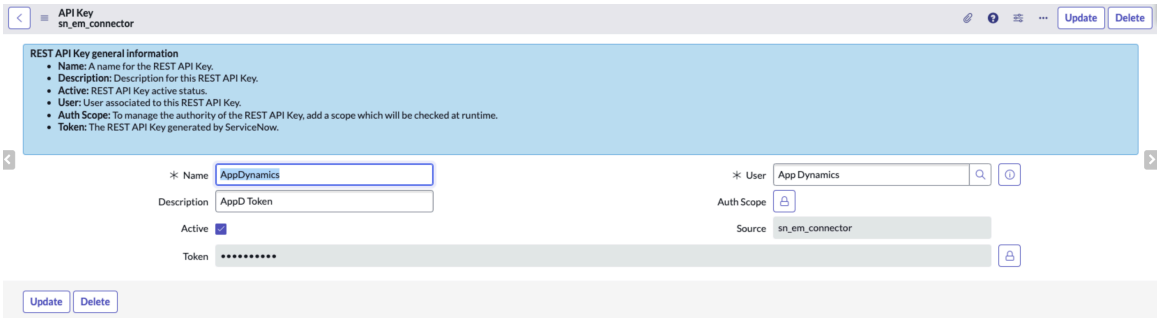
API Key

Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate ThousandEyes platform events

Integrate ThousandEyes with Event Management by adding a standard webhook in the ThousandEyes console.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using ThousandEyes Monitor V1 or V2 access tokens. For more information, see Integrate ThousandEyes with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for ThousandEyes Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate ThousandEyes with basic authentication.

Integrate ThousandEyes with basic authentication

Integrate ThousandEyes with Event Management by adding a webhook in the ThousandEyes platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Discovery for ThousandEyes services is not supported, so you must create a CI manually in the ServiceNow instance for event binding to work.

Role required: evt_mgmt_admin

About this task

Configure the Event Management environment for the collection of events from ThousandEyes by authenticating ThousandEyes as a data source. In your ThousandEyes platform, set your ServiceNow AI Platform instance as a rest endpoint using a webhook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the ServiceNow instance, complete the following steps to create a CI.
   a. From the navigation bar, navigate to **All** > **Configuration** > **CI Class Manager**.
   b. Click **Hierarchy** and search for `HTTP(S) Endpoint`.
   c. Select **CI List** and create a new CI.
2. In the ThousandEyes platform, create a notification destination.
   a. From the navigation bar, navigate to **Alerts** > **Alert Rules**.
   b. Click on any existing alert rule and select the **Notification** tab.
   c. Select **Edit Webhook** and enter the following information.

Edit Webhooks

Field	Description
Name	Enter a name for the webhook.
URL	Provide the webhook URL. **Note:** The default format of the URL to push events from ThousandEyes to the ServiceNow instance is `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=thousandeyes`.
Auth Type	Select **Basic**.

   d. Click **Add New Webhook**.

Result

The default severity for the ThousandEyes alert is **Major -2**, which can be changed in the *Push Connector Configuration* section of **Push Connectors** > **ThousandEyes Push Connector**. The valid values of severity are **1- Critical**, **2- Major**, **3- Minor**, **4- Warning**, and **5- Info**.

The default timezone of the ThousandEyes alert is GMT, if you want to send the alert in a different timezone, it can be changed in the *Push Connector Configuration* section of **Push Connectors** > **ThousandEyes Push Connector**. The valid value format is **GMT+01:00**, **GMT +02:00**, **GMT-05:30**, **GMT-02:00**, etc.

Integrate ThousandEyes with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

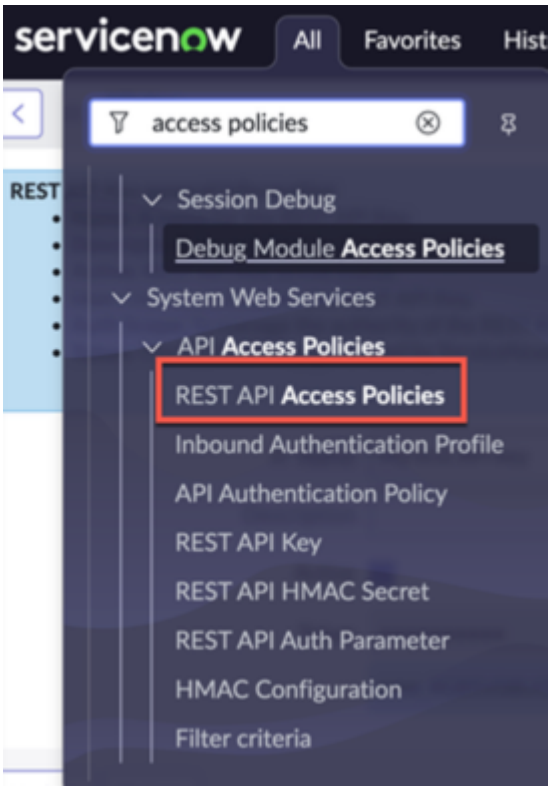
Before you begin

Role required: evt_mgmt_integration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:** The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

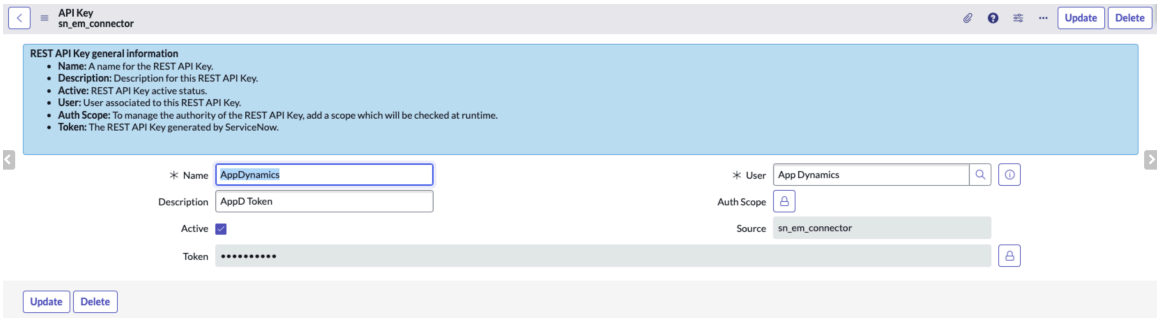
Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Result

Now you are ready to start sending events. In your monitoring tool you can send events either with the header or the query `param: x-sn-apikey`. For example:

```
https://[INSTANCENAME].service-now.com/api/sn_em_connector/em/inbound_event?source=[SOURCENAME]&sys_id=[SYSID OF PUSH CONNECTOR INSTANCE]&x-sn-apikey=[AUTH TOKEN]
```

Integrate ThousandEyes with OAuth authentication

Create credentials in the instance and configure the ThousandEyes webhook.

Before you begin

Role required: web_service_admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.
2. Select **Create an OAuth API endpoint for external clients**.
3. Copy the automatically generated field **Client ID**.
   The **Client ID** is used when configuring the ThousandEyes SeviceNow integration.
4. Unlock the **Redirect URL** field and assign the value: **https://app.thousandeyes.com/webhooks-oauth-callback/**
5. Configure the Access and Refresh token lifespans by providing a value in seconds.
6. Open the ThousandEyes webhook configuration and complete the following fields:

   Name

   Any name

   URL

   ServiceNow ThousandEyes Push connector end point

   Select Auth Type

   OAuth

   Grant Type

   Implicit

   Auth URL

   https://servicenow_insatnce>.service-now.com/oauth_auth.do

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client ID

Paste the Client ID automaticcally generated in Step 3.

7. Select **Get Token**.
8. Once the ThousandEyes connector navigates to a webpage requesting to connect to your ServiceNow account, select **Allow**.
9. Provide account credentials which have the **web_service_admin** role.

Integrate Panopta as a data source

Integrate the Panopta cloud-based monitoring solution with Event Management. To add Panopta as a data source, configuration is required in Panopta.

Configure Panopta

To prepare Panopta as a datasource, follow the procedure described in this link: How do I integrate with ServiceNow.

When the Event Management integration is configured in Panopta, add the integration to any of your Panopta Alert Timelines so that the ServiceNow instance receives incident events accordingly.

Optional Event Management configuration

Configure an alert action rule for launch in context of Panopta. For more information, see Launch web application from alert and Create or edit an alert action rule.

Related topics

Configure Event Management connectors

Integrate Event Integration (EIF) format event connector

Use the push connector that allows events to be forwarded from products, generally from IBM, that support the Event Integration (EIF) format to a MID Server.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure the MID Server is assigned with `EventManagement` or `ALL applications`.

Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from products that support the EIF format to a MID Server.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **EIF listener context**.
2. Click **New**.
3. Create a new EIF listener context by completing the EIF listener context form:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the form, fill in the fields.

EIF listener context form

Field	Description
Name	Unique name for the EIF listener context.
Short Description	Short description of the MID Server extension execution context.
Port	Port for the EIF listener to receive EIF events. The default value is **9998**. However, if the port is already in use, you can use any other free port instead.
Status	The status of the EIF listener. This field is blank until the listener is run. After the listener has run, the value is automatically populated to one of the following statuses: ▪ Started: The listener is running. ▪ Stopped: The listener is not running. ▪ Offline: The MID Server is down. ▪ Error: The listener failed with an error.
Execute on	The MID Server location for running the listener.
MID Server	The name of the designated MID Server when you select **Specific MID Server** in the **Execute on** field.
Executing on	The name of the MID Server on which the extension is running. This field is automatically populated with the name of the MID Server even if it's down. If you stop the extension, this field is empty.

b. On the form, you can select the related links on the EIF listener context form.

Commands available on the EIF listener context form

Related Link	Description
Start	Select this option if the listener is not running. The listener is started on the configured MID Server and port number.
Stop	Select this option to stop the running listener on the configured MID Server.
Restart	Select this option to stop then start the listener on the configured MID Server and port number.
Update Parameters	Select this option if you want to make changes to the listener configuration of the current running listener. If the parameters

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related Link	Description
	are valid, the listener disconnects and reconnects with new parameters.
Test Parameters	Select this option to test if the port is a valid number.

4. When you're finished, right-click the form header and select **Save**.
5. Click **Update**.
6. If you want to check the incoming EIF traffic, complete the following steps:
   a. Navigate to **MID Server** > **Servers**.
   b. Select the MID Server the EIF extension is running.
   c. Under the **Configuration Parameters** tab, add the **mid.log.level** properties.

What to do next
If the MID Server fails to start, you can review the MID Server log errors.

EIF events warning severity

If the EIF event payload has a warning severity, it will be mapped differently in the ServiceNow instance.

EIF events severity	ServiceNow events severity mapping
UNKNOWN	Warning
Warning	Minor
Minor	Major
Critical	Critical
Fatal	Critical

Create a push connector configuration parameter

Some connectors have no parameters that are shipped out of the box. Therefore, it's necessary to create and add the parameter to the push connector configurations list in the form layout before adding the new parameter.

Before you begin
Role required: evt_mgmt_admin, personalize_form

Procedure
1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connectors**.
2. Open a push connector.
3. On the **Push Connector** form, right-click on the form header and select **Configure** > **Form Layout**.
4. In the **Available** list, search for **Push Connector Configurations** > **Push Connector**, and move it to the **Selected** list.
5. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Push Connector Configurations [sn_em_connector_push_config] table, double-click on **Insert a new row** to add a new push connector configuration parameter.
7. Select **Update**.

Result
Push Connector Configurations list added to push connector form layout. You can now create push connector parameters.

Configure a push connector instance

Configure a push connector instance to receive the events from an external system.

Before you begin
Ensure that you've defined a push connector definition.

Role required: evt_mgmt_admin

About this task
You can use a connector instance to receive the events coming from external sources. You can create the following type of push connector instances:

- Instance type
- MID type

Procedure
1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connector Instances**.
2. Select the connector instance that you want to configure, or select **New** to create a push connector instance.
3. On the **Push Connector Instance** form, fill in the fields.

   For more details, see Push connector instance form.
4. Select **Submit** or **Update**.

Result
The push connector instance form is saved and now you can receive the events from an external system.

Configure event collection for SNMP traps

The SNMP listener runs on the MID Server, which acts as a collection endpoint for SNMP traps. The MID Server sends the traps to the ServiceNow instance for further processing as an event by Event Management.

Before you begin
Role required: agent_admin

Note:

- To view the MID SNMP Trap Listener in the UI: agent_admin
- To perform other operations, any one of the following roles is required: agent_admin, evt_mgmt_integration, or evt_team_operator

Ensure that the MID Server is assigned with either `EventManagement` or `ALL applications`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Use the **MID SNMP Trap Listener** to listen for SNMP traps. In this configuration, the specified MID Server acts as a collection endpoint for SNMP traps.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **MID SNMP Trap Listener**.
2. Click **New**.
3. Complete the SNMP Trap Collector Context form.

Option	Description
Name	Unique name for the SNMP Trap Collector.
Short description	Short description of the MID Server extension execution context.
SNMP version	Specify the SNMP version: ○ v1 and v2c ○ v3
Minimum Security Level	The valid security level values are: ○ None - No security level value set. ○ noAuthnoPriv - Communication without au thentication and privacy ○ authNoPriv - Communication with authenti cation and without privacy. ○ authPriv - Communication with authentica tion and privacy. **Note:** This field appears only when v3 is selected in the **SNMP version** field.
UDP Port	UDP port for SNMP Trap Collector to receive SNMP Traps. The default value is *1,162*. However, if the port is already in use, you can use any other free port instead.
Status	The status of the trap listener. This field is blank until the listener is run. After the listener has run, the value is automatically populated to one of these statuses: ○ **Started:** The listener is running. ○ **Stopped:** The listener is not running. ○ **Offline:** The MID Server is down. ○ **Error:** The listener failed with an error.
Execute on	The MID Server location for running this listen er. Select from specific MID Server. The rec ommended setting is **Specific MID Server**. Network hardware typically has to be config ured to send to a specific IP address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
MID Server	Specify the name of the designated MID Server when you select **Specific MID Server** in the **Execute on** field.
EngineID	Displays only when **SNMP version=v3**. ○ When sending an SNMP Inform message, include the default value of this field in the message. ○ When sending an SNMP Trap message, include a value other than the default value of this field in the message.
Executing on	The name of the MID Server on which the extension is running. This field shows the name of the MID Server even if the MID Server is down. If you stop the extension, this field is empty. This field is automatically populated.

4. Right-click the form header and select **Save**.
5. In the **Credentials for SNMPs** section, specify the required SNMP v3 credentials that the SNMP listener uses for authentication.

   Note: The **Credentials for SNMPs** section appears only when `v3` is selected in the **SNMP version** field.

6. In the **Related Links** section, click **Test parameters**.
7. Click **Update**.
8. **Optional:** If the MID Server fails to start, review the MID Server log errors.

   (Optional) When working with object identifiers (OIDs), the OID trap counter may cause problems activating event rules. To remove the trap counter from the OID, navigate to **MID Server** > **Properties** and set the **mid.em.snmp_old_key_counter_cut.enabled** property to **true**.

What to do next

In **Related Links**, these actions may be run against the SNMP traps listener:

Commands available in the SNMP trap listener form

Related Link	Description
Start	If it is currently not running, starts the listener. The listener is started on the configured MID Server and port number.
Stop	Stops the running listener on the configured MID Server. If the listener is not running, no action is taken.
Restart	Stops, then starts the listener on the configured MID Server and port number.
Test parameters	Tests that the port is a valid number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Commands available in the SNMP trap listener form (continued)

Related Link	Description
Update parameters	If you make changes to the listener configuration, use this option to update the parameters of the currently running listener. First, the parameters are tested for validity. If the parameters are valid, the listener disconnects and reconnects with the new parameters.

Note: Updates to the SNMP trap listener take effect only after clicking **Restart** or **Update parameters**.

Related topics

SNMP probe MIB modules

Configure the SNMP traps listener to receive OEM traps

Configure the SNMP traps listener to receive OEM traps

Configure the SNMP trap listener to receive traps from Oracle Enterprise Manager (OEM).

Before you begin

Role required: evt_mgmt_admin

About this task

Event Management can process Oracle Enterprise Manager Cloud Control SNMP traps as events. For the SNMP trap listener to receive traps from OEM, you must designate the MID Server that runs the SNMP trap listener as a recipient of the trap. Upon receiving an OEM trap, the MID Server sends the trap to the ServiceNow instance for further processing as an event by Event Management.

The `OEM 12c Trap` event rule is provided with the default base instance, as well as these alert action rules:

- `Oracle EM Launch Target Status`
- `Oracle EM Launch View Event`

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **MID SNMP Traps Listener**.
2. Click **New**.
3. Fill in the fields, as described in Configure event collection for SNMP traps.
   For the **SNMP version** field, select: `v1 and v2c`.
4. Click **Submit**.

Note:

Ensure all required SNMP MIB files are uploaded on the instance. For more information, see Load a MIB module.

.

What to do next

In Oracle Enterprise Manager Cloud Control, configure the MID Server as a trap listener target.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure SNMP Trap collection for high availability

For SNMP traps, the MID Server requires failover configuration for the trap listener.

You can configure two MID Servers for failover. Because the SNMP Trap listener on the MID Server receives inbound traffic on the IP address and port of the MID Server, you configure each MID Server to receive the same SNMP traps. Only one MID Server is active at any point in time, therefore Event Management does not receive duplicate traps.

Configure message keys to spread SNMP object identifiers

By default, most SNMP trap events are processed by a single Event Management processing job. This can negatively effect event processing. Configure message keys on the MID Server to ensure that more than one processing job is invoked, ensuring optimal SNMP trap performance.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
   The **MID Servers** page opens.
2. Select the relevant MID Server and on the MID Server page, select the **Configuration Parameters** tab.
3. Click **New**.
4. In the **Parameter name** field, select *`mid.snmp.event.oid.keys`*.
5. In the **Value** field, enter a comma separated list of OIDs to be used for the message key.
6. Click **Submit**.

   Note: The OID trap counter may cause problems activating event rules. To remove the trap counter from the OID, navigate to **MID Server** > **Properties** and set the **mid.em.snmp_oid_key_counter_cut.enabled** property to **true**.

7. To set conditions in a script that determine the message key to be used based on the SNMP traps received:
   a. Navigate to **MID Server** > **Script Includes**.
   b. Locate and select **SNMPTrapKeyFilter**.
   c. In the **Script** field, set conditions for which OIDs are to be used based on the SNMP trap event received.
   d. Select the **Active** check box to activate the script.
   e. Click **Update**.

Configure event collection from email

Configure an inbound email action to send email notifications when events and alerts are triggered.

Before you begin

Role required: evt_mgmt_admin

About this task

When you add an inbound email action to send email, Event Management uses inbound email actions to process inbound email in the same manner as any external event. The email content is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

used to generate and update events, use rules to generate alerts, or change event severity. The severity is updated after the impact calculation and stored in the em_impact_status table.

Procedure

1. Navigate to **All** > **System Properties** > **Email Properties**.
2. In the **Inbound Email Configuration** section, in the **Email receiving enabled** option, select **Yes** to enable the collection of events from email.
3. To configure the email information to pass to Event Management for event and alert processing, navigate to **System Policy** > **Email** > **Inbound Actions** and in the list of Inbound Email Actions records search for and open the default **create event** form.

   a. On the **Inbound Email Actions** form, specify these values.

Field	Value
Active	Select the check box to enable the email notification.
Target table	Select **Event [em_event]**.
Action type	Select **Record Action**.

   b. Select the **Description** tab and enter a description for the email message.

   c. Select the **Actions** tab and select these **Field Actions**.
   - **[Severity] [To] [<the event severity>]**
   - **[Type] [From email] [<portion of the email>]**

     For example, you can select **Subject** as the portion of the email to use.

4. To customize the inbound parameters and map the text to event variables, add a **Script**.

   Example
   For example:

```
current.source = 'email';
current.event_class = 'email';
current.description = email.body_text;
current.time_of_event = new GlideDateTime();
current.insert();
```

5. From the instance, send an email that contains matching data, and then confirm that the event or alert information appears in Event Management.
   For more information sending email messages to create an instance, see Inbound email actions.

   Note: Ensure that the user who sends the email has the role **evt_mgmt_integration**.

6. Select **Submit**.

Result

The inbound email is sent to the em_event table and regular Event Management processes continue, for example, event rules and alert management rules run.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event forwarding

Accelerate the event processing testing life cycle by forwarding a stream of events from your ServiceNow production environment to your non-production environment.

Use event forwarding to forward events from one instance to another, for example, from a production to a non-production instance. Event forwarding enables you to test and evaluate event rules, event field mappings, alert management rules, alert correlation, and so on, without having any impact on your production environment.

Not all monitoring sources can send events to multiple target instances. In such cases, you can configure a scheduled job to periodically forward the event stream from your ServiceNow instance that is connected to the monitored source to other instances.

Set up event forwarding

Create an event forwarding configuration record to enable events to flow from one ServiceNow instance to another instance. Forwarding events to multiple target instances requires creating separate configuration records for each target instance.

Before you begin

You must have a credential with the evt_mgmt_integration role, which enables you to create events in the target instance. If you don't have this credential, see Create basic auth server credentials for information on how to create it.

Role required: evt_mgmt_admin

About this task

The source instance, which forwards events to a target instance, must have a user with the evt_mgmt_integration role, a password for the credential, and a new event forwarding record. The target instance, which receives events from the source, must have a credential with the same user name and password as the source instance.

The event forwarding record contains details about the target ServiceNow instance URL to which events are to be forwarded along with the credentials to connect it.

You must create a separate configuration record for each target instance to forward events to multiple target instances. Events are then sent to each target instance with an active event forwarding configuration.

Procedure

1. On your source instance, navigate to **All** and enter `sn_em_connector_event_sync_configuration.list` in the filter navigator.
2. On the **Event Sync Configurations** page, select **New**.
3. On the **Event Sync Configuration** page, in the **Instance url** field, enter the target ServiceNow URL to receive events in the format `https://<your_instance>.service-now.com`.
4. In the **Credentials** field, provide the credentials for the target instance by either entering them or searching for them.
   - To enter your credentials, start typing and then select the credential from the drop-down list.
   - To search for your credentials, select the Lookup using list icon ( ) to select your credential from the credentials lookup table.
5. Select **Save**.
6. Select **Test Connection** to validate the connection to the target ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the connection succeeded, a confirmation message displays.
- If the connection didn't succeed, check your credentials and the instance URL.

7. When validated, select the **Active** check box to activate the event forwarding to the target instance and select **Submit**.
   The configuration is created and is listed on the **Event Sync Configurations** page.
8. For multiple targets, repeat the steps for a separate configuration record for each instance.

Related topics

Periodically run an event forwarding job

Periodically run an event forwarding job

Schedule an event forwarding job to periodically send events to all target instances with active event forwarding configurations when the monitoring source can't send events to multiple target instances.

Before you begin
Role required: evt_mgmt_admin

About this task
You can customize the *event - forwarding* job behavior through related system properties. For more information, see Event forwarding properties.

Note: To minimize the performance impact, the scheduled job sends events not older than the latest hour when it ran for the first time after setting up event forwarding.

Procedure

1. Navigate to **All** > **Scheduled jobs** > **Event Management - Event Forwarding Job**.
2. On the **Scheduled Script Execution** page, select the **Active** check box.
3. In the **Repeat Interval** field, set the appropriate time interval for the job to run periodically.

   The default value is for the job to run every minute.
4. Select **Update**.

Result
The event forwarding job runs periodically based on the repeat interval that you set. Events are sent to all target ServiceNow instances that have active event forwarding configuration records.

If the admin account is disabled, configure the user of the scheduled job. By default, it's admin, but in this case, it must be changed.

Note:

If the event forwarding to the instance failed due to any reason, the **Last Event Forwarding status** field displays `Failed` with a corresponding error message displayed in the **Last Event Forwarding error** field. The target instance generates a self-health monitoring event during the next successful event forwarding indicating the failure of event forwarding for the specified time range.

Create basic auth server credentials

Create credentials to access a ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.
3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential.
User name	Name to identify the user.
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential while it attempts to log in to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Select **Submit**.

Result
The Basic Auth credential for use with the server instance is created.

Processing Events

Event processing is the process of taking events or streams of events, analyzing them and taking automatic action. The process includes viewing events, event binding, event rules and event field mapping.

An event is a notification from one or more monitoring tools that indicate something of interest has occurred, such as a log message, warning, or error. Events are processed and alerts are generated based on the following factors:

Event collection configuration via a MID Server, script, SNMP trap collector, or email message.

An Event rule, alert binding, or event field mapping configuration for processing events from various sources. When a package of events that contains events with a custom (non-supported) state is processed, the events with the custom state are not processed.

For more information, see Exploring Event Management.

View events

Event Management tracks individual events to manage external systems. These events are notifications from monitoring tools indicating occurrences of interest, like log messages,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

warnings, or errors. Event Management gathers events from external sources and stores them in the Event [em_event] table, offering a list of raw incoming events.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, evt_mgmt_user, or evt_mgmt_integration

Note: Ensure that you do not change the **Classification** field value in event [em_event] tables, either manually, by script, or by event rule.

About this task

The event monitoring tool generates the values of the source and resource fields. Event Management implementers can define event types and register nodes to help uniquely identify incoming events and create alerts for the specific needs of the enterprise. Event Management uses this information to determine whether to create an alert or update an existing one.

An event source may generate duplicate events with the same identifying information. For events with the same identifying information, Event Management uses the time interval between events to determine whether the events represent an existing issue or new issue.

Additional fields should be included in the **Additional information** field of the event. Do not add additional fields to an event by adding a custom field to the event [em_event] table. For more information about how to include additional fields in events, see Custom alert fields.

Note: Avoid writing business rules for event [em_event] tables, as they can result in performance degradation.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.

   The All Events list displays the following columns.

All Events list

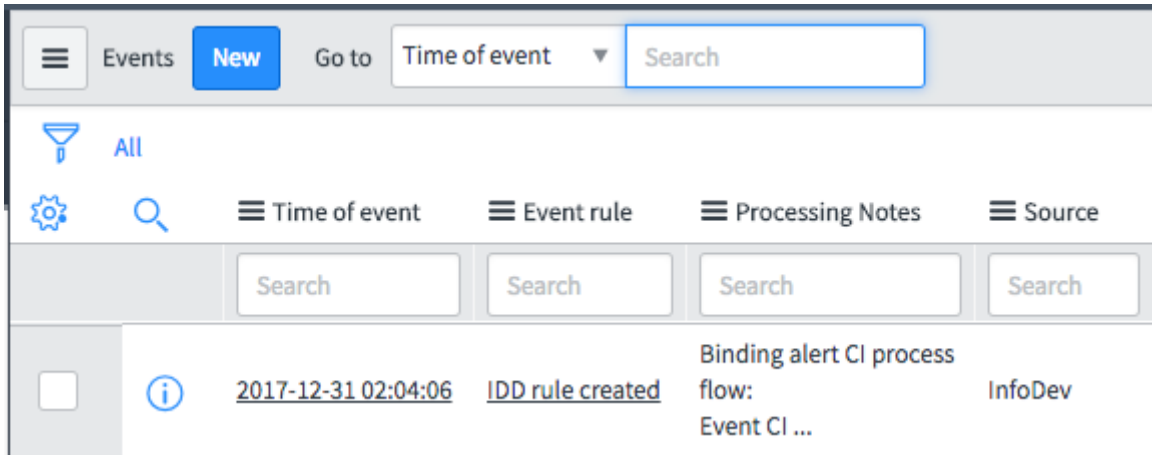
Column	Description	Populated by
Time of event	The time that the event occurred, in the network node time zone. The system supports time resolution in seconds.	External event monitoring tool
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.	External event monitoring tool
Description	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.	External event monitoring tool
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.	External event monitoring tool
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.	External event monitoring tool
Resource	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.	External event monitoring tool
Metric Name	Unique name that describes which metrics are collected and for which this alert has been created.	External event monitoring tool

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description	Populated by
Message Key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.	External event monitoring tool
State	The status of the event: ○ **Ready**: Event has been received and is waiting to be processed. ○ **Queued**: Event is queued by the event processor job. ○ **Processed**: Event was successfully processed. ○ **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank. ○ **Ignored**: Value is not in use.	Event
Severity	Mandatory. The options are typically interpreted as follows: ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **OK**: An alert is created. The resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.	Event
Alert	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.	A matching event rule or event field mapping

2. To review a single event, click the required row in the **Time of event** column.
3. To review the event rules that processed the event, in the **Related Links** section click **Check process of event**.
   For further ways to see which event rules were applied to the event, you can display the `Event rule` and `Processing Notes` fields in the Events list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Optional event fields to display the applied event rule

Column	Description
Matching Event rule	The event rule that matches the current event rule definitions. This information is primarily used to create event rule recommendations for events that currently are not covered by rules. If event rules have been modified, this information can be retrieved from the Processing Notes field, described below. **Note:** This field does not show the history of event rules that were applied to the event.
Processing Notes	Information related to the binding to CI type and the event rules that were applied to the event.

4. To create an event rule for an event that is not associated with an event rule:

   a. Click the event.

   The event opens in the Event form.

   b. Click **Create Event Rule**.
   The fields of the new Event rule are populated with data from the event. You can use the event information, for example, when composing fields for alerts.

Team-based integrations in Event Management

Team-based integrations empower teams to optimize event processing within Event Management to enhance efficiency and operational effectiveness.

Team-based integrations provides the following capabilities:

- Assign teams to particular connectors, providing a structured approach to integration efforts.
- Enable each team to define and apply custom rules, enabling a more targeted and straightforward handling of event processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Route alerts automatically to the appropriate team members responsible for the integrated systems based on integration ownership and configuration item (CI) ownership.
- Enable seamless integration and automation through the automatic assignment of alerts to appropriate team members based on integration ownership and configuration item (CI) ownership.

Customize event rules, event mapping, and the precedence of team rules for team-based integrations. For more information, see Team-based integration properties.

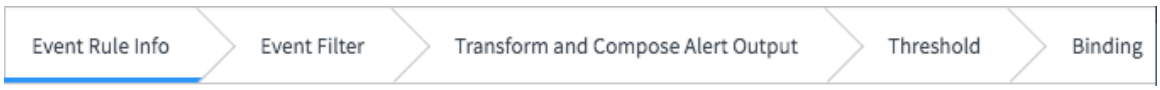
Event field mapping configuration

Alert assignment groups for teams

Event rules

Use event rules to generate alerts for tracking and remediation. Event rules are stored in the Event Rule [em_match_rule] table. Configure and customize event rules to manage events and alert generation.

Event rules do not change the event records in the Event table. Changes to event data are stored in the ServiceNow instance memory.



Use the Event rule designer to create and configure event rules. You can use the default event rules or event rules that you have created to:

- Apply an event rule filter to determine whether the rule applies to an event.
- Apply a transform with **Event Match Fields** and optional **Event Compose Fields** to format the alert text.
- Apply a threshold to create custom alerts for rapidly recurring events.
- Automatically create or close alerts.
- Bind alerts to CI information from the CMDB.
- Run multiple sequential rules defined for the same event by selecting the **Apply additional matching rules** check box. The event rules run in ascending order as defined in the **Order** field. Event rules applied to assignment groups only run after the global rules have run.

Create or edit an event rule

You can create event rules to generate alerts for tracking and remediation. Use team-based integrations in event rules to make sure that connector ownership and execution of rules give precedence to general rules. Teams can maintain consistency and hierarchy while offering flexibility and customization options.

Before you begin

Role required: evt_mgmt_admin

About this task

View the list of available event rules on the **Event Rules** page to determine whether you want to create or edit an event rule.

You can create rules that:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Transform information in events to populate specified alert field values and compose alert fields from various values.
- Configure threshold rules that create or close alerts only when the incoming matching events exceed the specified threshold.
- Bind alerts to CIs using CI identifiers.

Options to create the rule are:

- Create an event rule and assign event fields for alert generation.
- Create a rule from an existing event or group of events that don't have a rule. In this case, the event fields are copied to the Event Match Fields section of the rule.
- Edit an existing event rule.
- For Team-based integrations, select an assignment group.

- Run multiple sequential rules defined for the same event by selecting the **Apply additional matching rules** check box. The event rules run in ascending order as defined in the **Order** field. Event rules applied to assignment groups only run after the global rules have run.

You can refresh an existing event rule with new event data. For more information see, Refresh event rules.

Note:

- Event rules that aren't configured to perform any action are skipped. Therefore, if the rule isn't configured as ignore, threshold, or binding, it's important to specify either the match or the composed fields.
- Make sure that you don't change the **Classification** field value in event [em_event] tables, either manually, by script, or by event rule.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules** and take one of the following actions.

Option	Description
Create an event rule from an existing event	**a.** Select the link for unassociated events or grouped events that aren't mapped to the rules.  **b.** Select the event that you want to use for cre ating the rule. The event fields are copied to the Event Field Rules section of the rule.
Edit an existing event rule	In the event rule list, select the required event rule to be modified. The event rule opens in

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	the event rule designer where you can modify the values of the fields. Select **Save and Upgrade**  to modify the rule when the following banner message appears and you want to convert the event rule. `Rule cannot be viewed in the event rule designer. To modify the rule click 'Save and Upgrade'.`
Create an event rule	Select **New**.

2. Ensure that **Active** is selected.
When the rule is deactivated, Event Management finds and applies another event rule. An alert is still created for the event unless *Ignore* is selected in another applicable rule or when configuring the filter for this event rule.
3. Enter a unique and meaningful name and fill in the form.

Event Rule Info form

Field	Description
Source	Category to which this matching rule applies. The mapping rule only applies to events with the same event class value. If this value is empty, apply the rule to all events.
Order	Order in which an event rule is evaluated when multiple rules are defined for the same type of event. Event rules are evaluated in ascending order.
Description	Type additional information that describes the event rule.
Apply additional matching rules	Select to apply additional event matching rules according to the Order field. The last rule with binding settings sets the CI binding. When selected, the Thresholds tab is inactive.
Assignment group	For team-based integrations, select an assignment group. If no assignment group is defined in the event rule, then this event rule is considered as a global rule. When the rules are running – first the global rules run and then the rules that belong to the assignment group that the event's source instance belongs to.

4. **Optional:** Define the event rule using these Event Rule Designer features.

Option	Description
Event Filter	Define a filter to restrict to which events the event rule must apply. See Filter the events that an event rule applies to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Transform and compose alert output	Configure the customization of alert content. See Configure an event rule to customize alert content.
Threshold	Create or close alerts according to the specified threshold. See Set a threshold to suppress alert generation.
Binding	Configure event rules to automatically bind alerts to CI information from the CMDB. See Binding alerts to CIs.

5. Select **Save**, **Submit**, or **Update**.

Use event input information

The **Event Input** pane that is included in the steps to create an event rule provides a reference to the information that you can use when configuring an event rule.

In the **Transform and compose alert output** pane, you can also drag the information into the required fields to customize alert content. The fields in the right-hand pane appear as a reference to which fields, expressions, and their values are available when working in the Event Rule designer. The fields that display in the Transform and compose alert output left-hand workarea become the fields in the generated alert form. In addition, you can define alert tags that are specific for customization.

General components and navigation

The Event Input pane consists of these sections:

- Event Additional Info
- Expressions
- Event Raw Info

The Event Input pane displays in all Event Rule designer sections, except for the Event Rule Info section. The fields in the right-pane can be modified only in the Transform and compose alert output section. In all the other sections, the Event Input pane is read-only and available for reference purposes.

Note: If **Accessibility enabled**

is selected in System Settings, standard edit mode is not available .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edit modes

Mode	Description
Standard edit mode	Text selected in the left-hand workarea cannot be edited. Undo is not available. In this mode, you can only mark the text or values and transform it by selecting a field name.
Regex edit mode	Edit text in the left-hand workarea by selecting it, as required. After you have edited the text, you cannot go back to the standard mode. **Undo** is not available. However, **Reset** is available, returning the field to its original value. You can compose text using regular expression (regex) format conventions, for example, type (.*) to create a field name. You cannot use field values like: type "$" to include the value of a field and specify the name of the field in parentheses {}. You can include special characters in a field by "escaping" them, that is, by prefixing the character with a "\". For example, to include a "\" in your text, enter "\\".

Event additional info

The Event additional info section displays default event form fields, plus fields that were created to display in alerts and that are added to the **Additional information** section of the alert.

When configuring text in the fields in the left-hand workarea, you can drag field names and/or their value from this section into the fields.

Expressions

The Expressions section is available only if an additional information field was created. You can create expressions from event raw data or from additional information data.

1. Click in a field in the **Event Input** pane to perform transformation actions.
2. Create an expression by transforming information and associating it with a field name. Either select a field name from the suggested list, or create a field name, as required.

3. Click in a field in the **Event Input** pane. In the left-hand workarea, select the required information.

Create expressions by transforming information and associating it with a field name. Select a field name from the suggested list, or you can create a field name, as required.

Event raw info

The Event raw info section is always available. Its contents are the fields from the Event form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To transform text, click a field in the right-panel to open it in the work area on the left-panel, in the Mark Expressions section. You can select text in the **Mark Expressions** section where the selected text becomes the value of a newly created field. Name the new field. This new field is added to the Expressions section.

Note: When creating regex expression for input, ensure that you create input with the variables in sequential order. While variables can be skipped for inclusion, the selected order must be maintained.

Controlling how fields appear:

- Use the exclusion list [em_event_rule_black_list] table to hide fields from the right-pane.
- Use the em_event_rule_order form to order the position of each field.
- Fields that are not in the exclusion list and also not part of the em_event_rule_order table, still appear in the event rule designer, in the right-panel and in the **Transform and Compose Alert Output** tab.

Related topics

Create or edit an event rule

Configure an event rule to customize alert content

Filter the events that an event rule applies to

Set a threshold to suppress alert generation

Filter the events that an event rule applies to

Define a filter to restrict to which events the event rule must apply. Configure the filter by providing a set of conditions that each event must match to be either excluded or included from applying to the event rule.

Before you begin

Ensure that a name is specified for the event rule.
Role required: evt_mgmt_admin

About this task

To construct the required condition statement, you can use event fields as well as additional fields that are defined in the **Additional Information** field of the event. Use these fields to configure conditions that can exclude events. Alternatively, you can filter incoming events to ensure that only those events that meet the required conditions are included.

Note: Event rules filter is case-sensitive.

While working in the Event Filter tab:

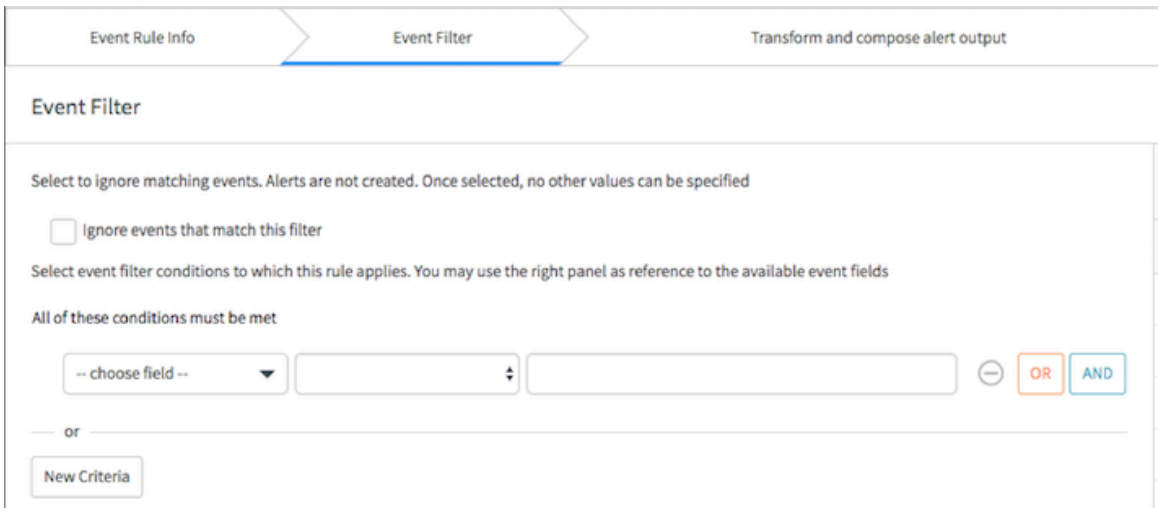
- In the Event rule list, if you selected a recommended rule or an existing rule, the filter fields are populated with values from these events. You can use these filter fields to compose filter conditions.
- You can click another tab (for example, **Threshold**), work in that area and then return to work in the Event Filter area without losing information.
- Use the right-panel as a source of reference for which fields are available to be used when composing filter conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Event filters created on additional_info fields only perform a string comparison and not a numeric comparison, even if the information entered into the value field appears as if it is numeric, as depicted in the following graphic:

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Click **New** or open an event rule.
3. Click **Event Filter**.



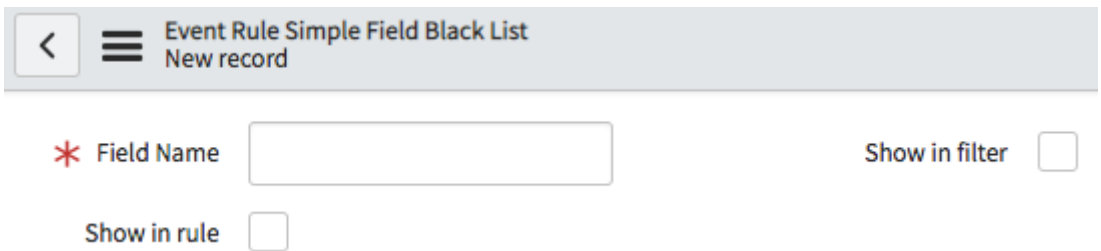
4. To ignore events, select **Ignore events that match this filter**.
   All events that match this event rule are ignored. You can add more conditions to the filter by clicking either **OR** or **AND**.

   Note: Even if an event is ignored by an event rule, the event is still recorded in the Event [em_event] table. Select this option to inhibit an alert from being created and be associated with the event.

5. To configure conditions to which the event rule must apply, click **New Criteria**.
   You can add further conditions by clicking either **OR** or **AND**.

   Note: The **%** character is not supported in filter conditions.

6. You can add field names to the Event Rule Simple Field Black Lists [em_event_rule_black_list] table to either show or hide fields from the filter.

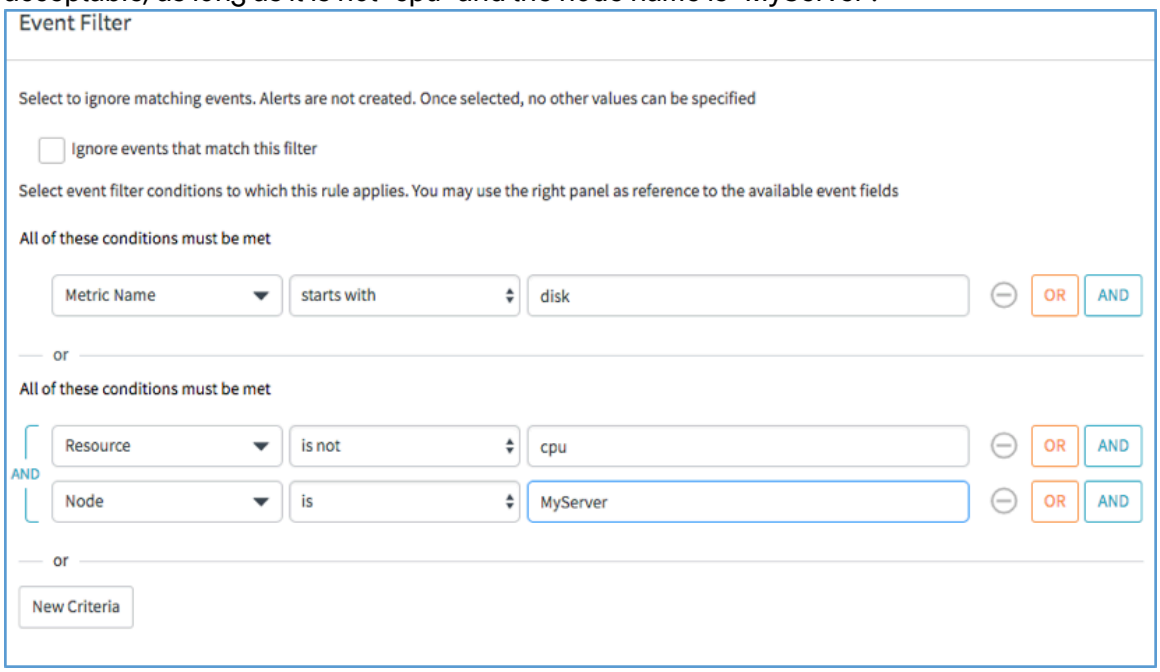


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To remove fields from the filter and the right panel, add a new black list field with **Show in rule** not selected.
- To remove fields only from the filter and still enable it to appear in the right panel, add an exclusion list field with **Show in rule** selected.

7. Click either **Save** or **Submit**.

Example:
Example showing filter conditions that are specified to run a rule when the metric name starts with the word "disk". For this example, any resource is acceptable, as long as it is not "cpu" and the node name is "MyServer".



Example to filter events using time conditions. In the **Select Field or add New** field, select `Time of event`.

Specify the required time conditions, for example, anytime after yesterday.

Find events that are not matched to rules

Find events that are not matched to any rules, and determine if it is necessary to create event rules to manage them.

Before you begin

Role required: evt_mgmt_admin

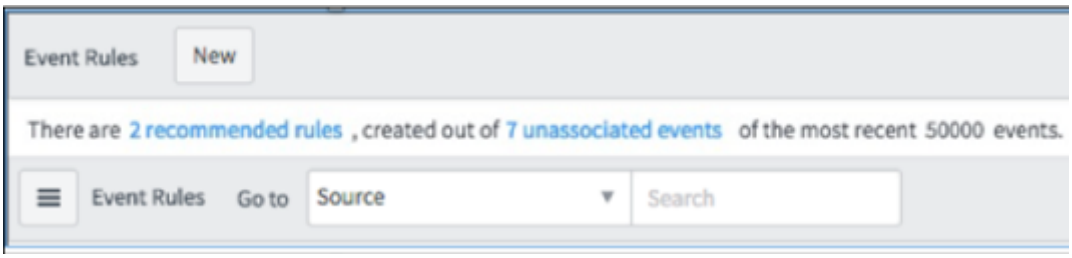
About this task

This task describes how to find events that are not matched to rules.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Near the top of the form, click the link for events or grouped events that are not mapped to rules.

Example



What to do next

Create an event rule. For example, event rules are useful for managing events that occur regularly.

View event rules

You can view all event rules on the Event Rules list.

Before you begin

Role required: evt_mgmt_admin

Procedure

Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.

Event Rules list

Field	Description
Name	The event rule name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Override default binding	Legacy binding criteria. If, in the **Bind** section criteria have not been specified or if the specified bind criteria are not matched, then the legacy binding criteria are considered.
Order	Order in which an event rule is evaluated when multiple rules are defined for the same type of event. Event rules are evaluated in ascending order.
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Updated	Update date and time for the rule.

Note: You can filter the Event Rule list to display the required subset of the information. However, if you create a favorite link after filtering, when the link is clicked the Event Rule list does not display the correct filter.

Related topics

View events

Configure an event rule to customize alert content

You can configure an event rule to customize alert content. You can customize the order of the fields and select which fields display. The fields in the left-hand work area of the **Transform and Compose Alert Output** section of an event rule are the fields that appear in the generated alert.

Before you begin
Role required: evt_mgmt_admin

About this task
You can customize alert content by adding the required event fields and modifying the text in the fields.

Note: When creating regex expression for input, ensure that you create input with the variables in sequential order. While variables can be skipped for inclusion, the selected order must be maintained.

Format alert text by using one or both of these methods:

Format alert text

Format method	Description
Transform	Create a field to display in an alert. The field and its value appear in the **Additional Information** section or in the **Alert Tags** section. In the **Event Input** pane, the new field is listed in the **Expressions** section.
Compose	Determine which text to display in the selected field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Configure which fields display in the **Event Input** pane by configuring the exclusion list [em_event_rule_black_list].

  A field entered into the exclusion list that already appears in an existing event rule is not removed from the rule; instead, it is moved to the **Manual Attributes** section in the rule.

- Control the order of event form fields by configuring em_event_rule_order.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Click **New** or open an event rule.
3. Click **Transform and compose alert output**.
   In this section, you can use the **Transform** mode and the **Compose** mode.
4. To transform information in fields—standard mode:

   Note: In this step, the selection of text is made in standard edit mode. In this mode, undo is available.

   a. Click the required field in the Event Input pane. The value and contents of the selected field appear in the workarea on the left.

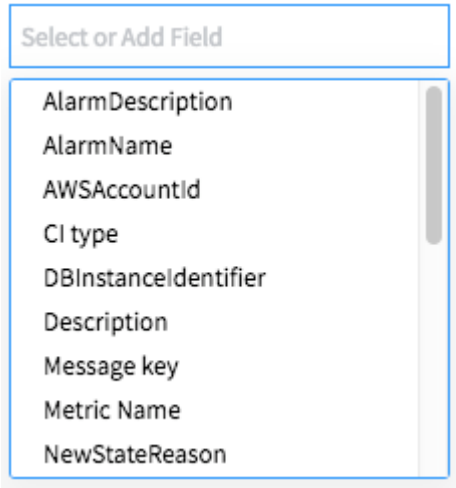
   
   b. Select standard edit mode .

   c. Using the pencil cursor, highlight the required text. You can double-click text in the field to select a word or select the required text and symbols.

   Note: If **Accessibility enabled** Accessibility enabled is selected in System Settings, standard edit mode is not available .

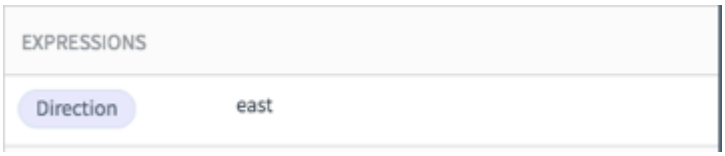
   d. Select a field name from the list or enter the required expression name. Fields that appear in the list are existing event fields, additional info fields or previously defined alert tags (fields prefixed with "t_"). The field name appears in the **Expressions** pane and the selected text is highlighted. Both the text and the expression name are highlighted in the same color. Each additional expression that you create, plus its value, is highlighted in a different color.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: Transform field names cannot contain a ‘ (single quote) character.

e. Click **Done**. The expression name appears in the **Expressions** section of the **Event Input** pane.



f. If you click an expression or its value in the **Event Input** pane, the details display in the workarea on the left.

5. To transform information in fields—regex mode:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- In regex mode, undo is not available.
- When building a regex expression from variables that are highlighted in the event, place the selected variables in the same order that they appear in the event field.
- When composing the event rule regex, specify the terms using an exact match of the input from the event fields. For example, for the text `vhxy2stlgwc_8888_hec03v012979`, the regex

  ```
  ^([^_]+)_
  ```

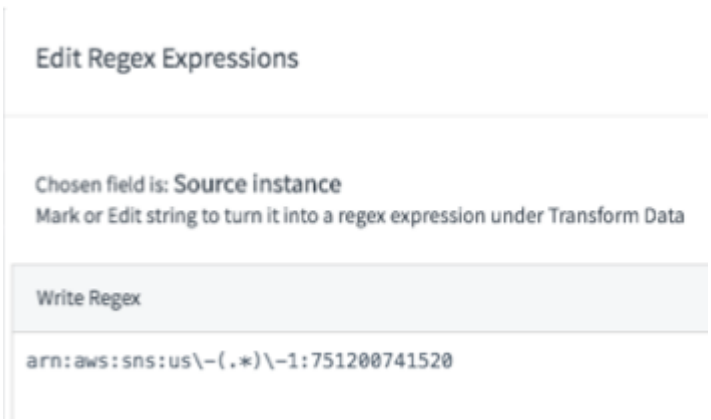
  looks as if it should catch the text `"vhxy2stlgwc"` that appears before the underscore. However, it does not work as this text is not an exact match. Use the full regex, as follows:

  ```
  ^([^_]+)_.*
  ```

- The Java Matcher parser is used for the regex engine. Ensure that you use a Java parser to test the regex.
- If the regex does not match the entire string when parsing data, the event rule will not capture the event, and no parsing takes place.
- The Java regex engine "matches" method is used. With this implementation, the regex engine attempts to match the entire input sequence against the specified pattern. Other matching methods, for example, the find method, are not supported.
- No regex flags are set by default, except the `Pattern.DOTALL` flag. With this implementation of Java regex, the DOT character "." matches any character, including a line terminator.
- Aside from `Pattern.DOTALL`, other regex flags cannot be changed.
- `Lookahead` is supported. However, `Lookbehind` is not supported.

a. Click the required field in the Event Input pane. The value and contents of the selected field appears in the workarea on the left.

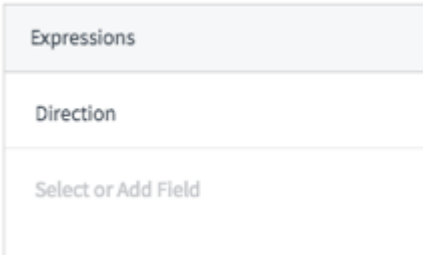
b. Select regex edit mode .



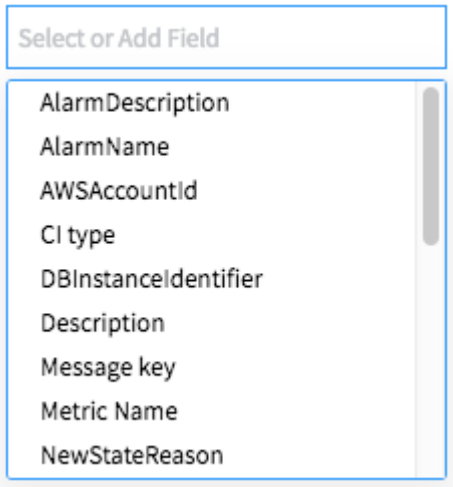
c. Select the required text and symbols 
. Replace the highlighted text with (.*) to create a regex expression.

d. In the **Expressions** pane, click the **Select or Add Field** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. Select a field name from the list or enter the required expression name. Fields that appear in the list are existing event fields, additional info fields or previously defined alert tags (fields prefixed with "t_"). The field name appears in the **Expressions** pane.



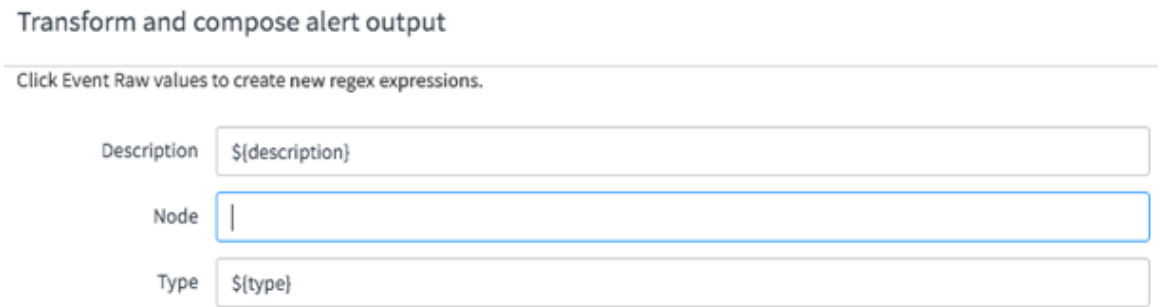
Note: Transform field names cannot contain a ‘ (single quote) character.

f. Click **Done**.

Note:

- When building a regex expression from variables that are highlighted in the event, place the selected variables in the same order that they appear in the event field.
- When composing the event rule regex, specify the terms using an exact match of the input from the event fields. For example, for the text vhxy2stlgwc_8888_hec03v012979, the regex ^([^_]+)_ looks as if it should catch the text “vhxy2stlgwc” that appears before the underscore. However, it does not work as this text is not an exact match. Use the full regex, as follows: ^([^_]+)_.*

6. To compose text, in the Transform and compose alert output section, click in the required field.



Compose text in the alert fields by performing any of these actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Drag a field from the Event Info pane into the required field.
- Use the Event Info pane as a reference of which fields are available. Write the field name details, using the format ${<fieldname>}, where "$" means "use the value". Between the brackets, the name of the event field replaces the <fieldname> variable.
- Freely enter text, spaces, or characters. For example, use spaces or underscore symbols (_) to make the text in the alert field readable.

7. To specify fields that must display in the generated alert, select the **Manual attributes** check box.

   Note: These fields, and their values, display in the **Additional Information** section or in the **Alert Tags** section for attributes prefixed with "t_".

   a. In the left-hand column, enter a value.

   b. In the right-hand column, either drag a value from the Add or Expression fields or type in a value.
   When entering a value with attributes prefixed with "t_", a drop-down list appears with all the previously defined "t_" attributes.

8. Click **Save** or **Update**.

What to do next
You can filter event rules. See Filter the events that an event rule applies to.

Related topics
Create or edit an event rule

Use event input information

Alert tags

Filter the events that an event rule applies to

Set a threshold to suppress alert generation

The event threshold is the rate upon which Event Management generates an alert. Receiving multiple events for a device over a short interval may warrant creating an alert, as the condition may be serious. However, receiving events over a longer interval may indicate a less serious situation which would not warrant creating an alert.

Before you begin
Role required: evt_mgmt_admin

About this task
You can configure the properties in an event rule to create alerts, suppress alert generation, or close existing alerts according to a specified threshold. The threshold is based on the value of event fields or number of occurrences over a specified period.

Note: **Field Name** can be the name of any numeric field in the **Additional information** field of the event. Therefore, if CPU is an additional information field for a specific event, then CPU can be used as a **Field Name**.

Assume that you want to generate an alert when CPU utilization reaches or exceeds 80% three times with no more than 20 seconds between any two consecutive events. Create an event rule with these settings (an explanation for each value is given in parentheses):

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Create Alert Operator**: *>=* (operator to determine whether utilization of **Field Name** reaches or exceeds the specified value)
- **Field Name**: *CPU* (events regarding high CPU usage)
- **Threshold Value**: *80* (percent)
- **Occurs**: *3* (three events occur where the CPU usage is at or above ">=" 80%)
- **Over(seconds)**: *20* (20 seconds or less between events)

To demonstrate how the preceding settings are evaluated, assume that the following events are received:

Scenario	Outcome
Reported elapsed time and the CPU usage for each event: • First event elapse time 20, CPU=85 • Second event elapse time 40, CPU=80 • Third event elapse time 60, CPU=70	In this scenario, no alert is generated since one event has a CPU utilization that is under 80%.
Reported elapsed time and the CPU usage for each event: • First event elapse time 20, CPU=85 • Second event elapse time 40, CPU=90 • Third event elapse time 70, CPU=95	In this scenario, an alert is not generated since the elapsed time in one event is over the specified 20 seconds.
Reported elapsed time and the CPU usage for each event: • First event elapse time 20, CPU=85 • Second event elapse time 40, CPU=95 • Third event elapse time 60, CPU=90	In this scenario, an alert is generated since in all events the elapsed time is within the specified time and the CPU usage is over 80%.

Note:

- When configuring an event rule to create or close alerts according to a threshold, events that arrive at the same second, as determined by the *time_of_event* field, are skipped. This occurs because these events are considered to be duplicates.
- When threshold conditions are configured, alerts close when the **Close Alert Operator** condition is met, and not when an event is received with **Severity = Clear** or **Resolution state = Closing**.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Create or open an event rule.
3. Click **Threshold**.
4. Select **Active**.
   If **Active** is not selected, the fields on this page do not appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Create Alert Operator** field, select an operator.
   - If you select **Count**, specify the corresponding **Occurs** and **Over(seconds)** fields.
   - If you select any operator other than **Count**, the **Field name** and **Threshold value** fields appear. Specify the required values in these fields.

     Note: The value of the **Threshold value** property can be the name of any field in the **Additional information** of the event. For example, if CPU is a field in **Additional information** for a specific event, then CPU can be used as the **Threshold value**.

   - In the **Occurs** field, specify the required value.
   - In the **Over(seconds)** field, specify the required period.
6. To automatically close alerts, in the **Close Alert Operator** field, select an operator.
   Extra fields appear according to your selection.
   - If **Count** is specified as the operator for the **Create Alert Operator** field, then the selection in the **Close Alert Operator** field is either `None` or `Idle`. Specify the required value.
   - If you select **Idle**, configure the **Over(seconds)** field.
   - In the **Close Alert Operator** field, if you select an operator other than **Idle**, then configure the **Threshold value**, **Occurs**, and **Over(seconds)** fields.
7. Click **Save** or **Submit**.

Example:
To create an alert when a specific event occurs 5 times in 10 minutes, in **Threshold**:

1. In the **Field name** field, specify the name of any field that exists in the **Additional information** field in the event. The value of the field is irrelevant.
2. In the **Create Alert Operator** field, select `Count`.
3. In the **Occurs** field, specify `5`.
4. In the **Over** field, `600` (10 * 60 seconds).
5. Click **Save** or **Submit**.

To create an alert when a specific event occurs 5 times in 10 minutes with a metric value greater than 55. Assume that “metric_value” is a field in the **Additional information** of the event. Specify:

1. Select the *`Active`* check box.
2. In the **Create Alert Operator** field, select `>=`.
3. In the **Field name** field, specify **metric_value**.
4. In the **Threshold value** field, specify `55`.
5. In the **Occurs** field, specify `5`.
6. In the **Over** field, specify `600` (10 * 60 seconds).
7. Click **Save** or **Submit**.

Binding alerts to CIs

CI binding or linking is the process of finding and connecting a Configuration Item (CI) from the Configuration Management Database (CMDB) to an alert, using the logic defined in event rules. This helps ensure alerts are tied to the right IT components for better visibility and faster issue resolution.

Understanding CI binding

Binding alerts to CIs links incoming alerts to the correct Configuration Item (CI) representing a specific host, such as a computer, server, router, or virtual machine in your IT infrastructure. This ensures accurate alert tracking, simplifies troubleshooting by identifying the source of issues, and maintains a historical record of alerts tied to specific systems.

In IT Operations Management, the relationship between alerts and CIs plays a critical role in effectively managing services and infrastructure. A CI represents a component within your IT environment, such as a server, application, or database. Linking alerts to CIs ensures that alerts and incidents are directly associated with the affected component, enabling accurate impact analysis and faster resolution.

In dynamic and large-scale environments, it's often challenging to pinpoint which CI is responsible for triggering an alert. Alerts are generated from raw event data captured across multiple sources, but this data may not explicitly reference a CI. Without a reliable method to bind alerts to CIs, IT teams face the risk of:

- Poor visibility into service impact.
- Longer mean time to resolution (MTTR).
- Inefficient alert management processes.

Event rules provide a structured way to analyze incoming event data, enrich it with additional context, and map it to the correct CI. These rules act as a bridge, transforming raw event data into actionable alerts linked to CIs. For example, event rules can:

- Parse incoming event data: The process involves breaking down raw event data to extract important details, such as hostnames, IP addresses, or service tags. These details are then used to analyze the event—identifying its source, type, and impact—and to enrich the alert by adding relevant context, like affected services, priorities, or resolution steps, ensuring it's actionable for IT teams.
- Match patterns: Here, the extracted event details—such as hostnames, IP addresses, or service tags—are compared against entries in the CMDB to identify the corresponding Configuration Item (CI) based on predefined rules or logic. Once matched, the alert is linked to the CI, providing context about the affected IT component for better visibility and faster resolution.
- Bind the CI to the alert: At this point, the alert is automatically associated with the identified CI. It ensures that the alert is connected to the right IT component in the system, making it easier to track and manage, and helping teams quickly address the issue.

Types of CI binding

Binding type	Description
Implicit Node binding (Default binding)	Binds alerts to host CIs by matching the **Node** field in the event with attributes like Name, FQDN, IP, or MAC address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Binding type	Description
CI field matching binding	Binds alerts using the **CI Identifier** field, a JSON structure containing column names and values (e.g., Name, FQDN, IP, or MAC Address).
CI identification binding	Binds alerts to specific applications on hosts using event rules.
Process-level binding	Binds alerts to application CIs by matching process-related attributes.
Device-level binding	Binds alerts to device CIs by matching event data with attributes like hostname, IP address, or MAC address.

Key benefits

- Improved service visibility: Alerts linked to CIs provide a clear picture of which IT components are affected.
- Enhanced automation: Automated CI binding reduces manual effort, ensuring consistency.
- Faster resolution: Teams can quickly diagnose and resolve issues by focusing on the impacted CI.

Example use case

Scenario: A company's email server named MailServer-01 goes down.

Process:

1. Alert generation: An alert is triggered when MailServer-01 becomes unresponsive.
2. CI binding: Event Management automatically looks for MailServer-01 in the CMDB (Configuration Management Database).
   - If found, the alert is linked to this specific server (CI).
   - If not found, the alert remains unlinked until more information is provided.

Result: The alert now shows that MailServer-01 is the affected system.

- Impact: IT teams immediately know which server to investigate.
- Efficiency: They don't need to check other infrastructure components or systems, saving time and effort.

This direct link helps streamline troubleshooting by pointing to the exact problem source.

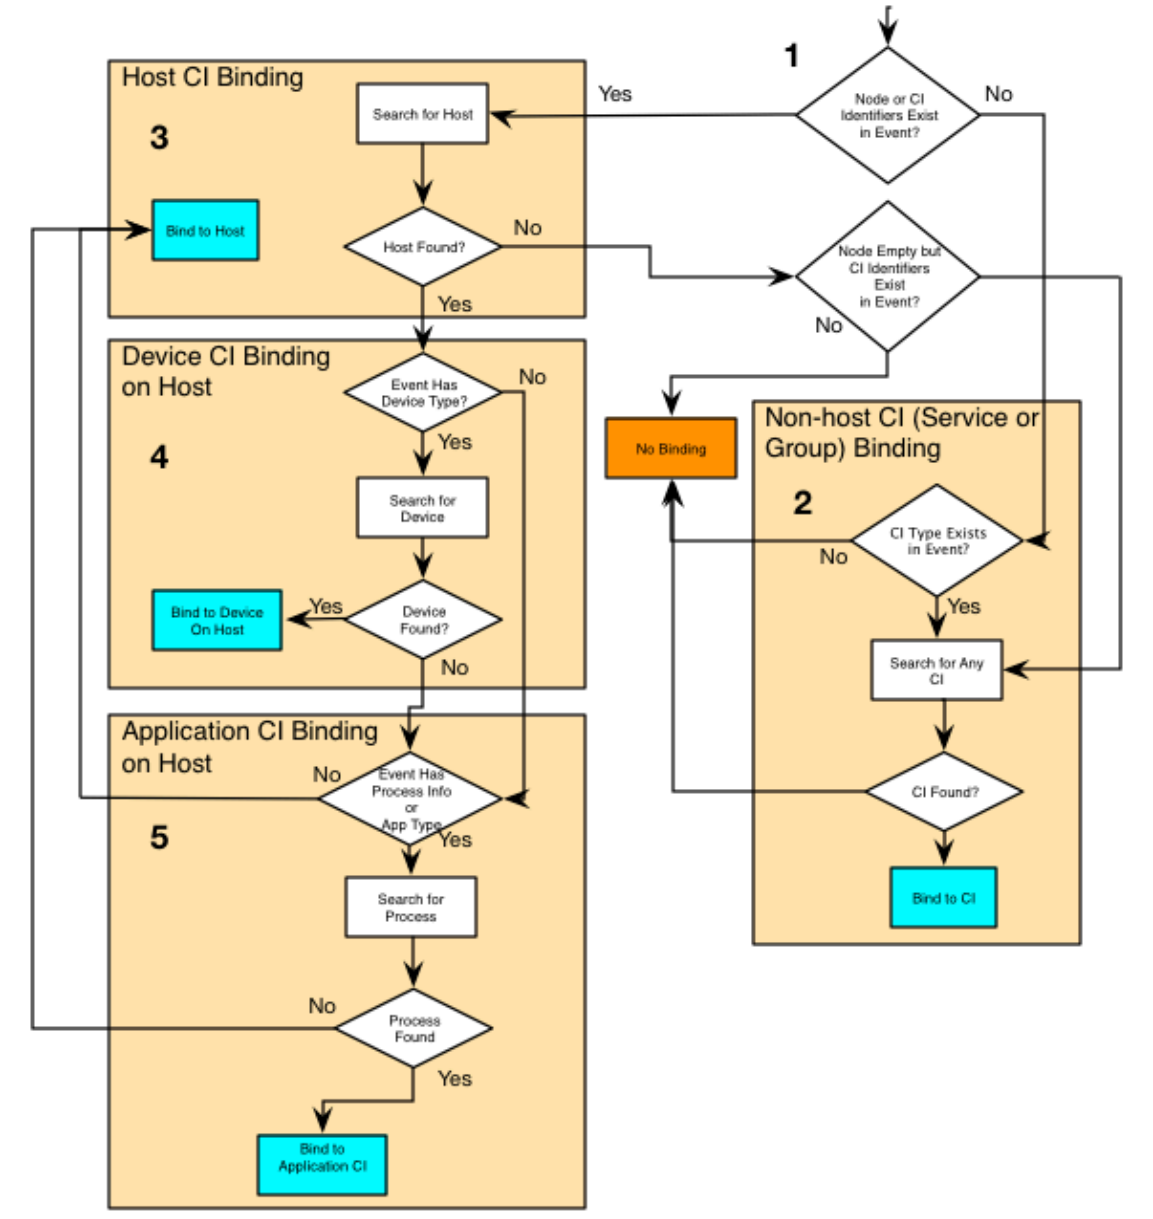
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI binding to alerts: Flow diagram



Process of linking CIs to alerts

1. Event Arrival: When an event is received, Event Management checks for node or CI identifiers.
2. Is Node Value Present?
   - Yes: If a node value is provided, Event Management searches the CMDB for a matching host.
   - No: If no node is found, the system attempts to bind the alert using other available details, such as:
     - Alert Type
     - Additional Information
     - CI Identifier

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For Kubernetes CIs and other non-host CIs, use an event rule with CI field matching instead of relying only on the Node value. Kubernetes CIs follow the same binding approach as other non-host CIs.

3. Host and CI Type Detection:
   - Both Found: If both a host and CI type are identified, the alert is linked to the corresponding device CI.
   - Host Only Found: If only a host is identified, the system links the alert to an application CI.

Additional Considerations

- Event Processing Notes: The event can include the binding process flow in its **Processing Notes** field, providing insights into the binding actions.
- Binding to Retired CIs: By default, events do not bind to CIs with a Retired status. To enable binding to these CIs, set the *evt_mgmt.ignore_retired_cis_in_binding* property to false.
- Specifying CI Statuses for Binding: You can configure the *evt_mgmt.install_status_list_to_ignore_in_binding* property by specifying CI status numbers to control which CIs are considered for binding. For example:

CI Statuses

Status Number	Status
1	Installed
2	OnOrder
3	InMaintenance
4	PendingInstall
5	PendingRepair
6	InStock
7	Retired
8	Stolen
100	Absent

Note: To specify multiple statuses, separate each status number with a comma.

Binding alerts to a specific host CI (default binding)

Binding alerts to Configuration Items (CIs) using the **Node** field or the **CI Identifier** field ensures accurate event association. By comparing an event record's **Node** or **CI Identifier** value, alerts are linked to the right system. This improves response, root cause analysis, and impact assessment by providing clear visibility into affected assets.

How default binding works

The system can perform default binding using the **Node** field or the **CI Identifier** field from the event record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When an event enters the system, a key field like **Node** is available in the event record. However, there is no **Node** field in the CI. Instead, the node value from the event is compared with various attributes in the host CI, such as Name, Fully Qualified Domain Name (FQDN), IP, or MAC address. If a match is found, the alert is linked to the corresponding CI. This is the default method for binding alerts to CIs.

The property *sa.active_operation_status* is used by the default binding mechanism, specifically when binding via IP/MAC using the node field in the event. When an event attempts to bind to a host through the node field (using IP/MAC), the system ignores hosts whose operational status is not included in this property and the operational status of the host must also not be null. By default, the property value is "1", which corresponds to Operational. You can extend the list to include additional statuses, and any status in the list is not ignored during binding.

Example: If *sa.active_operational_status* = "1,2", then both Operational and Non-operational hosts are considered valid for binding. The status attribute is defined by the following values:

- 1 – Operational
- 2 – Non-operational
- 3 – Repair in Progress
- 4 – DR Standby
- 6 – Retired

Note: In this binding process, the CI must be a host. Host CIs include Computers, Operating Systems (OS), Switches, Routers, or any CI type/class that extends the [cmdb_ci_hardware] table, meaning the CI type or class must be a hardware component.

If no match is found using node, the system looks at the **CI Identifier** field on the event record. The **CI Identifier** is a JSON structure containing column names and values for comparison (e.g., Name, Fully qualified domain name, IP, or MAC Address). The JSON is: {"column_name":"<column_value>"}. For example, if we want to bind to a CI identified by **serial_number** whose value is **Dell Latitude 7420 Laptop**, the JSON is: `{"serial_number":"Dell Latitude 7420 Laptop"}`. If a match is found, the alert is linked to the corresponding CI.

Difference between binding with Node vs. CI Identifier

In default binding, the system considers all fields in the **Additional Information** field and attempts to match their values with the CI table. The **CI Identifier** field allows specifying particular fields for matching, even if they are not present in **Additional Information**. This process uses a predefined JSON structure and applies only when the CI is a host.

Note: Even if the **Node** or the **CI Identifier** successfully binds the alert with the CI, event rules further determine how the binding occurs using the **Override default binding** check box available in Event rules. This ensures that alerts are bound correctly based on business logic, not just direct matches. This ensures that alerts are bound correctly based on business logic, not just direct matches.

Example: Resolving a CI Using Node and Event Rules

Imagine a server (Server-123) in your network generates an event. The event record contains a **Node** field with the value "Server-123.example.com".

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Matching with CI Attributes:
   a. The system checks the Node value against the CMDB.
   b. It compares "Server-123.example.com" with the FQDN, IP, MAC address, or Name of existing host CIs.
   c. If a match is found (e.g., FQDN in the CMDB is also "Server-123.example.com"), the alert is linked to that CI.
2. Applying Event Rules: Even if the Node resolves to Server-123, additional event rules might determine if the alert should be linked differently. For example, an event rule may specify that alerts from Server-123 should be linked to a parent CI (like a cluster) instead of the individual server.

Overriding default binding

Overriding default binding allows flexibility in linking alerts to CIs beyond the default Node-based matching. This helps customize alert binding based on business needs, ensuring accurate associations and preventing mislinked alerts, improving incident management and root cause analysis.

By default, alerts are bound to CIs by matching the node value in the alert with attributes like Name, FQDN, IP, or MAC Address in the CI. However, if you want to change this behavior—either by using additional criteria or ignoring the node altogether—you can use the **Override Default Binding** check box.

This allows for two scenarios:

1. When Binding Type = CI Field Matching
   - If the CI is a host, the Node is required for binding. For more information, see Bind host CIs using CI field matching.
   - If the CI is not a host, the Node must be empty. For more information, see Bind non-host CIs using CI field matching.
2. When Binding Type = CI Identification. For more information, see Bind alerts to CIs using CI identification.

This flexibility ensures alerts are linked correctly based on specific business needs.

Note: You can also use the Service Operations Workspace to define binding rules. For more information, see Create Enrich automation.

Bind host CIs using CI field matching

When CI Field Matching is used and the CI is a host, the Node value from the alert is used for binding. The system compares the Node with attributes like Name, FQDN, IP, or MAC Address in the CMDB to find a match. This ensures that alerts are correctly linked to the corresponding host CI.

Before you begin

Role required: evt_mgmt_admin

About this task

When an event enters the system, key field like **Node** is available on the event record. The **Node** field generally represents the name of the server. In CI there is no field like **Node**. However, the value of **Node** from the event is compared with different values in the host CI such as Name, Fully qualified domain name (FQDN), IP, or MAC Address. If a match is found, the alert is linked to the corresponding CI. This is the default binding of alerts to CIs. In this binding, the CI must be a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

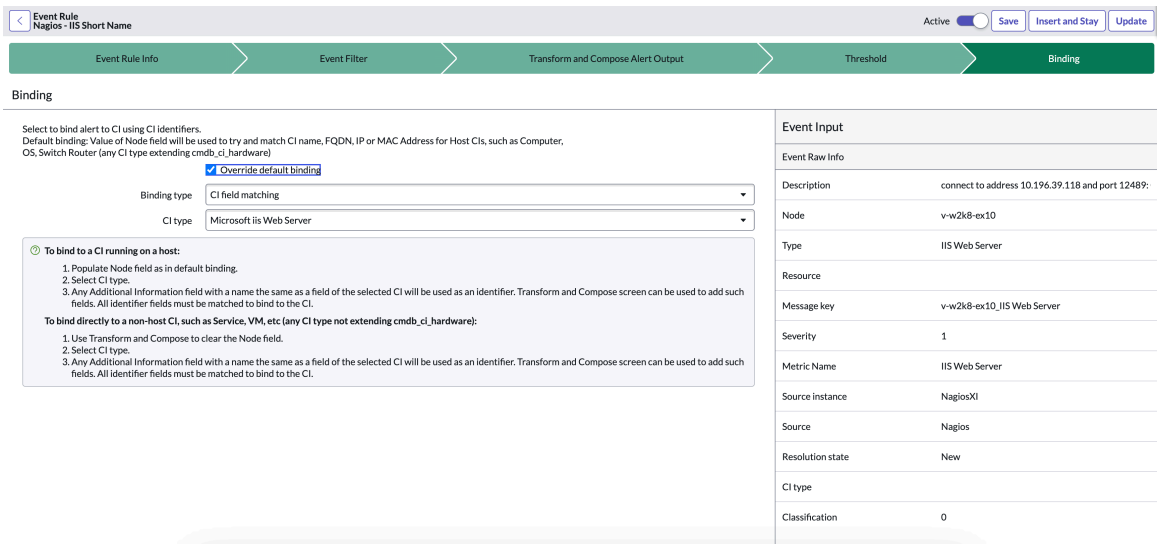
host. Host CIs include Computers, OS, Switches, Routers—essentially any CI type or class that extends the [cmdb_ci_hardware] table.

There may be cases where no match is found because the column names in the event record and the table differ for the same item. In such cases, you can manually create an additional key-value pair with a name matching the table column, ensuring the matching process continues successfully. For information on how to create a manual field, see Bind CIs using CI field matching and handling column name differences.

Note: Even if the node successfully binds the alert with the CI, event rules further determine how the binding occurs.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields of the event rule.
3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI field matching**.



6. In the **CI type** field, select the appropriate type of hardware component (such as a server, router, or storage device) that the CI type represents.
   The **CI type** determines the specific CMDB table where the system searches for the matching CI. For example, if the **CI type** is **Network Adapter**, the system searches in the [cmdb_ci_network_adapter] table.
7. Select **Submit**.

Note: You can also use the Service Operations Workspace to define binding rules. For more information, see Create Enrich automation.

Before you begin

Role required: evt_mgmt_admin

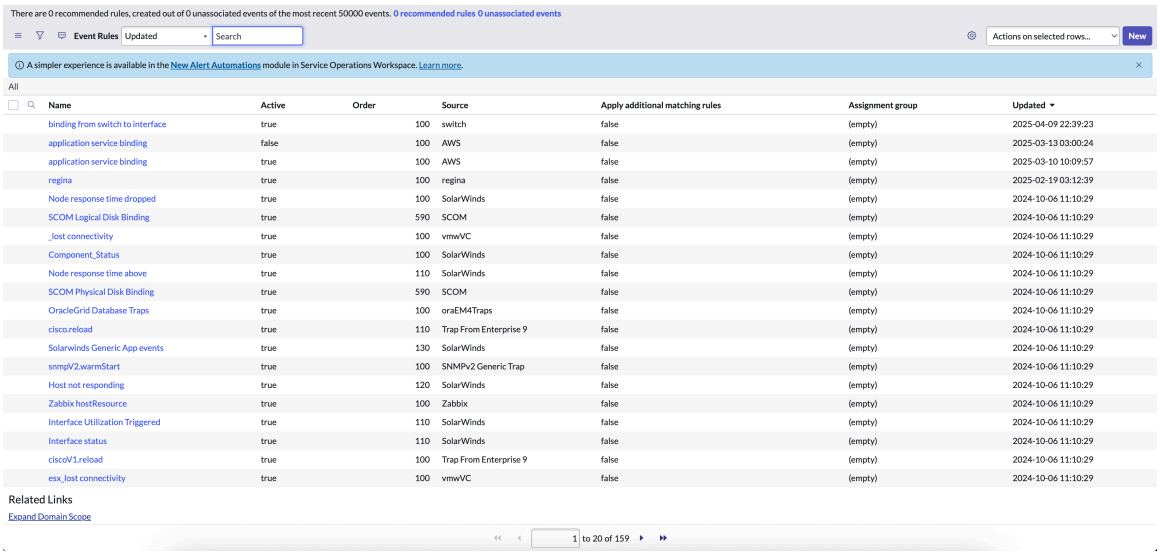
About this task

In IT environments, multiple devices like switches have many smaller components, such as ports. When something goes wrong, it's not enough to just say the switch has an issue—the system needs to pinpoint exactly which port is causing it. Binding alerts to the specific port that triggered the issue allows teams to act faster and fix the real issue without wasting time checking the entire switch or unrelated components.

The following example procedure shows the alert binding configuration for a switch named IP-Switch-1, ensuring alerts target the correct port. The event rule setup starts by enabling the **Override default binding** option and selecting **CI field matching** as the **Binding type**. Choosing **Switchport** as the **CI type** instructs the system to bind alerts to individual ports. The Binding Device Map defines how the system links the switch (cmdb_ci_ip_switch) to its ports (dscy_switchport) using the cmdb_ci reference field. This map guides the binding logic. Under **Configuration** > **Network** > **Switches**, selecting **IP-Switch-1** reveals its switchports and interface names. When an incoming event includes a matching interface name in the **Additional information** field, the system binds the alert directly to the correct port—ensuring precise and meaningful alert context.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New**.



3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI field matching**.
6. In the **CI type** field, select **Switchport**.
   The **CI type** determines the specific CMDB table where the system searches for the matching CI.

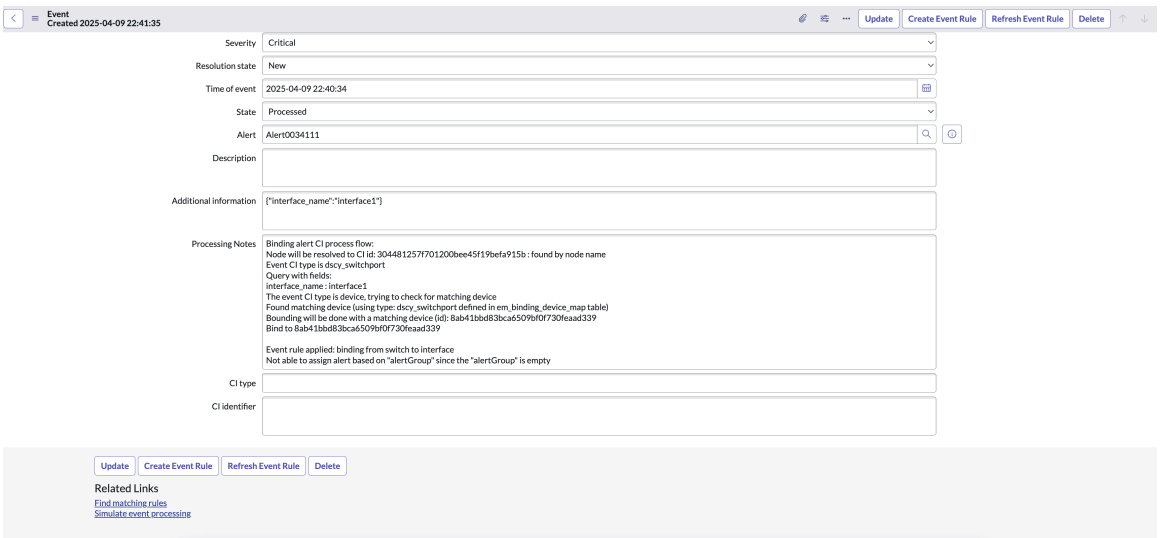
In the following image, you can see the processing notes indicating that the binding has occurred between the alert and the matching device.



Bind alerts to a specific process

Bind specific server processes to their corresponding Configuration Items (CIs) in the CMDB to ensure accurate mapping and visibility. This binding is crucial for identifying service dependencies, reducing ambiguity from generic process names, and enabling effective monitoring. It supports faster alert resolution, impact analysis, and better alignment between infrastructure and application components in dynamic environments.

Before you begin

Role required: evt_mgmt_admin

About this task

Sometimes, when an alert (or event) comes into the system, it needs to be connected — or "bound" — to a Configuration Item (CI) in the CMDB. By default, the system binds alerts to host specified in the **Node** field of the event. Imagine a situation where you have a Windows server running multiple processes, like MSFT SQL Instances and SQL Server Analysis Services. The challenge is to bind an event to the specific process instance rather than just the host server, as multiple processes could have the same generic name, such as MSSQLSERVER, leading to ambiguity.

The following example procedure uses a Windows server as the host, MSFT SQL Instances as the CI class of the process, and MSSQLSERVER as the process name. The following steps are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

based on the assumption that the event **Node** field of the event provides the host name, and the **Additional Information** field contains specific process details required for binding.

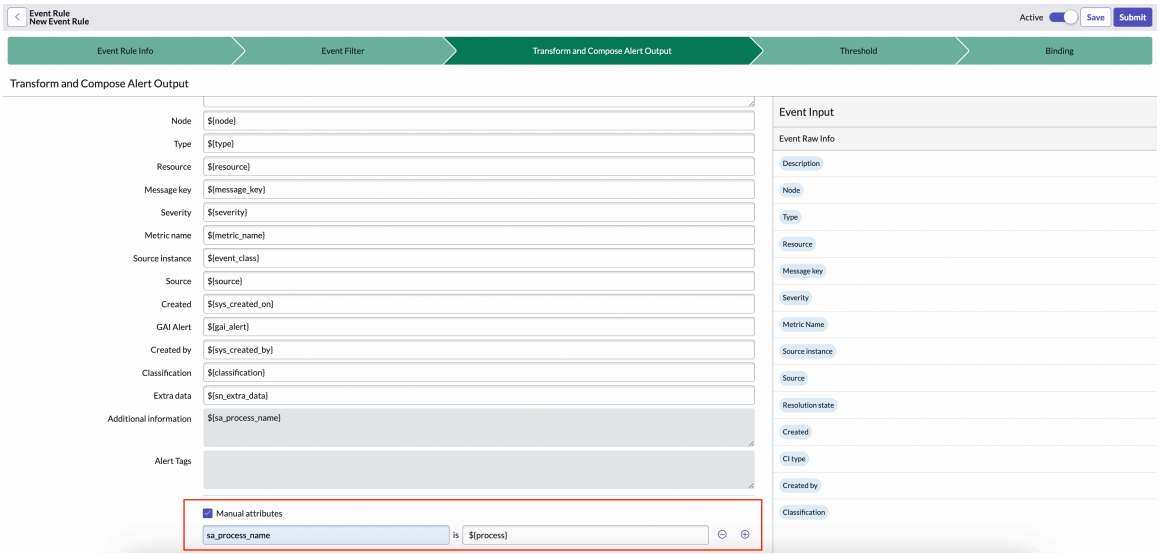
Alert-to-CI Binding via Process Mapping

Action	Steps
Set event rule: Add process name	Add the process name `sa_process_name` in the event rule.
Set event rule: Define CI type	Select the target CI type in the event rule. For example, MSFT SQL Instances.
Define process mapping	Navigate to the Process to CI Type Mapping table [em_binding_process_map] and add an entry mapping a CI type (e.g., MSFT SQL Instances) to a process name (e.g., MSSQLSERVER).
Bind CI to alert	When an event is triggered, the system: **1.** Applies default binding to identify the host. **2.** Checks the CI type specified in the event rule. **3.** Looks up the Process to CI Type Mappings table [em_binding_process_map] for a matching process name and CI type. **4.** Searches the CI Relationships table [cmdb_rel_ci.list] for a Runs on::Runs relationship between the process and the host CI. **5.** Binds to a process when values from the **CI Type** column match the corresponding entries in the **Process** column in the Process to CI Type Mappings table [em_binding_process_map].

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New**.
3. Select the **Transform and Compose Alert Output** tab and perform the following steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

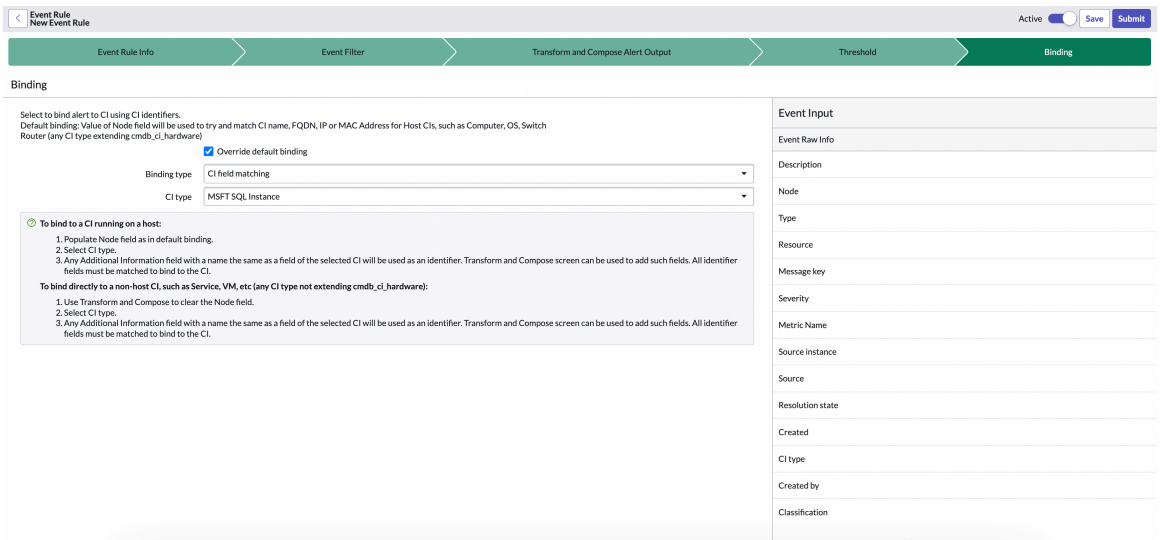


a. Select the **Manual attributes** check box.

b. Enter `sa_process_name` is `${process}`.

sa_process_name is a special variable name used to specify the name of the process to search for. ${sa_process_name} will appear in the **Additional information** field of the event. Instead of `${process}`, you can enter any other field name from which the variable `sa_process_name` derives its value.

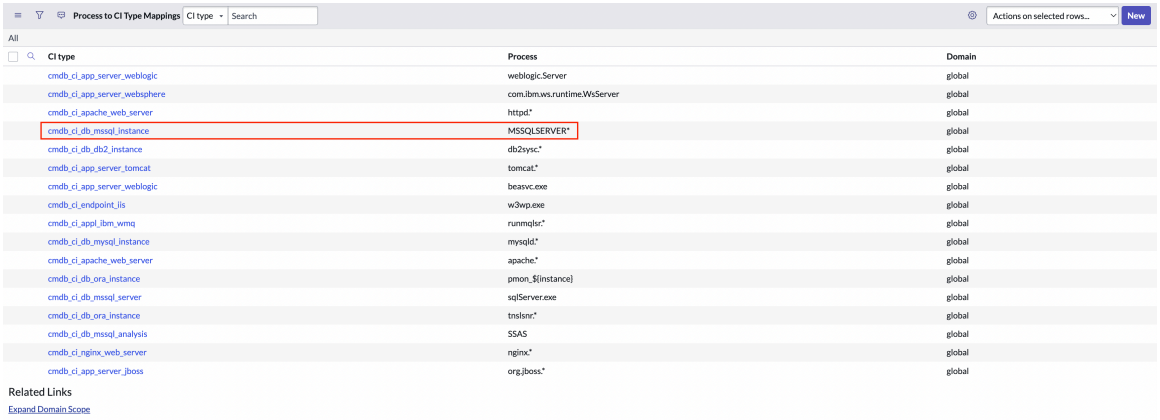
4. Select the **Binding** tab.
5. Select the **Override default binding** check box.
6. In the **Binding type** field, select **CI field matching**.
7. In the **CI type** field, select **MSFT SQL Instances**.
   The **CI type** determines the specific CMDB table where the system searches for the matching CI.



8. Navigate to **All** and search `em_binding_process_map.list`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

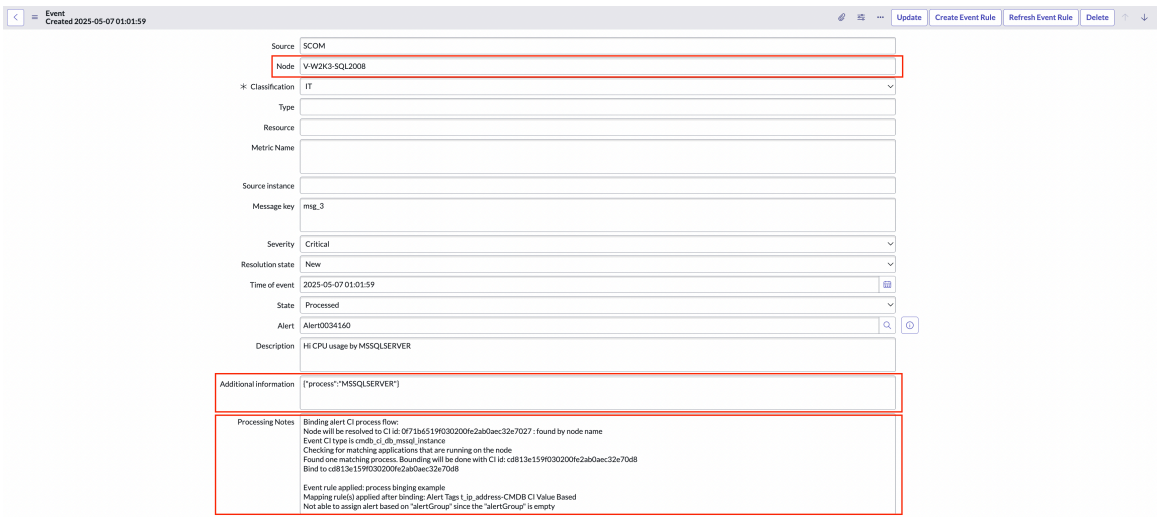
The Process to CI Type Mappings page opens. Here the values from the **CI type** column are mapped to entries in the **Process** column. For example, **cmdb_ci_db_mssql_instance** is mapped to the **MSSQLSERVER** process.



9. **Optional:** Navigate to **All** and search `cmdb_rel_ci.list`.
   The CI Relationships page opens.
10. **Optional:** Verify that the node is in a Runs on::Runs relationship with the appropriate process.

11. Navigate to **All** > **Event Management** > **All Events**.
12. Create an event with **Node** value as the name of the host such as Windows Server (V-W2K3-SQL2008).
    The **Additional information** field in the event has a key called **process** whose value is **MSSQLSERVER**.

    In the following image, you can see the processing notes indicating that the binding has occurred between the alert and the matching process.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bind non-host CIs using CI field matching

If no match is found using the **Node** field, the system uses the **CI identifier** field to match alerts with non-host CIs based on attributes like Name, FQDN, IP, or MAC. This ensures accurate alert association, improving visibility, troubleshooting, and root cause analysis for diverse infrastructure components.

Before you begin

Role required: evt_mgmt_admin

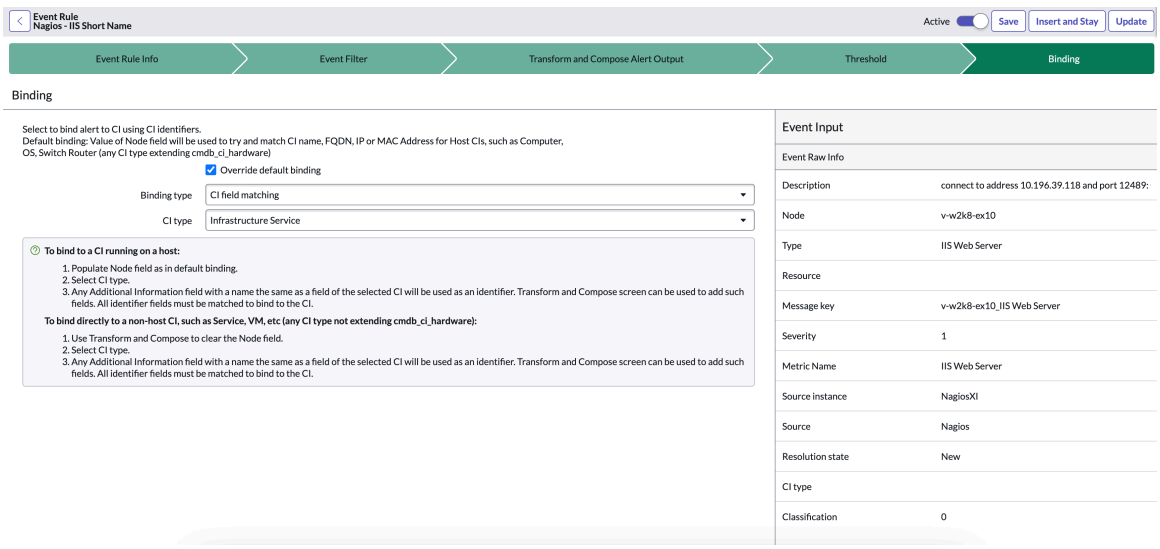
About this task

If no match is found using the **Node** field, the system looks at the **Additional information** field of the alert. When you select a CI type, such as File System, the system automatically searches for a matching record in the [cmdb_ci_file_system] table. It uses the details provided in event rule record, specifically in the **Additional information** field, to refine the search. For example, if the **Additional information** field contains values like `{"mount_point": "/snap/amazon-ssm-agent/9565", "name": "/dev/loop0"}`, the system looks for a record in the [cmdb_ci_file_system] table that matches these values. If a match is found, the system binds the CI to the alert, ensuring accurate identification and association. Similarly, if the **CI type** is **Network Adapter**, the system searches in the [cmdb_ci_network_adapter] table.

There may be cases where no match is found because the column names in the event record and the table differ for the same item. In such cases, you can manually create an additional key-value pair with a name matching the table column, ensuring the matching process continues successfully. For information on how to create a manual field, see Bind CIs using CI field matching and handling column name differences.

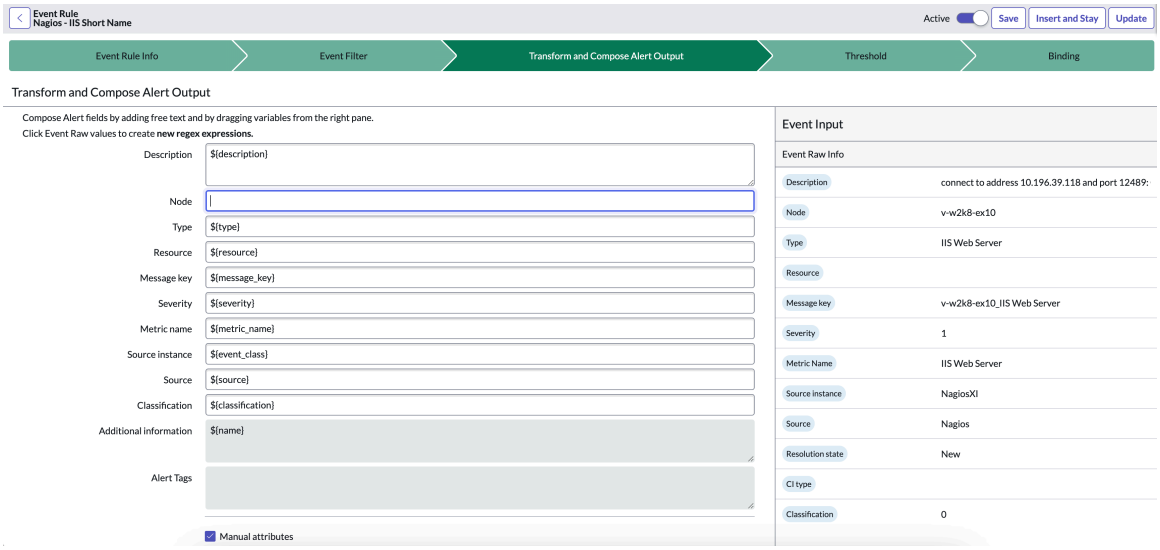
Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields of the event rule.
3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI field matching**.



6. Select the **Transform and Compose Alert Output** tab.
7. Clear the **Node** field value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. In the **CI type** field, select the non-host CI.

   A non-host CI type is any CI type that does not extend the [cmdb_ci_hardware] table, such as a Service or VM. The **CI type** determines the specific CMDB table where the system searches for the matching CI.

9. Select **Save**.

Bind CIs using CI field matching and handling column name differences

Bind CIs by matching event **Additional information** fields with CI attributes. If column names differ, manually create an additional key-value pair to align with the CI table, ensuring accurate CI association.

Before you begin

Role required: evt_mgmt_admin

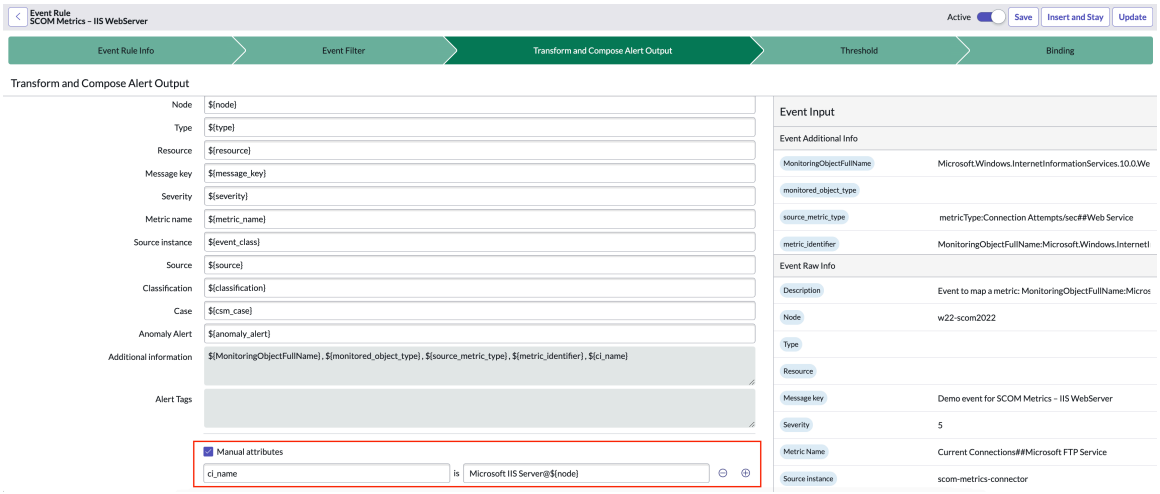
About this task

If no match is found using the **Node** field, the system looks at the **Additional information** field in the event record. There may be cases where no match is found because the column names in the event record and the table differ for the same item. In such cases, you can manually create an additional key-value pair with a name matching the table column and add it to the **Additional information** field, ensuring the matching process continues successfully.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields, or open an existing event rule record to modify it.
3. Select the **Transform and Compose Alert Output** tab.
4. Select the **Manual attributes** check box.
5. In the **Field Name** and **Field Value** fields, enter the corresponding field name and specify the source field from which the value should be populated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Use the add icon (⊕) icon to add multiple fields as needed.

6. Select **Save**.
   The fields are created in the event rules record. However, when any alert is generated from an event using the event rule, the manually added fields appear in the **Additional information** field of the alert.

Bind alerts to CIs using CI identification

Bind alerts to specific applications on hosts using event rules to ensure accurate tracking and to improve issue resolution speed—leading to efficient remediation and better alignment of alerts with the right resources.

Before you begin

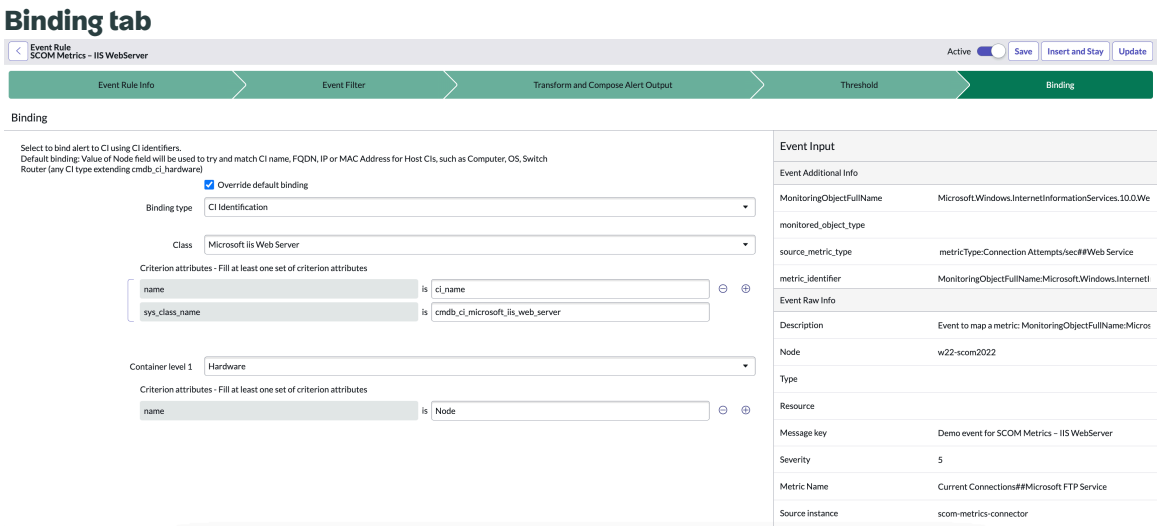
Role required: evt_mgmt_admin

About this task

Before going through the procedure, let's first understand how this binding works with an example. Suppose an out-of-the-box event rule, SCOM Metrics – IIS WebServer, generates an alert for a Microsoft IIS Web Server running on a host. Instead of binding the alert to just the host machine, you want it to be associated with the specific application (IIS Web Server) where the issue occurred. Here's how the system ensures accurate binding.

Let's say in the **Binding** tab, the **Class** and **Container Level 1** are defined along with their respective attributes, as shown in the image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The binding procedure follows these steps:

1. Identifying the Host (Container Level 1)

   Since the Microsoft IIS Web Server runs on a host (in this case Hardware), the system first locates the host, which is defined as **Container Level 1**. The name field is used to identify the host, and its value is taken from the **Node** field of the event. Using this name, the system searches the CMDB to find a matching host CI.

2. Identifying the Microsoft IIS Web Server CI on the Host

   Once the host is identified, the system looks for a Microsoft IIS Web Server CI under that host with the following attributes:

   - name = ci_name
   - sys_class_name = cmdb_ci_microsoft_iis_web_server

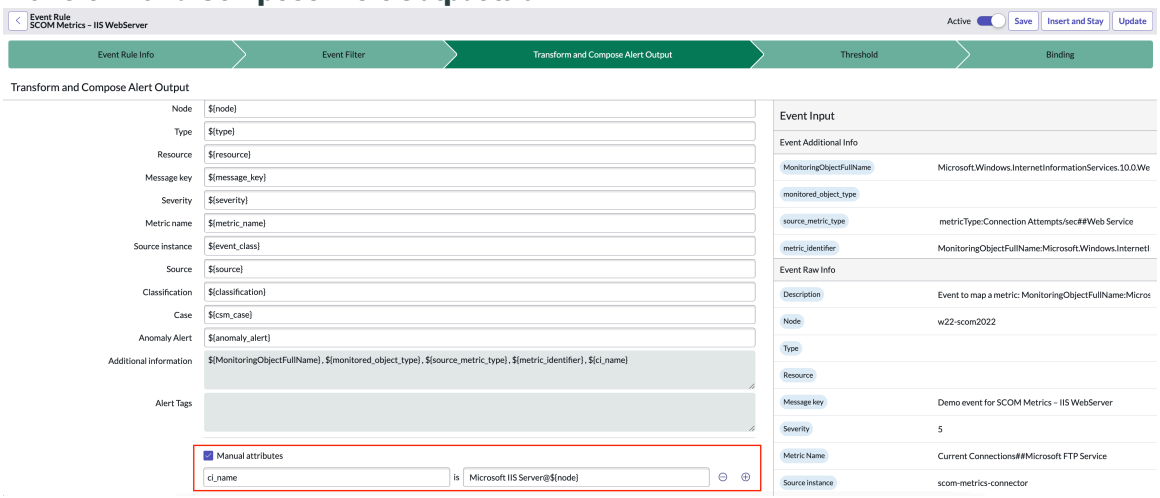
   Here, ci_name is derived from the key-value pair defined in the **Transform and Compose Alert Output** tab of the event rule. Assume that in the **Transform and Compose Alert Output** tab of the event rule, the **Manual attributes** check box is selected and the following key-value pair is already added:

   - **Field Name**: `ci_name`
   - **Field Value**: `Microsoft IIS Server@${node}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This ensures that `ci_name` appears in the **Additional information** field of the alert and is used when configuring the attribute field of the CI class.

Transform and Compose Alert Output tab



If a matching Microsoft IIS Web Server CI is found on the identified host, the alert is bound to the correct application CI rather than just the host. This ensures more precise incident tracking and resolution, linking the alert to the actual service affected instead of only the machine it runs on.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields of the event rule.
3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI Identification**.
6. In the **Class** field, select a CI class.
7. In the **Select an identifier** field, select an identifier for the class.

   An identifier for a class is a set of rules that helps the system recognize and match CIs correctly. Think of it like a fingerprint for each type of CI (such as a server, router, or application). The identifier uses key attributes—like a serial number, hostname, or IP address—to make sure that when new data comes in, it gets linked to the right CI instead of creating duplicates. For more information on CI identification rule, see Create a CI identification rule.
8. In the **Add value** field, add the exact value or specify the source field from which the value for the field must be populated.

   Add or remove fields using the add (⊕) and the delete (⊖) icons.

   Note: While filling in the CI Class attributes, if you do not find the attribute you need, you can use the **Transform and Compose Alert Output** tab of the event rule to add the necessary key-value pair. For more information, see Configure an event rule to customize alert content.

   The event rule transformation and composition is useful when relevant information exists in a different field but needs to be extracted or reassigned for proper alert processing. This is especially important when the required attribute is not directly available and must be manually defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, suppose the **Additional information** field of an alert contains the alert name under the **Node** field. However, for correct processing, we need this value to appear under the **Name** field instead. Since there is no existing name attribute in the event, we can manually create one using the **Transform and Compose Alert Output** tab in the event rule. Here's how:

a. Select the **Transform and Compose Alert Output** tab.

b. Select the **Manual attributes** check box.

c. Add the following key-value pair:

- **Field**: Name
- **Field Value**: Node

This configuration ensures that the system extracts the **Node** value and maps it to the name field, making it available for CI binding and alert correlation.

9. In the *Container level 1* area, specify the host.
10. In the **Select an identifier** field, select an identifier for the container.
11. In the **Add value** field, add the exact value or the field that is the source for the **Select an identifier** field of the container.

    Add or remove fields using the add (⊕) and the delete (⊖) icons.
12. Select **Save**.

Example: Binding alerts to non-host CIs

Bind alerts to an application service (a non-host CI) using event rules and event field mapping. This example demonstrates how to achieve this by leveraging the IP address associated with the service.

Before you begin

Role required: evt_mgmt_admin

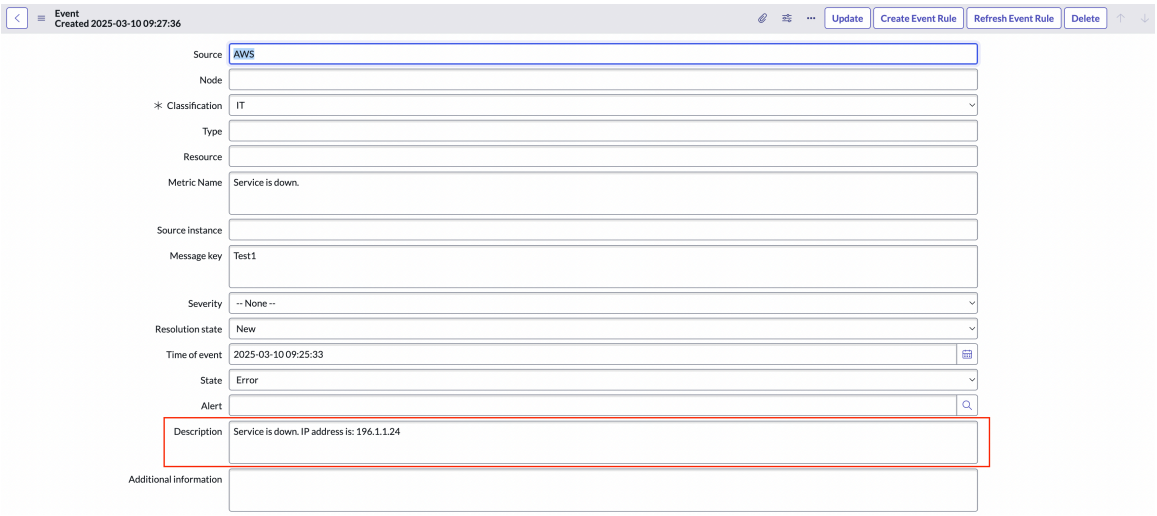
About this task

When an event is generated, it may not always include the exact name of the Application Service it affects. Instead, it might provide details such as an IP address. In this example, suppose application services are identified by IP addresses. Since the goal is to bind the alert to an Application Service, you need to determine which service name corresponds to the given IP address.

To achieve this, follow these steps:

1. Match the correct Application Service: Override the default binding and select **Binding Type** as **CI field matching**. The binding process needs to associate the alert with an Application Service, not a host. In the event rule, set the **CI Type** to **Application Service** so that the system searches for the service in the Application Service table (cmdb_ci_service_auto).
2. Extract the IP address from the event description: The event might contain a message like `Service is down. IP address is: 196.1.1.24`. You need to extract the IP address from this description for further processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

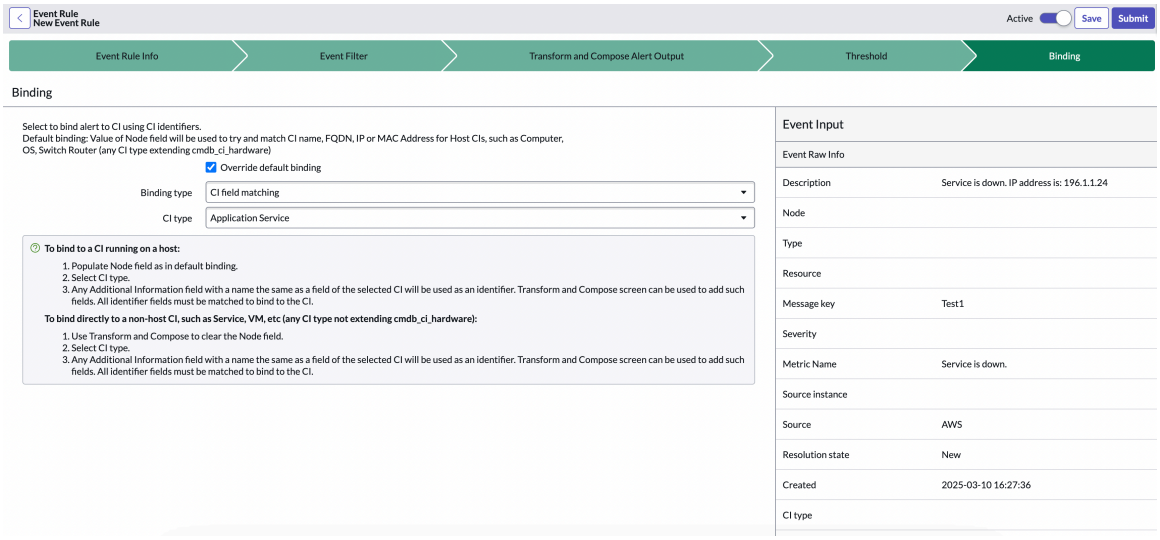


3. Translate the IP address into a service name using Event Field Mapping: Use Event Field Mapping to look up the extracted IP address in the CMDB and find the associated application service. Once a matching service is found, its name is stored in the **Name** field of the event.
4. Bind the alert to the correct Application Service: If the service name is identified, the alert's CI is populated with that service.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Open the specific event for which you want to create an event rule.
3. Select **Create Event Rule**.
   The new event rule page opens. Some fields in the event rule are populated based on the event record data, such as the Source field value.
4. In the **Event Rule Info** tab, in the **Name** field, enter `application service binding`.
5. Select the **Binding** tab.
   In this tab, you select the CI type as a service (non-host) instead of a host because the goal is to bind alerts to an Application Service, not to a physical or virtual machine.
6. Perform the following steps:
   a. Select the **Override default binding** check box.
   b. In the **Binding type** field, select **CI field matching**.
   c. From the **CI type** list, select **Application Service**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select the **Transform and Compose Alert Output** tab.

   In this tab, you extract the IP address of the application service into a manually created field. Extracting the IP allows the system to look up the corresponding service in the Application Service table (cmdb_ci_service_auto). Without extracting the IP, the system wouldn't be able to determine which Application Service the event belongs to, making it difficult to bind the alert correctly.

8. Perform the following steps:

   a. Clear the **Node** field.

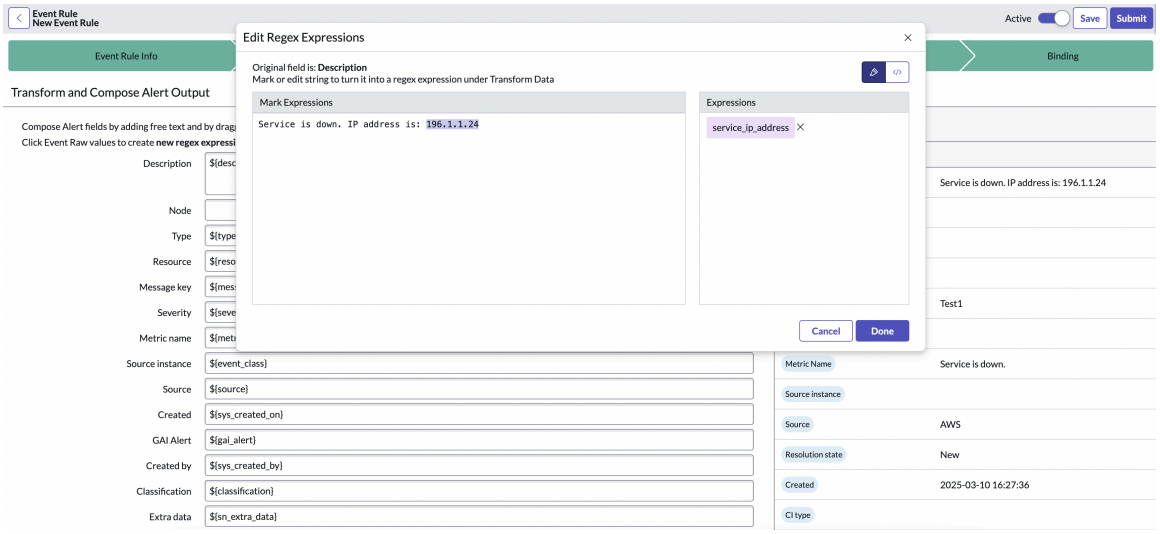
      When an event is processed, it often comes with multiple fields of information. The **Node** field typically contains the host or device name. However, since the goal is to bind the alert to an Application Service rather than a host, clearing the **Node** field ensures that the system focuses on identifying the correct service instead of mistakenly associating the alert with a host CI.

   b. Under **Event Input** > **Event Raw Info**, select **Description**.

      The Edit Regex Expressions window opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the Mark Expressions section, select the IP address, manually enter a field name (e.g., service_ip_address), and press Enter to save it.



d. Select **Done**.

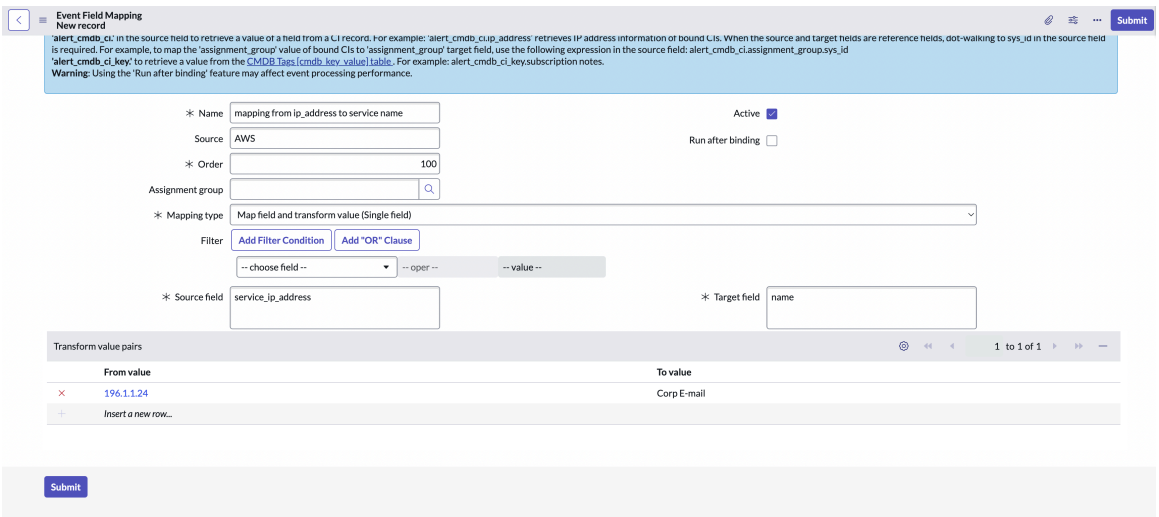
The IP address is extracted into the newly created **service_ip_address** field, which is added to the **Additional info** field of the alert. This allows it to be used later to identify the corresponding Application Service.

9. Select **Submit** in the event rule to save your changes.

10. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
In Event Field Mapping, configure the extracted IP address to map it to the corresponding service name. The event provides only an IP address, but alerts need to be associated with a service name (not just an IP). The system needs to map this IP to its corresponding Application Service so that teams can easily identify the impacted service.

11. Select **New**.
The Event Field Mapping window opens.

12. Perform the following:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

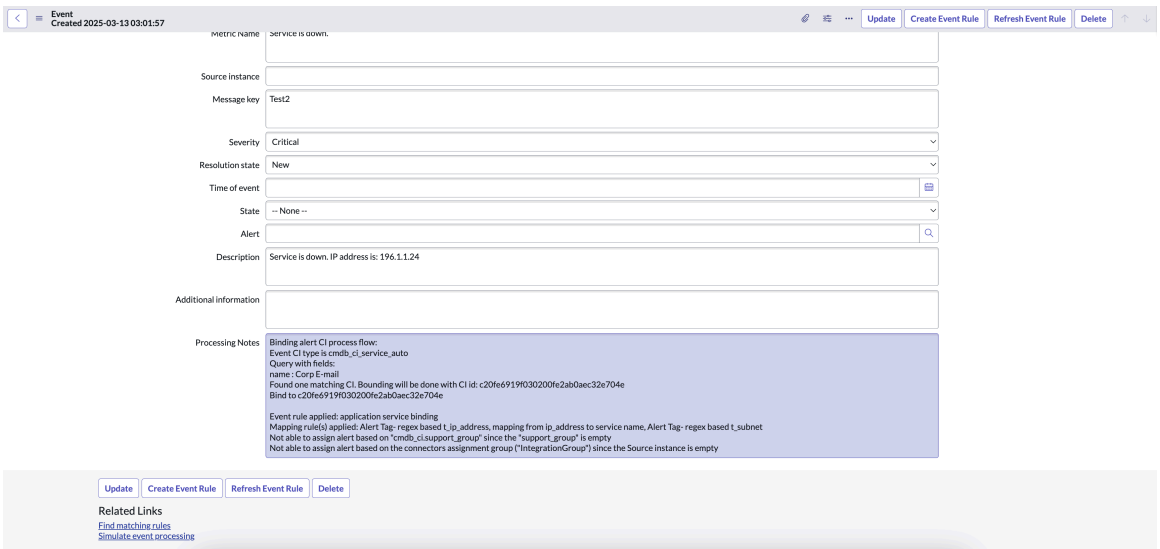
Field	Action
Name	Enter the name of the mapping. Example: mapping from ip_address to service name.
Source	Enter `AWS`. **Note:** The source is the same as the one in the Events record.
Mapping type	Select **Map field and transform value (Single field)**
Source field	Enter `service_ip_address`.
Target field	Enter `name`. The target field value is the column name in the Application Service table (cmdb_ci_service_auto) where the source field value is searched.
Transform value pairs	
From value	196.1.1.24
To value	Corp E-mail

13. Select **Submit**.

The system extracts the IP address of the service from the event and stores it in the **service_ip_address** field. Since the Application Service table (cmdb_ci_service_auto) does not have a column for searching by IP address, the Transform value pairs feature is used to map the IP address to a name—in this case, Corp E-mail and and saves it in the **name** field within the **Additional info** field of the alert. The **Target field** specifies where to search for the Corp E-mail in the Application Service table. The system looks for Corp E-mail in the **name** column of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the Application Service table (cmdb_ci_service_auto). If a match is found, the alert is bound to the corresponding Application Service.



Example: Bind alerts to CIs using dynamic CI types

Use event field mapping to dynamically bind alerts to the appropriate CIs based on event attributes, eliminating the need for separate event rules for each CI type (also known as CI class). This approach simplifies configuration, improves accuracy, and enhances alert to CI binding.

Before you begin

Role required: evt_mgmt_admin

About this task

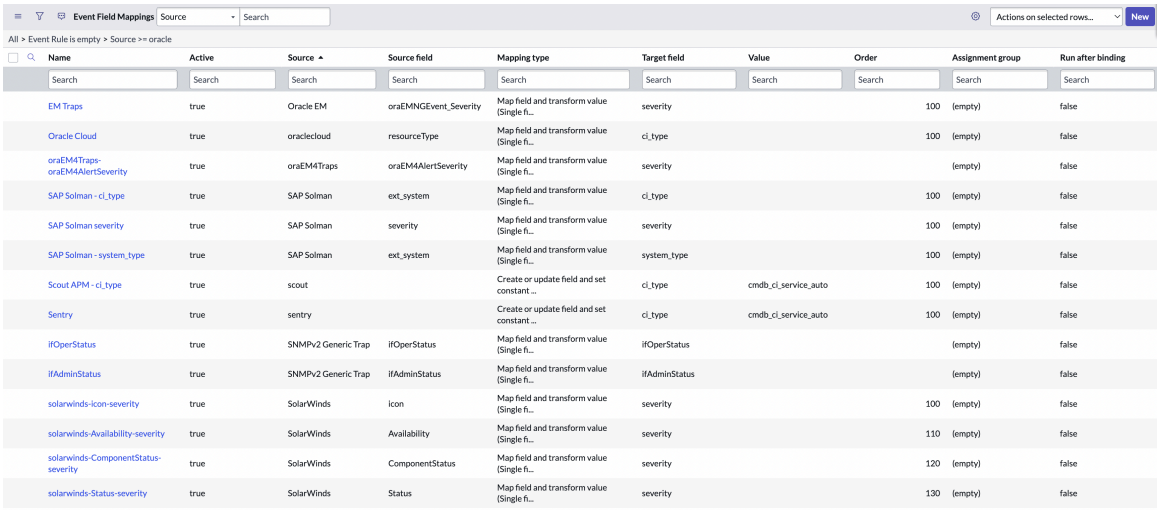
In general, for an event generated from a specific source mentioned in the **Source** field, the system applies the corresponding event rule. The override default binding option in an event rule specifies a specific CI class for binding. However, in a more dynamic use case, the CI class is not predefined and can change based on event attributes. For example, suppose a customer has multiple CIs with the same name, but each CI belongs to a different CI class. In the traditional event rule method, as the CI class (or the CMDB table) is defined for a CI, the mapping is incorrect because the system searches in the same CI class for all CIs with the same name and attributes, instead of looking in the specific CMDB table defined for each CI class.

To resolve this—in other words, to determine the correct CI class to search—the system uses the **CI type** field from the event to identify the CI class. By using an event field mapping that maps from event attributes to CI type, it becomes possible to know which CMDB table to search, ensuring that the CI is correctly mapped to the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

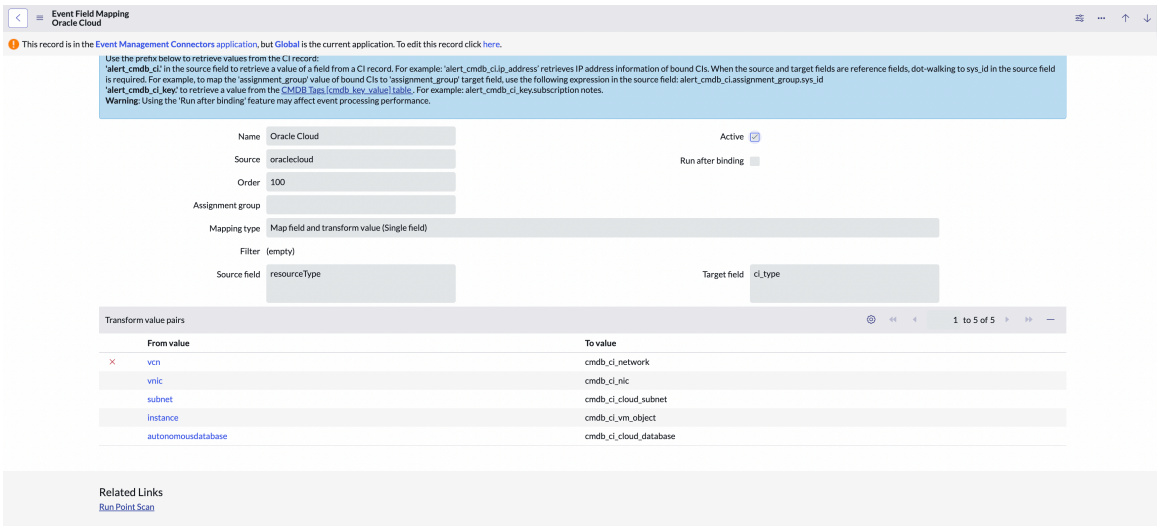
Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.



2. Select **Oracle Cloud**.

   This is an existing event field map used as an example. The event field map details page opens.



3. Review the event field mapping details page and understand the relevant fields and their corresponding values.

Event Field Mapping fields

Field	Description
Name	Event field map name.
Source	Event monitoring software that generated the event. In this case, oraclecloud.
Order	Number to define the order in which this action should be processed. Actions with lower numbers are processed first.
Mapping type	Select **Map field and transform value (Single field)**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Source field	**resourceType** is a field that is defined in the **Additional Information** field of the event defined by the Oracle Cloud system. The possible values of **resourceType** are listed in the **From value** column, while the corresponding CMDB tables for those values are specified in the **To value** column in the Transform value pairs section. If **resourceType** is **instance**, the system searches in the [cmdb_ci_vm_object] table for CI binding.
Target field	The **CI type** field (**ci_type**) in an event is a special field that provides the CI class name, indicating which CMDB table to search. The **CI type** field values are listed in the **To value** column in the Transform value pairs section.
Transform value pairs	
From value	Lists the possible values of the event field (e.g., `resourceType`) that are derived from the event data.
To value	Specifies the corresponding CMDB table associated with each value listed in the **From value** column. Indicates the CI type to bind the alert to.

View patterns for event group creation

Event groups are sets of events that do not have a matching event rule. You can view the patterns in a group of events to learn the impact of creating a rule based on the event source and description patterns.

Before you begin

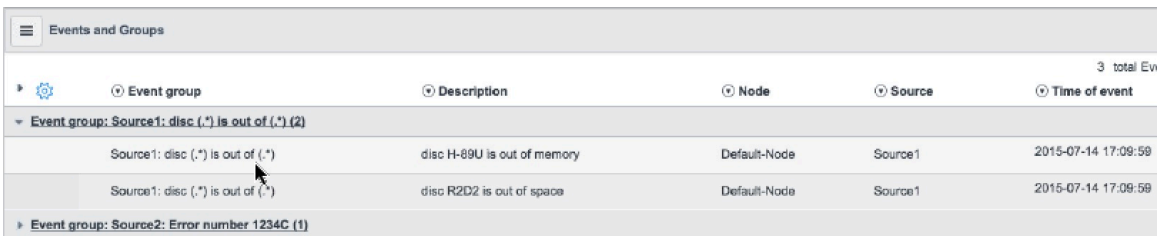
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Events are grouped according to their source and description.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Wait for the group calculation to complete and then click the created link.
   If there are not enough events, the calculation will not create groups.
3. In the list of events, select an event.
4. To change the pattern of an event, double-click the pattern, make your changes, and then click **Update**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Refresh event rules

Manually update event rules to reflect current event information because once an event rule is created, the **Event Additional info** and **Event Raw info** fields are not automatically updated.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Select the event.
3. Select **Refresh Event Rule**.
4. Select the event rules to refresh.
5. Select **Refresh Selected**.

   If you selected multiple event rules, then the last selected item in the list opens in the Event Rule Designer.

   Note: If the current event rule regex expressions do not match the selected event after the refresh, the update fails and an error message appears specifying the problematic fields. This safeguard ensures that your previously defined event rule regex expressions are not broken due to the refresh.

Find rules that will be applied to an event

View the rules that will be applied on an event to determine how this event will be processed.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Navigate to **Event Management** > **All Events**, and then click an event number.
2. Under **Related Links**, click **Find matching rules**.
3. Review the information that appears in the blue box at the top of the page, and review all **Processing Notes** to find rules that apply to an event.

Related topics

View events

Simulate event processing

You can simulate event processing logic on events and display the resulting alert to better understand which rules are executed on a given event and how the event fields change after the rule is executed.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Open the event you want to simulate.
3. In the **Related Links** section, select **Simulate event processing.**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the info message that appears at the top of the screen, select the link to the created simulated alert.
5. **Optional:** View which event rules and event field mapping rules were applied and the event field values by selecting the **Activities** tab.

Event field mapping configuration

Use Event field mappings rules to map values from specific fields to values in other fields.

Event Management stores event field mappings in the Event Field Mapping [em_mapping_rule] table. The mappings apply after event rule processing and prior to alert generation. The mapping values from the Event Mapping Pair [em_mapping_pair] table apply to the alert. The original event severity remains unchanged.

For example, if events come with the field "**org_severity**" with the values "*Low*, *Medium*, *High*" and you want the alert **Severity** to hold this value, create an event field mapping rule that maps the field **org_severity** to **Severity**, with these values:

Example showing org_severity mapped to Severity

Original org_severity value	Map to alert Severity value
Low	Warning
Medium	Major
High	Critical

Default event field mappings

Event Management provides default event field mappings for commonly used system monitoring tools. The Transform Value Pairs from event field mappings format the incoming event data for Event Management.

You can view the default event field mappings and mapping pairs by navigating to **Event Management** > **Rules** > **Event Field Mappings** and double-clicking **Name**.

Create event field mappings

Use event field mappings to map values from specific event fields to values in other fields to provide more comprehensive information in an alert. Use team-based integrations in event rules to make sure that connector ownership and execution of rules give precedence to global rules. Teams can maintain consistency and hierarchy while offering flexibility and customization options.

Before you begin

Role required: evt_mgmt_admin

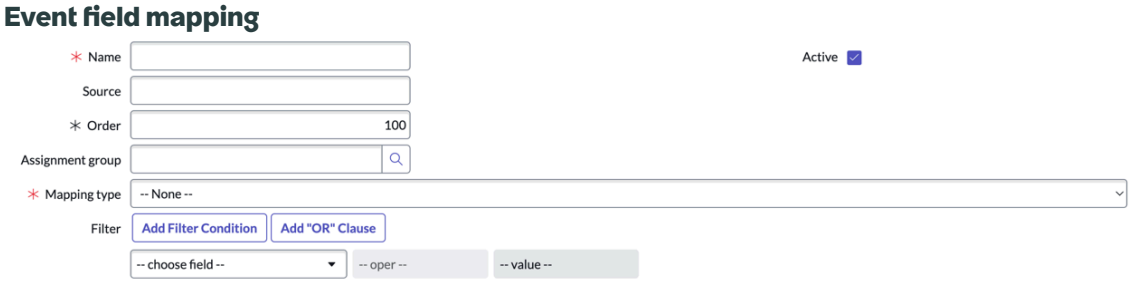
About this task

Create the rule to match the event by its class and original values. Also, specify the new values to replace the original values in the event.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
2. Select **New** or open an existing rule to edit and fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Event Field Mapping form

Field	Description
Name	Event field mapping name.
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Order	Number to define the order in which this action should be processed. Actions with lower numbers are processed first.
Assignment group	For Team-based integrations, select an assignment group. If no assignment group is defined in the event field-mapping rule, then this rule is considered global. When the rules are running – first the global rules run and then the rules that belong to the assignment group that the event's source instance belongs to.
Mapping type	Mapping mechanism that is used to change an event field value. ○ **Map field and transform value (Single field)**: Maps the **Source field** value to the matching value in the Transform value pairs [em_mapping_pair] table and populates the **Target field**. Source and Target fields may be event fields, additional info fields, or alert tags. ○ **Create or update field and set constant value (Constant)**: Sets a constant value to a **Target field**. The **Target field** may be an event field, additional info field, or alert tag. ○ **Map field (Copy field)**: Copies the exact value of a Source field to the specified Target field. The Source and Target fields may be Event field, Additional info field, or alert tags. ○ **Map field and transform value using regex**: Generically maps the value from the Source field to the matching value in the Transform value pairs table and populate the **Target field**. Source and Target fields may be event, additional info, or alert tags fields. ○ **Map field using regex**: Copies the value from a generically defined **Source field** to the **Target field**. The Source field must be a field from the event additional info field. The Target field may be the field of event, additional info, or alert tag. With this type, you can generically find the name of the Source field by using a regular expression (regex).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Map field and copy value from regex group**: Copies part of the Source field value to the Target field. Source and Target fields may be event fields, additional info fields, or alert tags. Define a regex to specify what part of the **Source field** should be copied. ○ **Advanced mapping using script**: Implements your own logic for event values transformation by using a script. When the 'Run after binding' check box is selected, the rule is executed after the CI binding phase and uses the dedicated script that also has the sys_id of the CI in the input parameters. **Warning:** Complex scripts may affect event processing performance. ○ **Map field from reference table** Use this rule type to extract a **Source field** value from the selected **Reference table** by matching the **Field to match**value to the **Matching alert field** value and then mapping the **Source field** value to the **Target field**. The **Matching alert field** and the **Target field** may be event fields, additional info fields, or alert tags.
Filter	A condition for event field mapping. Select **Add Filter Condition** or **Add "OR" Clause** to configure multiple conditions. **Note:** The filter is case-sensitive.
Active	Activates or deactivates the event field mapping. If possible, find and apply another event field mapping rule.
Run after binding	○ When selected, the rule is executed after the CI binding phase. ○ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example: Use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance. **Note:** This check box is displayed only for the following Mapping types: **Map field and transform value (Single field)**, **Map field (Copy field)**, **Map field and transform value using regex**, **Map field and copy value from regex group**, and **Map field from reference table**.

- If you selected **Map field and transform value (Single field)**, fill in the fields as appropriate.

Map field and transform value (Single field) fields

Field	Description
Source field	Event field to map - includes all event and additional info fields. Note: For Additional info fields use: "additional_info.<field name>". When the 'Run after binding' check box is selected, you can use the **alert_cmdb_ci** and the **alert_cmdb_ci_key** prefixes to receive CI related data.
Target field	Event field where the mapping rule inserts or updates the value. When this field is identical to the **Source field**, the mapping rule updates the value in memory of the event field. Alert tags can also be defined by using the *<t_>* prefix.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the following prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Key fields (Transform Value Pairs section)

Field	Description
Key	Value that the mapping rule searches for. Whenever the event field has this value, the mapping rule adds the value listed in the **Source field** field to the field listed in the **Target field**. This field is displayed when the **Mapping type** is **Map field and transform value (Single field)**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Select **+** to add more **Key** fields, as required.

Typical use case: To map the 'event_severity' field in the additional info field with possible values [such as WARNING, MINOR, CRITICAL, CLEAR, MAJOR] to the severity field, configure the following:

- Source field: 'event_severity'
- Target field: 'severity'
- Transform value pairs:
  - From value: 'WARNING', to value: '4'
  - From value: 'MINOR', to value: '3'
  - and so forth...

- If you selected **Create or update field and set constant value (Constant)**, fill in the fields as appropriate.

Create or update field and set constant value (Constant) fields

Field	Description
Target field	The **Target field** may be an an event field, additional info field, or alert tag. Typical use case: Set alert severity to 1 for all events that match the filter.
Value	Value you want to use for the **To field**. This field is displayed when the **Mapping type** is **Constant**.

Typical use case: Set alert severity to 1 for all events that match the filter.

- If you selected **Map field (Copy field)**, fill in the fields as appropriate.

Map field (Copy field) fields

Field	Description
Source field	**Source field** value to be copied to the **Target field** field. The **Source field** may be an event field, additional info field, or alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.

Field	Description
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: To copy the IP field from the event additional info field to the alert field node, use the following:

- 'Source field': ip
- 'Target field': node

○ If you selected **Map field and transform value using regex**, fill in the fields as appropriate.

Map field and transform value using regex

Field	Description
Source field	Source field value to be copied to the **Target field** field. The **Source field** may be an event field, additional info field, or alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record:

Field	Description
	▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: To map severity from the field color in the Additional info field to the Severity field, use:

- Source field: 'color'
- Target field: 'severity'
- Transform value pairs:
  - From value: !*red', To value: '1'. This covers both 'dark red', 'light red', and other values containing 'red' and maps them all to '1'.
  - and so forth...

Key fields (Transform Value Pairs section)

Field	Description
Key	Value that the mapping rule searches for. Whenever the event field has this value, the mapping rule adds the value listed in the **Source field** field to the field listed in the **Target field**. This field is displayed when the **Mapping type** is **Map field and transform value (Single field)**. Select **+** to add more **Key** fields, as required.

- If you selected **Map field using regex**, fill in the fields as appropriate.

Map field using regex fields

Field	Description
Source field	Generically defined Source field value to be copied to the **Target field** field. The **Source field** must be a field from the event additional info field. With this type, you can generically find the name of the

Field	Description
	is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.
Regex group expression	.*_.*_(.*)_.*

Typical use case: To extract the third octet from the IP and save it in the additional info *third_octet* field, use:

- 'Source field': ip
- 'Target field': third_octet
- 'Regex group expression': .*_.*_(.*)_.*

- If you selected **Advanced mapping using script**, fill in the fields as appropriate.

Advanced mapping using script fields

Field	Description
Script	The code editor gives text editor support for inline scripts. The code editor has these features for the supported language services and Inline scripts: Syntax coloring, indentation, line numbers, and automatic creation of closing braces and quotes, Auto-suggestions, and auto-completions. Editing tips: ▪ To insert a fixed space anywhere in your code, press the Tab key. ▪ To indent a single line of code, select in the leading white space of the line and then press Tab. ▪ To indent one or more lines of code, select the code and then press Tab. ▪ To decrease the indentation, press Shift +Tab. ▪ To remove one tab from the start of a line of code, select in the line and press Shift +Tab. ▪ To declare variables, use the var keyword so that they remain within the proper JavaScript scope.
Run after binding	When the 'Run after binding' check box is selected, the rule is executed after the CI binding phase and uses the dedicated

Field	Description
	script that also has the sys_id of the CI in the input parameters. **Warning:** Complex scripts may affect event processing performance.

- If you selected **Map field from reference table**, fill in the fields as appropriate.

Map field from reference table fields

Field	Description
Reference table	The reference table. Select the table from where the field is to be mapped to the Target field in the event.
Field to match	The field from the Reference table to be matched with the Matching alert field from the event. It's used to filter out the Reference table records.
Source field	**Source field** value to be copied to the **Target field** field. The **Source field** is the field of the table that was selected as the Reference table.
Matching alert field	Event field to find matching Reference table records. The **Matching alert field** is matched with the **Field to match** field. The Matching alert field may be the Event field, Additional info field, or the Alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** In the **Matching alert field**, to retrieve a value of a field from a CI record. For example: 'alert_cmdb_ci.ip_address' retrieves IP address information of bound CIs. When the **Matching alert field** and the **Field to match** fields are reference fields, dot-walking to sys_id in the **Matching alert field** is required. For example, to use the 'assignment_group'

© 2026 ServiceNow, Inc. All rights reserved.

Field	Description
	value of bound CIs to match with the **Field to match** field, use the following expression in the **Matching alert field**: alert_cmdb_ci.assignment_group.sys_id ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: Extract 'short_description' from the 'pc_vendor_cat_item' records matching its 'name' field with the 'cat_item_name' field in the Additional info field of the event and map it to the 'description' field on the event in the following fields:

- 'Reference table': pc_vendor_cat_item
- 'Field to match': name
- 'Source field': short_description
- 'Matching alert field': cat_item_name
- 'Target field': description

3. Right-click the form header and select **Save**.
4. Select **Submit**.

Example:
The following values comprise a predefined rule that is applied to events in the *`Trap From Enterprise 9`* class. If the events contain the `snmpTrapOID` element with a value of `iso.org.dod.internet.private.enterprises.cisco.0.0`, the mapping rule changes the value to `reload` in the alerts. If the events contain the `snmpTrapOID` element, a value of `iso.org.dod.internet.private.enterprises.cisco.0.1`, the mapping rule changes the value to `tcpConnectionClose` in the alerts.

Field	Values
Name	cisco.snmpTrapOID
Source	Trap From Enterprise 9
Mapping type	Map field and transform value (Single field).
Source field	snmpTrapOID
Target field	snmpTrapOID
Transform Value Pairs	• Pair 1 ○ **Key**: iso.org.dod.internet.private.enterprises.cisco.0 ○ **Value**: reload • Pair 2

Field	Values
	○ **Key**: iso.org.dod.internet.private.enterprises.cisco.0 ○ **Value**: tcpConnectionClose

What to do next
Test an event field mapping by sending an event that includes a field that is present in the event field mapping.

Create event field mappings with advanced mapping script

Create event field mappings with advanced mapping scripts to transform raw event data into structured, meaningful information. This method goes beyond basic configurations, aligns fields with business context, and improves event correlation. By reducing alert noise and enhancing visibility, it helps teams respond faster and manage incidents more effectively.

Before you begin
Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
2. Select New to fill in the form fields or open an existing one to edit the required fields.
3. In the **Mapping type** field, select **Advanced mapping using script**.
   If you selected **Advanced mapping using script**, fill in the fields as appropriate.

eventFieldMappingScript

Name	Type	Description
eventGr	glide record	GlideRecord representing the event.
origEventSysId	string	Id of the event. **Note:** The GlideRecord event parameter is a temporary object, and therefore does not contain the id of the original event.
fieldMappingRuleName	string	The name of this field mapping rule.

Returns

Type	Description
boolean	Value is `true` if the binding can proceed successfully, or `false` if the binding operation is aborted.

4. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example:
The use case for this script is to automatically enrich incoming events with classification details before they are processed further. For example, by adding u_alert_classification = "Network" into the event's metadata, the system can tag and group network-related alerts more effectively. This helps streamline event correlation, reduce noise, and improve routing so incidents are categorized and resolved faster.

This script checks the event's additional_info field, ensures it contains valid JSON, and then updates it by adding a new property called u_alert_classification with the value "Network." If the JSON is invalid, it logs an error and stops the binding. Otherwise, it saves the updated data back to the event record and allows the binding to proceed.

```
try {
        var addInfo = eventGr.getValue('additional_info');
        if (!addInfo) {
            addInfo = "{}";
        }
        var addInfoJson = {};
        // Parse JSON
        try {
            addInfoJson = JSON.parse(addInfo);
        } catch (parseError) {
            gs.error("Error parsing additional_info: " +
 parseError);
            return false;
        }
        addInfoJson.u_alert_classification = "Network";
        var updatedAddInfo = JSON.stringify(addInfoJson);
        eventGr.setValue('additional_info', updatedAddInfo);
        return true;
    } catch (e) {
        gs.error("The script type mapping rule '" +
 fieldMappingRuleName + "' ran with the error: \n" + e);
    }
```

Event identifiers

Event identifiers uniquely distinguish one event from another. Event Management uses these identifiers to determine whether to create a new alert or update an existing one.

By default, an event is uniquely identified by the following fields:

- **Message Key**
- **Domain**
- **Category**

Changing the **Category** field (for example, through a Background Script or Business Rule) may lead to unexpected system behavior.

If the **Message Key** is not provided, the system automatically generates one by concatenating the following fields:

- **Source**
- **Type**
- **Node**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Resource**
- **Metric Name**

If the above fields are not defined in the incoming event, you can define them using event rules.

Alert tags

Alert tags allow consolidation for all normalized fields and improve the admin experience to transform and normalize alert fields (key/value) enabling reuse of normalized fields across different sources. This improves alert quality for correlation and provides more out-of-the-box TBAC (Tag Based Automatic Correlation) definitions.

Example: Field normalization in alert management

In some cases, the same information may exist under different field names across data sources. For instance, an incoming event from one source has the location stored under the field **region**, but in other source, the same information is captured under **impacted_region**. To avoid confusion and enable consistent grouping, filtering, or automation, we normalize these fields by creating a unified field — for example,**t_region**. This field pulls the value from **region** or from **impacted_region** depending what field is present in the event. This way, the normalized field **t_region** always holds the location value in a consistent manner, regardless of the original source field.

Alert tags field appears in the Alerts form. These tags are created by Event Rules and in Event mapping and are saved in the alert tags' table [em_alert_tags]. The naming convention used to create key/value pairs is t_<tag name>. This enables reusing tags in the event rules by allowing users to select tags that were previously defined. When new alert tags are defined, TBAC (Tag Based Alert Clustering) tags are automatically created. Using these TBAC tags, you can create new TBAC alert clustering definitions from the new source of tags.

Event field format for event collection

Event Management requires all events to use a standard form, regardless of how they arrive at the instance.

In the application navigation filter, enter `em_event.list`.

Event form

Name	Description
em_event.source [Source]	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
em_event.node [Node]	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
em_event.type [Type]	Optional. The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
em_event.resource [Resource]	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event form (continued)

Name	Description
metric_name [Metric Name]	The name of the metric that has been measured, such as `DB Disk Free Space (MB)`, `Disk Writes/sec`, or `Disk Write Bytes/sec`.
em_event.event_class [Source instance]	If the em_event.node field is not specified, it is mandatory for alerts to be created automatically. Values for the em_event.event_class field originate from either the source generating the events or by event rule. Name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44. Corresponding field display name is **Source Instance**.
em_event.message_key [Message key]	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
em_event.ci_type [CI type]	String containing information about CI type. Maximum length: 100 characters.
em_event.severity [Severity]	Event severity options are: • **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. • **Major**: Major functionality is severely impaired or performance has degraded. • **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. • **Warning**: Attention is required, even though the resource is still functional. • **OK**: An alert is created. The resource is still functional. • **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.
em_event.resolution_state [Resolution state]	Optional. If the field is empty, the resolution on corresponding alerts is still pending. Event state from the event source is either **New** or **Closing**. • **New**, the resolution on corresponding alerts is open. • **Closing** event state closes corresponding alerts.
em_event.time_of_event [Time of event]	Time that the event occurred in the source system. This field is a GlideDateTime field in UTC or GMT format. Maximum length: 40 characters.
em_event.state [State]	Current processing state of the event: • **Ready**: Event has been received and is waiting to be processed. • **Processed**: Event was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event form (continued)

Name	Description
	• **Ignored**: Value is not in use. • **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank.
em_event.alert [Alert]	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.
em_event.description [Description]	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.
em_event.additional_info [Additional information]	Optional. A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field "Connection instance is successful". When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {"additional_content": "Connection instance is successful"}.
processing_notes [Processing Notes]	Display of the events processing log.

Custom alert fields

You can populate custom alert fields with data contained in **Additional information** field of the event.

Valuable data contained in **Additional information** fields of events can be useful, for example, for reporting. Alert fields are automatically populated from fields that have the same name in the event. This behavior holds true for **Additional information** event fields and for **Additional information** fields that Event Rule adds. Therefore, to populate a custom alert field with the value in **Additional information** fields, use the custom field name in the **Additional information** field. You can also use Event Rules for this purpose. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON format when the event is processed. For more information, see Configure an event rule to customize alert content.

The short description field of an alert is automatically written using the type, node, and description of the alert. To prevent the short description field from being over-written, open the *sys_properties* table, locate the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

evt_mgmt.override_alert_short_description property, change the value to `false`, and then click **Update**.

Depending on permissions, you may only be able to create fields with the **user_** prefix. If so, use Event Rules to create an **Additional information** field with the same name. To prevent some fields to be copied to the alert field, use the *evt_mgmt.alert_black_list_fields* property and add the field names that must be excluded. By default, the fields that are not copied are:

- message_key
- category
- additional_info
- sys_updated_on
- sys_updated_by
- sys_created_by
- sys_created_on
- sys_mod_count
- sys_id

Testing and sending events

You can manually test and send events to confirm that Event Management properly manages events and generates alerts.

Before you begin

Role required: evt_mgmt_admin

About this task

For example, you can manually send events to:

- Confirm that the MID Server is using an event connector definition and instance to send events.
- Confirm that event rules, event field mapping, and other configurations do generate alerts.
- Track an operation or action that did not generate an event.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Click **New** and then fill in the fields.

Event form

Name	Description
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.

Name	Description
Resource	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Metric Name	The name of the metric that has been measured, such as `DB Disk Free Space (MB)`, `Disk Writes/sec`, or `Disk Write Bytes/sec`.
Source instance	Name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44. Corresponding field display name is **Source Instance**.
Message key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Severity	The severity of the event. The options are typically interpreted as follows: ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed. ○ **OK**: An alert is created. The resource is still functional.
Resolution state	Optional. If the field is empty, the resolution on corresponding alerts is still pending. Event state from the event source is either **New** or **Closing**. ○ **New**, the resolution on corresponding alerts is open. ○ **Closing** event state closes corresponding alerts.
Time of event	Time that the event occurred in the source system. This field is a GlideDateTime field in UTC or GMT format. Maximum length: 40 characters.
State	The current processing state of the event: ○ **Ready**: Event has been received and is waiting to be processed. ○ **Processed**: Event was successfully processed. ○ **Ignored**: Value is not in use. ○ **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank.
Alert	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.
Description	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.
Additional information	A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field "Connection instance is successful". When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {"additional_content": "Connection instance is successful"}.

3. Click **Submit**.

View event processing statistics

Extract statistics from your instance to ensure that performance is not affected and extract metrics related to event processes to monitor event processing status.

Before you begin

Ensure that the *Event Management - Collect xmlstats* job is active. Configure this scheduled job by navigating to **System Definition** > **Scheduled Jobs**.

You can control the processing of event statistics using the *evt_mgmt.event_processing_stats_period* property. For information about configuring this property, see Configure statistics processing period.

Role required: evt_mgmt_operator

About this task

You can view key metrics from the instance to ensure that performance is not affected and monitor the status of the processing of events. For more information about viewing self-health monitoring statistics, see View self-health monitoring statistics for Metric Intelligence.

Procedure

1. In a browser where the instance is running, run the XML Stats script by appending the following text to the instance URL: `xmlstats.do?include=XMLStatsEm`
2. Press **Enter**.
3. Monitor the event processing metrics that are reported to ensure that events are processed according to accepted benchmark values.

Result

Example: Sample output after running the XML Stats script

```
<xmlstats created="Tue Oct 23 04:01:25 PDT 2018"
 includes="XMLStatsEm" version="2">
<itom_event_management>
<event_processing>
<processed count="47" max_process_time="10"
 mean_process_time="5" record_time="2018-10-23 11:00:41"/>
<ready count="7" oldest_ready_event="37" record_time="2018-10-23
 11:00:41"/>
<error count="5" record_time="2018-10-23 11:00:41"/>
<total_created count="5" record_time="2018-10-23 11:00:41"/>
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
</event_processing>
</itom_event_management>
</xmlstats>
```

The event processing metrics in the report are described in the following table.

Note: The default processing cycle is events created in the last hour and updated in the last minute.

Event processing statistics

Metric	Description
Event processing statistics	
processed count=n	Number of events processed by the instance.
max_process_time=n	Longest time taken by the instance to process an event.
mean_process_time=n	Average time taken by the instance to process the events in this cycle.
Event ready statistics	
ready count=n	Number of events that are in Ready state and are available to be processed. Default processing cycle: events created in the last hour and updated in the last minute.
oldest_ready_event=n	Longest time taken by an event to remain in Ready state. If this metric has a value that is bigger than your benchmark figure, investigate the event further to determine what is impeding the processing. Default processing cycle: events created in the last hour.
Other processing statistics	
error count=n	Number of events for which errors were reported. Default processing cycle: events created in the last hour and updated in the last minute.
total_created count=n	Overall number of events that were processed during this event processing cycle. Default processing cycle: events created in the last hour.

Enable processing of event process statistics

Enable the system property that switches on statistics processing for events to let the platform collect and analyze metrics such as event volume, processing flow, and handling time. This helps you monitor system performance, identify bottlenecks, and optimize event handling for faster and more efficient operations.

Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New** and fill in the form.

System property fields

Field	Description
Name	Name of the property you are creating.
Description	Narrative that describes the property and its function.
Choices	Comma-separated values for a choice list. If you need a different choice list label and value, use an equal sign (=) to separate the label from the value. For example, Blue=0000FF, Red=FF0000,Green=00FF00 displays Blue, Red, and Green in the list, and saves the corresponding hex value in the property value field.
Type	Data type, that is selected from a list (for example, integer, string, or true|false).
Value	Desired value for the property. When retrieving properties using the *gs.getProperty()* method, treat the results as strings. For example, a true|false property returns 'true' or 'false' (strings), not the Boolean equivalent.
Read roles	Roles that have read access to this property.
Write roles	Roles that have write access to this property.

3. Select **Submit**.

Add a system property

Configure statistics processing period

Set the time period, in seconds, for collecting event processing statistics. For example, you can set a time period twice as long as the default 60 seconds to collect more statistics.

Before you begin

Role required: evt_mgmt_admin

About this task

Use the *evt_mgmt.event_processing_stats_period* property to configure the XMLStatsEm script time to collect event processing statistics. The default value of this property is 60 and the unit is second. Set the property values to run the script over a longer or shorter period. For example, set a shorter period of statistics collection so fewer CPU resources are used.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the *evt_mgmt.event_processing_stats_period* property.
   Either configure the value of an existing *evt_mgmt.event_processing_stats_period* property to run the XMLStatsEm script over a shorter or longer time period or create a new property if it does not exist already.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the property exists, set the property to the required time period to enable the XMLStatsEm script time to collect event processing statistics and click **Update**.
- If the property does not exist, click **New**, fill in the form, and click **Submit**.

Add a system property

Manage and monitor alerts

An alert is a notification for selected events that are considered to be important and require attention. Event Management generates alerts based on event rules.

You can monitor and resolve alerts in ways that are based on alert impact calculations and alert configuration and property settings.

Alert management rules for resolving alerts

You can configure Event Management to respond to alerts automatically. An alert management rule determines the required alert response, such as to open an incident, knowledge base article, open a task, launch remediation action.

Alert management rules provided with the base system as a store application (Alert Rules Management [sn_em_arm]) to help you respond to alerts. You can create filters to specify conditions for the rule so that the remedial action specified in the rule takes effect only when the conditions are met. For example, launch the required subflow or open an incident based on an alert. The alert's execution history is automatically updated to indicate the actions that were invoked.

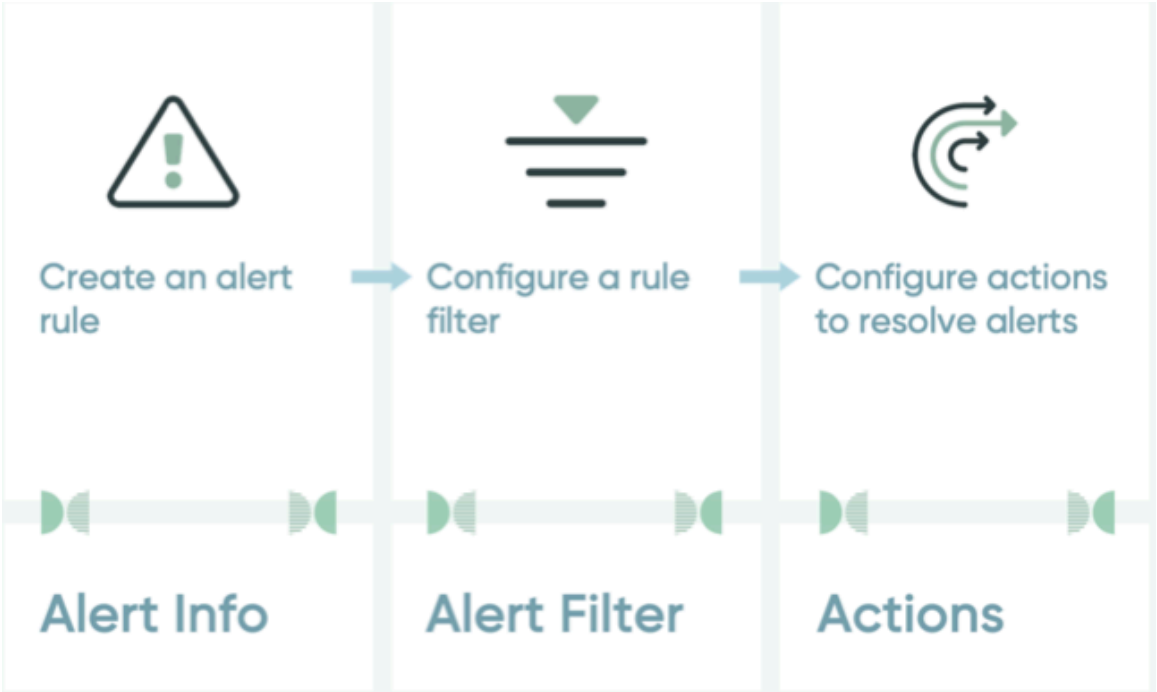
Users with the evt_mgmt_admin role can use the alert management rule designer to create and customize alert management rules to act on specified alerts. Define rules with filters to determine which alerts the rule applies to. You can create rules to launch applications, URLs, subflows, remediation actions, or take other actions, such as to open an incident. For more information, see Create an alert management rule.

Users with the evt_mgmt_operator role can manually run alert management rules.

Alert management rule flow

The flow to create and run an alert management rule is:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Alert management rule components

Component	Description
Alert Info	Configure a name and general information for the rule.
Alert Filter	Specify a filter to determine to which alerts the rule applies. You can specify the related list conditions. **Note:** The fields that are not supported for alert filtering are: Overall Event Count, Priority, Priority Group, Priority Breakdown, Tags, and Impacted Services.
Actions	Specify the response to the alert, such as to run a subflow, perform remediation action, launch an application, or launch a URL in a browser.

How rules are applied to updated alerts

Alert management rules run on all updated open alerts. Rules don't run on closed alerts, even if they've been updated. The filters determine whether the rule's actions apply to the alert. For example, if a rule's condition indicates that an email message is sent when the alert severity changes to Major, the rule applies to an alert updated by a severity change from Warning to Major.

Use of filters and other actions

Filters ensure that the rule is invoked only when the configured condition occurs, and not for every update of the alert. For example, you can configure a rule so that updates that aren't relevant (such as a **Work notes** field update) don't cause the rule to run. As another example, a filter condition can specify that the alert management rule runs only when the alert severity is critical.

You can perform the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Specify a filter that determines which alerts the rule applies to.
- In the Related List Conditions section of the form, configure additional conditions, for example, with an *Alert > Parent* relationship, to filter for any alerts that were received today.
- Respond to alerts. For example, by using subflows and workflows, create incidents for primary alerts with critical severity, or open a search engine in a browser to search for data according to the description field of the alert.
- Apply remediation. Remediation is based on Orchestration workflows that can be scripted to perform remediation tasks such as gathering system information or rebooting a server.

Note: For enhanced performance of *Event Management - Evaluate Scoped Alert Rules Management* scheduled jobs, use subflows instead of workflows.

Scheduled jobs that check alert management rules

Alert management rules are checked every 11 seconds by the default *Event Management - Evaluate Scoped Alert Rules Management0* scheduled job. The job then executes the required actions. For large-scale environments, you can add more than one job. Please contact Customer Service and Support.

Note: Only new users from Vancouver and up get two scheduled jobs: *Event Management - Evaluate Scoped Alert Rules Management0* and *Event Management - Evaluate Scoped Alert Rules Management1*. Users upgrading from previous family releases remain with a single scheduled job *Event Management - Evaluate Scoped Alert Rules Management0*.

Don't modify the *sn_em_arm.alert_management.num_of_jobs* property.

By default, the alert grouping job (**Service Analytics group alerts using RCA/Alert Aggregation**) and the alert management (**Event Management - Evaluate Scoped Alert Rules Management0**) jobs run independently of each other. For more information about coordinating the alert response and the automated alert grouping, see Synchronizing alert response with automated alert grouping.

Migrate existing alert action rules

Existing alert action rules from an earlier release can be migrated to become alert management rules. You can modify an alert action rule only after migrating it to an alert management rule. For more information, see Migrate an alert action rule to an alert management rule.

Create an alert management rule

Create an alert management rule to track alerts and resolve them by determining the required response, for example, to open an incident or launch remediation action.

Before you begin

To enable remediation with a subflow, you can use a subflow that is available with the base system, or you can create your own subflow. For details, see Create a custom subflow for alerts.

Role required: evt_mgmt_admin, flow_designer

About this task

Use alert management rules to track and resolve alerts.
While working in the alert management rule designer, you can work in multiple sections without losing information in any section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Alert management rules that are not configured to perform any action are skipped and the rule is automatically set to inactive.
- If an alert is bound to a CI by a user action (such as an alert management rule) and the CI is in the Maintenance state, you must manually bind the CI to the alert and mark it with the **In Maintenance** status.

Create alert management rules that:

- Locate other alert management rules that have relevance to the selected alert.
- Determine when the execution of the rule takes place.

Alert management rules do not necessarily complete in the order in which they are invoked.

You can configure alert management rules to:

- Automatically generate and link incidents, tasks, or knowledge articles to alerts.
- Automatically apply a remediation workflow or enable users to manually run remediation.
- Automatically construct a URL according to the value of specified fields in the alert.

To assist you, several alert management rules are provided with the base system. You can use them as presented or you can use them as examples to build custom alert management rules.

Alert management rules provided with the base system

Rule	Description	Active
Open sensor dashboard in PRTG	The sensor dashboard in the Paessler PRTG Network Monitor (PRTG) application opens.	Yes
Oracle EM Launch Target Status and View Events	Launch Oracle Enterprise Manager to view: • Target Status • Event for alerts from source Oracle EM	Yes
Drilldown to OMI	Drill down to the HP Operations Manager i (OMi) application.	Yes
Create Incident on Primary Critical Alert	Create an incident for primary critical alerts. The incident can be created automatically or manually.	No
Search Google for "description"	Open Google Search in a browser to search for data according to the description that appears in the alert.	Yes
Create Incident	Create an incident for all alerts that are not in maintenance state. The rule runs automatically on selective update.	No
Create Incident Manually	Manually create an incident for alerts that are not in maintenance state.	Yes
Create Major Incident Candidate	Create a major incident candidate for all alerts that are not in maintenance state and are not secondary alerts.	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert management rules provided with the base system (continued)

Rule	Description	Active
	A major incident candidate can be promoted to become a major incident.	
Create Major Incident	Create a major incident for all alerts that are not in maintenance state and are not secondary alerts.	No

If your instance was upgraded from Kingston, the alert action rules that were provided with the Kingston base system are available to you. However, if you modified any of the rules, the changes made are not carried over.

Alert management rules run 5 seconds after an alert is updated, resetting the timer if updates occur within that window. This delay ensures remediation actions, such as incident creation, are triggered only when the issue is clear and stable, reducing duplicates and unnecessary noise. To change the default 5-second delay, create the *evt_mgmt.alert_rule_delay* property on the **All** > **System Properties** > **All Properties** and change the value. To know how to create a property, see Add a system property.

Procedure

1. Navigate to **Event Management** > **Rules** > **Alert Management Rules**.
2. Click **New** and then fill in the fields.

Alert Management Rule form

Field	Description
Name	Unique name for the rule.
Active	Check box for enabling the rule. If this check box is selected, you must specify: ○ in the **Alert Filter** section, an alert filter ○ in the **Actions** section, at least one of any of these actions: ▪ active subflow ▪ workflow ▪ quick response
Order	Order in which rules are evaluated when multiple rules are defined for the same alert. Alert management rules are evaluated in ascending order. The default value is 100.
Multiple alert rules	Instruction about whether to search for additional rules: ○ **Search for additional rules**: Execute the current rule then continue and execute other matching rules in the order of rule priority, where the lower number has the higher priority. ○ **Stop search for additional rules**: Execute only the current rule for the alert that matches the filter. When selecting this option, a rule configured second in a rule hierarchy may run before the results of the first rule take effect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Descriptive text for the rule.
Assignment group	Assignment group that works on the alert. If no assignment group is defined in the alert rule, then this alert rule is considered as a global rule. When the rules are running – first the global rules run and then the rules that belong to the assignment group of the alert.

3. Click **Alert Filter** and specify conditions for alerts that this rule is applied to.

Alert Filter stage

Field	Description
Rule is activated when	Rule execution takes place when: ○ **Alert changes to filter**–content changes to the alert cause the alert to match the filter. If the filter is matched on following update of the alert, the rule is not applied. If the alert was closed and then reopens, at the next update of the alert and the filter is matched, the rule is applied. Thereafter, when there is an update of the alert, the rule is no longer applied. ○ **Alert matches filter**–the content of the alert matches the filter. On following update of the alert and if the filter is matched, the rule runs and is applied to the alert. The rule remains applied for every matching update.
Alert filter	
Preview	Function to preview alerts that match the specified condition. A hyperlink shows how many alerts match the filter.  If you click the hyperlink, the browser opens another tab that lists alerts in the Alerts [em_alert_list] table. The list shows which alerts match the rule, including closed alerts. Alerts that have already been run by the rule are not marked in any way. You can click any alert to view further details.
Conditions	Conditions that, if fulfilled, cause the filter to be applied. For more information about building conditions, see Using the condition builder. To add another condition, click **New Criteria**. **Note:** The **Created on** condition is not invoked when running the **Event Management - Evaluate Alert Management Rules** job. Instead, use the **Updated on** condition, as the job detects alerts based on the time they were updated and not on the time they were created.
Related List Conditions	Conditions to include a relationship with another table in the filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	a. Click **Table** and select the required table. **b.** Specify the conditions for this filter. For more information about creating related lists, see Add related list conditions.

4. Click **Actions**.
   In this section, you can configure the following action types as a response to alerts or to remediate alerts:
   - Remediation Subflows: Execute a subflow provided with the base system.
   - Launch Applications: Open applications and browsers that you configure.

   Note: The Remediation Workflows option is deprecated. To enable flows to be triggered by alerts, use the Flow Designer.

5. **Optional:** In the Remediation Subflows section, follow these instructions to add subflows:

   a. Under **Subflow**, double-click the cell.

   b. Click the search icon.
   The list of subflows provided with the base system appears. For more information, see Event Management subflows in the base system.

   c. From the subflow list, select a subflow.

   d. Repeat, adding as many subflows as required.

   (Optional)

   e. To specify when the subflow must be executed, double-click the cell under **Execution**.

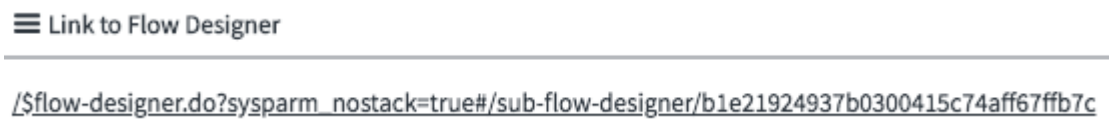
Subflow execution options

Name	Description
Automatic	The subflow is executed automatically when the rule is matched.
Manual	Execute the subflow if required when the rule is matched.
Both	When the rule is matched, the subflow is executed automatically and you can optionally execute the subflow again manually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Under **Automatic executions limit**, double-click the cell and enter the integer number of times to execute the subflow.
After the subflow has been executed the indicated number of times, it does not run anymore.

g. To enable the subflow to be executed, double-click the cell under **Active** and select `true`.
A link in the cell under **Link to Flow Designer** appears only after a subflow has been selected and the rule has been saved.



6. To add instructions to launch applications or to open browser windows, in the Launch Applications area:

a. Under **Display Name**, double-click the cell.
Specify a name for the link.

b. In the **URL** field, compose the URL using data from the alert in the format:`http://${source}.com:${port}/${cmdb_ci.name}`
The **Active** field is automatically updated.

Any URL-based action can utilize the alert parameters and the URLs can refer to wikis, messaging services, REST APIs, and so on.

7. Click **Submit**.

Result
The alert management rule is added to the list of available rules that can be used to resolve alerts.

Subflows in the base system

Name	Description
Acknowledge Alert	Subflow to mark the alert as being Acknowledged. Acknowledge an alert to show that further attention is required.
Attach Knowledge Article (legacy)	Subflow to attach a knowledge article to the alert. This subflow is provided for instances that are migrated from legacy releases (prior to the London release). **Note:** Add the **Knowledge article** column to the Alert Management Rules [em_alert_management_rule] table, and select an article to attach to an alert when the rule executes.
Change Alert to Maintenance Mode	Subflow to mark the alert as being in Maintenance.
Close Alert	Subflow to mark the alert as being Closed.
Create Incident	Subflow to create an incident. Fields from the alert are used to populate the matching fields in the incident that is created. **Note:** • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, an incident is not created. • The alert management job runs even if the alert grouping job is not complete, if a specified time frame has passed. When this occurs, you can enable the *Avoid INTs on secondary alerts* rule to prevent incidents from being created for secondary alerts (when the *evt_mgmt.avoid_int_enabled* property is enabled), since an incident already exists for the primary alert.
Create Major Incident Candidate	Subflow to create a major incident candidate. Fields from the alert populate the matching fields in the major incident candidate that is created. A major incident candidate can be upgraded to become a major incident.

© 2026 ServiceNow, Inc. All rights reserved.

.

Create a custom subflow for alerts

You can create a subflow according to your requirements. For example, you can resolve alerts, notify teams, or run remediation actions.

Before you begin

Role required: evt_mgmt_admin, flow_designer

About this task

Copy an existing subflow, and then customize it. Publish the custom subflow so that it is available to be used to resolve any alert. For more information, see Create a subflow.

Note: If your ServiceNow instance uses domain separation, you must ensure that the new custom subflow that you created operates only on the data of the designated domain.

Procedure

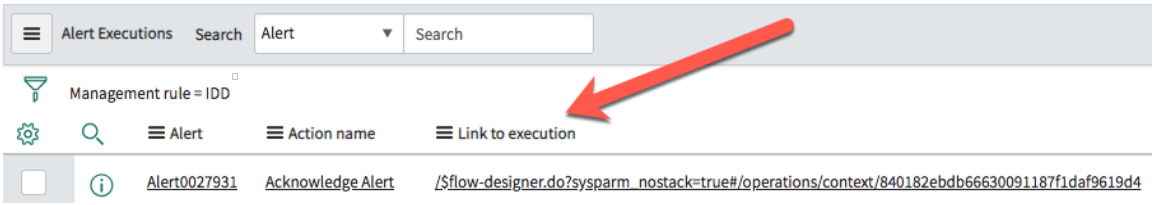
1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. In the Flow Designer window, click **Subflows**.
3. Click **Create Incident**.
   The Create Incident subflow opens in Flow Designer in read-only format. The inputs in the Create Incident subflow are described in the following table.

Create Incident input parameters

Value	Description
alertRuleName	The name of the alert management rule that specifies this subflow, for example `IDD`.
alertRuleId	The sys_id of the alert management rule, for example, `1ae122e84f5f1300b28392918110c71e`.
alertGR	The alert record that matches the filter that is defined in the alert management rule, for example, `Alert0027931`
executionId	The ID of the execution to be retrieved, for example, `000182ebdb66630091187f1daf9619d4`
userName	The current user's name, for example, `admin`.
userDisplayName	The name that the current user specified to be displayed, for example, `System Administrator`.

For example, in an alert management rule that has processed alerts, in the Alert Executions area, click the **Link to execution** of the required alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The Flow Designer opens. Click **Subflow Inputs and Outputs**. The input variable names of the subflow are displayed with their respective values.

Subflow Input

VARIABLE NAME	TYPE	RUNTIME VALUE
alertGR	Reference	Alert0027931
alertRuleId	String	1ae122e84f5f1300b28392918110c71e
alertRuleName	String	IDD
executionId	String	000182ebdb66630091187f1daf9619d4
userDisplayName	String	System Administrator
userName	String	admin

4. In the subflow header, click more actions and select **Copy subflow**.
5. In the **New Subflow Name** field, enter the name of the new subflow.
6. To limit the application scope of the subflow, in the **Application** field, select the required application, otherwise select `Global`.
7. Click **Copy**.
   The new subflow is created and is opened as a tab in the subflow designer editor. The inputs provided by the template appear.

   Inputs are fixed and cannot be added to.

   In the editor, you can delete subflow inputs or outputs, as required.
8. To delete an input, click .
   Inputs are fixed and cannot be added to.
9. Create subflow outputs by defining the names and data types.
   a. Click to add output.
   b. Define the name and the data type.
10. To save the subflow in draft status, click **Save**.
11. To save and publish the subflow so that it can be used in the alert management rule designer, click **Publish**.

Result

Include the modified subflow in an alert management rule to resolve alerts according to your customized requirements.

Alert executions information

Alert executions information provides a reference to the alert management rule actions that are performed. This information appears in the Alert Management Rule record only if an alert matches the filter in the rule and an action was performed. You can click any link in the Alert Executions list to open the referenced item.

Alert Executions

In the Alert Management Rule record, the Alert Executions list shows key related records for the rule.

Note: The Alert Executions list in the Alert Management Rules record shows alert execution information and lists the alert management rules that the selected alert matched.

Alert Executions list

Information in the Alert Executions list

The columns in the Alert Executions list are populated with details of the alerts that matched the alert management rule and the actions that ran. The listed alerts match the filter in the rule.

View alert execution information

You can click any link in the Alert Executions list to view the alert execution information of the referenced item. This information appears in the Alert Management Rule record only after an alert matched the filter in the rule and an action was performed.

Before you begin

Role required: evt_mgmt_admin

About this task

Among the information shown in the Alert Executions list is:

- The list of alerts that matched the filter of the rule.
- The tasks, including incidents, that were opened.
- Which remediation workflows ran and which subflows ran.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Management Rules**.
2. In the Alert Management Rules list, click the rule.
   If an alert matched the filter in the rule and an action was performed, the Alert Executions list appears in the Alert Management Rules record. The list appears irrespective of the stage of the selected alert management rule.

Alert Executions list

Column	Description
Alert	Alert number of the alerts that matched the alert management rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Action name	Name of the action that was taken to resolve the alert (subflow or workflow).
Link to execution	Link to the action execution log that was created when the action was performed.
Related task	Link to the task that was created when the alert was resolved. For example, if the action for a rule is to create an incident, this field provides the incident number with a link to open the incident. A link is provided to the workflow remediation task that is created to monitor the remediation.
Log	Notice or information showing the result of the execution action, for example, how executions took place, "`1 out of 2 executions`". When the alert closes, the execution count number (the first number) resets to 0. This information does not indicate that the subflow was executed successfully, rather that the call to that subflow was successful and that the subflow is correctly configured.
Automatic run	Indication of how the action ran: automatically (true) or manually (false).
Created	Date and time that the entry was created.

Migrate an alert action rule to an alert management rule

Existing alert action rules from an earlier release can be executed, but cannot be modified. Alert action rules that have been migrated become alert management rules and all the definitions of the alert action rules are migrated to the alert management rule format. Migrated rules can be modified.

Before you begin

Role required: evt_mgmt_admin

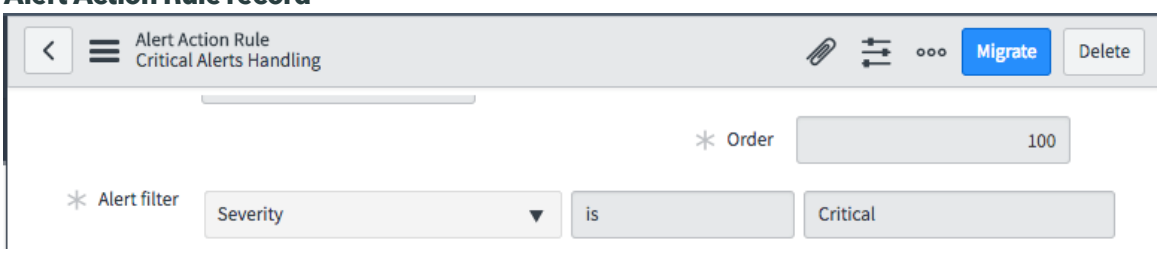
About this task

Existing alert action rules are active, read-only rules. An alert action rule can be modified only after it is migrated to an alert management rule.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Action Rules**.
2. Select an alert action rule to migrate or delete.

Alert Action Rule record



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Migrate**.
   If you clicked **Migrate**, the list of migrated rules can be found, together with new alert management rules, by navigating to **Event Management** > **Rules** > **Alert Management**.

   After a successful migration, all the definitions of the alert action rules are migrated to the alert management rule format.

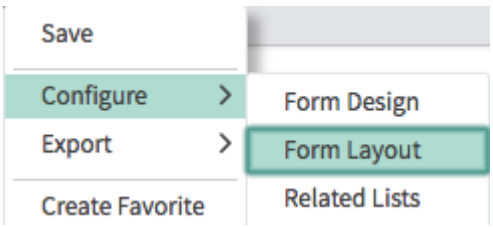
Result

When an alert action rule has been migrated successfully, the alert action rule can no longer be modified. However, the new alert management rule can be modified.

What to do next

If the alert action rule that was migrated had a task template, you can customize the alert management rule designer to display the task template name.

1. In the header of the alert management rule, click **Additional actions** .
2. Select **Configure** > **Form Layout**.



3. In the **Available** pane, select **Task template** and move it to the **Selected** pane. Position it as required.

4. In the **Task template** field, select the required template.
5. In the Actions tab, in the Remediation Subflows area, select the Create Task (legacy) subflow to run the task template.

Apply a quick response in an alert

Synchronizing alert response with automated alert grouping

Synchronize alert response with grouping by ensuring alert management jobs runs after alert grouping jobs—this prevents duplicate actions like incident creation on secondary alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
By default, the alert grouping job (**Service Analytics group alerts using RCA/Alert Aggregation**) and the alert management job (**Event Management - Evaluate Scoped Alert Rules Management0**) run independently of each other. To synchronize the alert response with automated alert grouping (for example, to avoid creating an incident on a secondary alert), you must enable the property *evt_mgmt.avoid_int_enabled* to ensure that the Alert Management job is executed after the Alert Grouping job is completed. This property is accessible from the Event Management Properties page (**All** > **Event Management** > **Administration** > **Event Management Properties**). In addition, you must configure the relevant alert management rule (for example, for incident creation), to filter out all secondary alerts.

Note: If only one alert exists when the Alert Management job runs, an incident is created. When a second alert arrives later, the next Alert Grouping job forms a group, makes the new alert as secondary, and creates a new incident.

Procedure
1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. If you want to avoid incidents on secondary alerts, select the **Enable Avoid Incidents on Secondary alerts and wait for Grouping job to be executed** check box.
3. Select **Save**.
4. To filter out secondary alerts, navigate to **All** > **Event Management** > **Rules** > **Alert Management Rules**.
5. Select the relevant rule.
6. In the Alert Management Rule form, select the **Alert Filter** tab.
7. In the Condition area, select **And**.
8. Add a condition:
   - **Role in Group**
   - **is not**
   - **Secondary**
9. Select **Update**.

Configure alert remediation actions

Run commands to perform alert remediation on remote Linux and Windows CIs.

Before you begin
Install the following plugins:

- IntegrationHub Enterprise spokes plugin
- ServiceNow IntegrationHub Action Step - PowerShell
- ServiceNow IntegrationHub Action Step - SSH

For Linux: Ensure that the remote Linux host is reachable using the MID Server IP address that runs action scripts.

For Windows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Ensure that Powershell v3.0 - 5.0 are supported and installed on the Windows target server.
- Enable Powershell remoting on the remote Windows target server.
- Ensure that the remote Windows target server is reachable using the FQDN from the MID Server that runs action scripts.

Add credentials to the credential aliases that come with the base system:

- linuxAdmin
- windowsAdmin

Role required: evt_mgmt_admin or flow_designer

Procedure

1. Access remediation actions in one of the following ways:
   - Quick actions in an alert, as described in Apply a quick response in an alert.
   - The Playbook tab in Service Operations Workspace, as described in Run actions to resolve alert issues .
2. Configure additional input in the alert's **Additional Information** field, using this format:

   ```
   {"remediation_action_resource":"<mandatory input>"}
   ```

   The mandatory input per action is described in the following table.

Action name	Mandatory input in Additional information field
Stop Windows Process	Process ID
Restart Linux Service	Service Name
Kill Linux Process	Process ID
Get Windows Processes	N/A
Stop Windows Service	Service Display Name
Restart Windows Service	Service Display Name
Get Windows Services	N/A
Stop Linux Service	Service Name
Start Windows Service	Service Display Name
Suspend Windows Service	Service Display Name
Get Linux Services	N/A
Run Linux Top for Memory	N/A
Show Disk Space Used	N/A
Run Linux Top	N/A
Start Linux Service	Service Name
Show Disk Space Used	N/A

Result

After executing an alert action, the results are noted in the *Work Notes* field of the alert.

CI Remediation

Alert and configuration item (CI) remediations help troubleshoot and resolve underlying problems that generate alerts. Remediation is based on Orchestration workflows that can be scripted to perform remediation tasks such as gathering system information or rebooting a server.

Event Management provides a framework for configuring and implementing a system-wide remediation plan to resolve, minimize, or prevent problems that generate events and alerts. Configure alert management rules to remediate alerts and CI remediation rules to remediate a set of CIs.

Alert remediation

Use alert management rules to associate specific alerts with a remediation workflow. You can apply a workflow to alerts manually. Alternatively, you can configure the alert management rule that executes a workflow automatically for alerts that match the rule criteria. The workflow can also be scripted to request user approval before executing subsequent workflow tasks. The workflow is paused for user approval, even if it was automatically triggered.

CI remediation

Configure remediation more comprehensively by creating CI remediation rules to manually apply remediation to specific CIs.

Remediation tasks

When a remediation workflow is executed, a remediation task is created to capture details such as the time that the workflow started to run, the alert that triggered the remediation workflow (if relevant), and the CI that was remediated. View these tasks to track remediation activities in the organization.

Related topics

- Migrate an alert action rule to an alert management rule

Create or edit CI remediation

Create a CI remediation rule that lets users manually apply an Orchestration workflow for resolving issues with specific CIs associated with alerts. Define these CIs in the CI filter conditions of the rule.

Before you begin

Create the workflow to remediate CIs. In the workflow settings, select **Remediation Task [em_remediation_task]** in the **Table** field.

Then submit the workflow definition, and add the following conditions to the workflow properties:

- **[Run Remediation][is][true]**
- **[Workflow][is][<name of the new workflow that you just created>]**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, if the name of the workflow is `CI remediation`, add this condition:

[Workflow][is][CI remediation]

After you finish configuring the workflow, make sure that you publish it. For more details, see Create a workflow.

Role required: evt_mgmt_admin

About this task

A CI remediation rule associates a set of CIs that might experience problems with a remediation workflow. The remediation workflow can either resolve the underlying problem or help troubleshoot the problem that generated the alert. For example, you can proactively configure a workflow with the appropriate response actions for predictable alerts. For more details, see the Event Management Remediation short video.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **CI Remediations**.
2. Click **New**, or select a CI remediation to edit.
3. Fill in the fields, and click **Submit** or **Update**.

CI remediation form

Control	Description
CI filter	Conditions to match the CIs that you want to apply this remediation to.
Orchestration workflow	The remediation workflow to apply to CIs that match the filter conditions.

Result

In service maps that are opened from the Event Management dashboard, this remediation can be applied to any CIs that match the filter conditions.

View remediation tasks

Event Management automatically creates a remediation task to capture every remediation that was applied to a CI or to an alert. It gives you an overall view of remediation activities in the organization.

Before you begin

Role required: evt_mgmt_user

Procedure

Navigate to **All** > **Event Management** > **Remediation Tasks**.

Column	Description
Number	Number assigned to this task.
Configuration item	Item or service affected by this task.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Priority	Priority that was assigned to this task, based on impact and urgency.
State	State of the task, which can be open or closed.
Assigned to	Person that this task was assigned to.
Short description	Description for the task.
Task type	This task type is a remediation task.

How alerts work with CIs in maintenance

When a CI is in maintenance, the impact tree, the service map, and Alerts tab are updated based on various factors.

Watch this brief video to learn about how alerts work with CIs.

A CI is in maintenance when:

- A change request is scheduled for the CI.
- The **Install Status** field on the CI record is set to **In Maintenance**.

Note: To customize how alerts work with CIs in maintenance, see Create maintenance rules.

How CIs in Maintenance appear in Event Management	Description and the optimal time to resolve the alert
CI with an active change request  If an active change request is scheduled for the CI or if the **Install Status** of the CI is **In Maintenance**, all alerts on the affected CI are excluded from impact calculation. The Alerts tab also temporarily hides all corresponding alerts. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green. For a service, all alerts on CIs in the service are also hidden from the Alerts tab. The entire service is shown in green on the impact tree. For a host with an active change request, the	An active change request has the following values: • The **State** is **Scheduled** or **Implement**. • The current time is between the Planned start date and Planned end date on the change request. OR • The current time is between the Actual start date and Actual end date on the change request. You can monitor the progress of the change request. Wait until the change request moves to the **Review** or **Closed** state. Then you can address all alerts for the affected CI and any alerts that generated between start and end dates. Use the impact tree, topology, and Alerts tab to show the calculated impact severity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How CIs in Maintenance appear in Event Management	Description and the optimal time to resolve the alert
host applications are considered as one unit. All child applications are treated in the same manner as the host until the change request is no longer active.	**Note:** The **Maintenance** check box for an alert is selected when the **Install Status** field on the CI record is **In Maintenance**. This **Maintenance** check box indicates that the alert must be hidden from the **Alerts** tab. When the maintenance job updates this field, the **Updated** field (sys_updated_on) changes for open alerts, but not for closed alerts.
CI with no active change request and not in maintenance  When there is no active change request for a CI and when the CI is not in maintenance, impact calculation resumes. The impact tree, the service map, and Alerts tab show the calculated impact severity for alerts.	An inactive change request has the following values: • The **State** is **New**, **Assess**, **Authorize**, **Review**, **Close**, or has no changes at all. • The **State** is **Scheduled** or **Implement**. However, the current time is before or after the planned or actual date ranges on the change request. You can monitor the progress of the change request. When a CI has an inactive change request, you can address the corresponding alerts as appropriate.
CI with no active change request and in maintenance If no active change request is scheduled for the CI and if the **Install Status** of the CI is **In Maintenance**, all alerts on this CI are excluded from impact calculation. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green.	All alerts on a CI with an inactive change request and **In Maintenance** has no impact calculation.

SLAs for application services and CIs

Event Management supports the creation of SLAs for application services and for CIs.

You can monitor and manage the quality of the application services offered by your organization. For example, you might want to set up an SLA that is triggered when the max alert severity of an application service or CI is **Critical**, and measure the time it takes to bring the application service or CI back to the **OK** state, when the conditions that caused the alert have been resolved.

SLAs and the Task table

You can create SLA definitions only for tables that extend the Task table. The Event Management application provides a table named Event Management SLA [em_ci_severity_task], which extends the Task table. Use this table in your SLA definitions to specify the severity level that should trigger and stop the SLA. During alert impact calculation, changes in the severity level of application services and CIs are automatically updated in the Event Management SLA table. Scheduled jobs keep the information in this table up to date.

How the Event Management SLA table is populated

The Event Management SLA table is populated differently for application services and CIs:

- For application services, the system automatically populates the Event Management SLA table when an application service is created or when its max severity is changed.
- For CIs, you must first identify which CIs can be made available for SLAs by creating an SLA configuration record. The system then automatically populates the Event Management SLA table with the CI max severity is changed.

Note: Duplicate CIs are not added to the Event Management SLA table even if the same CI matches more than one SLA configuration filter.

Create an SLA configuration for CIs

Create an SLA configuration from the Event Management application to determine which CIs are available for SLAs.

Before you begin

Role required: evt_mgmt_admin

About this task

The SLA configuration record is a filter on a table in the system. Select a table that has the CIs for which you want to create an SLA.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **SLA Configuration**.
2. Click **New**.
3. Fill in the form fields (see table).

SLA Configuration form fields

Field	Description
Name	Provide a descriptive name.
Table	Select a table with the CIs for which you want to create the SLA. You can also use the Configuration Item to Host View [query_based_service_basic_view] table, which is used by Dynamic CI Groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Filter	Configure the filter for the records.

4. Right-click the header and select **Save**.

Example:
The following is an example.

If you want to run an SLA on all Linux servers for major and critical alerts, first create an SLA configuration on the Linux Server [cmdb_ci_linux_server] table. Then create the SLA definition with this filter:

- `CI.class` is `Linux Server`
- `Severity` is `Major` or `Critical`

What to do next
Create an SLA definition on the CIs that match this SLA configuration.

Limit the records for the SLA configuration filter

If too many records are returned by the SLA configuration filter, you can add a property to set the maximum number of records.

Before you begin
Role required: evt_mgmt_admin

About this task
By default, the size of dynamic CI group records is limited to 10,000 elements. Exceeding this limit can affect system stability. If the filter configuration for a specified dynamic CI group returns too many records, you can limit the number of records that are returned by setting the value of the sa.qbs.max_num_of_cis property. For more information, see Create a Dynamic CI Group.

Procedure
1. Enter `sys_properties.list` in the application navigator.
2. Add the following property:
   `sa.qbs.max_num_of_cis`
3. Set the value to an integer that represents the maximum number of records to return.

Create an SLA definition for a CI or application service

You can create SLA definitions for CIs and application services just as you can for other task records in the instance.

Before you begin
Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Service Level Management** > **SLA** > **SLA Definitions**.
2. Click **New**.
3. Fill out the fields on the SLA Definition form.
   For a description of each field, see Create an SLA definition for a CI or application service.
4. For the **Table** field, select **Event Management SLA [em_ci_severity_task]**.
5. Configure the **Start condition** filter by adding conditions, such as:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA filter conditions

For all CIs where the **Severity** is **Critical**		
Type	**is**	**CI** **Note:** Event Management SLAs work only on CI classes from Service Instance [cmdb_ci_service_auto].
Severity	**is**	**Critical**
For a specific service, such as Email, when the **Severity** is **Critical**		
Application Service	**is**	**Email**
Severity	**is**	**Critical**

6. Configure pause, stop and reset conditions.
7. Click **Submit**.

Alert lifecycle configuration

Event Management provides various modules, templates, and properties for configuring alerts and the actions that execute for these alerts.

Configure the alert active interval

The active interval property (**evt_mgmt.active_interval**) determines how Event Management handles a new event that is similar to events that appear on an existing closed alert. Based on the active interval, event, and existing closed alert information, the alert is reopened and the event information is added to the existing alert or a new alert is created.

Before you begin

Role required: evt_mgmt_admin

About this task

When the new event is received and the alert is already closed, Event Management compares the time since the last alert update (**sys_updated_on**) and the active interval property value. Then, the system either updates the existing alert or creates a new alert (if the original alert is closed), as explained in the following table. If the alert is open, Event Management automatically updates it without checking the active interval property value.

Scenario	Result
The new event occurs before the active interval elapses for the existing closed alert.	The event is identified as a recurrence of an existing issue. The alert is updated with the event information and the alert is reopened.
The new event occurs after the active interval elapses for the existing closed alert.	A new alert is created because the event is identified as a new issue. The event information is added to the new alert.

Change the active interval by editing the **Active interval (in seconds), within which a new event reopens a closed alert** property value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. Change the number of seconds for the **Active interval (in seconds), within which a new event reopens a closed alert** property.
3. Click **Save**.

Configure alert flapping

Set flapping properties to determine when an alert enters and exits the flapping state. Flapping can indicate configuration problems (that is, thresholds set too low), troublesome services, or real network problems.

Before you begin

Role required: evt_mgmt_admin

About this task

Flapping occurs when the event source continues to generate events even after its associated alert has been closed. Flapping causes the resource's status to repeatedly fluctuate between the *OK* severity and a severity requiring attention, for example, *Critical*.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. Edit the following properties, as appropriate.

Property	Description
evt_mgmt.update_alert_restricted_fields_elapsed_time	When the system receives events that do not update alerts—because the event data is not new and is identical to the existing alert—system fields are not updated by default. This helps reduce noise. For example, a "keep alive" event might be sent every few minutes from a server to confirm that a device is still connected, even if no new data is being ex changed. This property defines the minimum time inter val (in seconds) that must pass before an alert can be updated based on identical events. If an identical event is received within this in terval, the update is suppressed to avoid gen erating frequent, redundant notifications. By default, the interval is set to 86,400 seconds (24 hours).
evt_mgmt.flap_interval	Flap interval, in seconds, which is the time pe riod within which an alert enters the flapping state. An alert enters the flapping state when its cur rent **Flap Count** value reaches or exceeds the given *evt_mgmt.flap_frequency* prop

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	erty value within the time period specified by the *evt_mgmt.flap_interval* property.
evt_mgmt.flap_frequency	Flap frequency, frequency an alert must reoc cur to enter the flapping state.
evt_mgmt.flap_quiet_interval	Flap quiet interval (in seconds), quiet time that must pass for an alert to exit the flapping state. An alert exits the flapping state when the time interval between the latest occur rence of the event and the **Flap last update time** of the alert reaches or exceeds the *evt_mgmt.flap_quiet_interval* prop erty value. An alert can also exit flapping in these conditions: ○ When an incoming event arrives after the *flap_quiet_interval* time has elapsed. The new alert generates and its state value depends on the incoming event severity. ○ After a background job, which runs every five minutes, verifies that no alert updates occurred and the *flap_quiet_interval* time has elapsed. If there are no updates, the alert shows the previous state value that it had before the background job ran.

3. Click **Save**.

What to do next

You can monitor the **Event Management** > **All Alerts** list for alerts that are in the flapping state. For details, see View alerts in the flapping state.

Related topics

Work with flapping alerts

View alerts in the flapping state

Alert priority

Determine the order in which to handle alerts according to the alert priority score. Multiple factors determine the alert priority score and this value changes with changes to the underlying factors.

Multi-factor decisions

The value of the alert priority score is a composite of the value of the category and its relative weight. You can configure the factors that make up the score, as described in the following sections, according to *Category order*, *Category value mapping*, and *CI type weight factor mapping*. The categories are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *Accumulated categories* - These categories accumulate items with different sub-types that may have a different status or weighing factor. For example, services that are factored according to different criticality or services that are factored according to cost.
- *Choice-list categories* - A list of items. You can map any of the items to a different value, thereby changing the priority for that item. For example, critical severity, which has the value of 1 by default, can be mapped to 4 to give it a higher weight in the calculated alert priority score.

List of categories

Category	Description
Accumulated categories	
Number of impacted business-services	This category is factored by the business-criticality of the service. An alert that has an impact on one service has a lower priority score than an alert that has an impact on many services. For example, if a router is down, then it might affect many services and a higher priority ensures that this alert is handled before handling another alert that has an impact on fewer services. An alert that has an impact on many non-critical services must be handled with priority. However, if an alert has an impact on only a few services, but they are critical services, then this alert has a higher priority.
CI type	This category distinguishes between various CI types. For example, an alert on a CI type that is a router or switch may have a higher priority than an alert on another CI type, like a server or application.
Number of Secondary alerts	Alerts that have characteristics similar to other alerts are usually grouped together, such as alerts with the same message key. A parent alert which has many secondary alerts has a higher priority than a parent alert that has only a few secondary alerts. All secondary alerts of a parent alert are counted. If a secondary alert is closed, it is no longer correlated to the parent alert. If a parent alert is closed, all secondary alerts are no longer correlated and their priority value is calculated accordingly.
Choice-list categories	
Alert state	Priority score is not calculated for an alert that is in *Closed* state. The available states with their default values are: • Open = mapping value 1 • Reopen = mapping value 2 • Flapping = mapping value 3
Alert severity	The priority score reflects the level of seriousness of the underlying alert, for example, an alert that has severity of *Critical* has a higher weighted value than an alert with a severity of *Minor*. Priority is not calculated for an alert that has a severity of *OK*. The available levels are: • Critical • Major

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of categories (continued)

Category	Description
	• Minor • Warning
Role	The priority score reflects the role of the alert. The priority score is higher for an alert that has a role of *Parent*, next is the role of *None*, and the least weight is given to an alert with a role of *Secondary*. A parent alert that has many secondary alerts has a higher value than a parent alert that has less secondary alerts. The available roles are: • Parent • None • Secondary

Structure of the alert priority score

Weighted value for each category

Each category has its own placement in the alert priority score, according to its order and limit. You can configure the order and limit, as described in Modify the alert priority score, below. There are only positive numbers.

All category values are mapped from the *em_alert_priority_category_mapping* table, except for the following:

- CI Type: Mapped from the *em_alert_priority_ci_type* table.
- Secondary: Value is the number of secondary alerts and is not mapped from any table.

Note: To ensure optimal memory protection, alert groups with more than 1000 alerts may not have an accurate priority score.

Example constituents of alert priority score of 7302020.003

Category	Score
Services	(7.0, 1000000.0) For example, if there are 2 impacted services whose business criticality priority score is as follows: • Service1: Business criticality priority score = **3** • Service2: Business criticality priority score = **4** The sum of the business criticality priority scores is **7**, so the computed priority value is 7,000,000 (7 * 1,000,000)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example constituents of alert priority score of 7302020.003 (continued)

Category	Score
	Note: The business criticality priority score is the mapped value (**Value after mapping**) in the application services entries of the Alert Priority Category Mappings table (em_alert_priority_category_mapping).
Severity	(3.0, 100000.0)
CI type	(20.0, 100.0)
Role	(2.0, 10.0)
Secondary	(0, 0.01)
State	(3.0, 0.001)

Using the scores from the preceding table, the alert priority score is computed as follows:

```
(Services value * 1,000,000) + (Severity value * 100,000) +
(CI type value * 100) + (Role value * 10) + (Secondary value) +
(State value * 0.001)
```

Replacing the values of the categories from the preceding table into the formula:

```
(7 * 1,000,000) + (3 * 100,000) + (20 * 100) + (2 * 10) + (0 *
0.001) + (3 * 0.001) = 7,302,020.003
```

In the **Priority Breakdown** area of the **More Information** tab, the alert priority value is displayed as 7302020.003. In the Alerts list, this value is displayed as 7302 (number of thousands).

Note: If you have customized business criticality values that differ from the out-of-box values, add an entry to the Alert Priority Category Mappings table [em_alert_priority_category_mapping].

Effect of category limits

Limits placed on categories enable overflow values to affect the next category that is ranked higher in priority order. Each accumulated category has a predefined limit. If the count goes above that limit, 1 is added to the next higher-order category. For example, if the number of CI types goes over the limit, then 1 is added to the next category (Severity) which is higher in priority: `yyy-zzz becomes yy(y+1) -` 000

Display in All Alerts list

In the **All Alerts** list, the alert priority score value is displayed in the **Priority** column. For display purposes only, the actual calculated alert priority score is divided by 1000, while in the database, for calculation and sorting purposes, the full computed value is used.

The detailed computation of the alert priority of the selected alert is displayed in the **Priority Breakdown** area **More Information** tab.

Calculating the alert priority score

Calculating alert priority is based on all of a group's alerts, and not only the group's primary alert. Priority is calculated for alerts that match these conditions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- State not-equal to **Closed**
- Severity not-equal to **OK**

Alerts that are queued for priority calculation are listed in the `em_alert_trigger_queue` table. In the Scheduled Jobs table, there are two `Event Management - Alert Priority Queue` jobs. These two jobs can run in parallel. You can use *`Insert and Stay`* to create another job. The `Event Management - Alert Priority Queue` job runs once every minute and calculates priorities in batches of 1000 open alerts. There are multiple factors that determine the value of the priority of an alert. A change in severity triggers an immediate update of the alert priority score. In this case, only the severity-part of the priority is changed, together with severity information in the **Priority Breakdown** area of the **More Information** tab.

Triggers that cause recalculation

Triggers that can cause the alert priority score to be recalculated are:

List of recalculation triggers

Trigger	Effect on the alert priority score
New alert	The generation of a new alert is a trigger to calculate the alert priority score.
Existing alert that changes from closed to any other state	Priority is not calculated for a closed alert, so if the alert state is changed from its current state of closed to open, reopen, or flapping, that change is a trigger to recalculate the alert priority score.
Role change, between primary, secondary, or none	Changes in role are a trigger for the alert priority score to be recalculated. For example: • An alert whose type has changed to `Primary`, triggers the alert priority score to be recalculated. • An alert whose type has changed to `None`, triggers the alert priority score to be recalculated. • An alert whose type has changed to `Secondary`, triggers the alert priority score to be recalculated.
CI type	When a CI becomes bound to alert, that change is a trigger to recalculate the alert priority score. This trigger to recalculate the priority occurs once only, when the CI is bound to the alert.
Change of number of secondary alerts	A change in the number of secondary alerts triggers the alert priority score to be recalculated.
Severity	A change in severity is a trigger to recalculate the alert priority score. For example, changing from OK to `Major` triggers the score to be recalculated. Unlike the other triggers listed above, a change in severity triggers an immediate update of the severity part of the alert priority score calculation.

Modify the alert priority score

You can change the importance of some categories of the alert priority, by modifying their order and/or their weight, as described below. For example, if the CI type is higher in importance than

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the number of impacted services, you can change their respective order. As a result, the number of services is now multiplied by 100, while CI type is now multiplied by 1000000.

Note: The changes that you make, using this advanced procedure, change the default method of calculating the alert priority score. Alerts that might otherwise not have a high score, by changing these configurable values, change the way you determine the order in which to handle alerts.

Changing category order

Navigate to the *em_alert_priority_category_order* table. In the **Order** column, you can change the order of the required category.

Category value mapping

The *em_alert_priority_category_mapping* table shows the configuration value for each category choice. Each value in a drop-down list of categories can be remapped to a different value by configuring this table.

CI type weight factor mapping

Navigate to the *em_alert_priority_ci_type* table. You can add a new CI, for example, `DualCoreCPU` and in the **Priority** column, you can change the priority of the required category. In addition, you can edit existing Type and also change its priority value. This table is used to map the value of each CI type, for example, a mainframe that is CI_type: cmdb_ci_mainframe might have a priority of 80, while a server with CI type: cmdb_ci_server might have a priority of 60. The mapping enables you to customize the priority of the various Ci types.

Alert assignment groups for teams

Alert assignment groups assign alerts to the right teams promptly and automatically, improving overall incident management capabilities.

Admins determine the alert assignment group priority, making sure that alerts are routed to the appropriate team members.

The Alert assignment group is determined by the *evt_mgmt.alert_auto_assignment_field* property value. As an admin, you can choose to set the assignment group based on the alert fields using the property value and the order of the comma-separated fields by editing the property value.

Assigning alert assignment group precedence

Assign alert assignment group precedence to make sure that alerts are routed to the appropriate team members.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** and search for `sys_properties.list`.
2. In the **Search** field, enter `evt_mgmt.alert_auto_assignment_field` and select the property record.
   For more information on the property, see Team-based integration properties.
3. In the **Value** field, enter the assignment group precedence.
   Set the assignment group precedence according to the order of the comma-separated fields such as cmdb_ci.support_group, IntegrationGroup.
4. Select **Update**.

Configuring Express List views for users and user groups

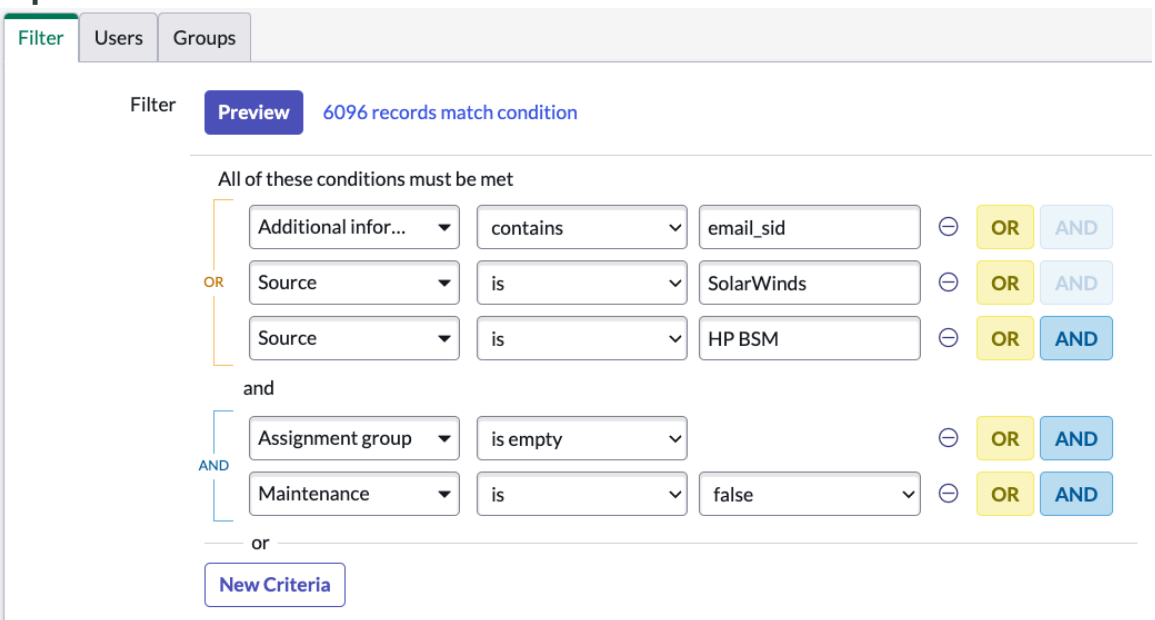
Centrally control what users monitor by predefining views in Express List and assigning them to users and user groups.

As an Event Management admin, you can create Express List views to ensure that users focus on specific services, priorities, or alerts. Event Management enables you to define the filters, column order, and filter attributes for an Express List view and then assign the view to individual users and user groups.

Users belonging to a group can only see the predefined views you assigned to that group and their own saved views. If a user belongs to multiple groups, they can see the views you assigned to all of these groups. Users can switch between views and modify and save all views except their assigned default view. However, they can't override settings in any of their assigned views and modify or share their default view.

The filter conditions builder enables you to configure AND and OR conditions between attributes.

Express List view filter conditions



For example, the admin can configure conditions that allow the user to see only alerts that are not assigned to an assignment group or in maintenance. In the example, the alerts must also contain a value of email_sid and must be from one of the specified sources.

Create a predefined Express List view for users

Identify an assigned Express List view

Create a predefined Express List view for users

Configure an Express List view for users to make sure that they focus on specific services, priorities, or alerts. You can set the filters, column order, and filter attributes for this view and assign it to individual users or user groups.

Before you begin

For more information about predefined Express List views, see Configuring Express List views for users and user groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Express List Views**.
2. Select **New**.
3. On the **Express List View** form, fill in the fields.

Express List View table

Field	Description
Name	Unique name of the Express List view.
Primary Sort By Field	The field by which to sort the Express List. Default: Initial event generation time.
Secondary Sort By Field	Optional field by which to sort the results of the primary sort-by field.
Order	The order of this Express List view, if multiple views exist.
Order of Primary Sort By Field	The sorting order of the Primary Sort By Field: Ascending or Descending.
Order of Secondary Sort By Field	The sorting order of the Secondary Sort By Field, if set: Ascending or Descending.
Default	Option to set this Express List view as the default view for the assigned user or group. If multiple default views exist, the value set in the Order field determines their order.

4. Set filter conditions for the Express List view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Filter** tab, select a field, an operator, and one or more values for a condition.

> **Note:** The default field is State. When selecting fields for filter conditions, use only direct reference fields or single-level references and not nested references. Nested references in filter conditions aren't supported. For example, **Configuration#item.Class** #uses a reference field, **Configuration item**, that#contains #another reference field, **Class**.

b. Optional: Add a filter condition or alert tag filter condition.

Task	Actions
Add a filter condition	**i.** Select either the AND or the OR operator. **ii.** Select a field, an operator, and one or more values for the condition.
Add an alert tag filter condition	**i.** In the Alert Tags Filter section, select **Insert a new row**. **ii.** Select the required tag, operator, and value for each tag filter. **iii.** Optionally add additional filter conditions by selecting **New criteria** and adding the tag filter condition.

c. View the number of results a query with the configured conditions would return by selecting **Preview**.

5. Assign users and groups to the Express List view.

Task	Procedure
Assign a user to the selected Express List view	**a.** In the **Users** tab, select **Insert a new row**. **b.** Select the search icon and search for the relevant user in the **Users** table. **c.** Select the user. **d.** Select the save icon.
Assign a user group to the selected Express List view	**a.** In the **Groups** tab, select **Insert a new row**. **b.** Select the search icon and search for the relevant group in the **Groups** table. **c.** Select the group. **d.** Select the save icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Procedure
	Note: Users who belong to a group can only see the views that you assigned to that group. If a user belongs to multiple groups, they can see the views you con figured for all of these groups.

6. From the form menu, select **Save**.
   The following tabs display:
   - The **Express List Table Fields** tab shows the fields to be displayed as table columns in Express List.
   - The **Express List View Field Attributes** tab shows the filter attributes for the open alerts in Express List.
7. **Optional:** Add columns to the Express List.
   a. In the **Express List Table Fields** tab, select **New**.
   b. On the form, fill in the fields.

Field	Description
Field	The column to add.
Express List View	Name of the view to which to add the column.
Minimum width	Minimum width of the column in pixels.
Order	Position of the column in the table.
Active	Option to display the column.

   c. Select **Submit**.
8. **Optional:** Add filter attributes to customize this view for assigned users.
   These filters are automatically applied to the Filters pane in Express List when users select this view.
   a. In the **Express List View Field Attributes** tab, select **New**.
   b. On the form, fill in the fields.

Field	Description
Field	Attribute to add to the Filter pane.
Express List View	Name of the view to which to add the attribute.
Order	Position of the attribute in the pane.
Active	Option to activate the attribute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. **Optional:** Exclude fields from the Express List view by deactivating them.
   a. In the **Express List Table Fields** tab, select the information icon for the relevant field record.
   b. Select **Open Record**.
   c. On the field form, clear the **Active** check box.
   d. Select **Update**
10. **Optional:** Exclude field attributes from the Express List view by deactivating them.
   a. In the **Express List View Field Attributes** tab, select the information icon for the relevant field attribute record.
   b. Select **Open Record**.
   c. On the field form, clear the **Active** check box.
   d. Select **Update**.

   Note: You can view the updated state of a field or a field attribute in the table by selecting the list controls icon and then selecting **Refresh List**.

11. When you're satisfied with the Express List view, select **Update**.

Assign users and groups to predefined Express List views

Assign individual users and user groups to preconfigured Express List views to make sure that they focus on specific services, priorities, or alerts.

Before you begin

For more information about predefined Express List views, see Configuring Express List views for users and user groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Express List Views**.
2. Select the predefined Express List view that you want to assign to a user or group.
3. Assign users or groups to the selected Express List view.

Task	Procedure
Assign a user to the selected Express List view	**a.** In the **Users** tab, select **Insert a new row...**. **b.** Select the search icon ( ) and search for the relevant user in the **Users** table. **c.** Select the user and then select the save icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Procedure
Assign a user group to the selected Express List view	**a.** In the **Groups** tab, select **Insert a new row...**. **b.** Select the search icon ( ) and search for the relevant group in the **Groups** table. **c.** Select the group and then select the save icon ( ). **Note:** Users belonging to a group can only see the predefined views you assigned to that group and their own saved views. If users belong to multiple groups, they can see the views you assigned to all of these groups.

4. Select **Update**.

Alert impact calculation

Impact calculation shows the magnitude of an outage on CIs, services, alerts, and alert groups. The system uses factors such as impact rules and CI relationships to calculate the severity of a generated alert. The severity appears on the impact tree, application services maps, and dashboards.

Impact calculations are available for application services alert groups. The following factors are used to calculate the overall impact of an outage.

- Impact rules.
- Number of related active alerts.
- Past history of the affected CI.
- Relationships between CIs for a particular application service or application services.
- If the CI element includes a network or storage devices.
- Alerts on CIs in the maintenance state are excluded from impact calculation.

Note:

  - CIs are considered to be in maintenance not only when an active change request is scheduled, but also when the **Status** field of the CI is set to **In Maintenance**.
  - When a child CI is put in maintenance, it also places the parent CI in maintenance.

- By default, impact is calculated for all operational application services. However, the system allows you to filter impact calculation by service class or by individual application service. For more information, see Add CMDB tables or classes for impact calculation and Add application services for impact calculation.

If there is a connection between services, the impact of one service on the other is also calculated.

© 2026 ServiceNow, Inc. All rights reserved.

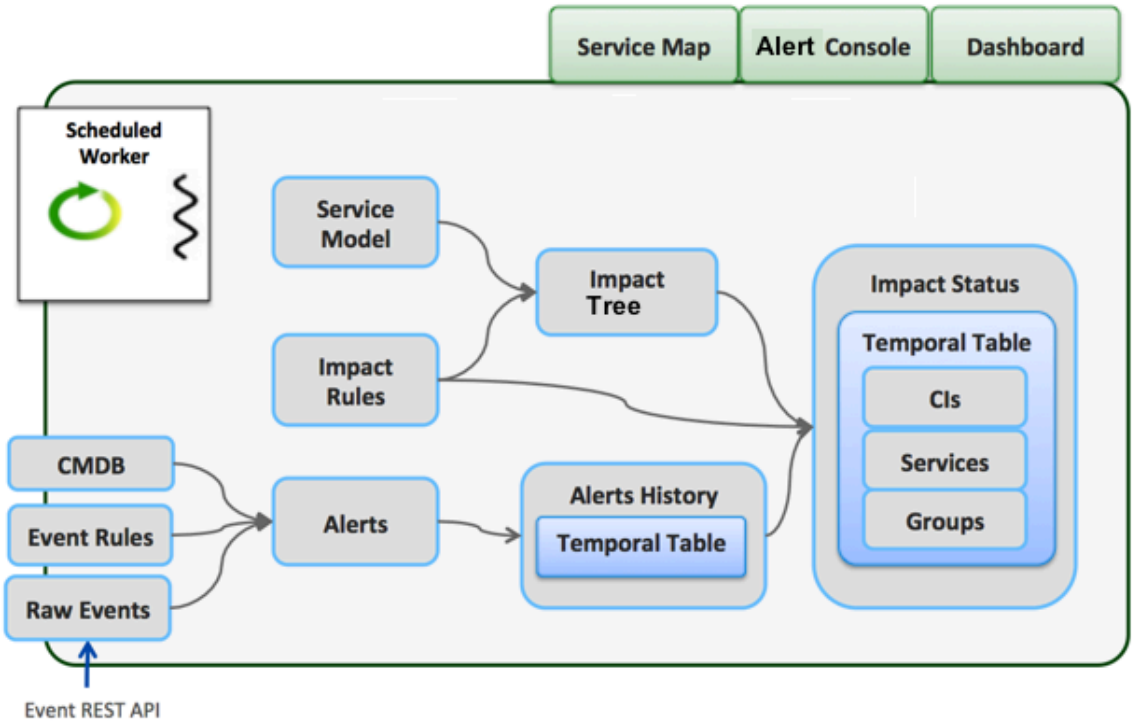
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact calculations use information from various sources to set the alert severity



How impact is calculated

Impact calculation varies depending on the CI relationships for a application service or application services. Additional factors, such as change requests, network paths, storage paths, and related CIs all affect impact calculation.

Services

The following impact calculation flow operates for alerts where the outage does not affect a network or network storage. Event Management performs the following steps:

1. Create a service map. Use the Service Configuration Item Associations [svc_ci_assoc] and CI Relationships [cmdb_rel_ci] tables to create child-parent relationships in the application service or application services.
2. If there is no CMDB path from the service to the CI but an association appears in the svc_ci_assoc table, show a Depends-on relationship between the application service and the CI. Otherwise, show no connection.
3. For an application services, if the CIs assigned to the service are also connected to the service in the CMDB, the map keeps the hierarchy between CIs as they appear in CMDB. The CI service assignments appear in the Service Configuration Item Associations section of the Application service form. If there is no connection to the service in the CMDB, the CIs appear directly under the application services in the map.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Change requests and the In Maintenance status

If an active change request is scheduled for the CI or if the **Install Status** of the CI is **In Maintenance**, all alerts on the affected CI are excluded from impact calculation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Alerts tab also temporarily hides all corresponding alerts. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green.

Note:

- CIs are considered to be in maintenance not only when an active change request is scheduled, but also when the **Status** field of the CI is set to **In Maintenance**.
- When a child CI is put in maintenance, it also places the parent CI in maintenance.

For a service, all alerts on CIs in the service are also hidden from the Alerts tab. The entire service is shown in green on the impact tree. For a host with an active change request, the host applications are considered as one unit. All child applications are treated in the same manner as the host until the change request is no longer active. For additional information, see How alerts work with CIs in maintenance.

Network paths

To account for network redundancy, Event Management uses a separate impact calculation. You can see network topology or path changes in the application service. The following impact calculation flow operates for alerts where a network path is affected. Event Management performs the following steps:

1. Create a application service map for the affected network.
   - Use the host ID and target IP information from the alert and the network path from the Network Paths [sa_network_paths] table.
   - Use the elements in the network path that derive from the Configuration Item [cmdb_ci] table. Also, use the elements that are associated to the path, from the Infra Path To Elements [sa_infra_path_assoc] table.
   - Set the relationships. The application CI has a Depends on::Used by relationship on an element in the path that is defined in the CI Relationship [cmdb_rel_ci] table. In the relationship, the application CI is the parent and the element in the network path is the child.
2. Calculate a separate severity for each regular element in the path. Each regular element in the path contributes its own severity to its ancestors up to the application CI where the path originated from.
3. Calculate all redundant elements in the path with the redundancy rule by reducing the severity on the impacted CIs by one level. For example, if the severity is *`Critical`*, the redundancy rule decreases severity by one level to *`Major`*.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Storage paths

To account for storage device redundancy, Event Management uses a separate impact calculation. You can see impact tree updates when the network storage topology changes from the application service. Event Management performs the following steps for alerts that contain storage CIs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Create a application service map for the affected storage device:
   - Use the storage device in the sa_fs_to_storage_path table. The storage device definition uses the file system information in the path.
   - Use the elements in the storage path that derive from the Configuration Item [cmdb_ci] table. Also, use the elements that are associated to the path from the Infra Path To Elements [sa_infra_path_assoc] table.
   - Set the relationships. The application CI has a Depends on::Used by relationship on an element in the path that is defined in the CI Relationship [cmdb_rel_ci] table. In the relationship, the application CI is the parent and the element in the storage path is the child.
2. Calculate a separate severity for each regular element in the path. Each regular element in the path contributes its own severity to its ancestors up to the original application CI the path.
3. Use the redundancy rule to calculate redundant elements in the path by reducing the severity on the impacted CIs by one level. For example, if the severity is *`Critical`*, the redundancy rule decreases by one level to *`Major`*.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Related CIs

As alerts generate for a CI, additional impact calculations run for related CIs. For example additional impact calculations run for a application service dependency to a CI that is not actually part of the application service. These related CIs are not discovered as part of the service. Instead, the related CIs are specified by an infrastructure relationship definition.

The following impact calculation flow operates for alerts with CIs that have a dependency to related CIs which are considered outside the application service. Event Management performs the following steps:

1. Derive relationships between the application service CIs and related CIs. Use the relationships, impact rules, and other data from the Infrastructure Relations [em_impact_infra_rel_def] table.
2. Add related CIs to the impact tree and alert list on the Event Management dashboard.
   - Use data from the Infrastructure Relationship [em_impact_infra_rel_def] table to show containment links to the host.
   - Use the Impact Status [em_impact_status] and Alert History [em_alert_history] tables to determine the status.

Impact rules

Impact rules, which are used for impact calculation, estimate the magnitude or severity of an outage based on affected CIs.

The Impact Rule [em_impact_rule] table contains impact rules that show the applicable CIs, application services, and settings for impact. The following default impact rules are available.

Application Cluster Member

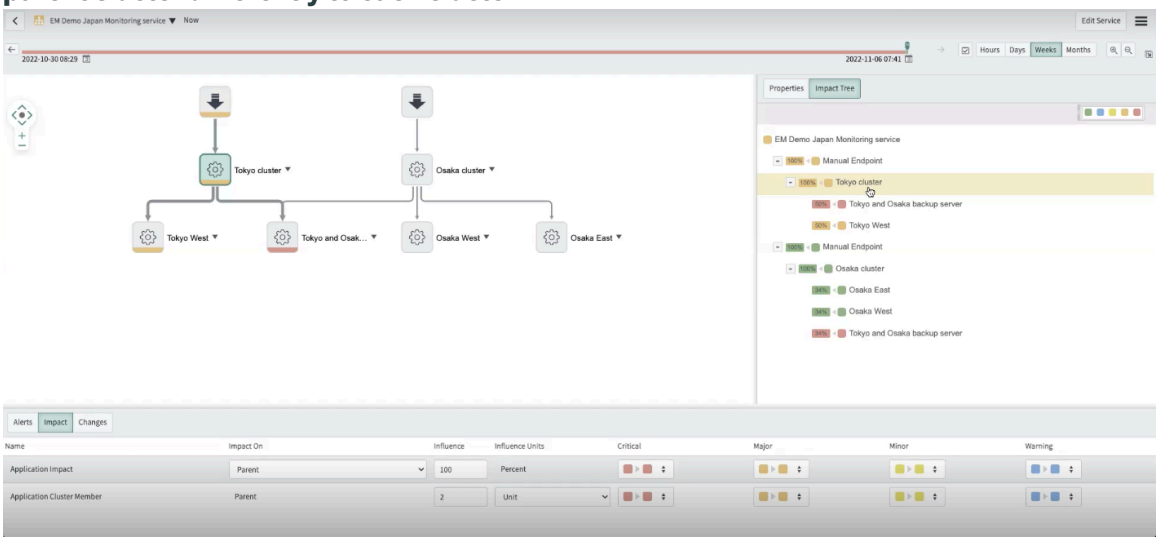
Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**.

You can configure different impact rules per cluster and thus the child CI impact propagation to the parent (for the same child CI) will be different. Therefore, you can manually create groups of Cis (aka manual clusters) and configure the impact rule at the cluster level for downstream towards the cluster children.

Example where the same child CI will propagate its impact to its parent cluster differently to each cluster



In the above example, there are two entry points. The Osaka cluster on the right-hand side has three CIs. The Tokyo cluster on the left-hand side has two CIs. The Tokyo and Osaka backup server has shared parents - Tokyo cluster and Osaka cluster. On the right-hand panel you can see the Impact Tree where the Tokyo cluster has two Application Cluster Members with 50% influence each and the Osaka cluster has three with 34% influence each.

For manual cluster configuration there are two rows: Application Impact and Application Cluster Member. The children are displayed since the Impact On field was selected as Parent and not Application Service. In the Application Cluster Member row the Influence field is configured to two. This implies that the minimum amount of children who fail (and that they propagate the failure upwards to their parents) are two. The Osaka cluster is configured to three. The percentage is different for the Tokyo and Osaka backup server for each cluster (50% and 34%). As you can see, even though the Tokyo and Osaka backup server failure is Red Critical, it influences the parents differently. The Osaka cluster remains green even though the Tokyo cluster failure is Orange Major.

Click a service or CI to see the alerts that are associated with it. For example, if you click the high-level application service, the alerts that are associated with it are displayed in the alert area under the Map View when you select **Alerts**. The alerts listed are those of the selected service. Alerts of child-services are listed when those services are selected.

The following impact fields are displayed when you select **Impact**.

Inclusion

Determines the impact on entities with a Contains relationship. This rule is read-only.

Infrastructure Dependencies

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Determines the definition of impact propagation for CIs in infrastructure relationships.

CI application service

Determines how impact applies to parent or child entities that are part of an application service.

CI Impact

Applies to application services. Determines the relationship between service members. The impact from child to parent CIs is always 100%. For example, the parent impact severity is derived from the child CI with the highest severity.

CI Parent in Application

Sets impact only on the parent entity.

Network Path

Determines how impact applies to parent or child entities that are part of a traditional network.

OS Cluster Member

Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down.

Storage Path

Determines how impact applies to parent or child entities that are part of a storage network.

Properties

In addition to configuring impact rules, you can configure properties for impact calculation.

Configure these properties, as appropriate:

Impact Calculation Properties

Property Name	Description
`evt_mgmt.impact_calculation.alert_grouping_support`	Enable alert grouping support.
`evt_mgmt.impact_maintenance.sleep_time_sec`	Minimum time in seconds for checking CI maintenance: checks both the Status field on the CI and any change request schedule for the CI.
`evt_mgmt.impact_calculation.alert_processing_delay`	The delay after creating or updating an alert, before it is used for impact calculation and grouping. Used to compensate for the late arrivals or slow business rules defined on the em_alert table. Default = 2000 msec. Used when alerts and events are processed one at a time (when the `evt_mgmt.max_objs_in_alert_query` property is not defined or is set to **1**).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact Calculation Properties (continued)

Property Name	Description
`evt_mgmt.impact_calculation.alert_holdback_delay`	The delay during which alerts are held back before it is used for impact calculation and grouping. Used to compensate the late arrivals or slow business rules defined on em_alert table. Default = 30000 msec. Used in large customer environments with high traffic, when alerts and events are processed in batches (when the `evt_mgmt.max_objs_in_alert_query` property is set to a value greater than **1**).

For more information, see Event Management - Impact calculation [KB1157218].

Understand Service Maps

Service maps show active alerts for CIs and the relationships between CIs. By viewing this information, you can better understand the source of alerts and take remediation steps. The service map is available for all application services.

About Service Maps

A service map shows alerts with impacted CIs and CI interdependencies. For example, changes to a connection between a host and hypervisor appear on the service map. As service map definitions change, the service map, alert, and impact information updates accordingly. From the Quebec release, there is enhanced visibility. When the alert is bound to the entry point, the service map identifies an entry point problem.

Note: Alerts will not be displayed for the entry points on the service map.

You can open a service map from these places:

- From the Application services list, you can view service maps for application services.
- From the Monitored services list, you can view service maps for monitored services.

The following icons are used in service maps. The icon shapes are slightly different for application services.

Service map icons

Icon	Description
	Represents applications such as Microsoft IIS or SQL servers.
	Represents physical and VM computers and servers.
	Represents the network starting point. For example, Layer 3 devices appear toward the top of the map, and connected software and services appear near the end of the map.
	Shows the number of redundant CIs.
	Shows the workload between machines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service map icons (continued)

Icon	Description
	The gray connector shows a relationship between CIs.
	Each CI with no active alerts box represents a network CI. A gray box represents a CI with no active alerts. Information about the CI is hidden.
	Hides multiple CIs that are designated as redundant.
	An impacted CI displays the color that represents the severity of the alert associated with the CI. • **Critical (red)**: Immediate action is required. The resource is either not functional or critical problems are imminent. • **Major (orange)**: Major functionality is severely impaired or performance has degraded. • **Minor (yellow)**: Partial, non-critical loss of functionality or performance degradation occurred. • **Warning (blue)**: Attention is required, even though the resource is still functional. • **OK (green)**: An alert is created. The resource is still functional. • **No color**: No active alerts.
	Represents a fiber channel, hard drives, or other data storage devices.
	Represents related web services for the network such as NGINX or JBoss web server.

Note: Session timeout settings don't apply to this screen. The session remains connected, even when there is no human interaction. If this setting is a concern, either log out or close the active tab in the browser.

Alert impact calculation

View an alert impact on CIs in a service map

View the impact tree

The impact tree shows the relationships between CIs and the relative percentage impact for each child CI. This information is available for both discovered services and application services.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

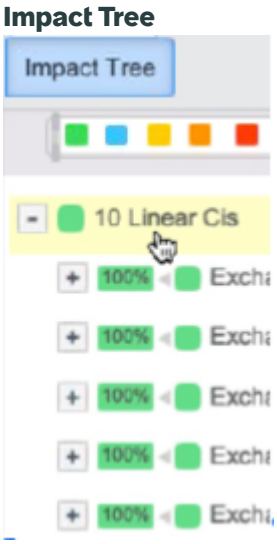
About this task

The impact tree shows the result of impact rules on CI parent and child relationships. The tree represents a service map with CIs from the Service Configuration Item Associations [svc_ci_assoc] table. When related CIs are connected but not part of the service map, the impact for the related CIs can also appear in the impact tree.

The numbers or percentages on a parent CI summarize overall severity based on alerts from child CIs. The parent severity is based on impact rule computations.

You can also learn about the impact tree from the following video tutorial.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Open the service map for the service from the Application service list.
   a. Navigate to **Event Management** > **Services** > **Application Services**.
   b. Click **View service** next to the service.
2. On the service map, click a CI that has a severity color.
3. Click the **Impact** tab.
4. From the **Impact Tree** tab in the side pane, expand the parent CI and click the CI that generated alerts.
5. Use the severity color to locate CIs that contain alerts:
   - **Critical (red)**: Immediate action is required. The resource is either not functional or critical problems are imminent.
   - **Major (orange)**: Major functionality is severely impaired or performance has degraded.
   - **Minor (yellow)**: Partial, non-critical loss of functionality or performance degradation occurred.
   - **Warning (blue)**: Attention is required, even though the resource is still functional.
   - **OK (green)**: An alert is created. The resource is still functional.
6. Do one or more of the following.

Option	Description
Adjust impact rules	**a.** Click the **Impact** tab. **b.** Review and adjust the impact rules as nec essary.
Remediate an alert	**a.** Click the **Alerts**. **b.** Right-click the alert and select **Run remedia tion**.

Network paths appearing in the impact tree can use a large amount of resources, which degrades system performance. To disable network paths from appearing

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

in the impact tree, navigate to **System Properties** > **All Properties** and set the *evt_mgmt.network_path_excluded* property to **true**.

To view impact tree using Service Operations Workspace, see View impact tree using Service Operations Workspace.

Adjust impact rules for a CI

Configure impact rules to customize the impact calculation for discovery services and manual services. The impact rules update the overall alert and show the impact on related CIs. When you change impact rules, the updates apply to alert severity in places such as the Event Management dashboard and Operator Workspace.

Before you begin

Role required: evt_mgmt_admin

About this task

You can view and adjust the impact rules of CIs from the application service map of a service.

Note: Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

Procedure

1. Open the application service map from either the Event Management dashboard or the Application service list.

Option	Description
From the Event Management dashboard	**a.** Navigate to **Event Management** > **Dash board**. **b.** Double-click the tile of the application ser vices.
From the Application Service list	**a.** Navigate to **Event Management** > **Services** > **Application Services**. **b.** Click **View Map** next to the application ser vices.

2. On the application service map, click a CI.
3. Below the map, click the **Impact** tab and then adjust the impact rules accordingly.

Impact Rules

Field	Description
Name	The name of the impact rule. ○ **Application Cluster Member**: Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3). The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**. **Note:** To configure a manual cluster, see Configure a manual cluster

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Application Impact**: Determines how impact is applied to a specific CI, the overall application service, or parent/child entities within an application service. For the Application Impact rule, you can choose from the following Impact options: **Application Service** or **Parent**. ▪ If no CI is selected, the alert rule applies to the entire application service. ▪ If you select a specific CI, you can define whether the rule applies to the service or its parent. ○ **CI Parent in Application**: Sets impact only on the parent entity. ○ **Inclusion**: Determines the impact on entities with a Contains relationship. This rule is read-only. ○ **Infrastructure Dependencies**: Determines the definition of impact propagation for CIs in infrastructure relationships. ○ **Network Path**: Determines how impact applies to parent or child entities that are part of a traditional network. ○ **OS Cluster Member**: Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down. ○ **Storage Path**: Determines how impact applies to parent or child entities that are part of a storage network.
Impact On	The valid type of service for this impact rule. ○ **Application Service**: The impact rule applies to a application service. ○ **Parent**: The impact rule applies to the parent CI.
Influence	The value to allow the impact rule to set on the parent. Set a value on the parent. This field works with the **Influence Units** field.
Influence Units	The unit of measurement to show impact on the parent. Set the highest value on the parent CI. Set lower values on each child CI. When alerts occur for several child CIs, Event Management calculates the sum of the **Influence Units** of each affected child. If the sum exceeds the parent **Influence Units** value, the parent receives the highest severity in the set. This field works with the **Influence** field. ○ **Percent**: When the percentage exceeds the **Influence** value, apply the impact on the parent. ○ **Number**: When the number exceeds the **Influence** value, apply the impact on the parent. For example, you can set the parent **Influence Units** to **100%** and the child CIs to these values: ▪ Child 1: 34% ▪ Child 2: 34%

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ Child 3: 34% ▪ Child 4: 70% When alerts for Child 3 and Child 5 have the Critical severity, the severity of the parent is set to Critical because the sum is greater than 100% (34% + 70% = 104%).
Impact when Critical	The alternative impact to use when the calculated severity is Critical. If the column to the right of **Impact when Critical** has a higher severity, update all right-most columns with the same or a lower severity as **Impact when Critical**. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Major	The alternative impact to use when the calculated severity is **Major**. If the column to the right of **Impact when Major** has a higher severity, update all right-most columns the same or a lower severity as **Impact when Major**. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Minor	The alternative impact to use when the calculated severity is **Minor**. Controls the field values to the right of this field. If the **Impact when Warning** column has a higher severity, use the **Impact when Minor** value for both fields. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Warning	The alternative impact to use when the calculated severity is **Warning**. To make sure the topology and impact tree accurately show impact, make sure that the columns to the left have higher severities. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).

What to do next

Review the changes on the impact tree. For example, if you changed a number or percentage influence for child CIs, review the impact tree updates accordingly.

View an alert impact on CIs in a service map

You can view service maps to see active alerts for CIs and the relationship between CIs. By viewing this information, you can better understand the source of alerts and take remediation steps. The service map is available for all application services.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

You can open a service map from these places:

- From the Application services list, you can view service maps for application services.
- From the Monitored services list, you can view service maps for monitored services.

Procedure

1. Open an application service map:
   a. Navigate to **Event Management** > **Services** > **Application Services**.
   b. Next to the service, click **View Map**.
2. Do one or more of the following.

Option	action
View alerts for a CI by type and severity	In the service map: **a.** Click a CI tile. **b.** Below the map, click the **Alerts** tab and re view the listed alerts.
View changes to a CI in a discovered ser vice	In the service map: **a.** Click a CI tile. **b.** Below the map, click the **Changes** tab.
Show alert bindings to CIs	In the service map: **a.** Click a CI tile. **b.** Click the additional actions menu icon to view the **Affected CIs** indicator. **c.** Below the map, click the **Affected CIs** tab.
View CI properties	In the service map: **a.** Click a CI tile. **b.** In the side pane, click the **Properties** tab and review information about the CI. **c.** If you want to view more detailed informa tion, scroll to the end of the pane and click **Detailed Properties**.
Show the impact rules for a CI	In the service map: **a.** Click a CI that has a severity. **b.** Below the service map, click the **Impact** tab and review the listed impact rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	action
Show alert details for networks or storage for a service	In the service map: **a.** Right-click a path between CIs. **b.** Select **Show network path**or **Show storage path**.
Display additional information for CIs	In the service map header: **a.** Click the additional actions menu icon **b.** You can select the **Map Indicators** for additional information that you want to view.
Remediate a CI	In the topology, right-click the CI, and then select **Remediation options**.

Understand Service Maps

Create an infrastructure relationship for related CIs

Infrastructure relationships show CIs that are connected to a application service but are not necessary parts of the service. Infrastructure relationships are only available for application services.

Before you begin

Role required: evt_mgmt_admin

About this task

When you create a CI infrastructure relationship, the information is stored in the Infrastructure Relations [em_impact_infra_rel_def] table. When alerts generate, the related CI accompanies the application service information on the Event Management dashboard and in the impact tree. Additional information for the related CIs only appears on a related dependency view map for the application service. The following default infrastructure relationships are available.

Default infrastructure relationships

Infrastructure relationship	Impact rule	Description
cmdb_ci_appl	OS Cluster Member	Shows alert impact between hardware and software applications.
cmdb_ci_esx_server	Infrastructure Dependencies	Shows alert impact between VCenter and ESX clusters.
cmdb_ci_kvm	Infrastructure Dependencies	Shows that alert impact on Linux Kernel-based Virtual Machine (KVM) connectivity.
cmdb_ci_vm_zones	Infrastructure Dependencies	Shows alert impact on the Solaris VM zones.

For example, based on of the cmdb_ci_vm_zones Infrastructure relationship definition, Event Management adds ZoneServer@mmp1 to the application service. The Containment rule manages impact severity on alerts.

© 2026 ServiceNow, Inc. All rights reserved.

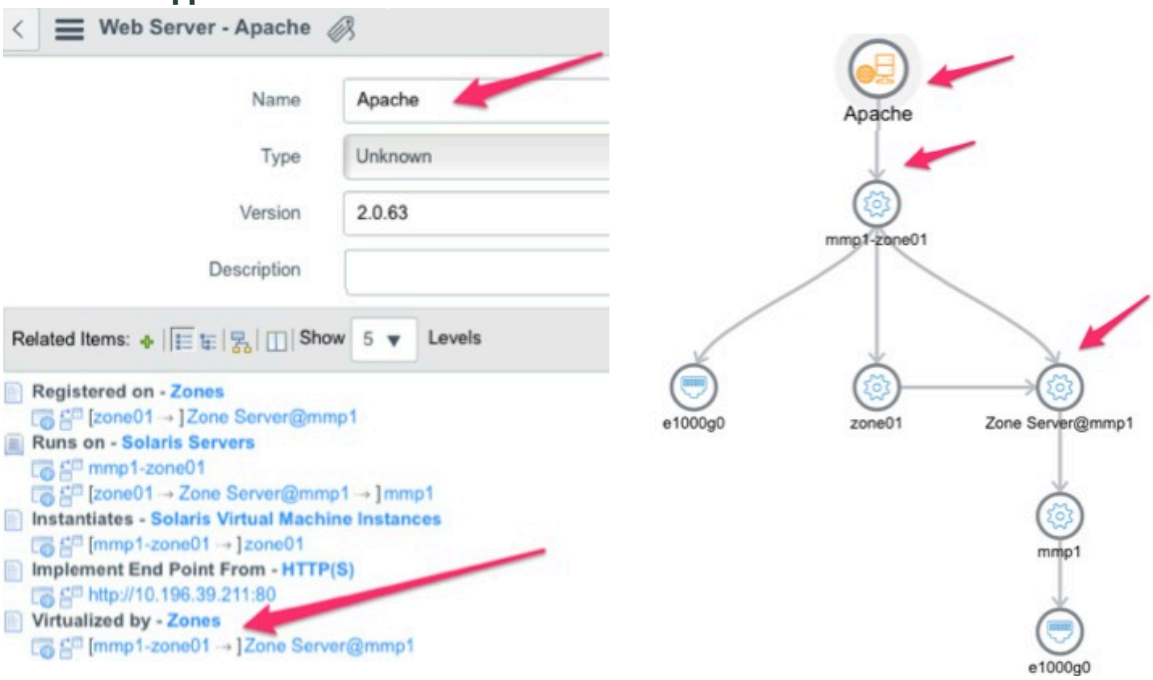
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related CIs appear on the BSM



Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Infrastructure Relations**.
2. Click **New**.
3. Fill in the fields, as appropriate.

Infrastructure Relations form

Field	Description
Child Type	The table that contains data about the child entity.
Parent Type	The table that contains data about the parent entity.
Relation Type	The relationship between the child and parent entities.
Impact Direction	The impacts direction to show on the application service map. ○ **From Child to Parent**: When an alert is regarding a child, show the impact on the parent. ○ **From Parent to Child**: When an alert is regarding a parent, show the impact on the child entity.
Impact Rule	The impact rule to calculate infrastructure relationships: ○ **OS Cluster Member** : Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down. ○ **Application Cluster Member** : Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3). The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**. ○ **Infrastructure Dependencies** : Determines the definition of impact propagation for CIs in infrastructure relationships. ○ **CI Application Service**: Determines how impact applies to parent or child entities that are part of an application service. ○ **CI Parent in Application**: Sets impact only on the parent entity. ○ **Inclusion**: Determines the impact on entities with a Contains relationship. This rule is read-only. ○ **Network Path**: Determines how impact applies to parent or child entities that are part of a traditional network. ○ **Storage Path**: Determines how impact applies to parent or child entities that are part of a storage network. ○ **CI Impact** : Applies to application services. Determines the relationship between service members. The impact from child to parent CIs is always 100%. For example, the parent impact severity is derived from the child CI with the highest severity.

4. Click **Submit**.

View impact of child service on parent service

In the map view of an application service, the severity of a child service is propagated to its parent service.

Before you begin

Role required:

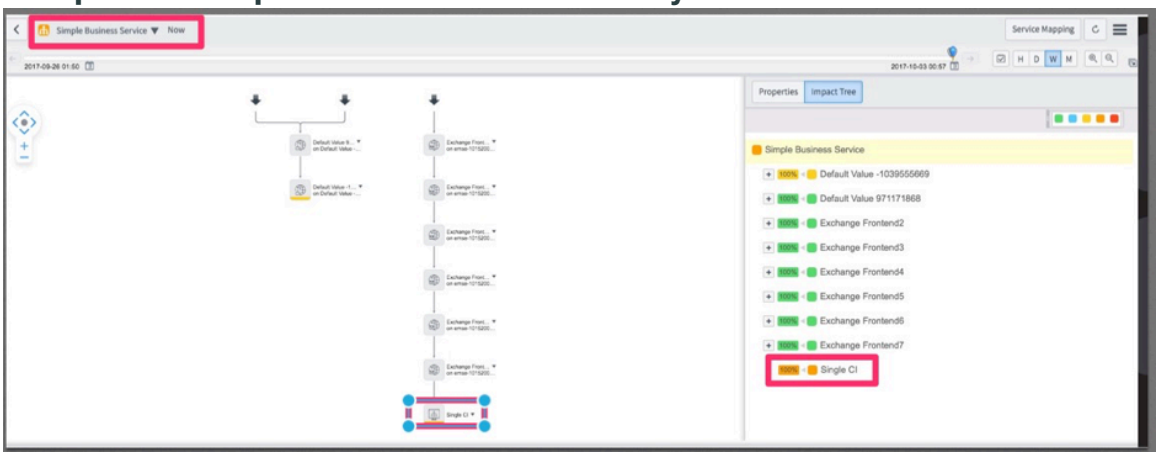
- for application services, evt_mgmt_admin
- for discovered services, service_mapping_admin

About this task

In the map view of a discovered application service, you can see that the severity of a child service is propagated to the parent service.
An application service is affected by the severity of alerts that are directly associated with it and alerts on the CIs that are in the service. If the severity of a child service is higher than that of its parent service, on the map view the parent service shows the severity of the child service. In the map view, the **Impact Tree** list shows the CIs. The color of the CIs indicates the alert severity. The child service is also affected by application services that are under it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example where the parent service shows the severity of the child service



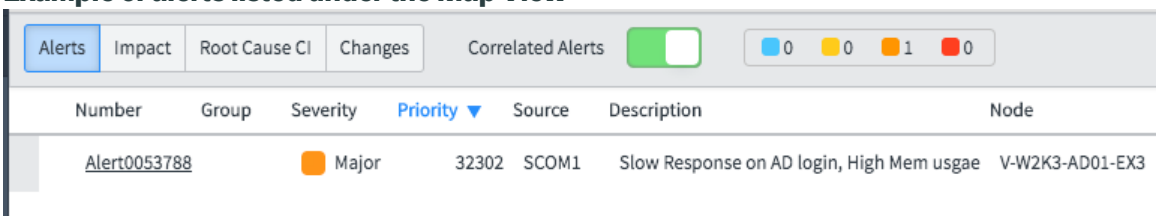
If a loop is created, for example, by connecting a parent service to a sub-service, this relationship can be viewed in the map view. The impact of this loop is not calculated and the Impact Tree does not display this relationship. For example, assume that there are three CIs, A, B, and C, where C is a sub-service to B and B is a sub-service to A. The relationship of the A connected service to C is displayed in the map view. However, this relationship is not shown in the Impact Tree.

Note: A message appears in the system error log in the following format, where the sys_id of the service and the node changes accordingly: `Found loop in ServiceId:[sysId], and node:[sysId]. Removing this relation to avoid impact loops`

For example, `Found loop in ServiceId:409d4fd59f030200fe2ab0aec32e705c, and node:df5cf6159f030200fe2ab0aec32e70a2. Removing this relation to avoid impact loops`

Click a service or CI to see the alerts that are associated with it. For example, if you click the high-level application service, the alerts that are associated with it are displayed in the alert area under the Map View. The alerts listed are those of the selected service. Alerts of child-services are listed when those services are selected.

Example of alerts listed under the Map View



Procedure

Open an application service map:

a. Navigate to **Event Management** > **Services** > **Application Services**.

b. Select **View Service** next to the service.

c. On the right-hand panel, select **Impact tree**.

d. On the lower panel, select **Impact**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

In the service map, you can visually verify that the service health of the sub-service is rolled-up to the parent service. At the bottom of each icon of an impacted CI is a colored bar that represents the severity of the alert. This color bar also displays in the bottom bar of its parent service. For manual cluster configuration, you can modify the Application Impact and Application Cluster Member.

Add CMDB tables or classes for impact calculation

Add the CMDB tables that contain application services to be considered during impact calculation, helping ensure accurate and relevant impact results.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

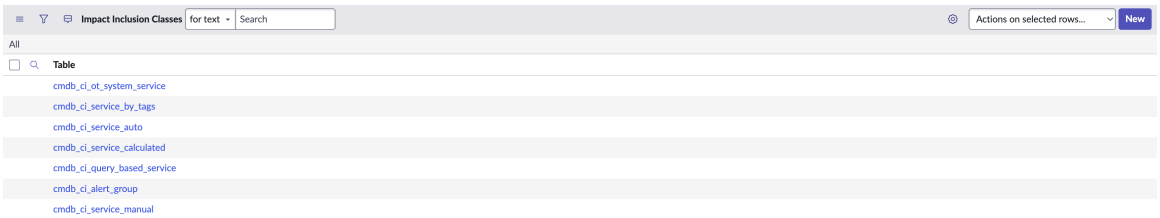
Organizations may have a vast number of CMDB tables—or classes—such as cmdb_ci_service_by_tags, cmdb_ci_service_auto and many others. However, not all of these are required for impact calculation. To streamline analysis and avoid processing irrelevant data, you can selectively add or remove only those CMDB classes that represent critical infrastructure or components. The procedure below shows how to add a CMDB class. If you want to remove any CMDB table from the list, see Remove CMDB tables or classes from impact calculation.

When you add a CMDB class, all application services related to that class are considered for impact calculation. However, if you do not want to include all services of a specific class and only want to select specific ones, you can do so on the Impact Filter Services page. For more information on how to include or exclude a service, see Add application services for impact calculation.

Procedure

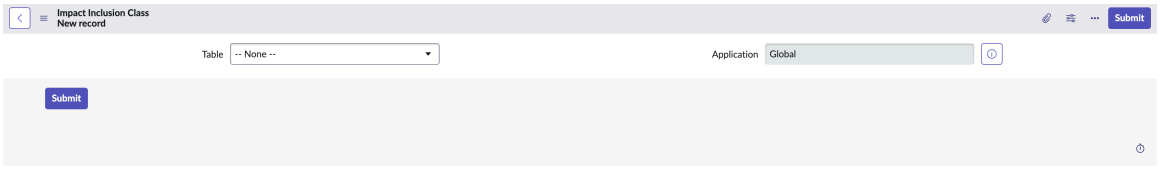
1. Navigate to **All** and search for `em_impact_inclusion_class.list`.

   The Impact Inclusion Classes page opens, displaying a list of CMDB classes that are included in impact calculation.



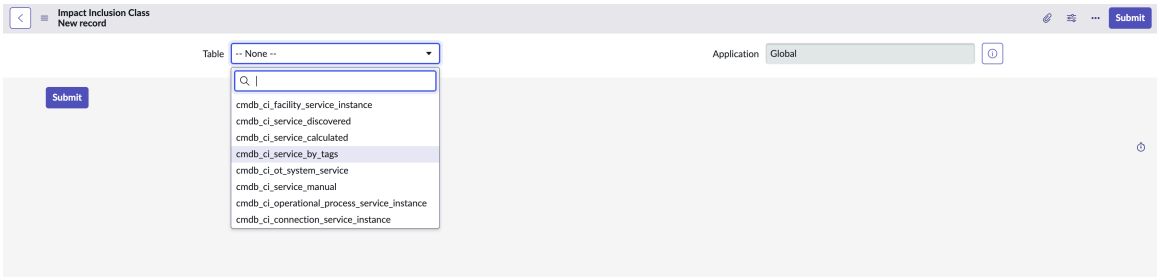
2. Select **New**.

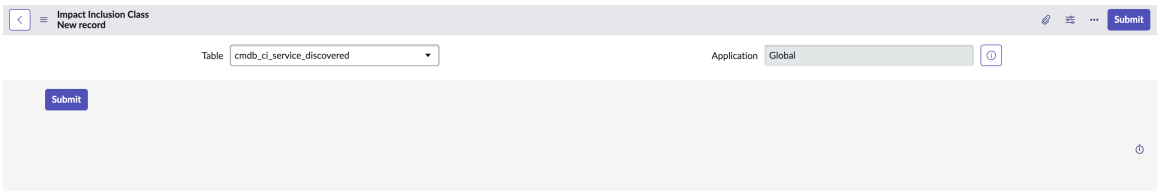
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



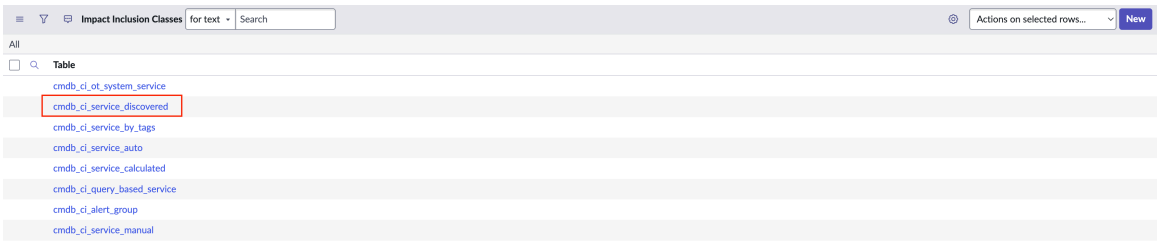
3. From the **Table** field, select a CMDB table.

> **Note:** The list contains only the CMDB tables supported for impact calculation, not all CMDB tables.





4. Select **Submit**.
   The CMDB table adds to the list of impact inclusion classes.



Remove CMDB tables or classes from impact calculation

Exclude unnecessary CMDB tables or classes from impact calculation to improve performance and focus on relevant data.

Before you begin

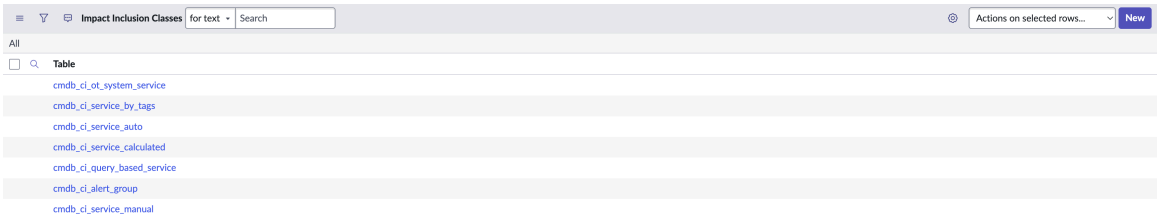
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Navigate to **All** and search for `em_impact_inclusion_class.list`.

   The Impact Inclusion Classes page opens, displaying a list of CMDB classes that are included in impact calculation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Select the CMDB table that you want to remove.
3. Select the Actions on selected rows menu and then select **Delete**.
4. In the confirmation window, select **Delete**.
   The CMDB table is removed from the list.

Add application services for impact calculation

Specify the application services that must be considered during impact calculation to ensure accurate service impact assessment.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Organizations may have thousands—or even hundreds of thousands—of application services. If a CMDB class is added to the em_impact_inclusion_class.list table, then all application services related to that class are included in impact calculation. However, there are two possible scenarios:

- Scenario 1: CMDB class is added to em_impact_inclusion_class.list but you want only specific services to be considered for impact calculation. You can either:
  - Remove the unwanted services from the em_impact_filter_service.list, or
  - Set their status to false in the em_impact_filter_service.list.

  For information on how to remove the application service from the list, see Remove application services from impact calculation.
- Scenario 2: CMDB class is not added to em_impact_inclusion_class.list. So, none of the application services related to this class are considered for impact calculation. However, you want only specific application services from this class to be included, you can directly add those services to the em_impact_filter_service.list table and set their status to true without adding the CMDB class to the em_impact_inclusion_class.list table.

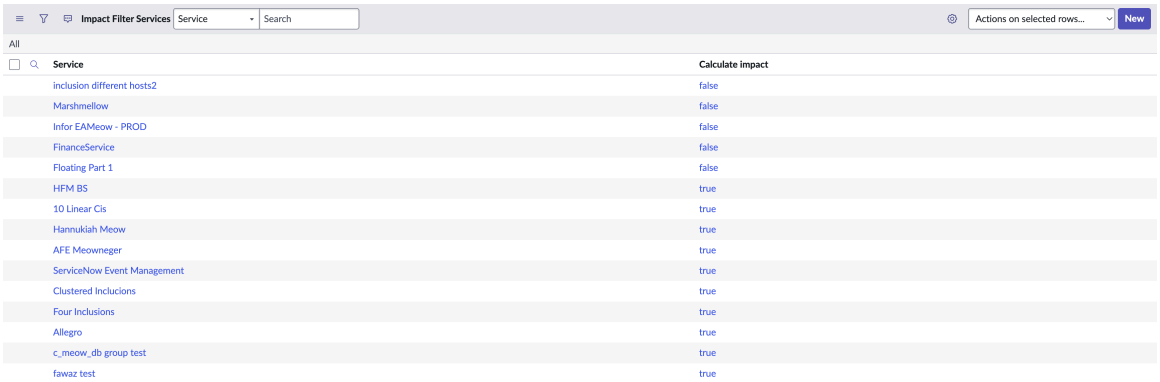
The following procedure shows how to add an application service directly to the em_impact_filter_service.list table so that it is considered for impact calculation.

Procedure

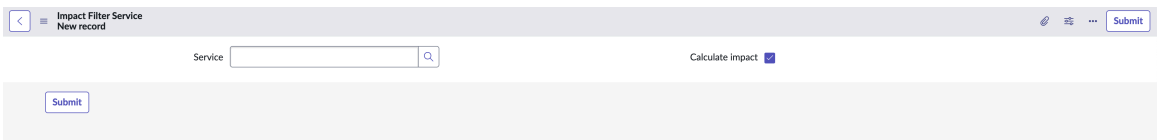
1. Navigate to **All** and search for `em_impact_filter_service.list`.

   The Impact Filter Services page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



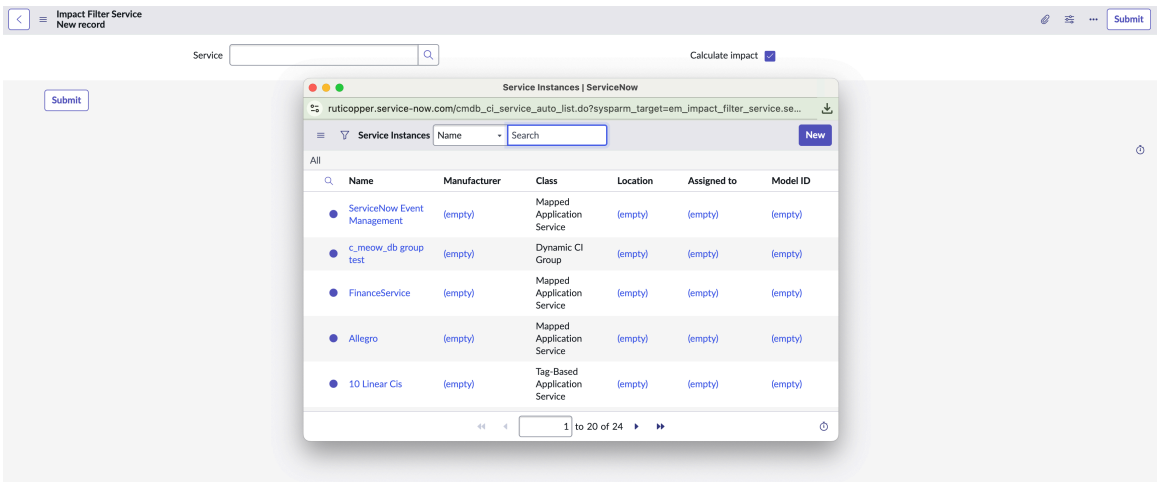
2. Select **New**.



3. In the **Service** field, select the search icon ( ).

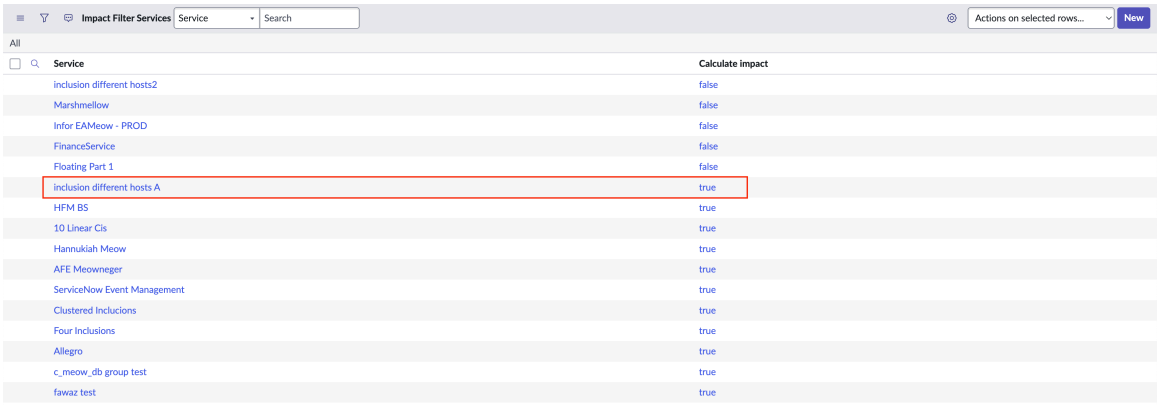
Note: By default, the **Calculate impact** check box is selected.

4. In the Service Instances page, select the service that you want to add for the impact calculation.



5. Select **Submit**.
The application service adds to the list of impact filter services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: Only the application services added to the Impact Filter Services list appear in the Service Dashboard.

Remove application services from impact calculation

Exclude specific application services from impact calculation to reduce noise and focus on critical components.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

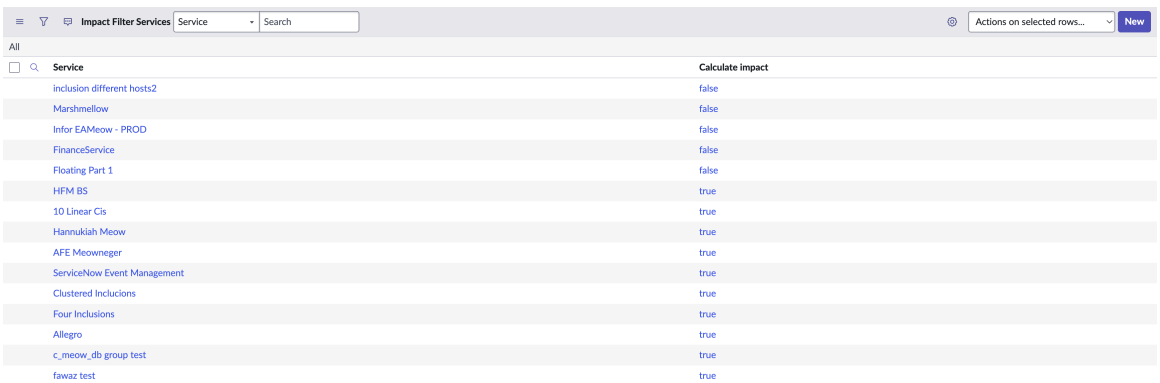
Removing or deleting a record from the list won't necessarily exclude the application service from impact calculation if the CMDB class still exists in em_impact_inclusion_class.list. However, even if the class exists in em_impact_inclusion_class.list, the application service will not be considered for impact calculation if its status is set to **Calculate Impact** = **false** in em_impact_filter_service.list.

For the application service that you want to exclude from the impact calculation, add the application service with **Calculate Impact** = **false**, or change the **Calculate Impact** = **false**, if this record already exist. The procedure shows how to configure this setting.

Procedure

1. Navigate to **All** and search for `em_impact_filter_service.list`.

   The Impact Filter Services page opens.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. For the application service that you want to exclude from the impact calculation, change the **Calculate impact** status of the application service to **false**.
   This keeps the application service record in the list but excludes it from impact calculation.

Probable Root Cause Analysis (RCA)

Shorten the mean time to repair (MTTR) by discovering the root cause of an alert.

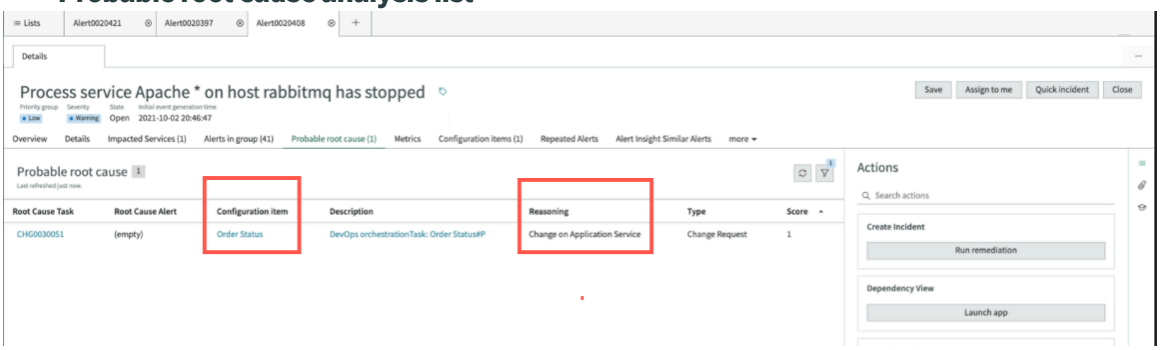
Probable root cause analysis (RCA) provides a list of probable root causes for alerts. This capability uses existing data in IT Service Management to help you determine the root cause of an issue.

RCA takes three factors into consideration: Alerts, configuration item (CI) topology, and change requests on the CIs. It extracts CIs from alerts or alert groups and analyzes the CI relationships in the CMDB. It then uses a set of configurable filters to consider relevant change requests on the CIs as possible root causes.

Change requests can be related to a time frame or to a CI, the application service it belongs to, or the software installed on it. For example, a CI must be upgraded or a security patch installed on it. A change request on one CI can affect other CIs.

RCA maps the alerts and change requests to the CIs. It proceeds to calculate the root cause score, a logical score used for sorting probable root causes. The calculation of this score is based on change requests on CIs, and on alerts on a crucial CI called the Topology Origin CI. The root cause score determines how RCA populates the probable root causes list.

Probable root cause analysis list



By default, the list shows the five probable root causes with the highest score. It lists the CIs related to each alert, and the reason RCA identified them as probable root causes.

Scoring for probable root causes is determined by the following criteria, in the indicated order (lower number = higher priority):

1. Change on a CI that originates from topology.
2. Change on a related CI originates from topology.
3. Change on a CI.
4. Change on a related CI/change on an application service/change on software.
5. Alert on the CI that originates from topology.

To disable the Probable Root Cause Analysis feature, you must create the property *sa_analytics.disable_prc* and set the value to `true`. For more information on how to create a property, see Add a system property.

Customize RCA settings

Modify default settings that determine RCA behavior.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
Default filter settings control which change requests RCA considers as possible root causes. You may want to change certain default settings, for example to make RCA ignore standard change requests.

You can also change the number of probable root causes shown in the list. By default, the list shows the five probable root causes with the highest root cause score.

By default the RCA calculation is enabled. You can disable it by changing the default *sa_analytics.disable_prc* value to True.

Procedure
1. Navigate to **All** > **System Properties** > **All Properties**.
2. Do one or both of the following, as needed.
   - Change default filter settings:
     a. Select **New**.
     b. In the **Name** field, specify the name of the property for which you want to change the default setting.

        The new property must have the same name as the related property in the table.

Property	Description	Type	Default value
sa_analytics.rca.filter_category	The categories of change requests that RCA considers as possible root cause.	string	" "
sa_analytics.rca.filter_type	The types of change requests that RCA considers as possible root cause.	string	"standard,normal,emergency"
sa_analytics.rca.filter_state	The state of change requests that RCA considers as possible root cause.	string	"-1,0,3,7,8,157" ▪ Implement: -1 ▪ Review: 0 ▪ Closed: 3,7,8,157
sa_analytics.rca.filter_interval_hour	The time frame, in hours, during which change requests occurred that RCA considers as possible root cause.	int	168
sa_analytics.rca_use_legacy_query	Use legacy queries for RCA calculation.	Boolean	True

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description	Type	Default value
sa_analytics.rca.get_tasks_under_changed_cis	Include change requests for impacted services in the RCA list.	Boolean	True
sa_analytics.rca_scoring_by_time_proximity	Enable scoring of RCAs by time proximity to the alert.	Boolean	True
sa_analytics.rca_cmdb_relation_levels	Number of levels to search related configuration items.	int	1
sa_analytics.rca_time_filtering_planned_time	Enable filtering of change requests by planned time.	Boolean	True
sa_analytics.rca_time_filtering_actual_start_time	Enable filtering of change requests by implementation time.	Boolean	True
sa_analytics.rca.upper_filter_time_unit	Determines the time unit for upper bound for change requests filtering.	int	1
sa_analytics.rca.order_by_scoring_for_virtual_alerts	When scoring for virtual alerts RCAs for virtual alert – order the records by scoring of PRCs of the corresponding secondaries.	Boolean	True
sa_analytics.rca_same_reason_prc_sys_mod_count	When 2 PRCs have the same reasoning, prioritize the one with the most recent change request during scoring calculations.	Boolean	True
sa_analytics.rca.prefer_rc_case_app_service	In case the service is the same change request on application service and on CI, prefer the one from application service.	Boolean	False

c. Enter a valid value for the property.

Note: The value you set for the new property overrides the default value for the related property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Change the maximum number of probable root causes shown in the list:

  a. Find the property *sa_analytics.rca_task_table_max_records*.

Property name	Description	Type	Default value
sa_analytics.rca_task_table_max_records	The maximum number of probable root causes shown in the Probable root causes list.	integer	5

  b. Replace the default value with a new valid value.

- Disable RCA by creating the *sa_analytics.disable_prc* property.

  a. Select **New**.

  b. Fill in the form with the following values.

Property name	Description	Type	Value
sa_analytics.disable_prc	Disabling the Probable root cause.	Boolean	True

3. Click **Submit**.

Alert similarity

Finding alerts that are similar to the alert that you are currently investigating can help save troubleshooting time by seeing how similar alerts were resolved.

Finding similar alerts

Alert similarity applies natural language processing (NLP) based on ServiceNow AI Platform machine learning (ML) as implemented in Predictive Intelligence.

ML logic filters out irrelevant information and provides further information to help you understand the cause of alerts. You can view solutions used to resolve similar alerts and the probable root cause.

ML helps find similar alerts based on text found in these alert record fields:

- Configuration item.Class
- Metric name
- Description

Additional alert information

In the Alert Workspace, select the required alert and click **Insight** to view additional information about the alert.

In the Alerts list, select the required alert and use the Alert Insight tabs on the right side of the alert record to view additional information about the alert. For example, you can view the top recent alerts for the current CI and similar CIs to find the most suitable solution towards resolving the alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The alert insight tabs are:

- Impacted Services
- Flapping
- History
- Activities
- More Information
- Repeated Alerts
- Similar Alerts
- CI Incidents
- CI Change Requests
- CI Problems
- Related Incidents
- Related Change Requests
- Related Problems

For more information about the alert insight tabs, see Alert insight information.

Find similar alerts

You can find alerts similar to the alert currently being investigated. Save troubleshooting time by reviewing similar alerts to see how they were resolved.

Before you begin

Ensure that the Predictive Intelligence plugin is activated. To activate this plugin, see Activate a plugin.

Ensure that the `evt_mgmt.similarity_use_ml` property is set to `true`.

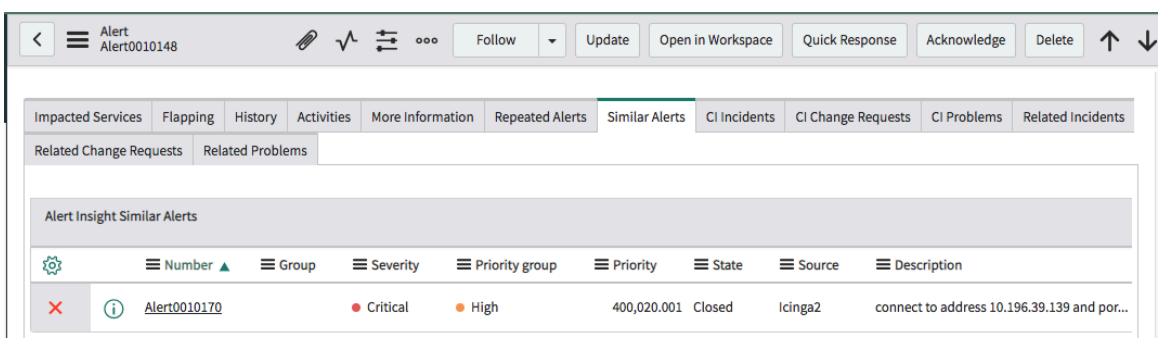
Role required: evt_mgmt_admin

About this task

Save time in resolving the current alert by reviewing how similar alerts were resolved. Provide resolution consistency by resolving similar alerts in the same way.

Procedure

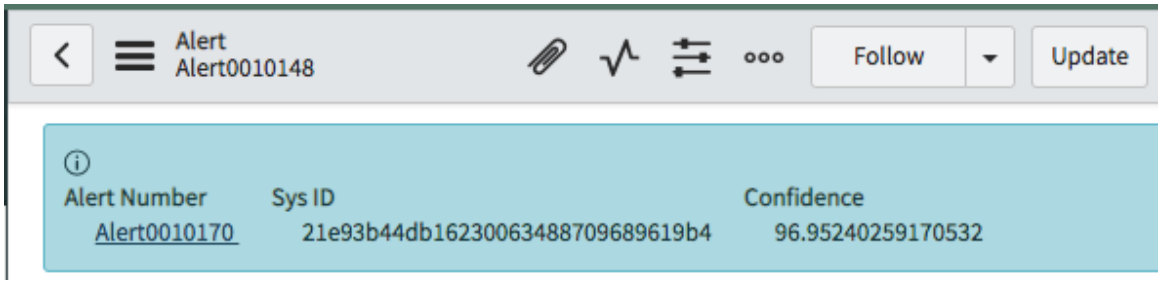
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. In the list of alerts, click the alert record that you want to investigate.
3. In the alert record, click the **Similar Alerts** tab.
   Alerts that are similar to the alert that is being investigated are listed.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, up to 10 similar alerts are listed. You can modify this value by setting the `evt_mgmt.similarity_max_similar_alerts_shown` property.

4. If you configured a threshold, in the Related links area, click **Show Similarities Details**. The Sys ID and confidence level of each similar alert is displayed. The Confidence level is an indication of how the similar alert matches the parameters that you set. As an example, a high confidence percentage value indicates a higher likelihood of similarity of the alerts to the values that you set.



You can modify the value of the threshold by setting the `evt_mgmt.similarity_use_threshold` property.

Similarity solutions

Similarity solutions enable you to use Machine Learning (ML) to compare the text in a resolved alert record to an open alert record to reuse its resolution approach.

Training a similarity solution

To train a similarity solution, you collect words to compile a collection that Machine Learning (ML) can use to compare text in the **Short Description**, **Description**, **Source**, **Type**, **Resource**, and **Metric Name** fields in a resolved alert to see whether the words in the set match words in an open alert. The resolved alert, which is similar to an open alert, provides an example to show how the open alert can be resolved.

To train a solution, the filter must return at least one record. If your filter returns no records, update it.

Note: The preferred number of records for training a solution is between 30,000 records and 300,000. If you submit more than 300,000 records, the most recent 300,000 records are used to train the solution. Use only authentic records from the database.

- Ensure that the records you train are not too old and that they are relevant to your business needs. Keep the words in the collection current.
- Do not use hard-coded dates as filters because these filters are not updated when you retrain solutions unless you update them manually before every retraining. Instead, use relative date filters, for example, the last 3 months, last 6 months, or last 12 months.
- Perform training as needed until it provides an acceptable similarity solution. This practice provides you time to review and update your solution definition.

Fields to include in the solution

Record the fields that are likely to contain words and phrases that help the system identify similar records for your solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The similarity fields that you select should be a subset of your input field selections. For example, if you select fields from incident records that are in Open state, do not select **Close note** as a similarity field. Because open records do not include **Close note** fields, the text cannot be similar.

The similarity fields are available to users when they create records.

About the similarity score

The similarity score is a measure from 0-100 of the degree of similarity between two alert records. Alert records that have a similarity score higher than the threshold that you specify is returned by the solution.

Review similarity examples and their scores using the **Show training progress** feature to determine whether to either increase or decrease the solution threshold. You can change the threshold value in the **Threshold for Similarity Score** field.

View training solution progress

Training times vary based on the number of records and classes within the training set. The more records and classes you use, the longer the training can take. For example, a data set containing 100,000 records and several hundred classes can take around five hours to complete.

To show the training solution progress, the ML solution automatically performs the following activities when you select **Show training progress** on the Solutions page. For more information, see View solution training progress.

Solution training activities

Activity	Description
Fetching files for training.	The system downloads the training records and sends them to the nearest training service.
Preparing the data.	The system removes duplicate records from the training set.
Training the solution.	The training service trains the solution.
Uploading the trained solution.	The training service uploads the solution as attachment records.

Create an Event Management similarity solution

Create and train a solution that applies machine learning to a collection of words to target and suggest similar alerts in your instance dataset. For example, you can compare the text in a resolved alert record to an open alert record to reuse its resolution approach.

Before you begin

Role required: evt_mgmt_admin

About this task

The encryption scheme that you use can affect whether you can train solutions.

- If your data is encrypted by Full Disc Encryption (FDE), you can train solutions.
- If the field you are using for training is encrypted using Field Encryption, ensure that the shared service worker user has the correct encryption module role that has been used for encryption.
- If you are using Edge Encryption, training is not supported.

Note: This feature supports only English language processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. Click **New**.
3. On the form, fill in the fields.

ML Solution Definition form

Field	Description
Solution Template	Use to define a word collection.
Label	Unique name for the similarity solution.
Name	Field that is auto-populated with a system-assigned name that is similar to the label name when the solution is created.
Table	Table that contains the records to use for the word collection, for example, the Incident table or the Asset table. When you assign a table value, a link appears that shows the number of records that match your current conditions.
Filter	Conditions that you want to apply to the training records. To train a solution, the filter must return at least one record. If your filter returns no records, update it.
Input Fields	Record the fields that contain the text and context that you want to include in your word collection. The field data type can be a string, reference, choice, or HTML, such as **Short description** and **Description**. **Note:** **Journal type** is not a supported data type. Good candidates for your input fields have text that is relevant to the solution. For example, if you are configuring a solution to find similar incident records, you can select the **Short Description**, **Description**, **Resolution notes**, and **Close notes** fields.
Training Frequency	Training is performed once by the system, by default. Because your data can age over time and degrade the accuracy of recommendations, consider invoking scheduled trainings once your solution definition is fairly stable.
Domain	On instances where domain separation is active, select the domain whose target records you want to use for your word collection. Create a separate similarity solution definition record for each domain whose field values you want to use for your word collection.
Similarity Fields	Record fields that are likely to contain words and phrases that help the system identify similar records for your solution. To change your **Similarity Field** choices, click the Lock icon ( ) to open the field and make your updates. Click the icon again to close the field and save your updates.
Similarity Window	The period in which you want to look for similar records. If you have a smaller number of total incoming records, a larger window might be best. However, if the window is too large, you may retrieve records that are not as useful. If the window is too small, you might not retrieve enough similar records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example, if you are looking for similar incident records that are open, you can select **Last 1 day**. This selection targets the most recent records, many of which could still be open.
Similarity Window Filters	Filter conditions for your similarity window. These filters define the dataset conditions under which your similarity results are determined. For example, if you are looking for similar incident records that are open, you can filter your search by creating conditions such as: **[Incident state] [is] [In progress]** These filters are applied in addition to the **Input Field** filters.
Window Refresh Frequency	Frequency to refresh the similarity window. For example, if your window contains incident records that are open, you can select a refresh frequency value of **Every 15 minutes**. New incidents typically occur frequently throughout the day so this frequency increases the likelihood that newly opened records are included in the refresh. **Note:** If your similarity window is composed of records such as Knowledge article records, which are typically not created often, you can choose a larger refresh frequency such as **Every 1 day**.

4. Click **Save** to save the solution definition record so you can return to it later, or click **Submit & Train** to create the solution definition record and train it.
5. If you submitted the solution for training, click **OK** on the **Training Activation** window to confirm.

Result

The system schedules the solution for training with the nearest training service. You and other users subscribed to the Predictive Intelligence Notifications category receive a notification when the training completes, including any errors that might have occurred in the training. When training is complete, the system uploads the solution as an Attachment record.

What to do next

Review the trained similarity solution examples in the **Similarity Examples** related link on your ML Solution Definition form.

View Event Management solution training progress

View solution training progress or statistics to determine whether a solution is available or how long the next training cycle might take to complete.

Before you begin

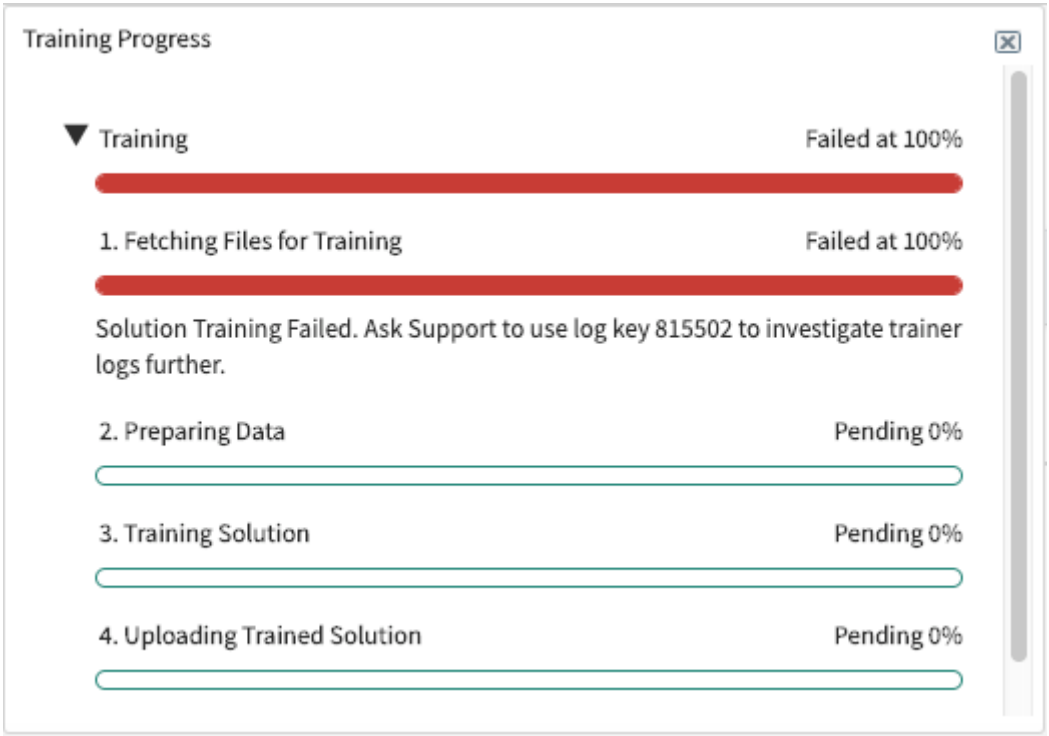
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, select the solution whose progress or statistics you want to view.
3. Click the **Show training progress** related link.
   The ML solution automatically performs activities that appear in the Training Progress pop-up window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system shows a Training Progress pop-up window. In the following example, the progress failed.



If the training is a success, all bars would be fully blue and the progress for each step would show 100%.

What to do next

See Review Event Management similarity examples.

Review Event Management similarity examples

Review the similarity examples and scores that the system provides during solution training to see how the selected alert record compares to existing alert records. For example, you can modify the similarity score threshold to increase the accuracy of your similarity recommendations.

Before you begin

Train a similarity solution in a ServiceNow datacenter. For more information, see Create an Event Management similarity solution.

Role required: evt_mgmt_admin

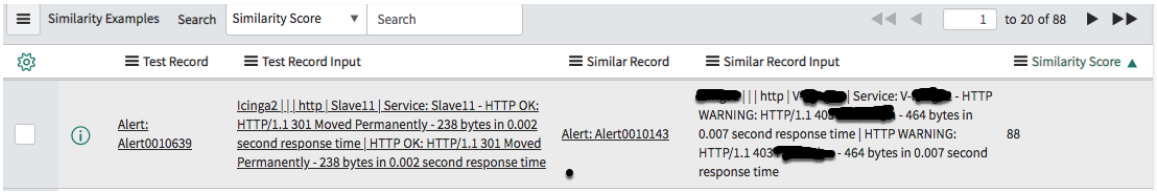
About this task

Adjust the current threshold to provide useful results. For example, a low similarity score has more coverage but less precision.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, locate your solution and click the Information icon (ⓘ).
3. Click **Open Record**.
4. Click the **Similarity Examples** related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Review the similarity examples and their threshold scores to determine the accuracy and coverage levels you want applied to your solution similarity results.
   The higher the similarity score, the more precise it is and the less coverage it offers. The lower the similarity score, the more coverage it has and the less precision it offers.
6. Based on your review, determine whether to increase or decrease the similarity score threshold value for your similarity solution

   The solution returns only similarity results that have a score that is higher than the threshold. If the current threshold is not providing useful results, adjust the threshold value.
7. Navigate to **Predictive Intelligence** > **Similarity** > **Solutions**.
8. In the ML Solutions list, locate your solution and click the Reference icon (ⓘ).
9. Click **Open Record**.
10. In the Solution Statistics tab, enter a new value in the **Similarity Score Threshold** field.
    For example, suppose that the current score is 80. Based on your similarity example review, you might want to update the field by entering a higher score of 90, which will return fewer results but ones that are more similar to the alert record under review. A lower similarity score has more coverage but less precision.
11. Right-click in the form header and click **Save**.
    Your solution uses the new similarity threshold value. In the example, the solution returns similar results that have a score higher than 90.

Activate Event Management solution version

The system activates the most recent version of the solution, but you can activate any previously trained Event Management solution version if it is more appropriate.

Before you begin

Because you might have created more than one solution, you can choose to activate the solution that is most appropriate.
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, click the Reference icon (ⓘ) for the trained solution that you want to activate.
3. Click **Open Record**.
   You can assign a title to the solution using the `evt_mgmt_similarity_solution_title` property. The default value is `ml_x_global_alert_similarity`. This property changes the value in the **Solution Name** field.
4. In the solution record, click **Activate**.
   The system activates this solution version and deactivates any other solution version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Self-health monitors for Event Management

Use the Event Management self-health monitors to track Event Management features and resolve issues.

Monitor Event Management to detect and resolve issues

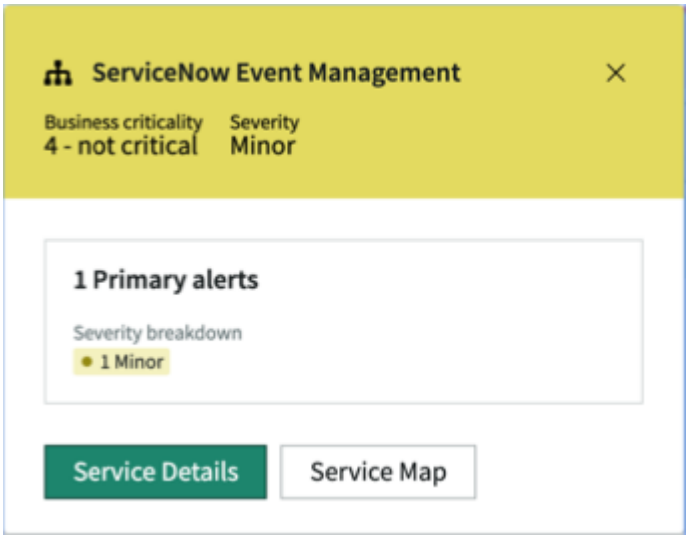
Enable the self-health feature to help detect and troubleshoot Event Management health issues. Some configuration is required before the self-health feature can display meaningful data. Once configured and the related scheduled jobs are enabled, the Service Operations Workspace displays data that is automatically collected and calculated on a recurring schedule.

Note: Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

The self-health feature creates CIs in the CMDB to represent the components of the self-health service. Use the provided monitors to monitor and track the health of services and Event Management features.

Event Management self-health can:

- Trigger alerts when there is an issue with Event Management.
- Display the **ServiceNow Event Management** application services in Service Operations Workspace. Use Service Operations Workspace to view alerts by application service, technical service, and alert groups. You can double-click a tile to view general information about the service.



- Click **Service Details** to view details of the service.
- Click **Service Map** to view a map representation of the **ServiceNow Event Management** application services to see the relationships between CIs in the **ServiceNow Event Management** application services.

Self-health monitoring process workflow

After the *Event Management – self-health monitoring* property is enabled:

1. The **ServiceNow Event Management** application services is automatically created.
2. Jobs are automatically scheduled to run scripts that configure what must be monitored.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The Monitoring States [em_monitor_state] table is updated after each event run that the configuration scripts trigger.
4. The alerts that are generated are monitored.

   The service displays the status of the monitored entity. For example, alerts are displayed in the Event Management dashboard, Service Operations Workspace or All Alerts list.

You can resolve the alerts according to the underlying issue by using **Quick Response** on the standard platform interface. For details, see Apply a quick response in an alert.

Jobs scheduled to process scripts

The jobs scheduled to run by default after the *Event Management — self-health monitoring* property is enabled are:

- The `Event Management - Insert Health Monitor` scheduled job which runs the scripts.
- The `Event Management - Update Health Monitor` scheduled job which runs the update scripts. This job runs once every minute.

Start or stop self-health monitoring

You can control the starting or stopping of the self-health monitor feature by configuring the self-health monitoring property. The first time that the self-health monitoring property is enabled, it automatically creates the ServiceNow Event Management application services.

Before you begin

Role required: evt_mgmt_admin

About this task

Configure the self-health monitoring property to monitor and track application services and Event Management.

Procedure

1. Navigate to **All** > **Event Management** > **Event Management Properties**.
2. Locate the *Enable Event Management self-health monitoring* (*evt_mgmt.self_health_active*) property.
   Select one of these values:

Enable Event Management self-health monitoring property

Field	Description
Enabled	The ServiceNow Event Management application services is created and set to monitor self-health. Events are received and alerts are generated.
Alerts Only	The ServiceNow Event Management application services and the CIs related to it are not created. Alerts are created but are not bound to a CI.
Disabled	The ServiceNow Event Management application services is not operational. Events are not received, and alerts are not generated.

3. Click **Save**.

Result

The ServiceNow Event Management application services is set according to the value selected for the *evt_mgmt.self_health_active* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the Event Management - Insert Health Monitor scheduled job

Determine what the Event Management - Insert Health Monitor scheduled job is to monitor. After the job runs, you can view the **ServiceNow Event Management** application services.

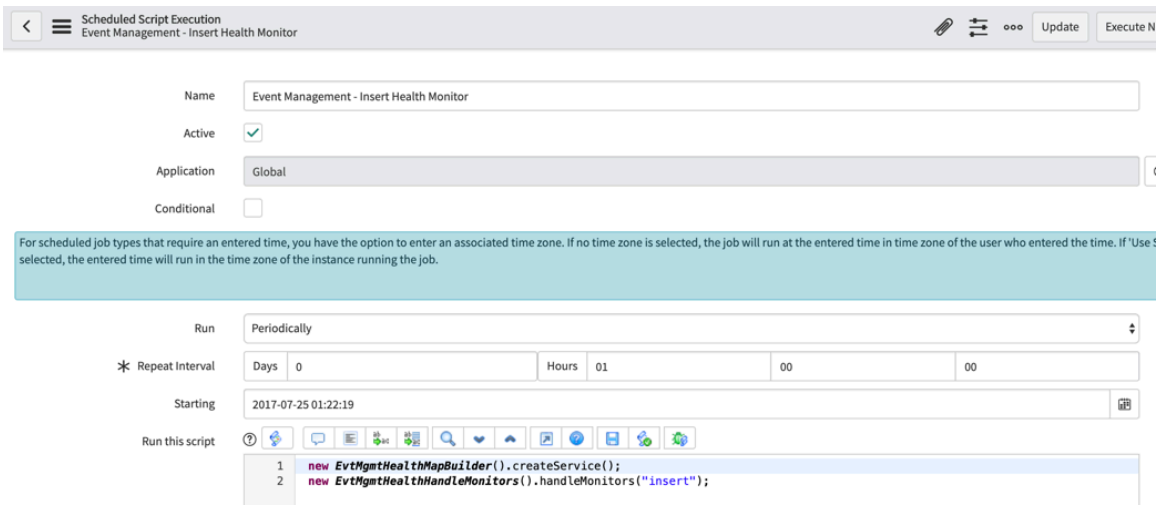
Before you begin

Ensure that the *Enable Event Management — self-health monitoring* property is enabled on the Event Management Properties page (**Event Management** > **Event Management Properties**).

Role required: evt_mgmt_admin

Procedure

1. Navigate to **System Definition** > **Scheduled Jobs**.
2. Locate and select the **Event Management - Insert Health Monitor** job.



3. Modify the scripts indicated in the **Run this script** field to determine what the scripts are to monitor.

Monitor self-health with domain separation

Use domain separation to enable self-health to display Event Management health issues that are based on data, rules, and settings from the logged in user domain. The selected domain must not contain any child domains.

Before you begin

Ensure that the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin is activated and that the MID Server you're connecting to is configured for Event Management.

Role required: evt_mgmt_admin

About this task

Self-health monitoring is domain aware. If the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin has been activated, then self-health displays health issues based on data, rules, and settings from the logged in user domain. If rules and settings aren't defined for a child domain, then the settings of the parent are applied, recursively.

Note: To generate self-health monitoring events in the domain-separated instance, you must specify the domain of these generated events. This is done by specifying the `sys_id` of the required domain in the *evt_mgmt.domain_self_monitoring* property.

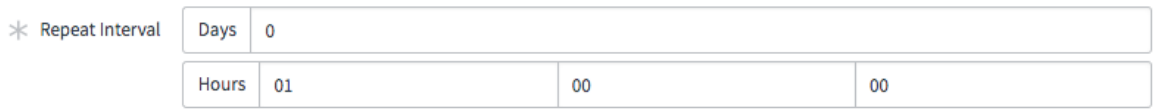
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin isn't activated, adding, or removing a connector or MID Server is immediately reflected in the map.

When the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin is activated, updates are done periodically according to the interval specifications of the Event Management — Insert Health Monitor scheduled job.

Procedure

1. Navigate to **All** > **System Scheduler** > **Scheduled Jobs**.
2. In the **Schedule** list, locate and select the Event Management — Insert Health Monitor job.
3. In the Event Management — Insert Health Monitor job, under Related Links, select **Configure Job Definition**.
4. Set the required periodic update time in the **Repeat Interval** field by specifying the required values.
   The default interval is one hour.

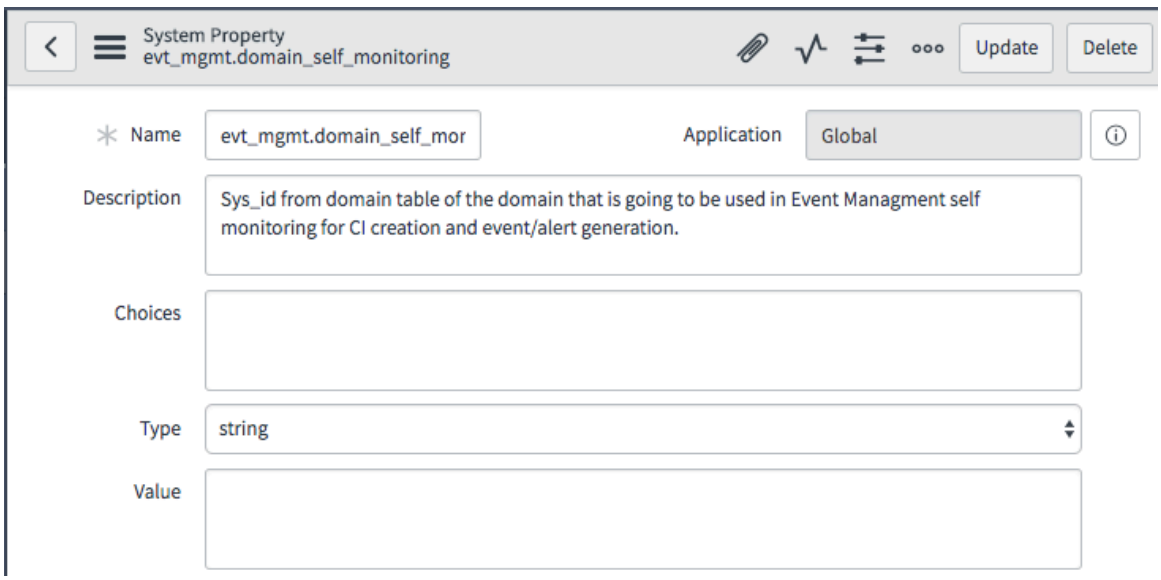


5. Select **Update**.

Result

Further configuration is required for CI creation, receipt of events, and alert generation. The `sys_id` of the domain must be specified in the **Value** field of the *`evt_mgmt.domain_self_monitoring`* property.

1. Navigate to **System Properties All Properties**.
2. Locate and select the *`evt_mgmt.domain_self_monitoring`* property.



3. In the **Value** field, specify the `sys_id` of the domain.
4. Select **Update**.

Configure a self-health monitor

You can configure a self-health monitor to track Event Management components and see that they do not exceed the specified threshold.

Before you begin

Role required: evt_mgmt_admin

About this task

The Monitoring Configurations [em_monitor_conf] table lists the records that determine which Event Management components are being monitored. Each record contains the health monitor script that is relevant to what you are monitoring. If you intend to create a new health monitor script, you must configure a monitor to match the purpose of the custom script. You can configure the monitoring configuration records to track the items that are important to you. For example, you can modify the threshold aspect in the *`Connector's Idle state monitoring`* record, by specifying that the monitoring job frequency is 90 seconds instead of 120 seconds.

Note: Each of the monitoring configuration records can be disabled.

If a monitoring configuration specifies a threshold, the configuration value determines what alert severity to display. Threshold values specify the delay time values in units of minutes.

After the *`Event Management - self-health monitoring`* property is enabled, these jobs are automatically scheduled to run scripts that configure what must be monitored:

- The `Event Management - Insert Health Monitor` scheduled job runs the scripts. Determine what must be monitored by adding or modifying the script in this job, which runs once every hour.
- The `Event Management - Update Health Monitor` scheduled job runs the update scripts. This job runs once every minute.

Use the following procedure to configure whether a monitoring configuration can run and set the frequency of the monitoring job. You can specify the threshold values that, if exceeded, trigger an alert.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Self-Health Monitoring**.
2. From the Monitoring Configurations list, select a monitoring configuration record and modify the required field.
   On the form, fill in the fields.

Monitoring Configuration form

Field	Description
Active	Check box for enabling the monitoring configuration to be active.
Monitoring job frequency [seconds]	Frequency that the monitoring job is run.
Critical Threshold	Any point above the value is considered a critical consequence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Major Threshold	Any point above the value, but below the value of the **Critical Threshold**, is considered a major consequence.
Minor Threshold	If exceeded, the value is considered a minor consequence.
Warning Threshold	If the value is exceeded, a warning is issued.

3. Click **Update**.

Result
The values in the modified monitoring configuration record are compared to the actual values as they occur in events that are received. Alerts are created according to the configuration settings.

Example:
Example 1: Use the following procedure to modify the **Critical Threshold** field of the **Connector's Idle state monitoring** monitor from 30 seconds to 35 seconds. This field determines the number of seconds that pass before an alert is generated when the **Critical Threshold** idle state value of a connector is exceeded. In this example, the **Critical Threshold** field is modified from 30 seconds to 35 seconds.

1. Navigate to **Event Management** > **Settings** > **Self-Health configuration**.
2. From the Monitoring Configurations list, select **Connector's Idle state monitoring**.
3. In the **Critical Threshold** field, modify the value to `35`.
4. Click **Update**.

Result The threshold value of the **Critical Threshold** field is increased from 30 to `35`, thereby increasing the number of seconds that pass before an alert is generated for this threshold.

Example 2: This example describes the configuration of the severity threshold when using the **Connectors Status** monitor. The **Connector Status** monitor has a true (= value 1) or false (= value 0) configuration for the severity threshold. For this monitor, where a threshold has the value `1`, then that severity is displayed. Only one severity threshold can have the value`1`. This example assumes that the required severity displayed is `Minor`.

1. Navigate to **Event Management** > **Settings** > **Self-Health configuration**.
2. From the Monitoring Configurations list, select **Connectors Status**.
3. In the **Minor Threshold** field, specify the value `1`.
4. Click **Update**.

Result The monitor issues an alert if the threshold value of the **Minor Threshold** field is exceeded.

What to do next
Create a customized monitor. A template is provided to assist you to create script that can monitor the specified components. For more information, see Create a self-health monitor to use custom health monitor script.

Create a self-health monitor to use custom health monitor script

You can create a self-health monitor to use custom health monitor script to monitor specified Event Management components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
To augment the self-health monitors that are provided with the base system, you can create a self-health monitor to monitor the components that you specify. The health monitor scripts that are provided with the base system are listed in the following table.

Health monitor scripts provided with the base system

Health monitor script	Used by a monitor to:
Check delay in event processing	Monitor the duration of events [in minutes] that remain in Ready state and are not processed.
Connectors Monitor	Monitor: • Whether the time that a connector in idle state surpassed the threshold [in minutes] configured. • The active status of connectors.
Get Event Processing state	Monitor the time that events are in Ready state. Alerts are sent when this time exceeds the threshold.
MID Server Threshold Alerts	Monitor MID Server health. Events are sent when changes in MID Server state are detected.

You can create alert management rules to respond to and remediate the issues detected by self-health. Alerts are generated based on the specified severity and threshold. Navigate to **Event Management** > **Administration** > **Self-Health Monitoring** for the monitors that are provided with the base instance to monitor the issues detected by self-health, which are:

Monitor	Description
Connector's idle state monitoring	Monitor to verify whether any of the connectors were in idle state that surpassed the threshold [in minutes] that was configured. Health Monitor script selected: `Connectors Monitor`.
Connectors Status	Monitor to track the active status of the connectors. Select only one threshold to configure which severity to invoke using 1 to select the threshold field or 0 to ignore the threshold field. For more information, see Connector status example. Health Monitor script selected: `Connectors Monitor`.
Delay in event processing	Monitor to track the duration of events [in minutes] that remain in Ready state and were not processed. This duration period initiates an alert for the event processing CI with severity according to the configured thresholds [minutes].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitor	Description
	Health Monitor script selected: `Check delay in event processing`.
Event Processing job	Monitor the state of the event processing jobs. An alert is generated when the idle time of a job exceeds the configured threshold. Health Monitor script selected: `Get Event Processing state`.
MID Server MID Server Threshold Alerts	Monitor MID Server MID Server health. Events are sent when issues with MID Server availability and resource thresholds are detected. Health Monitor script selected: `MID Server Threshold Alerts`.

Note: To prevent a self-health monitor from detecting the connector status, at any time you can clear the **Active** check box of the monitor and then click **Update**.

Procedure

1. Navigate to **Event Management** > **Administration** > **Self-Health Monitoring**, and click **New**.
2. On the form, fill in the fields.

Monitoring Configuration form

Field	Description
Name	Descriptive and meaningful name for the monitor.
Description	Text narrative that describes the monitor.
Active	Check box to enable the monitor.
Monitoring job frequency [seconds]	Frequency that the monitoring job should run. Default: `120` seconds.
Last Run	Last run date and time. These values are automatically updated.
Script	Monitoring script. Click the search icon. The existing scripts are listed in the Health Monitor Scripts screen, or click **New** to create a custom health monitor script. For more information about creating a custom health monitor script, see step 3.
Note: Regarding all the following threshold configuration fields: All monitored values are compared against the thresholds. If a monitored value exceeds a threshold, an alert with the appropriate severity is issued.	
Critical Threshold	Any point above the value is considered a critical consequence.
Major Threshold	Any point above the value, but below the value of the Critical Threshold, is considered a major consequence.
Minor Threshold	If exceeded, the value is considered a minor consequence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Warning Threshold	If the value is exceeded, a warning is issued.
Additional information	Further information about the monitor.

3. To create a custom health monitor script, on the Monitoring Configuration form, next to the **Script** field, click the search icon to open the Health Monitor Scripts form, and click **New**.
4. On the form, fill in the fields.

Health Monitor Script form

Field	Description
Active	Check box to enable the monitor.
Description	Text narrative that describes the custom script.
Name	Descriptive and meaningful name for the custom script.
Script	Custom script to run when called from a monitor. A script template is provided as a guide. You can use the Health monitor scripts provided with the base system as examples of how to author the script, and use the script editor tools. Ensure that the custom script includes: Run the monitor function, which is called according to the "monitoring job frequency" setting *runUpdateHealthMonitorScripts(scriptId)*. Add this function to run the monitoring logic. Specify the configuration function that is called every hour *runInsertHealthMonitorScripts(scriptId)*. Add the configuration logic and add a CI if needed. In the navigation pane search field, enter `em_monitor_state.list`. In the Monitoring States [em_monitor_state] table, specify the initialization of the monitor record in the required record. Use the helper functions defined in *EvtMgmtHealthMonitorCommon* and *EvtMgmtEventAlertGenerator* script includes: ○ EvtMgmtHealthMonitorCommon ○ healthMonitorCommon.shouldRun ○ healthMonitorCommon.calculateSeverity ○ EvtMgmtEventAlertGenerato ○ openAlert ○ closeAlert

You can use the Monitoring Configurations [em_monitor_conf] table for self-health monitoring configuration, the Health Monitor Scripts [em_monitor_scripts] table for scripts, and Monitoring States [em_monitor_state] table for displaying the results of the monitor, as initialized inside *runInsertHealthMonitorScripts*.

For more information about script includes and APIs, see:Script includes that are installed with Event Management

5. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
To monitor the Event Management components that you specify, you can configure a self-health monitor that uses the custom health monitor script that you created.

View the Event Management self-health application services map

You can view Event Management application services maps to have a visualization of the data on configuration items (CIs) that comprise this service, and the relations and connections between these CIs.

Before you begin
Role required: evt_mgmt_admin

The Event Management application services topology map only displays MID Servers that have passed validation and connectors that are active.

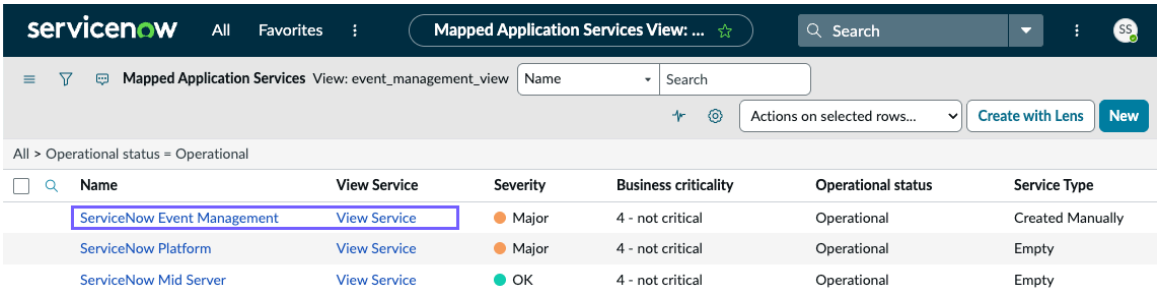
About this task
The Event Management components that are monitored by the self-health application services are listed in the following table:

Components monitored by the self-health application service

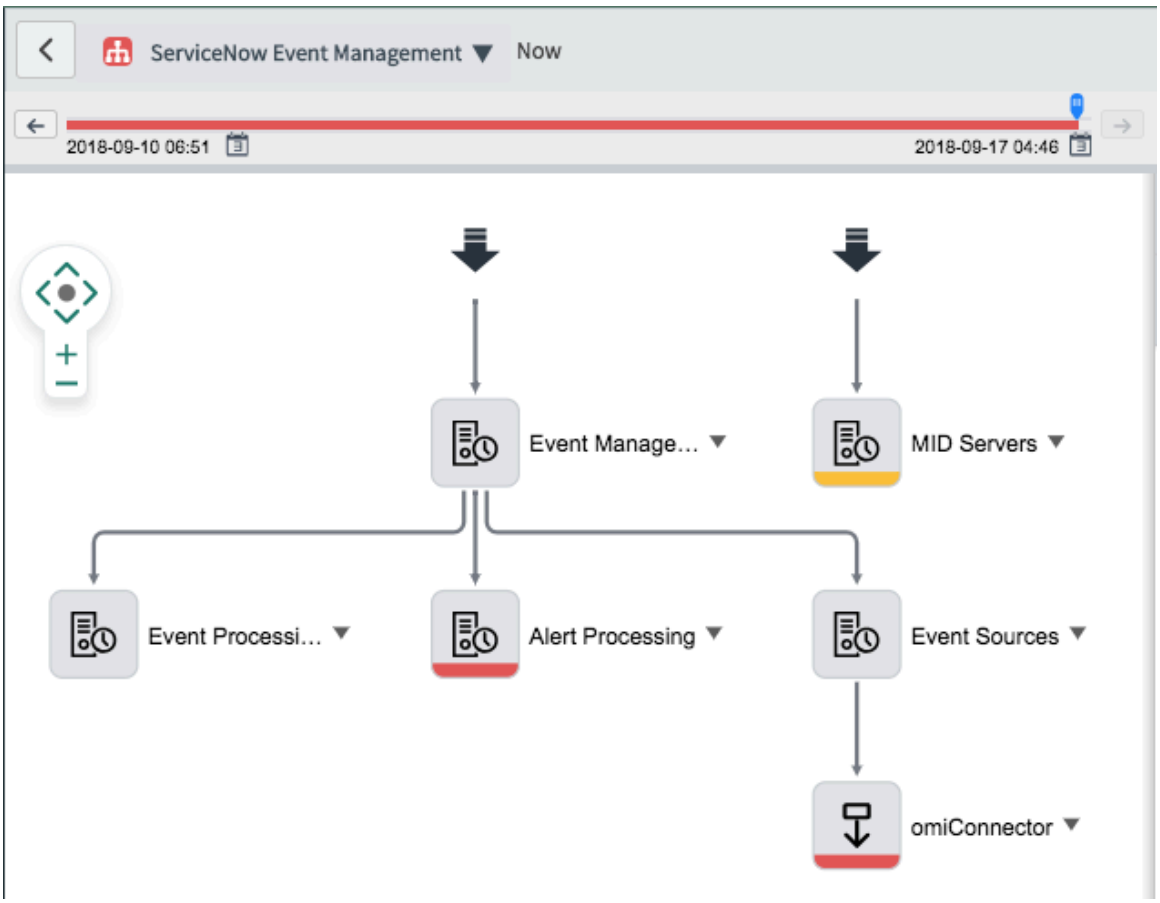
Component	What is monitored
Event connectors	For each connector: • Status: Success or Error • Delay: Elapsed time from 'last run time' (above threshold)
Event processing jobs	For each event processing job: • Number of actual jobs executed compared to the number of jobs configured to run. • Delay of any of the event processing jobs above the time set as threshold. • Duration of events in Ready state compared to the specified threshold. • Delay of event rule processing above the set threshold. If there is a delay, an alert is generated and the event rule is disabled.
MID Servers	MID Servers that have been validated are displayed. The MID Server status and the `Ecc_agent_issue` table are monitored. An event is triggered whenever this table is updated. The MID Server status is displayed, either **Up** or **Down**. For information about MID Server health, see MID Server heartbeat

Procedure
1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.
2. Click the **ServiceNow Event Management** application services.
3. On the **Application Services** page, locate **ServiceNow Event Management** and click **View Service**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Displayed on the map are the related MID Servers and the Event Management object, as depicted in the following image; these MID Servers have an **UP** status. MID Servers are updated when they are created or deactivated.



Under the Event Management object is Event Processing, Alert Processing, and Event Sources (for example, connectors). Only **Active** connectors are shown; when a connector is created, the connector is displayed only after it has been activated. The status of active connectors is updated and the status of non-active connectors is not displayed.

In the preceding image, the health of Event Management components is displayed. The omniConnector component has a red bar, indicating that a critical alert has occurred that affects this connector. In addition, this critical alert impacts the parent Alert Processing object, which as a result, has a red bar.

Result

You can select the configuration item that has a critical alert and change the impact from parent to application service.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create maintenance rules

Use maintenance rules to mark CIs in maintenance status. When in maintenance status, these CIs are excluded from impact calculation.

Before you begin

Role required: evt_mgmt_admin

About this task

You can define rules to mark CIs that match the specified criteria as being in maintenance status. The marked CIs populate the Impact Maintenance CIs [em_impact_maint_ci] table.

Note: When running maintenance rules, the cmdb_ci status of matching CIs is not changed. However, matching CIs are flagged in the em_impact_maint_ci table by these rules and this status is considered for impact and alert calculations.

The field flagged by this rule as being in maintenance status is the CMDB status field.

Note: To activate a maintenance rule, select the **Active** field in the maintenance rule. To deactivate a maintenance rule, clear the **Active** field.

The maintenance rules provided with the base instance are:

Default maintenance rule	Description
CI in Change Window	Where the CI has an active change window, the matching CIs are marked as being in maintenance status. The rule runs a query against the change request [change_request] table to determine whether the rule is applied. All these conditions in the change_request table must be met: • **State** is one of these options: Scheduled, Implement, Work in Progress, or Open/New (state in (-2, -1, 1, 2)). • **Approval** is Approved (approval = 'approved'). • The change request window is active, that is, the current time is between **Planned start date** and **Planned end date**, or the current time is between **Actual start date** and **Actual end date**. • The change request record is not an on-hold record (on_hold='false'). **Note:** All these conditions must be present for the CI to be placed in maintenance status by this rule. For example, if the **State** of the change request approval status is `Change is waiting for approval`, then the change is not added to the em_impact_maint_ci table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default maintenance rule	Description
Maintenance status of CI	CIs whose CMDB status field is **In Maintenance** are flagged by this rule as being in maintenance status. By default, retired CIs are not included in CIs that are **In Maintenance**. To include retired CIs: **1.** Navigate to **All Properties**. **2.** Select **New**. **3.** Configure the *evt_mgmt.maintenance_rule_include_retired* property with **Value = true**. **Note:** Including thousands of retired CIs may decrease system performance.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Maintenance Rules**.

2. Click **New**.

3. Fill in the fields, as appropriate.

Column heading	Description
Name	The maintenance rule name.
Active	Select to activate the maintenance rule.
Advanced	Select to enable the optional script section to display.
Description	Information that describes this maintenance rule.
Flag CIs that run on this host	Select to flag all applications running on the recognized host as being in maintenance.
Table	Select the table that contains the CI that you require.
Filter	Specify how to select the data.
CI field name	Select the CI from the list. The list is populated according to your selection in the **Table** field. If a CMDB table, or a table derived from CMDB, was selected, specify `sys_id` for the **CI field name**. Otherwise, specify the required CI field that you want to use. See the examples.

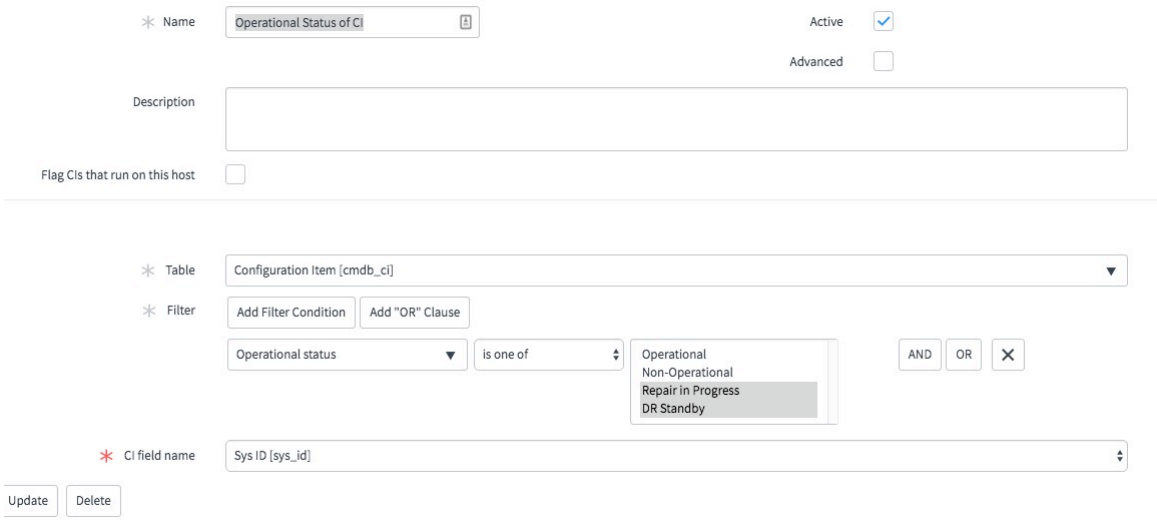
4. Click **Submit**.

Example:

Example of a maintenance rule using a CMDB table.

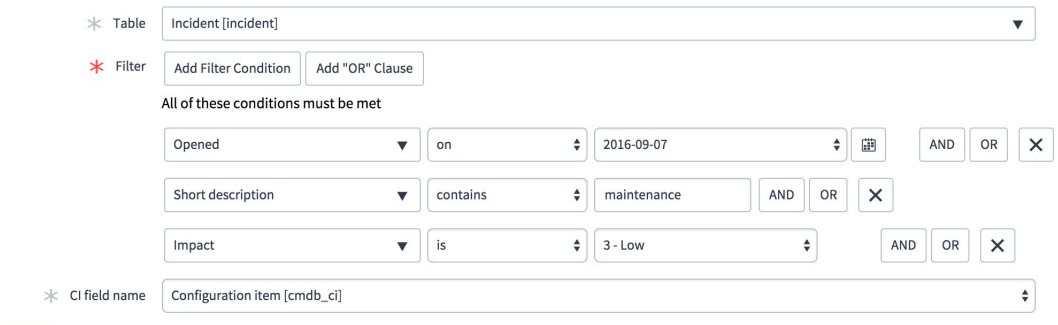
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assume that a company defines a CI as being in maintenance when the Operational Status of the CI is either **Repair in Progress** or **DR Standby**.



Example of a maintenance rule using a table other than CMDB.

Assume that a company uses Incident records to track maintenance. Any maintenance request is translated to an incident when it has a description that starts with “Performing maintenance on CI”. As long as the status of such an incident is open, this status indicates that the maintenance is in progress. For the **CI field name** field, specify a CI name from the table that was chosen, in this case **Incident**.



Example of a maintenance rule that uses the advanced script feature.

In the Maintenance Rule page, select the **Advanced** option. Customize the provided example script:

```
var now_GR = new GlideRecord('cmdb_ci');
gr.addQuery('name', 'your_name_here');
gr.query();
while (gr.next()){
 result.push(gr.sys_id +'');}
```

The return value for this example script is a text string that represents an array of CI IDs, for example, ['sys_id1','sys_id2','sys_id3'].

You can use this script as an example to prepare your own customized script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
(function findCisInMaint(){
var result = [];

//Your code goes here, this is an example of setting CIs in maintenance
var gr = new GlideRecord('cmdb_ci');
gr.addQuery('name', 'your_name_here');
gr.query();
while (gr.next()){
 result.push(gr.sys_id +''); //The array should be a string array, make sure to add strings
}

//Make sure to create a string representation of the array
return JSON.stringify(result);

})();
```

Resolve an incident related to an alert

When you resolve an incident that is associated with an alert, the alert can also close according to the *evt_mgmt.incident_closes_alert* property.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Open an incident.
2. Click **Resolve Incident**.

   The corresponding alert is closed, resolved, or left alone as specified by the *evt_mgmt.incident_closes_alert* system property.

   The alert may not close immediately when the incident is closed. Depending on the value of the *evt_mgmt.alert_rule_close_delay* parameter, the alert may close 5 seconds after the last alert update. This value (in seconds) is defined in the parameter. To use the property, you need to create the property with the same name and assign the required value to it. For more information on how to create a property, see Add a system property.

Close an alert

Close an alert by an event or a user action. Closing an alert also closes any related incident that is not already resolved or closed.

Before you begin

Role required: evt_mgmt_admin or evt_mgmt_operator

About this task

An alert can be closed manually, automatically by a close or clear event, or when a related incident is resolved. Whether the alert is closed when the incident is closed is determined by the *evt_mgmt.incident_closes_alert* property.

When a Clear event is triggered for an open alert, the corresponding alert is set to the "Closed" state. Closing an alert also closes any related incident that is not already resolved or closed. This default behavior can be configured using the *evt_mgmt.alert_closes_incident* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Event Management** > **All Alerts**.
2. Select the alert you want to close.
3. In the Alert Form, select **Close**.
   The alert closes without confirmation. If the alert has any resolved or closed incidents, a work note is added to the incident indicating that the related alert was closed.

   If an alert has an open incident that is not related to any other open alerts, the incident is either closed, resolved, or left unchanged based on the *evt_mgmt.alert_closes_incident* property.

Reopen an alert

Additional events can cause reopening of alerts, or you can reopen an alert by changing its state. When an alert reopens, any associated incidents can also be updated or reopened according to the incident state and the *evt_mgmt.alert_reopens_incident* property.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
When an alert is reopened, the related incident is processed as follows:

- If the incident is not *Resolved* or *Closed*, a work note is added to indicate that the related alert was reopened.
- If the incident is *Resolved* or *Closed*, the incident is reopened, a new incident is created, or nothing is done, depending on the *evt_mgmt.alert_reopens_incident* property value.
  - If the incident is reopened, work notes are added to the incident.
  - If a new incident is created, any matching alert management rule, alert action rule, and task template applies to the incident. If there is no matching alert action rule or template, fields from the existing incident are copied to a new incident.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Search by alert number.
3. In the **State** field, click **Reopen**.
4. Click **Update**.

Alert insight properties

Use these properties to configure alert insight.

The role required: evt_mgmt_admin

The following alert_insight properties are under sys_properties.

Property	Usage
Time Frame	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Usage
evt_mgmt.alert_insight_alert_history_min	Set the time frame (in minutes) to retrieve repeated and similar alert data. Default `43200` (30 days) **Note:** Alerts are retrieved regardless of their state (open / reopen / flapping / closed).
evt_mgmt.alert_insight_closed_alert_window	Set the time frame (in minutes) to retrieve alerts that were already closed. It is the time after the alert last updated date. Default: `4320` (3 days)
Similarity	
evt_mgmt.alert_insight_alert_same_as_filter	This property is a comma-separated string that defines which of the alert fields is used to consider alerts to be similar. Default: `source,type,resource,metric_name`
Related CIs	
evt_mgmt.alert_insight_related_cis_topology_levels The relationship types are: • CMDB based (metadata rules and suggested relations) • Within application services • Within Alert groups	For 'Within application service' relationship type, this property sets the depth or the maximum level of relationship of retrieved CIs. Default: 3
Score	
evt_mgmt.alert_insight_group_mapping	This property sets the score for within alert group relations. Default: `2`
evt_mgmt.alert_insight_level_1_mapping	This property sets the score for level 1 relationship. Default: 3
evt_mgmt.alert_insight_level_2_mapping	This property sets the score for level 2 relationship. Default: 2
evt_mgmt.alert_insight_level_3_mapping	This property sets the score for level 3 relationship. Default: `1`
Maximum related tasks	
evt_mgmt.alert_insight_max_tasks	Maximum related tasks to retrieve for alert insight. Default: `10`

Metadata rules consideration

The parent-child relationship of CIs is considered. Dependent relationship rules consist of hosting and containment rules, each type modeling the data from a different perspective of the CI.

To manage dependent relationship rules:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To access rules at the class level, use the CI Class Manager. Navigate to **All** > **Configuration** > **CI Class Manager**.
- To access grouped rules, use the Metadata Editor. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Metadata Editor**.

Containment rules represent configuration hierarchy of CIs, describing which CI contains which other CIs.

Hosting rules represent placement of CIs in a business definition, describing what CIs run on.

Modify the alert insight properties to configure the way alert information and analysis appears in the Alert Insight pane.

Related CIs configuration

The following properties control which CMDB relationships to consider for related CIs. The CMDB relationships include regular CMDB relation rules, metadata rules (containment rules and hosting rules), and suggested relations.

Property	Usage
evt_mgmt.related_cis_get_all_relation_types	Get all relation types, not including metadata rules. Default: `false`
evt_mgmt.related_cis_use_containment_rules	Use metadata containment rules. Default: `true`
evt_mgmt.related_cis_use_hosting_rules	Use metadata hosting rules. Default: `true`
evt_mgmt.related_cis_use_suggested_relations_rules	Use suggested relations rules. Default: `false`
evt_mgmt.related_cis_validate_relation_rules	This property controls whether to validate relation of CI according to metadata rules. Default: `true`

Score

Scores are configured per relation type or depth. Scores are accumulated. The higher the score, the more relevant is the related CI to the current CI.

Example: For a CI that was found at level `2` in the same application service of the current CI, the score is 2. The same CI is in the same alert group, so there is an extra score of `3`. The accumulated score is therefore `2+3 = 5`.

Affiliation type

The Affiliation Type column in the **Related Incidents**, **Related Change Requests**, and **Related Problems** tabs shows the type of relationship that the CI of the selected alert and the related CI have.

To see affiliation type relationships, navigate to **All** > **Configuration** > **Identification/ Reconciliation** > **Metadata Editor**.

The parent-child relationship between configuration items is considered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rotate event and alert table for cleanup

The growth of data tables impedes performance. Preserve instance performance by event table rotation and alert table cleanup for status and alert history retention.

Containing the growth of event tables

By default, the Event Management event [em_event] table uses table rotation. The table rotation schedule ensures that new data is written to one of the tables in the rotation group. According to the value of **Clean base rotation** setting, the base table is deleted and then a new round of writing the tables in a daily rotation commences. By default, this table deletion occurs after seven rotations.

To back up events to a custom table, see Event Management configuration preferences.

Containing the growth of alert tables

By default, a scheduled job cleans out the alert [em_alert] table. Table cleanup is done also for impact status and alert history table.

Related topics

- Purge impact status and alert history
- Alert table clean up
- Table rotation

Modify event table rotation

Table rotation is used by Event Management, by default, to contain the growth of event [em_event] tables within the rotation table group.

Before you begin
Role required: evt_mgmt_admin

About this task
Table rotation ensures that event tables grow to a reasonable size.
Each table rotation has a schedule, according to which new data is written to one of the tables in the rotation group. A table rotation group includes the original table plus several additional tables. After the rotation procedure has written the last table in a rotation, the rotation overwrites the first table in the rotation. By default, the table rotation for Event Management is to rotate the em_table to an offload table and the base table cleanup takes place after seven table rotations. For information about backing up events to a custom table, see Event Management configuration preferences.

Procedure

1. Navigate to **All** > **System Definition** > **Table Rotations**.
2. Select the [em_event] table rotation group to modify.
3. Edit the required fields.
4. Select **Update**.

Purge impact status and alert history

Automatically cleans up outdated impact statuses and alert history from the database to free up space, improve system performance, and ensure only relevant data is retained.

Before you begin

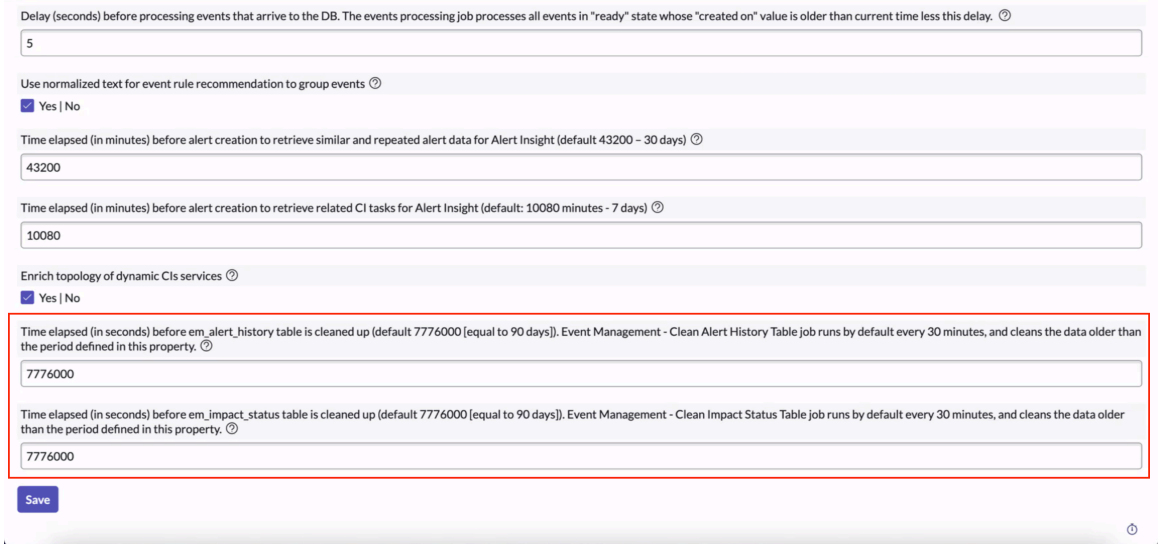
Role required: evt_mgmt_admin

About this task

If records are older than 90 days, by default they are purged. If records are retained for a longer period, larger volumes of data are stored, and performance may be impacted. The data cleanup is done by two jobs: Event Management - Clean Alert History Table and Event Management - Clean Impact Status Table.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. To shorten the retention period, use the highlighted properties.



Related topics

- Rotate event and alert table for cleanup

Clean alert history and impact status tables

Schedule jobs to mark and remove old alert records in the Alert History [em_alert_history] and Impact Status [em_impact_status] tables, to prevent the tables from becoming overloaded with data.

Before you begin

Role required: evt_mgmt_admin

About this task

Schedule the following jobs to remove old alert records:

- **Backfill**: Determines when alerts are to be marked for deletion.
- **Clean**: Deletes the alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The records in the [em_alert_history] and [em_impact_status] tables are deleted by default after three months. This is controlled by the properties *evt_mgmt.impact_calculation.cleanup_age_seconds.em_alert_history* and *evt_mgmt.impact_calculation.cleanup_age_seconds.em_impact_status*. The default value is 7,776,000 seconds (equivalent to 90 days).

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
   The **Scheduled Jobs** page appears.
2. To determine how often to mark alerts for deletion on the **Impact Status** table:

   a. Locate and select the **Event Management - Backfill Impact Status Table** job.
   The **Scheduled Script Execution** page appears.

Scheduled Script Execution page

   b. In the **Repeat Interval** field, configure how often you want the job to run.
   To run the job immediately, select **Execute Now**.

   c. Select **Update**.

3. To remove old alerts from the **Impact Status** table:

   a. Locate and select the **Event Management - Clean Impact Status Table** job.
   The **Scheduled Script Execution** page appears.

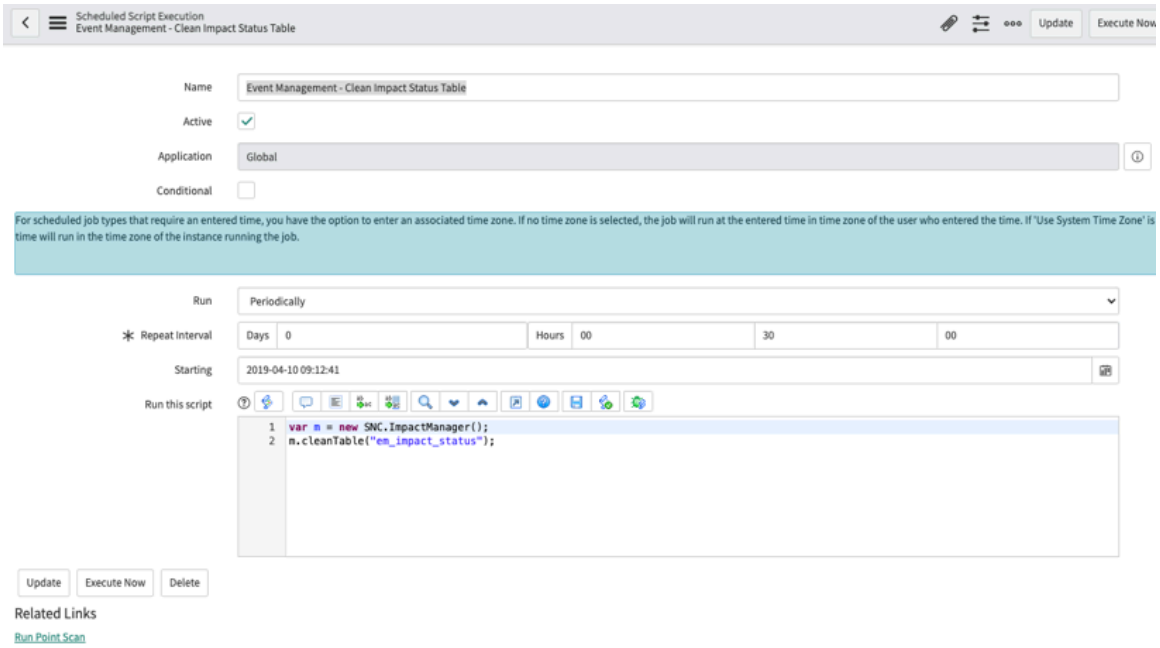
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



b. In the **Repeat Interval** field, configure how often you want the job to run.
To run the job immediately, select **Execute Now**.

c. Select **Update**.

4. Repeat steps 2 and 3 to perform the Backfill and Clean jobs on the **Alert History Table**.

Alert table clean up

The Scheduled Jobs feature runs a script to automatically close alerts in the Alerts [em_alert] table that meet specific conditions, helping reduce alert noise and keep the system clean and efficient.

Before you begin

Role required: evt_mgmt_admin

About this task

When the Event Management plugin is activated, by default a job is scheduled to run the `Event Management - auto close alerts` script to automatically close alerts in the alerts table that meet the specified conditions. The default retention policy for closed alerts is that the system deletes closed alerts if it is not updated for 90 days. For more information on the scheduled job, see Table cleaner.

Due to the high level of traffic to the table, you cannot audit the Alert table [em_alert] as a whole. Instead, audit selected fields of interest on the table.

Procedure

1. Set the table to `audit = true`.

2. Set `audit = true` on the relevant fields.
To avoid an excess of audit records, audit only the fields that are necessary for auditing.

Result

The `Event Management - auto close alerts` script runs automatically and repeatedly at the scheduled time and closes alerts that meet the specified conditions.

Alert grouping

Alert grouping is the process of organizing and consolidating related alerts into sets based on common characteristics or criteria. This helps in simplifying alert management by reducing noise, making it easier to prioritize, track, and address issues efficiently. Grouped alerts provide a clearer overview of related incidents, facilitating quicker root cause analysis and remediation.

Understanding alert grouping

Watch this brief video to learn how alert grouping organizes alerts into clusters based on specific criteria.

How alert grouping works

Alert grouping enhances operational efficiency and optimizes alert management by categorizing alerts. Here's how it works:

1. Event consolidation: Event Management collects alerts from multiple sources, providing a centralized view of notifications and alerts. This consolidation enables teams to manage alerts more efficiently and recognize critical issues more easily.
2. Contextual Enrichment: Alerts are enriched with data from the Configuration Management Database (CMDB), which contains detailed information about applications and infrastructure components. This context allows teams to better understand the significance of alerts and prioritize responses based on their impact.
3. Intelligent Correlation: Event Management utilizes different types of machine learning algorithms to automatically group related alerts. This intelligent grouping reduces alert noise by combining similar alerts, allowing teams to concentrate on significant issues rather than being inundated with multiple notifications.

Benefits of alert grouping

- Creating automated alert groups by aggregating alerts based on predefined patterns.
- Correlating alerts using timestamps and CI identification to form automated alert groups.
- Forming CMDB based alert grouping by correlating alerts based on CI relationships in the CMDB.
- Correlating alerts based on text similarity of alerts using NLP (Natural Language Processing).

Related topics

- Synchronizing alert response with automated alert grouping

Alert grouping and use cases

Alert grouping methods range from user-defined approaches, like Manual and Rule-based to advanced, fine-tunable algorithms, including Automatic, Mixed, Text-based, Log Analytics, and Network Traffic-based grouping.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases

Type	Description	Use case
Log Analytics Grouping	Alerts are grouped based on the analysis of log data. This involves correlating log entries to identify related alerts and issues. By leveraging log patterns and sequences, this method can detect complex, multi-step problems across the IT environment.	An online gaming company enhances server stability by implementing proactive log analytics. They monitor logs from game servers in real-time and use analysis tools to detect patterns of errors that occur before crashes. For instance, the analysis reveals that certain error patterns appear about 30 minutes prior to server crashes. By setting up automated alerts for these patterns, the company can initiate remediation actions, such as restarting services or reallocating resources, before a crash occurs. This proactive approach prevents disruptions, minimizes downtime, and improves the gaming experience by addressing issues before they impact players.
Rule-based Grouping	Alerts are grouped according to predefined rules and criteria set by users. These rules might include specific conditions, such as thresholds or event types. This method is effective for consistent and repeatable patterns but requires maintenance of the rules.	In a data center managing an e-commerce website, rule-based alert grouping helps handle high traffic during events like flash sales. Alerts about server issues, such as high CPU usage, are designated as parent alerts. These parent alerts are linked to child alerts that report related problems, like slow database queries. The rules ensure that server-related alerts are grouped with their symptoms, allowing the IT team to quickly identify and address server overload issues. This approach improves issue resolution efficiency and minimizes downtime.

Alert grouping types and use cases (continued)

Type	Description	Use case
Automated Grouping	Advanced algorithms automatically identify and group related alerts based on patterns and similarities in the alert data. This method leverages machine learning and AI to adapt to new and unknown issues, providing proactive alert management. Event Management groups alerts that are similar, but not necessarily identical, based on the proximity in time of the last event generation. Alerts with the same CI and the same pattern identifier are grouped together. Automatic alert grouping consists of the following components. • Alert Aggregation Learner (**Service Analytics Alert Aggregation Learner - Daily**): This offline job runs daily to process past alerts and perform statistical analysis to build alert patterns. For details, see Configure pattern based alert grouping. • Real-time Alert Aggregation job (**Service Analytics group alerts using RCA/ Alert Aggregation**): This job runs every minute to generate alert aggregation groups based on alert patterns, CMDB relationships, text similarity, user-defined alert clustering tags, and network traffic connection between processes.	A large financial institution uses machine learning to manage alerts from numerous servers and applications. The system analyzes historical alert data to recognize patterns, such as database server failures frequently being accompanied by client connection errors. It then automatically groups related alerts together. For instance, when a new database server failure alert is detected, it is grouped with previous connection error alerts. This automated grouping helps the IT and security teams quickly identify and address issues, improving response times and reducing downtime.
Mixed Grouping	Mixed Grouping method combines alerts using multiple grouping strategies, such as CMDB-based grouping and tag-based grouping, into a single, cohesive group.	Use case for CMDB-based grouping: A telecommunications company uses CMDB data to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases (continued)

Type	Description	Use case
	It leverages the strengths of each strategy to reduce alert noise, improve alert correlation, and highlight the true root cause of incidents. • CMDB-based Grouping: Alerts are grouped based on Configuration Item (CI) relationships and dependencies from the Configuration Management Database (CMDB). This approach ensures that alerts related to specific infrastructure components or services are grouped together, providing context-aware alert management. • Tag Cluster Grouping: Alerts are categorized and grouped using tags or labels that represent common attributes, such as application, server type, or geographic location. This method allows for flexible and dynamic grouping based on evolving tagging strategies.	manage alerts related to their network infrastructure. Alerts related to a specific network router and its connected devices are grouped together based on their CMDB relationships, enabling the network team to see all related issues and address the root cause efficiently. Use case for tag cluster grouping: An organization without a CMDB manages a Linux server running various services. The IT team uses a **Node** field in each alert to identify the server, and they group all events related to services on the same server based on this node value. For example, they cluster alerts like Service A down and Service B high CPU usage together if they share the same node value. This approach helps the IT team address server-related issues more efficiently. By clustering alerts for the same node, application, or IP address, the team streamlines their response efforts and resolves issues more effectively, even without a CMDB.
Network-traffic based Grouping	Network-traffic-based alert grouping analyzes network connections between processes across hosts to identify related alerts. This method leverages service candidates detected through ML Service Mapping, ensuring that alerts related to network traffic issues are grouped together for better context and faster alert resolution.	A cloud-based e-commerce platform experiences transaction slowdowns, causing delays in payment processing. Traditional alerting generates separate alerts for API timeouts, database lags, and network issues, making it difficult to pinpoint the root cause. With Network-Traffic Based Grouping, alerts

Alert grouping types and use cases (continued)

Type	Description	Use case
		are automatically grouped based on process-to-process connections identified through ML Service Mapping. The system detects that payment gateway services, fraud detection, and order processing are part of the same service candidate. This reveals that an overloaded fraud detection process is causing transaction bottlenecks. By scaling up the service, the team quickly resolves the issue, minimizing downtime and improving customer experience.
Text-based Grouping	Alerts are grouped by analyzing the text content of alerts to identify similarities and related issues. Natural language processing (NLP) techniques are used to find commonalities in alert description, metric name, and ci class, making this method effective for unstructured data.	In an organization that uses Zoom rooms for virtual meetings, the IT team receives numerous alerts when the Zoom room server experiences an outage. Each alert might indicate a different Zoom room being down, such as Zoom room no 10 is down, Zoom room no 11 is down, and so on, with the only difference being the room number. For organizations with a CMDB, these alerts can be grouped using CMDB relations, as the system can correlate the alerts based on the server's impact on all associated Zoom rooms. However, for organizations without a CMDB, text-based grouping can be used. The system applies natural language processing to group alerts with similar descriptions, helping the IT team quickly identify that multiple Zoom rooms are affected by the same underlying server issue. This approach allows the IT team to efficiently address the root cause of the problem,

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases (continued)

Type	Description	Use case
		reducing downtime and improving response times.
Manual Grouping	Users manually select and group related alerts based on their expertise and understanding of the system. This approach allows for precise control but can be time-consuming and may miss automated correlations.	A system administrator receives multiple alerts about different services failing on a single server. The admin manually groups these alerts, recognizing that they are all related to a single hardware failure on that server, and prioritizes fixing the hardware issue to restore all services.

Manual and rule-based alert grouping differs from algorithm-based grouping mainly in how the parent alert is chosen. In manual, rule-based, or log analytics grouping, one of the real alerts is designated as the parent alert. In Automatic, CMDB, Text-based, Tag Cluster modes, and Network Traffic, a virtual alert, representing the oldest and most severe alert in the group, is created as the parent alert.

Note: In domain-separated environments, alert groups are created only for alerts within the same domain.

For information on scheduled jobs and parameters, refer to Scheduled jobs and parameters for alert grouping. For detailed information on different grouping types, see Alert grouping types and creation methods.

Scheduled jobs and parameters for alert grouping

Automate alert organization by configuring jobs to group alerts based on predefined criteria and parameters.

To group alerts in Automated, CMDB, Text-based, Tag Cluster, and Network Traffic Correlation groups, the scheduled job named **Service Analytics group alerts using RCA/Alert Aggregation** is typically run once per minute. This job handles the grouping of alerts based on the specified method. Additionally, you can run multiple scheduled jobs in parallel to manage alert grouping more efficiently. For further details, see Run multiple scheduled jobs for alert grouping.

To define which alerts are grouped, the following parameters are used:

- *sa_analytics.aggregation_enabled*: This parameter enables alert grouping created by the schedule job. Set the property *Enable alert aggregation for Automated, CMDB, and Text-Based groups* to `true` to activate this feature.

  Note: This property also applies to Tag Cluster and Network Traffic Correlation grouping.

- *sa_analytics.agg.query_dynamic_window*: By default, this is set to 10 minutes (600 seconds). It defines the maximum time difference allowed between the last event generation times of two alerts that can be grouped together.
- *sa_analytics.agg.query_max_group_lifetime*: This parameter specifies the maximum time period from the generation of the first alert to the last alert in a group, with a default of 30 minutes (1800 seconds). If events arrive with a delay exceeding this period, the *sa_analytics.agg.group_expiration_time* parameter can be used to extend the grouping time beyond 30 minutes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Some parameters, such as **sa_analytics.agg.query_dynamic_window**, **sa_analytics.agg.query_max_group_lifetime**, and **sa_analytics.agg.group_expiration_time**, are not provided out of the box. To use these properties, you need to create properties with the same names and assign the required values to them. For more information on how to create a property, see Add a system property.

Example: How alerts are grouped

For tag-cluster grouping, alerts are added to a group based on the timeframe parameter defined in the alert tag clustering settings. For automated, CMDB, and text-based, network traffic grouping, alerts are aggregated as follows.

Consider the following alerts with the same CI. (All of them may be added to the same CMDB group).

- Alert1: Initial event generation at 01:00:00 AM
- Alert2: Initial event generation at 01:11:00 AM
- Alert3: Initial event generation at 01:13:00 AM
- Alert4: Initial event generation at 01:16:00 AM
- Alert5: Initial event generation at 01:25:00 AM
- Alert6: Initial event generation at 01:34:00 AM
- Alert7: Initial event generation at 01:43:00 AM

Alert1 and Alert2 are not grouped due to the time gap exceeding 10 minutes. Alert2 and Alert3 create a group at 01:13:00 AM. The 10-minute dynamic window starts at 01:13:00 AM, with the following:

- Alert4 is added to the group at 01:16:00 AM, restarting the 10-minute window.
- Alert5 and Alert6 are added to the group as their event times are within the 10-minute window.
- Alert7 is not added to the group because it arrives 9 minutes after Alert6, exceeding the *sa_analytics.agg.query_max_group_lifetime* limit of 30-minute maximum group lifetime from the initial group creation (01:13:00 AM + 30 minutes = 01:43:00 AM).

Note: After an alert is created, correlation logic is applied only once. Changes to the alert after its creation are not re-evaluated for correlation. If correlation is not established initially, the alert may still be added to a group later—but only if a new incoming alert matches and triggers grouping logic.

Configure scheduled job-based alert grouping

Set up rules and parameters to group related alerts automatically, streamlining alert management and reducing alert noise.

Before you begin

Role required: evt_mgmt_admin

About this task

The scheduled job Service Analytics: Group Alerts Using RCA/Alert Aggregation helps in grouping alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. On the Alert Correlation Properties page, enable the relevant properties.
   - Enable CMDB correlation (*sa_analytics.agg.query_cmdb_correlation_enabled*).
   - Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*).
   - Enable ML based Automation correlation (*sa_analytics.specific_patterns_enabled*).
   - Enable Text based correlation (*sa_analytics.text_based_group_enabled*).
   - "Group by" property, with comma-separated list of field names that need to have matching values across alerts to allow alerts to be grouped together. The property can contain alert field names (such as assignment_group), CI field names (such as alert_cmdb_ci.location), alert additional info field names (such as additional_info.state) or alert tags (such as t_data_center). When the specified field values match each other between alerts, those alerts can be grouped together (*sa_analytics.agg.group_alert_with_same_group_by_fields*).
   - Max number of relations between CIs in a topology which form a CMDB group (*sa_analytics.agg.query_cmdb_graph_walk_nodes*).
   - Use all CMDB relations for CMDB group correlation (*evt_mgmt.related_cis_get_all_relation_types*).
3. Select **Save**.

   To group alerts without a CI as Text-based or ML based groups, set *sa_analytics.enable_no_ci_grouping* to `true`. Ensure the Feature Identifier includes both the node and metric name. For details on configuring the feature identifier, see Specify and manage pattern identifier attributes for alert grouping.

4. **Optional:** Set *evt_mgmt.alert_groups_reasoning.enable_worknotes* to `none` to prevent group reasoning work note display.

   (Optional) By default, a work note appears in the **Activities** tab when a group is created or updated, showing the grouping reason.

Automated alert grouping

CMDB based alert grouping

Text-based alert grouping

Tag cluster alert grouping

Run multiple scheduled jobs for alert grouping

Run multiple scheduled jobs in parallel to group alerts. This helps prevent overwhelming the system during surges (alert storms).

Before you begin

Role required: admin

About this task

The current scheduled job operates with a single thread. During alert surges (alert storms), processing takes significantly longer. To address this impact, now multiple jobs can process

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

alerts within the scheduled job. This enhances scalability and improves overall performance during high-volume periods.

The number of jobs to be running in the alerts processing is defined in a new property *sa_analytics.agg.alert_grouping.num_of_jobs*. The job number is sent as a parameter to the relevant method.

Note: In this scenario, the procedure for increasing the scale-out from no scale-out (single job) to 2 jobs is shown.

You can efficiently manage and run multiple scheduled jobs in parallel to group alerts using specific properties. These properties allow you to tailor the grouping criteria to meet your needs, ensuring that alerts are processed based on assignment groups, domain separation, or group-by fields. The available properties are:

- *sa_analytics.agg.group_alert_with_same_assignment_group_only*: Groups alerts that share the same assignment group. By default, the value is set to false. If you want to set this property to true, create a property with the same name and set the value to true.
- *sa_analytics.agg.group_alert_with_same_domain_only*: Groups alerts that belong to the same domain. By default, the value is set to true.
- *sa_analytics.agg.group_alert_with_same_group_by_fields*: "Group by" property, with comma-separated list of field names that need to have matching values across alerts to allow alerts to be grouped together. The property can contain alert field names (such as assignment_group), CI field names (such as alert_cmdb_ci.location), alert additional info field names (such as additional_info.state) or alert tags (such as t_data_center). When the specified field values match each other between alerts, those alerts can be grouped together.

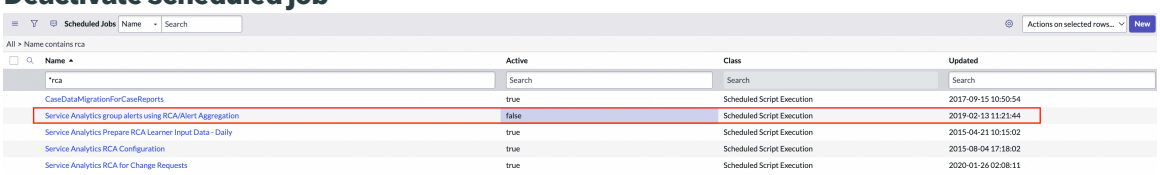
Note: To ensure efficient scale-out, at least one of these properties must be defined to establish some form of separation or grouping logic. This is necessary to ensure that all alerts belonging to the same group are processed correctly by specific jobs, creating a logical division of alerts.

Without setting at least one of these properties to true, the alerts will not be properly segregated. For instance, if you do not define any grouping logic (set any property to true) and both the assignment group and domain separation are set to false, the scale-out will not work, and all alerts will be processed by a single scheduled job.

Procedure

1. Navigate to **All** > **System definition** > **Scheduled jobs**.
2. Locate the scheduled job: Service Analytics group alerts using RCA/Alert Aggregation.
3. For all existing scheduled jobs Service Analytics group alerts using RCA/Alert Aggregation, set the value in the **Active** column to **false**.

Deactivate scheduled job



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Create a new property *sa_analytics.agg.alert_grouping.num_of_jobs*, or if it already exists, update the property to the desired number of multiple scheduled jobs for alert grouping such as 2 or 4.
5. Clone the scheduled job definition from the Scheduled jobs [sys_auto] table to the desired number of multiple scheduled jobs for alert grouping.
6. In the new jobs, in the Run this script section, call the new JS function queryS0 (instead of old query() function) and transfer to it the job number as input parameter.

   Note: Job numbers must start at 0 and follow consecutively: 0, 1, 2, 3, 4...

7. Fix hashes in the [sa_analytics_status] and [sa_hash] table by selecting the earliest hash with the same prefix, cloning it, and adding the hash name suffix, for example, "_groupingX", where X is the job number.

   In the case of scaling out from no scale-out (single job) to 2 jobs, and for the hash name `last_alert_process_time`, clone it to maintain the same value as in `last_alert_process_time`:

   - `last_alert_process_time_grouping0`
   - `last_alert_process_time_grouping1`

   In the case of scaling out from no scale-out (single job) to 4 jobs, and for the hash name `last_alert_process_time`, clone it to maintain the same value as in `last_alert_process_time`:

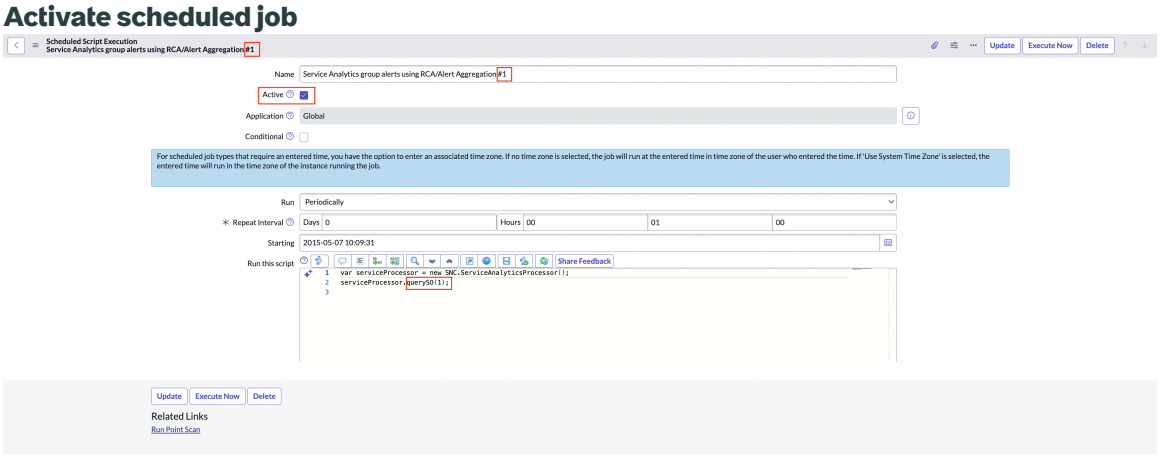
   - `last_alert_process_time_grouping0`
   - `last_alert_process_time_grouping1`
   - `last_alert_process_time_grouping2`
   - `last_alert_process_time_grouping3`

Hashes to be cloned

Hash name	Table
query_job_last_run	sa_hash
last_alert_process_time	sa_analytics_status
last_staging_table_update_time	sa_analytics_status
last_staging_table_truncate_time	sa_analytics_status
analytics_trigger_g1	sa_hash

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Activate the new jobs by selecting the **Active** check box for each job.



Result

The scheduled job Service Analytics group alerts using RCA/Alert Aggregation is set up to run multiple jobs simultaneously for alert grouping.

Configure alert correlation logic order

Improve alert management by enabling users to customize correlation logic order. This feature empowers you to fine-tune correlation methods to their specific needs, enhancing alert prioritization and response efficiency.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the property *sa_analytics.agg.query.group_logic_order*.

   Default value is “CMDB,NETWORK_TRAFFIC,TAG_BASED,PATTERN,TEXTBASE". This is a comma separated list of the grouping types in the order of their execution.

   Note: If one of the grouping types is not specified in the property, it needs to be added manually. Alert correlation rules are trigger-based and applied immediately when an alert is created or updated, before other grouping algorithms.

   - CMDB: CMDB grouping
   - NETWORK_TRAFFIC: Network traffic grouping
   - TAG_BASED: Tag cluster grouping
   - PATTERN: Automated CI-based patterns grouping
   - TEXTBASE: Text-based grouping
3. Use the property *sa_analytics.agg.query.group_logic_order* to define or modify the order of correlation methods based on your preferences.

Related topics

Alert grouping and use cases

Configure filters for automatic alert groups

Filter alerts and alert groups to reduce alert noise. Only alerts that match the filter are included in the group of the selected group type (Automated, CMDB, or Text).

Before you begin

Role required: evt_mgmt_admin

About this task

If your filter specifies alerts whose configuration item class is not Linux, then only alerts with non-Linux configuration items are included in the group of the selected group type.

Note: After the filter is created, it will only apply to new alerts.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Automatic Group Filter**.
2. On the Automatic Group Filters page, either select an existing group filter or create a new filter.
3. If you are creating a new filter:

   a. Select **New**.

   b. Enter a name for the filter in the **Name** field.

   c. Select the alert group type:

   - Automated
   - Test
   - CMDB

   You can assign more than one group type with a single filter condition.

   Each group type can have only one active filter.

4. In the **Alert Filter** section, create conditions for the alert to meet to be included in the group.
5. Save the alert group filter.
   - For an existing alert group filter, select **Submit**.
   - For a new alert group filter, select **Update**.

Result

The filter condition appears on the SA Grouped Alert Filters page in the **Alert filter** column.

Apply alert group filters to aggregated groups

Reduce noise by locating only aggregated alert groups that match a configured filter. Aggregated groups are groups created for alerts with identical CIs and pattern identifiers.

Before you begin

Note: This procedure is relevant for advanced configuration only.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Automatic Group Filters**.
2. On the Automatic Group Filters page, add the **Aggregated** column.
   a. Select the Personalize List icon ( ) in the upper right corner.
   b. Move the **Aggregated** entry from the **Available** list to the **Selected** list.
   c. Select the up/down arrows to determine where the **Aggregated** entry is to appear on the form.
   d. Select **OK**.
3. On the Automatic Group Filters page, double-click the value in the **Aggregated** column.

   Aggregated groups apply only to automated alert groups. When the Aggregated option appears, it is automatically activated for an automated alert group.

   Note: If the value of the **Automated** field changes, the value of the **Aggregated** field also changes. You can change the value of the **Aggregated** field only if the value of the **Automated** field is true.

4. Select **true** for the specified filter to apply to groups with identical CIs and pattern identifiers or select **false** to ignore the filter and create aggregated groups for all alerts in the system.

Related topics

Specify and manage pattern identifier attributes for alert grouping

Alert grouping types and creation methods

Explore different alert grouping types, understand their descriptions, and learn about their creation methods to enhance problem identification and streamline alert management.

Viewing and managing alert groups

Navigate to **Event Management** > **All Alerts** to view all alert groups. The icon in the **Group** column denotes the alert group type, while alerts not associated with any group have no entry in the **Group** column. Double-click the **Group** column to open the Grouped Alerts dialog, where you can view all alerts in the group and manually add or remove alerts.

Note: An alert can belong to only one alert group at a time.

Types of alert grouping

Alert grouping types

Type	Icon	Description	Creation method	Additional information
Log Analytics	L	Log Analytics groups are formed when the system identifies multiple related Log Analytics alerts, grouping them based on their significant connections.	Created as part of log analytics event processing.	Kinds of Health Log Analytics alerts

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information on scheduled jobs and parameters, refer to Scheduled jobs and parameters for alert grouping. For detailed information on configuring alert correlation logic order, see Configure alert correlation logic order.

Log analytics alert grouping

ServiceNow Health Log Analytics identifies patterns in log data and learns pattern behavior. When its artificial intelligence engine detects anomalous behavior, it sends an event to the ServiceNow Event Management application.

Log analytics alert groups are created by the Health Log Analytics application. For more information, see Types of Health Log Analytics alerts.

Rule-based alert grouping

Rule-based alert grouping is created by alert correlation rules. These rules allow you to manually classify alerts as primary or secondary and establish a relationship between them. Use alert correlation rules to group related alerts. The rule runs only for new alerts or alerts whose status changed from close/flapping to open/reopen.

Example: If rule-based alert grouping is applied, secondary alerts indicating that virtual machines or applications on the offline server are also down and are grouped under the primary alert, which is the root alert for the server that is offline. You can view rule-based alert grouping in Express List of Service Operations Workspace (ITOM). For more information, see Viewing links between alerts in rules-based alert groups.

Primary and secondary alerts

- Primary alert: Identifies the root cause of an alert group and represents its secondary alerts.
- Secondary alert: Related to the same issue, they are grouped under the primary alert. The purpose of secondary alerts is to determine which alerts to suppress, reducing alert noise and allowing you to focus on the primary alert.

How primary and secondary alerts interact

In rule-based alert grouping, one of the real alerts is designated as the primary alert. Primary and secondary alert filter conditions specify which alerts are classified as primary and which as secondary. The filter criteria are applied to the Alert [em_alert] table.

In this alert grouping, both primary and secondary alerts are visible but secondary alerts are grouped under the primary alert. The property **Keep the secondary alert open even when primary closed. for manual or rule based** (*evt_mgmt.rule_based_manual_closure*) controls whether secondary alerts remain open or are closed when the primary alert is closed.

If the property is not selected (i.e., set to No), after the primary alert is closed, the parent reference is removed from the secondary alerts (the grouping is dissolved), and the secondary alerts are closed and become stand-alone. If you select the checkbox for the property (i.e., set it to Yes) and the primary alert is closed, the parent reference is removed from the secondary alerts (the grouping is dissolved), causing them to become stand-alone open alerts.

Alert hierarchy

Only one level of secondary alerts is permitted. In situations where a secondary alert has its own secondary alert, the Event Management application flattens the hierarchy to preserve only two levels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, assume alert A is the primary alert and alert B is the secondary alert. If alert C becomes a secondary alert for alert B, the application flattens the hierarchy so that A remains the primary and B and C become sibling secondary alerts, one level below A.

As another example, assume that there are three correlation rules that produce the following results:

- Rule 1 (with an Order value of 1): B becomes a primary alert for A.
- Rule 2 (with an Order value of 2): A becomes a primary alert for C and D.
- Rule 3 (with an Order value of 3): E becomes a primary alert for A.

When alerts B, C, D, and E are triggered, they all appear in the alert list separately because there are no correlations between them.

When alert A is triggered:

1. Rule 1 makes A a secondary alert under alert B.
2. Rule 2 makes both C and D secondary alerts under alert A, and the hierarchy is flattened so that A, C, and D become secondary alerts to the primary alert B.
3. Rule 3 is not applied because multiple parents are not allowed—A already has B as its primary.

Therefore, if all alerts are triggered, only B appears as the primary alert for A, D, and C, while E remains a standalone alert.

Create an alert correlation rule

Create an alert correlation rule to designate primary and secondary alerts. The primary alert is identified as the root cause of the alert group and the secondary alerts are grouped under the primary alert.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Correlation Rules**.
2. Click **New**.
3. On the form, fill in the fields.
   For information on the fields, see Alert correlation rule form.
4. Select **Submit**.

Result

A rule-based alert group is created when a new alert is generated or when the status of an existing alert changes from Closed or Flapping to Open or Reopened, provided the filter criteria are matched.

Automated alert grouping

Automated alert grouping is a process that uses historical data to automatically organize similar alerts into groups. These alerts could be system issues, like server errors or network outages. By grouping related alerts together, it helps teams quickly identify patterns, manage recurring problems, and reduce the noise from too many individual alerts.

Imagine you're monitoring a city's traffic system. You get a lot of alerts—like reports of accidents, traffic jams, and road closures. Automated alert grouping works like a smart assistant that organizes these alerts based on patterns, so you can see related issues together and respond

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

more efficiently. These automated alert groups are displayed in the Express List within the Service Operations Workspace.

How do you enable this grouping

To enable machine learning-based automation for alert correlation, set the property **Enable ML based Automation correlation** (sa_analytics.specific_patterns_enabled) to true.

If the Domain Support - Domain Extensions Installer is activated, alert aggregation patterns are created based on the domain level defined in the sa_analytics.agg.learner_domain_level property. By default, this domain level is set to two, which corresponds to the second level in the domain hierarchy. For example, in a company, Level 1 might represent the company itself, while Level 2 could represent departments or teams within the company. Alerts are grouped based on this second level, like sorting them by department or team. For more details, Domain separation and Event Management.

How does it work

Automated alert grouping uses machine learning (ML) and historical data to identify patterns among alerts. It looks at specific characteristics, called pattern identifiers—such as the type of issue, the affected system, CI or metric that happened multiple times within a similar time period—to determine if alerts are related. The Alert Aggregation Learner uses algorithms to group alerts based on patterns. Specifically, it uses pattern-based algorithms and probabilistic methods to analyze incoming alerts and identify related ones.

Think of it like noticing that accidents often happen at a particular intersection at rush hour. The system groups similar alerts (like recurring traffic jams at the same spot) together based on certain identifiers (like location or type of problem). The system follows these key steps to group alerts effectively:

- Analyze Historical Data: The system studies past alerts to learn patterns and relationships.
- Apply Machine Learning: ML algorithms analyze historical alert data to identify patterns and relationships among alerts. It enables the system to learn from past incidents and improve its ability to group similar alerts together over time.
- Group Similar Alerts: Alerts with matching patterns are automatically grouped together.

Imagine you're managing a city's traffic system, and you receive multiple alerts:

- 8:00 AM: Accident on Main Street
- 8:05 AM: Traffic jam near Main Street
- 8:10 AM: Road closure on Main Street

Automated alert grouping works like a smart assistant by analyzing these alerts and recognizing a pattern. It groups them together because they all relate to Main Street, likely stemming from the same accident. This helps you see the bigger picture quickly and focus on resolving the root cause (the accident), rather than addressing each alert separately.

Benefits

- Find Recurring Issues: Quickly spot patterns (like a server consistently overheating).
- Save Time: Handle groups of related alerts instead of individual ones.
- Improve Response: Focus on fixing the root cause rather than dealing with scattered issues.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Understanding pattern identifiers

A pattern identifier is a set of criteria or attributes (such as alert type, affected system, etc.) used to group similar alerts. It helps to identify recurring issues, making it easier for teams to respond and address ongoing problems.

How pattern identifiers group alerts

Consider a network monitoring system that generates alerts for various issues, such as high CPU usage, memory leaks, or connection timeouts.

Pattern Identifier: Metric Name and CI

- Alert 1: High CPU usage on Server A at 10:00 AM
- Alert 2: High CPU usage on Server A at 10:05 AM
- Alert 3: Memory leak on Server B at 10:10 AM
- Alert 4: High CPU usage on Server A at 10:15 AM

In this case, the pattern identifier could be set to the Metric Name (e.g., high CPU usage) combined with the Configuration Item (CI) (e.g., Server A). Alerts 1, 2, and 4 would be grouped together because they share the same metric (high CPU usage) and the same CI (Server A), indicating a recurring issue that may need further investigation. Alert 3, however, would not be included in this group because it has a different metric (memory leak) and CI (Server B).

Note: The set of alert fields used for the pattern identifier is also referred to as Feature Identifier Attributes or simply attributes.

How to configure effective pattern identifiers

To configure effective pattern identifiers for alert grouping, follow these three key steps to ensure accurate and meaningful analysis of alerts.

Step	Action	Description
Create an event rule	Define an event rule. To know how to create an event rule, see Create or edit an event rule.	Set up an event rule to populate the relevant alert fields for the pattern identifier.
Manage pattern identifier	Add relevant alert field to the pattern identifier. To know how to add fields to the pattern identifier, see Specify and manage pattern identifier attributes for alert grouping.	After adding the relevant alert fields, select **Deploy** to activate the pattern identifier.
Choose relevant identifiers	Select alert fields that clearly identify the problem. For example, if the issue is that a service is offline or there's no connection to the database, look for specific	• Avoid overly unique fields (e.g., date) that make pattern identification difficult. • Avoid overly common fields that result in too

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Step	Action	Description
	values in the alert that indicate this. Add these types of fields to the pattern identifier. By default, we provide the **Metric Name** field as a pattern identifier.	many alerts being grouped together, making patterns indistinguishable.

Alert grouping and Learned Patterns

Learn how alert patterns are discovered, grouped, and displayed in the system.

Concept	Description
Pattern discovery	When a set of alert fields matches, the alerts are grouped into a "Learned Pattern." For example, alerts with the same Priority Group and Resource are grouped into a pattern.
Pattern reporting	These patterns are displayed on the Learned Patterns report found under **Event Management** > **Administration** > **Learned Patterns**.

Managing Pattern Attributes and Time Frame

Learn the process of managing pattern identifier attributes, deployment of new sets, and how the system identifies issues.

Concept	Description
Active pattern identifier attributes	Only one set of attributes can be active at a time. **Note:** The new set replaces the current one after deployment.
Purpose and time frame	Pattern grouping identifies issues within the last 30 days, controlled by the **sa_analytics.agg.learner_period_days** property.
Issue identification	To identify an issue, the system utilizes a combination of Configuration Items (CIs) and Pattern Identifiers (sometimes referred to as Feature Identifiers). By default, a Pattern Identifier is defined as the Metric Name, but this can be modified. Two alerts are considered similar if they share the same CI and Pattern Identifier, although fields such as Source, Severity, Description, and others may differ.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Concept	Description
	For more information, see Specify and manage pattern identifier attributes for alert grouping. **Note:** The Alert Aggregation Learner also identifies patterns of alerts within manual alert groups. In some cases, you can create patterns from alerts where the CIs share the same value in a specified field. For example, to build patterns from alerts with the same CI **Location** field, enter `location` in the *`sa_analytics.agg.learner_group_by_property`* property. For more information, Configure scheduled job-based alert grouping. When working with CI-based groups, ensure that the pattern identifier includes both the node and the metric name. For details on configuring the Feature Identifier, see Learned patterns report. **Note:** Alerts that lack a CI can still be grouped together as Text-based or CI-based alert groups, treating a node as a CI. To enable this functionality, set the sa_analytics.enable_no_ci_grouping property to true.

Configure pattern based alert grouping

Configure the Alert Aggregation Learner (Service Analytics Alert Aggregation Learner - Daily), an offline job that runs daily to process past alerts. It identifies patterns of related alerts using a combination of pattern-based and probabilistic techniques, enabling quicker detection and resolution of recurring issues.

Before you begin

Role required: evt_mgmt_admin

About this task

The Alert Aggregation Learner tracks manual additions and removals of alerts from automated alert groups. If you undo any previous alert additions or removals, the automatic process adjusts accordingly.

You can review user additions and removals from automated alert groups and undo any action to prevent it from being automatically repeated. The Alert Aggregation Learner also identifies patterns in manual alert groups, enabling automatic formation of new alert groups based on these patterns when new streams of alerts arrive.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Corrlelation Properties**.
2. Enable the following properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable alert aggregation for Automated, CMDB, and Text-based groups (*sa_analytics.aggregation_enabled*).

  Note: When disabled, disables all other groups.

- Enable ML based Automation correlation (*sa_analytics.specific_patterns_enabled*).

3. **Optional:** To configure the time period for the Alert Aggregation Learner to process alerts, perform the following steps:

   a. Navigate to **All** > **System Properties** > **All Properties**.

   b. On the System Properties page, select the *sa_analytics.agg.learner_period_days* property.

      If the property doesn't exist, you need to define it.

   c. Set the property's **Value** to the number of days by which you want alert aggregation learner job to process.

      Note: Values larger than 30 days increase job processing time. For optimal performance, use values of 30 days or less.

Specify and manage pattern identifier attributes for alert grouping

The Alert Aggregation Learner analyzes alerts and identifies patterns using a defined set of alert and configuration item (CI) attributes. By configuring these attributes as pattern identifiers, you can control which characteristics are used to group alerts. This customization creates meaningful alert groups, improving alert management and response times by reducing noise and enabling focus on critical issues.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Event Management** > **Administration** > **Manage Pattern Identifier**.
2. On the SA Alert Aggregation Pattern Attributes page, select **New** to create a new pattern identifier, or open an existing pattern identifier.
   The SA Alert Aggregation Pattern Attribute page opens.
3. Select the Unlock Feature Identifier Attributes icon ( ) and move attributes from the **Available** list to the **Selected** list.

   Note: Properties from CMDB CI via dot-walking are not populated.

   The **Configuration Item** attribute is automatically considered as an identifier and should not be added explicitly to the Feature Identifier Attributes section. The pattern is defined as a combination of the configuration item and your selected feature identifier attributes.

4. Selecting the Lock Feature Identifier Attributes icon ( ).
5. Select **Submit** for a new pattern identifier or **Update** for an existing pattern identifier.
6. Navigate back to the SA Alert Aggregation Pattern Attribute page by opening the pattern identifier.
7. Activate the pattern identifier attributes by selecting **Deploy**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Ensure a corresponding event rule exists: Verify that there is an event rule set up to assign or populate the newly defined pattern identifier attributes to the incoming alerts. Event rules define how attributes are assigned to alerts based on certain conditions.
- Run the Service Analytics Attribute Populator for Historical Alerts job: After the new event rule is in place, this job is used to retroactively populate the pattern identifier attributes for existing alerts that were created before the new attributes were defined. It ensures that even past alerts (historical alerts) have the necessary attributes filled in for grouping them properly.

Learned patterns report

The Learned Patterns report helps assess the efficiency of alert aggregation and identify recurring alert patterns. It enables proactive issue resolution, enhancing overall system performance by providing insights into frequent alerts.

Navigating and sorting the report

To access the Learned Patterns report, navigate to **Event Management** > **Reporting** > **Learned Patterns**.

Sorting Options: You can sort patterns by Pattern Score, Frequency, and Size to prioritize which alerts to address first.

Metrics and data in the report

The report displays key metrics associated with learned patterns, including:

- Frequency: The occurrence count of pattern identifier attributes (CI/MetricName).
- Pattern Identifier Attributes: Describes how alert grouping combines relevant pattern attributes to create a learned pattern. These patterns can reappear across multiple alerts, often indicating the same underlying issue.
- Presentation Format: Metrics are shown in a table format, organized by learned patterns.

This report allows you to:

- Focus on Higher Frequency Alerts: Allocate resources to higher-frequency alerts to expedite the resolution of numerous alerts.
- Target Larger Patterns with Lower Frequency: Allocate resources to larger learned patterns with lower frequency for targeted analysis.

Pattern group details and identifier attributes

- Expand a pattern group to display details about all the identifier attributes that are associated with the pattern.
- Sort the entries within each pattern by Configuration Item and Feature Identifier.

Column	Description
Configuration Item	CI associated with the combined pattern identifier attributes.
Feature Identifier	Feature identifier used for the combined pattern identifier attributes.
Frequency	Number of times the combined pattern identifier attributes appear in the data set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Size	Number of occurrences of the combined pattern identifier attributes (like Configuration Item and Feature Identifier) within a learned pattern.
Score	Calculated score that combines the frequency and size of the learned pattern. The formula for this score is: `Score = Frequency × (Size + 1)`. This score helps prioritize patterns based on their recurrence and size, making it easier to focus on high-priority patterns.
CI Link	Link in the **Configuration Item** column to view details of the CI information.

Exclude patterns from learned patterns

Exclude CI-based or CI class-based alerts and patterns when you encounter alerts incorrectly added to a learned pattern by the Learned Patterns job. For example, a pattern might include an alert that occurred at the same time as other alerts but is not actually related to them. This maintains accuracy, ensuring better alert groupings and improved management efficiency.

Before you begin

Role required: evt_mgmt_admin

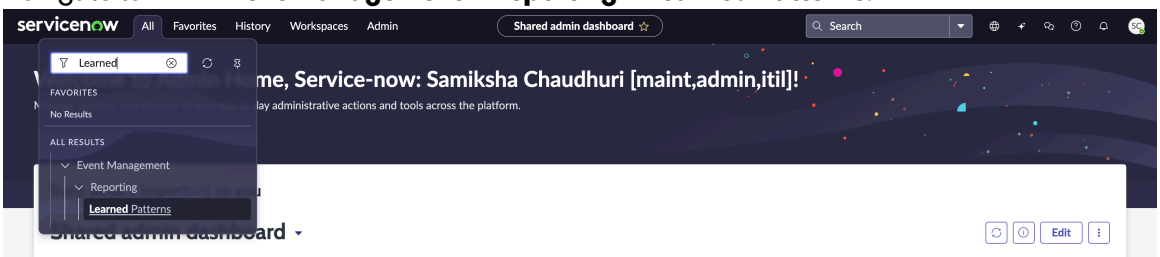
About this task

You select the incorrect alert in a pattern to exclude the entire pattern to which it belongs.

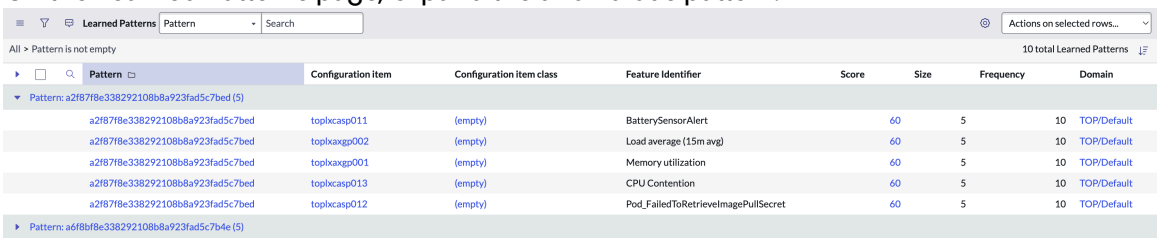
> **Note:** When you exclude an incorrect alert, any other patterns containing that alert are also excluded.

Procedure

1. Navigate to **All** > **Event Management** > **Reporting** > **Learned Patterns**.



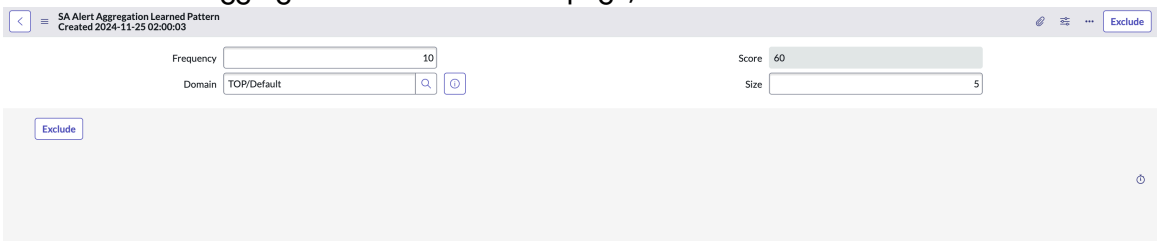
2. On the Learned Patterns page, expand the anomalous pattern.



3. Select the pattern name to open it for exclusion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the SA Alert Aggregation Learned Pattern page, select **Exclude**.



Result

The entire pattern is removed from the Learned Patterns report and listed on the Excluded Patterns page, located at **Event Management** > **Administration** > **Excluded patterns**.

If the pattern includes other alerts, you can restore it by reclaiming those alerts as a learned pattern. For further details, see Restore excluded patterns.

Restore excluded patterns

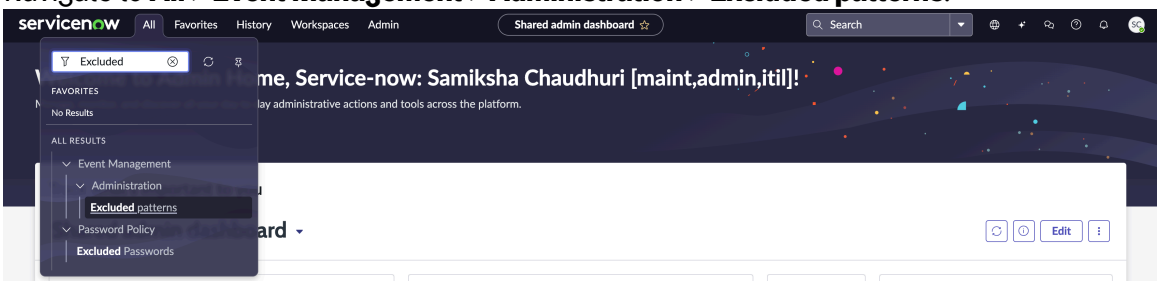
Restoring excluded patterns to the learned patterns report lets you reintegrate valuable insights lost due to incorrect alerts. This flexibility maintains accurate alert aggregation and enhances monitoring. For example, if you excluded a pattern due to an incorrect alert, you can restore it without that alert, ensuring relevant data remains accessible for analysis and decision-making.

Before you begin

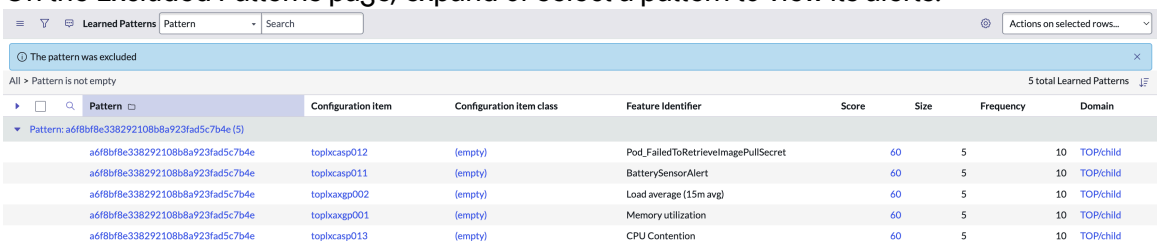
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Excluded patterns**.

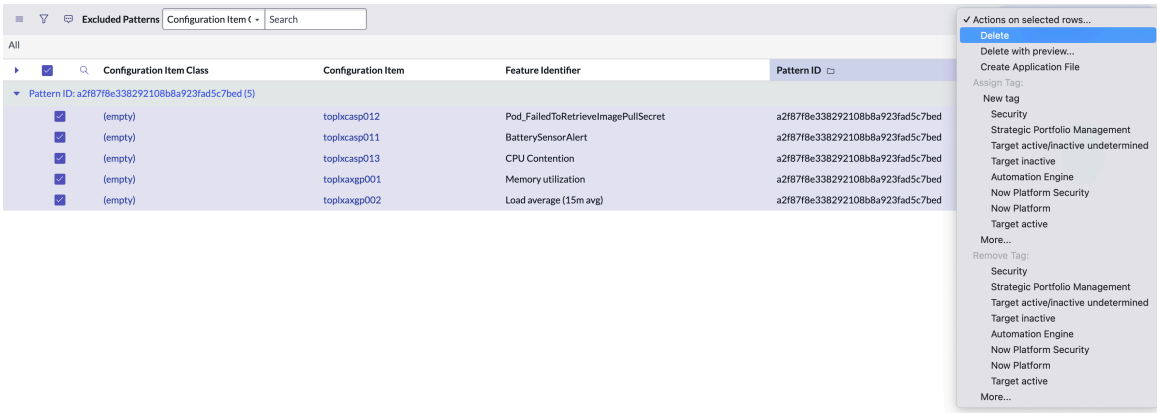


2. On the Excluded Patterns page, expand or select a pattern to view its alerts.



3. Select the patterns you want to restore.
4. In the **Actions on selected rows** drop-down menu, select **Delete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. In the confirmation window, select **Delete**.
6. Run the Learned Patterns scheduled job.
   a. Select **System Definition** > **Scheduled Job**.
   b. On the Scheduled Jobs page, search for the Service Analytics Alert Aggregation Learner - Daily job.
   c. Open the Service Analytics Alert Aggregation Learner - Daily job.

   d. Select **Execute Now**.

Result

The pattern appears with its restored alerts on the Learned Patterns report page. To access this page, navigate to **Event Management** > **Reporting** > **Learned Patterns**.

Network traffic based alert grouping

The Network traffic based alert grouping method groups alerts by analyzing network traffic connections between processes across hosts. It leverages service candidates identified by ML Service Mapping to group alerts related to network traffic issues. This ensures alerts from directly connected processes within the same service candidate are grouped together, offering a more contextual view of network incidents.

Service candidates are potential collections of processes within your IT environment that are identified based on their network connections and interactions. They represent different services or functions that your IT systems provide, even if they are not fully detailed in your

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

system's configuration database. For example, service candidates might group together all the processes involved in email delivery, even if the configuration details are incomplete.

ML Service Mapping uses machine learning to automatically discover and map out these service candidates. It identifies how different processes and components are connected and grouped together based on their network traffic and interactions. This helps in understanding and organizing the IT services and their components, making it easier to manage and troubleshoot issues. For example, ML Service Mapping might automatically identify and map the connections between email servers and mail clients based on their network interactions.

Note: Network traffic based alert grouping is enabled for new customers starting with the Zurich release. Existing customers need to enable the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*) manually.

How it works

- Host identification: Alerts related to network issues are generated from various sources.
- Network context identification: The correlation process uses horizontal discovery results and ML Service Mapping to identify the most relevant service candidates and network connections.

  This process uses the results of the scheduled job **Event Management - Populate Service candidate process to process mapping - Daily**, which runs once a day and is used to store process-to-process connections for Host CIs in the format required by the alert grouping algorithm.

- Alert grouping: Alerts are grouped based on direct process-to-process connections within the context of the same service candidate. Grouping is updated in real-time as new alerts are received.

Benefits

- Improved accuracy: By leveraging network traffic connections and service candidates, this method provides high accuracy in grouping alerts, minimizing false positives.
- Enhanced coverage: It effectively groups alerts even in environments with low CMDB maturity, covering a broader range of alerts and issues.
- Streamlined resolution: IT teams can quickly identify and resolve related issues in bulk, reducing the volume of alerts to manage and improving operational efficiency.

Enable network traffic-based alert grouping

Activate network traffic-based alert grouping to automatically correlate and reduce alert noise by grouping related events based on network traffic patterns. This helps improve efficiency in alert response and streamlines alert management.

Before you begin
Ensure the Service Mapping Plus application (sn_sm_scoped_app) is installed.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. Ensure that the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*) is selected.

Disable network traffic-based alert grouping

Disable network traffic-based alert grouping to prevent alerts from being grouped solely by network activity, reducing noise during traffic spikes and ensuring critical issues stand out for quicker resolution.

Before you begin
Role required: evt_mgmt_admin

About this task

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. Clear that check box for the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*).
3. Set the property *sa_analytics.enable_process_mapping_calculation* to false.

Follow up on work notes and review service candidate

Track and follow up on work notes while reviewing the service candidate to ensure all actions and updates are captured. This helps maintain clarity and continuity in the review process, reducing the chances of missed details.

Before you begin
Role required: evt_mgmt_admin and sm_admin

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.

   Note: Scroll down to an alert with **Network Traffic** as the group, and in the **Group** column, right-click and select **Show Matching**. This displays all alerts related to **Network Traffic**.

2. For the alert whose work notes you want to see, select the alert number.
3. On the Alert page, scroll down and select the **Activities** tab.
   You can view the work notes for the selected alert.
4. In the work notes, select the service candidate to view details.
   The Application Service Candidate page opens.
5. Select **Preview Map Graph** to view the service candidates mapping in the form of a graph.
   Service candidates mapping provides a visual representation of how different service candidates are connected, making it easier to understand relationships, identify potential issues, and analyze dependencies more effectively.

Mixed alert grouping

Mixed alert grouping combines multiple strategies—currently CMDB-based and tag-based grouping—to form a single, cohesive alert group. It reduces noise, bridges gaps when one method isn't enough, and delivers a clearer, end-to-end view of incidents. This approach helps operators identify root causes faster and take informed action, even in complex or incomplete data environments.

To understand how Mixed grouping works in practice, it's important to look at the individual strategies it currently supports. At this stage, Mixed Grouping comprises two core methods: CMDB based alert grouping, which leverages service relationships defined in the CMDB, and Tag cluster alert grouping, which uses shared metadata across alerts. Each plays a distinct role in correlating related alerts effectively.

If you're looking to group alerts, see Create Group automation.

CMDB based alert grouping

CMDB based alert grouping helps organizations manage alerts by organizing them according to their related configuration items (CIs) within the Configuration Management Database (CMDB). This method group alerts based on CI relations in applications or infrastructure components, allowing teams to better understand the impact of issues, respond more effectively to alerts, and maintain service availability.

CMDB alert groups are created based on the current relationships between CIs in an organization. This means that when several alerts are triggered on different CIs—for example, if a server is experiencing issues — alerts are grouped based on CI relationships.

By default, all the existing connections between CIs are used to group alerts. However, given the complexity of IT systems, there are many types of relationships, and organizations can filter which ones to consider when aggregating alerts. For instance, you can filter relationship types by suggested relationships that appears in the CMDB Group CI Relations [em_suggested_relation_type] table. You can also filter using the hosting and containment rules (dependent relationship rules).

For example, if a server is hosting multiple applications, and there's a problem with that server, all the alerts related to both the server and the applications it hosts can be grouped together. This helps the IT team quickly identify and address the root cause of the issue rather than dealing with each alert in isolation. Similarly, if different processes are running on a server, grouping alerts based on those processes allows teams to see how problems in one area might affect others, leading to a more comprehensive understanding of the situation.

The CMDB alert groups are effectively displayed in the Express List within the Service Operations Workspace, which allows teams to easily monitor and manage related alerts. This feature enhances operational efficiency by providing a clear view of alerts that are interconnected based on the current relationships among configuration items (CIs).

Use cases for CMDB based alert grouping

Use cases for CMDB grouping enhance alert management by correlating alerts based on Configuration Item relationships, improving visibility, and facilitating more efficient troubleshooting.

Common CMDB grouping use cases

In the context of CMDB grouping, organizations face several challenges when managing alerts related to Configuration Items (CIs).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common use cases

Use Case	Challenges	Solutions
Shared Configuration Item (CI) Scenario: An organization monitors a database server experiencing multiple issues, resulting in numerous alerts related to different applications using that database.	• Delayed response: Teams may respond to alerts in isolation, potentially overlooking related alerts, leading to delayed resolutions. • Inefficient resource allocation: Time and resources may be wasted on investigating separate alerts that are actually related. • Lack of context: Alerts related to the same CI can be scattered across different alert groups, making it difficult to see the full picture.	• Aggregate alerts related to the same CI into a single group for a unified view. • Facilitate faster alert resolution by addressing all related alerts together.
Hosting/Containment Relations Scenario: A physical server hosts several virtual machines (VMs), and an alert is generated for a hardware failure on the server. Multiple alerts also arise for the VMs due to their reliance on the server.	• Visibility into dependencies: Teams may lack visibility into how CIs are interconnected, leading to inefficient troubleshooting processes. • Complex alert resolution: Understanding which CIs are affected and how they relate can be complicated, resulting in longer resolution times. • Resource drain: Mismanagement of alerts can lead to duplicated efforts across teams, wasting time and resources.	• Group alerts using CMDB hosting/containment rules to aggregate alerts related to the physical server and its hosted VMs into a single alert group. • Provide a comprehensive view of all alerts tied to the physical server's failure. • Focus remediation efforts on the physical server while monitoring the VMs to ensure all aspects are addressed efficiently.
Applicative Relations Scenario: An enterprise application relies on multiple micro-services, and an issue arises with one of these services, generating alerts across several components, complicating diagnosis.	• Understanding application dependencies: Teams may find it challenging to trace how application components interact, making it difficult to pinpoint issues in complex systems. • Slow incident resolution: Without a clear understanding of applicative flow, alert	• Implement grouping based on applicative flow relations to aggregate alerts related to the affected microservice and its dependent components. • Utilize dependency maps to visualize how different services interact.

Common use cases (continued)

Use Case	Challenges	Solutions
	resolution can be slow and labor-intensive. • Inconsistent monitoring: Alerts related to applications may not be consistently monitored or prioritized, leading to potential oversights.	• Streamline the resolution process by addressing grouped alerts related to the application, improving response times.

CMDB alert grouping — properties and functionality

Learn about the key properties and functionality of CMDB alert grouping, which facilitate efficient alert organization based on relationships and enhance the overall effectiveness of alert management.

Properties for managing CMDB alert group creation

Use the properties listed in the following tables to control CMDB alert group creation. For more information, see Configure scheduled job-based alert grouping.

Property	Setting
Enable CMDB correlation *sa_analytics.agg.query_cmdb_correlation_enabled*	Enable this property to automatically use CI relationships for alert aggregation, correlating alerts and creating CMDB alert groups.
Max number of relations between CIs in a topology that form a CMDB group *sa_analytics.agg.query_cmdb_graph_walk_nodes*	Set the maximum number of enabled relations between CIs in a topology that form a CMDB group. For example, if you set this property to 3, a CI associated with an alert will automatically be grouped with similar CIs within three hops or less. **Note:** This property setting impacts all types of relations used for alert aggregation. Using a value greater than 4 may negatively affect the performance of the alert aggregation job.
Use all CMDB relations for CMDB group correlation *evt_mgmt.related_cis_get_all_relation_types*	Set to true if you want to use all relationship types for CMDB grouping. The default setting for new users is that the option is set to true, meaning all relationship types are used for grouping. Set the property to false to filter the relations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for managing automatic creation of CMDB alert groups for advanced use cases

In some use cases, you may need to ignore or exclude certain CI relationships from automatic alert group creation. In this case, the *evt_mgmt.related_cis_get_all_relation_types* property must be set to false, and the properties in the below table must also be configured.

Note: If the *evt_mgmt.related_cis_get_all_relation_types* property is set to false, and the relationship isn't specified in the [em_suggested_relation_type] table, the relationship is not considered for alert aggregation.

Properties for managing automatic creation of CMDB alert groups for advanced use cases

Property	Setting
Enable Suggested Relations for CMDB Correlation *sa_analytics.agg.query_cmdb_suggested_relationship_enabled*	Keep this property enabled to use any suggested relationships defined in the CMDB Group CI Relations [em_suggested_relation_type] table when forming CMDB alert groups. To include a new relationship, add it to this table. This property is enabled by default.
Use CMDB relationship based on host-containment Metadata rules *evt_mgmt.related_cis_use_containment_rules*	Containment rules specify which configuration item classes can be contained within another item through a specific relationship when creating a service template. Keep this property enabled when forming CMDB alert groups to use any host-containment rules defined in the Metadata Editor. For more details, see CMDB dependent relationship rules. This property is enabled by default.
Enable filtering by dependent relationship rules *evt_mgmt.related_cis_use_hosting_rules*	Hosting rules define what classes of configuration items are hosted on other classes of configuration items. Keep this property enabled when forming CMDB alert groups to apply any hosting rules, which define which classes of configuration items are hosted on other classes. This property is hidden and enabled by default. **Note:** If you need to change the default value, add the property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for managing automatic creation of CMDB alert groups for advanced use cases (continued)

Property	Setting
Ignore CMDB alert groups from forming due to CI applicative flow relations *sa_analytics.agg.ignore_cmdb_applicative_flow*	Set this property to true to prevent CMDB groups from forming based on applicative flow relations for CI relations in application services. This property is hidden and enabled by default. **Note:** If you need to change the default value, add the property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.
sa_analytics.applicative_flow_relation	This property is hidden and enabled by default.

Event Management stores a map of related CIs in the Event Management CI Graph Reuse [em_ci_graph_reuse] table for each processed CI. You can adjust the storage period by modifying the *sa_analytics.agg.query_cmdb_graph_reuse_period* property, with the default set to one day (86,400 seconds). This process enhances the search performance of relations in the CMDB. To disable the storage process during advanced use-case configurations, set the property value to zero.

Note: If you need to change the default value, add the *sa_analytics.agg.query_cmdb_graph_reuse_period* property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.

View the Dependency map for CMDB alerts

The Dependency map illustrates how and why alerts are grouped, simplifying troubleshooting and issue management. It reveals connections between CIs within a CMDB alert group, enhancing visibility into their relationships. Additionally, if a CI is not part of the group but connects to other alert CIs, it remains visible on the map, aiding alert resolution and proactive management.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator

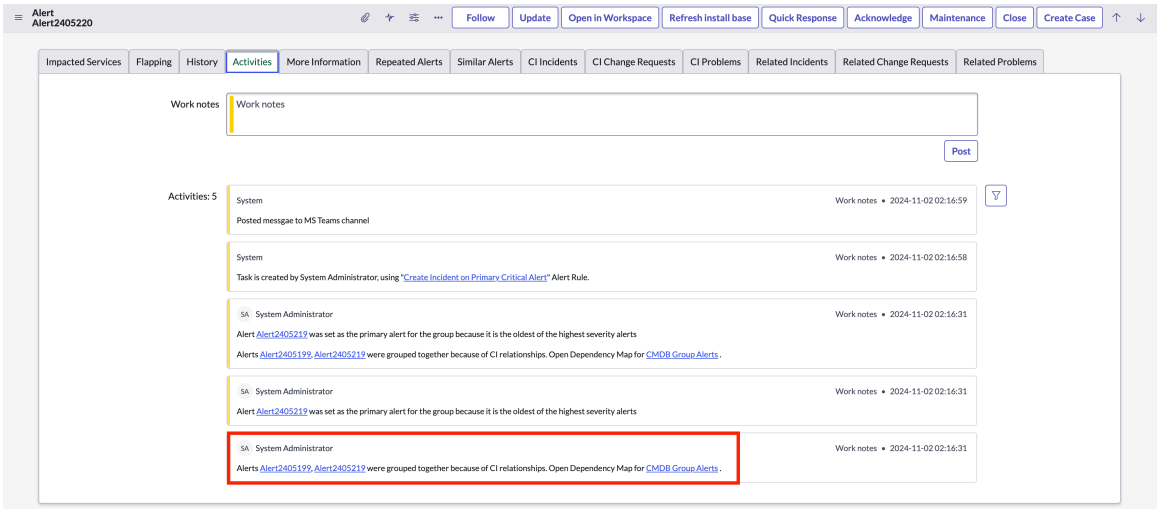
Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Search for the CMDB group.
3. Open a CMDB group alert.
4. Scroll down and select the **Activities** tab.

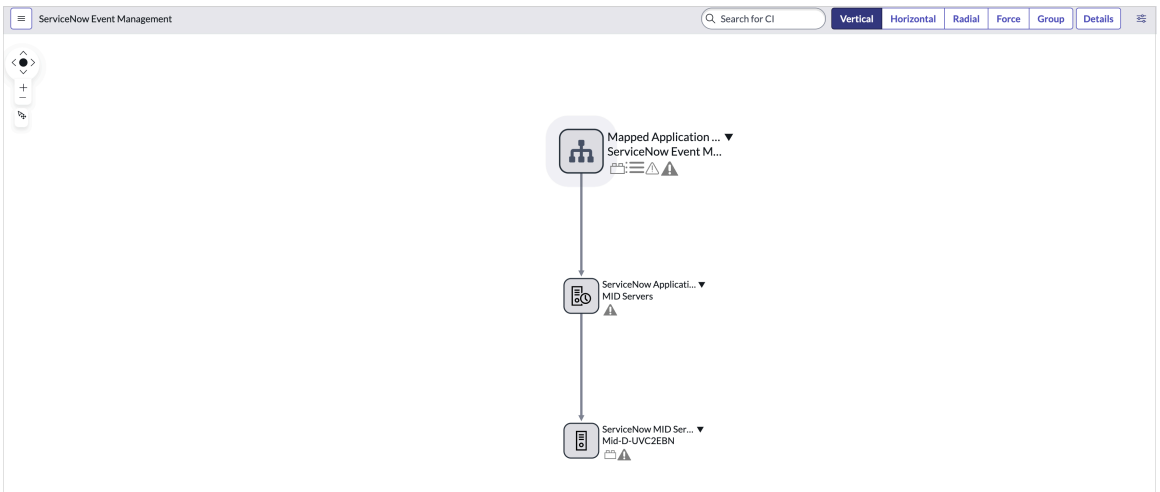
   You may see a message similar to the following:

   ```
   Alert2405199 and Alert2405219 were grouped together because of
   CI relationships. Open Dependency Map for CMDB Group Alerts.
   Open Dependency Map for CMDB Group Alerts.
   ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select the link to see the dependency view of the CMDB alerts.



Add a CI relationship to CMDB Group CI Relations

Add a CMDB group CI relationship for a CI class to enable accurate alert group generation.

Before you begin

Role required: evt_mgmt_admin

About this task

Configure the *sa_analytics.agg.query_cmdb_suggested_relationship_enabled* property to further enhance alert grouping by using suggested relationships. For more information on properties, see CMDB alert grouping — properties and functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **CMDB Group CI Relations**.

   a. Click **New**.

   b. Complete the form.

Suggested Relationship fields

Field	Description
Base class	The base class in the relationship serves as either the parent or the child, depending on the type of relationship established.
Relationship	The type of relationship that defines how two or more entities are connected.
Dependent class	The class that relies on another class in the relationship, serving as either the parent or the child depending on the relationship type.

2. Click **Submit**.

Example: CMDB Group CI relation

Base Class	Relationship	Dependent/Target Class
Oracle	Is Hosted On	Linux Server
Oracle	Is Hosted On	Solaris Server

Note: The same parent class and relationship can appear more than once.

Delete a CI relationship from CMDB Group CI Relations

Delete a CMDB group CI relationship to limit available relationships for CMDB alert grouping, helping to reduce noise and improve alert relevance.

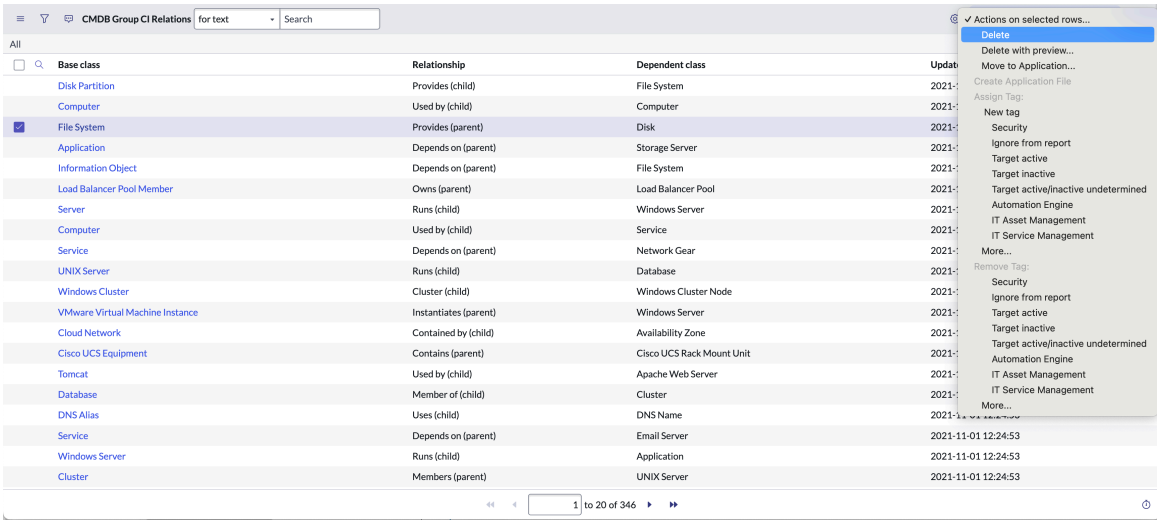
Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **CMDB Group CI Relations**.
2. Select the checkbox next to the CI relationship you want to delete.
3. Select the Actions menu and then select **Delete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. On the confirmation window, select **Delete**.
   The CI relationship is deleted.

Tag cluster alert grouping

Tag cluster alert grouping enables you to easily create groups of alerts. It is a non-code method of alert grouping that correlates alerts without having to use CMDB or model training. This simpler way of grouping similar alerts reduces the overall noise of a large quantity of alerts.

Tag cluster alert grouping is enabled immediately after the activation of the Tag-Based Alert Clustering Engine application, available in the ServiceNow Store. This grouping is applied according to the correlation logic order specified in the Configure alert correlation logic order. Alert grouping tags are attached to definitions on a many-to-many (M2M) basis. Multiple tags can be linked to a single definition, and a tag can be part of multiple definitions. Groups formed from tag cluster alert grouping definitions are classified as the Tag Cluster group type.

Tag cluster alert grouping supports domain separation, allowing different domains to have their own distinct alert grouping configurations and logic.

First, create alert grouping tags to define the criteria for grouping alerts. You can set the tags to require an exact match, an approximate ('fuzzy') match, or a character pattern match.

You can also use preconfigured tags to speed up alert clustering. These predefined tags are mapped from alerts and are based on information from sources such as the Alert field, Alert tags, or Alert additional info. If the required data is missing and the selected tag source is Alert CI or Alert CI key, the tag is populated using the Configuration Item (CI) value from the Configuration Management Database (CMDB). Predefined tags are easily identified by their description, which includes out of the box.

You can attach one or more tags to an alert clustering definition, which specifies the conditions for alert correlation. You can either create your own alert clustering definition or use a predefined one provided by the application. Predefined definitions come with associated tags.

> **Important:** Make sure to activate predefined definitions before use. In new systems, several definitions are active by default. The remaining ones must be activated. For more information, see Activate a predefined alert clustering definition.

Once one or more alert clustering tags are attached to a definition, the system collects alerts and checks if their tags match all the tag values specified in the definition. Alerts with matching or similar tag values are grouped together. New incoming alerts join an existing group if their tags match the tags in the definition used to create the group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For tag-cluster grouping, alerts are added to a group based on the timeframe defined in the alert clustering settings. The time between the initial alert (virtual alert) and subsequent alerts is evaluated. If two new alerts are received, and their time difference falls within the defined timeframe, they are added to the group. The initial event's generation time is used to determine the relevance of the timeframe.

Create alert clustering tags

Create streamlined alert correlations with alert clustering tags by grouping alerts that share identical or similar tags based on your configured match method. This reduces noise, enhances incident prioritization, and improves operational efficiency, enabling faster issue resolution and response times.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Tags**.
2. Click **New**.
3. Fill in the values on the Event Management tag based alert clustering tag form.
4. Select **Submit**.

Result
The tag appears in the Tag Based Alert Clustering Tags table.

Create an alert clustering definition

Define alert clustering conditions to trigger one or more alert clustering tags, which help create alert groups from fewer alerts. Creating alert groups from fewer alerts reduces noise, making it easier to identify critical incidents, prioritize responses, and manage issues effectively.

Before you begin
Role required: evt_mgmt_admin

About this task
To create a tag def users need to use filter to define on which alerts the definition will apply and define a grouping criteria by specifying which field values should be compared to create a group.

Procedure

1. Navigate to **All** > **Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Definitions**.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Configure the fields on the Event Management tag based alert grouping definition form.
4. Select **Save**.

Result
The definition appears in the Tag Based Alert Clustering Definitions table and Service Operations Workspace (ITOM) > Grouping automation. Alert groups created by this definition are categorized as Tag Cluster groups.

Activate a predefined alert clustering definition

Activate the predefined alert clustering definitions provided with the Tag-Based Alert Clustering Engine application before use. Utilizing these preconfigured definitions minimizes setup time and ensures a more efficient configuration process, allowing for quicker implementation and streamlined alert management.

Before you begin

Important: If you are already using the Tag-Based Alert Clustering Engine application, all the predefined definitions are inactive and must be activated. In contrast, new customers will find several definitions active by default, allowing for immediate utilization of the alert clustering capabilities without additional setup.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **#Event Management** > **Tag Based Alert Clustering Engine** > **Clustering Definitions**.
2. Select a predefined definition.

   Note: For a complete list of the available predefined definitions, see List of predefined tag-based alert grouping definitions.

3. On the Tag Based Alert Clustering Definition form, select the **Active** check box.
4. Select **Save**.

Result
In the Tag Based Alert Clustering Definitions table, the **Active** field for the activated definition displays the value **true**. You can now associate an alert clustering tag with this definition, enabling effective grouping of alerts based on the defined criteria.

Attach a predefined tag to a tag-based alert grouping definition

Get started faster with alert clustering by attaching a predefined alert clustering tag to a tag-based alert clustering definition in Event Management. By associating a predefined tag, you ensure that alerts meeting the specified criteria are grouped effectively, facilitating quicker identification and response to related incidents.

Before you begin
Role required: evt_mgmt_admin

About this task
The Tag Based Alert Clustering Engine application comes with a set of predefined alert clustering tags. Attach a tag to a tag-based alert clustering definition to specify the conditions that must be met for alert correlation. This enables effective grouping of alerts based on shared characteristics, improving the accuracy and efficiency of incident response and management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **#Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Definitions**.
2. Select a definition.
3. Under the Tag Based Alert Clustering Definitions Tags M2M section, select **Insert a new row**.
4. Use the search field to locate a predefined alert clustering tag, and then select the green check mark to confirm your selection.

   Note: Predefined tags are recognizable by their description, which includes "out of the box." For a complete list of the available predefined tags, see List of predefined alert grouping tags.

5. Select **Save**.

Result

The predefined alert clustering tag is now attached to the tag-based alert clustering definition. This association enables the effective grouping of alerts based on the specified criteria, facilitating improved alert management and response efficiency.

Text-based alert grouping

In text-based alert grouping, alerts are organized and correlated based on specific text patterns or keywords within the alert content. This approach dynamically groups alerts that share similar textual characteristics, such as error messages or event descriptions, allowing for more flexible and adaptive management of alerts.

The EM Alert Clustering Solution is a method used to correlate alerts based on similarities in specific fields and form clusters or groups. In ServiceNow Event Management, it creates clusters based on the Description, Metric name, and Configuration item.Class fields. This solution organizes alerts into text-based groups, and when a new alert arrives, the ML Predictor identifies the appropriate cluster, grouping alerts within the same cluster.

Note: The ML Predictor job is asynchronous and assigns real-time alerts to clusters, which may result in slight delays. This delay can cause text-based groups to be created several minutes later, as the alert grouping job runs once per minute. If prediction results are not available during a run, they are rechecked in the next grouping job.

For text-based logic to execute, you must have the Predictive Intelligence plugin (com.glide.platform_ml) installed and the EM Alert Clustering Solution definition activated.

There are specific settings or limits used to control the behavior of text-based alert grouping. These thresholds define the criteria for how alerts are grouped based on text patterns or attributes. The text-based thresholds are:

- Cluster quality threshold: The Cluster quality threshold (*sa_analytics.alert_grouping_tb_cluster_quality_threshold*) determines the minimum quality required for an alert cluster to be considered valid. This threshold ensures that only clusters with a minimum level of similarity and reliability are used. Clusters that meet this threshold are considered valid, improving the precision of the groupings and reducing noise from irrelevant or low-quality clusters. The range of the threshold is from 1 to 100 and the default value is 70.
- Alert rank threshold: The Alert rank threshold (*sa_analytics.alert_grouping_tb_alert_rank_threshold*) defines the minimum rank required for an alert to be included in a group. This threshold ensures that only

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

alerts with a certain level of similarity are grouped together, filtering out lower-ranked alerts to maintain the quality of the alert group. The default value is 0.3, where smaller values indicate better similarity.

Note: To use these properties, you need to create properties with the same names and assign the required values to them. For more information on how to create a property, see Add a system property.

The EM Alert Clustering Solution definition is located in the [ml_capability_definition_clustering] table. To access it, navigate to **Predictive Intelligence** > **Clustering** > **Solution Definitions**.

To verify if the solution definition is active, see Verify text-based clustering solution. To disable the EM Alert Clustering Solution definition, disable text-based alert grouping by setting the property *sa_analytics.text_based_group_enabled* to `false` and clearing the **Active** check box in the EM Alert Clustering Solution definition.

Example of text-based alert grouping

Scenario	Example
Network Connectivity Problems: There are widespread network connectivity issues affecting multiple departments.	Alerts from various network monitoring tools might report issues like Network segment down, High packet loss, or Connectivity issues in subnet. Text-based alert grouping uses the EM Alert Clustering Solution and ML Predictor to streamline alert management. The EM Alert Clustering Solution employs Natural Language Processing (NLP) algorithms to analyze and identify common text patterns in alerts such as Network segment down or High packet loss. It then clusters these alerts based on their text similarity, grouping related issues together. The ML Predictor further enhances this process by evaluating new alerts in real time and assigning them to the appropriate existing clusters based on their text patterns. This dynamic grouping provides a consolidated view of the connectivity problems, allowing network engineers to quickly diagnose and address the root cause of the issues more efficiently.

Verify text-based clustering solution

Event Management uses Natural Language Processing (NLP) algorithms to identify common text patterns in alerts and create alert groups through clustering. This approach not only organizes similar alerts efficiently but also reduces noise and helps focus on significant issues, enhancing overall alert management.

Before you begin

Ensure that the Predictive Intelligence plugin (com.glide.platform_ml) is installed.

Ensure the parameter *sa_analytics.text_based_group_enabled* is set to `true`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the Predictive Intelligence plugin is not installed, the text-based logic will not execute, even if *sa_analytics.text_based_group_enabled* is set to true. This is because text-based grouping relies on clustering alerts based on the description, metric name, and CI class. Without the plugin, clustering cannot be performed, and as a result, text-based groups will not be created, regardless of the active status.

Ensure that there are at least 100 alerts in the Alerts table [em_alerts].

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Predictive Intelligence** > **Clustering** > **Solution Definitions**.
   The Clustering Definitions page opens.
2. Select EM ALert Clustering Solution.
3. Verify that the **Active** check box is selected.
4. Select **Update & Retrain**.
   For more information on ML solutions, see Reviewing your ML solution training jobs.

Manual alert grouping

Manual alert grouping involves organizing and categorizing alerts based on user-defined criteria and direct intervention.

You can manually select and group alerts to better manage and resolve incidents by tailoring the grouping based on specific needs, relevance, or context. This approach ensures that alerts are categorized effectively, enhancing overall incident management and response efficiency.

Create alert group manually

Manually create an alert group to organize and manage related alerts when not using scheduled jobs. This provides flexibility to group alerts on-demand for effective resolution.

Before you begin

Role required: evt_mgmt_admin

Procedure

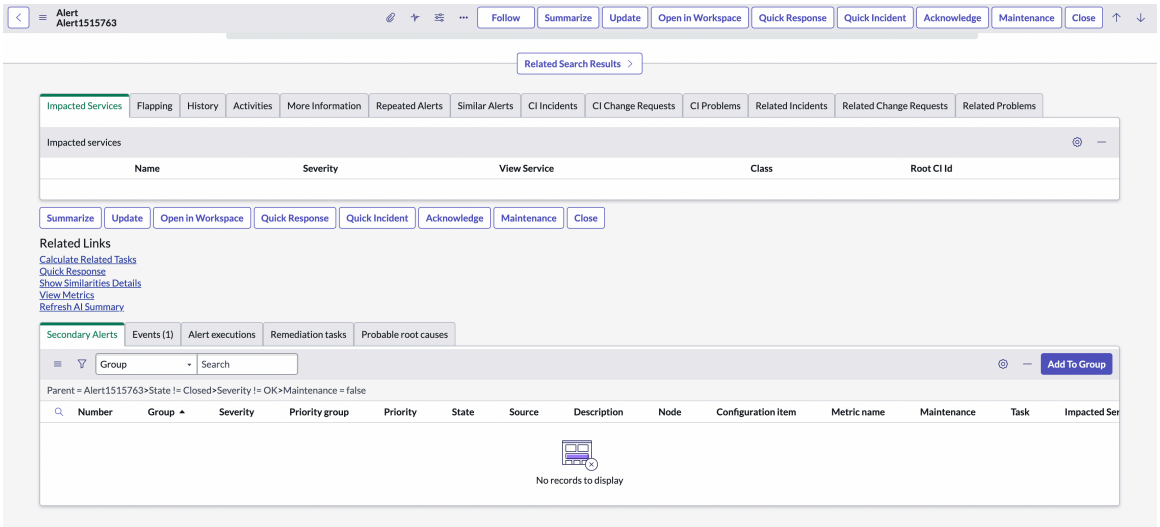
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert.

   The alert will be used to create an alert group, designated as the primary alert, to which you can add secondary alerts.

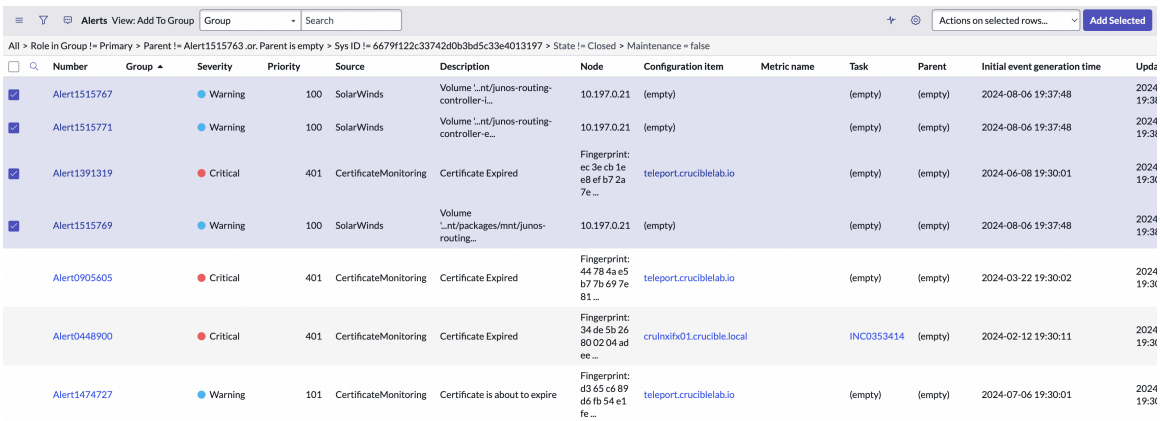
   Note: A closed alert cannot be assigned as a parent alert.

3. Scroll down and in the **Secondary Alerts** tab, select **Add To Group**.

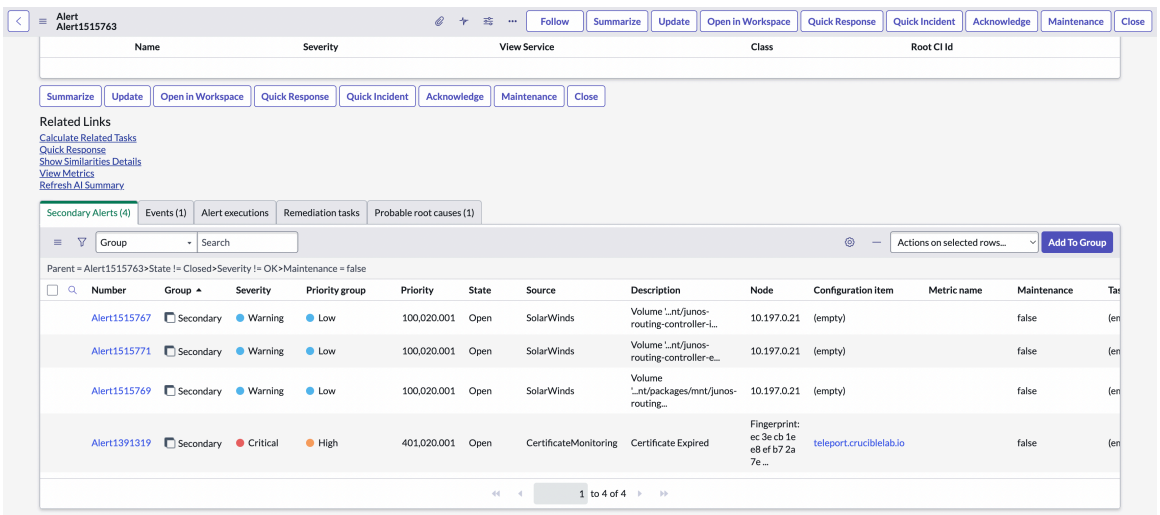
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select the check boxes for all alerts you want to add to the group as secondary alerts and select **Add Selected**.



5. In the **Secondary Alerts** tab, view the alerts that have been added as secondary.



Add secondary alert manually to an existing alert group

Add any relevant alert discovered during the review of an automated alert group as a secondary alert to improve the group's completeness and utility for incident troubleshooting.

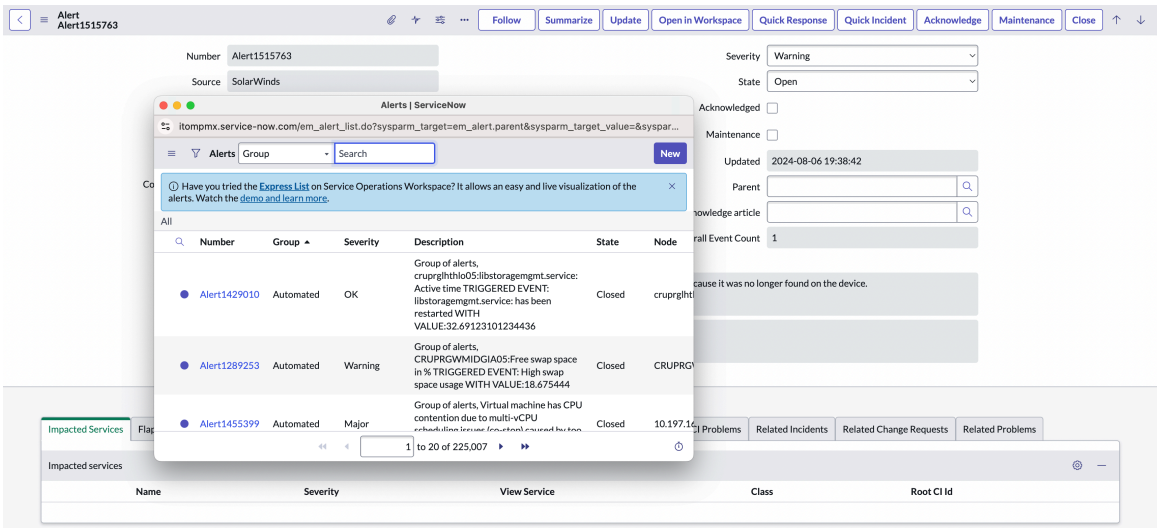
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
The alert you select to add to a new group may already be part of another group. Adding it to the new group will automatically remove it from its current group, changing its group association. Alternatively, you can update the alert's parent to move it to a different group. By specifying a new parent, the alert is transferred to the new parent's group and removed from the previous one. This can be accomplished by updating the **Parent** field on the alert form or by modifying the **Parent** column in the Alerts list.

Note: When you add an alert to a group, this action is logged as feedback for alert grouping as part of the process. Currently, the feedback option is available but does not trigger further actions after being logged. Future enhancements to this feature are being considered.

Procedure
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert.
3. In the **Parent** field, search for the alert you want to assign as the parent for the selected alert.



4. Select the parent alert number.
5. Select **Update**.

Result
The alert is added as a secondary alert to the selected parent alert.

Remove an alert from an alert group

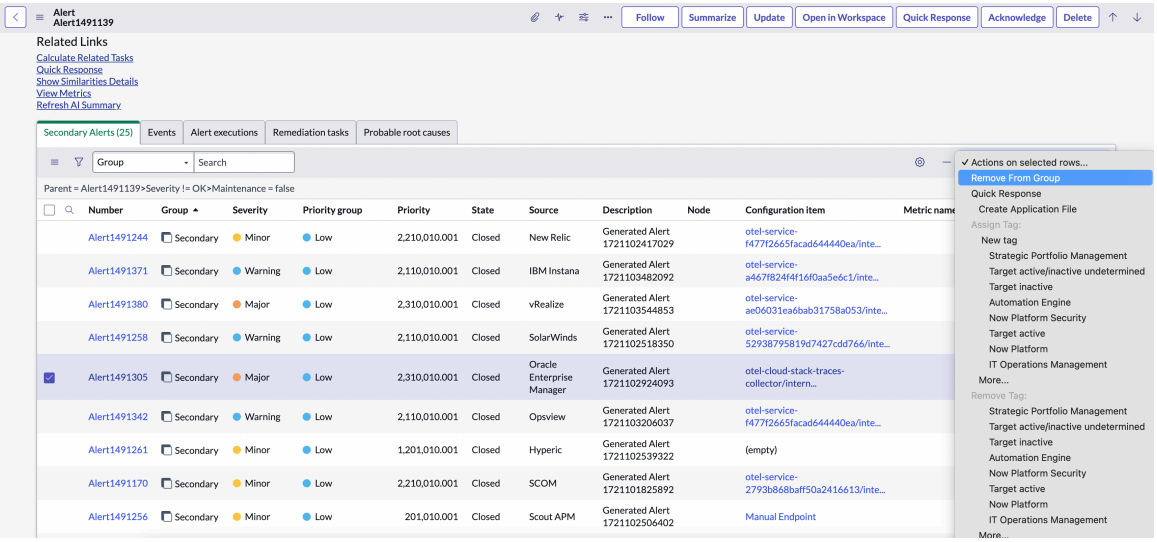
Remove an alert if you want to improve the group's accuracy and usefulness in troubleshooting an incident. If this action leaves the group with one or no alerts, the group is deleted and no longer displays as an alert group.

Before you begin
Role required: evt_mgmt_operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert group.
3. Scroll down to view the **Secondary Alerts** tab.
4. Select the check box next to the alert you want to remove from the group.
5. From the Actions on selected row menu, select **Remove From Group**.



Result

The alert is removed from the group.

Configure work notes to capture alert grouping justifications

As alerts are added to a group, a message is recorded in the alert's Work notes field to explain why the alert was included in the group. Define alert types for creating these worknotes related to alert group reasoning.

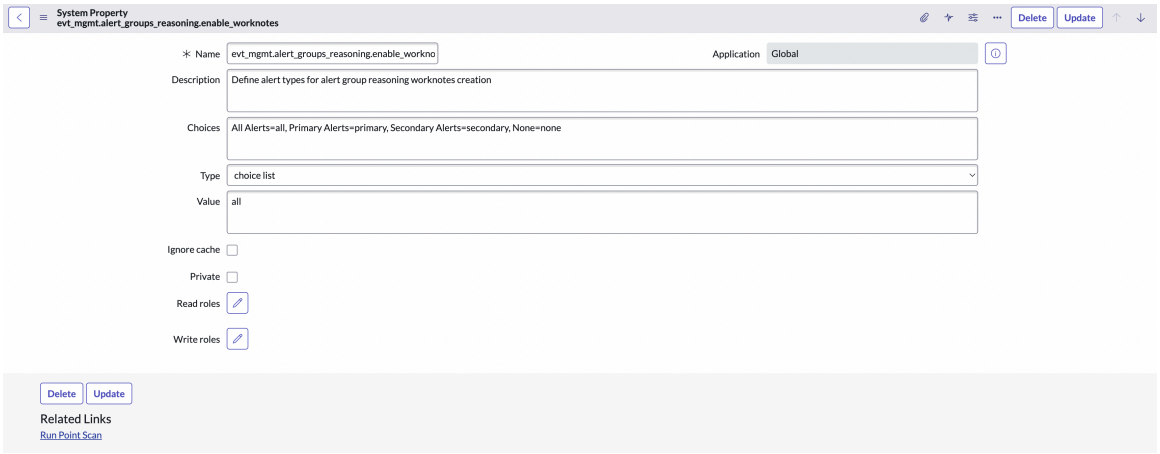
Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the property *`evt_mgmt.alert_groups_reasoning.enable_worknotes`*.
3. Open the property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. In the **Choices** field, define alert types for creating worknotes related to alert group reasoning.

Property values

Value	Description
All Alerts	Work note information is generated for every alert.
Primary Alerts	Work note information is generated only for primary alerts.
Secondary Alerts	Work note information is generated only for secondary alerts.
None	No work note information is generated.

5. Select **Update**.

Alert grouping types and creation methods

Application services in Event Management

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization.

For general information on application services, see Application services.

Manually create an application service in Event Management

You can manually create an application services. Event Management can use application services to monitor service performance and identify health issues.

Before you begin

Role required: evt_mgmt_admin

About this task

An application services is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website. Use application services to organize, maintain, and monitor services in your organization.

Application services do not support these CI types:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.
2. Click **New**.
3. On the form, fill in the fields.

Create a Service form

Field	Description
Name	Enter a unique application service name.
Owned by	Specify an owner who is responsible for this application service in the organization
Add entry points:	
CI Type	Select the CI type (CI class) for the CI you are adding. Every CI belongs to a CI type which contains a set of attributes configured for this kind of CI, for example, cmdb_ci_appl for applications.
CI Name	Select the CI from the list of CIs of the selected CI type.

The CI type list includes only allowed CI types. For example, you cannot add an application cluster.

4. Click **Submit**.

What to do next

For details on grouping application services, see Group application services.

For details on controlling user access to application services, see Control user access to application services.

Convert manual services to application services

You can convert existing manual services to application services. Event Management can use application services to monitor service performance and identify health issues.

Before you begin

Role required: evt_mgmt_admin

About this task

Manual services are no longer supported and this service type, as well as discovered services, have been replaced by application services. Any existing manual services must be converted to application services.
During the conversion process:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The manual service record is moved from the Manual Services [cmdb_ci_service_manual] table to the Mapped Application Service [cmdb_ci_service_discovered] table by changing the record class.
- All the original manual service attributes, such as, name, owner, and operational status, are retained in the application services.
- The configuration items (CIs) of the manual service are retained in the application services after the conversion.
- The system queries the CMDB for the latest CI changes and applies CI impact rules.

Application service does not support these CI types:

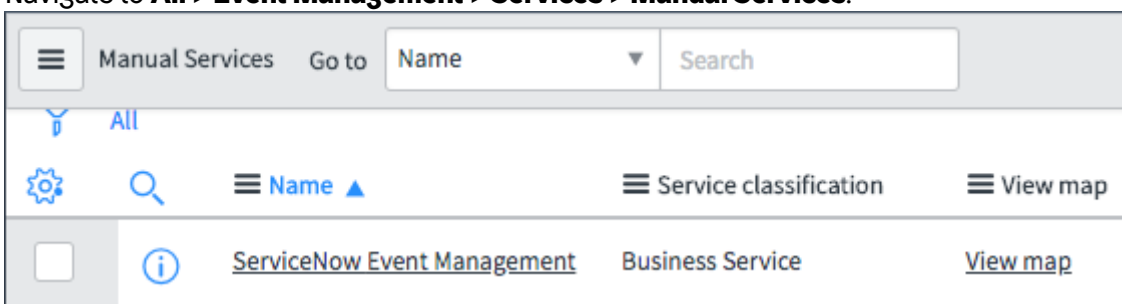
- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If the preceding CI types are used in the manual service that you want to convert, the conversion fails. CIs of this type should be removed before conversion. They can be replaced by adding new CIs to the application services after conversion.

If your ServiceNow instance uses domain separation, the conversion fails if CIs from multiple domains are in the same service. Replace or remove relevant CIs before conversion. The converted application services contains only CIs assigned to the same domain as the application services.

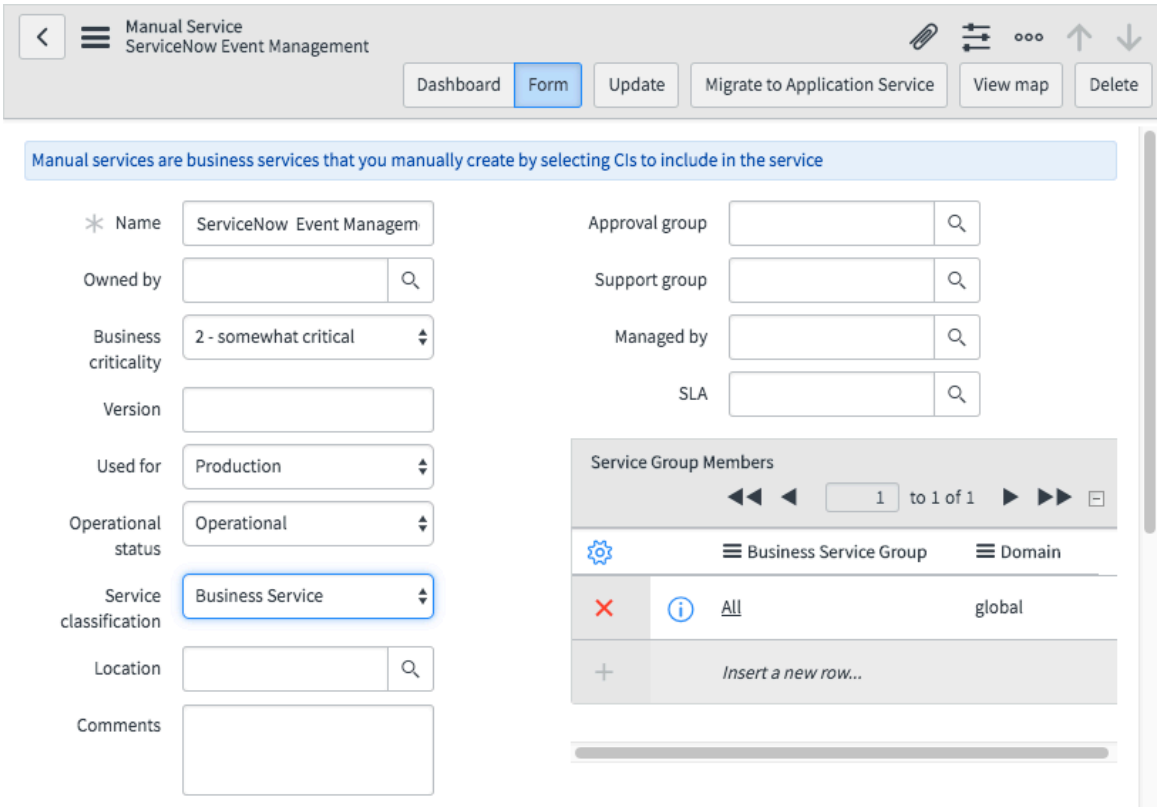
Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Manual Services**.



2. Select the manual service that you want to convert to an application services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Click **Migrate to Application Service**.
4. Click **OK**.

Result

- The CIs from the manual service are added to the converted application services.
- After the conversion process is complete, the application services form opens.

Convert manual services to application services using API

You can use a JavaScript API to convert existing manual services to application services. Event Management can use application services to monitor service performance and identify health issues.

Manual services are no longer supported and this service type, as well as discovered services, have been replaced by application services. Any existing manual services must be converted to application services. Ensure that any automation of manual services (such as business rules or scheduled jobs) have been built and tested before converting to application services.

Note: Manual services are static and retain their original structure after conversion to application services. To update imported manual services with the existing CMDB state, either populate the original manual services to ensure that all CIs are assigned to the correct service, or run the **update with CMDB changes** option after the conversion.

During the conversion process:

- The manual service record is moved from the Manual Services [cmdb_ci_service_manual] table to the Mapped Application Service [cmdb_ci_service_discovered] table by changing the record class.
- All the original manual service attributes, such as, name, owner, and operational status, are retained in the application services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The configuration items (CIs) of the manual service are retained in the application services after the conversion.
- The system queries the CMDB for the latest CI changes and applies CI impact rules.

The maximum number of CI connections added to application services during this operation is controlled by the sa.service.max_ci_service_population property. By default, the value is 1,000 (one thousand connections). Increasing the number of CI connections may cause performance issues. To adjust the maximum number of added CI connections, add the sa.service.max_ci_service_population property, as described in Add a system property.

Attempting to process more CIs than the value specified in the sa.service.max_ci_service_population property causes the operation to fail.

Run the conversion process in small chunks of approximately 10 at a time, to make it easier to pinpoint the problematic service in the event of a conversion problem.

Application services do not support these CI types:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If the preceding CI types are used in the manual service that you want to convert, the conversion fails. CIs of this type should be removed before conversion. They can be replaced by adding new CIs to the application services after conversion.

If your ServiceNow instance uses domain separation, the conversion fails if CIs from multiple domains are in the same service. Replace or remove relevant CIs before conversion. The converted application services contains only CIs assigned to the same domain as the application services.

The JavaScript API is:

```
BusinessServiceManager.migrateManualToApplicationService(String
 service_id)
```

Parameters

Name	Type	Description
service_id	String	sys_id of the manual service to be converted

Returns

Type	Description
Boolean	`true` for a successful conversion, `false` for a conversion that failed

Where the `sys_id` of an existing manual service is `451047c6c0a8016400de0ae6df9b9d76`, run the following API to convert it to an application services:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var bsManager = new SNC.BusinessServiceManager();
var res =
 bsManager.migrateManualToApplicationService("451047c6c0a8016400
de0ae6df9b9d76");
```

Configuring CIs in a manual service as a manual cluster

Configure or modify a CI as a specific CI or a generic CI class in a manual service (that was not discovered automatically) as a manually defined cluster. A manual cluster delivers redundancy capabilities in the cluster and provides continued operations or services of the entire cluster in case of failure of one or more CIs in that cluster.

Manual cluster allows you to group CIs under a logical cluster in a service. In the impact tree you can set the relative impact of a cluster member on the cluster.

Note: Creation of nested manual clusters (cluster inside cluster) is currently not supported.

Once the CI is defined as a manual cluster its impact calculation shows the magnitude of an outage on its children CIs. Impact calculation uses factors such as impact rules and CI relationships to calculate the severity of a generated alert. Impact rules, which are used for impact calculation, estimate the magnitude or severity of an outage based on affected CIs and determines how the impact applies to parent or child entities that are part of an application service.

The magnitude of an outage can be 100% down, 60% affected, 40% impaired, or 20% impaired.

Redundancy is defined in impact rules. For example, you can define that the parent CI is critical if at least two child CIs are critical. The impact from child to parent CIs is not always 100%. If the CIs of all three children are affected, the impact is 100% down.

In a service map, you can configure or modify a specific CI or a generic CI class in a manual service as a manually defined cluster. When configuring as a generic CI class, all the CIs of the selected class in that service are configured the same.

Note: Visual representation of a manual cluster may differ from the visual representation of a cluster that is discovered automatically.

Related topics

Alert impact calculation

Configure a manual cluster

Provide redundancy capabilities of an entire cluster in case of failure of one or more CIs in that cluster. By viewing the relative impact of a cluster member on the cluster information, you can better understand the source of alerts and take remediation steps.

Before you begin

Role required: evt_mgmt_admin

About this task

In a manual service that was not discovered automatically, you can manually group a specific CI or a generic CI class under a logical cluster. The relative impact of a cluster member on the cluster can be configured in the impact tree.

For more information, see Alert impact calculation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Manual Clusters**.
2. Select **New**.
3. In the **Select a Service containing this manual cluster** section, select an application service to contain the new manual cluster based on a specific CI or general CI class.
   The cluster number is automatically generated and appears in the **Number** field.

   a. Select the Lookup using list icon ( ) in the **Service** field.

   b. In the CMDB CI Service [cmdb_ci_service_discovered] table, select a manually created service.
   To define a new application service, see Manually create an application service in Event Management.

   c. **Optional:** Preview the record by selecting the Preview this record icon ( ).

4. In the **Select a Specific CI or generic CI class** section, in the **Defined As** field, select whether to define the manual cluster as a specific CI of a manual cluster or as a generic CI class of a manual cluster that will be applied to all CIs of this class.
   - Specific CI - In the **Configuration item** field, select the Lookup using list icon ( ) and select the configuration item.
   - Generic CI class – In the **Configuration item class** field, select the configuration item class.
5. In the **Provide a Description** section, either provide a description in the **Description** field or leave it blank to contain an automatically generated description when you select **Save** or **Submit**.

   The **Description** field is automatically updated when you select **Save** or **Submit**.
   The automatically generated description consists of the configuration item name and the service name. For example: `CI <Alert Processing> in service <linuxApplService> (*** auto generated ***)`.

   To prevent an automatic update of the Description field and retain your changes, delete the (*** auto generated ***) suffix that appears as part of the description.

6. Activate the cluster by selecting the **Activate** check box.
7. Select **Submit**.

Result
The manual cluster is saved in the EM Impact Manual Cluster [em_impact_manual_cluster] table. The impact calculation is recalculated automatically.

Configuring CIs in a manual service as a manual cluster

Modify a manual cluster

Modify an existing manual cluster by changing the service, the specific CI, the generic CI class, or the description in case of an incorrect initial configuration, changes in the network, or other issues.

Before you begin
Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Manual Clusters**.
2. From the list, select a manual cluster.
3. Change the service containing the manual cluster by selecting a different one in the **Select a Service containing this manual cluster** section.
   The cluster number appears in the **Number** field.
   a. Select the Lookup using list icon ( ) in the **Service** field.
   b. In the CMDB CI Service [cmdb_ci_service_discovered] table, select a manually created service.
   c. **Optional:** Preview the record by selecting the Preview this record icon ( ).
4. In the **Select a Specific CI or generic CI class** section in the **Defined As** field, modify the manual cluster either as a specific CI of a manual cluster or as a generic CI class of a manual cluster that will be applied to all CIs of this class.
   - Specific CI - In the **Configuration item** field, select the Lookup using list icon ( ) and select the configuration item.
   - Generic CI class – In the **Configuration item class** field, select the configuration item class.
5. **Optional:** In the **Provide a Description** section, modify the description in the **Description** field.

   (Optional) The **Description** field is automatically updated when you select **Save** or **Submit**. The automatically generated description consists of the configuration item name and the service name. For example: `CI <Alert Processing> in service <linuxApplService> (*** auto generated ***)`.

   To prevent an automatic update of the Description field and retain your changes, delete the (*** auto generated ***) suffix that appears as part of the description.
6. Activate or deactivate the cluster by selecting or clearing the **Activate** check box.
7. Select **Update** to save your changes.

Result
The manual cluster is saved in the EM Impact Manual Cluster [em_impact_manual_cluster] table. The impact calculation is recalculated automatically.

Related topics
Configuring CIs in a manual service as a manual cluster

Create an alert query
An alert query is a set of alerts that meet specific criteria for a particular service.

Before you begin
Navigate to **Event Management** > **Administration** > **Event Management Properties** and ensure that the **Enable alert query support** (*evt_mgmt.impact_calulation.alert_group_support*) property is set to **Yes**.

Role required: evt_mgmt_admin or evt_mgmt_operator

About this task
The main motivation to use alert queries is a modeling solution based on data contained in the alert itself, as an alternative to using either discovered, application, or technical services. Create an alert query to combine similar alerts that meet the specific criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can learn about Event Management basics, including alert queries, from this video:

Procedure

1. Navigate to **Event Management** > **Services** > **Alert Queries**.
2. Select **New**.
3. On the **Alert Query** form, fill in the fields.

   For a description of the field values, see Alert Query form

   Note: In the **Filter** field:

   - When defining an alert query filter, include only fields that appear in the Alert Histories [em_alert_history] table. Impact calculation is based on Alert History data and fields such as Overall Event Count, Priority, and Priority group are not copied to the Alert Histories [em_alert_history] table.
   - Do not specify a dynamic time condition. For example, in the filter, do not specify `Created` condition of `Last 45 minutes` because impact calculation is triggered by a change of alert or alert query. However, for the dynamic time condition, none of these conditions have changed.

   - Some filters may slow down impact calculation. To solve this problem, adjust your alert query by adding an appropriate index, as described in Index suggestions for slow queries.
4. Select **Update**.

Related topics

Create alert group manually

Create an application service group

Create service groups to combine similar services. Organize services by groups to perform actions simultaneously on multiple services and to control user access to services.

Before you begin

Role required: evt_mgmt_admin

About this task

Service groups are a way to organize and group services based on the application services or technical services they impact. Instead of looking at individual service from different infrastructure components (like servers, databases, or applications), Service groups help consolidate them under the umbrella of a service group. Application service groups enable faster identification of alert impact. Service groups appear in the **Group by** option on the Service Operations Workspace dashboard.

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Service Groups**.
   The Application Service Group page opens.
2. Select **New**.
3. In the **Name** field, enter the name of the new service group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** In the **Parent Group** field, enter the name of another group in which to embed the new group.
   Users with access to a parent service group automatically have access to all its child groups.
5. Select **Submit**.

Related topics

Assign a role to a service group

Group application services

Assign a role to a service group

Assign an Event Management role to the application service group to ensure that group members can manage and act on alerts.

Before you begin

Configure a service group to enable users to manage application services or alert groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Service Group Responsibilities**.
2. Click **New**.
3. In the **Application Service Group** field, select the name of the service group.
4. In the **Role** field, select an Event Management role:
   - evt_mgmt_admin
   - evt_mgmt_integration
   - evt_mgmt_operator
   - evt_mgmt_user
5. Click **Submit**.
6. To find users who are assigned to the role, navigate to **User Administration** > **Users** > **Roles** and search for the role.

Request Service Mapping

Configure email notification on application service severity change

Configure an email notification to notify users when there is an application service severity change.

Before you begin

Role required: evt_mgmt_admin

About this task

Configure an email notification to notify users when there is an application service severity change. The notification involves specifying when to send it, who receives it, and what it contains.

Procedure

1. Navigate to **All** > **System Properties** > **Email Properties**.
2. In the **Outbound Email Configuration** section, in the **Email sending enabled** option, select **Yes** to enable sending severity information by email.
3. Click **Save**.
4. Navigate to **System Notification** > **Email** > **Notifications**.
5. Click **New**.

   a. In the **Email Notification Actions** form, specify these values.

Field	Value
Name	Type a descriptive name, for example, *Application Service severity change*.
Table	Select the required service type and its corresponding table: Alert Group, Discovered Service, Technical Service, or Application service.
Active	Select the check box to enable email notification.

   b. Click the **Who will receive** tab.
   In the **Users** area, search for and select the required user (the user does not require System Administrator credentials). Repeat this step for as many users that are required to receive this notification.

   c. Click the **When to send** tab and in the **choose field** box, search for and select *Severity*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Click the **What will it contain** tab and in the **Subject** field, type meaningful text that makes it clear to the receiver of the email notification what the content of the email is.

e. In the **Message HTML** message area, using the **Select variables** functions, compose the conditions under which the email notification is to be sent.
For example, configure these variables to change severity:

```
severity changed
```

```
Severity: ${severity}
```

```
on application service
```

```
Name: ${name}
```

6. Click **Submit**.

Configure contextual colors and icons

Use the **Contextual colors and icons** form to configure color, text, and icons to have different default or custom contexts, identified by a context ID.

Before you begin

Role required: evt_mgmt_admin

About this task

You can customize the colors or icons of elements in the **Contextual colors and icons** form to affect the displayed colors or icons of severities in related Event Management screens, either when accessibility mode is off or on. For more information about accessibility, see Accessibility features .

In each color selection field, you have the option of entering the value of the color as any of the following Cascading Style Sheet (CSS) formats that determine how HTML elements should be displayed:

- Name: predefined color names, for example, red, green, olive, blue, darkblue, or lightblue
- RGB decimal: RGB(102, 153, 204)
- RGB hex: #223344

See the following websites for information about CSS color declarations (including hex or RGB notation):

- HTML Colors (W3CSchools) for more information on hex and RGB notation.
- HTML Color Names (W3CSchools) for valid color names.

The context IDs that are provided with the base instance are:

- information_severity
- warning_severity
- minor_severity
- major_severity
- critical_severity
- topology_connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Contextual colors and icons**.
2. Click **New** or modify an existing configuration.
3. Configure the following fields.

Item	Description
Context details	
Context ID	Enter a unique ID for the context, for example, clear_severity.
Context Name	Readable name for the context. This text is available to be read out by screen readers.
Batch	The batch that this context is a member of.
Description	Description of uses for the context.
Colors **Note:** For each entry in the color fields, after you enter a color code, a block appears to the right of the field showing the specified color. Use of invalid color codes triggers an appropriate error notification.	
CSS Color	The corresponding CSS color code for the context color name.
CSS Color on Interaction	CSS color code that appears on hover or focus.
Accessible CSS Color	Accessible CSS color code that appears when accessibility mode is enabled.
Accessible CSS Color on Interaction	Accessible CSS color code that appears on hover or focus.
Icons	
Icon	Icon that is displayed when the context includes an icon.
Accessible Icon	Icon that is displayed when the context includes an icon and when accessibility mode is enabled. To add your own icon, or to see a list of available icons, see Upload one or more images.

4. Click **Submit**.

View Event Management license usage

Event Management is licensed based on the number of CIs bound to alerts during the last year. For alerts that are not bound to CIs, the system calculates the number of nodes (servers) that can send events to the instance directly or through a third-party monitoring tool during the last year.

Before you begin

Role required: evt_mgmt_admin or evt_mgmt_operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The **Event Management - Node Count Store** job calculates the number of unique nodes that send event information, either directly or through third-parties, to Event Management and are eligible for licensing in the last year. The information from this job is stored in the License Usage [em_unique_nodes] table for visibility by all users. CIs bound to alerts are counted towards licensing; if there are no CIs that are bound to alerts, the event node field is used. Node is a reference to a server, not the instances of the software on it. Your node count is based on the amount of infrastructure (servers for example) that will be sending events.

Procedure

Navigate to **All** > **Event Management** > **Reporting** > **License Usage**.

The table is filled automatically based on the alerts in the system. The user has no permission to edit the table. It is used to calculate the usage of the Event Management licensing.

Column	Description
CMDB CI	The CI that is bound to the alert that is gener ated from the event. If there is a value for this field, the **Node** field is empty.
Node	The string value of the **Node** field of the event. If there is a value for this field, the **CMDB CI** field is empty.
Type	One of these values: • Unknown - A CI has not bound to the gener ated alert. • Server - The source of the event was a serv er. • PaaS - The source of the event was Platform as a Service.
Is licensable	One of these values: • True - The event listed is counted towards the license usage. • False - The event listed is not counted to wards the license usage.

Using Event Management

As an Event Management operator, your role is to find alerts, analyze them, and take action to help resolve the underlying issue.

This guide can assist you on a regular basis.

View alert information

View a list of all alerts for application services s, and then manage individual alerts as necessary.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Multiple related events may correlate into a single alert. Event Management only creates alerts when one or more events meet the conditions defined in event rules, alert action rules, and alert configuration settings.

When updating an alert, empty field values do not override values inherited from the alert's event.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.

Note: To stop the message from appearing, set the *show_sow_enhanced_experience_message* property in the [sys_properties] table to false.

2. To view or manage an alert, click the alert number.
3. Review the information on the Alert form.
   You can click tabs on the form for further information.
   - To view flapping information, click the **Flapping** tab.
   - To view alert history, click the **History** tab.

Alert form

Field	Description
Number	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
Resource	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.
Configuration item	JSON string that represents a configuration item. For example, `{"name":"SAP ORA01","type":"Oracle"}`. The CI identifier that generated the event appears in the **Additional information** field. Maximum length: 1000 characters. Note: Reference pop-ups and click-throughs are hidden by default for read-only fields. For **Configuration item** and other read only fields, you can optionally change the read-only setting. For more information, see Configure pop-ups on read-only fields . Click to open the alert in dependency view.
Task	The corresponding task for the alert, such as an incident, change, or problem.
Metric Name	Unique name that describes which metric data is collected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	A description of the alert.
Message key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Severity	The severity of the event. The value for this field is copied from the event unless the event closes the alert, in which case the previous severity is retained for reporting. ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **OK**: An alert is created. The resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.
State	The state of the alert. ○ **Open**: The alert requires user action. ○ **Reopen**: The previously closed alert requires additional user action. ○ **Flapping**: After the alert has been closed, it receives a high frequency of identical events from the same source that causes many alert reopenings. User action is required. ○ **Closed**: The alert is closed and no further user action is required.
Acknowledged	Select **Acknowledged** to indicate that a user has acknowledged the alert.
Maintenance	A check box that shows whether the resource that is affected by the alert is in maintenance.
Updated	The most recent time that the alert information was updated.
Parent	○ If this field is blank, you can specify an alert number. The current alert becomes a secondary alert to this parent alert. ○ If an alert number is displayed, then the current alert is already a secondary alert to this current alert, which is the parent alert.
Feedback	This field appears in alert forms only if the alert being modified is a parent alert. Your response provides feedback about the accuracy and usefulness of the group. Possible values are: ○ None - No value was selected. ○ No Feedback - There is no feedback for this alert. ○ Yes - The alert group is accurate and useful. ○ No - The alert group is not accurate and not useful.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Currently, the feedback option is available but does not trigger further actions after being logged.
Knowledge article	The knowledge article associated with the alert, if any.
Overall Event Count	The counter is increased every time an event is bound to the alert. The count value is kept even after the actual event has been purged. Primary alerts (virtual alerts) are updated based on their secondary alerts. The actual number of events that affected the alert is displayed. **Note:** Do not create an Alert Group based on Event Count. Where an Alert Group is based on Event Count, the impact of the group does not calculate properly because the Event Count field is not copied to the em_alert_history table for impact calculation.
Source instance	The name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44.
User name and role	The user and role of the person who made the most recent alert updates.
Acknowledged	The **Acknowledged** check box value after the most alert recent update. ○ *True*: The **Acknowledged** is selected. ○ *False*: The **Acknowledged** check box is cleared.
Correlated Alerts section	The secondary alerts that are correlated with this alert, where this alert is the primary alert. For more information, see Rule-based alert grouping.
Primary Alerts section	The primary alert that is correlated with this alert, where this alert is a secondary alert. For more information, see Rule-based alert grouping.

Additional tabs.

Field	Description
Impacted Services tab	
Impacted Services	The impacted services that are related to this alert are listed. For more information, see View the impact tree.
Flapping tab	
Flap count	The number of times the alert has flapped—that is, has fluctuated between a closed and a non-closed state—within the flap interval since the start time in the **Flap start window**.
Flap start window	The initial start time to measure the flapping occurrences.
Flap last update time	The last time flapping occurred. This time is the platform processing time, not the source system time.
Flap last state	The state before the alert entered the flapping state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
History tab	
Initial event generation time	The time when the event that generated the alert first occurred. This time is the platform processing time, not the source system time.
Last event generation time	The last time the event that is linked to the alert occurred. This time is the platform processing time, not the source system time.
Created	The time that the alert was created.
Work notes	The additional notes about the alert.
Activities tab	
Activity	A record of the work that was performed. The text has a date and time stamp.
More Information tab	
Priority Breakdown	Displays the computation of the alert priority score.
Additional information	A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field “Connection instance is successful”. When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {“additional_content”: “Connection instance is successful"}.

What to do next

You can respond to the alert in the following ways:

Alert response options

Option	Description
Submit	Save the modifications that were made to the form and return to the **Alerts** list.
Acknowledge the alert.	Click **Acknowledge**. If the alert is reopened, this button reappears so you can reacknowledge the alert.
Create an incident.	Click **Create incident**. For more information, see Create incident or security incident from an alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert response options (continued)

Option	Description
If Security Incident Response is activated, create a security incident response.	Click **Create Security Incident**.
Designate that the alert is in maintenance.	Select the **Maintenance** check box. For more information, see View all alerts by the maintenance status.
Close the alert.	Click **Close**. For more information, see Close an alert.

Security incidents created from events and alerts

Priority group

For better triage and focus, alerts that have a higher priority are brought to the top of the alert list. This placement brings to your attention those alerts that require you to handle them at a higher priority than other alerts.

The priority group indicates which alerts should be attended to first. Priority is calculated for each open alert and then mapped into one of four priority categories.

Thresholds

Thresholds on the calculated priority are used to determine to which category the alert is mapped to. Alerts with a priority above the value of the *evt_mgmt.top_priority_group_threshold* property are categorized as **Urgent**, which is the highest priority. The default value of this threshold is 1M.

Priority group categories

The priority groups into which alerts fall are listed in the following table.

Alert priority groups

Priority group	Icon
Urgent	
High	
Moderate	
Low	

The value of the alert priority group is more meaningful than the alert severity on its own. For example, an alert with a severity of Major, may not be in need of resolution ahead of an alert whose priority is Critical. The combined group priority value takes the weight of each factor into account, giving you a better indication of which alert to attend to first.

The alert priority group is available in alert lists in the Dashboard, Alert Intelligence, and All Alerts page. For example, in the **All Alerts** list, the alert priority group is displayed as depicted in the following image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Number	Group	Severity	Priority group	Priority
Demo0001011		Warning	Low	100
Demo0001006		Warning	Moderate	100
Alert0010004		Minor	High	200

Triggers that cause recalculation

Changes to open alerts trigger the recalculation of the priority and then the alert is again categorized into the relevant priority group. Closed alerts are not considered for alert priority group calculation.

Alert priority

Alert execution information

Alert execution information provides a reference to the actions that have been performed concerning the alert. Among the information presented is which alert management rules ran on the alert, incidents that were opened, and which remediation workflows ran.

Alert Executions

In an alert form, the Alert Execution tab shows key related records for the alert. For example, it shows which actions were performed and which alert management rules were run. If an incident was opened, the related tasks are shown.

Fields in the Alert Executions section

Field	Description
Alert	Reference to the alert that ran under this rule.
Action name	Indicates how the alert was resolved.
Link to execution	Link action that was taken to resolve the alert.
Related task	Link to the incident that was created when the alert was resolved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields in the Alert Executions section (continued)

Field	Description
Log	Link to the log that details the actions taken to resolve the alert
Automatic run	Indicates if the rule was automatic (true) or manual (false).

Action name
This indicates what occurred, for example, if an incident was created.

Log
The log reveals which alert management rule initiated the action. It shows, for example, automatic execution 1 out 3, or manual execution, 2 out of 4.

View alerts in the flapping state

You can view alerts that are specifically in the flapping state.

Before you begin
Before starting this procedure, ask your administrator to configure alert flapping properties.
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
Flapping occurs when the event source continues to generate events even after its associated alert has been closed. Flapping causes the resource's status to repeatedly fluctuate between the *OK* severity and a severity requiring attention, for example, *Critical*.

The frequency of events from an identical source within a given time interval determines whether an alert is in a flapping state or a new issue has occurred. Based on the *evt_mgmt.flap_frequency* and *evt_mgmt.flap_interval* property values:

- If the same issue is recurring, Event Management associates the new event with the existing alert and the state of the alert is set to **Flapping**.
- If the issue occurs after the time interval expires, Event Management creates an alert.

For example, you can respond to an alert by rebooting a problematic server. After no events are generated for several minutes, it is assumed that the issue is fixed and the alert is closed. If the reboot did not actually fix the issue, this server can generate more events later. Then additional alerts are generated for the same issue.

Procedure
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the number of an alert that is in the **Flapping** state.
3. On the alert, click the **Flapping** tab.

Flapping tab on Alert form

Field	Description
Flapping tab	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Flap count	The number of times the alert has flapped—that is, has fluctuated between a closed and a non-closed state—within the flap interval since the start time in the **Flap start window**.
Flap start window	The initial start time to measure the flapping occurrences.
Flap last update time	The last time flapping occurred. This time is the platform processing time, not the source system time.
Flap last state	The state before the alert entered the flapping state.

4. If the **Parent** field is empty, address this alert as a new issue.

Related topics

Configure alert flapping

View all alerts by the maintenance status

The **Maintenance** status indicates that the CI is under maintenance. For example, there is a software upgrade, and the issues can result from that activity, therefore all maintenance alerts are discarded.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

The alert maintenance status can change due to any of these reasons:

- A user selected the **Maintenance** check box on the alert, or selected the alert from the list view, and then clicked the **Maintenance** UI action.
- A new alert that had been bound to a CI whose status is in maintenance status on the CMDB table.
- If all previous events associated with the alert are in maintenance, the alert **Maintenance** field can automatically be set to *`true`* showing maintenance is in progress. However, if an alert **Maintenance** field is *`false`* but the related CI status is changed to *`In Maintenance`* after the alert was created, any subsequent events do not put the alert into maintenance. For example, if an alert is generated for a router and later the router is taken down for maintenance, it is still assumed that there was a problem before maintenance started and the issue must not be ignored.

Note:

- If a maintenance flag was set on an alert in Geneva, after upgrading to Helsinki it affects the impact as a regular alert.
- If an alert is bound to a CI by a user action (such as an alert management rule) and the CI is in the Maintenance state, you must manually bind the CI to the alert and mark it with the **In Maintenance** status.

Procedure

1. Navigate to **All** > **Event Management** > **All alerts**.
2. Review the **Maintenance** column for each alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A value of *true* indicates that the CI is under maintenance.

Note: If the **Maintenance** field is not visible on the Alert form, personalize the list to add the field. For more information, see Personal lists.

Collaborate from within an alert

You can collaborate with colleagues and write work notes while working in an alert.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
You can select to work either in a compact view of Connect that overlays the standard user interface or in a full-screen workspace. The conversations are not copied into the alert.

Procedure
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the required alert.
3. In the alert screen, click **Follow**.
   The label of the button changes to **Following**, showing the current connection to collaboration status.
4. To view the Connect sidebar in a full window, click the down arrow in the **Follow** button and select **Open Connect Full**.
   You can write text in the **Worknote** field. This text is not copied into the alert.
5. To collaborate with colleagues or with support, click the **Add User** icon.
6. To conclude the Connect collaboration session, click **Following**.

Create incident or security incident from an alert

When an alert must be escalated and assigned to someone who can resolve the underlying issue, you can open an incident.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
If Security Incident Response is activated, a security incident can be created.

You can manually create incidents and security incidents from the Alert form. To prevent duplicate tasks, the system checks the conditions of all task templates before creating an incident.

You can customize the created incident using the *EvtMgmtCustomIncidentPopulator.populateFieldsFromAlert* script include. The customization includes mapping fields from the alert to the incident or aborting the incident creation according to customized conditions. For more information, see Custom alert fields.

You can populate incident fields using custom alert fields values that where populated from additional information fields. Use the *EvtMgmtCustomIncidentPopulator* script include to copy the values to the incident after copying the data to the alert. For more information, see Custom alert fields.

Note: If Security Incident Response is activated, the base system includes an alert action rule called **Create security incidents for critical alerts**. This alert action rule creates security incidents when critical security events are reported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the alert **Number**.
3. To create an incident:
   - To create an incident, click **Quick Incident**.
   - To create a security incident, click **Create Security Incident**. You must install the Security (secops) plugin to enable this option.
4. Click **Update**.

Result

The created incident appears in the **Task** field of the Alert form.

Related topics

Security incidents created from events and alerts

Place an alert into maintenance

You can manually place any alert into maintenance to hide it from the Alerts list and Agent Workspace.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator

About this task

Placing the alert in maintenance does not place the CI into maintenance. The **Status** field on the CI record remains the same.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Perform one of the following actions.

Option	Description
To put multiple alerts into maintenance	Select the check boxes next to each alert, and then click the **Maintenance** UI action at the top of the list.
To put one alert into maintenance	Open the alert, and either select the **Maintenance** check box and click **Update**, or click the **Maintenance** UI action at the top of the list.

Use alert insight to find a solution and help find the root cause of the alert

Results from data analysis provide further information about the alert, beyond that of the alert form. This aids faster alert triage, enabling a quicker way to find a solution and expose the probable root cause of the alert.

Information shown is from repeated alerts, similar alerts, incidents, problems, and change requests on the same CI, similar CIs, and other CIs that are related by CMDB relations or grouping.

Apply a quick response in an alert

In an alert, use the *Quick Response* feature to apply remediation to the alert or to launch a web application.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

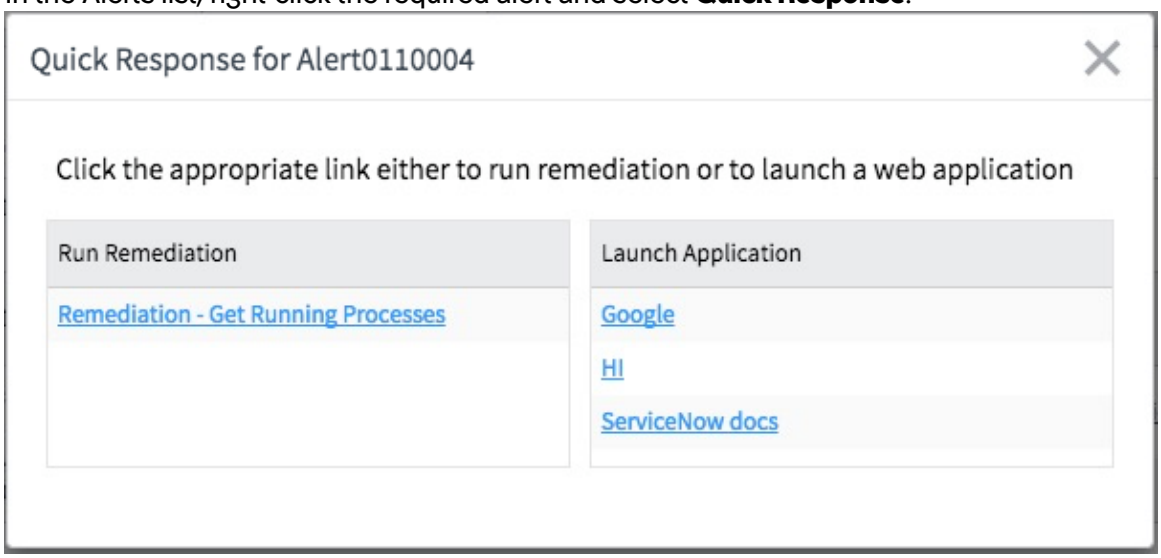
About this task

Quick Response is a feature that enables you to perform a quick action on the selected alert. The action is to apply remediation or to launch an application. If you have upgraded from Istanbul or earlier, this feature is a combination of the **Remediation** and **Launch an application** features.

If you select a remediation link when invoking a Quick Response, a workflow is executed according to the criteria specified in the alert management rule. Click a launch application link to launch the web application that was configured in the alert management rule. For further information, see Migrate an alert action rule to an alert management rule.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. In the Alerts list, right-click the required alert and select **Quick Response**.



3. In the Quick Response page, click the required link to perform the required action.
   If the link that you require is not available, perform one of these actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
For Remediation, define a remediation task using an Alert rule based on the selected alert	**a.** Navigate to **Alert Rules**. **b.** Select the required alert management rule to edit. **c.** Click **Remediation**. **d.** Click **Enable Remediation**. **e.** In the **Execution** field, select either Auto matic or Manual. **f.** In the **Orchestration** workflow field, specify the remediation workflow. ▪ For **Orchestration**, in the workflow set tings, select **Remediation Task [em_re mediation_task]** in the **Table** field. ▪ After you finish configuring the orchestra tion workflow, publish it. **g.** Click **Update**. For further information, see Migrate an alert action rule to an alert management rule.
For Launch Application, create a web appli cation link using an Alert rule based on the selected alert	**a.** Navigate to **Alert Rules**. **b.** Select the required alert management rule to edit. **c.** Click **Launcher**. **d.** Click **Enable**. **e.** In the **Display Name** field, specify a name for the link. **f.** In the **URL** field, compose the URL using data from the alert in the for mat: `${source}.com:${port}/${cmdb_ci.name}` **g.** Click **Update**. For further information, see Migrate an alert action rule to an alert management rule.

What to do next

To create a remediation task or web application link, see Migrate an alert action rule to an alert management rule.

Launch web application from alert

Monitor service health

On the Operator Workspace, you can view alerts by application services, technical service, and alert group. For services, you can also open a service map to view relationships between CIs in the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Ask an administrator to create at least one application services, technical service, or alert group if none of these items exist.

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

The Operator Workspace tiles represent a service, alert group, or CI. The tile color represents the overall alert severity.

Note: Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

These tile icons are available:

Dashboard tile icons

Icon	Meaning
	Represents the status of a mapped application services.
	Represents the status of an Alert group with a set of corresponding open alerts.
	Represents the status of a dynamic CI group.

Each tile represents the highest severity of an alert for the service, alert group, or CI. For example, a tile appears in red if an alert is critical. A green tile indicates either information alerts or no currently active alerts. As the alert severities change, the tile colors update accordingly. The following severities are available:

- **Red**: critical severity (highest severity). Immediate action is required. The resource is either not functional or critical problems are imminent.
- **Orange**: major severity. Major functionality is severely impaired or performance has degraded.
- **Yellow**: minor severity. Partial, non-critical loss of functionality or performance degradation occurred.
- **Blue**: warning severity (lowest severity). Attention is required, even though the resource is still functional.
- **Green**: informational. No severity. An alert is created. The resource is still functional.

Procedure

To integrate with Operational Intelligence, activate the Operational Intelligence (com.snc.sa.metric) plugin.
Follow the steps in the Get started with Metric Intelligence topic. Metrics information appears on the **Metrics** tab in the Service Operations Workspace.

Related topics

View metric values in the Insights Explorer

View discovered service history

The discovered service history shows the frequency of discovered services for a particular time period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
The discovered services history appears only when there are multiple discovered services that occur over a period. A discovered service is a service that is discovered by Service Mapping. The discovered services history is not available for application services. If no discovered services are generated for a particular service, the discovered services history is hidden.

Procedure
1. Navigate to **All** > **Event Management** > **Service Operations Workspace**.
2. Click a service tile and click **Service Map**.
3. Click the **History map** button.

   The history timeline appears, with changes to the service indicated by a clock icon ( ).

4. To view a map showing changes in the service's severity, click the More icon ( ) and select **Advanced map**.

   The displayed color corresponds to the discovered services severity, and the length of the bar in each color corresponds to how long the discovered services stayed at that severity.

   The following table explains the severity colors:

Service severity colors

Severity	Icon color
Critical	Red
Major	Orange
Minor	Yellow
Warning	Blue

5. To change the information that appears on the discovered services history Advanced map, click a history icon.

   - **Calendar icon**: Show information for currently active discovered services.
   - **Hours**: Show information for discovered services that occurred in the past hour.
   - **Days**: Show information for discovered services that occurred in the past 24 hours.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Weeks**: Show information for discovered services that occurred in the past week.
- **Months**: Show information for discovered services that occurred in the past month.

Monitor alerts for an application services

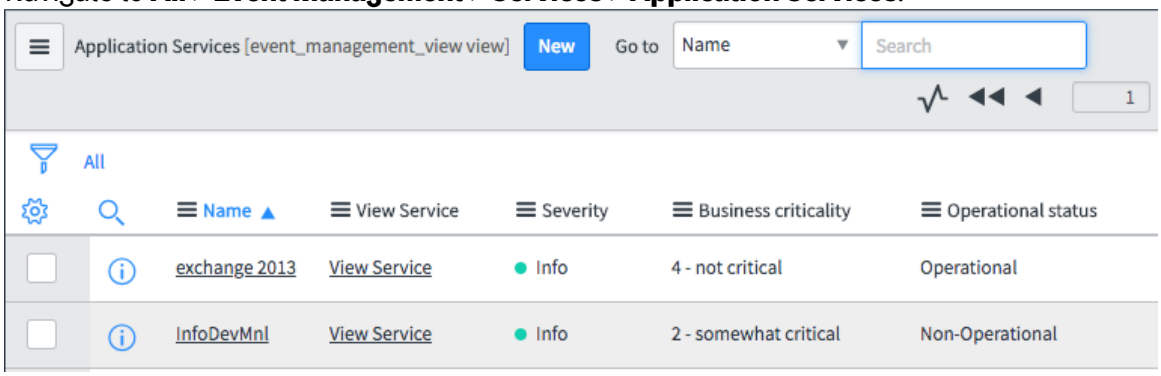
To view information for application services only, navigate to the application services list. From this list, you can open service maps to view and manage alerts for the CIs in each service.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.



2. In the row of the required application services, click **View Map**.
3. Do one or more of the following.

Option	Action
View alert details for a CI	In the service map: **a.** Click a CI tile. **b.** Below the map, click the **Alerts** tab and re view the listed alerts.
View impact on the CI parent	In the service map: **a.** Click a CI tile. **b.** Below the service map, click the **Impact** tab and review the listed impact rules. **c.** Adjust the impact rules as necessary.
Change the map display, map layout, or map indicators	In the service map header: **a.** Click the menu icon. **b.** Configure the appropriate settings.
Navigate to another application services	In the service map header: **a.** Click the down arrow next to the service name or the folder icon for all services. **b.** Search for and select another application services ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
	The icon color represents the highest impact or severity for active alerts on the application services. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
View properties for a CI	In the service map: **a.** Click a CI tile. **b.** In the side pane, click the **Properties** tab and review information about the CI. **c.** If you want to view more detailed informa tion, scroll to the end of the pane and click **Detailed Properties**.

View monitored services

View all services that Event Management supports, such as, alert groups, discovered services, application services, and technical services. According to the type of service, you can view service definition details or drill down into the service.

Before you begin

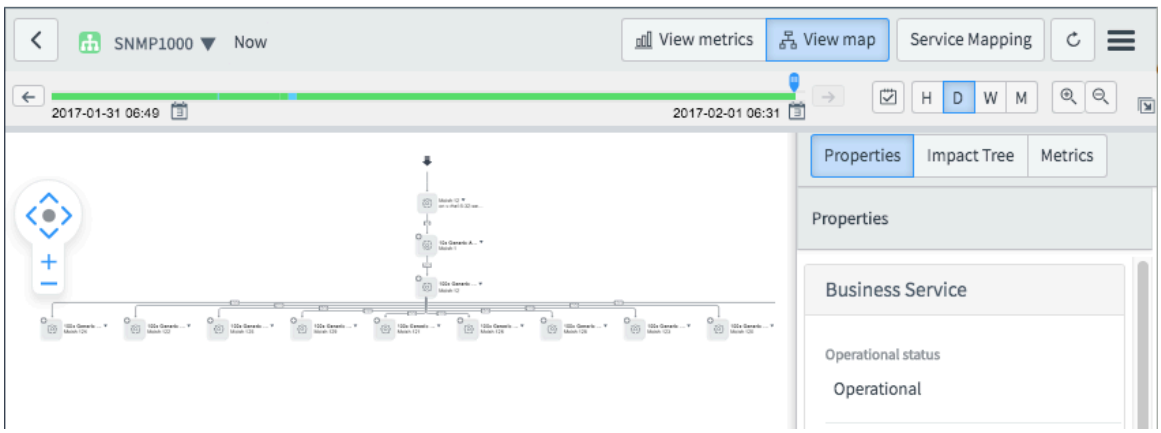
Role required: evt_mgmt_user

Note: Application services that were created before activating the Event Management plugin are not listed in the in the **View Service** column of the Monitored Services list.

Procedure

1. Navigate to **All** > **Event Management** > **Monitored services**.
2. Click **View Service** to open the view that is relevant to that service.
   When you drill down to the contents of the service, either a map, alert list, or CI list appears according to the type of service.

   For example, if you click **View Service** for SNMP1000, you can drill down to the contents of the service and the related topology map appears.



3. To view service definition details of a service, click the name of the service on the **Monitored services** page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, in the **Name** column, click SNMP1000 (SNMP1000).

Monitor service health

Use the Event Management overview dashboard

The Event Management overview module uses Performance Analytics to present data from your instance for you to better visualize and understand your processes and drive continual improvement.

About this task

From the Xanadu release onward, the Event Management overview module has been deprecated and replaced with the AIOps dashboards. The dashboards deprecated include the following:

- Event Management insights
- Event Management scorecards
- Event Management overview

The AIOps dashboards offer comprehensive visualizations of critical operational data. You can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment. For more information, see AIOps Dashboards in Service Operations Workspace for ITOM.

Performance Analytics and Reporting

Launch web application from alert

You can launch a web application from an alert that matches the conditions set in an alert action rule.

Before you begin

Create an alert action rule that is configured to prepare a URL when the conditions that you stipulate are met. For example, based on the results when the alert parameters are resolved, this feature can open a Knowledge Base article or construct a URL.

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Right-click an alert in All Alerts or the Alert list in the Event Management Dashboard (for instances upgraded from a release before Orlando), and choose **Quick Response**. Click the required link to launch the web application that was configured in the alert action rule. For further information, see Migrate an alert action rule to an alert management rule.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Right-click the required alert and select **Quick Response**.
   A window appears with a list of available web applications that were configured in the alert action rule and the filter that matches the alert. To see the target URL, point to the cursor over the application name.

   Note: If one or more of the alert action rule parameters cannot be resolved, the related application name appears in black. When the alert parameters are resolved, then the application name becomes a link.

3. Click the name of an application to open the URL in another tab or window in your browser.

Example:

A common use case is launch in context to the source management system.
Other examples include to search in knowledge bases, not only within ServiceNow, but externally as well. Any URL-based action can utilize the alert parameters and the URLs can refer to wikis, messaging services, REST APIs, and so on.

Apply a quick response in an alert

Event Management Operator Tutorial

As an Event Management operator, your role is to find alerts, analyze them, and take action to help resolve the underlying issue.

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Take the tutorial

Before you can work as an operator, you should take a tutorial to become familiar with several Event Management concepts and understand what operators typically do on a regular basis.

Start the tutorial by clicking the first lesson:

Lesson 1	An overview of events and alerts
Lesson 2	An overview of application services
Lesson 3	Event Management operator workspaces

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lesson 4	What operators do

An overview of alerts for Event Management operators

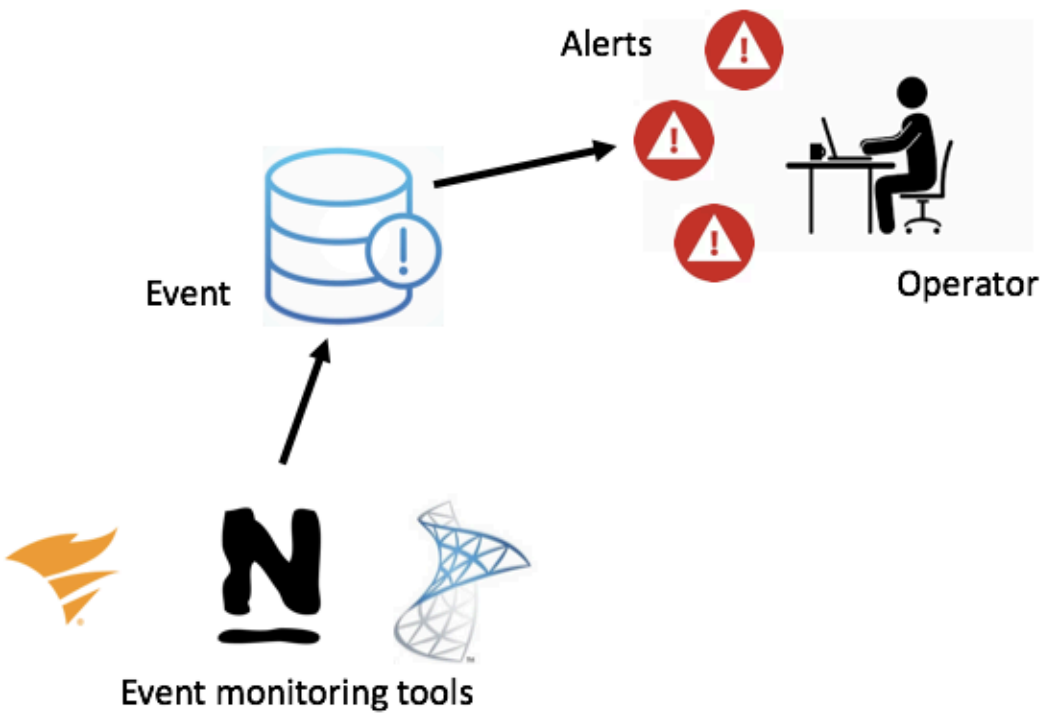
As an Event Management operator, you need to understand how an alert is generated from an event, what to look for in an alert, and how alerts can be grouped together.

This is the first lesson in the Event Management tutorial.

Lesson 1	○	**An overview of events and alerts**
Lesson 2	○	An overview of application services
Lesson 3	○	Event Management operator workspaces
Lesson 4	○	What operators do

Your organization already has an event monitoring tool in place, such as Microsoft System Center Operations Manager (SCOM), Nagios, SolarWinds, and so on. When an issue occurs on your network, such as a computer going down or a database failure, the event monitoring tools send events to your ServiceNow instance. The Event Management application processes the events according to the settings that your administrator configured, and then generates alerts. An alert is an indicator that the issue requires some type of action.

Alert generation



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an Event Management operator, your role is to view alerts and, depending on how Event Management is implemented in your organization, take an action to help resolve the underlying issue or notify someone who can. Later in this tutorial, you will see the phases of a typical alert management process.

Alert priority and severity

The two most common characteristics of an alert are the priority and the severity.

- The priority of an alert is a score that helps you determine how important the impact is to application services. Multiple factors determine the alert priority score. Your Event Management administrator can configure the algorithm that the Event Management application uses to calculate priority.
- The severity of an alert is an indicator of how serious the underlying issue is. The event monitoring tool in your organization usually sends severity values with the event, which then gets carried over in the alert. These are the default severity types that you will see in this tutorial:

Severity	Description
Critical	The resource is either not functional or critical problems are imminent.
Major	Major functionality is severely impaired or performance has degraded.
Minor	Partial, non-critical loss of functionality or performance degradation occurred.
Warning	Attention is required, even though the resource is still functional.
OK	No severity. An alert is created. The resource is still functional.
Clear	The alert no longer needs action.

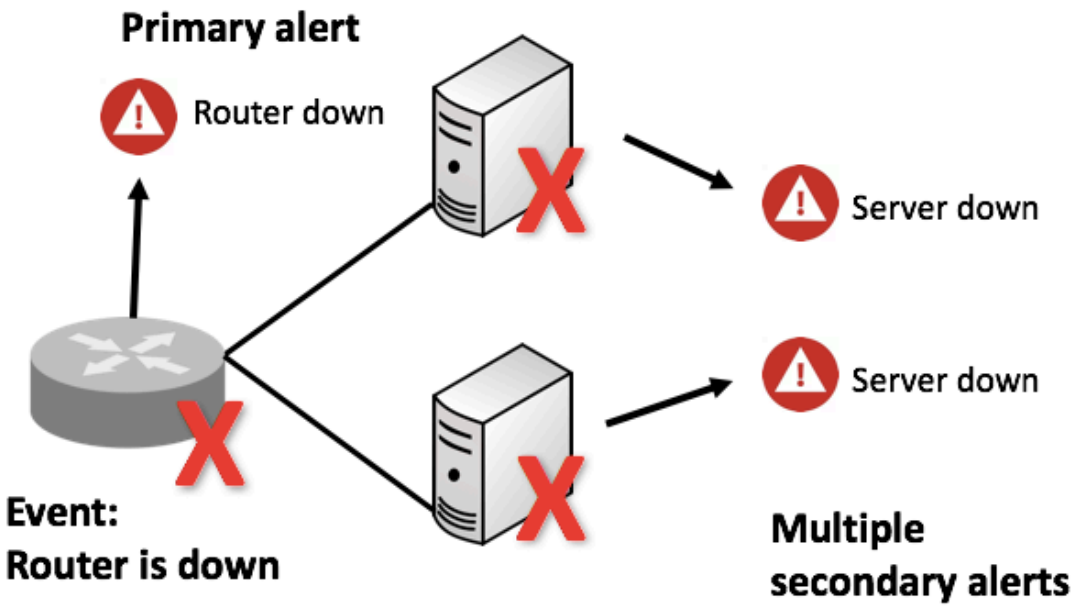
Correlated alerts

Some alerts are related to each other. For example, if a router goes down, several separate alerts could be generated, one for each server connected to the router. All of these alerts are related, or correlated. To help you manage correlated alerts, Event Management can automatically group them and establish a two-level hierarchy with one root alert, called the primary alert, at the top, and other related alerts, called secondary alerts, under the primary alert. When you view alerts, primary alerts stand out by default so you know which alert to focus on without being distracted by the secondary alerts.

In our example, if a router goes down on your network, network communication is also affected for connected servers, assuming they cannot reach any other routers. The router outage becomes the primary alert and the alerts generated on the server are secondary alerts that are correlated under the router alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Secondary alert generation



Depending on your organization's Event Management implementation, alerts might be grouped automatically based on correlation rules that your administrator sets up. Your instance can also learn how to improve the way it correlates alerts based on these rules. As an operator, you should still verify the accuracy of the correlation and, if necessary, manually correlate additional alerts with the primary alert. Later in the tutorial, you will learn how to do this.

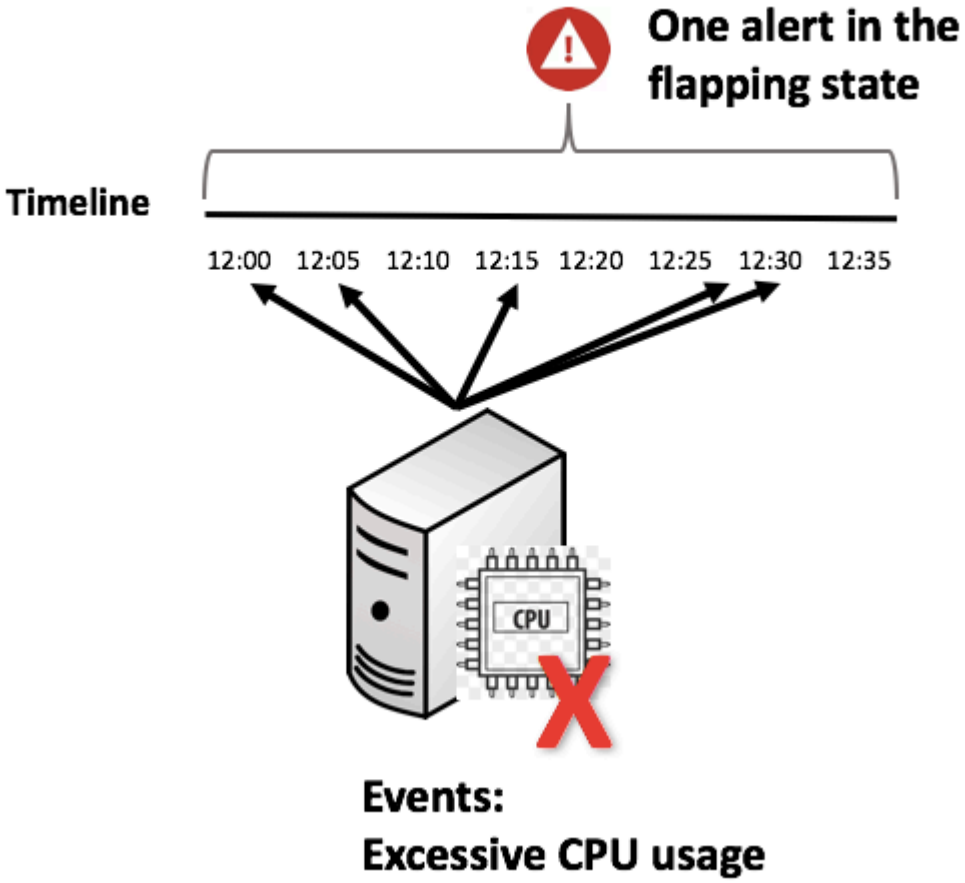
In this tutorial, you will learn how to manually correlate alerts.

Alert flapping

An alert can flap, meaning that it gets multiple open-close events in rapid succession. Flapping indicates that Event Management does not know whether the underlying events are genuine or not. The events could indicate small issues with the way CIs are configured, or larger issues, like network outages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert flapping



For example, if a server that hosts a web service has too many active processes, it might trigger an event about excessive CPU usage. Since CPU usage can fluctuate rapidly depending on web service requests, several events might be triggered, leading to the alert being put in the flapping state. As an operator, you might need to create an incident to have the server restarted, or someone might have to reconfigure the CPU, or possibly make a hardware change on the device.

As another example, consider a loose network cable that causes momentary, repeated network outages. The thresholds that your administrator configures might not be optimal for this kind of alert and Event Management considers it a flapping alert.

Continue the tutorial

Proceed to the next lesson: Application services for Event Management operators.

Application services for Event Management operators

As an Event Management operator, you need to understand what application services are.

This is the second lesson in the Event Management tutorial.

Lesson 1	✓	An overview of events and alerts

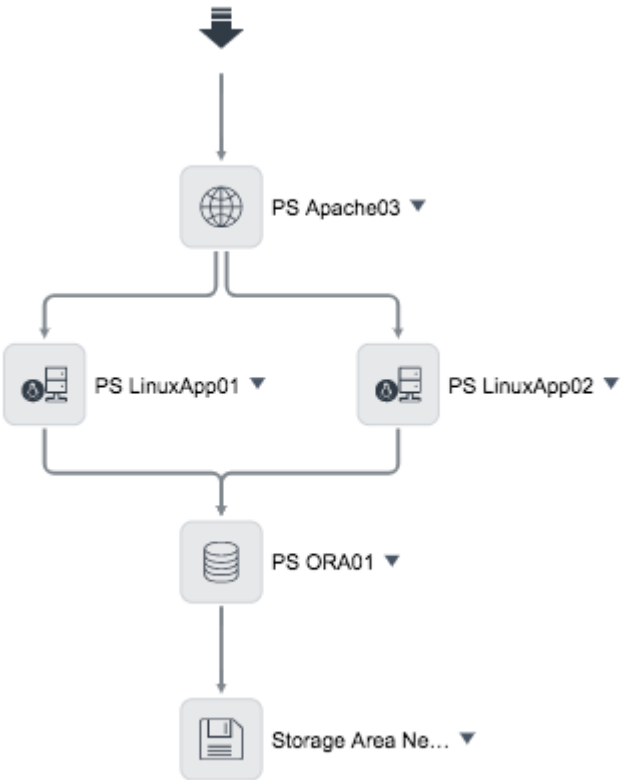
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lesson 2	○	**An overview of application services**
Lesson 3	○	Event Management operator workspaces
Lesson 4	○	What operators do

An application service is a collection of components, such as network devices, computers, and applications that offer a service to your organization. The services can be something like an email system or a website that tracks orders or requests in a database. Your administrator should have already specified the application services in your ServiceNow instance.

Each component that makes up an application service is referred to as a configuration item or CI. This service map provides a visual representation of an application service:

Service map



In this example, you can see a Web Portal application service with these CIs:

- **PS Apache03**: An Apache web server that hosts a company website.
- **PS LinuxApp01** and **PS LinuxApp02**: Two Linux servers that share the workload from the web server.
- **PS ORA01**: A database server that both Linux servers need to access.
- **Storage Area Network 001**: A mass storage device on which the other CIs depend.

You can see service maps like this on the Service Operations Workspace dashboard. Later in this tutorial, you will learn about the dashboard and what an application service looks like when an alert is associated with a CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Types of application services

Event Management classifies application services into the following types:

Technical services

A technical service is a dynamic grouping of CIs based on some common criteria. For example, a technical service could be comprised of all web servers or all Oracle databases for a specific location, like North America.

Application services

An application service can consist of discovered services, manual services, or both. A discovered service is an application service that the Service Mapping application finds (if your organization uses Service Mapping). A manual service is an application service that your administrator configures by selecting and adding each CI and specifying the relationships between CIs.

Alert groups

Alerts that are grouped together, either manually or automatically.

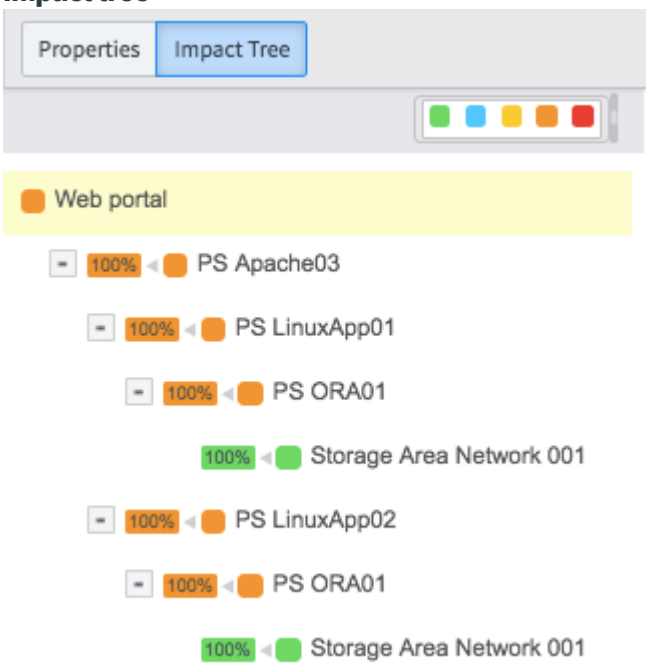
Alert impact

Application services are critical to the operations of your organization. If an issue occurs on one CI, the entire application service can be affected. Part of your role as an operator is to analyze alerts on CIs and see how they impact the application service as a whole, and then take an action to help remediate or solve the underlying issue. Your administrator can configure impact rules that go into calculations for the severity of an alert.

Later, when you learn how to use the Service Operations Workspace dashboard, you will learn how to view an impact tree for an application service so you can understand the relationship between the severity of an alert and the overall application service.

In this example, you can see how a **Major** alert on an Oracle database (**PS ORA01**) also causes a major alert on its parent CIs and on the Web portal application service itself.

Impact tree



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Continue the tutorial

Proceed to the next lesson: Event Management operator environment.

Event Management operator environment

As an Event Management operator, your primary work environment is the Service Operations Workspace dashboard.

In this, the third lesson in the Event Management tutorial, you get an overview of your workspaces so you know how to find the information you need.

Tutorial lessons

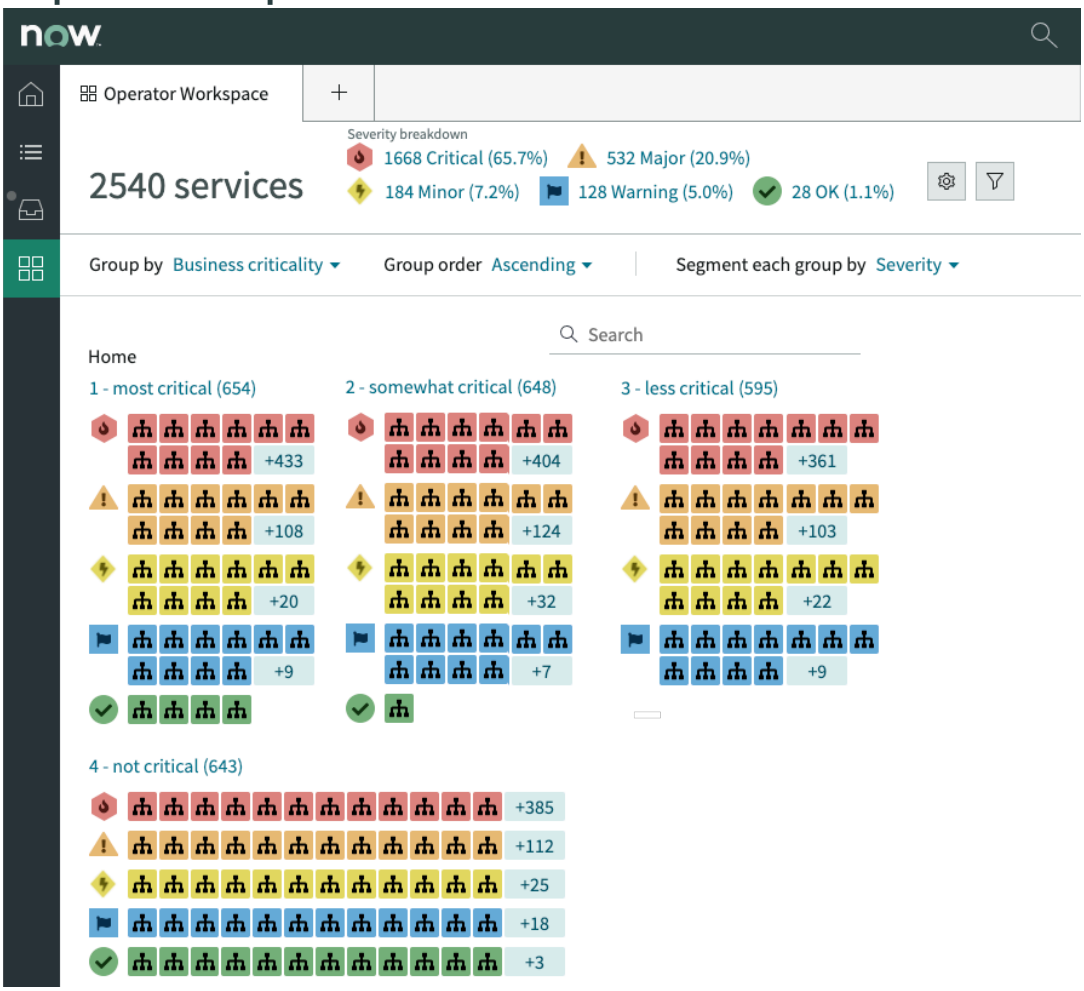
Lesson 1		An overview of events and alerts
Lesson 2		An overview of application services
Lesson 3		Event Management operator environment
Lesson 4		What operators do

The Service Operations Workspace dashboard

Your main area of work is the Service Operations Workspace dashboard, which provides a view that focuses on how alerts relate to application services. From here, you can drill into each application services to see the affected CIs and get an understanding of the overall impact of whatever caused the alert. To open the dashboard, navigate to **Event Management** > **Service Operations Workspace**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Operations Workspace



The main sections of the dashboard are:

Banner

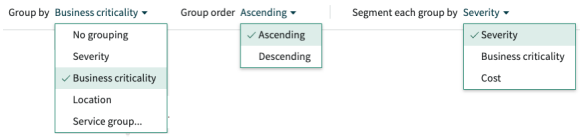
The banner contains controls that show or hide application services based on the criteria you select:

Click a severity level to show or hide application services based on the alerts associated with them.

Use the **Group** and **Segment** controls to organize the view.

Note: Your administrator assigns an application the criticality and cost value to your application services.

Group and Segment filters

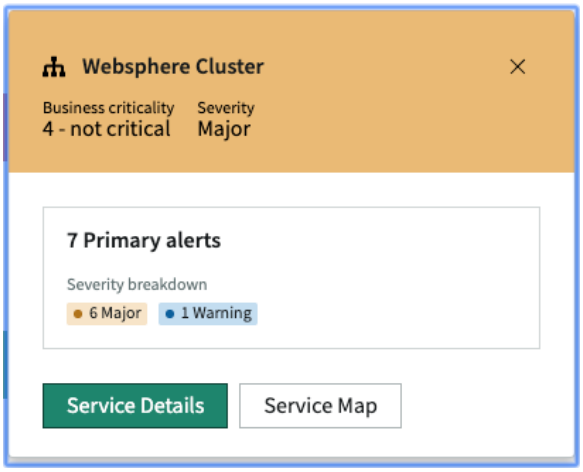


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application services

The Service Operations Workspace dashboard displays tiles that represent application services. The color of a tile represents the severity of the alerts that are associated with the application service.

Click a tile to show a summary of alerts associated with the application service. Click to view details or the service map.



Alerts

Click the List icon (

). On the Lists tab, click the kind of alert to view.

You can filter or sort the list to find an alert. Sort by any alert details, such as the **Priority**, which considers multiple factors for how serious the alert is, or the **Severity**, which is value provided by the event monitoring tool.

Open any alert by clicking the number.

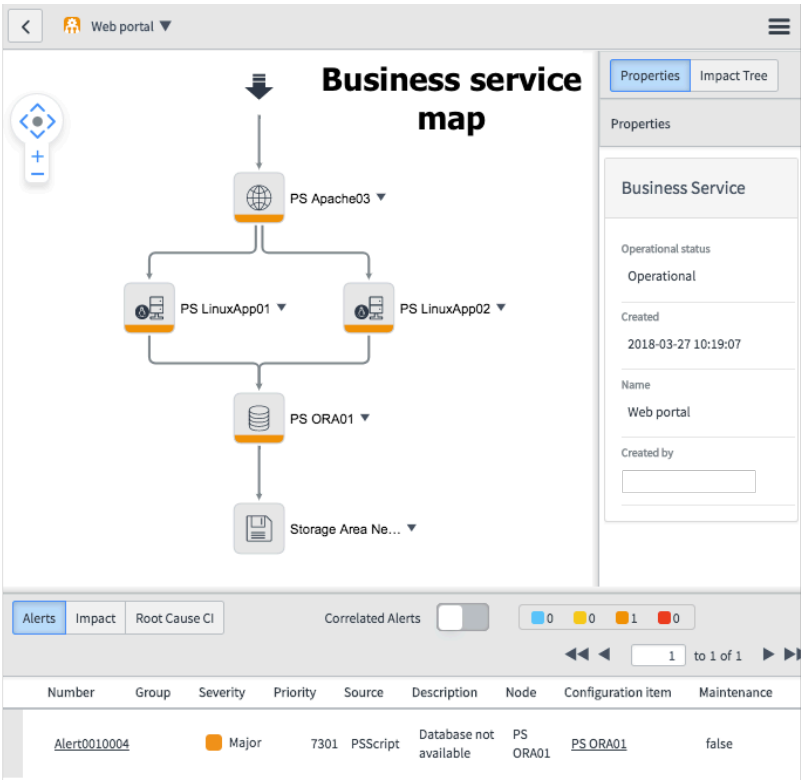
You will learn about what each of the columns means for an alert later on when you analyze an alert.

Application service map views on the Service Operations Workspace dashboard

Double-click the name of an application service tile to open one of the application service map views. The view that you see depends on the type of application service.

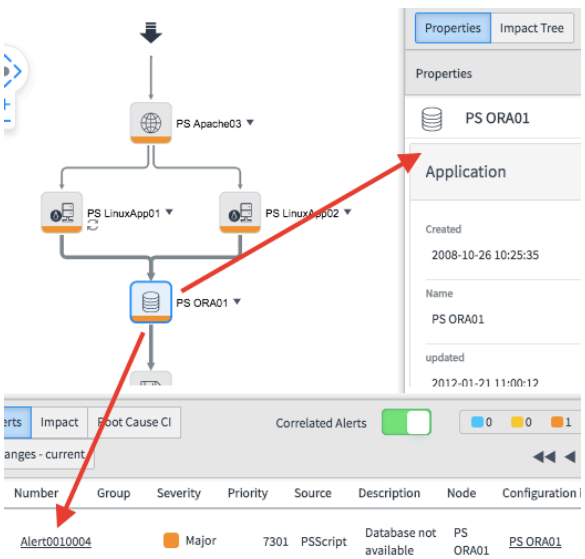
For a manual or standard application service, this view appears:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



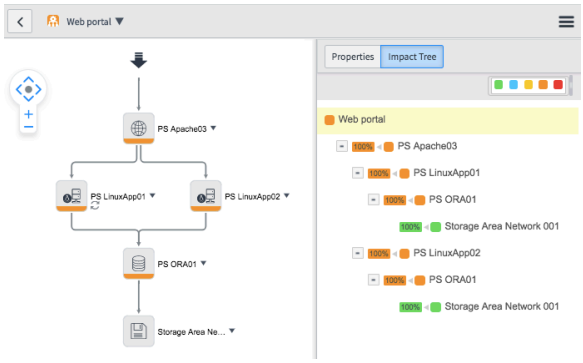
The application service map that you were introduced to in a previous lesson appears in the main panel. This is what you can do from this view:

Click any of the CIs to see the alerts only for that CI and to display the details about that CI in the **Properties** pane.



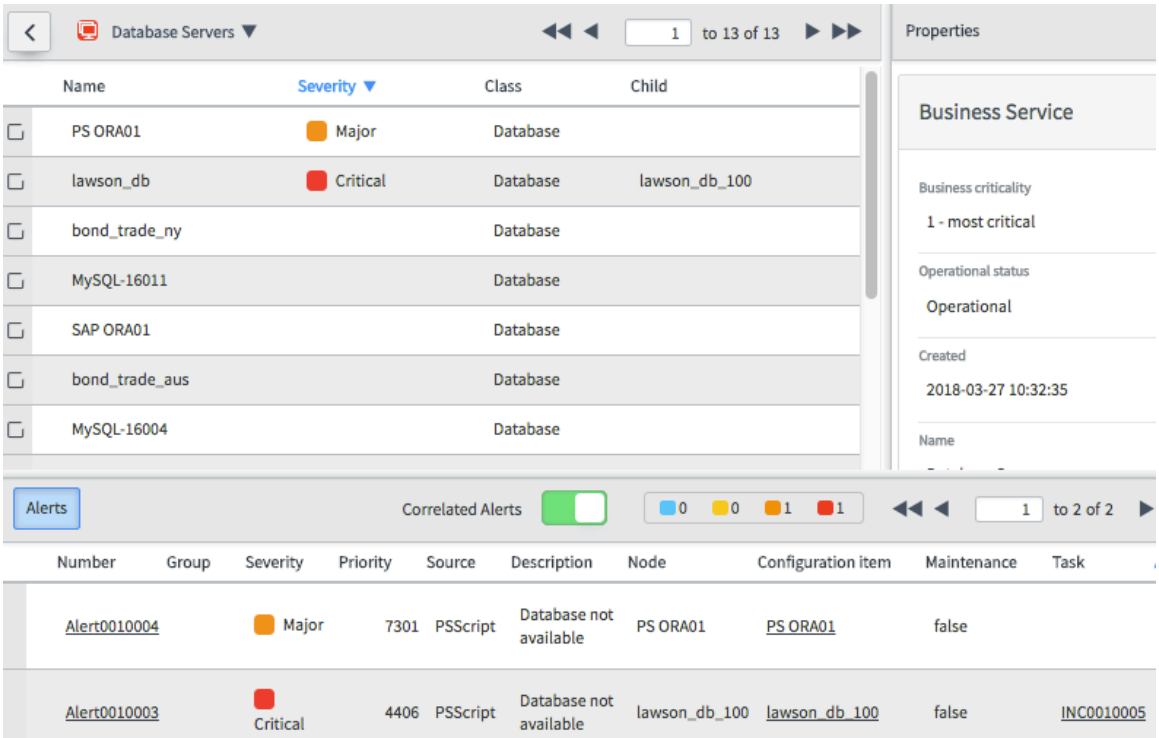
Click **Impact Tree** to see the state of all the CIs and how they affect each other when receiving an alert. You will learn more about the impact tree later on in the tutorial.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



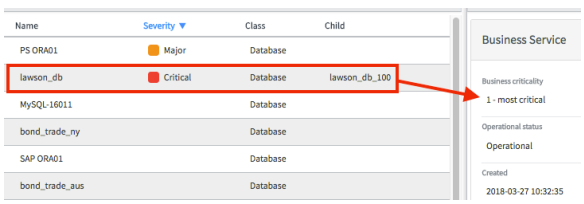
Open any alert from the **Alerts** list at the bottom by clicking the number.

For a technical application service, this view appears:



This is what you can do from this view:

Click any CI to view details about it.



Open any alert from the **Alerts** list at the bottom by clicking the number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Continue the tutorial

Proceed to the next lesson: What Event Management operators do.

What Event Management operators do

As an Event Management operator, your typical workflow involves three phases: analyzing an alert and its effect on application services, taking some type of action, and making sure the alert is finally closed.

This is the last lesson in the Event Management tutorial. In this lesson, you will run through the three phases of a typical operator day-to-day workflow.

Lesson 1	✓	An overview of events and alerts
Lesson 2	✓	An overview of application services
Lesson 3	✓	Event Management Service Operations Workspace
Lesson 4	○	**What operators do**

Your organization will have specific policies and procedures that may differ from the phases outlined in this topic. In addition, your administrator might have customized the Event Management application so that some of these phases are automated and do not actually require any action on your part.

For the purposes of this tutorial, we will walk you through each phase and allow you to perform the tasks manually.

Phase 1	Analyze and acknowledge an alert	In this phase, you will find an alert to work on, analyze the details, and acknowledge it so that other operators know it is a legitimate alert.
Phase 2	Triage an alert	In this phase, you take an action to help remediate the issue that caused the alert. The most common action to take is to create an incident and assign it to someone who can solve the underlying issue.
Phase 3	Close an alert	In this phase, you will verify that the alert is resolved, and then close the alert.

Start here

Start out by learning how to Analyze and acknowledge an alert.

Operator phase 1: Analyze and acknowledge an alert

As an Event Management operator, the first thing you should do is access alerts and then find the ones you want to focus on. You can open the Alert form to analyze the details, and then

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

acknowledge it to let other operators know that the issue causing the alert should be addressed in some way.

Before you begin

Phase 1	◯	**Analyze and acknowledge an alert**
Phase 2	○	Triage alerts
Phase 3	○	Close an alert

You must understand both of your operator environments: the Service Operations Workspace dashboard and Service Operations Workspace. Review Event Management operator environment if you have not already done so. This tutorial uses the Service Operations Workspace dashboard.

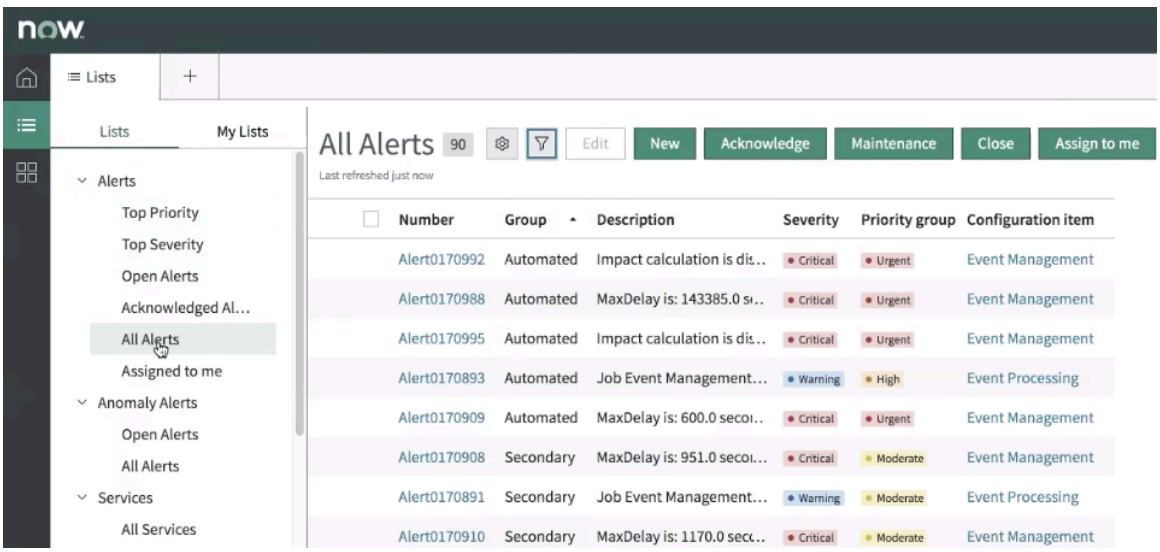
Role required: evt_mgmt_operator

Procedure

1. Navigate to **Event Management** > **Workspaces** > **Service Operations Workspace**.

   In the list, click **Alerts** > **All Alerts**. By default, all alerts appear in the list sorted by **Group**. Click any heading to sort by that value. To view current filter settings, click the filter icon

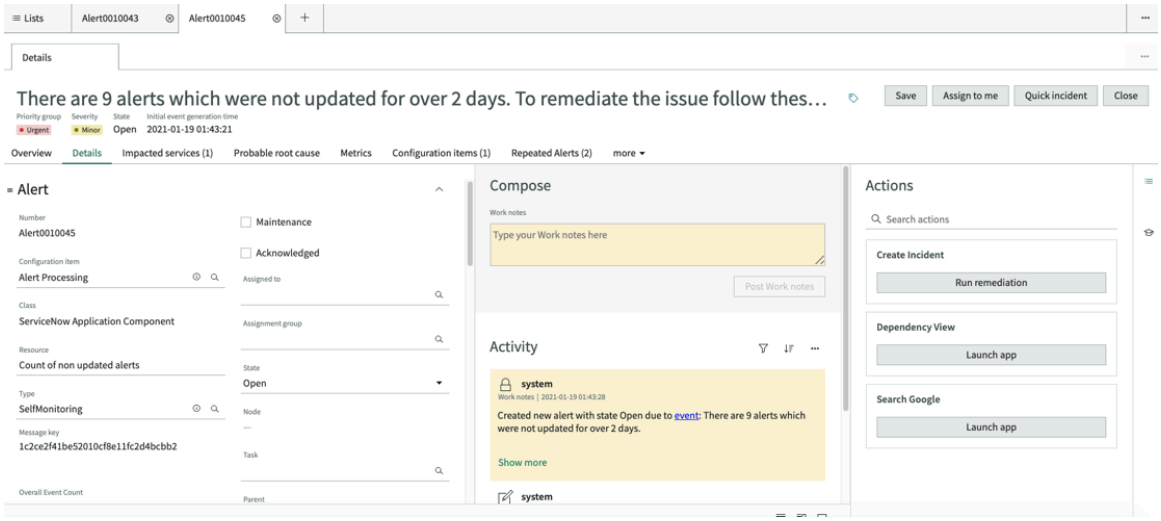
   . To modify filter settings, click **Advanced view**.



2. Find the alerts to focus on by clicking **Application Services** > **Services**, or by using any of the filtering and sorting options.
3. Click an alert name to open the **Details** tab for the alert.

   Example
   The important fields on the form and related items are described after the screenshot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Fields on the Alert Details tab for an alert that is associated with a single CI

Field	Description
Number	The automatically generated alert number that you saw in the list of alerts on the Service Operations Workspace dashboard.
Node	The name of the CI with which the alert is associated. The event that generated the alert occurred on this CI. You might see a computer name, or an IP address or MAC address of a device.
Resource	The object on the node that caused the event. You might see values like the name of a hard disk, a CPU, or the name of a process or a service. You can add information to this field if necessary.
Configuration item	The CI in the CMDB to which this alert applies. If the **Node** field is filled in but this field is empty, and if you know which CI the node represents, you can enter the CI in this field to manually associate the alert with it. **Note:** Your administrator can configure rules that automatically bind CIs to an alert, usually based on what is in the **Node** field. However, it is possible that the system is unable to find the correct CI to bind the alert to. In this case, you might need to manually select a CI. For the purposes of this tutorial, we assume that the correct CI is bound to the alert. When an alert contains a CI, the **Overview** tab opens when selecting the alert.
Task	Any existing task that is associated with the alert, such as an incident, change request, or problem, is shown in this field. When you first look at an alert, this field is blank. You can associate a task when you triage the alert. You associate an incident to an alert and assign the incident to someone at a later stage in this tutorial.
Description	A description of the alert that came from the alert monitoring software in your organization. You can add information if necessary.
Severity	Severity value for the alert:

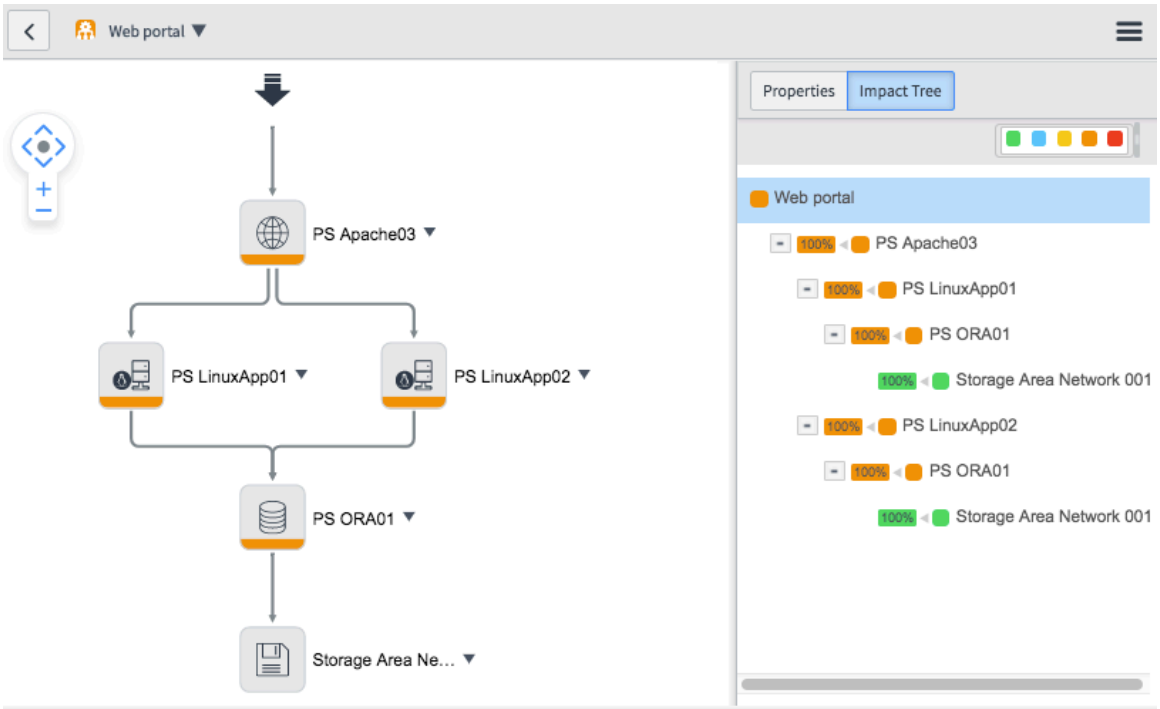
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Critical: Immediate action is required. Either the resource is not functional or critical problems are imminent. ○ Major: Major functionality is severely impaired or performance has degraded. ○ Minor: There is a partial, non-critical loss of functionality, or performance has degraded. ○ Warning: Attention is required even though the resource is still functional. ○ Info: An informational message. An alert is created, but the resource is still functional. ○ Clear or Resolved: No action is required. An alert is not created from this event. Existing alerts are closed.
State	The processing state that the alert is in. A newly generated alert is in the **Open** state. Other states are: ○ **Reopen** indicates that a previously closed alert is open again, and it requires your attention. ○ **Flapping** indicates that the alert is receiving a high frequency of identical events from the same source, which can cause many alerts to re-open even after it is closed. ○ **Closed** indicates that the alert is closed and does not require any further action. You will close an alert as part of the last stage in this tutorial.
Maintenance	Indicates that the alert does not need to be worked on and is hidden from the list of alerts in the Service Operations Workspace dashboard. In this example, we do not want to put the alert in maintenance.
Acknowledged	Indicates that an operator verified that the alert is genuine and is triaging it. You acknowledge the alert at a later stage in this topic. Your Event Management administrator can also have alerts automatically acknowledged immediately after they are generated. If this is the case, the **Acknowledge** check box on the Alert form might already be selected.
Parent	Displays a value only for secondary alerts. The value indicates the alert number of the parent alert. The field is empty for primary alerts (alerts with no parent alert).
Knowledge article	Any existing knowledge base (KB) article that is associated with the alert. When you first open an alert, this field is blank. You can associate a KB article when you triage the alert.

4. Click the **Impacted Services** tab and then click the service name.
   Before you acknowledge the alert, you might want to learn more about the services that are affected due to the service that is the source of the alert.

   The service opens and displays the **Details** tab. Click **Service Map** to view the map of related application services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



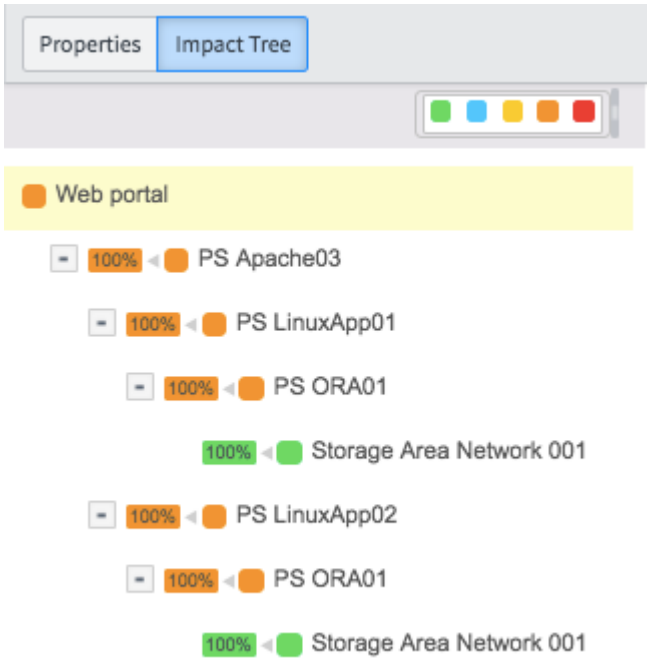
Notice that the major severity indicator in orange is displayed on several CIs. It starts with the Oracle database (**PS ORA01**) and propagates up to all CIs that depend on the database. From this, you can surmise that the alert with the highest level of severity on the Oracle database indicates the root cause of the issue.

This does not necessarily mean that the system generated separate alerts for each CI, but it is possible. When you triage an alert, you can determine whether alerts on other CIs should be correlated under a primary alert.

5. Click the **Impact Tree** tab and review the impacts on each CI.

   The percentages next to each CI in the impact tree show you the effect on each CI. In this example, each CI is impacted 100% by the alert, which means the underlying issue that led to the alert is serious enough to impact the functionality of the application service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

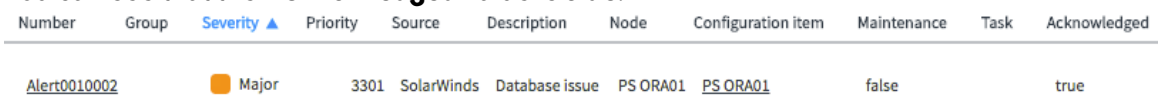


6. Acknowledge the alert.

   Acknowledging an alert does not assign it to you, nor does it create a task like an incident or change request. It simply lets other operators know that you are aware of the issue. After you acknowledge an alert, you will take further action during the triage stage.

Option	Description
Acknowledge a single alert	With this process, you can acknowledge only the alert that you are viewing. **a.** Open the Alert Details form as described earlier. **b.** Select the **Acknowledged** check box.
Acknowledge one or more alerts	With this process, you can acknowledge one alert or multiple related alerts. **a.** Open the list of alerts as described earlier. **b.** Select each alert to acknowledge. **c.** Click **Acknowledge**.

7. Navigate back and look for the alert that you acknowledged.
   You can see that the **Acknowledged** value is **true**.



Number	Group	Severity ▲	Priority	Source	Description	Node	Configuration item	Maintenance	Task	Acknowledged
Alert0010002		Major	3301	SolarWinds	Database issue	PS ORA01	PS ORA01	false		true

What to do next

Go to Operator phase 2: Triage an alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operator phase 2: Triage an alert

After you analyze and acknowledge an alert, you must triage it. The triage phase involves verifying alert correlation and taking an action to help resolve the issue that caused the alert. This topic covers the most common triage task: creating an incident from an alert.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1		Analyze and acknowledge an alert
Phase 2		**Triage alerts**
Phase 3		Close an alert

Role required: evt_mgmt_operator

Procedure

1. Before you start to work on the alert, check whether other alerts should be correlated with the one you just reviewed:

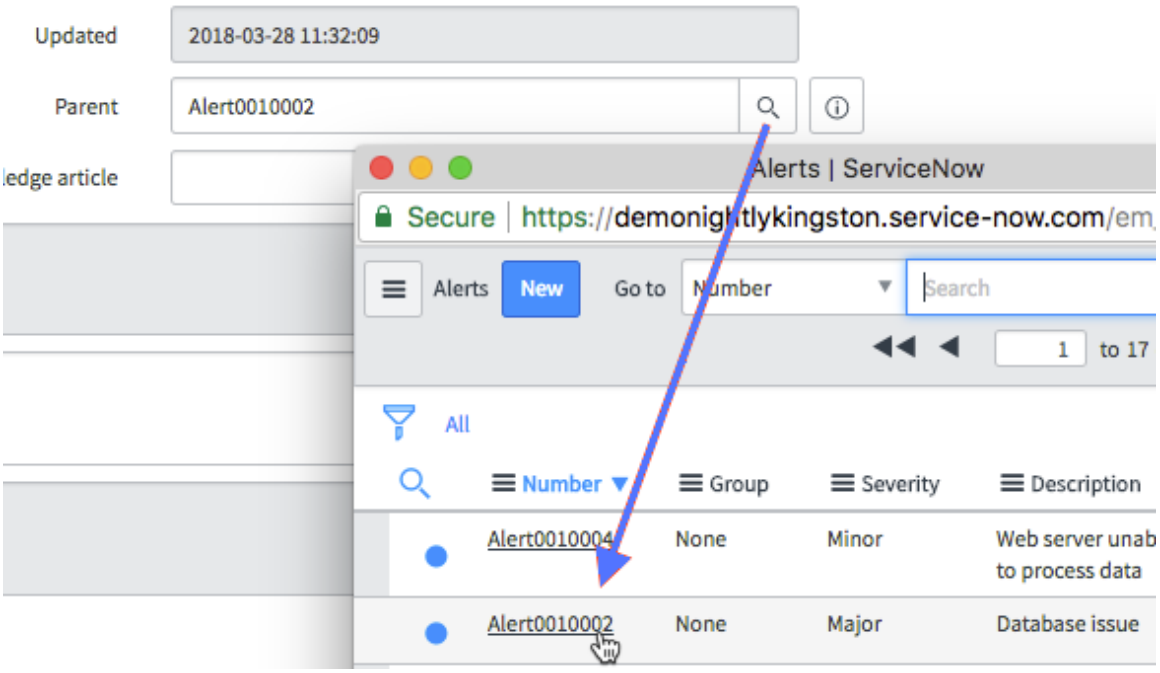
   a. Navigate to **Event Management** > **Service Operations Workspace**.

   b. Click the same application service tile and review the alerts in the **Alerts** list.

   c. If multiple alerts are present, open one to determine if it is related to the other alert, or if the underlying issue is the same in both alerts.
   For example, if an alert is associated with a web server and there is already an alert for the database issue, correlate the web server alert as a secondary alert with the database alert as the primary alert.

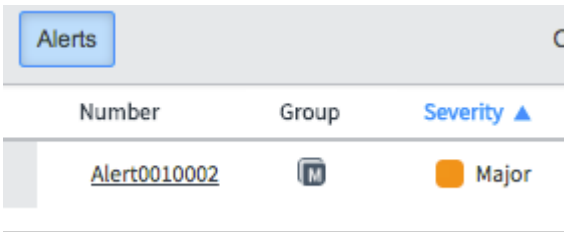
   d. Open the secondary alert, click the lookup icon ( ) in the **Parent** field, and then select the primary alert.
   This creates a primary (parent) / secondary (child) relationship between the two alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. Repeat this process to correlate as many secondary alerts as necessary.

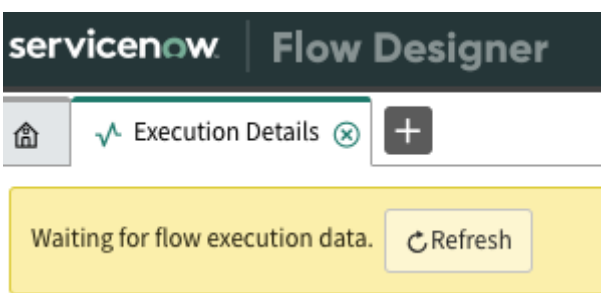
f. Navigate back to the Service Operations Workspace dashboard and verify that the primary alert displays an icon in the **Group** column.



Note: Your administrator can set up rules that let the system automatically correlate alerts so that you do not need to do so manually. In that case, a **Feedback** field appears on the Alert form. Select **Yes** if the system correlated the alert correlated correctly, or **No** if not. Currently, the feedback option is available but does not trigger further actions after being logged.

2. Open the primary alert.
3. On the Alert form, click **Actions** > **Create Incident**.
   If your organization uses Security Incident Response, the button is **Create Security incident**.

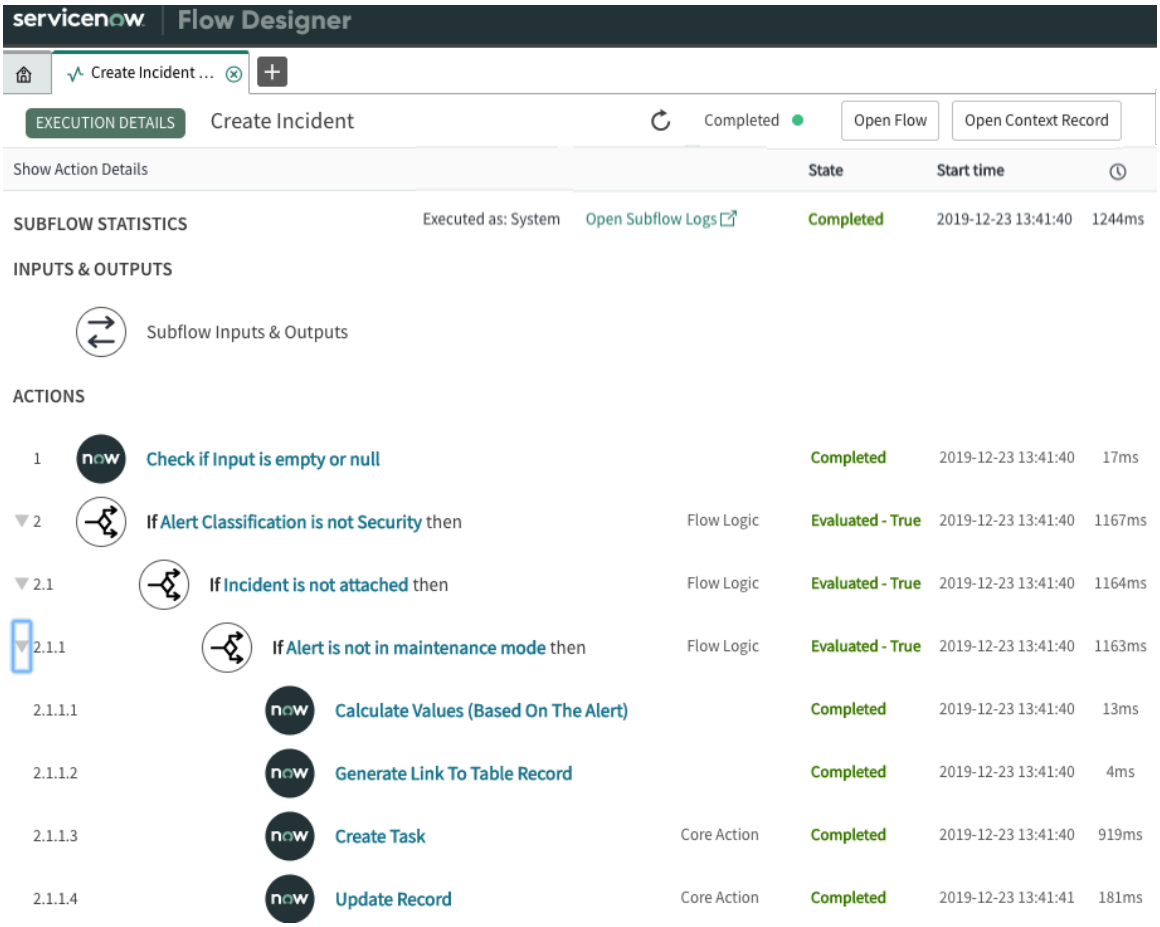
   The Flow Designer opens.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

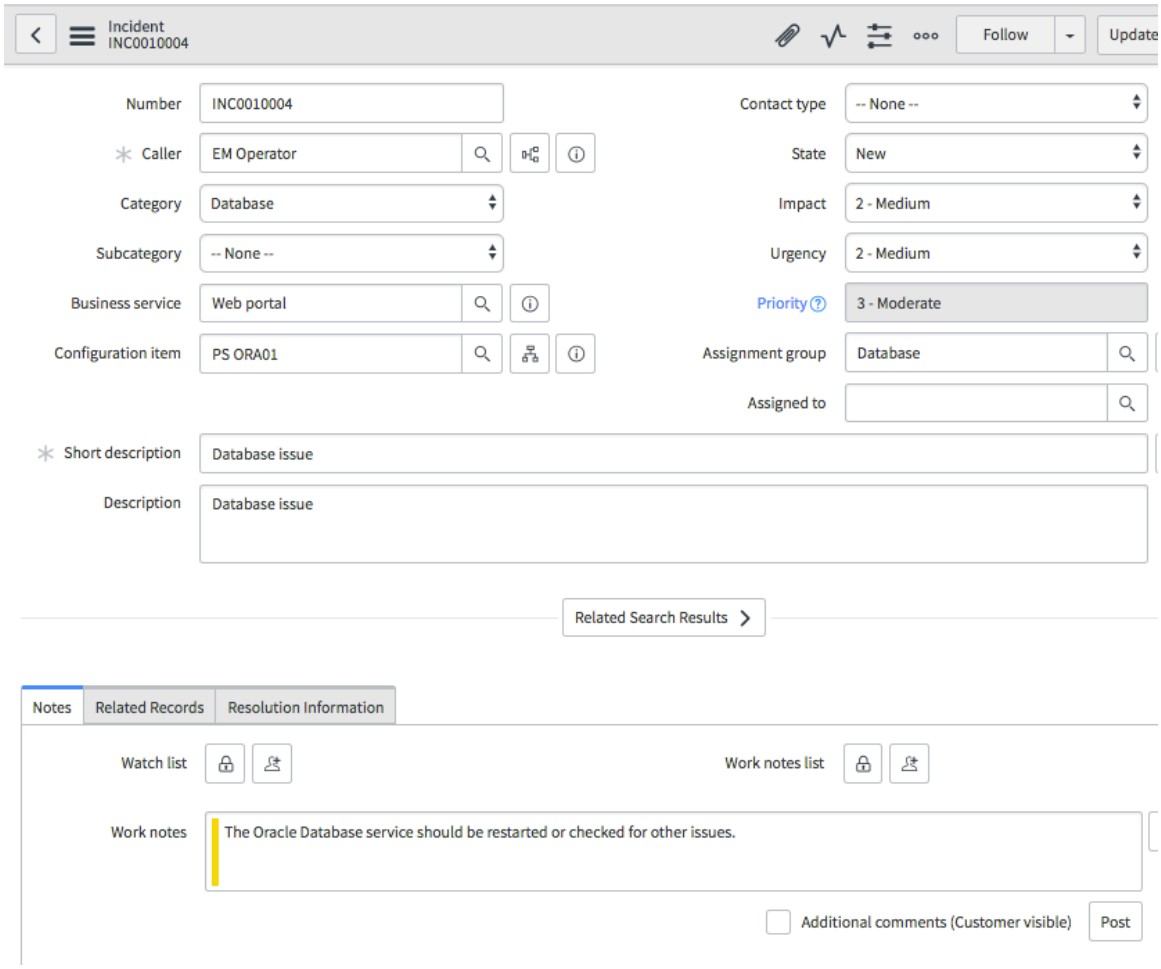
4. Click **Refresh**.

   The **Execution Details** page opens.



5. Click **Open Context Record** and then fill in the Incident form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

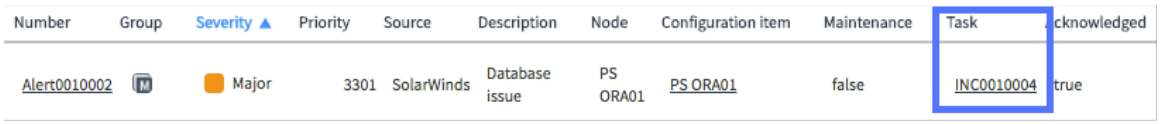


Field	Description
Caller	Click the lookup icon ( ) and then select your name. The caller is the person who discovered the issue that led to the incident.
Category and Subcategory	Select a category that best describes this alert. In this example, **Database** is the best choice.
Application service	Select the application service to which the CI belongs. In this example, the application service is **Web portal**.
Configuration item	If it is not already populated, select the CI. In this example, the Oracle database (**PS ORA01**) is automatically populated into the field.
Impact and Urgency	Select the impact and urgency levels that you think appropriate.
Assignment group Assigned to	Click the lookup icons ( ) for both or either of these fields, and then select the group or the individual that can handle the issue.

6. Click **Submit** to create the incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Alert you are working on reappears. On the Alert form, the incident is populated in the **Task** field. You can also see the incident number in the Task column on the Service Operations Workspace dashboard.



Number	Group	Severity ▲	Priority	Source	Description	Node	Configuration item	Maintenance	Task	cknowledged
Alert0010002		Major	3301	SolarWinds	Database issue	PS ORA01	PS ORA01	false	INC0010004	true

What to do next

There are other tasks you perform as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Run a remediation workflow on an alert

As an Event Management operator, you can also run a workflow on your ServiceNow instance that helps remediate the alert. For example, you might run a workflow that automatically restarts a server on your network, which might resolve an alert about CPU usage.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**
Phase 3	○	Close an alert

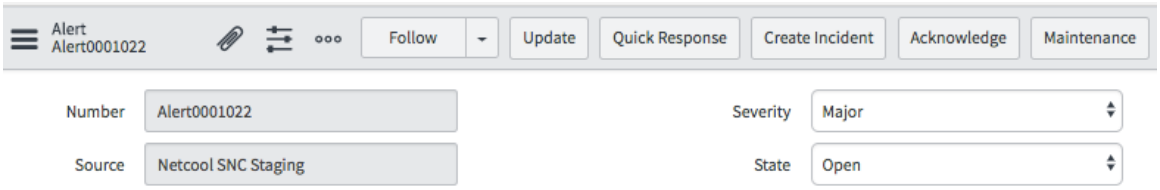
Note: You can run a remediation workflow if your administrator already set up workflows for you to choose from. You should be familiar with your organization's policies regarding triaging of alerts.

Role required: evt_mgmt_operator

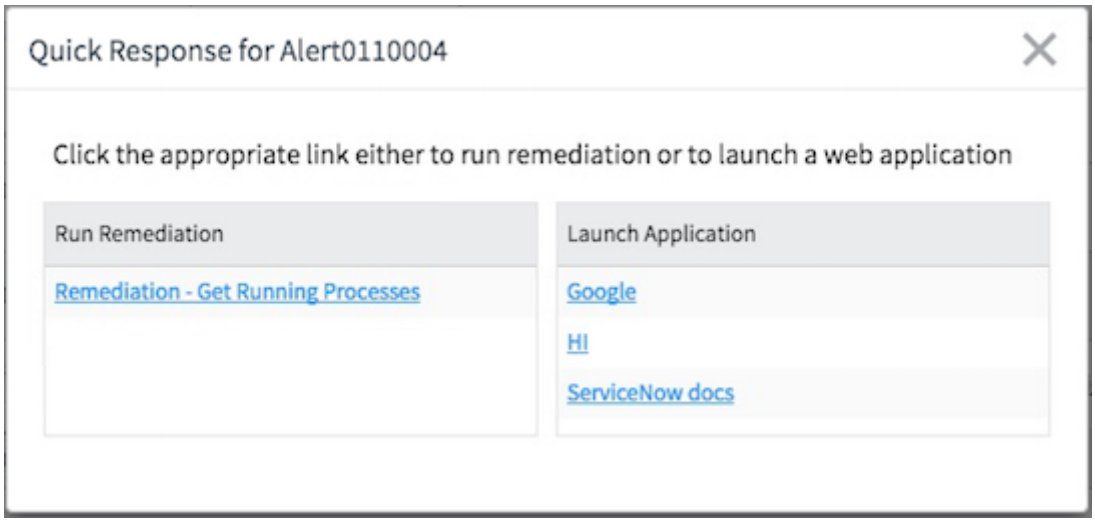
Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click **Quick Response**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. In the Quick Response window, click the name of the remediation under **Run Remediation**.



What to do next

There are also other tasks you can take as part of the triage stage:

- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Launch a web application from an alert

As an Event Management operator, you can also launch a web application from an alert. The web application might be a console for the event monitoring tool that your organization uses, or any external website that provides additional information you might need about the alert.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Phase 3	Close an alert

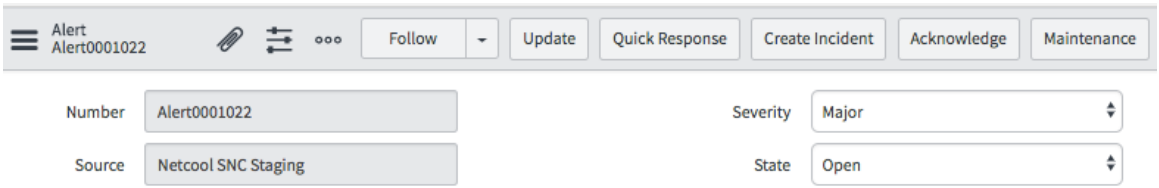
Role required: evt_mgmt_operator

You can launch a web application if your administrator has set up a link to the application. You should be familiar with your organization's policies on triaging alerts.

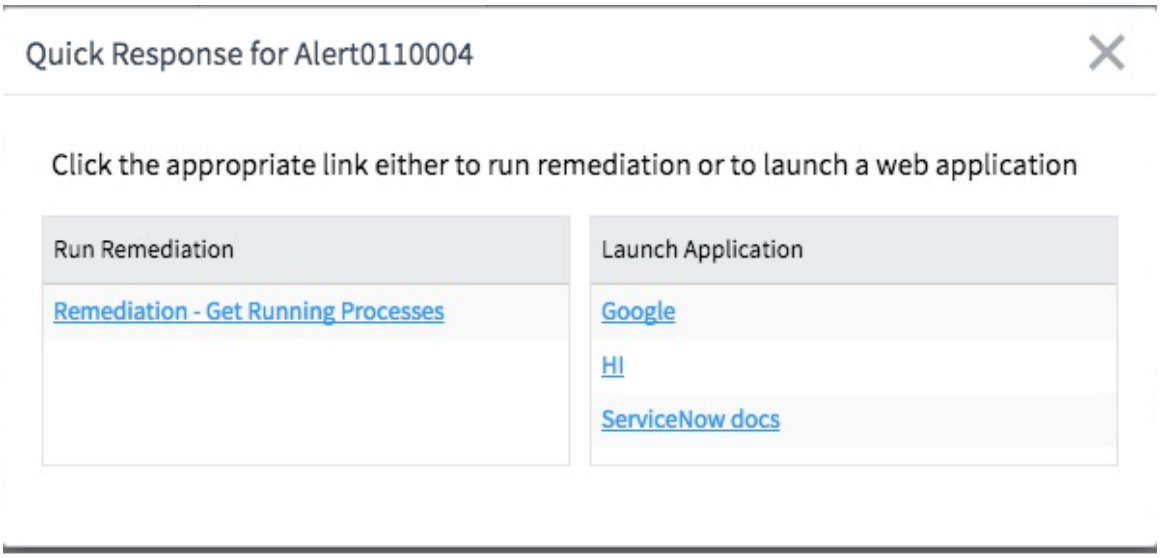
About this task

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click **Quick Response**.



3. In the Quick Response window, click the name of the application under **Launch Application**. Your administrator has specified which applications should appear in the list.



What to do next

There are also other tasks you can take as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Associate a knowledge base article with an alert

As an Event Management operator, you can associate a knowledge base (KB) article with the alert to capture additional information about the alert. This might include a procedure that someone has to follow to resolve the underlying issue on your network, or a best practice to prevent the issue from reoccurring.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

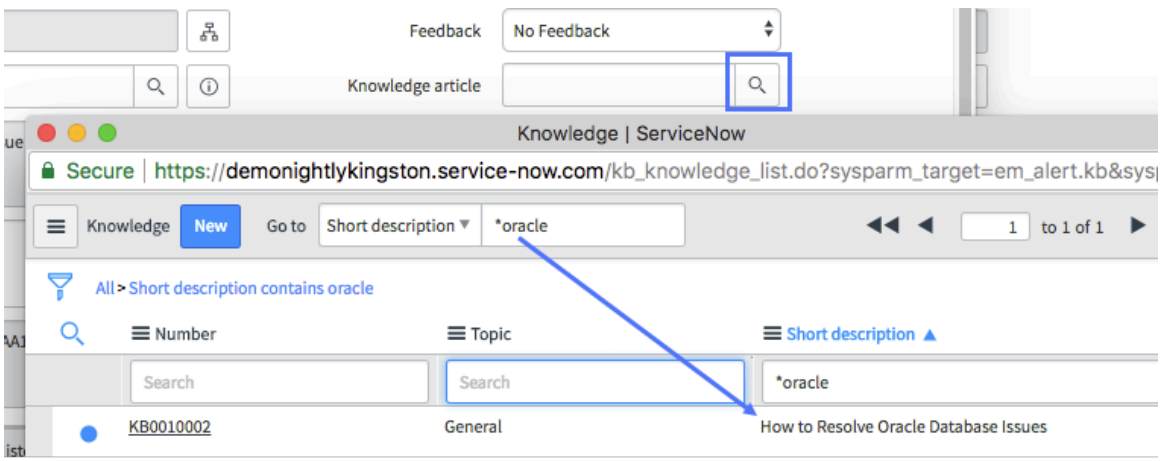
Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**
Phase 3	○	Close an alert

This task assumes that your organization uses the Knowledge Base application in your ServiceNow instance.

Role required: evt_mgmt_operator

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click the lookup icon (🔍) next to the **Knowledge article** field.
3. Filter the list of existing KB articles by first selecting a field, such as **Short Description**, and then entering related text into the search text field.
   You can use the `contains` (*) operator to search for articles that contain keywords. For example, entering `*oracle` in the short description filters the KB articles that contain the word `oracle` somewhere in the short description.



4. If you cannot find any related KB articles, you can click **New**, create a new one, and then click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The KB article number appears in the **Knowledge article** field on the Alert form.

5. Click **Update** on the Alert form to save the information.

What to do next

There are also other tasks you can take as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Put an alert into maintenance

As an Event Management operator, you can put an alert into maintenance if the alert does not require any further action, but you still want to keep the alert active. Putting the alert into maintenance hides it from the Service Operations Workspace dashboard so that other operators do not need to access it, but it does not close the alert.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**
Phase 3	○	Close an alert

Role required: evt_mgmt_operator

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. Select the **Maintenance** check box and click **Update**, or click the **Maintenance** button at the top of the list.
3. Click **Update**.
4. Navigate to **Event Management** > **Operators Workspace**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notice that alerts in maintenance are not visible in the list by default. The filter excludes alerts where `Maintenance | = | true`.

What to do next

If the issue that led to the alert still needs further attention later, navigate to **Event Management** > **All Alerts**, open the alert, and then clear the **Maintenance** check box and click **Update**. From there you can perform other triage actions.

There are other tasks you can take as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Operator phase 3: Close an alert

After you take action on an alert, you can verify several items on the alert and then close it.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	✓	Triage alerts
Phase 3	○	**Close an alert**

Role required: evt_mgmt_operator

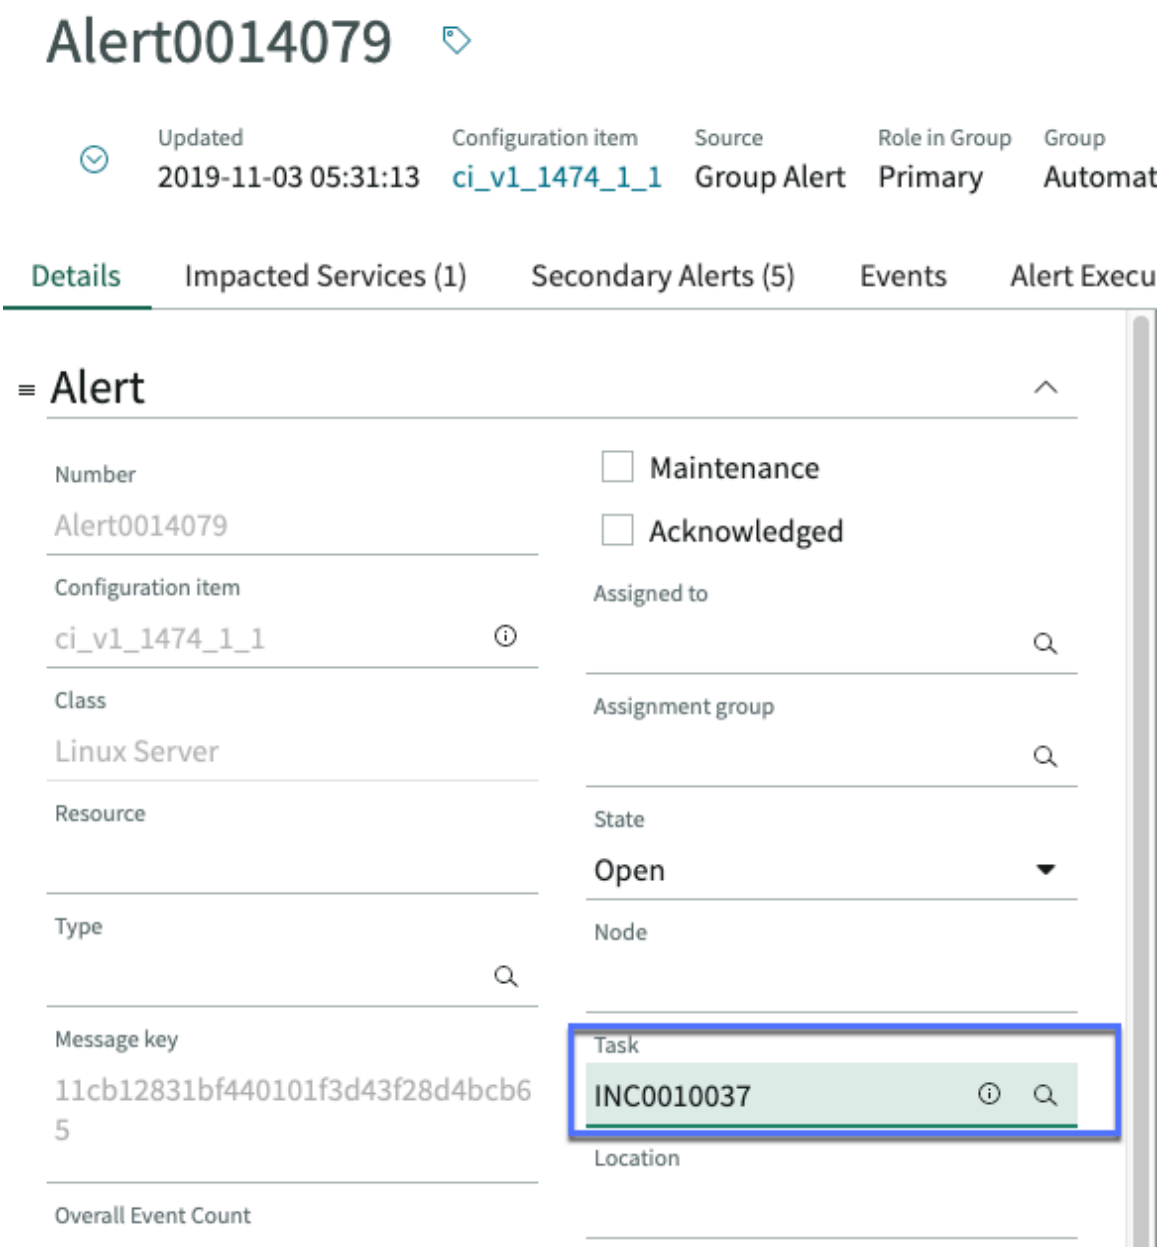
About this task

Procedure

1. Navigate to **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
2. Find the alert you want to close.
   If the alert does not appear in the list, for example because it is in maintenance, change the filter options as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

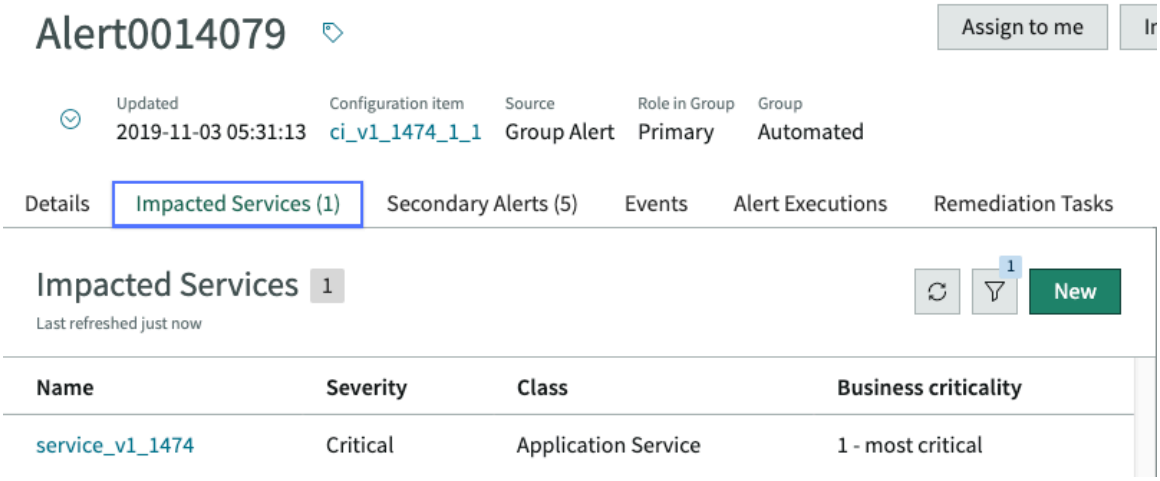
3. Click the alert number to open the Alert Details tab and review key information about the alert.



4. Review information about application services on the **Impacted Services** tab.

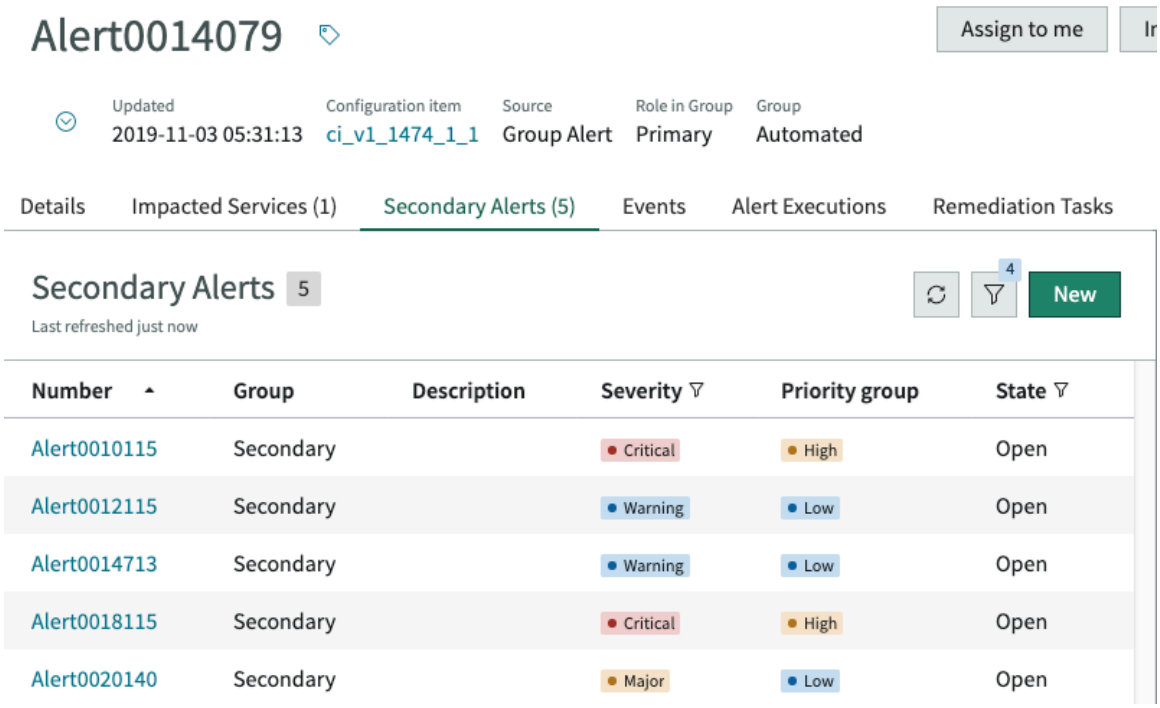
In this example, the service_1474 application service appears in the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you need more information about an application service and want to see the service map, click the service name and then click **Service Map**.

5. Look at the alerts related to this application service, and modify the correlation if necessary. The process for a primary alert differs from the process for a secondary alert.
   - On a primary alert, the secondary alerts that are correlated with the primary appear on the **Secondary Alerts** tab.



Typically, you do not have to do anything with the secondary alerts unless you want to add more secondary alerts or remove the correlation altogether.

Note: When you close a primary alert, the secondary alerts are also closed by default.

   - On a secondary alert:

     The alert number of the primary alert appears in the **Parent** field. You do not have to do anything with the parent alert, unless you want to re-correlate this secondary alert with another primary alert, or remove the correlation altogether by clearing the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When you close a secondary alert, the primary alert is not closed. You must close the primary alert separately.

6. When you are sure the underlying issue causing the event and corresponding alert has been rectified, click **Close**.
   If you think that the alert needs attention, do not close it. Instead, put it into maintenance by selecting the **Maintenance** checkbox.

What to do next

You are finished with the Event Management Operator tutorial, which covers a basic workflow of analyzing alerts, triaging them, and closing them out.

After you close an alert, you might need to follow up on these items:

Reopen an alert

If you think an alert requires further action, you can manually change its state to **Reopen**. When an alert reopens, any associated incidents can also be updated or reopened according to the incident state and the rules that your administrator configured.

Note: Any time you reopen an alert, always go through the triage and close phases again.

Work with alerts in the flapping state

In some cases, the same event that created the alert you just closed could be triggered again, even repeatedly, in a short amount of time. If this occurs, the **State** of the alert that you just closed changes to **Reopen**, and eventually to **Flapping** depending on settings that your administrator configures.

See Handle alerts in the flapping state for more information on what to look for.

For a summary of other tasks that you might need to perform at some time, see Advanced tasks for the Event Management operator.

Advanced tasks for the Event Management operator

As an Event Management operator, you might need to perform additional tasks that are outside of your typical workflow, or tasks that you need to perform only once.

Advanced task	Description
Customize your alert list view	Get to the alerts you need to analyze as soon as possible.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced task	Description
Work with flapping alerts	If an alert is in the flapping state, it means that the underlying issue keep reoccurring. You should triage the alert again and look for another solution.
Handle alerts while CIs are in maintenance	Learn how to handle alerts on a CI that is in the maintenance state, which means it is undergoing some type of change.
Adjust alert impact while triaging an alert	You can change impact rules, which affects how alert impact is calculated and alert severity.

Customize your alert list view

You can create one or more customized alert list views that show only the information pertinent to you. For example, you might want to focus only on the alerts for application services in a specific location, or only the alerts for application services of high criticality.

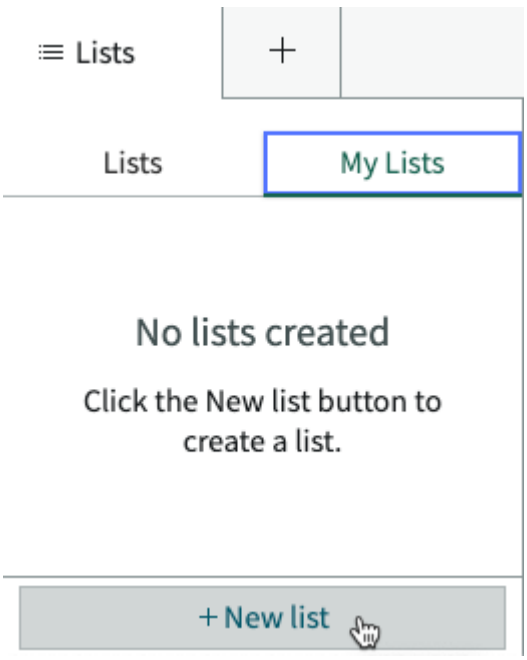
Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

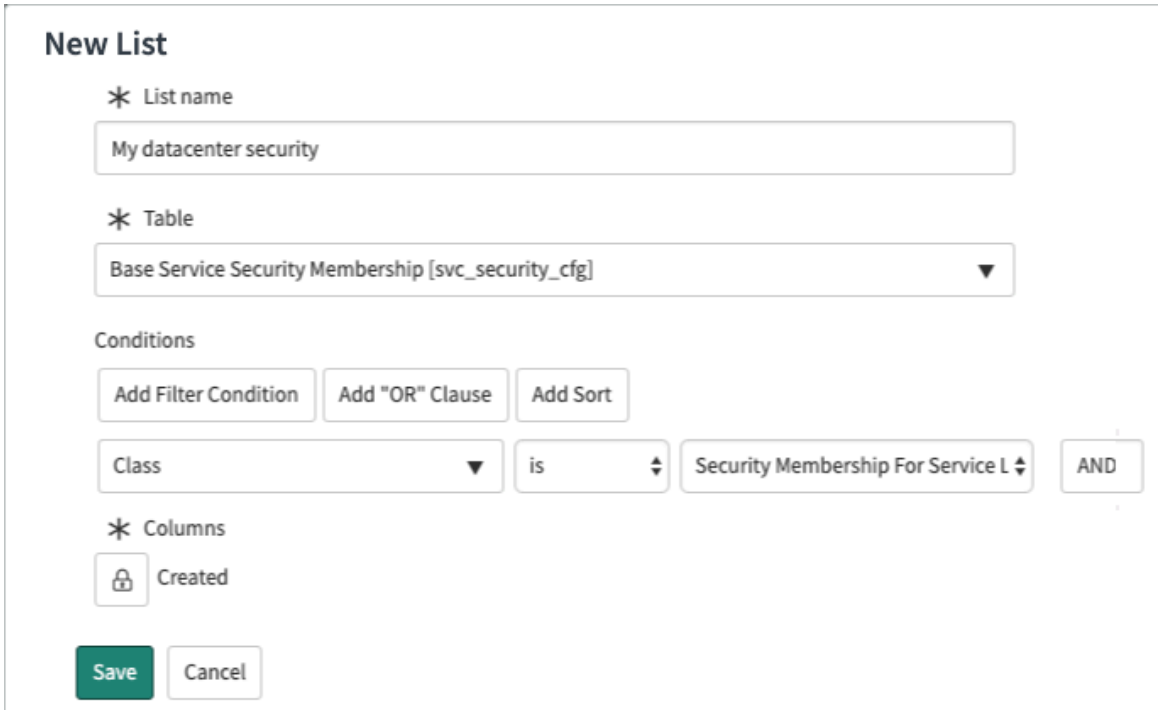
Procedure

1. Navigate to **Event Management** > **Operators Workspace**.
2. On the **Lists** tab, click **My Lists**.



3. Click **+ New list**, fill in the form with name and filter conditions, and then click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The list appears on the **My Lists** tab.

Note: The list applies only to application services, and not to application service groups. The groups appear whether or not they match the filter, and whether or not they contain any services that match the filter.

Work with flapping alerts

If an alert is in the flapping state, you might need to triage the alert again.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

About this task

If an event repeatedly triggers the same alert in a short amount of time, the alert is put into the flapping state, even if an operator closed it previously. The event can also be fluctuating between severity levels, such as Info and Critical. You should triage the alert again, and take action to try to prevent the event from reoccurring.

Note: Your Event Management administrator can configure several settings that determine when to mark an alert as flapping, and other settings that determine what action you can take. This topic covers a generic example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Find alerts in the flapping state:
   a. Navigate to **Event Management** > **Operators Workspace**.
   b. Modify the list of alerts by clicking the filter icon ( ) and specifying criteria to find flapping alerts.
   Click **Advanced view** to modify filter settings. For example, you can specify:
   `State | is | Flapping`.
2. Click the alert number to open it.
3. On the alert, click the **Flapping** tab and review the information:

Field	Description
Flap count	The number of times the alert started flapping since the time in the **Flap start window** field.
Flap start window	The time that flapping started.
Flap last update time	The last time flapping occurred. This time is the instance processing time, not the source system time.
Flap last state	The state of the alert before it entered the flapping state.

4. Decide which action to take based on how often flapping has occurred.
   You can do any of the following, depending on what your organization's standard operating procedures are and what your Event Management administrator configured:
   - Run a remediation workflow that might do something like reboot a server or reset a router.
   - Access a web application, like the application for your event monitoring software on your network.
   - Modify an associated incident or a KB article to include additional information or steps.
5. After you are certain that the underlying issue is addressed, close the alert.

Handle alerts while CIs are in maintenance

When an alert occurs on a CI that is in the maintenance state, the alert state is also changed to maintenance. You should find and monitor the states of these alerts. Later, when changes on the CI are complete, finish triaging the alert and close it.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before completing this task, familiarize yourself with basic form configuration in an instance. You might need to add fields and related lists to forms.

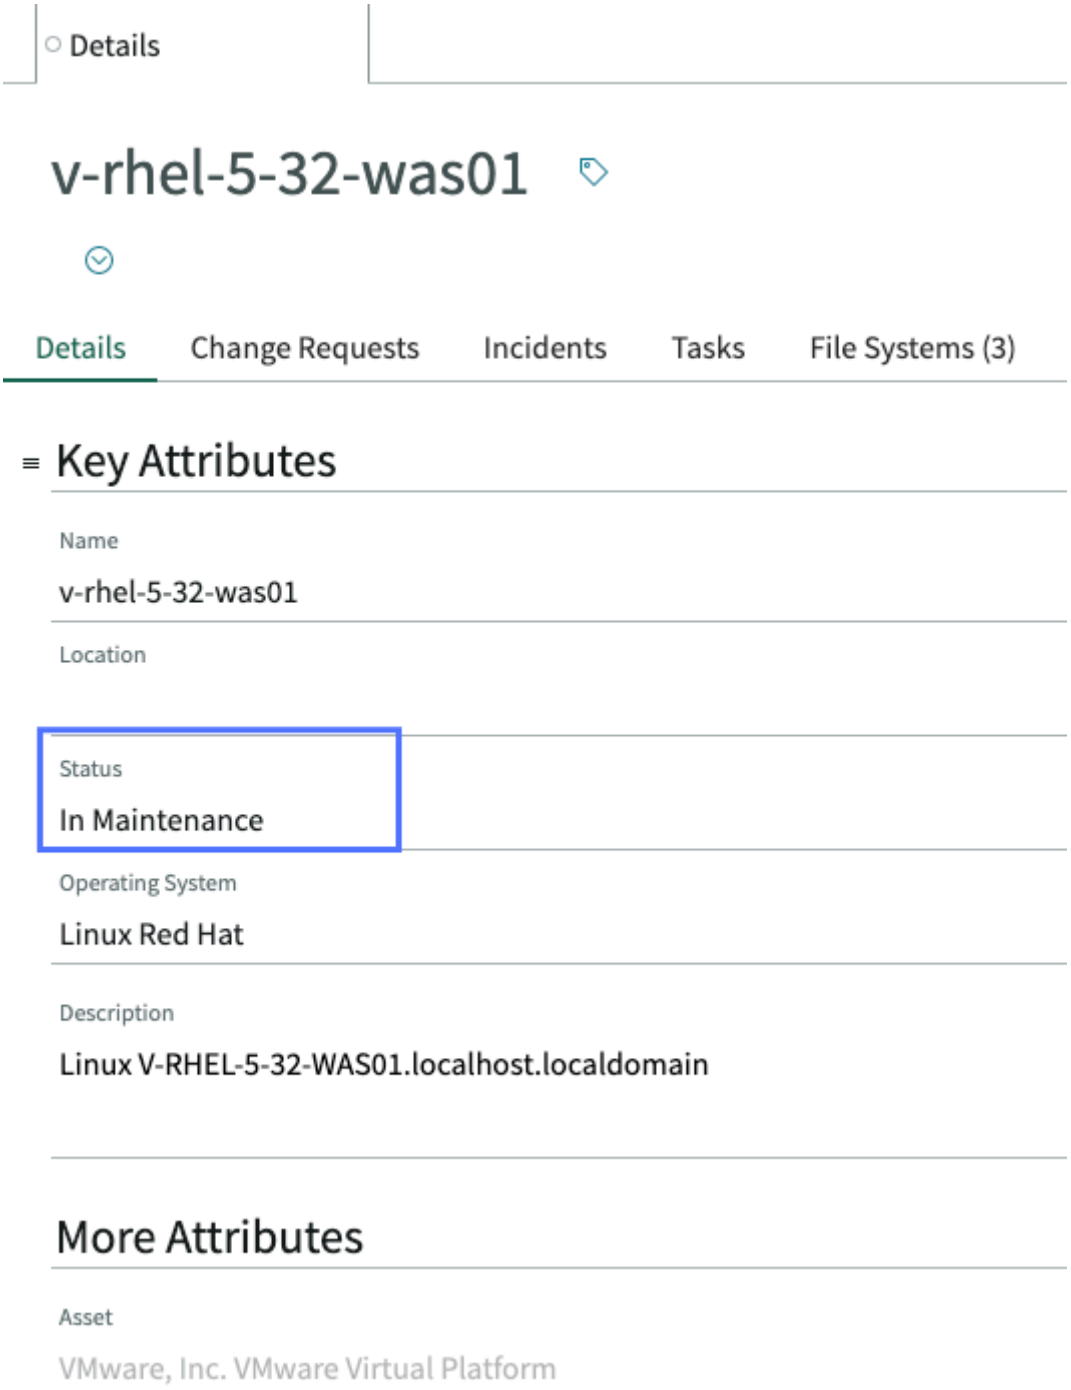
The example in this topic assumes that a network administrator opened a change request to reconfigure a problematic web server.

Role required: evt_mgmt_operator

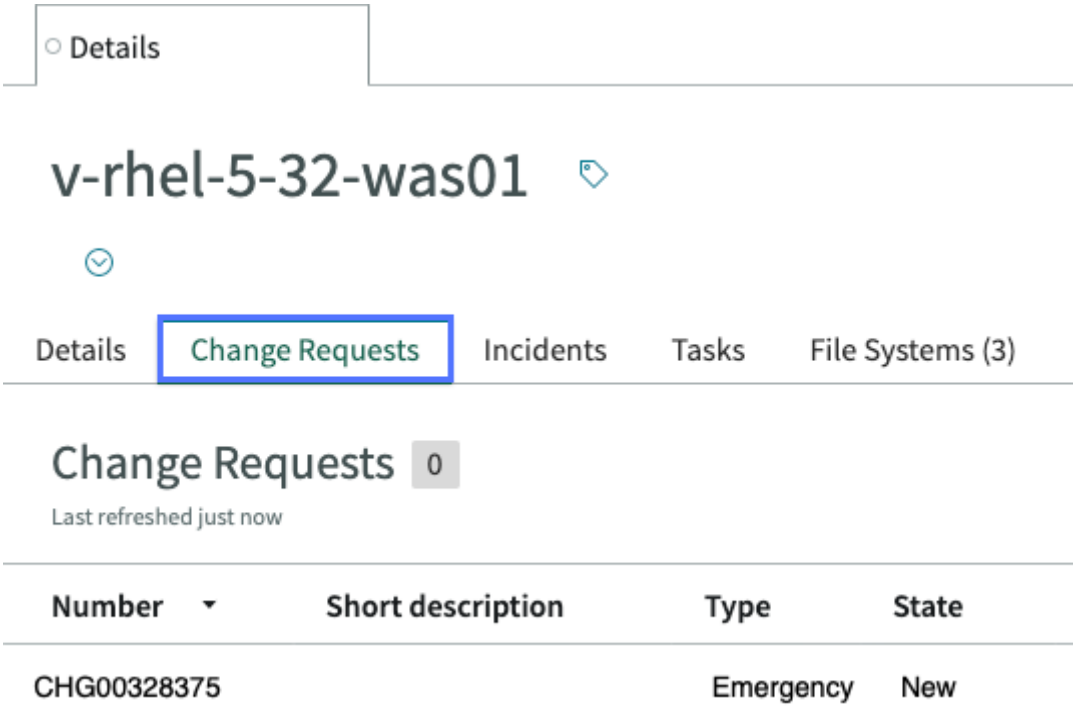
Procedure

1. Find alerts in maintenance:
   a. Navigate to **Event Management** > **Operators Workspace**.
   b. Click the filter icon ( ) and in the Filter box, click **Advanced view** and specify:
      `State|is|Maintenance`.
2. In the list of alerts, find an alert with a value in the **Configuration Item** column. This is the CI on which the alert occurred.
3. Click the CI name to open the form that displays information about the CI.
   In this example, the status of the web server is **In Maintenance** and there is a change request scheduled so that someone can reconfigure it.
4. Click the CI name to open the form that displays information about the CI.
   In this example, the status of the server (on the **Details** tab) is **In Maintenance**. You can view the scheduled change request on the **Change Requests** tab (someone will reconfigure the CI).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. At this point, you should not modify the alert associated with this CI.
   You can open the change request to see if a schedule is attached, or coordinate with your team to find out when the CI will no longer be in maintenance.
6. After you verify that the **Status** field on the CI is not **In Maintenance**, open the alert again and clear the **Maintenance** check box.
7. Continue to triage the alert.

Adjust alert impact while triaging an alert

As an Event Management operator, you might need to modify the impact that an alert has on an application service and on the CIs in a service. Do this when you think that the impact does not accurately represent what you see in your network environment so other operators and administrators see the correct impact information.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

About this task

Before you make any modifications to impact calculations, make sure that you understand how the application services and the CIs actually function. You might need to perform tests on network infrastructure or contact someone who can.

Procedure

1. Navigate to **Event Management** > **Operators Workspace**.
2. Double click the name of the application service that has the alerts you want to modify.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Details tab, click **Service Map**.
4. On the **Service Map** tab, click **Full Map** Tree.
5. On the map, click **Impact Tree**.
6. Analyze the application service to see whether the impact tree accurately reflects the impact of the alerts based on what you know about the CIs involved.

   In this example, a critical alert indicates a serious issue with a Linux server that is part of a Web portal application service.

   Notice that the impact on the Web portal itself is red, meaning critical, even though only one of the Linux servers that it relies upon actually has a critical alert. The other Linux Server does is not impacted by the alert. Assume for this example that the Linux servers perform different roles for the web service, and that even though **PS LinuxApp02** has a critical alert, the **PS LinuxApp01** server can adequately provide all the necessary services to keep the application service operational.

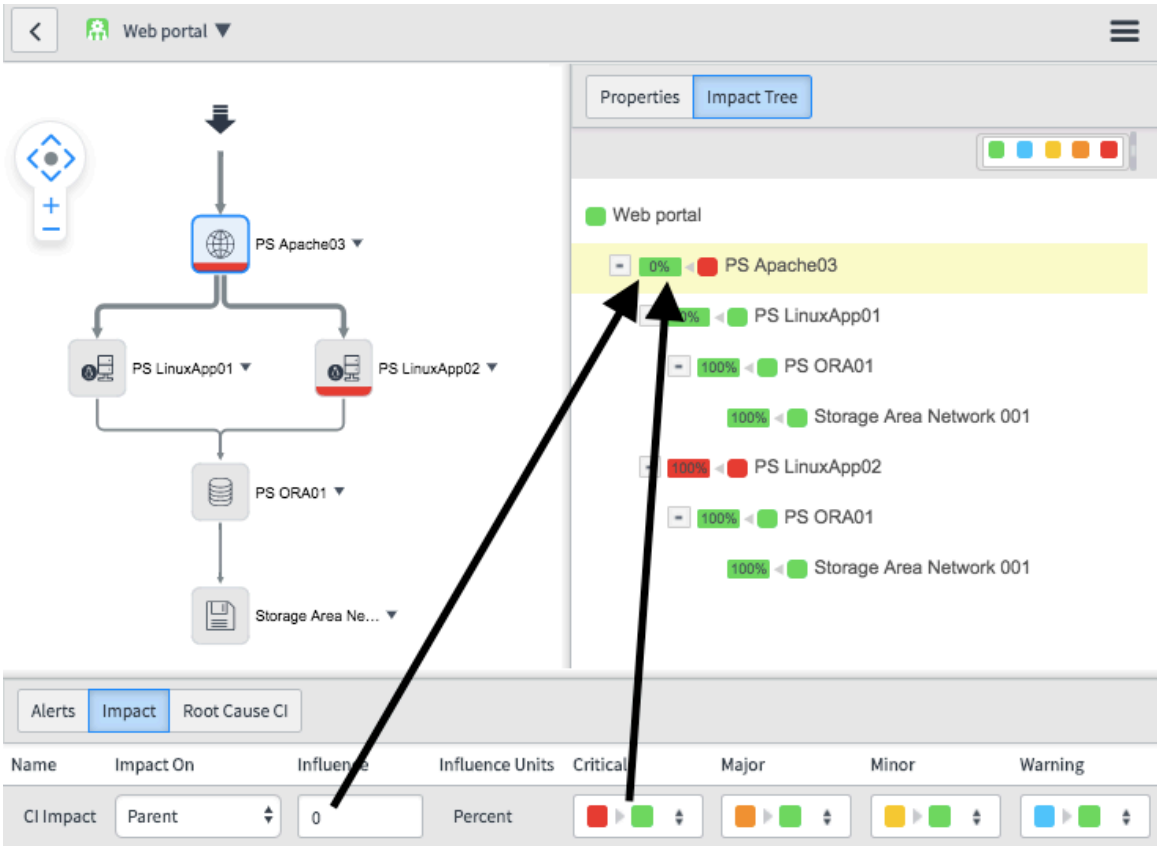
7. Click the **PS Apache03** CI, and then click **Impact** to display the impact rules for the CI. By default, the CI impact rule appears, showing you this information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Impact On** and **Influence** columns show you that the CI (**PS Apache03**) should inherit 100% of the impact of all child CI impacts, which in this case includes the critical impact on the **PS LinuxApp02** server. This setting is why the **PS Apache03** web server, and the application service as a whole, inherits the impact 100%.
- The **Critical** column shows you that a critical alert (red) is inherited as critical alert (red).

8. Change the **Influence** value to 0 since the web server is still operational, and then change the **Critical** column to indicate that a critical impact status (red) should be inherited as a non-impact (green).
9. Wait for the dashboard to update automatically, or click **Event Management** > **Service Operations Workspace** and double-click the same application service to get an updated application service map.

   Notice that the influence on the Apache web server is 0% and the impact status is green. Also notice that the critical alert status (red) remains unchanged, even though the impact changed to green.



10. Navigate back to the Service Operations Workspace dashboard.
    Notice that the application service is now green, indicating that the overall application service is operational. The critical alert still displays at the bottom in the Alerts list, indicating that there is still an issue that you or other operators can address.

What to do next

Your administrator might configure additional impact rules that display when you click a CI in the application service map. You can make adjustments to the **Influence** fields on any impact rule to get the most accurate impact tree.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event Management reference

Reference topics provide additional information about mapping and fine-tuning application services using Event Management lists and forms.

Components installed with Event Management

Activating the Event Management (com.glideapp.itom.snac) plugin adds several roles, scheduled jobs, and tables.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed with Event Management

Roles used by the Event Management application.

Event Management adds these roles.

Role title [name]	Description	Contains roles
Event Management Administrator [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Event Management. **Note:** Exercise caution with the evt_mgmt_admin role, as it can be elevated to the admin role. A user with the evt_mgmt_admin role has the ability to add and modify scripts that run on a global scope. Ensure proper access control. With this role, the user can create and/or update the following scripts: • Alert correlation rules • Alert management rules • Maintenance rules • Advanced scripts • Event field mapping • Pre- and post-binding scripts	• evt_mgmt_user • template_editor_global
Event Management Operator [evt_mgmt_operator]	In addition to the evt_mgmt_user permissions, can also activate operations on alerts such as acknowledge, close, open incident, and run remediations.	evt_mgmt_user
Event Management User [evt_mgmt_user]	Has read access to all Event Management features. Has the itil role to be able to manage incidents that are created from alerts.	itil
Event Management Integrator	Has create access to the Event [em_event] and Registered Nodes	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
[evt_mgmt_integration]	[em_registered_nodes] tables to integrate with external event sources.	

Scheduled jobs installed with Event Management

List of scheduled jobs that are provided with Event Management.

To review the list of scheduled jobs, navigate to **System Scheduler** > **Scheduled Jobs**. Event Management adds the following scheduled jobs.

Scheduled job	Description
Event Management — Connector execution job	Compares current time with time when active connector instances were last run and sets relevant connectors to execute. Runs every 10 seconds.
Event Management — Handle Impact Stuck Service	Releases stuck services and marks them as requiring rebuilding in the Impact Changes table to rebuild the impact tree. Runs every 2 minutes, 31 seconds.
Event Management — Impact Calculator Trigger	Trigger the impact calculation. The Event Management dashboard and impact tree are refreshed using the calculated figures. Runs every 6 seconds.
Event Management — Impact Topology Consumer	Consumes topology changes and marks the related services as 'require rebuilding' in the Impact Changes table to rebuild their impact trees. Runs every 19 seconds.
Event Management — Update stuck connectors	Release connector instances that are stuck. Runs every 2 minutes.
Event Management — Alert Priority Queue	Calculate alert priority. Two Alert Priority Queue jobs are active and available and can be run multi-thread. Runs every minute.
Event Management — Auto Close Alerts	Alerts that are idle longer than 7 days (default time period) are closed. Modify the default using the `evt_mgmt.alert_auto_close_interval` property. Runs every 10 minutes.
Event Management — Calculate Alert Priority Grouping	Runs and calculates the priority groups: urgent, high, moderate and low for the alerts

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
	according to the highest and lowest priority score in the system. Runs every 30 minutes.
Event Management — Close Flapping Alerts	Close flapping alerts. Runs every 5 minutes.
Event Management — Close Threshold Alerts	Close threshold alerts. Runs every 2 minutes.
Event Management — Evaluate Scoped Alert Rules Management0	Execute alert management rules. Two separate jobs run to ease the load on the system. Runs every 11 seconds.
Event Management — Evaluate Scoped Alert Rules Management1	
Event Management — Filter Services for Impact - Queue Handler	Process changes from em_impact_inclusion_class and em_impact_filter_service. Runs every minute.
Event Management — Impact Tree Builder	Handles all services with changes from the em_impact_changes table and rebuilds their impact trees. Runs every 11 seconds.
Event Management — Insert Health Monitor	Job to produce the **ServiceNow Event Management** application services. Runs once every hour.
Event Management — Maintenance Calculator	Calculate the maintenance for CIs. Runs every minute.
Event Management — Node Count	Calculate license usage. Runs once every hour.
Event Management — Populate Impacted Services Table	Scan cmdb_ci_service_auto and copy all services to em_impacted_service, along with all related classes to em_impact_inclusion_class. Runs once after upgrade.
Event Management — Process Events	Job that runs and processes each Ready event (apply event rule, mapping rule, and create or update alert) Runs every 5 seconds.
Event Management — Process Metric Binding	Process metric binding.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
	Runs every 5 seconds.
Event Management — Process Records in em_extra_data_json	Creates events for log analytics anomalies. Runs every 13 seconds.
Event Management — Queue Connector Processor	Bi-directional functionality. Processes all pending alerts in the Update Queue and sends them to the MID Server. By default, this dequeue process is performed in batches of 1,000 alerts. Runs every 30 seconds.
Event Management — Recalculate Impact for Groups	By default, this job is not active. Can be run on demand to correct the impact on service groups. Runs on demand.
Event Management — Recover Stuck Events	Handle all events that are in queued state and switch back to Ready to handle events from the beginning. Runs at system startup.
Event Management — Update Health Monitor	Update the **ServiceNow Event Management** application services. Runs once every hour.
Event Management — Update SLA Configuration Result	Synchronizes the CIs that match the SLA configuration filter with the Event Management SLA [em_ci_severity_task] table. Runs every 10 minutes.
Event Management — Update SLA Severity	Updates Event Management SLA [em_ci_severity_task] table with the new severity. Runs once every minute.
Event Management — Convert IT Service	Run this property on demand to convert manual services to application services. Runs every 30 minutes.
Event Management — Collect xmlstats	Collect event processing statistics. Runs once every minute.
Event Management — Impact Calculator for Alert Groups and SLA	Calculates the effect of alerts on alert group services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
Event Management — Manual Impact Calculator Trigger	Manually trigger of Impact Calculation on all operational Services.
4x Event Management — Impact Calculator for BS_0	Calculates the impact of alerts on application services, and builds the impact tree on the Event Management dashboard. Four separate jobs run to ease the load on the system.
4x Event Management — Impact Calculator for BS_1	
4x Event Management — Impact Calculator for BS_2	
4x Event Management — Impact Calculator for BS_3	
Event Management — Backfill Alert History table	Locates redundant records in the em_alert_history table and cancels them.
Event Management — Backfill Impact Status table	Locates redundant records in the em_impact_status table and cancels them.
Event Management — Impact for Groups	Calculates the impact of alerts on service groups.
Event Management — Clean Alert History Table	Cleans the Alert History (em_alert_history) table by removing records more than 90 days old. You can customize the amount of time after which alerts are removed by configuring *evt_mgmt.impact_calculation.cleanup_age_sec* in the sys_properties.list table.
Event Management — Clean Impact Status Table	Cleans the Impact Status (em_impact_status) table by removing records more than 90 days old. You can customize the amount of time after which alerts are removed by configuring *evt_mgmt.impact_calculation.cleanup_age_sec* in the sys_properties.list table.

Event Management adds the following scheduled jobs to support alert aggregation and RCA.

Name	Description
Service Analytics Purge Old Observation Data — Daily	Cleans the staging data.
Service Analytics Prepare RCA Learner Input Data — Daily	Prepares RCA input data. Stores and probes MID Server to learn statistical information about alerts.
Service Analytics group alerts using RCA/Alert Aggregation	Applies RCA and alert aggregation to open alerts and prepares automated alert groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Service Analytics Alert Aggregation Learner — Daily	Learns information about existing alerts and groups new open alerts.
Service Analytics RCA Configuration	Configures root cause analysis.
Service Analytics Check File System Space on Analytics MID — Daily	Checks disk usage on the dedicated MID Server, and generates an event if it exceeds the threshold set in the *sa_analytics.rca.mid_max_allowed_space* property.
Service Analytics Gather Value Report Data — Daily	Gathers data for the Value Report.
Service Analytics — Update virtual alerts for aggregation groups	Update the virtual alerts that were created to represent alert aggregation groups, with any changes to alerts belonging to that group. Runs every minute.
Service Analytics Attribute Populator for Historical Alerts	Populate attributes used in feature identifier for historical alert data using event rules. Runs on demand.
Event Management - Analytics Alert Syncer	Gathers alert data that is used by grouping job.

Properties for personalizing domain separation for Event Management connectors

Properties provide the metadata to identify the domain.

You can change the values if you want to use any other table or fields for domain identification but make sure that the table is domain separated.

Note: When personalizing domain separation for event management connectors, all the properties can be overridden at the connector level as well.

There are three caches maintained for personalizing domain separation (main, user_access, missing_domain). You can create a few system properties to control them.

Default System Properties

Property	Description
evt_mgmt. connector_domain_info_table_name	The table where you store domain information for personalizing domain separation. • **Type**: string • **Default value**: core_company
evt_mgmt. connector_domain_info_column_name	The field name in the table to identify the provided domain for personalizing domain separation. • **Type**: string • **Default value**: name
evt_mgmt. connector_domain_id_column_name	The field to get domain ID from for personalizing domain separation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default System Properties (continued)

Property	Description
	• **Type**: string • **Default value**: sys_domain
evt_mgmt. connector_domain_path_column_name	The field to get the domain path from for personalizing domain separation. • **Type**: string • **Default value**: sys_domain_path

Property	Description
evt_mgmt.connector_custom_domain_sep_cache_expire_in_seconds	For personalizing domain separation, if you don't want your main cache to expire every week.
evt_mgmt.connector_custom_domain_sep_user_access_on_domain_cache_size	For personalizing domain separation, if you want to increase the size of the user access cache.
evt_mgmt.connector_custom_domain_sep_missing_domain_cache_expire_in_seconds	For personalizing domain separation, if you want to increase the expire time for cache storing information regarding the missing domain.
evt_mgmt.connector_custom_domain_sep_cache_size	For personalizing domain separation, if you need more main

Property	Description
	cache size for storing domain information.

Tables installed with Event Management

Tables that are provided when Event Management is activated.

Event Management adds these tables.

Table	Description
Alert [em_alert]	Alerts that Event Management manage.
Alert Correlation Rule [em_alert_correlation_rule]	Rules specifying primary and secondary correlated alerts.
Alert Aggregation Group Alerts [em_agg_group_alert]	Stores alerts associated with aggregated alert groups.
Alert Aggregation Group [em_agg_group]	Relationships between aggregated groups and primary alerts.
Alerts History [em_alert_history]	History of alerts. Used for impact calculation.
Alert Rule [em_alert_rule]	Mappings of alert fields to the Incident [incident] table.
Alert Template [em_alert_template]	Alert templates. This table extends the Template [sys_template] table.
Event Management SLA [em_ci_severity_task]	Event Management SLA tasks for CIs and services.
Connector Definition [em_connector_definition]	Settings for gathering events from external event sources.
Connector Instance [em_connector_instance]	Connection details for external event sources.
MID Server to Connector Instance [em_connector_instance_to_mid]	Mappings of MID Servers to connector instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Event Management License Usage [em_unique_nodes]	When events are received by ITOM AIOps, an entry is added or updated in this table based on the monitored target specified in the received message. The entry links to its corresponding CMDB CI. If none is found, the entry is assigned *Type = Unknown*.
Event [em_event]	Events received by Event Management.
Event Filter [em_event_filter]	Storage for defined event filters.
Event Match Rule [em_match_rule]	Updated events for alert processing. Used by event rules.
Event Match Field [em_match_field]	Mappings of event fields to alert fields. Simple mapping. Used by Event Rules.
Event Compose Field [em_compose_field]	Mappings of event fields to alert fields. Composite mapping. Used by Event Rules.
Event Mapping Rule [em_mapping_rule]	Updated event fields for alert processing.
Event Processing Statistics [em_event_stats]	Statistics on Event Management performance.
Event Type [em_event_type]	Event types.
Task Template [em_incident_template]	Templates that define how to populate new tasks. For example, how fields of an incident that is being created from an alert, must be populated. This table extends the Template [sys_template] table.
Registered Nodes [em_registered_nodes]	Registered nodes data.
Threshold Rule [em_threshold_rule]	Alert threshold rules.
Binding Device Map [Em_binding_device_map]	Event binding to network paths and storage paths.
Process to CI Type Mappings [Em_binding_process_map]	Event binding to specific processes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
CI Remediation [em_ci_remediation]	Remediation rule definitions.
Impact Graph [em_impact_graph]	Impact tree of CIs containing CI hierarchy and impact rules to be used for impact calculation.
Impact Graph History [em_impact_graph_history]	History of changes in impact tree.
Impact Rule Definitions [em_impact_rule_definition]	Definition of rules used for impact calculation.
Impact Rule instance [em_impact_rule]	Rules based on impact rule definitions.
Impact Inclusion Classes [em_impact_inclusion_class]	Specifies the classes to be used for impact calculation.
Impact Filter Services [em_impact_filter_service]	Specifies services to be included or excluded from impact calculation.
Infrastructure Relations [em_impact_infra_rel_def]	Child-parent pairs or CI types. CIs matching these definitions are added to impact trees.
Impact Maintenance CIs [em_impact_maint_ci]	CIs that are in maintenance and therefore are excluded from impact calculation.
Impact Status [em_impact_status]	Calculated status of CIs and services to be displayed in the dashboard and service maps for dynamic CI groups.
SLA Configuration [em_sla_configuration]	SLA configuration records that identify the CIs that SLAs can run on.
Service Analytics Metric Type Registration [sa_metric_registration]	Source registration details for processing raw data.
Health monitor scripts [em_monitor_scripts]	These scripts determine how to monitor or check, for example, when using the Connectors Monitor script. You can create customized script to monitor a device or an entity. The scripts provided with the base instance are: • Check delay in event processing • Connectors Monitor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
	• Get Event Processing state • MID Server Threshold Alerts
Monitoring configuration [em_monitor_conf]	Use this table to configure what to monitor according to the scripts that are listed. Configure how often to run each script. If a script has a threshold, it determines what alert severity to display. Threshold values are in units of minutes and specify the delay time. Navigate to **Event Management** > **Settings** > **Self-Health configuration** to see the list of Monitoring Configurations or to create a new one. Use this script to test Data Center Monitoring. The scripts provided with the base instance are: • Connector's idle state monitoring-monitor to verify whether any of the connectors was in idle state that surpassed the threshold [in minutes] that was configured. • Connectors Status- monitor to track the active status of the connectors. • Delay in event processing-monitor to track the duration [in minutes] of events that remained in 'ready' state and were not processed. • Event Processing job-monitors the state of the event processing jobs. • MID Server Threshold Alert-monitors MID Server health.
Monitoring Event Management Jobs [em_monitor_jobs_state]	Monitor Event Management jobs by adding the relevant jobs to the table. **Note:** The following jobs are not monitored by this table: • Event Management - Process Events • Event Management - Impact Tree Builder • Event Management - Recover Stuck Events • Event Processing
Monitoring state [em_monitor_state]	Use this table to set the threshold for each connector. When there is a value above the threshold, an alert is generated.
EM XMLStats Data [em_xmlstats_data]	Self-health statistics and diagnostic details for Metric Intelligence and Event Management, which are used to produce the XMLStats page.

Event Management adds the following tables to support alert aggregation and RCA.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
SA RCA Status [sa_rca_status]	Information (such as IDs) for the latest messages that were sent to the ECC Queue for a service during RCA.
SA RCA Output [sa_rca_output]	RCA learner output data.
SA RCA Group [sa_rca_group]	Automated alert groups for the RCA query.
SA Analytics Alert Staging [sa_analytics_alert]	Staging table for alerts used for analytics.
SA RCA Input [sa_rca_input]	Input data for the RCA learner.
SA Analytics Status [sa_analytics_status]	Last run information to be used for alert aggregation and RCA.
SA RCA Group Alert [sa_rca_group_alert]	Alerts associated with automated alert groups.
SA RCA Service Configuration Item Association [sa_rca_svc_ci_assoc]	Associations between CIs and services.
SA Alert Aggregation Learned Pattern [sa_agg_pattern]	Learned patterns from alert aggregation.
SA Alert Aggregation Learned Pattern Elements [sa_agg_pattern_element]	CI/Metric Name pairs associated with learned patterns.
SA Alert Aggregation Query Group Patterns [sa_agg_group_pattern]	Relationships between groups discovered in alert aggregation queries and patterns found in learning.
SA Alert Aggregation Query -- Staged (Recent) Alerts [sa_agg_group_alert_staging]	A staging table for alerts that have not yet been associated with any aggregated alert group.
SA Agg Pattern Attribute [sa_agg_pattern_attribute table]	CI/alert attributes to be used for finding patterns for alert aggregation.
SA Alert Attribute Populator Status	State and statistics for attribute populator job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[sa_alert_attribute_populator_status table]	
SA Alert Aggregation Learned Pattern Elements Pair wise Mutual Information and Joint Probability [sa_agg_pattern_element_pair]	Pairwise probabilities for pattern elements.
EM Agg Group Prediction [em_agg_group_prediction]	Alert predictions for alert groups.

Event Management Platform Analytics Solutions

Platform Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Platform Analytics Solutions

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

To enable the solution for Event Management, an admin can navigate to **Performance Analytics** > **Guided Setup**. Click **Get Started** then scroll to the section for Event Management. The guided setup takes you through the entire setup and configuration process.

Data visualization in ITOM now includes a funnel component to help you track metric progression across stages, making it easier to identify drop-offs or bottlenecks in processes. For more details, see Data visualization in ITOM.

Related topics

Activate your Performance Analytics subscription

Customize Platform Analytics elements

Customize the appearance of widgets when viewing Platform Analytics visualizations.

Before you begin

Role required: user

Procedure

1. Navigate to **All** > **Performance Analytics** > **Dashboards**.
2. On the **Dashboards** page, select a dashboard to view.
3. Select the **Edit** button.
4. Select the relevant element to open the Configuration panel.
5. In the Configuration panel, edit the element's options.
6. Select **Save**.

What to do next

Users with the admin role can customize colors and fonts. To customize fonts, navigate to **sys_ux_theme_property.list** and edit the applicable fonts.

Machine learning solutions for Event Management

Build solutions for Event Management with Predictive Intelligence.

Solution definition

Solution Definition for Event Management

Solution Definition	Description
Closed alert similarity	Closed alert similarity is a similarity solution definition that is used to recommend similar Alert records based on these fields: Description, Node, Resource, CI Type,Source, and Metric Name from the Alert [em_alert] table. Results are visible to users on the Alert form and on the Similar Alerts tab in Workspace.
EM Alert Clustering Solution	EM Alert Clustering Solution is a clustering solution definition used in Event Management. Allows building clustering models enabling identification of common text patterns in alerts to create alert groups. Text clusters are based on these fields: Description, Metric Name, Configuration Item Class from the Alert [em_alert] table.

Performance Analytics Edit Widget dialog box

Fields in the dialog box for editing a Performance Analytics dashboard widget.

Section	Description
Show real-time updates	Select for updates to appear in the widget in real-time.
Show	Select or clear the boxes to show or hide the following on the widget: • Border • Header • Title
Title alignment	Select the alignment of the widget title: • Left • Center • Right
Title color	Select to configure the color of the widget title.
Header color	Select to configure the color of the widget header.
Interactivity	Select from the displayed options. • Follow interactive filter • Show when following filter

Event Management MID Web Server extension form

Fields in the form for creating or modifying a MID Web Server extension.

MID Web Server Context form

Field	Description
Name	Unique name for the extension for easy identification.
Short description	Brief, meaningful description of the extension.
Status	This field is auto-populated with the status of the extension. The field is blank until the extension is started. After issuing a command to the extension, one of the following values is displayed: • Started: The extension is running. • Stopped: The extension is not running. • Offline: The MID Server is down. • Error: The extension failed with an error. The error message is displayed in the **Error Message** field. • Warning: A run-time exception has occurred. The extension continues to work.
HTTP/HTTPS Port	Port number the extension listens on for incoming requests.
Authentication Type	The available authentication types are: • **API Key** (default): Any client connecting to the extension must enter an API key into the request's authorization header. For details on viewing existing API keys, see Configure MID Web Server API key authentication. • **Keybased** (deprecated and kept only for compatibility with releases prior to the Zurich release): The value in the **Secret Key** field is used to generate an authentication token sent in the **Authorization** header of incoming client requests. For details, see Configure key-based MID Web Server authentication. • **Basic**: Define a username and password in the **Basic Auth User** and **Basic Auth User Password** fields, which appear when selecting this option. • **mTLS**: A certificate-based authentication that uses the TLS protocol. For details, see MID Web Server and agent mTLS Authentication.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Web Server Context form (continued)

Field	Description
Secret Key	The value generated when Keybased authentication is selected for the value in the Authentication Type field.
Basic Auth User	Username to be used when selecting Basic authentication.
Basic Auth User Password	Password to be used when selecting Basic authentication.
Secure Connection	Option to indicate that the extension is to use the TLS protocol to encrypt incoming connections. A certificate and private key combination must also be provided to the extension. When selecting this option, the **MID Server Unified Keystore** check box appears.
Use MID Unified Keystore	Option for using the MID Server Unified Keystore option for a secure connection. Clear this option to use **Web Server Keystore**. For details, see Configure a secure MID Web Server extension.
Keystore Certificate Alias	The alias name of the keypair inside the selected keystore that the extension uses to establish a secure connection. Leave this field empty to use the default alias when using the MID Unified Keystore or when using the Web Server Keystore with a single alias.
Keystore Password	The password for the Web Server Keystore when it is used to establish a secure connection.
Keystore Key Password	The password of the private key entry mapped to the specified alias of the Web Server Keystore. This field can be left empty if the password matches the entry in the Keystore Password field.
Truststore Password	The password to the truststore that holds the Certificate Authority (CA) certificates used to validate the signatures of the client certificates. Appears when the **mTLS** authentication type is selected. Leave this field empty if the extension is configured to use the cacerts truststore of the JRE running the MID Server.
Error Message	Message describing any error that causes a command, such as Start or Stop, to fail. This

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Web Server Context form (continued)

Field	Description
	field appears only when the value in the Status field is Error.
Execute on	Location for running this extension. The available options are **Specific MID Server** or **Specific MID Server Cluster**.
MID Server	Depending on your selection in the **Execute on** field, the name of the designated MID Server or MID Server cluster. • If you selected **Specific MID Server**, the name of the designated MID Server. • If you selected **Specific MID Server Cluster**, the name of the designated MID Server cluster.
Executing on	Displays the name of the MID Server on which the extension is running even if the MID Server is down. If the user stops the extension, this field is empty.

Event Management tag based alert clustering tag form

The form for creating or modifying a tag based alert clustering tag displays detailed information about the tag.

Tag based alert clustering tag form

Field	Description
Name	Name of the clustering tag. Defaults to a description of the configured tag (such as, **Exact match on Alert Field "metric name"**). The default name is visible only after saving the tag. Tag names must be unique.
Customized name	Select the check box to customize the value in the **Name** field.
Domain	The domain in which the current record was created. Read-only.
Description	Enter an optional description of the tag.
Source	Select the source from which to choose the field to be matched. • **Alert field** • **Alert additional info** • **Alert CI**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering tag form (continued)

Field	Description
	• **Alert CI key** • **Alert tags** If you select **Alert additional info**, choose an **Additional Info Key** instead of a field. **Alert additional info** is a field on alert containing the key value pair in Jason format and we can use a specific key. **Alert CI key**: Create CMDB key values to cluster alerts based on CMDB Key Values [cmdb_key_value] table. Key values provide an additional method for determining commonalities between alert CIs.
Selected field	Indicate the field that has to match between alerts for the alerts to be included in a group. Appears when you select **Alert Field** or **Alert CI** in the **Source** field. If you select **Alert CI** in the **Source** field, you need to select a CMDB key. A CMDB key is assigned to the CI of the alert.
Key	Indicate the Key that has to match between alerts for the alerts to be included in a group. Appears when you select **Alert additional info** in the **Source** field, or appears when you select **Alert tags** in the **Source** field. When **Alert additional info** is selected, enter the name of one of the fields in the additional info field. When **Alert tags** is selected, enter the name of the relevant alert tag.
CMDB key	Indicate the CMDB key to match for the alerts to be included in a group. Appears when you select **Alert CI Key** in the **Source** field.
Match method	Select the type of match required for the alerts to be included in a group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering tag form (continued)

Field	Description
	• **Exact**: Indicates that the field value must be an exact match for the alert to be included in a group. For example, you can configure an alert clustering tag indicating that the alert's **Metric name** field must be an exact match to form a group. When invoking that tag, all alerts with identical values in the **Metric name** field are included in the same group. • **Fuzzy**: Indicates that the field value needs to be an approximate match (depending on the value configured in the **Similarity** field) for the alert to be included in a group. • **Pattern**: Indicates that the field value needs to follow the pattern in the **Pattern** field. For correct syntax and usage examples, see Pattern matching.
Similarity	Specify the similarity percentage that must be met by the alerts to be included in a group. For example, entering 50 indicates that at least 50 percent of the indicated value must appear in the alert for the alert to be included in the group. Appears only when **Fuzzy** is selected as the **Match Method** value. Default value = 90

List of predefined alert grouping tags

A list of the predefined alert clustering tags provided with the Tag Based Alert Clustering Engine # application.

Predefined alert clustering tags

Name	Source	Match method
CI	em_alert.cmdb_ci	Exact match
Description	em_alert.description	Exact match
Metric Name	em_alert.metric_name	Exact match
Node	em_alert.node	Exact match
Resource	em_alert.resource	Exact match
Source	em_alert.source	Exact match
Source instance	em_alert.event_class	Exact match

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predefined alert clustering tags (continued)

Name	Source	Match method
Type	em_alert.type	Exact match
Assignment group	em_alert.assignment_group	Exact match
CI Class	cmdb_ci.sys_class_name	Exact match
Dns domain	cmdb_ci.dns_domain	Exact match
ip address	cmdb_ci.ip_address	Exact match
Location	cmdb_ci.location	Exact match
Environment	cmdb_ci.environment	Exact match
CI name	cmdb_ci.name	Exact match
Namespace	cmdb_ci.namespace	Exact match

Predefined tags extracted from connector payload

Name	Description	Default mapping from CMDB
t_ip_address	IP address	cmdb_ci.ip_address
t_application	Application	-
t_region	Region	-
t_location	Location	cmdb_ci.location
t_environment	Environment	cmdb_ci.environment
t_namespace	Namespace	cmdb_ci.namespace

Event Management tag based alert grouping definition form

The form for creating or modifying a tag based alert clustering definition displays detailed information about the definition.

Tag based alert clustering definition form

Field	Description
Name	Name of the alert clustering definition. Definition names must be unique.
Active	Select to activate the definition. This option is selected by default.
Order	The order by which definitions are tested for incoming alerts. Those with lower Order values are tested first. When an alert matches one of the definitions' filters, it continues searching for more definitions. Default value = 1000

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering definition form (continued)

Field	Description
Domain	The domain in which the current record was created. Read-only.
Assignment group	Assignment group that works on the alert. If no assignment group is defined in the alert rule, then this alert rule is considered as a global rule. When the rules are running – first the global rules run and then the rules that belong to the assignment group of the alert.
Description	Enter an optional description of the alert clustering definition.
Filter	Set conditions that incoming alerts must meet to be measured by the alert clustering definition's tags. If the tags correspond to alerts that exist in the system and are within the **Clustering timeframe (minutes)** value, the incoming alerts join with the existing alerts to form an alert group. After configuring the filter, you can click the **Preview** button to view how many existing alerts match the filter's condition. **Note:** • Matching alerts are not automatically included together in an alert group. Alerts are grouped only if they have corresponding alert clustering tags. • Filter parameters are case sensitive by default. To disable case sensitivity, set the *sa_analytics.correlation_case_sensitive* parameter to **false**. • You can also configure alert fields to be excluded from the search, using the *sn_em_tbac.tag_excluded_alert_fields* property. By default, the following are excluded by this property: ○ type ○ event_class
Override group description	Default group descriptions begin with a "Group of alerts" prefix, followed by the description of the primary alert in the group. You may override this group description by selecting the **Override group description** check box. Then, in the **Custom description**

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering definition form (continued)

Field	Description
	field, type a description. This description is used as the description of the groups that are created by this alert clustering definition. **Note:** You cannot save the form if you left the Custom description field blank or with the default 'Group of alerts' text.
Clustering timeframe	The maximum time, in minutes, allowed between the first alert and subsequent alerts for them to be grouped together. For example, a value of 60 indicates that any alert generated within 60 minutes of the first alert in the group (the oldest alert) is included in the alert group. Any alert generated after this 60-minute window from the initial alert is not included in the group. Permitted values = 0-1440
Tag Based Alert Clustering Definitions Tags M2M	Select the alert clustering tags to be assigned to the alert clustering definition. Alerts that meet the criteria specified in the selected tags are included in the alert group. The available options are the tags created on the **Tag Based Alert Clustering Tags** page.

List of predefined tag-based alert grouping definitions

A list of the predefined alert clustering definitions provided with the Tag Based Alert Clustering Engine#application.

Predefined alert clustering definitions

Name	Description	Order
Group alerts from the same Application	Group all alerts from the same application, created in the last 10 minutes. In new systems, this definition is activated by default.	9010
Group all alerts from the same IP address	Group all alerts from the same IP address, created in the last 10 minutes.	9020
Group all alerts from the same Namespace	Group all alerts from the same namespace, created in the last 10 minutes. In new systems, this definition is activated by default.	9030
Group all alerts from the same Subnet	Group all alerts from the same subnet, created in the last 10 minutes. In new systems, this definition is activated by default.	9040
Group alerts from the same CI class and Location	Group all alerts from the same CI class and location, created in the last 10 minutes.	9050

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predefined alert clustering definitions (continued)

Name	Description	Order
Group alerts from the same Application and Environment	Group all alerts from the same application and environment, created in the last 10 minutes.	9060
Group all alerts from a similar Node	Group all alerts from a similar node name, created in the last 10 minutes.	9070
Group alerts from the same Location and Assignment group	Group all alerts from the same location and assignment group, created in the last 10 minutes.	9080
Group alerts from the same Region and Metric	Group all alerts from the same region and metric, created in the last 10 minutes.	9090
Group alerts from the same CI class and Metric	Group all alerts from the same CI class and metric, created in the last 10 minutes.	9100
Group alerts from the same Node and Metric	Group all alerts from the same node and metric, created in the last 10 minutes.	9110
Group alerts from the same Assignment group and Class	Group all alerts from the same assignment group and class, created in the last 10 minutes.	9120
Group alerts from the same Type, Metric and Source	Group all alerts from the same type, metric, and source instance, created in the last 10 minutes.	9130
Group alerts from the same CI	Group all alerts from the same CI, created in the last 10 minutes. **Important:** When this rule is active, CMDB grouping must be disabled.	9140
Group alerts from the same Node	Group all alerts from the same node, created in the last 10 minutes. In new systems, this rule is activated by default.	9150

Domain properties installed with Event Management

Use the domain properties installed with Event Management to provide the metadata that points to the appropriate table to identify the domain so that you know which domain to create the event in.

Default domain metadata properties

Property
evt_mgmt. connector_domain_info_table_name
evt_mgmt. connector_domain_info_column_name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default domain metadata properties (continued)

Property
evt_mgmt. connector_domain_id_column_name
evt_mgmt. connector_domain_path_column_name

Connector domain metadata

Override push connector default domain metadata values installed with Event Management with the values in the event HTTP request, including the URL, headers, request body (payload), and connector parameters. Override pull connector domain metadata values with connector parameters only.

Domain metadata parameters

Name	Description	Overrides System Property
connectorDomainInfoTableName	Name of the table containing the records with the domain information.	evt_mgmt.connector_domain_info_table_name • **Type**: string • **Default value**: core_company
connectorDomainInfoColumnName	Name of the column that has a value that should be matched with the domain identifier. For example, you might want to identify a record in the Domain Info table that has a matching value in the **company_name** field.	evt_mgmt.connector_domain_info_column_nam • **Type**: string • **Default value**: name
connectorDomainIdColumnName	Name of the table column that stores the domain ID.	evt_mgmt.connector_domain_id_column_name • **Type**: string • **Default value**: sys_domain
connectorDomainPathColumnName	Name of the table column that stores the domain path.	evt_mgmt.connector_domain_path_column_na • **Type**: string • **Default value**: sys_domain_path

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order of preference for accessing domain metadata

You must provide domain metadata to configure personalized push connector domains. The metadata in preferred accessing order are:

1. Push connector parameters
2. URL query parameters
3. HTTP headers
4. Request body (payload)
5. Default system properties

URL query parameters

Push connectors have the following URL syntax:

- Instance Type: `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=<connector-source>`
- MID Server type: `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=<connector-transform-script-name>`

You can include domain metadata as additional query parameters in the ServiceNow push connector webhook URL. For example, if the domain information source is the sys_user table, the URL could be `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=<connector-source>&connectorDomainInfoTableName=sys_user`

Request headers

Any of the domain metadata properties can be passed as part of HTTP request headers. Check the documentation from your third-party monitoring tool for information about how request headers are set.

Request body (payload)

You can reference domain metadata from the request body (JSON payload) by setting the metadata parameters as root-level keys in the payload. The following example shows how the *connectorDomainInfoTableName* and *connectorDomainInfoColumnName* parameters might be passed as part of the request body:

```
{
    “source”: “Azure Monitor”,
    “host”: “127.0.0.1”,
    “company”: “ServiceNow”,
    “connectorDomainInfoTableName”: “sys_user”,
    “connectorDomainInfoColumnName”: “first_name”
    }
```

Note: For information on connector parameters, see Personalize domains for push connector events to use in event creation.

Dynatrace connector instance form

The Dynatrace connector instance form displays the fields you must fill in when creating a Dynatrace connector instance.

Connector instance page

Field	Description
Name	Unique name for the Dynatrace metric connector instance.
Description	Description for the use of connector instance.
Connector Definition	The connector definition to be used by the connector. Select **Dynatrace Metrics**.
Host IP	Hostname/IP address of the Dynatrace server.
Credential	Select the search icon and select the existing API key credential. If this credential does not exist, create a new credential, as follows: **1.** Ensure that you have an access token with Read Metric (metrics.read) permissions, created on the Dynatrace UI. **2.** Select **New** after selecting the search icon. **3.** Select **API Key Credentials**. **4.** In the **API Key** field, enter the access token from the Dynatrace UI. **5.** In the **Name** field, enter a descriptive name to uniquely identify the credential. **6.** Fill in any other relevant fields, and select **Submit**.
Metric collection	Selected by default. Read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the metric connector pulls metrics from the Dynatrace server. Default: 60.
Active	Select to activate the connector instance.

Dynatrace connector instance value parameters

The following table displays the Dynatrace connector instance value parameters that you can fill in, as needed, when creating a Dynatrace connector instance.

Connector instance value parameters

Parameter	Description
BaseApiPath	Custom base path for Dynatrace API calls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
	If your Dynatrace instance uses a different path than the default `/api/v2/metrics`, enter the custom path to ensure successful collection of metrics.
debug	Set to **true** to enable debug logs. Default: false
initialSyncInMins	Number of minutes before the current time that the initial metric collection runs. For example, if the value is 15, the connector fetches metrics from the past 15 minutes. Default: 15
logPayload	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default: false
maxMetricsPerQuery	Maximum number of metric ids to query per API call to Dynatrace. The value cannot exceed 32, the maximum limit allowed by Dynatrace. Default: 32
pageSize	Maximum number of records to return in an API response from Dynatrace. Default: 500
port	Port number for the Dynatrace server to connect to. empty
protocol	Protocol to use when connecting to the Dynatrace server. Default: https
throttleApiCalls	Determines whether throttling is enabled. When enabled (**true**), a limit is set on the number of API calls to Dynatrace per minute. Default: false
requestPerMinute	The limit on number of API calls to Dynatrace per minute. Relevant only when *`throttleApiCalls`* = **true**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
	Default: 1000

Datadog connector instance form

The Datadog connector instance form displays the fields you must fill in when creating a Datadog connector instance.

Connector instance page

Field	Description
Name	Unique name for the Datadog metric connector instance.
Description	Description for the use of connector instance.
MID Server	Select the MID Server configured with the Datadog capability.
Credential	Select the API Key Credential that you made in the authentication step. If this credential does not exist, create a new credential, as follows: **1.** Ensure that you have an access token with Read Metric (metrics.read) permissions, created on the Datadog UI. **2.** Select **New** after selecting the search icon. **3.** Select **API Key Credentials**. **4.** In the **API Key** field, enter the access token from the Datadog UI. **5.** In the **Name** field, enter a descriptive name to uniquely identify the credential. **6.** Fill in any other relevant fields, and select **Submit**.
Metric collection schedule (seconds)	Time interval (in seconds) at which the metric connector pulls metrics from the Datadog server. Default: 60.
Host IP	Enter the base URL for your Datadog API endpoint (e.g., api.datadoghq.com).

Note: For collecting cloud-native metrics (e.g., from AWS, Azure, GCP), it is recommended to set the collection schedule to 300 seconds (5 minutes). This accounts for potential data latency from the cloud provider to the Datadog platform.

To go back to the procedure page, see Configure the Datadog metrics connector instance.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Datadog connector instance value parameters

The following table displays the Datadog connector instance value parameters that you can fill in, as needed, when creating a Datadog connector instance.

Connector instance value parameters

Parameter	Description
application_key	(Mandatory) Enter the Application Key generated from your Datadog account, used for authentication.
BaseApiPath	The specific API path for querying metrics. The default is `/api/v2/query/timeseries`.
debug	Set to true to enable detailed, high-level logging for this instance during troubleshooting. Default: false
hostApiPath	The specific API path for retrieving the list of hosts. The default is `/api/v1/hosts`.
hostBatchSize	The number of hosts to retrieve in a single API call. The default is 500, and any value above 1000 is automatically capped at 1000.
hostFilter	(Optional) A comma-separated list of regular expressions (regex) to filter for specific hosts to monitor. or example, ^prod-db-.* is a regex pattern that means "match any host whose name starts with prod-db-". Example Use Case: To monitor only hosts starting with app-server- and the specific host critical-db-01, you would set the hostFilter to: ^app-server-.*, ^critical-db-01$.
initialSyncInMins	For the first run of the instance, the number of minutes of historical data to retrieve. The default is 15, and any value above 120 is capped at 120.
logPayload	Set to true to log the full request and response bodies for deep debugging. Use with caution as it can generate very large logs.
metricBatchSize	The number of metrics to query in a single API call. The default is 50, and any value above 50 is automatically capped at 50.
port	Port number for the Datadog server to connect to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
	This is typically not needed when using https.
protocol	The protocol for the connection. Default: https

In the Connector Instance Metrics related list, specify which metrics to collect. To use all 23 out-of-the-box metrics, no action is needed.

To go back to the procedure page, see Configure the Datadog metrics connector instance.

Kafka connector instance form

The Kafka connector instance form displays the fields you must fill in when creating a Kafka connector instance.

Connector instance page

Field	Description
Name	Unique name for the Kafka Metric Consumer connector.
Description	Description to be used by the Kafka metric Consumer collection instance.
Connector Definition	Name of the required connector definition, which in this case should be **Kafka Metric Consumer**.
Credentials	Kafka SSL credential.
Metric collection last run time	Option is pre-selected and read-only.
Last metric collection status	Option is pre-selected and read-only.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the Kafka Consumer.
Last error message	This field is automatically set to the last error message.

Kafka connector instance value parameters

The following table displays the Kafka connector instance value parameters that you can fill in, as needed, when creating a Kafka connector instance.

Connector instance value parameters

Parameter	Description
bootstrap_servers	Set to **true** to enable debug logs. Default: false
consumer_group_name	Limits metric history retrieval to prevent system overload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
	Default: 180 minutes
topic	Adds a small time buffer to ensure no metrics are missed. Default: 5 minutes
Field_mappings	Maps field names from Kafka message payload to internal field identifiers. For example: - "node": "host" → maps host in message to internal node field. - "value": "value" → maps metric value. - "timestamp": "ts" → maps timestamp field. Default: "{ "metric_type": "metric_name", "resource": "mountpoint", "node": "host", "value": "value", "timestamp": "ts"}
logPayloadForDebug	Determines whether to print the raw log payload. Set to true only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default value: false
debug	Displays debug messages. Default value: false. Specify true to see debug messages.
max_poll_attempts	Number of times to attempt polling Kafka for messages before stopping. Default value: 10
max_poll_records	Maximum number of records fetched in a single poll. Default value: 5000
max_poll_retry	Number of times to retry polling if no records are returned consecutively. Default value: 2
poll_timeout_ms	Maximum time (in milliseconds) to wait during a poll operation before timing out. Default value: 60000

Push connector instance form

Push Connector Instance form displays the fields that you must fill when you create or modify a connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	A unique name for the connector instance record, such as the name of an event source host.
Description	Any optional information that the administrator wants to use to identify this record.
Push Connector definition	Select the definition for the external system from which you want to receive events. You can select any existing definition, for example: • Thousandeyes • Dynatrace • Catchpoints For a list of the connector definitions available in the base system, see Configure Event Management connectors. **Note:** If there are available configuration parameters for the push connector type you select, they appear under Push Connector Instance Configuration Parameters.
MID Server	It shows the list of MID Servers that has at least one MID Server Event Listener context up and running. The MID Server section appears only when the MID type of definition is selected.
URL	This field is auto-populated only after saving the details of the connector instance. Instance: The URL has to be configured in an external system with the ServiceNow credential having a evt_mgmt_integration role to receive the events. MID push connector instance: The URL has to be configured from an external system with Configure the MID Web Server extension credential to receive the events. This field appears only after the form has been saved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Select this check box to enable receiving the events from this external event source. This field appears only after the form has been saved.

Nagios connector instance value parameters

The following table displays the Nagios connector instance value parameters that you can fill in, as needed, when creating a Nagios connector instance.

Connector instance value parameters

Parameter	Description
debug	Set to **true** to enable debug logs. Default: false
max_fetch_interval_min	Limits metric history retrieval to prevent system overload. Default: 180 minutes
offset_min	Adds a small time buffer to ensure no metrics are missed. Default: 5 minutes

Nagios connector instance form

The Nagios connector instance form displays the fields you must fill in when creating a Nagios connector instance.

Connector instance page

Field	Description
Name	Unique name for the Nagios metric connector instance.
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Nagios Metrics**.
Metrics database host	Host IP address of the host where the Nagios server collects metrics.
Metrics database credentials	Credentials required to access the Nagios database.
Metric collection	Option is pre-selected and read-only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Nagios server. Default: 60 seconds.
Active	Option to activate the connector instance.

Zabbix connector instance form

The Zabbix connector instance form displays the fields you must fill in when creating a Zabbix connector instance.

Connector instance page

Field	Description
Name	Unique name for the Zabbix metric connector instance.
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Zabbix Metrics**.
Host IP	Host IP address of the host where the Zabbix server collects metrics.
Credential	Credentials required to access the Zabbix database. Select the search icon and select the Basic Auth credential. • Name: Provide the unique name for Zabbix cred. • UserName: Provide Zabbix server username • Password: Provide Zabbix server password • Select **Submit**.
Metric collection	Option is pre-selected and read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Zabbix server. Default: 60 seconds.
Active	Option to activate the connector instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Zabbix connector instance value parameters

The following table displays the Zabbix connector instance value parameters that you can fill in, as needed, when creating a Zabbix connector instance.

Connector instance value parameters

Parameter	Description
api_endpoint_suffix	Set this value based on your Zabbix server web interface installation: https://www.zabbix.com/documentation/current/en/manual/installation/frontend#welcome-screen Default value: /zabbix/api_jsonrpc.php [For Apache Server]
debug	Set to **true** to enable debug logs. Default value: false
enable_batch_processing	If batch processing is enabled, metrics details are fetched in batch with 1000 (can be altered by setting appropriate value to - 'max_hosts_per_batch' parameter) hosts per batch. Default value: false
groupids	Provide the host group IDs. These IDs will be used to fetch metrics from the hosts attached to the specified groups. This applies only if `enable_batch_processing` is set to true.
logPayloadForDebug	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default value: false
max_fetch_interval_min	Configured from the 'max_fetch_interval_min' parameter: If the time exceeds 'max_fetch_interval_min', fetching starts from 'max_fetch_interval_min' before the current time; for an INITIAL run without 'lastMetricSignature', the time is set to 'max_fetch_interval_min' before the current time. Default value: 180 minutes
max_hosts_per_batch	If batch processing is enabled, metrics details are fetched in batch with 1000 (can be altered by setting appropriate value to - 'max_hosts_per_batch' parameter) hosts per batch. Default value: 1000
offset_min	Specifies the time offset in minutes for adjusting the fetch start time relative to the current time. Default: 5 minutes
port	Port number for the Zabbix server to connect to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
	Default value: empty
protocol	Protocol to use when connecting to the Zabbix server. Default value: http
with_triggers	It will fetch the trigger information. Default value: false

Note: When monitoring a large number of hosts in Zabbix, fetching massive metric data can impact performance and cause API timeouts; enabling batch processing (enable_batch_processing = true) mitigates this by fetching metrics in batches (default: 1000 hosts, configurable via *max_hosts_per_batch*), though it increases network calls and must be used when monitoring 10,000+ hosts or facing performance issues.

SCOM connector instance form

The SCOM connector instance form displays the fields you must fill in when creating a SCOM connector instance.

Connector instance page

Field	Description
Name	Unique name for the SCOM connector instance.
Description	Description for the use of the SCOM event collection instance.
Active	Select to activate the connector instance. Appears only when selecting a connector instance that has already been created.
Connector definition	The vendor and protocol used to gather events from the external event source. For a regular SCOM connector, select **SCOM**. For a connector instance that you want to monitor metrics, select **SCOM Metrics**. When selecting this option, the fields in the **Connector instance - metrics fields** table appear.
Assignment group	Select the group to whom the connector instance is assigned. For example, this may be a group of administrators or a support group.
Host IP	Specify the SCOM IP address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
	This field does not appear when **SCOM metrics** is selected as the Connector definition.
Credential	Select Windows credentials. **Note:** When configuring Windows credentials, if the credential applies to specific MID servers, ensure that the MID Servers you specify on the credential record match the MID Servers specified in the **MID Servers for Connectors** section on the Connector Instance form. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Event collection last run time	The last event collection run time value updates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Last event collection status	The last event collection run time status updates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from SCOM Operations. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Bi-directional	Select to invoke the bi-directional option. This option enables the bi-directional exchange of values to-and-from the external event source. There is default implementation for SCOM. The **Last bi-directional status** option displays only when this option is selected. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Last bi-directional status	The value of this field populates automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
	This field does not appear when **SCOM metrics** is selected as the Connector definition.
Last error message	The last error message field is automatically updated. This message is the last error message received by the connector. If the test connector fails, an error message is displayed in this field. This field does not appear when **SCOM metrics** is selected as the Connector definition.
MID Servers (MID Server for Connectors section)	Specify one or more MID Servers that are up and valid. MID Servers sort according to the order that their details were entered into the MID Server for Connectors section. The port requirement from the MID Server to the SCOM server is `1433`. If the specified MID Server is in a cluster, it may not be selected and another available MID Server is selected in its place. Ensure that the specified MID Servers match the MID Servers specified on the Windows Credentials page, as the connector uses Windows credentials to access MID Servers. If no MID Server is specified, an available MID Server that has a matching IP range is used.

Connector instance - metrics fields (displayed when Connector definition = SCOM Metrics)

Field	Description
Metrics collection	Selected by default. Read-only.
Metrics collection last run time	The last run time of the Metrics Collection scheduled job. This field is read-only.
Last metrics collection status	Status of the Metric Intelligence collection activity. The value of this field populates automatically. This field is read-only.
Metrics collection schedule (seconds)	The time, in seconds, to repeat the Metric Intelligence Collection scheduled job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance - metrics fields (displayed when Connector definition = SCOM Metrics) (continued)

Field	Description
Metrics database host	The IP address or the host name of the metrics database host.
Connect using a named instance	When selected, the connection is made using the specified named instance. Otherwise, the connection is made using the specified port.
Metrics database port	The port used by the metrics database. The connection is made using JDBC. Default port number is 1433. If **Connect using a named instance** is selected, this option does not appear.
Metrics database named instance	The metrics database instance name.
Database login with Windows authentication	Perform database login with the credentials of the logged-in user defined on the MID Server service.
Metrics database credential	Credentials for the metric database. Use JDBC credentials for the local database user. If **Database login with Windows authentication** is selected, this option does not appear.

Solarwinds connector instance form

The Solarwinds connector instance form displays the fields you must fill in when creating a Solarwinds connector instance.

Connector instance page

Field	Description
Name	Unique name for the Solarwinds metric connector instance.
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Solarwinds Metrics**.
Host IP	Hostname/IP address of the Solarwinds server.
Credential	Credentials for a SolarWinds user with Basic Authentication and read access to the SWIS REST API.
Metric collection	Option is pre-selected and read-only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Solarwinds server. Default: 60 seconds.
Active	Option to activate the connector instance.

Solarwinds connector instance value parameters

The following table displays the Solarwinds connector instance value parameters that you can fill in, as needed, when creating a Solarwinds connector instance.

Connector instance value parameters

Parameter	Description
debug	Set to **true** to enable debug logs. Default value: false
max_fetch_interval_in_min	Number of minutes before the current time when the initial metric collection runs. For example, if the value is 180, the connector fetches metrics from the past 180 minutes. Default value: 180 minutes
logPayloadForDebug	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default value: false
offset	Specifies the time offset in minutes for adjusting the fetch start time relative to the current time. Default: 0 minutes
Port	Port number for the Solarwinds server to connect to. Default value: 17774
protocol	Protocol to use when connecting to the Solarwinds server. Default value: https

Event forwarding properties

Several system properties enable you to customize an event forwarding job.

Note: To access the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
evt_mgmt.event_forwarding.sources_to_exclude	List of event sources from which events should not be forwarded. By default, all events are forwarded. Separate multiple sources by commas. • **Type**: string • **Default value**: Empty
evt_mgmt.event_forwarding.event_fields_to_include	List of event fields to include when sending events to the target instance besides the required default fields: resolution_state, event_class, additional_info, node, resource, cmdb_ci,severity, time_of_event, message_key, sys_domain, metric_name, ci_type, ci_identifier, type, source, description, and sys_domain_path. Separate multiple fields by commas. • **Type**: string • **Default value**: Empty
evt_mgmt.event_forwarding.event_batch_size	Maximum number of events to batch while sending to the target instance. • **Type**: integer • **Default value**: 500
evt_mgmt.event_forwarding.max_payload_size_in_mb	Maximum size of the event payload, in MB, sent to the target instance at a single time. • **Type**: integer • **Default value**: 5
evt_mgmt.event_forwarding.max_events_to_forward_per_day	Maximum number of events that can be forwarded from the instance per day to minimize the performance impact on the source instance. • **Type**: integer • **Default value**: 100000
evt_mgmt.event_forwarding.log_debug	Enables or disables debug logging for event forwarding. Set this property to true to log debugging information. • **Type**: Boolean • **Default value**: False

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Team-based integration properties

Team-based integration system properties enable you to customize the assignment group functionality for existing and new customers for event rules and event field mapping.

Team-based integration system properties

Property	Description

evt_mgmt.alert_auto_assignment_field	The property determines automatic alert assignm list of comma-separated fields.
	
	The default value of this property is cmdb_ci.sup IntegrationGroup. The assignment group value is **group** field (cmdb_ci.support_group) of the alert the value is taken from the IntegrationGroup valu **group** field in the Connector instances table [em
	
	For upgraded instances from previous family rel to avoid any impact on production instances.
	
	• **Type**: String
	• **Default value**:
	  ○ Empty - for upgraded customers
	  ○ cmdb_ci.support_group, IntegrationGroup -
	
	Note: When you use an alert field in this p alert field in the **Additional Info** field, an ale the value of the **Assignment group** field mu For example, `{"Alert field name":"` `desired sys_user_group record>`

evt_mgmt.enable_group_level_event_rules	Activates team-based functionality for executing field-mapping rules. Global rules take precedenc based rules.
	
	• **Type**: Boolean
	• **Default value**:
	  ○ False - for upgraded customers
	  ○ True - for new customers

Alert Query form

You can combine similar alerts that meet specific criteria for a particular service by creating an alert query.

Alert Query form

Field	Description
Name	The alert query name.
Business criticality	The importance of this alert query to the business. This field can determine disaster recovery strategies for this alert query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert Query form (continued)

Field	Description
	• 1: most critical • 2: somewhat critical • 3: less critical • 4: not critical
Used for	The purpose of the alert query. Select from: • Production (Default) • Staging • QA • Test • Development • Demonstration • Training • Disaster recovery
Owned by	The party that is responsible for the alert query.
Email	The email alias for the alert query.
Business phone	The phone number for the business.
Operational status	The status of the alert query. • **Operational**: The alert query is running. Impact calculation runs only on alert queries in the Operational status. Select this option to use this service. If you customized preconfigured options for this category, select the option whose value is set to 1. Event Management calculates impact only on services in use. If you do not want to use this service now, select one of these options: • **Non-Operational**: The alert query is unavailable, disabled, or down. • **Repair in progress**: The alert query is receiving maintenance. • **DR Standby**: The alert query is available as a disaster recovery (DR) standby. • **Ready**: The alert query is prepared for use. • **Retired**: The alert query is withdrawn from active use.
Comments	Any additional notes and information.
Service Group Members	The service group which contains this service.
Filter	The conditions for sending a notification to the alert query. The conditions must meet the alert values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert Query form (continued)

Field	Description
	Note: • When defining an alert query filter, include only fields that appear in the Alert Histories [em_alert_history] table. Impact calculation is based on Alert History data and fields such as Overall Event Count, Priority, and Priority group are not copied to the Alert Histories [em_alert_history] table. • Do not specify a dynamic time condition. For example, in the filter, do not specify `Created` condition of `Last 45 minutes` because impact calculation is triggered by a change of alert or alert query. However, for the dynamic time condition, none of these conditions have changed. • Some filters may slow down impact calculation. To solve this problem, adjust your alert query by adding an appropriate index, as described in Index suggestions for slow queries.

Alert correlation rule form

Manage the fields that define how alerts are correlated and grouped.

Alert correlation rule form

Field	Description
Name	Name of the correlation rule.
Order	The evaluation priority for the rule. Rules with lower numerical values are given higher priority. An alert is evaluated against each alert action rule until a match is found. For example, if you have two alert correlation rules with priorities 10 and 20, respectively, the rule with priority 10 will be evaluated first. If an alert matches the criteria of the rule with priority 10, no further rules will be checked. If it doesn't match, the alert will then be evaluated against the rule with priority 20.
Active	Option to activate or deactivate the rule.
Advanced	Option to switch to advanced mode, which lets you use custom scripts to define your own logic. The sample correlation rule, **Alert correlation rule SAMPLE**, is provided out-of-the-box for reference. You can use the available script as a guide. **Note:** The **Filter** condition specifies which alerts the rule will apply to. Ensure that the same condition is used in the advanced script to identify alerts to be included in the group.
Description	Description of the rule.
Primary Alert	The filter condition to identify the alert that is the primary alert, or most important alert, in a set of related alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert correlation rule form (continued)

Field	Description
	This field does not appear when **Advanced** is selected.
Secondary Alert	The filter condition to identify the alert that is related to the primary alert, however it is of lesser importance. This field does not appear when **Advanced** is selected.
Filter	The filter condition to identify the alert on which the script is run. **Filter** is available only when **Advanced** is selected. Filter parameters are case sensitive by default. To disable case sensitivity, set the *sa_analytics.correlation_case_sensitive* parameter to **false**.
Relationship Type	Specify the type of relationship between the primary and secondary alert: • **No Relationship**: Ignore the relationship when looking for a match. • **Same CI or Node**: Relate both alerts with the same CI. If the CI field is blank, the alerts must have the same Node value. • **Primary is Parent**: Relate the alerts where the primary alert is the parent in a parent-child relationship, as described in the CI Relationship Types table [cmdb_rel_ci]. • **Primary is Child**: Relate the alerts where the primary alert is the child in a child-parent relationship, as described in the CI Relationships table [cmdb_rel_ci]. This field does not appear when the **Advanced** check box is selected.
Time Difference in Minutes	The minutes between which the primary and secondary event must occur to match this rule. The default value is 60 minutes. **Note:** The value for this entry cannot exceed 1440 minutes (one day). This field does not appear when **Advanced** is selected.

Script	Custom script that you can modify to return a JSON string that specifies the primary and secondary alerts.
	
	Select **Advanced** to display the script field.
	
	`(/* The function needs to return a JSON-{correlationType:[correlatedAlerts]} for example: if your filter matches the alert, set the alert as the primary alert and set alerts 1, 2 and 3 each as secondary alerts.`
	
	`You can use both multiple primary alerts and multiple secondary alerts.`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert correlation rule form (continued)

Field	Description

	The correlationType can be PRIMARY or SECONDARY, and the alerts ID must be in an array.
	CurrentAlert is the GlideRecord of the currentAlert on which that rule runs.
	The system supports only one primary per alert, so:
	Do not correlate more than one alert under the PRIMARY array.
	Do not correlate alerts that already have a primary under the SECONDARY array.
	The system supports open alerts only, so do not correlate alerts that have been closed under either one of the arrays.
	*/
	
	(function findCorrelatedAlerts(currentAlert){
	
	var result = {}; //Insert your code here
	result = {'SECONDARY':['alertID1','alertID2','alertID3']};
	return JSON.stringify(result);
	
	})(currentAlert);

Relationship	Description of the CI relationship between primary and secondary, for example, *Allocated from::Allocated to* or *Allocated to::Allocated from*. This field displays only if either **Primary is Parent** or **Primary is Child** is selected for the **Relationship Type**.  This field does not appear when **Advanced** is selected.

Health Log Analytics

The ServiceNow® Health Log Analytics application helps prevent IT issues before your users are affected. It helps you identify the root cause of an issue by enabling you to triage related logs and analyze the raw data.

Health Log Analytics collects raw log data streaming into your instance and structures textual data into key-value pairs. It detects meaningful patterns in the data, and when it discovers an anomaly, it sends an event to the Event Management application.

Health Log Analytics is available in the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Exploring Health Log Analytics

ServiceNow Health Log Analytics predicts IT issues before they affect your users by collecting, analyzing, and correlating machine-generated log data in real time. It discovers anomalies and alerts you to potential issues.

Health Log Analytics overview

Health Log Analytics typically receives and processes log data and sends events to ServiceNow Event Management. The application discovers anomalies as they happen and helps you identify the root cause of an issue by enabling you to triage related logs and analyze the raw data.

Health Log Analytics can handle any kind of machine-generated textual log data. It can process application, infrastructure, and network logs, as well as other types of textual log data. Although a configuration management database (CMDB) can be helpful to generate high-quality events and alerts, it is not necessary.

Note:

- Health Log Analytics supports only UTF-8 logs. It does not support binary logs.
- If you are sending logs in a language other than English, additional configuration may be required.

Health Log Analytics users

Health Log Analytics Users

User	Description	Role
Administrator	Configures the Health Log Analytics application to make it ready for use by Operators. Performs administration tasks to keep the system running efficiently.	evt_mgmt_admin, admin

Health Log Analytics Users (continued)

User	Description	Role
Operator	Analyzes Log Analytics alerts and takes action to help resolve the underlying issue.	evt_mgmt_operator

Health Log Analytics workflow

Health Log Analytics collects and processes log data automatically. It structures the data logically for operators to analyze, and generates meaningful alerts and suggestions that display in Event Management.

The diagram shows the Health Log Analytics workflow from collecting the data through sending an event or alert to Event Management.

Health Log Analytics workflow

Ingestion

This layer connects your environment to Health Log Analytics. You can stream your logs directly from servers and endpoints or from log repositories. The optional guided setup helps you create data input connectors for common data sources, such as:

- Rsyslog
- Beats
- Splunk
- Elasticsearch
- MID Server
- TCP

Structuring

This layer deals with structuring log data and auto-mapping it to logical silos, called Components. Data structuring can be done automatically or manually.

The system auto-structures log data by extracting the following properties from incoming log messages: Message, Timestamp, Host, Severity, and External-IDs. It extracts explicit values, like "property-name" and "value is IP." and semantic ones such as length, number of English words, and variance.

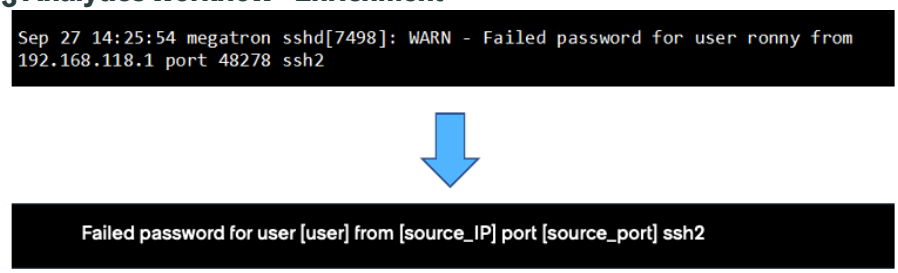
Auto-mapping assigns log samples and metadata to the appropriate tags automatically. The system tries to map log lines by analyzing the source that streams the data. The mapping is based on agent hints and common transport header fields.

Enrichment

This layer handles identifying the variable parts of a log message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics workflow - Enrichment



It also identifies keywords and contextual properties. In the image, "WARN" and "Failed" are the keywords to track. "User," "source IP," and "port" are the contextual properties.

Analysis

In this layer, each log line is indexed. Health Log Analytics extracts properties from the inner log message that contribute to models of behavior that the system learns to expect. Anomalous behavior departs from this expected behavior. You can search for an event and its most significant properties for manual triaging.

Machine Learning (ML) and Artificial Intelligence (AI)

Health Log Analytics uses advanced unsupervised machine-learning algorithms to discover patterns within logs and learn their unique data behavior. It then sets dynamic thresholds based on the data signature in real time to detect issues when they first occur. When the system detects a deviation from the typical pattern, it sends an event to Event Management.

Alert in Event Management

Health Log Analytics sends events to Event Management. In Event Management, Health Log Analytics alerts appear in the **All alerts** list. This list enables operators to see alerts from the event and the Health Log Analytics alert type in a single location.

Health Log Analytics benefits

What to explore next

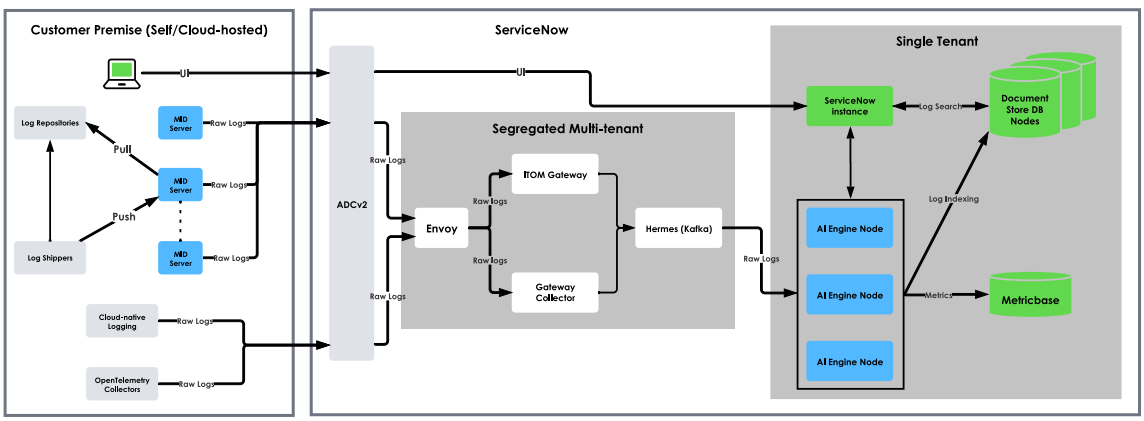
- Health Log Analytics architecture
- How Health Log Analytics generates alerts

Health Log Analytics architecture

Health Log Analytics collects logs streaming into your ServiceNow instance from endpoints or data lakes, such as Splunk and Elasticsearch.

The ServiceNow instance receives the logs either via a MID Server connector instance or via MID-less Ingest, which supports integration with services such as Amazon Data Firehose. Health Log Analytics identifies and triages anomalies in your log data using unsupervised machine-learning (ML) models. It then groups the anomalies together and applies further algorithms to help identify the root cause of the issue.

Health Log Analytics scaled architecture



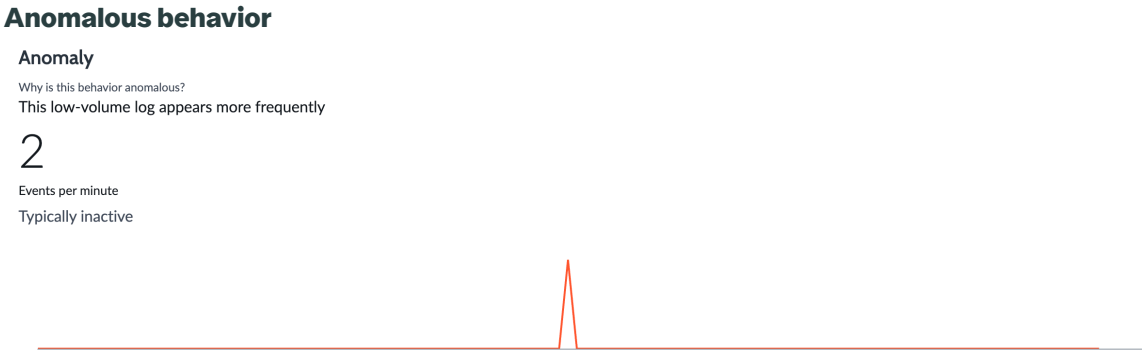
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How Health Log Analytics generates alerts

Health Log Analytics identifies patterns in your log data and learns pattern behavior. When HLA's AI engine detects anomalous behavior, it sends an event to the ServiceNow Event Management application. As an operator, you can use these predictive alerts to handle emerging IT issues before they impact users.

Log anomaly detection

Anomalies are abnormal or unexpected behavior that occur when activities deviate from established baselines. There are many kinds of anomalies. In this example, the system tracks the baseline rate (the average number of events per minute) for a specific log pattern. When this typically inactive log generates a spike in events, the system detects the deviation from the baseline and generates an alert.



Health Log Analytics uses various methods to detect anomalies and generate alerts.

Alert metrics

Health Log Analytics monitors multiple metrics in the log stream to detect anomalous behavior. Each metric is associated with a unique source: the combination of service instance and component. When the system identifies an anomalous pattern for a metric, it generates an alert.

As an operator, you can provide feedback about the generated alerts. Your feedback "teaches" Health Log Analytics that a specific alert is significant or irrelevant to you. The application then either raises the priority of the alert metric or mutes it to reduce noise.

- A significant alert is more likely to be included in a Log Analytics group when the associated metric behaves anomalously. For more information, see Mark an alert as significant in Health Log Analytics
- Mute an alert for a specified source to eliminate distracting new alerts for unimportant issues. When a metric is muted, Health Log Analytics removes the current alert and any other alerts based on that metric from the feed. It also stops generating new alerts from that metric. For more information, see Mute an unimportant alert in Health Log Analytics.
- When the situation changes, you can return a significant metric to its default significance. You can also reactivate a muted metric to cause the system to start generating alerts again. For more information, see Restore normal importance to an alert metric in Health Log Analytics.

Lexical keywords

Health Log Analytics scans your logs for words that can indicate important issues. Lexical keywords such as "crashed" or "failed" signal a condition that can merit attention.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system sets a threshold for each lexical keyword that is based on what it considers the normal occurrence pattern and frequency of that keyword in your logs. When it scans your logs, it finds all occurrences of the keyword. If the number exceeds the threshold, it generates an alert. For more information, see View the lexical keywords that generate alerts in Health Log Analytics.

For information about managing global keywords, see Add, edit, or delete lexical keywords in Health Log Analytics. To create or delete keywords for a specific source type, see Configure source type capabilities in Health Log Analytics.

Correlations

Log correlators are keys or values in log data that detect correlations between alerts. For example, a log correlator could detect when the ID of a particular network device occurs simultaneously in multiple warnings across different service instances. For more information, see Identifying related alerts in log data by using log correlators.

Advanced alert filtering

Add advanced log alert filters to scan alerts for conditions that you specify. The filters reduce noise by dropping alerts that do not indicate a significant issue. While developing a filter, you can test, update, publish, or activate the filter at any time. For more information, see Create advanced log alert filters.

Custom alert rules

Define a Log Analytics alert rule when you encounter log data that should generate an alert. The alert rule generates an alert for a specified metric with a threshold that you specify and sets the properties of the generated alert. For more information, see Alert rules in Health Log Analytics.

Types of anomalous behavior in Health Log Analytics

Anomalous behavior in a CI or a service can indicate an important issue. For example, a spike in the frequency or number of messages of a particular type can indicate a problem.

Understanding anomalies

To build models of expected behavior, Health Log Analytics monitors the log stream to learn baselines for patterns, metrics, and gauges over various time periods. Time periods can be hourly, daily, weekly, or unlimited. Behavior that departs from the learned models is considered anomalous behavior.

Types of log property

Pattern

A pattern is a value or rate that repeats, whether in text, time, or relationships.

Meter

A meter property is a numeric or text value. For example, a status code, a response code, an action, or a pattern.

Gauge

A gauge property has a numerical value that is reported continuously. Gauge properties represent operations that consume resources. For example, CPU usage, memory usage, or response time.

How anomalies appear in Health Log Analytics

The Anomaly card illustrates the anomalous activity that led to the alert.

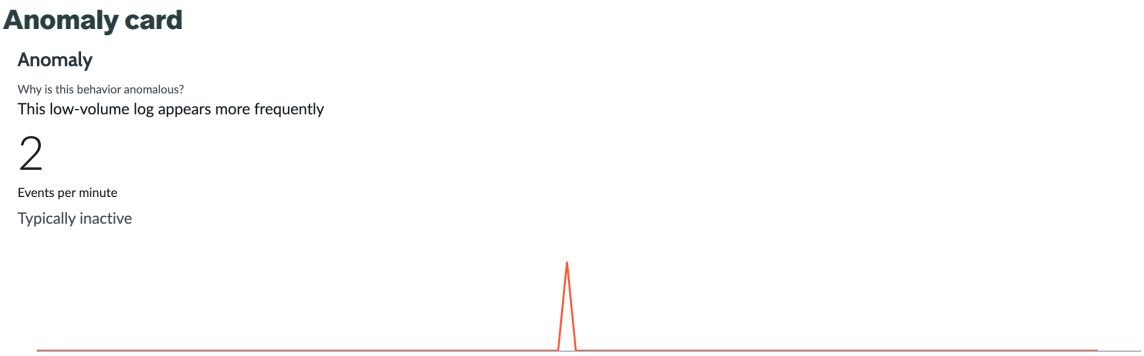
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The blue line shows the recent anomalous activity.
- On some charts, the lightly shaded area indicates the expected (learned baseline) behavior.

  A peach-shaded area represents the baseline values for the same hour one day earlier. A pink-shaded area shows the values for the same period in the previous week.

- Click the information icon to see how the anomaly was identified: .

In this example, the peach-shaded area shows the same data for the same hour one day earlier. The spike in the metric value (events per minute) is clearly visible.



Kinds of anomalies

Some of the kinds of anomalies

Behavior	Description
New behavior	A pattern that has not ever been seen. The New Behavior alert type does not display a chart.
Signal dead/Stopped appearing	All pattern or log data from a source has stopped. There has been no signal for at least five minutes.
Signal alive/Appearing again	A pattern or log data from a "dead" source is appearing again. For a baseline of one hour, a pattern is "dead" if it appears less than once per minute.
Anomaly above average or below average	Activity that deviates from expected baseline behavior for pattern or meter or gauge metrics, such as keywords metrics or severity metrics.
Baseline reference increase or decrease	An increase or decrease in the value or volume of a log property as compared to the one-hour or one-week baseline.
Correlation of severity and keyword alerts	An increase in the volume of a severity level or keyword.

Types of Health Log Analytics alerts

Health Log Analytics generates several types of alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In a list of alerts, all alerts that are generated by Health Log Analytics have the value **Log Analytics** in the **Source** column. The value in the **Group** column identifies the kind of alert, as follows:

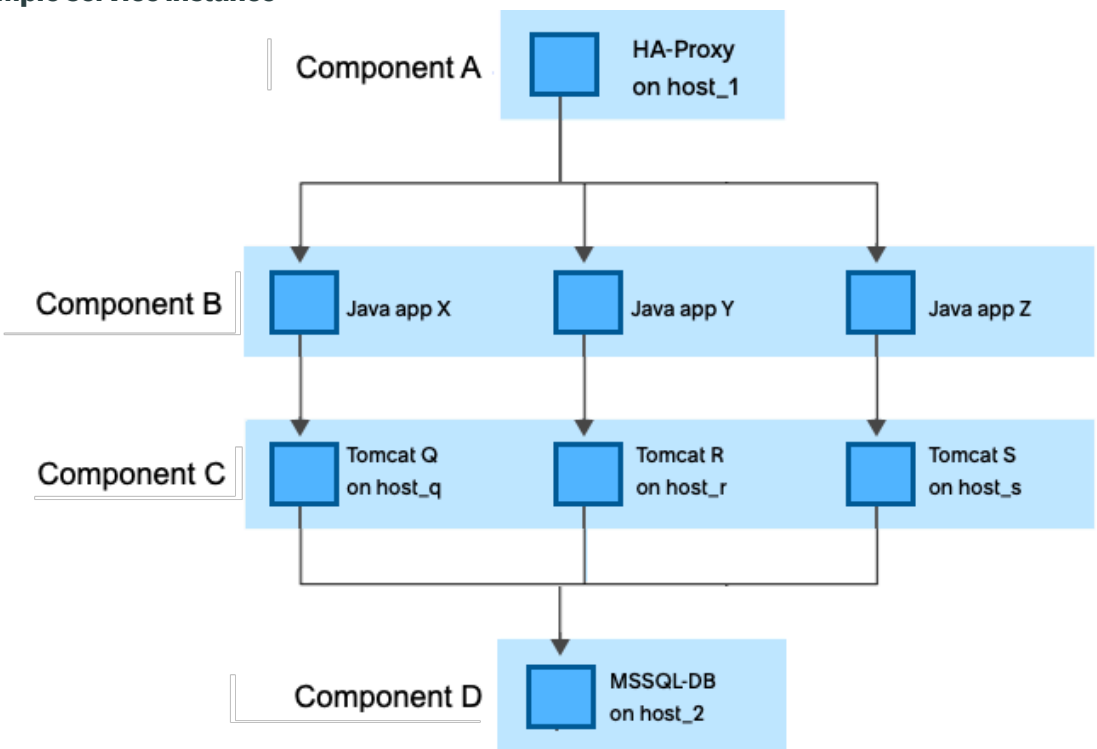
Component-based alert

Component-based alerts involve more than one configuration item (CI). A component is a logical component of a service instance that caused the alert. A component can be multiple CIs that perform the same function, such as multiple redundant hosts.

> **Important:** Each Component-based alert is the parent of a number of read-only alerts. You do not work directly on read-only alerts. You work only on the parent Component-based alert.

In this example service instance, the identical Java apps X, Y, and Z make up a single component: Component B. Tomcat servers Q, R, and S and their hosts make up a different single component: Component C.

Example service instance



Log Analytics alert

A Log Analytics alert identifies an anomaly that involves a single CI. A Log Analytics alert has the value **None** in the **Group** column. The anomaly that leads to the alert can be an unexpected number of log entries or an unexpected value of a metric.

Log Analytics group

When the system identifies multiple Log Analytics alerts that are related in important ways, it groups them into a Log Analytics group. A Log Analytics group can group up to four alerts. The system generates a Log Analytics group when the Log Analytics alerts share one or more of the following relationships:

- Time: The events all occurred within a configured time interval.
- Metadata: The alerts have matching values in log-line metadata. For example, all alerts involve the same host.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Message text: The message text in the log data is similar or identical between alerts.
- Trend: The alerts show a similar tendency in values or rates. For example, a particular metric value is increasing in all alerts.

Note: You can mark an alert as significant. A significant alert is more likely to be included in a Log Analytics group when the associated metric behaves anomalously. For more information, see Mark an alert as significant in Health Log Analytics.

Configuring Health Log Analytics

As an Administrator, set up and configure Health Log Analytics for Operators to use, and carry out administration tasks to ensure that the system runs efficiently.

Configuration overview

Complete the following tasks for a successful setup and configuration of Health Log Analytics.

Important: Regardless of how you implement Health Log Analytics, for log data ingestion via a MID Server you must first configure MID Server system requirements and ensure that the MID Server log ingestion capability is enabled.

For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to Health Log Analytics.

1. Install Health Log Analytics (HLA).

   Install the Health Log Analytics application.

2. Set up log data inputs for streaming raw log messages to your ServiceNow instance.

   Use any of the following methods:

   - Set up integrations for Health Log Analytics from the Integrations Launchpad.

     You're encouraged to set up data input integrations from the Integrations Launchpad, which provides a unified interface for convenient integration.

   - Set up data inputs in Health Log Analytics using guided setup.
   - Set up data inputs in Health Log Analytics manually.

3. Identify and resolve a log streaming issue in Health Log Analytics.

   Identify and address log streaming issues to ensure that the data inputs you have configured are streaming data properly to your instance.

4. Edit raw log data before processing in Health Log Analytics.

   Modify raw log messages before they are processed in the MID Server, and therefore before Health Log Analytics maps and structures it.

5. Map raw log data so HLA can correctly process it.

   Configure mapping for your raw log data so that Health Log Analytics can correctly parse and analyze it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The user-friendly Log context mapping interface in the new HLA UI is simpler to use than Data input mapping in HLA's classic interface (UI16). For more information about Log context mapping, see Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics.

6. Refine the source type structure.

   Fine-tune how Health Log Analytics reads your inner log messages and detects anomalies by customizing the extracted properties in the source type structure.

   Health Log Analytics enables you to reclassify auto-classified properties and change auto-mapped labels. These adjustments help the system's machine learning better understand your priorities.

7. Perform additional data input setup tasks.

   After performing the mandatory data input setup and configuration, you can continue with optional setup tasks.

8. Perform advanced data input configuration tasks.

Install Health Log Analytics (HLA)

Install Health Log Analytics by requesting ServiceNow HLA installation from ServiceNow Customer Support.

Before you begin

Verify that the Health Log Analytics application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. To obtain the entitlements, contact your ServiceNow Solution Consultant.

The minimum version of the ServiceNow AI Platform required for Health Log Analytics installation is Zurich.

Important: Health Log Analytics uses the default user sn_occ_occultus for internal communication. Make sure that this user is active and do not deactivate it.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On the ServiceNow Store website, opt into the ITOM AIOps product.

   a. Go to the ServiceNow Store website and search for the Health Log Analytics app.

Health Log Analytics app in the ServiceNow Store

   b. Select the Health Log Analytics tile.
   The Health Log Analytics product page displays.

Health Log Analytics product page in the ServiceNow Store

   c. Under **Included in Products**, select ITOM AIOps.

   d. Select **Opt-in** to opt-in to ITOM AIOps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Install the Health Log Analytics application on your ServiceNow instance.

   a. On your instance, navigate to **System Applications** > **All Available Applications** > **All**.

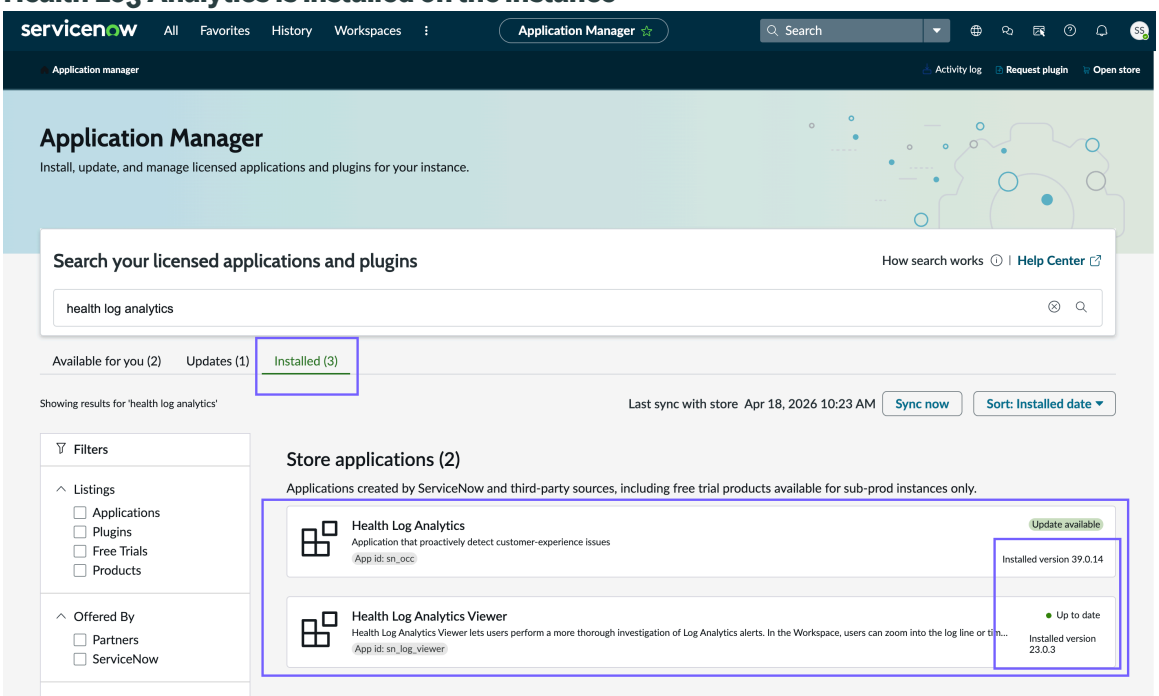
   b. Find the Health Log Analytics application using the search bar.

   c. On the Health Log Analytics tile, select **Install**.
   When the application is successfully installed on the instance, an automatic change request (CHG) is triggered to request provisioning for the necessary endpoints. The instance admin receives the request and any relevant notifications.

   > **Note:** Even when the Health Log Analytics application is installed successfully, it will not work until the endpoints have been provisioned. Provisioning endpoints configures your source systems to collect and send their log data to your ServiceNow instance. Health Log Analytics depends on this ingested data to detect anomalies, correlate events, and generate alerts.

   d. On the **Installed** tab, verify that the application and its dependencies were installed successfully.

Health Log Analytics is installed on the instance



3. **Optional:** Observe the status of the provisioning process by reviewing the CHG.

   > **Note:** Some steps in the provisioning process might require your explicit approval. In such cases, ServiceNow Customer Support will reach out.

4. When provisioning is completed, verify that the Health Log Analytics application is up and running on your ServiceNow instance.

   a. On the instance, enter `sn_occ_stats.do` in the navigator and press the **Enter** keyboard key.
   The Health Log Analytics Package Dependencies and Versions table displays.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics Package Dependencies and Versions table

Health Log Analytics Package Dependencies and Versions

Dependency	Version
Health Log Analytics	39.0.14
Service Operations Workspace Log Analytics	26.5.0
Alert Intelligence	23.13.0
---	---
Occultus Version	1.36.0.27
MetricBase Version	25.2.0.6
ElasticSearch Version	8.17.3
---	---

Occultus

Node: svc241172.aus101.service-now.com ,Status: Active ,Version: 1.36.0.27

The provisioned endpoints are listed along with their version number:

- Occultus
- MetricBase
- ElasticSearch

The Health Log Analytics application is up and running on your instance.

Result

The Health Log Analytics application is installed and provisioned on your instance.

What to do next

- Set up the data input process for Health Log Analytics
- (Optional) Install the ServiceNow® Agent Client Collector Log Analytics (ACC-L) plugin.

  Agent Client Collector Log Analytics enables you to stream log data from Linux and Windows hosts to a ServiceNow instance using the Agent Client Collector. For more information, see the Agent Client Collector Log Analytics documentation.

Set up Health Log Analytics on your ServiceNow instance

Implement Health Log Analytics on your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- Install Health Log Analytics on your instance before implementation. For more information, see Install Health Log Analytics (HLA).
- Regardless of how you implement Health Log Analytics, you must configure MID Server system requirements and ensure that the MID Server log ingestion capability is enabled.

  For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to Health Log Analytics.

Setting up data inputs

You're encouraged to integrate data inputs with Health Log Analytics from the Integrations Launchpad. This tool provides a unified interface for convenient integration with connectors that feed raw log messages from external sources into your instance for processing and analysis. For more information, see Set up integrations for Health Log Analytics from the Integrations Launchpad.

Alternatively, you can set up data inputs in one of the following ways:

- Using guided setup. The guided setup provides a sequence of tasks to help you configure data inputs on your ServiceNow instance. Using the guided setup ensures that you have the minimum required setup for the data input process. For more information, see Set up data inputs in Health Log Analytics using guided setup.
- Manually. For more information, see Set up data inputs in Health Log Analytics manually.

For supported data inputs, see Supported data inputs for Health Log Analytics.

Set up integrations for Health Log Analytics from the Integrations Launchpad

Set up integrations from the Event Management Integrations Launchpad in Service Operations Workspace for ITOM.

Integrations Launchpad

The Integrations Launchpad tool provides a unified interface for convenient integration with connectors that feed raw log messages from external sources into your ServiceNow instance for processing and analysis. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Integrations for Health Log Analytics

The Integrations Launchpad enables the following integrations for Health Log Analytics:

Pull integrations

These integrations pull log data from external data sources and stream the data to your instance, typically via a MID Server. Select an integration in the table to open a page with the setup procedure.

Pull integrations

Integration	Description
Elasticsearch	Streams log data from Elasticsearch indices to your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pull integrations (continued)

Integration	Description
ServiceNow System Logs Retriever	Sends log data from the ServiceNow System Log table to the Health Log Analytics AI engine. This integration doesn't run on a MID Server. **Note:** Only a single ServiceNow System Logs Retriever data input can exist in the system, and only users with the admin role can create and configure it.
Apache Kafka	Streams log data from Apache Kafka to your instance.
Splunk Poller	Pulls log data from Splunk to your ServiceNow instance periodically by query.
Amazon CloudWatch	Streams log data from Amazon CloudWatch to your instance.
Amazon S3	Streams log data from Amazon S3 (Simple Storage Service) buckets to your instance.
Microsoft Azure Log Analytics	Streams log data from Microsoft Azure Log Analytics to your instance. The connector points the Health Log Analytics AI engine to a data source in your Microsoft Azure Log Analytics account.
Microsoft Azure Event Hubs	Streams events from Microsoft Azure Event Hubs to your instance.
Microsoft Azure Event Hubs (MID-less)	Streams events from Microsoft Azure Event Hubs to your instance without a MID Server.
MID Server	Collects log messages from the MID Server and streams them to your instance.

Push integrations

These integrations connect to external data sources that push log data to your instance, typically via a MID Server. Select an integration in the table to open a page with the setup procedure.

Push integrations

Integration	Description
ACC Log Analytics	The ACC-L agent is installed on the monitored host and sends raw log data to your instance via the MID Server.
UDP	Sends raw log messages to your instance directly over a UDP socket.
TCP	Sends raw log messages to your instance directly over a TCP/SSL socket.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Push integrations (continued)

Integration	Description
REST API	Streams log data to your instance in JSON format.
GCP PubSub	Receives log messages that were published to a Google Cloud Pub/Sub topic and streams them to your instance.
Splunk UDP	Streams log messages to your ServiceNow instance over the UDP transport protocol using a Splunk heavy forwarder.
Splunk TCP	Streams log messages to your ServiceNow instance over the TCP transport protocol using a Splunk heavy forwarder.
Amazon Data Firehose	Streams log messages from Amazon Data Firehose directly to the collector service in ITOM Gateway, where it's queued for Health Log Analytics processing. This integration doesn't run on a MID Server.
Cribl	Enables Health Log Analytics to process Cribl log messages streaming into the ServiceNow instance.
Edge Delta REST	Enables Health Log Analytics to process logs it receives from Edge Delta in a distinct format. These logs stream into the ServiceNow instance via REST.
Edge Delta TCP	Enables Health Log Analytics to process logs it receives from Edge Delta in a distinct format. These logs stream into the ServiceNow instance over the TCP transport protocol.
Vector Agent	Enables Health Log Analytics to process log messages that are streaming into the ServiceNow instance via a Vector Agent.

Set up an Amazon CloudWatch integration for Health Log Analytics

Set up an integration for streaming log data from Amazon CloudWatch to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

> **Important:** Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, search for `CloudWatch`.
5. Select the Amazon CloudWatch integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Amazon CloudWatch integration configuration fields.
7. Select **Next** to save your settings and proceed to the next configuration form.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval method** table in Amazon CloudWatch integration configuration fields.
9. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Amazon CloudWatch integration configuration fields.
10. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
11. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

      When the test is successful, you can activate the integration either with or without AI-powered capabilities. Select the appropriate option:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Activate with AI** enables AI-powered automatic mapping of log data. When the integration is activated successfully, the **Overview** tab is displayed. Now Assist collects and analyzes log data. An AI icon indicates that Now Assist auto-maps log data to service instances and components for contextual alert generation.
- **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

- If you didn't complete all the prior requirements, select **Save draft**.

  The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics.

Set up an Amazon S3 integration for Health Log Analytics

Set up an integration for streaming log data from Amazon S3 (Simple Storage Service) buckets to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

  Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, search for S3.
5. Select the Amazon S3 integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Amazon S3 integration configuration fields.
7. Select **Next** to save your settings and proceed to the next configuration form.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval method** table in Amazon S3 integration configuration fields.
9. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Amazon S3 integration configuration fields.
10. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
11. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

      When the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you didn't complete all the prior requirements, select **Save draft**.

  The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

Set up an Apache Kafka integration for Health Log Analytics

Set up an integration for streaming log data from Apache Kafka to your ServiceNow instance for processing by Health Log Analytics.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

  Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

- Consider whether to pull the log data to a single MID Server or to a MID Server cluster.

  In MID Server clusters, multiple MID Servers are grouped together for failover protection. The active integration runs on a single MID Server in the cluster. If that MID Server fails, the system moves its tasks to the next available MID Server in the cluster in a configured order.

  If you decide to use a MID Server cluster, verify the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The MID Server cluster includes only MID Servers that support basic authentication.

  Note: mTLS is not supported for log ingestion.

- Log ingestion is enabled for each MID Server in the cluster.

  Note: If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically.

- No more than the default maximum of 10 integrations will pull logs to a single MID Server.

  A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 integrations running on it, even when that MID Server is down.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, search for `Kafka`.
5. Select the Kafka integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Apache Kafka integration configuration fields.
7. Select **Next**.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval method** table in Apache Kafka integration configuration fields.
9. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Apache Kafka integration configuration fields.
10. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

      When the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

Set up an Amazon Data Firehose (MID-less) integration for Health Log Analytics

Set up an integration to stream log data from Amazon Data Firehose directly to the ServiceNow datacenter, where it's queued for Health Log Analytics processing. There's no need to store AWS keys on your ServiceNow instance.

Before you begin

This integration doesn't run on a MID Server.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Firehose` in the search field.
5. Select the Amazon Data Firehose (MID-less) integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see Amazon Data Firehose integration configuration fields.
7. Select **Next**.
8. Follow one of the procedures provided on the **Set-up instruction** screen to install the integration in AWS.
   You can perform the installation procedure using either AWS CloudFormation or the AWS Management Console. Both methods require the same input. The appropriate choice depends on your requirements and the size of your deployment:
   - Use AWS CloudFormation when you need automation, repeatability, and infrastructure-as-code benefits. It's best for deploying standardized configurations across multiple environments. AWS CloudFormation prompts for input automatically.
   - Use the AWS Management Console when you need manual setups or quick configurations without automation.

   Before you perform either of these procedures, copy the access token, the ServiceNow endpoint URL, and the integration ID to the clipboard. You need these values during the installation process.
9. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option:
     - **Activate with AI** enables AI-powered automatic mapping of log data. When the integration is activated successfully, the **Overview** tab is displayed and Now Assist collects and analyzes log data. An AI icon indicates that Now Assist auto-maps log data to service instances and components for contextual alert generation.
     - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.
   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

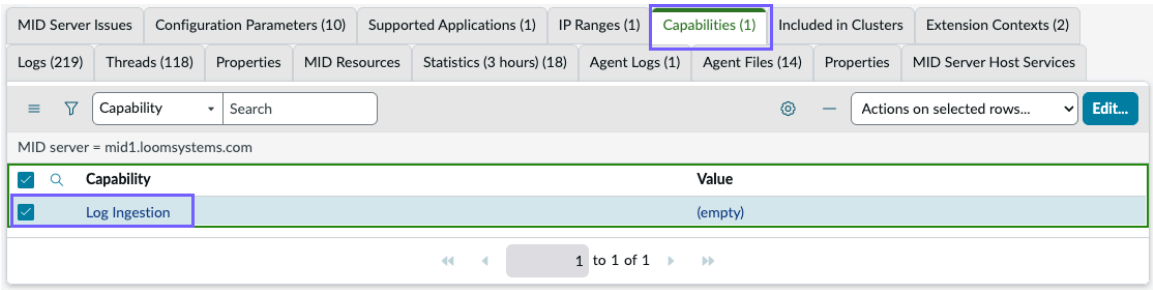
If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics.

Set up a Cribl integration for Health Log Analytics

Set up an integration to enable Health Log Analytics to process Cribl log messages streaming into your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

If your organization uses Cribl for filtering and routing large volumes of log data from various sources, the log format received by Health Log Analytics is distinct from other types. The Cribl integration enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Cribl` in the search field.
5. Select the Cribl integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see Cribl integration configuration fields.
7. Select **Next**.
8. On the **Set up connection** form, fill in the fields.
   For a description of the fields, see Cribl integration configuration fields.
9. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     When the integration is activated successfully, the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

Set up authentication credentials for the Cribl integration in Health Log Analytics

Configure credentials for the authentication method used by the Cribl integration.

Before you begin

Decide on the appropriate authentication method for your instance:

- Basic authentication is preferred for self-hosted (On-Prem) Cribl instances.
- Token-based authentication is required for Cribl Cloud instances.

> **Note:** Token-based authentication is also supported for self-hosted (On-Prem) Cribl instances.

For token-based authentication, create a client ID and a client secret on your Cribl instance and use them to generate a token. For example:

- Client ID: 1234567890abcdef
- Client secret: abcdef1234567890

For detailed information on the Cribl API, refer to the Cribl API documentation.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Select the default Cribl credential alias: Cribl_Credential_Alias.
3. Select **New** to create a credential record.
4. Select the appropriate credentials type for your Cribl instance:
   - For basic authentication, select **Basic Auth Credentials**.
   - For token-based authentication, select **Custom Header API Key Credential**.
5. On the displayed form, fill in the fields.
   - For basic authentication:

Basic Auth credentials fields

Field	Description
Name	A name that describes the credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Username	Your Cribl server username. For example: admin.
Password	Your Cribl server password. For example: admin123.

- For token-based authentication:

Custom Header API Key credential fields

Name	A name that describes the credential.
API Key	The authentication token you generated on the Cribl instance.

6. Select **Save** to save the credentials configuration.

What to do next

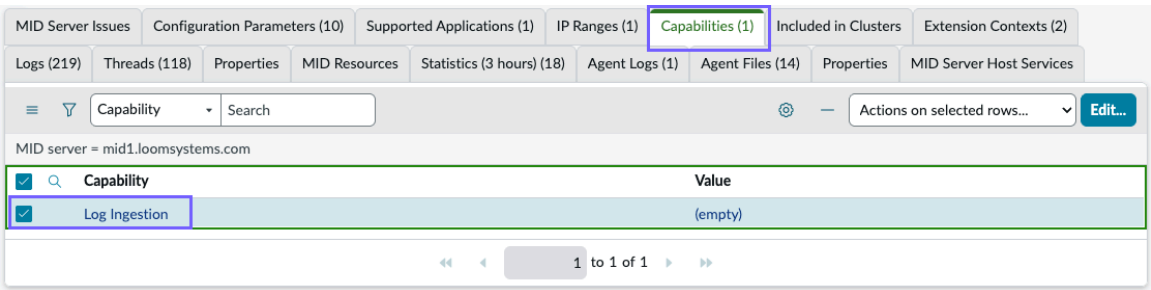
- Verify that the provided credentials have appropriate permissions to access your Cribl instance.
- Verify that only one active credential record of each credentials type exists under the credential alias.

Set up an Edge Delta REST integration for Health Log Analytics

Set up an Edge Delta REST integration to enable Health Log Analytics to process logs it receives from Edge Delta in a distinct format. These logs stream into your ServiceNow instance via REST.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

If your organization uses Edge Delta to handle large volumes of log data from multiple sources before sending it to Health Log Analytics, the log format HLA receives from Edge Delta is different from other types. The Edge Delta integration enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Edge Delta` in the search field.
5. Select the Edge Delta REST integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see Edge Delta REST integration configuration fields.
7. Select **Next**.
8. Follow the instructions in the **Set-up instruction** page to install the integration in the 3rd party console.
   a. Copy the displayed URL.
   b. In Edge Delta, create an HTTP destination.
   c. Paste the copied URL into the HTTP destination.
   d. Add the following headers:
      - Authorization

        Use either of the following:

        - Key <API_KEY>

          Find the API_KEY by navigating to **All** > **MID Web Server API Key** > **View API Key**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Basic <Base64 (username:password)>

  Note: Verify that you use a username and password for a MID web server with Basic Auth enabled.

- Content-Type: application/json.

9. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     When the integration is activated successfully, the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

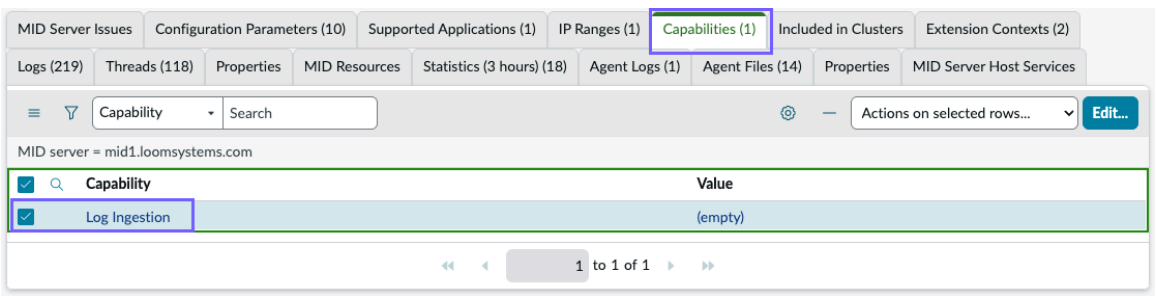
- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

Set up an Edge Delta TCP integration for Health Log Analytics

Set up an Edge Delta TCP integration to enable Health Log Analytics to process logs it receives from Edge Delta in a distinct format. These logs stream into your ServiceNow instance over the TCP transport protocol.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

If your organization uses Edge Delta to handle large volumes of log data from multiple sources before sending it to Health Log Analytics, the log format HLA receives is different from other types. The Edge Delta integration enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Edge Delta` in the search field.
5. Select the Edge Delta TCP integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Edge Delta TCP integration configuration fields.
7. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Edge Delta TCP integration configuration fields.
8. Select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. In the **Set-up instruction** screen, copy the displayed Host IP and Port values and paste them in your Edge Delta pipeline under TCP destination.

   Note: The Host IP and Port values are based on your configuration on the **Provide details** form.

10. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      When the integration is activated successfully, the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment

Set up an Elasticsearch integration for Health Log Analytics

Set up an integration to stream log data seamlessly from Elasticsearch indices to your instance for Health Log Analytics processing.

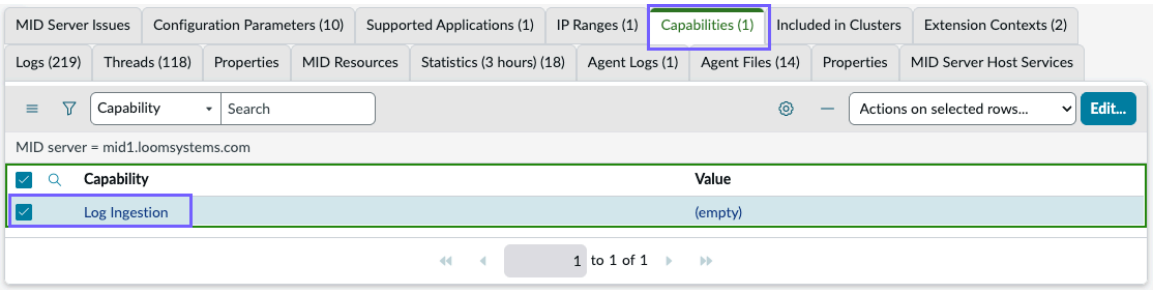
Before you begin

Note: Health Log Analytics supports Elasticsearch versions above 7.10.2 and below 8.18.2. For advanced Elasticsearch log streaming guidance, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the Health Log Analytics AI Engine is up and running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter *`Elasticsearch`* in the search field.
5. Select the Elasticsearch integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the fields, see the **Provide details** table in Elasticsearch integration configuration fields.

7. Select **Next**.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see Elasticsearch integration configuration fields.
9. **Optional:** Select **Advanced settings** to set advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Elasticsearch integration configuration fields.
10. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

      When the test is successful, you can activate the integration either with or without AI-powered capabilities. Select the appropriate option:

      - **Activate with AI** enables AI-powered automatic mapping of log data. When the integration is activated successfully, the **Overview** tab is displayed. Now Assist collects and analyzes log data. An AI icon indicates that Now Assist auto-maps log data to service instances and components for contextual alert generation.
      - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.
    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics.

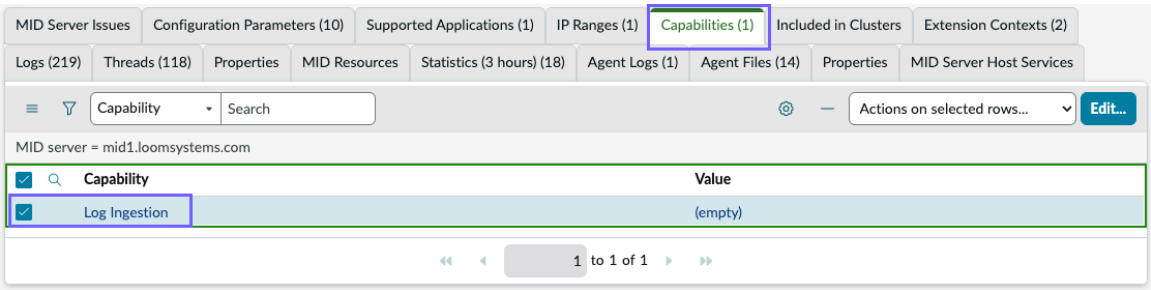
Set up a GCP PubSub integration for Health Log Analytics

Set up an integration for receiving log messages that were published to a Google Cloud Platform (GCP) Pub/Sub topic and streaming them to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

Set up a Microsoft Azure Event Hubs integration for Health Log Analytics

Set up an integration for streaming events from Microsoft Azure Event Hubs to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

> **Important:** Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Event Hubs` in the search field.
5. Select the relevant Azure Event Hubs integration tile.

> **Note:** If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields and then select **Next**.
   For a description of the fields, see the **Provide details** table in Microsoft Azure Event Hubs integration configuration fields.
7. On the **Set data retrieval** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval** table in Microsoft Azure Event Hubs integration configuration fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Microsoft Azure Event Hubs integration configuration fields.
9. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
10. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

      When the test is successful, you can activate the integration either with or without AI-powered capabilities. Select the appropriate option:

      - **Activate with AI** enables AI-powered automatic mapping of log data. When the integration is activated successfully, the **Overview** tab is displayed. Now Assist collects and analyzes log data. An AI icon indicates that Now Assist auto-maps log data to service instances and components for contextual alert generation.
      - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.
    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics.

Set up a Microsoft Azure Event Hubs (MID-less) integration for Health Log Analytics

Set up an integration for streaming events from Microsoft Azure Event Hubs to your ServiceNow instance without a MID Server.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
This Microsoft Azure Event Hubs integration eliminates the need for a MID Server, which simplifies setup and enables more efficient log data ingestion into your instance. By removing the MID Server requirement, log data collection and processing are streamlined to promote faster analysis and root cause identification.

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Azure Event Hubs (MID-less)` in the search field.
5. Select the Azure Event Hubs (MID-less) integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields and then select **Next**.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Event Hubs MID-less integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Description	Option to add a brief description of the integration to help identify it.
Transport	Protocol used to stream the log data. This field is read-only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This integration uses Microsoft Azure Event Hubs to stream log data to your instance.

7. On the **Set-up instruction** screen, perform the appropriate procedure to install the integration in your third-party console.
   - Install the integration with Bicep, a domain-specific language (DSL) that uses declarative syntax to deploy Azure resources.

     Using Bicep enables automation and consistency across environments through Infrastructure as Code (IaC), allowing you to manage your Azure environment more efficiently. It also supports version control and integration with CI/CD pipelines.

   - Install the integration in the Azure portal.

     If you're doing a one-time setup or prefer a graphical interface, installing in the Azure portal is a good choice. It provides a convenient way to configure resources, making it suitable for straightforward deployments.

   The screen provides a link to detailed configuration instructions for each of these two installation options.
8. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option:
     - **Activate with AI** enables AI-powered automatic mapping of log data. When the integration is activated successfully, the **Overview** tab is displayed and Now Assist collects and analyzes log data. An AI icon indicates that Now Assist auto-maps log data to service instances and components for contextual alert generation.
     - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.
   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics.

Set up a Microsoft Azure Log Analytics integration for Health Log Analytics

Set up an integration for streaming log data from Microsoft Azure Log Analytics to your ServiceNow instance. The integration points the Health Log Analytics AI engine to a data source in your Microsoft Azure Log Analytics account.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

  Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Azure Log` in the search field.
5. Select the Azure Log Analytics integration tile.

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics.

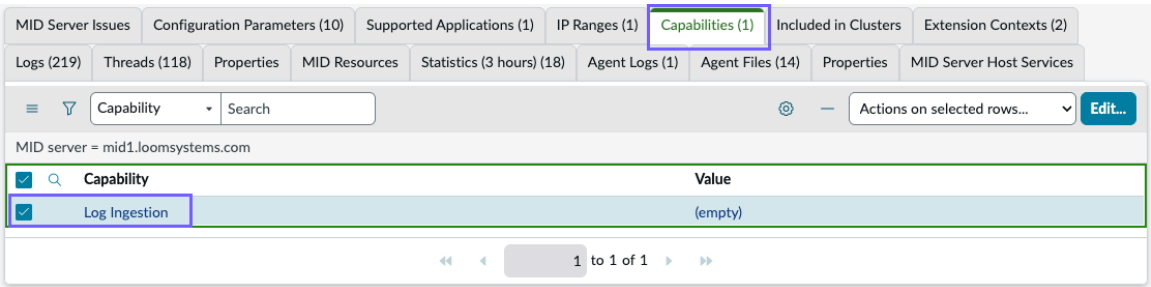
Set up a MID Server integration for Health Log Analytics

Set up an integration for collecting and streaming MID Server log messages to your ServiceNow instance for processing by Health Log Analytics.

Before you begin

Important: You can create only one MID Server integration per MID Server.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `mid` in the search field.
5. Select the MID Server integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in MID Server integration configuration fields.
7. Select **Advanced Settings** and fill in the fields.
   For a description of the fields, see the **Advanced Settings** table in MID Server integration configuration fields.
8. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     The integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:

  - Source type structure adjustment
  - Review logs on the Log Viewer

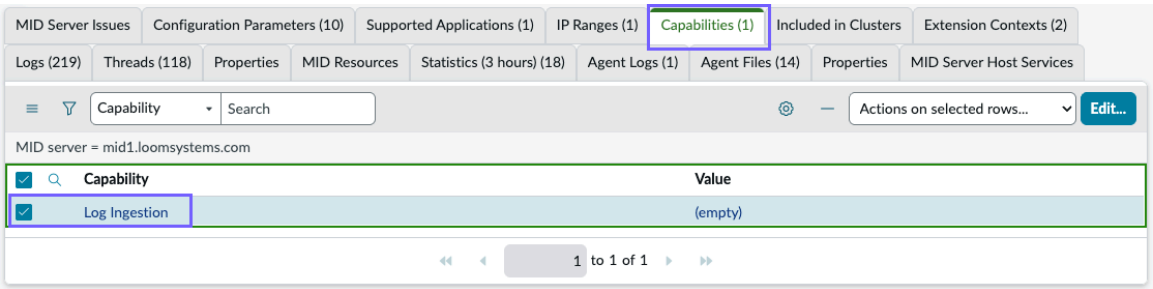
Set up a REST API integration for Health Log Analytics

Set up an integration for streaming log data to your ServiceNow instance for processing by Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the Health Log Analytics AI Engine is up and running.
- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

On the MID Web Server Context form, in the **Execute on** field, select *Specific MID Server* and not the cluster option. In the **MID Server** field, select the specific MID Server to which the log data is pulled.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Note: REST API integrations support only UTF-8 encoding for incoming data.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter REST in the search field.
5. Select the REST API integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see REST API integration configuration fields.
7. Select **Next**.
8. In the **Set-up instruction** screen, copy the provided URL to the clipboard.

   The format of the URL is: `http://(MID_SERVER_IP):(MID_WEB_SERVER_PORT)/ap1/mid/hla/raw`, where `/aps/mid/hla/raw` is the endpoint. HLA has replaced `(MID_SERVER_IP)` and `(MID_WEB_SERVER_PORT)` with the values you configured on the **Provide details** form.

9. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.
